THE RUGOSA ROSES.

THE period from the middle of May till the end of June, before the ordinary Roses open in any quantity, is the time when we most appreciate the Rugosa Roses. They all flower again, it is true, but when we have the H.P.s, H.T.s, and Tea Roses they are apt to be neglected and passed over.

They are nearly all delightfully sweet-scented; some of them are among the most fragrant Roses we possess; they are very hardy, and thrive even with indifferent treatment, and they flower a second time, a few of them being almost constantly in flower throughout the season, while the autumn berries of the fruiting section are very bright and cheerful.

No doubt they have somewhat serious limitations. One that has perhaps restricted their popularity more than any other is that they are not of much use as cut flowers in the house or at the shows. Nearly all the Roses of the group soon flag and fade in water, and their sphere of usefulness is, therefore, in the garden. Then the form of the flower in the double Rugosas is generally poor. Even Conrad F. Meyer, which is, perhaps, the best of the group in the matter of form, produces a large number of badly-shaped flowers. In colour, again, they leave something to be desired. The whites are generally good, and many of the pinks are soft and pleasing, but the red shades, for the most part, have a certain tint of violet or blue in them which soon gives to the flowers a dingy appearance.

They have been long known and grown in gardens. It was as far back as 1784 that Thunberg obtained the carmine Rosa rugosa and the white form, rugosa alba, from Japan. Not, however, till the closing years of the nineteenth century was much attempted in improving them. Since that time a number of hybrids have begun to appear, notably as the result of the work of M. Jules Gravereaux, Dr. Müller, Bruant, Lambert, Cochet, and in this country Paul and Son, and we now have upwards of 160 varieties of this race of Roses. These were for the most part obtained by hybridising the Rugosa with the Tea Rose. When these hybrids first began to appear it seemed to some of us that the Rugosa Roses, if developed so as to retain the new qualities, and if the defects of the race could be eliminated, promised great things for the Rose gardens of this country, where hardihood is so particularly desirable a quality. But without in any way abandoning our hope for what the future may have in store for us, it may be at once admitted that this desirable consummation has not yet been realised.

To begin with, it was found that the first effect of the admixture of an alien strain at once caused the resulting hybrid to lose the characteristic autumn fruit. There is, for instance, a very pretty little hybrid between R. rugosa and R. foliolosa which is constantly in flower, and in many respects is highly attractive, but the seed pods wither as soon as the flowers fade, and no fruit is produced. Although in some cases something has been added to the length of flowering period, yet not only have the bright-coloured fruits gone, but the power to last in water as cut flowers has not yet been acquired. And even where an improvement has been effected in the formation of double flowers, with some approach to form such as Conrad F. Meyer, Nova Zembla and Mme. Georges Bruant, we are fully conscious that this should properly be regarded as an instalment only, these Roses producing a rather undue proportion of poorly-formed flowers.

Although the Rugosas do not as yet in any way rival the garden Roses, yet they are extremely useful in filling in the gap before the bulk of the Roses come into flower. For this reason their appropriate position is not in the Rose garden itself, but rather in its outskirts.

The number of Roses that make satisfactory hedges is extremely limited. A few of the species will do this; for instance, several of the Scotch Roses and some of the older hybrids such as Rosa alba; but their period of flowering is very short, and a good dense hedge may be made of the Wichuraiana hybrids, if they are supplied with a hurdle to fasten them to; but among the garden roses proper, if we except the Bourbon Zéphirine Drouhin and, perhaps Grüss an Teplitz, the Roses that will make a good hedge are negligible.

With the Rugosas it is otherwise, nearly all of them make excellent hedges, and this is one of the best ways of growing them. They require no support; all that is necessary is to tie the growths diagonally, either to a few stakes or to one another, while some do not even require this attention. Thus treated they quickly make a very pleasing fence from 4 to 7 feet high, as may be desired. If not grown as hedges, then they should be allowed to expand into big isolated bushes. I have tried some of them as pillars, but only a few are adapted for this treatment, and when I mention that the best for this purpose are those with something of the Dijon Tea habit, like Conrad F. Meyer, Mme. Lucienne Willeminot, Nova Zembla, Daniel Leseuer and Mme. Alvarez del Campo, it will be realised that plenty of room must be allowed them when they are grown in this manner.

In the ensuing review I have grouped the colours of the flowers. Those that make orange or red autumnal fruits usually grow 4 to 6 feet high. The hybrids vary considerably in the vigour of their growth. We have (i.) big growers like Conrad F. Meyer, (ii.) bushes from 4 to 7 feet high, such as America, and (iii.) low growers 2 to 4 feet high, such as Schneezwerg, Mercedes, and the hybrid with foliolosa I referred to above.

Among the whites there are two excellent varieties bearing red berries in autumn. For the most part the berry-bearing Rugosas are single, or nearly so; but one of these is an exception. The old Rugosa alba (Thunberg, 1784) is quite one of the most pleasing. The flowers are a very good white, and have a good outline; the plant makes a bush about 4 to 5 feet high.

BLANC DOUBLE DE COUBERT (Cochet, 1892) is one of the best of the family. The flowers are double and a good white, and though not so perfect in outline as the single alba, are much more freely and constantly produced. In fact, my bushes of this variety are never without flowers from the time they begin, about the third week in May, to the October frosts.

REPENS ALBA (Paul and Son, 1903) is a huge grower, with long sinuous stems which, if it be in a position where it can develop rapidly, makes an enormous bush. It is said to have been obtained by crossing R. rugosa with R. wichuraiana.

MME. GEORGES BRUANT (Bruant, 1887), a hybrid between R. rugosa and the Tea Rose Sombreuil, is one of the best-shaped of the Rugosas. The flowers are a good white and freely produced, but, like the last, it is not a berry bearer.

SOUV. DE PHILEMON COCHET (Cochet, 1899), a seedling from Blanc Double de Coubert. The colour is a good white and the flowers are double, but flat centred.

SCHNEEZWERG (Lambert, 1911) is a charming little plant with white flowers, which seems promising for the rockery.

FIMBRIATA (Morlet, 1891), the result of a cross between Mme. Alfred Carrière and R. rugosa, is an extremely pretty little flower: white-tinged blush, with fringed petals, reminding one of the pinks. Though hardy enough, it is not so strong a grower as some.

MME. HENRI GRAVEREAUX (Gravereaux, 1905), from Marie Zahn × Conrad F. Meyer, is creamy white, with a blush pink centre.

Nova Zembla (Mees, 1906), said to be a white sport from Conrad F. Meyer, is often very pleasing and better shaped than its parent. In wet weather the flowers are apt to become dirty; but it is useful and distinct. When grown as a free bush it is about 8 feet high.

Daniel Leseuer (Dr. Müller, 1909), said to have the parentage of Pierre Notting × Safrano × rugosa, is the only approach to yellow in the group. It is a big grower, of the habit rather of the Dijon Teas, with brittle stems. The flowers are large and double and often attractive, of a nankeen yellow, with a faint salmon flush.

Mme. Ancelot (Gravereaux, 1906) is said to have the attractive origin Reine des Iles Bourbons × Maréchal Niel × Perle des Jardins × Germanica. It is healthy and a huge grower, but not too free in flowering, and its flowers are flesh pink.

Thusnelda (Müller, 1889), from Rugosa alba × Gloire de Dijon. This is one of the most pleasing and most constantly in flower, early and late. Among the first and the last in flower, the colour is a pale salmon pink.

Mme. Alvarez del Campo (Gravereaux, 1904) is of a rosy flesh colour. I have tried several of the Rugosas as pillar plants, but this is one of the few I have retained for this purpose.

Mercedes (Guillot, 1900) is a very pale pink, or, rather, a pink on a white ground. It is quite one of the prettiest of the semi-double varieties, but not nearly so robust as the type, my plant, which I have had for some years, being about 18 inches high and rather spreading.

Of the pinks and rose-pinks of the typical Rugosa shape, single or semi-double, there are a considerable number. The best of them, to my taste, is Delicata (Cooling, 1898), a soft rose-pink which is very pleasing in the early summer garden. Another good one is Rose Apples (Paul and Son, 1896), a silvery rose-pink. And slightly darker are Chedane Guinoisseau (Guinoisseau, 1895), and Souvenir de Christophe Cochet (Cochet 1894), and darker still Calocarpa (Bruant, 1895), from Rugosa × Common China, one of the best for fruiting.

There are several pinks and rose-pinks among the double varieties. The greater number of these are of the old-fashioned, flat-centred type of flower. I may mention Bienvêtu (Gravereaux, 1906), salmon pink; Mme. Ballu (Gravereaux, 1905); Mme. Laborie (Gravereaux, 1905); Mme. Rénée Gravereaux (Gravereaux, 1906); and Madeline Filot (Gravereaux, 1907). These are all plants growing 4 to 6 feet high, and less of interest in themselves than as steps in the direction we may hope to go in this race.

Of the taller growers we have Conrad F. Meyer (Müller, 1899), which will make a huge bush 12 feet high if allowed, or may be trained in a 4-feet hedge. This is the best-shaped double Rugosa we have down to the present. It was obtained by crossing a seedling from Gloire de Dijon × Duc de Rohan with the Rugosa Germanica. Slightly paler, but also a big grower, is Mme. Lucien Willeminot (Gravereaux, 1904), said to have come from Conrad F. Meyer × Safrano. Though not quite so full as Conrad F. Meyer, it is more free in flowering with me, but otherwise is of similar habit of growth to that of Conrad F. Meyer.

Among the double reds, two deserve special mention, if only for their perfume. They are among the most fragrant of Roses. Rose à Perfum de l'Hay (Gravereaux, 1904) is the result of crossing a seedling from R. damascena × Général Jacqueminot with the Rugosa Germanica. The flowers are large and of a good carmine red when young. This Rose was selected by M. Jules Gravereaux as the most highly scented of all Roses from which to make a Rose perfume. The flowers are sometimes quite a fair shape, but are often apt to come with a confused centre, and are decidedly heavy. The other double red I would name is Mrs. Anthony Waterer, said to be a cross between Général Jacqueminot and an hybrid Rugosa. The bush is very spreading, but only some 3 feet high, and the flowers are a good dark crimson, slightly larger than those of the common China and semi-double. They are so fragrant that when in full flower the bush quite scents the air round it.

Most of the other double reds are of little interest save so far as they may be stepping-stones to something better. Perhaps Le Cid (Vigneron, 1908) is the best of them. It came from Conrad F. Meyer × Belle Poiterine.

But there are three single reds I must mention:—

America (Paul and Son, 1899) is a dark crimson lake, and I have been told it was sent over to the firm who brought it out in 1892 by Prof. Sargent, of Harvard University Botanic Gardens. It is the first in flower of all the Rugosas, and has large fruits covered with long spines.

Carmen (Lambert, 1906) is a good crimson with the least trace of mauve, but very constantly in flower and bright and attractive. However, it makes no fruits.

Atropurpurea (Paul and Son, 1899) is perhaps the most attractive of all the singles except the white. The buds are deep blackish-crimson, opening to maroon-crimson flowers, and the foliage a pleasing lightish green.

Rubra, or Thunberg's type, and Regeliana, which is very like it, are of a rather ugly, purplish, or violet red. Souvenir de Pierre Leperdrieux, a deep vinous, purple red, however, is worth notice for its fine perfume.

Some of the hybrids of R. rugosa with other species are quite interesting; but I must deal with them later. I have, however, perhaps said enough to show that the Rugosas and their hybrids are worthy of a place of their own in the garden, and may yet repay the rosarian who will be at the pains of careful hybridisation and selection. *White Rose.*

PUYA CHILENSIS.

The flowering of Puya chilensis out-of-doors in the Botanic Garden, Cambridge, is the event of its kind for the year in that garden. Almost eighteen years ago a small plant, kindly presented by Mr. T. A. Dorrien-Smith, was received from the fine mass at Scilly. For three years it was grown in the Succulent House, and it was then planted out in the bay formed by the Corridor (at the back), the Succulent House and the Orchid House. Here it was about twelve years in forming the fine head that was figured in the *Gardeners' Chronicle*, 1910, November 26, p. 390, which measured 6 feet through. In February of this year the flower spike began to rise, and the first information of it was that it had pushed through a pane of glass of the "light" that had been set overhead to keep off wet. From that time it gradually rose and before the opening of the first flower on

Fig. 1.—Puya chilensis flowering out-of-doors in Cambridge Botanic Garden.

May 24 had attained a height of 9 feet 7½ inches. The inflorescence itself was 2 feet 5¼ inches in height from base to apex and the stalk from its origin among the leaves about 3½ feet long. The scape grew in height at the rate of about half an inch per day until the branches of the inflorescence began to grow, and when they had nearly ceased growth the flowers began to open. The flowering period lasted just about a month and the flowers were of slightly greenish yellow colour, as nearly as possible the Pyrethrum yellow of the *Répertoire de Couleurs*, published by the Société Français des Chrysanthémistes, distributed by the Royal Horticultural Society. The accompanying illustrations, one of the entire plant and flower, another of the inflorescence, and a third of the young rising scape showing the very fine bracts, show well what the general appearance was. In the rising of the scape there was a

Fig. 2.—inflorescence of puya chilensis.

very interesting feature which seemed almost abnormal at the time. It appeared after the time of the small illustration of the early rising stage. The large bracts of one side extended over the top, covering and forming a sort of cowl over the growing point; but as the inflorescence grew to be quite symmetrical, this must have been quite normal. It seemed evidently to form a protection for the top, but apparently no protection against rain can be necessary in its native country. Since the illustration of 1910, side growths have extended so that the width of the mass is now about 8 feet 1¼ inches. At the base of the scape a shoot is growing so that the symmetry of the mass may not much be spoilt by the loss of the original and central crown. The growing and flowering of this plant is a good example of what can be done in a warm and sheltered corner outside plant-houses. *R. Irwin Lynch, Botanic Garden, Cambridge.*

CELERY "BLIGHT" OR "RUST"

(*SEPTORIA PETROSELINI* VAR. *APII*) AND ITS PREVENTION.

(*Concluded from Vol. LIII., page 416.*)

Experiments with Remedies.

An experiment was devised to test the value of spraying in stopping the further spread of the disease. About the middle of May the seedling plants were transferred to trenches in the open ground in the usual way; no discrimination was made, the diseased plants being planted along with the healthy ones in the row. The trenches were 84ft. long and 2ft. wide, with two rows of plants, 1ft. apart, in the trench. Thus at the time the spraying experiment started a considerable proportion of the plants already bore the disease, so that it was as severe a test of the value of spraying as could be wished for. To make the test as drastic as possible, Solid White was chosen for treatment as being the worst affected. One complete row of Solid White was sprayed, while two-thirds of the adjoining row, consisting of exactly similar plants of the same variety from the same bed, were left unsprayed as a "control." The mixture used for spraying was home-made Bordeaux mixture, prepared as follows :—

Copper sulphate ("bluestone")	2 lbs.
Quicklime (in lumps)	2 lbs.
Water	25 gallons.

The 2 lbs. of bluestone are dissolved in 2 gallons of water (this can be done at once with hot water, or in a few hours with cold water if the bluestone is suspended in a piece of sacking). A wooden receptacle (pail or tub) must be used. The 2 lbs. of quicklime (freshly burnt—*i.e.*, in lumps) are placed in a tin or wooden pail and slaked by adding water. A few pints of water are first sprinkled over the lumps of quicklime, which causes them to crack, give off steam, and finally to crumble down. A little more water is added as soon as the slaking lime tends to get dry. In this way, after a few minutes, a thick, creamy paste is obtained. (The operation of slaking lime is hastened if hot water is used, and if the pail is covered with a sack.) Water is added to the slaked lime, thereby making "milk of lime." until there are 2 gallons in the pail. Stir and strain through a coarse strainer into a tub holding 21 gallons of water. Stir well; the tub will now contain 23 gallons of "milk of lime." Pour in the 2 gallons of bluestone solution, when a chemical action takes place at once, and Bordeaux mixture is formed. By this method 25 gallons of Bordeaux mixture of the best quality are obtained. The mixture when made should be used as soon as possible, as it deteriorates on keeping, and should never be kept longer than 48 hours. To obtain the best results only freshly-mixed Bordeaux mixture should be used. It should be applied with a nozzle throwing a very fine, "misty" spray, when it will be found that it is remarkably adherent, and remains on foliage for a month or longer. The Bordeaux mixture should be strained through a fine copper gauze strainer (as provided with most knapsack sprayers.

In our experiments the Vermorel "Eclair" knapsack sprayer was used, with the finest nozzle. The spraying rod was fitted with two adjustable nozzles (as supplied for Potato-spraying). In spraying Celery the best method is as follows : With the nozzle directed upward, spray the under-side of the leaves on each side of the row; then, with the nozzle directed downwards, spray the upper surface of the leaves. Care should be taken to see that the spray gets well into the crown of the plant. When the spray is dry a bluish deposit is seen over the sprayed parts. If the spraying is well done all the fresh growth of the plant is protected by this deposit.

The first spraying of the row of Solid White was given on June 25, by which time the plants had made a fair growth. On the older leaves of the plants a fair amount of the disease was present; the aim of spraying was to cover the fresh growth with the fungicide in order to protect it from infection. One of the effects of this spraying was to kill off rapidly the lower leaves which had been spotted with the disease. In the adjoining unsprayed "control" row similarly affected leaves died off more gradually under the continued progress of the disease.

On July 17 the dead leaves from both the sprayed and unsprayed rows were removed and burnt. On July 18 the sprayed row was given a second spraying. At this time the plants in the sprayed row showed, on the whole, a more vigorous growth in comparison with the unsprayed plants, and their leaves were of a decidedly darker and healthier green.

On August 9 the row of Solid White was given its third and final spraying. At this date the plants in the sprayed row were conspicuously

Fig. 3.—puya chilensis; showing the large bracts before the flowers expanded.

taller and more vigorous, with much darker green leaves, the difference between the sprayed and unsprayed rows being greater than on July 18.

On September 14 the difference between the sprayed and unsprayed rows was so great as to strike the eye at a distance. The sprayed plants were carefully examined, and it was found that through the fresh growth having been unsprayed, the disease was apparent in a few spots on the upper leaves, though none of the diseased leaves was in any way withered or seriously affected. This slight infestation of the fresh growth of the sprayed row after the last spraying was inevitable under the circumstances, with the adjoining and neighbouring rows of badly infested Celery.

By October 11, when the season's growth had finished, it was seen that the plants in the sprayed row were nearly double the size of the unsprayed plants. (See Fig. 4.) The tall, fine plants of the sprayed row seemed none the worse for the slight traces of disease on a few of the leaves, none of which was withered; while plants in the unsprayed rows were poor and stunted, and had many withered leaves on them.

All the plants in the unsprayed, short row, and the same number of plants from the sprayed row, were dug up, and after the removal of

the roots, were washed and weighed. The results were as follows :—

Weight of sprayed plants	672 lbs.
Weight of unsprayed plants	281 lbs.
Increase in weight of plants due to three sprayings with Bordeaux mixture	391 lbs.

The plants in the sprayed row were worth from 1s. 3d. to 1s. 6d. per dozen, and were quite up to, if not exceeding, the average for the variety. The plants in the unsprayed row would not have paid for sending to market. Through the ravages of the disease only a very small centre in each could be used, so that the plants were not of sufficient value to be worth the labour of lifting and washing. At the most, the value of the unsprayed plants was 3d. per dozen.

The actual nett profit due to the spraying can be estimated as follows : There were 274 plants in the sprayed row. These were worth from 1s. 3d. to 1s. 6d. per dozen—average,

Fig. 4.—"Solid White" celery ; the plant to the left lifted from the sprayed row, to the right from the unsprayed row.

1s. 4½d. ; while the plants in the unsprayed row were, at the most, worth 3d. per dozen, so that the increased value due to spraying was 1s. 1½d. per dozen plants. We have now to deduct the expenses of the treatment.

In spraying the 274 plants three times 50 gallons in all of Bordeaux mixture were used. The cost of this can be put at 1s. 6d. For the labour of mixing, spraying, wear of machine, etc., the sum of 3s. 6d. may be allowed, making the total cost of the treatment 5s. Thus we have :—

Increased Value of Plants due to Spraying.

23 dozen plants, at 1s. 1½d. per dozen	£1	5	10½
Less cost of spraying	0	5	0
Nett profit due to spraying ...	£1	0	10½

With such a variety as Solid White, when the plants are infested at an early stage with the disease, spraying means (after deducting expenses) an added value of 11d. per dozen plants.

All the other varieties of Celery planted out in the experimental vegetable garden at Wye College contracted the disease, the severity of infestation of the various varieties being in the following order : Solid White, worst of all ; Clark's Early Market, nearly as bad ; then Superb Pink, Giant Red and Standard Bearer ; and Celeriac least of all.

Conclusions.—(1) Although the Celery "blight" disease is generally first noticed in July or later, it is usually present on the plant much earlier, and inflicts serious damage all through the growing period of the plant. (2) Three sprayings with home-made Bordeaux mixture in June, July and August will protect Celery plants during the growing period from attacks of the Celery "blight." (3) In view of the evidence to hand, outbreaks of the disease very early in the season, even in the seed-bed, may be expected to occur. It would probably be a good plan, when the disease is noticed on the seedling plants, to dip them in Bordeaux mixture at the time of transplanting them to the trench.

It may be mentioned that the Celery is liable to be attacked by other fungous pests—e.g., Cercospora and Phoma. Further, Mr. H. Wormald has found on Celery at Wye a bacterial disease. I should be glad during the coming season to receive from gardeners, for examination, specimens of Celery suffering from any disease.

I wish to acknowledge the help of my assistant, Mr. H. Wormald, A.R.C.S., B.Sc., in carrying out the experiments and in supplying the photographs. *E. S. Salmon, Mycologist to the South-Eastern Agricultural College, Wye, Kent.*

FORESTRY.

THE SPRUCE APHIS.

In the issue of this journal, Vol. LIII., p. 279, attention was drawn to the occurrence of Aphis abietina on Spruce trees, many of which "had been killed outright in various parts of the country." On my arrival last April in Ireland I found the pest doing considerable damage at the Avondale and Dundrum Forestry Stations, especially to the Sitka Spruce, which is now being largely planted in parts of the new areas that have been acquired for afforestation by the Department of Agriculture.

So far as I know this insect has never been reported in any publication to have done serious damage to forest trees until the present year. The mild winter is supposed to be responsible for the epidemic, as the insect has been noticed at work ever since last autumn. I have made considerable enquiries, and find that the aphis is widely distributed throughout Ireland, and has been observed in both the north and south of England, but does not seem to have attracted any attention in Wales.

The aphis has not been noticed on any genus except Picea, and is very diverse in its occurrence and in the extent of the damage done to the different species of Spruce. Some species are not, or very rarely, visited by the aphis ; others are visited but suffer little from the attack ; while trees of other species become entirely defoliated and subsequently die. The varying damage on the various species is well illustrated in the Conifer collection at Kew. On the side next the lake, planted mainly with American species, P. sitchensis, P. Engelmannii, and P. pungens here suffered severely, many of the trees (including some 30 feet or more high) being entirely stripped of their leaves. Some trees of P. nigra and P. alba escape, whilst others sustain severe damage. On the other side of the path, where European and Asiatic species are planted, the damage is much less, the only trees seriously injured being certain varieties of P. excelsa, like var. Clanbrasiliana and var. gigantea.

The damage is not confined to young trees, though these are generally worse attacked than mature specimens. In a large nursery in the south of England nearly the whole of the stock of P. sitchensis, P. pungens, and P. alba has been seriously damaged or killed. I hear also that a good many young plants of the common Spruce have died in one of the northern nurseries.

The report drawn up for me by Mr. Black at Avondale illustrates the usual conditions that prevail as regards the incidence and severity of the attack. There, P. pungens, four years planted, and P. sitchensis, six years planted, are much hurt, the leaves having turned brown and subsequently fallen off nearly completely. P. excelsa, P. nigra, P. rubra, P. alba, and P. Morinda are infested with the aphis, but the trees are not defoliated to the same extent as in the Sitka Spruce. The insects are numerous on P. Engelmannii and on P. orientalis, but no defoliation has ensued in these two species. In the case of three species, viz., P. polita, P. hondoensis, and P. Omorica, aphis has not been observed. The same results practically hold good for the same species in Kew Gardens. At Kew, however, while one tree of P. Omorica near the Forestry

Fig. 5.—Sitka spruce defoliated by the spruce aphis.

Museum has not been visited by aphis, the five fine trees of this species, 30 to 35 feet high, in the collection on the side next the nursery, were infested at an early period this year, but showed no signs of damage when I inspected them on June 13.

It is remarkable how selective the aphis is. At Avondale, within a few yards of a flourishing specimen of P. Omorica, about 8 feet high, which is free from any trace of the insect, a slightly smaller tree (see fig. 5) of P. sitchensis is entirely bare of leaves and in a dying state. At Rostrevor, Sir John Ross-of-Bladensburg showed me a Sitka Spruce almost entirely defoliated, while there was no sign of attack on his specimens of P. Omorica, P. Schrenkiana, P. polita, and P. Engelmannii. In his plantations, above the aboretum, the common Spruce was slightly affected.

In certain parts of England the aphis appears to be doing little harm. In the Cambridge Botanic Garden no trace of it was observed on any of the Spruces in May. At Culford, near Bury St. Edmunds, all the species in the nursery, as well as large trees of the common Spruce in the plantations, were untouched ; but some large trees of P. sitchensis, twenty-five years old, were

attacked, according to a letter I received from Mr. Hankins, dated May 17.

For trees in a nursery or isolated specimens spraying with paraffin emulsion is recommended. Soft soap and quassia extract may also be tried. *A. Henry.*

UNUSUAL GROWTH OF ELM.

WE are indebted to Mr. T. E. Stephens, Claybury, Woodford Bridge, Essex, for the photograph reproduced in fig. 6, showing an extraordinary growth of Elm. Mr. Stephens writes as follows:—

"I enclose a photograph of a part of an old Elm tree I recently had felled. The tree had at some time been pollarded, and the section shown was cut near to the crown, which was found to be hollow. The cortex has formed on the two 'wings' inside the tree; the departure from the natural formation is apparently due to a stone which had at some time become embedded in the cortex and cambium. I had the stone whitened over to enable its position to be more easily discerned in the photograph."

GARDENERS' ROYAL BENEVOLENT INSTITUTION.

FESTIVAL DINNER, JUNE 25, 1913.

As announced in these pages last week, the seventy-fourth annual dinner of the Gardeners' Royal Benevolent Institution took place on the 25th ult., in the Whitehall Rooms of the Hôtel Métropole. The Chairman, Mr. Leopold de Rothschild, was supported on the right hand by Mrs. Baxendale, Colonel the Right Hon. Mark Lockwood, M.P., Sir F. Flannery, Bart., the Hon. W. T. Mackenzie, High Commissioner for the Dominion of New Zealand, Sir Stuart M. Samuel, Bart., M.P., Sir E. Stern, D.L., Mrs. J. W. Campbell, and Mr. N. N. Sherwood. On his left were Sir Jeremiah Colman, Bart., and Lady Colman, Sir Walter Smythe, Bart., Mr. Leopold Salomons, J.P., and Mrs. Salomons, Sir Harry and Lady Veitch, Sir G. Pragnell and Lady Pragnell, and the Master of the Worshipful Company of Gardeners. There were upwards of two hundred guests present; the heads of the side tables were Mr. T. N. Cox, Mr. W. O. Hiehle, Mr. Jas. Hudson, Mr. W. Y. Baker, Mr. Geo. Monro, Mr. Joseph Rochford, and Mr. J. W. H. Barr.

The toast of the evening, "Continued Prosperity to the Gardeners' Royal Benevolent Institution," was proposed by the Chairman. He reminded those present that the Institution was founded in the year 1838. The Duke of Cambridge was its first President, and Queen Victoria its Patron. At the present time the King was the Patron, and Queen Mary and Queen Alexandra were Patronesses. He had been reminded by Mr. Ingram, the Secretary, that it was just twenty-five years ago that he had presided at the Festival Dinner of the Institution. Much progress had been made since that time; there were then only 134 pensioners on the books—today there were 258 gardeners and gardeners' widows, whose maintenance amounted in the aggregate to a sum of £4,500 (four thousand five hundred pounds) per annum. Only a small portion of the income of the Institution was obtained from annual subscriptions. The Committee had to look for the greater part of it to other sources, including, of course, such occasions as the Annual Festival Dinners. He was desirous of assisting the cause of those who were unfortunately compelled to seek the benefits of the Institution. In pleading for them, he was pleading for those whose work had so greatly contributed to the pleasure of those present, for those whose toil was so completely in the service of beauty and things beautiful. Most of those present were better acquainted with the circumstances than he himself, and the objects of the Institution had been eloquently described again and again. For instance, on his left hand he was pleased to see his friend, Sir Jeremiah Colman, who presided at the Festival Dinner last year, and whose appeal was so successful in raising funds for the use of the Institution. Mr. Rothschild spoke of the development which had taken place in horticulture within his own experience; of the wonderful hold which the love of flowers had taken on the people of these islands; how the flowers themselves had become more numerous, both in the larger markets and in the flower shops, and even upon the street barrows. He could remember a time when there were only two shops of this kind in Covent Garden—one at one end, and one at the other. Nowadays choice flowers were to be seen everywhere, and very few people indeed were without appreciation of them. In the olden days the chief plants at the few exhibitions which were held consisted of trained Azaleas and other plants suitable for forming into specimens; but these trained plants had now become out-of-date. Although many of the plants which used to be popular have now passed almost out of cultivation, at the same time we had more flowers, and more beautiful ones, now, than was the case formerly. Notwithstanding all the progress that was being made, he had noticed an article in the *Times* of a recent date, in which the R.H.S. was criticised, the writer stating that their Exhibitions were composed too much of well-known plants, whereas they should consist of new ones, more or less unfamiliar to the general public. All he could say was that these exhibitions delighted

FIG. 6.—ABNORMAL GROWTH OF ELM TRUNK.

and attracted him whenever it was his privilege to be able to attend them. Mr. Rothschild coupled with his toast the name of Sir Harry J. Veitch, Chairman and Treasurer of the Institution.

Sir Harry J. Veitch, in reply, thanked the Chairman for being present that evening, and said that the supporters of the Institution could not but remember that it was the second time that he had helped them in this manner. Nor could they help recalling that for sixty years the members of the Rothschild family had supported the Institution with most liberal subscriptions from year to year. Six members of that family had presided at festival dinners. Sir Harry also said that the executive were very grateful for the assistance that had been rendered them in their effort to relieve the distress of poor and aged gardeners and their widows. Notwithstanding the sacrifices made, however, and all the work that had been done, they were bound to recognise that their efforts fell far short of what is desired. For instance, at the last election there were forty-one unsuccessful candidates, in spite of the fact that all these candidates had been selected by the committee as suitable applicants for relief. Their oldest pensioner at present was ninety-nine years of age. She had succeeded her husband, who had contributed in subscriptions twenty-five guineas to the Institution. Altogether the Institution had contributed to the support of this pensioner and her husband, the sum of £428 to date. The two youngest pensioners were forty-six and forty-seven years old respectively. They were totally incapacitated, but neither had subscribed anything to the funds. They were, however, elected, as was right and proper; for this being a *benevolent* Institution, while giving a certain preference to those who have subscribed, reserved its full right to elect on occasion those who were previously unknown to it. As evidence that progress had been made, he would mention that since Mr. Rothschild presided, twenty-five years ago, at the Festival Dinner, two subsidiary funds had been founded. The Victorian Era Fund was for the assistance of candidates while awaiting election; and the Good Samaritan Fund, having for its object the relief of those who had not subscribed to the funds, also assisted those who, under this category, were awaiting their enrolment under the main fund. Sir Harry referred to certain special donations which had been received by the Institution during the past year, including the amount contributed by the Directors of the Royal International Horticultural Exhibition of 1912. He also thanked those proprietors of gardens who were in the habit of throwing open their gardens on certain occasions for the benefit of the Institution, and stated that by these and many other means those who were interested in the relief of distress were doing their utmost to increase the power of the Institution for usefulness. He reminded those present that the expenses of organisation were very few, and that the salaries and expenses of all descriptions were more than covered by investments. For this reason he could assure those who were about to contribute that their donations would go straight to the relief of the necessitous, without any deductions for management purposes. The Institution had already distributed a sum exceeding £145,000.

The next toast, "Horticulture in all its Branches," was proposed by the Hon. W. T. Mackenzie, High Commissioner for the Dominion of New Zealand, and responded to by Colonel the Right Hon. Mark Lockwood, M.P. Mr. N. N. Sherwood, V.M.H. (Trustee), then proposed the toast of "Our Chairman." He said that it was the 44th Festival Dinner he had attended, and that he could testify to the exceedingly liberal support which had always been received by this premier gardening charity from the Rothschild family in general. The list of donations included the following:—

	£	s.	d.
Mr. Leopold de Rothschild	105	0	0
Messrs. N. M. Rothschild and Son ...	105	0	0

The following donors each gave £10 10s.:—
W. Atkinson, Esq., J.P.; N. F. Barnes, Esq.; Charles Davis, Esq.; J. C. Geiselbrecht, Esq.; E. Hazelton,

Esq.; Master of the Worshipful Company of Gardeners; J. McKerchar, Esq.; Robert Sydenham, Esq.; David W. Thomson, Esq.; S. T. Wright, Esq.

The following donors each gave £5 5s.:—

Messrs. Anderson and Sons; Walter Cobb, Esq.; W. L. Corry, Esq.; T. N. Cox, Esq.; Donald McDonald, F.R.S.; Arthur Dye, Esq.; J. Jennings, Esq.; R. B. Leech, Esq.; J. F. McLeod, Esq.; Mrs. Geo. Monro; Messrs. Pulham and Sons; Ernest Stevens, Esq.; Arthur Stevens, Esq.; J. P. Rochford, Esq.; A. Watkins, Esq.; Mrs. A. Watkins; and *Gardeners' Chronicle.*

HOW TO FIGHT DROUGHT.

DURING a hot, dry period when the sun is at its highest altitude and drying winds are prevalent there are many plants which suffer from the consequent drought, and any means by which this risk of damage may be reduced, especially at a time when labour is in the greatest demand, are welcome. Naturally, the first impulse of the conscientious gardener is to supply the water which is lacking, but in many cases it would be better to take other means. When water is given to the ground great care should always be used to supply it in a form as nearly resembling the falling of rain as possible; by this means it is broken up into numerous small particles which have sufficient time to become warmed before reaching the roots. Moreover, when water is given in this way it has time to percolate gradually into the soil without causing a hard crust to form on the surface, and even when the greatest care is exercised it is advisable to move the surface soil as soon as it is sufficiently dry, so that the percolation tubes caused by the water passing into the ground are broken at the surface. This effectually stops evaporation, and consequently less water is needed to keep the soil in a moist condition.

On heavy soils it is seldom necessary to give any water to growing plants for the simple reason that the subsoil contains enough surplus water to carry them over any period of drought such as we experience in the United Kingdom: that is, providing the proper measures are taken to conserve the water in the sub-soil. In many hot, dry countries this conservation of water is carried on under the name of "dry farming" to an extent which is astonishing, and gives better results than irrigation, and this with the use of much less labour. The invention of many new tools for carrying out this form of culture has no doubt helped to spread this practice, but it might be adopted to a far greater extent than it is at present.

The first movement of the soil should be made with a toothed "cultivator," which makes the work far easier and more speedy of accomplishment than with a "Dutch" hoe. Care should be given, not so much to the cutting of weeds, as to the thorough breaking up of the surface; then a hoe over, and the ground will continue in a soft, friable state, easily and speedily worked, and it will act as a blanket, conserving the moisture in the soil and yet allow the air to penetrate with beneficial results.

If soil is treated in the way outlined above, the root action will be perfect if everything else is right, and all the water that will be required is a light spraying after the sun is off the plants.

As much, or even more, benefit can be derived from the considered use of a spraying machine than from root watering; there never was a time in the history of horticulture when the engineering part of spraying was so perfect, and so easily manipulated, and yet in many of our large establishments a spraying machine is seldom used for the simple spraying of water on outside subjects. We go on spraying plants which are in greenhouses, never realising the great benefit which would follow from the same operation outside, added to which is the economy both in water—which is a great consideration when it has to be carried a distance—and labour. The time when plants make the most growth is "after the turn of the day." At this time the nights become longer, and plants are subject to heavy dews, and hence are able to obtain all the water they require. Now if this happy state can be realised earlier in the year by artificial spraying, the crop will give in many cases a double yield, and fully repay the little extra work. It is wonderful to watch how quickly a plant recovers from the utter exhaustion of a sunny day, when it receives a gentle fine spray *under* the foliage. It has the same effect that a bath has on a tired man, and it should be practised, especially on heavy land, to the exclusion, or nearly so, of root watering.

Mulching of garden crops with short manure is another means by which water can be conserved in the soil, but possibly there are more reasons against this practice than appear on the surface, especially for plants growing in the open ground. It is often assumed that plants gain a considerable amount of nourishment from the manure used, but this can only be true where there is plenty of time for the plant food to become available, and even then rain or artificial watering is needed to bring the food in contact with the roots. The filthy practice of using manure for the bedding of strawberries requires no comment.

Shading is a means of helping plants to give the best results, which deserves more attention in these days of cheap material suitable for the purpose.

The writer had the pleasure a short time ago of perusing a pamphlet containing a description of an invention by one of his predecessors. This invention, for which a gold medal was awarded by the Caledonian (or Scottish) Horticultural Society, some eighty years ago, was, roughly, a shallow box fastened round trees on walls, which had an arrangement of tiffany curtains which could be drawn in front of the trees at will, for several purposes, among which was the retarding of the ripening process of Peaches. The price of tiffany was given as 5d. per yard. It can be purchased now for less than half that price, and when it is fastened to roughly made frames there are a variety of uses to which it can be put; shading is one of these. There are many tender subjects which will benefit by their use, and for Sweet Peas, which burn with the sun, they are indispensable. *T. W.*

FOREIGN CORRESPONDENCE.

CULTIVATION OF WITLOOF CHICORY IN BELGIUM.

As I live in the centre of the Belgian chicory district, I was much interested in Professor Chevalier's article on the subject of Chicory growing (see Vol. LIII., p. 405). But I fear that the average gardener, having but little land at his disposal, would be somewhat discouraged by this description of the method of growing this useful vegetable. Here it is forced by a much simpler and less expensive method, and as this method is followed by most of the growers in Evere, Haaren, Saventhem and Louvain, it may be of interest to your readers. The greater part of the cultivators here are "smallholders," working a very few acres each. I cannot find that such trenching as M. Chevalier describes is practised at all: the ground is well manured, ploughed in the late autumn, and left in a rough condition all the winter. The ploughing is usually done by a couple of cows, so it is easy to believe that the ground is not worked very deeply. The land is exceptionally good for root crops, consisting of light loam to a depth of 3 or 4 feet. I see that M. Chevalier says if the leaves are removed from the stalks the roots will suffer; but here it is necessary to do this in the summer in order to provide food for the cows, as there is hardly any grass land. The cows are stabled all the year round, and are used on the land for ploughing, carting, etc. The leaves are therefore stripped for food as soon as full grown, apparently without injuring the forcing qualities of the roots at all. Witloof is, indeed a most useful plant. The cows feed on the leaves in the summer, the heads are then forced for market, after which the roots are chopped up and used for winter fodder! When the roots are lifted in October, after the leaves are all cut off, they are laid in the ground in thick clumps. The trench which is dug for their reception is about 3 feet wide and 10 or 20 feet long. The crowns are placed just level with the surface of the ground, and as each clump is laid in it is covered with ordinary garden soil to a depth of about 1 foot. The beds are then left without any other covering until the crowns are required for forcing. This system has the advantage of allowing the beds to settle with the weather, which makes the heads firm and close. When the beds are required for forcing a pit about 2 feet square and 2 feet deep is dug at either end. In this a fire is made with bricks and mud, similar to the old-fashioned arrangement which used to be employed for heating greenhouses. A trench is then dug along each side of the bed, close to the roots, in which a stove-pipe 3 or 4 inches in diameter is laid. This communicates with the fire at one end, and rises slightly therefrom, so as to be on a level with the crowns at the opposite end. A short length of pipe is then attached to the stove-pipe to carry off the smoke, the piping thus serving both as a heating medium and a chimney. The short pipe is placed upright, not too near the manure with which the whole bed is finally covered. The manure is fresh and is spread over the whole bed, except where the fire-pits are; it is piled into a ridge 3 feet high in the centre, and rough straw mats are laid on the top to keep off heavy rains. The fire is kept burning for twelve or fourteen days, according to the weather, and the bed is then left for four or five days without fire. After this process has been repeated three times, or four in very severe weather, the chicory is found to be ready for cutting. A very small fire is found sufficient—half a pailful in each pit. If two beds are laid close together three fires are sufficient, the middle one serving to heat one end of each bed. For the purpose of placing their produce on the market the growers here have formed a kind of co-operative society, of which the local clergyman is the secretary. The Chicory is collected and sent to the large centres in consignments, the expenses of cartage, etc., and finally the returns on the transactions, being divided among the growers according to the amount they have contributed to the consignment. In this way they are able to compete with large growers. I use the same system that I have described above for forcing the Chicory in my gardens, except that my beds are much smaller—about 3 feet wide and 6 feet long. By starting a bed every fortnight I am able to keep up a constant supply all through the winter. I consider Chicory a most useful vegetable and distinctly superior to Sea-kale. *E. C., Brabant.*

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

NATIONAL INSURANCE ACT.—The following further decisions from the National Insurance Commissioners are of interest to gardeners:—

————446.—A man is employed as groundsman of a cricket club from March to September at a wage of £2 a week. During the winter months he contracts with the club to do all the necessary work in connection with the club grounds for a fixed sum of £5. He does the work in his own time, and no control is in practice exercised over him as to the way in which the work is to be done. The question asked is whether the man is employed under a contract of service during the winter months. [*Decision.*—That the groundsman of the —— Cricket Club, who is en-

gaged during the winter months for certain work under the conditions set out in the application, is not during these months employed under a contract of service within the meaning of the National Insurance Act, and is accordingly not liable to be insured thereunder for such period. —Question 1359.]

————224.—A graduate of a University who is engaged in research work at the School of Agriculture is employed by the authorities of a college as garden steward. Her duties are to manage the garden generally, to appoint and control the gardener and his assistants, and to present a monthly account of expenses entailed in the upkeep of the garden. Her duties occupy about twelve hours a week, and she works for twenty-nine weeks in the year, the amount of time devoted to the work being left to her discretion, provided that the work is done to the satisfaction of the College Council. [*Decision.*—That the employment of the garden steward at a college connected with a University, under the conditions set out in the application, is employment for part-time service only at a rate of remuneration exceeding the equivalent of £160 a year for whole-time service, and is accordingly not employment within the meaning of the National Insurance Act.—Question 1300.] *A. C. Hill, secretary, United Horticultural Benefit and Provident Society.*

REMINISCENCES OF THE YORKSHIRE GALAS—After an interval of thirty years I again visited this famous flower show a week or so ago. The huge "Chelsea" tent was a real acquisition—its capaciousness, airiness, and huge proportions admitted of a whole-picture effect in the general arrangement of the exhibits. Yet something remains to be done in this direction. As in all big flower fêtes, by far the greater part of the exhibits are staged by the "trade," and are honorary; and whilst this is a progressive feature from a national and commercial point of view, it is to be feared that the high-class productions of the private gardener of a few years ago are becoming correspondingly fewer, and this is a point of possible decadence. One of the outstanding features of 1883, as impressed upon my mind, were the gigantic Crotons and other foliage and flowering stove and greenhouse plants staged by Mr. Letts, of Aske Hall, the late Mr. James Cypher, of Cheltenham, Mr. Tudgey, Mr. W. Cole, of Wittington, and others. Mr. Simpson, of Selby, who with his late father exhibited at the old shows (and still continues without a break), smiled aloud at the mention of one of the finest plants ever grown of Erica ventricosa, and shown by Mr. Tudgey at York. Phænocoma prolifera and Hederoma tulipifera are names merely to the present-day gardener. These, in common with the so-called "New Holland" plants, require great skill and much patience to produce the specimens such as were seen in the old days at York. I would not dare suggest the absence of skill to-day, but it will probably be admitted that up-to-date gardening conditions have put patience to flight. But if we deplore the loss of the high culture in specimen plants, there is much compensation to be found in the newer and highly artistic grouping of smaller and well-grown plants. These marvellous groupings in our leading shows have called into practice latent artistic powers in the modern gardener previously unknown, and this to the general advantage. Another of my early impressions was the fruit—in single dishes and in collections—and such fruit! put up by such men as McIndoe, McIntyre, Elphinstone and others—the forenamed are, I think, all departed—but if I remember aright there is still among us an honoured name who figured in 1883 in the prize list, Mr. Goodacre, of Elvaston Castle. It would be interesting to turn up the back pages of the *Gardeners' Chronicle* for a report of the fruit section of York Show in that year and compare with your very studiously moderate remarks on this occasion. I, too, will emulate your reporter and refrain from characterising this year's display, but I must not be misunderstood either, for there were several very fine dishes in the somewhat meagre display. One of the fruit judges in 1883 was the late Mr. R. Gilbert, of Burghley. I can easily imagine the word "decadence" falling from his lips had he been present this year. It is a temptation to recall other prominent features and incidents which occur to the mind in connection with 1883, including the great cart-wheel-trained Show, Fancy and Zonal Pelargoniums. In this same tent in the old days were gigantic, well-flowered Fuchsias and huge multi-coloured Coleses. These are seen no more at York. Roses in 1883 were well staged, particularly on boards, but not so numerous as at present; and the mention of Roses reminds me of an incident which Mr. Avey declares to be impossible now. It was no unusual thing for exhibitors from a distance to put in the few hours "between lights" on the exhibition boards, some falling into the arms of Morpheus, others by the flickering of their penny dips (no electric light in those days) endeavouring to gain inspiration for arranging their exhibits when daylight appeared, whilst one very wide-awake individual perambulated and explored such exhibits as were to his liking, and honestly—or at least openly—appropriating such flowers from the various Rose bushes as enabled him to stage a winning stand on the morrow. York was a great show in 1883. It is a greater show in 1913. There have been many changes for better and worse. It is the same old ground—but much improved. There is the same spirit of determination apparent in the powers that be to succeed. There is the same substantial backing to the efforts of those responsible in the glorious and changeless old city; and there is the same rugged, hearty geniality in the indefatigable secretary and his committee in their generous and unanimous "Welcome to York." "*On the Walls.*"

THE PLAGUE OF CATERPILLARS IN THE DUNKELD DISTRICT.—The enormous damage done to forest trees in the above district must be seen before one can effectually realise the extent to which caterpillars can devastate the young foliage on nearly all kinds of trees. Of course, this is no new thing in the district, as visitations of more or less severity occur every year, but this season the pest seems to have reached unprecedented dimensions. For the benefit of those who have not had the pleasure of feeling the influence of the grandeur of these parts, which were made famous in *Macbeth*, a few details of the country will not be out of place. The well-wooded heights of Birnam and the mountains surrounding the River Tay at this point form a basin, which has been likened to a cauldron, in which the air has little or no chance of circulating quickly, and consequently it is oppressively hot and still—a set of circumstances which are entirely helpful to the propagation of insect pests when they are once established, and the absence of rain which we have experienced during the past few weeks has been favourable to their development. All kinds of trees, excepting Firs, seem to be subject to this devastating influence, and the Oak especially, which at Inver is defoliated, has been in its line of route during this season. Beech, Birch, Limes, Planes, Acers, and Larch have not suffered to the same extent, although Larch was subject to the most severe defoliation two years ago. This naturally leads one to enquire for a probable cause as to why one kind of tree should suffer most in one season, and another kind later. The caterpillar swings on a silken thread and is so light that the direction of the swing is in the same way as the wind. If the direction prevailed for any length of time in one quarter the caterpillars might easily move a considerable distance. If we also apply this theory in regard to the movement of the winged males and wingless female when she is seeking a suitable place to deposit her eggs, we can readily conceive sufficient movement to account for the infestation being in a new quarter, determined by the direction of the prevailing wind during the migratory periods in the life history of the pest; the kind of tree would then be determined, not by its constitution, but by outside influence. This would also account for the fact of trees in the midst of the most affected part being comparatively free when there is an open space on one side of a plantation, but open spaces in the locality are more the exception than the rule. It is much easier to state the fact and suggest the cause than it is to invent a remedy. Birds are the natural enemy of the pest, and they have had a grand time among them in the worst infested part: but possibly, like animals more intelligent, they can get a surfeit of a good "high" feed, especially when it is so easily captured. Possibly something could be done to let more air into this area so that the strong gales could help to clear the caterpillars from the trees, but anything in this way would have to materially alter the climate of this part before it would do any good. And that could only be brought about at the expense of the beauty of the landscape. The conditions at present prevailing would make a splendid object lesson to those who have charge of the afforestation scheme, and they might do worse than send a few men there to study the matter to gather and record information so that it will be available for any scheme which might be advanced. *T. W.*

YEW-WOODS AND BEECHWOODS ON THE CHALK.—Mr. Sprague (p. 364) believes that Beeches have invaded and replaced Yew-wood on chalk escarpments, but he offers no evidence that such a process is going on. His belief appears to be based on cases of the invasion of chalk scrub by Beechwood. Such cases I also have observed, though I do not find the process very general. But the conditions of chalk scrub are very different from the conditions of Yew-wood, and one cannot argue from the one case to the other. The Yew rejuvenates by seed quite successfully in many places on the chalk escarpment, and there appears no reason why naturally occurring gaps in Yew-wood should not be replaced by young Yews, rather than by young Beeches. On the other hand there is a reason, as I have pointed out, why Beechwood should not, in general, invade Yew-woods, and in the absence of evidence that such a process occurs I think we are justified in disbelieving it. Mr. Sprague believes that the invasion of the chalk escarpment by Beech took place from Beech plantations on the top of the escarpment. It is certainly true that many such plantations exist, but it is hard to believe that any of them are old enough to have given origin to the extensive invasion of the escarpment that would have to be postulated if we suppose that all the Beechwoods on the escarpment originated by invasion from above. Mr. Sprague does not definitely state that this is his view, but he implies it. It is the general belief of botanists who know the south-east of England well that the Beech is native on the chalk escarpments, and a careful consideration of the whole of the available evidence convinces me that this view is probably justified. If the "summit plantations" are antecedent to the escarpment woods whence came the Beech that was used for the plantations? That there are local cases of invasion of chalk scrub by Beech plantations above may well be true. It seems to me probable that in some cases Oak woods, in others mixed Oak and Beech woods, especially covered parts of the chalk plateau. I should be inclined to doubt the general extension of heaths on the chalk plateaus suggested by Mr. Sprague; I think the former distribution of woodland and heath on these plateaus is largely a question of the variation of soil, which is very wide. But the whole question of the relation of woodland to heath in south-eastern England presents another and also a difficult problem. I do not at present see any reason for modifying the views expressed in *Types of British Vegetation* on all these questions, except that I am now prepared to believe that the Yew-woods of the chalk may be older, at least in some cases, such as the magnificent Kingley Vale wood near Chichester, than the Beechwoods, and that when the invasion of the Beech came it failed to displace the existing Yew-woods. In conclusion, I should like to say that I do not recognise any valid method of approaching these or any other problems concerning the distribution of vegetation except that of "studying the present vegetation in a limited (not too limited!) tract of country, and endeavouring to reconstruct the original vegetation from the portions that remain." On the other hand, one must use not only the results of study of existing distribution and of the changes now going on, but also considerations based on well-ascertained conditions existing in various types of vegetation which tend to prevent, retard or encourage the replacement of one kind of vegetation by another. Of these shade is an obvious example, but there are many others, particularly soil conditions, of which we know at present very little, and which must be made the subject of careful investigation and experiment. *A. G. Tansley.*

The Week's Work.

THE ORCHID HOUSES.

By W. H. White, Grower to Sir Trevor Lawrence, Bart., Burford, Dorking.

Calanthe and Phaius. — Deciduous Calanthes of the C. Veitchii and C. vestita sections are growing vigorously, and well-rooted plant need plentiful supplies of water. Very great care must be exercised in applying moisture to plants that are not yet well established or the young leaves will soon become spotted. The best-rooted plants may be afforded weak liquid manure made from cow dung at alternate waterings; the drainings from the farmyard are also suitable as a fertiliser for these Orchids. Do not use the stimulant at too great a strength at first; about one part to three parts of water will be sufficient for the first few waterings, afterwards increasing the amount to about one-half of each liquid. This will favour the development of stout, healthy pseudo-bulbs and strong flower-spikes. Generally, at this season, many young roots appear on the surface of the compost, and if a thin layer of fibrous yellow loam be placed lightly over them they will root quickly into this material with benefit to the plants. Keep the house warm with sun heat; there will be no danger from scorching if the glass immediately over the plants is lightly stippled; a denser shading is only necessary for a few hours during the hottest part of the day. With this thin shading gradually increase the amount of ventilation, especially on hot, sunny days. Under these conditions the plants will dry quickly, but if an abundance of water is afforded the treatment will greatly benefit them. Do not crowd the plants, but arrange them so that each growth obtains plenty of light and air, and grow them near to the roof-glass. Back pseudo-bulbs that were placed in Sphagnum-moss a few months ago for purposes of propagation should be examined, and those that have formed new growths re-potted. The distinct Eulophia guineensis may be treated exactly as the Calanthes as regards potting, watering and resting, but it does not, while growing, require such a light situation. The large rose-lipped flowers last a long time fresh, and the plant is a good garden subject. Such evergreen Calanthes as C. veratrifolia, C. macroloba, C. Masuca, C. japonica, C. densiflora and C. Cecilia may be re-potted if necessary, using similar compost to that advised for the deciduous kinds. When these plants are in full growth they require liberal supplies of water and occasionally weak liquid cow manure; the stimulant is especially beneficial when the flower-spikes begin to develop. Do not expose these plants to direct sunshine after the young growths have started, but place them in a shady position in the Cattleya house, but if at any time they show signs of spotting or damping remove them at once to the intermediate house.

Habenaria.—Such species as H. rhodochila and H. pusilla (militaris) are in full growth and require an abundance of water at the roots. These plants are grown in a rather shallow layer of compost, and the principal roots being on or just below the surface of the soil, the plants should be constantly examined to see if water is necessary. Grow the plants in the hottest house, and stand them on inverted pots close to the roof-glass, so that they may obtain plenty of light, but not direct sunshine. Diffused light coming through open lattice-wood blinds suits their requirements; whereas they seldom produce fine, dwarf spikes of bloom when grown in denser shade. A light spraying overhead at closing time is beneficial all through the growing season.

Catasetum, Cycnoches, Mormodes and Cyrtopodium.—The different species and varieties of these singular and interesting Orchids are growing vigorously, and all well-rooted plants need plentiful supplies of water, but specimens that are not yet well-established need watering with extra care. The flower-spikes generally appear as the pseudo-bulbs become matured. After the plants have bloomed they should be exposed gradually to full sunshine, and be watered at the roots till the new pseudo-bulbs are ripe. At that stage the leaves commence to fall, when root-waterings should be reduced. These plants grow best on the lighter side of a very warm house, and, if convenient, they should be suspended from the roof with their foliage within one foot from the glass. A temperature such as is maintained in a Pine stove, Cucumber or Melon house in summer, is suitable for Cycnoches and Mormodes. Such plants as Cyrtopodium Andersonii, C. St. Ledgerianum. and C. punctatum require a similar treatment to that recommended above. But these Orchids flower during the early spring months, the spikes appearing in conjunction with the young breaks.

Eulophiella.—E. Elizabethæ and E. Peetersiana are generally considered difficult subjects to cultivate, but with proper treatment and suitable conditions generally no trouble will be found in growing both species successfully. Both plants appear to thrive best in a moist, shady position in the hottest house. Immediately new roots grow from the young rhizomes an abundance of water must be afforded, and the plants liberally treated in every way till the growths are fully matured. The plants of E. Peetersiana at Burford are attached firmly to their original clumps of Platycerium into which the new roots have penetrated freely. A loose layer of living Sphagnum-moss has been placed around the bases of the Ferns, and into this the old roots are pushing large numbers of rootlets. The Fern and Sphagnum-moss is sprayed several times daily, so that at no time is a thorough soaking with water necessary. Plants of E. Elizabethæ grow and root well in a mixture of Osmunda-fibre and Sphagnum-moss, baskets being the more suitable receptacles. Thrips and red-spider soon infest the young growths, especially the under sides of the leaves, and constant attention is needed to keep them in check.

Pleione.—The Indian Crocuses, as these Orchids are termed, are in full growth, and if the plants are strong specimens they should be supplied plentifully with water at the roots supplemented by occasional doses of weak liquid manure, made from cow dung. This treatment should be continued until the foliage shows signs of maturity, when the use of manure water should be discontinued. When the leaves begin to fall moisture should be withheld gradually. Grow these Pleiones in a light position, suspended near to the roof-glass either in the intermediate or Cattleya house.

THE FLOWER GARDEN.

By Edward Harriss, Gardener to Lady Wantage, Lockinge, Berkshire.

Spring-flowering Plants.—Transplant seedling Wallflowers, Pansies, Aubrietias, Alyssums, and Silenes in the open as soon as the plants are large enough for shifting. If the soil is very dry, it should be soaked with water, levelled, and raked to a fine tilth. During very hot weather it will be an advantage to shade the plants for a day or two after they are replanted. Polyanthuses may be pricked out first into boxes, to be transplanted in the open when they are larger. Delphinium, Anchusa, Chelone or any perennials which have been raised from seed this spring may be set out in well-prepared ground in the reserve garden. Let the soil be broken thoroughly, and, if it is of a stiff texture, mix plenty of light material with it, so that when shifting the plants in the autumn they may be lifted with plenty of soil attached to the roots.

The Wild Garden.—The same bright effects cannot be had in the wild garden during the summer and autumn months as in the spring, when the bulbs and early flowering shrubs are in their full glory, but much can be done to make this part of the pleasure grounds interesting, if not showy, during the next two or three months. The foliage of spring-flowering bulbous plants having now sufficiently ripened, it may be cut level with the grass, but care must be taken that other plants are not damaged when carrying out this work. Plants of Oriental Poppies which have finished flowering may be cut partly back. Subjects suitable for planting or plunging in the wild garden comprise not only bedding plants, but any species which have been employed in the greenhouse or conservatory. Stove plants also may be used beneath trees provided they have been somewhat hardened in preparation. Scented-leaved Pelargoniums are excellent subjects for the purpose; others include Daturas, Crinums, Aloysia (lemon-scented Verbena), Agapanthus, Abutilons and Humeas. Before putting out the plants it is advisable to give the soil a thorough soaking by means of the hosepipe.

Humea elegans.—These plants attract considerable attention when in flower, but unfortunately they cannot always be relied upon to last in good condition throughout the season. They often die suddenly when they have reached the height of their beauty without any apparent reason. For this reason they should not be made use of extensively in positions of importance. The utmost care is necessary in applying water to the roots when they have been placed in their flowering quarters, as irregularities in this matter are, in my opinion, one of the chief causes of failure. Provided they are regularly supplied with water, the plants succeed best plunged in the ground in their pots in a position that is partially shaded. If seeds are not already sown for raising plants for next season lose no time before inserting them, as the Humea requires a long season to grow into a good specimen. More than ordinary care is necessary in the treatment of the seeds of this plant. They should be sown in shallow pans in a very fine, sandy compost and covered only slightly with fine soil or sand. Place a sheet of glass over the seed-pan and cover the glass with damp moss till the seeds have germinated. Place the pan in a moderately warm pit and keep it shaded.

Pinks.—It is necessary to raise fresh stocks of Pinks each season or the clumps will become weak and straggly. This work may be done now either by layering the grass in the same manner as Carnations, or by striking cuttings. The latter method is usually adopted. The cuttings may be pulled off the old plants and, after trimming off the lower leaves, inserted in boxes of sandy soil placed in a close frame for a week or two and kept shaded. As soon as the pipings are rooted they should be inured gradually to more light and air.

Geum Mrs. Bradshaw.—Seeds of this pretty border plant should be sown to furnish plants for flowering early next spring. The seeds should be sown in boxes filled with light compost, and the soil watered with a fine-rose can. Stand the seed-boxes in a cold frame and keep them shaded until the seeds have germinated. When the seedlings are large enough for re-potting place them singly in 60-sized pots and plunge them in ashes in a cold frame, where they may remain for the winter. Another sowing may be made in the autumn to furnish plants for flowering later.

THE HARDY FRUIT GARDEN.

By B. Goodacre, Gardener to Sir Ernest Cassel, Moulton Paddocks, Newmarket.

Morello Cherries.—Trees of the Morello Cherry trained against north walls should be examined carefully for the presence of black aphis, which infests the points of the new shoots. If there are bad infestations the growths most affected should be cut off and burned, and the tree syringed afterwards, first with an insecticide and later with clear water. These trees are trained very similar to the Peach. Shoots growing at right angles to the wall — known as foreright shoots, and others that are not required for fruiting, should be cut clean away, for the Morello Cherry requires a different treatment to the Sweet Cherry, which develops its fruits on spurs. A sufficient quantity of young wood should be trained in annually on Morello Cherries to furnish the fruiting wood of next season. In tying the growths take care not to cramp the soft points of the shoots, but tie them loosely and encourage a healthy, clean growth. In these gardens we get good results with Morellos as standards. When trained in this way the growths need rather closer restrictions, and, at the time when summer pruning is done, it is sometimes an advantage to cut out some of the older wood and allow young shoots to grow in its place. The shoots may be spurred in a little to encourage the development

of fruiting wood towards the central parts, much in the same way as is practised in the case of bush Apples.

Peaches.—The crop of Peaches in the open is generally a light one, and as those fruits which have set will be the more valuable in consequence, they should receive every encouragement to ripen. The trees should also be given every attention, as the next season's crop largely depends upon the growth which is made now. All lateral growths arising from strong shoots of the current year should be kept constantly removed, except when young trees are required to furnish the wall space quickly, in which case a few of the more forward breaks may be allowed to remain. Lateral growths may, however, be encouraged to develop on rank-growing trees, as these ripen better and prove more fruitful than the thick, sappy branches from which they arise. If these laterals are trained in carefully, they will add to the neat appearance of the trees. They should be tied loosely at first, or they may be pegged back with light pieces of Birch stuck between the wires or older parts of the tree. The latter system is certainly preferable at this busy season than tying done hastily and carelessly. Let the trees be watered regularly whenever they require moisture, and those with fair crops may be afforded a little stimulant, but I do not advise applying food to trees bearing few or no fruits, as this may cause them to develop rank wood and set up gumming, whilst the few fruits that have developed may split their stones. A good mulching of light stable litter may be placed on the border, as this will keep the soil moist and encourage the roots to grow near the surface.

THE KITCHEN GARDEN.

By John Dunn, Foreman, Royal Gardens, Windsor.

Broccoli and Cauliflowers. — Autumn Broccoli should be planted now. Varieties intended for use before the New Year should be planted in the richest ground available, allowing a space of 2 feet between the plants each way. Make the soil firm about the roots and afford the latter a copious watering. Moisture should be afforded on frequent occasions until the plants are well established. Broccoli intended to remain over the winter for use in the spring should not be planted in very rich soil, as this would cause growth to be succulent and tender and unable to withstand the cold of winter. Let the ground be made moderately firm before the plants are put out in order to promote stocky growth. If Halloween Giant Cauliflower is planted at the present time the heads should be ready for use just before the autumn Broccoli; this is a splendid late Cauliflower and the heads are well covered with foliage, which protects them from early frosts. Water all Cauliflower plants liberally during times of dry weather and stir the soil after each application of water.

Preparing the Ground for Winter Crops.—All plots recently occupied by early crops should be cleared and prepared for plantations of Coleworts and other winter vegetables. Ground which has been occupied by early Peas and other spring crops should be planted with some vegetable which will be removed in time to prepare the soil for plantations of early Potatos or Cauliflowers. If these matters are settled before the winter crops are planted there will be less difficulty in finding sheltered positions for the early spring crops.

Onions.—Plants that were set out in April for the purpose of furnishing extra large bulbs should be plentifully supplied with moisture at the roots. Liquid manure from the farmyard may be applied freely, but take care not to use it at too great a strength. Soot is an excellent stimulant for this crop and should be applied when the atmosphere is moist. Spring-sown Onions growing in light soil must receive careful attention. In dry weather a mulching of horse droppings is beneficial, and by keeping the ground moist reduces the labour of watering.

Late Peas.—Do not wait until the plants show signs of injury from drought before applying moisture to the roots. Soft water is best, and it should be given in sufficient quantity to reach the lower roots, for culinary Peas require much moisture when they are growing freely. Place the stakes in position when the plants are a few inches high, using new sticks as far as possible, as they will best withstand the rough winds of autumn.

Lettuce.—Make weekly sowings of Lettuce in order to secure an unbroken supply. It is better to sow the seeds thinly and allow the plants to mature in the same position than to transplant the seedlings. In this way the plants will afford a succession of heads and grow better during the next few weeks, especially if the weather is dry.

Chicory.—Chicory raised from seeds sown a month ago should be ready for thinning; this is best done when the plants are very young. Allow a distance of 9 inches between the individual plants in the rows. Another sowing may be made to furnish plants for use during the spring. When the plants are well through the ground stir the soil on frequent occasions with the hoe to promote a free growth.

PLANTS UNDER GLASS.

By F. Jennings, Gardener to the Duke of Devonshire, Chatsworth, Derbyshire.

Chrysanthemums.—Chrysanthemums which are intended to flower in small receptacles, and which are now in 3-inch pots, should be transferred to 5-inch ones, in which they will flower. The compost for this final potting should consist of three parts rich loam and one part leaf-mould, coarse sand, and wood ash. To each barrowload of this compost, add a 9-inch potful of soot and the same measure of fine bones. After potting, the roots should be soaked with water, and, if the weather is hot and dry, the pots may be plunged in ashes. The plants should be stopped until the end of July, if the flowers are required late in the season; otherwise the stopping should be done according to circumstances. The plants must not be allowed to suffer for want of water, especially as the pots become filled with roots; and they should be liberally supplied with liquid manure and soot-water. Regular and frequent syringings will be necessary, using some effective insecticide, as a preventive of green fly and other pests.

Souvenir de la Malmaison Carnations.—Preparations should now be made for layering Carnations of the "Malmaison" type. If sufficient frames are not available it is a good plan to make an improvised frame of a few old boards and rest some fair-sized lights upon them. A border should be chosen which is not exposed to the full glare of the sun, and the soil carefully prepared of good sifted loam, leaf-mould and coarse sand in equal quantities. The plants and growths should be prepared and cleaned for layering; the foliage should not be removed too high up the growth, as nothing is gained by the production of a short layer. The cut should not be too drastic; it is much better to cut too lightly than to penetrate too deeply, and when inserting the peg care must be taken not to break the part of the stem which is left after making the cut. The layers should be kept as near to the glass as possible, well watered and shaded during the day, and syringed both night and morning. Until the layers begin to root they should be kept rather close; afterwards they may be allowed a free circulation of air, and when well established the lights may be removed altogether. They should be well soaked before potting, as this will make the lifting process much easier. When they are being potted do not knock the pots on the bench to make the soil firm, as this is apt to split the stem of the young plant, often causing total withering. Border Carnations grown in pots should be layered and treated generally in the same way as "Malmaisons," but they can also be layered outside in the open border with good results.

Statice Suworowii.—The seeds of this plant may now be sown, in a pot or pan, using finely sifted loam mixed with plenty of sand, leaf-mould and fine peat. Place the pans on a shelf in a warm house, first watering the soil well; keep the plants shaded from direct sunshine. When the seedlings are large enough to handle they should be pricked off, placing three in each 60-sized pot, and grown in a frame or on a shelf in a glasshouse. They should finally be transferred to 4-inch or 5-inch pots and placed to flower in a greenhouse. Batches of seeds should be sown at different periods, to keep up a succession of flowers.

General Work.—Chrysanthemums should be staked, to secure the growths from damage by wind and rain. Standard Heliotropes should be ready for their final potting, and Browallia seedlings for stopping and potting for autumn flowering. Examine Tree-carnations for the presence of green fly, which may attack the plants at this stage. Re-pot Clerodendron fallax, Plumbago rosea, and plants of late batches of Begonia Gloire de Lorraine. As Hydrangeas pass out of flower the dead trusses should be removed and the plants placed out-of-doors to ripen. As the foliage dries up cut it off, and store the plants closely together until the flower-spikes appear.

FRUITS UNDER GLASS.

By James Whytock, Gardener to the Duke of Buccleuch, Dalkeith Palace, Midlothian.

Pineapples.—At this season many fruits may ripen together. This is a disadvantage, and measures should be taken to retard some of the plants, selecting those with fruits just about to colour. These plants should be taken to a more airy house, where the conditions are cooler, and allowed less moisture at the roots and no stimulants. Specimens with the fruits swelling must be watered with especial care. At each application a small quantity of guano may be added to the water. The weather may now be expected to be sufficiently warm to enable most of the fire heat to be dispensed with in the pits. It will be advisable to make the most of the sun's heat by closing the houses at 4 p.m., allowing the temperature to rise as high as 90° or 100°. At the same time the plants may be sprayed lightly, and the paths and bare surfaces damped freely in order to provide plenty of atmospheric moisture. Should the weather turn dull, wet, and cold, it will be necessary to keep the temperature up by means of the hot-water system. Ventilate the pits early in the morning on all bright days, and admit sufficient air, as nothing is more detrimental to Pines in all their stages than a close atmosphere, which causes the growth to become drawn. Plants of the smooth-leaved Cayenne and Charlotte Rothschild varieties which have been resting during May and June, with a view to furnishing ripe fruits during the winter, may now be started into growth by increasing the temperature and providing more moisture. Both these are strong-growing varieties, and care must be taken that the plants do not become dry at the roots; whilst drought is harmful, guard against an excess of moisture, as the result of syringing too freely Plants of the Queen variety, from which the pines have been cut, with suckers required for purposes of propagation, should receive every encouragement to make strong growth. Attend to such details as syringing and watering, with extra care, for it is important to have the suckers fairly well rooted in 6 inch pots before the winter arrives.

Successional Pines.—Plants intended for fruiting next season are growing rapidly and filling their pots with roots; they will therefore need great care in watering, as the soil may become dry quickly. At the same time, moisture must not be applied to the roots unless it is required, and then it should be given copiously. Applications of soot water and weak guano water may be given with benefit. During times of warm weather, when bright sunshine prevails, attend to the ventilation of the house early in the day, increasing the amount of fresh air up to noon, as this treatment will keep the plants robust. Close the house at 5 p.m. on the afternoons of fine days, and allow the temperature to rise as high as 90° to 95°. At the same time spray the leaves very lightly, but prevent any water accumulating in the axils of the foliage. During fine, summer weather, there should be no difficulty in maintaining a minimum night temperature of 70° without the use of much fire heat. If however, the conditions are not favourable, the hot-water system must be utilised to provide a minimum warmth of 70°. In the culture of successional Pines the grower should guard against the plants becoming prematurely pot-bound, and also against the growth being soft and immature.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Editors and Publisher. — *Our Correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the* PUBLISHER; *and that all communications intended for publication, or referring to the Literary department, and all plants to be named, should be directed to the* EDITORS. *The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.*

Letters for Publication, *as well as specimens of plants for naming, should be addressed to the* **EDITORS, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Special Notice to Correspondents. — *The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.*

Illustrations.—*The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury*

Local News.—*Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, JULY 8—
Wolverhampton Floral Fête (3 days). Baltic Rose and Sweet Pea Sh. at the Merchants' Hall, London. Roy. Scottish Arbor. Soc. Exh. and general meet. at Paisley (4 days). Cork Fl. Sh. (2 days).

WEDNESDAY, JULY 9—
Dover Fl. Sh. Elstree Fl. Sh. Saltaire Fl. Sh. West Surrey Fl. Sh. at Camberley Park.

THURSDAY, JULY 10—
Potter's Bar Fl. Sh. Weybridge Fl. Sh. Women's Agric. and Hort. Soc. Sh. at Botanic Gardens, Regent's Park.

FRIDAY, JULY 11—
Manchester Fl. Sh. (2 days).

SATURDAY, JULY 12—
Nat. Amateur Gard. Assoc. Sh. Congleton Rose Sh. Edgware and Little Stanmore Fl. Sh. Co-partnership Festival at Hampstead Garden Suburb.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—62.4.

ACTUAL TEMPERATURES :—
LONDON.—*Wednesday, July* 2 (6 p.m.); Max. 70°, Min. 53°.
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, *Thursday, July* 3, (10 a.m.); Bar. 29.7; Temp. 61.
Weather—Overcast.
PROVINCES.—*Wednesday, July* 2, Max. 64°, Aberdeen, Min. 56°, Paisley.

SALES FOR THE ENSUING WEEK.

THURSDAY NEXT—
Special sale of Orchids at 67 and 68, Cheapside, E.C., by Protheroe and Morris, at 1.

The Food of Wild Birds.

Mr. Collinge has done good service to horticulturists in bringing together in this volume the results of his laborious investigations into the nature of the food of our British birds. The importance of such investigations is manifest. No one desires the indiscriminate destruction of bird life, and no one would wish our own countryside reduced to the dismal state of that of some parts of Europe where wild birds are not, and where a dozen guns are levelled at any small feathered interloper misguided enough to stray thereto. We are all aware that the small birds are some the friends and some the foes of the garden. We know that some do much harm to the fruit and buds and seedlings, and some seem to revel in destruction from pure devilment—choosing a quiet Sunday for uprooting and laying out rows of seedlings—yet even many of the worst offenders have the grace to mix good with evil, and to clear our fields and gardens of many of the insect pests which infest them.

Further, as Mr. Collinge has shown, in not a few cases a bird may be an insectivorous friend at one period of its life and a fruit-eating nuisance at another. For these specific reasons, therefore, as well as for the fact that the collection of knowledge is good for man, the task which Mr. Collinge has undertaken is to be commended. In illustration of the difference between adult and nesting birds Mr. Collinge describes the daily food ration of the young house wren. Judd observed in the case of this bird that the young were fed 67 times in the course of three hours. The author refers also to Newstead's similar observations on the starling. This bird was seen to make 169 journeys to the nest during some 17 hours. The importance of this greediness on the part of young birds is considerable, for if, as appears to be the case, a young bird consumes during the first few days of its life a weight of food in excess of its own weight, and if, as appears probable, the food consists in most cases of insects, worms and slugs, much must be forgiven the adults for the sake of the annual "weeding" which they perform on behalf of their young.

Into the detailed feeding habits of the various birds which are described in the present volume we cannot go now, but anyone who will study for himself the account given by Mr. Collinge will endorse Mr. Theobald's aphorism that "the economic value of birds must be considered from all points of view in a very broad spirit."

Following on the account of the feeding habits are chapters devoted to the subjects of birds as destroyers and distributors of weed seeds, birds in relation to forestry—in which latter connection our readers will recall Professor Hickson's valuable description in these pages of the use of birds in destroying the large Larch Saw Fly in the plantations of the Manchester Corporation's waterworks at Thirlmere.

Of the 29 species of birds examined by Mr. Collinge, 5 are regarded by him as being distinctly injurious—the house sparrow, bullfinch, sparrow-hawk, wood pigeon, and stock dove—6 are too plentiful, and consequently injurious—missel-thrush, blackbird, greenfinch, chaffinch, starling, and rook: the blackcap is injurious, but not plentiful, the jay is neutral, and the remaining 16—song thrush, white throat, great tit, blue tit, wren, goldfinch, linnet, yellow bunting, magpie, skylark, barn owl, brown owl, plover, etc.—are beneficial, and most of them merit protection, especially the owls, the wren, and the plover.

There is ample room for further investigation into this interesting subject, and it is to be hoped that people of leisure who have the opportunity will assist Mr. Collinge and contribute to the welfare of horticulturists and agriculturists by making observations on the food and feeding habits of birds.

* *The Food of Some British Wild Birds.* By Walter E. Collinge, M.Sc. (Dulau and Co., Ltd. London, 1913.)

The Crystal Palace.

Gardeners have a special interest in the effort now being made by the *Times* to preserve the "great conservatory"—the Crystal Palace—from destruction. Not only are the grounds which surround the Palace of considerable extent and of great beauty, but the Palace itself owes its existence to the hardy genius of a great gardener—Sir Joseph Paxton. When the critics heard of Paxton's proposals to erect a building of glass and iron for the 1851 exhibition they predicted woeful things, and it required firmness and diplomacy on the part of the Prince Consort to prevail over the prophets of evil. The building itself cannot be called beautiful; but it is a remarkable *tour de force*, a notable landmark and memorial. Mean buildings have crept past it, stretching away into the country, and it would be a great disaster if the grounds were to be sold for building purposes. This disaster will doubtless be averted by the public-spirited action of the *Times*. In doing what we can towards this end we as horticulturists are actuated by motives which, though mixed, are all of equal cogency. In common with the general public we desire the site to be reserved, and in helping to secure that end we pay a tribute to the memory of Sir Joseph Paxton, whose greatness as a gardener deserves commemoration. In the latter connection it may be mentioned that it was Paxton who, next to Lindley, played the most conspicuous part in founding this journal, and in making it the medium for both practical and scientific horticulture. Not only was Paxton one of our founders, but he established the custom which his successors have maintained of dealing evenly with the many sides of horticulture. He began and wrote regularly for many years the articles on the Week's Work of the garden, and by establishing this custom, which has been adopted by many of our contemporaries, Paxton made a notable and lasting contribution to the popularisation of horticulture. If all the men who as boys have seen from the Surrey hills the sunlight flashing on the Crystal Palace will but subscribe according to their means there is no doubt but that that sunny beacon and all which it symbolises will be preserved from its impending and ignoble fate.

Coloured Supplement.—Of the numerous fine greenhouse Rhododendrons of the R. javanico-jasmiflorum section, raised by Messrs. JAS. VEITCH AND SONS, Clorinda (see Supplementary Illustration) represents one of the latest and most charming varieties. The inflorescence and individual flowers are exceedingly attractive, and larger than most others in this class. R. jasmiflorum was introduced by THOMAS LOBB,

Messrs. Veitch and Sons' collector in the East. He also sent home R. javanicum, but this was introduced at the same time by Messrs. Rollisson, and it is difficult to say by whom it was first discovered. The first two hybrids, Princess Royal and Princess Alexandra, were raised at Exeter by Sir Harry Veitch's grandfather, who died in 1863, so that the family of Veitch has been working with these plants for more than fifty years. The colours in the hybrids range through many shades, including white, rose, yellow, orange and red. Moreover, the habit of most of the varieties is so dwarf that the plants make excellent subjects for the stage of a greenhouse, or the warm conservatory, whilst a collection is capable of affording flowers in every week of the year. They grow best in a temperature of about 60 deg., and a moist atmosphere. The variety Clorinda received an Award of Merit from the Royal Horticultural Society on July 30, 1912.

Testimonial to Messrs. Adnitt and Naunton.—Messrs. N. F. Barnes and W. G. Brazier, the hon. secretaries for the testimonial which is being raised to Messrs. Adnitt and Naunton in recognition of the services they have rendered as hon. secretaries of the Shropshire Horticultural Society for a period of 38 years, inform us that it is proposed to close the list of subscribers on the 5th inst. Up to the present upwards of 200 subscriptions have been received. Any of our readers who still desire to take a part should send their subscriptions to the secretary of the Shropshire Horticultural Society, The Square, Shrewsbury.

R.H.S. Daffodil Show, 1914.—The President and Council of the Royal Horticultural Society have arranged to hold next year's Daffodil Show on Tuesday and Wednesday, April 21 and 22. The secretary informs us that the schedule of the show will be ready for issue in a few weeks' time.

Kearsney Court.—In respect to the note on Kearsney Court, which appeared in Vol. LIII., p. 438, Messrs. Clark, Ltd., Dover, inform us that, whilst the designing of the grounds was the work of Messrs. Mawson Bros., the actual work was carried out by themselves. Messrs. James Gray, Ltd., Chelsea, state that they erected the glasshouses to which reference was made. It must be understood that in describing the features of a garden we do not necessarily set out to enumerate the firms who may have been employed there at one time, and who have therefore contributed towards the effects obtained, but at the request of our correspondents we have pleasure in publishing the particulars given above.

Flowers in Season.—Mr. G. B. Blackwell, Woodgreen Park Estate, Cheshunt, has kindly forwarded two large boxes of Dianthus barbatus (Sweet Williams), representing an excellent strain of these old-fashioned border flowers. We have received a box of beautiful Pæonies from Messrs. Kelway and Son, the varieties including Miss Ada Chamberlain, rose coloured, single; Conference, red; Lady Carrington, blush-pink; A. J. Hunter, pink; and Sophia Millar, the cream centre set off by large pink petals.

Nigerian Chiefs at a Nursery.—On Tuesday, the 24th ult., the Southern Nigerian chiefs who are at present visiting England went over Messrs. Sutton and Sons' nursery at Reading. They were hospitably received by members of the firm, and were shown over the premises and trial grounds, their tour of inspection occupying several hours. They were entertained to luncheon at the Abbey Hall, after which they drove to the trial grounds on the London road. Many of the chiefs wore their native costumes.

Violas at Wisley.—After the Floral Committee of the Royal Horticultural Society had inspected and reported on a large trial of Violas grown at Wisley in 1912 it was suggested in these columns that the plants might be allowed to remain undisturbed during the winter with a view to determining those varieties which would best stand such a test. In our present issue will be found a list of varieties commended by the Floral Committee for hardiness—i.e., varieties which have stood the test of living through two seasons and are still in good condition. In many instances not a single plant died. Apart from the question of hardiness, it is most interesting to observe the behaviour of the different varieties. All which were commended were in good condition, the plants being in excellent health, with abundance of bloom, but in regard to the height to which they had grown there was great variation. The indispensable Maggie Mott, pale blue, Virgin White, a most floriferous white, and Kitty Bell, small flowered, pale heliotrope in colour, had each reached a stature of 15 to 16 inches. Varieties which had risen to a height of 12 inches were numerous, and included Walter Welch, deep yellow; Archibald Grant, indigo purple; W. Robb, a light shade of violet; Primrose, sulphur-yellow; Arabella, plum-violet; and Kingcup, a fine rayless yellow variety. Among dwarfer varieties—those which had not grown more than about 9 inches in height to the top of their flowers—were Pencaitland, white, with a yellow eye; Grievei, pale yellow; Molly Pope, early yellow; Bullion, early rich yellow; and Palmer's White, a new white variety, which received an Award of Merit last year. It would be useful if the Royal Horticultural Society prepared a tabulated list of all the Violas on trial, classifying them according to their heights and colours, as was done at the Viola Conference at Regent's Park in 1896. Such a list published in the Society's *Journal* would be valuable to all interested in spring and early summer bedding. Great interest has been taken in the Viola trials by the majority of those visiting the Wisley gardens. It will be seen from the list of Awards on p. 18 that the veteran, Mr. Grieve of Messrs. James Grieve and Sons, Edinburgh, has raised a large number of the varieties that received awards. After fifty years' work amongst these beautiful flowers this success is a fitting reward for his labours.

Gardeners' Benevolent Institution.—During the past year the Berkshire, Reading and District Auxiliary of the Gardeners' Royal Benevolent Institution has contributed a sum of £119, the largest amount forwarded (with one exception, 1911) since the formation of the Auxiliary, making a total of £1,264 16s. 6d. contributed to the Institution.

The Fruit Crops on the Continent.—According to the Board of Agriculture and Fisheries the fruit prospects in Germany are most unfavourable. Cold weather, with frosts and snow, which set in about the middle of April, did great damage to almost every kind of fruit, and in all quarters much damage was done to what had promised to be an exceptionally plentiful crop. Baden, Wurtemburg, Hesse and Saxony appear to have suffered most. Red, white and black Currants promise small to medium crops, and Gooseberries and Strawberries a medium crop; most of the Raspberry blossom stems were frozen, but it is hoped that fresh shoots may yet make the crop a medium one. Large Cherries may be a good crop, but it is feared that the cold days at the beginning of May did further damage; in many districts sweet Cherries have been for the most part destroyed, whilst sour Cherries are expected to have suffered more than the larger kinds. Peaches and Apricots suffered most severely, and failure of these crops is reported. Apples and Pears were not much damaged and good crops are expected. Early Zwetschen Plums promise a scanty crop, but a slightly better crop of later kinds is hoped for. Mirabelles are expected to be a good crop on the whole; in the interior of Lorraine they are promising well, but in the left Moselle valley the crops have been frosted. With respect to France, the cold, windy weather in early spring was most prejudicial to fruit trees such as Plum, Peach and Apricot at Côtes-du-Nord, so that these crops are failures. There is promise of a plentiful crop of Gooseberries, and a very good crop of Strawberries. With favourable weather a full crop of Apples may be expected. In the Morbihan district the crop of Pears will be slightly under average and less abundant than last year. An abundant crop of cider Apples is expected. There will be a poor crop of Cherries, very small crops of Peaches and Strawberries, and the crop of Plums will be practically of no value. With the exception of Apples, the crops will be so small that it will be impossible for growers to export their products. In Loire-Inférieure good crops of Pears are expected. In Maine-et-Loire, Mayenne and Sarthe black Currants are more abundant than in 1912, but the crop is variable. A small crop of some varieties of Cherries may be obtained, but on the whole the crop is a failure. Very small crops of Plums will be obtained, whilst Pears will be below average, especially dessert varieties. There will be a very small crop of nuts. Abundant crops of Strawberries and good crops of Apples are looked for. The Apple crop at Ille-et-Vilaine is good, and there is a fair crop of Pears. Black and red Currants are full crops. Appearances are not very favourable for fruit in the Department of Calvados. Stone fruit suffered much from the frosts during the flowering period. Dessert Apples and Pears promise a medium to small yield, according to localities. In the Honfleur district there are good prospects for Williams Bon Chrétien Pears, but only a quarter of a crop is expected of the Duchesse variety, and two-thirds of a crop of winter varieties. Plums are a failure, and Cherries are unsatisfactory in general. Currants and Gooseberries seem likely to yield only half crops. With regard to Holland, the prospects for the Apple crops in Groningen, near Leeuwarden and Drachten are reported to be fairly good. Fair crops of Pears are expected in Groningen, Friesland, Overyssel and Guelderland north of the Rhine. In the Tielerwaard and round Utrecht the early Cherries are good, whilst late Cherries are fair in the Tielerwaard, Bommelerwaard and Betuwe, and fairly good round Utrecht. Prospects for Damsons are fair in the south-western part of the Province of Utrecht, in other parts of the country they are very bad. The condition of Plums is good in Upper Betuwe and Groningen; fair in Overyssel, Guelderland north of the Rhine, around Utrecht and Lower Betuwe; rather bad in the Tielerwaard, and bad in the Bommelerwaard. Peaches grown under glass in Overyssel and in Guelderland north of the Rhine are reported to be fair. Fair crops of red and white Currants are expected. Gooseberries are moderately good in the Beemster, Lower Betuwe and the Vecht district, and fair in Upper Betuwe, Tielerwaard and Utrecht. Raspberries are reported to be fairly good near Utrecht, in the Tielerwaard and near Leeuwarden, and fair in the Lower Betuwe and near Groningen. There are good prospects for Walnuts in the Lower Betuwe, and fair prospects in the Tielerwaard and near Utrecht. From Belgium there are reports of poor Plum crops. Pears are altogether unsuccessful, and Apples were considerably damaged by hail. In the Ghent district bad crops of all varieties of Plums are expected, fair crops of Gooseberries, Cherries, Currants and late varieties of Apples, and bad crops of early varieties of Apples and Pears. In the Liége district the snow falls in April had no bad effect upon the fruit, and crops are expected to be as good as in the previous season.

R.H.S. Assistant Superintendent.—The Council of the Royal Horticultural Society has appointed Mr. Blakey, a foreman in the Society's gardens at Wisley, to be Assistant Superintendent.

ROYAL HORTICULTURAL SOCIETY

Summer Exhibition at Holland House.

July 1, 2 and 3.—Many of the recent shows at Holland House, Kensington, the beautiful and historic residence of Mary Countess of Ilchester, have been marred by unfavourable weather, but on this occasion the climatic conditions in London on Tuesday and Wednesday were perfect. This had the effect of making the attendance on the first day the largest on record, and notwithstanding the increase in the number of Fellows, the receipts at the gate also constituted a record for these shows. In some respects the exhibition differed from those that have preceded it, the most notable change being in the open, where large rock and water gardens were arranged, also exhibits of arbours, glasshouses, summerhouses, tents, seats, and other garden buildings and furniture. Of the more prominent floral exhibits in the tents we may mention Roses, Orchids, Sweet Peas, Carnations, Irises, Phloxes and Delphiniums, and other hardy flowers. The exhibition was equal to the best held at Holland House, and the Society's officials are to be congratulated on the splendid results of their efforts. The premier Award, the Coronation Cup, was given to Messrs. Sander and Sons, for their fine group of Orchids. No fewer than fourteen Gold Medals were awarded by the Council.

The Committees sat on the morning of the first day; the Floral Committee recommended two First Class Certificates and twelve Awards of Merit to new plants, and the Orchid Committee three First Class Certificates and four Awards of Merit, but the Fruit and Vegetable Committee made no award to a novelty. As usual the members of the Committees and the judges met at luncheon, at which the new president, Field-Marshal the Rt. Hon. the Lord Grenfell, presided. In proposing the toast of the judges Lord Grenfell referred to the number of committees now working for the advancement of the Society's aims, pointing to the fact that several new committees had been appointed during the past year including one to deal with the question of a National Diploma in Horticulture, and a Parliamentary Committee which would watch the interests of horticulture in the matter of fresh legislation. The permanent committees and the judges who acted on such occasions as the Holland House shows gave their services ungrudgingly to the Society entirely from the love for horticulture which all of them possessed. In the name of the Society he thanked them. Mr. Charles E. Pearson responded.

Orchid Committee.

Present: Sir Harry J. Veitch (in the chair), and Messrs. Jas. O'Brien (hon. sec.), De B. Crawshay, W. Bolton, Gurney Wilson, A. Dye, Sidney W. Flory, R. G. Thwaites, W. H. White, W. P. Bound, Walter Cobb, A. McBean, Stuart Low, J. Wilson Potter, W. H. Hatcher, H. G. Alexander, J. E. Shill, H. J. Chapman, R. Brooman White, R. A. Rolfe, W. Waters Butler, G. F. Moore, F. Sander, J. Charlesworth, C. J. Lucas, J. S. Moss, A. A. Peeters, and Sir Jeremiah Colman, Bart.

The Orchids occupied the greater part of the central staging in the spacious No. 6 tent, the number of groups being less than in some of the former shows on account of the exhibition at Bristol at which Sir George L. Holford, K.C.V.O., Messrs. Armstrong and Brown, and other exhibitors were arranging groups of Orchids. The quality of the exhibits was good throughout, and all the groups excellently well arranged.

On one side Sir Jeremiah Colman, Bt., V.M.H., Gatton Park, Reigate (gr. Mr. Collier), commenced with a very effective and interesting group, in which the orange and red sprays of Epidendrum Boundii, raised at Gatton, appeared at the back, the central elevation being of white Phalænopsis Rimestadiana overhanging and mingling with sprays of Lælio-Cattleya Hippolyta Phœbe with yellow, ruby-lipped blooms. Some bright scarlet Odontiodas, with well-flowered Miltonia vexillaria; some pretty hybrid Odontoglossums, including the Gatton hybrid O. Lady Roxborough, with four spikes of its pretty white, purple-spotted flowers showing up well beside the scarlet Renanthera Imschootiana; a good display of Lælio-Cattleya Canhamiana, and other large-flowered hybrids; two forms of the beautiful Sobralia Colmaniæ, one with clear yellow flowers, and the other with pale pink blooms, and many other showy kinds, were noted, and among the curious and rare Catasetum Cliftonii, Epidendrum prismatocarpum with five spikes, Bulbophyllum tremulum and B. barbigerum, several pretty Pleurothallis brightly coloured Masdevallias and Eria pannea.

Messrs. Sander and Sons, St. Albans, continued with a magnificent group, the centre of which was of the large white Moth Orchid Phalænopsis Rimestadiana, about forty large sprays of which were gracefully drooping over the fronting of Miltonia vexillaria of varying shades of pink, and M. Bleuana. The end elevations were of fine specimens of Cattleya Warscewiczii Sanderiana, of the true type originally introduced by Messrs. Sander, and which is the most beautiful and floriferous form of this favourite plant. The plants bore a profusion of magenta rose flowers of varying shades with rich ruby-crimson lips. At each side of the central elevation a fine display of good varieties of Cattleya Mossiæ, including white forms, and the phenomenally large and beautifully coloured C. Mossiæ Dreadnought, with a very broad and richly-coloured lip, and a selection of hybrid Odontoglossums were arranged. Again, in this group, Messrs. Sander showed the decorative value of their Miltonia Warscewiczii crosses. The varying and prettily-marked flowers are very effective and seem to be available at all seasons. Most of the forms were shown, including Odontonia St. Alban and O. Lælia Sander, both of which had secured Awards of Merit. The novelty at the present show was Odontonia Magali Sander (M. Warscewiczii × O. ardentissimum), with blush-white lip effectively marked with reddish rose, the sepals and petals purplish red. The gem of the group was Miltonia Sanderæ (St. Andre × vexillaria Memoria G. D. Owen), whose flowers follow closely the famous Memoria G. D. Owen, but are white flushed with pink and the mask at the base of the lip almost black. Miltonioda Cooperi (M. Warscewiczii × C. Noezliana) is a remarkable cross with slender branched spikes of brick-red flowers with lighter tip to the labellum, and a number of other undeveloped crosses of interest were included. Among others noted were Cirrhopetalum graveolens with a fine spike, Ornithocephalus grandiflorus, Nanodes Medusæ, a very interesting selection of species of Masdevallia, and several probably new species of botanical interest received from their collector Micholitz.

Messrs. Charlesworth and Co., Haywards Heath, on the other side of the central stage, arranged a very fine group, the elevated portions being of handsome Lælio-Cattleyas, hybrid Odontoglossums, scarlet Odontiodas, and other popular Orchids, all excellently well grown. The group contained several very fine novelties, the most attractive of which were the new Odontioda Brewii (O. Charlesworthii × O. Harryanum), the large flower of a deep bronzy-red with yellow freckling on the broad lip; O. Wilsonii the President (C. Vulcanica × O. Pescatorei), a neat and pretty flower, white spotted with purple; Odontoglossum President Poincaré, and O. percultum Olympia, two massive flowers finely coloured; the already certificated Miltonia Charlesworthii with its rose-pink flowers with ruby-crimson mask; and the very beautiful Lælio-Cattleya Gottoiana the President, and Grammangis Ellisii from Madagascar were well shown, one specimen having two spikes from one bulb bearing sixty-four flowers. The scarlet Odontiodas Chanticleer, Lambeauanum, and the prettily marked Vuylstekeæ arranged with the numerous hybrid Odontoglossums, with the sides arranged with white Phalænopsis Rimestadiana drooped over scarlet and purple Masdevallias, and were fronted by a selection of Miltonias, M. vexillaria La Niege being a fine pure white. Good forms of Lælio-Cattleya Canhamiana, L.-C. Ulysses, L.-C. Aphrodite; fine Cattleya Mossiæ, including Reineckiana and The Bride, Cattleya Mendelii Queen of Spain and C. M. leucochila, two very good forms, Oncidioda Charlesworthii, Aëranthes grandiflorus with many slender sprays of cream-white flowers; Cymbidium tigrinum, Oncidium Claesii, and many other rare specimens were noted.

Messrs. Mansell and Hatcher, Rawdon, Leeds, staged one of the largest and most effectively arranged groups, in which the white Phalænopsis Rimestadiana drooped over scarlet Renanthera Imschootiana and Odontiodas, Miltonia vexillaria extending along the front and at points of vantage in the group. Lælio-Cattleya Canhamiana, L.-C. Aphrodite, and others were shown in good form, and among hybrid Cattleyas C. Serenata (see awards) was noteworthy. Cattleya Mossiæ, C. Mendelii, and C. Warscewiczii were well shown. Odontoglossum crispum and hybrids, and many interesting species were exhibited, including Bulbophyllum Binnendijkii, Brassia caudata, Disa grandiflora and Trichopilia Backhousiana.

Mr. Sidney Flory, Tracey's Nursery, Twickenham, staged an attractive group, a telling feature in which were some good pans of beautiful leaved Anœctochilus, which were in fine health, and included A. regalis, A. Turneri, A. setaceus, A. intermedius, and A. Petola. Cattleya Mossiæ, including white forms and a singular variegated or bizarre variety were shown; good C. Mendelii, one variety being specially distinct; C. Warneri alba, a very remarkable form of Lælia purpurata, with richly-coloured lip and petals; good Lælio-Cattleyas, the finest being L.-C. Bletchleyensis King George, a pretty Odontoglossum hybrid, and various good Odontoglossums, including O. ardentissimum xanthotes.

Mr. Harry Dixon, Spencer Park Nursery, Wandsworth Common, staged a group of Odontoglossums, Cattleyas, Cypripediums, and various hybrids, including pretty Odontoglossums and Odontiodas. At the back the old yellow Oncidium flexuiosum and other Oncidiums were arranged.

Messrs. Stuart Low and Co. completed the side with an extensive group, well set up, in which Dendrobium Dalhousianum and other Dendrobiums showed up well beside Phalænopsis Rimestadiana, and bright red Renanthera Imschootiana. Among the many good things staged, Cattleya Dupreana Gorgeous was a superb flower, of perfect shape, and with a broad and finely expanded lip of ruby-claret colour. Lælio-Cattleya Aphrodite Crowborough variety, large and of fine colour; Cattleya Mendelii Crowborough variety, a charming white-petalled form with pink-tinted margins and deep purple front to the lip; Cirrhopetalum graveolens, Bulbophyllum saltatorium, Stanhopea tigrina, and other showy species were also noted.

Messrs. Jas. Veitch and Sons, Royal Exotic Nursery, King's Road, Chelsea, staged a good group, in which fine forms of their hybrids Lælio-Cattleya Canhamiana, L.-C. Aphrodite, and some secondary hybrids of L.-C. Dominiana were remarked. Also a selection of their pretty Disa Luna, hybrid Odontoglossums, including Solon, Jasper, ardentissimum and illustrissimum, were well displayed.

Mr. E. V. Low, Vale Bridge, Haywards Heath, staged a selection of rare Orchids, including several albino Cattleyas, the novelty being C. Mendelii Lambeauana, a pure white flower with

bluish-pink front to the lip. Good examples of Cypripedium Rossettii Westonbirt variety, C. callosum Sanderæ, C. Lawrenceanum Hyeanum, Odontioda Vuylstekeæ, Bulbophyllum Lobbii Colossus, B. barbigerum, and other pretty Orchids were also included.

Thirty-five subjects were entered for certificate.

M. Jules Hye de Crom, Ghent (gr. Mr. Coen), sent three beautiful Miltonias — M. Hyeana gracilis, a charming white flower, with distinct rose flush on the lip and petals; M. Hyeana ardentissima, a large milk-white flower with dark mask on the lip; and M. vexillaria gigas, a gigantic bright-rose flower.

De B. Crawshay, Esq., Rosefield, Sevenoaks (gr. Mr. Stables), showed Odontoglossum Boadicea (triumphans Lionel Crawshay × ardentissimum), a grand flower, with broad petals, resembling O. triumphans Lionel Crawshay; and O. Vesta (bellatulum × percultum).

J. Gurney Fowler, Esq., Glebelands, South Woodford (gr. Mr. J. Davis), showed two fine forms of the deep rose-red Odontioda Lambeauana, Fowler's variety, and the very beautiful cerise-rose Miltonioda Harwoodii, Fowler's variety. (See awards.).

W. Waters Butler, Esq., Southfield, Edgbaston, sent Cattleya Warscewiczii J. Charlesworth, a very large and finely coloured form: and C. lymene, Southfield variety, a pretty cross of C. Rex.

Mr. W. A. Manda, St. Albans, sent Cattleya Warscewiczii Mandaiana, of a peculiar salmon shade of colour, and two forms of C. Mendelii.

AWARDS.

First Class Certificate.

Miltonioda Harwoodii, Fowler's variety (*M. vexillaria* × *C. Noezliana*) from J. Gurney Fowler, Esq., a charming flower, far superior to the variety which had previously had an award of merit. Flower bright cerise-rose with yellow crest to the lip.

Miltonia Sanderae (*St. Andre* × *M. vexillaria Memoria G. D. Owen*), from Messrs. Sander and Sons, St. Albans. Certainly one of the most beautiful of modern hybrid Miltonias, and probably because the key of the cross depends on the unique form of M. Bleuana, Sander's variety, bought from M. Bleu in a very small plant of a superb variety, as it proved on flowering. The flowers of the new hybrid are clear white with a charming flush of rose-pink, the mask on the lip with its radiating lines in front being nearly black—the darkest of any known hybrid Miltonia.

Odontioda Brewii (*Charlesworthii* × *Odontoglossum Harryanum*), from Messrs. Charlesworth and Co., Haywards Heath. The famous O. Charlesworthii (O. Harryanum × C. Noezliana) with which Messrs. Charlesworth and Co. took the Orchid world with surprise, and which in its best forms still takes front rauk, in point of colour is excelled by this handsome secoudary hybrid which is larger in size and darker in colour. Flowers dark bronzy-red, larger than Charlesworthii, the lip having a seven-cleft yellow crest.

Award of Merit.

Cattleya Mossiae Olympia, from Messrs. Charlesworth and Co. Flowers of fine shape, blush-white veined with rose, lip large with claret-purple markings.

Odontioda Wilsonii The President (*C. vulcanica* × *O. Pescatorei*), from Messrs. Charlesworth and Co.—A charming flower in this form. Flowers white, shaped like O. Pescatorei, and densely blotched with violet.

Cattleya Mossiae Dreadnought, from Messrs. Sander and Sons.—Viewed from all points the best C. Mossiæ, the rose-pink sepals and petals —the latter being 4ins. across—being very massive, broad, claret-crimson veined lip.

Cattleya Serenata, from Messrs. Mansell and Hatcher, Rawdon, Leeds.—A brightly-coloured hybrid of C. Whitei, with rosy-mauve flowers shaped like C. labiata.

Cultural Commendation.

To Messrs. Charlesworth and Co., Haywards Heath, for fine plants of the Madagascar Grammangis Ellisii.

To Sir Jeremiah Colman, Bart. (gr. Mr. Collier), for Odontioda Bradshawiæ.

Stove Plants.

Caladiums arranged by Messrs. John Peed and Son, of West Norwood, were models of skilful cultivation. In the centre of the group was a plant of the variety Harry Lovatt, which bore upwards of 50 large, richly-coloured leaves. Somewhat smaller, but even more highly coloured, were the specimens of Madame Mitjana, Maj Lek, Princes Sansparcet, and Fastuosum, whilst in the front a comparatively small plant of Red Indian glowed with warm, tropical colouring. At the end of the Caladiums a rather formally arranged collection of Carnations contained many beautiful blooms.

Mr. L. R. Russell, Richmond, exhibited the finest group in this section. The collection was a very extensive one, and embraced Codiæums (Crotons), Caladiums, Dracænas, Cycads, Alocasias, Marantas, Anthuriums, Aralia Veitchii, Anæctochilus, Stenandrium, Lindenii, Reidia glaucescens and other handsome-leaved exotic plants. The centre of the display was formed of plants of Nertera depressa in fruit, with the green and silver-leaved Dracæna Sanderiana at the back and showy Caladiums on either side. Mr. Russell also exhibited a fine scarlet Salvia named Glory of Richmond, in which were interspersed plants of the large-leaved Nicotiana colossea variegata.

Ferns.

Messrs. H. B. May and Sons, Edmonton, arranged a large group of excellent Ferns. On this occasion the collection was composed chiefly of warm-greenhouse and tropical species. The splendid pale-green, billowy Nephrolepis Willmottæ occupied the central place of honour, and served as an admirable foil for the rosy-purple tints on the young growths of Adiantum Veitchii. A large group of Pellæa rotundifolia, a species which is reminiscent of the hardy, wall-loving Asplenium trichomanes, but characterised by rather larger pinnæ and brown hairs on the stems, was seen to advantage luxuriating on the stem of a dead Tree-fern, Polypodium Vidgenii, and P. Mayi cristatum, with large glaucous fronds, attracted attention. The very tall pillars of Lygodium japonicum lightly and tastefully relieved the level of the prostrate species, and the Gold and Silver Ferns (Gymnogrammes) added just the needed touch of brightness.

Roses.

The prominence given to the hybrid Tea and the Wichuraiana Roses in the magnificent exhibit of Messrs. Wm. Paul and Son illustrated the great popularity of these types of Roses. The tall standards of the latter kind were exexceedingly dainty and graceful. The baskets, each containing a dozen or more of perfect blooms, showed the great decorative value of the Tea-scented varieties. The charming and fragrant variety, Juliet, was shown in perfect form, and for bright effect was only equalled by the rich apricot-red of Beauté de Lyon. The chaste, flesh-pink centred Ophelia, which received an Award of Merit, attracted attention, and led the eye to the charms of Madame Segond-Weber, a variety which flourishes in town gardens, and very many other splendid blooms in this excellent collection.

A corner of the large tent was filled by Messrs. Paul and Sons, Cheshunt, with a wealth of Roses. A few tall-stemmed Wichuraiana standards placed at infrequent intervals served to relieve the mass of the group, which was arranged in the form of a low sloping bank, which owed its effect to a multitude of H. P. and H. T. Roses in glowing colours effectively massed. The best of the exhibition varieties were G. C. Waud, Lyon Rose, Lady Alice Stanley, Madame Segond-Weber, Hugh Dickson, Lady Ashtown, Mrs. W. J. Grant, and Caroline Testout.

Stands of bright red Roses, relieved by tall standards of Wichuraiana varieties were splendidly shown by Mr. Charles Turner Slough. The former included Ulrich Brunner, Hugh Dickson and Duke of Wellington, and contrasted well with such pink varieties as Lady Ashtown, Madame A. Chatenay, and the ubiquitous Lyon Rose. Of the Wichuraiana varieties, Coronation was especially desirable.

As is their custom, Messrs. Hobbies, Ltd., arranged the tall clean-stemmed standard Wichuraiana hybrids, chief amongst them being the popular varieties Hiawatha, Minnehaha and Dorothy Perkins; Coquina, a small single-flowered pink variety, bears pretty blooms, but is not equally effective. Several baskets of Rayon d'Or, which were suspended from Smilax-covered supports, were very pretty.

Just inside the large tent, Messrs. Wm. Cutbush and Son, Highgate, exhibited an exceedingly bright and artistically arranged group of Carnations and polyantha Roses; weeping pyramids and tall pillars of such Roses as Dorothy Perkins, Excelsa and White Dorothy rose high above a groundwork furnished with Lady Coventry, Maggie Hodgson, Monk and other varieties of Carnation, which were delightfully interspersed with garden Pinks and the dwarf floriferous Rose "Jessie."

Although Mr. George Prince, Oxford, relied principally on large bamboo stands of such Roses as Ulrich Brunner, Mrs. John Laing, Lady Ashtown and Gardenia for the chief effect the smaller exhibits of Lady Pirrie, Juliet, Rayon d'Or, Irene Watts, and similar varieties were equally worthy of admiration.

The central feature of the large stand of cut Roses exhibited by Messrs. W. and J. Brown, Peterborough, was an arch of the Lyons Rose. On either side there were tall stands in which Frau Karl Druschki, Marquise de Sinety, Harry Kirk, and Joseph Hill were effectively massed.

Stands of exhibition varieties were the predominant feature of the Rose exhibit from Messrs. G. Bolton and Co., Buntingford. The very best blooms were of Dean Hole, Mildred Grant, Jonkheer J. L. Mock, Mrs. Ed. Mawley, and His Majesty.

Mr. R. C. Notcutt, Woodbridge, included in his collection of cut Roses a vase of Rosa Sinica anemone, a large pink single-flowered variety, which luxuriates on a warm wall. The dark velvety sorts, Victor Hugo, Duke of Edinburgh, Senateur Vaisse, Commander Félix Faure and Château de Clos Vougeot were also noteworthy.

Messrs. Jackman and Son, Woking, showed Roses in large bunches, with exhibition blooms in boxes along the front. A box of White Maman Cochet and Maman Cochet was especially good, the blooms of each variety being arranged alternately.

Messrs. Frank Cant and Co., Colchester, filled a large table space with excellent Roses, the blooms remaining fresh even under the very hot conditions. We noticed the newer Juliet, Rayon d'Or, Mrs. Walter Easlea, cherry-red; Lady Hillingdon, Viscountess Enfield, blush; Mme. Chas. Lutaud, a hybrid tea variety, coloured apricot-yellow and gold; Miss Ada Francis, yellow; and Braiswick Charm, white with yellow at the base of each petal.

Messrs. B. R. Cant and Sons, Colchester, exhibited Roses finely; notable varieties were Rayon d'Or, Killarney, Sunbeam, St. Helena, a blush flower with creamy centre; Marquise de Sinety, Mrs. Peter Blair, Leslie Holland, Edward Mawley, and the new H.T. variety, Joan, the blush petals showing a trace of gold at their bases.

Messrs Stuart Low and Co., Enfield, showed a collection of Roses, which was much admired for the clever arrangement, the colours being massed in harmonious shades; great clusters of blooms were employed in stands, on pillars or in vases. We specially admired the two varieties Rayon d'Or and Molly Sharman Crawford.

Roses were also shown by Messrs. H. Cannell and Sons, Swanley, Kent; Messrs. Morse Bros., Woodbridge; Messrs. Jarman and Co., Chard; Mr. John Mattock, New Headington, Oxford; and Mr. W. Easlea, Eastwood, Essex.

Carnations.

The Right Hon. Lord Burnham, Hall Barn, Beaconsfield (gr. Mr. Geo. Johnson) exhibited a large group of magnificent Souvenir de la Malmaison Carnations. Of the 70 or more plants the majority were unusually large and well furnished with the healthy glaucous foliage which gives evidence of skilful culture.

Souvenir de la Malmaison varieties figured largely in the collection from Messrs. Stuart Low and Co., Enfield. The large stands of such varieties as Lady Coventry and Sir Charles Freemantle glowed with warm colouring. Not less beautiful was a bowl of the rich pink Princess of Wales.

Mr. JAMES DOUGLAS, Great Bookham, staged varieties of border Carnations. There were several novelties, two of which received awards. Others specially noticed were Innocence, blush pink and of exquisite form; Bookham White, Fijiyama, red; Robert Berkley, scarlet; Ellen Douglas, heliotrope-grey, and Renown.

Mr. H. BURNETT, Guernsey, showed Carnations, as usual, of splendid quality, but the arrangement was a little too dwarfed, owing to limitations of space, to produce the best effect.

Mr. BERTIE E. BELL, Castel, Guernsey, exhibited Carnations in variety, the group being very prettily arranged. At the top was a beautiful basket of Mrs. C. W. Waud, arranged on a fancy stand, a most delightful piece of flora work.

Mr. C. ENGELMANN, Saffron Walden, Essex, showed Carnations of the perpetual-flowering type. The beautiful blooms were arranged in tall epergnes at the back, the centrepiece containing magnificent flowers of Pioneer, a lovely rosy-cerise variety.

Sweet Peas.

Sir RANDOLF BAKER, Bart., Ranston, Blandford (gr. Mr. A. E. Usher), showed a collection of Sweet Peas remarkable for the uniformly high culture and excellence of the blooms in so large a display. Tall columns of Barbara, Dobbie's Cream, and Edrom Beauty reached to the roof of the tent. The rest were arranged in vases. They were not too densely packed, and showed to advantage. Among the best varieties were True Lavender, Anglian Orange, Princess Victoria, Dobbie's Cream, Clara Curtis, Marks Tey, May Campbell, Lady Millar and Dorothy. This excellent group was lightly relieved with a few Adiantum Ferns and Grasses.

Messrs. DOBBIE AND CO., Edinburgh, exhibited a magnificent collection from their Marks Tey Nursery. The flowers were arranged on wide staging in a series of four steps, the uniformity of the vases being broken by tall pillars, and the whole relieved by Smilax, Kochia and variegated Maize. Dobbie's Cream was outstanding, and its striking feature was the large number of tinted flowers.

Messrs. E. W. KING AND CO., Coggeshall, staged a representative group. It faced both gangways, and baskets of choice varieties were hung between arches of flowers which linked the two sides. The general level of the group was broken with bolder masses of a few varieties. The Anglian novelties were the feature of the group, those shown well including pink, crimson, lavender, orange, cream and white Anglian, and the novelty for distribution in 1914, Anglian Royalty, a dark bronze-crimson flower.

Mr. JAMES BOX, Lindfield Nurseries, Haywards Heath, showed a collection of standard sorts, using Asparagus and broad Antholyza foliage for relief. Some of his best varieties were Nubian, Scarlet Monarch, Rosabelle, Empress, Blue Belle, and James Box (orange).

Messrs. JOHN K. KING AND SONS, Coggeshall, staged a large group, facing both ways, on the central tabling. Several varieties were well shown in large bunches, especially the blues and mauves, including True Lavender, Nettie Jen-

FIG. 7.—HOLLAND HOUSE SHOW: COLLECTION OF SWEET PEAS EXHIBITED BY MESSRS. SUTTON AND SONS.

Splendid plants of Souvenir de la Malmaison Carnations were shown by W. M. GOTT, Esq., Trempthon, Cornwall, relieved with Smilax and Adiantum Ferns. The varieties Princess of Wales, Mrs. Trelawney, Maggie Hodson and Calypso were all uncommonly good.

Clematis.

Messrs. GEO. JACKMAN AND SON, Woking, exhibited a collection of exceedingly floriferous Clematis. The large-flowered Jackmanni hybrids were represented by Caroline Neville (mauve), Mrs. Spencer Castle (bright heliotrope), Star of India (reddish-plum) and Mrs. Geo. Jackman (satiny-white with cream bar). The best of the free-growing sorts, which are valuable for training over pergolas, were Kermesiana (bright red), Viticella alba (greyish-white) and Flammula purpurea (sweet scented, rose-purple). Following the Clematis Messrs. Jackman arranged such valuable border flowers as Gaillardia Mrs. Rollinson, Helenium cupreum, Sidalcea "Rosy Gem" and mixed Japanese Irises.

Messrs. SUTTON AND SONS, Reading, made a very rich and varied display (see fig. 7). Some of the choicest varieties were placed against black velvet shields, between each of which rose tall pillars of other varieties linked up by trails of Smilax. The groundwork was filled with vases and bowls of flowers. The varieties staged were very numerous. We noted the salmon-orange Barbara, Melba and Earl Spencer, the flesh-pink Lady Millar, the rose-coloured Decorator, the white Moneymaker and Etta Dyke, with Mrs. Hugh Dickson, Orion, Sunproof Crimson, the giant-flowered W. P. Wright, Asta Ohn, and many others. The collection was very effective, and with a number of new unnamed seedlings the following sorts were specially good: Melba, Frilled Pink, True Lavender, New Marquis, T. Stevenson, Brunette, Edrom Beauty and Inspector. The colour arrangement of this group was particularly pleasing.

Messrs. SUTTON AND SONS, Reading, made a very rich and varied display (see fig. 7). Some of the choicest varieties were placed against black velvet shields, between each of which rose tall pillars of other varieties linked up by trails of Smilax. The groundwork was filled with vases and bowls of flowers. The varieties staged were very numerous. We noted the salmon-orange Barbara, Melba and Earl Spencer, the flesh-pink Lady Millar, the rose-coloured Decorator, the white Moneymaker and Etta Dyke, with Mrs. Hugh Dickson, Orion, Sunproof Crimson, the giant-flowered W. P. Wright, Asta Ohn, and many others. The collection was very effective, and its striking feature was the large number of tinted flowers.

kins, Mrs. Heslington, and R. F. Felton. Other good sorts included Agricola, King Alfred, Gladys Burt, Edrom Beauty, and Edith Taylor.

Messrs. BIDE AND SONS, LTD., Farnham, showed a considerable collection in vases, interspersed with a few Roses, but arranged in a rather uniform bank. Edna Harland, Bertha Massey, Mrs. Cuthbertson, and Walter P. Wright were among the varieties best represented.

ROBERT SYDENHAM, LTD., Birmingham, showed a small collection. The varieties, Bertie Usher, Zarina Spencer, Edith Taylor, Lilian, Princess Mary and others were included with a few novelties.

Messrs. G. STARK AND SON, Great Ryburgh, had an interesting group with a number of novelties. At the back were tall pillars of Wenvoe Castle (deep mauve), Primrose Beauty, Bertrand Deal, A. A. Fabius (deep pink), and the double Maggie Stark.

Mr. D. WEBSTER showed a small collection, most notable for the good bamboo stands of Mrs. Henry Bell, R. F. Felton and Doris Usher.

Begonias.

Messrs. Blackmore and Langdon, Twerton, Bath, showed Begonias of superb quality, the plants being equal to any we have seen. They were truly described by visitors as "wonderful." On this occasion the firm grouped the varieties in batches of colours. Thus there were several plants of the charming Rose Queen in a group, a cluster of the White Empress Marie, Duchess of Cornwall, crimson; Millicent, salmon; Mrs. Robert Morton, yellow; and George Pike, bright red. The finest individual plant was a specimen of Lady Tweedmouth variety, with petals of salmon-pink colour.

Mr. A. Le Gwillim, Sidcup, Kent, showed abundantly flowered plants of the double-flowered bedding Begonia, Washington, and its yellow companion, Colonel Lauserat, in the centre of a group of very large double-flowered varieties.

Hardy Plants and Flowers.

Messrs. James Carter and Co., Raynes Park, carried out on a large scale a design for an Iris and water garden. A rectangular pool furnished with Lilies was fed by dolphin fountains at the four corners. On three sides this was surrounded by a mass of Japanese Irises, but on the fourth was a low wall in shallow bedded stone retaining an upper walk, reached from either end of the pond and paved with square marble paving. On the pond side of the path was an edging of Snapdragons, and on the other were masses of Cannas behind an edging of dwarf polyantha Roses, with large, trained pink ramblers placed between the large stone columns, of what might be one side of a pergola.

Messrs. J. Piper and Son, Bayswater, built a large formal wall and water garden. A low, rectangular foundation was used to level up the ground and to form a base for the semi-circular walled garden. The space thus left at the corners was turfed over and ornamented with miniature cannon, which emphasised the embattled character of the heavily-pierced bastion-like wall, topped by a low Yew hedge with taller trained figures on each pier. The enclosed area included a paved upper walk curving to connect the two heavily-pillared temples at either end, which were directly connected by an herbaceous border planted with Lilies, Campanulas, Delphiniums, and other border flowers. Sunk at a lower level in the centre were two pools, divided by a path and a large lead figure of Hermes.

Mr. Chas Rassell, Earl's Court Road, London, designed a small railed-in town garden, some 38 by 18 feet in dimensions. The irregular lawn was surrounded by a narrow paved walk, which led to the features of interest, the herbaceous border of Stocks, Violas, Marguerites, Marigolds and Delphiniums; the raised seat screened by trim Box and variegated Privet, which gave opportunity for varied planting at the base, and in one corner the inevitable rock garden, furnished with Heuchera, Candytuft, Sedum and Wistaria.

Messrs. Thompson and Charman, 11, Adam Street, Adelphi, staged an ornamental and prettily balanced group, with border flowers at the back and the smaller Alpines nearer the eye. Among the latter were noticed Teucrium pyrenaicum, Gentiana cruciata, Viola bosniaca and Dianthus Napoleon III.

Mr. H. Hemsley, Crawley, arranged a steeply-sloping rock bank to give effect to a number of interesting Alpine and herbaceous plants. The Antirrhinums derived from A. glutinosum and A. sempervirens pollinated with A. majus, already give some range of colour and habit.

Messrs. Rich and Co., 2, Walcot Street, Bath, showed bunches of Campanulas, Phloxes, English Irises, Ostrowskia and other herbaceous plants, with a collection of Violas.

Mr. Howard H. Crane, Woodview, Highgate, N., made a pretty arrangement of Violas and Violettas, placing the blooms in wet sand in shallow dishes and giving a touch of green with Thorn and Hornbeam foliage.

Mr. Reg. Prichard, Westmoors, Wimborne, staged the most varied collection of dwarf Alpines in a limited area, arranging the plants on the flat and without any rockwork in a manner that has become novel, although equally effective with many more ambitious designs in stone.

The Burton Hardy Plant Nurseries, Christchurch, Hampshire, displayed a small collection of Campanulas, Sedums, Stachys, Sempervivums and other rock plants.

The Guildford Hardy Plant Nursery, Millmead, Guildford, staged a number of interesting hardy plants, massing the blues of Delphiniums at one end, and the yellows of Helenium, Verbascum and Thalictrum at the other.

Mr. H. C. Pulham, Elsenham, Essex, made good use of dwarf Campanulas and Hypericums on a small rock-garden exhibit. There were numbers of pretty forms of Dianthus, place of honour being given to the very large D. annulatus Pulhamii, and space at the back was found for Escallonia langleyensis, Veronica, Spiræa and Philadelphus.

Messrs. Whitelegg and Page, Chislehurst, staged a good collection of herbaceous flowers and rock plants. The clumps of Nepeta Mussinii, Potentilla Miss Willmott, Saxifraga pyramidalis and Wahlenbergia vincæflora were fine, and good use was made of Galega, Astilbe Queen Alexandra, Artemisia stelleriana and the pleasing pink early Gladiolus Queen Mary.

Messrs. Barrie and Brown, King William Street, London, showed a small collection of Gladiolus, Spiræas and Gloxinias.

Messrs. Godfrey and Son, Exmouth, Devonshire, arranged a fine batch of their excellent strain of Canterbury Bells. Those of pink and pale blue shades were particularly admired. Scabiosa caucasica superba and a few Oriental Poppies were also well shown.

Messrs. Kelway and Son, Langport, Somersetshire, staged an up-to-date collection of their Delphiniums, with, at the foot of the group, a few vases of Pæonies, Coreopsis and the dark Dianthus Cæsar's Mantle. The Delphiniums were the feature of the group, and many magnificent varieties were included.

Messrs. H. Cannell and Sons, Eynsford, Kent, showed a small group of Delphiniums, Spiræas, Pentstemons and Canterbury Bells.

Messrs. Fells and Son, Hitchin, against a background of Crambe, Erigerons and Delphiniums, showed a number of choicer dwarf plants, Thymes, Campanulas and Veronicas, with a fine clump of the little-known Polemonium pauciflorum and masses of Gaillardias.

Mr. Stuart Maples, Lytton House, Stevenage, showed a small moraine clothed with Saxifraga Cæsia, Coronilla cappadocica, Campanula Miss Willmott and Veronica Bidwillii.

Mr. H. Newman, 16, Woodford Road, Watford, staged a large, massed group of the new border Pink, "Challenger."

Mr. T. R. Hayes, Keswick, Cumberland, showed an interesting little square group of Alpines and dwarf Shrubs. Sedum obtusatum, Campanula turbinata pallida, C. abietina, Thymes and Edraianthus were well represented.

Mr. G. W. Miller, Clarkson Nurseries, Wisbech, showed a number of choice herbaceous flowers. Viola cornuta "The Clarkson," is a pretty variety, with darker flowers than the well-known var. purpurea.

Mr. H. J. Jones, Ryecroft Nurseries, Lewisham, staged a large collection of Phloxes, representing perhaps the best-grown group of these flowers in the show, although arranged in rather a solid bank. The centre was marked by the enormous Goliath, 5 feet high, G. A. Ströhlein, Gen. Van Heutsz and Dr. Königshofer, among scarlets, Iris, Le Mahdi and Antonin Mercie, blues, and the new Rose Queen show the up-to-date character of the varieties included. A large group of "calycanthema" varieties of Campanula medium (Canterbury Bells) were also shown.

Messrs. Fred Smith and Co., Woodbridge, Suffolk, staged a collection of well-grown herbaceous flowers, with well-contrasted masses of clean colour. At the back were large vases of Alstroemeria chilensis, Lathyrus latifolius albus, Delphiniums, Verbascums and other large-growing subjects.

Miss K. Hopkins, Mere Gardens, Shepperton-on-Thames, arranged two oblong beds of rockwork, connected at one end by a small water garden.

Mr. J. S. Arkwright, Kinsham Court, Presteign, showed a large batch of Lychnis Arkwrightii. This appeared to be a rather good strain of L. Haageana, showing considerable variation in the shades of scarlet, and some of the varieties showing the crimson leaf. All were well-grown pot plants, and some time ago the Scientific Committee recommended the Botanical Certificate for the strain, which the Council duly confirmed.

Messrs. B. Ladhams, Ltd., Shirley Nurseries, Southampton, staged good bunches of Gaillardias, Salvia turkestanica superba, Malva Olbia Potentilla Rollissoni, and Campanula persicifolia coronata. Especially good were the border Pinks Coronation, a large white with distinct crimson eye, and Favourite, a very pale pink flower with small dark eye.

Mr. James Box, Lindfield Nurseries, Haywards Heath, arranged one of the largest display of hardy plants, filling the end of one of the tents. Nymphæas, backed by Iris Kæmpferi and Thalictrum flavum and flanked by Funkias, Phloxes and Spiræas formed a centre piece. To right and left were large wings devoted mainly to florists' flowers, Gladiolus and Delphinium in variety at the back, and such plants as Erica, Prunella, Gypsophila repens monstrosa, Geum Mrs. Bradshaw, Betonica grandiflora and Adiantum pedatum in the foreground.

Messrs. W. and C. Bull, Eames' Floral Nurseries, Frome, Somersetshire, showed cut bunches of Poppies, Pyrethrums, Heucheras with Geum, Sidalcea, Erigeron and other flowers.

Messrs. W. Cutbush and Son, Highgate Nurseries, N., built up from the ground space a large decorative group of hardy flowers. Nymphæas and Japanese Irises at the ground level, with Spiræas were used effectively. Eremurus Bungei with Delphiniums and other tall-growing plants were displayed with spreading spikes in tall stands above them.

Mr. Clarence Elliott, Stevenage, Herts, arranged in the open a little group of alpines in a manner that has become characteristic of him; he appreciates so finely the value of mass of flower and shade of stone. Campanulas were the feature of the group C. pulla, C. pusilla Miss Willmott, C. pulloides, and C. linifolia being best represented.

Mr. G. Reuthe, Keston, Kent, staged an interesting group of hardy flowers. Lilium Hansonii and L. pomponium gave good patches of colour. Escallonia Philippiana was represented by large bushes. The trusses of Rhododendron cinnabarinum were a beautiful shade of colour, and the dwarfer plants of interest included Hypericums, Ericas, Statices and Campanulas. Mr. Reuthe also staged groups out-of-doors, including good plants of Allium pedemontanum and Patrinia palmata among the lesser-known plants.

Lady Mary Countess of Ilchester (gr., Mr. C. Dixon) exhibited a collection of Sedums and Silver Saxifrages grown in small pans, including 72 varieties of the former and 63 of the latter. Very few varieties were in flower, but they were mostly a picture of health and good condition, and represented a very interesting collection.

Messrs. Harkness and Sons, Leeming Bar, Bedale, staged a group of hardy flowers on tabling which, though not so rich in variety as many others, compared favourably with the best for the quality and freshness of its plants. The Oriental Poppies Mrs. Perry and Mrs. J. Harkness (a shade deeper) were particularly good. The bicolor English Iris Almona with violet standards and blue falls, and the white Mont Blanc were excellent. Lupines, Anchusas and Delphiniums were also well represented.

Messrs. R. H. Bath, Ltd., Wisbech, showed good collections of Delphiniums and border Carnations. Notable Delphiniums were the rich deep purple Clara Stubbs and Norman Garston. Lize was a beautiful pale blue, while we considered Ustane and Nellie Irvine the best of the intermediate mauve and blue varieties.

Messrs. Watkins and Simpson, Ltd., Tavistock-street, Covent Garden, staged a group of annuals and Snapdragons on the ground in the open. The strains of Nemesia compactum Blue Gem and N. strumosa hybrids were much admired, and the Antirrhinums included some very pretty shades. The whole was connected up and bounded by a dwarf edging of Alyssum minimum.

Messrs. G. Gibson and Co., Leeming Bar, Bedale, Yorks, arranged a small group on the

ground with a curving edge. Verbascum Caledonia, Lupinus polyphyllus roseus, varieties of Spanish Irises and Iceland Poppies were the notable features of the exhibit.

The Wargrave Plant Farm, Ltd., Liverpool-street, London, arranged a small rock-garden out-of-doors, and a collection of Gaillardias, Pinks, Delphiniums, Gladioli, and other border flowers under canvas. The best plants in the open included Stachys pyrenaica, Campanula Raddeana, Viola bosniaca, and Primulas angustidens and capitata.

Messrs. W. Wells and Co., Ltd., Merstham, Surrey, staged a group of Phloxes, including the varieties Rose Queen, André Laurie, Antonin Mercie, King Edward and Elizabeth Campbell. The first-mentioned is of a very rich colour, and has particularly large "pips."

Messrs. Bees, Ltd., Mill-street, Liverpool, staged an interesting group of hardy plants most notable for its inclusion of new Chinese introductions, amongst which we noticed Dracocephalum bullatum, Primula Bulleyana, Trollius yunnanensis, T. patulus, and Primula angustidens. The double white Dianthus petræus, Spiræa digitata nana (four inches high), Oxalis enneaphylla and Œnothera cæspitosa are also worthy of mention.

Messrs. Geo. Bunyard and Co., Ltd., Maidstone, exhibited finely grown and very fresh-looking hardy flowers, staged in bold masses, of which the monotony in arrangement was broken by clumps of Spiræas, Eremuri, and Lilium longiflorum.

Messrs. Paul and Son, Cheshunt, staged a bank of herbaceous flowers with showy bunches of Spiræa Aruncus, Verbascum Chaixi, Thalictrum flavum, Eryngiums, Heucheras and Potentillas.

Messrs. Blackmore and Langdon, Twerton Hill Nursery, Bath, showed some of the finest spikes of Delphiniums in the show. Most of the varieties had already won awards. The mauve and pale blue Statuaire Rude was particularly fine, both in flower and spike.

Messrs. Barr and Sons, King Street, Covent Garden, staged a collection of cut flowers, including Lupines, Canterbury Bells, Ixias.

Messrs. John Forbes, Hawick, Ltd., Hawick, N.B., arranged a showy bank of named varieties of Delphiniums, Pentstemons and Phloxes.

Mr. A. St. Gwillim, Cambria Nursery, Sidcup, showed a small collection of cut bunches of Campanulas, Erigerons, and other flowers, with a number of varieties of Mimulus.

Mr. Frank Lilley, Guernsey, staged a collection of early flowering Gladioli, with Ixias and English Irises.

Messrs. Gunn and Sons, Olton, Warwickshire, made an effective display of Phloxes, showing the best varieties in great masses of from a dozen to nearly fifty trusses, which admirably brought out the colour values. The best varieties included G. A. Ströhlein, Gen. van Heutz and Coquelicot (scarlet), Le Mahdi (violet), E. Danzanvilliers (lavender), F. von Lassberg (white), Elizabeth Campbell (pink) and the fine crimson-eyed Josephine Gerbeaux.

Mr. J. Macdonald, Harpenden, showed his novel method of growing Grass on fabric.

Messrs. R. Wallace and Co., Colchester, furnished a large space at one end of the large tent to great advanage. The predominant feature was a large Water-lily pool flanked by stepping stones which gave access to a paved terrace where the very many border plants might be easily viewed. Of these latter perhaps the huge-flowered Japanese Irises by the water-side were the most noteworthy, but we also admired the groups of Eremurus, E. Bungei pallidus, E. B. superbus, with bright yellow flowers, and the buff-coloured E. Warei rising above dwarfer plants which were freely grouped, making a magnificent spectacle. On the opposite side to the Water-lily garden the exhibit was enclosed by a "dry wall" where many less showy, but equally valuable, plants found a place.

Messrs. John Piper & Sons, Bishop's Road, Bayswater, built an unostentatious rock-garden of weathered boulders, amongst which they planted a variety of Alpines. The Stonecrops (Sempervivum arachnoideum) were so cunningly planted that it appeared as though they had occupied their positions for several years. Although the season of the Primula is over, Messrs. Piper were able to exhibit good breadths of P. japonica and of P. warleyensis. In sharp, but not unpleasing, contrast to the quiet tone of the rockery was an exhibit of border flowers in which bright colours were freely used. Gaillardias gigantea, Gladys and Lady Rolleston, bunches of rich orange-coloured Papaver nudicaule aurantiacum and Alstrœmeria aurantiaca served to enhance the rich blues of the Delphiniums.

The exhibit of Messrs. J. Cheal & Sons, Crawley, took the form of a semi-formal wall garden and a small rockery, with a dividing paved walk and backed by a narrow shrubbery. The principal Alpines were Sedum Maweanum, Dianthus graniticus, Artemisia lanata, and various Campanulas. Vases with cut sprays of Rose Aennchen Müller were placed along the path.

Messrs. Phillips and Taylor, Bracknell, Berks, planted two Water-lily pools in an exceedingly effective manner. The bordering groups of Ranunculus lingua grandiflora, Cyperus longus, Calla palustris and Alisma Plantago efficiently removed any effect of formality. The background was furnished with Typhas and a variety of herbaceous Spiræas. Not less attractive was the adjoining group of hardy border flowers, in which prominence was given to Pink "Progress" and Sedum obtusatum.

Messrs. "Bakers," Wolverhampton, specialised Delphiniums, of which they exhibited a splendid collection. Other plants of note were Thymus coccineus, which is so valuable for planting in the interstices of paved walks, Heuchera "Lady Greenall," and the Giant Thrift, Armeria cephalotes rubra.

Following their excellent exhibit of pot fruits Messrs. James Veitch and Sons arranged a collection of splendid Eremurus amongst a groundwork of Spiræas and Astilbes. Chief amongst the Eremurus was a large batch of E. Warei, which was in harmony with the bright yellow colour of E. Bungei.

To have properly appreciated the effect of the group arranged by Messrs. R. and G. Cuthbert, of Southgate, it should have been viewed from a greater distance. Exceptionally well-grown plants of Humea elegans gave a feathery lightness to the brilliant batches of Viscaria oculata "Brilliant," Streptosolen Jamesonii and the salmon-coloured variety of the Ivy-leaved Pelargonium Madame Crousse. In the foreground several little groups of Delphinium "Blue Butterfly," a valuable annual variety, were very effectively placed.

Delphiniums of many shades of colour, ranging from the almost pure white Moerheimii to the very dark blue-purple Mrs. Creighton, occupied the centre of the group arranged by Mr. Amos Perry, Enfield. Along the front many circular pans with a great variety of Water-lilies floating in water attracted attention. At one end of the Delphiniums a collection of herbaceous Phloxes, Senecio Grayi, and the orange-coloured Trollius abschasicus adjoined an extensive collection of hardy Ferns.

The design of the exhibit arranged by Mr. Maurice Prichard, Christchurch, was that of a long, narrow rockery supporting a well-filled flower border. In the rockery the principal plants were Sedum cæruleum, Asteriscus maritimus, Erythræa diffusus, and several species of Dianthus. The outstanding features of the flower-border were the splendid spikes of Delphinium and a bold group of the deep-red Spiræa palmata.

Messrs. T. S. Ware, Ltd, Feltham, divided a water garden and hardy flower exhibit into three sections. The central portion contained a good group of Romneya Coulteri arising from Geum Mrs. Bradshaw and hardy Ferns. On the banks of the pool Mimulus cardinalis, various Campanulas and Delphinium nudicaule relieved and brightened the still water. The dividing paths were bordered with Thymus serpyllum coccineum, Sedums, Linaria pallida, Erythræa diffusa, and other low-growing plants.

Messrs. G. and A. Clark, of Dover, also placed a pool in the centre of a gorgeous display of border flowers, but in this case the pool was larger and contained more Nymphæas; of these N. Laydeckeri fulgens and N. Marliacea carnea were especially bright. Boldly arranged vases of Alstrœmerias, border Phloxes, tall, stately Delphiniums, Heucheras and Verbascum Weidmannia also assisted in making a noteworthy display.

The exhibit staged by Messrs. Barr and Sons, Covent Garden, took the form of a Water-lily pool surrounded by a very pleasant rockery which was backed and flanked by choice border flowers. The weather-worn boulders of the rockery were planted with Sempervivums (S. arachnoideum, S. Laggeri and many others), which were set off by breadths of Campanula pusilla, Artemesias and other appropriate plants. The most attractive of the border flowers were Lilium myriophyllum, Lavatera Olbia, and a good strain of Orchis maculata.

Trees and Shrubs.

Messrs. James Veitch and Sons, Ltd., Chelsea, exhibited a large group of new trees and shrubs introduced by the firm from China. This exhibit included 130 distinct species and varieties, some of the plants being large specimens. Practically all were raised from the first consignment of seeds received from their collector, Mr. E. H. Wilson, in 1899.

Among the more notable were Magnolia Delavayi, with lemon-yellow flowers terminal on the branches; Cotoneaster Harroviana, in flower, but more attractive when furnished with its bright coral-red berries in the autumn; Viburnum Henryi, with loose panicles of white flowers, succeeded by coral-red berries; Aristolochia heterophylla, with diminutive flowers; Lilium myriophyllum, having the exterior of the trumpet flushed with rose colour and sweetly scented; Diospyros armatus, an evergreen species; Liriodendron chinensis, Populus lasiocarpus, the largest leaved Poplar; and Rubus Veitchii, with finely cut leaves and tiny pink flowers. Adjoining this exhibit Messrs. Veitch showed splendid specimens in tubs of Laurus nobilis (Bay Laurel), is pyramidal, columnal and standard form.

Mr. L. R. Russell, Richmond, Surrey, showed magnificent tree-Ivies in golden and silver varieties; a group of Dimorphanthus Manchuricus, and hardy Fuchsias. The Ivies represented about 30 of the finest gold and silver leaved forms, with a few uncommon green-leaved sorts. We noticed the beautiful silver Ivy known as Hedera dentata variegata flavescens; elegantissima, a silver-leaved variety grafted on the Common Ivy; and Sheen Silver, a dwarf silver Ivy suitable for edging beds and borders. The finest Fuchsias were F. Riccartonii Enfant Prodigue, F. R. Drame, a fine form of F. Thompsonii, and brightoniensis.

Messrs. W. Fromow and Sons, Chiswick, arranged an imposing group of Maples, relieved with a few other kinds of ornamental-leaved trees. The beautiful Acer palmatum laciniatum, A. japonicum aureum, A. palmatum roseum marginatum, A. p. linearifolium purpureum, A. p. sanguineum, A. dissectum variegatum, A. japonicum aureum, A. palmatum versicolor, and many more were shown well as standard pyramid or bush plants, with variegated Bamboos, Eurya latifolia variegata, Nandina domestica, and other pretty shrubs as foils.

Mr. Reuthe, Keston, Kent, showed rare shrubbery species, including dwarf Conifers, large plants of Desfontania spinosa finely in flower, Restio sub-verticillata, Pæonia lutea, Rhododendron camelliæflorum and Berberis Bealii.

Messrs. J. Piper and Sons, Bayswater, showed examples of topiary in Yew and Box, also splendid plants of Acer palmatum.

Messrs. W. Cutbush and Son, Highgate, showed examples of topiary.

Mr. Carlton White, New Bond Street, London, showed good specimens of topiary.

Messrs. Paul and Son, Cheshunt, showed ornamental-leaved trees and shrubs, also Philadelphus Avalanche, P. Souvenir de Billard, Spiræa Fræbellii, Abutilon vitifolium and Ligustrum multiflorum in bloom.

A number of model gardens were shown by the Yokohama Nursery Co., Kingsway, London. They were arranged in porcelain dishes that in nearly every case held a pool of water, which was spanned by a miniature bridge. The inclusion of pigmy trees and shrubs, with tiny summer-houses and figures of men and animals placed at appropriate spots, sometimes on a miniature hill, gave these pretty toy gardens a realistic appearance.

Messrs. Barr and Sons, King Street, Covent Garden, showed numerous pigmy trees in ornamental porcelain pans.

Miscellaneous Greenhouse Plants.

Messrs. James Carter and Co., Raynes Park, had a separate tent filled with banks of flowers. They grouped a large batch of Petunia Queen of the Roses with tall stands of Sweet Peas at the back, relieved with the greenery of Palms and Ferns. Next to the Petunias was a mass of finely-flowered Streptocarpuses, separated from a central exhibit of Sweet Peas by a band of Stocks, and edged by the pretty dwarf Rose Jessie. Next was a fine clump of tuberous-rooted Begonias, with more Sweet Peas, and finally a bay filled with Viscarias, Phlox Drummondii and Verbena Miss Willmott. The tent was a fairy-like bower of bright blossoms.

Messrs. James Veitch and Sons, Ltd., King's Road, Chelsea, showed large batches of greenhouse flowers, including Solanum Wendlandii, Cannas, Souvenir de la Malmaison Carnations, Exacum macranthum (extra fine); Lavatera assurgentiflora, Begonia Lucerna, Sollya Drummondii, and a new Calceolaria named Stewartii. All the plants were flowering profusely, and remarkably healthy.

A bank of the showy Crassula coccinea was exhibited by Lady Northcliffe, Sutton Place, Guildford (gr., Mr. J. Goatley).

Mr. H. Page, Hampton, Middlesex, showed his new Pelargoniums: Fiscal Reformer, salmon rose; His Majesty, scarlet; Her Majesty, salmon; and Winter Cheer, scarlet cerise, a very free-flowering variety.

Messrs. Godfrey and Sons, Exmouth, showed Pelargoniums, of the zonal-leaved, Regal, show, and scented-leaved sections. Of the last, Mrs. B. Smith, white splashed with crimson-lake; Godfrey's Pet, white with rosy-maroon upper petals; and Mrs. Galsworthy, white suffused with blush-pink, were shown for the first time.

Mr. W. A. Manda, St. Albans, showed hardy Cacti, Ferns, Asparagus elongatus, and Cattleyas.

Messrs. Stuart Low and Co., Bush Hill Park, Enfield, displayed the free-flowering fancy Pelargonium Juvenal amongst large bushes of Metrosideros floribunda. The bright red bottle-brush like flowers of the shrub considerably enhanced the glowing pink of the Pelargonium. Along the front of the group a row of Heeria elegans illustrated its trailing nature; the flowers are purplish-rose coloured.

A large number of well-bloomed Gloxinias were displayed by Messrs. J. Peed and Son, West Norwood.

Messrs. H. Cannell and Sons, Swanley, showed varieties of zonal-leaved Pelargoniums.

Pelargoniums were also shown by Mr. W. Treseder, Cardiff.

AWARDS.

First-class Certificates.

Adiantum trapeziforme var. "*Queen Mary.*"—This is a sport from the type showing the first approach to a plumose form. The pinnules are more densely placed on the branched fronds and hang gracefully instead of being held flat, so that the frond is as beautiful from below as above. The pinnules themselves are expanded from the typical trapezoid shape into that of an expanded fan, with the margin beautifully fringed and undulated. The young fronds assume a very delicate green, but the plant has the same vigour as the type, the black, wiry stems reaching about 2½ft., and the lowest pair of pinnæ branching. (Messrs. H. B. May and Sons.)

Magnolia Delavayi.—A new species from Southern China, which has proved hardy at Coombe Wood, Kingston, but which would appear to require the shelter of a south wall in most gardens. The flowers are 6 inches in diameter, and the petals of great substance and breadth. The colour is a rich cream, but the central column of anthers and stigmas, which rise 2 inches in the saucer-shaped flower, is tinged with red. The leaves are evergreen, of a leathery texture, with entire margin, but waved at the edge. The upper surface is slightly glossy. Their beauty lies largely in their size, as they are nearly 12 inches long, and broadly oval or ovate in shape. A tub plant about 4 feet high was shown, and the only two flowers were solitary at the ends of this season's growths. (Messrs. J. Veitch and Sons, Ltd.)

Awards of Merit.

Adiantum Siebertianum.—This beautiful fern, named in honour of a curator of a German botanic garden, is what may be called a "gracillimum" form of A. Wiegandii. The pinnules are lighter in colour and more slender and graceful in form than the type. The young fronds are pleasingly shaded with rose colour, which runs strongly through the central vein and shows finely against the black rachis. It resembles the species in having the quaint, wedge-shaped pinnules which overlap to form an oblong-like blade.

Polypodium Mayi var. cristatum.—P. Mayi is a fringed form of P. glaucum, and in this new variety the fringing of the lobes of the frond is carried further, and the tips become lightly crested. It is a distinct and handsome form, retaining the vigour and colour of the type.

[These two Ferns were shown by Messrs. H. B. May and Sons.]

Iris Kaempferi "*Morning Mists.*"—Of the single forms of Iris Kæmpferi this is the largest and most beautiful. The falls are pure white, touched at the claw with yellow, and suffused in the upper half very finely with a shade of pale blue, which is bright in the expanding bud, but gradually fades as the flowers age. The blade of the fall is circular and 4 inches in diameter, as shown, so that the expanded flower is nearly 1 foot across, but the falls arch gracefully with their own weight, as they are of unusual substance. The standards are pure white. The plant is of medium height, and has distinct broad, arching foliage. (Messrs. R. Wallace and Co.)

Erigeron hybridus "*Pink Pearl.*"—This is a very bright pink variety. The flowers are not large, being only 1½ inches in diameter at the best, but the habit is vigorous and free, and the colour is very bright and pleasing. The disc is greenish-yellow. (Mr. Amos Perry.)

Rose "*Ophelia.*"—A hybrid Tea Rose in colour very close to Prince de Bulgarie and Antoine Rivoire, but the form is better. The bud is longer and more pointed, and the outer petals expand flat, recurving at the margins. The flower gives shades of cream-flesh and pink, and a delightful touch is given by the glint of yellow in the shadows at the bases of the petals. (Messrs. Wm. Paul and Son.)

Rose "*Muriel Dickson.*"—The blooms are a brilliant cherry-rose colour, a very delightful and novel shade, but with little substance; large, loose, open, and with a weak centre. This variety was described as a hybrid Austrian Briar, but appeared to have been disbudded.

Rose "*Ulster Standard.*"—This is a glowing, velvety-crimson, single, Hybrid Tea variety. The petals show great breadth, and the expanded flower is some 5 inches in diameter, but it appears to lack the beautiful bud form of some of the Irish singles, and belongs to a different section. From the mass of buds on the plant the variety promises to be a most profuse bloomer.

Rose "*Mrs. Godfrey Brown.*"—A very large flower, flesh-coloured on the inner side of the petal and pink on the reverse. It is described as a glorified Mrs. W. J. Grant, with the colour rather of Lady Faire, but in size and form it suggests Mildred Grant, although it has much less substance than that variety.

These three Irish-raised Roses are essentially garden Roses, not exhibition varieties. Their appeal is through their freedom in blooming and in their advance in colour, rather than in form and substance. They are said to be of excellent habit and constitution for the garden. (Messrs. Hugh Dickson, Ltd.)

Carnation "*Virginia.*"—A buff-ground, fancy, border variety, suffused and broadly edged with rose-pink, with a suggestion of lilac. A large flower, with plenty of substance.

Carnation "*The Baron.*" — A pale, yellow-ground, fancy border variety, lightly splashed with lilac and rose. A large and handsome flower.

Both the above have good stems and calyxes. (Mr. J. Douglas.)

Nepenthes atropurpurea.—A finely coloured seedling, raised from N. sanguinea and N. Curtisii superba. The total length of the pitcher and lid is nearly 1 foot. It is cylindric in shape, with a slight constriction in the upper half, and the cap spreads horizontally. The general colouring is deep brownish-crimson, which also suffuses through both stalk and cap. The finely-fluted rim is also crimson coloured. Inside the pitcher the surface is seen to be green blotched with chocolate.

Nepenthes "*Lewis Bradbury.*"—This beautiful variety was raised from N. sanguinea and N. mixta; it has larger pitchers than the last, but is scarcely so finely coloured. The pitcher is a greenish-crimson, irregularly covered with narrow blotches, running longitudinally. The interior is heavily blotched, and shows well under the erect lid. Like the last variety, the shape is cylindric, with a scarcely perceptible constriction in the upper half. In this one the stalk is not well coloured.

Both these Nepenthes were shown by Messrs. Jas. Veitch and Sons, Ltd.

Messrs. Sutton and Sons, Reading, showed the new chestnut-banded or "red" sunflowers, which have resulted from crossing with Helianthus annuus, a red-marked variety of Helianthus lenticularis (the common wild Sunflower of North America), which Professor Cockerell, of Colorado, had discovered wild and found to breed true. The hybrids vary considerably in markings, some showing merely a defined maroon band and others being wholly suffused with brown. It is to the former that the greatest garden interest attaches, as they are much more showy than the others.

Fruit and Vegetables.

Visitors to flower shows in the metropolis have come to expect splendid exhibits of vegetables from the gardens of the Hon. Vicary Gibbs, at Aldenham House, but on this occasion his gardener, Mr. Edwin Beckett, may be said to have excelled himself. Mr. Beckett is not only a skilful cultivator of high-class vegetables, but he is also a past master in the art of displaying them to the best advantage. Even as a master's painting deserves an ornate frame, so a master collection of vegetables is worthy of an uncommon setting, and this exhibit was fittingly set out on a green enamelled frame. To enumerate the kinds of vegetables so well shown would be to make a list of the vegetables possible at this season, with the exception of Parsnips, and each item was as near to perfection as human skill could make it. The "bloom" on such kinds as Cucumbers, Tomatos and Peas was such as to make many a Grape-grower envious.

Lord Llangattock, The Hendre, Monmouth (gr. Mr. T. Coomber) exhibited 26 Queen Pine-apples. This monster collection of pale-golden, fragrant fruits was reminiscent of the days when every garden of any pretensions had its pine-stoves and grew the noble Pineapple. But Pine-apples were never grown to greater perfection than Mr. Coomber cultivates them to-day.

Messrs. Laxton Bros., Bedford, exhibited 25 varieties of ripe Strawberries. It was interesting to note how the more recent varieties show the characteristics of one parent. In the best of the late varieties the influences of British Queen and Waterloo are, for instance, readily apparent. The fruits of such varieties as Laxton's Utility, probably the best variety for a heavy soil, and Epicure all have, in a modified degree, the green tip of British Queen. This will undoubtedly be "bred out" in a few generations. The Waterloo parentage is obvious in the rich, dark flushes on the fruits of Laxton's Profit, The Laxton, Bedford Champion and Laxton's Reward. These sorts are, like the predominant parent, eminently suitable for culture on light soils. Messrs. Laxton were still able to exhibit baskets of their newest early Strawberry, King George, which is said to be decidedly earlier than Royal Sovereign and to possess superior qualities.

Messrs. Laxton Bros. also showed a dish of a new Peach, "Laxton's Advance," a large, pink-flushed fruit, much like Royal George in appearance, but larger and of superior flavour. The Committee expressed a wish to see it again, and accompanied by specimens of foliage.

Messrs. W. Seabrook and Sons, Chelmsford, exhibited fruiting branches of "Seabrook's"

Black Currant, a very prolific variety, which bears large, round fruits. The exhibitors were asked to send plants to Wisley for trial.

Messrs. JAMES VEITCH & SONS, Chelsea, exhibited a selection of their well-known fruit bushes in pots. At the back of this exhibit of splendid quality there were standard and fan-trained Peaches and Nectarines studded with ripe fruits. The body of the group was composed chiefly of dwarf pyramid Apples, Pears and Plums and short-stemmed, fan-shaped Peaches, all loaded with ripe fruits. The most attractive items were the red-streaked Lady Sudeley Apples and the Précoces de Croncels Nectarines, but the pale-golden Early Transparent Gages bore even more fruit.

S. HELLIBUT, Esq., The Lodge, Holyport, Maidenhead (gr. Mr. G. Camp) exhibited a group of such large and heavily-fruited pot Cherries and Plums as are rarely grown in private gardens. The largest bush, that of Cherry Bigarreau Noir de Guben, was fully 10 feet high and bore a large number of luscious fruits. The red Cherries were, however, the most attractive, especially those on the bushes of Bigarreau Napoleon. The Gages were Early Transparent and McLaughlin.

Messrs. STUART LOW & Co., Bush Hill Park, Enfield, exhibited many different sorts of fruiting Figs in pots. Trees of the well-known Brown Turkey variety bore ripe fruits of good size. In point of fruitfulness the variety White Ischia, which bears such luscious fruits, was a good second; for home consumption there is no more desirable variety, but the fruits are too soft to travel in good condition.

Messrs. WHITELEGG AND PAGE, Chislehurst, Kent, showed in long fruiting branches festooned on a pergola-like structure and in fruits laid out in dishes the fruiting capabilities of their Newberry, which was derived from the Loganberry and the Superlative Raspberry.

A small collection of seasonable Vegetables was exhibited by the Rev. CHALMERS HUNT, Letchworth, Herts. The leading feature was the dishes of Peas—Sutton's Early Giant, Prince of Wales and Centenary Marrowfat.

Messrs. J. PITHER, LTD., Uxbridge, presented a large quantity of Mushrooms, lifted, as grown, from the beds. These illustrated in a marked degree the fertility of the "Pither spawn" as well as the cultural skill of Mr. Bide, the manager.

Trials of Violas.

JUNE 5.—The deputation of the Floral Committee which visited Wisley on June 5 recommended Awards of Merit to the following varieties of Violas grown under trial. The awards were confirmed by the Council at the meeting held on June 17. The raisers' names are given in parenthesis:—Royal Scot (Grieve), Agnes Kay (Kay), Sulphurea (Grieve), Purity (Forbes), Redbraes Bronze (Grieve), Bethea (Gold), Alexandra (Grieve), Admiral of the Blues (J. P. Robertson), Redbraes White (Grieve), Blue Duchess (Dobbie), Redbraes Yellow (Grieve), and Virgin White (Todd). All these varieties were sent by Messrs. DOBBIE AND Co. Bridal Morn (C. Turner, Slough), and Fred Williams (Forbes), sent by FORBES, Hawick.

The following Violas were commended for having stood well through two seasons:—Kitty Bell, Pencaitland, Archie Grant, Walter Welsh, Maggie Mott, Snowflake, Grievei, Mrs. Chichester, William Robb, Primrose, Arabella, Max Kolb, Ivanhoe, Countess of Kintore, James Pilling, Kingcup, Molly Pope, Virgin White, Bullion, Rotherfield Belle, Kate Blyth, V. cornuta, Dawn and Palmer's White.

CITY OF LONDON ROSE.

JUNE 26.—The first exhibition of the above Society, which was formed to "foster and increase the love of the Rose and of Rose-growing amongst our city workers, who stand most in need of the freshening influence and beneficial relaxation that the exercise of such a hobby affords," exceeded the expectations of its most sanguine supporters. The large hall at the Cannon Street Hotel proved to be inadequate to contain the exhibits, which overflowed into an adjoining room.

The high quality of the flowers was surprising. The first-prize stands in Classes 9 and 10 were of "championship" quality. In nearly every class the competition was keen, and this was especially noticeable in the classes confined to the smaller growers. Such well-known cultivators as Messrs. J. BURRELL AND Co., B. R. CANT, FRANK CANT AND Co., ALEX. DICKSON AND SONS, PAUL AND SON, PRIOR, PRINCE, and STUART LOW AND Co. staged trade exhibits.

OPEN CLASSES.

The Nurserymen's Challenge Trophy for the best collection of 48 varieties was won by Messrs. ALEX. DICKSON AND SONS, Newtownards, Ireland. This winning stand was exceptionally strong in the deep-red varieties, of which there were velvety, fragrant blooms of such varieties as Earl Dufferin, Horace Vernet, and Edward Bohane. The brighter-coloured H. V. Machin and large blooms of François Michelon, Mildred Grant, Mrs. Edward Mawley, and the Lyon Rose were all noteworthy. 2nd, Messrs. B. R. CANT AND SONS, Colchester, whose collection was rich in the pink-coloured varieties, and contained in the bright-red A. Hartman the premier bloom shown in classes 1 to 16.

There were 12 exhibits in the class for 12 varieties, three blooms of each, and the first prize was awarded to Messrs. G. and W. H. BURCH for a splendid collection, in which Lady Ursula, the Lyon Rose, Mrs. T. Roosevelt, Dean Hole, and William Shean figured largely. 2nd, Mr. GEORGE PRINCE, Oxford, who showed the rich-red Edward Mawley and Bessie Brown in excellent condition.

The bunches of decorative Roses were excellent, and the arrangement was very tasteful. Mr. JOHN MATTOCK, Oxford, whose best vases were of Marie Van Houtte, Duchess of Wellington, and Lady Pirrie, won the first prize.

The exhibits of new Roses (varieties introduced to commerce during the past three years) were very interesting. The first prize was won by Messrs. ALEX. DICKSON AND SONS, whose best blooms were Mrs. H. Hawksworth, Lady Greenall, Mrs. Amy Hammond, Mrs. Foley Hobbs, and Duchess of Sutherland.

Class 7 in the open division was reserved for competition amongst amateurs, irrespective of the number of plants grown. The best collection of 24 blooms was shown by Mr. W. O. LINES, Bedford Road, Hitchin, who had fine examples of Bessie Brown, Lohengrin, Dean Hole, J. B. Clark, and Wm. Shean.

The next class was open to amateurs who grow fewer than 1,000 exhibition varieties. Here Mr. E. F. BROWN, Sussex Place, Slough, in whose stand Comtesse de Nadaillac, Dean Hole, and Mildred Grant were the finest blooms, was the most successful exhibitor.

MEMBERS' CLASSES.

The first four of the members' classes were for open competition. The City of London Championship Trophy induced excellent competition, and the winning collection of 12 blooms, shown by Mr. H. L. WETTERN, 16, Water Lane, London, was magnificent. The blooms of Wm. Shean, Mrs. J. Laing, Mildred Grant, Caroline Testout, Hugh Dickson, and Yvonne Vacherot were fit for exhibition anywhere. The bloom of the last-named variety was awarded the premier prize offered in Classes 9-17. The second prize was won by Mr. L. S. PAWLE, Stock Exchange, with a very creditable collection.

In the classes open to growers of fewer than 1,000 plants of exhibition varieties Mr. A. C. BROWN, Brookes Lodge, Reigate, showed the best exhibit of 12 blooms, and Mr. R. DE ESCHOFET, 55, Holborn Viaduct, the finest collection of 6 blooms.

METROPOLITAN CLASSES.

The first classes in this section were restricted to competition amongst members who grow their Roses within eight miles of the Royal Exchange. The Champion Trophy for the best 12 blooms was won by Mr. A. E. COXHEAD, 10, Ambleside Avenue, Streatham, with well-set-up, beautiful blooms of such varieties as Caroline Testout, William Shean, and Florence Pemberton.

The Champion Trophy offered to members within five miles of the Royal Exchange was won by Mr. R. DE ESCHOFET, whose exhibit included a splendid bloom of Frau Karl Druschki.

ROYAL AGRICULTURAL.

Floral Exhibits at the Bristol Show.

JULY 1-5.—The horticultural section of the Royal Agricultural Society's Exhibition at Bristol was by general consent among the best of the Society's successes, notwithstanding that the dates clashed with those of the Holland House Show. There may be no outstanding feature as was the case at Norwich, when Messrs. Wallace, of Colchester, enhanced their fame by a wonderful production in the way of a sunken wall garden; but the excellence of the trade and private exhibits throughout is such that justify this high praise. As at Gloucester a few years ago, Sir GEORGE HOLFORD, K.C.V.O., is represented by truly magnificent exhibits of Orchids and Amaryllis, the latter containing many distinct self-colours of great merit and the former a brilliant and extensive collection of Cattleyas; an old and seldom seen well-flowered Ærides odoratum; Odontoglossums, including a fine variety named Amabile; Brasso-Cattleya Euterpe, and many other choice plants. This magnificent exhibit of Orchids has been awarded the Gold Medal of the Royal Horticultural Society, and the Hippeastrums the R.H.S. Silver-Gilt Medal.

In the competitive class for a group of miscellaneous plants occupying a space of 350 square feet, Messrs. J. CYPHER AND SONS, Cheltenham, are awarded the first prize for a delightful arrangement of highly-coloured foliage and flowering plants, the self tone of colour in the flowers throughout the arrangement being very telling. Mr. HOLMES, of Chesterfield, is placed second for a fine collection of plants, most creditably arranged. 3rd, Mr. C. J. ELLIS, Weston-super-Mare. In the class for a collection of Orchids, arranged for effect in a space of 100 square feet, Messrs. ARMSTRONG AND BROWN, Tunbridge Wells, are placed first; 2nd, Messrs. J. CYPHER AND SONS.

For a group of Carnations occupying 100 feet, with other foliage plants included for effect, Mr. CHARLES WALL, Melrose Nursery, Bath, the only competitor, is awarded the first prize. The first prize for a group of tuberous-rooted Begonias in pots, occupying a space of 100 square feet, is won by Messrs. BLACKMORE AND LANGDON, Bath, who well merited the first place, though they had no rivals.

Messrs. ARTINDALE AND SON, Sheffield, are the only exhibitors in the class for a group of hardy plants, Bamboos and Aquatics, and are awarded the first prize. In the next class, that for a group of hardy herbaceous plants and cut flowers, arranged on a ground space 25 feet by 10 feet, the last-named firm were given third prize, the second and first being awarded to Messrs. GIBSON AND Co., Bedale, and Messrs. HARKNESS AND SONS, Bedale, respectively, all three worthy exhibitors hailing from the broad-acred county. This form of staging has much to commend it, the effect created being much better than the usual table arrangement. Mr. CHARLES WALL, Melrose Nursery, Bath, is placed first for cut sprays of Carnations, occupying 12 feet by 5 feet space, with a light and bright arrangement, followed by the DUCHESS OF SOMERSET, with Mr. ENGELMANN, Saffron Walden, third.

One of the keenest competitions is seen in the class for 72 cut Roses, Messrs. DICKSON AND SONS, of Newtonards, being first, with very little dividing them from the KING'S ACRE NURSERY COMPANY, who are second. The best collection of cut Roses in a space 15 feet by 5 feet is staged by Mr. R. ADAMS, White Wells Nurseries, Bath, who has fine blooms; 2nd, Messrs. G. COOLING AND SONS, Bath.

For Sweet Peas there was a spirited competition. Messrs. KING AND Co., Coggeshall, are placed first; Miss HEMUS, Upton-on-Severn, second; Mr. J. STEVENSON, Wimborne, third.

The DUKE OF PORTLAND, Welbeck (gr. Mr. Jas. Gibson), without opposition wins the first prize for a decorative display of ripe fruit, thirty dishes in a space of 20 feet by 4 feet, with excellent Peaches and Nectarines, Figs, "King George" Melon, and Madresfield Court Grapes. This exhibitor also excels in the classes for (*a*) four bunches of Grapes, distinct; (*b*) two bunches of Black Hamburgh; (*c*) two bunches of Madresfield Court; (*d*) two dishes of Nectarines; and (*e*) two dishes of Peaches.

Non-Competitive Exhibits

Non-Competitive Exhibits, as already stated, are so numerous as to constitute the chief part of the show

Large Gold Medals are awarded the following :—Sir George Holford, K.C.V.O., Westonbirt (1) for a group of Amaryllis, and (2) for Orchids; Sutton and Sons, Reading, for a superb stand of vegetables and flowers; Geo. Mallett and Co., Cheddar, for a display of rockwork and plants.

Gold Medals to James Carter and Co., Raynes Park, for vegetables; E. W. King and Co., Coggeshall, for Sweet Peas; W. J. Unwin, for Sweet Peas; Young and Co., Cheltenham, for Carnations, arranged on 300 or more square feet of space, with massive pyramids in bold colours; Stuart Low and Co., Enfield, for Orchids, Roses, and Carnations; H. B. May and Sons, for a choice collection of Ferns; King's Acre Nurseries, Ltd., fruit trees in pots, Apples, Lady Sudeley, James Grieve, being finely coloured; Jefferies and Sons, Cirencester, for a collection of Conifers; Jarman and Co., Chard, for Sweet Peas, Roses, etc.; Isaac House and Son, Westbury-on-Trym, for a collection of Alpine and herbaceous plants and flowers; Alexander Dickson and Sons, Ltd., Newtownards, for a collection of Roses containing several novelties; Dobbie and Co., Edinburgh, Sweet Peas, etc.; Vernon T. Hill, Mendip Nurseries, Bristol, herbaceous and Alpine plants, etc.

Silver-Gilt Medals to Blackmore and Langdon, Bath, for a fine collection of Delphiniums; W. Artindale and Son, Sheffield, for Violas, Sweet Peas, and Roses; James MacDonald, Harpenden, for a collection of Grasses; H. N. Ellison, West Bromwich, for a collection of Ferns; James Garaway and Co., Clifton, for a good stand of Schizanthus, Petunias and a number of well-flowered Eucharis grandiflora; Geo. Cooling and Sons, Bath, for hardy shrubs; Godfrey and Sons, Exmouth, for Canterbury Bells, Pelargoniums, etc.; A. J. Keeling and Sons, Bradford, for Orchids; Parker and Sons, Bristol, for Roses, etc.; A. Walters and Son, Bath, for herbaceous flowers, Roses, etc.; Robert Veitch and Sons, Exeter, for a most interesting collection of choice shrubs, which include Rhododendron Falconeri, Leptospermum flavescens obcordatum, L. Nichollsii, Grevillea alpestris, G. longifolia, Ozothamnus rosmarinifolius, Celmisia Monroii, Mitraria coccinea, etc.; A. F. Dutton, Iver, Bucks, for Carnations; John Waterer and Sons, Ltd., Bagshot, for Kalmia latifolia, late-flowering Rhododendrons, Japanese Maples, etc., and Kelway and Son, Langport, for Delphiniums.

Silver Medals to Cutbush and Sons, Highgate, N., for Carnations, Roses, etc.; E. C. Bowell, Alpine Gardens, Cheltenham, for collection of Alpines; C. J. Ellis, Weston-super-Mare, for Alpines; Miss Hemus, Upton-on-Severn, for Sweet Peas, etc.; J. Milburn, Victoria Nurseries, Bath, for Alpines, etc; Rich and Co., Bath, for hardy cut flowers; W. Treseder, Ltd., Cardiff, for Roses, Pelargoniums, etc.; Geo. Massey and Sons, Spalding, for hardy cut flowers; Col. Cary Batten, Leigh Lodge, Bristol, for a collection of Orchids; Toogood and Sons, Southampton, for a collection of choice vegetables.

Awards of Merit to Young and Co., Cheltenham, for Carnation Hon. John Boscawen, a new pretty flesh-pink, and Lady Nunburnholme, a new delicate salmon shade of pink, with petals of good substance; Rose Mrs. A. Glynn Kidstone, a new H.T. variety of a pearly-pink colour, and R. Denis, a new flowering vermilion variety, said to be good in growth and free-flowering, shown by A. Dickson and Sons, Newtownards.

Awards Made by Royal Horticultural Society.

Gold Medal to Sir Geo. Holford, Westonbirt (gr. Mr. Alexander), for Orchids.

Silver-Gilt Medal to Sir Geo. Holford for Hippeastrums; Blackmore and Langdon, Bath, for Begonias; Duke of Portland, Welbeck (gr. Mr. Jas Gibson), for a collection of fruit; H. B. May and Sons, Edmonton, for Ferns, and Kelway and Son, Langport, for Delphiniums.

Large Silver Cups to Cypher and Sons, Cheltenham, for a group of plants; Kingsacre Nurseries Co., Ltd., for fruit trees in pots, and Sutton and Sons, Reading, for vegetables and flowers.

Silver Cups to W. Holmes, Chesterfield, for a group of plants; Harkness and Co., Bedale, for hardy herbaceous plants; Stuart Low and Co., Enfield, for plants and cut flowers; R. Veitch and Son, Exeter, for miscellaneous plants; H. J. Ellison, West Bromwich, for Ferns; A. F. Dutton, Iver, for Carnations; and Garaway and Co., Bristol, for Eucharis, etc.

Silver Banksian Medals to A. J. Keeling and Sons, Bradford, for Orchids; Slade, Taunton, for Pelargoniums; Parker and Sons, Bristol, for Roses; Miss Hemus, Worcester, for Sweet Peas; and Col. Cary Batten for Orchids.

Standard Cups to Mallet and Co., Cheddar, for rock plants; J. Carter and Co., Raynes Park, for vegetables; Gibson, Bedale, for hardy plants; Jefferies, Cirencester, for hardy shrubs; Alex. Dickson and Sons, Newtownards, for Roses; Godfrey and Son, Exmouth, for Pelargoniums, etc.; Wall, for Carnations; Armstrong and Brown, for Orchids, and Vernon Hill, for Sweet Peas.

Silver-Gilt Flora Medals to Dobbie and Co., Marks Tey, for Sweet Peas; Young and Co., Hatherley, for Carnations; and Adams, Bath, for Roses.

Silver-Gilt Banksian Medals to E. W. King and Co., Coggeshall, for Sweet Peas; Jarman and Co., Chard, for Roses and Sweet Peas; W. J. Unwin, Hinston, Cambridgeshire, for Sweet Peas; and G. Cooling and Co., Bath, for Roses.

Silver Knightian Medal to Toogood and Son, Southampton, for vegetables.

Silver Flora Medals to Artindale and Co., Sheffield, for water garden; Walters and Co., for Roses; and Kelway and Son, Langport, for Delphiniums.

RICHMOND HORTICULTURAL.

June 25.—For many years the summer shows of the Richmond Horticultural Society were famous for their exhibits of Roses, but then came the inevitable lean years, and for a time Roses ceased to occupy their former prominence. But it would seem that the old glory of the Richmond Roses has returned. Last year the Roses were truly magnificent, and at the show held on the above date in the Old Deer Park Roses shared with the dinner table decorations the honour of being the chief features of a successful show. The hardy border flowers were finely shown, and the stove and greenhouse plants were also very attractive. As compared with last year's show, the weak spot on this occasion was in the Sweet Pea classes; the 1912 exhibits were exceptionally fine, but this year it must be confessed that the display was below the average. Queen Amelia of Portugal visited the show during the afternoon and made a prolonged inspection of the exhibits.

Open Classes.

Sir Max Waechter, Richmond (gr. Mr. H. Barfoot), was the most successful exhibitor in the class for a large group of plants. His pleasing arrangement of well-grown plants attracted a deal of admiration from the visitors. The principal flowering plants were Carnations, Campanulas, and Orchids. 2nd, C. M. Bartlett, Esq., East Sheen (gr. Mr. H. Hicks). Sir Max Waechter was the only exhibitor of three varieties of Palms, and was awarded the first prize for a collection of healthy and graceful plants. The prizes for Orchids were won by Dr. M. Lacroze and the Rev. D. L. Chandler, Ashford, Middlesex, in the order named. Exotic Ferns were well shown, the first prize being awarded for a nice collection of large plants to Mrs. Vaughan Arbuckle, Richmond (gr. Mr. H. Lawrence); 2nd, Dr. M. Lacroze; 3rd, Mrs. King Farlow. The competition in the class for five stove and greenhouse foliage plants was also good; Mrs. Arbuckle won the first prize; 2nd, C. M. Bartlett, Esq.; 3rd, E. R. W. Bennett, Esq. (M. W. Chant), Sunbury-on-Thames.

The collection of Caladiums which won the first prize for Lionel Warde, Esq., Petersham (gr. Mr. A. Allum), was composed of exceptionally fine plants; 2nd, C. M. Bartlett, Esq.; 3rd, Mrs. Arbuckle.

Mr. Lionel Warde also deservedly won the first prize for Coleus. The best tuberous Begonias were shown by G. Atkins, Esq., East Sheen (gr. Mr. W. J. Hill), who also won the first prize in the class for Streptocarpus. Mrs. King Farlow was awarded the first prize for a very good collection of Gloxinias.

Roses.

As already indicated, Roses were splendidly shown, and the first prize collection of 48 varieties, three blooms of each, shown by Messrs. R. Harkness and Co., Hitchin, was "good enough for anything"; 2nd, Messrs. B. R. Cant and Sons, Colchester; 3, Messrs. D. Prior and Sons, Colchester.

In the class for 24 varieties the premier prize was awarded to Messrs. W. and J. Brown, Peterborough; 2nd, Messrs. C. and W. H. Burch, Peterborough; 3rd, Messrs. R. Harkness and Co. The best 12 blooms, distinct, were exhibited by Messrs. C. and W. H. Burch, who also won the first prize for 12 blooms of any one variety; whilst Messrs. W. and J. Brown showed the best 12 Tea Roses.

The class for 24 bunches of hardy herbaceous flowers was responsible for a splendid array; Lionel Warde, Esq., was placed first with an excellent collection; 2nd, Messrs. Massey and Son, Spalding; 3rd, Marquis of Ripon, Kingston Hill (gr. Mr. Thos. Smith).

Sir Walpole Greenwell, Bart., Caterham (gr. Mr. W. Lintott), was the most successful exhibitor of fruit. He won the first prizes offered for a collection of six dishes of fruit, for white and for black Grapes.

Amateurs' Classes.

In this division Roses also occupied great prominence, and in the two classes (for 24 and for 12 blooms, distinct), both of the first prizes were won by the Rev. Chalmers Hunt, Letchworth; whilst the Rev. J. H. Pemberton, Haveringatte-Bower, received the second prizes.

The "Carter's" prize for a collection of vegetables was won by Miss Langworthy.

The baskets of plants were again very attractive, the first prize being awarded to Lionel Warde, Esq., and Sir Walpole Greenwell showed the best six dinner table plants.

SOUTHAMPTON ROYAL HORTICULTURAL.

June 25.—By permission of Ellen Lady Swaythling, the annual Rose Show of the Southampton Horticultural Society was held in the grounds attached to South Stoneham House. The exhibits were not very numerous, but were of an interesting character. They were of first-class quality and included a very large number of newer varieties, many of the old favourites being almost unrepresented. There were scarcely any H. P. varieties to be seen, so much more popular have the H. T.'s become of late years. The arrangements for the show were excellent, having been made under the superintendence of the secretary, Mr. Fnidge, and the chairman of Committee, Mr. H. E. Molyneux. Twenty-seven classes for cut flowers were provided, ten being open competitions. The principal class was for forty-eight distinct varieties; there were four competitors, and an effective display was made by each. Mr. G. Prince, of Longworth, Faringdon, was first, with medium-sized specimens of a high quality. Messrs. D. Prior and Sons, of Colchester, were placed second; their specimens were larger, but not so well coloured, though one of their blooms, Lady Barham, was so fine that it was selected as the premier bloom in the open classes. Mrs. J. Mattock, of Headington, Oxford, was third. Mr. G. Prince was also first in a class for twelve triplets, in which four exhibitors competed. Mr. J. Mattock was a good second, but his specimens were rather smaller than Mr. Prince's. In the competition for twelve Tea or Noisette Roses Mr. Prince was again placed first, with a splendid exhibit of well-coloured healthy blooms. The second place was allotted to Alex. H. Gray, Esq., Beaulieu, Newbridge, Bath, for a very creditable exhibit. Mr. Gray won the first prize for six specimens of any yellow or white Roses with Mrs. Foley Hobbs; Messrs. Prior and Sons took the second prize with Bessie Brown. Six competitors entered in a class for a representative group, to occupy 50 square feet; but only two finally competed, Mr. J. Mattock being placed first, and Messrs. W. Rogers and Sons, Southampton, second. Baskets of cut Roses, in three distinct sorts, made a good display. Mr. J. Mattock won the first prize in this class with several sorts well blended; Messrs. D. Prior and Sons came second, and Mr. G. Prince third.

Five ladies competed in the class for a decorated dining table 6 feet by 4 feet. Mrs. A. M. BURNETT, Southampton, was placed first for an effective arrangement of Irish Elegance with its own foliage. Mrs. BEALING came second, but her centre-piece of Mme. Abel Chatenay was rather too heavy for perfect beauty. This lady gained the first prize for a vase of cut Roses, and Mrs. BURNETT was successful in the class for a basket of mixed kinds, very effectively arranged.

There were several classes for amateurs. For eighteen distinct varieties four competitors entered, and Mr. W. JARRATT THORPE, Gransmoor, Hucclecote, Glos., won the first prize. Mr. A. H. GRAY came second, with rather smaller specimens; and Dr. SEATON, Lymington, was third. In the class for six triplets there were five competitors. Mr. A. H. GRAY won the first prize with a fine set, and was also first in the class for twelve Tea or Noisette varieties. A class for twelve distinct blooms, open only to growers of fewer than five hundred plants, was well contested. Dr. J. T. GILLETT, of Andover, was placed first, with some very neat specimens. Mr. J. A. FORT, the College, Winchester, won the piece of plate which formed the first prize in the class for twelve specimens, open to growers of less than three hundred plants. Among the classes confined to the county of Hants was one for twelve distinct blooms, the prize for which is the "Allan Gunn" Cup. This was won by Mr. H. E. MOLYNEUX, of Southampton, five other competitors taking part. For twelve Tea or Noisette varieties Mr. ALAN SEARLE, of Bassett, was placed first. Mr. MOLYNEUX gained the first prize for six bunches of decorative varieties, and Mr. A. SEARLE was second. In the class for a display of garden or decorative varieties Mr. F. M. VOKES, Birch Lawn, Sholing, was placed first. There were classes for a few other flowers besides Roses; and good varieties of Sweet Peas were to be seen in the classes devoted to this flower. Messrs. TOOGOOD AND SONS offered prizes for six bunches of distinct varieties. There were three entries, and the first prize was awarded to Mr. USHER, gardener to Sir Randolph Baker, Branstone. In the amateur class for six bunches the first prize was won by Mr. S. T. WHITE, Eastleigh. Trade exhibits were numerous and effective.

Messrs. J. K. KING AND SONS, Coggeshall, showed a remarkably fine collection of well-grown Sweet Peas, and Messrs. B. LADHAMS AND SONS, Shirley, received a Silver-Gilt Medal for a fine display of hardy-cut flowers, charmingly arranged, and a large collection of Pinks, for which their firm is noted. Messrs. W. H. ROGERS AND SON showed Roses, hardy plants, and an effectively arranged rockery. Mr. E. J. WOOTTEN, Eastleigh, showed numerous varieties of well-grown Carnations.

CROYDON HORTICULTURAL.

JUNE 25.—For many years past unfavourable weather has attended this society's shows, but this year a shower of rain about noon was the only drawback to an otherwise perfect day. The Park Hill recreation ground, where the show was held, is admirably adapted to such a purpose. It is central in position, and the stately trees with which it is partly bordered, and the proximity of the beautiful grounds of Coombe Cliffe, greatly enhance the charm of the site. Coombe Cliffe Gardens were opened on this occasion by the kindness of Alderman Allen, and many of the visitors enjoyed a stroll through them. Rose exhibits have always been made a special feature in the shows of the society, and over a dozen cups, bowls, and pieces of plate are offered in this section alone. This ensures keen competition, and the display of Roses shown on Wednesday is considered to have been the best ever known in the forty-six years' history of the society. The Croydon Challenge Silver Cup, which was competed for in the open class for nurserymen, was awarded to Messrs. B. R. CANT AND SONS, Colchester. These people showed a collection of forty-eight distinct varieties, each perfect in its own way. Messrs. R. HARKNESS AND CO., Hitchin, and Messrs. F. CANT AND CO., Colchester, came 2nd and 3rd respectively.

In the class for twenty-four distinct trebles Messrs. B. R. CANT AND SONS were again successful, and were followed by Messrs. F. CANT AND CO., and Messrs. D. PRIOR AND SONS, Colchester. The remaining classes in the open sections were well competed.

In the section for amateurs competition was exceedingly keen. Mr. H. L. WETTERN, Waratah, Sanderstead, was the winner of the society's Cup in the principal class, for twenty-four distinct varieties; Dr. J. E. PALLETT, Earl's Colne, came 2nd; and Mr. G. C. EVERSFIELD, Denne Park, 3rd. Mr. WETTERN also gained the National Rose Society's Silver Medal for the best H. P. or H. T. Rose in the amateur's section. His choice was a H. T. "Avoca," a splendid specimen. Dr. LAMPLOUGH, Alverstoke, was also successful in gaining the Silver Medal of the National Rose Society for the best Tea Rose (amateurs)—this was a white "Maman Cochet." Besides this, he was the winner of two cups. The "Frank Cant" Challenge Cup and the "Bowman" Silver Cup were won by Dr. PALLETT, and Mr. E. B. LEHMAN, Crawley, Mr. P. T. DAVIS, Burgess Hill, and Mr. FRED SLAUGHTER, Steyning, were among other winners. The ladies' class for table decorations was very poorly represented, Mrs. H. L. WETTERN being the only competitor. In the open class for twelve bunches of Sweet Peas the number of exhibitors was not large. Mr. R. J. LEMON, of Godstone, was the winner, with some very fine blooms. Mr. T. N. COLLYER, gardener to Mr. A. H. ALLEN, Beddington, showed a very fine group of plants, and secured the 1st prize for a group of Gloxinias. Specimen plants were not very well shown; and vegetables, probably owing to the recent drought, were not up to the usual standard. This was most evident in the cottagers' classes, in which the produce is usually of a very high order of merit. Trade exhibits were numerous and good, many well-known nurserymen contributing excellent groups.

After the exhibition a sale of flowers was held in one of the tents, the proceeds of which (amounting to £6 2s.) were sent to the Royal Gardeners' Orphan Fund.

The attendance was very good, and the gratifying result of the exhibition is that a sum of nearly £40 has been raised, which will be devoted to the purpose of wiping off last year's deficit.

REIGATE ROSE AND SWEET PEA.

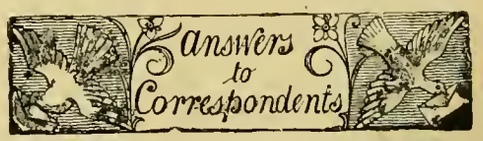
JUNE 29.—The eighth annual exhibition was held on the above date in the grounds of Broke's Lodge. Fine weather prevailed, and, as the classes were exceptionally well filled, there was a brilliant display of exhibits. The Challenge Cup offered for forty-eight distinct varieties of Roses (open to nurserymen) was won by Messrs. FRANK CANT AND CO., Colchester. This firm also won the Challenge Cup offered for twelve bunches of garden Roses, distinct. In the class for twenty-four distinct varieties the 1st prize was awarded to Mr. W. HAMMOND, Burgess Hill, who showed choice blooms of the varieties Edward Mawley, Lyon, Mrs. T. Roosevelt, Hugh Dickson, Mme. Jules Gravereaux, and Mrs. Roosevelt; 2nd, Mr. GEO. PRINCE, Longworth; and 3rd, Mr. ERNEST HICKS, Wallingford. Mr. GEO. PRINCE, Oxford, was successful in the class for eighteen distinct varieties, Teas or Noisettes, prominent blooms being Mrs. Myles Kennedy, Mme. Jules Gravereaux, White Cochet, Media, and W. R. Smith; 2nd, Messrs. BENJAMIN R. CANT AND SONS.

In the amateur classes the Challenge Cup offered for twenty-four distinct varieties was awarded to Mr. H. L. WETTERNE. His bloom of Mme. Jules Gravereaux was awarded the Silver Medal offered for the best bloom in the amateur classes.

For twelve distinct varieties open to growers of fewer than 1,000 plants, Dr. LAMPLOUGH was successful in winning the Challenge Cup.

The most successful exhibitor of Sweet Peas in the open section was Mr. NOEL E. THORNTON, who won the premier award in the classes for six bunches of distinct varieties, two bunches of scarlet or crimson varieties, two bunches of pink varieties, and the Challenge Cup for twelve distinct varieties.

Non-competitive exhibits included a magnificent display of Sweet Peas from Mr. JOHN K. KING, Coggeshall, and an exhibit of Roses from Mr. ELISHA J. HICKS, Twyford, Berkshire, both of whom were awarded Gold Medals. Messrs. W. WELLS AND CO., Merstham, J. CHEAL AND SONS, Crawley, and the GUILDFORD HARDY PLANT Co. showed attractive exhibits of flowers.



ASPLENIUM BIFORME UNHEALTHY: *J. and A. H.* The plants are infested with small thrips, which attack the crown. The pests are not readily destroyed by syringings or fumigations, and the best treatment for infested plants is to place them in a cold greenhouse, or better still, a cold frame. The pest is a tropical species and will not succeed under cool conditions. The plants may be expected to grow out of their present unhealthy condition and produce healthy fronds by the autumn.

FIR TIPS DAMAGED: *P. W.* The injury is caused by the Conifer Coccus. It is too late to spray now, but next winter drench the trees thoroughly with soft soap and paraffin emulsion.

MUSHROOM BEDS: *H. H* A fungus—Hypomyces perniciosus, is causing the injury, and is present in the soil or dung. The most certain remedy is to remove all the old soil and start afresh, otherwise outbreaks of the disease may occur from time to time.

NAMES OF PLANTS: *Mrs. Crum.* Acer Negundo (Box Elder).—*W. P.* 1, Holcus lanatus; 2, Festuca duriuscula; 3, Holcus lanatus; 4, Lolium perenne; 5, Arrhenatherum avenaceum; 6, Poa trivialis; 7, P. pratensis; 8, Deschampsia flexuosa; 9, Festuca ovina; 10, Alopecurus pratensis; 11, Bromus mollis; 12, Holcus lanatus variegatus.—*C. S. and Co.* Phlox lilacina.—*L. L.* 1, Saxifraga Aizoon var.; 2, Sempervium filiferum; 3, Sedum rupestre monstrosum; 4, Sempervivum sp., too scrappy to identify.—*C. W.* 1, Rêve d'Or; 2, Wm. Allen Richardson; 3, Albert Stopford; 4, Reine Olga de Wurtemburg; 5, Albéric Barbier.—*Mr. O. O. Wrigley.* Linum catharticum. *F. W. S.*: Petrea volubilis.—*Moseley*: Steptosolon Jamesonii.—*F. F.* 1, Cattleya luteola; 2, Oncidium pubes; 3, Stelis micrantha; 4, Oncidium divaricatum.—*J. D., Blackheath.* The leaves sent for determination are of a type common to many plants, and it is impossible to say to what they belong. The only climbing plants with which we are acquainted that would agree with your description are the Actinidias, of which several species are in cultivation.—*C. B. G.* Pernettya mucronata.

PEACH LEAVES DISEASED: *R. R. G.* Shot-hole fungus is present on the leaves. It is too late to treat the plants now. Next season spray them when the leaves are quite young with the self-boiled lime-sulphur mixture.

PHLOX GROWTHS: *A. E. T. R.* Eel-worm is present in the root. Treat the soil with gas-lime.

ROSES FAILING: *Delta.* Both the soil and the plants are evidently at fault; the flowers of named varieties would not open like wild roses, which have no doubt developed from suckers. As you say that the plants have shed their buds the roots would seem to be defective in action. This might be the result of poor or unsuitable soil, of insufficient working, or an excess of strong, artificial manure. The best plan is to trench the ground next autumn to a depth of 2 or 3 feet, adding if possible some new soil. Such Roses as are healthy can then be re-planted and the stock made up with fresh plants. Four suitable varieties for standards are:—Madame Hoste (yellow), Frau Karl Druschki (white), Hugh Dickson (crimson), and Caroline Testout (pink).

VINE LEAVES: *J. L.* The injury is known as sap-warts, and is caused by the presence of too much moisture in the air. Afford the Vines plenty of ventilation.

DISEASES OF THE SWEET PEA.

THE object of this paper is two-fold. First, to describe certain diseases of the Sweet Pea; second, to add to some topics of discussion in the horticultural press. From these discussions and from correspondence which we have carried on, it is evident that English gardeners are very much alert to the difficulties which beset the growing of Sweet Peas. The American growers are beginning to realise that the failure in Sweet Pea culture cannot be attributed always to the ravages of the green aphis or to overfeeding, but that there are also definite disease factors to be taken into account. These are in the form of fungous and bacterial parasites which are capable of producing various diseases. We shall therefore enter at once into a discussion of some of these diseases.

The Mosaic Disease.

This disease is readily recognised by the yellow dotting or mottling of the leaves, hence the name mosaic (see figs. 8 and 9). In varieties with thick leaves this mottling is associated with curling; a cessation of growth results, but later the plant may overcome the disease. In varieties with delicate and thin leaves the yellow mottling soon reaches a state where much of the chlorophyll disappears and the affected leaves become yellowish, then whitish, and finally drop prematurely. In very advanced stages the disease is also noticed on the stems, causing dwarfing, yellowing and rolling, though this is not common. The mosaic disease affects the seedlings at an early stage, and for some time keeps pace with the growth of the plant. Infected seedlings or older plants often show a curling of the youngest leaves, suggesting the rolling due to green aphids (see fig. 8). Badly diseased plants often bear flowers, but the blooms occur either on very short peduncles, or, if borne on comparatively long ones, they have their petals curled and distorted, and the natural colour of the blossom is faded. All varieties, with the exception perhaps of the Cupid or dwarf varieties, are subject to the disease; but some sorts are much more severely affected than others. It is not uncommon to see infected plants so badly diseased as to be unable to make any further growth. In the majority of cases under our observation, however, infected plants outgrow the disease entirely, showing a distinct line of demarcation between the early affected parts and the healthy, new growth made at a later period. Other leguminous plants which suffer from a similar mosaic disease are the Red Clover (Trifolium pratense L.), and several forage species of Lathyrus.

Fig. 8.—The mosaic disease. Dwarfing of plant and rolling of leaves, characteristic symptoms.

The mosaic disease of the Sweet Pea may be induced artificially by thrusting a sterile needle from an infected into a healthy plant. The check punctures remain free. Under field conditions the green aphids appear to be active agents in the distribution of the disease. The malady may be reproduced on healthy plants in the laboratory by transferring stem mothers of green aphids from infected plants to healthy ones. In twelve to fifteen days the typical mosaic appears. The mosaic disease cannot, however, be reproduced when the stem mothers are free from—that is, not carrying—the disease, which shows that the mosaic is not a disease which is induced by the puncture of aphids but that the aphids are carriers of the disease. The mosaic, therefore, is a contagious disease, although all attempts to discover the organism have as yet failed. The mosaic affects greenhouse plants as well as those in the garden.

Root Rot Caused by Thielavia.

Chittenden* and Massee† have suspected the fungus Thielavia basicola to be the cause of "Streak." This latter disease we have shown to be of bacterial origin, and related to a bacterial disease of the clovers. Plants severely infected with Thielavia have practically little or no root system, since the latter is destroyed by the fungus as rapidly as the roots appear. Whatever root system be present is of a stubby nature, charred in appearance (see fig. 11 at ×). The fungus sometimes works up on the stem to a dis-

Fig. 9.—The mosaic disease. Showing the curious mottling of the leaves.

* Chittenden, F. J., "Diseases of the Sweet Pea," *Sweet Pea Annual*, 14-24, 1912, Eng.

† Massee, George, "A Disease of Sweet Peas, Asters and other Plants—Thielavia basicola Zopf.," *Roy. Bot. Garden, Kew, Bul.*, Misc. Inf., 44-52, 1912.

tance of 2 to 3 inches above ground, but never to the extent of invading the entire stem. It is probably due to this blackened appearance of the roots and of the stem nearest the ground that some workers have mistaken this disease for the well-known "Streak" disease. Chittenden, in his report to the National Sweet Pea Society of England, gives an accurate description of the "Streak," so that there can be no doubt but that he had the disease well in mind—that is, he described it as a stem disease. The Thielavia disease, as already mentioned, is not a stem but a root disease.

Chittenden seemed to have been unable to infect healthy Sweet Pea seedlings with the fungus Thielavia basicola under normal conditions of growth. It was only when his plants were subjected to overwatering that the fungus became an active parasite.

In our own inoculation experiments, healthy Sweet Pea seedlings have been readily infected by placing the Thielavia fungus on the roots of plants growing in sterile soil. In two to three weeks the roots were thoroughly diseased. Overwatering was not found necessary to bring about infection, although such treatment as well as injury to the roots favour the fungus in its activity.

The fungus Thielavia basicola is a very common source of seed-bed trouble in tobacco and trucking districts in the United States. Undoubtedly this fungus is common in the gardens of Great Britain, which explains its occurrence on the roots of plants attacked by "Streak."

Plants infected with Thielavia basicola do not quickly die; they may linger for a long time, or indeed sometimes throughout the entire growing season. However, such infected plants remain very dwarfed, and are practically useless for flower production.

Fig. 10.—Root rot caused by Thielavia. Contrasting healthy with diseased plant same age.

Root Rot Caused by Rhizoctonia.

This fungous disease is common to many seedlings, namely, Lettuce, Tomato, Tobacco, Pea and others. Like the culinary Pea, the Sweet Pea in its early stages is also subject to the disease. The fungus is known as Rhizoctonia and also Corticum vagum.

Severely infected plants have practically no root system (see fig. 12 *b*). In less infected plants only one or two rootlets may be destroyed. By the layman this disease may be confused with the stem rot, a description of which follows. It differs from the latter in its browning effects on the roots, and in severe cases in the total destruction of the root. The latter disease rots the stem at or near the surface of the ground.

Fig. 11.—Root rot caused by Thielavia. Comparing root systems of healthy plant with diseased plants same age.

Stem or Collar Rot.

This is usually a seedling disease, although it may attack plants of all ages. Like the Rhizoctonia rot it attacks many different kinds of seedlings. This trouble is most severe in houses poorly ventilated and in beds over-watered or lacking proper drainage, and in damp places out-of-doors. The disease spreads very quickly, and is soon fatal. Affected plants first show a wilting of the tip and flagging of the leaves, and then the

seedlings fall over and collapse (see fig. 13). The cause of this disease is a fungus (Sclerotinia libertiana), which also causes

Fig. 12.—Root rot caused by Rhizactonia. (*a*) healthy, (*b*) diseased.

a drop disease of Lettuce and of other plants. The fungus does not seem to attack the roots, but penetrates the collar of the stem and completely invades the vessels of the plants, thus clogging the upward flow of the water from the roots to the stem. Freshly collapsed plants usually have a water-soaked appearance, later to be overrun with a white weft, which is merely the mycelium of the fungus; this is followed by sclerotia (fruiting bodies), which are found scattered here and there on or within the affected stems. The fungus is a soil organism which occasionally causes root trouble on clover. It is sometimes introduced with animal manure.

Fusarium Wilts, or Root Rots.

Another form of root rot is that caused by two species of the fungus Fusarium. The fungi are distinct and yet produce the same symptoms in disease, namely, that of a wilt and root rot. Each Fusarium when once introduced is a persistent soil organism. Seeds germinate normally, and everything looks promising for a good stand. However, when the seedlings reach the height of about 8 to 10 inches they suddenly wilt, fall over, and collapse (see fig. 14). Seedlings thus affected may be readily pulled out, the central woody region easily slipping out from the bark or cambium which has been rotted by the fungus. If the collapsed seedlings are allowed to remain on the ground the stems will soon be found covered with the sickle-shaped spores of the fungus. The rotted seedling becomes a breeding place for small flies which infest decaying organic matter. These spread the spores of the fungus from infected to healthy plants. Rain and running water also distribute this disease. These species of Fusarium are as yet undetermined; however, more work is in progress on them.

Root Galls (Eel Worms).

The presence of eel worms is characterised by small swellings on the roots. These

Fig. 13.—Collar rot or wilt (Sclerotinia)— (*a*) healthy plants in sterile soil, (*b*) and (*c*) infected seedlings.

are either formed singly, thus giving the roots the appearance of a minute swelling, or they run in pairs or in strings, thus creating a beaded appearance (see fig. 17). These galls cannot be mistaken for the normal root nodules of leguminous plants (see fig. 18), as the latter are considerably larger and lobed, while the former

Fig. 14.—Fusarium wilt or root rot. (*a*) healthy plants in sterile soil, (*b*) wilted seedlings in soil infected with disease.

are small and elongated. Affected plants stop growing and show a dwarfed and sickly appearance. Such plants may produce a few blooms which are of little value since they are borne on small peduncles. The disease is not often met with in the field, but it is a common greenhouse trouble. Sometimes the disease is manifested in spots which gradually spread, at other times the entire bed is uniformly infested, and the prospect of a crop of blooms cannot be realised.

The cause of the root gall is one of the eel worms (Heterodera radicicola), a common root trouble in greenhouses on Roses, Violets, Carnations, Begonias, Lettuces, Cucumbers and Tomatos.

The eel worm is introduced in the greenhouse with infected soil or manure.

Bud Drop, or Failure to Set Blossoms.

A common trouble in the culture of Sweet Peas for market and show purposes is the failure of apparently healthy and rapidly-growing plants to complete the bud development. The bud appears, but quickly withers, finally dropping. Hence the term "bud drop" well describes this behaviour.

It results from the use of a too highly nitrogenous food ration. That is, the trouble is one of nutrition, in which the mineral elements are too low, especially phosphorus and potassium. We have successfully controlled this trouble within one week by the application of phosphoric acid and sulphate of potash along the row.

ANTHRACNOSE.

The symptoms of a disease known as Anthracnose are diverse. Sometimes it attacked and die. On the leaves the disease starts as whitish spots, which enlarge and involve the entire area (see fig. 16).

FIG. 15.—BITTER ROT OF APPLE CAUSED BY ANTHRACNOSE.

is manifested in a wilting or dying of the tips, which become whitish and brittle and

FIG. 17.—SWEET PEA ROOTS AFFECTED WITH EEL WORM.

readily break off. At other times the dying works downwards, and involves the entire branch. Frequently also the leaves are Such infected leaves become brittle, and soon drop. Examination of an infected leaf with a hand lens shows that it is peppered with minute salmon-coloured pustules. At the time of blossoming the fungus makes its attack on the peduncle at the point of union with the buds, in this case producing bud-drop, the bud hangs wiltingly from the peduncle, or the fungus attacks both the flower bud and the peduncle, in which case both dry up but do not fall off. The most easily distinguishable symptoms of this disease are on the seed pods. Infected pods lose their green colour, become shrivelled, and are soon covered with salmon-coloured patches which cannot fail to attract attention. The cause of the anthracnose is the fungus Glomerella rufo-maculans (B) Sp. and Vsch.

FIG. 16.—THE ANTHRACNOSE DISEASE ON SWEET PEA LEAF.

This fungus causes also the bitter rot of Apple and the ripe rot of Grapes. Cross inoculations by Sheldon‡ and by one of us§ have definitely proven that the fungus can go back and forth from the Apple to the Sweet Pea and vice versâ, in each case reproducing the typical symptoms of the diseases.

The anthracnose, like the "Streak," is of great economical importance. When once introduced into a field the disease spreads rapidly, often destroying the

FIG. 18.—SWEET PEA NODULES CAUSED BY NITROGEN-FIXING ORGANISM.

entire crop. Unlike the "Streak" the anthracnose may attack young seedlings; this sometimes being the case in greenhouse conditions. In field conditions the disease starts about July 1, when the plants are in their bloom and in the prime of beauty. This is also the time when the bitter rot disease of the Apple (see fig. 15) makes its appearance in the orchard. The fungus is carried over winter on cankered limbs and mummied fruits of diseased Apples, or on the diseased pods and seeds of the Sweet Pea and also in the soil.

POWDERY MILDEW.

The powdery mildew is a very prevalent disease on greenhouse Sweet Peas and on

‡ Sheldon, J. L., "Concerning the Identity of the Fungi Causing the Anthracnose of the Sweet Pea and the Bitter Rot of the Apple," *Science*, N.S., 25, 51-52, 1905.

irrigated fields or on low land or where the plants are grown too thickly. Ordinarily, however, in small garden lots, and especially where the plants do not receive any water, the disease is practically unimportant since the attack is usually very mild during the active growing season, though it becomes somewhat more abundant when the plants have passed all usefulness. Massee attributes the Sweet Pea mildew in England to Erysiphe polygoni. Thus far, only the conidal or oidium stage has been found in the United States, so that the identity of the fungus here is as yet not definitely established. *J. J. Taubenhaus and Thos. F. Manns, Dept. of Plant Pathology, Delaware College Experiment Station, Newark, Delaware, U.S.A.*

THE BULB GARDEN.

SOME NEW IRISES.

The hybridisation of species is at best an unsatisfactory pursuit. It may be argued that the success or failure of attempts at crossing plants which seem to be only very distantly related to one another may throw some light on the real relationship between them, but it is at least doubtful whether any inference can be drawn from the non-success of such a cross. For instance, it is known that Sir Michael Foster tried many times to obtain hybrids of Iris tectorum, and similar attempts were also made in the south of France, where there is usually more chance of obtaining sound seeds of Irises than in our variable climate. These attempts remained fruitless, and it seemed as though I. tectorum would not unite with any other species. More recently, however, its pollen has fertilised the Loppio variety of I. cengialti and also a form of I. chamæiris.

In both these cases the resultant plants are puny—at any rate in England, though I hear that I. Loptec is doing well in Hérault. Moreover, they have proved so far to be sterile both to their own pollen and also to the pollen of either parent. It is, however, a curious fact that such plants go to the trouble of forming capsules in which the seeds do not develop. Even a hybrid between such apparently close relations as I. Korolkowii and I. stolonifera produces huge capsules 5 inches long which contain not a single seed, though the meaning of this apparent waste of energy is hard to see.

It is possible that hybridisation only has a stunting and debilitating effect when species are used that are really widely separated. At any rate, several instances of hybrids which are far more vigorous than either of their parents have occurred here this year.

Early in May I was surprised to see that a number of plants which were producing masses of narrow leaves and which had the appearance of being some form of I. sibirica had no signs of flower stems, as all the other sibiricas had. Closer examination showed, however, that numbers of spikes were developing, and I looked with some curiosity to the reference for the number on the label. To my astonishment the plants came from a cross between I. tenax, a Californian species, and I. Wilsonii, the taller of the two yellow-flowered relatives of I. sibirica, introduced a few years ago from China. At the beginning of this month these plants were literally covered with flower-spikes and were the most vigorous and floriferous in my garden, each seedling plant producing twenty or more stems. The leaves are of a pale green, distinctly ribbed, about 3 feet long by ½ inch wide, linear in the lower part and then tapering gradually to a point. The stems are a little longer than the leaves—or, at any rate, rise above their drooping tips—and are slender and wiry. They are not, however, solid like those of I. tenax, but have a small hollow running down the centre, a feature which is characteristic of I. Wilsonii. In the vast majority of cases the stems bear a single terminal head of two flowers, though a lateral flower occasionally develops about 4 or 6 inches below. The spathes are long and narrow, as are those of both the parent plants, and are persistently green even when the flowers have withered

The flowers resemble in shape those of I. tenax, except that the standards are not erect but incline outwards, though not to the extent of those of I. Wilsonii. It is remarkable that the flowers have that curiously mottled appearance which is also found in another hybrid between the sibirica and the Californian groups—namely, I. Clarkei crossed with pollen of I. Douglasiana. On the falls the white ground is nearly obscured by suffused colour from the close-set, deep-purple veins. Near the end of the styles the ground colour becomes a deep yellow or orange, as in the case of I. Wilsonii. The standards have to a remarkable extent the curious mottled appearance, an effect which is apparently produced by red-purple veins and suffused colour on a slightly bluer ground.

The short perianth tube is purple as in the mother plant, and what is more surprising is that the plants are apparently fertile even to their own pollen. At any rate, the capsules are now swelling and have not the puffy appearance that usually betrays the absence of contents.

Another instance of a hybrid which surpasses in vigour both its parents comes also from I. tenax, the pollen-parent being in this case I. Purdyi. This has leaves of considerable substance and a polished upper surface, not unlike those of I. Douglasiana, about 2 feet long by ½ inch wide. The leaves do not stand erect, but droop gracefully round the stems, which are about 12 or 15 inches high, closely covered with large tract-like leaves which entirely conceal it. In some cases there is a lateral branch of some inches in length besides the terminal head of two flowers. The flowers are in shape not unlike those of a large I. tenax, being veined with a faint pinkish-mauve on a white ground. In strong sun the colour soon fades to a soft grey, and the old and the new flowers thus form a striking contrast. This plant produced apparently fertile pollen, and capsules are now developing with every appearance of being sound.

It is curious that some Irises seem to produce true albinos, which breed true, such as I. tectorum alba and I. orientalis alba, which is largely grown under the name of Snow Queen, while others produce white flowers from which indications of the purple shade are not entirely absent. Of these latter, obvious examples are the alba-purpurea variety of I. lævigata and the white form of the true European sibirica. The flowers of the latter have usually some slight tinge of mauve, and that the purple element is there has been strikingly proved by hybridising one of these white sibiricas with the yellow I. Wilsonii. The resultant plants are very similar to true sibiricas. The

tall, hollow stems raise their head of three or four flowers well above the foliage, and the colour of the flowers is, as far as I know, entirely new among sibiricas. The falls have rounded blades, which are held out stiffly and not allowed to droop. They are veined with pale sky-blue on a creamy white ground, which near the margin is entirely obscured by suffused colour from the veins. Near the end of the styles the white ground is more conspicuous and the veins become violet. Further back still the ground becomes yellow, and the yellow colour of the haft of the falls contrasts with the blue of the styles and standards. This plant seems also to be readily fertile, though it still remains to be seen whether the capsules now developing will contain sound seed. The hybrids are very vigorous, for each seedling plant has produced from ten to twenty flower stems.

A hybrid which is distinctly less desirable than either of its parents has resulted from the crossing of I. chrysographes with pollen of I. Forrestii. The plant is very similar to I. chrysographes, but the wonderful velvety richness of the latter has given place to a violet-blue colour. The flower retains, however, the bright yellow reticulations on the falls, from which I. chrysographes takes its name.

Another new hybrid, which it is unnecessary to describe beyond saying that it is an exceptionally vigorous sibirica, with as many as eight flowers on a stem, has resulted from crossing I. Wilsonii with pollen of typical I. sibirica. The shape of the flowers is somewhat different, especially in the standards, which are unusually large; but in other ways the influence of I. sibirica seems to have entirely dominated that of the Chinese mother. It will be interesting to see whether the plants prove to be fertile and what the second generation will give us. *W. R. Dykes, Charterhouse, Godalming.*

THE ROSARY.

ROSE CISSIE EASLEA.

This variety is one of the latest Pernetiana novelty. The great fault of many yellowish Roses is that the older flowers turn nearly white, but this is not so in the variety under notice, for even during the very hot weather recently experienced the petals retained their lovely Naples-yellow colour. The bud is delightful; it is even more shapely and richer in tint than that of the variety Arthur R. Goodwin. I am of the opinion that Cissie Easlea will replace Madame Ravary and Le Progrès as a yellow bedding Rose; indeed, I know of nothing to equal it for colour effect. The blooms are carried erectly, and the plants are vigorous growers. The foliage is of a bronzy-green colour and glistening as in Rayon d'Or.

M. PERNET-DUCHER'S ROSES.

Lyons is the Mecca of the rosarian. I had long promised myself a visit to my friend M. Claude Pernet, but it was only this season that I was able to go and to feast my eyes on the world-renowned Roses of his father, M. Pernet-Ducher.

On my way to Lyons I passed through the ancient, picturesque town of Dijon. My thoughts irresistibly travelled back to the early days when the Gloire de Dijon was the most popular variety grown. Indeed, it is not so very long ago that a vote was taken as to the most popular Rose, and the Gloire de Dijon headed the list. On arriving at Lyons I was met by M. Claude Pernet (who speaks English excellently), and we proceeded together to the village of Venissieux, where he lives. It was too late to see the Roses the same evening, but I was promised a view the next morning, before breakfast, if the weather was fine. After a night of sound sleep I awoke before six to find the sun shining brightly. I got up at once, and was pleased to find my friends astir already. They believe in early rising, and the Rose-budding is done while the day is still cool, the workmen being allowed two hours for luncheon —time for a really good rest. Notebook in hand, we made our way to the seedling quarters, where a perfect blaze of colour rewarded our inspection. Among other lovely varieties, a mass of Madame Edouard Herriot provided a feast of glorious tints; no wonder everyone is so anxious to grow this beautiful Rose. I noticed many first-rate varieties among the seedlings, bearing the now well-known characteristics of the Pernetiana tribe, the large spines and glistening foliage. As I looked at the original plant of Soleil d'Or, it seemed wonderful to think that all the novelties around me owed their origin directly or indirectly to this one marvellous cross. There were some seedlings with colours even deeper than that of Sunburst, and larger blooms than Souvenir de Gustave Prat. Others had the same golden ground and scarlet markings as Rayon d'Or, with more elongated buds. Few had been christened as yet, most of them being known only by number. There were novelties innumerable—some with blossoms of bright scarlet, others of the deep crimson of Louis van Houtte, others again imitating the glorious tints of Mme. Edouard Herriot. There is a large glasshouse filled entirely with seedlings raised this year, all in the best possible condition. As I saw the "Wizard of Lyons" moving quietly about among his flowers, gathering for pollen and crossing the blossoms, I was struck by his unassuming, modest manner. There was no ostentation in this man who had given so many and such fine novelties to the world.

There is much *bon camaraderie* among the Lyons growers. They are all on the most cordial terms with each other, and will freely help any one of their number who may be backward with his budding. We paid a visit to M. Guillot's famous gardens; the proprietor was himself away, but Mme. and Mlle. Guillot (whom I happened to have met in Ireland last year) gave us a very kind reception and showed us over the grounds. We saw some very interesting Roses, including some seedling Wichuraianas. We also visited M. Dubrieul, who is the raiser of several Polyantha Roses, and M. Chambard, an experienced grower, who showed us some very good seedlings, including a new Frau Karl Druschki—more double than the type, with a lemon-coloured shading—which he is going to call Mlle. Louise Cratté. On another day we went to see M. Bernaix's nurseries, and I was pleased to see some almost forgotten varieties in the extensive collection grown there. The soil is very stony, and I marvelled how Roses could grow there at all.

We visited the Parc de la Tête d'Or, where there is a splendid collection of old Roses. On seeing this collection I felt more convinced than ever that we ought to have in England a public Rose garden. In the Tête d'Or there were numerous narrow beds containing one plant of a variety, and every plant labelled accurately and legibly. At Kew Gardens there are great masses of a single variety—very effective as bedding, but such beds are not nearly so useful or informative as the arrangement at Tête d'Or. I found the old Madame Knorr, and many another friend of earlier days —beautiful in their way and far more fragrant than the newer sorts. *Experience.*

Horticultural Club: Excursion to Friar Park.— We are now able to print particulars of the excursion announced on p. 439, vol. liii. The party will leave Paddington in first-class saloon carriages on the 24th inst. at 9.57 a.m., and proceed to Marlow Station. Sir Frank Crisp's launch will be in waiting at Marlow to convey the party by river to Henley, where the president will entertain the visitors at lunch in the boat-house. After luncheon inspection will be made of Friar Park gardens. Before joining the launch again, *en route* for Caversham lock, Reading, the company will again partake of the president's hospitality at tea. From Reading the return journey to Paddington will be made by rail. Applications for tickets should be made to the Hon. Treasurer, Sir Harry Veitch.

THE MARKET FRUIT GARDEN.

From May 12 to July 1, a period of seven weeks, the rainfall at my station amounted to only 0.83 in., rain having been measured on no more than eleven days, and in minute quantities, except on one occasion, when the fall was just a quarter of an inch. Most parts of the country have been less unfortunate in this connection; but generally last month was one of the driest of Junes. Results were all the worse on account of the severe drought having followed a flood of rain for a prolonged period; for when that is the case the land is converted from a state of mud to a consistency approaching that of burnt bricks. For all classes of vegetation the trial was a very severe one, while for many it was almost fatal. Moreover, at the time of writing, the trial is not finished. A little rain fell on the evening of July 2; but it amounted at my station to only one-tenth of an inch.*

Drought and Fruit Crops.

To describe the effects of the drought on corn and vegetable crops would be beyond the scope of my notes. In relation to fruit those effects are very serious. The Strawberry crop gave a good first picking, but fell off immediately afterwards, giving a total yield below the average, and very much less than early prospects indicated. To myself this is not a matter of importance, as I do not grow Strawberries for market. I do grow Black Currants extensively, however, and my estimate is that the drought reduced my crop by at least four tons, as the berries were only about two-thirds of their proper size. This is not all the injury, however, for the hard-baked condition of the soil has prevented the shoots that should bear next year's crop from making normal extension. Young bushes particularly present a stunted and starved appearance, the liberal dressing of artificial manure applied to them never having had a good chance of getting down to their roots.

The Raspberry crop has been injured to a still greater extent, so that the yield of fruit will prove comparatively small, and the young canes for next season's crop will be stunted unless an abundant rainfall occurs speedily.

Both Apples and Plums have suffered more or less from lack of moisture. The swelling of the fruits has been checked severely, and their dropping will be increased. The drought penetrated the soil all the more deeply on account of its cloddy condition after cultivating and hoeing. In an ordinary season these operations would have formed a drought-resisting mulch of fine soil, which is lacking this season.

The Aphis Blight.

It is hardly necessary to say that the effects of the drought are particularly serious on trees which have been smothered with aphides. The pest has now left Plums, after sapping the vitality of a large proportion of the foliage, which has turned brown, giving the trees a very unhealthy appearance. The case is similar with Apples, particularly in relation to the foliage around the fruits. The latter are small where the aphis has been, and in some cases they have turned yellow, and will either drop off or prove nearly worthless. Beauty of Bath, a special favourite of the aphis, has suffered more than any other variety that I grow. Quite a large number of the fruits have become yellow or even striped where the trusses were smothered with aphides. They are ripening prematurely, and will not swell to any considerable extent, while most of them will drop. This variety is much given to dropping, even in a normal season, and this year it will be more so than usual.

* Since these notes were written a fall of 0·40 inch of rain has occurred. This is the greatest quantity registered at my station since April 29. It cannot fail to do a great amount of good to ungathered fruit crops.

But what grieves me most is the effect of aphis blight on young trees, and particularly on those of Beauty of Bath. Last year a field of Apples in the third season from the planting was very badly infested, in spite of spraying, and many trees had to be cut back severely in the winter pruning in order to get to wood buds below the dwarfed and twisted parts injured by the pest. This season the new wood of some varieties has suffered another severe attack, Beauty of Bath again being the most unfortunate victim. Some trees of this variety present an almost hopeless appearance, and it will probably be deemed advisable to replace them with fresh trees.

Top-Grafting Apple Trees.

Nothing impressed me more forcibly in my recent visits to Kent orchards than the extent to which top-grafting had been practised. The best growers appear to have recourse to the operation on slight provocation. If a variety does not give them fair satisfaction in growth, fruiting, or price of produce, they cut the trees back and top-graft them. Equally striking is the fact that in the great majority of instances the variety chosen to provide scions was Bramley's Seedling. In the course of a few years there will be immense supplies of Bramleys in the markets from the great number of top-grafted trees. If anything will "cut-out" the swamping supplies of American and Canadian Apples in our markets to any considerable extent, it will be a liberal supply of Bramley's Seedling fruit kept over Christmas.

The Apple Sawfly.

Many varieties of Apples are badly infested with the maggots of the Apple sawfly (Hoplocampa testudinea) this season. In thinning the fruits numbers of Apples containing the maggots have been picked off the trees, placed in bags, and burnt. This appears to be the only satisfactory method of dealing with the destructive pest, at least if it be true that arsenical spraying is of no avail against it. Why the poison does not kill the maggots, as it kills the larvæ of the Codlin moth, is not at all clear. Perhaps the reason is that the period during which the maggots enter the fruit is not as clearly defined as is that of the other pest. The varieties Cox's Orange Pippin and Worcester Pearmain are special sufferers from the attack in my orchards; but many other varieties have suffered more or less. Unfortunately, Apple thinning (which my workpeople curiously term "slightening") has been stopped for a time by the necessity of employing all available hands in the picking of Black Currants.

A Doubtful Point.

So far as my reading enables me to judge, no definite period has been given by any authority as the latest time at which a fresh shoot resulting from pruning may start without the risk of the new growth being cut off by the frosts of winter. In summer pruning it is usual to avoid the cutting back of any leaders left for extension growth, deferring that operation until the winter pruning; but if a shoot arising from the cutting of a branch at the present time will survive the winter, it would be an advantage to cut it in certain cases. For example, Apple shoots of this year's growth infested with aphides, and covered with curled leaves, might be cut back with advantage, if the new shoots proceeding from the bud or buds just below the cuts will not be liable to injury from winter frosts. In summer pruning it has been found advantageous to strip off the curled leaves infested with aphides; but cutting-back would be better, if it can be done without the risk named above. The experiment is being tried on some of the most badly infested trees at the present time. Much valuable information on the summer pruning of fruit trees was published in *Gard. Chron.*, June 22, 1907, when correspondents gave their experience not only upon the general results of the practice, but also in regard to the best dates to commence the work in their particular localities. *Southern Grower.*

NOTICES OF BOOKS.

Flora of the Lower and Middle Congo.*

The classical saying, "Always something new from Africa," still holds good in the vegetable kingdom, though few striking or singular new types have been discovered quite recently. For many years there have been four specially active centres of publication of new African Plants, namely, Berlin, the British Museum, Brussels, and Kew, and, in a lesser degree, Paris. Kew led the way in the early sixties of the last century with Gustav Mann's excellent collections from the tropical and temperate zones of the Cameroon region and some of Welwitsch's novelties from Portuguese West Africa, followed by Speke and Grant's *Nile Plants* and the beginning of Oliver's *Flora of Tropical Africa*, still being continued under the editorship of Sir William Thiselton-Dyer. The Belgian or Brussels contributions are almost confined to the Congo, and are mostly the work of De Wildeman and the late Th. Durand. Their works are illustrated by some 400 quarto plates, and the part before us is the third and concluding part of the third volume of De Wildeman's *Etudes*. It includes additions to the Fungus-Flora and to nearly the whole of the families of Flowering Plants represented in tropical Africa. In this connection De Wildeman states there are types in foreign herbaria of at least 500 species from within the limits of his labours, which are unrepresented by authenticated specimens in the Brussels herbarium. The African species of the genus Dioscorea have engaged the attention of botanists of all the nationalities named above, notably of Dr. A. Chevalier (who has travelled widely in tropical Africa), both for systematic and economic reasons. In the work under notice De Wildeman describes about a score of new species, illustrated by seventeen plates. Chevalier refers a larger number of the forms cultivated in tropical Africa to D. prehensilis of Bentham (D. cayenensis, Lam.), but, as De Wildeman observes, his classification is perhaps open to revision. D. prehensilis was founded on African specimens collected by Vogel, and Chevalier identifies this with the American D. cayenensis. Of this he distinguishes a score of varieties from Dahomey and fifteen from Baouli, on the Ivory Coast. These varieties are distinguished by the size, shape and colour of the tubers, by the presence or absence of spines on the stems, and by the shape and colour of the leaves. While admitting that much remains to be done before a satisfactory classification of the African Dioscoreas could be attempted, De Wildeman discusses and criticises Chevalier's choice of characters. He also illustrates and amplifies an earlier description of the root spines of his D. Liebrechtsiana, and raises some interesting questions as to their biological importance. Some particulars of these organs by Dr. D H. Scott will be found in the *Annals of Botany* for 1897. Several of the new species described by De Wildeman yield edible tubers, and this general contribution to our knowledge of the genus is a very valuable one, even to showing how much remains to be done. *W. B. H.*

The Young Gardener.†

The object of this little book is to interest children in garden operations, so that they may work the more proficiently and keenly in their school gardens. Each chapter, which deals with some special aspect of gardening, is supplemented by a series of questions and answers relating to the subject of the chapter.

Excellent judgment has been exercised in the selection of the subjects, and considerable art is shown in the simple style in which the chapters are written.

Occasionally, however, the writer falls into the error of giving wrong explanations of correct observations, as, for example (p. 13), in stating as a reason for draining soil that "plants get cold if they are kept too wet." Similarly, on pp. 17 and 18, with respect to seed saving, it is risky advice to recommend the children to collect their own seed unless the necessary precautions are indicated.

Nevertheless, and, although we cannot subscribe to all the writer's statements as, for example, that only Crab Apples arise from seed of a cultivated kind (p. 23), we can offer our sincere congratulations to the writer on the general excellence of the booklet. It lacks altogether the stuffiness which is not rare in more pretentious garden books, and it betrays evidence that it is written by a keen gardener and a born teacher. We feel sure that the children whom she is addressing will listen to the lessons.

The Garden Manual.‡

This is a new and revised edition of a very old, very practical, and very unpretentious book issued from the *Journal of Horticulture* office, written by contributors to that paper, and edited by its editor. Its pages run to over 450, its type small, but clear, closely spaced, and broken up with numerous illustrations. Its editor disclaims its being more than a "handbook or compendium; a concise, yet comprehensive guide to the subjects with which it deals." That is just what it is, and withal one of the most satisfactory horticultural handbooks that have appeared for some time. As is but natural the several parts of the manual are somewhat unequal, some of the matter being very good, some not quite so good, but it never sinks to a low level. Starting with a brief review of the History of Gardening, not so correct as one would wish, followed by a short chapter on French Gardening, which ought to prove a wet blanket to the most impulsive, the volume goes on to its more legitimate task of showing in four sections how to manage the Kitchen Garden, the Flower Garden, the Fruit Garden, and the Plant Houses, concluding with an appendix devotel to soils, manures and fertilisers. Besides the brief cultural details, which are admirable, the selections all through are to be commended, being neither too short nor too long, but generally all the varieties of vegetables, flowers and fruits named are those cultivated in our best gardens. The details of Grape-growing form a model of brevity and excellence, and very useful are the numerous pictured methods of doing various gardening operations, with their accompanying remarks, which are scattered profusely throughout the book. For those who are not gardeners nothing could be more informative, and to the gardener who can spare half-a-crown for its purchase it will prove a ready-at-hand book to refer to in the moments of forgetfulness which overtake most of us sooner or later. *B.*

The Week's Work.

THE ORCHID HOUSES.

By W. H. White, Grower to Sir Trevor Lawrence, Bart., Burford, Dorking.

Platyclinis.—Plants of Platyclinis glumacea that have completed their growth should be suspended in a light, airy position in the intermediate house. For the present the plants will need but little water at the roots, but must not be allowed to suffer from excessive dryness. Sponge the leaves frequently to keep them from insect pests. P. uncata and P. Cobbiana require similar treatment. The pretty P. filiformis, with its long, thread-like spikes of small golden-yellow flowers, is in full growth, and the roots require an abundance of water, whilst the foliage will be benefited by overhead sprayings until such time as the flowers open. All the species of Platyclinis thrive well in the intermediate house during the whole year. Formerly these plants were grown in too much heat; being natives of the Philippine Islands, it was considered that they needed considerable warmth, but the plants, as a rule, deteriorated gradually, and were always infested more or less with insect pests. Now, in the cooler atmosphere of the intermediate house, they grow and bloom profusely. These Orchids may be repotted at any time between the fading of the flower and the commencement of growth. Shallow pans are preferable to pots, as they are more easily suspended from the roof, in which position the plants grow best. They root freely in a mixture composed of equal parts of Osmunda-fibre and Sphagnum-moss. Freshly potted plants should be shaded until they are established.

Epidendrum radicans. — This beautiful scarlet-flowered Epidendrum has been in bloom for several months past, and the long panicles of flowers have been extremely useful for furnishing cut blooms. Now that the plants have started to grow again the flower spikes should be removed, and if it is desirable to grow the plants as large specimens, the young shoots should be tied around a few neat stakes, keeping the tops of each growth well up to the light. A good plan is to remove the young offshoots which appear on the old growths and insert four or five of these around the centre of each 6-inch pot, using one part of Osmunda-fibre to three parts of Sphagnum-moss as the rooting medium. Encourage these plants to grow as quickly as possible, standing them in a light position in the Mexican house, where they may be afforded plenty of water at the roots, and overhead syringings whenever the weather is suitable. By the end of October they will have made considerable growth, and at that time my practice is to cut each stem off at the bottom, leaving the growth about 18 inches long, repotting them as before, and tying each shoot to a neat stick. Under this treatment nearly every growth will develop an inflorescence, and when the flowering time arrives the plants, being dwarf, will be serviceable for many purposes; whereas if the growths are allowed to extend at will they take up considerable room, and seldom bloom satisfactorily.

Odontoglossum. — Odontoglossum grande, O. Insleyi, and O. Schlieperianum are growing freely, and specimens that require larger pots should be attended to. A very porous compost should be employed, for although Odontoglossums require plenty of water when growing actively, moisture should pass away quickly, as the fleshy roots are liable to decay if the soil is waterlogged. As the young breaks push up and the leaves commence to expand, see that no water lodges in the centre of the growths, or they will probably damp off. All plants of this section grow well on a high, dry shelf in a cool house, as they require plenty of light, but not direct sunshine. Slugs are fond of the outside tissues of the young growths, also the succulent roots, and must be guarded against.

THE FLOWER GARDEN.

By Edward Harriss, Gardener to Lady Wantage, Lockinge, Berkshire.

Carnations.—Thin the flower buds of the late-flowering varieties and support the stems to stakes. The work of layering will soon demand attention, and a quantity of soil should be got ready for the purpose. Loam and leaf-mould mixed with a good sprinkling of coarse sand or road grit furnishes a suitable compost. Raby Castle is still one of the best garden varieties, and where large quantities of cut flowers are in demand a special plantation of this variety should be included in the reserve garden. A bed of the Perpetual-flowering variety Mrs. Burnett, planted here at the end of May, has just commenced to flower. The plants are in perfect condition and give promise of a wealth of blossoms all through the summer. It is my opinion that this race of Carnations will in time supersede the border kinds for planting in beds and borders in the flower garden. At present the varieties suitable for out-of-doors are limited in numbers, but with a demand the supply is sure to increase. If large quantities of cuttings will be required for propagating purposes later on, old plants which are being removed from the flowering houses should be cut back and plunged in ashes outdoors. They should be encouraged to develop clean, healthy shoots by strict attention to such important details as watering and syringing. Propagating may commence next month, and the insertion of cuttings may be continued until the end of the autumn.

Gladiolus.—Neat stakes should be placed to Gladioli to prevent winds damaging the flower spikes. The plants require to be watered frequently during hot weather. The benefit of top dressings applied earlier in the season is now apparent, and it is not too late to place a little top-dressing material over the roots now. The soil about the plants should be stirred with the hoe occasionally.

The Mixed Border.—The staking of the plants that were set out in May is one of the most important details needing attention. Certain kinds of Annuals, such as Lavateras, Cosmos, Coreopsis, Carnations, the taller-growing Godetias, and Larkspurs all require support. The stakes should be as little in evidence as is possible, or the natural beauty of the subjects will be marred. The border should be examined at least once a week with a view of removing dead flowers and foliage. The first flower spikes of Delphiniums should be cut down as soon as possible after the blooms are over to encourage later spikes to develop. Water the border thoroughly every three or four days, and hoe between the plants frequently.

Dahlias.—These plants have needed regular waterings with the garden hose to get them to start freely into growth. When they are established and the ground between the plants covered with a dressing of some moisture-retaining material they will not need so much attention in the matter of watering. The new Collerette varieties are splendid for massing in beds if the colours are selected carefully. They come into flower directly after planting and continue to bloom all through the season. Some of the flowers of this type hang their heads and need supporting by a tie.

THE KITCHEN GARDEN.

By John Dunn, Foreman, Royal Gardens, Windsor.

Cabbage.—A sowing of Cabbage seed may be made now, and a second sowing a fortnight later, according to the locality. In northern gardens the sooner the seeds are set the better. Cabbage seeds are often sown on a border from which some early crop has been gathered, but it is better practice to choose an open space where the ground is not too rich, as plants grown in the open are much hardier than those raised in a sheltered position. Sow the seeds thinly in shallow drills, which should be made at 1 ft. apart in order to allow the Dutch hoe to be worked between the rows. If the ground is still dry the drills should be watered before the seeds are sown. The following varieties are suitable for present sowing: Flower of Spring, Offenham, Milecross Marrow, and Improved Excelsior.

Shallots. — The bulbs should be lifted and placed in an open shed as soon as the foliage has died down. Turn them frequently in the store, and when quite dry place them in a well-ventilated loft until they are required for use.

Cucumbers. — Sow seed to furnish plants for cropping in early winter. If the seeds are sown singly in small pots and germinated in a temperature of 70° the seedlings should be ready for planting by the middle of August. Previous to planting cleanse the house thoroughly, washing the woodwork with soft soap and water. When the work of cleansing is finished burn a little sulphur in the house to destroy any insects that may be present. Make a mild hotbed, and on this place small mounds of soil at 4 ft. apart, and set the plants when the soil is warmed through. Secure the main stem of each plant to a small stick as a precaution against injury when syringing. The soil should consist of a mixture of three parts turfy loam and one part decayed manure. As soon as the roots appear through the mounds of soil apply fresh soil as top dressings. Dust the beds frequently with soot, which promotes a dark green colour in both the fruit and foliage. Plants in bearing should be kept free from decaying foliage. Thin and regulate the growths, stopping the shoots at the first or second joint beyond the fruits.

Turnips.—A sowing of Turnip seed should be made now to furnish roots in the late autumn, and again a fortnight later to supply roots next winter. In mild winters the latest-sown Turnips may be allowed to remain in the open for a long time, and for this purpose the variety Green Top Stone may be sown as late as the end of July. During dry weather this crop will be benefited by waterings. On frequent occasions wood ashes and soot should be dusted along the plants and rows to keep the Turnip fly in check.

Winter Crops.—All kinds of Broccoli should be planted as soon as possible. Water the roots of all green vegetables thoroughly as soon as they are transplanted; this is especially necessary in the case of Broccoli.

Salads. — Make sowings of Endive and Lettuce at frequent intervals throughout July, and thin the plants as soon as they are large enough to handle. Radishes should be sown behind a north wall and the seeds watered liberally to ensure a quick growth. Mustard and Cress should be sown in the coolest situation available.

PLANTS UNDER GLASS.

By F. Jennings, Gardener to the Duke of Devonshire, Chatsworth, Derbyshire.

Callicarpa americana and C. purpurea.—Young plants of these species raised from seeds or cuttings in the spring should now be ready for their final transfer into 6-inch pots. The compost should consist of three parts good loam and one part peat and leaf-mould, with the addition of a little sand, wood ashes and decomposed cow-manure. The young shoots should be stopped to two or three joints until the beginning of August, and the plants should be grown in a temperature of 60° to 65°. As soon as they show signs of flowering plenty of ventilation must be provided, and if they are to be planted out they may be placed at the warm end of a conservatory or Palm-house and trained to a stake or planted against the wall. The old plants should be cut back in the spring, and directly the young shoots are made they may be taken off and rooted quite easily.

Statice profusa. — As the young plants of this Statice finish flowering they should be transferred to larger pots to produce good flowering specimens for next spring. A suitable compost for them is one consisting of three parts good loam and one part leaf-mould, wood ashes, and coarse sand. If the loam is rather heavy add a little peat. The plants should be placed after potting in a cool house or frame, and well soaked with water. They should be shaded during the hottest part of the day, and well ventilated as

soon as they become established. The old plants should be carefully layered or divided if the stock requires replenishment; the layering may be done by filling up the pots with prepared, sifted soil mixed with plenty of sand. The shoots should be cut in the same way as those of "Malmaison" Carnations or Primulas. The plants must be kept damp and shaded during the heat of the day. Statice profusa can also be propagated from cuttings placed under a bell glass, but layering is more satisfactory.

Pot Liliums for Autumn.—L. tigrinum, L. Fortunei, L. speciosum rubrum, and L. s. album should be frequently fed with good liquid manure, never letting the roots suffer for want of water. The growths should be staked and the plants kept in a shady place so that they will bloom in the autumn. Frequent syringings with quassia extract are useful to destroy aphis.

General Work.—Scented-leaved Pelargoniums should now be ready for putting into their final pots, viz., 6-inch or 7-inch pots. They require a compost of rich loam, with a little coarse sand, leaf-mould and wood-ashes. Add also a 7-inch pot of soot and some fine bones to a barrowful of soil; pot the plants firmly, and well soak the soil with water. It is a good plan to put a strong stake in each pot, to which these plants can be attached later in the season. They should be grown in a cool greenhouse, and shaded from hot sunshine. The shoots should be stopped, to make the plants bushy, and when the growth is established applications of artificial and liquid manure should be given. Green-fly must be guarded against by frequent fumigations.

FRUITS UNDER GLASS.

By James Whytock, Gardener to the Duke of Buccleuch, Dalkeith Palace, Midlothian.

Peaches and Nectarines.—The fruits having been gathered from Peach and Nectarine trees in the earliest house, the foliage should be syringed thoroughly or washed by means of the garden engine two or three times each week. This will cleanse the leaves from insect pests. If the border is dry it should receive a thorough watering; in the case of old trees liquid manure may be used. The trees should be kept cool by opening the ventilators top and bottom to their fullest extent. Houses with trees bearing ripe fruit should be kept moderately cool, with plenty of ventilation. Ripe fruits should be gathered and placed in a cool, airy fruit room, on some soft material, until they are required. Trees in succession houses with fruit that is still swelling should be syringed early in the mornings and again in the afternoons. The air should be allowed to circulate freely, but the house should be closed at four o'clock in the afternoons of bright days with a minimum temperature of 65°. If fire heat is necessary at night the paths and bare surfaces should be damped in order to moisten the atmosphere. The borders, and especially those inside, must be watered freely. If the trees are fully grown and bearing good crops, liquid manure may be used and a mulch of short manure applied; but this does not refer to young trees, for which clear water will be better. Any leaves which may tend to shade the fruit must be drawn on one side, in order that the sun may have full access. In the late Peach houses the superfluous shoots should be cut out, leaving only the lowest one at the base of each branch. Any growths which seem stronger than the rest should be cut back severely, or removed altogether, in order that the balance of the tree may not be disturbed. The final thinning of the fruit should be left until after the stoning period. Ventilation should be regulated by the time at which the fruit is required; but the watering and manuring of the borders can be done on the same lines as those indicated above for earlier crops.

Strawberries.—Strawberries required for forcing may be transferred into their fruiting pots. Young plants layered in 4-inch pots may be removed from the old plants when sufficiently rooted and placed in a shady position. They should be well watered before re-potting. The soil should be carefully prepared, and should consist of fresh, fibrous loam from an old pasture. If rather light, add to every three barrowfuls one barrowful of old mushroom-bed manure and two six-inch pots of bone meal, mixing the ingredients well together. If the soil is heavy and retentive (the best kind for Strawberries), in addition to the manure some finely-sifted mortar should be mixed with it. The best size of pot is the 6-inch, except for the late batches, which may be placed in seven-inch pots. The receptacles should be thoroughly cleansed, and a layer of crocks placed in the bottom, over which should be laid a few ¼-inch bones and a little soot. The heart of the plant should not be lower than the surface of the soil, and the mould should be in a condition to be firmly packed around the balls. After potting the plants should be shaded for some days from sunshine and thoroughly watered with a rose-can. Afterwards they should be removed to a warm, sheltered place on a raised trellis, where they can obtain the maximum of sun heat. If the weather is hot they should be watered morning and evening. On the evenings of bright days the foliage should be syringed with an insecticide to check red spider. The plants should be frequently watered with manure water, with soot and guano sometimes added. All runners should be removed, and if the plants produce several crowns all but the strongest should be taken away.

Figs.—Old Fig trees which were forced early and are now producing a second crop of fruit are apt to be rather too prolific and should be severely thinned. All fruits of a third crop should be removed or next year's fruit will suffer. With the increased heat of the outside air a higher temperature may be maintained in the house, which can be closed in the afternoon of fine days with a temperature of 80° to 85°. The foliage should be syringed twice daily when the weather is warm and fine, and the house kept damp. If the borders are very full of roots, and the roof of the house covered with fruit-bearing wood, liberal supplies of rich top-dressings and copious manure waterings should be given until the ripening period, after which the roots and atmosphere must be kept a little drier. In the cool houses, the Figs in which produce only one crop of fruit, the foliage should be syringed on all bright days, and the house closed in the afternoon with much sun heat. They should receive liberal supplies of manure, and the atmosphere of the house must be kept drier as the fruit approaches the ripening stage. Figs in pots should be thoroughly cleansed from red spider and other pests as soon as the fruit has been gathered. Any which require re-potting should be attended to at once, so that the roots may be introduced into the fresh soil while still active. The potting should be firm, the soil consisting of turfy loam mixed with fine lime rubble and a little artificial manure.

THE HARDY FRUIT GARDEN.

By B. Goodacre, Gardener to Sir Ernest Cassel, Moulton Paddocks, Newmarket.

Fruit for Preserving.—This is the best time for gathering fruit for preserving purposes, and every fine day should be made use of in this way. If the fruit is allowed to become over-ripe, or is gathered when damp the flavour of the preserve is very adversely affected. For Brambles, Raspberries, etc., the vessels used should be of china, and the fruits picked quite clean and ready for immediate use. In all other cases shallow trays are the best, on which the fruit should be laid upon fresh green leaves or greased paper.

Strawberries.—Some varieties of Strawberries, such as Givons, Utility, and Laxton's Latest, are just coming into bearing. They should be well watered at the roots, or the later fruits will not swell. If the nets have been placed over the beds for a considerable time they should be taken off and the ground cleared of weeds. Useless or superfluous runners should also be cut away.

Thinning Apples.—Apple trees should now be finally thinned, and in no case should overcropping be permitted. Fruit should never be left in clusters; they do not attain perfection in such a position, but serve to harbour insects and other pests. Many trees are now suffering from drought and require watering. The crop this year is a small one in most places.

THE APIARY.

By Chloris.

Swarms.—Should the weather become wet after hiving bees which have swarmed, thin syrup should be given them until the weather is better, but it is necessary not to give it to them in such quantities that they will store it. They require sufficient only to meet their daily needs and to stimulate the queen to lay a maximum number of eggs per day.

Showing Extracted Honey.—In the issue of May 23 I pointed out how to exhibit section honey, but omitted to mention that sections should never be exhibited in glazed cases to hold four, six, or eight, but singly. The jars chosen should be perfectly clear, without air bubbles or rough ingrained markings. Bottles made of the best English flint glass will give entire satisfaction. Generally it will be found advisable to use square, not round bottles, as they may be packed better, and the corners reflect light and thus give the honey a much brighter appearance. To assist the judge use a metal screw cap, which will screw down tightly enough to prevent leakage, but not so tightly that it cannot be easily unscrewed with the hand, as a competent judge will taste and smell the exhibit. In place of the usual cork wad use white cardboard to reflect as much light as possible to give the honey a sparkling appearance. Before using the bottles thoroughly wash them and then polish with a dry cloth. The honey that is being gathered now will be best for show purposes, because it will not granulate readily, and care should be taken to use that from combs which are perfectly sealed in order to secure thoroughly ripened honey. Some beekeepers, in order to run no risk of using any other than ripe honey, strain the honey into a perfectly clean ripener, then place it in water heated to 120° or 130° and leave it there for about 20 minutes. Great care is needed, for if the temperature rises much above 130° the honey will lose much of its delicate aroma and may become seriously discoloured. Afterwards strain the warm honey into a warmed covered tin furnished with a tap. In about four or five hours the air bubbles will have risen, when the honey should be run off into well-warmed clean bottles, holding them at an angle of 60° so that the honey will strike the side just below the neck. Screw down whilst the nectar is warm and place the bottles on a shelf in a warm room to help air bubbles that may be present to rise. These will be formed on the top as a scum and should be skimmed off with a piece of pasteboard; afterwards the honey should be stored in a dark, cool place until the show. Those who have granulated honey for showing should, before despatching it, remove the caps, and if these are dull or soiled replace with new, bright covers and a clean wad. Before replacing the screw cap polish up the neck of the bottle, removing at the same time anything in the shape of a deposit that makes the exhibit unsightly.

Poisoned Bait for Insect Pests.—Experiments carried out by Mr. J. F. Illingworth (Cornell University Agricultural Experiment Station) on the destruction of Cherry fruit flies suggest that the method of "poisoned bait" used with success in the case of these pests may prove useful in the case of other fly pests. The method adopted with success by Mr. Illingworth consists in scattering, by means of a syringe, drops of the bait on the foliage of trees infested with the Cherry fly (Rhagoletis cingulata). The bait used consisted of arsenate of lead, 3 ounces (or 5 pounds); cheap molasses, 1 pint (or 3 gallons); water, 4 gallons (or 100 gallons). As Mr. Illingworth points out in Bulletin 324, the feeding habits of flies of this class suggests the adoption of some such method as that just described, for the flies continually moisten and sip the gum of the fruit trees, the fruit of which they attack. Hence they may be destroyed if the fruit or foliage be covered with an insecticide. Moreover, the use of poisoned bait has proved effective in the case of other fruit flies, in Italy and South Africa.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the **PUBLISHER**, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, *as well as specimens of plants for naming, should be addressed to the* **EDITORS**, 41, Wellington Street, Covent Garden, London. *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, JULY 14—
United Hort. Ben. and Prov. Soc. meet.

TUESDAY, JULY 15—
Roy. Hort. Soc. Comms. meet. (Masters Memorial Lecture at 3 p.m. by Prof. R. F. Biffen, M.A., on "Some Factors in the Prevention of Disease in Plants.") Nat. Rose Soc. Sh. at Gloucester, in conjunction with Gloucestershire Rose and Sweet Pea Soc. Sb. Southampton Fl. Sh. (2 days).

WEDNESDAY, JULY 16—
Reigate Fl. Sh. Nottinghamshire Hort. and Botanical Soc. Fl. Sh. (2 days). Bishop's Waltham Fl. Sb. Watford Hort. Soc. Sh. at Little Cassiobury.

THURSDAY, JULY 17—
Nat. Sweet Pea Soc. Sh. at R.H.S. Hall. Dulwich Hort. Exhibition, Isle of Wight Fl. Sb. Lincolnshire Agric. Sb. at Lincoln.

FRIDAY, JULY 18—
Nat. Carnation and Picotee Soc. Sh. at R.H.S. Hall, Birmingham Hort. Soc. Sh. (2 days).

SATURDAY, JULY 19—
Blackburn Hort. Exhibition.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—63.2.

ACTUAL TEMPERATURES:—
LONDON.—*Wednesday, July* 9 (6 p.m.); Max. 64°, Min. 51°.

Gardeners' Chronicle Office, 41, Wellington Street. Covent Garden, London, *Thursday*, July 10, (10 a.m.); Bar. 29.7; Temp. 62.

PROVINCES.—*Wednesday, July* 9, Max. 57° Shields, Min. 56° Valencia.
Weather—Overcast.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, AND WEDNESDAY NEXT—
Clearance sale of the whole of the stock at Messrs. Cannell and Sons' Nurseries, Swanley Junction, Kent, by Protheroe and Morris, at 12.15.

On Watering.

The experienced gardener knows as it were by instinct when to give and when to withhold water; but to the intelligent beginner watering presents many puzzling problems. Some of these problems may be solved by common sense aided by a knowledge of plants and their habits; others are more intricate, and may be resolved only by long and close study of the peculiarities of plants.

Apart, however, from special cases, it is possible to lay down certain general rules for the guidance of beginners, and although a knowledge of these rules will by no means prevent the amateur from making mistakes, it may help him to discover his mistakes, and thus to avoid repeating them.

In order to be in a position to lay down rules—to sketch in outline a philosophy of watering—we must know something about the water requirements of the plant, and we must have a clear idea as to the nature of the reservoir—the soil—in which is stored the water absorbed by plants. For the sake of conciseness we will state the main facts with respect to the water requirements of plants in categorical fashion:—

First, it is to be observed that plants consist mainly of water. In a dry seed such as a pea there is about 10 per cent., and in a lettuce leaf something like 85-90 per cent. of water. There are other yet more watery vegetables—certain gelatinous algæ, for example, consist of no less than 99 per cent. of water.

Second, a plant utilises for one purpose or another and during its growing period an amount of water many times greater than its own bulk. How great is this amount may be gauged by the fact that mangels, which are thirsty plants, give off from their leaves a quantity of water equal to about half the amount of rain which falls during a year on the field on which they are growing. This stream of water, which passes through the plant, comes from the soil and escapes as vapour from the leaves. In that stream the mineral substances—essential to the building up of the living material—are carried to the leaves, and by the evaporation of the water from the leaf and other surfaces the temperature of the plant is regulated.

Third, the roots of a plant require not only water, but air, and therefore a constantly saturated soil is fatal to the health of nearly all plants. Wherefore it follows that if water fills completely the interstices of the soil the plant cannot flourish. From this we may infer that the plant growing in properly cultivated soil obtains its water not from minute liquid masses lying in the spaces between the soil-particles, but from the water-films which surround and adhere to those particles. These films are attached or stuck to the particles by surface tension, and the thinner the water film the tighter it sticks to the grain of soil. Hence before a soil is itself dry there comes a time when it refuses to yield up any more water to the plant, and the latter may begin to wilt whilst there is yet a considerable amount of water in the soil. The power of holding water by surface tension varies according to the nature of the soil; sands with their big particles have the power less than clays with their excessively minute soil particles.

Fourth, and speaking generally, there is a relation between amount of water and state of the plant. The nature of this relation may be judged from the fact that it is possible to prevent plants from flowering, whilst maintaining them in healthy vegetative growth by supplying them continuously with plenty of water. Indeed, it might be said that every plant requires a longer or shorter period of rest between its growing vegetative period and its flowering period, and that during this rest period it requires to be kept drier than at other times. Sometimes, as in epiphytic and certain other orchids, the resting period is well marked, and during that period, as is well known, water must be given sparingly, if at all. Sometimes the transition between vegetative and flowering stage is so slight as to be unnoticed or even unnoticeable. It follows therefore that when water is given to ordinary actively growing garden subjects plenty must be given, for in the first place the plant requires much water, and in the second place much that is given is bound to drain away; yet after the watering each of the countless soil particles which make up the soil should be surrounded by as thick a water film as it can hold. An actual example will serve to illustrate not only the slight effect of light watering and the big effect of thorough watering, but also the fact that a too copious and frequent watering is useless, and indeed often harmful. The example consists of an experiment carried out by M. A. Petit, Professor of the French National School of Horticulture. A crop of lettuces was divided into plots of 1-40th acre each, which were watered at intervals 13 times, and each time with a known amount of water. The results were as follows:—

Plot.	Amount of water (galls.) Per watering.	Total.	Yield in lbs.
1	0	0	316
2	51	663	326
3	102	1,326	369
4	153	1,989	390
5	204	2,552	360

As the numbers show, the light watering received by Plot 2 made practically no difference to the yield, double the quantity (Plot 3) increased the crop by about 15 per cent., three times the amount of water (Plot 4) caused a yet greater yield, whereas further increase actually reduced the size of the crop. This general rule admits of exceptions, of course, but it is not our present task to deal with the difficult plants; but rather with the common sense of watering.

It might at first sight seem a matter of indifference at what time of the day watering is done, and yet there is a well-established prejudice against watering in the middle of a bright sunny day. As so often happens, science, at first nonplussed by and sceptical of practical experience, contrives subsequently to discover the reason for the practice. In the present instance the explanation is extremely curious, and shows incidentally what a remarkably complicated thing is the soil. From the investigations of German men of science it appears that when water is added to dry earth a considerable quantity of heat is disengaged. This is specially marked in the case of soils rich in clay, and particularly in clays containing a large proportion of organic matter; in short, the heat produced by the addition of water to soil will be greatest in the best garden soils. If therefore water be added to a soil dried and baked by the sun, the temperature of the soil, already high, is raised yet more, and may well bring about serious damage to the roots. M. Petit finds that the rise of temperature brought about by watering a dry rich garden soil may amount to so much as 20° F. With plants under glass the gardener has, of course, another way of controlling the water content of the plant, and that is by regulating the amount of water in the atmosphere and by syringing the foliage. The effect of increasing the humidity of the air is, of course, to reduce the amount of water given off by the leaves; the physiological effect of syringing is more complicated, and must be considered on another occasion.

[*Photographs by R. A. Malby.*

FIG. 20.—EDRAIANTHUS DALMATICUS (ABOVE); E. PUMILIO (BELOW).

(See p. 34.)

Coloured Supplement.—The subject of the coloured plate to be published with the next issue is Nymphæa "Conqueror."

ROYAL HORTICULTURAL SOCIETY. — The next meeting of the Committees will be held on the 15th inst. in the Vincent Square Hall, Westminster. At 3 o'clock in the lecture room Prof. R. H. BIFFIN, M.A., will deliver the ninth Masters Memorial Lecture, entitled "Some Factors in the Prevention of Disease in Plants."

R.H.S. DAFFODIL SHOW, 1914. — The Secretary informs us that the Royal Horticultural Society's Daffodil Show for 1914 will be held on Wednesday and Thursday, April 15 and 16, and not on April 21 and 22 as previously notified.

NATIONAL CARNATION AND PICOTEE SOCIETY (SOUTHERN SECTION).—The annual exhibition of the Southern Section of the National Carnation and Picotee Society will be held on Friday, the 18th inst., in the R.H.S. Hall, Vincent Square, Westminster.

NORTH OF ENGLAND HORTICULTURAL SOCIETY'S CONFERENCES.—The conferences arranged by the North of England Horticultural Society will take place at Kendal on September 24 and 25, and in addition to the usual Fruit Show and Congress there will be an important addition this year in the form of a Potato Show and Conference, which is to be held on Thursday, the 25th. Mr. G. P. BERRY, the newly-appointed Chief Inspector of Department of Horticulture under the Board of Agriculture, will give a lecture on "Potato Culture." Mr. T. ANDERSON, M.A., B.Sc., will lecture on "The Diseases of Potatos." Alderman ABBATT and Mr. CLARENCE T. WEBB are the local secretaries at Kendal.

FLOWERS IN SEASON.— Messrs. GEORGE JACKMAN AND SON have forwarded specimens of their new Clematis, C. recta grandiflora, which received the R.H.S. Award of Merit on June 17 last. The variety is a large-flowered form of this sweetly-scented white Clematis. Mr. F. C. PUDDLE, Scampston Hall Gardens, Rillington, York, has forwarded two interesting plants, accompanied by the following note :—"I am sending you a hybrid between Primula Bullyana and P. Beesiana, which originated in the rock garden here. The plants are self-sown seedlings, springing from a bed where last year the parents flowered together. I also send flowers of Vicia onobrychioides. This is a very beautiful and striking plant in the rock garden. It is described in Nicholson's *Dictionary of Gardening* as an annual, but in these gardens it has proved to be perennial. The plants were collected by my employer, Mr. W. H. ST. QUINTIN."

SPRING FROSTS AND THE FRUIT CROPS.—The *Pharmaceutical Journal* states that since the damage done to the tender shoots of the vine (and also of other delicate plants) by the extreme fluctuations of temperature, such as occur in spring, is due to too rapid abstraction of water from the tissues, it is suggested that this may be checked, and the crystallisation of water on the buds and in its tissues prevented, by dusting them with an inert powder. For this purpose talc in the finest powder, freely applied to the shoots and buds, is recommended. This checks too rapid transpiration of water; its white particles reflect a portion of the sun's rays, which too greatly stimulate the early growth, and also mechanically prevent the formation of ice crystals. This device is described as more efficacious and practicable than the method of forming smoke screens from bonfires to protect the vineyards.

HONOUR FOR A FRENCH NURSERYMAN.—We are pleased to learn that M. ALBERT TRUFFAUT, sen., the well-known nurseryman of Versailles, has just been raised to the rank of Officier de l'Ordre de Mérite Agricole. M. TRUFFAUT is one of the pioneers of French horticulture, and his two sons, GEORGES and ALBERT TRUFFAUT, have inherited their father's tastes and capabilities. M. TRAFFAUT, sen., was the first vice-president of the Société Nationale d'Horticulture de France.

CANARY ISLANDS EXPORTS.—A Consular report shows that in the year 1912 1,526,640 crates of Bananas, 996,891 bundles of Tomatos, and 211,862 cases of Potatos were exported from Teneriffe and Las Palmas to the United Kingdom. So far as Bananas are concerned the figures show an increase of 60,000 crates as compared with 1911. The report mentions incidentally that one of the principal houses in the trade has lately invented a new means of packing Bananas for travelling, using papier mâché covering for the fruit instead of wooden crates. The experiment, it is said, has given most satisfactory results, both as regards the condition of the bunches on arrival at destination and in the cost of packing, a great saving having been realised by the new method.

"THE BOTANICAL MAGAZINE."—The issue for June contains illustrations and descriptions of the following plants :—

RHODODENDRON AUGUSTINII. TAB. 8,497.—This Chinese species was illustrated and described in *Gardeners' Chronicle*, July 6, 1912, page 4, fig. 3. The colour of the petals, as shown by the *Botanical Magazine* plate, is a rather unattractive shade of mauve. The species is allied to R. lutescens, from which it is distinguished by a line of persistent hairs on the midrib of the leaf beneath.

HYPERICUM AUREUM. TAB. 8,498.—This species of St. John's Wort, a native of the South-Eastern United States of America, is an old garden plant. The petals are of canary-yellow colour and the bunch of anthers is slightly tinted with reddish-brown. Unlike most of the other species, H. aureum forms a distinct stem, which gives the plant the appearance of a small tree. As this Hypericum flowers in August it is valuable for making a display when flowers of other woody subjects are scarce.

AMELANCHIER OLIGOCARPA. TAB. 8,499.—The plant is hardier and not so tall-growing as the Snowy Mespilus, and, owing to its being very rare, some form of A. canadensis is sometimes substituted for it by nurserymen. Because of this many have confused it with A. canadensis, regarding it as a variety of that species. But the inflorescences contain fewer blossoms, there being very rarely as many as four. Owing to its hardiness the plant should prove useful for gardens in very cold districts.

OSBECKIA STELLATA. TAB. 8,500.—This very brightly flowered Melastomad has been in cultivation in this country since about 1820, having originally been introduced from Nepal, India. The plant is easily grown, and in an ordinary greenhouse forms a shrub about 2 feet high that flowers in the autumn. Its cultivation has been largely discontinued, but recently seeds have been again introduced to Europe. The material for the *Botanical Magazine* figure was obtained from a plant raised from seed obtained at Sikkim and forwarded by the Royal Botanic Garden, Calcutta. The colour of the corolla is lilac-red.

AGAVE WARELLIANA. TAB. 8,501. This noble Agave was first described by Mr. J. G. BAKER in *Gardeners' Chronicle*, September 1, 1877, p. 264, in his monograph of the Genus Agave. The species is illustrated in the same issue from a sketch by Mr. WORTHINGTON SMITH. Our figure does not show the inflorescence of bright yellow flowers, which rises to a height of more than 15 feet.

"JOURNAL OF ECOLOGY."—So rapid has been the progress made in ecology—that is, the study of plants and animals in relation to their environment—that the need for a journal devoted to this subject has been felt by many biologists. Since some of the most striking contributions to plant ecology have been made by British workers it is but fitting that the first periodical of this kind should be issued in this country and in connection with the recently-founded British Ecological Society. Among those associated with this enterprise are some names well known to our readers, the Council of the new society including Professor F. W. OLIVER, Mr. A. G. TANSLEY, and Dr. C. E. MOSS. The secretary of the Society and editor of the journal is Dr. F. CAVERS, Goldsmith's College, London, S.E. Two numbers of the quarterly *Journal of Ecology* (Cambridge University Press) have now been issued (March and June, 1913). In No. 1 Mr. TANSLEY explains the aims of the new journal; the editor presents an attractive programme of forthcoming articles; Professor OLIVER writes an interesting account of the vegetation of Blakeney Point, with some notes on the animal world in its relations to the vegetation; Dr. W. G. SMITH gives a summary of the work of Raunkiär on "life-forms" among plants; and Mr. TANSLEY contributes a long and critical review of the recent attempt by the Swiss botanists, BROCKMANN-JEROSCH and RUBEL, to found a universal system of classification of plant communities. These articles are followed by shorter contributions dealing with the relation of the present plant population of the British Isles to the Glacial Period, by Mr. CLEMENT REID, and on the Nature Reserve movement in Britain by Mr. W. M. WEBB; and the remainder of the number is occupied by notices on recent publications. The second number contains articles on "The Woodland Vegetation of the Cotswolds and the Forest of Dean," by Messrs. TANSLEY and ADAMSON; on the quadrat method of vegetation survey, by Professor J. H. PRIESTLEY; on "Beech Forest in Its Relations to Edaphic Factors," by Mr. M. SKENE; on "The Determination of the Water-Content of Soils and the Wilting-Point of Plants," by Mr. W. B. CRUMP; and on "Vestigial Floras : Relics of Former Heaths and Bogs in the Midst of Cultivated Areas," by Mr. A. R. HORWOOD.

HARVEST WEATHER FORECASTS.—The Board of Agriculture and Fisheries desire to draw the attention of farmers to the Harvest Weather Forecasts issued by the Meteorological Office between June 1 and September 30. These forecasts are sent out at 2.30 p.m. and cover a period of 15 hours, viz., from 6 a.m. to 9 p.m. on the following day, and when conditions are sufficiently definite a "further outlook," extending the period covered by the forecast to two or more days, is added; thus farmers who receive them have the best possible information about the weather when planning their work. A correspondent who recently applied to the Meteorological Office for special forecasts, wrote : "You may be interested to know that I acted on the forecast last year and, consequently, saved £200." The Meteorological Office supplies this valuable service free, under certain conditions, to those who prepay the cost of telegrams. Full information may be obtained on application to the Director, Meteorological Office, London, S.W.

MR. JAMES GIBSON. — Mr. JAMES GIBSON, gardener to the Duke of PORTLAND at Welbeck Abbey, seems to excel in everything he undertakes. His successes at flower shows, where he stages magnificent collections of vegetables, or tastefully arranges a decorated dinner-table, as at Shrewsbury, are matters well known to our readers, but it may not be common knowledge that he is also one of the best bowlers in the Midlands. On June 28 last, at the Nottinghamshire County meeting, Mr. GIBSON won the championship gold medal and 40-guinea challenge cup with an excellent score.

THE CRYSTAL PALACE.—As these pages go to press (Thursday) we learn that the *Times* Fund amounts to £78,500. Success seems assured, but it should be recognised that there is still another £8,000 to be subscribed, and it is imperative that this sum be raised before the 31st instant.

EDRAIANTHUS DALMATICUS AND E. PUMILIO.

(See page 31.).

THE genus Edraianthus was established by Alphonse de Candolle, and includes a small group of plants formerly classed with the Campanulas. Some botanists have sunk Edraianthus under Wahlenbergia, and as such it appears in the *Index Kewensis*, but for garden purposes it is useful to keep up de Candolle's name. The plants are distinct, all the species being stemless, with linear, grass-like radical leaves, and prostrate or sub-erect flowering shoots bearing heads of sessile flowers. E. dalmaticus (see Fig. 20) is synonymous with Wahlenbergia tenuifolia, and is a native of the mountains of Southern Austria. The clusters of pale violet-blue flowers have some resemblance to the Campanulas, of which family the Edraianthuses belong.

E. pumilio is described by Mr. Reginald Farrer* as one of the most cherished of Alpines, and a thrifty doer in any good place in fine soil rubbly with lime. The flowers of this species are also violet-blue coloured, and the illustration on page 31 shows well how freely they are produced. The Edraianthuses are splendid subjects for planting on the moraine, and they also grow well on the rockery.

FIG. 21.—HYBRID TEA ROSE QUEEN MARY: COLOUR OF FLOWER, PINK AND GOLD.
(Awarded Gold Medal by the National Rose Society, July 4, 1913. See p. 37.)

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

FRUIT BUDS NOT FLOWERING.—I fail to follow the remarks made by "A Southern Grower" (vol. LIII. p. 407) on fruit buds. I take it that on Apple and Pear trees three classes of buds are found, i.e., blossom, or fruit, buds; leaf-buds, or immature fruit buds; and wood buds. I fail to see how a bud which produces only leaves can properly be termed a fruit bud. If "A Southern Grower" means that fruit buds are *not* flower buds it would be obvious that in such case birds could not destroy the bloom; but how can this be so? *G. H. H. W.*

[I should divide "buds" into two classes—wood buds and fruit buds—both of which bear leaves. Of course, a fruit bud bears blossoms if it remains healthy, but not always in the fruit season following its development, nor in a season following one in which a very heavy crop was borne. Surely, G. H. H. W. would not maintain that the large number of mature trees which failed to blossom this season were devoid of fruit buds.—*Southern Grower.*]

EARLY CABBAGE (see vol. LIII. pp. 365, 388, and 407).—I quite agree with Mr. Cook's remarks about the cultural treatment of Cabbages, and concur in his opinion that the plants ought to be in their places by October. If your correspondent will turn to my letter again he will find that we work, at Hindhead, under considerable difficulties. Farmyard manure is certainly the best to use, but extremely difficult for us to obtain. I admit that nitrate of soda and superphosphate are stimulants, but my crop required a stimulant. I should like Mr. Cook to come to Hindhead and see what he could do in the way of growing cabbages in the open which should be fit to cut by the beginning of March. I fancy he would find his task an impossible one. He says that "he was cutting when I was planting." This statement is true only in so far as it applies to this particular batch which I selected for description as best showing what can be done on a soil extremely deficient in mineral matter, and in most respects unsuited to the growing of Brassicas. *C. Harris, Corona, Grayshott, Surrey.*

REMINISCENCES OF YORK GALA (see p. 7).—Having attended forty-one consecutive galas, I read with much interest the remarks of your correspondent on p. 7. I have a good recollection of the Exhibition in 1883, especially of the Fruit classes, as in my desk, used as a letter-weight, is a bronze Veitch Memorial Medal, which won for the three best bunches of Grapes in the show. I forget who was Mr. Gilbert's colleague as a judge, but I remember Mr. Gilbert saying afterwards they could not agree, and called the late Mr. McIndoe to decide. His decision was given from the point of flavour, and he selected Black Hamburgh. Somewhat singular to say an old friend who has been present at fifty-one consecutive galas and myself were discussing the pros and cons of past shows on the first day this year. We took the line of "On the Walls" as to merits or defects of individual versus collective culture of plants at Exhibitions. Reading betwixt the lines of his remarks we were both of a similar opinion, and my friend was in 1883 (also before and after) a winning exhibitor in the class for "Cart-wheel" Pelargoniums and specimen Fuchsias. There is no reason why the galas at York should not go on and prosper. The committee is composed of the best business men of the city Good men fall out from time to time, but their places are filled by others, who take a keen interest in the shows. In one respect the York Committee is unique, for there is not one of its members who could be termed a horticulturist pure and simple. The same remark applies to the three secretaries I have known. *Horticulturist.*

ANTIRRHINUMS.—Now, when the Antirrhinums are coming into full flower, it is clear that early sowing, though not essential, is an important item in their cultivation. They succeed sown as late as March, but it necessitates a long period in heat, whereas by sowing towards the end of January, or even at the beginning of February, they can be forwarded in comparatively cool conditions. Early sowing has the further advantage that it is possible to make a second sowing of any variety that may have failed to produce a sufficient number of plants, for different varieties vary to a large extent in their power of germinating just as they do in general habit, some being weakly as compared with others, and in early or late flowering. Varieties also vary considerably in stature, not only in the intermediate, but also in the tall sorts. Yellow tall, under favourable conditions, mount up to 7 feet in height, while Orange King may not attain to 4 feet. Some again are bushy, while others incline to shoot sartight up, and these characters have to be taken into consideration in arranging the plants for effect. There is no difficulty in the production of stock. I find they succeed equally well when pricked from the seedling receptacles into cutting-boxes in which the compost need not be more than 2 inches deep, or direct into beds of soil in cold frames. In the latter system less labour is required in watering and general attention, but the boxed plants are more easy to transport to the flower beds, so there is not much gained or lost by adopting either system. The plants being hardy should be planted as early as possible, so that they may get a good grip of the soil before the hot summer weather sets in. There are always rogues amongst the seedlings even when the greatest care is taken in selecting them; almost every variety has a different colour or shade of green on the under side of the leaf, and this is a character by which rogues may be determined for weeding out. A break I got a few years ago was grown from cuttings, and from one plant seeds were saved which gave two colours in the seed leaves. These were separated and the dark leaves gave a fine violet purple flower, and the others came true to the type with a large admixture of a self cream. Last year I had an intermediate crimson variety produce a very tall offspring of a variety of shades from scarlet to crimson, and I have found a self-yellow variety among the crimson seedlings. Though Antirrhinums grow plentifully on walls, it is noteworthy that for garden decoration they require very liberal treatment. Neither 1911 nor 1912 were seasons to the liking of these showy plants. In the former year the flower-spikes went to seed

through the abnormal heat and drought without the flowers opening, with the consequence that for weeks beds occupied by them were green at a time when they should have been gaily coloured; yet by cutting such spikes at short intervals as they became worthless, and watering the beds with manure water three times weekly, I was enabled to keep the beds, with the exception of a very short time, in their usual condition. Last year in some gardens the flowers did not appear until September, the result of the cold and wet June. When I observed them hanging growth, the soil surfaces were dressed with pigeon dung, manure from a spent mushroom bed and a chemical compound, with the result that the plants turned out extraordinarily fine. Firm soil is another essential in the successful cultivation of these plants. Yet with perfect cultural provisions Antirrhinums may easily be a failure decoratively, either through a want of knowledge of the varieties, or through want of care in the choice and arrangement of colours. Last year our varieties were mainly of faintest pink shades, deepening to carmine, with a smaller number of pink and cream-coloured varieties. This year the tall Orange King, mixed with Calceolaria amplexicaulis—though Celsia cretica under certain conditions would be better—occupies a prominent place with several smaller beds of Intermediate Fire King, which, though similar to Orange King, is much more effective for grouping. The same varietal colours are to be had from many seedsmen, but they are sold under different denominations, and it is annoying to have one variety from different sources under different names. *R. P. Brotherston, Tyninghame Gardens, Prestonkirk.*

Anæctochilus at Tracy's Nursery, Twickenham.—The sturdy plants of these prettily-leaved Orchids in the group staged at Holland House by Mr. S. Flory, Tracy's Orchid Nursery, Twickenham, were much admired, and many who had failed to grow them successfully were curious to know in what conditions they were grown. Subsequent inspection of the plants at Twickenham seems to point to the fact that failures in many gardens have been brought about by employing too much heat and too much nursing. Mr. Flory's plants are grown in a case placed over the tank at the end of a small house in which Phalænopsis, Vandas, Saccolabiums, etc., are growing, also in rather cool conditions. The bottom of the case is of perforated zinc, on which a layer of small coke is placed, then some Orchid pans, on which a wooden stage is placed, which leaves openings at the back, front, and sides for moist air to come up. There is a glazed light, but it is not used much. In summer it is removed, and at other seasons tilted as required for ventilation. The plants are potted in a mixture of leaf-mould, peat and Sphagnum-moss, the material being always kept moist, but no water overhead is given. An intermediate heat and a low night temperature are maintained. The plants have been grown from very small specimens, and increased by propagation. Generally these Orchids are kept in a very warm, moist house and under bell-glasses, and their life is short. Here they were placed in a very inexpensive case for a trial, and the result has been satisfactory in every way. *Visitor.*

Second Blossoming of Plum Trees.—Several trees of Victoria Plum in these gardens are flowering for a second time this year, some at the extremities of the young growths. I have never seen this occur with Plums before. We have most extraordinary crops of Gooseberries, Currants, and Raspberries; otherwise our fruit prospects are similar to those described by "Southern Grower." *A. J. Elgar, Killarney House Gardens, Ireland.* [We hear of this second blossoming of Victoria Plums from several quarters. In our own garden, a tree of Williams' Bon Chrêtien Pear has developed a second crop of blossoms at the ends of the branches. The blossoms should be picked off.—Eds.]

Chicory Cultivation in Belgium.—In my note on this subject printed on p. 6 a small error has crept in. The paragraph in col. 3 should read: "The fire is kept burning for twelve or fourteen hours, according to the weather, and the bed is then left for four or five days without fire." *E. C., Brabant.*

SOCIETIES.

ROYAL HORTICULTURAL.

Summer Exhibition at Holland House.

(Concluded from page 18.)

Horticultural Sundries.

All the exhibits of horticultural sundries of a perishable nature, the paintings of garden scenes and garden literature were accommodated in a special tent. The principal exhibitors of the first-named were Messrs. Barr and Sons, Covent Garden, whose chief "lines" were garden tools and special manures; Messrs. Joseph Bentley, Ltd., Barrow-on-Humber, who specialised chemical manures and insecticides; Messrs. Cooper and Nephews, Berkhamsted, with weed killers and sprayers; Jeyes' Sanitary Compound Co., 64, Cannon Street, London, who displayed various washes and disinfectants; Messrs. H. Pattisson and Co., Streatham, on whose stand were displayed horse boots for use on lawns and golf greens; Messrs. Wakeley Bros and Co., Ltd., Bankside, London, with samples of their well-known Hop manure and plants illustrating its fertilising properties; Messrs. E. A. White, Ltd., Paddock Wood, Kent; and the Four Oaks Spraying Machine Co., Sutton Coldfield. Messrs. Robinson Bros., Ltd., West Bromwich, erected an attractive, castellated building in the grounds, where they displayed "Guaranteed Gardenalities," including the Carmona fertiliser and Clift's fluid insecticide.

In a separate tent the "Lamp Pump," made by the Lamp Pump Engineering Co., Ltd., Westminster, which is worked by a small paraffin-heated dome boiler and lifts 400 gallons of water per hour at an estimated cost of less than one penny, was steadily working.

Messrs. T. Crowther and Sons, Fulham, London, had a very large collection of beautiful marble garden seats, old lead vases, and hammered gates of exquisite workmanship, with elegantly designed pediments.

Messrs. Lloyd, Laurence and Co., 29, Worship Street, London, effectively watered the parched grass with the newly designed "Pluvi-ette" sprinkler, which, by an ingenious adaptation of the turbine principle, evenly projects the water over a considerable area—an area of from 300 to 500 square yards, according to the water-pressure available. The appliance is automatic, and is easily adjusted.

AWARDS MADE BY THE COUNCIL.

Coronation Challenge Cup.

Sander and Sons, St. Albans, for Orchids.

Gold Medals.

The Rt. Hon. Lord Langattock, for Pineapples; Sir Randolf Baker, Bart., for Sweet Peas; the Hon. Vicary Gibbs (gr., Mr. E. Beckett), for Vegetables; Blackmore and Langdon, for Begonias; H. B. May and Sons, for exotic Ferns; Paul and Son, for Roses; Wm. Paul and Son, Waltham Cross, for Roses; Sander and Sons, for Orchids; Sutton and Sons, for Sweet Peas; James Veitch and Sons, Ltd., for Fruit Trees in pots; James Veitch and Sons, Ltd., for Chinese Plants; R. Wallace and Co., for ornamental water garden; Charlesworth and Co., for Orchids; and Dobbie and Co., for Sweet Peas.

Silver-gilt Cups.

James Box, for water garden, Sweet Peas, etc.; and L. R. Russell, for stove plants, shrubs, and Irises.

Large Silver Cups.

Sir Jeremiah Colman, Bart., for Orchids; Wm. Cutbush and Son, for Carnations, Roses, herbaceous flowers, cut trees, and flowering plants; G. Bunyard and Co., Ltd., for Roses and hardy flowers; and Charles Turner, for Roses.

Silver Cups.

Mansell and Hatcher, Ltd., for Orchids; Stuart Low and Co., for Orchids, Roses, Carnations, New Holland plants, and fruit; J. Piper and Son, for formal garden, rock and water plants, Fuchsias, Japanese trees, etc.; J. Carter and Co., for water garden, and flowering plants; J. Veitch and Sons, Ltd., for flowering plants, Bay trees, Orchids, etc.; Barr and Sons, for flowering plants, foliage plants, and herbaceous and water garden; W. and J. Brown, for Roses and hardy flowers; M. Prichard, for herbaceous and Alpine flowers; Mr. Prichard, for bog plants; and A. Gwillim, for Begonias and herbaceous plants.

Standard Cups.

Stuart Low and Co., for Orchids; J. Peed and Son, for Caladiums and flowering plants; Amos Perry, for herbaceous plants, alpines, Ferns, etc.; G. Jackman and Son, for roses, herbaceous plants and Clematis; J. S. Arkwright, Esq., for Lychnis Arkwrightii; and W. Fromow and Sons, for Japanese Maples.

Silver-gilt Hogg Medal.

S. Heilbut, Esq. (gr. Mr. Camp), for fruit trees in pots.

Silver-gilt Knightian Medal.

Laxton Bros., for Strawberries.

Silver-gilt Flora Medals.

S. W. Flory, for Orchids; J. King and Sons, for Sweet Peas; G. and A. Clark, Ltd., for herbaceous plants and aquatics; Bakers, for herbaceous plants and alpines; B. E. Bell, for Carnations; H. Burnett, for Carnations; C. Engelmann, for Carnations; F. Cant and Co., for Roses; B. Cant and Co., for Roses; Hobbies, Ltd., for Roses; Wilfred W. Gott, for Carnations; and J. Cheal and Son, for ornamental garden.

Silver-gilt Banksian Medals.

G. Reuthe, for border flowers, Alpines, and shrubs; S. Bide and Sons., Ltd., for Sweet Peas; E. W. King and Co., for Sweet Peas; Gunn and Sons, for Phloxes; Harkness and Sons, for border flowers and Spanish Irises; Geo. Prince, for Roses; Fred Smith and Co., for hardy herbaceous plants and flowers; G. Stark and Son, for Sweet Peas and Kniphofias; Bees, Ltd., for alpines and hardy plants; Rt. Hon. Lord Burnham (gr., G. Johnson), for Carnations; John Forbes (Hawick), Ltd., for summer-flowering plants; H. J. Jones, for Phlox and Canterbury Bells; Thos. S. Ware, Ltd., for Begonias; and Mary Countess of Ilchester, for Sempervivums and Saxifrages.

Silver Flora Medals.

H. Dixon, for Orchids; J. Veitch and Sons, Ltd., for Orchids; Rev. Chalmers Hunt, for Roses, Sweet Peas, and vegetables; Phillips and Taylor, for water garden and border flowers; Whitelegg and Page, for Sweet Peas; Robert Sydenham, Ltd., for Sweet Peas; R. and G. Cuthbert, for Humea elegans and Spiræa; Jas. Douglas, for border Carnations; the Guildford Hardy Plant Nursery, for herbaceous plants; T. R. Hayes, for Heaths and Alpines; H. Hemsley, for Antirrhinums and rock garden; J. Mattock, for Roses; R. C. Notcutt, for Roses; Reginald Pritchard, for herbaceous plants; Frank Lilley, for Spæraxis and Gladioli; Thompson and Charman, for herbaceous plants, Alpines, etc., and W. Fells and Son, Hitchin, for hardly herbaceous plants.

Silver Banksian Medals.

Lady Northcliffe (gr., Mr. J. Goatley), for Crassula coccinea; E. V. Low, for Orchids; Jas. MacDonald, for exhibit of grasses; Carlton-White, for clipped trees; R. H. Bath, Ltd., for Roses and herbaceous plants; Webster, for Sweet Peas; Kelway and Son, for Delphiniums, Sweet Peas, etc.; Carter Page and Co., for flowering plants; G. Bolton and Son, for Roses; Howard Crane, for Violas and Violettas; Walter Eastlea, for Roses; Clarence Elliott, for Alpines; G. Gibson and Co., for herbaceous plants; G. W. Miller, for herbaceous and small plants; Morse Bros., for Roses; W. H. Page, for flowering plants; Watkins and Simpson, for Antirrhinums; W. and C. Bull, for herbaceous flowers; Wargrave Plant Farm, Ltd., for herbaceous flowers; Godfrey and Son, for flowering plants.

Certificate of Appreciation.

Mr. Hemsley for work in raising new Antirrhinums.

AWARDS TO HORTICULTURAL SUNDRIES.

Silver-gilt Banksian Medals.

T. Crowther and Son, for ornamental stone and iron work; and Gamage and Co., garden tents, etc.

Silver Banksian Medals.

Abbott Bros., for table trays, etc.; Benton and Stone, Ltd., for spraying machines, etc.; Castles, for garden furniture; and Liberty and Co., for Japanese garden ornaments, etc.

Bronze Banksian Medals.

Barr and Sons, for tools and implements; Jos. Bentley, Ltd., for horticultural chemicals; John Bradley, for Bunty tea-house; Miss Edith Fisher, for water-colour drawings; Four Oaks Spraying Machine Co., for spraying machines; Heathman and Co., for ladders, hose, etc.; Robert Hughes, for water-colour drawings; Miss Mitchell, for garden baskets; John Pinches, for labels, exhibition boxes, etc.; W. Voss and Co., Ltd., for insecticides; and E. A. White, Ltd., for insecticides, sprayers, etc.

NATIONAL ROSE.

July 4.—The great Rose event of the year, the National Society's Metropolitan Exhibition, took place on this date in the Botanic Gardens, Regent's Park. It was the thirty-seventh of these annual shows, which have been held at different periods in various places of the Metropolis, but never in a more suitable place than the Botanic Gardens. The fortunes of the Society have always been rosy, but never more so than at the present time, when it can claim to be the most important Association connected with a special flower, for the Rose Society is second only to the Royal Horticultural Society in membership. These exhibitions have grown in importance, and they are now greatly superior to those of only a decade ago. They have a great attraction for the public, and when a flower show "takes," the competition is sure to be good. The schedule is so extensive—there are 111 classes—that almost every section of the flower and class of grower is provided for. The present summer, so far, has suited Roses, and especially those flowers which exhibit the lighter

tints. The red Roses are never so good, by comparisons, as the paler sorts, in very hot seasons. To single out varieties that were shown unusually well last week, we may instance Mildred Grant, Bessie Brown, Maman Cochet, White Maman Cochet, and Mrs. Edward Mawley.

The number of new Roses was, as usual, very large, and these were staged in a tent by themselves. Everyone appeared anxious to see the novelties, and although the tent was much larger than usual, many gave up the attempt to inspect them, owing to the crush. The Floral decorations were also arranged in a separate tent apart from the rest of the show. It would have been a great advantage and added to the importance of the exhibition had all the exhibits been arranged in one large tent, such as at the recent York gala.

NURSERYMEN'S CLASSES.

The Champion Class in this section is for 72 blooms of distinct varieties, a large number for any grower to stage in exhibition form at one time. Some of the best known firms competed, and a splendid contest resulted, in which Messrs. BEN CANT AND SONS, Colchester, excelled, beating four other exhibitors. Not only in the winning stand was the quality splendid, but generally, also, in the other collections. The following varieties were staged by Messrs. B. CANT AND SONS :—O. Terks, Hugh Dickson, Marquise de Ganay, Gustave Piganeau, Earl of Warwick, Mrs. J. Laing (a magnificent specimen), Mildred Grant (of very fine form), Lieutenant Chaure, Frau Karl Druschki, Mrs. Stewart Clark, St. Helena, J. B. Clark (a big red Rose), Bessie Brown (a finely formed flower of this creamy-white variety), Caroline Testout (extra good), Alice Cory Wright, Gloire de Chédane Guinoisseau (a splendid bloom of this fine red, sweet-smelling variety), Her Majesty, Helen Keller, Mrs. Theodore Roosevelt (a big blush Rose), Mrs. W. J. Grant, Mrs. Cornwallis West (of fine shape and nearly white), Mrs. Wallace Rowe, Mrs. Sam Ross (coloured cream, rose and gold), Ed. Mawley (a fine red Rose), Lady Barham, Freda (exquisite in form), Nadia, Mrs. Arthur Coxhead, Mme. Jules Gravereaux, Geo. Dickson (a fine example of this beautiful red Rose), Mrs. Ed. Mawley (a large, blush variety), Dr. O'Donel Browne (cerise colour), Maman Cochet, Frances C. Seton (bright rose), Dean Hole (extra good), Elizabeth, Lady Helen Vincent, Lohengrin, Duchess of Normandy, Mrs. J. Bateman (a very choice specimen of this carmine-rose coloured variety), Mabel Drew (pale yellow), Duchess of Westminster, Mme. Constant Soupert, August Hartmann H.T. seedling (cherry red—a fine shade), Lady Mary Fitzwilliam, W. Shean, Alice Lindsell, Florence Spaull (a seedling of pale rose colour), Mrs. A. Hammond, M. H. Walsh, British Queen, Mrs. Geo. Shawyer, White Maman Cochet, Mrs. Maynard Sinton, Lady Ashtown (a big specimen), Comtesse de Nadaillac, Lyon Rose, White Killarney, Chas. J. Graham, Mme. Melaine Soupert, Leslie Holland, Beatrice, Freiherr von Marschall, Margaret, Claudius (extra good), Yvonne Vacherot, Ulrich Brunner, W. R. Smith, Aimée Cochet, Lady de Bath and Alfred K. Williams. 2nd, Messrs. ALEX. DICKSON AND SONS, LTD., Newtownards, whose choicest blooms included those of the varieties :—Lady Barham (palest pink, almost blush colour), Lohengrin (pink), Mrs. Geo. Preston, S. M. Rodocanachi (cerise), Marchioness of Downshire, Mrs. John Laing, Florence Pemberton (cream, with rose flush), W. Shean, Pharisaer (cream and rose), Mrs. G. W. Kershaw, Mamie (rose coloured), Bessie Brown (a fine bloom of this pale rose), Ulrich Brunner, Mildred Grant, and Brilliant, a fine new red rose, which was awarded a Gold Medal; 3rd, Messrs. FRANK CANT AND CO., Colchester, whose collection included a magnificent specimen of George Dickson, that was awarded the Silver Medal offered for the best H.T. variety in this section. 4th, Messrs. R. HARKNESS AND CO., Hitchin.

The next class was for 40 varieties, three blooms of each variety. Here again the contest was keen, and Messrs. ALEX. DICKSON AND SONS succeeded in winning the 1st prize, followed closely by Messrs. B. R. CANT AND SONS with Messrs. FRANK CANT AND CO., 3rd. The blooms, as shown in triplets, were perhaps even more striking than in the Champion class. Those that appealed to us most in Messrs. DICKSON'S fine collection were H. V. Machin, Mme. Jules Gravereaux, Ulster (a pale pink Rose of fine form), Mabel Drew (pale yellow, shaded a deeper yellow in the centre), Mrs. John Laing, Conway Jones (cherry red), Lohengrin, Mrs. Arthur E. E. Coxhead, Denis (new), Lyon Rose, Mrs. Geo. Shawyer, Alice de Rothschild (of gold colour, a pleasing change from the red and pink varieties), Xavier Olibo (a dark coloured Rose), Bessie Brown, and Mildred Grant, with big curving petals of exquisite form, just flushed with rose. 2nd, Messrs. B. R. CANT AND SONS, who had Gloire de Chédane Guinoisseau, Mrs. John Laing, Theodore Roosevelt, Ulrich Brunner, White Maman Cochet, J. B. Clark, Walter Speed, Lieutenant Chaure, Dean Hole, Mildred Grant, Lohengrin, and Augustus Hartmann. 3rd, Messrs. FRANK CANT AND CO.

The contest for the China Trophy, which was offered for the best exhibit of 48 blooms, distinct, was a very spirited one amongst 11 competitors. Mr. GEORGE PRINCE, Oxford, was placed 1st. His choicer blooms were : Bessie Brown, Mrs. Amy Hammond, Geo. Dickson (a fine Rose of rich red colour), George C. Waud, Mrs. Joseph Welch (pink), Mrs. Arthur E. E. Coxhead, Florence Pemberton, Mrs. Maynard Linton (very pale in colour, almost white), and Avoca (a fine rose-red bloom). 2nd, Messrs. PERKINS AND SONS, Coventry, who showed amongst others Mildred Grant (the large spreading white petals just tinged with pink), Gloire de Chédane Guinoisseau (a beautiful red Rose, with strong scent), Her Majesty, and Mrs. Cornwallis West (white). 3rd, Messrs. G. AND W. H. BURCH, Peterborough.

Eleven entered in the class for 24 blooms, distinct, in which Messrs. W. R. CHAPLIN BROS., LTD., Waltham Cross, won the premier honours, followed by Mr. W. R. HAMMOND, Burgess Hill, the 3rd prize being won by Mr. J. MATTOCK.

In the smaller class for 16 varieties, distinct, shown in triplets, the KING'S ACRE NURSERIES, Hereford, excelled. 2nd, Messrs. G. AND W. H. BURCH; 3rd, Mr. W. H. FRETTINGHAM, Nottingham.

TEA AND NOISETTE VARIETIES.

The D'Ombrain Cup formed the most important prize in this section. It was offered in the class for 24 blooms, distinct, and attracted five competitors. Mr. G. PRINCE secured the trophy for an excellent collection, which included the varieties Souvenir de Pierre Notting (apricot-yellow), Bridesmaid, Mme. Constant Soupert, Mrs. Edward Mawley (awarded the Silver Medal for the best bloom in this section), Muriel Graham, Innocente Pirola, and Golden Gate. 2nd, Mr. H. DREW, in whose collection we noticed Mme. Jules Gravereaux, Mme. Constantin, Maman Cochet, Freiherr Von Marschall, Media (a perfect bloom of this pale yellow variety), Souvenir d'Elise Vardon (a blush Rose of exquisite shape), Alexandra Alice Hill, and White Maman Cochet. 3rd, Messrs. B. R. CANT AND SONS.

For twelve blooms, distinct, no fewer than 14 entered. The first prize was awarded to Mr. JOHN MATTOCK, and the 2nd Prize to Messrs. J. BURRELL AND CO.; whilst for 16 varieties, shown as triplets, Mr. H. DREW excelled.

BLOOMS SHOWN IN VASES.

There were two classes for blooms shown in vases, the one for 12 varieties and the other for 9. In the larger class Messrs. D. PRIOR AND SONS, Colchester, won the 1st prize with splendid blooms shown on tall stands. The varieties were Bessie Brown, Pharisaer, Lady Ashtown, Mrs. T. Roosevelt, Leslie Holland, Mme. Jules Gravereaux, White Maman Cochet, Mons. J. Hill, Mr. J. Bateman, Lyon Rose, Kaiserin A. Victoria, and Mrs. A. E. E. Coxhead. 2nd, Messrs. ALEX. DICKSON AND SONS, LTD., for G. C. Waud, Mildred Grant, Countess of Annesley, Countess of Derby, Bessie Brown, Mabel Drew, Mrs. W. J. Grant, and others.

In the smaller class Mr. HENRY DREW had the best of five exhibits. He showed Mme. Jules Gravereaux, W. R. Smith, Mme. Constantine Soupert, Mrs. Hubert Taylor, Medea (yellow), and Alex. Hill Grey (a darker yellow than the preceding). 2nd, Messrs. D. PRIOR AND SONS.

PERPETUAL FLOWERING DECORATIVE ROSES.

In this section the best 9 baskets of cut Roses were shown by Messrs. G. PAUL AND SON, Cheshunt; their blooms of Lady Ashtown, Joseph Hill, Mollie Sharman Crawford, Marquise de Sinety, and Lyon Rose were all excellent. 2nd, Mr. JOHN MATTOCK. For five baskets Messrs. CHAPLIN BROS. excelled with such beautiful varieties as Lyon Rose, Duchess of Wellington, Pharisaer, Mme. Abel Chatenay, and George C. Waud. Other 1st prize winners in this section were (a) Mr. JOHN MATTOCK, for 18 varieties, shown in vases; (b) Mr. W. BENTLEY, for 9 varieties, shown in vases; (c) Mr. E. J. HICKS, for 16 varieties, shown in two exhibition boxes.

DECORATIVE ROSES.

The classes for decorative Roses enabled growers to make large displays of their specialities. In three classes the number of varieties were stipulated, and a given space allotted. For 36 distinct varieties, arranged in a space measuring 14 feet by 3 feet, Mr. JOHN MATTOCK won the A. G. Turner Challenge Cup; the best exhibit of 18 distinct varieties, in a space not exceeding 14 feet by 3 feet, was displayed by Mr. E. J. HICKS; whilst Messrs. W. SPOONER AND SON had the winning stand of 18 varieties of summer-flowering Roses.

Mr. JOHN MATTOCK exhibited the best 9 varieties of new decorative Roses, Messrs. F. CANT AND CO. the best 12 varieties of dwarf Polyantha Roses, and Mr. E. J. HICKS the best 12 varieties of Wichuraiana Roses.

The imposing exhibits of groups of Roses arranged in Class 22 were arranged on the ground. Messrs. HOBBIES, LTD., Dereham, excelled with a pretty collection, in which Ramblers gave grace and lightness over a ground of the larger H.P., T. and H.T. varieties. 2nd, Messrs. G. PAUL AND SON.

The group of cut Roses arranged by Messrs. W. AND J. BROWN, Peterborough, on a table space measuring 33 feet by 3 feet, was amongst the finest exhibits in the show, and included a very comprehensive collection of varieties.

For a smaller exhibit of cut Roses arranged on staging Messrs. G. JACKSON AND SON were awarded the 1st prize.

AMATEURS' CLASSES.

The Champion Trophy, which is open to all amateurs, and is offered for the best collection of 36 blooms of distinct varieties, induced a splendid competition. The 1st prize was won by FRANKLIN DENNISON, Esq., who showed a collection of blooms but little inferior to the winning exhibit in the premier open class. Mr. DENNISON'S examples of such varieties as Oberhofgartner Terks, Mrs. Welch, William Shean, Mrs. Myles Kennedy, and Lady Myra Beauclerc were all that could be desired. Mr. DENNISON also won the 1st prize for 24 distinct varieties. In this class he included excellent blooms of Florence Pemberton, Her Majesty, Mabel Drew, Bessie Brown, and Suzanne Marie Rodocanachi.

The nine blooms of Avoca which won the 1st prize for Dr. T. E. PALLETT in the class for any one variety were almost perfect. The 2nd prize was awarded Mr. A. HILL GRAY, who showed a splendid set of Florence Pemberton.

In the premier class for growers of fewer than 3,000 plants of exhibition varieties the quality of the blooms were not so high. The 1st prize was awarded to Mr. W. ONSLOW TINES; but the nine blooms of Dean Hole, which won the 1st prize in Class 42 for Mr. E. E. EVERSFIELD, were excellent. This variety was shown largely throughout the amateurs' classes, and in excellent condition.

The Ben Cant Memorial Prize, which is restricted to growers of fewer than 2,000 plants of exhibition varieties, was won by Mr. W. J. THORPE, whose 24 blooms included fine examples of Hugh Dickson, Mildred Grant, and Mrs. Foley Hobbs.

The President's Prize for the best collection of 12 blooms exhibited by growers of fewer than 1,000 plants of exhibition varieties was responsible for a large number of very meritorious blooms. Dr. C. LAMPLOUGH, who won the Silver Cup, showed an excellent dozen blooms, those of Mrs. J. Grant, Florence

Pemberton, Mrs. T. Roosevelt, Mrs. Foley Hobbs, and Madame Jules Gravereaux being equal to any others in the show. In this division Dean Hole, shown by Mr. L. S. Pawle, was placed first in the class for six blooms of any Rose except T. or N.; whilst in the division restricted to growers of fewer than 750 plants Frau Karl Druschki was similarly placed.

The vases of Roses in the amateurs' classes were for the most part tastefully arranged, and contained exceedingly good blooms.

The collection of seven distinct varieties of exhibition Roses which was placed first in Class 87 included very fine blooms of Lyons Rose and Mrs. John Laing.

Amongst the five varieties which won the first prize in the next class for Mr. J. Hart there was a splendid vase of Souvenir de Pierre Notting.

The bamboo stands of rambler Roses were generally effective, and several which were filled with such varieties as American Pillar were very charming.

Decorated Dinner Tables.

The entries in both the open and the amateur classes were unusually numerous, and the long rows of tables, each measuring 6 feet by 4 feet, were very attractive. Pink Roses were chiefly used, and although this choice was, from a prize-winning point of view, wise—the white canvas walls and roof of the tent made red Roses look garish and the lighter shades insipid—the display only just escaped being monotonous. In our report of last year's shows, when we noted the overwhelming use of the single-flowered variety Irish Elegance, we suggested that the society would probably consider the advisability of making two classes for the amateurs' dinner-table decorations. This suggestion was adopted, and has proved to be very popular with the exhibitors. Perhaps influenced by last year's preponderance of Irish Elegance, several exhibitors made good use of other varieties in the class restricted to Single-flowered Roses, but the variety named again won the chief prizes, although other tables, notably that decorated with Blush Rambler, ran them very close. It was interesting to note the variability of Irish Elegance; in the 1st Prize table, arranged by Mrs. E. M. Burnett, the buds as well as the outer-petals of the mature flowers were of an unusually reddish tint; while the flowers in Mrs. F. P. Woods' 2nd prize exhibit were considerably paler.

Miss M. West arranged the most successful table in the class in which the single-flowered Roses are debarred and cleverly toned the Richmond Roses with the free use of foliage; in the 2nd Prize table, arranged by Mrs. G. C. Sawday, pink Roses were used; a few sprays of the pale green foliage of a rambler variety struck a jarring note in an otherwise admirable exhibit. Mrs. A. Bide won the 1st Prize in the Open Class with an exceedingly artistic arrangement; 2nd, Mrs. F. M. Bradley.

The general effect of the Decorative Classes suffered somewhat from the almost universal use of one variety of Rose; occasionally an exhibitor placed a small-flowered Wichuraiana hybrid with a Hybrid Tea variety, but the contrast in size and form was not pleasing. Nevertheless, some at least of the many exhibitors should be quite capable of filling bowls and vases with three or four, or even more, distinct varieties in an attractive manner. Too often the flowers were arranged in a very formal fashion, and in several 1st prize exhibits it was only the accompanying sprays of buds and tinted foliage which saved them from mediocrity.

New Roses.

Although the tent set aside for the new seedling Roses was twice as large as that of last year the fascination of the novelties was so great that throughout the afternoon Rose enthusiasts were formed up in a long queue waiting, more or less patiently, their turns to enter. The most severe critic could not accuse the judges of lightly bestowing their awards, for of the many exceedingly meritorious seedlings presented only three received the coveted Gold Medal. There were nine Silver-gilt Medals, and a like number of Cards of Commendation also awarded.

Gold Medals.

Queen Mary (*H.T.*) (see fig. 21).—A very distinct bloom somewhat suggestive of the fragrant Juliet, but more globular in shape. The combination of bright pink with the pale golden reverse is enhanced by the golden centre of the flower in this most delightful variety. Shown by Messrs. Alex. Dickson and Sons, Ltd.

Brilliant (*H.T.*).—A very striking dark red variety: the centres of the bread, stout petals have a streak of purplish magenta, which is uncommonly effective. The young foliage is prettily tinted, and the blooms are borne on long, stout stems. Shown by Messrs. Hugh Dickson, Ltd.

Mrs. James Lynas (*H.T.*).—The flowers of this fascinating Rose are large and pointed, the centres are of medium pink colour, which fades to nearly white on the bread expanded petals. Shown by Messrs. Hugh Dickson, Ltd.

Silver-gilt Medals

Rose Mrs. Ambrose Ricardo (*H.T.*).—The round lemon-coloured blooms are flushed with pink at the base; briefly, this variety may be described as being a slightly-improved Madame Jules Gravereaux. Shown by Messrs. S. McGredy and Son.

William Cooper (*H.T.*).—A very sweetly-scented Rose, which has broad petals of a charming deep, cherry-red colour. It has a robust habit, and is said to be a splendid garden Rose.

Mrs. J. W. Parker (*H.T.*).—The blooms of this variety are large and full; the base of the petals is tinted with green, and the centre of the flowers flushed with pink.

Ulster Gem (*H.T.*).—An unusually large-petalled single variety with a very small eye; colour yellow.

Muriel Dickson (*H.A.*).—Next to Queen Mary this very attractive hybrid Austrian Briar Rose was the general favourite amongst the visitors. Unfortunately it has but little scent. The large petals are of a bright cerise colour.

Mrs. Hugh Dickson (*H.T.*).—A deliciously-scented, full flower with a lemon-yellow centre. This and the four previous varieties were shown by Messrs. Hugh Dickson, Ltd.

Red Letter Day (*H.T.*).—A nearly single variety with charming velvety petals, much like Ulster Standard, but with more petals.

Conway Jones (*H.T.*).—A highly-scented, almost scarlet Rose: the flower is very full, and has recurved petals. Both were shown by Messrs. Alex. Dickson and Sons.

Mrs. George Norwood (*H.T.*).—The medium pink shade of this deliciously-scented variety is very like that of the popular Mrs. John Laing, except that it is a trifle brighter. Shown by Mr. Elisha J. Hicks.

Cards of Commendation.

Rose Duchess of Abercorn (*H.T.*), *Mrs. Godfrey Brown* (*H.T.*), *Mrs. Wm. Sargent* (*H.T.*), all shown by Messrs. Hugh Dickson, Ltd.; *Naarden* (*H.T.*), shown by Mr. G. A. van Rossen; *J. F. Barry* (*H.A.*), shown by Mr. G. W. Piper; *Moyna* (*H.T.*), shown by Messrs. Alex. Dickson, Ltd.; *Mary Greer* (*H.T.*), shown by Messrs. Alex. Dickson, Ltd.; *Freda Welter* (*P.*), shown by Mr. H. Welter; *Pink Pearl* (*Climbing H.T.*), shown by Messrs. Hobbies, Ltd.

Premier Blooms.

nurserymen's classes.

Tea or Noisette.—Mrs. Edward Mawley. Shown by Mr. George Prince.

Hybrid Tea.—George Dickson. Shown by Messrs. Frank Cant and Co.

Any Other Variety.—Mrs. John Laing. Shown by Messrs. R. Harkness and Co.

amateurs' classes.

Tea or Noisette.—Mrs. Foley Hobbs. Shown by C. C. Eversfield, Esq.

Hybrid Tea.—Aveca. Shown by Dr. Pallett.

Any Other Variety.—Horace Vernet. Shown by A. Foley Hobbs, Esq.

WOLVERHAMPTON FLORAL FÊTE.

July 8, 9, 10.—The Wolverhampton Flower Shows have reached an importance equal to that of any provincial exhibition with the exception of Shrewsbury. On Tuesday last, on the occasion of the judges' luncheon, Alderman Craddock, who has been a committeeman during the twenty-five years since the Society was established, referred to the assistance which he received in the early days from Mr. Naunton, and he (Alderman Craddock) then determined not to rest content until his Show was equal to that of Shrewsbury. Working with this fine spirit, it is not surprising to find the committee getting nearer to their ambition, year by year, and it is certain this year's show was much the best of the series. The entries numbered 900, a great advance on last year, and everything on the first day pointed to the attendance being a record. Like Shrewsbury, Wolverhampton is indebted to its flower shows in more ways than one. Upwards of £8,000 has been contributed from the profits for the improvement of the parks and open spaces of the town, and it is to the efforts of the committee that the borough is indebted for the conservatory in the West Park, the greenhouse at the East Park, the shelter and seats there, and for assistance in the provision of the children's playground at Blakenhall and the open space round St. Peter's Church. The West Park is an ideal site for the holding of a flower show, and just now it is looking its very best. Roses and other flowers were no less charming features out-of-doors than in the competitive area enclosed by the tents.

Groups of Plants.

The sum of £100 was offered as prizes in a class for a display of miscellaneous flowering and foliage plants arranged in a space of 30 feet by 14 feet. Three exhibits were forthcoming, and each was worthy of the excellent exhibition. The 1st prize was won by Messrs. James Cypher and Sons, Cheltenham, for one of the finest groups we have seen at this or any other show. It was characterised by lightness and bright colouring, and was arranged by a master hand in grouping. Foils of tall Codiæums and stands of Orchids served to break the formality, whilst the ground was studded with splendid specimens of fine-leaved and beautifully flowered exotics. The back was crowned with a magnificent Kentia, in front of which was a rustic archway furnished with bright flowers and foliage. The 2nd prize was awarded to Sir G. H. Kenrick, Edgbaston (gr. Mr. J. V. Macdonald), for a more solid arrangement but splendid nevertheless, and composed of excellent specimens of a variety of subjects. Orchids were employed freely, and these gave just the necessary touch of bright colour, to make a harmonious blending with the fine foliage plants. Miltonias, Epidendrum vitellinum, Cattleyas, Masdevallia Harryanum, Odontoglossums, Thunia Marshalliana, and Phalænopsis grandiflora were all shown excellently. The 3rd prize was won by Mr. W. A. Holmes, Chesterfield, for a remarkably good exhibit, in which Caladiums, Codiæums, Dracænas, Ixoras, Lantanas, Polyantha Roses, Francoa ramosa and Liliums were prominent subjects.

The class for a group of ornamental foliage plants arranged in a space measuring 250 square feet attracted four competitors. The groups were arranged along the side of the principal tent, opposite those in the preceding class, and presented a magnificent spectacle. Messrs. Cypher again excelled, but they had worthy rivals in the other competitors, for all showed finely. Messrs. Cypher's plants were of excellent quality, and the group was especially rich in brightly-coloured Codiæums. The ground was a splendid conception of bright colours mingled with banks of moss-like Ferns, the more sombre greys and metallic greens of Anthuriums and Dracænas, lightened here and there with tall specimens of Veitchii, Eulalia lucida variegata, and other graceful plants. The 2nd prize was awarded to Sir G. H. Kenrick, whose magnificent display included a central archway; not obtrusive, furnished with a Phœnix Palm in the centre, and grouped with Caladium argyrites, Begonia Rex, Selaginella and fine plants of Anthurium Veitchii and A. Warscewiczii. In the body of the groups were showy plants of Nandina domestica, Caladiums, Codiæums, Ferns and Saxifraga sarmentosa. 3rd, Mr. W. A Holmes.

For a group of flowering plants of one kind only 5 competed, the subjects employed being Clerodendron fallax, Tuberous-rooted Begonias, Gloxinias and Pelargoniums. The 1st prize was awarded for the Clerodendrons, which were

shown by Sir C. T. Mander, Bart., Tettenhall Wood (gr. Mr. J. F. Simpson). There were 50 plants, and each bore a good inflorescence of the showy red blossoms. But we preferred Messrs. Blackmore and Langdon's Begonias, which were placed 2nd. These beautiful flowers never appear so effective massed on the ground as on a table, but this group merited attention, as much for the splendid quality of the flowers as for their delicate tints. 3rd, Mr. J. E. Knight, Wolverhampton, for standard-trained Pelargoniums.

The class for a collection of decorative plants and bunches of cut flowers was well contested. Messrs. Cypher and Sons won the 1st prize, their fine Orchids contributing largely to their success, whilst the flowers were set off by stately Codiæums. 2nd, Mr. W. R. Manning, Dudley, who also employed Orchids extensively.

Messrs. James Cypher and Sons were also successful in the class for 20 plants in pots not exceeding 10 in. in diameter, beating two other exhibitors. The best of these large specimens were Stephanotis floribunda, Statice intermedia, Ixora Williamsii, Anthurium Scherzerianum, Clerodendron Balfouri and Erica ventricosa Bothwelliana. The 2nd prize was awarded to Sir C. T. Mander, Bart., whose plants included Gloriosa superba, Allamanda Williamsii, Hydrangea Mme. Moullieré, Acalypha hispida, various Codiæums, Palms, and Dracænas. 3rd, Mrs. H. Mander, Wolverhampton (gr. Mr. C. Weaver).

So excellent were the Gloxinias staged by Mr. G C. Manda, Wightwalk (gr. Mr. J. Dickson), in a class for 12 plants, that the judges awarded a Cultural Commendation, in addition to the 1st Prize.

Mr. F. Taylor showed best in the class for 12 flowering Begonias. Mr. E. Shaw-Hellier, Wombourn (gr. Mr. Parnwell), won the 1st Prizes in the classes for 12 trusses of single, and 12 trusses of double zonal Pelargoniums respectively.

Mr. John E. Knight, Wolverhampton, was the only exhibitor in the new class for a display of growing bedding-out plants. The arrangement was in the style of an old English garden, with archways of climbing Roses, leading by a flagstone pathway to a pool containing Nymphæas, with beds of Begonias, Verbena Miss Willmott, and early-flowering Chrysanthemums around. The 1st prize was awarded.

Two excellent groups of plants were shown in the Amateurs' Classes, the better by Mr. J. A. Kenrick, Edgbaston (gr. Mr. A. Cryer), who was awarded the 1st Prize. The centrepiece was a stand built up with Humeas, Liliums, Codiæums, Orchids, and crowned with a Palm; whilst this was grouped with Orchids, Dracænas. Begonias, Streptocarpuses, Caladiums, Ixoras and other stove plants; 2nd, Mr. H. C. Prince, Harborne (gr. Mr. J. Corbett).

Roses.

The 1st prize in the class for 72 blooms, distinct, was won by Messrs. Ben. R. Cant and Sons, Colchester, who thus repeated their success at the National Rose Society's Show in the previous week. The blooms were equal in merit to those they showed at Regent's Park. We may single out the varieties St. Helena, Mrs. Amy Hammond, Hugh Dickson, Maman Cochet, Bessie Brown, Mrs. J. H. Welch, Victor Hugo, Lieutenant Chaure, Dean Hole, Comte de Raimbaud, and Mildred Grant as the pick of this splendid collection 2nd, Messrs. R. Harkness and Co., Hitchin, who had Avoca, Mildred Grant, Lieutenant Chaure, Horace Vernet, Mrs. W. J. Grant, and Mrs. Edward Mawley in fine condition. 3rd, Messrs. Perkins and Sons, Coventry.

In the smaller class for 36 varieties, distinct, Mr. W. H. Frettingham, Nottingham, had the best of eight exhibits. This exhibitor had magnificent blooms; there was not a weak flower in the whole three dozen. The specimen of Mrs. Myles Kennedy was conspicuous for its size and general good quality. Other varieties that deserved mention are Mme. Jules Gravereaux, Claudius, Queen of Spain, Alice Lindsell, Mrs. Foley Hobbs, La France (1898), and Mildred Grant. 2nd, Messrs. B. R. Cant and Sons, Colchester. 3rd, Messrs. R. Harkness and Co., Hitchin.

There were five classes for baskets of Roses. The most important one was for nine baskets, each containing a distinct variety. The 1st prize was won by Messrs. Hugh Dickson, Ltd., Belfast, for the varieties William Cooper, Mrs. James MacKellar, Golden Gem, Countess Clanwilliam, Archie Gray, Blush Queen, Mrs. Mona Hunting, Mrs. James Lynas, and Mrs. James Williamson. Equal 2nd prizes were awarded to Mr. J. Mattock, Headington, and the King's Acre Nurseries, Ltd., Hereford.

The best exhibit of five baskets was shown by Messrs. Hugh Dickson, Ltd., who also showed the best single basket of a dark variety in their new Brilliant and the best single basket of a light coloured variety in the blush-pink Mrs. James Lynas.

In the class for 12 new Roses, distinct, Mr. J. Mattock, Headington, excelled with the varieties Mrs. W. H. Rowe, Edward Mawley, Mrs. H. Taylor, His Majesty, St. Helena, Earl of Gosford, Nita Weldon, Claudius, Mrs. Foley Hobbs, Elizabeth, Mrs. Maynard Sinton, and Mrs. J. H. Welch, none of these being in commerce previous to 1909. 2nd, Messrs. B. R. Cant and Sons.

Mr. John Mattock excelled in the class for 18 Tea varieties, followed by Messrs. Frank Cant and Co., with the King's Acre Nurseries, Ltd., 3rd.

Mr. Frettingham showed best in the class for 18 blooms of perpetual-flowering varieties; whilst Mr. H. Dickson was easily first for nine distinct varieties of any perpetual-flowering Roses, his vase of Countess of Granard being splendid.

Messrs. Gunn and Sons, Olton, led for a collection of Roses arranged in a space measuring 12 feet by 4 feet. The only other exhibitor, Mr. John Mattock, was awarded the 2nd prize. Both these collections were excellent.

In the local class for 12 Roses, distinct, the 1st prize was won by Miss Leek, Shifnal.

In the Amateurs' Classes, the principal prize-winners were Mr. F. Dennison, Leamington, Mr. G. Speight, Market Harborough, and Mr. F. Foley Hobbs. Mr. Dennison won in the classes for 36 blooms distinct, and 12 blooms distinct; and was placed 2nd for 6 distinct varieties, in which class Mr. Speight excelled. Mr Hobbs had the premier collection of 24 blooms, distinct.

Sweet Peas.

The Society offered prizes for exhibits of 18 varieties of Sweet Peas arranged on spaces measuring 8 feet by 4 feet. The competitors included Sir R. C. Baker, Bart., Blandford (gr. Mr. A. E. Usher). It was not surprising to find this well-known exhibitor occupying the first place in most of the Sweet Pea classes. In the class for 18 bunches Mr. Usher won, but he met keen rivals, especially in Captain G. Lubbock, Warminster (gr. Mr. J. B. Lowe), who was placed 2nd, and Mr. F. J. Bealing, Southampton, 3rd. Sir R. Baker's fine stands of Lavender George Herbert, Maud Holmes, Audry Crier, Barbara, Marks Tey, and Etta Dyke, were greatly admired.

Sir Randolf Baker also won the first prize in Mr. Robert Sydenham's class for nine distinct varieties, in which Mr. L. Webb, Welshpool, was placed 2nd.

In Messrs. Webb's class for six bunches Mr. W. H. Holloway, Shrewsbury, won easily with splendid bunches of Elsie Herbert, W. P. Wright, Sunproof Crimson, King Manoel, Dazzler, and Hercules; 2nd, Sir Randolf Baker, Bart., whose orange and pink varieties—Barbara, Edrom Beauty and Anglian Pink—were magnificent.

Sir Randolf Baker won the first prize for Sweet Peas in a class open to amateurs and gentlemen's gardeners.

Carnations.

The best display of Carnations arranged on a space measuring 12 feet by 4 feet was exhibited by Mr. Chas Wall, Bath. The blooms were massed, but not too densely, and they were borne on long stems, with a setting of Asparagus Sprengeri beneath them. The beautiful salmon-pink Mrs. C. W. Waud was conspicuous amongst other choice varieties; 2nd, Messrs. Blackmore and Langdon, whose group was broken by the inclusion of bamboo epergnes.

The finest Souvenir de la Malmaison varieties were shown by Lady Grey, Stourbridge (gr. Mr. F. Green).

Hardy Flowers.

Messrs. Harkness and Sons, Bedale, had an easy win in the class for an arrangement of hardy border flowers, in which there were three exhibitors. Oriental Poppies contributed largely to make the exhibit so striking, together with Gaillardias, Delphiniums, Lupins, Gladioli Colvilei, English Irises, Verbascums and Iceland Poppies. 2nd, Messrs. G. Gibson and Co., Leeming Bar, Yorkshire. 3rd, Messrs. F. Smith and Co., Woodbridge.

Messrs. Blackmore and Langdon, Bath, showed the best exhibit of Delphiniums in a class for a collection of these stately border flowers, whilst Sir C. T. Mander, Bart., excelled in the class for seedling Delphiniums with a new white variety.

The finest exhibit of Pansies and Violas was staged by Mr. A. R. Dempster, Kidderminster.

Fruit.

There were two exhibits in the class for a collection of 12 dishes of dessert fruit in not fewer than 9 distinct kinds, and a magnificent exhibit by Lord Savile, Ollerton (gr. Mr. J. Doe), was awarded the 1st prize. This splendid collection included large, finely-coloured bunches of Madresfield Court Grapes—two splendidly matched bunches; very large bunches of Black Hamburgh, uncommonly good Buckland Sweet Water, and rather green-berried Muscat of Alexandria; also Pineapple, Nectarines, Early Grosse Mignonne and Stirling Castle Peaches, Brown Turkey Figs, Lady Sudeley Apples, Early Transparent Gage Plums, Queen of the West Melon and superb berries of Royal Sovereign Strawberries.

The Duke of Westminster, Eaton, Chester (gr. Mr. N. F. Barnes), was the only exhibitor in the new class for a collection of 30 dishes of fruit in not fewer than 10 distinct kinds, arranged on a table decorated with flowers. This imposing exhibit of high quality fruit was awarded the 1st prize. There were of Grapes Black Hamburgh, Madresfield Court, Muscat of Alexandria, Muscat Seedling and Buckland Sweetwater; Lord Napier and Elruge Nectarines, Royal George and Violette Hâtive Peaches, Jefferson Plums, Brown Turkey Figs, Royal Sovereign Strawberries, magnificent Marguerite Marillat Pears, Triomphe de Vienne Pears, James Grieve and Rival Apples and Melons. The decorations were mauve-coloured and white Carnations, Thalictrum and Oncidiums, with sprays of Asparagus.

For a collection of 6 varieties of fruits the Duke of Westminster again excelled, with produce of sterling quality, daintily decorated with pink Carnations and sprays of the mauve-coloured Thalictrum. Lord Savile, the only other exhibitor, was awarded the 2nd prize for a good collection.

The best four bunches of black and white Grapes were shown by Lord Savile; the best two bunches of white Grapes (Muscat of Alexandria) by the Duke of Westminster, and the best black Grapes by Lord Savile, who had excellent bunches of Black Hamburgh.

Vegetables.

The exhibits of vegetables were good, but not so numerous as might be expected for so important a show. For a collection of ten kinds of vegetables, distinct, the 1st prize was awarded to the Marquis of Northampton, Castle Ashby (gr. Mr. A. R. Searle), for fine Marrowfat Peas, Emperor Tomatos, Reliance Globe Beets, Defiance Intermediate Carrots, New Supreme French Beans, Early Mammoth Cauliflowers, Green-striped Marrow, Colonist Potatos, and Commander Cucumbers. 2nd, H. Andrews, Esq., Winchcombe (gr. Mr. J. R. Gorley).

Messrs. Sutton and Sons offered prizes for a collection of six kinds, and five competed. The 1st prize was won by the Marquis of Northampton, who showed Perfection Tomatos, May Queen Potatos, Favourite Carrots, Centenary Peas, Purity Cauliflowers, and White Leviathan Onions. 2nd, Mr. E. Winchester, Birmingham.

Messrs. Edward Webb and Sons offered prizes in two classes, for eight and six kinds respectively. In the larger class the Marquis of Northampton again excelled; his Stourbridge Marrowfat Peas and Conqueror Tomatos were both excellent. 2nd, Mr. E. Deaken, Hay Mills.

H. W. Smith, Esq., Stourbridge (gr. Mr. H. Davis), was placed 1st in the smaller class with a moderate display.

Non-competitive Exhibits.

Messrs. Pipers, Bayswater, furnished a space of nearly 3,000 square feet in the largest tent with a garden scheme representing a fine herbaceous, Alpine and water garden. This exhibit was a show in itself. Three large bays were planted with Liliums, Spiræas, Delphiniums, Gaillardias, and other border flowers, and next was a rockery that led to two pools planted with Nymphæas, and at the back of these were outcrops of stonework gay with Alpines in flower. The group was completed with a bog garden and several beds of flowers cut in the turf.

In the same tent Messrs. Pipers showed specimens of topiary. (Large Gold Medal.)

Messrs. Edward Webb and Son, Stourbridge, were awarded a Gold Medal for a magnificent exhibit of flowers, fruits and vegetables. Arches furnished with Sweet Peas were a feature of this fine collection, which included good Melons, Tomatos, Peas, Cucumbers, Onions, Potatos, and other produce grown from seeds.

Messrs. Sutton and Sons, Reading, had one of the finest non-competitive exhibits in their collection of Sweet Peas, for which a Special Gold Medal was awarded. This magnificent exhibit was the feature of the Sweet Pea tent, and included some eighty varieties.

Messrs. Dobbie and Co., Marks Tey, were awarded a Gold Medal for Sweet Peas. There were ninety vases, representing about 60 varieties, including King White; New Marquis, rosy-mauve; Ruby Palmer, rich ruby red; Mrs. McIlwrick, mauve and pink; Blue Picotee, white, faintly-edged with purple; and Queen of Spain Spencer, shell pink; all of which are novelties. This firm also exhibited Violas and Collcrette Dahlias.

Messrs. W. H. Simpson and Sons, Birmingham, showed varieties of Sweet Peas, for which a Silver Medal and a Certificate of Merit were awarded.

Sweet Peas were also shown by Messrs. E. W. King and Co., Coggeshall, Essex (Silver-Gilt Medal); and Miss Hemus, Upton-on-Severn (Silver Medal).

Mr. A. F. Dutton, Iver, Buckinghamshire, showed Carnations. (Gold Medal.) Lady Grey, Enville Hall, Stourbridge, also showed Carnations, for which a Silver Medal was awarded.

Mr. H. J. Jones, Ryecroft, Lewisham, showed splendid border Phloxes. It was a massive group of fine colours well blended for colour effect, and all the plants were growing in pots. (Gold Medal.)

Messrs. Young and Co., Hatherley, were awarded a Silver-Gilt Medal for a grand exhibit of perpetual-flowering Carnations.

Messrs. Godfrey and Son, Exmouth, staged Canterbury Bells of a good strain. (Silver Medal.)

Mr. William Lowe, Beeston, Nottinghamshire, showed Roses, for which a Silver Medal was awarded.

Messrs. Dicksons, Chester, exhibited border flowers on a table space 40 feet long, for which a Silver-Gilt Medal was awarded.

Messrs. Forbes, Ltd., Hawick, displayed Pentstemons, Delphiniums, Phloxes, and border Carnations. (Silver-Gilt Medal.)

Mr. W. A. Manda, St. Albans, showed hardy Cacti, Ferns, and Orchids. (Bronze Medal.)

Miss S. Thompson, Handsworth, exhibited cactaceous plants. (Bronze medal.)

Messrs. Jarman and Co., Chard, showed Sweet Peas, Roses, Pelargoniums, and Centaureas. (Silver Medal.)

Mr. H. N. Ellison, West Bromwich, had greenhouse Ferns in variety. (Silver Medal.)

LINNEAN.

June 19.—The President announced that a dinner would take place on Thursday, October 30 next, at 7 p.m., to inaugurate the new session, and that details would be circulated in due course.

Dr. C. E. Moss introduced the recent discoveries of varieties in Britain of certain plants, instancing three varieties of Populus nigra and as many of Alnus glutinosa, Ranunculus ficariæformis, Primula scotica var., Lyceum barbarum confused with L. chinense, both of which occur, and the Orchids Gymnadenia Wahlenbergii and G. densiflora, both figured by Reichenbach.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

June 5.—*Committee:* Messrs. Z. A. Ward (in the chair), H. Thorp, J. Evans, D. McLeod, Dr. Hartley, J. Bamber, C. Parker, G. Weatherby, A. J. Keeling, W. Shackleton, A. G. Ellwood, J. Lupton, J. Cypher, and H. Arthur (secretary).

A *Large Silver-Gilt Medal* was awarded to Mr. R. Ashworth, Newchurch (gr. Mr. Gilden), for a miscellaneous group, and Messrs. Armstrong and Brown, Tunbridge Wells, for a mixed group.

A *Large Silver Medal* to Mr. A. Warburton, Haslingden (gr. Mr. Dalgleish), for a miscellaneous group.

Silver Medals to Messrs. Cypher and Sons, Cheltenham; the Liverpool Orchid and Nursery Co.; and Messrs. A. J. Keeling and Sons, Bradford.

Other exhibitors were: Mr. O. O. Wrigley, Bury (gr. Mr. Rogers); Mr. Z. A. Ward, Northenden (gr. Mr. Weatherby); Col. J. Rutherford, M.P., Blackburn (gr. Mr. Lupton); Messrs. Stuart Low and Co., Enfield; and Messrs. Charlesworth and Co.

NEW AWARDS.

First-Class Certificate.

Coelogyne Pandurata variety, from Messrs. Armstrong and Brown.

Awards of Merit.

Odontioda Vuylsteke "Ashlands" var.; and O. Vertumis, both the property of Mr. R. Ashworth.

LAW NOTE.

RAILWAY AND CANAL COMMISSION.

Increased Rates for Garden Produce.

In the Royal Courts of Justice, before Mr. Justice Bankes, the Hon. A. E. Gathorne Hardy, and Sir James Woodhouse, Wednesday, July 2, 1913, the S.E. and Chatham Railway Company asked for a day to be fixed for the hearing of their application for leave to raise their rates for merchandise traffic by 4 per cent.

Mr. Lynden Macassey, Counsel for the Railway Company, said: Will your lordship permit me to mention the case of the application of the South-Eastern and Chatham Railway Company, the London, Chatham, and Dover Railway Company, and the South-Eastern Railway Company's Managing Committee? As the Court knows, it is an application for an increase of three different kinds of rates, and, acting on the directions of the Court, we published a notice in *The Times* and various other newspapers, asking all persons who deemed themselves aggrieved by the increase to furnish objections to the Registrar within twenty-one days. In pursuance of that notice, the Registrar, I believe, and the South-Eastern and Chatham Managing Committee have received objections from three persons. One set of objections is sent by Messrs. Elders and Fyffes, Limited. It is a notice to abstain from the proposed increase of rates in respect of banana traffic and certain other kinds of fruit; another is an objection by the Horticultural Trades Association of Great Britain and Ireland, who object to an increase in rates in the case of trees, plants, and shrubs; and then there is another general notice of objection from the Corporation of Reigate. As regards the first two objections I have mentioned, those of Elders and Fyffes, Limited, and those of the Horticultural Association of Great Britain and Ireland, they seem to me, as far as I can understand them, to be notices rather in respect of through traffic than in respect of the local traffic, to which alone our application to this Court relates. I should tell the Court that under Section 30 of the Act of 1899 we are, of course, precluded from raising our rates on our own line until we obtain the prior approval of the Court. It seems to be suggested by some of these objections that Section 30 of the Act of 1899 applies not merely to local rates, but to through rates which are quoted and charged by other companies for traffic on their line on to our line, and in the reverse direction. That, of course, is a view which the Managing Committee do not accept, and, anyhow, it is a view, if there is any issue between the parties on that score, which will not be adjudicated upon by this Court; it will be a matter for the Court of Chancery to restrain the South-Eastern Company, or to grant the complainants any remedy that they think fit. But, so far as this application is concerned, it purely relates to local traffic on the South-Eastern and Chatham Managing Committee's system, and not all local traffic, but local traffic of two kinds—merchandise traffic between competitive local stations, and also merchandise traffic by passenger trains—at company's risk and at owner's risk. My application now is to ask the Court to fix a day for the hearing of this application. I am in a little difficulty about the objections by Messrs. Elders and Fyffes and by the Horticultural Trades Association. No doubt we can ascertain between this date and the date which the Court may fix for the hearing what exactly their position is—whether they are objecting to through rates with this particular traffic, or to local rates.

Sir James Woodhouse: Are they here now?

Mr. Veitch: I appear for Elders and Fyffes and for the Horticultural Trades Association.

Mr. Justice Bankes: You hear what the learned counsel says, that the objection seems to be with reference to through rates.

Mr. Veitch: I do not admit that for one moment. There is nothing in this objection to show that it relates to either through rates or local rates, one or the other; it applies to both.

Mr. Lynden Macassey: No doubt the difficulty arises in this way: There were two notices which were published by the South-Eastern and Chatham Managing Committee; there was first the notice in respect of the increase of the local rates to non-competitive stations, and there was the other notice which was published by them in conjunction with all the other railway companies in respect of through traffic. The notices of objection we have heard appear to relate to both those rates, and, of course, my friend is entitled by Act of Parliament to bring, as far as the local rates are concerned, any objection before the Court. It may be a question of convenience afterwards for the Court to say whether, if there is to be a case for the consideration of the increase of local banana rates and also a case to consider the question of the increase of through banana rates, whether both those cases might not more conveniently be dealt with at one and the same time.

Mr. Justice Bankes: You are only asking now for an increase in the local rates.

Mr. Lynden Macassey: That is all.

Mr. Justice Bankes: That would be the only point before us in your application.

Mr. Lynden Macassey: That will be so, but, of course, if the question of the increase of the through banana rates is to be raised under the Act of 1894, it would seem to be a little inconvenient that a case involving very much similar circumstances should be tried by the Court at different times. Probably an arrangement might be come to by which both those might be taken by the Court on one occasion. Of course, I cannot bind the advisers of Messrs. Elders and Fyffes.

Mr. Veitch: Of course, this is a case of very great importance, because, although it is only an application of the South-Eastern and Chatham Managing Committee, at the same time it may create a very serious precedent in the case of the other railway companies, who are not obliged to come to this Court in the first instance.

Mr. Justice Bankes: That leads me to make this suggestion. I have been looking at the recent Act, and that Act contemplates in one of its provisions that this Court would make an order which shall give persons the opportunity of the matter being reconsidered, that it should be an order not necessarily applicable for all time, but

it should be an order with liberty to apply, or an order, we will say, for a certain number of months. It has occurred to me whether, from the point of view of these objectors, it would suit their case better for the Court to make an order of that kind in the first instance with regard to your company, which would give them, of course, an opportunity of replying at any later stage if they were so advised.

Mr. Veitch : I am very anxious that the railway companies now should justify the increase in rate rather than put upon me some months hence the onus of showing why the Court should retrace its steps.

Mr. Justice Bankes : You wish to maintain your objection.

Mr. Veitch : If your lordship pleases.

Mr. Justice Bankes : Very well. Of course, that being so, we must deal with it. If you want a decision before the Long Vacation I think you will have to take Tuesday, the 15th.

Mr. Veitch : Will your lordship make it two or three days later. In this case we have to go into an enormous number of railway accounts over a series of years, and work of preparation will be very heavy.

Mr. Justice Bankes : I quite follow that, but we must, in fairness to the railway company, consider this before the Long Vacation if we can. I partly threw out the suggestion I did because I realised the difficulty of presenting this case in anything like detail in the short time at your disposal, but if you want to do it we must do it. I cannot promise the following Monday because I may have to sit in the Court of Criminal Appeal. Therefore, I must begin it that week; and it is much more convenient for my other work that I should begin on Tuesday, at the beginning of the week, than, perhaps, commence jury work and have to break off and to come here.

Mr. Lynden Macassey : May I say this, if it is at all for the convenience of my friend who appears for Elders and Fyffes, that the South-Eastern Managing Committee are quite prepared, as the objection relates only to a specific class of traffic, to defer the increase of rate on that particular class of traffic until such time as the general increase is adjudicated upon in the case of all the railway companies. My friend is appearing, I understand, to support a complaint against other railway companies for an increase of through rates on this particular banana traffic, and it should all be dealt with at the same time. That would enable a modified form of your lordship's suggestion to be given effect to.

Mr. Justice Bankes : What I think we had better do is, we had better fix Tuesday, the 15th, and meanwhile you have my suggestion before you, and you have now the offer of the railway company, and if between now and the 15th the objectors think that the best course to take, under all the circumstances, is to allow the railway company, if they make out a prima facie case, of course, to take an order which shall be a limited order—that is to say, shall be without prejudice to the liberty to apply—if they think that the best course, then we can dispose of it without much difficulty in a short time.

Mr. Lynden Macassey : Yes, they have my offer on that.

Mr. Justice Bankes : I think that will be the best course, then.

Sir James Woodhouse : Does your offer apply to all the objectors?

Mr. Lynden Macassey : Only one limited class of traffic.

Sir James Woodhouse : But there is also the horticultural traffic.

Mr. Lynden Macassey : I am quite prepared in that case to make the same offer.

Mr. Justice Bankes : Very well, we will fix that day, and you shall all consider your position in the meantime. If the objectors make up their minds that they will not persist in their present objection, but will reserve any objection for some future occasion, they will intimate that to the Registrar, and then we shall know where we stand.

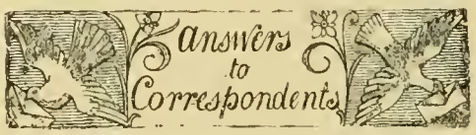
Sir James Woodhouse : Of course, I think it is desirable the objectors should understand that the Court should have the fullest assistance as regards any objections that are going to be taken. If the time is insufficient for that it would be well worth while considering whether the suggestion thrown out by the Court should not be adopted for the purpose of having the matter thoroughly threshed out.

Mr. Veitch : Do I understand Mr. Macassey's offer applies also to through rates? I understand the company's construction is that through rates do not come within Section 30 of the Act of union between the two companies.

Mr. Justice Bankes : You had better discuss that with him; I do not think we have any power. You must deal with that by friendly arrangement.

Mr. Lynden Macassey : I can give no undertaking on behalf of the other companies who are parties to the through rates.

Mr. Justice Bankes : You are not being shut out for all time—that is to say, it is a mere question how far Mr. Macassey has suggested the concession; you must arrange that. All we say is, the date shall be the 15th. You must intimate the position you are going to take up through the Registrar.



Attar of Roses : *E. S.* You will find particulars of the Attar of Rose industry in Bulgaria in *Gardeners' Chronicle*, April 20, 1912, page 252, where it is stated that the Rose cultivated in Bulgaria and East Roumelia is a variety of Rosa Damascena, the red Damask Rose. Around the borders of the plantation either a single or double row of a white Rose is usually planted, a variety of Rosa alba; but the perfume from this variety is not so good as that obtained from the red Rose.

Names of Plants : *G. H. H. W.* Seedling variety of Heuchera sanguinea.—*T. H. R.* 1, Hemerocallis flava; 2, Œnothera fruticosa; 3, Philadelphus coronaria; 4, Campanula latifolia; 5, Tradescantia virginica; 6, Veronica prenja.—*A. W. Williams.* 1, Cistus salvifolius; 2, Cistus corbariensis; 3, Clematis recta.—*J. A. J. Briggs.* 1, Rhus canadensis; 2, Pittosporum tenuifolium; 3, Cedronella triphylla.—*R. T.* 1, Cryptomeria japonica; 2, Cupressus pisifera var. squarrosa; 3, Cedrus Libani; 4, Cupressus Lawsoniana var.; 5, Cedrus Deodara; 6, Tamarix gallica.—*A. W.* Roses : 1, Renée Wilmart-Urban; 2, Madame Ravary; 3, Prince de Bulgarie; 4, Cheshunt Hybrid; 5, Exquisite; 6, Madame Leon Pain; 7, Tuscany; 8, Le Progrès.—*T. Bridge.* Rose Paul Lédé.—*T. Sexton.* Roses Mrs. F. W. Flight (pink), Non plus Ultra (crimson).—*J. W.* 1, Betty; 2, Prince de Bulgarie; 3, Madame Ravary; 4, Gustave Grünerwald; 5, Hugh Dickson; 6, George C. Waud.—*E. B.* Hedysarum coronarium.—*W. H. Euston.* 1, Campanula persicifolia; 2, Melittis Melissophyllum; 3, Salvia Horminum; 4, Salvia rutilans; 5, Oxalis floribunda.—*R. G.* Tragopogon pratensis—*W. T. and Co.* Deschampsia cæspitosa.—*Dublin.* 1, 2, Roses too faded to identify; 3, Geranium ibericum; 4, Buphthalmum salicifolium; 5, Linum flavum; 6, Spiræa Aruncus.—*F. E. G.* Coronilla cappadocica. — *A. B. H.* Iris sibirica var. orientalis alba, and Escallonia hybrid, near exoniensis.—*Gardner.* (a), White, Lychnis alba; (b) mauve, L. coronaria.—*E. W.* Begonia argyrostigma; 2, Begonia President Carnot. The variety Gloire de Lorraine is affected with "rust" due to the presence of mites. Dip the leaves in tobacco water.—*J. H.* 1, Lantana hybrida; 2, Sedum carneum variegatum; 3, Diosma ericoides.—*A. M., Londonderry.* 1, Astrantia major; 3, Claytonia perfoliata.—*R. T. A.* 1, Vanda parviflora; 2, Saccolabium bellinum; 3, Sophronitis cernua. *F. Z., Rotherfield.* 1, Gesneria tubiflora; 2, Stachys lanata; 3, Santolina incana; 4, Geranium pratense; 5, Sedum reflexum; 6, Sedum album.

Peach Leaves : *J. T.* The Peach trees are attacked by the Shothole fungus (Cercospora circumscissa). Spray with the ammoniacal solution of copper carbonate just as the leaves are expanding, and repeat the operation at intervals. A correspondent writing in our pages for October 14, 1905, p. 282, stated that he had used Campbell's sulphur vaporiser against the disease with good results.

Peach Stones Splitting : *F. G. W.* The splitting of the stones is due to some check to the plants, caused most probably by excessive moisture at the roots early in the season. Next spring, if the weather proves very wet, cover the border with spare lights or some other material to ward off the rains. See reply to *J. H.*, p. 444, vol LIII.

Photographing Flowers : *E. P.*—In reply to your inquiry as to the best apparatus for photographing horticultural subjects, it will be found that a half-plate camera, taking pictures 6½ inches by 4¾ inches, is the most useful all-round size, and you should take care to choose one by a good maker. Rigidity is of great advantage, also a long extension—viz., long bellows—so that the front of the camera draws out a very considerable distance. A substantial tripod should be used, and one which has a long sliding joint, such as the "Ashford" stand. It is almost a necessity to have at least two lenses of varying foci, useful sizes being 8 inches and 12 inches. These need not, for plant photography, be of the very high-priced anastigmat variety, the more modest rapid rectilinear, provided it gives perfect definition, even though working at only *f*/8, will serve excellently. A shutter is rarely, if ever, required. The plates used should be orthochromatic (or equally colour sensitive, a term which is by no means accurate, though useful in the sense in which it is used), and these plates should always be backed to prevent halation or spreading of the high lights. There are many varieties of excellent plates, and it is largely a matter of personal choice which is considered the best. Satisfactory results have followed the use of Royal Standard Orthochromatic plates, using, in addition, a yellow light filter where necessary. Personal tuition is the best way of learning how to use the camera, the chief points to master being exposure (which should always be ascertained by the use of an actinometer) and development. No matter how excellent the outfit unless the worker is skilful and painstaking no certain and reliable results can be anticipated.

Rose Trees : *Delta.* The soil mentioned would be suitable for your purpose, especially as you suggest mixing sand and horse manure with it. Do not employ the lowest layer, but some of the stiffer soil, just below the dark loam.

Vines : *E. H.* Your vines are in a very enfeebled condition; the foliage is not of sufficient substance to withstand injury by strong sunlight. The trouble arises from the roots not being in a suitable medium. The soil may contain too much of some manurial substance; it may be insufficiently aerated, or it may contain something deleterious. The stronger vines have done better because, not being cut back, they have produced a comparatively large number of leaves which caused a more vigorous root action and enabled them to overcome unfavourable conditions which were too much for the weaker vines.

Propagating Brambles : *G. A. Constant Reader.* The best method of increasing the Loganberry and American Blackberry is to cover the tips of the current year's shoots with light, sandy soil in the autumn. These will be found to root freely the first year. When sufficiently rooted they may be detached and planted in good soil in their permanent quarters. Another method of propagation is by layering, but this requires a longer time. Neither of these subjects grow vigorously when raised from seed.

Figs Diseased : *W. H.* The Figs are attacked with Cercospora Bolleana. All diseased leaves and fruits should be collected and burned, and the trees sprayed with diluted Bordeaux mixture, which will check the disease. Where the disease is very bad, it is best to root up and burn the trees, afterwards planting new stock in fresh soil.

THE DEVELOPMENT OF THE RED HYBRID TEA ROSE.

A REVIEW OF RED ROSES.

THE notable advance of the Hybrid Tea Rose during the past 35 years is a matter of common knowledge, but during the early period of its development most of the new varieties were pink and blush of various shades. It was soon felt that the triumph of the H.T. would be incomplete until we had real Red Roses of this type, for red is the colour we constantly associate with the highest development of the Rose, and with its most grateful fragrance. Nearly all the poets have associated white with the Lily and red with the Rose. Perhaps we scarcely wanted the poets to praise the red of the Rose. We may think we were already conscious of its supremacy, but they may themselves, without our being conscious of it, have guided our thoughts in this direction. At least, there is plenty of authority for the proposition. "My love is like a red, red Rose," sings Burns, and for Coleridge, "The bride hath paced into the hall; red as a Rose is she." Anacreon told of the nectar poured by the gods to hail the Rose, "a ruby tide, the sweetly Orient buds they dyed," and in the old distich attributed to Halliwell "the Rose is red, the Violet blue"; while Mrs. Hemans thinks of the Rose "to crimson glory burst." It is, however, unnecessary to labour the point, for the supremacy of the Red Rose is acknowledged by all. The shows of an "early year," when the boxes are filled with nothing but pink and white, are felt to be lacking in some essential quality; and the judge who, when going through the exhibition on the look-out for the best bloom in the show, is fortunate enough to light upon a perfect flower of Horace Vernet or Avoca instinctively feels he has found what he wants, and though as a conscientious man he goes carefully through the rest of the flowers with the bloom in his hand, he knows it is really wasted labour. For as the Rose is the Queen of the Flowers, so the perfect Red Rose is the Empress of the Roses.

In tracing the development of the modern Red Roses, we need not go very far back to find the origin of the denizens of our gardens to-day. In old time the Crimson Damask was considered one of the most useful of Roses, just as Turner's Crimson Damask is still in our gardens, and occasionally at our shows.

The old Crimson China came in 1810, and 1819 saw the birth of the celebrated Rose du Roi, an ancestor of the great Hybrid Perpetual race. Then there was that lovely little Rose, the old Tuscany, dyed deepest purple, most velvety in texture of petal, and delicious in fragrance. In spite of all our modern Roses, when I can get an opening bud of Tuscany I find it a delightful companion as a buttonhole. Whatever the date of its introduction, it must have been before 1820, for Dr. Lindley included it among the garden Roses of the Gallica section in his well-known Monograph. Gloire des Rosomanes, still one of the few good perpetual pillar Roses, came in 1825, and 1832 saw the development of R. semperflorens in Fabvier, closely followed by Cramoisie Supérieure in 1834.

Perhaps the birth of the modern Hybrid Perpetual may be placed about 1842. The bright red Géant des Batailles came in 1846, and thenceforward the development of this group proceeded apace; Victor Verdier came in 1851. The birth of Général Jacqueminot, in 1854, must certainly be considered an epoch in the history of the Red Rose, founder, as it was, of a group which includes some of our most perfect crimson flowers, Fisher Holmes (1865), Horace Vernet (1866), Prince Camille de Rohan (1861), and others. The group headed by Triomphe de l'Exposition, in 1855, is still represented in our gardens by Captain Hayward, raised by Bennett in 1894, while Charles Lefebvre, which dates from 1861, is, I think, the founder of a group which includes Dr. Andry and Hugh Dickson, the latter one of the best red H.P.s in cultivation.

Mme. Victor Verdier, which came in 1863, though somewhat cherry-red in colour, has probably furnished at least one brilliant Crimson Rose in Victor Hugo, produced in 1885.

Nevertheless, the Hybrid Perpetuals have considerable limitations; the flowers at their best are grand, and the perfume glorious, but the flowering period in summer is somewhat short, the second flowering in autumn is not free, and the habit which most varieties affect, of sending up long waving shoots in autumn, carrying a few flowers at their tops, is somewhat inconvenient. For a large part of the summer they are flowerless.

The autumnal flowering of the Hybrid Perpetual had been attained by the introduction of the indica strain. The Tea Roses were, in fact, sufficiently perpetual, but they were wanting in hardiness, and it was by a fresh resort to this strain to modify the hardier Hybrid Perpetual that hybridists sought to secure a combination of the characters lacking—continuity of flower, and vigour and hardihood of growth.

Messrs. Paul and Son, of Cheshnnt, had the honour (and it is no mean one) of introducing in 1873 the first Red Hybrid Tea in Cheshunt Hybrid, the offspring of Mme. de Tartas and Prince Camille de Rohan. La France had come out six years earlier, but it was at first called an Hybrid Perpetual, and Cheshunt Hybrid was the first Rose to be recognised as an Hybrid Tea. It is of fine vigorous growth, and free in flowering, and though somewhat wanting in form, and of a colour apt to be dull and unattractive, much must be credited to the first of a new race. It was five years before it had a rival among the Red H.T.s, and this came in Reine Marie Henriette, in 1878, obtained by crossing the varieties Mme. Bérard and Général Jacqueminot. Though this was long called the "Red Gloire" it was of much the same unattractive shade of red as Cheshunt Hybrid. Shortly afterwards, in 1880, came Longworth Rambler, perhaps a brighter colour, but sadly wanting in form, and the next year, 1881, a quite distinct break appeared in Reine Olga de Wurtemburg, a Rose with Gloire de Dijon and the hardy North American Rosa setigera among its ancestors. In many ways Reine Olga was a decidedly more attractive Rose than its predecessors, the flower bunches hang more gracefully and the colour is brighter, though beauty of form was still some way off. Notwithstanding that little, if any, development has taken place on the lines of this Rose, it may not unfairly be regarded as a landmark in the history of the red Roses, being one of the very first of the decorative Roses. Soon afterwards, between 1881 and 1885, came the three Waltham Climbers, the first and the third still sometimes met with; No. 1 being the best colour, and No. 3 of better shape. About this time, too, came Souvenir de Thérèse Levet, a dark red Tea Rose, apt, however, to be of rather dull colour in this country.

The year 1885 gave us a really fresh departure in W. F. Bennett, of good growth and free in flowering, perhaps the first of the dwarf H.T.'s. It is rather curious that all the earlier red H.T.s had been of more or less climbing habit, but W. F. Bennett was more manageable in this respect, and was found useful, especially under glass. Its thin and papery petals, however, were unable to stand much rain, and this caused it to disappear somewhat early from our gardens.

The year 1887 produced two Roses worth notice, Bardou Job, a seedling from the old Gloire des Rosomanes, a Rose of semi-climbing habit, and flowers of a rich crimson with a deep plum-coloured shading, not unlike the bloom of Grapes, rather loose in build and scarcely more than semi-double. At its best it is a fine-coloured flower, and the plant does well on a low south wall, and often as an 8 ft. pillar, but is not very hardy. The other Red Rose of this year is Princesse de Sagan, variously described as a China, a Tea, or a H.T. It is one of the dwarfest of Roses of a spreading habit, with dark, yet bright crimson flowers, and makes an excellent Rose for bedding or edging, but like the Chinas the flowers are wanting in form.

Another H.T. of 1887, the Meteor, may be noticed in passing, but need not detain us, nor do we find any other red H.T. worth notice till we come to the Marquise de Salisbury in 1890. This is a Rose of fine dark crimson, not much more than semi-double, but the young flowers are of a pretty shape. I always look upon this as one of the first of the true decorative Roses. Mme. Ravary among the yellows was two years, and Mme. A. Chatenay in the pinks eight years later. Marquise de Salisbury possesses extremely sharp and strong prickles, with which its stems are densely covered, a fact that will be well known to those who have to arrange the flowers. The second crop of summer flowers are apt to get rather burnt and small if the weather proves hot and dry. Another gap of three years and there appeared Marquise Lita (often, but I am told wrongly, spelt Litta), a cross between Lady Mary Fitzwilliam and Eugène Fürst, a good carmine-coloured flower, and perhaps the first of the Red H.T.s to make a really good exhibition Rose. The flower is of good shape, and stands well in a box and on the plant, but the plant is not a strong grower, nor, I think, very long lived.

From this date onwards the number of new Red H.T.s steadily increases, nearly every year producing one or more new varieties.

In 1894 there were two Red Roses, Ards Rover and François Dubreuil. Ards Rover is a strong H.T. (sometimes described as an H.P.) of very vigorous, climbing habit, useful for a pillar, trellis, or screen. The flowers are crimson and freely produced. They are of moderate size, and look well in the garden, but are rather wanting in form. It was the first of the three Roses bearing Ards' name, and I incline to think the most generally useful of the three. François Dubreuil is a Red Tea of a dark crimson colour, perhaps the best of the Crimson Teas; but the form is not first-class, and, like the other Red Roses of this class, the colour is sometimes dull.

1895 also gave us two Red Roses, and, like the previous year, one was a climber, Paul's Carmine Pillar, and the other a dwarf plant, Princess Bonnie. They are both H.T.s. Paul's Carmine Pillar is a really beautiful decorative Rose of vigorous growth, producing shoots which grow 10 or 12 feet in a season, with good foliage, which is free from mildew. The flowers are single, or nearly so, carried in small trusses, mostly at the top of the shoots, and open gradually. They are a brilliant carmine-crimson colour, but unfortunately there is but one flowering, and that is very early; the flowers have little fragrance.

Princess Bonnie was a pretty little Rose of carmine colour and semi-double. It was delightfully fragrant, free-flowering, and perpetual. It is a pity that a Rose that smelt so good was not of a better colour and shape. I speak of it in the past tense, for, though a considerable advance on decorative Roses at the time, it must be regarded as superseded. It was raised as a seedling from Bon Silène, a rose-coloured Tea, and W. F. Bennett.

The only Rose I have down for 1896 is the Rosette de la Légion d'Honneur. It flowers rather late; if hard pruned (which it ought not to be), it is very late, not flowering till it has made considerable growth. It is best treated almost like a Noisette, or pegged down, pruning being directed rather to thinning than to cutting back the shoots. The flowers are only of moderate size and cherry-red in colour, with a yellow veining, but it makes a pretty button-hole Rose. Its strong points are its brightly-coloured buds and good foliage.

1897 gave us only one Rose of any note, but that was Gruss an Teplitz, still without a rival of its particular type. According to Mr. Arthur Paul it was raised by crossing a seedling from Sir J. Paxton and Fellenberg with Papa Gontier. It is a very vigorous plant, of semi-climbing habit, and carries most beautiful foliage; the flowers are bright crimson, produced in small clusters in considerable quantity, and more or less continuously throughout the season. Those who would see some quantity of it may do so by visiting Harrow churchyard. It is useful for a really big bed, or for a specimen standard. When so grown it makes a huge head and must have plenty of room and a strong stake. Pruning should be only moderate.

The following two years were rather barren in regard to Rose novelties. I have nothing for 1898, and Exquisite, which appeared in 1899, need not detain us, though it was a prettily pointed flower, with a tinge of magenta in the crimson. *White Rose.*

(*To be continued.*)

LINUM SALSOLOIDES.

This is one of the most satisfactory plants for a retaining wall exposed to full sunshine. I planted a specimen three years ago, and in the middle of June it was literally smothered with flowers. These are of the white colour called "steely," with purplish veins, and are of the typical Linum shape, but hardly so large as the flowers of L. perenne. The plant is a native of the Mediterranean Alps, and appears to be represented by two forms. Mr. Farrer, in his delightful book, *Among the Hills*, speaks of the close association of this plant with Hypericum Coris, and adds that the two plants have much the same habit, but that the Flax is laxer in growth. Clearly this does not describe my plant, which is quite prostrate, its woody, wiry stems being closely interwoven, and firmly appressed against the stones. Presumably this variety is the nanum of Sundermann's catalogue, which again is probably identical with the prostratum of Farrer's own list.

I have, so far, found the plant impossible to propagate by cuttings, and a skilful gardener to whom I have given material has been equally unsuccessful. I have taken cuttings in the end of June after flowering, and in March when it is throwing out fresh shoots, but with no success. True, I have at the present moment half a dozen cuttings that have remained green since March, but examination a fortnight ago failed

[*From a photograph by Dr. Somerville.*

Fig. 22.—Linum salsoloides; flowers white with purplish veins.

to discover a single rootlet. Perhaps, however, some of them may yet strike, but I am not hopeful. Seed, however, seems to be setting this year, though hitherto there has been none. *William Somerville, Oxford.*

IRIS FOLIOSA—A JULY GEM.

The gay Iris season is nearly over, except for some of the more aquatic species, but just now there is a very conspicuously brilliant, blue flower growing in the open borders. It is not often seen, but is well worth growing; its colour being so striking and distinct, but withal difficult to describe. It is well named Iris foliosa, as it grows in leafy masses, rather untidily, but in lists it is usually called I. hexagona Lamancei.

The plant has a densely creeping light-brown rhizome half-an-inch thick, with closely set ridges where the old leaf-bases have withered; a fresh rhizome forms on each side of the flowering stem. At first the leaves are rather a bright green, but they become glaucous as they grow older. They are 1 inch broad and 2 to 3 feet long, of a rather thin texture, and prominently ribbed. The tip of the leaf ends in a slender point with a small hook bending at a right angle.

The short stem is hidden away among the thick foliage, and is 9 to 10 inches in length, rarely more, and spreads almost horizontally, so the flowers lie near the ground. It is curiously zigzag in direction, leafy, with flowers in the axils of the upper leaves. The lower leaves on the flowering shoots are 2 feet long, the upper ones 12 to 8 inches. There are from one to four flowering axils, generally three, each bearing two flowers on very short pedicels.

The flowers open rapidly in succession, so that for a short period the flower stem is thickly set with strikingly blue flowers, which measure 3 inches across.

The standards are long and narrow, of a light blue shade, with a white claw. The blades of the falls are over an inch broad and three or more inches long—a brilliant vivid blue, slightly deeper towards the centre, rather tending to violet-blue, while the middle of the blade is occupied by a triangular patch of white streaked with green, and a deep golden central line accentuates the beauty of the flower. The greenish-white styles have light, lilac-blue tips; the pollen is white. The small triangular ovary has six ridges in three pairs together on the angles. The flowers are scentless.

The flowering season is rather short. During the last six years that I. foliosa has flowered with me the earliest date of opening has been June 23, and the latest July 17, any one flowering period not exceeding a fortnight. The best way to enjoy the flowers is to cut the stem as soon as the first ones open, as they last well in water and continue to open in succession for several days. I. foliosa grows easily and increases quickly in a light, rich sandy loam, and stands the winter well in a warm, dry soil.

If the season is dry just before or at flowering time, a good soaking with water occasionally will be beneficial. In early autumn after flowering it may be taken up and replanted, as the rhizomes soon get too matted.

After the foliage has died down it passes the winter almost wholly underground, as the new shoots make scarcely any growth until spring.

The Leafy Iris hails from the South-Eastern United States, Missouri, Kentucky and elsewhere, and a closely allied form, I. hexagona, comes from a similar part of North America, Florida and Louisiana. The foliage of I. hexagona is almost identical, but the flower-stem is tall instead of short. The six ribs of the capsule are equally spaced, and the flower is lilac and not blue.

The only other species belonging to this small group is the curious copper-coloured I. fulva, from New Orleans. It has a similar but more widely creeping rhizome and long, deep-green leaves, which remain on the plant through the winter. The small terra-cotta-coloured flowers with pendant falls grow terminally and in the leaf-axils on a slender stem about 2 feet in height.

The plant likes a light, rich soil in a moist position, and does well by a sunny pondside; it will even submit to be under water during winter and spring.. It flowers from the middle to the end of June. It is unique in its colouring, but not so effective as I. foliosa, neither is it so tractable in cultivation. *Elconora Armitage, Ross.*

TRILLIUM RIVALE.

There are some thirty species contained in this genus, mostly inhabitants of North America, although two or three are found in Japan and Eastern Asia. In habit they bear a great resemblance to each other, with the characteristic three leaves in a whorl, borne on a stem varying from a few inches to a foot or more in height.

[*Photograph by W. Irving.*

Fig. 23.—trillium rivale; flowers white, marked with purple spots.

The similarity of the name of the Trillium here illustrated with that of T. nivale may very easily lead to some confusion. With the names, however, the resemblance ends, for T. nivale has pure white flowers, and may be classed as a form of T. grandiflorum, while the subject of this note, T. rivale, has the white flowers more or less marked with purple spots.

According to Watson in the *Proceedings of the American Academy*, xx. (1885), 378, it is found on stream banks in the Siskyon mountains of California, and coast ranges of South-western Oregon. It was first collected by W. H. Shockley in the year 1880 and by T. Howell in 1884. It has only recently been introduced into cultivation, but has proved to be quite hardy when grown in similar conditions to those which suit the well-known T. grandiflorum. Grown in a cold frame, T. rivale comes into flower early in March, the blooms expanding just above ground, but develop in size as the stems and leaves grow, till they are at their best at about the end of the month. In suitable conditions the stems reach a height of about 6 or 9 inches. *W. I.*

ORCHID NOTES AND GLEANINGS.

MESSRS. SANDER AND SONS, BRUGES.

The establishment of Messrs. Sander and Sons at Bruges, Belgium, is famous for its Azaleas, Camellias, and other decorative plants for sale in bud, for standard and pyramid Bay-trees in tubs, and for enormous numbers of Kentia and other Palms and foliage plants. Nevertheless the most important branch is that devoted to Orchids, and these plants occupy a large proportion of the sixty or more glasshouses.

The Orchid department may be divided into two sections—one devoted to the raising and culture of hybrid Orchids, and the other for the reception and cultivation of imported species. In this latter work Messrs. Sander have always taken a leading part, and the introduction to Europe of many garden favourites has been due to their enterprise. The chief inducements to risk the heavy cost of collecting are, first, the certainty of flowering new and fine varieties and albinos out of any large importation obtained from the proper localities, and, secondly, the certainty of getting a remunerative return for the space occupied even by ordinary varieties by the sale of cut flowers. A good example of this was given in the two houses of the true Lælia Gouldiana which we saw in April last, and which at Christmas were covered with graceful sprays of white and rosy-mauve flowers, numbering 7,000, all open together. Similarly satisfactory results were also given by the houses of white Lælia anceps, and the long lean-to houses, with splendidly grown plants of Phalænopsis Schilleriana, and P. Rimestadiana. At the time of our visit many of the showy Cattleyas, including C. Dowiana and aurea, were present in large quantities, one long house being almost entirely devoted to the true C. Warscewiczii Sanderiana, which has an established reputation for being not only the finest form, but one which may be depended upon to bloom. A house of C Schröderæ had a fine display of blooms, some nearly white forms, and one even brighter in colour than "The Baron." A large batch of C. Mossiæ showed the good quality of the strain, and specimens of the

blush-white variety, Arnoldiana, the pure white form, Wageneri, and Reineckiana, white with coloured lip, were in bloom. Suspended from the roof were a good specimen of the pure white C. Warneri alba, and one of C. Luddemanniana alba, with several specimens of other albinos, including C. Myra Peeters, C. Schroderæ alba, C. O'Brieniana alba, C. Mendelii alba, and C. Dusseldorfei Undine.

A house of Cymbidium insigne Sanderi showed its occupants as not only beautiful when in bloom, but elegant in habit in the non-blooming season. This plant has been extensively used for crossing, and some further developments, including a cross with it and C. grandiflorum, are well on the way to flowering size. Dendrobiums occupied many houses, one being filled with D. superbiens, D. bigibbum, and D. Phalænopsis; while in others were the flowers of D. Bronckartii, D. thyrsiflorum, D. Wardianum, and its variety album; the fringed-lipped D. Brymerianum, and D. Harveyanum, which also has its bright yellow petals fringed; D. formosum giganteum, D. Jamesianum, D. Devonianum, D. superbum and its white form; the white D. Dearei and the new D. Schuetzei and the beautiful D. Sanderæ of the same section. At one end of one of the houses was a selection of curious Orchids—Bulbophyllums, Cirrhopetalums, and others, some being in bloom, including the pretty little Vanda alpina.

Vanda cœrulea of the best type is grown in quantity, the plants being sturdy and well over the critical time after importation.

Two houses of Miltonia vexillaria and its hybrids had many in bloom, among the imported plants being several of the deep rose-coloured M. v. Empress Augusta Victoria, and several home-raised forms of this type, which have larger and still brighter flowers. Some of the forms of M. Bleuana, M. Hyeana, and M. St. André also showed great improvement in colour.

A house of Aërides, Saccolabiums and Vandas presented a spectacle now rarely seen, for these former favourites are seldom imported, but V. Kimballiana, with its rose-lipped flowers, and the white V. Watsonii will always be in demand. A quantity of Renanthera Imschootiana were well furnished with bright-red flowers, and the elegant Angræcum Sanderianum was effective with its white sprays of bloom.

Houses of the showy Oncidiums, Sophronitis, Lælia purpurata, L. tenebrosa, Cochlioda Noezliana, and the ever-welcome best type of Odontoglossum crispum (Alexandræ) follow, in most of which interesting plants were in bloom.

ORCHID HYBRIDS.

Possibly for the same reasons that the baby is the centre of solicitude and admiration in the home circle, hybrid Orchids engross the attention of cultivators, causing them to treat with apparent (not real) neglect the grown-up plants. Mr. Sander conducted us to a fine block of houses in which the operations of raising and development are carried on from the seed to the plant in flower; and here by his kindness we learnt some particulars which may be of service to others. We had evidence of the success of the practice in the hundreds of thousands of seedlings in all stages, the hundreds of store pots showing scarcely a break in the lines.

Mr. Sander attributes much of his success to "pricking-off" into these small store pots, made up of a special preparation, the material being carefully prepared with a smooth surface and well watered before the tiny seedlings are inserted. In this compost it is found that the seedlings thrive and grow rapidly until the rooting stage, when they are removed to fresh store pots made up of half Sphagnum-moss and half Polypodium-fibre, and when large enough to have single thimble pots either Polypodium-fibre or a mixture of it and half Osmunda-fibre with some Sphagnum-moss is used, care being taken to have the material fine enough to favour the rooting of the little plants. The advantage of the moss and fine Polypodium-fibre mixture in the first pricking off is that its uniformly smooth surface, retentive of moisture, admits of the removal of the tiny spherical seedlings from the seed-pans earlier than when a more open material is used, whilst their progress is hastened by the early transplantation. In the glass cases were large quantities of freshly-germinated crosses. Cypripediums are not so much used, but secondary crosses of Odontioda and new crosses with Cochlioda Noezliana are being worked, and the improvement continued on the fine hybrid Odontoglossums, Cattleyas and Lælio-Cattleyas for which the establishment is famous. Here as in other places we heard of unexpectedly good results, and of unfulfilled expectations from wide crosses, attributed to the diverse nature of the subjects used; but this uncertainty gives zest to the pursuit. A noticeable point is that air is freely admitted to the plants in all stages of growth. Leaving the houses of seedlings in all stages, but not yet of flowering size, we came to the ranges of mature hybrids, in each of which some good things were in bloom.

In one cool house in three divisions the first was of Odontoglossum Edwardii crosses, many with spikes, the next consisted of Odonticdas, with several fine forms of O. Bradshawiæ in bloom, two of the deep bronzy-red type of O. Charlesworthii raised here; O. Cooksoniæ, O. Cupid, and some others. In the best forms of O. Bradshawiæ a near approach to the so-called scarlet O. crispum is attained, but trial is being made to evolve an exact counterpart of the best form of O. crispum with scarlet flowers, and among the thousands of small plants plunged eight together in larger pans it is hoped that the desired result will be shown.

A goodly number of blotched forms of Odontoglossum crispum, both imported and home-raised, were in bloom, and many handsomely blotched hybrids, including the O. crispo-Harryanum bruggense, some good forms of O. amabile, O. eximium, O. ardentissimum, and a great many unnamed hybrids, some of which will develop into exceptionally good things. One named Rio Tinto, of a bright copper-red with thin, yellow margin; some handsome forms of O. Jasper and hybrids of O. Lawrenceanum were specially attractive. Several houses of Lælio-Cattleyas and Brasso-Cattleyas each contained some good forms in bloom.

Messrs. Sander have new tints in Brasso-Cattleya Digbyano-Mendelii and other well-known forms not yet excelled in shape; they have obtained also colour changes in other garden favourites, especially intensely dark forms of L.-C. Dominiana: in one, obtained between Cattleya Mendelii and Lælia Latona, we noted a vivid rose-purple band on the rose-coloured petals—a very attractive combination.

The crosses of Miltonia Warscewiczii, including Odontonia St. Alban, which were flowering profusely, are desirable plants for decorative purposes.

Grammangis Ellisii.

Among the rare Orchids which were conspicuous at the recent Holland House Show the Madagascan Grammangis Ellisii was noticeable. This remarkable species—the only one in the genus—was introduced in 1858 or 1859 by the Rev. W. Ellis. It is one of the most distinct Orchids, its large, oblong pseudo-bulbs and strong growths giving it a commanding appearance. From the young growth is produced a ponderous raceme of pendulous flowers; one plant shown at the Exhibition produced two spikes from one and the same growth, bearing together sixty-four flowers. The blossoms, each of which is as large as that of Lycaste Deppei, are arranged cylindrically on stout stems about three feet in length. They are of peculiar shape, and present a singularly varied combination of colours even for an Orchid; they are, moreover, very sweetly scented. The predominating hue is not particularly brilliant—it is a purplish brown, marked out with dull yellow; but the general effect of the flowers is decidedly handsome. It has, indeed, been remarked by one noted grower that the most gorgeous East Indian would not lose caste by keeping it company. Grammangis Ellisii has unfortunately proved a refractory subject under cultivation, and though it has been several times imported since its first introduction few growers can claim any great or permanent success in its culture.

Messrs. Charlesworth, however, appear to have overcome the attendant difficulties by giving the plants every encouragement in the way of light, heat, and moisture. The species is commonly known in gardens as Grammatophyllum Ellisii. *W. H. White, Burford, Dorking.*

POTATOS AND DISEASE.

Last season was a most disastrous one for many cultivators of the Potato; the havoc caused by disease (Phytophthora infestans) was widespread, and destroyed many promising crops. Certain remedies have been prescribed for this disease, and the most usual is the spraying of the haulm of the plant with Bordeaux Mixture. It has been found that this method is to a certain extent efficacious, but I suspect that the Potato crops could be rendered much more immune through the judicious application of certain artificial manures in addition to the ordinary natural manures generally used. One of the leading English Potato growers has stated that there is no such thing as a "disease-proof" Potato. I am, however, not of this opinion, and I believe that within the next decade a race will be evolved which will withstand disease. It is only a matter of scientific and careful breeding and selection. For the last two or three seasons I have been experimenting with a variety of Potato which readily contracts disease, and certain treatment in the way of manuring has given me excellent results. I am convinced that potash applied to the soil is an almost certain preventive of disease. Potassium fertilisers are known to promote a short, sturdy growth of the haulm, and this result alone materially increases the plant's power of resistance to disease. The mycelium of the fungus which causes Potato disease is known to penetrate the tissues of the foliage, which it subsequently destroys. The effect of the potash is to enable the tissues to resist the entrance of the germ-tubes, which, emitted by the zoöspores, normally penetrate the epidermis of the tuber or foliage. The subjects upon which they operate are in a harder and more solid state, and this enables them to resist the development of the spores. The foliage, particularly, becomes so tough and leathery that it is quite immune to the action of the disease germs. A plant like the Potato, rich in carbohydrates, requires large quantities of potash in the soil. Last spring I treated a small plot of ground, which had been liberally supplied the previous autumn with animal manure, with a top-dressing of sulphate of potash and planted it with Potatos. In the same environment another plot of ground (also liberally manured, but not treated with potash) was planted with the same variety of Potato. In the autumn, when the crop was raised, there was no disease on the plot treated with the artificial manure, while on the other there were diseased tubers on almost every plant. About a fortnight after the plants began to show through the soil another top-dressing of potash was given; and the strong, tough, hardy foliage of the potash-treated plants stood out in marked contrast with those which were not treated. So far as quality is concerned the potash-treated plot yielded tubers which were appreciably finer in this respect. The season was a good one for a test of the kind and was certainly favourable to

the spread of disease. I have found sulphate of potash (K_2SO_4) much the best form in which to apply this manure, and as it is a crystalline salt, it is readily soluble. It usually contains from 46 per cent. to 52 per cent. of potash (K_2O), and I think the best form of application is by way of a top-dressing at planting time, followed by another application about two weeks after the shoots appear above the soil. In using this manure, I think sulphate is safer than muriate of potash, because when the latter is used as a top-dressing there is considerable danger if it comes into contact with the plant. Muriate of potash is best applied to the soil during winter. Kainit is not sufficiently rich in potash to be of any value for this particular purpose. I am well aware that the use of potash is injurious when applied to some soils, owing, no doubt, to its action upon the calcium carbonate present in them. Then, many clay soils simply require some agency to release the potash which is already locked up in them. My own experience is limited to a light, loamy soil, but I give it in the hope that it may be useful to others, who might test it for themselves and endeavour to discover, if possible, the exact amount of potash required for effective treatment. Potash is usually a constituent of all suitably compounded artificial manures for Potatos, but it is not present in sufficient quantity to be of very great value in warding off disease. The Board of Agriculture, for example, recommends the following mixture as an artificial manure for Potatos :—

Half-hundredweight nitrate of soda, ½ cwt. sulphate of ammonia, 2 cwt. dissolved bones, 2 cwt. superphosphate, 1 cwt. sulphate, or muriate, of potash.

The quantity to be used per acre is given as from 5 to 8 cwts., if supplemented with a liberal dose of animal manure ; or if without the latter, double the quantity of artificial may be used. The Board, it is worth noting, does not recommend a top-dressing of artificial manure for the Potato crop ; but this is precisely where I have found potash to be of the utmost value. Further experiment on the lines I have indicated would seem necessary before any particular quantity of potash per acre can be recommended as ensuring the best results. *George M. Taylor, Midlothian.*

CANADA.

TRILLIUM GRANDIFLORUM IN CANADIAN WILDS.

Nothing gives greater pleasure to the sojourner in a new land than the wild flowers that have been treasured in gardens at home. Trillium grandiflorum in clearings in the bush, shady, spongy ravines, and circling round the gaunt pines, has shone out this season like great, white stars amidst their cool, leafy surroundings. I have measured many flowers, and in one instance, a little along in half shade on a dry rooty slope, they were 5 inches across and lasted a month, fading off to a warm rich rose. Among the lovely wildings of Canada, T. grandiflorum, Cypripedium pubescens, and Nymphæa odorata [the fragrant waterlily of Lake waters], are three of the most exquisite, but the Trillium is among the first to usher in the spring, and, after a winter that does not always spell comfort, its Easter loveliness seems to come with a special meaning. The fair beauty of the plant is astonishing, even in the most unlikely situations ; in practically barren soil, on dry, shady banks, or near creeks (as brooks or small streams are named), though never actually in wet soil. The flowers are much prized for simple decorations, and in retreats not far from such a city as Toronto the brown earth is white with blossom. Moving gently in the wind and lit up by the spring sunshine as it sends shafts of light through the branches, one realises that, beautiful as it is on the rock garden, it is more so in the wilds where black squirrels run over fence and branch and the racoons whisk their bushy tails. *E. T. Cook, Ontario, Canada.*

CALGARY HORTICULTURAL SOCIETY.

Mr. W. R. Reader, secretary of the Calgary Horticultural Society, has been appointed Park Superintendent for that city. Mr. Reader is an Englishman, but has resided in Calgary several years.

CROCUS FLEISCHERI.

One of the most distinct members of the whole genus, C. Fleischeri belongs to the section "Intertexti," of which there are only two constituents. The other one, C. parviflorus, I have not seen in cultivation, although it appears to have been grown at some time or other. The plant illustrated in fig. 24 is remarkable for its yellow corm, covered with a tunic of brown fibres, arranged in vertical strands as though plaited. It belongs to the spring-flowering section, coming into bloom very early in the year, and when grown in the open border should have the protection of glass to ward off heavy rains and protect the flowers from the weather. The leaves, usually four or five to each corm, are long and very narrow, while the flowers are about 2 inches in diameter. They are pure white, with a pale yellow, unbearded throat. As it comes into flower so early, C. Fleischeri makes a charming subject for growing in pans for the Alpine house. In such a house its somewhat frail flowers are seen to advantage. It is grown in loamy soil, to which is added a little leaf soil and plenty of coarse, gritty sand.

Although C. Fleischeri has been recorded from Lycia, it is known to occur at the western extremity of Asia Minor, near Smyrna, and at the eastern extremity of the Cilician Taurus, where it is found at an altitude of over 6,000 ft. *W. I.*

Fig. 24.—Crocus fleischeri; flowers white, with a pale yellow unbearded throat.

FORESTRY

PRESERVING TIMBER BY CHARRING.

The beneficial effects of charring Oak posts before placing them in the ground was clearly demonstrated a short time ago at Holwood, in Kent, in taking down an old boundary fence and erecting a new one. Probably the open, gravelly soil had as much to do with the longevity of the fence in question as the charring process ; but the fence had stood with little or no repairs for seventy-three years. To the last the charred portions of the posts, which extended for about one foot above and three feet beneath the ground, were perfectly sound, the remaining portions being so much decayed that they would not carry the horizontal bars on which the upright pales were nailed. The charring process is easily and cheaply carried out by lighting a fire of wood and placing the portion of each post which is to be treated over the flame. This is done by supporting each end of the post on a large stone or block of wood at the required height. The wood should not be merely surface scorched, but thoroughly burnt to, say, three-quarters of an inch in depth. This not only forms an outer covering to the timber, but forces the tannin and other products inwards, thus effectually sealing up the inner layers of wood and preventing fungus and insect attacks. The principal point where charring is required is a little above and below ground level, the portion most readily affected by atmospheric and other changes. It has been found that by immersing the burnt portion of each post in tar the lifetime of the timber is further increased ; and since both processes can be carried out as the erection of the fence proceeds, and cost very little, there is no reason why this simple method of preserving fencing timber should not be always adopted. The tar is most easily applied and most efficacious in its results, if put on before the timber cools down after the charring operation.

TIMBER OF THE CLUSTER PINE.

Though the Cluster or Maritime Pine (Pinus pinaster) has attained to large dimensions in this country, the timber is practically useless except for the manufacture of cheap packing boxes and as firewood. Several trees containing from 80 to 100 cubic feet of timber have come under my notice, and in one instance in Kent the wood was used experimentally in several ways, but with very unsatisfactory results. One of the largest trees, containing fully 90 cubic feet of wood, was sawn into planking of various sizes, and the timber used for general estate purposes. Some of the boards were about 3 feet wide and, having been sawn to 3 inches in thickness, were peculiarly adapted for flooring and shed cleading. In one notable case thirty of the boards were used as flooring for a dry faggot shed—a well-built building and thoroughly ventilated; but in a few years they were all so decayed that they fell to pieces when removed.

When we take into consideration the size and age of the trees from which the planking and fencing were cut, and remember that the timber is permeated with resin—and on that account heavier than almost any other Pine wood that has come under my notice—it seems remarkable that the lasting properties are not greater. It has, however, long been known that the lasting properties of the timber of the Cluster Pine are comparatively small, and that even as firewood it can only be considered as of inferior quality.

The Cluster Pine is a tree of rapid growth, and at Keston, in Kent, has produced one and a third cubic feet of timber per annum for ninety years. It is best known as a seaside tree, and is valuable for reclaiming sandy wastes and dunes; but in Kent equally rapid growth has been recorded where the trees are growing on deep, gravelly soil. *A. D. W.*

NEW HOLLAND PLANTS.

The somewhat vague title "New Holland plants" was formerly used to designate an extensive class of hard-wooded plants, some of which, however, were natives of Australia. They were at one time very commonly grown to form large specimens, upon which an infinite amount of labour and skill was expended, at a time when glass and other aids to cultivation were very inferior to those procurable at the present day.

Their production was extremely slow—it took years to build up a really satisfactory plant. As cut flowers very few of these plants are of any value, the stems being too short for present-day ideas. Messrs. J. Cypher and Sons staged a large exhibit of New Holland Plants last year, but the specimens were looked upon more as ancient relics of a bygone period than as examples of modern culture.

Although the day of large specimens is over, many of the hard-wooded species are still grown as small, bushy plants in pots five or six inches in diameter. They are usually grown, if at all, in large numbers, as they demand a house to themselves, their conditions of culture not resembling those of any other flowering plants. Heaths are still popular in this form, but of the two hundred or so varieties originally known, only about a score are now in general cultivation. During the season, good flowering plants may be purchased of such species as Erica candidissima (white), E. Cavendishiana (yellow), E. cerinthoides (scarlet), E. colorans (white and pink), E. gracilis (purple), E. gracilis nivalis (white), E. Massonii (red), E. hyemalis (rosy-pink), E. melanthera (mauve), E. persoluta alba (white), E. propendens (lilac), E. ventricosa (purplish-red), and E. Willmorei (rosy-pink). There has lately been a demand for miniature plants in quite tiny pots. Erica gracilis and E. persoluta lend themselves readily to this mode of treatment, and during the present season quite a number of miniature plants of E. ventricosa have been seen in Covent Garden Market.

Next in popularity to the Heaths come the Boronias, of which the sober tinted B. megastigma is perhaps the most valued, on account of its delicious perfume. B. elatior and B. heterophylla are good plants, with showy blossoms; B. serrulata, which used to be considered a good test of the cultivator's skill, is now quite rare. Epacris of various sorts, with blossoms ranging in colour from white to bright red, are still grown in considerable numbers; the fact of their blooming even in the depth of winter being in their favour. The long sprays can be cut, and effectively used in table decoration. There are other plants of this class which are suitable for growing as small bushes—notably, Aotus gracillima Aphelexis (now classed under Helichrysum) humilis, A. macrantha purpurea, Chorizemas, Crowea angustifolia, C. saligna, Eriostemons, Pimeleas of different varieties, and Polygala Dalmaisiana. *W. T.*

FOREIGN CORRESPONDENCE.

DISTRIBUTION OF ALPINE PLANTS.

I do not understand Mr. Thompson's comment (see Vol. LIII., p. 381) on my note upon endemic plants. He must surely be aware that phytogeographists look upon the centre of dispersion of any plant as the source of the species, not its sole habitat. For instance, Dr. Christ, in his admirable work, *The Swiss Flora and its Origins*, gives Siberia as the centre of dispersion of the Swiss Pine, as well as of the Edelweiss. Of course, he did not mean—nor did I—that these plants are only to be found in their country of origin. *H. Correvon, Floraire, Geneva.*

NOTICES OF BOOKS.

The Flora of Queensland.*

Frederick Manson Bailey, the veteran State Botanist of Queensland, has been labouring on the Flora of his native State an indefinite number of years, as he records reminiscences of events of the year 1844. Working in isolation from botanical colleagues, books, and type specimens he has nevertheless accomplished much that is useful to his countrymen, and interesting to scientific men. Queensland has an area nearly six times that of the United Kingdom, stretching through 10° 40′ to 29° of south latitude, and about 15° of longitude, and rising to elevations up to 5,500 feet, presenting, therefore, great variety of climate and vegetation and conditions favourable for the production of crops of both tropical and temperate cereals, vegetables, and fruits. Heavy floods, succeeded by prolonged droughts, are in some districts a drawback; but engineers are accomplishing much to lessen the evils. Apart from the illustrations, concerning which we have something to say further on, Mr. Bailey's book is much more than a catalogue, as it embodies "copious notes on the properties, features, etc., of the Plants." Aboriginal and other vernacular names are cited, where known. The book is in many respects supplementary to the same author's *Synopsis of the Flora of Queensland*, a work issued, with additions, between 1886 and 1890. The catalogue comprises all classes of plants down to microscopic Fungi and Algæ, and the lists of most groups are very copious; but there are few records of collectors and localities. Mr. Bailey gives no statistics and attempts no analysis of the composition of the vegetation, but a cursory examination is sufficient to reveal the fact that all the characteristic Australian families are abundantly represented within the boundaries of Queensland, though in the north there is a considerable Malayan element, belonging to such families as the Meliaceæ, Lauraceæ, tribe Myrteæ of the Myrtaceæ, and Palmaceæ, of which there are about thirty species belonging to eighteen genera. Epiphytic Orchids are also numerous, including between forty and fifty species of Dendrobium. One species of Rhododendron has been discovered, and Bailey enumerates eleven species of Nepenthes, ten of which were originally described by himself. So far as known these are all restricted to Queensland. Among characteristic Australian genera Acacia stands first with 130 species, and Eucalyptus is represented by about 65 species. Boronia, Dodonæa, Leucopogon, Goodenia, Stylidium, Hakea, and Grevillea are abundantly represented. We have said that Bailey gives no statistics, but he does mention that the woods number about a thousand kinds, including kinds suitable for all purposes to which wood is applied. The following paragraph from the prefatory part is instructive:—"Besides those plants marked in the catalogue as possessing certain valuable economic properties, there are probably a number of others equally rich. In fact the Queensland Flora contains plants which yield almost all the substances obtained from the vegetable kingdom. In food for stock it is uncommonly well supplied, and, what is of the greatest importance, the indigenous plants are suitable to the climate in a remarkable degree. For instance, what grasses other than the indigenous ones could be found to sleep through years without rain, and then, at the advent of a week or so of good rain, spring into life and cover the country with fresh green herbage, not only, let it be understood, from the seed which might be preserved in the earth, but also from the old roots, which to all appearance had been destitute of life? It may be safely said that very few, if any, other parts of the world could furnish grasses equally good with such a tenacity of life." In this connection it may be mentioned that the catalogue contains nearly 300 species of native grasses belonging to about 90 genera. Equally interesting are Bailey's remarks on the germination of seeds as influenced or affected by climate.

The illustrations add much to the usefulness of this book, almost every family being represented by at least one species. There are reproductions of about 1,000 pen-and-ink sketches, mostly characteristically executed, though sometimes weak in detail, especially in the dissections. The sixteen excellent coloured plates are by the well-known flower painter, Mrs. F. C. Rowan, whose large and beautiful collection of paintings of Australian flowers at the Colonial and Indian Exhibition in 1886 is remembered by some of us. The plants depicted are: Wormia alata, Sterculia quadrifida, S. trichosiphon, Flindersia pubescens, Hardenbergia retusa, Cassia Brewsteri var. sylvestris, Archidendron Vaillantii, Melaleuca Leucadendron, Eugenia Hislopii, Delarbrea Michieana, Clerodendron Cunninghamii, Piper Mestonii, Hernandia peltata, Pimelea hæmatostachya, Phaius grandifolius var. Rowanæ, and Alpinia arctiflora. These are all showy subjects, and some of them very striking, even in the distance, from their very brilliant colouring. The crimson, orange, and white open carpels of Sterculia quadrifida, revealing the almost black seeds, are very conspicuous. Similar colours are exhibited by the necklace-like pods of Archidendron, which is one of the very few Leguminosæ producing several carpels from each flower. Eugenia Hislopii is one of the most beautiful of the genus, and bears dense clusters of red and white flowers on the old wood, succeeded by large red fruits. Piper Mestonii is remarkable for its orange-crimson flower-spikes, and Pimelea hæmatostachya is a highly ornamental species with the flowers in dense spikes 1½ to 2 inches long, similar to Trifolium incarnatum. The object is to show that the book will be a valuable aid in

* *Comprehensive Catalogue of Queensland Plants both Indigenous and Naturalised.* By F. Manson Bailey, C.M.G., etc., State Botanist. A. J. Cumming, Government printer, Brisbane.

obtaining knowledge of the Australian Flora; not to discover small errors. It is remarkably free from evident mistakes, but the plate named Delabrea [Delarbrea] Michieana appears to be an association of leaves of the true plant with the beautiful blue fruit of an Elæocarpus *W. B. H.*

"Les Aspects de la Végétation en Belgique."

The above is the title of an official Belgian publication, the scope and character of which is somewhat fully explained in these columns, September 18, 1909, p. 195, more especially in relation to the districts into which the country is divided. The fascicles of this work as indicated in the general title are partly descriptive, partly pictorial, including a folio volume containing 86 plates of views of vegetation. The littoral and alluvial districts are there dealt with in detail. A further instalment of the work has now appeared devoted to the "Districts Flandrien et Campinien." There are four maps with brief explanations, and twenty folio photographic plates illustrative of the vegetation, both natural and artificial. The woods in Flanders are composed largely of Pinus sylvestris; the soil is often of the very poorest, yet they have been reclaimed from barren wastes within less than a century. In the Campine, Pines are gradually replacing the Heath. The uncultivated open ground is almost wholly acid and unproductive. Cultivation yields little more than Rye, Potatos, Spurrey and Buckwheat; but, thanks to the sandy nature of the soil, and to cheap labour, a second crop in the year is almost invariably secured. Further inland the conditions are different; Apple orchards are a feature, and a variety of crops are grown, including Tomatos on a large scale. The work done by the recently instituted Ecological Society in this country might well form the basis for the production of a similar series of volumes on the aspects of vegetation in our Islands.

MYOSOTIDIUM NOBILE.

The New Zealand Forget-me-not, as this plant is generally termed, is a native of Chatham Island, which is situated about seventy miles to the east of the southern island of New Zealand. Here the Myosotidium grows on the sea beach, just above high-water mark, near enough to the salt water to be drenched with the spray. Unfortunately it is, by all accounts, being exterminated in its native home by the cattle that now overrun the land. It was introduced into this country in 1858, and was first described in the *Botanical Magazine* in 1859, but for many years was treated solely as a greenhouse plant, and the earlier illustrations of it were evidently prepared from poor specimens which had been grown under glass. Mr. John D. Enys, of Enys in Cornwall, was the first to introduce seeds into that county from New Zealand, and to grow it permanently in the open garden, and it is owing to his generosity that it is now to be met with in almost every garden of note in Cornwall. He has exhibited fine plants in tubs at the Temple Shows, and these attracted much attention. There is no comparison between the somewhat weak growth exhibited by pot plants and the vigorous habit manifested by well-grown specimens in the open garden, where the plants sometimes attain a height of 3 feet, and produce leaves often as much as 2 feet in length and 18 inches in breadth, the foliage suggesting that of the Rhubarb and being particularly attractive owing to its bright-green colour and glossy surface. These splendid specimens throw up dozens of branching inflorescences (see *Gard. Chron.*, July 4, 1908, fig. 5), the flower-heads of which are often 8 inches in diameter, while the individual blossoms are about half an inch across. There is considerable variation in the colour of the flowers. In the best form they are a uniform deep blue, but in others they are blue in the centre fading to white at the edge. At Enys a pure white variety is grown which is very beautiful. The fact that in its native land this species grows in sea-sand has led to this material being used extensively in its culture in this country. In some cases only a heavy mulch is given over a subsoil of porous compost, but at Menabilly, where it is certainly as well grown as in any other garden, a large hole is made in the ground, a cart is sent down to the beach and filled with sand, and this is emptied into the hole, the Myosotidium being then planted in it At Menabilly, the plants are grown immediately in front of high walls facing in various directions, and apparently the plants like least a full southern exposure. In such a site, on hot summer days, the radiation from the wall is intense, and the leaves will often flag badly. When making growth the Myosotidium requires a copious supply of water. The plants are generally in the zenith of their beauty in the month of May, when a large colony carrying hundreds of large, deep-blue flower-heads is a glorious sight. It is unfortunately only in the south-west that this plant can be treated as an open-air subject. Mr. Enys used formerly to grow his plants under a wall facing south-west, but he has now made a plantation under a north wall. Here the plants have made excellent growth and have flowered well. After attaining full size they rarely retain their vigour long, gradually dwindling in size. When this occurs they are rooted up and replaced by seedlings. The flowers are followed by large, four-winged seeds and self-sown seedlings may often be seen springing up in numbers around the parent plants. The illustration in fig. 25 shows a plant growing in a South Devon garden close to the mouth of the River Dart. It carried over twenty flower-heads, some of which were eight inches across. It reproduces itself by self-sown seedlings. *Wyndham Fitzherbert.*

Fig. 25.—Myosotidium nobile in a South Devon garden: flowers blue.

The Week's Work.

THE ORCHID HOUSES.

By W. H. White, Grower to Sir Trevor Lawrence, Bart., Burford, Dorking.

Trichopilia Backhouseana.—This species is one of the best white, free-flowering Orchids, and one that deserves a place in every collection, for spikes of white flowers suitable for almost any form of decoration are not common. T. Backhouseana sometimes passes under the name of T. Hennisiana. The plant requires only a trifle more warmth than Odontoglossum crispum; therefore in summer it may be grown at the warmer end of the cool house, or in a suitable position in the intermediate house, the latter being preferable during the autumn and winter months. T. Backhouseana is fond of light, but not of the sun's rays, which sometimes turn its leaves yellow. Well-drained Osmunda-fibre is a suitable medium for the roots. As roots from a healthy plant are large and numerous, they require considerable pot-room. Now that the plants of this species have passed their flowering season, and growth has commenced, they may be repotted if necessary. In potting it is advisable to keep each plant well elevated, so that it may be watered without any fear of water lodging in the young growths, for these, like all other Trichopilias and Pilumnas, are easily rotted. Established and well-rooted plants will need but little root disturbance, merely turning them out of their pots, placing them in larger, well-drained receptacles, and filling around the ball with the compost, making it moderately firm. Enough water should be sprayed over the surface to keep the compost only just moist, but when growing and rooting freely the plant will take as much water as the cool Odontoglossums. Keep the leaves clean by sponging.

Cypripedium.—Such dwarf-growing species of Cypripedium as C. bellatulum, C. niveum and C. concolor having passed out of flower the present is a good time to repot them. These plants often give more trouble to the cultivator than all the rest of the Cypripediums, and when once they get into an unhealthy condition it is difficult to restore them to health. One of the chief causes of decline is a close and heavy compost. A compost of this nature retains moisture for too long a time, and causes the roots to decay, for growing as they do in Nature in the hollows and on the surface of limestone rocks, the plants are always in well-drained conditions. They prefer a warm, moist atmosphere with plenty of ventilation, and should be placed in a position where the foliage will be near to the roof, slightly shading them whenever the sun shines directly upon them. The potting of these species should not be done oftener than is necessary, as the plants do not grow or extend themselves nearly so fast as the majority of Cypripediums: and, no matter how carefully the work is done, a few roots are generally injured, these being very brittle, and the result of injury to the roots is more felt by them than by their congeneric species or hybrids. The proper time for repotting is a few weeks after flowering, and plants that are healthy and have room for further development should not be disturbed. I may mention that at Burford we have a healthy specimen of C. concolor which has not been repotted or disturbed since it was purchased in 1904, and the plant has produced several spikes of bloom every year. When it is necessary to repot well-established plants it is advisable gently to break the pot, removing it piece by piece. If the plant is well-rooted this can be done without disturbing the roots or drainage material. The whole mass should then be placed in a clean pot of sufficient size to allow for several seasons' growth. Fill around the roots to about half the depth of the pot with drainage material, surfacing it with good fibrous loam and mixing with it plenty of old mortar rubble. About 2 inches of the compost pressed firmly with the hand will be enough for the strongest plants to root in, and still less must be used for weak ones. There is no need to elevate the plants above the rim of the pot, for they will grow equally well if potted so as to allow a good space for watering. Carefully attend to the watering of these species at all times, and it is important always to allow each plant to become thoroughly dry at the root before water is given. A few days on the dry side will do no harm; but whenever water is needed it should be given abundantly. Sponge the foliage occasionally, and in so doing care must be taken that the succulent leaves are only raised a very little above the level they grow, or their mid-ribs will crack.

THE KITCHEN GARDEN.

By John Dunn, Foreman, Royal Gardens, Windsor.

French Beans.—A liberal sowing of French Beans should be made as soon as possible to provide supplies during September. A sheltered position should be selected so as to avoid injury by early frosts. Ground which has been occupied by spring Lettuce will be suitable, but it must be thoroughly broken up, and if too dry it should be well watered the day before the seeds are sown. The drills should be made 2 feet apart and about 2 inches deep. The Belfast and Earliest of All are good varieties for this sowing. Plants from which supplies are being gathered should be freely watered with weak, liquid manure from the farmyard, and the pods should be regularly picked (whether required or not) to prolong the bearing period.

Winter Spinach.—A sowing of Long-standing Prickly Spinach should be made now, and another in ten days' time It is better to make two or three sowings during the month than to sow a large quantity at once. The ground should not be too light; if it is dug just before before the sowing, it should be trodden fairly firm before the drills are drawn. These latter should be 15 inches apart and 1 inch deep. If slugs are troublesome lime should be dusted over the surface of the bed in the early morning and the plants carefully examined. The plants should be subsequently thinned to 3 inches apart, as they will stand the winter better if they are separated. Frequent sowings of summer Spinach should be made, and the plants freely watered with clear water to prevent their running to seed.

Celery.—The planting of this crop should be finished as soon as possible and the plants well watered as soon as they are put out. In planting late Celery it is not necessary to leave much space between the plants, as they do not grow so large as those planted earlier in the season. Their advantage lies in the fact that they will stand the winter better and keep later into the spring. When earthing-up the early Celery the bed should be examined, and if at all dry a thorough watering should be given twenty-four hours before the soil is to be applied to the stems. When tying up the plants the heart of each must be kept quite free from soil.

Leeks.—Plantations of Leeks can be made now for consumption during the spring. Good, rich soil should be chosen for this purpose, and the roots liberally supplied with water in dry weather. Leeks which were planted early should be watered with liquid manure from the farmyard and the soil kept open by the use of the Dutch hoe.

Globe Artichokes.—As soon as the Artichokes are cut the old stems should be removed and a good watering given. Young plantations made last spring should be freely watered with liquid manure. If the plants are in good condition they will provide supplies later in the season.

Early Potatos.—Certain varieties of Potatos will now be ready for lifting. This should be done as soon as possible in order to prevent a second growth, which is almost inevitable after the first heavy rain. The tubers should be stored in a cool, dark shed until required for use; the seed tubers for next season's planting may be exposed to the light for a few days in order to harden the skins, and then stored in a cool, dry place that can be freely ventilated.

THE FLOWER GARDEN.

By Edward Harriss, Gardener to Lady Wantage, Lockinge, Berkshire.

Roses.—Dead flowers should be removed from the Rose trees every two or three days, or the beds will look untidy. The plants should have been mulched early in the season before the dry weather set in; but if this was not done it is not too late to mulch after the first crop of flowers is over with a view to benefiting the autumn crop. Many of the early-flowering climbing Roses will have shed their blossoms, and the old flowering wood should be pruned and thinned. A few of the young growths from the base should be retained and attached to the supports; but the growths should not be crowded or they will not ripen. If there are signs of aphis infestation the plants should be syringed with an insecticide.

Anchusa.—As the first flower spikes of Anchusa pass over new growths will in many cases be observed. If the old spikes are cut back the new growths will develop, and will continue to flower until the end of the season. Young plants raised from seed sown in the spring should be repotted as occasion demands or planted in the reserve garden. The plant is easily propagated, and self sown seedlings are often found in the border. These can be potted if required and planted out in the spring.

Antirrhinum.—It was formerly the practice to sow seeds of Antirrhinums in July or August to produce flowering plants for the following season. Except for very early flowering this is not necessary; plants raised early in the year will flower from July to the end of the autumn. If, however, flowers are required in May or June, seeds should be sown now in the open ground. The colours are very varied and attractive, and the plants are extremely useful for bedding.

Violas.—It is difficult to keep Violas flowering freely in very dry weather, and they should be sprinkled with water at least once a day. If they show signs of exhaustion a little artificial manure or soot sprinkled between the plants and watered in will form an effectual stimulant. Dead flowers should be constantly removed. Old plants in the reserve garden should be cut down to encourage new growth, from which cuttings may be obtained for planting in the autumn.

PLANTS UNDER GLASS.

By F. Jennings, Gardener to the Duke of Devonshire, Chatsworth, Derbyshire.

Salvia splendens.—Where small plants of this resplendent Salvia are required cuttings should be at once inserted. These may be obtained from the plants now in 10 inch pots, placed three in a small 60-size pot, and grown as rapidly as possible. When rooted they should be transferred to 4½ inch pots and stopped according to the time at which they are required to flower.

Begonia Gloire de Sceaux.—Plants of this Begonia should now be ready for their final potting. They should be frequently examined for traces of the small yellow thrip which is so dangerous to them; it is often fatal before it has been detected. It usually shows on the young leaves, which become wrinkled and crippled-looking, and should be combated by regular fumigation. The atmosphere of the house should be kept close, warm and moist, and the plants well shaded from the sun.

Ipomæa rubro-cærulea.—(See Coloured Plate in *Gard. Chron., Feb.* 15, 1913).—Seeds of this climber may now be sown for autumn and winter flowering. It is a useful decorative plant, both for the table and for the stove. Three seeds should be sown in each 60 pot, placed in a frame with gentle bottom heat. When the two first leaves have appeared the pots should be taken out of the frame and placed on a shelf near the glass. When the plants have outgrown the pots they should be transferred into those of 6 inch size and placed in a stove or warm house. A stake should be placed in the centre of each pot around which the young tendrils can climb. The plants should be finally transferred into 10 inch pots in a compost of three parts good, rich loam, and one part leaf-mould, coarse sand, wood ash and decayed cow manure. The pots

should then be placed in the position in which the plants will flower and the growths trained over wires across the roof. The flowers must be removed as soon as they fade, or seeds will form and the flowering season be shortened. The pots may be placed with advantage on some turf.

Tree Carnations.—These should now be stopped for the last time, so that they may produce flowers early in the winter. The earliest batch may be given a top-dressing of Clay's fertiliser and soot mixed together, about a dessertspoonful to each plant once a week. The plants should be carefully examined for traces of small, green caterpillars. They should be syringed with nicotine and afterwards well shaken, and regularly fumigated if grown indoors. "Malmaisons" are subject to the same pest, and should be treated in a similar manner.

THE HARDY FRUIT GARDEN.

By B. Goodacre, Gardener to Sir Ernest Cassel. Moulton Paddocks, Newmarket.

Strawberries.—The Strawberry-beds being now clear of fruit, preparations must be made for next year's crop. Layers one year old usually produce the finest fruit, and if the layer is rooted early, and full advantage is thus taken of the summer sun to promote growth, the plants will become healthy and vigorous. Most varieties will provide any quantity of layers, and those required should be rooted at once in 3-inch pots. A small crock should be placed over the hole, and the pots then filled to the brim with good permeable soil containing a fair proportion of leaf-mould. The layers should then be fastened down to the soil with wire pegs. A small stone is sometimes used instead of a peg, but is not quite so satisfactory. As a rule the first crown to be formed on the runner will be the best and should be secured, the runner being cut away a few inches beyond. Old plants which do not seem inclined to produce runners should be thoroughly soaked with clear water; extra moisture will probably bring about the desired end. A warm border in the walled garden is the best position for the earliest plants, for here they are sheltered from the cold winds in spring. They should not, however, be left in this position for more than a year, and, as they will be moved later on, they may be planted rather closely—say 18 inches apart each way. If the ground has been previously occupied by early Potatos or Peas, it should be well dressed with well-decayed manure from the farmyard. It should then be thoroughly soaked and allowed to settle, after being trampled down, as in the making of an Onion bed. Before the young plants are put in they should have their roots moistened; they should be handled with care and planted with a trowel as deeply as possible without covering the crown. The soil should then be rammed around the plant, which will, with proper care and attention, produce a profitable crop early next season.

Gooseberries.—Cordon trees yielding dessert fruit should now have their shoots pinched. They should first be thinned out to the desired number, and the remainder pinched back to four or five leaves, the leader being left to grow unchecked. The fruits will now be colouring, and the trees will require a good deal of water. The older ones should be given a mild stimulant, but in small quantities, or the fruits will split. Heavy rains sometimes produce splitting, and unless the fruits are to be used almost immediately a temporary overhead protectior should be provided. If the leaves become soiled from red spider or any other cause a good syringing with clear, soft water will be found completely efficacious.

FRUITS UNDER GLASS.

By James Whytock, Gardener to the Duke of Buccleuch, Dalkeith Palace, Midlothian.

Vines.—Vineries in which the Grapes are just colouring should be slightly ventilated throughout the night, but except in favoured localities a little fire-heat will be necessary. In the case of Muscats the temperature should not fall below 75°. The shoots and lateral growths which have already been stopped will now be making fresh growth, and this should be completely removed. The foliage should be carefully examined for traces of red spider, and means taken to eradicate or prevent attacks of the pest. To guard against scorching of the foliage ventilation should be given in the morning on bright days. In localities where the rainfall is usually heavy the outside borders should be covered with wooden shutters or pieces of corrugated iron from the middle to the end of July. This will protect the borders from excessive damp, and will enable the Grapes to keep longer hanging on the vine. The inside border should also be mulched, while the Grapes are colouring, with manure from an old Mushroom bed or some other material, and be kept dry. Late vines, on which the Grapes have to hang during the winter, should be more severely thinned than summer ones. Those with large bunches, such as Black Alicante, will require the most thinning, and if the berries seem still to be too thick when they have attained to full size some more should be removed. Clean, healthy foliage is an important factor in the proper ripening of the fruit, and has also a good effect upon their keeping qualities. The paths and surfaces of the house should be damped daily, and a little vine manure occasionally sprinkled about to create a slight scent of ammonia, and so check red spider. The fire-heat at night must be regulated according to the weather. The vines from which the Grapes have all been cut should be frequently syringed, to keep the foliage clean and healthy. The top and bottom ventilators should be fully opened, and if the inside border seems dry it should be thoroughly moistened with clear water. Exhausted vines should be replaced with fresh ones, preferably canes that were one year old last spring, or were raised from eyes struck early this year. This operation should not be postponed, as the present is the best time to perform it. The house should be thoroughly cleansed from insects, and a fresh border prepared, as advised some weeks ago for a new vinery.

Tomatos.—Tomato seed sown this month to provide winter fruiting plants should be kept near the glass from the time of germinating, with plenty of ventilation. When the second leaf appears upon the seedlings they should be transferred to 3-inch pots, and when these are filled with roots, to 6-inch pots. The best soil is turfy loam, with not too much manure. They should be potted firmly, and again placed near the roof glass. Ample ventilation should be provided to keep the plants sturdy and short-jointed.

THE "FRENCH" GARDEN.

By Paul Aquatias.

Old Manure Beds.—The planting of early Celery should now be completed. The ground should be kept fairly damp until the roots are established, but will not require much watering this month. Preparations should be made for setting the main crop of winter Celery on the old cold beds as soon as the Cauliflowers are disposed of. Small ridges should be made 2 feet apart, and the plants set in the ridges at a distance of 6 inches from each other. The spaces between the ridges can be filled with drills of Radishes and Spinach, or two rows of Lettuces. Part of these beds may be reserved for sowing a late batch of Beans (such as the Nigra) for autumn use, the frames and lights being called into requisition to prolong the yield. The Cauliflowers in the clôche beds should now be nearly ready, and water should be freely administered. Cauliflowers should be marketed at this season in large quantities.

Melons.—The fruits on the plants which were set at the end of March and beginning of April are ripening apace, and should be examined daily. The chief indication of ripeness is the cracking around the stalk; those displaying this symptom should be cut and sent to market or placed in a cool situation for home consumption. Home-grown Melons are infinitely superior to the imported varieties, the flavour of the latter being often completely spoiled by their being cut before they are ripe and subsequently sent on a protracted voyage. The main crop Melons will require ample watering; this should be done three times a week in the early morning. Ventilation should gradually increase until, towards the middle of the month, a full supply of fresh air is afforded by day and night. The growths should be carefully pruned, the object being to enable the healthiest plants to bear fresh female flowers which shall set their fruits when the first crop have attained to three-quarters of their full size. When the first batch has been gathered the frames should be put over the plants which were set early in June, as the clôches are not now able to afford them adequate shelter.

Cucumbers.—The lights should be whitewashed (with the syringe rather than with a brush), and when stopping the side shoots—which will give the young fruits room to grow straight—any superfluous fruits should be removed. Ventilate freely in the daytime, but not as yet at night.

Open-air Ground.—Open-air crops require frequent watering. All Carrots and Turnips are now ready for market, and when they are disposed of their place can be filled with Cauliflowers, Celery or Kidney Beans. Early Broccoli (such as Walcheren or Leamington) will also be suitable if the ground is not required again before Christmas. Witloof Chicory should be well grown by this time, and the Dutch hoe should be frequently worked through the drills. If the plants are too thick they should be thinned out; they will then produce larger roots and stronger plants, and can be pricked out, if necessary, early in August. The Marrows set in April are now in full bearing. They should be regularly pricked when 6 inches long to prolong the crop and increase the yield. An occasional watering with liquid manure should be given.

Nursery Beds.—Seeds of Endive La Truffec or La Meaux, and the Batavian Green for a succession, should now be thinly planted in well-prepared beds. Germination should be encouraged by frequent light waterings, otherwise, unless the seeds are quite new, they are apt to germinate unevenly. Accommodation will soon be required for sowings of spring Cabbages. This crop is susceptible of considerable improvement by intensive culture, both in quality and in earliness, if plenty of water and manure are available. There are many varieties which are suitable for such treatment; Harbinger does well both in wet and dry seasons, but it is rather small, and should be sown very early. Myatt's Early, Offenham and Ox Heart should be sown in conjunction to form a succession. All nursery beds not in use should be broken up to provide fine soil for covering the sowings in July and August.

THE APIARY.

By Chloris.

Wax.—The cappings from the shallow frames should be carefully preserved and kept from other pieces of comb, as they make the best wax, which will fetch a good price, and win prizes when placed on the show bench. When performing this operation of melting, it must be recollected that the wax must not be allowed to boil or come in contact with fire, or it will lose its texture, aroma, and colour. After the wax is melted, place a mould in a bowl of hot rain-water; if this cannot be obtained, then distilled water should be utilised. Use enough to cover the mould within a quarter of an inch of the top. When the top layer of wax has set, pour over it some hot water, of the same heat as that in the bowl. Allow the wax to remain until quite set, and it will float out of the mould, when it should be allowed to remain in the water until quite cold. When pouring the wax into the mould, strain it to remove all foreign matter. The whole operation is best carried out in a warm room, or cracked cakes will result. The colour of the wax should be primrose, clear yellow, or lemon. It may be polished, if desired, and a piece of old silk is best to use. As soon as the wax is cold (and polished), it should be stored in an air-tight tin, so that its aroma may not evaporate. Should a wooden box be used, then it must be of wood that is free of any scent.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, *as well as specimens of plants for naming, should be addressed to the* EDITORS, 41, Wellington Street, Covent Garden, London. *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Editors and Publisher. — *Our Correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the* PUBLISHER; *and that all communications intended for publication, or referring to the Literary department, and all plants to be named, should be directed to the* EDITORS. *The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.*

Special Notice to Correspondents. — *The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.*

Illustrations.—*The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury*

Local News.—*Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, JULY 22—
Southampton Fl. Sh. (2 days). Ulster Rose Sh. (2 days).

WEDNESDAY, JULY 23—
Leamington Fl. Sh. (2 days). Cardiff and County Hort. Soc. Sh. (2 days). Tunbridge Wells Agric. and Hort. Sh. (2 days). Hayward's Heath Fl. Sh. Twickenham Hort. Sh. Yorkshire Agric. Soc. Sh. at York (3 days).

THURSDAY, JULY 24—
Horticultural Club: Excursion to Sir Frank Crisp's residence at Henley-on-Thames. Roehampton Fl. Sh. Carnegie Dunfermline Trust Sh. (2 days).

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—61.0.

ACTUAL TEMPERATURES:—
LONDON.—*Wednesday, July* 16 (6 p.m.); Max. 68°, Min. 53°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, *Thursday*, July 17 (10 a.m.); Bar. 29.7; Temp. 67°.

PROVINCES.—*Wednesday, July* 16, Max. 65° Margate, Min. 54°, Stornoway.
Weather—Fair.

SALES FOR THE ENSUING WEEK.

TUESDAY NEXT—
Sale of Howbery French or Intensive Gardens, Wallingford, Berkshire, by Wilson and Gray, 100, Mount Street, Grosvenor Square, London. At the Mart, London, E.C.

The Artificial Ripening of Fruits.

The changes which occur during the ripening of fruits are numerous and varied—starch disappears and is replaced by sugar, organic acids decrease in amount, and bitter substances, such as tannins, are destroyed, or at all events lose their astringency.

Of these changes the last is perhaps, from the commercial point of view, the most important; for if a fruit tastes ripe the eater thereof is not concerned with its precise chemical composition. Hence it is a matter of importance to discover means which may serve to ripen fruits artificially. Picked green and packed, they may be "shipped" without damage and ripened when wanted.

It is stated that the practice of artificially ripening Dates by exposing the fruits to the fumes of vinegar has been used for centuries by the Arabs. According to an article in the *Agricultural News* (West Indies), the Japanese impress art into the service of nature in a somewhat similar way. They cause Persimmons to ripen by storing the fruit in a closed cask in which the national alcoholic beverage (saké) has been kept.

Yet more recently, as already mentioned in these pages, carbon dioxide has been used for this purpose. The method which has been employed is described by Professor Francis Lloyd in *Science*, and consists in exposing unripe fruits for fifteen to thirty-six hours to carbon dioxide under pressures of from fifteen to forty-five pounds per square inch.

The results of experiments of this kind indicate that artificial ripening may be induced by subjecting unripe fruits to carbon dioxide; but the physiology of the process is not altogether clear. The most plausible suggestion which has been put forward is as follows:—

Astringency is due to the action on the tongue of the tannins contained in the unripe fruit. It disappears if the tannins are destroyed, or if these bitter substances are prevented from acting on the tongue. Carbon dioxide seems to produce the latter effect, and in the following way: Associated with the tannins in plant tissues are coagulable substances. Such substances when caused to coagulate hold the tannins very strongly, so strongly, indeed, that the latter substances are prevented from giving rise to an astringent taste when the fruit containing them is eaten. In short, the coagulated substance plays the part of the coat of a bitter pill, enabling the latter to be taken untasted. The explanation may be that which has been given; but we are inclined to think that other changes are induced by carbon dioxide. For example, it is possible that the effect of carbon dioxide is to hasten the oxidation processes of the tissues, and hence to cause a partial or complete destruction of the astringent substances. Recent experiments have shown that when plant tissues are exposed to carbon dioxide their specific oxidising substances, previously held in check by "inhibitors," are set free from this restraint, and so are able to set up oxidation in the cells. Whatever be the precise interpretation of the process the important thing is to ascertain whether a similar process may be induced in our common large fruits; for although artificial ripening is primarily of importance to the grower of tropical fruits—Dates, Bananas, Persimmons, and the like—it may prove also of service to the home grower.

Coloured Supplement.—The subject of the supplementary illustration is Nymphæa "Conqueror," one of the newer varieties raised by M. LATOUR-MARLIAC. The specimen shown in the illustration was grown in Mr. LEOPOLD DE ROTHSCHILD'S garden at Gunnersbury. Mr. HUDSON, who is responsible for the cultivation of the Gunnersbury House Nymphæas, describes this variety as one characterised by its robust growth and free-flowering habit. It is easy of culture, but requires to be planted in rather deeper water than some other varieties of more tender growth. The variety has been given the Award of Merit of the Royal Horticultural Society.

THE CRYSTAL PALACE FUND.—We offer our hearty congratulations to the *Times* on the success which has crowned its efforts to assist the Lord Mayor in raising funds for the purchase of the Crystal Palace. The *Times* set out to collect £90,000, and the work has been accomplished in fourteen days. Our readers will be glad to know that the preservation of the Palace and grounds for the public use is now assured.

HONOUR FOR ORCHIDIST.—Alderman WILLIAM BOLTON, the well-known Orchidist of Warrington, and member of the Orchid Committee of the Royal Horticultural Society, having sent HER MAJESTY THE QUEEN a number of choice Orchid flowers, received a telegram from Lord DERBY, Knowsley, that HER MAJESTY wished to thank him personally. An invitation was enclosed for himself and Mrs. BOLTON to attend the garden party on the 10th inst. Alderman and Mrs. BOLTON attended, and were graciously received by HER MAJESTY, who expressed her thanks and appreciation of the beauty of the flowers.

VACANT APPOINTMENTS AT ABERDEEN.—The Central Studies and Staff and Forestry Committees of the Aberdeen and North of Scotland College of Agriculture require a lecturer in forestry in the College in succession to Mr. William Dawson, who has been appointed Reader in Forestry in Cambridge University. The commencing salary offered in this case is £350 per annum. It has also been resolved to advertise for a lecturer in horticulture at a commencing salary of £150, rising by annual increments to £300.

HAMPSTEAD GARDEN SUBURB CO-PARTNERSHIP FESTIVAL.—In connection with the above festival a flower show was held on Saturday, the 12th inst., when a good schedule of prizes brought together a number of excellent exhibits. The quality, particularly in vegetables and Sweet Peas, was of a high standard, though a falling off in entries generally was recorded. A novel feature here is the Gurney Trophy Competition, open to the various co-partnership tenants' societies. The trophy is held for one year only, and is awarded the society making the best general display in the co-partnership classes. Last year Ealing was successful, and Ealing made a fair bid for the honour on this occasion also, but were beaten by the Hampstead Tenants' Society. In a class open to children under 14 years of age for the "Best Collection of Wild Flowers, collected and arranged by the exhibitor," there was keen competition, the 1st prize being well won by a Croydon boy with a fine collection, nicely staged, and correctly named. The large central square, in the vicinity of which the festival is held, has undergone a desirable change since the previous one held here two years ago. Avenues of Limes and suitable flower beds nicely filled with colour have replaced the clay heaps and builders' bric-à-brac, and the neatly-kept gardens skirting the tree-furnished roads leading from all points to the centre testify to the thoroughness of the management of the Garden Suburb.

BOTANICAL GARDENS AT BATOUM.—Mr. P. STEVENS, the British Consul at Batoum, writes: "The year 1912 was marked by the foundation of Botanic Gardens, and it is hoped that the institution will do much to advance botany in the district. The primary object of the gardens is to supply the natives and settlers from Russia with economic seeds and plants of all kinds in lieu of importing them from tropical possessions. Professor KRASNOV has been appointed by the Russian Government to lay out the gardens on an extensive piece of land which has recently been acquired some seven miles north of Batoum. This property comprises hilly lands at various altitudes up to about 1,000 feet, covers an area of 81 acres, is well situated on the coast with northern and

southern sloping aspects, and contains a variety of soils suited to the cultivation of tropical and semi-tropical plants. The experimental stations which it is proposed to attach to the nurseries will prove what plants can be acclimatised for commercial purposes, and a thorough-going system of classification and arrangement of plants is to be introduced. The funds for carrying out this work and maintenance of the gardens are to be assigned annually by the State."

Phœnix Roebelinii.—In the Floral Hall of Harrods, Ltd., in the Brompton Road, London, this elegant species of the Date Palm well displays its almost circular heads of plume-like bright green foliage. The fact that this comparatively little-known Palm is available for decorative purposes is important, especially when it is considered that the earliest introduction was of stems a foot or more in height, and it was thought improbable that dwarf plants, to be obtained at a sufficiently reasonable rate to admit of their being used for indoor decoration, would ever be forthcoming. Phœnix Roebelinii was described in the *Gardeners' Chronicle* by Mr. James O'Brien, from a plant said to have been imported from Manila, and it was illustrated in the *Gardeners' Chronicle*, October 26, 1889. The plant received a First Class Certificate at the Royal Horticultural Society, March 11, 1890, the specimen resembling a two-stemmed, dwarf tree Fern. For years the species was extremely rare, and we were pleased to see it playing such a charming part arranged with vases of Carnations, Sweet Peas, Lily of the Valley, and Orchid flowers.

Sweet Pea Trials.—We are informed that a party of Sweet Pea growers gathered at Reading on the 10th inst. to inspect the Sweet Peas at University College, and to visit the trials of Messrs. Sutton and Sons at Southcote, near Reading. The visitors included the Rev. Harold Mayall, Dr. Phillips, Dr. Hinton, Messrs. Leonard Sutton, Robert Sydenham, Herbert Smith, James Agate, W. J. Unwin, T. A. Weston, H. E. Ward, Horace J. Wright, Harry L. Foster, H. H. Lees, T. Want, A. Moring, Ralph Aldersey, W. Iggulden, H. D. Tigwell, George Aitkens, Arthur Hallam, A. E. Usher, Wheeler, F. G. Drew, J. H. Millard (J K. King and Sons), J. Jones (H. Eckford), W. J. Neily (Webb and Sons), J. S. Baker, and Walter P. Wright. The International Trials were in splendid condition, and reflected great credit on Mr. Drew and his assistant, Mr. Barnes. An advisory committee of trade and amateur experts first went through the trials and made recommendations, and subsequently a sub-committee of amateurs, who had nothing on trial, made the awards as follows:—*Silver Medals:* Edna May Improved, sent by F. C. Woodcock, Walmer; and Walter P. Wright, sent by W. J. Unwin, Histon, Cambridge. *Awards of Merit*: Edna May Improved, Walter P. Wright; Deal's Cerise Seedling No. 226, sent by B. W. Deal, Brooklands, Kelvedon; R. F. Felton, sent by Robert Bolton, Warton, Carnforth; Leslie Imber, sent by W. J. Unwin; white Picotee Seedling, sent by G. L. Hutt, Lullingstone Castle Gardens, Eynsford, Kent; Hercules, sent by Star and Son, Great Ryburgh, Norfolk; Florence Wright Spencer, Stark and Son; Red Chief Improved, R. Bolton; and Colour Schemes, sent by Messrs. Sutton and Sons. The party then drove to Southcote, where, after inspecting the extensive and splendidly-grown trials of Messrs. Sutton and Sons, they were entertained to tea by Mr. Leonard Sutton. Cordial votes of thanks were given to Messrs. Leonard Sutton, F. G. Drew, Horace J. Wright, and Walter P. Wright.

Centenary of a German Nursery.—The firm of T. J. Seidel and Co., of Laubegast, Dresden, is this year celebrating its hundredth birthday. It is not often that a firm has existed under the same name for so long a period, and Messrs. Seidel have published a very dainty little souvenir to mark the event. This book contains an account of the history of the firm and numerous illustrations showing the chief partners in the business, beginning with the founder, Traugott Seidel, who was born in 1775. Other illustrations show the nursery at various stages of its existence, the last one giving a very good idea of the large size of the present space occupied.

Kainit as a Fungicide.—The *Agricultural News*, West Indies, publishes a note on the value of kainit as a fungicide. It is said that useful results have accrued from spraying leaves of certain plants with a solution of this fertiliser. It does not appear to have any perceptible effect in the prevention of disease when applied in the usual way as a manure. One curious action of kainit is worthy of note. It seems that when applied to the soil in large amounts the manure increases the conductive power of the soil for heat, and hence keeps the temperature more uniform. In Germany it was found to reduce the severity of frost.

Use of Paper Bags in Grape Culture.—A British consular report states that the practice in Maryland, U.S.A., of enclosing bunches of Grapes in paper bags while they are growing on the vines appears to possess many advantages. These bags protect the fruit from destruction and injury by birds, against extremes of temperature, drought and rain, and even from light frost. The Grapes can also be kept on the vine, it is said, for about six weeks after they have ripened, which enables them to be marketed long after the Grape season is over. The bags, which are usually 2lb. ones, and have a small puncture in the bottom for air circulation, are placed over the Grapes, and fastened by pins, when the Grapes are about the size of Peas.

Hop Mildew.—The attention of those concerned with the control of Hop mildew is drawn to Bulletin 328, published by the Cornell University Agricultural Experiment Station. The Bulletin contains a careful record of sulphuring experiments, and of the success with which the use of this insecticide has met. Failure to control this serious disease is to be traced often to the insufficient capacity of the sulphuring machine, which should have a maximum capacity of not less than 100 pounds. Machines of less capacity do not distribute enough sulphur per acre. The amount which should be used is not less than 40 to 50 pounds per acre, and in case of severe attack 75 or more pounds should be applied. The first sulphuring should be made before the disease has declared itself. The author of the Bulletin, Mr. F. M. Blodgett, is inclined to think that "flour sulphur," which, so far has not been much used, will prove superior to flowers of sulphur. According to the manufacturers, flour sulphur can be made into a finer and more uniform powder than the common flowers of sulphur. Flour sulphur is prepared by distilling sulphur in a small iron receptacle, the temperature of which is raised to a point above the melting point of sulphur. The sulphur vapour condenses, is run into moulds, allowed to harden, and ground to the required degree of fineness.

Australian Fruit.—The *Journal of the Royal Society of Arts* quotes a reference in the *Restaurant and Hotel Review* to the grading and packing of Australian fruit. The expert who contributes the article states that nothing is permitted to be sent which is not perfect, and the grading is of such a high order of merit that a single Apple or Pear taken from a consignment is certain to be representative of the whole. No doubt those of our readers who import Australian fruit will have noticed a decided improvement in grading and packing during the last few years, the result of which is a great and growing demand for Australian supplies in England. Gros Colman grapes arrive with the beauty of their bloom hardly impaired, and the Queensland Pineapple is greatly in demand. The advantage of the availability of first-class fruits from Australia, at a time when English fruits are rare, is obvious.

Destruction of Insect Pests in France.—A recent issue of the *Revue de Phytopathologie* gives an interesting account of the means employed by the Ministry of Agriculture to exterminate an insect-pest—Icerya purchasi—in the department of Alpes-Maritimes. The pest is usually found on Orange and Lemon trees, and it has done extensive damage in many tropical and sub-tropical countries; but has almost everywhere been successfully checked with the aid of another parasite—Novius cardinalis—which feeds upon and ultimately kills the Icerya, its favourite host. The Icerya breeds with the utmost rapidity, and has damaged many of the trees at Cap Ferrat; but until last year the cause of the mischief was unknown. As soon, however, as the identity of the pest was discovered the Department took steps to introduce and acclimatise the Novius cardinalis, specimens of which were obtained from the entomological station at Portici, near Naples. These specimens, and some others obtained from Portugal, were placed in a breeding cage at the end of July, and by August 15 a first detachment of the parasite was placed on an infested Lemon tree. By the end of the season other colonies were distributed in various gardens of the peninsula. To establish a colony of the Novius cardinalis it is only necessary to place a few leaves, with the nymphæ of the Novius attached, in small wire baskets, and suspend these on the branches of an infested tree. On issuing from the chrysalis the insects soon reach their prey, and immediately deposit their eggs in the Icerya, chiefly in the parts of the body near the ovaries, where the larvæ, as soon as hatched, find abundant food at the expense of their hosts. Another way is to place branches infested with Icerya in the breeding cages for twenty-four to forty-eight hours; these will by that time be covered with the parasite, and can be removed and placed on the trees. The Novius cardinalis is now perfectly acclimatised at Cap Ferrat, and is to be found everywhere. On the other hand, the spread of the Icerya is kept well within bounds, and from some gardens it has completely disappeared. It is to be hoped that owners of Orange and Lemon plantations will remember not to spray their trees with any sort of insecticide which would infallibly kill the useful insect as well as the noxious pest.

Artificial Manures.—Leaflet No. 270 published by the Board of Agriculture deals with the sale of low-quality manures at excessive prices. The leaflet draws attention to the need for the purchasers of artificial manures not only to understand the meaning of the analysis which accompanies the invoice and advertisement of the manure, but also to be able to calculate the value of the manure according to its content in nitrogen, etc. Users of artificial manures may obtain from the Board the following leaflets:—No. 72, "The Purchase of Artificial Manures"; 80, "Use of Artificial Manures"; 93, "Farmyard Manure"; 106, "Fertilisers for Market Garden Crops"; 170. "The Uses of Lime"; 175, "Waste Organic Substances as Manures"; 254, "The Composition of Seaweed and Its Use as Manure."

Nature Reserves in Belgium.—A part of the *Jubilee Volume* of the Royal Society of Botany of Belgium is devoted to a plea for the protection of Nature. In an admirably illustrated and exhaustive article on this subject Professor Massart discusses the reasons why natural sites must be protected, and points out how the countryside of Belgium is being disfigured by the spread of factories. After demonstrating the pressing need for establishing nature reserves, Professor Massart proceeds to discuss the kinds of sites which should be protected and the type of protection which is needed in the several cases. The volume concludes with an interesting account of

what has been done in other countries to remedy the consequences which ensue when "trade's devouring train possess the land and dispossess the swain." It is indeed satisfactory to learn that nearly all civilised nations are alive to the need for preserving the natural amenities of their several countries. In times past it was assumed that Nature could look after herself, and it seemed unnecessary and almost absurd for men to presume to lend her assistance. Now, however, we are all alive to the facts that the work of destruction and defacement is fatally easy and that reconstruction and embellishment are inevitably slow processes. Therefore indiscriminate destruction must be checked, and at the least Nature must be given time and opportunity in which to repair the ravages of man, beside which those of time are but superficial.

Cook, the President, in his opening address, spoke of the joy that it gave him to see such a display in spite of terrific heat—a continuous day temperature of 96 degrees, with a hot wind that made everything uncomfortable for Roses and people. The flowers were kept fresh by spraying every half hour or so. Next year the society hope to hold a greater festival. The first exhibition has given the committee and officers a vast amount of work, and there have been moments when the outcome of all the preparations was a matter of much doubt, but the result is compensation for all. The keenest interest was manifested in the competition for the Silver Cups and other valuable prizes offered. When we say that the schedule comprised classes for 36 blooms, distinct, in two divisions, and boxes were used for the first time in Canada unless any of the latter should be required for any purpose, none of the seed-pods should be allowed to ripen, otherwise it may well become a nuisance and smother up everything else. Its pure yellow flowers are particularly attractive when arranged either by themselves or with other flowers. To have them last as long as possible when placed in water, the flowers should be cut when they first open. If this is done they last quite a week before the petals drop. For crumbling walls it is a capital companion to Corydalis lutea, Veronica Cymbalaria, and other plants that appear to thrive well in such situations. It forms a dense groundwork of ornamental foliage, surmounted by a wealth of large yellow flowers. It does not require a large amount of soil and thrives almost anywhere. *Wyndham Fitzherbert.*

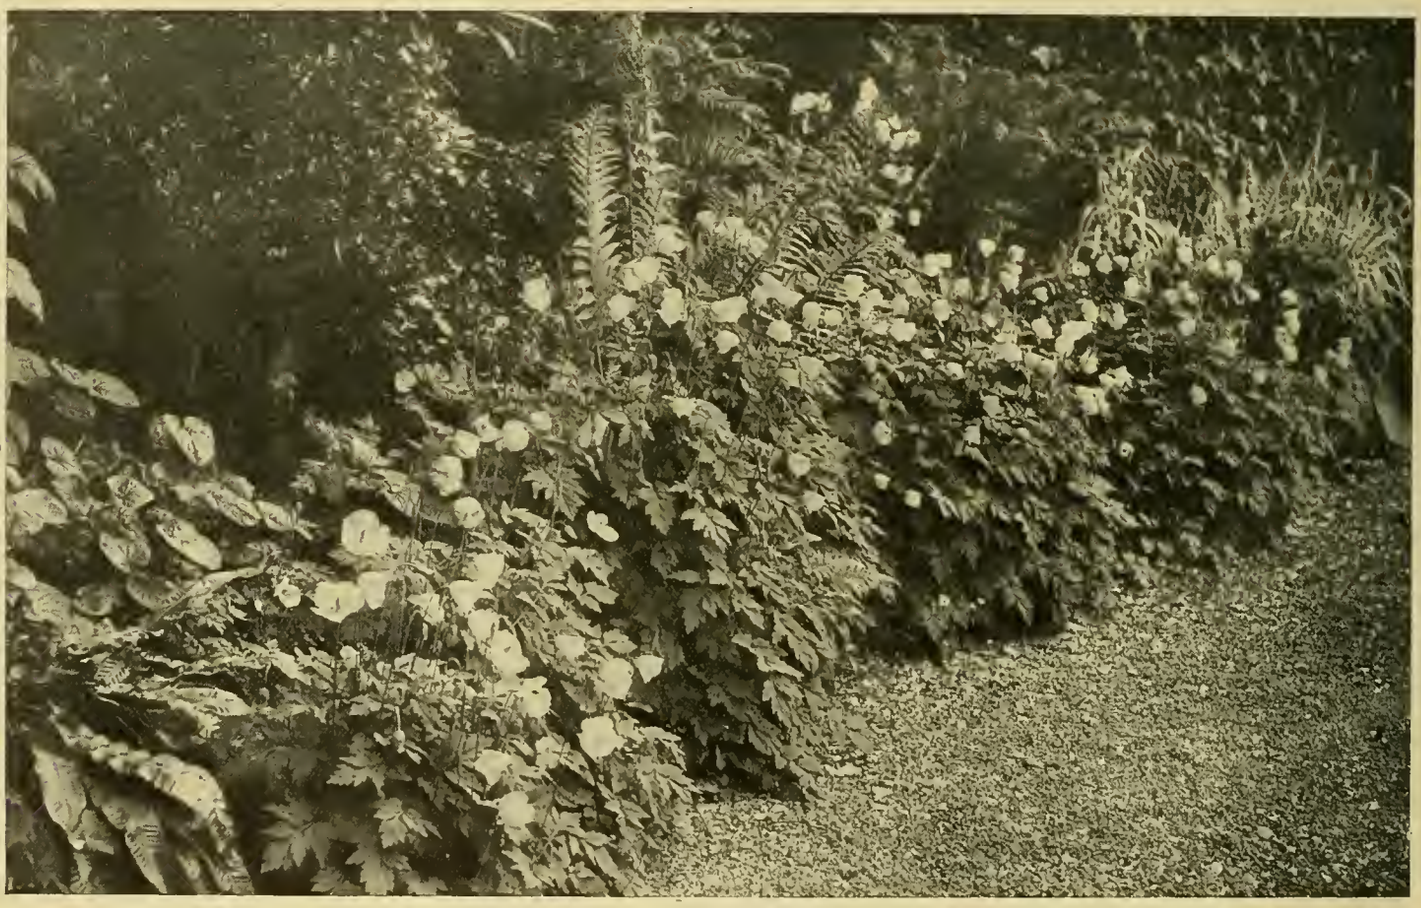

FIG. 26.—WELSH POPPY (MECONOPSIS CAMBRICA) AS A BORDER PLANT.

PÆONIA DELAVAYI (see *Gardeners' Chronicle*, vol. LIII., p. 405, fig. 169).—In respect to Mr. BALL'S note and figure of this plant, Mr. E. H. WILSON writes from America as follows :—"The type—P. Delavayi—is probably not in cultivation; it differs from the plant figured in *Gardeners' Chronicle* in having broader lobes to the leaves. The correct name of the plant illustrated is Pæonia Delavayi var. angustiloba (see *Plantae Wilsoniana*, Part III.). I introduced this same plant to Messrs. VEITCH'S in 1904. It is stoloniferous in habit, and is perfectly hardy here in Boston.

THE FIRST ROSE SOCIETY'S SHOW IN CANADA.—An event long looked forward to by flower-lovers in Toronto took place on the 3rd inst., and was a brilliant success, far exceeding expectations. Some of the exhibits were quite equal to the best English Roses, and the bloom—the best in the show—of A. K. Williams was superb. The exhibition was patronised by many of the leaders of Canadian society, and there was evidence that the Rose Society of Ontario is built upon a firm foundation. Mr. E. T. (vases also were there), it will be seen that the society is severely practical.

WELSH POPPIES.

THE Welsh Poppy, Meconopsis cambrica, is a native of Britain, but is a very showy and desirable perennial plant for the garden.. The type bears single flowers of a bright yellow colour, and is also represented by double forms having yellow and orange-coloured blossoms respectively. The species and its varieties will succeed in almost any soil, provided it is well drained in the winter. The species is common in the crevices of the steep dripping precipices on the higher Carnarvonshire mountains. The number of flowers produced by a single plant is wonderful, and if the roots are only kept moist the plants will continue to blossom for a lengthened period. In a north border they succeed well, and will last in flower well into July. Once it is established in the border there is but little fear of losing the Welsh Poppy. It reproduces itself very abundantly from seed, and

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

NATURALLY-GROWN ROSES.—During the present season the extreme beauty and gracefulness of our ordinary Hedge-Rose, or Briar, has been more than usually displayed. Many garden varieties are capable of the same natural effect if permitted to grow more or less in their own way, especially Ramblers and the stronger-growing varieties in each section. There is an old, tumble-down cottage near here which is a mass of lovely Roses. At one end an immense bush of Félicité-et-Perpétue flings out trailing growths ten to twenty feet long, which are just bursting into flower. No attempt has been made to train the growth of the plant, and it wanders over the roof of a small lean-to shed at the side of the cottage in the most picturesque and charming manner. In the centre of the cottage and over the roof Reine Olga de Würtemburg makes a splendid show, its deep scarlet blossoms contrasting finely with the creamy-white ones of Félicité-et-Perpetue. At the other end is a bush of William Allen Richardson of the deepest and purest orange I

have ever seen in this variety; while that part of the roof which is unoccupied by the Roses is covered with thick Ivy. The general effect is wonderfully beautiful, and I have seen many artists attempting to transfer some of its charms to canvas. Now, the graceful habit of these plants was obtained without any trouble at all, and is, in fact, pure accident rather than design. We can, however, learn something from the result of such entirely natural growth, and, for my own part, I consider that many of our old climbers are never more effective than when climbing at will over an old hedge. A tall, rather sparse hedge usually contains a few stems rather stouter than the rest; a few strongly-growing Ramblers should be placed near these so as to climb up them. The Roses should be vigorous enough to hold their own against the roots already established, and some good soil should be provided. This will naturally soon be occupied by the old roots, but the Roses will probably get a good start, and a little judicious feeding afterwards will sustain them. I have adorned many old hedges in this way myself, and have never known the Roses to fail to grow. They select for themselves the most graceful positions, and very little training is necessary or even advisable. The stumps of worn-out fruit trees are good positions for climbing Roses, or the whole tree may be retained (as it often is, for the sake of the blossom, even when it has ceased to fruit), in which case a Rambler Rose planted at the base will soon provide a lovely show of blossoms hanging from the branches. Thus what might have been an eyesore when once its own flowering time was past is rendered a thing of beauty. Most of our strongly-growing climbing Roses are overtrained, and by this practice much of their beauty is lost. *A. Piper, Alexandra Road, Uckfield.*

Correlation in the Peach.—The number of correlations recorded is not large, and a clear and definite new discovery in this interesting subject must be always of great interest. A recent number of *Science* contains a case noted by Professor Hedrick, of the New York Experiment Station, which is of value also from the practical point of view. The examination of a large number of Peaches of distinct varieties when in flower revealed the fact that the base of the calyx cup was coloured green in some and orange-yellow in other cases. This coloration was found to be correlated with the colour of the flesh, the white-fleshed varieties being those with the green at base of calyx cup, and the yellow-fleshed those with the orange pigmentation. No exceptions were found, and no intermediates. Thus, where the parentage was known, varieties were found to inherit these characters alternatively. Apart from the scientific interest of this discovery, it is of some practical value. Nurserymen check the accuracy of their stock when blossoming by the examination of the flowers, and the presence of a small-flowered sort among large-flowered varieties denotes an error. But it may happen that two large-flowered varieties are mixed together, and therefore, if of different flesh colours, this can now be determined in the flowers. This interesting discovery forms an excellent argument for more minute examination and description of our varieties of fruits with a view to greater accuracy in the determination of correct nomenclature. *B.*

Quality at the Shows.—May I ask the courtesy of your columns in order to make a protest against the way awards are made at the Horticultural Shows? And may I be informed whether there are any recognised rules for the guidance of those who officiate as the judges of "non-competitive" exhibits? For it has struck me (and the opinion is shared by many others) that at the recent large Shows the highest awards have been given almost without exception to the most imposing exhibit, regardless of quality. Take Sweet Peas for instance. You have in your columns time after time advised your readers when showing Sweet Peas to stage them so that each spike will stand clear of its fellows, so that the public will be able to see the size and quality of each bloom. Yet I have noticed at two of the recent large Shows that huge exhibits containing vases of short-stemmed blooms, packed like bloaters in a box (so that their inferior quality shall not be too plainly visible), were given a higher award than smaller exhibits which contained far better flowers. So that it would seem that the trade grower to gain leading honours must aim at making as gorgeous and extensive a display as possible regardless of superior quality. If officials of Societies are going to allow it to be understood that the firm which fills the largest space may expect the highest award regardless of the quality of the exhibit then it is time for someone to speak out. One wonders, too, whether judges are strictly impartial where trade exhibits are concerned. For my part I would suggest that firms should not be allowed to display their names on exhibits until after the judging has been done. Of course, I am well aware that some firms have a certain style of exhibiting which makes them readily recognised. *H.*

The Royal Horticultural Society's School of Horticulture.—The Council of the Royal Horticultural Society are prepared to receive a few further applications from young men between the ages of seventeen and twenty-two years for a two-years' course of practical and scientific training in horticulture at the Society's gardens at Wisley, Surrey. A syllabus, with form of application, can be obtained on application to the Secretary, Royal Horticultural Society, Vincent Square, Westminster. *W. Wilks, Secretary.*

Lilium sulphureum.—I enclose a photograph (see fig. 27) of Lilium sulphureum, bearing 16 flowers. The same bulb produced 12 flowers in 1912. *Robert Dimsdale, Ravenshill, Lechlade, Gloucestershire.*

Fig. 27.—Lilium sulphureum: flowers white, with yellow throat and crimson stamens.

Strawberry "President".—Can anyone kindly give me information about this Strawberry, sometimes called "Green's President," as to when, where, and how it was raised? I have given a good deal of attention to Strawberries for the last 25 years, testing nearly all the new ones, and raising a great many seedlings myself, and am to-day inclined to consider President quite the best existing variety, reckoning all points. It is vigorous on almost all soils—perhaps on all if well cultivated—is an immense and continuous cropper, solid of flesh, very richly flavoured, and equally good for dessert and preserving. It is difficult to name another variety of which so much can be asserted. Great numbers of new Strawberries are advertised and put on the market, but, except now and again one, they fall into the limbo of second and third rates. Royal Sovereign is almost the only one that in my time has maintained its position, but this has been owing to other features than that of first-rate quality, which no one can claim for it. The truth is we none of us know how to set to work to raise a first-rate Strawberry. Messrs. Laxton have worked the hardest, but they will perhaps forgive me for saying that they made an initial mistake in using the insipid American blood, which gave them "Noble," and has been largely infused into their entire strain of seedlings. I speak in humility as having myself failed to raise anything worth keeping. My reason for seeking information about Mr. Green and the origin of his "President" is that, to my mind, he must have had better material to work with than modern raisers have had or used. For one thing he attained to great richness of flavour altogether apart from the British Queen blood. Anyone at all experienced in Strawberries can see that President has in it no trace of British Queen ancestry. My own opinion, fortified by a good deal of experiment, is that it is a mistake to use British Queen at all, not only because it has exceptional soil requirements, but because it scarcely ever, if ever, transmits its flavour to its progeny. In its seedlings, whether it is used as father or mother, the flavour either disappears, or is accentuated into a foxy and disagreeable taste. The blemish of the green tip to the fruit is also passed on, and often much exaggerated. An instance of the effects of British Queen blood may be seen in the variety "Epicure"—named on the *lucus a non lucendo* principle, for it is quite insipid—which has a most noticeable green tip and no single good quality of British Queen. English raisers of Strawberries and of other fruits are disadvantaged by the fact that they cater for an undiscriminating public. In France the people will not look at a big, bright fruit if it is worse flavoured than a small, dull-coloured one. In England they ask only for something big, red, and plentiful, and therefore a legion of seedlings which ought to have been strangled at birth are suffered to live and pass into currency. But if we desire to raise Strawberries worth eating we ought to cut our losses and begin all over again with the admirable Mr. Green, if we can ascertain anything about his material and methods. *G. H. Engleheart.*

SOCIETIES.

ROYAL HORTICULTURAL.

July 15.—There was a much smaller show than usual on Tuesday at the Royal Horticultural Hall, Vincent Square, and the steady rainfall, which was otherwise so much needed, caused a rather poor attendance. The outstanding features of the show were the magnificent collection of fruit trees in pots from Messrs. James Veitch and Sons and the beautiful Carnations shown by Mr. James Douglas. There were very few Orchids, but hardy border flowers were well represented. The Orchid Committee recommended 1 First-class Certificate and 3 Awards of Merit.

The Floral Committee awarded 12 Medals to collections and 3 Awards of Merit to novelties. The Fruit and Vegetable Committee awarded one Gold and One Silver Knightian Medal to collections of fruit.

At the three o'clock meeting of Fellows in the Lecture Room, Professor R. H. Biffen, M.A., delivered the ninth Masters Memorial Lecture, the subject being "Some Factors in the Prevention of Disease in Plants."

Floral Committee.

Present: Henry B. May, Esq. (in the chair), and Messrs. G. Reuthe, Chas. E. Pearson, W. J. James, Charles Dixon, John Dickson, Arthur Turner, J. W. Moorman, John Green, C. R. Fielder, J. T. Bennett-Poë, Bernard Crisp, W. J. Bean, W. P. Thomson, J. F. McLeod, John Jennings, Charles Blick, E. H. Jenkins, C. T. Druery, George Gordon, W. Cuthbertson, George Paul, W. A. Bilney, and Thomas Stevenson.

Mr. James Douglas, Great Bookham, exhibited a magnificent collection of Carnations. The varieties which received Awards of Merit aroused much admiration. Other first-class varieties were Hercules (deep maroon), Mrs. G. A. Reynolds (buff-apricot), Cecilia (yellow), Jean Douglas (bright red), and Renown (a buff fancy marked with fiery red). (Silver Flora Medal).

Messrs. H. B. May and Sons, Upper Edmon-

ton, gave special prominence to an excellent batch of Gymnogrammas in their exhibit of stove and greenhouse Ferns. Besides the better-known species we noted Gymnogramme chrysophylla Reginæ with more than the usual amount of "gold," G. wettenhalliana and G. Peruviana argyrophylla, two silvery varieties. Against the wall Messrs. May arranged a large group of floriferous standards of Fuchsias Corallie and Thalia. (Silver Flora Medal.)

Messrs. Dobbie and Co., Edinburgh, showed many beautiful flowers in their collection of Sweet Pea novelties for 1914-15-16. Many of these, such as a large-flowered bright red, several

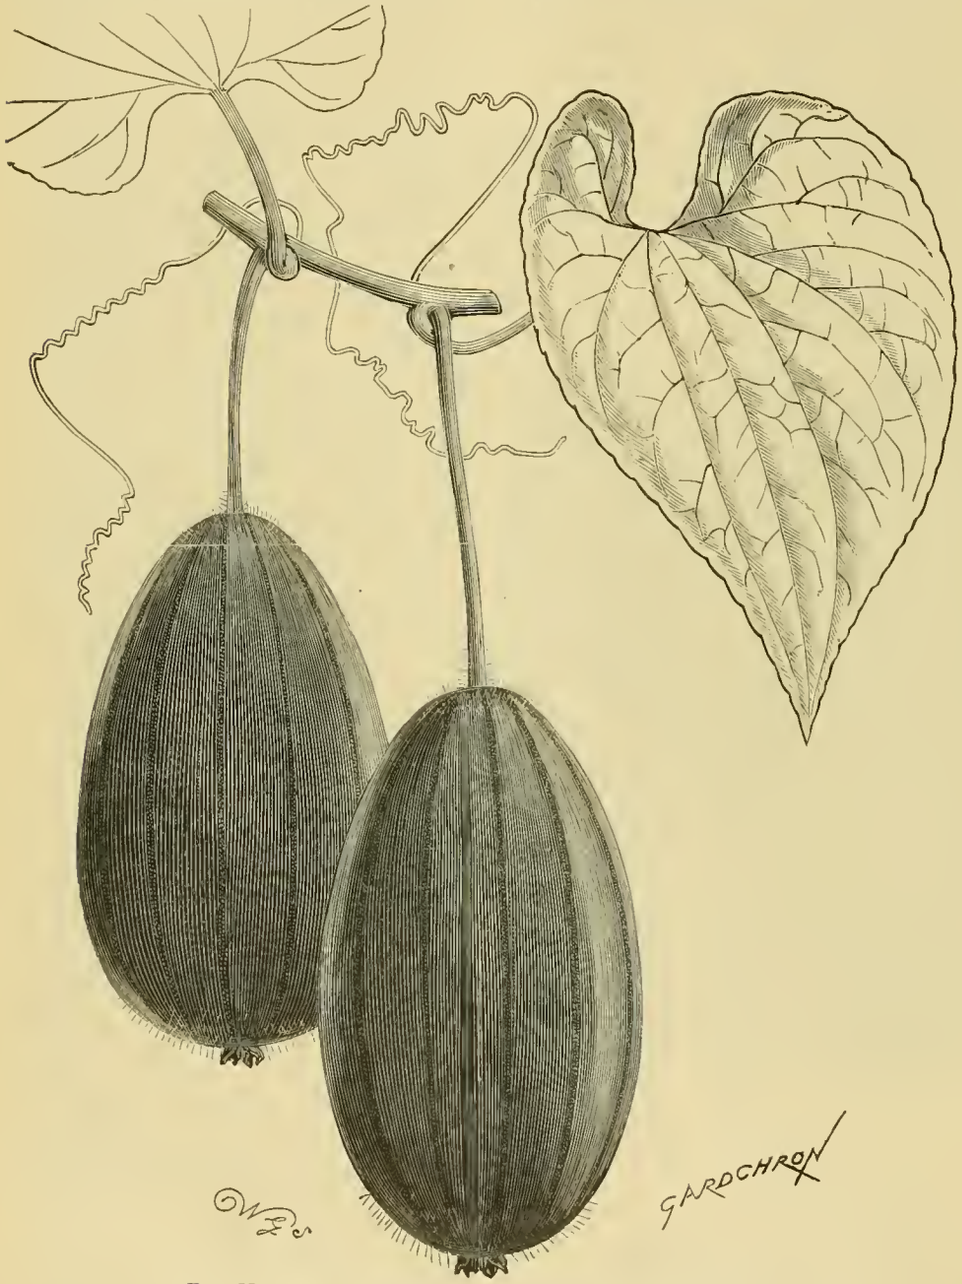

Fig. 28.—fruits of thladiantha dubia : colour, dull red.

(Awarded Cultural Commendation on Tuesday last when shown by Col. Lockwood, M.P.)

charming pinks, and a good blush white, were unnamed. Of the others Margaret Atlee (shades of pink with a suggestion of yellow at the base of the petals), Early Cream, Ruby Palmer, and King White, were excellent. (Silver Banksian Medal.)

Messrs. Wm. Cutbush and Son, Highgate, showed Caladiums, Codiæums, Clerodendron Balfouri, Coleus Cordelia, and various Liliums in a bright collection of indoor plants.

Messrs. Stuart Low and Co., Bush Hill Park, Enfield, staged a stand of the richly-coloured Rose Rayon d'Or in the centre of a large collection of cut Roses, which were attractively arranged with greenhouse Ferns. (Silver Banksian Medal.)

Messrs. G. Bolton and Son, Buntingford, Herts, included large stands of such good Roses as John Cuff, Avoca, Hugh Dickson, and Mons. Joseph Hill in an extensive collection of cut blooms. The exhibition boxes, which were placed at intervals along the front, contained large, well-formed blooms, which showed traces of the recent rains.

Messrs. Hobbies, Ltd., Dereham, gave especial prominence to vases of the fragrant pillar Rose "Effective" in a small but choice collection of Roses. Other desirable new varieties were Lemon Queen and Pink Pearl.

Messrs. H. Cannell and Sons, Eynsford, Kent, showed a good collection of cut Roses and trusses of brilliantly coloured zonal Pelargoniums.

Messrs. Fred Smith and Co., Woodbridge, made an attractive display with vases of herbaceous Phlox, Romneya Coulteri, Kniphofias, Gaillardias and other hardy flowers in a large group against the end wall. Not only were the flowers of high quality, but good taste was evidenced in their arrangement. (Silver Flora Medal.)

Messrs. Geo. Bunyard and Co., Ltd., Maidstone, showed a wide range of desirable border flowers, amongst which the varieties of Campanula platycodon were especially noticeable. (Silver Banksian Medal.)

Messrs. T. S. Ware, Ltd., Feltham, Middlesex, relied largely on flowers with shades of blue and lavender for making an effective display. Anchusa italica Dropmore variety, Eryngium Oliverianum, Salvia nemorosa virgata and Veronica pyramidalis were happily blended with the flowers with yellow shades of colour. (Bronze Flora Medal.)

Mr. Maurice Prichard, Christchurch, showed such sterling varieties of Astilbe as Pink Pearl, Juno, Venus, Vesta and Princess Juliana, and a large batch of the very showy Spiræa palmata in an excellent exhibit of hardy flowers. (Bronze Flora Medal.)

A large bush of Desfontainea spinosa bearing numerous scarlet and yellow flowers occupied the central position in Mr. G. Reuthe's exhibit from Fox Hill, Keston, Kent.

Mr. G. Miller, Wisbech, included many vases of herbaceous Pyrethrums and several good varieties of Delphiniums in a well arranged collection of border flowers. (Bronze Banksian Medal.)

Mr. James Box, Haywards Heath, Sussex, arranged a very large collection of hardy plants and cut flowers just inside the entrance of the Hall. A central pool contained several good Nymphæas, but the conception was rather artificial, the fronting of Pentstemon Newbury Gem, Erica vulgaris alba, etc., being incongruous; but this was amply atoned for by the excellence of the other portion. (Silver-Gilt Banksian Medal.)

Messrs. G. and A. Clark, Ltd., Dover, filled the centre of a collection of hardy flowers with a large number of Downer's "Pride" Carnation —a sweet-scented, pure-white variety of great merit. (Bronze Flora Medal.)

Mr. Howard H. Crane, Highgate, also showed a collection of Violettas.

Messrs. Carter, Page and Co., London Wall, London, contributed a great variety of the dainty little Violettas and a smaller collection of zonal Pelargoniums. (Bronze Flora Medal.)

Mr. L. R. Russell, Richmond, showed a tastefully-arranged collection of border flowers fronted with a row of profusely-berried Nertera depressa.

The Guildford Hardy Plant Co., Guildford, included spikes of Dracocephalum virginianum album, Sidalcea Listeri and Francoa appendiculata in a very attractive collection of hardy border flowers.

Messrs. Wm. Fells and Son, Hitchin, built a small rock garden.

Award of Merit.

Carnation "Firefly."—A border variety, producing large scarlet flowers. The petals are rather too bunched and full at the centre for an outdoor variety. The calyx and stem are both good and the flowers sweetly scented.

C. "Bookham White."—Another border variety of a very beautiful ivory-white, with well-formed flowers, and fine-textured petals. Calyx and habit are good, but the variety lacks fragrance. These two shown by Mr. J. Douglas, Great Bookham.

Delphinium "Mrs. W. J. Sanderson."—This is a variety notable for its pure colour, a deep marine blue, with scarcely a touch of purple, rather than for the size of flower, which is medium only, or habit of spike which is full and close-flowered. The variety reminds one of Masterpiece or Mrs. Rushton, and has the same neat white eye to the flower, but the colour is a purer blue. In full light this is a very beautiful plant. Shown by W. J. Sanderson, Esq., Warkworth, Northumberland.

Cultural Commendation.

Thladiantha dubia.—Some very fine pot plants of this cucurbitaceous creeper were shown, heavily laden with the fleshy red hanging gooseberry-like fruits, which, are sometimes nearly 3 inches long. The species is dicœcious, and when introduced about 1861 from China (it was figured in the *Bot. Mag.* in that year) created considerable discussion, but at that time only the male plant was known, and the fruit and female flower in the *Bot. Mag.* plate are those of a different species. The leaves are cordate, tapering at the tip; the flowers are yellow and no inconsiderable ornament, and the habit is vigorous, so that the plant should be a little more common on the roof or trellis-work of cool houses. Shown by Colonel Lockwood, Romford (gr. Mr. A. Bagg).

Other Novelties.

Delphinium Van der Weyeri is a strange introduction from British East Africa, and under cultivation may lead to something very useful. As shown the plants appeared to have been cultivated in pots under glass, and though from 1 to 3 feet in height, only carried from two to four flowers each. The most striking characteristic of the flower is that it is sweet scented—it was even compared with the Stephanotis—but it is also a very pure white and of large size, being nearly 2 inches in diameter, with the upper sepal separated from the four lower. This was shown by Mr. Van der Weyer.

Mr. Maurice Prichard showed three interesting new forms of Sidalcea Listeri, deeper in colour than the very pale pink of the type, and in two of the forms with rounded instead of fringed petals. They were named after the Rev. Page Roberts, and as Strathfieldsaye seedlings.

Orchid Committee.

Present: J. Gurney Fowler, Esq., in the chair, and Messrs. Jas. O'Brien (hon. sec.), J. S. Moss, Gurney Wilson, J. Wilson Potter, R. G. Thwaites, F. M. Ogilvie, T. Armstrong, C. H. Curtis, W. Cobb, J. Charlesworth, W. H. Hatcher, J. E. Shill, R. Brooman White, W. Bolton, C. J. Lucas, H. G. Alexander, A. Dye, W. H. White, S. W. Flory and Sir Harry J. Veitch.

Messrs. Sander and Sons, St. Albans, were awarded a Silver Banksian Medal for an interesting group of Orchids, both hybrids and species, at one end being a very remarkable plant of Vanda cœrulea, with thirty pairs of leaves and a very fine spike of pale-blue flowers netted with violet. Some Lælio-Cattleyas, Cattleya Lord Rothschild, hybrid Odontoglossums, the pretty Odontonia Magali Sander, Odontioda Vuylstekeæ, O. Charlesworthii, O. Keighleyensis and other hybrids were noted, and among species Ancistrochilus Thompsonianus, Platyclinis filiformis, Maxillaria marginata, M. Meleagris, M. nigrescens and other Maxillarias, Masdevallia corniculata, Bulbophyllum barbigerum and several Dendrobium Dearei.

Messrs. Charlesworth and Co., Haywards Heath, were awarded a Silver Banksian Medal for a group in which were two plants of the pretty Paphinia cristata (see Awards). The showy Sophro-Lælio-Cattleya Sibyl (S. L. heatonensis × L.-C. Haroldiana), with bronzy-orange flowers with purple-veined lip; several good Odontoglossums, two plants of Catasetum fimbriatum, Cycnoches chlorochilon, the rare Lycaste trifoliata, a nearly white form of Miltonia vexillaria, Dendrobium Dearei, Anguloa Cliftonii and Peristeria elata.

Messrs. Stuart Low and Co., Bush Hill Park, Enfield, were awarded a Silver Banksian Medal for an attractive group containing good examples of many favourite species, including Aërides multiflorum, Cattleya Harrisoniæ, Vanda cœrulea, Oncidium Krameri, O. amictum, Chysis bractescens, Cirrhopetalum pulchrum, Cœlogyne Massangeana and various Dendrobiums. Also Cypripedium Maudiæ, Odontioda Thwaitesii, Miltonia Bleuana and other hybrids.

Sir Jeremiah Colman, Bart., Gatton Park (gr. Mr. Collier) sent Catasetum Colmanæ, resembling C. Cliftonii, but with the large yellow lip spotted with red and the thick callus coloured chestnut brown; Anguloa Cliftonii, with four flowers, and the pretty Odontioda Papilio "Gatton variety," with red flowers having white markings on the petals, and white front to the lip.

E. de Q. Quincy, Esq., Oakwood, Chislehurst, sent a well-flowered plant of Cypripedium Wiertzianum (Rothschildianum × Lawrenceanum).

Monsieur H. Graire, St. Fuscien, Amiens, sent Odontioda Brindejonc des Moulinais (Odontioda Devossiana × Odontoglossum Arlequin), with rather small claret-red flowers. The name might better be restricted to one of the three words used or some other name of a single word given.

The Earl of Craven, Coombe Abbey Coventry (gr. Mr. H. Chandler), sent Lælio-Cattleya Martinetii Coombe variety (Cattleya Mossiæ Arnoldiana × Lælia tenebrosa), a distinct form with primrose-yellow sepals and petals and purple lip.

AWARDS.

First-Class Certificate.

Dendrobium Dearei McBean's variety, from Messrs. J. and A. McBean, Cooksbridge. A magnificent form of this fine, white Dendrobium and the largest which has yet appeared, the blooms being nearly twice the size of the original and of a pure snow white.

Award of Merit.

Odontioda Cooksoniae verustum (*O. ardentissimum* × *C. Noezliana*), from Lieut.-Col. Sir Geo. L. Holford, K.C.V.O., Westonbirt (gr. Mr. H. G. Alexander). A model flower of fine size and brilliant red colour. The front of the lip is bluish-white, the crest yellow.

Odontioda Thwaitesii Purple Emperor (*O. Harryanum* × *C. vulcanica*), from E. H. Davidson, Esq., Orchid Dene, Twyford. A remarkable variety with large bronzy-purple flowers, with lilac-coloured lip freckled with white, and with yellow crest. The finely-grown plant bore a branched spike of thirty-five flowers.

Paphinia cristata, from Messrs. Charlesworth and Co., Haywards Heath. A charming old Orchid which has been known since 1843, but has been always scarce. The plant is of dwarf habit, the flowers usually produced two on a short spike, being 4 inches across and of a rich claret colour, with white lines. Lip dark purple with white hairs at the apex. It is placed by some authorities under Lycaste. P. grandiflora (grandis) and P. rugosa are described as distinct species, and are found under those names sometimes in gardens, but the cultivated plants appear to be all forms of P. cristata.

Fruit and Vegetable Committee.

Present: George Bunyard, Esq. (in the chair), and Messrs. Jos. Cheal, J. Bates, F. Perkins, G. Woodward, Ed. Beckett, A. Grubb, A. W. Metcalfe, H. Markham, J. Davis, Wm. Pope, P. C. M. Veitch, J. Willard, Geo. Wythes, John Harrison, W. Poupart, and C. G. A. Nix.

Messrs. James Veitch and Sons, Ltd., Chelsea, arranged, against the back wall, a wonderfully fine collection of fruit trees in pots. Each young tree was a model of cultural skill, and bore a heavy crop of perfect fruits. The most attractive to the general visitor were the 6 feet high bushes of Apple Lady Sudeley, which were thickly studded with bright crimson fruits. Standard fan-trained Peaches, dwarf pyramid Nectarines and bushes of heavily-laden Plums and Greengages also formed part of this excellent exhibit. (Gold Medal.)

Lady Wernher, Luton Hoo, Luton (gr. Mr. A. W. Metcalfe), exhibited 7 large boxes containing giant Strawberry fruits of the varieties Givon's Late Prolific and the rich Mulberry-red Waterloo. (Silver Knightian Medal.)

W. J. Sanderson, Esq., Northumberland, was awarded a card of Cultural Commendation for huge fruits of Strawberry "Bedford Champion."

The Hon. Vicary Gibbs, Aldenham House, Elstree (gr. Mr. Ed. Beckett), showed perfectly formed roots of Beet "New Intermediate," for which a Cultural Commendation was awarded, and the committee desired that seeds be sent to Wisley for trial.

Trials at Wisley.

July 15.—At their meeting on this date the Council of the Royal Horticultural Society approved the following recommendations for awards made by the Fruit and Vegetable Committee at Wisley on July 7 to the subjects indicated.

First-Class Certificate.—Strawberry British Queen from R.H.S. Gardens.

Award of Merit.—Strawberries: Cropper, Fillbasket*, Progress, Rival. (Of the above, Fillbasket has already received an Award of Merit. They were all sent by Messrs. Laxton, Bedford.) Pea Alderman*, from Messrs. Dickson, Newtownards, and Messrs. Dobbie, Edinburgh. Pea Exhibition*, from Messrs. Wheeler, Gloucester. Pea Favourite, from Messrs. J. Veitch, Chelsea. Pea Masterpiece, from Messrs. Sutton, Reading. Pea Premier*, from Messrs. Bell and Bieberstedt, Leith. Pea Quite Content*, from Messrs. Dobbie, Edinburgh. Pea Sir Arthur Bignold, from Mr. Holmes, Tain. Pea Warriston Wonder, from Messrs. Bell and Bieberstedt, Leith.

Highly Commended. — Peas: America* (Holmes), Battleship (Carter), Best of All (Wheeler), Discovery (Dickson), Harvestman* (Carter), International* (Carter), Laxtonian* (Hurst), Magnum Bonum* (Sutton), Marquis of Stafford (Holmes), Peerless* (Sutton), Prodigy* (J. Veitch), The Clipper (Sydenham), Up to Date (Sutton), Victor* (J. Veitch), Orwell (Staward).

Commended.—Pea Ideal* (Sutton).

The varieties marked thus * have already received awards

NATIONAL ROSE.

Exhibition at Gloucester.

July 15.—In honour of the Gloucestershire Rose and Sweet Pea Society having attained its twenty-fifth anniversary, the National Rose Society held their provincial show (in conjunction with the local society) at Gloucester on Tuesday last. Most of the leading growers and better-known amateur exhibitors were represented, and the keenest competition was met with in every section. The season has not been a good one for Roses in all districts, but whilst local rosarians complain of the forwardness of their Roses owing to the dry weather, Messrs. A. Dickson and Son, Newtownards, Ireland, who have also an extensive nursery at Ledbury, Gloucestershire, regard the season as having been most favourable to them; indeed, one of the best. Certain it is, however, that anyone looking at the magnificent display staged at Gloucester on Tuesday, from most parts of the kingdom, would have concluded that so far as the season has been concerned Rose growers and exhibitors alike have not had much to complain of.

The show was opened by Lady Cunynghame, and the Mayor of Gloucester, the City High Sheriff, and members of the Corporation attended in state. The Mayor subsequently entertained the officials and friends to luncheon on the ground.

For the National Society's premier award, the Jubilee Fifty-Guinea Trophy and Gold Medal, in the nurserymen's class for 36 blooms, distinct varieties, there were six entries, the competition resulting in the success of Messrs. Hugh Dickson, Ltd., Belfast, who showed a remarkably fine stand of beautiful Roses. Messrs. B. R. Cant and Sons, Colchester, were placed second, and Messrs. A. Dickson and Sons, Ltd., Newtownards, Ireland, third.

For a trophy in the amateur section, and Gold Medal, Mr. Tom Park, Bedale, carried off the 1st prize among eight strong competitors, of whom Mr. Franklin Dennison, Leamington, was second, and Dr. T. E. Pallett, Colne, Essex, third.

Considerable interest was evinced in the struggle in the amateur class for the local society's 30 Guinea Silver Challenge Bowl (for 36 varieties), which for the last two years has been held by Mr. Conway Jones, of Hucclecote, Gloucester. After a very hard fight Mr. Conway Jones succeeded in winning the bowl outright. Mr. George Prince carried off a Challenge Cup for 9 blooms of Harry Kirk, shown in a single vase.

Captain W. J. Thorpe, Hucclecote, won Mr. Conway Jones' Silver Challenge Cup for 12 varieties open to Gloucestershire amateurs, the National Society's Silver Medal for the best bloom in open amateur classes with a George Dickson, and a Silver-Gilt Medal for the best collection of 12 Roses. The Silver Challenge Cup offered by Messrs. John Jefferies and Son, Cirencester, for some Tea or Noisette Roses, shown by Gloucestershire amateurs, went to Mr. George Bonner, Barnwood. The Challenge Cup presented by the Mayor and Corporation of Gloucester for 9 varieties in the division for City of Gloucester amateurs was won by Mr. J. G. Orpin, Tweenbrook Avenue. There were 5 entries. The National Rose Society's Silver Medal for the best bloom in this class was won by Mr. Orpin with a flower of J. B. Clarke. The N. R. Society's Medal in the county cottagers' class was awarded to Mr. John Waite, Hucclecote, with a flower of Hugh Dickson.

The National Society awarded 6 Silver Medals to nurserymen and amateurs. For the nurserymen the medal for a Hybrid Tea went to Messrs. Alex Dickson and Son for H. V. Machin; for a Tea to Messrs. D. Prior and Son, Colchester, for a bloom of Mrs. E. Mawley; and for a Hybrid Perpetual to the King's Acre Nurseries, Hereford, for a fine flower of A. K. Williams. For the amateurs a medal for the best Tea went to Mr. J. H. Welsh, Londonderry, for a Mrs. Foley Hobbs; for a Hybrid Tea to Mr. Garnett Holt, Ray, Hereford, for a George Dickson, and for a Hybrid Perpetual to Mr. Tom Park, Bedale, for an A. K. Williams.

Other prize-winners in the nurserymen's section were Messrs. George Prince, Longworth; John Mattock, Oxford; Ernest Hicks, Wallingford, Berks; English, Ltd., Gloucester; John Jefferies and Son, Cirencester; D. Prior and Son, Colchester; and Henry Drew, Longworth.

New Seedlings.

The new seedlings, which were staged in a separate tent, formed a popular feature of the show. They were generally pronounced to be some of the finest that had ever been shown at a National Society's provincial show. Twenty-three new seedlings were shown, and eight National Society's Gold Medals awarded. Messrs McGredy received four, the first for Colleen, an enormous flower, bright pink, an improvement on Killarney; another for Mrs. F. W. Vanderbilt, the best of the Lyon seedlings, shaded gold and red : a third for Florence Forrester, a massive flower with a slight Tea scent, and a little yellow at the base of the petals, and a fourth for Irene Osgood, a brilliant yellow of the decorative garden variety, which promises to attract a great deal of attention. Messrs. Hugh Dickson were awarded 3 Gold Medals, one for Mrs. Archie Gray, an exhibition flower, pale cream in colour; one for Gorgeous, somewhat resembling the Lyon variety in colouring, promising to be a useful sort alike for the garden as for exhibition purposes, and a third for Countess Clanwilliam, cream tinted with pale pink picotee edging. Messrs. Alex. Dickson and Son won a Gold Medal for G. A. Hammond, a very fine exhibition Rose, of good shape and yellow in colour. It was interesting to note that two new Roses, just in commerce, Irish Fireflame (Messrs. Alex. Dickson) and Old Gold (Messrs. McGredy), secured the 1st and 2nd Prizes, respectively, for table decorations, which were won by Mrs. J. W. Cook, Radstock (1), and Mrs. Colston Hale, Warminster (2). Miss E. E. Riddle, of Cranham, was third, the Rose shown by this lady being Mme. Abel Chatenay.

Sweet Peas.

The Sweet Pea display was one of the finest and largest ever staged in the history of the local society. Mr. A. W. Stirling, Goring-on-Thames, carried off the Challenge Cup for 24 distinct varieties, Sir Samuel Baker, M.P., Blandford, Dorset, being second. The "Edwin Lea" Challenge Cup for the best display was awarded to Mr. E. Horwood, Stroud, Mrs. W. Gordon Canning being second. The Winfield Challenge Cup for 6 distinct varieties was carried off by Mr. W. Jarratt Thorpe. The National Sweet Pea Society's Medal for the best bunch of Sweet Peas in the show was awarded to Mr. E. R. James, Banbury, for a bunch of yellow Barbara.

ELTHAM HORTICULTURAL.

July 10.—The thirty-fifth annual show in the grounds of Eltham Court proved successful, but a heavy thunderstorm which occurred shortly after the opening hour prevented many from seeing the lovely grounds attached to the Court. In the competitive classes thirteen were provided for Roses. Four competed for the "North" Cup, valued at 25 guineas and offered for the best collection of 48 blooms, distinct varieties; the 1st prize was awarded to Messrs. B. Cant and Sons, Colchester, who showed handsome flowers, large, clean and highly coloured, including the varieties Captain Hayward, Aug. Hartman, a new variety of a cherry-red colour and faultless shape; Edward Mawley, Mildred Grant, J. B. Clark, Horace Vernet, Madame Theodore Roosevelt, His Majesty, British Queen, Mrs. Amy Hammond, Gloire de Chédane Guinoisseau, deeply coloured and shapely; Leslie Holland and George Dickson; 2nd, Messrs. F. Cant and Co., Colchester; 3rd, Messrs. G. and W. H. Birch, Peterborough.

There were three entries in the class for 24 blooms, distinct; Messrs. B. Cant and Sons were again successful, and were followed by Messrs. F. Cant and Co.

C. C. Eversfield, Denne Park, Horsham, (gr. Mr. M. Bursfield), won the 1st prize for 12 tea or noisette varieties, showing White M. Cochet, Mrs. E. Mawley, Medea, Bridesmaid, Nita Weldon, Maman Cochet and others; 2nd, Messrs. F. Cant and Co.

The following classes were confined to members: Mr. Eversfield secured the cup offered for 18 distinct varieties with a stand of superior flowers, also the Silver Medal of the N.R.S. for the best Rose in Classes 1 to 4; 2nd, G. H. Hammond, Esq., Woodlands, Burgess Hill (gr. Mr. E. Jutland); and 3rd, H. L. Wettern, Waratah, Sanderstead, both exhibitors staging superior examples of popular varieties. Mr. Eversfield was also successful in the class for six tea or noisette varieties, for six triplets and for six flowers of any one variety. The Silver Cup offered for twelve distinct varieties reserved to members growing fewer than 500 plants was won by H. J. Bartleet, Esq., Severndroog, Shooters Hill (gr. Mr. H. Agate), showing high-class specimens. Hugh Dickson was especially good, securing the N.R.S. Medal in that section. 2nd, Mr. F. Barratt, Eltham. Mr. Barratt also won in the classes for six tea or noisette varieties. In a keen competition for garden or decorative Roses Mr. Wettern was successful with Hiawatha, Orleans and Blush Rambler. He also secured the 1st award for single flowers, showing Irish Elegance, Moschata, Nivea and Hiawatha.

Sweet Peas were well shown. In the class for twelve distinct varieties A. F. Blades, Esq., Woodfield (gr. Mr. F. Cordell), was successful, his most prominent varieties being Regalia, Dobbie's Cream, Hercules, Lavender George Herbert, King Edward, Spencer and Melha.

Hardy cut flowers were a fine feature of the show. S. Palgrave Page, Esq., Mottingham Hall, Eltham (gr. Mr. M. E. Brown), was placed 1st for nine bunches.

There were nine competing in the class for table decorations (Sweet Peas excluded), and the 1st prize was awarded to Mrs. Latter, Southend Hall, Eltham, who showed an effective arrangement of Wild Poppies, Gypsophila gracilis and grasses; 2nd, Miss Hollis, Court Yard, Eltham. Baskets of Roses were contributed freely, Mrs. S. Palgrave Page, Mottingham Hall, received the 1st prize for a flat mass of Dorothy Perkins with but few developed flowers. Mrs. Gaitskell, The Croft, Court Road, Eltham, with Caroline Testout, showing many traces of weather in the blooms; 3rd, Miss D. Banwell, Beachcroft, Eltham, with a lovely arrangement of Hugh Dickson in perfect order. This exhibit well deserved the premier award.

Non-Competitive Exhibits.

Mr. W. Chantler, St. Mary Cray, Kent, showed Roses and hardy flowers; Mr. Herbert Dudney, South Road, Erith, Kent, showed Carnations; Mr. A. L. Gwillim, Cambria Nursery, Sidcup, tuberous Begonias, and Mr. G. Reuthe showed hardy flowers and shrubs.

ELSTREE AND BOREHAM WOOD HORTICULTURAL.

July 9.—The fifth annual summer show of the Elstree and Boreham Wood Horticultural Society was held in ideal conditions in Aldenham Park on July 9, and proved a record one, in the number both of entries and of visitors. Lord Aldenham kindly placed the park at the disposal of the society, and the President, the Hon. Vicary Gibbs, had the gardens thrown open to the public. This year there were two extra Silver Cups awarded, one in open competition for Sweet Peas and the other for 12 Roses, open to residents only. The former was won with a magnificent twelve vases by Lord North, Wroxton Abbey, Banbury (gr. Mr. E. R. James), who also staged an honorary exhibit and was awarded a Gold Medal in addition to the Cup. The Cup for 12 Roses was won by J. B. Wellington, Esq. (gr. Mr. G. Allen). The Rose Cup was again won by Messrs. Frank Cant and Co., who were closely followed by Messrs. Harkness, of Hitchin. A large collection of Vegetables was staged by Mr. E. Beckett, V.M.H., gardener to the Hon. Vicary Gibbs, and was awarded a large Gold Medal. Sutton's Early Giant Cauliflower, Duke of Albany Pea, Sutton's Table Dainty Vegetable Marrow, King Edward and May Queen Potatos, Sugar Peas, Aubergines, Kohl Rabi and Sutton's Black Beet were especially fine. Mr. G. Paul, gardener to Mrs. Vasmer, arranged a semi-circular group of Orchids and stove flowering and foliage plants. (Large Silver Medal.) Groups of flowering and foliage plants were also exhibited by K. Edgcumbe, Esq. (gr. Mr. Eggleton) and G. W. Atkins, Esq. (gr. Mr. Lawrence). Trade exhibitors included Messrs. Wm. Cutbush and Sons, with a fine exhibit of Roses, Messrs. Thomson and Chapman, Alpines and herbaceous; and among miscellaneous items Messrs. M. Gleeson and Co., floral arrangements. The winning exhibit of Queen Wasps totalled 375. Table decorations brought eight competitors, the 1st prize being awarded for an artistic arrangement of Nemesias.

EALING HORTICULTURAL.

July 9.—The outstanding feature of the 49th annual show of the above society, which was held, through the kindness of its President, Leopold de Rothschild, Esq., in the beautiful grounds of Gunnersbury Park on July 9, consisted of the many exhibits of magnificent Roses. The 1st prize in the All Comers' class for 48 blooms in no fewer than 24 varieties was won by Messrs. G. and W. H. Burch, Peterborough, for an excellent collection. The "Richard Dean Memorial" Silver Cup and Gold Medal were won by A. W. Perkin, Esq., Greenford Green (gr. Mr. G. Baldwin). In Class B of the Special Division, the best 24 Roses were shown by Mr. W. R. Chaplin, Waltham Cross. The Premier Prize for a semi-circular group of plants arranged by nurserymen was awarded to Mr. Geo. Cannon, Ealing, for a light and tasteful display in which Schizanthuses, Lilium Harrissii and double Begonias were especially well grown.

In the Amateurs' Class the 1st prize group was set up by M. Hulbert, Esq., J.P., Ingleside, Ealing (gr. Mr. T. Skingle); the four groups in this class, arranged along the side of one of the large tents, were very attractive. The specimen plants were of only moderate quality. The most noteworthy in Division I. was a very large pyramid of Hibiscus rosa-sinensis Cooperi, in the collection of Mrs. Spence, East Acton (gr. Mr. H. Knightley), whilst in the class for single-handed gardeners a very good specimen of the "Bottle Brush tree" (Metrosideros florihunda), shown by Mrs. Underhill (gr. Mr. J. Erry) excited the admiration of many of the visitors. Specimen Fuchsias were the best we have seen for a long time; Mrs. Spence won the 1st prize for excellent pyramidally-trained plants fully 6 feet high. A class for bunches of stove or greenhouse flowers, once a regular feature of all flower shows, is still retained at Ealing, and this season induced good competition; but the exhibits were not so effective as in the class for 12 bunches of Gloxinia blooms, in which the exhibit from Mrs. Davies was tastefully arranged with fronds of Maidenhair Fern.

Fruit and Vegetables.

Raspberries and Currants of all kinds were staged in very good condition, but the Strawberries indicated that their season is nearly over. The 1st prize for Grapes was easily won by A. W. Perkin, Esq., who exhibited 2 bunches of exceptionally good Madresfield Court. The best collection of vegetables was shown by Mrs. Spence, who staged excellent heads of Cauliflower. As is often seen, the cottagers staged highly meritorious vegetables; in many instances their exhibits excelled those of the professional gardeners.

Leopold de Rothschild, Esq., Gunnersbury Park (gr. Mr. G. Reynolds), contributed an exceedingly attractive group of stove and greenhouse plants which was arranged opposite the entrance in one of the large tents. Other non-competitive exhibits were Roses from Messrs. James Veitch and Sons, Mr. Arthur Turner,

and Mr. George Cannon; Ivies and other hardy shrubs from Mr. L. R. Russell; a collection of Japanese Maples from Messrs. Fromow and Co., and Sweet Peas from "Tigwells," Greenford, Middlesex.

LIVERPOOL HORTICULTURAL.

July 10.—The Summer Show of this Society was held in the Corn Exchange, an excellent show being the result. Roses were the best yet seen under the auspices of the Society, and the Sweet Peas, although somewhat lacking in quality, compensated by the quality.

For 20 distinct varieties of Sweet Peas R. R. Anderson, Esq. (gr. Mr. N. Hughes), was awarded the 1st prize with spikes of fine substance and colour, having choice blooms of Thomas Stevenson, May Campbell, Mrs. Hugh Dickson, Nellie Jenkins, Dobbies Cream, Edrom Beauty, Mrs. W. J. Unwin, R. H. Felton, etc. 2nd, Dr. J. E. Phillips (gr. Mr. W. Davies). Mr. W. Davies was successful for 12 distinct vases. For 12 vases of blooms with waved standards, J. R. Heron, Esq. (gr. Mr. W. Bond), showed the best collection. For 12 vases of flowers with erect standards the 1st Prize was won by Mr. E. Smith. Jos. Booth, Esq. (gr. Mr. J. R. Ball), won in the class for 12 Hybrid Tea Roses, his best blooms being Madame Mélanie Soupert, Mrs. W. J. Grant, Lyon, and General McArthur.

Thomas Henshaw, Esq. (gr. Mr. F. George), showed the best 18 blooms, distinct varieties, including a fine bloom of Juliet; for 12 distinct varieties, Mr. J. R. Ball secured the 1st award; and for 6 blooms, distinct varieties, J. Watson Todd, Esq. (gr. Mr. A. Griffiths), was successful.

In the class for 12 vases of hardy and bulbous cut-flowers, Mr. J. George proved the winner with a good display.

In the three classes devoted to Carnations and Picotees, Sir W. H. Tate, Bart. (gr. Mr. G. Haigh), excelled in each class. The 1st prize for a decorated table of Sweet Peas was awarded to Miss Newsome, and Mrs. E. M. Allen was successful for the table (Orchids excluded). Joseph Roberts, Esq., in the amateurs' section, was placed in the 1st position in the three classes for Sweet Peas.

Leo Thomson, Esq., excelled for 12 Roses in not fewer than 6 varieties; and for 6 blooms, distinct, Edgar M. Allen, Esq., was awarded the 1st prize. Messrs. J. Gilbourne, J. McFarlane and H. Lunt were successful in the classes for cut Begonias and Carnations.

Gold Medals were awarded to Messrs. A. Dickson and Sons, Newtownards, who contributed a fine display of Roses; The Liverpool Orchid and Nursery Co., who exhibited Orchids; Mr. H. Middlehurst, for Sweet Peas; Messrs. Bees, Ltd., for Delphiniums and Roses, etc.

Silver Medals to Mr. R. Manson, for a bright bank of Roses; Messrs. R. P. Ker and Sons, for miscellaneous plants; Mr. W. Rowlands for cut Roses; Messrs. Jones Bros. Roses; and Messrs. Dicksons, for Delphiniums and Roses.

ROYAL BOTANICAL AND HORTICULTURAL OF MANCHESTER.

July 11 and 12.—Manchester in the past has been famous for the excellence of its Horticultural Exhibitions. Of late years its reputation in this respect has suffered a decline. On this account it is doubly pleasing to record that this year's summer Show marks a distinct improvement on those of recent years. Although in some classes there appeared to be no entries, and in others very few, the principal classes were well contested, and the standard of excellence throughout was of a high character. Roses were particularly good, in size, form, and colour. In the spacious Exhibition Buildings at Rusholme the various exhibits made a fine display.

In the Premier Rose Class for 60 distinct single blooms Hugh Dickson, Ltd., Belfast, secured 1st place with superb flowers, of which the following varieties were particularly good:—Lieut. Chaure, Gorgeous, Brilliant, Mrs. Archie Gray, Mrs. Sam Ross, Rhea Reid, Mrs. Foley Hobbs, Golden Ball, and Mrs. George Gordon. Messrs. Alexander Dickson and Son, of Newtownards, were a close 2nd, with beautiful examples of Lady Ursula, St. Helena, Conway Jones, Alex. Hill Gray, F. K. Druschki, Mrs. Mackellar, H. V. Machin (awarded the Society's Silver Medal for the best Hybrid Tea in the Show), Wellington, and George Dickson. Mr. W. H. Frettingham, Beeston, Notts, was placed 3rd.

For 36 distinct trusses Hugh Dickson, Ltd., was again 1st, his examples of Oriflamme, Leslie Holland, Mme. M. Soupert, Gorgeous, Lyon, and Brilliant were particularly good. Messrs. Alex. Dickson and Son were 2nd with lovely flowers of George Hammond, J. B. Clark, Gloire de Chédane Guinoisseau, Mrs. Mackellar, and H. V. Machin. 3rd, W. H. Frettingham. In the class for 24 Teas or Noisettes Mr. George Prince, of Oxford, was 1st with fine blooms of Miss A. de Rothschild, Comtesse de Nadaillac, Souv. de S. A. Prince, The Bride, and E. V. Hermanos. Messrs. Alex. Dickson and Son were 2nd.

For 12 Teas or Noisettes Mr. Geo. Prince was placed 1st with good blooms of Medea, W. R. Smith, White Maman Cochet, Molly Sharman Crawford, and Nita Weldon. 2nd place was gained by Messrs. A. Dickson and Son with good specimens of Mrs. S. T. Wright, Mrs. Herbert Hawksworth, Alex. Hill Gray, Maman Cochet, and Lady Inchiquin. Messrs. W. and J. Brown, Peterborough, were 3rd.

For 12 Single Trusses of any White or Yellow Rose Mr. Geo. Prince won the 1st prize with superb blooms of White Maman Cochet, and he also gained the Society's Silver Medal for the best Tea Rose in the Show with this variety; 2nd, Hugh Dickson, Ltd., with Mrs. Archie Gray; 3rd, Messrs. Alex. Dickson and Son with Mrs. Cornwallis West.

In the class for 12 blooms of any light-coloured Rose other than White or Yellow Messrs. Alex. Dickson and Son led with Mrs. Theodore Roosevelt (particularly good). Mrs. Jas. Lynas, shown by Hugh Dickson, Ltd., was placed 2nd, and Lyon, shown by Mr. W. H. Frettingham, was 3rd.

For 12 blooms of any Crimson Rose Messrs. Alex. Dickson and Son were 1st with fine examples of J. B. Clark; 2nd, Hugh Dickson with Sir Wm. Quartus Ewart; 3rd, Mr. W. H. Frettingham with Horace Vernet.

In the Amateurs' Classes, Dr. T. E. Pallett, Earls Colne, Essex, took 1st place for 24 blooms. His best flowers were Avoca, Mrs. Foley Hobbs, Lady Ashtown, G. C. Waud, Ed. Mawley, C. J. Grahame, Leslie Holland, and White Maman Cochet.

Mr. F. Dennison, Leamington, was 2nd with Wm. Shean, Horace Vernet, F. K. Druschki, G. C. Waud, Lyon, and White Maman Cochet. 3rd place was gained by Mr. R. Foley Hobbs, Worcester, with Kaiserin A. Victoria, Leslie Holland, Nita Weldon, and J. B. Clark.

In Class 9 for 12 distinct blooms, Mr. F. Dennison was 1st with C. J. Grahame, Florence Pemberton, Avoca (very good), and Hugh Dickson; 2nd, Dr. T. E. Pallett with F. K. Druschki, Mrs. Foley Hobbs, Mrs. C. West, and Lady Alice Stanley; 3rd, Mr. T. Park, Bedale, whose J. B. Clark was of particularly fine colour.

For 18 Teas or Noisettes Mr. T. Park was 1st; his best blooms were Lady M. Corry, Comtesse de Nadaillac, Mrs. Myles Kennedy, Mme. Constant Soupert, The Bride, and White Maman Cochet; 2nd, Mr. R. Foley Hobbs with Medea, Souv. de Pierre Notting, and Mrs. Foley Hobbs.

Mr. T. Park was 1st for 12 Teas or Noisettes with good blooms of Molly S. Crawford, W. R. Smith, Muriel Grahame, Auguste Comte, and White Maman Cochet; 2nd, Mr. F. Dennison; 3rd, Mr. R. Foley Hobbs.

A box of superb blooms of Frau Karl Druschki, shown by Mr. F. Dennison, won premier honours in the class for 12 single blooms of any White or Yellow Rose; 2nd, Mr. R. Foley Hobbs; 3rd, Dr. T. E. Pallett.

For 12 blooms of any light-coloured Rose other than White or Yellow Mr. R. Foley Hobbs was 1st with fine flowers of Her Majesty; 2nd, Mr. T. Park with Wm. Shean; 3rd, Mr. F. Dennison with Lady Moyra Beauclerc.

The class for 12 blooms of any Crimson Rose was won by Dr. T. E. Pallett with magnificent flowers of Avoca; Mr. F. Dennison was 2nd with J. B. Clark; and Mr. T. Park 3rd with A. K. Williams.

Local Exhibits.

In the Local Classes, limited to growers within 20 miles of Manchester, Mr. P. Wilkinson, of Styal, led for 24 distinct blooms; his best were Wm. Shean, Caroline Testout, Lyon, Mabel Drew, Comtesse de Nadaillac, and Florence Pemberton; 2nd, Mr. A. G. Hogg, Altrincham; 3rd, Mr. W. Cowley, Bramhall.

For 12 distinct blooms Mr. B. J. Saxby, Sandiway, was 1st with Wm. Shean, Lady Ashtown, Ed. Mawley, and Kaiserin A. Victoria; 2nd, Mr. J. Holt, Mobberley, Knutsford.

Mr. B. J. Saxby was again 1st for 6 distinct blooms; Mr. J. Holt, 2nd; Mr. R. Hutchinson Booth, Bolton, 3rd.

In the Open Class for 12 bunches of Buttonhole Roses Mr. Geo. Prince was easily 1st. Colour and form left nothing to be desired, and the varieties were well chosen. The names are well worth giving in full:—Lady Hillingdon, Souv. de Catherine Guillott, Georges Schwartz, Souv. de Stella Gray, Lady Roberts, Marie Van Houtte, Rayon d'Or, Mrs. H. Stevens, Liberty, Lady Pirrie, Rosette de la Légion d'Honneur, and Mildred Blackburne. Messrs. W. and J. Brown, Peterborough, were 2nd. Their best bunches were:—Mrs. Aaron Ward, Lyon, Duchess of Wellington, Gen. McArthur, Pharisaer, and Mrs. H. Stevens.

For a display of Roses arranged for effect Messrs. W. and J. Brown carried off the honours with an artistic and effective arrangement.

The prize for a basket of Roses was gained by Mr. W. J. Garner, Hale; 2nd, Mr. O. Robinson, Alderley Edge.

Mr. W. J. Garner was again 1st for 3 beautiful bouquets of Roses.

Sweet Peas, etc.

Sweet Peas, probably owing to the sunless weather, were not so good as one would have wished, colour in particular being lacking. Messrs. Castle Bros., Warton, Carnforth, were the winners in the largest (open) class; 2nd, Mr. R. Wright, Formby, Liverpool; 3rd, Mr. F. A. Robinson, Styal.

In the Amateurs' Class for 12 varieties Mr. J. S. Proctor, Altrincham, was 1st, and Mrs. S. S. Rigg, Rowdon, was 1st in the class for 25 varieties.

For the best group of Miscellaneous Plants arranged for effect (nurserymen), Messrs. Jas. Cypher and Sons, Cheltenham, were 1st; Mr. W. A. Holmes, Chesterfield 2nd; and Mr. W. J. Garner, Hale, 3rd.

The prize for the Best Group of Plants set up by an amateur was won by Mr. W. Duckworth, Ribby, Lancashire.

Class 32, for the best display of Herbaceous Flowers, was won by Messrs. Harkness and Son, Bedale, who staged a fine exhibit, boldly and effectively arranged; Delphiniums, Oriental Poppies, Gaillardias, Lupins, and Gladiolus Crimson Queen were outstanding features in a very fine display.

Mr. O. Robinson, Alderley Edge, was 1st for dinner table decorations with a light artistic arrangement, chiefly composed of Gerbera Jamesonii and Gloriosa superba. Mr. W. J. Garner was 2nd.

Non-Competitive Exhibits.

A comprehensive display of Sarracenias and other Insectivorous plants, together with a variety of foliage plants, was set up by Messrs. Bruce, of Chorlton-cum-Hardy, Manchester. The group was arranged in a pleasing manner against a background of painted scenery. (Gold Medal.)

Mr. A. F. Dutton, Iver, Bucks, had a charming display of cut Carnations, chiefly perpetual flowering, artistically arranged in wicker baskets. Winsor, R. F. Felton, Mrs. A. F. Dutton, Carola, May Day, La Mode, and Mrs. H. Burnett were particularly good (Gold Medal.)

Sweet Peas from Mr. W. J. Unwin, Histon, Cambridge, made a beautiful show; lightly arranged in vases set well apart, with trails of Smilax between, they made a lovely picture. Prominent amongst the varieties shown were Zilla Smith (new), Edna Unwin, Gladys Burt, King Edward Spencer, Orange Perfection, Mrs. Cuthbertson, Scarlet Emperor, Hercules, and Evelyn Hemus. (Gold Medal.)

Messrs. Webb and Son, Stourbridge, set up a prettily arranged exhibit of Sweet Peas,

Hydrangeas, Pink Spiræa, and a comprehensive range of choice vegetables. (Gold Medal.)

A bold and effective group of Herbaceous flowers was shown by Messrs. Bakers, Codsall, Staffs. Amongst other good things Aquilegia glandulosa and Dianthus graniticus were charming. (Gold Medal.)

Messrs. Dickson and Robinson, Manchester, had a display of herbaceous flowers, Zonal Pelargoniums, etc. (Gold Medal.)

A small Rockery on a table was set up by S. Broadhead and Son, Huddersfield. (Silver-Gilt Medal.)

Messrs. Caldwell and Son, Knutsford, staged hardy flowers and Roses. (Silver-Gilt Medal.)

Fruit Trees in pots were shown by W. R. Lee, Esq., Plumpton Hall, Heywood. Peaches, Cherries, Apples, and Gooseberries were well fruited.

FORMBY HORTICULTURAL.

July 10.—This Society held its summer exhibition on this date in the grounds of Briars Hey. The entries were fully up to the average, with an increase of Roses counterbalanced by a decrease in Sweet Peas, which were somewhat late.

The Rose section proved the attractive feature of the show. A generous prize list, including eight silver cups, brought a splendid collection of finely-formed and highly-coloured blooms, and these maintained their beauty until the conclusion of the show, owing to the moderate temperature and lack of sunshine. In the premier class for 12 blooms distinct Mr. A. E. Gunson was awarded the 1st prize, for blooms of excellent quality, chief amongst them being Richmond, Mrs. W. J. Grant, Dean Hole, and Caroline Testout. 2nd, Mr. Joseph Booth, having in his stand the premier bloom of the show in William Shean. Among other 1st prize winners were Messrs. W. Rockliff, T. Carlyle, Loo Thomson, George Lunt, and A. W. Ardern.

This year, for reasons already stated, the Sweet Peas were not so prominent, although the quality of the flowers was good. Mr. Edgar M. Allen staged a dozen vases of excellent flowers, the varieties Edith Taylor, Mrs. Cowdy, Mrs. Cuthbertson, Melba and Thomas Stevenson being noteworthy; 2nd, Mr. J. K. Heron. The winners in the other classes were Messrs. A. Rushworth, J. Gilbourne, and T. B. Burnett. Cut Begonias, Carnations, Pelargoniums, and hardy perennials made a pleasing display, and noteworthy collections were staged by Messrs. J. Booth, Joshua Rea, F. C. Calthorp, J. Gilbourne, E. Sargenson, and F. G. Aindon.

The plant classes were not numerous, but many charming specimens were staged, the 1st prizes being awarded to Messrs. J. Booth, A. Storey, W. Rockliff, J. H. Page, T. R. Burnett, H. S. Hodgkinson, and C. A. Calthorp. Vegetables and fruit were highly creditable, Mr. T. Morris winning in the gardeners' section, and Mr. W. Dickinson in the amateurs' division.

A few exhibits were staged which were not for competition. Messrs. A. Dickson and Sons, Newtownards, and Mr. Karl Thirkildsen showed Roses; Mr. H. Middlehurst, Sweet Peas, and Messrs. Woodward and Cuthbert, cut flowers.

PENZANCE HORTICULTURAL.

July 11.—The first show of the Penzance and District Horticultural Society, held in the grounds of Penalvern, reflects much credit upon its promoters. The standard of quality was of a high order, the entries were numerous (over 600), the show was well attended by the general public, and, fortunately, the weather was fine. The principal features were the exhibits in the classes for Sweet Peas, the table decorations, and the children's collections of wild flowers. In the Sweet Pea section the premier award went to Mr. P. T. Chirgwin, Penzance (gr. Mr. Murray), who staged a really first-class exhibit in which Hercules, Nubian, Clara Curtis and Lavender George Herbert were especially prominent. Miss M. Reynolds, Penzance, was first in the table decorations, but the judges had much difficulty in selecting the best of thirteen splendid efforts in this class. The entries in the children's classes approached 200, and every encouragement was given to the children by the local education authorities. The example of Penzance might profitably be followed in other districts. The fruit exhibits were very fine, and the 1st prize collection of six dishes exhibited by Miss Branwell, Penzance (gr. Mr. Gribble), included Black Currant Boskoop Giant, Raspberry Superlative, Strawberry Royal Sovereign, Loganberry, Red Currant The Comet, and Gooseberry Golden Drop, all of which were beyond criticism. The same exhibitor also won the chief prize for a group of miscellaneous plants in a space not exceeding 50 square feet. T. B. Bolitho, Esq., Trewidden (gr. Mr. Maddern), won numerous 1st prizes. His exhibit of hardwooded flowering shrubs was very interesting. Other principal prizewinners were Miss Nankivell, Heamoor; Mr. W. Polsue, Penzance; Maj. F. F. Oats, St. Just; E. Jenkins, Hayle; W. P. Mumford, Lelant; and C. Evans, Probus. Non-competitive exhibits were staged by Messrs. Young and Co., Cheltenham, who sent some of their well-known Carnations; Treseder and Co., Truro, who staged a charmingly furnished rockery; The Devon Rosery Co., Torquay; George Fox and Sons, Penzance, who showed a good collection of miscellaneous plants; T. R. Bolitho, Esq. (gr. Mr. A. Creek), who staged excellent collections of fruit and plants; and other local gentlemen. The society will surely be encouraged to persevere, and there is no reason why the Penzance Show should not become one of the most popular shows in the country.

WOODBRIDGE HORTICULTURAL.

July 9.—The sixty-second annual show of this society was held in the grounds of Woodbridge Grange on the 9th inst. Many large marquees were required to accommodate the exhibits, and as all Woodbridge makes this occasion a holiday and gala, there was a large attendance.

Roses were a strong feature of the exhibition, being represented in eighteen classes. The leading class was for thirty-six blooms, distinct varieties, and the 1st prize was awarded to Messrs. B. Cant and Sons for fine specimens, including the following varieties:—Augustus Hartman, bright cherry-red; Leslie Holland, E. Mawley, Bessie Brown, Horace Vernet, Lyon (in its best colour), Mme. Chédane Guinoisseau (a magnificent bloom), Mabel Drew, Dean Hole, Mrs. J. Laing and J. B. Clark. 2nd, Messrs. F. Cant and Co.; 3rd, Mr. W. Crisp, Dordham Heath. The winners of the 1st and 2nd prizes also won in the same order for the best collection of 24 blooms, distinct, showing St. Helena and E. Mawley, and Messrs. F. Cant and Co. were awarded the 1st prize for 12 Tea or Noisette varieties, the more notable flowers being Mme. Cusin and W. R. Smith. The class for 24 distinct varieties of the garden or decorative type made an attractive display. Messrs. F. Cant and Co. excelled with a charming display of highly decorative varieties; Red Damask, Madame d'Arblay and Goldfinch were especially outstanding varieties. The president's twenty-guinea silver cup, offered to amateurs for 18 distinct single trusses, brought six exhibits, and the 1st prize was won by Dr. Pallett, Earles Colne, Essex, who showed beautiful examples of Avoca, Maman Cochet, White Maman Cochet, Mrs. Foley Hobbs, Mrs. Cornwallis West and Helen Keller. 2nd, F. H. Fieldgate, Esq., Chester. Lord Rendlesham, Rendlesham Park, Suffolk (gr. Mr. H. Rogers), was awarded the 1st prize for a group of cut Carnations on a run of 3-feet tabling, with a fine collection of high-class blossoms. 2nd, F. Lowe, Esq., The Rookery, Yorford. Other cut flowers generally were numerous and interesting.

The floral decorations at these shows have become a very important feature. There were five entries in the open class for the most tastefully arranged dinner-table decorated with Roses and relieved with foliage or grasses. The 1st prize was won by Mrs. H. Barton, Plainfield, Colchester, with a charming low arrangement of Mrs. A. Tate, in which the coppery-red and fawn-shaded buds showed to perfection. The 1st prize for the best arranged bowl of cut flowers was won by Mrs. L. Hayward, Highlands, Woodbridge, with Le Progrès most effectively arranged. Mrs. G. H. Saville, Woodbridge, secured the premier award for a fancy basket of Roses, using richly-coloured flowers of the Lyon variety arranged in long sprays. In the class for a floral harp, Mr. A. R. Notcutt secured the premier award for a neatly-executed exhibit in Lilium Harrisii, Lily-of-the-Valley, Stephanotis and Croton leaves. Seven competed for the most tastefully arranged circular dinner-table. Miss M. Snell, Ipswich, excelled with crimson Gladioli, Heuchera, Gypsophila and Acers. A large vase for hall decoration was best shown by Mr. G. H. Saville, who used Lilium lancifolium rubrum, Gypsophila, and grasses.

Plants were not shown in great numbers. In the class for a group of miscellaneous plants, J. H. Grant, Esq., was awarded the 1st prize. He used Codiæums, Humea elegans and Begonias, which were tastefully grouped. Mr. F. Lowe was placed in the first position for a group of Carnations, whilst tuberous-rooted Begonias were best shown by J. A. Burners, Esq., Melton Lodge, Woodbridge. The Earl of Guildford secured the 1st award for the best six ornamental foliage plants. The twenty-five guinea trophy offered by the Woodbridge Hunt for nine bunches of Sweet Peas, distinct varieties, was won by the Rev. E. S. King, Clemham Rectory, who displayed a fine collection of blooms.

For the best decorated collection of dessert fruit (Pines excluded) on a table 8 feet by 4 feet 6 inches, with cut flowers and foliage, there was a close contest between C. H. Berners, Esq., Woolverstone Park, Ipswich (gr. Mr. Rogers), and Lord Rendlesham. The winner proved to be C. H. Berners, Esq., who showed Grapes (Black Hamburgh and Buckland Sweetwater), Dymond Peach and Pine Apple Nectarine, Taunton Yellow Melon, Brown Turkey Figs, and Givon's Late Strawberry, with an effective decoration of Rose Irish Elegance. Lord Rendlesham showed fine Black Hamburgh Grapes, exceedingly large Strawberries, and a good Melon. In other classes, Grapes, Peaches, Melons and small fruits were admirably shown.

Trade exhibits were numerous and of an interesting character. Mr. Ernest Morse filled the whole of one tent with Roses, Messrs. Morse Bros. had an interesting collection of cut Roses, Messrs. John King and Son arranged a magnificent display of Sweet Peas, including the bulk of new varieties as well as the best of older varieties, and Messrs. E. Abbott and Sons showed a splendid collection of Sweet Peas.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

June 9.—The monthly committee meeting of the above society was held in the R.H.S. Hall, Westminster, on the 9th inst., Mr. Chas. H. Curtis in the chair. Five new members were elected. Four members were allowed to withdraw double the amount of interest from their deposit accounts, the sums amounting to £6 1s., £4 12s. 4d., £3 2s. 2d., and £2 14s. 8d. respectively; one member withdrew the sum of £20. The sick pay for the month amounted to £61 14s. 8d., including £18 7s. 4d. National Insurance section. The late secretary, Mr. W. Collins, was co-opted a member of the committee in the place of Mr. A. C. Hill.

(Philippine Islands: Bureau of Agriculture).

THE WEATHER.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending July 12, is furnished from the Meteorological Office :—

GENERAL REMARKS.

Weather was generally of a rather changeable character, but over a large portion of Great Britain the latter part of the week was mainly fair and dry. Thunder was heard on Sunday in some parts of Western and Central Scotland, and thunderstorms occurred on Monday at a few of the South Coast stations, and very generally on Thursday in the East and South-east of England.

Temperature was considerably below the average in all districts excepting Scotland North, where the deficit was slight. In the Midland Counties and England East and South-east the deficit amounted to between 4½° and 5.° The highest readings, which occurred mainly on the 11th or 12th, ranged from 78° in England East, and 75° in the Midland Counties, to 67° in Scotland North and West and the English Channel, and to 66° in England North-west. The lowest readings were observed on the 8th or 9th, when the thermometer fell below 40° in most of the western and northern districts, and reached 34° in Scotland East. In England South-east it did not fall below 42°, and in the English Channel it only touched 51°. At a depth of 1ft. the temperature of the soil was in most places below the average, but in many English districts the temperature at a depth of 4ft. was slightly above it.

Mean temperature of the sea was lower than in the corresponding week of last year, and was below the average except on the north and east coasts of Scotland. The mean values for the week ranged from 61.9° at Eastbourne and 60.5° at Seafield to 52° and less on several parts of the North and North-east Coasts, and to 50° at Burnmouth.

Rainfall.—Over the country generally the total rainfall was considerably less than the average. In the Midland Counties, however, it was nearly equal to the normal, while in England South-east and North-west it was in excess. During a thunderstorm on the 6th an inch and a quarter of rain fell at Westbourne, and during the thunderstorms on the 10th an inch fell at Worthing and an inch and a half at Brighton. At Lewisham on the 10th the fall of rain and bail amounted to 0.72in. in the space of 27 minutes.

Bright sunshine was very deficient in all districts excepting Scotland North and East. In the Midland Counties the mean daily duration was less than 2½ hours, and amounted to only 15 per cent. of the possible. In Scotland North the daily duration was 5.3 hours, and in Scotland East 5.5 hours, the proportion of the possible amount being respectively 30 and 32 per cent.

Barometer and wind.—At the commencement of the week a large anticyclone covered the eastern and central parts of the North Atlantic, while an area of low pressure lay over Denmark and the Baltic, the prevailing winds being light to moderate from the northward or north-westward. On the 8th and 9th, when the anticyclone receded temporarily southward, a large depression travelled north-eastwards across Iceland, while a V-shaped secondary disturbance passed from west to east across the United Kingdom, the progress of the latter system being accompanied firstly by a backing of the wind to the southward, and afterwards by a veering to west or north-west. Towards the close of the week a new area of low pressure began to appear off our North and North-west Coasts, and the wind, which was everywhere light in force, again backed to the westward or south-westward.

THE WEATHER IN WEST HERTS.

Week ending July 16.

The wettest week for ten weeks.—Since the present month began there have occurred only two unseasonably warm days, and but three warm nights. On the warmest day of the past week, which was also the warmest day of the month as yet, the highest reading in the thermometer screen reached 72°, but on the following day the same thermometer never rose above 62°. The ground temperatures still remain low for midsummer, the reading at 2 feet deep being 2° colder, and at 1 foot deep 3° colder, than is seasonable. Rain fell on four days, and to the total depth of ¾ inch. This, although only moderately wet, was the wettest week since the beginning of May, or for ten weeks A few drops of rainwater came through the bare soil percolation gauge on the last day of the week, but previous to this no rain water at all had passed through either gauge for five weeks. The sun shone on an average for only 2½ hours a day, which is 3¾ hours a day short of the July mean. Calms and light airs again prevailed, the direction of these light airs being exclusively some point between south and west. The mean amount of moisture in the air at 3 pm. exceeded a seasonable quantity for that hour by as much as 10 per cent. *E. M., Berkhamsted, July 16, 1913.*

JUNE.

Seasonably warm, exceptionally dry, and rather sunny.—Taken as a whole, this was a June of about average temperature, both during the daytime and at night. On the warmest day the temperature in the thermometer screen rose to 83°. In the last twenty-seven years there have been only five other Junes with as high a temperature as this. On the coldest night the exposed thermometer registered 1° of frost—which is in no way very exceptional. Rain fell on only ten days, and to the total depth of less than three-quarters of an inch—nearly all of which was deposited during the first eight days. The total fall fell short of the average quantity for the month by 1½ inches. In only four of the previous fifty-seven Junes has the rainfall been as light—the last being that of 1895. The sun shone on an average for 6¾ hours a day, which is half an hour a day longer than the June average. The wind was, as a rule, of about average strength. During the one windy week the mean velocity in the windiest hour reached 20 miles—direction S.W. For 429 hours, or eighteen days, the direction of the wind was some point between south and west. The mean amount of moisture in the air at 3 p.m. fell short of a seasonable quantity for that hour by 4 per cent.—the driest air in June for seven years. *E. M., Berkhamsted, July 9, 1913.*

DEBATING SOCIETIES.

BATH GARDENERS'. — At the meeting of the Society held on the 9th ult., a lecture was given on "Choice Flowering Shrubs," by Mr. J. D. Halliburton, superintendent of Bath Botanical Gardens. Mr. Halliburton said that as a general rule shrubs which flowered in the spring should be pruned immediately after their flowering; whilst shrubs which blossomed after June should be pruned in the autumn at any time from October to January.

SOUTHAMPTON AND DISTRICT GARDENERS'. —At the June meeting of this Society a lecture on "Roses" was delivered before a good attendance of members by Mr. S. Smith, of Cadland House Gardens. Mr. Smith's remarks were practical and interesting. He dealt with such subjects as soil, planting, pruning, budding and grafting, watering, pests, and exhibition work, and closed his lecture by naming the best varieties of all classes of Roses. A special exhibition of Roses was also held, the classes being well filled with flowers of excellent quality. Roses, Begonias, Carnations, etc., were exhibited, but not for competition.

DUNDEE HORTICULTURAL. — At the monthly meeting of this Society, held on the 6th ult., Mr. Alexander Duncan gave an account of the work accomplished at the Gardens of Mains (St. Andrew's Training College for Teachers) under his charge.

——The members of this Association enjoyed a very pleasant afternoon on the 12th inst., inspecting the woods and grounds of Murthly Castle. On arrival the party was met by Mr. James Lawrie, Gardener and Forester, and subsequently Mr. and Mrs. Fothringham joined the party. The picturesque landscape from the finely wooded slopes of historic Birnam Hill to the low-lying banks of the Tay (which often rolls in torrents through the grounds) contains so much of interest that a whole week could be profitably spent inspecting giant trees, natural beauty, and art treasures with historic associations. The hour of departure amid such surroundings came all too soon.

WATFORD HORTICULTURAL.—The usual monthly meeting of the above Society was held on the 13th ult. at St. Andrew's School Room, under the chairmanship of Councillor F. H. Gorle. Mr. W. G. Taylor, of Garston House Gardens, delivered a lecture on "Salads All the Year Round," which was much appreciated by the audience; and Mr. A. Clements dealt with "The Fertilization of Flowers," and gave a vivid description of the development of the flower from bud to seed, and illustrated his remarks by specimens of various flowers in different stages of their life. His description of the habits of different flowers was new to the majority of the members present. Mr. H. Newman displayed a fine collection of Iris, and Mr. Alwyn Harrison exhibited a new seedling Lælio-Cattleya, raised by himself.

CLEVEDON HORTICULTURAL.—At a recent meeting of this Society a lecture on Carnations was given by Mr. Franks, of Portishead. The date of the society's outing to King's Acre Nurseries, Hereford, has been altered from August 13 to August 20.

BRITISH GARDENERS' (Edinburgh Branch). —The monthly meeting of this branch of the B.G.A. was held on the 16th ult., Mr. W. H. Morland presiding. A paper was read by Mr. Thomas Waite, Royal Botanic Garden, on "Some Popular Wild Flowers." The lecturer divided the flowers as far as possible into four sections, representing the seasons of the year, and further into those found on moors, in woods, by streams, on rocks, on the seashore, and in cultivated fields and meadows.

COLCHESTER AND DISTRICT GARDENERS'.— On the 12th ult. the members of the above Association visited Lower Park, Dedham, the residence of the President, Mr. W. W. Hewitt. The party was received by Mr. Hewitt, who acted as guide in the tour of inspection, and afterwards entertained the visitors at luncheon.

STIRLING AND DISTRICT HORTICULTURAL.— On the 14th ult., the members of this association visited the gardens and pleasure grounds at Larbert House, near Larbert, the residence of Sir John Graham, Bart. The party was met by Sir John Graham, and, together with the gardener, Mr. Henderson, made a tour of inspection through the estate.

SCOTTISH HORTICULTURAL. — The monthly meeting of this Association was held in the Goold Hall, 5, St. Andrew Square, Edinburgh, on the 1st inst. Mr. King, the president, was in the chair, and there was an attendance of sixty members. The evening was devoted to the reading of short papers by juniors on subjects of their own selection, for which prizes were offered by the president. There were eleven entrants, and the judges, Dr. Smith and Messrs. Highgate and Pirie, awarded the prizes as follows:—1st, W. H. Allan, Edinburgh, subject—"Soil Sterilisation"; 2nd, E. G. Extence, Stoke Bishop, Bristol, subject—"Onions"; 3rd, John Smith, Castlemilk, Lockerbie, subject—"Begonia Gloire de Lorraine"; 4th, Peter Kerr, Mauldalie Castle, Carluke, subject—"Hardy Fruit Interest"; highly commended, C. T. Mackintosh, Quarter House, Stirlingshire, subject—"The Gardener—An Artist"; commended, F. G. Barrie, Gosford, East Lothian, subject—"Culture of Cyclamen in Pots." The first prize, a gold medal, was presented to the winner by Mrs. Whytock, and on the motion of Mr. C. Comfort a cordial vote of thanks was given to the president for providing the prizes, a similar vote being accorded to the judges. The papers were thereafter read to the meeting. The exhibits were: Crassula coccinea, from Mr. F. Fulford, Montgomerie Castle Gardens, Tarbolton, Ayrshire; Hydrangea, from Mr. John Whytock, Edinburgh; single white Pink, from Messrs. James Grieve and Sons, Edinburgh. At the meeting on August 5 a paper on "Villa Gardening from the Professional Gardener's Standpoint" will be read by Mr. John Highgate, Hopetoun Gardens, South Queensferry.

BROUGHTY FERRY HORTICULTURAL. — The annual excursion of this society took place on the 3rd inst., when Kinnaird Castle was visited. Mr. Robert Bell, the gardener, conducted the party through the beautiful grounds. Interest in the trees in the grounds was only surpassed by the pleasure shown in the beautiful hardy flower borders.

DUMFRIES AND GALLOWAY GARDENERS'.— The first excursion of this Association took place on July 12, when a large number of the members motored to Castlemilk, Lockerbie, the seat of Sir R. W. Buchanan-Jardine, Bart. Here they were met by Mr. James Jeffrey, the gardener, Mr. Campbell, the architect on the estates, and a few local gardeners. They were then conducted through the gardens by Mr. Jeffrey and Mr. Campbell. After a long and careful inspection, the beautifully kept and picturesque grounds were traversed on the way to the Castle, where the Rose garden was visited and other features of interest seen. Adjournment was made to the gymnasium, where tea had been generously provided by Sir Robert Buchanan-Jardine. Shortly afterwards the company returned to Dumfries, highly pleased with their first outing.

GARDENING APPOINTMENTS.

[*Correspondents are requested to* **write the names of persons and places as legibly as possible.** *No charge is made for these announcements, but if a small contribution is sent, to be placed in our collecting Box for the Gardeners' Orphan Fund, it will be thankfully received, and an acknowledgment made in these columns.*]

MR. W. D. SHILL, previously Foreman at Ashlyns Hall, Hollington House, The Lilies, Rolleston Hall, etc., as Gardener to Lieut.-Colonel SHIPWAY, V.D., J.P., Grove House, Chiswick, Middlesex. [Thanks for 1s. for R.G.O.F. box.—EDS.]

MR. FRANK BIBLE, as Gardener to Baron ALPHONSE DE ROTHSCHILD, Schillersdorf, Preuss, Oderberg, Germany.

MR. W. KNELLER, for the past sixteen months Gardener and Forester to EDITH COUNTESS OF WINCHELSEA, Haverholme Priory, Sleaford, Lincolnshire, as Gardener and Forester to the Right Hon. the EARL OF WINCHELSEA, at the same place.

MR. A. J. HARRIS, for 3½ years Foreman at Hilfield Park, near Watford, and previously at Canon'a Park, Edgware, as Gardener to RUTHVEN HALLIDAY, Esq., of Hillside House, King's Langley, Hertfordshire.

MR. E. STEVENS, for the past 4 years Gardener to W. NELSON-BILBROUGH, Esq., Adderbury Grange, Banbury, as Gardener to Major BENTHALL, Highfield Hall, Chesterfield.

MR. G. MARLOW, for the past 24 years Gardener to HERBERT E. REID, Esq., Walton Oaks, near Epsom, Surrey, as Gardener to HENRY BAKER, Esq., Weston Acres, Woodmansterne, Surrey.

MR. GEO. RIMMER, for the past six years Gardener to the Hon. Lord ROCHDALE, and formerly of Prestwold, Waddesdon, as Gardener to A. H. CROSFIELD, Esq., Parkfield, Highgate, London. [Thanks for 1s. for R.G.O.F. box.—EDS.]

MR. S. SHUTLER, for the past 9½ years Gardener to J. RUSHBROOKE, Esq., St. George's, Ampthill, Bedfordshire, as Gardener to the same gentleman at Bulmershe Court, Earley, near Reading. [Thanks for 1s. for R.G.O.F. box.—EDS.]

MR. A. DADSWELL, for the past 18 years Gardener to N. WATNEY, Esq., Valence, Westerham, Kent, as Gardener to LORD AVEBURY, High Elms, Orpington, Kent. [Thanks for 2s. for the R.G.O.F. box.—EDS.]

Mr. J. W. SEDEN, as Gardener to J. P. Hornung, Esq., West Grinstead Park, Horsham.

Mr. H. CAMERON, as Gardener and Overseer to Sir WILLIAM GOULDING, Bart., Millicent, Sallins, Co. Kildare.

Mr. H. WILKS, for the last 4½ years Foreman at Shugborough Hall, Staffordshire, as Gardener to H. C. MOFFAT, Esq., Hamptworth Lodge, near Salisbury.

Mr. JOHN TATE, for the last 8 months Foreman at Shavington Hall, Market Drayton, and previously for 2 years Foreman at Summerhill Gardens, Shandon, N.B., as Gardener to E. G. REDPATH, Esq., Hilfield Park, Watford.

Mr. WM. TURNER, previously Gardener to J. A. MORRISON, Esq., Basildon Park, Reading, as Gardener to D. C. GUTHRIE, Esq., East Haddon Hall, Northampton.

Mr. JAS. POWELL, previously as Gardener at East Haddon Hall, Northampton, as Gardener to his Grace the DUKE OF HAMILTON, Balcombe Place, Balcombe, Sussex.

Mr. WM. GAIGER, Gardener at Kendall Hall, Elstree, Hertfordshire, and previously for 6 years Hardy Fruit Foreman at Aldenham House Gardens, as Superintendent of the Outdoor Department, The College, Studley Castle, Warwickshire.

Mr. J. OSBORNE, jun., for 27 years in the Gardens at Wykehurst Park, Bolney, as Gardener to S. HANCOCK, Esq., Kennell Holt, Cranbrook, Kent.

Obituary.

NICHOLAS HOLTZE.—The Australian papers record the death of Mr. Nicholas Holtze, curator of the Experimental Garden, Darwin, Northern Territories. Deceased was the eldest son of Dr. Holtze, curator of the Adelaide Botanic Garden. About four months ago Mr. Nicholas proceeded on a botanical expedition to the Katherine River. He became ill on his way back to Darwin, and died on his return. He was born in 1868 in Russia, and when five years old went to Australia with his parents. He entered the public service in 1879, and when his father succeeded the late Mr. Schomburgh as Director of the Botanical Gardens at Adelaide, Mr. Nicholas Holtze was appointed to the control of the gardens in the Northern Territory.

Answers to Correspondents.

AQUILEGIA AND CAMPANULA : *I. S. E.* The doubling of the parts in the Aquilegia flower is due to fasciation. With regard to the Campanula, we regret that the specimen sent is insufficient to enable us to ascertain whether or not it is a hybrid between C. persicæfolia and C. pyramidalis.

BULBS FAILING TO FLOWER : *T. C.* There is no disease present. We are unable to account for the failure.

CARNATIONS : *G. M.* The injury has been caused by the punctures of insects. If green-fly is still present, apply an insecticide.—*L. T.* The best growers do not place their "Malmaison" Carnations out-of-doors even in the summer, the reason being that such treatment causes the leaves to become soft, and therefore susceptible to disease.

CUCUMBERS DISEASED : *G. R.* Your plants are attacked with the fungus which causes Cucumber leaf-blotch (Cercospora melonis). Spray them with sulphide of potassium (liver of sulphur) at the strength of one ounce in three gallons of water.

"DIPELTRA VENTRICOSA": *H. F. L.* We have no knowledge of a genus "Dipeltra." Perhaps you refer to the Chinese genus "Dipelta," but we do not know the specific name "ventricosa" in this connection. Can you not give us more in the way of information and description?

FIG BROWN TURKEY : *J. W.* It is not a parasitic disease that is injuring the tree, but the trouble is due to an excess of food or water when the fruit is maturing.

GRAPES DISEASED : *A. J. L.* Grape rot is present, caused by Gloeosporium ampelophagum. The only thing that can be done now is to remove the diseased berries. In the winter thoroughly drench every part of the vine with sulphate of iron—1 lb. in 25 gallons of water. Give two dressings at intervals of a month before the buds commence to swell.

HEUCHERA SANGUINEA.—*G. H. H. W.* This plant was introduced into cultivation in 1882, being then imported from Northern Mexico, where it is indigenous.

CELERY FLY OR MAGGOT : *E. F. G.* The best way to get rid of this pest (see fig. 29) is to pinch the maggots to be found in the leaves, and remove the leaves which are very badly attacked, burning them. Afterwards you can make the plants distasteful to the flies by syringing them with Quassia extract, thus preventing them laying their eggs on the leaves, or you may scatter soot, lime, etc., on the leaves whilst they are damp. Feed the plants liberally, and flood them with water or manure water during dry weather. When the crop has been lifted, trench the ground, and bury the top spit deeply so that the flies then in the pupal stage will be unable to get through the depth of soil. If the attack has been very bad apply a little fresh gas-lime to the soil, and fork this in to the depth of 4

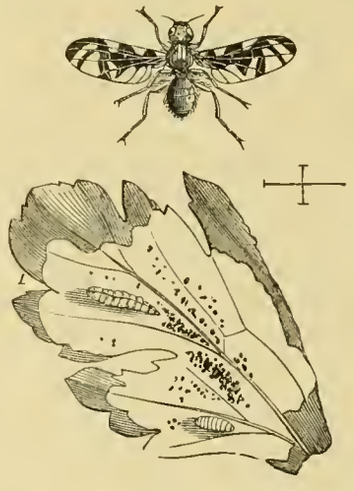

FIG. 29. — THE CELERY-LEAF FLY AND LARVÆ (MAGN.).

inches, taking care not to plant another crop upon the same ground until two months or more have elapsed.

LILIUM CANDIDUM : *A. S.* The soil is infected with the fungus Botrytis. No certain cure is known for this disease, but good results have been obtained from spraying the plants early in the spring with a weak solution of potassium sulphide. Some growers have lifted the bulbs and kept them in flowers of sulphur for the winter, with a view to destroying the fungus. If your plants are very badly affected, however, we would advise you to burn them, and procure fresh stock from an uncontaminated source, planting the bulbs in a fresh situation, as far from the old site as circumstances will allow.

"MALMAISON" CARNATION : *W. S. C.* We are unable to say why the plant is unhealthy. There is no disease present.

MELON SEEDS GERMINATING WITHIN THE FRUIT : *G. T., Oxon.* Intracarpellary germination is not unusual in Melons. It also often takes place in other plants, including Carica, Citrus, and Pernettya.

MELONS : *R. N.* There is no disease present on the plants. The roots are very much injured, probably by wire worm, as you suspect.

NAMES OF PLANTS : *Castell.* No. 1, Commelina sp.; 2, Lissochilus sp.; 3, this is probably a species of Scilla. They are an interesting lot, and should be grown well until they flower. We may then be able to name them with certainty.—*Correspondent (no name).* Roses : 1, L'Innocence; 2, Baron Gonella; 3, Lanrette Messimy.—*Constant Reader.* Roses : 1, La France de 89; 2, Lady Ursula; 3, Caroline Testout; 4, Château de Clos Vougeot; 5, Triomphe de Caen; 6, Admiral Dewey. *T. T. A.* 1, Mackaya bella; 2, Polygonum affine; 3, Chrysogonum virginicum; 4, Veronica exaltata. *C. H.* 1, Sempervivum Funckii. *Journeyman.* 1. Heuchera micrantha; 2, Heuchera sanguinea; 3, Linaria moroccana; 4, Lychnis coronaria; 5, Malva moschata alba; 6, Aconitum Lycoctonum. *G. Speller.* 1, Centranthus ruber; 2, Colutea arborescens; 3, Euphorbia amygdaloides; 4, Mertensia sibirica; 5, Spiræa Bumalda; 6, Achillea alpina.—*A. J. G., Calne.* Probably Village Maid.—*A. W., Newark.* Karatas fulgens, often called Nidularium fulgens and Guzmania picta in gardens. — *W. P.* Bignonia radicansa, hardy climber.—*F. T. A.* 1, Sophronitis cernua; 2, Gongora galeata; 3, Calanthe veratrifolia; 4, Phaius grandifolius; 5, Pteris longifolia; 6, Blechnum polypodioides.—*N. C.* 1, Adiantum concinnum latum; 2, Dracæna fragrans variegata; 3, Dracæna concinna; 4, Callicarpa tomentosa (cana); 5, Peperomia arifolia; 6, Sansevieria zeylanica.—*H. G., Bray.* 1, Dieffenbachia nobilis; 2, Begonia subpeltata; 3, Begonia metallica; 4, Pelargonium quercifolium; 5, Pelargonium variety; 6, Linaria genistifolia.—*Miss Pike.* Rose Coquina.

PEAS : *F. A. E.* The injury was caused earlier in the season by aphides.

PURPLE HELLEBORINE : *Mrs. B.* The Helleborine is identical with the etiolated, purple-tinted form on which Epipactis purpurata was originally based by Sir James Edward Smith. It occurs from time to time, but we believe the actual cause is not known, except that it is a condition of Epipactis or Helleborine media in which the chlorophyll is not normally developed. Observation of the plant might perhaps show whether the condition is constant.

STREPTOCARPUS : *J. H.* We do not know of a cross between the genera mentioned. Can you send us a specimen of the flower that we may examine it for evidence of crossing.

SWEET PEAS : *B. K.* Excessive watering of the Peas is the cause of injury in this instance. There is no disease present.

TOMATOS AND PEACHES : *M. M.* The Tomatos are attacked by the fungus Macrosporium, but the plants must not be sprayed whilst the fruit is ripening. Remove any diseased parts as they appear. The Peaches appear to have been too moist at the root.

TUBEROUS BEGONIA : *T. W.* The rusty appearance of the leaves is caused by a mite. Sponge them with a solution of soft soap and Quassia.

VICTORIA PLUM : *W. W.* You are quite right in assuming that the Plum tree is affected with the Silver-leaf disease. The silver appearance of the foliage is the only symptom of the presence of this disease

VIOLA AND STOCK : *Outside Foreman.* There is no disease present in either specimen, but the injury is caused by insects.

WEED-KILLER ON PASTURE : *J. G.* We are afraid we cannot give an opinion on the subject of the safety or otherwise of giving to sheep and cattle grass which has been treated with weed-killer, as the strength you mention would produce different effects in the case of the different makes. We should advise you to write to the manufacturers and ask their advice.

THE HISTORY OF CULTIVATED FRUITS

AS TOLD IN THE LIVES OF GREAT POMOLOGISTS.

II.—Antoine Nicholas Duchesne.

THE name of Duchesne has been somewhat neglected by the historians of Horticulture, but his claims to remembrance are worthy of investigation. His chief work, *Histoire Naturelle des Fraisiers,* would be an achievement for any writer, but when we remember it was written when the author was only nineteen, and when it is viewed in the light of the current opinions of his day, it must be considered a very remarkable production.

The great botanists of the time, including Linnæus, gave but scant attention to horticulture. It betokens great independence of thought, in so young a man, that Duchesne gave to the study of garden varieties of Strawberries the minute and searching investigation which was hitherto reserved only for botanical species. In order to appreciate the originality of his work, it is necessary briefly to consider the state of botanical knowledge at the time his book was published.

The fact of the separation of the sexes in certain plants had, of course, been known from the earliest times. The mention by Theophrastus of the necessity of shaking the pollen of the male palm over the female flower is a well-known example. It is remarkable that from these days until the eighteenth century, so far as can be ascertained, it did not occur to gardeners that fruits and flowers might be cross fertilised as a means of raising new varieties. A notable and neglected passage in Bacon's *Natural*

Fig. 29.—Antoine Nicholas Duchesne.

History (1629), however, pointed out this possibility, and is worth quoting. In the fifth century, under heading "Experiments in Consort touching Compound fruits and flowers," occurs this passage: "The compounding or mixture of kinds in plants is not yet found out, which nevertheless, if it be possible, is more at command than that of living creatures (animals), for that their lust requireth a voluntary motion, wherefore it were one of the most noble experiments touching plants to find it out, for so you may have a great variety of new fruits and flowers yet unknown."

This hint, however, was not acted upon, and it was left to Bradley, Miller, and others in the eighteenth century to make experiments which proved the practicability of cross-fertilising plants. The honour of being the first to raise fruits by this method has been claimed for the Abbé Hardenpont, of Mons, Belgium (1705-1774), but there are no definite records.

In the case of Duchesne, however, he gives exact information of his experiments in this direction, and there is but little doubt that he may be considered one of the first to use this method of producing new fruits.

At the middle of the eighteenth century the botanical world was under the powerful sway of Linnæus, and the greatest botanist was he who could identify the largest number of plants. Never was the cult of the label in greater favour; the correct name once affixed, the plant was dismissed. The sexual system of Linnæus was a means to identification only, and natural relationships had to give way before the cast iron system. It has been said the botanical treatises of those days mostly resembled Latin dictionaries!

Linnæus himself, however, saw the necessity for a natural classification of plants, but it was unfortunate that his writings on this subject were overshadowed by the artificial system which was so widely associated with his name. In France, however, Bernard de Jussieu did much in the cause of the natural system, and had probably a considerable influence upon Duchesne.

Such, then, were the outstanding conditions of the botanical world in 1747, when Duchesne was born. His father having a Court appointment as Inspector of Buildings at Versailles, the vast resources of the stupendous gardens of the Palace were open to the young student. In the gardens of the Trianon especially were plants gathered from all countries. The influence of Rousseau had brought agriculture and horticulture into royal favour, and there might be seen royal and noble personages milking cows and indulging in other rural occupations, taking care, meanwhile, to get their share of the accustomed luxuries of Court life. The by-product, however, of this artificial enthusiasm was an accumulation of horticultural knowledge to which Duchesne himself was no mean contributor.

His early education was directed towards a career at the Bar, but natural science was more attractive, and soon claimed his exclusive attention. His unusual linguistic ability rendered him valuable service in after years in his correspondence with foreign botanists. His skill as a draughtsman was also remarkable, and his drawings for a projected, but never completed, work on Gourds exist to-day at the Museum of the Jardin des Plantes, Paris.

It was at the age of nineteen that he published his famous *Histoire des Fraisiers,* the classic work on the Strawberry, but two years earlier he had published his first work, entitled

Manuel de Botanique, and it was this work that first brought him into relationship with the principal botanists of the day.

The *Histoire des Fraisiers* is the first monograph of the fruit, and it contains a genealogical table in which the descent and relationship of species and varieties are displayed. A fact which attracted Duchesne's attention to the Strawberry was the royal favour which it received at Versailles. By systems of retarding and forcing, ripe Strawberries were available for nearly the whole year, and the Royal gardens contained all the varieties existing at that day. The book itself deals with the species of Fragaria then known, practically the same number as that of to-day, and gives the most minute descriptions of the plants and their culture and includes a valuable review of the references in the older authors. Duchesne had a keen eye for detail, and his observations of the botanical characters of the plant were very acute. His greatest contribution to cultural knowledge was his observation of the cause of the sterility of the "capiton" or Hautbois Strawberry. The opinion held by Quintinye and gardeners generally was that this fruit was degenerating, but Duchesne showed that the sexes in this variety are separate. The male plant, being fruitless, was gradually weeded out from the gardens, with the result that the female plants had no pollenizers, and in their turn became sterile. The fact that the female plants possessed stamens no doubt misled gardeners as to the true cause of the failure to get fruit; but the keen eye of Duchesne saw that these stamens produced no pollen, just as in the male plant the ovaries, though present, were incapable of being fertilised. When raised from seed it was found that the numbers of the sexes were equal, an interesting fact in the light of recent research on this subject.

Another remarkable experience of the author was the raising from seed of the Wood Strawberry, the curious Fraisier de Versailles, or Fragaria monophylla, in which the three leaflets usually present are united into one. This curious variety has appeared more than once. Linnæus found it in his travels in Lapland, and it is portrayed in a picture of Holbein's (1495-1543) now at Munich. Duchesne saw that this plant might be regarded as a chance variation, and therefore raised seedlings from it in large numbers, all of which came true.

The greatest event in the history of the Strawberry was, without doubt, the importation in 1716 of the Chili variety (Fragaria chiloensis) by M. Frezier. It happened, however, that these plants were all females, and for many years no fruit was produced. Many botanists and gardeners had endeavoured to fertilise this variety with pollen of the Wood Strawberry without effect, and it was not until Duchesne used the pollen of the Hautbois that the fine fruit of the Chili plant was seen. But even here his extreme care was shown. In his own words: "Enchanted as I was by this discovery, but knowing well that a just conclusion could not be formed from one experiment . . ." preparations were made for a large-scale test the following year, with confirmatory results.

The Wood Strawberry had been cultivated in gardens from the earliest times, and had produced varieties such as the "gaillon," which is deprived of runners, the white fruited form, the double flowered, the sterile or "Coucou," and the curious malformation known as the Plymouth Strawberry (F. muricata) in which the stamens and petals are leaf-like, and the achenes resemble buds. When the striking differences of these types are considered, it is remarkable that Duchesne rightly classed them as varieties of F. vesca and not as distinct species.

In regard to the perpetual fruiting variety of F. vesca, the Fraisier des Mois, Duchesne considered this as the original species from which the ordinary Wood Strawberry had been derived. A probable reason of this is that he had a very clear idea of the production of new varieties by loss of a character—defective varieties, as he termed them. The Wood Strawberry was therefore produced by loss of the autumn fruiting powers of the Fraisier des Mois. Though this opinion is now known to be false, as the perpetual fruiting variety is not found wild, and is known to have originated under culture, nevertheless, his conception of defective varieties is of special interest in the light of recent research. That he had some idea of the conception of descent with modification seems evident from a remark he makes upon classification: "The genealogical order is the only one which satisfies; but before one can be certain it is necessary to test if each sort comes true from seed."

In 1776 Duchesne journeyed to England, in company with the Abbé Nollin, director of the Versailles Royal Nurseries, and the principal gardens of this country were visited. On his return he published a book *Sur la Formation des Jardins*, being largely the results of his observation in England.

At this time he was appointed assistant to his father, and in 1779 he married. The storm clouds of the Revolution were now gathering, but notwithstanding the terrible events of the last years of the century, Duchesne published many works on various subjects, those of interest from the horticultural standpoint being *Le Jardinier Prévoyant*, 1770-1781, an almanack of gardening operations; *Considérations sur Jardinage*, 1779, and other papers were contributed to Scientific Societies on kindred matters.

His closing days were spent in comparative poverty, and at the age of eighty he died. Had circumstances placed him differently, it is easy to imagine that his horticultural work might have been greater in volume, but his *Histoire des Fraisiers* ensures for him a worthy place among the great Pomologists. *E. A. Bunyard.*

NOTES FROM MONREITH.

The Gardens of Sir Herbert Maxwell, at Monreith, Wigtownshire, grow in attraction year by year, especially to the lover of hardy flowers and shrubs. Most of the rock plants are cultivated in the wall garden on the garden front of the mansion, and in a series of rock beds of low elevation. The wall garden is composed of several terrace walls, which support the higher sloping ground. The stones are laid without mortar, and are generally in such a fashion that the rains find their way to the roots of the plants. Such Androsaces as A. lanuginosa do well in the wall, and the large tufts of silky leaves and the pretty flowers of this species are surprisingly effective. Dianthuses are favourites, and D. alpinus is exceedingly happy and floriferous, covering itself with large and handsome rose-coloured flowers. The lovely D. neglectus of even greater refinement thrives admirably, and other species include D. zonatus, D. petræus, D. sylvestris, and D. deltoides. Of Campanulas, a number of good species are grown, though the slugs are troublesome in the mild and rather humid climate. C. pulloides, C. pulla, C. G. F. Wilson, C. Profusion, C. Hohenackeri, C. garganica, C. Portenschlagiana and C. pusilla were observed, mostly in the pink of condition. Onosma albo-roseum makes large masses on the wall, and was flowering very freely this season; though equally large specimens of the more common O. tauricum were not affording their usual bloom. Lithospermum graminifolium was also flowering very shyly, but L. prostratum and its variety Heavenly Blue were both floriferous; while Moltkia petræa was full of flower. Helianthemums give countless blooms in a sunny position, and some of the Cisti, although injured by frosts during last winter, were flowering. I observed Cistus formosus, C. salviæflorus, and the one named in gardens S. corbariensis. Erinus alpinus spreads very quickly, and has to be kept within strict bounds; the variety carmineus is the brightest and best. The charming Linaria alpina, difficult to grow elsewhere in S.W. Scotland, thrives in the wall garden, and the charming variety rosens is most attractive. Antirrhinum species are represented by A. Asarina and A. glutinosum, both of which do well on a sunny part of the wall. Of the various sections of Saxifrages, it was interesting to observe the fine tufts of S. burseriana; S. longifolia has taken an unusual spurt of flowering, and several of the plants at Monreith have given glorious spikes of bloom. Ramondias are excellently grown in the shadier parts, and some of the best of the Arenarias, Aubrietias, Acantholimons, Achilleas, and Æthionemas are cultivated with the greatest success. Asperula Gussonii was a mass of flower, and a grand group of Coronilla iberica and another of Hieracium villosum afforded sheets of glowing yellow. Hypericum reptans is thoroughly at home, and H. fragile and others give their charming golden flowers in profusion. The best of the Alyssums are cultivated, but none is finer than the big mass of A. spinosum, charming as seen at Monreith.

The Primulas would alone form an interesting study. P. Forrestii is apparently happy in the wall garden, though it has not yet flowered; P. nivalis, of gardens, grows well there also, with a number of the other Primulas of the saxatile class. Curiously, P. pulverulenta and P. Cockburniana have both died, but the effective P. Poissonii, usually considered more tender than these, has thriven in the border and is giving handsome spikes of its purplish flowers. P. Bulleyana and P. Beesiana are glorious, and thoroughly hardy. P. Veitchii makes big plants in the border, and P. Littoniana has survived the past winter in the Lily bed.

This Lily bed is worth more than a passing notice. It was furnished with water-pipes for the supply of underground moisture, but this season it has not been found necessary to supply the Lilies with water in this way. Lilium giganteum,

L. auratum, L. pomponium, L. Szovitzianum, L. Humboldtii, and many other species are grown either in this bed or in other parts of the garden. L. Szovitzianum is especially fine. The border flowers would require an article to themselves; for planted in winding beds backed by shrubs and trees, an abundant variety of good plants show to great advantage. I may mention grand specimens of Cypripedium spectabile, several species of Meconopsis, Geraniums and Erodiums, Cimicifugas, Asters, Delphiniums and Phloxes.

Fig. 30.—Lilium martagon album in Dr. Bretland Farmer's garden.

Rhododendrons, both species and hybrids, are in hundreds—R. cinnabarinum having been exceedingly good this year—Azaleas, Spiræas of many kinds, Andromedas and allied plants, Roses in great numbers, Leptospermum scoparium, L. Nichollsii, Carpentaria californica, Tamarix, and a large and choice collection of other trees and shrubs might be mentioned. The woods are also most interesting with their wealth of uncommon coniferous and other subjects. It may be added that plant lovers wishing to visit Monreith may always obtain permission from Sir Herbert Maxwell. *S. Arnott.*

LILIUM MARTAGON ALBUM.

This beautiful Lily is apt to be somewhat capricious, and often fails to flourish in a border, even where every effort is made to satisfy its needs. The secret of success would seem to lie in providing a tolerably dry, light soil for the bulb and a good and damp substratum for the roots. But although seldom thriving as a border plant, it will often respond at once to the conditions provided by the rockery. Nevertheless, success is not secure, even in this habitat, but where water is moving through the soil a couple of feet or more below the surface I have always found the bulbs to rapidly increase both in size and number, whilst the trusses of flowers exhibit a corresponding luxuriance. The two flowering heads shown in the illustration (fig. 30) afford an example of this. The plants are growing in a peaty soil overlying a mound of burnt clay, and the surplus water from an adjacent pool percolates the soil at a depth of about 3 feet. These plants, one of which had 42, the other 38, perfectly formed flowers in the raceme, were in marked contrast to others growing on other parts of the same mound, and under precisely similar conditions save for the water leaking out of the pool. I have had very much the same experience with plants in another position, and in each instance the same factors appear to account for the luxuriant habit. But, so far as my own experience goes, the plants always do better when the bulbs are in dry soil, and only the roots below are exposed to conditions of moisture. It seems also to be important that the water shall be moving through the soil and not in any way stagnant.

This lily is so beautiful when well known that it well repays all the trouble which its somewhat exigent demands impose on the gardener. It would be interesting to learn from the experience of others who have grown it, for I am far from supposing that successful treatment is only to be found in the method which in my own garden has answered well. *J. B. F., Gerrard's Cross.*

THE TIMBER OF WESTMINSTER HALL.

For long it has been a disputed point whether the timber of the roof of Westminster Hall is of oak or chestnut. Originally, the wood was described as Irish Oak, but about the end of the thirteenth century, when extensive structural alterations and repairs were undertaken, it was stated to be of Spanish Chestnut. This caused great confusion and controversial correspondence.

The date when the roof was erected and other interesting particulars will be found in the note reproduced from the *Times* on p. 69. That a quantity of chestnut timber was used in connection with certain of the buildings at Westminster is well known, and this fact has given rise to the erroneous statement that the roof of the famous hall is also of that wood. In order, if possible, to settle this vexed question, a thorough examination of the roof has been made during the repairs at present being carried out, with the result that all the timber was found to be of oak. Not only was the timber of the roof examined *in situ*, but portions of the decaying wood which it was found necessary to remove during repairs were subjected to a careful scrutiny and comparison with other timber of a similar kind, the examination leaving no doubt as to the particular wood of which the roof was constructed.

To those who are unacquainted with the botany of timber it may be stated that oak and chestnut can be readily distinguished by the peculiarities of their medullary rays, which are lines radiating from the centre to the circumference, and presenting a starlike appearance. To the carpenter these lines are known as felt or silver grain, but to the botanist as medullary rays. In oak, there are two sizes of medullary rays, a few being broad and numerous very narrow, all, however, distinctly visible. Chestnut, on the contrary, is readily distinguished by having no broad rays, while the narrow can only be detected by means of a magnifying glass. In the accompanying illustrations, (fig. 31) oak from the roof of Westminster Hall, (fig. 32) brown oak from Welbeck Abbey, and (fig. 33) old Spanish chestnut from Greenwich Park, the peculiarities of graining in the different woods are readily detected, and will leave no doubt that the roof of the hall was constructed of prime British oak. Figures 31 and 32 of the oak show distinctly the medullary rays in that timber, while in the chestnut, figure 33, not a trace of these can be detected.

But not only is there a diversity of opinion as to whether the roof of Westminster Hall is oak or chestnut, but the place from which the timber was obtained has been variously stated, some writers declaring it to be of English origin, while others contend that it is of Irish growth and was brought from either Dublin or Wicklow. Certainly at one time the claim that the far-famed Shillelagh Oaks furnished the timber

seemed well supported, but the following letter which I have received from the Rev. G. H. Vaughan, Rector of St. Michan's Church, Dublin, leaves no doubt that the original roof of Westminster Hall, one of the glories of timber architecture, was constructed of Irish Oak :--

"In reply to your inquiry regarding the timber used for the roof of Westminster Hall in 1098, I send you an extract taken from 'Memorials of St. Michan's.'

"'Stanihurst findeth that Anno 1095 there came certain Easterlings to the north side of Dublin adjoining to the Liffey and settled themselves there, so that of them to this day it is called Ostmontown and corruptly Oxmantown, in the parish of St. Michan of one Michanus, Dean and Bishop, who founded the church unto whom Murchard or Murrough, King of Leicester, gave that parcel of land to that use. The freeground or common now called Oxmantown Green was all wood. He that diggeth at this day to any depth shall find the ground full of great roots. From them Anno 1098 King William Rufus, by licence of Murchard, had that frame of wood which made all the roof of Westminster Hall, where no cobweb or spider breadeth to this day.'"

Assuming that the oak trees from which the roof of 1399 was reconstructed were at least 200 years old when felled, and it is very unlikely that younger trees would be chosen for so important a purpose, the timber would thus be over 700 years old. Generally speaking the timbered roof is in a fair state of preservation, some of the wood being as sound as when placed in position at least seven centuries ago. Insect attack with its usual accompaniments is, however, to be noticed in some of the logs. Though varying in appearance, much of the timber is of a rich, dark-brown colour, in some cases cinnamon brown, and some of the beams measure about two feet square. Judging from the appearance of the timber in various parts of the roof, I am strongly of opinion that during the alterations and repairs of 1397 the best of the original Irish oak was retained and, in conjunction with other timber of the same kind, used in the present roof. That the original timber was of Irish origin is certainly surprising when we consider the vast forests of Oak that were at that time to be found in many parts of England, but particularly in the counties of Kent, Sussex and Surrey, and within easy reach of the metropolis. *A. D. Webster.*

THE DEVELOPMENT OF THE RED HYBRID TEA ROSE.

A REVIEW OF RED ROSES.

(Continued from page 42.)

The year 1900 produced three Roses, two of them of climbing habit, François Crousse and Noëlla Nabonnand, and the dwarf Liberty. François Crousse (H.T.) is perhaps best on a low wall, in which position it is bright and attractive, flowering very early. The flowers are bright crimson, brilliant, glowing, and handsome. Tied to a pillar it does not seem so satisfactory, and is apt to become bare at the base. Noëlla Nabonnand, another climber, is often called a Noisette, but must be very near the H.T.s. It makes stronger growth than the last-mentioned Rose, the flowers are larger and looser, and darker in colour, being a purple-crimson, with dark shading. It is handsome when at its best, but the later flowers are apt to become dingy in the autumn rains.

Liberty (H.T), obtained by crossing the varieties Mrs. W. J. Grant with Général Jacqueminot, was a great advance on anything that had preceded it as a garden and decorative Rose. The flowers, though not very large, are a fine crimson colour, with a slight purplish bloom, which is very effective, and of a beautiful shape. It produces several crops of flowers in the season, and is useful alike in the garden, for cutting, or under glass.

1901 produced a handsome single Rose, Turner's Crimson Damask, a fine plant for an isolated position, but it flowers early and only once in the season; and Lady Battersea, an H.T. of fairly dwarf habit, producing long-pointed buds of cherry-crimson, carried erect on long stems. It is said to be a cross between the varieties Mme. Abel Chatenay and Liberty.

In 1902 Ards Pillar was introduced. This is an H.T. of semi-climbing habit, the flowers of brighter colour than that of Ards Rover, and somewhat better shape, but it has not, so far as my experiences goes, proved so good a garden plant.

Morgenroth came in 1903. This is an H.T. of climbing habit, single, or nearly so, after the type of Paul's Carmine Pillar, but not so brilliant in colour. It has, however, the advantage of being perpetual, and makes a very fine, large isolated bush, or may be used for the pergola, or as a pillar Rose.

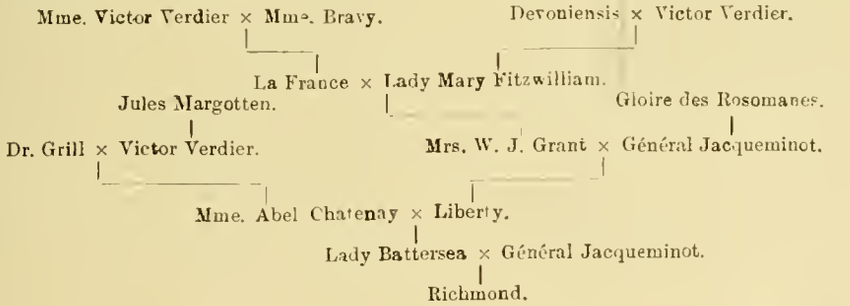
The most notable rose of 1904 is, curiously enough, one which has proved a complete failure in this country, Etoile de France. The flower is a fine, very dark crimson colour, of good pointed shape, and composed of a mass of tightly-packed petals, which requires hot weather to induce it to open. It came from France with a great reputation, but is here only of service for pot culture under glass. Two other H.T. Roses of this year are a dark crimson, the Rev. D. R. Williamson, which, perhaps, has not become so well known as it deserves; and George Laing Paul, a well-shaped and useful Rose, with a bright carmine crimson flower of fair size; though not a great Rose, it is one which always provides a high proportion of good-shaped flowers. Hugh Dickson I have already mentioned, while Maharajah, which also belongs to this year, is a fine, deep-crimson, single-flowered H.P.

The year 1905 was a great year in the development of the Red Hybrid Tea. C. J. Graham is a Rose of an exceedingly bright crimson colour, not very full, but often good enough for exhibition. It is, however, so near the H.P. section that it might have been included therein without raising controversy. General McArthur is

another bright crimson Rose, with good foliage and habit of growth. It has a delightful fragrance, and the true decorative type of flower, with not too many petals to prevent it opening well in wet weather. The form of the flower, however, is only good while quite young, and it seems to require a somewhat heavy, retentive soil to be free in flowering. J. B. Clark is a Rose of very big habit of growth, making thick, erect shoots of 10 feet in length on pegged down plants. The flowers are large, often good enough for exhibition, and of a rather light, plum-crimson, but they are apt to be coarse. Putting it on a standard has a dwarfing effect, but it makes a big head, and as it is free and continuous in flowering, it looks well and cheerful in the distance. Rather curiously, this Rose has the same parentage as Hugh Dickson, namely Lord Bacon × Gruss an Teplitz. The Dandy is a seedling from Bardou Job, and produces rather small flowers of a good crimson colour, suitable for buttonholes.

The Rose of this year, however, is Richmond. With a fine shape and rich crimson colour, this beautiful Rose has a glorious perfume, and seems to me in the first rank as a garden plant. It flowers continuously from June to December; and in addition to its value in the garden, it is, perhaps, the best Red Rose for forcing under glass.

When it first came out I was inclined to think it rather short-lived. It seemed as if it flowered itself to death, but it appears to be improving in constitution. At least, it is only the early plants I had of it that I have had to replace. It does, however, require good cultivation, and proper drainage is essential, so perhaps it is better on a slightly porous than on a very retentive soil. Down to the present this Rose seems to me unsurpassed among Red Roses for garden purposes. It is interesting to recall its pedigree, which is unusually long, and will be admitted to include some good Roses :—



It will be seen that Général Jacqueminot and Victor Verdier have both entered twice in its ancestry, and that, with the possible exception of Dr. Grill and Gloire des Rosomanes, all the forbears of Richmond have been celebrated for beauty of form. A characteristic which should not pass unnoticed is the pretty coral pink colouring of the young leaves produced in early spring.

The year 1906 need not detain us. The only Rose I will describe is Warrior, obtained from Marie Van Houtte × Princess Bonnie. Its principal feature is the fine blood-red colour of its young flowers, which are only semi-double, and though freely produced, are wanting in form. Souvenir de Maria de Zayas and Lady Rossmore also belong to this year.

1907, however, is more interesting. We have seen a gradual improvement in form, accompanied by freedom and constancy of flowering, culminate in Richmond. An even more lovely form of flower is found in Avoca, a fact attested by the numerous medals for the "best Rose in the show" awarded to this variety; but though the form is lovely and the crimson colour excellent, this Rose has certain drawbacks as a garden plant. Its growth is very unmanageable when treated as a dwarf and severely pruned, and its flowering, though free in summer, at least on pegged-down plants, is not followed by a second crop till autumn, and that crop is not usually large. It is, in fact, in this respect rather a return to the H.P. type, and its habit of growth may be compared with that of Hugh Dickson or even J. B. Clark. Like these two Roses it is much more prolific in bloom when pegged down or grown as a standard, the latter method producing a decided dwarfing of the otherwise too vigorous growth.

A Rose of very different character is Ecarlate, obtained by crossing Camoens and Crimson China. This Rose has run to the other extreme. It is obviously very near the Chinas, both in derivation and habit, but is even more continuously in flower than this floriferous group. It is of a brilliant colour, almost approaching its eponymous scarlet, but is sadly wanting in form; nevertheless, it is an extremely useful bedding Rose, and very bright and cheerful in the garden.

Laurent Carle, in habit of flowering, is somewhere between the two last named. It is hardy and of good habit, and but for a taint of claret colour in the crimson would be a fine garden Rose. It is not usually large enough or of good enough shape for exhibition, though it sometimes appears in an exhibition box. Sarah Bernhardt is more of the habit of Avoca, a semi-climber, but much more free and continuous, a good decided crimson, but of somewhat ragged form. Two other Red Roses of this year are Friedrichsruh and W. E. Lippiatt.

With one exception the best Red Roses of 1908 were either Chinas or varieties nearly allied to this group. Charlotte Klemm, a cross between Alfred Colomb and Cramoisie Supérieure, is a brilliant scarlet crimson, the flowers large for a China, and somewhat floppy, like the type of this class. It is constantly in flower, and specially good in autumn. The variety is, therefore, valuable as a bedding Rose, but not of much use for picking, the flowers when put in vases being disappointing.

Chateau de Clos Vougeot, called H.T., but very near the Chinas, is of unique colour—a very deep scarlet-crimson, with velvety-black shading—attractive everywhere when shown, but not very free for this class. It has an ugly habit in autumn of pushing out its flowering branches at right angles to its stems, which gives a row of this variety quite a weird appearance. It is delightfully scented. Leuchtfeuer, raised by crossing Gruss an Teplitz with Cramoisie Supérieure, is another China Rose of wonderfully fine colouring. It is said to be synonymous with Spitfire and President Taft; whether this is so or not I do not yet know, but this year I am growing them together for comparison. However this may be, I think I am justified in calling the colour a distinct fiery crimson. It seems nearly, but not quite so continuously in flower as the majority of the Chinas, and though of better shape than these, it has little to recommend it in this respect. Its glory lies in its colour, which is excellent. *White Rose.*

(To be continued.)

RAILWAY AND CANAL COMMISSION.

INCREASED RAILWAY RATES FOR GARDEN PRODUCE.

The application of the South-Eastern and Chatham Railway Companies' Managing Committee for leave to raise the rates for a portion of their traffic came before the Railway Commissioners, Mr. Justice Bankes, the Hon. A. E. Gathorne Hardy, and Sir James Woodhouse, last week.

Sir Alfred Cripps, K.C., Mr. Lynden Macassey, K.C., Mr. Bremner, and Mr. Cleveland-Stevens appeared for the Committee; Mr. F. G. Thomas for the Corporation of Reigate; Messrs. Elders and Fyffes, Limited, appeared in person by their Traffic Manager (Mr. R. W. Pinder); and Mr. Morgan Veitch appeared for the Horticultural Trades Association of Great Britain and Ireland.

Sir A. Cripps, in opening the case on behalf of the Railway Companies, explained that the application was limited to certain specific rates, namely :—

1. Rates for the carriage of traffic by merchandise train between certain competitive stations.
2. Rates for parcels not exceeding 3 cwts. by passenger train; and
3. Rates for merchandise traffic by passenger train at owner's risk.

He withdrew the claim of the railway companies as to that part of the application which asked leave to raise rates on the ground of increase in wages of its staff or of capital expenditure amounting to nearly £6,000,000.

Mr. Dent (general-manager of the railway company) put in certain tables comparing the years of 1898 and 1912 respectively, and claimed that these showed an increase in the ratio of expenditure to receipts.

Cross-examined by Mr. Pinder, witness stated that the companies were not applying to raise class rates. As regards through rates, they contended that the leave of the Court was not required.

Cross-examined by Mr. Veitch, witness stated that if the Order were made he was willing to undertake it should not be used for the purpose of justifying any increase in through rates. Witness further stated that he had not got out any figures for any other years except 1898 and 1912; he could not say within his own knowledge whether the companies undertook not to increase their rates when they applied for leave to amalgamate in the year 1899, as he was not with the company at that time. He could not say what further income the company would be raising by the increase of through rates, but it would not be much.

Case for the Traders.

Mr. Pinder, on behalf of Messrs. Elders and Fyffes, Limited, gave evidence to the effect that the companies were in a better position now than they were in 1898, and put in evidence an elaborate set of tables showing an analysis of the companies' accounts for each year from 1892 to 1911, the latter being the last year in respect of which details of the companies' accounts could yet be obtained.

Cross-examined by Sir A. Cripps, witness stated that certain items of working expenditure had been apportioned between passenger goods and mineral traffic according to their respective total receipts as the companies' accounts lumped these together.

Mr. Veitch stated that, as Sir A. Cripps had withdrawn the new Act of 1913 as an element of justification, he would not go into the cost of working horticultural traffic as distinct from other traffics, but reserved his rights on that point for some future occasion. He, therefore, called no witnesses, and accordingly claimed the right to have the last word in reply, which was granted.

Mr. Pinder, on behalf of Messrs. Elders and Fyffes, Limited, stated that he was quite willing to have all his tables submitted to the Board of Trade for analysis and report, as he was quite satisfied as to their accuracy, and they in fact checked themselves.

Sir A. Cripps replied on behalf of the railway companies, and pointed out that he was asking for only a very small Order, the total estimated

increase being some £5,000 to £6,000 per annum.

Mr. Veitch, on behalf of the Horticultural Trades Association of Great Britain and Ireland, said :—

"I cannot help thinking that if I had come into this Court as a stranger, and had wondered who the Applicant was in this case, and who was the Objector, I should have thought that Mr. Pinder was the Applicant, and that the railway companies were the Objectors, if I had judged by the amount of information placed at the disposal of the Court. Under the Act of 1899 the burden of proof is on the railway company to show why this Court should remove what has been called a 'clog' on the raising of the rates. I do not quite see why the word 'clog' should be used in any derogatory sense, because I assume that it was placed there by the wisdom of Parliament for a special purpose—not to be waived aside as if it were rather an incubus or an unfairness to the railway company the moment it comes into operation; but, on the contrary to enable this Court to inquire into such a position as arises in the case before it to-day. At first sight this application appears to be a very trivial one, and my learned opponent skated over the thin ice in his opening speech with his usual skill. I submit, however, that there is more in this application than meets the eye. I think one might feel perfectly certain that if the Order is made to-day on the application of the railway companies, that Order will be constantly quoted in support of other matters which come up for hearing in this Court from time to time.

"My next comment is on the very small amount of information which the railway companies have placed at the disposal of the learned Commissioners. When I was putting a few questions to Mr. Dent I was surprised how often he said 'he did not know.' He had 'taken no steps to ascertain.' The railway companies did not even put into the box anyone who could be cross-examined out of his own knowledge as to what the position of matters was at the time when the Act of 1899 was passed: whether the railway companies had given an assurance then that they would not seek to do what they are trying to do to-day, namely, to take advantage of the elimination of competition to come to the Court and ask to raise their rates. There has been no one placed before the Court who can throw any light on that point at all. Secondly, Mr. Dent very kindly offered to get some information for me by to-morrow morning, but this case may not perhaps last so long, and, therefore, again the information I ask for is not at the disposal of the Court.

"My third point is the very remarkable coincidence which we find when we come to look at the years which the railway companies themselves have taken, and, on the strength of which they ask your Lordship to make the Order in this case. They take two years—1898 and 1912. Those are single years. They do not give the Court the benefit of any triennial or quinquennial calculation, but they take single years. There may be unusual circumstances in those years. We know in one year there were, at all events, and, of course, in the absence of time to apply for particulars in this case, there has been nothing to show the Objectors that the railway companies were going to take the year 1898 as the one year on which their application was based. It is fair that I should admit that in the printed application it does say that the rates were too low at the time of the amalgamation, but, at the same time, I confess I am staggered to find that that is the only year that is placed by the railway companies at the disposal of the Court. Then, at the other end of the scale, they take the year 1912. It is unfortunate, again, from the public point of view, that that is the very year about which the traders cannot yet get information from the Board of Trade, and there again the trader is placed at a disadvantage. There is the further point of view that in taking these two years the railway companies are not comparing 'like with like'; they take one year at the time *before* the companies amalgamated, and they ask you to compare that with another year fifteen years *afterwards* when the companies have amalgamated, and they say that because there are certain deductions which they draw from those figures, therefore, they are entitled to ask this Court to make the Order without any further information at all. I would have expected that, at all events, as some guidance to the Court, some intermediate year between 1898 and 1912 would have been taken, but again the railway companies are absolutely silent so far as that is concerned, and any information which may be at the disposal of the learned Commissioners in this case we have to thank Mr. Pinder for, and not the railway companies at all. Some attempt has been made to question these figures. I am anxious to take full advantage of those figures on my clients' behalf, and I equally agree, if it were feasible, that Mr. Pinder's figures should be sent to the Board of Trade for checking of calculations and report to your Lordship. Then, again, the railway companies, in taking the years 1898 and 1912, have taken two years which are fifteen years apart, and there is no need for me to remind this Court that it is not desirable to take years which are too far separated. We know that in the case of 'Smith and Forrest' the Court pointed out that twenty years was a most unfair period to allow to elapse in taking two different years. I do not know precisely where one can draw the line, but, at all events, the railway companies' fifteen years' interval is dangerously near the twenty years' interval, much more so than the period of years which Mr. Pinder has taken in his tables, when, in fact, every single year, one following the other, can be taken.

"Then the railway companies themselves in their figures are forced to make certain estimates. I think they said that columns 6, 7, 8, 9, on their part were estimates, and I think also they said that about two-thirds of this expenditure could be allocated with accuracy, which left the remaining one-third to be a matter of estimate on their part also. And, my Lord, even if there had been an error in Mr. Pinder's figures, I submit it would be right to say that if he has made an error of apportionment by taking the receipts from different traffics, that error would be constant each year if the proportion of those different traffics to each other remains the same. Therefore, I take it that the result would be largely the same so long as the proportion of traffics one to the other continues. Then the railway companies say that it is not always easy to distinguish between goods traffic, minerals as distinguished from other goods, and so on, but the Court will remember that in Black v. the Caledonian Railway Company it was pointed out that if the railway companies do not choose to keep proper and sufficient accounts, it is their fault, and you cannot blame Objectors because the information is not forthcoming. It is for the railway companies to keep such accounts as will enable them to give the Court the fullest information and assistance when they come to the Court for help.

"My Lord, I do not think I need keep the Court any longer on that particular point, except that I would ask to be pardoned if I refer to a case of which probably every word is well known; but I might just remind the Court of one paragraph in the case of 'Smith v. Forrest,' in the year 1900, where Mr. Justice Wright said this: 'I desire to add that, although in my opinion the railway companies are entitled to succeed to the extent which I have indicated, on one view of the presumption which it may be proper to make I think that they rested their case on a wrong basis. They strenuously contended that it was enough for them to show an increase in the ratio of cost to receipts to an extent equalling or exceeding that of the advance in the rates. Such an increase may, as Mr. Justice Collins observed in the cases cited, and in the South Yorkshire Case, be evidence to show that an increase of rates is reasonable, and may be sufficient evidence where no disturbing elements exist. But an increase in that ratio cannot of itself either absolutely justify an increase of rates, or be of itself the measure of the justifiable increase. Nor can I find anything in the judgment of Mr. Justice Collins to support that contention. To hold that, would in effect be to guarantee the existing dividends of the railway companies so far as an increase of rates could be made without defeating its own object. That, of course, is not the intention of the Railway Acts. The real security of investors for the maintenance of existing rates of dividend, so far as any such security exists, is the absence of any power to compel the railway companies to reduce their charges below the level of 1892, coupled with the right to raise them on proof that the increase is reasonable. The rates as they existed at the end of 1892 being presumed to have been not excessive, I think the proper test may be stated as follows: If it is shown, after all elements of cost and economy' (I pause to say I do not think the evidence of economy laid before your Lordship by the railway companies in this case has been very large) 'have been taken into consideration, that the necessary cost per ton carried will, under uniform conditions, be increased by 1s. or any other sum without any compensating circumstance, then it is *prima facie* reasonable to increase the charge by the same sum.' Then on that basis I make use of Mr. Pinder's Table No. 12.

"I submit that the burden of the proof being on the railway company, the railway company has entirely failed to discharge that burden in such a way as to enable it to ask the Court to make an order without any further information whatever than what is before it; but in the event of your Lordships considering that an Order for any amount should be made, I suggest that there is nothing to show whether 4 per cent. would not be grossly excessive, especially if we take up considerations of income and economy and increased profit from raising through rates which are not before the Court—there is nothing to show whether 1 per cent. would not be much nearer the mark than 4 per cent., even if any increase were allowed at all. Then, secondly, I would ask that the Court should declare that this case is not to be treated as a precedent—at all events, to the prejudice of traders who come here on the question of through rates. Mr. Dent agreed that he would not contend that it should be treated as a precedent to their detriment, if they come here under the Act of 1894; if I might have that embodied in any order that the court might make, that would be of assistance to the traders. The third point would be, if I might, in any Order that was made, have it made clear that this case had not been fought on the cost of working the railway as affecting the particular traffic of those clients whom I represent, as distinguished from the general point in this case. That is all I have to say, and I leave the matter in the hands of the Court accordingly."

Mr. F. G. Thomas, on behalf of the Reigate Corporation, explained the modified form of Order which he had agreed to accept.

JUDGMENT.

The Court held that a *prima facie* case had been made out for the limited form of Order desired by the Applicants, but that the Objectors ought not to be prejudiced in respect of the points which they had pressed on their own behalf, and accordingly directed that no question of principle should be deemed to be laid down, and that nothing in the judgment should influence any future application or should be used as a precedent in any way.

The Registrar was specially directed to make it plain in the Order that it was not to be effective necessarily for all time, but that it should be open to anybody at any time, upon proper materials, to challenge the increases, and it was suggested that the best course to take with this object would be to make the Order with "liberty to apply."

SELLING HONEY.—Apiarists should not forget that well ripened honey will always command a good price, so why hasten to sell it when the market is glutted? When Christmas is nearer there will be a good demand, which cannot be met by the supply. The sections must be thoroughly cleansed of propolis, which operation can be easily performed with a sharp penknife, or with the edge of a piece of broken glass. In this manner all stains ought to be erased from the wood, so that it presents the same cleanly appearance as it does when received from the appliance makers. Attending to small points like this helps to secure good prices, because food ought to be placed before people in a cleanly and appetising form. The sections can be placed in cheap cardboard cartons, or glazed and laced with paper edging, but this latter is rather expensive since the price of glass has been advanced. *Chloris.*

The Week's Work.

THE ORCHID HOUSES.

By W. H. White, Grower to Sir Trevor Lawrence, Bart., Burford, Dorking.

Cool House.—Plants of Odontoglossum crispum, O. Pescatorei, O. triumphans, and O. luteopurpureum sections that have passed their flowering season should be watered just often enough to keep the compost moist. This particularly applies to large specimens that are planted in 7-inch or 8-inch, or even larger pots, for if they are kept in a saturated condition the old roots will decay, and the new growths be soft and weak. Those plants which flowered early in the spring, and now have their growths well advanced, will be making roots, and, having got near to the edge of the pot, may need re-potting. This may be done at the present time if care is taken not to disturb the old roots, merely turning the plant out of one pot and transferring it to a larger one. As a rule, these cool Orchids that are shaken out of their soil and re-potted during the summer shrivel a great deal, and are long in recovering. Therefore, unless it be absolutely necessary to repot a plant at this season, it is better to wait until the cooler days of autumn. This house should be freely ventilated whenever the external air is cool and moist, the cool evening and night air being especially beneficial. On hot, dry, sunny days we keep all the top ventilators closed and open the bottom ones wide; but when the sun ceases to shine on the glass all the roof ventilators on the lee side (the house being span-roofed) are opened. If the air outside is moist, and there is no wind to cause a draught, the doors are opened also; but at times, when there are warm, drying winds, it is best to dispense with top ventilation altogether. When the top ventilators are not used during the day it is not advisable to keep damping down the house to maintain a saturated atmosphere; if the house is kept moderately moist this will be sufficient, but towards evening, when the top lights are open, a good damping down is to be recommended. It is to be hoped that no fire heat will be necessary in this house for some time to come, as the less artificial heat these plants have the better. Strong sunshine should not be allowed to reach the plants direct, and on hot, sunny days all that is possible should be done to keep the temperature inside several degrees below that of the outer air. Small, yellow thrips often cause great disfigurement to the young growths of Odontoglossums at this time of the year. Therefore, before any damage is done, and whether these insects are present or not, it is advisable to periodically fumigate the house with some safe vaporising compound. Those plants that produced strong flower spikes early in the season, and now have their young growths well advanced, with flower spikes just showing, should be given a rest by having their spikes removed immediately they appear in the young growths; for if they are allowed to bloom too frequently the plants will sooner or later deteriorate. After such a rest they will break all the stronger next time.

PLANTS UNDER GLASS.

By F. Jennings, Gardener to the Duke of Devonshire, Chatsworth, Derbyshire.

Gypsophila elegans.—Seeds may now be sown for raising plants to flower in autumn in 5 and 6-inch pots. The compost should consist of good loam, leaf-mould and sand, and the surface requires to be covered with finely-sifted soil; similar soil will be needed for covering the seeds. Place them in a cold frame after well soaking the soil with water, and shade until the seedlings appear. Gradually expose the seedlings to both light and air, but shade them for a couple of hours during the hottest part of the day. As the plants advance in growth feed the roots with manure-water; when the flowering stage arrives remove them into the greenhouse or conservatory.

Chrysanthemums.—The side-growths should be carefully removed from large-flowering Chrysanthemums, and those left should be examined for green fly and other pests. A little soot-water will now be beneficial, but great care must be taken not to administer manure at too early a stage.

Winter-flowering Pelargoniums will require regular feeding from now on as the pots become filled with roots; soot-water is very helpful, and Clay's fertiliser may be applied once a week.

THE FLOWER GARDEN.

By Edward Harriss, Gardener to Lady Wantage, Lockinge, Berkshire.

Summer Bedding Plants.—Most summer-flowering plants have had to be watered on frequent occasions and such waterings are apt to impoverish the soil. Hardy, herbaceous plants require water as often as any, and they will derive much benefit from a little artificial fertiliser dusted between the plants or a sprinkling of well-seasoned soot. Watering should be done as far as is possible early in the morning or late in the afternoon or evening. Recently-laid turf must be watered if it is feeling the effects of drought. It is necessary to mow lawns periodically, even when the grass appears dry, but in these circumstances the grass-box should be removed from the machine, thus allowing the cut grass to be scattered over the surface of the lawn.

Sweet Peas.—Plants which are cultivated for supplying cut flowers will be all the better if the flowers are kept constantly cut. In the absence of rain the roots must be supplied with water, or they will quickly show signs of distress. A sprinkling of artificial manure previous to watering will also be of benefit. Keep the hoe in use between the rows as often as time will permit. Sweet Peas in tubs must be watered liberally and fed with stimulants. Such plants should be examined daily for dead flowers.

Violets.—Carefully disturb the soil between the rows with the Dutch hoe on frequent occasions and apply light dustings of soot. The plants are now growing freely and will need to be examined occasionally and all runners and dead leaves removed. Give the roots a thorough watering at least once a week during dry weather and syringe the foliage every evening. Keep a sharp look out for attacks of red spider, and take immediate steps to destroy them on their first appearance.

FRUITS UNDER GLASS.

By James Whytock, Gardener to the Duke of Buccleuch, Dalkeith Palace, Midlothian.

Melons.—In the case of Melon plants developing heavy crops of fruit, it may be necessary to apply a top-dressing consisting of rich, retentive soil, covering this with a mulch of short manure. The plants require more water at the present time than earlier in the season when the sun was less powerful; at each watering give a thorough soaking, using occasionally some liquid manure or chemical stimulant. The plants should be examined weekly, removing all lateral growths, and the foliage syringed lightly on fine afternoons. Close the house early with plenty of atmospheric moisture and considerable sun heat. Later, when the fruits commence to ripen, the application of manures should be discontinued, and the atmosphere of the house kept dry, admitting more air and exposing the fruits to the sun as much as possible. In the Melon house, where fruits are now ripening, sufficient heat should be provided by means of hot water or the sun's rays to allow for a circulation of air. The atmosphere should be moderately dry, but whilst withholding manures, do not neglect to apply sufficient clear water to prevent excessive dryness.

Succession Melons.—Plants should now be put out into beds for fruiting in late autumn. Assuming the bed has a pavement over a bottom heat chamber, put a layer of 4 to 6 inches of broken stone at the bottom, and on this at least 12 inches of soil, using loam of an adhesive texture; if the soil is of a light nature it will be well to mix with it some artificial manure. After the plants get established employ thorough ventilation whenever the weather conditions are favourable. Seeds of quick ripening Melons may be sown to produce the latest fruits. These plants should be grown in pots, and they are only likely to be successful in cases where they are cultivated in houses provided with plenty of atmospheric and bottom heat.

Melons in Frames.—At the present season Melons may be cultivated successfully in frames, but the fruits should be kept up as much as possible, raising them so that they become exposed to the light and warmth; cut out all lateral growths. Sufficient soil with fermenting material should be given them at the first, but manure water may be applied now in place of clear water, provided it is kept away from the stems of the plants. Syringe the foliage early in the evening, and close the frames while the sun's rays are warm.

THE KITCHEN GARDEN.

By John Dunn, Foreman, Royal Gardens, Windsor.

Winter Onions.—This crop should be lifted before the bulbs begin to make fresh roots, and the bulbs allowed to remain in the open until they are quite hard; after which, they may be removed whilst quite dry to a loft until required for use. The bulbs should be frequently turned in the loft, removing any which show signs of decay.

Mint.—If plantations of this herb were made from cuttings in April last, some of the plants may be cut close to the ground in order to promote the growth of healthy green Mint for use in autumn. The remainder of the plantation may be allowed to remain for a time until the growth becomes brown, when the plants should be cut over and the roots lifted about the end of October for forcing on a gentle hotbed in November. By this means large quantities of green Mint may be obtained during the winter.

Parsley.—Seeds may yet be sown for the supply of winter Parsley. This is a deep-rooting crop, and requires well-prepared ground. The situation should be one sheltered from the north and east. Sow the seeds in shallow drills drawn at 1 foot apart, and thin the seedlings to 3 inches apart. If a cold frame is available some of the seedlings may be transplanted into it for use during rough weather. Parsley sown early in the season should not be allowed to become overgrown, but should be cut close to the ground before the season is too far advanced in order to promote the growth of fresh, green leaves.

THE HARDY FRUIT GARDEN.

By B. Goodacre, Gardener to Sir Ernest Cassel, Moulton Paddocks, Newmarket.

Peaches and Nectarines.—Peach and Nectarine trees will now require frequent attention. The growths should be tied into position and the laterals pinched. I am not in favour of using a piece of wood to prop up the fruit from the wall, as is frequently done in the case of Peaches cultivated in glasshouses, because the fruits are more liable to get damaged by heavy rain storms. If the shoots are tied well back in the best manner to expose the fruits this will be all that is necessary in order to ensure the development of sufficient colour. Peach and Nectarine crops are very thin this year, and but little thinning will be necessary; but if it is desirable to remove any fruits the work should be done without delay. In ordinary seasons the cultivator is guided by the condition of each tree in determining the crop it should be permitted to ripen; and in a season of scarcity, like the present, isolated trees that are bearing freely should not be permitted to ripen a more liberal crop than its condition justifies, as overcropping is never satisfactory in any circumstances. Regular syringings may now be discontinued, but a thorough syringing may be given occasionally in the evenings of warm days for the purpose of destroying red spider. Rain water is best for this purpose, more especially in districts where the tap water is charged with lime or chalk, otherwise the fruit may be marked by deposits. As soon as the fruits have passed the stoning period the trees may be given applications of manure water, unless the weather at the time is on the wet side, and the borders are found to be already over-moist. In the latter circumstance it would be better to rake back the mulch and top-dress with artificial manure, forking this into the surface soil and watering it in with water from a rose can. The mulch should then be well shaken out, and again applied to the border.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the **PUBLISHER**, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, *as well as specimens of plants for naming, should be addressed to the* **EDITORS**, 41, Wellington Street, Covent Garden, London. *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Editors and Publisher. — *Our Correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the* PUBLISHER; *and that all communications intended for publication, or referring to the Literary department, and all plants to be named, should be directed to the* EDITORS. *The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.*

Special Notice to Correspondents. — *The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.*

Illustrations.—*The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.*

Local News.—*Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—62.6°.

ACTUAL TEMPERATURES:—

LONDON.—*Wednesday, July* 23 (6 p.m.); Max. 59°, Min. 52°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, *Thursday*, July 24 (10 a.m.); Bar. 29.7. Temp. 62°.

PROVINCES.—*Wednesday, July* 23, Max., 59° Bradford; Min., Shields, 53°.
Weather—Sunshine.

APPOINTMENTS FOR AUGUST.

SATURDAY, AUGUST 2—
Soc. Française d'Hort. de Londres meet.

MONDAY, AUGUST 4—
Sandiway Fl. Sh. Bletchley and Fenny Stratford Hort. Soc. Sh. in Bletchley Park. Old Sherborne Hort. Soc. Annual Sh. in the Old Castle, Sherborne.

TUESDAY, AUGUST 5—
Leicester Fl. Sh. in Abbey Park (2 days). Aberdare Fl. Sh. Scottish Hort. Assoc. meet. Nat. Amateur Gard. Assoc. meet.

THURSDAY, AUGUST 7—
Perthshire Sweet Pea Sh. (2 days).

SATURDAY, AUGUST 9—
Cercle Horticole Van Houtte, Ledeberg, Gand, International Exhibition in the Palais d'Horticulture, Gand (10 days). Crewe Memorial Cottage Hospital Fête Rose and Sweet Pea Sh.

MONDAY, AUGUST 11—
United Hort. Ben. and Prov. Soc. meet.

TUESDAY, AUGUST 12—
Roy. Hort. Soc. Coms. meet. (Lecture at 3 p.m by Mr. Frederick Enoch, on "Fairy Flies and Their Hosts.")

WEDNESDAY, AUGUST 13—
Carlisle and Cumberland Hort. Assoc Sh. (2 days).

THURSDAY, AUGUST 14—
Taunton Deane Hort. Exhibition.

MONDAY, AUGUST 18—
Pitsmoor (Sheffield) Hort. Soc.'s Sh., in conjunction with Artindale's Sweet Pea Sh.

TUESDAY, AUGUST 19—
Brighton and Sussex Hort. Soc. summer sh. (2 days).

WEDNESDAY, AUGUST 20—
Shropshire Hort. Soc. Summer Sh. at Shrewsbury (2 days). Wallingford Fl. Sh.

THURSDAY, AUGUST 21—
Aberdeen Hort. Soc. Sh. (3 days).

SATURDAY, AUGUST 23—
Hawick Hort. Soc. Summer Sh. in Town Hall.

TUESDAY, AUGUST 26—
Roy. Hort. Soc. Coms. meet. (Lecture at 3 p.m. by Messrs. Blackmore and Langdon on "Begonias.") Roy. Hort. Soc. of Ireland Autumn Sh.

FRIDAY, AUGUST 29—
Dunfermline Fl. Sh. (2 days). Dundee Hort. Exh. (2 days). Dumfries and District Hort. Sh. (2 days).

Soil-Temperature.

So many of the books which discourse on scientific horticulture confine themselves to the repetition of old-established and not always relevant facts that it is a particular pleasure to meet with one which treats of horticultural science at first hand. Such a book is M. A. Petit's *Notes d'Horticulture Experimentale.**

It is true that M. Petit's book makes no attempt to cover the whole subject of horticulture. That, however, is a merit, and not a defect. For what it treats of is dealt with in a thoroughgoing way, with the result that an attentive reader gets a rich reward for his pains.

Among the subjects discussed in this volume are the influence of cultural operations on the nocturnal cooling of plants and on the formation of hoar-frost, the effects of organic manures on the physical condition of the soil, and the uses of certain artificial manures and of various stimulators such as sulphur.

As the title indicates, the book is the outcome of experiment, and herein lies its value. The author's records of soil-temperatures provide a sound basis for his recommendations as to the means to be taken to prevent the formation of frost in cultivated plants.

If means of covering the plants are lacking all that the cultivator can do to prevent excessive cooling of his plants is to so cultivate his soil that at the time frosts are to be feared it will have a large store of heat available for the replacement of that which is radiated from the surface. For if heat be radiated from the surface of the soil it will help to raise the temperature of the plants and hence help to compensate for the loss of heat by radiation from the surface of the plants. Watering the soil is one of the most efficacious means of effecting this end—how effective may be seen from the facts set forth in the following table:—

TEMPERATURES AT HALF INCH FROM SURFACE.

			In dry soil.	In saturated soil.
April 23	... 4	p.m.	29.7° C.	21.1° C.
"	... 7.15	"	18.5	16.1
" 24	... 5.20	a.m.	3.9	6.5

Whence it follows that a means of protecting them from frost is to give plants a copious watering, it being understood, of course, that the water must not be too cold.

From similar soil-temperature measurements M. Petit shows that a soil merely dug with the earth left in lumps cools distinctly more quickly than one which has been dug and hoed to form a fine surface, and further that the cooling is checked still more if the surface is well rammed down (*plombé*) by heavy rolling or other means.

A heavily manured soil cools more rapidly than one which contains little organic matter. For the same reason, namely, the low conductivity of organic matter, hoar-frosts are more frequent in peaty soils than in soils poorer in humus, and it is the practice in some parts of Europe to protect such soils by a covering of five to six inches of sand.

It might be thought that no effect on soil temperatures would be produced by leaving a mulch of straw on a strawberry plot or by strewing the mulch early in the year. Yet, as M. Petit shows, owing to the poor conductivity of the straw the plant immediately above it will be on cold nights the colder for its presence.

The clue to an understanding of this effect lies in a recognition of the fact that the plant cools quicker than the soil, and therefore unless the soil be radiating heat and thereby helping to warm the plant the latter is apt to suffer. It follows from what has been said that a weedy soil loses heat more quickly than a clean soil, and that therefore a crop grown on a soil which has been allowed to bear weeds during the winter may be appreciably later than one which has been kept clean.

In regard to the application of mulches, as, for instance, a mulch upon a strawberry bed, the practical gardener will determine whether it is most essential to protect the roots or the growth above ground from frost. If his purpose is to protect the roots then mulches of short litter are amongst the best means to be employed for the purpose.

* *Notes d'Horticulture Experimentale.* By A. Petit. (Published by Librairie Agricole de la Maison Rustique, Paris. 3fr. 50.)

Coloured Supplement.—The subject of the coloured plate to be published with the next issue is Strelitzia Reginæ.

Supplementary Illustration.—The supplementary illustration affords two views of the Gardens at Eaton, near Chester, the seat of the DUKE OF WESTMINSTER, G.C.V.O. The uppermost picture is a view of the Hall, as seen from the wild garden, with the lake in the foreground. The view is of the south-east front, where the principal flower garden is situated. When the design of this parterre was printed in these columns, January 7, 1871, each half of the flower-garden described the letter W., with embellishments around. But two years ago this design was swept away entirely, new stairways, terraces and a lily pond have been added, and either side has been divided into three parterres, outlined by more than 2,000 English yews, which in time will form a perfect enclosure for each partition, giving variety and privacy to each. The clock tower shown on one side of the general building is 200 feet high, and contains 28 bells that have the Westminster chimes, and chime the hour and the half-hours; the bells are worked by machinery. The other picture represents a hardy plant border, originally the "ribbon border." Roses and various Creepers form a pleasing background and a foil to the wall, and the border is gay in spring with Darwin Tulips, then Pæonies, and in autumn Michaelmas Daisies. Eaton is one of the finest and most complete country seats in the kingdom, and everything is done by its noble owner to maintain the highest efficiency throughout the estate. The hall and gardens are open during most of the summer months to the public on payment of a small sum, which, at the end of the year, is given to various local charities. Thousands take advantage of this privilege, and being near Liverpool a great number of Americans make Eaton their first call. The control of the gardens has been in the hands of Mr. N. F. BARNES for many years past, and he is to be congratulated not only upon the excellent appearance of every department, but also upon the splendid quality of the fruit that frequently represents Eaton at the competitive exhibitions.

ROYAL HORTICULTURAL SOCIETY. — The next meeting of the committees of this society

will take place on Tuesday, the 29th inst., in the Society's hall, Vincent Square. At 3 p.m. Prof. R. H. Biffen, M.A., will deliver a Masters Memorial Lecture, the subject being "Some Factors in the Prevention of Disease in Plants."

Visit of R.H.S. Scientific Committee to the John Innes Horticultural Institution.—On the 18th inst. some of the members of the R.H.S. Scientific Committee visited the John Innes Horticultural Institution at Merton, on the invitation of the director, Mr. W. Bateson, F.R.S. The main aim of the institution is investigation into the laws of inheritance, but there are also experiments in progress on certain plant diseases, especially those of Peas, and on silver-leaf in Plums. The latter clearly corroborate the findings of other experimenters with regard to the fungus Stereum purpureum being the cause of the trouble. Perhaps the chief interest at present attaches to the series of investigations into the inheritance of sex, especially in Tropæolum, Reseda, and other plants. But fruit trees (self-fertility and self-sterility); Peas, Potatos, Gooseberries, Primulas, Calceolarias, Begonias, Capsicums, Campanulas, and various other plants are contributing to the investigations.

South-Eastern Agricultural College, Wye.—A meeting of the Governors of the Wye Agricultural College was held on the 19th inst., Lord Ashcombe presiding. The principal (Mr. M. J. R. Dunstan) reported that 149 students were in residence, the total number of students for the session being 187. An anonymous donor has given £500 to the College for the extension of the research department, and the Development Commission are recommending a grant of £6,000 for the completion of the new college buildings. The Governors also decided upon the erection of the buildings at the Fruit Research Station at Malling, the land for which (22 acres) has been purchased by the Kent County Council. The election of Mr. C. W. Mason to a Carnegie Research Scholarship was also reported.

Church Army "City Gardens."—In Stillington Street, Westminster, not very far from the Royal Horticultural Society's Hall, the Church Army has established two gardens on waste building sites, for the benefit of married workmen with families. The gardens comprise 23 plots, which are loaned free to the workmen. The gardens are now in their best condition, and the crops include a good collection of early vegetables, such as Artichokes, Marrows, dwarf Beans, Mushrooms and Tomatos. One ingenious cultivator has utilised an old piano-case as a greenhouse for cultivating his Tomatos. Flowers are also grown; some of the most popular sorts are Evening Primroses, Pansies, Hollyhocks, Dahlias, Carnations and Stocks. Most of the produce has been raised from seed.

Roof of Westminster Hall.—In further reference to the subject of Mr. Webster's article on p. 63, it may be pointed out that the *Times* for July 11 gave an interesting survey of the noble hammer-beam roof of Westminster Hall, which has recently been examined by experts with a view to its repair and strengthening. The timberwork dates from 1399, and is the finest example extant of the Gothic open timber roof. In order to give greater height in the centre, says the *Times*, the ordinary tie-beam is cut through, and the portions remaining, known as hammer-beams, are supported by wall-posts and curved struts or braces, both resting upon stone corbels projecting from the wall. Upon the extremity of the hammer-beam rests the hammer-post, supporting the main collar-beam. The principal rafter is 60ft. long from the ridge of the roof to the wall. The span of Westminster Hall is 68ft. 4in.; and the opening between the ends of the hammer-beams is 25ft. 6in. The height from the paving of the hall to the hammer-beams is 40ft., to the under-side of the main collar-beam 63ft. 6in., and to the apex of the roof 92ft. There is a tradition that the roof was constructed of a particular kind of Irish Oak in which spiders cannot live, or at all events which they avoid, and the cleaners declare that they have never found a spider or a web in the roof. The rich golden-brown colour which the timber has assumed has latterly given rise to doubt whether it is Oak or Chestnut, for Oak when it ages usually assumes a greyish-white colour. Mr. Baines, the architect of the Ancient Monuments and Historical Buildings Department, has made a careful examination of sections of the timber, and has established beyond doubt that the wood is Oak. The two principal forms of decay found in the timber are caused by beetle and dry-rot. The former is the more serious, as it has attacked the most vital parts of the structure, such as the juncture of one member with another, and in the joint between two beams laid side by side, as in the case of the collar-beams. It is the larva of the beetle, commonly called worm, which attacks the wood; but few traces of the insect have been found. Several dead beetles were discovered amongst the dust and one worm, white in colour. Dry-rot has been found chiefly where the timbers have been subjected to dampness. It has attacked the wall-posts, particularly those at the northern end of the hall, where they are embedded in the wall and packed round with soft rubble. The timber of the arched ribs is on the whole in good condition. Each rib consists of three separate timbers, two outer ribs and one central rib. Originally the outer ribs were secured to the central ribs by means of Oak pins. The struts are also generally in good condition, there being only slight decay caused by sap-wood. The bases of the principal rafters are found to be affected by decay, some of them seriously; and a similar condition has been found to exist in the hammer-beams, upon which the stability of the roof largely depends. The hammer-beams have been badly mutilated at different periods when repairs have been done. In one instance the wood has been so cut away at its junction with the arched rib that the whole beam can be shaken by hand pressure. The hammer-posts bear a heavy load transmitted from the collar-beams and the purlins, and fractures have appeared in the timber, much of which is worm-eaten. The collar-beams are also decayed in places, and some of them have been repaired with Oak and iron plates.

Fig. 34.—Rose Mrs. Godfrey Brown: flesh-coloured on the inner side of the petal and pink on the reverse.

(Received R.H.S. Award of Merit at the Holland House Show, July 1, 1913.)

(See page 17, *Ante.*)

Fruit and Vegetable Crops in Holland.—The Board of Agriculture and Fisheries have received from His Majesty's Consul at Rotterdam reports giving the prospects of fruit and vegetables, as published by the Dutch Ministry of Agriculture, from which the following are extracts:—On the whole the condition of the smaller fruits, such as Red, White and Black Currants, Gooseberries and Raspberries, is very good. Only in Oud-Beyerland is the condition of Apples very good; elsewhere the

condition is moderate to good. Pears are moderate to good all over the country, but Plums, although moderate to good in most districts, are considered a failure in others, and in general are unsatisfactory. Grapes under glass are reported to be fairly good in the West-land and good in other districts. Grapes grown in the open will be disappointing. Nuts are everywhere moderate to good. On July 12 the condition of Onions was fairly good throughout the country. Beans and Peas have suffered from unfavourable weather and have a bad appearance. During the last few weeks edible Potatos have made but little progress; otherwise, however, they are satisfactory, there being little disease as yet. Factory Potatos are less satisfactory, and it is expected that only half or two-thirds of last year's yield will be obtained. The crop of 1912, however, was exceptionally large. The area under Onions this year is 6,541 acres, compared with 7,289 acres in 1912; under edible Potatos, 357,755 acres, compared with 351,333 acres; under factory Potatos, 77,44 acres, compared with 74,357 acres; and under Beans and Peas, 126,420 acres, compared with 122,082 acres last year.

Gloucester Rose Show.—Mr. Elisha J. Hicks, Twyford, informs us that he was the winner of one first, one second, and one third prize respectively in the Rose classes at this show.

The Hon. Martin Burrell, Canadian Minister of Agriculture, will shortly visit England. Born at Faringdon, Berkshire, in 1858, Mr. Burrell in 1886 married a daughter of the late Joseph Armstrong, General Superintendent of the Great Western Railway. He took up farming in the Niagara Peninsula, but since 1900 he has been engaged in fruit growing in British Columbia. Whilst in Europe he will visit the Ghent Exhibition and consult Colonel Hutchison (the Dominion Exhibition Commissioner) with regard to the Panama Exhibition in 1915. In view of the effects of Canadian commerce of the opening of the new waterway, it is felt that the Dominion should be specially well represented at the projected San Francisco Exhibition.

Potato Disease in Lancashire.—The Board of Agriculture and Fisheries desire to inform Potato-growers that cases of wart disease of Potatos (Synchitrium endobioticum, Percival) have occurred in Lancashire, and to remind them that they are required to report the presence of this disease to the police or other officers appointed for the purpose, under penalty of a fine. Notifications may be sent to the Board. A leaflet on the subject of the disease can be obtained from the Secretary, Board of Agriculture and Fisheries, 4, Whitehall Place, London, S.W., gratis and post free. Letters need not be stamped.

Research Scholarships in Agricultural Science.—The Board of Agriculture and Fisheries have awarded Research Scholarships in Agricultural Science, of the annual value of £150, tenable for three years, to the following candidates, viz.:—E. W. Barton, B.A. (Wales), Economics of Agriculture; W. Brown, M.A., B.Sc. (Edinburgh), Plant Pathology; Miss E. C. V. Cornish, M.Sc. (Bristol), Dairying; F. L. Engledow, B.Sc. (London), B.A., University Diploma, Agriculture (Cambridge), Genetics; E. J. Holmyard, B.A. (Cambridge), F.C.S., Plant Nutrition and Soil Problems; R. C. Knight, B.Sc. (London and Bristol), Plant Physiology; F. J. Meggitt, B.Sc. (Birmingham), Agricultural Zoology; H. Raistrick, B.Sc. (Leeds), A.I.C., Animal Nutrition; G. O. Sherrard, A.R.C.S. (Dublin), Genetics; T. Trought, B.A. (Cambridge), Genetics; G. Williams, B.Sc. (Wales), Animal Nutrition; S. P. Wiltshire, B.Sc. (Bristol), Plant Pathology. They have also awarded Miss T. Redman, B.Sc. (London), a scholarship in Dairying, tenable for 2½ years, to fill a vacancy caused by the resignation of a former scholar. The scholarships have been established in connection with the scheme for the promotion of scientific research in agriculture, for the purposes of which the Treasury have sanctioned a grant to the Board from the Development Fund, and they are designed to provide for the training of promising students under suitable supervision, with a view to enable them to contribute to the development of agricultural science.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

The Ladies' Classes at the Recent N.R.S. Show.—It is so seldom that one can catch the *Chronicle* "tripping" that I may be forgiven for correcting a curious error in your reporter's account of these classes at this Show. After commenting on the alteration in the schedule introducing for the first time separate classes for tables for the single Roses—an improvement appreciated alike by judge, exhibitor, and visitor—he refers to Irish Elegance, seeming to regret its general use by the exhibitors. But one can hardly blame them for using the most beautiful single Rose in commerce, and when one of them has the necessary enterprise to obtain something different, his only comment is to draw attention to the variability of Irish Elegance. He may perhaps be forgiven for not knowing the name of the Roses that secured the 1st Prize for Mrs. E. M. Burnett, as "Irish Fireflame" is not yet in commerce, and the high speed at which a reporter works is no doubt his excuse, but the two Roses have nothing in common except their form—his comment that the buds as well as the outer [*sic*] petals were of an unusually reddish tint, might have helped him to form some conclusion other than the one he arrived at. Irish Fireflame is destined to share, if not to displace, Irish Elegance from its pedestal, but there is ample room for both, and it is good news to know that the raisers, Messrs. Alex. Dickson and Sons, of Newtownards, hope to distribute it this autumn. I also rather regretted to read the somewhat scathing comments on the general effect of the Decorative Classes, and, if you will permit me to say so, I think they were not justified. The general effect of the tent was excellent, and has certainly never been excelled at any previous exhibition. Further, I think that the exhibitors chose "the wiser part" in not putting three or four different varieties in one vase, as your reporter suggests they should have done. One bed one variety is sound as applied to the garden, and it is equally true of vases and bowls, and "mixed" vases and bowls are best avoided, and are indeed only to be forgiven when one's supply of flowers is inadequate, and this should not be the case at a National Show. If there was any fault to find with this section of the Show it was not with the flowers or their arrangement, but with the floor, the boarding being very uncomfortable to walk on, and almost dangerous in some places—for which I presume the unlevel site was answerable. *Herbert E. Molyneux, Brantwood, Southampton.*

[Mr. Herbert Molyneux shows my error, and then very kindly makes an excuse for my ignorance; but the misnaming of Irish Fireflame (I am assuming that Mr. Molyneux is right and myself wrong) was partly the result of the overwhelming popularity of the National Rose Society's Show; for, although I visited the "Decorative" Tent three times during the afternoon, it was each time so crowded that I was unable to obtain such a leisurely inspection as was apparently made by my critic. As the two varieties concerned are alike in form, and Irish Fireflame is not in commerce, my error was an excusable one. The difference in colour was duly observed; but, as so many Roses vary considerably in this respect, according to the conditions under which they are grown, and individual blooms change their tints almost from hour to hour, I concluded that it was an interesting colour variation of Irish Elegance. The rest of Mr Molyneux's complaint is a matter of opinion and not of facts. I still hold that the decorative classes would have been more attractive had some of the competitors been courageous enough to arrange their exhibits with three or more distinct varieties. I have myself used thousands of Roses for decoration as cut blooms, and found no difficulty in harmoniously blending different varieties in one bowl. The "one variety one bed" dictum is debatable, and is not so universally held as Mr. Molyneux would have us believe. In the decorative classes at the Regent's Park Show most of the individual blooms were charming; but their arrangement indicated mathematical, rather than artistic, minds. It was the regularity of arrangement which I found monotonous, although at first sight the effect of the tent was very attractive. *Your Reporter.*]

The Future of the N.E.H.S.—Allow me, as a private individual, to intimate to the gardening fraternity in general, and northern horticulturists in particular, the opportunities that exist at present for development. The cards have been dealt and the call for trumps has been given. Has it been noticed, and will the response be forthcoming? There are two grand openings lying right in front of the N.E.H.S., and it would appear that too much caution may prevent an advance through these open doors. (1) Without going into details, which are being thoroughly overhauled by legal and other interested persons, there is undoubtedly a crying need for a Northern School of Horticulture. The general idea is a Government Garden Institute with the N.E.H.S. co-operating, with the object of training horticulturists capable of developing the economic resources of the soil at home or in the Colonies. (2) There is another clear call—the establishment of a N.E.H.S. rock garden. Such a Mecca for lovers of rock gardens would be popular and useful. To me one thing is certain—when at a general meeting, to be called shortly, the music is faced, the tune will be played, for it is preposterous to think that the many enthusiasts who have sacrificed, gladly and willingly, their time and money, will allow this Northern movement to end in failure. It is not as if cash was not forthcoming. All that is required is a strong lead, and similar enthusiasm such as was displayed over the new R.H.S. Hall and the R.H.S. Gardens. Notwithstanding deaths and withdrawals, the N.E.H.S. still increases its membership. Several Fellows and members have proved by their withdrawal their ignorance of elementary forces in nature. A seedling cannot be forced without harm being done. Also all progress comes through and by suffering. It is disappointing, too, to note that three Northern Societies outside Yorkshire have accepted from the N.E.H.S., which has tried to be true to name, free judging, costly medals, or other practical support, and then given nothing, or practically nothing, in return. *J. Bernard Hall, Rawdon, Leeds.*

A Hybrid Foxglove.—At the back of a wide border in the flower garden here a quantity of the common red and white Foxgloves have sown themselves. In front of the border is a strong plant of the perennial yellow Foxglove, Digitalis ambigua. This species also sows itself freely, and there has sprung up in this border a hybrid intermediate in stature between the new species. The foliage closely resembles that of D. ambigua, while the flowers partake of the character of both kinds, being yellow inside, marbled with maroon and flesh-coloured outside. It is a very ornamental plant, being quite devoid of the taint of magenta, which is the only defect in our native species. It will be interesting to see whether the hybrid will prove biennial like one parent or perennial like the other. The crossing of these two species, if taken in hand by skilful cultivators, might result in a new and decorative race of hybrids. *Herbert Maxwell, Monreith.*

Strawberry "President."—In reply to Mr. Engleheart (p. 53), Strawberry "President" was raised at Highcross, near Ware, Hertfordshire, by Mr. Charles Green, a builder and estate carpenter, at Youngsbury. I was at that time serving my apprenticeship in the gardens under Mr. Terry. I think it was early in the 'fifties. I cannot remember the pedigree, but the old favourite Keene's Seedling was one of the parents. Mr. Green was an amateur gardener and raised seedling Dahlias, including the variety Green's Admiration. I cannot remember others, as my memory fails me, for I am in my 79th year. *Thomas Godfrey, 53, Broomwood Road, Clapham Junction.*

——— In reply to Mr. Engleheart (see p. 53) I am able to give some particulars of the raising of Strawberry "President." About

60 years ago I knew quite well two brothers, Charles Green and Sam Green, village carpenters, both enthusiastic gardeners. They were estate carpenters at Youngsbury, Hertfordshire, an estate which belonged to the late Lady Louisa Giles Puller. The Greens lived at High Cross, close to the estate, and were always in touch with the steward and gardener of the estate, Mr. Terry, a noted rosarian. Three men more devoted to gardening I have never since known. The Strawberry was dedicated to the Very Rev. Dr. Weather, who was then President of the Roman Catholic College of St. Edmund's, Old Hall Green, and who was a frequent visitor at the house of the Greens. Who really put the Strawberry into commerce I do not know, but Mr. Terry had a son, who is still farming on the estate at Collier's End, Hertfordshire. He may perhaps have heard his father talk about it and be able to give more information. But President Strawberry was raised by the brothers Green. *Thos. Houchin, Supt. St. Mary's Cemetery, Harrow Road, College Park, N.W.*

Edraianthus Pumilio and E. dalmaticus (see fig. 20, p. 31).—These two Edraianthuses (or as they are sometimes called Wahlenbergias) form particularly attractive subjects for the moraine, and in the early summer make brilliant purple splashes as they mantle the cool-looking, stone chips. The Dalmatian Hare-Bell (E. dalmaticus) is less silvery in appearance than its relative E. Pumilio, while its blossoms are borne in dense clusters at the end of decumbent stalks thrown out to some distance from the parent crown. My experience leads me to believe that the best results are obtained by raising these plants from seed, and planting them out while they are still in a small state—so that their roots may wander deep into the grit—which in my moraine is copiously supplied with fresh water (running over an impervious bottom) during the growing season, while through the winter months the supply of moisture is cut off and a sheet of glass placed above the plants to intercept overhead wet and dirt—which latter in my district descends in extraordinary quantities. It will be remembered that last year, when writing in the *Gardeners' Chronicle* (May 11, p. 323), I referred to three seedling plants of Edraianthus which I had pricked out into the moraine the previous summer, from seed sown in February, 1911. The tuft formed by these three plants produced 30 flowers in June, 1912, and the illustration cited above of E. Pumilio shows how it has progressed since that time. It has given me this season over 200 glorious blossoms, set close upon its silvery foliage. Not only do the plants appear perfectly happy in my moraine conditions, but they steadily and rapidly increase, both in size, quantity of flowers produced, and amount of seed ripened, which seed by the way germinates rapidly and produces vigorous progeny. *Reginald A. Malby.*

Lychnis Arkwrightii.—In your report of the R.H.S. summer show at Holland House (p. 15) you state that an exhibit of Lychnis Arkwrightii "appeared to be a rather good strain of L. Haageana." This suggests that your reporter assumed that the plants I showed were L. Haageana pure and simple, and I should be glad if you would allow me to state through your columns that they were the results of a cross made by me some years ago between L. Chalcedonica and L. Haageana, to which the R.H.S. Scientific Committee awarded a Botanical Certificate last year. *John S. Arkwright, Kinsham Court, Presteign, Radnorshire.*

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

July 15.—*Present*: E. A. Bowles, Esq. (in the chair); Sir J. T. D. Llewellyn, Dr. Bateson, Messrs. Fraser, Fawcett, Hales, Bennett-Poë, Cuthbertson, Sutton and Chittenden (hon. sec.).

Proliferation in Rose.—Mr. Bennett-Poe showed a Rose having a fasciated and branched shoot bearing several buds developed from its centre. The branch bearing the flower showed no sign of fasciation.

Lithiasis in Pear.—Mr. W. A. Voss sent a small Pear (Doyenné Boussoch) from a tree of about 25 years of age showing peculiar developments of "stone-cells" breaking through the epidermis here and there. Only one or two fruits on the tree, which was bearing a heavy crop, were affected, and these were from the end of a branch. The trouble is one not commonly met with in England, and has been attributed by German investigators to insufficient water-supply.

Alder Diseased.—Mr. J. O'Brien sent fruits of Alnus glutinosa, gathered near Le Touquet from a tree bearing many similar ones, in which some of the carpels had grown out in a peculiar fashion, becoming fleshy and somewhat curled, standing out like leafy projections from the cones. The development of these peculiar growths is due to the attack of the fungus Ascomyces alnitorquus.

Poplar Diseased.—The Ven. Archdeacon Meredith sent leaves of a Poplar with large golden-yellow areas upon them, occupying in some cases half the leaf surface—Ascomyces aureus, a fungus nearly allied to the one producing leaf-curl in Peaches. One or two of the leaves showed on their upper surfaces the silvery appearance characteristic of the attack of Stereum purpureum as seen in Plums.

Liparis lacerata.—Mr. J. O'Brien showed an inflorescence of Liparis lacerata (Ridley, *Journ. Linn. Soc.*, XXII., 1886, p. 284. Malay Peninsula, Perak, etc., Dist. Tenasserim, Borneo). A small example is represented in Burbidge's drawings of Borneo plants in the Natural History Museum. The species was little known until it flowered with the Hon. N. Charles Rothschild, and was noted in *Gardeners' Chronicle*, February 15. 1913, p. 99, from a plant sent to him by a collector in Borneo. The present specimen flowering with Sir Marcus Samuel was obtained from the same source. Some of the flowers had dropped, but the spike was about 9 inches in length.

Robinia Pseudacacia monophylla.—Mr. E. A. Powles showed flowers of the variety of Robinia Pseudacacia called monophylla, obtained in a garden in Italy. It is characterised by the very large terminal leaflet and pair of small ones below it. All the flowers he had examined had two or three carpels, but seed was being produced.

Progeny of Green Wallflower.—Mr. Chittenden referred to the Wallflower cross, the F_1 generation of which was shown to the committee last season. The original cross was between a "green-flowered" form and the normal form, and in the first generation all the flowers produced in many plants were normal. The self-fertilised seedlings from these plants had in some cases flowered this season, but in insufficient numbers to give any reliable statistics. The results, so far, showed, however, that segregation was occurring, several of the plants producing the "green" abortive flowers, and others the normal flowers. The plants are being grown on.

Fruit and Vegetable Committee.

July 7.—The Fruit and Vegetable Committee of the Royal Horticultural Society met at Wisley on the 7th inst. and made the following recommendations for Awards, which were confirmed by the Council at their meeting on July 15.

First-class Certificate.

Strawberry British Queen, from R.H.S. Gardens, Wisley.

Awards of Merit.

Strawberries Cropper, Progress and Rival, all from Messrs. Laxton Bros., Bedford.

Peas.—Favourite, from Messrs. J. Veitch, Chelsea; Masterpiece, from Messrs. Sutton, Reading; Sir Arthur Bignold, from Mr. Holmes, Tain; and Warriston Wonder, from Messrs. Bell & Bieberstedt, Leith.

The following varieties of Peas were highly commended:—Battleship, from Messrs. Carter, Raynes Park; Best of All, from Messrs. Wheeler, Gloucester; Discovery, from Messrs. Alex. Dicksay, Newtownards; Marquis of Stafford, from Mr. Holmes, Tain; The Clipper, from Robert Sydenham, Ltd., Birmingham; Up to Date, from Messrs. Sutton, Reading; and Orwell, from Mr. Staward, Panshanger, Hertford.

NATIONAL SWEET PEA.

July 17.—The thirteenth annual show of this society was held in the Royal Horticultural Hall on the above date. Exhibits were so numerous that the entire hall, including the annexes, was filled with Sweet Peas—no other flower was present, the only "foreign" vegetation being the graceful Palms, of just the right size, which were effectively placed along the tables, and the few trails of Selaginella and of Asparagus used in the dinner table decorations. When viewed from the slight elevation of the floors of the annexes the show presented a charming appearance. Nearly all the principal trade growers had arranged imposing stands of their best and newest varieties all around the hall, the dinner table exhibits (13 of them) occupied the centre, and the remainder of the competitive classes were arranged on the customary tabling; even the balcony was adorned with an ample selection of Sweet Peas. The smooth working of the show and the ease which the classes and each exhibit could be distinguished indicated forethought on the part of the hon. secretary and his willing assistants. In nearly all the classes the entries were very gratifying, the highest number being 33 in Class 11. The exhibits reached a high standard of excellence.

General Division.

The trade growers were excluded from competition in the first six classes.

Twenty-one bunches of Sweet Peas, distinct.—In this class the varieties must be selected from a published list, of which, with three exceptions, all the flowers have waved standards. The 1st prize, which included the Sutton Challenge Cup and the Society's Gold Medal, was won by Sir Randolf Baker, Bart., M.P., Randston, Blandford (gr. Mr. A. E. Usher), with 21 bunches of fresh, large flowered spikes of very even quality, the finest being Thos. Stevenson (orange-scarlet), Mrs. Cuthbertson (rose pink), Agricola (white ground flushed with heliotrope), Elsie Herbert (white, edged with rose), Rosabelle (rose), Barbara (salmon-orange), Edrom Beauty (orange-salmon) and Florence Nightingale (soft lavender, lightly tinted rose-pink); 2nd, Mrs. W. Jarratt Thorpe, Gransmoor, Hucclecote, whose best spikes were of Mrs. C. W. Breadmore (creamy buff edged with rose), Mrs. R. Hallam (salmon-pink), Edna Unwin (orange-scarlet), Etta Dyke (white), Rosabelle and Clara Curtis (primrose yellow); 3rd, A. W. Stirling, Esq., Holme Lea, Goring, Oxon (gr. Mr. A. Morning).

Eighteen bunches of Sweet Peas, distinct.—The object of this class was to indicate the varieties most suitable for garden decoration, and these were selected from a list specially compiled by the Society. Sir Randolf Baker was the only exhibitor, and was awarded the 2nd prize for a collection which included Mrs. H Dickson, Etta Dyke, Eric Harvey and Queen of Norway.

Twelve bunches of Sweet Peas, distinct.—The Henry Eckford class was responsible for the finest exhibit in the show. The Challenge Cup and Gold Medal were won by Mrs. F. E. Hall, Cumberland Cottage, Redbourn, Herts (gr. Mr. F. Peacock), with a splendid set of flowers, which were characterised by tall stems, evenly furnished with large, fresh blooms of clear colours and good substance. All the varieties were worthy of mention, but special mention must be made of R. F. Felton (lavender), Melba (salmon-orange), King Manoel (maroon), and White Queen; 2nd, Lord North, Wroxton Abbey, Banbury (gr. Mr. E. R. Janes), whose praiseworthy exhibit was overshadowed; but it included splendid vases of Barbara, Lady E. Eyre, and Mrs. C. W. Breadmore; 3rd, E. J. Mocatta, Esq., Woburn Place, Addlestone (gr. Mr. T. Stevenson).

Twelve bunches of Sweet Peas, distinct.—The 1st prize, offered for 3 vases each of cream-pink, lavender, orange and scarlet varieties, was won by Sir Randolf Baker, whose exhibit was so good that the only other competitor was awarded the 3rd prize. The winning varieties were, *Cream-pink:* Anglian Pink, Lady Miller, Doris Usher; *Orange:* Thos Stevenson, Anglian Orange, Edrom Beauty; *Lavender:* True Lavender, R. F. Felton, Lavender Geo. Herbert; *Scarlet:* Dobbies Scarlet, Premier and Red Star.

Six bunches of new Sweet Peas, distinct.—The exhibits were to be of varieties first put into commerce during or since the autumn of 1912. Mr. THOS. JONES, Bryn, Penylan, Ruabon, won the 1st prize with bunches of Lavender George Herbert, Agricola (white flushed with heliotrope), Thos. Stevenson (orange-scarlet), Mrs. E. Cowdy (maroon), Marks Tey (rosy maroon and mauve) and Birdbrook; 2nd, Mr. EDWARD COWDY, Green Hall, Southgall, Co. Armagh, who showed excellent spikes of Agricola, Florence Wright and Thos. Stevenson; 3rd, Mr. T. STEVENSON, Woburn Place Gardens, Addlestone.

Three bunches of waved Sweet Peas, distinct.—In this class, for pink or cream-pink varieties, Sir R. BAKER won the 1st prize with excellent bunches of Hercules, Doris Usher and Lady Miller; 2nd, B. PEYMAN, Esq., Sandford Manor, Sherbourne (gr. Mr. W. Preedy).

OPEN CLASSES.

Classification Class: 24 vorieties of Sweet Peas.—Not more than one variety of any colour was to be shown, the object being to bring into prominence the finest varieties of the several colours. The competition was not so strong as might have been wished, but Mr. H. D. DIGWELL, Harrow View, Greenford, Middlesex, won the 1st prize with a very interesting collection. The unavoidable prominence of what we may term the dull colours detracted from its spectacular appearance, but the exhibit was a really good one; the finest flowers being of Melba, Nora Unwin, Dobbie's Cream and Mrs. Cuthbertson; 2nd, Mr. J. STEVENSON, Wimborne.

Twelve Bunches of Sweet Peas, distinct.—The competition in this class was very strong, and nearly all the exhibits were of a high order of merit. The 1st prize was awarded to Sir G. O. TREVELYAN, Bt., Wallington, Cambro, Morpeth (gr. Mr. E. Keith), who showed splendid examples of Edith Taylor, Thos. Stevenson, Rosabelle, R. F. Felton, and Agricola. Lord NORTH won the 2nd prize, showing Hercules, Elsie Herbert, Moneymaker, and Mrs. Routzahn in excellent condition.

Three Bunches of Seedling Sweet Peas.—This class, for distinct varieties not yet in commerce, was very disappointing, only two varieties being of any great merit. The 1st prize was won by Mr. R. BOLTON, Warton, Carnforth, who had in "Steeton"—which may be described as being a Melba with a line of deeper colour in the centre of the petals—a distinct variety; 2nd, Mr. R. WRIGHT, Formby, Liverpool, who showed a delightful vase of Royal purple. The flowers were borne on long, gracefully arched stems, which were not so disproportionately stout and stiff as is the case with many of the standard varieties.

The G. W. King Challenge Cup, offered for twelve bunches of waved Sweet Peas, induced a very strong competition, and was won by Capt. GEOFFREY LUBBOCK, Greenhill, Warminster, Wilts (gr. Mr. J. B. Lowe).

Display of Sweet Peas.—The Burpee Cup was offered for the best display of waved varieties arranged in a space of 8 feet by 6 feet, and was responsible for several attractive exhibits. The Cup and Gold Medal were awarded to F. A. WELLESLEY, Esq., J.P., Westfield, Woking (gr. Mr. W. Hopkins); 2nd and Silver Medal, W. E. ALSEN, Esq., Denmead, Hants.

Mr. THOS. JONES won the 1st prize in the class for six bunches, and MARSHALL GREEN, Esq., The Lodge, Eynsford (gr. Mr. W. White), was similarly successful in the class for three bunches of the Helen Pierce type, waved or grandiflora varieties.

DISTRICT CLASSES.

Prizes were offered for exhibits of Sweet Peas from nine "districts" of the British Isles. The best exhibit was found in the Northern Counties class, where the Right Hon. Sir G. O. TREVELYAN won the 1st prize with a splendid display.

In the Scottish class the 1st prize was awarded to Mr. JAMES KERR, Westmount, Stewarton, Ayrshire; 2nd, Mr. J. A. GRIGOR. The prizes in the Irish class were won by Mr. EDWARD COWDY and Mr. M. W. SHULDHAM, Ounavarra, Gorey, in the order named. The Welsh prize went to Mr. THOS. JONES; 2nd, Mr. L. WEBB, Welshpool. Mr. B. PEYMAN was the most successful competitor in the Western Counties class; 2nd, Mr. A. P. BROAD, St. Austell. In the Eastern Counties class Mr. H. TYSOE, The Gardens, The Lodge, Bedford, was placed 1st, and Mr. A. W. RALPH, Kempston, Beds, 2nd. Lord NORTH won the premier prize in the Midland Counties class, and Mrs. KENSINGTON, Haverbrack, Uckfield (gr. Mr. F. C. Beale), was similarly placed in the class for the Southern Counties.

The Breadmore Challenge Cup, restricted to competition amongst exhibitors who employ only one gardener, was won by Dr. PHILIPS, Malpas, Cheshire (gr. Mr. W. Davies).

AMATEURS' CLASSES.

The Hawlmark Challenge Cup was won by Mr. THOS. JONES, who showed twelve bunches of excellent Sweet Peas, rivalling those of Mrs. HALL in class 3. Mr. A. T. STEADMAN, Glanford, Cley, Norfolk, won the 1st prizes in the classes for six bunches and for three bunches of Sweet Peas.

The Horace Wright Cup was awarded to Mr. W. H. HOLLOWAY, Percyville, Shrewsbury, and the Walter Voss Cup to Mr. W. T. JAMES, Kempston, Hoo, Bedford. The best six bunches with waved standards were shown by Mr. W. SEABROOK, Harpenden, and the finest three bunches by Mr. GEO. PAIN, Hornsey.

FLORAL DECORATIONS.

There were thirteen dinner tables decorated with Sweet Peas and appropriate foliage. The 1st prize was awarded to Miss BEATRICE ARMSTRONG, Fishpond Road, Hitchin, for a light and graceful arrangement, but the colour combination of pale cream-pink and lavender did not favourably impress us; 2nd, Mrs. W. FULCHER, jun., Moulsham Street, Chelmsford.

In the class for an epergne of Sweet Peas Mrs. D. RUFF, Sharnbrook, Beds, who utilised pale lavender and creamy-buff flowers, was awarded the 1st prize; 2nd, Mrs. C. A. BROWN, Brooke's Lodge, Reigate, whose arrangement was very dainty and attractive. The vase of Sweet Peas exhibited by Mrs. RUMBLE, Addlestone, was quite the best in the class.

The sprays and buttonholes were not very attractive; the former were mostly too narrow, and nearly all the buttonholes were unduly large. The 1st prize for "two buttonholes and one lady's spray of Sweet Peas" was won by Mrs. RUMBLE.

NON-COMPETITIVE EXHIBITS.

Displays of Sweet Peas were contributed by Messrs. DOBBIE AND CO., Edinburgh (Gold Medal), Mr. ROBERT BOLTON, Warton, Carnforth (Gold Medal); Messrs. E. W. KING AND CO., Coggeshall; S. BIDE AND SONS, Farnham; R. H. BATH LTD., Wisbech; Messrs. CARTER AND CO., Raynes Park; Messrs. A. JARMAN AND CO., Chard; and Mr. W. J. UNWIN, Histon (Silver-Gilt Medals); Mr. JAMES BOX, Haywards Heath; Messrs. R. SYDENHAM, LTD., Birmingham; JONES AND SONS, Shrewsbury; G. STARK AND SON, Norfolk; and Mr. J. STEVENSON, Wimborne (Silver Medals); W. VOSS AND CO., Millwall; ALDENSEY AND JONES, Kingsbridge; JOHN K. KING, Coggeshall; J. D. WEBSTER, Chichester; and B. W. DEAL, Kelveden, Essex (Bronze Medals).

THE ANNUAL DINNER.

The customary dinner took place at the Hotel Windsor, Mr. Herbert Smith presiding. He was supported by Messrs. Robt. Sydenham, W. Cuthbertson, E. Cowdy, J. S. Brunton, A. Malcolm, and Dr. Philips. Reference was made by the various speakers to the continued success of the society and its wide ramifications—members were mentioned as residing in such diverse places as Japan, New Zealand, Canada, and the United States of America. The "Streak" disease and the necessity for obtaining a remedy was referred to. In responding to the toast of the Hon. Secretary, Mr. C. H. Curtis spoke of the valuable spade work done by his predecessors, the late Mr. Richard Dean and Mr. Horace Wright, and urged those present to use their endeavours to obtain more new members.

NATIONAL CARNATION AND PICOTEE. (Southern Section.)

JULY 18.—The annual show of the florists' Carnation and Picotee, which was held in the Royal Horticultural Hall on this date, was one of the best held during recent years in London. The entries were more numerous than usual, the quality of the blooms higher, and there was a gratifying attendance. The outstanding feature of the show was the great success of Mr. JAMES DOUGLAS, who excelled in a large number of the classes.

FIRST DIVISION.

FLOWERS SHOWN ON CARDS.

Twelve Carnation Blooms, Bizarres and Flakes.—Mr. JAMES DOUGLAS, Great Bookham, won the 1st prize in this class with a stand of fresh, well-formed blooms of Recorder (scarlet flake), Master Fred (very fine crimson bizarre), J. S. Hedderley (crimson bizarre), Torchlight (scarlet flake), Meteor (rose flake), Tom Tit, George Melville, Kobe (scarlet flake), Supreme (scarlet bizarre), Gordon Lewis (purple flake), Sarah Payne, and a splendid flower of Robt. Houlgrave (scarlet bizarre); 2nd, Mr. C. BLICK, Hayes, whose best blooms were Portia, King Olaf, and Beggar Maid; 3rd, Messrs. A. R. BROWN, LTD., Birmingham.

Twelve Carnation Blooms, Selfs.—1st, Mr. JAMES DOUGLAS, with a beautiful collection, the very best blooms being Bookham White (see *Gardeners' Chronicle*, July 19, 1913, page 54), Elizabeth Shiffner (rich orange), Cardinal Basuto (crimson), and May Day; 2nd, Mr. H. MATHIAS, Medstead, who showed excellent blooms of Daffodil, Eva and a crimson seedling; 3rd, Messrs. A. R. BROWN, LTD.

Twelve Carnation Blooms, Fancies.—In this class, Mr. C. BLICK won the 1st prize with a noteworthy collection, which included Lord Steyne (red and crimson on yellow ground), Linkman (scarlet on yellow ground), Thomas à Becket and Bombardier; 2nd, Mr. H. MATHIAS, who showed two fine blooms of Lord Steyne.

Twelve Picotees, White Ground.—In this class, Mr. J. DOUGLAS recovered the first place, showing a beautiful collection: the outstanding varieties were Harry Kenyon (light-edge purple), Favourite, John Smith (heavy-edge red), and Fair Maiden (light-edge rose); Mr. C. BLICK was a very good second, his stand contained the Premier Picotee, Melita, Quaker Girl, and Euphrosine, in very fine specimens.

Twelve Picotees, Yellow Ground.—The order was reversed in this class, where Mr. BLICK won the 1st prize, Mr. DOUGLAS being 2nd. The winning stand was especially grand, the very best blooms were the Premier Her Majesty (heavy-edge purple), Daisy Boston, Miss Winifred and Onward (light-edge purple); the 2nd prize stand included very good blooms of Mrs. J. J. Keen (heavy-edge rose), John Ruskin (light-edge rose), and Agnes (medium-edge purple).

FLOWERS SHOWN AS GROWN.

The following five classes, which required three blooms of each variety to be shown in vases with Carnation foliage, illustrated their decorative value, and were very attractive. In most instances the quality was exceedingly good.

Four Carnations, Selfs.—Mr. DOUGLAS was an easy winner in this class; his best varieties were Daffodil and Miss Willmott; 2nd, Mr. C. BLICK.

Four Carnations, Fancies.—Mr. DOUGLAS was again 1st; in this class he showed splendid vases of Lord Steyne and Queen Eleanor (scarlet markings and edgings on buff ground); 2nd, Mr. R. MATHIAS.

Four Carnations, White Ground Fancies.—One vase of flowers in Mr. DOUGLAS's 1st prize collection had been removed, but the best of the remaining three was that of Montrose; 2nd, Mr. BLICK, with a good vase of Octavia.

Four Picotees, Yellow Ground.—In this class Mr. DOUGLAS, who won the 1st prize, showed splendid examples of Togo (heavy crimson edge), and Mrs. J. J. Keen; 2nd, Mr. C. BLICK with a vase of splendid J. W. Goodfellow (heavy rose edge).

Nine varieties, Selfs, Fancies, and Yellow Ground Picotees.—This was an excellent class, and the exhibits were a very attractive display: 1st, Mr. DOUGLAS (Basuto, Fujiyama, a glowing red self, and Pasquin, a splendid fancy, were the best flowers); 2nd, Mr. H. MATHIAS, whose outstanding vases were of Sunproof Scarlet and Linkman.

SECOND DIVISION.

FLOWERS SHOWN ON CARDS.

Six Carnation Blooms, Selfs.—Mr. H. R. TAYLOR, Oakleigh, Cheam, was placed 1st with a very creditable exhibit; the varieties Capt. Scott

and Caruso were especially good; 2nd, Mr. C. A. LINZEE, Alresford, whose stand contained the Premier Self, Mrs. George Marshall.

Six Carnations, Bizarres and Flakes.—1st, Mr. H. R. TAYLOR; in this class his outstanding blooms were Bedouin, Gordon Lewis, and Zebra; 2nd, Mr. J. FAIRLIE, Acton, who had a splendid bloom of Gordon Lewis (Premier Flake).

Six Carnations, Fancies.—Mr. H. R. TAYLOR was also 1st in this class, where he showed large and excellent blooms of Nobleman and Queen Eleanor; 2nd, Mr. J. A. FORT, Winchester, who had an excellent bloom of Rhea.

Six Picotees, White Ground.—The 1st prize stand of Mr. J. J. KEEN, Southampton, contained in John Smith, the premier heavy-edge bloom; 2nd, Mr. H. R. TAYLOR, whose best flower was Favourite.

Six Picotees, Yellow Ground.—Mr. TAYLOR was a comparatively easy 1st. On his stand of clearly-marked blooms was Maid Marion and Eclipse (premier light-edge yellow) in excellent condition; 2nd, Mr. W. H. PARTON, Moseley.

FLOWERS SHOWN AS GROWN.

The best collection of three blooms of one variety of pink or Rose Self Carnation were shown by Mr. W. H. PARTON; 2nd, Miss SHIFFNER. The best 3 blooms of White Self Carnations were those of Farthest North, shown by Mr. J. FAIRLIE; 2nd, Mrs. MORTON, who showed good blooms of Mrs. Eric Hambro. Mr. C. A. LINZEE, showing W. H. PARTON, won the 1st prize for dark-red or maroon selfs; 2nd, Mr. W. H. PARTON, with John Knox.

In the class for yellow selfs nearly all the 11 competitors showed Daffodil; Miss SHIFFNER and Mr. TAYLOR won the prizes in the order named. Mr. MORTON won the 1st prizes for red self Carnations and for yellow ground Picotees. In the class for any other colour self Mr. H. W. FROSTICK won the 1st place, and Mr. FORT was similarly successful with yellow ground fancies.

Mr. PARTON won the 1st prize for six distinct varieties of Carnations and Picotees, with an especially good collection; 2nd, Mr. MORTON.

Martin Smith Memorial Cup.—Of the four exhibits of 12 selfs, fancies and yellow-ground Picotees in competition for the Smith Memorial Cup, the best was that by Mr. R. MORTON, Woodside Park. His best blooms were of Donald McDonald, Skirmisher and Miss Willmott; 2nd, Mr. PARTON; 3rd, Mr. J. FAIRLIE.

OPEN CLASSES.

FLOWERS SHOWN AS GROWN

Mr. DOUGLAS won the 1st prizes for 9 blooms of a white self (Bookham White), dark-red or maroon self (Mrs. Geo. Marshall), red or scarlet self (Fujiyama), any other variety (Purple Emperor), yellow-ground Picotees (John Ruskin), yellow or buff-ground fancy (an excellent Edenside), any other fancy (Daisy Walker), and yellow self (Daffodil). Mr. PARTON won the 1st prize for 9 pink or rose selfs (Rosy Morn), and Mr. H. LAKEMAN for 9 buff or terracotta shades (Elizabeth Shiffner).

The Seedling classes did not contain any blooms of superlative merit; the best were Mrs. R. Percy Smith, a self-coloured flower shown by Mr. R. MATHIAS; J. J. Keen, a fancy, also by Mr. MATHIAS; and Aureus, a yellow-ground Picotee, by Mr. TAYLOR. In the class for a vase of seedlings Mr. E. CHARRINGTON, Limpsfield, showed a very good collection; 2nd, Mr. C. BLICK.

Dinner Table Decorations.—The first prize was awarded to Mr. F. PRICE, Bournville, for a rather high arrangement of blush coloured Carnations which was very bright and attractive; 2nd, Mr. C. BLICK, Hayes, who used pink blooms; and 3rd, Mrs. A. BIDE, Farnham. The sprays and buttonhole flowers were generally very tasteful, although in a few instances the buttonhole flowers were arranged with too much foliage. The prizes were awarded to Mr. L. HART, Hertford, and Mr. W. PITCHER, Maidenhead, for sprays, and to Mr. C. H. LINZEE and Mr. W. H. PARTON for buttonhole flowers, in the order named.

PREMIER BLOOMS.

FLOWERS ON CARDS.

Bizarre.—Robert Houlgrave, by Mr. J. DOUGLAS.

Fancy.—Linkman, by Mr. J. DOUGLAS.

Self.—Mrs. George Marshall, by Mr. C. A. LINZEE.

Flake.—Gordon Lewis, by Mr. J. FAIRLIE.

Picotee (heavy-edged white ground).—John Smith, by Mr. J. J. KEEN.

Picotee (light-edged white ground).—Melita, by Mr. C. BLICK.

Picotee (heavy-edged yellow ground).—Her Majesty, by Mr. C. BLICK.

FLOWERS AS GROWN.

Fancy.—Linkman, by Mr. H. R. TAYLOR.

Self.—Mrs. Geo. Marshall, by Mr. J. DOUGLAS.

Fancy White Ground.—Daisy Walker, by Mr. J. DOUGLAS.

Picotee (light-edged yellow ground).—Eclipse, by Mr. TAYLOR.

NON-COMPETITIVE.

Exhibits of Carnations were made by Messrs. WM. CUTBUSH AND SONS, Highgate; PHILIPS AND TAYLOR, Bracknell, Berks; H. LAKEMAN, Thornton Heath; and Mr. JAMES DOUGLAS, Bookham. Messrs. F. CANT AND CO. showed Roses, and Mr. M. PRICHARD hardy flowers.

BIRMINGHAM HORTICULTURAL.

DEPUTATION FROM ROYAL HORTICULTURAL SOCIETY.

JULY 18 and 19.—The annual show of the Birmingham (formerly Handsworth) Horticultural Society, held in Handsworth Park on the above dates, was a pronounced success. The number of exhibitors was a record one—205 against 161 a year ago, and the entries 1,083—127 in excess of last year, which is very gratifying to the committee. Additional interest was given to this year's show by reason of the visit of a deputation from the Council of the Royal Horticultural Society. The deputation were so pleased with the general high quality of the exhibits that they made 29 awards, including silver cups, gold, silver and bronze medals—in addition to those made by the judges—to exhibits of superior merit. The awards gave general satisfaction, and they will greatly encourage local horticulturists. Awards were also made on behalf of the National Hardy Plant Society to exhibits of Alpine plants and hardy cut flowers.

PLANTS (OPEN).

The leading class was for a group of plants arranged for effect with double straight fronts in a space of 300 square feet. There were three exhibits, and each one had a rustic arch or bridge over the centre on which handsome Palms and choice plants were displayed. The 1st prize of twenty guineas and a Silver Challege Cup, value ten guineas, the latter to be won three times before becoming the absolute property of the winner, was won by Messrs. JAMES CYPHER AND SONS, Cheltenham, whose brightly coloured foliage and flowering plants were skilfully arranged. Codiæums, which were extensively employed, were largely of the yellow and reddish-leaved varieties. Tall plants of Humea elegans reared their graceful plumes over a host of choice plants such as Cattleyas, Odontoglossums, Oncidiums, Liliums, Begonias, Francoas, Aralias, Dracænas and Ferns. Sir GEORGE H. KENRICK, Edgbaston (gr. Mr. J. V. Macdonald), who secured the 2nd prize, had a splendid group in which well-coloured plants of Nandina domestica were associated with Cattleyas, Oncidiums, Odontoglossums, Begonias, Selaginellas, Codiæums, and Dracænas; 3rd, Mr. W. R. MANNING, Dudley.

Messrs. JAMES CYPHER AND SONS were again placed first in a class for 12 stove or greenhouse plants, distinct, in which 6 were to be in bloom. The winning collection contained excellent specimens of Statice intermedia, Bougainvillea Sanderiana, Clerodendron Balfouri, Stephanotis floribunda, Ixora Williamsii, and Codiæum Countess. 2nd, JOHN ARTHUR KENRICK, Esq., Edgbaston (gr. Mr. A. Cryer). The last-named exhibitor was awarded 1st prizes in classes for (1) 6 Coleus; (2) 6 Fuchsias; and (3) 6 Caladiums.

There were two contestants in a class for rock and water gardens, and both exhibits were much admired. The space allotted was 30 feet by 30 feet in "The Dell," some distance from the show tents. The 1st prize of £10, together with a Silver Challenge Cup, value 20 guineas, was won by Messrs. T. R. HAYES AND SONS, Keswick, whose design was very natural and well carried out. Clumps of Ericas, Irises, Sedums, Sempervivums and a number of choice species looked as though they had occupied the same position for a long time. 2nd, Messrs. GUNN AND SONS, Olton.

CUT FLOWERS (ROSES).

The class provided for a display of Roses on a table space of 20 feet by 5 feet was a good one. Three exhibits were placed before the judges, who awarded the 1st prize, consisting of a Silver Challenge Cup, a Gold Medal, and £10 to Messrs. GUNN AND SONS, Olton, for a magnificent display, arranged in vases, stands and pillars, over which arches decorated with small flowered varieties of good quality and variety created a charming effect. 2nd, Mr. J. MATTOCK, Oxford; 3rd, Messrs. W. AND J. BROWN, Stamford.

Mr. J. MATTOCK beat Mr. W. T. MATTOCK in the next class, for 12 bunches of garden Roses, distinct.

Mr. J. MATTOCK took the lead in a class for 48 Roses, distinct. He showed extra good specimens of Alfred Colomb, Mrs. W. J. Grant, A. K. Williams, Gustave Piganeau, Lady Ashtown, Lady Ursula, Captain Hayward, Avoca and Ulrich Brunner. 2nd, Messrs. PERKINS AND SONS, Coventry, whose best blooms were of Madame Victor Verdier, Lieutenant Chaure, Countess of Shaftesbury and the Lyon Rose.

The same two exhibitors were placed as named in the next class, which was for 24 Roses, distinct. In the 1st prize stand the following blooms were beautifully clean, fresh and of good size, including Gustave Piganeau, Avoca, Suzanne Marie Rodocanachi, J. B. Clarke, Mrs. Herbert Stevens and Mildred Grant.

The best exhibit of 18 Roses, distinct, came from Mr. W. T. MATTOCK, Headington, whose blooms of Hugh Dickson, Earl of Warwick, Mrs. W. J. Grant, Gloire Chédane Guinoisseau, Dupuy Jamain, Dean Hole and Duke of Wellington were noteworthy. 2nd, Messrs. PERKINS AND SONS, who had shapely blooms of Madame Victor Verdier, St. Helena, George C. Waud and Leslie Holland.

The best of four exhibits in a class for 12 Tea Roses (not fewer than 6 varieties) also came from Mr. W. T. MATTOCK, whose best flowers were Empress of Russia, Mrs. Edward Mawley, Maman Cochet and White Maman Cochet.

CARNATIONS, SWEET PEAS, ETC.

The winning exhibit of 12 vases of Carnations or Picotees, 3 blooms of each, came from Mr. C. WALL, Bath, who had superb blooms of Scarlet Glow, R. F. Felton, Mrs. C. Knoff and Mrs. G. Marshall. 2nd, Messrs. A. R. BROWN AND CO., King's Norton, whose best specimens were Linkman (extra good), Mrs. Robert Gordon and Margaret Thurston. 3rd, Mr. W. H. PARTON, Moseley.

Mr. R. G. RUDD, King's Heath, beat Messrs. A. R. BROWN AND CO. in the next class, which was for 12 border Carnations or Picotees, distinct, shown in vases as grown. In the 1st prize stand we noted shapely blooms of Hercules, Sam Weller, Lord Steyne, Alice Stewart and Mrs. Robert Gordon.

There was spirited competition in the class for 12 bunches of Violas, distinct, in which Mr. H. ALLEN, Handsworth, won the 1st prize. His flowers were large, richly coloured, and effectively staged. 2nd, Mr. H. MILNER, Handsworth.

The 1st prize in a class for a decorative arrangement of Pansies and Violas on a space of 6 feet by 3 feet was well won by Messrs. PEMBERTON AND SON, Bloxwich. In a class for a display of Sweet Peas in a space of 20 feet by 4 feet, a Silver Challenge Cup, value 20 guineas, and a Gold Medal, value £5, were offered as the 1st prize. These were won by Messrs. E. W. KING AND CO., Coggeshall, Essex, whose large strong-stemmed flowers were very handsome. Mr. W. E. ALSON, Denmead, Hants.

Messrs. T. B. GROVE AND SON, Sutton Coldfield, were the only competitors in a class for 24 bunches of hardy border flowers in not fewer than 18 varieties (annuals and shrubs excluded), and they were deservedly awarded the 1st prize.

Messrs. PERKINS AND SONS, Coventry, excelled in a class for three bouquets.

TABLES DECORATED WITH FLOWERS AND FRUIT.

Ten tables, each 8 feet by 4 feet, decorated with flowers (Orchids excluded) made a very pretty feature. The 1st prize of 3 guineas was awarded to Miss F. JENKS, Codsall, who used

yellow Roses. 2nd, Miss D. Cope, Balsall Heath.

There were four contestants in a class for dinner tables 8 feet by 4 feet decorated with fruit and flowers and laid for dessert. The 1st prize was awarded to Mr. C. Crooks, Droitwich, whose specimens of Muscat of Alexandria and Black Hamburgh Grapes, Melons, Dymond Peaches and Humboldt Nectarines were very fine. The flowers consisted of Schizanthus and Selaginellas. 2nd, Captain W. H. Starkey, Leamington (gr. Mr. G. L. Blackburn), whose Peaches, Nectarines and Strawberries were of good merit. Roses were used as decorations. 3rd, Mr. Stephen Sims, Borrowash.

In a class reserved for ladies Mrs. E. Winchester, Rubery, won the 1st prize with pale pink Carnations relieved with sprays of Selaginella and Asparagus. 2nd, Mrs. E. Reeve, Balsall Heath.

Special prizes were offered by Robert Sydenham, Ltd., for Sweet Peas displayed in rural decorations. 1st, Mrs. H. Reeve, Berkswell; 2nd, Mrs. E. Winchester, Rubery.

Plants (Open to Gentlemen's Gardeners and Amateurs).

The most important group class in this section occupied a ground space of 15 feet by 8 feet. The five exhibits were arranged down the centre of the tent, and were much admired by visitors. The 1st prize was awarded to J. A. Kenrick, Esq., Edgbaston (gr. Mr. A. Cryer), for a lightly-arranged group in which Codiæums, Dracænas, Begonias, Kalanchoes, Liliums, Humea elegans and tall Campanulas, Ferns and Palms were the principal plants employed. 2nd, Hume Pinsent, Esq., Harborne (gr. Mr. G. Corbett).

Mr. Cryer was also awarded 1st prizes for (1) 6 stove or greenhouse plants; (2) 6 exotic Ferns; (3) 3 Zonal Pelargoniums; and (4) 6 double-flowered Begonias. Mr. G. Corbett beat Mr. Cryer in another class for 6 single-flowered Begonias.

Fruit (Open).

The best of four collections of ten dishes of fruit, not fewer than 7 kinds, came from the Duke of Westminster, Eaton Hall, Chester (gr. Mr. N. F. Barnes), who showed well-coloured fruits of James Grieve Apple, Royal George and Crimson Galande Peaches, Pine Apple Nectarine, Clapp's Favourite and Williams' Bon Chrétien Pears, Eaton Seedling Melon and Madresfield Court and Muscat of Alexandria Grapes. 2nd, Hugh Andrews, Esq., Toddington Manor, Winchcombe (gr. Mr. J. R. Tooley), whose Brown Turkey Figs were particularly good. 3rd, Captain W. H. Starkey, Leamington (gr. Mr G. L. Blackburn). The Duke of Westminster (gr. Mr. N. F. Barnes) gained 1st prizes for (1) Two bunches of Black Grapes with large-berried, well-finished bunches of the variety Madresfield Court, and (2) Two bunches of White Grapes with Muscat of Alexandria.

Mr. C. Crooks, Droitwich, had the best scarlet-fleshed Melon. Sir Robert Graham, Bart., Carlisle (gr. Mr. G. F. Hallett) was second.

1st prizes were awarded to J. Boston, Esq., Handsworth (gr. Mr. T. Perks), for Black Currants; Captain W. H. Starkey (gr. Mr. G. L. Blackburn), for Red Currants; The Manor Fruit Farm, Knowle, for Gooseberries; Sir Francis Lloyd, Oswestry (gr. Mr. W. T. Staward), for Strawberries; and W. Sarsons, Esq., Moseley, for Loganberries.

Vegetables.

In a class for 9 distinct kinds Mr. E. Winchester, Rubery, was placed first with a well-set-up collection containing Tomatos, Cauliflowers, Peas, French Beans and Onions. 2nd, Hugh Andrews, Esq. (gr. Mr. J. R. Tooley).

Messrs. Webb and Sons offered prizes for collections of 8 kinds, and 4 competed. The 1st prize was won by the last-named exhibitor with a very handsome exhibit. Mr. E. Deakin, Hay Mills, secured 1st prize in classes provided by (1) Messrs. Sutton and Sons for 6 kinds; (2) Messrs. Dickson and Robinson, for 6 kinds; and by (3) Messrs. Yates and Son, Birmingham, for 6 kinds. The proprietors of the *Birmingham Daily Mail* offered a Silver Challenge Cup value 20 guineas for the best display of produce including flowering plants, cut flowers, fruit and vegetables on a space of 8 feet by 5 feet. Open only to amateurs not employing help more than one day per week on an average throughout the year. The coveted prize was awarded to Mr. A. T. Rainbow, Northfield, who was strong in vegetables, which were clean and well displayed. Some fruit and a few flowers were also included in this exhibit. The 2nd prize collection, which came from Mr. E. J. Keeling, Small Heath, was representative but rather overcrowded.

Non-Competitive Exhibits.

Messrs. Barr and Sons, Covent Garden, sent a collection of dwarf Japanese trees; also hardy cut flowers and Alpine plants; Messrs. Hewitt and Co., Solihull, had a large exhibit of hardy flowers and cut Roses; Messrs. R. J. Barnes and Son, Malvern, a small bank of Roses; Mr. H. J. Jones, Lewisham, a magnificent group of Phloxes in pots; Bowell's Alpine Garden, Cheltenham, a small and interesting collection of Alpine plants; Messrs. W. H. Simpson and Sons, Birmingham, Sweet Peas, annuals and perennials; Messrs. Webb and Sons, Stourbridge, a choice exhibit of flowers, fruit and vegetables; Messrs. Young and Co., Cheltenham, Carnations; Messrs. Piper, Bayswater, an extensive exhibit of hardy flowers and clipped Box trees; Messrs. Sutton and Sons Reading, a grand display of Sweet Peas, fruit and vegetables beautifully arranged. Messrs. Sutton and Sons were awarded a Gold Medal by the Society — a Gold Medal by the deputation of the Royal Horticultural Society, as well as a Silver Cup for the best exhibit in the show. Mr. John Barnet, King's Norton, Roses; Messrs. Seagrave and Co., Sheffield, Show Pelargoniums and Violas; Mr. Fred Smith, Woodbridge hardy flowers; Messrs. Holder Brothers, Erdington, Sweet Peas; Messrs. Ware and Co., Feltham, double-flowered tuberous-rooted Begonias; Mr. George Aitkens, Tarvin, Chester, Sweet Peas; Messrs. Ritch and Co., Bath, hardy flowers; Mr. F. Walton, Handsworth, an interesting collection of Cactaceous plants; Mr. A. F. Dutton, Iver, Carnations; Mr. H. Burnett, Guernsey; Mr. John E. Knight, Wolverhampton; Mr. C. Wall, Bath, and the Clury Nurseries, Langley, Bucks (all Carnations); Mr. H. N. Ellison, West Bromwich, a choice collection of Ferns.

SOUTHAMPTON ROYAL HORTICULTURAL.

July 15.—The summer exhibition of the above society was held on the 15th inst. in the County cricket ground. The entries were fewer than in past years, especially in the Carnation section, which represented what was formerly known as the Southern Counties Carnation Association. In the first three classes for Carnations in the open section for twelve vases of Selfs, Fancies, and yellow-ground Picotees, four vases of Selfs, and four vases of Fancies respectively, there was but one entry in each case. The exhibitor was Mr. Mathias, Medstead, and the 1st prize was awarded in each class. Outstanding varieties were Sunproof, Mrs. Leo. Hunter, Linkman, Margaret Thurston, and Leslie. Exhibits of dressed flowers on cards were slightly more numerous. For six Flakes or Bizarres, Mr. J. J. Keen, The Avenue, Southampton, was placed 1st with Curzon, Flamingo, Houlgrave, Premier Shamrock, and Cleopatra; 2nd, Mr. H. Mathias, whose best blooms were Ethel Macrae and Mrs. R. Lord. The former was selected as the premier bloom. Mr. Mathias showed the best of three exhibits in the class for six Fancy Carnations, staging good blooms of Lord Steyne, Donald McDonald, Bombardier, Hercules, and J. J. Keen (premier); 2nd, Mr. Keen. The best collection of six Carnation Selfs was shown by Mr. Mathias, who had Mrs. G. Marshall (premier), Mrs. R. Percy Smith, Helen and others; 2nd, Mr. H. M. Elford, Bournemouth.

Mr. Keen won the premier position for both yellow and white ground Picotees with Viola (premier yellow), Miss Goodfellow, John Smith (premier white), Mrs. Payne, Lavinia, and Radiant; Mr. Mathias was awarded the 2nd prize in both these classes.

There was not much competition in the classes for amateurs. In many cases there was but one exhibitor, Mr. J. A. Fort, The College, Winchester, who won several 1st prizes.

Perpetual-flowering varieties made a rather better show. For five vases of Tree or Americau varieties Sir R. S. Baker, Bart., Ranston, Blandford (gr. Mr. Usher), was placed 1st with Scarlet Glow, R. F. Felton, White Wonder and Mrs. T. W. Ward as his best varieties; 2nd, W. H. Myers, Esq., Swanmore House, Bishop's Waltham (gr. Mr. G. Ellwood). These two exhibitors reversed their positions in the class for three varieties; Mr. Myers exhibited Mrs. Dutton, Britannia, and President.

Three competed in the class for a dinner-table arrangement. Mrs. F. G. Bealing, Basset, Southampton, was placed 1st; 2nd, Mrs. E. Ladhams, Shirley, Southampton.

Sweet Peas.

Messrs. Sutton and Sons offered prizes for six bunches of Sweet Peas. Sir R. Baker had the best of three exhibits, showing good blooms of Barbara, King Manoel, Clara Curtis, and Princess Victoria; 2nd, Mr. F. G. Bealing, who staged Elfrida, R. F. Felton, and Helen Lewis well. For one bunch of the variety Sutton's Queen these two exhibitors occupied similar positions.

In Messrs. Toogood's class for nine bunches there were three entries; two exhibits were disqualified, and the 2nd prize was awarded to Mr. A. Maple, Aldermoor, Shirley. Mr. Bealing won Messrs. Webb and Sons' prize offered for eight bunches with Elsie Herbert, Mrs. H. Dickson, King Manoel, and Masterpiece, and he also excelled in Mr. Robert Sydenham's class for nine distinct varieties with Thos. Stevenson, Asta Ohn, Mrs. R. Hallam, Etta Dyke, and Maud Holmes; 2nd, Mr. Maple.

Fruit and Vegetables.

For a collection of four dishes, Ellen Lady Swaythling, South Stoneham House, Southampton (gr. Mr. T. Hall), was the only exhibitor. The Madresfield Court Grapes, Melons, Peaches and Nectarines were of splendid quality. The same exhibitor also won the 1st prize for Black Grapes with Madresfield Court, for two bunches of White Grapes with Muscat of Alexandria, and one dish of Peaches with the variety Dymond. The Locksheath Nursery Co. showed the best Nectarines, the variety being Humboldt. Vegetables were numerous and good. Mr. Myers won, with splendid produce, the 1st prizes in Messrs. Toogood's class for six varieties, Messrs. James Carter and Co.'s Challenge Cup for eight dishes, Messrs. Sutton and Sons' class for six kinds, and Messrs. Webb and Sons' class for six kinds. Admiral Sir John Hopkins, Greatbridge House, Romsey (gr. Mr. H. Mattingley), was placed 2nd in Messrs. Toogood's, Carter's, and Webb's classes.

Non-Competitive Exhibits.

The finest trade exhibit was shown by Messrs. Sutton and Sons, Reading, who had a display of Sweet Peas of the finest quality.

Messrs. Toogood and Sons, Southampton, showed Sweet Peas, Vegetables, Melons, and other produce grown from seeds.

Messrs. W. H. Rogers and Son, Southampton, showed Roses and hardy flowers.

Mr. Fred Longster staged Sweet Peas.

Mr. C. Fay, Testwood Nurseries, Totton, Southampton, exhibited Carnations.

Mr. A. F. Dutton, Iver, Bucks, also showed Carnations.

Messrs. Jarman and Co., Chard, showed Roses and other flowers.

Messrs. B. Ladhams and Son, Shirley, Southampton, showed hardy plants.

Mr. E. Wills, The Nurseries, Winchester Road, Southampton, had miscellaneous plants.

Messrs. E. Hillier and Son, Winchester, contributed hardy plants, etc.

Mr. W. F. Gullick, florist, Salisbury, had a large and attractive exhibit of Violas.

GARDENING APPOINTMENTS.

[*Correspondents are requested to* **write the names of persons and places as legibly as possible.** *No charge is made for these announcements, but if a small contribution is sent, to be placed in our collecting Box for the Gardeners' Orphan Fund, it will be thankfully received, and an acknowledgment made in these columns.*]

Mr. John E. Davis, for the past 10 years Gardener to Colonel E. R. Stewart Richardson, of Ballathie, Perthshire, as Gardener to Sir Felix Schuster, Bart., Virdley Place, Fernhurst, West Sussex.

Mr. W. Newman, for the past 2½ years Foreman at Marstham House, Merstham, Surrey, as Gardener to Lady Addy Grant, Melton Hall, Newdigate, Surrey.

Mr. G. Sears, for the past 2½ years Inside Foreman at Pellwall Gardens, Market Drayton, Salop, as Gardener to Samuel B. Bamford, Esq., Hawthornden Manor, Uttoxeter. [Thanks for 1s. for R.G.O.F. box. Eds.]

Mr. Jas. W. Robertson, lately Gardener at Seaforth House, Arbroath, as Gardener to Archibald Cochrane, Esq., Abbotshill, Galashiels, N.B.

Obituary.

Robert Sydenham.—It is with deep regret that we record the death of Mr. Robert Sydenham, of Tenby Street, Birmingham, which occurred with tragic suddenness on Saturday, the 19th inst. In the morning Mr. Sydenham left his home at Edgbaston apparently in his usual health and spirits, and upon reaching the office, about nine o'clock, he plunged at once into business. Only a couple of hours or so afterwards, at 11.30, a member of the staff found Mr. Sydenham lying on the floor in a state of collapse; a doctor was immediately summoned, but Mr. Sydenham was already beyond human aid. He never regained consciousness, and passed away a few minutes after the doctor's arrival.

Born at Salisbury in 1848, Robert Sydenham received his early education in the city of his birth, but later he attended a school at Christchurch, Hampshire. At 14 years of age he went to Birmingham, and became apprenticed to a firm of general merchants. After six years' service he was given the charge of the firm's shipping department, and was subsequently appointed their representative in the United States, where he spent a considerable time travelling about the country. Returning to Birmingham in 1872, he joined his elder brother George in a partnership offered to them by the firm by whom Robert Sydenham was employed, the condition being that they opened a jewellery department in connection with the same business. Robert Sydenham was always extremely fond of flowers, and soon began to grow bulbs, but in quite an amateurish way, without the slightest intention of developing his hobby on commercial lines. His first "bargain" was a dozen Hyacinth bulbs for which he paid 8s. in 1881. They did so well, and yielded so much pleasure for their small cost, that he procured three dozen bulbs the following year; and in 1884 he bought several hundreds at an auction sale. As this latter purchase involved the possession of more bulbs than he required for his own use, he distributed the surplus among his friends, a transaction which may be looked upon as his entrance into the seed and bulb industry. The business, once begun, increased with marvellous rapidity, and became one of the most successful of its kind in the country. Such extension of business necessitated the erection of a block of warehouses and offices, and the Tenby Street site was selected, the buildings being fitted with every modern convenience. By 1886 the annual sales amounted to about eight tons in weight. In the following year, we are informed, the quantity was almost doubled, and this process continued until in 1896 no fewer than 5,000 packages were sent out, containing upwards of a million and a half of bulbs. In the season of 1897-8 over 33,000 orders were executed, and during September and October, 1910, over 40,000 orders were dealt with, the average daily output being about four tons weight. During the last season, about 15,000 customers were supplied with bulbs or seeds.

Robert Sydenham was a man of wonderful energy, perseverance, and industry. No enterprise seemed too difficult for him to undertake, and he spared no pains to make successful any project which he took in hand. Thoroughness was his guiding principle, and he always paid the most minute attention to matters of detail. He was an early riser, and personally supervised every branch of his extensive business. Although he took no part in public or local affairs, he was ever generous in helping charitable institutions or individuals needing temporary assistance. He was a very good friend to the Birmingham Hurst Street Christian Mission and the Early Morning Adult School movement; and his gifts of bulbs to the City Parks of Birmingham were numerous.

Three flowers chiefly claimed his interest—the Daffodil, the Carnation, and the Sweet Pea. The Daffodil was by far his favourite, and he was one of the founders and chief supporters of the Midland Daffodil Society. No Society ever possessed a more energetic and loyal supporter; he was honorary treasurer of the Society, and it was his ambition to make and maintain it the premier society of its kind in the kingdom. Its present position is largely due to his untiring efforts, and the annual gatherings, in which the social side was always prominent, did a great deal to give the Society a character all its own. He also helped to form the Midland Carnation Society in 1891; he gave it his liberal support, and was Chairman of the Committee at the time of his death. He was attached to many other societies, and was, at one time, President of the National Sweet Pea Society. He was formerly a very successful exhibitor of Carnations, but in recent years his flowers were seldom seen on the tables of the shows.

Robert Sydenham was laid to rest in Lodge Hill Cemetery, Birmingham, on Tuesday, the 22nd inst. A service at Edgbaston Old Parish Church preceded the interment, many friends being present. The service was conducted by the Ven. Archdeacon Owen, Vicar, and the Rev. Joseph Jacob, Chairman of the Daffodil Society. Immediately after the funeral service a meeting of the Committee of the Midland Daffodil Society was held, and a resolution of condolence with Mrs. Sydenham and her family was adopted.

Mr. Sydenham was 65 years of age. He leaves a widow and two married daughters.

Appreciation by a Fellow-Seedsman.

"Uncle Robert" is gone, and one of the most interesting figures in contemporary horticulture is thus removed. He attended the Sweet Pea Show on Thursday (17th inst.), and the dinner on the same evening, but by Saturday he had entered into his rest. On Thursday night, when I asked him how he was, he answered: "My general health is better, but my increasing deafness is very trying." It must be twenty-five years or more since I made Mr. Sydenham's acquaintance. At that time the late Mr. William Dean was living at Solihull, near Birmingham, and it was chiefly owing to Mr. Dean that Mr. Sydenham and I became interested in Sweet Peas. Mr. Dean used always to insist that Sweet Peas were the flowers of the future, a prophecy which was fully justified. Mr. Sydenham subsequently became one of the largest dealers in Sweet Pea seed in the country; but formerly he used to devote a great deal of time to growing Carnations, Mr. Dean assisting him with the packing. It was, however, as a bulb importer that he made his great name. His interest in Daffodils, especially, was intense, and he knew Holland as few Englishmen can ever hope to know that country. Had he been a less strenuous worker he might have been with us now; but he was energetic by nature, and used invariably to rise early in order to put in several hours' work before breakfast. The loss of my friend is a serious one to me. We occasionally had slight differences—most of his friends found him hasty—but he never bore malice or cherished animosity. We therefore think of him as one who possessed "the heart of love that guides the helping hand." He was one of the most generous of men; no appeal on behalf of a deserving case was made in vain. He was beloved by his staff for his liberal appreciation of their efforts; his hearty commendation was the unfailing reward of a task well performed. *W. Cuthbertson.*

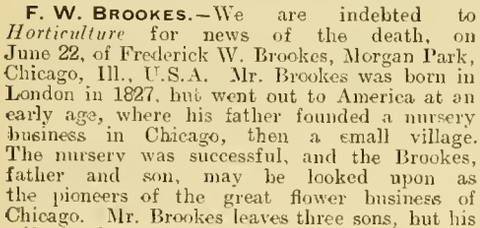
Fig. 35.—the late robert sydenham.

Henry Chilman.—We regret to record the death of Mr. Henry Chilman, which occurred on the 19th inst., at his residence, Cavendish Villa, Leatherhead, in his 87th year. Mr. Chilman was

a successful exhibitor of specimen stove and greenhouse plants at the leading London shows in the middle of last century, and he was a frequent contributor to the pages of the *Florist and Pomologist* in the early 'sixties. Though ripe in years, his intellect was unimpaired to the last. A few days before his death he was relating to a friend some of his experiences in the exhibition tent.

JULIUS ROEHRS.—By the death of Mr. Julius Roehrs, horticulture in America has lost one of its most enthusiastic pioneers in the development of the wholesale and retail seed business. Mr. Roehrs had been ill all the winter with a bad cough, and the doctors advised him to go to Capri. There he stayed three months, but, not getting better, he returned to New York from Naples on June 28, and arrived home on the 8th inst. and died on the 20th inst., in his seventy-third year. Born in Germany, where he received his early training, Mr. Roehrs, whilst still a young man, emigrated to the United States, entering private service in Jersey City, New Jersey, where he cultivated most successfully Orchids, stove and greenhouse plants, including some of the finest specimens of Phalænopsis Schilleriana and P. amabilis. The collection was eventually dispersed owing to the death of the owner, and Mr. Roehrs shortly afterwards commenced business on his own account at Rutherford, New Jersey. His energetic, vigorous constitution, amiable disposition, and strict business qualities enabled him to create an establishment unequalled in America. His keen judgment of plant novelties prompted him to devote whole houses to particular kinds, and he visited Europe almost every year in quest of them. Twenty-five years ago he commenced to cultivate Orchids, which were at that time almost unobtainable in New York flower shops. He began by suspending and growing them from the roofs of his Palm houses. Gradually the demand developed to such proportions that his nursery now contains many Orchid houses of great size and modern construction, and includes thousands of specimens of Cattleya gigas, C. Mossiæ, C. Mendellii, C. Trianæ, C. labiata, Oncidium varicosum, O. splendidum, Dendrobium formosum, and D. Phalænopsis, thousands of Vanda cœrulea, and many other useful varieties of Orchids, together with a collection of rare species and hybrids. His Palm and decorative plant business is also one of the largest in the country, especially in plants for use at Christmas and Easter. He leaves a widow, two daughters, and five sons. Three of the latter are in the business. Each has received a thorough horticultural training in this country, which, together with their home experience, should enable them to maintain and continue the excellent reputation of the "Roehrs' Establishment."

F. W. BROOKES.—We are indebted to *Horticulture* for news of the death, on June 22, of Frederick W. Brookes, Morgan Park, Chicago, Ill., U.S.A. Mr. Brookes was born in London in 1827, but went out to America at an early age, where his father founded a nursery business in Chicago, then a small village. The nursery was successful, and the Brookes, father and son, may be looked upon as the pioneers of the great flower business of Chicago. Mr. Brookes leaves three sons, but his wife pre-deceased him by many years.



BOARD OF AGRICULTURE LEAFLETS: *C. H.* The leaflets you mention may be obtained from the Board of Agriculture and Fisheries, 4, Whitehall Place, London. No charge is made for them, and it is not necessary to affix a stamp to your communication.

CHERRY TREES: *R. J.* The leaves are attacked by the Silver-leaf disease. This disease is caused by the fungus Stereum purpureum, but no certain method of combating it has been discovered. Stereum purpureum gains access to the plant through an injury to the superficial tissues, such injury being sometimes caused by cold winds. It has been claimed by New Zealand growers that sulphate of iron will check the disease. The spores of the fungus are developed on dead branches, therefore a vigilant watch should be kept on diseased trees, and their dead branches should be removed and burned.

DIPELTA: *H. F. L.* D. ventricosa was shown by Messrs. James Veitch and Sons at the R.H.S. exhibition at Chelsea last month. See note in *Gardeners' Chronicle*, June 14. p. 409.

FUNGUS ON TENNIS COURT: *T. S.* There is no parasite of any kind to be found. The sod consists almost entirely of moss, which has evidently killed the grass.

GRAPES SPLITTING: *E. J. A. L.* Your treatment of the vines is too exciting for the fruit during the final swelling. Those of Black Hamburghs suffer the most, because they are the more forward. You may expect the berries of the other varieties to crack in the same way later on if a similar treatment is followed. Discontinue the use of the concentrated manure and the afternoon damping, allowing the atmosphere to become somewhat drier before closing the vinery, and the temperature should not rise appreciably without ventilation either in the morning or afternoon.

GOOSEBERRY SHOOT: *S. W.* English Gooseberry mildew is present; the disease will do no great harm to the plants.

GRAPES DISEASED: *L. H.* The berries are affected with Grape rot, caused by Glœosporium ampelophagum. See reply to *A. J. L.* in last week's issue. Send the Grapes for naming when the berries are ripe.

MELON ROOTS: *H. W.* Eelworm is present in the roots. Water the plants with a solution of sulphate of potash, 1oz. in 1 gallon of water.

MELON PLANTS: *J. E.* We are unable to find any trace of disease due to fungi on the specimens submitted for examination. The trouble must be looked for in some error of cultivation.

NAMES OF PLANTS: *B. C.* 1, Stachys lanata; 2, Sedum grandiflorum; 3, Spiræa Douglasii. —*A. A.* Tacsonia exoniensis. — *Bumarkaig.* Probably Meum athamanticum.—*R. T.* 1, Alstrœmeria chilensis variety; 2, Leycesteria formosa; 3, Rhus Cotinus; 4, Cornus sibirica variegata; 5, Send in flower; 6, Alstrœmeria aurantiaca.—*Constant Reader.* 1, Magna Charta; 2, Florence Pemberton; 3, Mrs. Sharman Crawford; 4, Rev. A. Cheales; 5, Ulrich Brunner; 6, Cuphea.—*W. D. B.* 1, Cytisus scoparius var.; 2, Epilobium angustifolium album; 3, Geranium pratense (white variety); 4, Sidalcea candida; 5, Aconitum Lycoctonum; 6, Lonicera involucrata. — *S. C. H.* 2, Spiræa lobata; 3, Spiræa Douglasii; 4, Leycesteria formosa; 5, Potentilla fruticosa; 6, Hedysarum multijugum; 7, Flowers all gone.—*S. G. R.* Pentstemon campanulatus.—*T. T.* 1, Lotus corniculatus; 2, Vicia Cracca; 3, Avena flavescens; 4, Galium verum; 5, Avena flavescens; 6, Heracleum Sphondylium. All are common wild plants, none being of value as forage plants.—*G. W. W.* Matricaria Tchihatchewii.—*Cestrian.* 1, Carex brunnea variegata; 2, Sedum Middendorffianum; 3, Oxalis rosea; 4, Oxalis sp. (flowers gone, but probably O. brasiliensis); 5, Not recognised; 6, Rosa lucida; 7, Tuscany; 8, Thymus sp.; 9, Sedum album.—*Pelargonium.* The Pelargonium bloom was shattered; it is a variety of the show section. The seed-pod is Datura Stramonium (Thorn Apple).—*Hortus.* Lysimachia vulgaris.—*C. G. Assoc.* Inula dysenterica (Fleabane).—*A. K. T.* Lysimachia punctata.—*E. F.* 1, Lastrea æmula; 2, Athyrium Filix fœmina corymbifera; 3, Polystichum aculeatum; 4, Lastrea rigida.—*O. H.* 1, Liparis longipes; 2, Acriopsis javanica; 3, Seraphyta multiflora; 4, Epidendrum rigidum; 5, Cochlioda rosea.—*G. C.* Plantago Coronopus.—*Horsley.* 1, Phygelius capensis; 2, Dendrobium Dalhousieanum probably, but flower quite decayed; 3, Spiræa arifolia; 4, Galium Mollugo.—*Interested.* 1, Rosmarinus officinalis (Rosemary); 2, Santolina incana; 3, Campanula laciniata; 4, Stachys lanata; 5, Agathæa cœlestis; 6, Rose not recognised.—*Hortus.* 1, Rhus Cotinus; 2, Veronica salicifolia.— *E. A. L.* 1, Geranium pratense; 2, Piptanthus nepalensis; 3, Erigeron speciosus. —*R. A. H.* 1, Pteris tremula; 2, Pteris argyræa; 3, Pteris cretica; 4, Adiantum assimile.

PALM ROOTS INFESTED WITH WHITE INSECTS: *R. Green.* The pest is probably Ripersia terrestris. Remove the plants from the pots and spray the exposed roots and soil with carbon bisulphide, using a small glass spraying apparatus. Scald the pot and have it in readiness for replacing immediately after spraying. The process must be repeated, as this will not be sufficient to kill the eggs. The plants should be shaded from the sunshine for about a week after this treatment. Another plan is to bore holes in the soil with a stiff wire and pour one teaspoonful of the carbon bisulphide in each hole. It must be remembered that this material is highly inflammable.

PEACH AND PEAR TREES: *T. R.* Spray the Peach trees with liver of sulphur; the Bordeaux mixture must not be used. There is no disease on the Pears, the trouble is at the roots. It is not usual for Pear trees to throw double trusses of bloom.

PRIMULA AND AUBRIETIAS: *B. C.* The period immediately following the flowering stage and the latter part of September are the best times for dividing and re-planting the double forms of Primula acaulis. They require partial shade, rich soil and plenty of moisture. In the case of the Aubrietia, the plants may be cut back after flowering with the garden shears to about half their height. In a month or so the old stems—if the plants have been well watered meanwhile—will be seen studded with fresh shoots, and when these are an inch or two long, strip them off with a heel attached and insert them in sandy soil. Do not waste time "making" the cuttings, as thousands are spoiled in the process. Moreover, the cutting is perfectly suitable when merely detached from the parent plant. Do not water the cuttings too frequently.

ROSE LEAVES: *J. L.* There are several insect pests that cause the leaves to become rolled, and even green fly is often responsible for "leaf rolling." The best plan is to spray the trees with an insecticide early in the season, wetting the under as well as the upper surfaces of the leaves. Extract of Quassia may be employed, or one of the numerous preparations advertised for the purpose.

SWEET PEAS FAILING: *J. R.* We have examined the specimens of Sweet Peas, but fail to find definite traces of disease. In the circumstances it would appear that the trouble has arisen through the rather liberal use of chemical manures. In any case, we should advise you to discontinue applying them without delay, and afford the plants copious supplies of clear water, noting whether they appear to make better growth after such treatment.

VINE LEAVES UNHEALTHY: *W. B.* Water the leaves with a solution of sulphate of iron, 1oz. in gallon of water, at intervals of four days. Sprinkle a small quantity of sulphate of iron, in small lumps, in the soil.

VINES: *C. N.* No disease is present. The trouble is due to scalding. Attend carefully to the ventilation of the vinery, especially in the morning before the sun's rays become powerful.

WEED: *Taxie.* The name of the weed is Prunella vulgaris, a very difficult plant to get rid of, but since it is chiefly fond of poor soils, you might keep it under by constant feeding. For heavy soils use basic slag applied in the autumn, and on light soils superphosphate, applied in the spring.

INCREASED RAILWAY RATES.

IN these pages last week there appeared a report of the recent proceedings before the Railway and Canal Commissioners when the South-Eastern and Chatham Railway Companies Managing Committee applied for leave to raise certain of their rates to the amount of 4 per cent.

It should be explained that the position of the South-Eastern and Chatham Railway Company is different to that of any other railway company in England. In the case of all the other companies they can raise their rates at any time provided they do not exceed the maxima fixed by the Railway and Canal Traffic Acts; nevertheless, anyone who is affected by an increase can call upon the railway companies to prove to the satisfaction of the Railway Commissioners that such increase is justifiable. The South-Eastern and Chatham Railway Companies, however, in addition to coming under this rule, are also under the special necessity of obtaining leave from the Commissioners before they can raise their rates at all, this provision having been inserted by Parliament in the interests of the public when the two companies applied to amalgamate their concerns (with the consequent elimination of competition between them) in the year 1899.

At first sight it might seem a little hard upon the two companies in question that steps should be taken by traders to oppose the companies' application to be placed on the same footing as the other railway companies so far as the rates specified in their recent public notices are concerned. Closer examination of the subject, however, will show that it was of vital importance to the mercantile community either to oppose the application or, at all events, to make sure that only a limited form of Order was obtained, so as to prevent the Order from being made effective and binding for all time, and especially to prevent the railway companies from using the small Order asked for as a precedent to enable them to raise their other rates in any manner they chose.

Rates Affected.

It should be observed that the companies did not apply for leave to raise all their rates, their application being limited to the following, namely :—

1. The rates for the carriage of traffic (other than coal, coke and round timber) by merchandise train between certain specific stations on the South-Eastern and Chatham lines which were alleged to come into competition with other stations on lines of the London, Brighton and South Coast Railway, the South-Western Railway, and the Great Western Railway.

2. The rates for the carriage of merchandise traffic by passenger train for small parcels—*i.e.*, consignments not exceeding 3cwt., and

3. Rates for the carriage at owner's risk of merchandise traffic by passenger train.

It will be noticed that no leave was asked to raise through rates; the companies, in fact, contend that no sanction is required with respect to these, though there is serious doubt whether such a contention is well founded. It should also be noted that as soon as signs of opposition began to manifest themselves the railway companies announced that so far as Class Rates were concerned they did not intend to make use of any sanction obtained, and that they would increase only the Exceptional Rates.

In any event, however, the Order asked for was of great importance to dealers in perishable goods, as they naturally require to send a considerable portion of their traffic by passenger train at owner's risk.

Grounds of Application.

In their formal application lodged with the Court, the railway companies sought to justify their request by alleging :—

(*a*) That their ratio of expenditure to receipts had increased during recent years.

(*b*) That the cost of working the railways had already risen, or would shortly rise, by the sum of £40,000 per annum, owing to improvements made since the railway strike of 1911 in the conditions of employment of their labour and clerical staff, and

(*c*) That they had expended a sum of nearly £6,000,000 in enlarging and improving their stations, warehouses and plant and providing new and modern rolling stock.

When the case came before the Railway and Canal Commissioners, however, the railway companies did not seek to justify their application on grounds (*b*) and (*c*) above, but fell back on the plea that their working expenses had increased in their proportion to receipts.

It is instructive to observe, however, that the railway companies placed no figures before the Court in justification of their assertion, except certain accounts for the years 1898 and 1912 respectively. As to the accounts for 1898, they necessarily represented a combination of the accounts of the South-Eastern Company and the London, Chatham, and Dover Company before the amalgamation—*i.e.*, at a time when they were acting separately and in competition. This, of course, furnished hardly a fair basis of comparison with the accounts for the year 1912—*i.e.*, a date after the companies had become to all intents and purposes a single concern.

Curiously enough, the companies were not prepared to furnish the Court with any information as to what economies had been secured owing to the amalgamation between them, although these economies must have proved of considerable value, and, in fact, the saving of expense was a point on which the companies greatly relied when they were applying for leave to amalgamate in 1899.

Very little information was also forthcoming as to how much the companies were getting or could get by increase in passenger fares, apart from what they were asking to get from goods traffic, nor were they prepared to show how much of their increased cost of working arose from passenger traffic or mineral traffic or the cost of running hotels, as distinct from the traffic of those traders whose rates they were asking leave to increase.

It is satisfactory to find, therefore, that pending closer investigation of the subject, the railway companies failed to obtain such an Order as would enable them to claim that a precedent had been created. The Court decided that a *primâ facie* case had been made out by the railway companies, but at the same time it safeguarded the interests of the objectors by pointing out that in making a limited form of Order it was not desired to lay down any principle or to say anything which could be used as a precedent in any way. The right of the objectors to bring the matter again before the Court as they might think fit was expressly reserved, and it should be noted that the right of any member of the public to call upon the railway companies under the Act of 1894 to justify any increase in his rates admittedly remains unimpaired.

The Traders' Burden.

It is, of course, perfectly reasonable for the railway companies to wish to recoup themselves for increases in their wages bill if they can show that increased efficiency or other compensating advantages have not resulted. At the same time, traders on their part have to bear many increasing burdens in respect of rates, taxes, wages and foreign competition, and are often unable to recoup themselves from the general public. The traders feel, therefore, that before further burdens are placed upon them in the shape of increased merchandise rates, the railway companies should make further efforts to see whether their passenger fares cannot bear a fair proportion of any increased cost of working. In the present instance, also, there is good reason for stating that during the past ten years the expenditure of the South-Eastern and Chatham Railway Companies has considerably decreased in proportion to receipts, and it is encouraging, therefore, to find that pending the opportunity for closer investigation of the subject, traders have been able to preserve their right to go further into the matter and have been able to prevent the companies obtaining any Order which might have been used as a precedent for those further increases in rates which the traders apprehend. *Correspondent.*

NEW OR NOTEWORTHY PLANTS.

LILIUM SUTCHUENENSE.

Enough is known now of the characters and habits of this Lily to settle the question of its name and at the same time dispose of the several incorrect names which have been given it. The figure in the *Botanical Magazine*, t. 7,715, represents a poor example of L. sutchuenense. There is a much better one in the *Gardeners' Chronicle*, July 29, 1905 (Supplementary illustration), though that shows the pedicels shorter than they usually are and the flowers closer together. There is now flowering at Kew a batch of seedlings, raised from seeds ripened at Kew on a plant obtained from Messrs. J. Veitch and Sons, for whom Mr. Wilson collected a number of bulbs of this Lily, and these seedlings show that the species varies sufficiently to include the several forms to which names have been given, such as warleyense or Willmottiæ, pseudotigrinum and Thayeræ. Mr. Grove, following other authorities and the *Index Kewensis*, makes pseudotigrinum synonymous with L. Maximowiczii, but this is, I believe, a mistake, the last-named, as described by Regel and represented by dried specimens at Kew, being a form of L. Leichtlinii, figured in the *Botanical Magazine*, t. 5,673. This is very similar to L. sutchuenense, but it has wider leaves, shorter pedicels, and the flowers are straw-yellow with brown spots, those of L. sutchuenense being orange-red and dotted rather than spotted with dark brown. In Messrs. Veitch's nursery at Coombe Wood there was considerable variation in stature, degree of branching and size of flowers in the plants of L. sutchuenense raised from Mr. Wilson's bulbs. There is a tendency nowadays to overlook the fact that variation is common to all species—very markedly in some, less in others. Lilies are no exception in this respect, as may be seen in such species as L. umbellatum, L. pardalinum, L. speciosum, L. Martagon, L. auratum and others. To elevate to the rank of a species every slight deviation from what is termed the type is to ignore the evidence that both cultivated and wild plants are perpetually providing in support of the accepted definition of a species, namely, it "comprises all the individual plants which resemble each other sufficiently to make us conclude that they are all, or may have been all, descended from a common parent. These individuals may often differ from each other in many striking particulars, such as the colour of the flower, size of the leaf, etc., but these particulars are such as experience teaches us are liable to vary in the seedlings raised from one individual." *W. W.*

GLORIOSA ROTHSCHILDIANA CITRINA.

A very beautiful form of this handsome Liliaceous plant has flowered in Mrs. Myles Kennedy's collection at Stone Cross, Ulverston. In size it is equal to the best form of G. Rothschildiana, and the arrangement of the segments of the flowers is different in their various stages, the younger blooms having them reflexed and forming an oval outline, gradually inclining as they approach maturity to the horizontal plane. The flowers sent are six inches across when mature; in colour they are intermediate between the wholly ruby-red form and the variety citrina described in the *Gardeners' Chronicle*. The basal third of each segment is pale citron-yellow with a greenish tinge, the colour being continued up the margin, gradually becoming narrower towards the tips, the rest of the segment being light ruby-red with a mauve shade. Gloriosa Rothschildiana of the best form illustrated in the *Gardeners' Chronicle*, May 23, 1903, is the finest Gloriosa known. G. Rothschildiana citrina was illustrated in the *Gardeners' Chronicle*, September 16, 1905, p. 211, being a specimen that came in an importation from Uganda. In the *Gardeners' Chronicle*, August 20, 1904, p. 127, Gloriosa Carsonii is mentioned; collected at Fwambo, 50 miles south of Lake Tanganyika. It differs from G. Rothschildiana citrina mainly in having a claret-purple colour in the segments instead of ruby-crimson. The varieties mentioned are allied to G. virescens, though immeasurably superior for garden purposes. *J. O. B.*

Photograph by W. Irving.

Fig. 36.—Androsace pyrenaica : flowers white.

ANDROSACE PYRENAICA.

There are some dozen species which belong to the group of Androsaces known as Aretias. They are all of low, tufted growth, forming close cushions or hummocks of tightly-packed stems, covered in spring with white, pink, or yellow flowers. Perhaps the best known of the group is the beautiful A. glacialis from the high granitic Alps, with its pubescent foliage and abundance of pink flowers. With a tighter habit and closely-packed stems, another member of the set, A. helvetica, is found in the fissures of rocks exposed to full sunshine. The white flowers are produced so thickly as to quite obscure the plant. It does pretty well in this country planted in crevices where there is little soil, especially if so arranged that, while there is moisture within reach of the roots, no direct rain can fall on the plant. Similar in habit, but more compact still, is the species now illustrated [A. pyrenaica]. As its name implies, it comes from the Pyrenees, where it grows in the fissures of siliceous rocks. Although usually of small size, sometimes it forms large tufts of hemispherical shape covered in April and May in this country with white flowers.

For culture in pots in frames these charming little plants are more adapted than for growing outside, unless special places in vertical rocks can be made for them. Where there are no cracks a good plan is to bore a hole into or through the stones, and then wedge the plant into it. When grown in pots a very gritty compost should be used for potting, while thorough drainage is essential. During wet weather and throughout the winter the lights should be kept over the plants. *W. I.*

THE ROSARY.

CULTURAL HINTS FOR AUGUST.

Rambler Roses which blossomed early in June should now have a good deal of the old wood pruned away. This work is often postponed until the autumn for want of time, but it is much better to do it in August, as the ripening of the new wood is materially helped thereby. Roses of the Multiflora group (such as Crimson and Blush Ramblers) need much more thinning of old wood than the Wichuraianas. American Pillar and similar Roses should be assisted by placing poles on either side of the specimens to which one or more of the younger growths may be attached. Besides preventing overcrowding, such training adds to the effect. In Chalkwell Park, Westcliff-on-Sea, there is a plant of American Pillar which at first sight looks like three large specimens together, but is, in fact, only one. This appearance was obtained by the bending of a strong growth on each side of the main specimen, so low down that, its base being covered with soil, it produced fresh roots of its own. Weeping Roses should be examined, and some of the oldest growths cut out. Those which were pruned moderately in the spring should be further thinned now, and Moss Roses and other summer-flowering sorts will also benefit by the thinning of the older wood. Beds of decorative Roses should be examined daily and faded flowers removed. The soil, if flattened by frequent treading, should be lightly forked over, and a dusting of some quickly-acting fertiliser will considerably assist the plants to produce flowers in autumn. Standard Briars from the hedgerows should be budded without delay, as the sap is just now flowing freely on account of the recent rains. Good, plump buds should be selected. After a month has elapsed the buds should be untied and examined, after which they should be retied, but rather less tightly than before. Wool is better than raffia for this purpose. All growths should be removed which appear below those upon which the buds are in-

serted, but do not shorten the latter until next February. Dwarf stocks will also be ready for budding now. The Brier cutting stocks should be budded first, but the seedling Brier and Manetti will continue growing later, and may be budded up to the end of the month.

The seed pods should be removed from Penzance Briers if they are required to flower again in the autumn. Some varieties will yield quite a fair number of autumnal blooms if this be done at once.

It is a good plan to visit various gardens and nurseries to inspect the newer decorative Roses as a guide for autumn planting. More information can be gained in this way than by visiting an exhibition, where the flowers are necessarily shown under unnatural conditions.

Cuttings of Tea, Hybrid Tea and China Roses will strike freely if inserted at the present time in frames placed in the full sunshine, with the glass lightly painted as a protection from the glare. The bed should be composed of sandy loam with plenty of silver sand. The cuttings should be planted about 2 inches apart. Shoots which have just borne trusses of bloom make the best cuttings. Two eyes are enough for each cutting, but the top leaflet should be retained The cuttings should be sprinkled with clear water frequently on hot days, but no ventilation should be admitted for the first fortnight. Under this treatment the cuttings will quickly form callus. When growth begins air may gradually be admitted, and finally the lights can be removed. The plants should be allowed to remain in the frames for the winter, and be planted out in April in light, gritty soil.

Any Roses that have to be layered should be treated at once. The process is the same as that in the case of Carnations, except that the layer is inserted a little more deeply. Ripened wood of the current year is the best to layer. Plenty of gritty material should be spread around the layer, and the tongue should be kept open by the insertion of a piece of matchwood. The layers should be frequently watered. Any old Roses of which a few plants are desired can be layered, providing there are shoots of the current year's growth near the ground. Next April, if they are found to have rooted, they may be transplated to their permanent positions.

Roses for early forcing should be repotted in a compost consisting of two parts of good loam and one part well-rotted manure from a hot-bed. A little silver-sand should be added, and about a quart of bone-meal to a bushel of compost. Re-potting is unnecessary each year unless the old pots are filled with roots; but if it is not done a top-dressing should be applied in the autumn. This can be carried out by removing about 2 inches of the surface soil and scattering a little Clay's or other good fertiliser over the soil, then covering with good fibrous loam two parts and well-rotted manure one part. The pots and crocks for re-potting should be quite clean, and the potting should be done firmly. The plants may remain out of doors, standing them on a bed of ashes, and they should be watered occasionally.

Mildew and Black Spot fungus (especially the latter) are very prevalent. The treatment recommended by Dr. Waddell, in the National Rose Society's Annual for this year, has been found successful by many who have tried it. The recipe is as follows: One tablespoonful of commercial Formaldehyde of 40 per cent. to a gallon of soft water; spray frequently with this mixture, applying on a cool, calm evening, and previously moistening the soil if dry. Every part of the plant should be sprayed, and also the soil around it. The article in which this treatment is described is extremely interesting. It may be obtained from Mr. E. Mawley, Hon. Sec. of the National Rose Society, Rosebank, Berkhamsted. *Experience.*

SCOTLAND.

ACCIDENTAL DEATH OF A YOUNG GARDENER.

A young Edinburgh gardener, Mr. Adam Stenhouse, met with his death in a sad way recently. He drank from a bottle containing some acid and paraffin by mistake for lemonade. The shock of the discovery caused heart failure, although the mixture in itself was not of a poisonous character.

DAMAGE TO ABERDEEN GARDENS.

Wanton injury has been caused to several Aberdeen Gardens. One of those most injured is the garden of Lord Provost Maitland, where several fine plots of flowers have been seriously damaged, and a number of plants in other parts were raised and left out of the ground. In the gardens of Sir Alexander Lyon, and at other places, much damage has been done. In all cases there were left signs that the damage was the work of Suffragists, or of people posing as such.

HOUSING ACCOMMODATION FOR FRUIT PICKERS.

The question of the accommodation provided for fruit pickers and Potato gatherers in Scotland has been engaging the attention of the Royal Housing Commission, and a deputation from that body is investigating the subject by personal visits to the fruit-growing districts. They recently visited the Clydesdale district, and inspected the bothies and other buildings occupied by the pickers. *Correspondent.*

RANDIA MACULATA.

Randia maculata is a striking species when in full blossom. The plant is really a small, erect, sparsely branched tree, belonging to the Gardenia family (Rubiaceæ), and is a native of Tropical Africa. The curious, funnel-shaped flowers are from 7 to 9 inches or more in length; they are of a cream colour suffused with a reddish-chocolate, the throat and tube of the corolla being of a deeper brown tint. These peculiar flowers are equally striking in the undeveloped bud as when expanded, as for several weeks before opening the long, spikey buds look like small Indian clubs with the thick end upwards, and give the plant an uncommon effect. Owing to its showy and interesting character this plant is well worthy of a place in the plant stove. It is also known by the name Gardenia Stanleyana. *H. F. M., Peradeniya, Ceylon.*

Photograph by H. F. Macmillan.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the **PUBLISHER**, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, *as well as specimens of plants for naming, should be addressed to the* **EDITORS**, 41, Wellington Street, Covent Garden, London. *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Editors and Publisher.—*Our Correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the* PUBLISHER; *and that all communications intended for publication, or referring to the Literary department, and all plants to be named, should be directed to the* EDITORS. *The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.*

Special Notice to Correspondents. — *The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.*

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—63°.

The Fruit Crops.

We have rarely, if ever, been called upon to publish more dismal tables in our annual fruit records than is the case this year. Our Special Commissioner, after his visits to the fruit districts in Gloucestershire and Kent, described in his articles published several weeks ago, a condition of things eminently unsatisfactory, and the tables which we give this week confirm only too conclusively his careful observations. If we look at the returns for Pears, we find that out of 245, there is only one report where an overcrop is recorded; and this is in Ireland! So far as we are aware, this is without a precedent in the half-century or so during which these records have been made. The number of average crops is only given as 227, whilst as many as 222 are described as "under" in order to keep to the rules of the table, but in many cases we are informed that the trees bear no fruit whatever! Plums are not much better; out of 248 returns, only 5 cases are above the average, and there are 203 deficient crops to compare with 40 of average yield. Cherries, again, give us 137 deficient crops; whilst there are only 71 records of average yields, and 3 of crops above the average. Peaches and Nectarines have 1 overcrop in Scotland; and whilst there are only 23 average crops, there are 143 cases in which the trees have failed to produce an average yield.

The next crop, following the sequence of the table, is that of Apricots; and these share with the Pears the distinction of constituting the conspicuous failures of the year—failures unprecedented.

Out of 158 returns, there are 152 in which the crops fall below the average.

We have so far spoken of the crops which are least satisfactory, and we may now turn to others which are not of so disappointing a nature. The first is Apples, the principal hardy fruit crop in this country. Fortunately, 1913 is not a bad Apple year; indeed, it may be said that the Apple crop is an average one. There are 256 returns, and of these 150 record average crops. There are, it is true, 106 records of deficient yields; but this, though bad, is not so hopeless as the case of Pears and stone fruits.

Small fruits are also satisfactory; there are only 16 under-average returns out of a total of 137.

Strawberries provide the most bountiful crop of the season, being much in excess of the yield in 1912, as shown by the summaries. There are 248 returns, and 239 of these register satisfactory crops.

Nuts are not nearly so plentiful as in 1912, and may be described as much below the average.

Our correspondents have expressed opinions upon the causes which have operated so adversely upon the Pear crop and the yield of stone fruits, and their remarks will be published in subsequent issues; but it is already evident that the reports are singularly uniform in their general character, and tend to show that the climatic conditions must have been the determining factor. Diversities of climate, soil, and elevation, which must necessarily be considerable, do not seem to have affected the general results; the responsibility for the poorness of the crops is therefore to be laid on the weather. It will be remembered that the winter of 1912-13 terminated earlier than usual, and that at the very commencement of spring outdoor plants appeared to be dangerously forward. Then, in the middle of April, when the Pear blossom was opening; and again in May, when the Plum trees were in flower; and the Pear and Apricot blossom still lingered in the trees, there were again winter conditions, which prevented bees and other insects from visiting the flowers, thus hindering fertilisation, and explaining in some measure the lack of fertility. But in seeking for such explanation it has to be remembered that the summer of 1912 was deficient in sunshine, and the frequent rains in August and September caused the fruit trees to continue their development longer than usual. Some cultivators, therefore, attribute the failures this year partly to the fact that the trees were less well matured than usual, it having been noticed that in frequent cases where the flowers set, the fruits fell from the tree whilst still very young.

In the very worst cases there are some varieties, especially of Plums, that are bearing moderately well, and the careful cultivator will be sure to take notes of these, and endeavour to find a reason for their bearing. It may be that they are fairly persistent croppers in the particular locality; or, on the contrary, their fruitfulness may be due to the fact that whilst other trees yielded well last season, these particular varieties were more or less barren.

Such seasons as the present show unmistakably that efforts ought to be made to raise new varieties of fruit which can be more depended upon to crop in average seasons. The qualities to be encouraged are immunity from disease, resistance to cold, and capacity for self-fertilisation. We do not know that any serious work is being done in this way on systematic lines at the present time. It is a long and tedious business, and this fact probably deters workers who would be willing enough to embark upon the task if the results could be properly attested after the lapse of a few seasons. It is sometimes argued that varieties are needed which will have a habit of late flowering, so that they may escape the late frosts, but this quality would not always suffice to avert failure, for in the case of Plums some of the early varieties flowered this year in favourable weather and set good crops; but later ones are perfectly barren, owing to the fact that the weather was altogether unsuitable at the flowering period.

Thus at present we fall back upon the skilled and prescient cultivator, who, by the selection of site, judicious thinning of trees, avoidance of excessive use of stimulants, prevention of overcropping in good seasons, and by waging incessant war against pests and diseases, can do a very great deal towards obtaining crops in the majority of seasons. When all has been said against our most variable climate, it is very rarely indeed that our hardy fruit crops fail us. Occasionally some are below the average, but usually the shortage is compensated for by an abundance of some other kind of fruit. The success that is obtained is the success of the cultivator, and to him, rather than to any appreciable alterations in climatic conditions or in the habits of fruit trees, must we look for still further progress in the efforts to obtain from the trees their fruit in due season.

Coloured Supplement.— Among the many interesting plants introduced into European gardens from South Africa a century or more ago, the several species of Strelitzia have held a prominent place owing to their striking appearance and capacity for doing well in ordinary garden conditions. The early history of the first-comer, S. Reginæ, is given in the *Botanical Magazine*, Vol. IV., published in 1795, when a plant flowered for the first time in the Apothecaries' Garden at Chelsea. We there learn that the genus was named by Sir JOSEPH BANKS "in honour of our most gracious Queen Charlotte." It was first introduced into Kew in 1773, but does not appear to have perfected itself there owing, it is hinted, to its roots having been confined in a flower-pot; whereas in the Chelsea garden, the roots having extended by accident into a bed of rotten tan, the plant grew with greater vigour and developed flowering stems. Like all fleshy-rooted plants, Strelitzias require

plenty of root-room and are gross feeders. The best examples we have seen have been planted in a border of good soil in a conservatory, where they enjoyed a fair amount of sunshine. If grown in a pot or tub it must be of large dimensions or there will be no flowers. The genus is related to Musa and is confined to South Africa. S. parvifolia (juncea), remarkable in having elongated, rushlike leaf-stalks and a blade reduced to a very small size, is a second stemless species, whereas the other two, S. augusta and S. Nicolai, have woody stems which attain a height of 20 feet or more. A hybrid named S. kewensis (see fig. 38), raised at Kew by crossing S. Reginæ with S. augusta, flowered in 1910, the flowers being pale ochre-yellow and blue. There are several varieties of S. Reginæ, namely, citrina, farinosa, and ovata. In sub-tropical countries these Strelitzias may be planted in permanent positions where, when once established, they will thrive indefinitely, as they produce sucker shoots freely, and their constitution is such that nothing except frost appears to hurt them.

Geo. Monro, Ltd.—The name of George Monro is a household word amongst growers, buyers and sellers of garden produce. The business is by far the most important of its kind in Great Britain, and yet, like many other great undertakings, it had a small beginning, as was told by Mr. Monro himself at a luncheon which took place in the Hotel Cecil on the 22nd ult., to celebrate the opening of new premises in Tavistock Street. Mr. Monro invited some four hundred guests, including many well-known horticulturists. The history of the firm is really a history of modern market-gardening, especially as it concerns the development of the trade in choice fruits and flowers. Mr. Monro first started business in Covent Garden Market in August, 1862, so that his experience extends over fifty years. In those early days the market growers were chiefly concerned with the cultivation of vegetables and other outdoor crops, and of crops raised under frames. Such indoor fruits as reached the market came mainly from gentlemen's gardens, being the surplus after satisfying the home requirements. The first person to undertake the growing of Grapes for market on serious lines, said Mr. Monro, was Mr. William Thomson, of Clovenfords, and Mr. Monro acted as his agent. In 1882, when Mr. Thomas Rochford started Grape-growing for market at Turnford, near Broxbourne, the trade grew by leaps and bounds. Other early growers were Mr. Sweet, of Whetstone, Mr. Peter Kay, of Finchley, and Messrs. Shoults, of Finchley. The Grape-growers soon found that Tomatos were a most profitable crop to cultivate in conjunction with their vines, and Mr. Monro stated that no crop was of more importance to the grower, the salesman, or the trader than Tomatos. The Tomato soon became popular with the public, and the demand for this fruit is now an enormous one. The success of the growers advanced steadily, and they next turned their attention to Cucumbers, which proved profitable. But the profits of English Grape-growers are said to show a serious decline nowadays owing to competition from Dutch, Belgian, and other nurserymen on the Continent. However, the modern growers have many advantages, such as improved railway facilities, cold storage and a greater number of shops dealing in the sale of their commodities. Forty years ago, said Mr. Monro, there were practically no flower shops. The greengrocer and fruiterer of those days bought flowers only when they were cheap, and there were no florists such as we know them. However, the flower trade has grown, especially during the past twenty years, and there is a constant demand for Roses, Carnations, Narcissi, Chrysanthemums and such like subjects. Much of this is due, said Mr. Monro, to the fortnightly meetings of the Royal Horticultural Society, which create a desire amongst those who visit these shows to have the things they see for themselves. The Continental method of arranging bouquets and sprays in a lighter manner than the old style that formerly obtained has also been a help in the extension of trade. The market fruit and flower trade has become a national industry and also an international one, and is worthy of more patronage by the Government. Good advice was given by the speaker on the question of prices. It was no use seeking to obtain fancy prices, for it paid better in the end to sell for a moderate value, as those who bought cheaply came again for more and trade grew in consequence. His motto was sell cheap, not dear. Mr. Joseph Rochford and other growers and salesmen gave interesting reminiscences of the market trade, and afterwards the guests were invited to inspect the new buildings in Tavistock Street, which extend through to Exeter Street. The ground floors—for there are two, owing to the difference in the level of the two streets, the ground floor in Tavistock Street becoming the first floor in Exeter Street—are utilised as sale-rooms for the trade in flowers. They are both very spacious, and provided with every convenience for a business of this description. The size of the two floors may be estimated when it is stated that the area of the two together is greater than that of the foreign flower market in Covent Garden. The most interesting parts of this large building are the sale-rooms for the sundries department and the offices. The first floor in Tavistock Street is occupied by show-rooms for displaying glass and china ware, and baskets used for arranging flowers and fruits, and is connected by a wide corridor with the corresponding floor in Exeter Street, which is stocked with articles of more general use, such as florists' paper, wire, string, moss, fertilisers, and a thousand and one other things used in all branches of the nursery,

Fig. 38.—Strelitzia kewensis (S. reginæ × S. augusta).

(See p. 86 and Coloured Supplement.)

florists', fruiterers', and allied businesses. On the third floor are found the English and French offices, together with four private rooms for the sub-managers; whilst on the fourth (or top floor) are the housekeeper's quarters, store-room, salesmen's reading-room and dining-room, and the kitchens. Nothing appears to have been overlooked in the arrangement of these fine buildings, either for the convenience of trade or for the comfort of the staff.

"The Journal of Horticulture."—We understand that Mr. J. Harrison Dick, editor of the *Journal of Horticulture*, will shortly leave England for America. Mr. Horace J. Wright will succeed Mr. Dick at the *Journal of Horticulture*, a paper which he edited some years ago, when it belonged to Mr. Hogg.

"Trees of Great Britain and Ireland."—This great work has been brought to a close by the publication of the seventh volume, together with a separate index volume, containing a list of 80 pages, a list of subscribers, addenda and errata, also a postcript by the authors, Mr. H. J. Elwes, F.R.S., and Prof. A. Henry. The book contains in all 2,022 pages. We understand that only 500 copies of the entire work have been issued.

Gift of Orchids to Kew.—We learn from the *Kew Bulletin* that the collection of Orchids in the Royal Botanic Gardens has been enriched by the gift of 150 large plants of Cattleya, Lælia, Lælio-Cattleya, Brasso-Cattleya, Cymbidium and Cypripedium by Lt.-Col. Sir George Holford, from his famous collection at Westonbirt. While the collection of Orchids cultivated at Kew must be essentially botanical, its main object being to represent the family in as comprehensive a way as possible, the great progress made in recent years in the breeding of hybrids, many of which are botanically interesting as well as possessed of exceptional claims as garden plants, necessitated the addition of a selection of them to the collection. Increased accommodation was provided last year by the erection of an intermediate house adjoining the T Range, and, thanks to Sir George's generosity, Kew now possesses some of the best of the Cattleyoid hybrids.

The L.C.C. Winter Garden at Avery Hill.—The winter garden at Avery Hill has been closed to the public, owing to the dangerous condition of the roof, since January, 1912, but there is now every prospect of its reopening. The total area of land occupied by the garden is about 1,645 square yards, or slightly over one-third of an acre. The average expenditure for maintenance has been £220 a year. The original cost of providing the winter garden is stated to have been over £20,000. After giving full consideration to all the facts and inspecting the building and the plants contained therein, the Parks' Committee came to the conclusion that the Council would be justified in incurring the expenditure of £2,750 involved in reopening the garden for the use of the public. The Finance Committee of the County Council, however, withheld their approval, and on Tuesday last Mr. H. J. Greenwood moved that the recommendation of the Parks' Committee should be referred back. This was lost by 44 votes to 27, and the recommendation of the Parks' Committee was adopted.

Gardeners' Royal Benevolent Institution.—A garden fête was held at Ynys-y-Maengwyn, Towyn, Merioneth, the residence of Mrs. Cobbett, on Wednesday, July 23, in aid of the funds of this Institution. It is satisfactory to learn that, as a first venture, the fête was successful.

Nova Scotia Apple Crop.—According to reports from various districts the Nova Scotia Apple crop will probably be below normal. Cold, wet weather at blossoming time caused imperfect pollenisation, while frosts in early June also caused damage. Certain places, however, have been more favoured and report a better crop than that of last year.

Motor Car Unpopular in Canada.—A curious prejudice against the automobile exists in the province of Prince Edward Island. A measure recently passed by the Legislature admitting this familiar vehicle has been held up pending a plebiscite. The returns at present to hand show that the farmers are strongly opposed to allowing autocars to run under any conditions. This attitude is in strange contrast to that of Canada generally. In Ontario, and even more so in the West, the automobile is almost as ubiquitous as the buggy, while motor power is becoming more and more extensively employed in agricultural and other industries.

A New Method of Preserving Fruits.—It is stated that excellent results with various fruits—Apples, Cherries, Grapes, etc.—have been obtained by a new and comparatively simple method of preservation. The process, due to Mr. E. Cooper, consists in packing the fruits in tarred cardboard boxes in which the air has been replaced by nitrogen. The tarred cardboard renders the box impervious to air. It is filled with fruit and closed, except for a small hole. The boxes are put into a large chamber, the air of which is exhausted, and hence the major part of the air is removed from the boxes. Nitrogen is passed into the chamber, and when sufficient time has elapsed the holes in the boxes are sealed. It is stated (see *La Tribune Horticole*, June 21) that fruit remains perfectly fresh for from three to five months when packed in this way. It is evident that if the process leads to good results it is of considerable importance, but till it has been tested fully it is premature to express an opinion as to its utility. The fact that many chemical changes go on in plants in the absence of air—the conversion of sugar into alcohol, for instance—would suggest that fruits are not likely to remain unchanged for long even in an atmosphere of nitrogen. Without giving much weight to theoretical objections, it is as well to bear them in mind when forming a first estimate of the value of new processes. The most recent investigations bearing on this new method (see Bulletin 330, April, 1913, Cornell University Agricultural Department) would appear to show quite definitely that storage in oxygen-free gases is not likely to replace refrigeration. The writer of the bulletin, Mr. G. K. Hill, jun., shows as the results of his experiments that ripe fruits—Cherries, Grapes, Apples, etc.—continue to respire and to produce carbon dioxide in the complete absence of oxygen. This form of respiration is, of course, well known, but the fact that it goes on in ripe fruits suffices to show that the latter continue to undergo chemical changes, and, it is to be presumed, to deteriorate even when stored in such gases as nitrogen. Mr. Hill finds, moreover, that, as a matter of fact, ripe Apples lose in colour, texture, and flavour, and take on the quality of the half-baked fruit as a result of being kept for a considerable time in oxygen-free gases. If this be the case, the shipper of fruit will have to continue to rely on refrigeration, which method, if proper attention be given to the all-important matter of ventilation, gives excellent results.

Fruit Crops in Brandenburg, the Province of Saxony and Silesia.—The Board of Agriculture and Fisheries have received a further report from his Majesty's Consul-General at Berlin on the fruit crops in his district, from which the following are extracts: "On the average there may be expected in this district a moderate crop of Apples, Pears, and Plums of all kinds; a poor crop of sweet Cherries, although sour Cherries will be better; very few Peaches and Apricots and a good crop of Strawberries. Gooseberries and Currants will be below the average, but other berries will be fairly good. The principal varieties of Plums grown in the district are Victorias, Wangenheimer and Buhler Early Zwetschen, Hausswetchen, Mirabelles, and Greengages for dessert, chiefly Hausswetchen for cooking and Mirabellen von Nanzy, large Greengages and Italian Zwetschen for jam-making. The varieties mainly used for home consumption are Victorias, Wangenheimer and Buhler Early Zwetschen, Hauszwetschen, Oulin Greengages, and large Greengages. The principal kinds exported are blue Hauszwetchen, large Greengages, and Mirabellen von Nanzy. The Zwetschen crop this year is expected to be very fair in Brandenburg—in some parts, especially the Altmark district, very good. In the Province of Saxony they will be moderately good and very fair in Silesia. The prices of this crop should be very nearly the same as last year—perhaps, on an average, 1s. per cwt. higher.

Flowers in Season.—We have again to acknowledge the receipt of a bouquet of Delphiniums from Messrs. Kelway, in which the pretty gradations of tint in pale and dark blue are very pleasing.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

Artificial Ripening (see p. 50).—If it is the fact "that artificial ripening may be induced by subjecting unripe fruits to carbon dioxide," the "physiology of the process" is certainly "not altogether clear." Ripening is not a matter on which much information will be found in the textbooks. But the main facts are pretty obvious. A green fruit behaves like any other green plant-structure; it decomposes carbon dioxide and gives out oxygen. It is still doing its work as part of the general plant body. When it begins to ripen this ceases and is, in fact, reversed; oxygen is absorbed and carbon dioxide and water are given off. Ripening is a thing apart from the general life of the plant; the chemical changes which take place are not in the nature of the upbuilding of nutritive material, but are on the down grade and analogous to decay and death. It is of no advantage to the plant, but only to the race; it has been brought about to attract frugivorous animals and so facilitate the dispersal of seeds. Man has developed its capacity for the gratification of his own palate. Ripening, like germination, is broadly a process of oxidation. The changes which actually take place have been little studied and are certainly complex. The acids at first produced more or less disappear, tannin is broken up and sugar increased. These changes are due to the action of ferments, many of which are no doubt oxidases—i.e., capable of producing oxidation. Cooking produces similar changes in unripe fruit, an illustration of the fact that in chemical change time and heat are interchangeable. In what is called "bletting," oxidation is carried still further and sugar itself is destroyed. As long ago as 1872 Pasteur experimented on the effect of placing unripe fruit in carbon dioxide. "Plums remained firm, hard, and sound in appearance, even if some of these characters were not sensibly increased." Sugar, instead of being increased, was destroyed with the production of carbon dioxide and alcohol. The same thing happens with Pea-seeds germinated without air. We now know that this is due to the action of zymase, which effects alcoholic fermentation. In a control experiment Pasteur found that "similar Plums left in contact with air became soft, watery and very sugary." He adds that "Grapes, all acid fruits, Melons, etc., behave in the same manner," when placed in carbon dioxide. It is difficult to reconcile Pasteur's results with those described by Professor Francis Lloyd. It seems hardly possible that "ripening," properly so-called, can take place under the conditions. The only difference is that "pressures of from 15 to 45 pounds per square inch" were used. But the former is only that of the atmosphere, which is presumably what Pasteur used, though it may have been a little more from the additional carbon dioxide given off by the Plums. As far as I can see, the only mode of arresting ripening is by keeping fruit in a cold storage. But even then, Cape Peaches often have a vapid flavour which may possibly be due to some trace of alcoholic fermentation. *W. T. Thiselton-Dyer.*

A Hybrid Foxglove.—In connection with Sir Herbert Maxwell's note (see p. 70), it is perhaps worth recording that from seed obtained here in 1910 by crossing Digitalis ambigua with pollen of the white form of D. purpurea there resulted about a dozen hybrid

plants, which flowered for the first time in 1912 and are doing so again this year. Though varying somewhat among themselves, the flowers of all these plants agree very well with Sir H. Maxwell's description. My plants have all the appearance of being truly perennial. Though visited freely by humble bees they have not so far produced fertile seed. It is interesting to note that though the pollen parent belonged to a strain of white Foxgloves which have been kept severely rogued for 15 or 20 years, yet the red colouring is developed in all my hybrid plants. *W. H. B. Fletcher, Aldwick Manor, Bognor, Sussex*

Disease in Peas.—I was very much interested in the article concerning the diseases of Sweet Peas (see p. 21). Before I proceed further I must state that I am only outside foreman at the establishment I serve, but none the less I should be grateful if you will permit me to explain my experience with culinary Peas. This garden has been under cultivation for a longer number of years, and since I have been here (three years) I have cultivated culinary and Sweet Peas fairly extensively. Last year and this season my culinary Peas have been attacked with root or stem rot, which sets in just under the ground and turns the stems of the Peas black and soft, working its way down to the roots; the behaviour of the haulm after the attack coincides exactly with the Sweet Peas illustrated in fig. 10, and said to be attacked with the fungus Thielavia basicolor. They make healthy growth till just before they start blooming, then the disease attacks them, and they cease to grow. In bad cases there are very few pods that develop properly, the foliage turns yellow, and the plants just linger on, not dying outright. On three rows that were attacked I gave each row a good dusting of lime, and watered it in, and on one row it checked the disease to a great extent, but on the other two it had but very little effect, owing, no doubt, to the disease being far worse in degree. Those rows were of the variety Early Morn, and were sown at about the middle of April. I have one row of Duke of Albany, and two rows of Harvestman with the same disease, they were sown early in May in the same garden, but not on the same plot of ground. Harvestman, in addition to being diseased at the roots, has on the extreme end of the haulm, and about 1 foot down, a yellow appearance, and the leaves are mottled with brown spots, and they look altogether very sick and unhealthy. The article published in *Gardeners' Chronicle* states that root rot is caused by the fungus known as Rhizoctonia and Corticum vagum, and stem or collar rot is caused by the fungus Sclerotinia libertiana, but by the habit of my Peas after an attack it seems to me that they are attacked by the fungus Thielavia basicolor. Last year I intended sending you some for examination, but thought that possibly it was the wet weather we had that caused it, but now this season has been so far a dry one, and the attack is worse, weather conditions have not much to do with it. *Correspondent.* [Kindly send specimens for examination.—Eds.]

How Plants are Named.—The following conversation between two experts took place at a recent fortnightly meeting of the R.H.S. :—A. : Have you ever seen that plant before? B. : I don't think I have; it appears to be something new. A. : I know it is new, as it came from a place where no collector had ever been. No one here knows it. B. : How did it get the name it bears? A. : Oh, I named it, as the Society will not look at a plant that is unnamed. B. : Have you tried Kew? A. : It is no use sending plants there, as they give them any kind of name; they won't bother. B. : But they will. The collections of living and dried plants are maintained to enable them to identify plants, and I know they do a lot of it. A. : I wouldn't ask them. I would rather name my plants myself. B. : Then you would most likely make a mistake. It doesn't follow because a plant is not known to cultivators that it has not already been named by some one competent to do it. A. : Surely when I introduce a new plant I have the right to name it? B. : But you must first find out if it is new and nameless. A. : Well, I know this is new. B. took particulars of the plant, went to Kew and found that it was well known there, a figure of it having been published in the *Botanical Magazine* a few years ago. *Eavesdropper.*

Fasciation in Lilium candidum.—A plant of Lilium candidum in my garden developed a dense, rounded mass of flowers at the top of a fasciated stem about 3 feet high. This stem was flat, with a spiral twist throughout its length; it measured ¾ inch at the base, and increased in width to about 3½ inches at the top. There were over 60 flowers in the head; they were smaller than ordinary blooms, but most of them perfectly formed. Instances of stem fasciation in Lilies have been fairly numerous in my garden, but I do not remember such a case as this occurring with L. candidum. *S. G. Reid (Capt.), Yalding, Kent.*

Distribution of Alpine Plants (see p. 46, and Vol. liii., p. 381).—When I commented on M. Correvon's use of the word endemic, as applied to certain species in the Maritime Alps, which are by no means confined to that region, I did not realise that he was alluding to "centres of dispersion," and I was careful to say that "It [the paragraph] reads as if all the plants named therein were endemic, but evidently that was not the writer's intention." M. Correvon now begs the question by reminding one that "the centre of dispersion of any plant is the source of the species, not its sole habitat." Of course, but "he must surely be aware" that the word endemic means "confined to a given region, as an island or a country." See Dr. Jackson's *Glossary of Botanic Terms. H. S Thompson.*

Fig. 39.—Solanum jasminoides flowering by the roadside at Stoke Fleming, near Dartmouth.

SOLANUM JASMINOIDES.

This climber is surpassed by none of its race in the beauty of its flowers and in the lengthened period through which it blooms. A few years ago a large specimen, which covered the gable of a house from ground level to eaves, expanded its first flowers towards the end of April, from which time the white bloom-clusters increased in number every week until, in August and September, the whole plant was

veiled in a wealth of snowy blossoms, swaying with every breeze on their slender tendrils. October showed little diminution of their numbers, which gradually grew fewer as Christmastide approached, a few blossoms, however, remaining through the whole of January, while the second week of February had arrived before the petals of the last flower-cluster fell, the plant having bloomed continuously for nearly ten months. It is, naturally, only during open seasons, even in the favoured South-West, that such an extended period of blossoming can be looked for, but five or six months' flowering may be confidently expected. When planted in good soil the growth of this Solanum is very rapid, a small, rooted layer forming a plant that will reach to the eaves of a two-storied house in three years. For pergolas, trellises, and archways this climber is equally valuable, its white flower-wreaths festooning them with graceful bloom-trails for many a week. The plant is not unreasonably exacting as to the nature of the soil in which it is planted, and may be seen in equally satisfactory condition when growing in stiff, almost clayey, loam, and in a light and porous staple. It is, however, well in the case of this, as of all other climbers, to give it every inducement to make a good start by planting it in a barrowful of rich and friable compost, in which its roots will at once commence to grow freely. Where specimens make weak growth this may usually be attributed to their having been planted in soil naturally very poor, or being crowded with the roots of other vigorous subjects, in which cases the struggle for existence does not permit the plants to assume the robust habit that would have characterised them if they had been given a rich and unhampered root-run at the commencement of their career. Though admittedly of a somewhat tender constitution, being a native of South America, this Solanum has been known to succeed as far north as Derbyshire, and is well worth a trial in sheltered South-west angles of the house wall, even in the colder localities, where it may be afforded some temporary winter protection, since it amply repays by its summer beauty any little trouble expended on its winter preservation. The illustration (see fig. 39) shows a plant that may be viewed any summer day on the coach drive from Dartmouth to Kingsbridge. Passing through the village of Stoke Fleming, the road descends a winding hill to the beach at Blackpool, on which a charming valley opens out. In the valley runs a lane by the side of which is the shed here shown entirely smothered in Solanum jasminoides. *Wyndham Fitzherbert.*

THE APIARY.

By Chloris.

Storeo Honey.—Many are eager to remove racks of sections and shallow frames, i.e., before they are completed, because they believe that by adopting this method it will conduce to a big "take," while experience proves that the converse is true. The best course to adopt is to place another rack under the first when it is two-thirds to three-fourths filled. There is a period of waiting necessary before the last honey stored can be sealed, because bees will not cap it until it is perfectly ripened, and this interval the bees will employ in drawing out foundation, and filling the cells in the new rack. Since the nights are rather cold bee-keepers will be well advised to wrap up the racks round the outside with material of a non-conducting nature, so that the internal heat may be conserved, and they should not be afraid of placing on plenty of good quilts, remembering that what will prevent loss of heat will also act as a protective covering during the heat of midday. If the heat of the hive be allowed to drop seriously during the night the bees will soon leave the supers, and nothing will induce them to return again this season.

A little extra care in the management of Bees is always repaid by better results, and now that good English honey is so scarce, owing to the prevalence of the Isle of Wight disease, those with healthy stocks should make the most of their advantage in immunity from the complaint.

The Week's Work.

THE ORCHID HOUSES.

By W. H. White, Grower to Sir Trevor Lawrence, Bart., Burford, Dorking

Epidendrum vitellinum.—Plants of this summer-flowering species will be starting into growth, and when root action commences they should be afforded a fresh compost consisting chiefly of Osmunda-fibre. This useful species may be grown either in the ordinary flower-pot or shallow Orchid pan. Good drainage is essential, and in re-potting keep the base of the young growths well above the compost, as they will be less liable to decay. The later-flowering variety is finishing up its season's growth, and flower spikes are appearing from the apex of the new pseudo-bulbs; at this stage the plants will require abundance of water at the root till the flowers commence to open, but afterwards the quantity of moisture should be lessened gradually. Grow these plants in the lightest position available in the house, and especially at the time when forming their new pseudo-bulbs, light being an important factor, so that the latter, aided by plenty of ventilation, will assist the plants to dry quickly and assimilate plenty of water, and thus help them to form strong flowering growths.

THE FLOWER GARDEN.

By Edward Harriss, Gardener to Lady Wantage, Lockinge, Berkshire.

Pentstemon.—Few plants give a better return for liberal cultural treatment than Pentstemons. Some of the varieties are now in full bloom, and if not already supported with stakes suitable supports should be provided without delay. Pentstemons are invaluable for massing in the mixed border or for cultivation in beds by themselves. The variety Newbury Gem is a distinct and beautiful sort, which may be used in various ways in the flower garden. In order to extend the flowering season for as long as possible the plants should be watered frequently during dry weather, using diluted liquid manure occasionally as a stimulant.

Holly and Yew Hedges.—The present is a suitable time to cut hedges formed of Holly or Yew, as they will make very little growth after this month. The work is best done with the shears. Specimen Yews may be pruned at this season, also various other kinds of conifer, but such work can only be entrusted to experienced workmen.

Foliage for Indoor Decoration.—Where large quantities of flowers are required for indoor decoration there is always a demand for suitable foliage, especially for furnishing very large glasses. To save spoiling the trees in the pleasure grounds others should be planted in out-of-the-way places for cutting. Species suitable for this purpose are Prunus Pissardii, Copper Beech, Ruscus racemosus, Acer Negundo and other variegated Acers; Dogwoods, and some of the finer Bamboos. Ruscus racemosus should be planted in considerable quantity, as it is most useful for indoor decorations.

Agapanthus.—Large plants of Agapanthus are very thirsty subjects, and now that the flower spikes are in course of development, any specimens that have already filled their tubs or pots with roots may be given copious supplies of liquid manure.

Begonia.—Examine beds of tuberous-rooted Begonias frequently to remove dead flowers and seed-vessels. Begonias succeed best in half-shady situations, where they have a free rooting-medium and plenty of moisture. Similar positions are best suited also for the fibrous-rooted Begonias, amongst which the varieties Crimson Bedder and Fairy Queen are excellent bedding plants.

Spiræa (Astilbe).—Plants of Spiræas that have flowered in the conservatory may be planted by the margins of water. The varieties Queen Alexandra and Peach Blossom will succeed in such a situation just as well as the old Astilbe japonica. A. palmata deserves a prominent place in the bog garden, where its roots may find plenty of moisture. It is a very effective plant in July and August.

Lavender.—If the flowers of Lavender are required for use indoors they should be cut and dried before they are too far advanced, and the plants may afterwards be trimmed. Hedges of Lavender may be cut fairly hard back at this season, as they will break readily into growth again. Lavender flowers may be dried on sheets of canvas, spread out in a vinery which has yielded its fruit.

Spring Bedding Plants.—Prick out the seedlings of spring-flowering plants as soon as they are ready for handling, or they will become drawn and weakly. Wallflowers should be planted in an exposed situation in ground that is neither too rich nor too loose, it being necessary that the growth should be hard in order to stand the winter. If there are colonies of Foxgloves, Honesty and such plants in the woodland garden that have sprung from self-sown seeds, they may need to be thinned, and the thinnings can be used for planting further batches. The seed pods of Honesty (Lunaria biennis) should be left on the plants, as they may be cut later for decoration indoors during winter, when they associate very well with dried specimens of the winter Cherry (Physalis Alkekengi).

THE HARDY FRUIT GARDEN.

By B. Goodacre, Gardener to Sir Ernest Cassel, Moulton Paddocks, Newmarket.

Morello Cherries.—Trees of Morello Cherries are carrying good crops, both the specimens against walls and the standards in the open garden. The fruit is just colouring, and the birds are getting troublesome, therefore it is desirable to transfer the nets from the Strawberry beds for use upon the Cherry trees. In netting the trees on the wall see that they are placed clear of the young shoots, and that the bottoms are tied up so that they will not drag upon the ground, otherwise they will be likely to decay with the weather. Galvanised wire should be placed over the top a foot above the trees, supported by posts driven into the ground to keep the net clear from the growth. The end of the young growth very often bears the only wood bud on the whole shoot, consequently the tips need to be retained. If Cherry trees are planted in a spot by themselves, and they are secured from pests and rain, fruits may then be allowed to hang on the trees for a considerable time, and they supply an addition to the dessert at a time when variety is sought after.

Sweet Cherries.—These being now almost all gathered the nets may be removed from the trees and attention given to the shoots, thoroughly syringing the trees and watering the roots if these appear to be dry.

Strawberries.—A plot of land should be got ready for the cultivation of the main crop of Strawberries, and no ground is better than that which has been cropped with Onions, as it will need little attention beyond cleaning. Strawberries may also follow early Potatos, which leave the land thoroughly clean; but a good dressing of manure will be necessary. The ground should be allowed to settle, and afterwards made firm, as advised for early planting. The runners should be well rooted, but if their layering is not complete the stronger plantlets should be chosen, and those uninjured by trampling, for if the crown is bruised the plant will be useless. They may be layered in small pots or in pieces of turf; but pots are preferable. Fill the pots to the brim with good, open loam, and keep the runners in position with a peg or stone, as previously advised. If well attended to the runners will quickly fill the pots with roots, and should be detached and planted out before they become potbound. Another plan, and one which answers quite as well with less labour, is to lift runners from between the rows of the old plants with a trowel. Such plants, if lifted before they develop many roots, generally grow away better than those planted from pots, but this plan can only be practised in wet seasons, when runners are plentiful. The rows should be 3 feet apart, and the plants 2 feet distant in the rows. In the first year after planting, a crop such as Lettuce, Spinach, or French Beans may, if desired, be grown be-

tween the rows. Then, if the plants do well, they will occupy the whole bed the second year. Unless light and air reach all parts of the plants the flavour of the berries will be inferior, and if the season is excessively wet many of the fruits will rot before reaching maturity. As advised for early planting care in the matters of watering, mulching, etc., will be necessary if the season remains dry.

Selection of Varieties.—The best varieties for planting will depend largely on the nature of the soil and the district. Certain varieties which succeed well on heavy land and in low-lying districts will not do at all in these gardens. The best variety for all purposes is Royal Sovereign, but for flavour British Queen is still unexcelled. This latter variety, however, is, with us, a wretched grower, and we have substituted Laxton's New Queen. This Strawberry is nearly equal in flavour to British Queen, is a grand grower, and bears large fruits of a bright appearance. Other good varieties in their order of ripening are President, Louis Gauthier, Utility, Waterloo, Given's Late Prolific and Latest of All.

FRUITS UNDER GLASS.

By James Whytock, Gardener to the Duke of Buccleuch, Dalkeith Palace, Midlothian.

Cucumbers.—Cucumber plants that have been bearing fruits for some time should have the older growths and foliage removed, training young shoots to take their places. Apply a top dressing of half turfy loam and half manure from an old hot-bed, and water the plants copiously with manure water. Syringe the plants with clear water on fine afternoons, and close the houses early while the sun's rays are still upon the glass, in order to produce considerable heat, which should be maintained more or less during the night with fire heat. Sow seeds at the beginning of August to produce plants for winter-fruiting, and encourage the seedlings to make a sturdy growth, ventilating the house freely during favourable weather.

Pineapples.—The commencement of August is the best time for potting suckers of Queen Pines. Fruiting plants of this variety produce suckers freely when in a satisfactory condition, and it is usual to allow two suckers to develop on each. Sever the offsets and make the base of each smooth by means of a sharp knife; also remove several of the short leaves. The stronger suckers should be selected and planted in 8-inch pots, placing the remainder in 6-inch pots. Let the receptacles be cleansed thoroughly, and place a layer of crocks about 2 inches in depth in the 8-inch pots, and rather fewer in the smaller ones. Spread a layer of moss or some of the more fibrous portions of the loam over the crocks, and next a few crushed bones mixed with a little soot. The soil for growing Pines should contain plenty of fibre, and should be on the light rather than the heavy side in texture. To every barrowful of the loam, mix with it an 8-inch potful of bonemeal. Let the suckers be placed sufficiently deep in the soil for them to remain firmly in position, and make the compost firm by means of a blunt stick. They should be grown in a shallow pit, preferably one furnished with bottom heat from hot-water pipes. Plunge the pots to their rims in a bed of tan or leaves, and maintain the bottom heat at 85° to 90°. Shade the suckers from direct sunshine until roots have formed; if the soil is fairly moist at the time of planting water will not be needed until this stage is reached, when tepid water should be afforded in sufficient quantity to afford a thorough soaking. Up to the time when roots develop, overhead sprayings will be beneficial, and this may be done by means of a can with a fine rose. Let the night temperature be about 70°, allowing a rise of 10° or 15° in the afternoon at closing time, when the sun is shining brightly. When the plants are growing freely, air may be admitted early on fine days, and let the plants be exposed as much as possible to sunlight. The pit or other structure in which Pine suckers are grown must be perfectly clean, therefore the house should be washed and cleansed thoroughly, also the walls limewashed, before the plants are brought into them. At this season there are usually more Pines ripe at one time than are required. The fruits may be retarded by keeping the house comparatively cool and permitting a circulation of dry air. Another plan is to remove the plants to a vinery where the grapes are ripening; the cool air of the vinery together with the shade of the vines will have a successful retarding influence. Plants of Smooth Cayenne, Charlotte Rothschild and other late varieties intended for fruiting in the late autumn and winter should be fed with weak guano water as soon as they have finished blooming and commenced to swell, each time moisture is afforded. During bright days the Pine pit should be closed in the afternoons, when the temperature is very high, and this warmth, if supplemented with fire heat in the evening, will prevent the temperature falling below 70° at night-time.

PLANTS UNDER GLASS.

By F. Jennings, Gardener to the Duke of Devonshire, Chatsworth, Derbyshire.

Calceolaria and Cineraria.—Seedlings of Calceolaria and Cineraria should be afforded plenty of air and light; the earliest plants will now be large enough to handle, and may be pricked out into pans or boxes. Keep a sharp look out for slugs and other insect pests.

Lachenalia.—A batch of Lachenalia, so useful for greenhouses or conservatory, may now be potted. The corms should be shaken from the old soil and potted in a compost of rich loam, leaf-mould, coarse sand, and a little wood ashes and decayed cow-manure. Use pots 4½ or 5 inches in diameter, and provide good drainage. Five or six corms may be placed in each pot, covering them with soil and placing the pots in a cold frame. The soil may be watered once, but moisture will not be required again until the growths appear. Grow the plants as cool as possible. Provide them with shade from hot sunshine and plenty of air, preventing cold draughts, as these are apt to injure the foliage. As soon as the flower-spikes are seen a little manure-water may be used with benefit, but care must be taken to keep the manure-water from the foliage, and on no account permit overwatering during the winter months. Lachenalias are very effective grown in baskets or pans. It is not advisable to force them, as they are more satisfactory when grown in cool conditions.

Mignonette.—Seed of Mignonette should be sown for winter flowering.

Cyclamen latifolium.—Sow seeds of Cyclamen in pots or pans filled with a mixture of fine loam, leaf-mould, and sand. Distribute the seeds evenly at a suitable distance apart, and cover them lightly with fine soil. Give a thorough soaking with water, and then cover the pans with a sheet of glass, shading the latter with paper. Stand the receptacles on a shelf in a greenhouse, and take care that the soil does not become dry at any time. When the seedlings appear remove the glass by degrees, and accustom the plants gradually to more light, until finally they are pricked off singly into thumb pots. At this stage the seedlings should be placed as near to the roof glass as convenient, and grown during the winter in a temperature of 60° to 65°. Old plants require feeding, and a suitable stimulant is liquid manure made from cow or sheep dung supplemented with a little soot water. As the pots become filled with roots top dress the soil with Clay's fertiliser.

Poinsettia.—Re-pot Poinsettia plants into 6-inch pots, and re-pot the old plants if they require more rooting space.

Crassula coccinea.—These plants, which are often known in gardens as Kalosanthes, should be cut down as they pass out of flower, and the best of the growths selected for inserting as cuttings. Place three or more of the shoots around the edge of each 60-sized pot. Plenty of mortar rubble should be mixed with the soil, which must be of a fine, porous nature. Make the cuttings firm in the soil, and then place the pots under hand lights or bell glasses in a shady position either out of doors on an ash bottom or in a house facing north. When roots have formed afford plenty of ventilation to prevent the shoots from becoming drawn. Later the plants may be potted into 6-inch pots in a mixture of rich loam, leaf-mould and mortar rubble, adding a little coarse sand to keep the compost open. Grow the plants in a cool house or frame during the whole season. Those plants which were cut back may be potted into larger receptacles as soon as they have made new growth, but do not disturb the roots more than is unavoidable. These plants, being succulent, require very little moisture during the winter, and, as succulent plants are always very brittle, the inflorescences should be supported by stakes at an early stage.

Early Bulbs.—The earliest batch of Roman Hyacinths should be potted or boxed at once. In potting bulbs it is not advisable to ram the bottom soil; they should be simply pressed into the soil, and the latter made firm around them. When the work of potting is finished plunge the pots and cover them with a layer of cocoanut fibre, fine leaf-mould or manure from an old mushroom bed before the final covering of ashes is applied. Where large quantities of these plants are forced it is economical of both labour and pots to grow them in boxes. When the pots are removed from the layer of ashes liquid manure should, if the pots are filled with roots, be afforded the plants. Paper Narcissi should be treated in much the same manner as advised for Roman Hyacinths. See that the bulbs do not remain in the packing cases after they are received from the nurserymen; if it is not convenient to pot them at once spread them out on the floor in a cool house or in boxes.

Humea elegans.—Pot the seedling plants of Humea elegans singly into thumbs or small 60-sized pots, and grow them in frames close to the glass, keeping the atmosphere close and moist. Later, when they are re-established and growing again, the plants should be hardened gradually.

THE KITCHEN GARDEN.

By John Dunn, Foreman, Royal Gardens, Windsor.

French Beans in Pits.—If space is available in one of the glass pits, a plantation of Dwarf Beans should be made at once, in order to prevent a break in the supply occurring during the autumn. Protection from frost is necessary for this plantation, but not any artificial heat. The bed of the pit should be dug deeply, and a quantity of old potting soil or manure from a spent Mushroom bed mixed with it. Make the soil moderately firm, then draw shallow drills at 18 inches apart, placing the seeds 6 inches apart in the drills, and covering them with fine soil. Dwarf-growing varieties should be chosen for this purpose. At Windsor we grow the Belfast, the pods of which are gathered while quite small, and cooked for the Royal table whole. The lights should be removed from the pits until the weather becomes cold, when they should be washed and placed in position.

Tomatos.—Tomato plants in the open should be thinned freely, removing all side shoots and keeping the plants tied to strong sticks. Fruits have not set well so far, but when sufficient have been secured to furnish a crop, the main stem should be stopped and a liberal dressing of artificial manure applied to hasten the development of the fruits. Seeds may be sown now to produce plants for fruiting in winter. As soon as the young seedlings are large enough they should be potted singly into small pots and grown quite close to the roof glass, shifting them later into 6-inch pots, and using a compost composed of two-thirds turfy loam and one-third leaf-mould or thoroughly-decayed horse manure, with a sprinkling of coarse sand. These plants should produce ripe Tomatos in January and February.

Late Peas.—The latest batch of Peas should have the sticks placed in position before the plants fall over. New sticks should be used as far as possible. Give liberal supplies of weak liquid manure at least once a week.

Cucumbers.—Sow seeds of Cucumber for winter fruiting, placing the seeds in small, clean pots. If these are placed on a gentle hotbed the plants will be ready to put out about the third week in August. All the Year Round and Every Day succeed best at Windsor in winter, and are strongly recommended. It is best to make two plantations, one in the middle of August and the other in the first week in September; the earlier ones for fruiting in November and December, and the second batch in the New Year. Overcropping of these winter Cucumbers must be prevented.

SOCIETIES.

ROYAL HORTICULTURAL.

July 29.—At the meeting of the Royal Horticultural Society in the Vincent Square Hall on Tuesday last, visitors were unusually few. The exhibits, too, were fewer than usual, but the special show of the National Gladiolus Society contributed its quota to the display.

Orchids showed the greatest falling off in numbers, but several novelties were submitted to the Orchid Committee for award, and two of these received Awards of Merit.

The Floral Committee granted 11 Awards of Merit, and, in conjunction with the National Gladiolus Society, one First-class Certificate and seven Awards of Merit to varieties of Gladioli.

The Fruit and Vegetable Committee found little to inspect. This body granted three Awards of Merit to two varieties of Beans and one variety of Turnip respectively, after trial in the Wisley Gardens.

At the 3 o'clock meeting in the Lecture Room Prof. R. H. Biffen, M.A., delivered a Masters Memorial Lecture, his subject being "Some Factors in the Prevention of Disease in Plants."

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the chair), and Messrs. Jas. O'Brien (hon. sec.), R. B. White, W. Bolton, W. H. White, S. W. Flory, W. P. Bound, J. E. Shill, W. H. Hatcher, J. Charlesworth, W. Cobb, C. H. Curtis, T. Armstrong, A. McBean, F. Sander, Gurney Wilson, C. J. Lucas, R. G. Thwaites, A. Dye, R. A. Rolfe, and Sir Harry J. Veitch.

The meeting was of the kind usual at this season of the year, the exhibits being interesting, but with fewer novelties than there are earlier in the season, and the groups restricted in size and number.

Messrs. Sander and Sons, St. Albans, were awarded a Silver Banksian Medal for a group specially interesting in rare species, some of which are not yet identified, and which included a singular Bulbophyllum from West Africa, and a charming species near to Platanthera iantha. The plant was of erect growth, the spike bearing a head of cream white flowers with large rosy-lilac labellums. Oncidium Sanderæ, the elegant species of O. Papilio section, was shown, together with O. Papilio for comparison. O. luridum guttatum, the rare Dendrobium Griffithianum, D. ciliatum annamense, Angnloa eburnea, with a large, pure-white flower; the fine white Cœlogyne Mayeriana, Cirrhopetalum biflorum, Bulbophyllum galbinum, Ancistrochilus Thompsonianus, the pretty little scarlet Lælia monophylla; Masdevallia bella and other Masdevallias; a selection of Lælio-Cattleyas, the best of which was the finely-coloured L.-C. Bletchleyensis The King; Odontioda Wilsoni, O. Charlesworthii and other hybrids were also included; some Brasso-Cattleya albanense (C. Aclandiæ × B. Digbyana), has cream-coloured sepals and petals, striped and dotted purple, and distinctly three-lobed, fringed lip, veined with rose.

Messrs. Charlesworth and Co., Haywards Heath, were awarded a Silver Banksian Medal for a group of finely-grown specimens, the principal plants being Angræcum Eichlerianum (see Awards). Odontoglossum ardentissimum xanthotes with nine-branched spike of 60 white flowers; O. Rolfeæ, also with a branched spike; Peristeria elata, the rare Houlletia Wallisii, Odontioda Keighleyensis, Paphinia cristata, two finely-flowered Miltonia Roezlii alba, the elegant little Oncidioda Charlesworthii (Oncidium incurvum × C. Noezliana), Cattleya Warscewiczii delicata and a very interesting Schombolælia obtained from a cross between S. tibicinis and L. tenebrosa. The flower resembles L. tenebrosa, and is bronzy-orange with rose-veined lip.

Messrs. Jas. Veitch and Sons, Chelsea, were awarded a Bronze Banksian Medal for a small group of very finely flowered Disa grandiflora raised from seeds, sown less than three years ago, and now blooming on very stout spikes, the flowers being large and of a brilliant scarlet. A very dark form of Lælio-Cattleya callistoglossa was also shown.

Messrs. Hassall and Co., Southgate, secured a Bronze Banksian Medal for a group in which were several good examples of Cattleya Thurgoodiana, some good forms of C. Dowiana, a fine Odontoglossum percultum, an interesting cross between Cattleya Bowringiana and C. Skinneri, and the fine yellow Acineta Barkeri.

R. G. Thwaites, Esq., Chessington, Streatham (gr. Mr. J. M. Black), was awarded a Bronze Banksian Medal for a small group of splendidly grown Orchids, including several of the very attractive Odontioda Thwaitesii; the fine white-petalled Cattleya Warscewiczii Frau Melanie Beyrodt, C. F. W. Wigan, and several C. Caduceus (Gaskelliana × granulosa), that named Imperialis, with pink-tinted flowers, having purple-veined lip.

Sir Jeremiah Colman, Bart., Gatton Park (gr. Mr. Collier), showed as Aërides odoratum album, a species with a spike of white flowers, which the committee decided was a form of Aërides virens; Miltonia vexillaria Queen Alexandra, Gatton variety, a large flower tinted with pink; and M. vexillaria radiata splendens, a large variety with a fine mask of radiated deep rose-coloured lines on the lip.

Pantia Ralli, Esq., Ashtead Park, sent Odontioda Keighleyensis Ashtead Park Variety, scarlet, with some yellowish-white markings on the petals; Odontoglossum eximium Mrs. Ralli, a large flower, finely blotched with purple, and Miltonia Charlesworthii var. G. Hunt (see Awards).

Sir Trevor Lawrence, Bart., Burford (gr. Mr. W. H. White), showed the rare Odontoglossum Galeottianum, the singular Bulbophyllum odoratissimum, Maxillaria fractiflexa, with slender segments with curiously twisted petals and Dendrobium polyphlebium. Also a fine basket of Habenaria rhodochila (see Awards).

De B. Crawshay, Esq., Rosefield, Sevenoaks (gr. Mr. Stables), sent Odontioda Desdemona (C. Noezliana × O. Othello), with broad and finely-shaped light-red flower, and Odontoglossum Queen Alexandra var. Theodora (see Awards).

Messrs. Manda, St. Albans, showed three well-flowered Cattleya Gaskelliana, and a dark C. Warscewiczii.

AWARDS.

Award of Merit.

Miltonia Charlesworthii var. Mrs. Ralli (*M. vexillaria Memoria G. D. Owen* × *M. Hyeana*), from Pantia Ralli, Esq., Ashtead Park, Surrey.—A form of the fine hybrid which secured a First-class Certificate at the last Chelsea Show. The present variety was of a delicate rose pink tint, with white margin, and white base to the lip, on which was an intensely dark triangular maroon mask, with short lines in front, and a ruby-red, oval blotch at the base of each petal.

Odontoglossum Queen Alexandra var. Theodora (*Harryanum* × *triumphans*), from De B. Crawshay, Esq., Rosefield, Sevenoaks (gr. Mr. Stables). The best of the fine batch, for two of which Mr. Crawshay had previously obtained Awards. The variety Theodora closely approaches O. Harryanum, especially in the fine white front to the lip and its rose-purple markings. Sepals and petals yellow, heavily marked with chestnut-brown.

Cultural Commendation.

To Mr. W. H. White, Orchid grower to Sir Trevor Lawrence, Bart., K.C.V.O., for a basket of about twenty plants of Habenaria rhodochila, all propagated from two or three original plants. The specimens were dwarf and bore heads of light orange-coloured flowers, some with a rose tint.

To Messrs. Charlesworth and Co., Haywards Heath, for a tall specimen of Angræcum Eichlerianum, with fifteen large, white-lipped flowers distributed over the whole length of the stem.

Floral Committee.

Present: H. B. May, Esq. (in the chair), Messrs. G. Reuthe, C. T. Druery, Chas. Dixon, John Dickson, W. Bain, W. J. Bean, E. A. Bowles, W. A. Bilney, Jas. Hudson, J. W. Moorman, Thomas Stevenson, C. R. Fielder, Chas. E. Shea, Chas. E. Pearson, J. T. Bennett-Poë, George Paul, Arthur Turner, R. C. Reginald Nevill, W. Howe, R. Hooper Pearson, W. B. Cranfield, R. C. Notcutt, John Jennings, George Gordon, and E. H. Jenkins.

Messrs. H. B. May and Sons, The Nurseries, Edmonton, showed stove and greenhouse Ferns in variety, for which a Silver Flora Medal was awarded. Tinted Adiantums such as A. Veitchii, velutinum and pulverulentum were all pretty. Choice Nephrolepsis were shown in N. exaltata superba and the finely dissected variety Willmottæ. Other good things were shown in Drynaria quercifolia, Asplenium radicans, Pteris cretica Childsii, Polypodium Vidgenii, Lomaria Pattersonii, Davallia assamica, and Niphobolus lingua.

Mr. L. R. Russell, Richmond, staged a collection of stove and greenhouse plants. This exhibit was a pleasing change from the numerous groups of hardy flowers, and was one of the best displays in the Hall. This nurseryman always shows the beautiful Anæctochilus well, and his plants of A. petola were delightful; the leaves resembling green velvet with tracery of gold, like fine filigree work. Codiæum (Croton) Mars, C. Thompsonii, yellow and green; Maranta insignis. Cyperus alternifolius variegata, Homalomena picturata, Aralia Veitchii, Dracæna Sanderiana, and Saxifraga sarmentosa bicolor were all excellent. Mr. Russell also exhibited large plants of Hydrangea hortensis finely in flower. (Silver Flora Medal.)

Messrs. James Veitch and Sons' exhibit of Gloxinias was as meritorious for the fine quality of the plants as for the excellence of the strain, which received an Award of Merit. The plants were raised from seed sown in January last, yet these six months old seedlings were perfect models, each bearing several excellent blooms. They were arranged in batches of distinct colours, the most striking shade being indigo-blue. Those with crimson petals and cream-coloured throat, the picotee-edged varieties, and the spotted sorts were all charming. As a separate exhibit Messrs. Veitch showed the graceful Thalictrum dipterocarpum with tall, loose plumes of mauve and yellow blossoms. (Silver Flora Medal.)

Messrs. W. Cutbush and Son, Highgate, filled a large table with tender foliage and flowering plants, Caladiums, and a large batch of the beautiful rosy-coloured Coleus Cordelia showed to advantage in a setting of the more sombre greens and greenish-yellows of Ferns, Palms, and Dracænas. This firm also showed varieties of Chrysanthemum maximum, known in America as Shasta Daisies. "The Speaker" was the largest flowered variety, and Kenneth has fimbriated flower heads. (Silver Banksian Medal.)

Mr. James Douglas, Great Bookham, showed border Carnations, including the novelties, Rosy Morn, a beautiful shade of rose; Mrs. Elliot Douglas, yellow; Mrs. Andrew Brotherstone, a flower with white spots on a clove ground and beautifully scented; and Basuto, crimson-maroon. (Silver Banksian Medal.)

Messrs. W. Paul and Son, Ltd., Waltham Cross, showed Roses, representing the more recent varieties raised by this firm. There were vases of the beautiful Juliet, a large batch of the H. T. Ophelia, of exquisite shape in the bud, and showing a touch of gold at the base of the pale pink petals; Lady Downe, buff-yellow; Bianca, creamy yellow; and Mrs. Chas. Hunter, rosy-carmine. (Bronze Banksian Medal.)

Messrs. Bakers, Wolverhampton, exhibited varieties of coloured Astilbes (Spiræas). Venus showed most tinting, a shade of pink; Ceres is flushed faintly with purple on a pink ground. (Bronze Flora Medal.)

Mr. Chas. Turner, Slough, showed a collection of shrubby Spiræas, for which a Bronze Flora Medal was awarded.

Messrs. Sutton and Sons, Reading, exhibited a large batch of the "red" Sunflower, which originated in America. The colour is reddish-brown. The value of the plant for breeding may be considerable. A hybrid, with Helianthus cucumerifolius, was shown, and this has great promise as a border plant. The flowers are not so heavy as in the "red" variety, whilst the yellow ground is much brighter. (Bronze Flora Medal.)

Mr. Amos Perry, Enfield, was awarded a Silver Gilt Banksian Medal for Astilbes, Nymphæas, and other hardy flowers. A fine feature was a pool of water planted with Nymphæas, and backed by masses of the golden Senecio macrophylla, S. Veitchianus, and S. lingulata, with Bocconia cordata, interspersed. Iris Kæmpferi contributed bright colours, and a border of Ferns to the pond completed this imposing portion of the group. Anomatheca cruenta, a pretty little

bulbous flower of coral-pink colour, with a maroon tinted base, Lilium longifolium formosum and a fine mass of Achillea Perry's White were other good features.

Messrs. Phillips and Taylor, Bracknell, Hertfordshire, showed a group of border flowers and Lily pool, the latter planted with fine Nymphæas, including the varieties Wm. Falconer, crimson; Carnea and Gladstoniana, the last being especially good. The double Arrowhead, Sagittaria japonica plena, associated well with the Water Lilies. (Silver Banksian Medal.)

Hardy flowers were shown well by the Guildford Hardy Plant Nursery, including Adenophora Potaninii, with china-blue, Campanula-like flower; Sidalcea Listeri, a pale pink mallow; and Dracocephalum virginianum album.

Messrs. Wares, Ltd., Feltham, exhibited a very large group of hardy flowers, for which a Silver Banksian Medal was awarded. Veronica virginica alba, with tall spikes of bloom; Galega Hartlandii, a pretty pale mauve and white Goat's Rue; and Campanula grandiflora, with flowers a fine shade of blue, were noticed in this extensive collection.

Mr. Maurice Prichard, Christchurch, Hampshire, showed, in a collection of hardy flowers, Delphinium, Mrs. Brunton; Montbretia, Mrs. Geo. Davison; Stokesia cyanea præcox, Liatris spicata, and the new Campanula Tenori, var. maculata, Campanula acutangulosa, and Rhododendron lanatum. (Bronze Flora Medal.)

Mr. James Box, Lindfield, Haywards Heath, exhibited a large floor group of hardy flowers, for which a Silver Banksian Medal was awarded. The principal subjects were Phloxes, Sweet Peas, and Gladiolus "Halley," which received an Award of Merit last season. At the back was a large mass of Aconitum, Sparks's variety, a fine dark blue flower, distinct in shade from any other Monkshood.

Mr. H. J. Jones, Ryecroft Nurseries, Hither Green, showed pot plants in 52 varieties of border Phloxes, and was awarded a Silver Flora Medal. This excellent exhibit was staged on the floor and was very pleasing with its background of small Bamboos and border of Helxine Soleirolii and Adiantum Ferns. Of the Phloxes, we admired nana cœrulea, Fort de France, salmon-pink; Widar, mauve, with white centre; Rosenberg, violet-purple; and Mrs. R. C. Pullin, salmon-pink.

Messrs. W. Wells, Ltd., Merstham, Surrey, showed border Phloxes in variety, including Arthur Rane, salmon and white; Aurora, scarlet; Richard Strauss, violet-purple; and Antoine Mercie, lavender and white, these representing good new sorts. (Silver Banksian Medal.)

Messrs. W. Fells and Son, Hitchin, put up a rockery and planted it with suitable alpine and border flowers.

Messrs. J. Cheal and Sons, Crawley, showed border flowers in variety and vases of rambler Roses.

Messrs. Carter, Page and Co., London Wall, exhibited varieties of Antirrhinum and Violas, for which a Bronze Banksian Medal was awarded.

Awards of Merit

Carnation Rosy Morn.—A deep rose-pink self border variety. The large flower has a full, deep centre. Both calyx and stem are good, but the variety possesses little fragrance. Shown by Mr. J. Douglas.

Fig. 40.—Dendromecon rigidum: flowers bright yellow.
(R.H.S. Award of Merit on Tuesday last.)

"*Red*" *Sunflower.*—A strain of "Red" Sunflowers (Helianthus annuus), in which the yellow of the ray is more or less obscured by a reddish-brown band, the red on yellow producing a dull brown, which is effective in sunlight. The strain owes its origin to H. lenticularis var. coronatus, a banded form of a Colorado Sunflower, collected by Prof. Cockerell, of Boulder University, which Messrs. Sutton crossed with H. annuus. The resultant strain has the vigour and habit of H. annuus, reaching 8 to 10 feet in a good border, and 90 per cent. of the seedlings are said to have the brown band more or less in evidence. Shown by Messrs. Sutton and Sons.

Rose Annie Crawford.—A vigorous H.P. variety raised by Dr. J. Campbell Hall from the varieties Mrs. J. Laing × Capt. Hayward. The flowers are of great size and depth, much resembling those of Mrs. J. Laing in form and colour—a clear light pink, with deeper shades in the opening bud. The petals are very large and have a distinctly waved margin. The blooms are fragrant. Shown by Mr. W. R. Hammond.

Sweet Pea King White—A very large, pure white flower with much frilled standards. The habit is excellent and all the stems carried four blooms. It was raised by Mr. Malcolm, of Duns.

Sweet Pea Dobbie's True Lavender.—This is a good Spencer form, having the true Lady Grisel Hamilton colour—a pale mauve-shaded lavender. The stems each carried three or four large flowers, with waved standards. Both these varieties were shown by Messrs. Dobbie.

Dendromecon rigidum.—A sub-shrubby Poppy with large, bright yellow fleeting flowers and rigid, erect stems. It has the curious habit of bearing its flowers singly at the end of the shoot, and further growth, which soon overtops the faded flower, is taken up by two lower axillary shoots which bear buds at the end and are extended in the same way. The foliage is flat, leathery and glaucous, lanceolate in shape and with a finely serrated edge. This is an old garden plant, but remains scarce though hardy and reaching some ten feet in height when given a favourable position at the foot of a south wall, such as that given to the allied Romneya Coulteri. Shown by Sir Trevor Lawrence, Bt.

Gloxinias, Veitch's strain.—This is an admirable strain of large-flowered forms showing a wide range of colour which was mostly represented by strong-flowering young seedlings only six months old. On one side Messrs. Veitch are working for a deep, self-coloured crown and a clear, white, unspotted throat; the deep violet-purples and crimsons showed these characters well. Others have large, flatter flowers wholly covered with a delicate spotting. Pure white, Rose-edged White, Plum-purple and deep crimson self were other selected forms which were much admired. The whole exhibit showed fine culture and care in selection. Shown by Messrs. Jas. Veitch and Sons, Ltd.

Spiraea (Sorbaria) arborea var. grandis.—This is a shrubby Chinese species with pinnate leaves belonging to the same section as S. Aitchisonii and S. sorbifolia. The shoots exhibited showed very large, conical, branched heads (some 18 inches in length and 15 to 18 inches broad at the base) consisting of densely-packed, small creamy white, strongly-scented flowers, each only a quarter of an inch in diameter. The foliage consists of about nine pairs of lanceolate tapering leaflets, which are deeply and closely feather-veined and finely serrated at the edge. The leaflets are each about 4 inches in length by 1 inch in breadth. They are not so sharply serrated as in S. sorbifolia, and are much larger and duller than in S. Aitchisonii. Shown by the Hon. Vicary Gibbs.

Clematis tangutica var. obtusiuscula.—This variety has the elegant, finely-divided, glabrous foliage of the type, with five to seven leaflets each ternately divided, and wiry, purple stems which are held up by the tendril-like stalks to the leaflets. The flowers are nearly globular, from ½ to ¾ inch in diameter, golden-yellow, mostly solitary in the leaf axils and pendant at the end of stiff pedicels 4 or 5 inches long. The four "petals" are glossy on the inner surface and curiously and sharply folded at the margin. A distinct plant raised from seed collected by Mr. G. Fenwick-Owen in the Chow district of West Kansu in 1911. Shown by F. C. Stern, Esq.

Nymphaea Escarboucle (Marliac, 1909).—This fine hybrid Water Lily is, without exception, the most richly coloured of all. The colour is of a uniform vermilion-red, the stamens also are of the same colour, but of a deeper shade. The flower possesses great substance, notably in the sepals, and is some seven or eight inches in diameter. In every respect it is a most remarkable variety.

N. Colossea (Marliac, 1901).—This variety has now been some few years in cultivation, but its merits as a vigorous grower and an abundant bloomer have not been generally recognised. It blooms both early and late in the season, and the flowers are sweetly scented. They are of the largest size, some 9 to 10 inches in diameter, with broad and elongated petals. The colour resembles N. Marliac rosea, but is of a deeper tint. The variety is one of the very best Water Lilies for planting in deep water; a depth of six feet is not too much. These two Nymphæas were shown by Mr. Leopold de Rothschild, Gunnersbury House, Acton (gr. Mr. James Hudson).

Awards to Gladioli.

The following awards were made by a Joint Committee of the Floral Committee and the National Gladiolus Society.

First-class Certificate.

Gladiolus Electra.—A fine Childsii variety, with large flowers and bold, well-balanced spike of some 15 flowers and buds. The colour is deep scarlet in the bud. When open it varies from a bright scarlet self and sometimes shows a rich rose-pink in the upper petals. On the lower inner petal (generally on only one and not on two, as is the rule) is a light cream band with a central, scarlet blotch. Shown by Mr. P. Hopman, Hillegom.

Awards of Merit.

Gladiolus Prince of Wales.—The flowers of this variety are of a soft orange or salmon-pink, with a small yellow blotch on the two lower inner petals. They are of the same type as Halley, but the spike is stronger, carrying fifteen buds and flowers. This was adjudged the premier salmon-coloured variety. Shown by Mr. C. van Zanten, Hillegom.

G. Frank Paddleton, Jr.—The colours of Pink Beauty are reproduced in this variety, which has flowers the size of those of G. Childsii—a pleasing pink, with large crimson-scarlet blotch on the lower inner petals. The flower is neat, but the spike rather weak, as only three flowers appeared to remain open together. Shown by Mr. Firma P. Vos Mz, Sassenheim.

G. King of the Blues.—The deepest velvety violet-purple self. The flowers are small, as in the Lemoinei section, but the spike is bold and full. The colour is much darker than in the invaluable Baron Joseph Hulot, and is a pure self, except for a minute splash of white on the two lower inner petals. Shown by Mr. K. Velthuys, Hillegom.

G. Pink Perfection.—The flowers are a very pure and lovely shade of uniform clear soft pink, the outer petals showing a faint splashing towards the margin in a deeper shade. There is no blotch, but a scarcely seen touch of purple is present in the centre. The flowers are of a very fine texture. Shown by Mr. P. Hopman, Hillegom.

G. Incontestable.—A well-formed, round flower with white petals; a large scarlet blotch on the lower inner segments lights up the bloom. It resembles the variety Willy Wigman, and has the weak spike of that variety, but the flowers are a little smaller and the white is quite pure, not pink shaded. Shown by Messrs. Alkemade and Co., Noordwijk.

G. Liebesfeuer—A striking coral-scarlet self variety with a very smooth petal of Canna-like texture. The flowers are large and the spike good. There is a thin purple line down the centre of the two lower inner petals, but it is insufficient to mar the intensity and purity of the self colouring.

G. Loveliness.—This is a large, finely-formed, smooth-petalled flower in a strong, bold spike, carrying as many as eight blooms in good condition, expanded at the same time. The colour is cream, with a faint suffusion of buff or apricot except on the inner petal, which is primrose, and has a few purple lines and dottings at the throat. The blue anthers set off the purity of this noble flower. These two shown by Mr. de Ruyter, Noordwijk.

Other Novelties.

A pan of the lovely Chinese Gentian, Gentiana Veitchiorum, was shown by Messrs. J. Veitch and Sons, who, on August 31, 1909, secured an Award of Merit for it under the name of G. ornata. The habit is low, the solitary flowers much resembling those of G. acaulis, but the flower stem is more leafy, and the compact glossy foliage is much narrower. The great value of the plant lies in its late-flowering habit.

Campanula Tenori var. Somerville.—An interesting hybrid between C. Tenori ♀ × C. pyramidalis ♂ was shown by Mr Maurice Prichard. It has the spike of C. pyramidalis, rising to a height of five feet, but the blue centred flowers and tough foliage show the influence of the mother plant. It is hardy, and its long spikes are showy.

Fruit and Vegetable Committee.

Present: A. H. Pearson, Esq. (in the chair), Messrs. Jos. Cheal, Geo. Woodward, Owen Thomas, J. Jaques, A. Grubb, J. Davis, and S. T. Wright (secretary).

Lady Wernher, Luton Hoo (gr. Mr. A. W. Metcalfe), showed fine Muscat of Alexandra Grapes and twenty Melons of the varieties Ringleader and Hero of Lockinge. (Silver Knightian Medal.)

A Cultural Commendation was awarded to Mr. James Hudson, gardener to Leopold de Rothschild, Esq., Gunnersbury House, Acton, for an excellent plant of Bourgassotte Grise Fig, propagated from a cutting rooted on February 2 last. The plant had made excellent growth and was furnished with several fruits.

Awards of Merit.

French Beans Sunrise and Perpetual, both from Messrs. J. Carter and Co., and a selection of *Turnip Snowball*, from Messrs. Sutton and Sons. These vegetables were grown under trial at Wisley, and proved to be very abundant croppers. Sunrise is of very dwarf habit and has small leaves, two desirable points in a forcing variety.

HORTICULTURAL CLUB.

VISIT TO FRIAR PARK.

On Thursday, the 24th ult., a party consisting of upwards of sixty members and friends of the Horticultural Club took part in the annual excursion. By the kindness of the President, Sir Frank Crisp, Bart., the afternoon was spent in the beautiful grounds at Friar Park, and as the weather was extremely fine the gardens were seen to the best advantage. The party started from Paddington in saloon carriages at an early hour in the morning, and proceeded to Marlow. Here they alighted, and walked down to the riverside, where the President's launch was waiting to convey them to Henley. Alighting at the boathouse, the party were entertained at lunch by Sir Frank and Lady Crisp, after which they drove to Friar Park, and spent a delightful afternoon in the gardens. Sir Frank did the honours himself, assisted by his head gardener, Mr. P. Knowles, and although many of the guests had already visited the grounds, there seemed to be some new plant or fresh effect at almost every turn. The Alpine gardens and rockeries, the Japanese gardens, the old Tudor and Elizabethan gardens, the Rose gardens, all were visited and admired.

The Alpine garden, with its representation of the snow-capped Matterhorn, produces a wealth of flowers from early spring until late autumn. Many of the plants are rare as well as beautiful, and many of the colour effects would delight the eye of the artist. Large patches of purple Aubrietias, white Saxifrages, and blue Gentians, Primulas of every tint, and Lithospermums of the loveliest blue, adorn the lower slopes; while the higher ground is occupied by such plants as Alpine Pinks, Arenarias and Androsaces. The rivulets

which run down the sides of the rocks are flanked with beds of Irises, and Marsh plants occupy the islands; while in the water Nymphaeas, white, rose, and yellow, raise their heads just above the surface.

The shrubberies are interesting by reason of the independence of their construction. The plants of which they are composed are not the conventional shrubs of the ordinary garden, but every plant which is above the average in attractiveness, and which can be got by any means to grow out-of-doors, is represented, and each is given the particular soil in which it succeeds best.

The Japanese garden has begun to show the softening effect of time—a great improvement. The most prominent feature consists of the bright golden-yellow, clipped Yews. Quaint conifers of great age are planted on the banks of a rivulet, spanned by a picturesque bridge, and ancient standard Wistarias fling down a shower of rosy blooms from their spreading branches. Below the waterfall, Azalea amœna shows its delicate mauve-coloured flowers, and rare species of many forms and hues adorn the banks of the stream. The Japanese Maples are well worth a study, the tints of the foliage being most remarkable.

The Tudor and Elizabethan gardens carry the visitor back in spirit to the sixteenth century, and the Herb garden and Topiary garden are extremely interesting. The Rose garden is beautifully arranged in the old style, with pergolas and pillars.

In the Orchid houses a speciality is made of those plants which are interesting by reason of the curious construction of their flowers. The purely ornamental kinds, however, are by no means despised, and at the present time a number of Lælio-Cattleyas and Brasso-Cattleyas are in bloom. A fine specimen of Aerides Fieldingii, and other Aerides; some beautiful Dendrobiums, including D. Falconeri, the slender stems of which bore a profusion of large white and mauve flowers; a good show of Odontoglossums, and scarlet Odontiodas; the fragrant yellow Cattleya citrina—these were among a few of the plants, for the proper examination of which the time available was only too short.

A new house has been constructed for the shelter of hardy or so-called hardy Alpines, which do not do well in our changeable English climate. The method pursued has been a great success, and many pretty Androsaces, Primulas, Saxifrages, Oxalis, and other plants bloom profusely, together with European terrestrial orchids of various kinds.

The Fern rockery is a beautiful sight, each Fern showing its own characteristic growth to perfection.

By the side of the lake there are caves which form the entrance to a succession of underground stalactite caverns. Through these the party was conducted; a stream runs through the centre, and a skilful system of lighting by electricity has been made to produce quite a weird effect.

The tour of the gardens took up the whole afternoon, and when it was finished the party again drove to the boat-house, there to partake of the excellent tea provided by their host and hostess. After tea the party re-embarked in Sir Frank's launch and proceeded to Reading, where the train was in readiness to complete the journey back to Paddington.

It was agreed by the whole party that nothing had been wanting to make the day a complete success, and Sir Harry Veitch, in a few appropriate words, offered the thanks of the club to the President and Lady Crisp. *J. O.*

NATIONAL GLADIOLUS.

July 29.—The exhibits at the second summer show of this society, which was held on Tuesday last, in conjunction with the fortnightly exhibition of the R.H.S., included a large collection of flowers from the Society's trial grounds at Southampton. Owing to the lateness of the season, which prevented English growers competing, the President's Cup, which is offered for the best exhibit of 20 varieties of Gladiolus, was not awarded. The several exhibits were judged on "points," and the competition will be continued on August 12, when the exhibitors of Tuesday may, if they wish, stage fresh collections, and the Cup will be awarded to the exhibitor obtaining the highest number of points on either day. The chief exhibitors on Tuesday were Messrs. de Ruyter and Hogewoning, Noordwijk, Holland; G. Zeestraten en Zonen, Oegstgeest; P. Hopman and Sons, Hillegom, Holland; and Messrs. Kelway and Son, Langport, Somerset.

Group of Late-Flowering Gladioli.—The 1st prize was awarded to Messrs. Van Waveren and Sons, Hillegom, for an excellent display, the finest spikes being of several unnamed Childsii seedlings and Salmonette, a dainty Lemoinei variety; 2nd, Mr. H. Barlow, Clapton, whose exhibit was bright and attractive; the three vases of the scarlet variety Seiger were very prominent.

Twenty-four Varieties of Late-Flowering Gladioli.—Mr. K. Velthuys, Hillegom, Holland, staged a splendid collection of strong spikes, well furnished with large and fresh flowers; those with blue and purple shades of colour being particularly good; 2nd, Messrs. Kelway and Son.

Twelve Varieties of Late-Flowering Gladioli; three spikes of each. — Messrs. Kelway and Son were the only exhibitors, and were awarded the Bronze Medal. In the class for 12 similar varieties, but of English origin, Messrs. Kelway were also the only exhibitors, but included some varieties not of English origin, and were disqualified.

Two Spikes of any New Seedling Gladiolus or Distinct Sport.—The Silver Medal was awarded to Mr. C. van Zanten, Hillegom, for Glory of Noordwijk.

The premier varieties in the colour classes were as follows:—*Premier Spikes. Yellow:* Nugget, shown by Messrs. Frylink and Zonen, Sassenheim. *Scarlet:* Liebesfueur, a well furnished spike of vivid scarlet flowers, shown by Messrs. Frylink and Zonen. *Pink:* Pink Perfection, shown by Messrs. P. Hopman and Sons. *Salmon:* Prince of Wales, shown by Mr. C. van Zanten. *White:* Europa, shown by Mr. K. Velthuys. *Blue:* Badenia, shown by Mr. G. Zeestraten.

G. primulinus hybrid.—No. 123, an unnamed variety, with large pink flowers, shown by Mr. G. Churcher.

Awards.

The awards were made after the society's trials at Southampton.

First-class Certificate.

Liebesfueur (see p. 94).

Halley, very strong spike of bright salmon-pink flowers, raised by Mr. K. Velthuys.

Awards of Merit.

Orby, rosy carmine, with occasional splashings of dull carmine.

Brooklands, bright shade of salmon-pink, with a white throat. These two varieties were raised by Messrs. Kelway and Son.

Ida Van, orange-scarlet, with white throat.

Golden King, rich yellow, with a carmine blotch on the lower segments. The names of the raisers were not stated.

LEAMINGTON AND COUNTY HORTICULTURAL.

July 23, 24.—Fine but cool weather favoured the fifth annual show of the Leamington and County Horticultural Society held on the foregoing dates.

Viewed collectively the exhibition was a success. Roses and vegetables were particularly good, but Carnations and Sweet Peas were shown in fewer numbers than hitherto. Of the 8 Silver Challenge Cups offered for competition, three were won outright on the present occasion, viz., two by Messrs. Gunn and Sons, Olton, and one by the Misses Robinson, Leamington. Electric light was installed in the tents and better provision than usual was made for ventilation. The general arrangements were satisfactory.

Plants (Open).

Twelve classes were provided for groups and specimen plants, and there was competition in all of them. The most important class was one for a group of plants arranged on ground space of 20 feet by 12 feet in the centre of a tent. Of the three contestants, two, viz., Messrs James Cypher and Sons, Cheltenham, and Sir George H. Kenrick, Whetstone, Edgbaston (gr. Mr. J. V. Macdonald), who were awarded 1st and 2nd prizes respectively last year, repeated their successes on the present occasion. The centre of each exhibit was marked by the familiar rustic bridge surmounted with graceful Palms and other beautiful plants. Both collections contained well-grown and highly-coloured Codiæums and a rich variety of flowering plants pleasingly arranged. 3rd, Mr. W. R. Manning, Dudley.

In the next class, which was for 12 stove and greenhouse plants, distinct, at least four to be in flower, in pots not exceeding 10 inches in diameter, Messrs. James Cypher and Sons again won the 1st prize. Included in their exhibit were particularly good specimens of Codiæum inimitabilis, C. Sunset, Bougainvillea Cypheri, Anthurium Scherzerianum and Ixora Pilgrimii. 2nd, C. C. Shaw, Esq., Thornbank, Leamington (gr. Mr. W. Bartlett), whose best specimen was Acalypha Sanderiana. The best of three exhibits of 3 Fuchsias came from Mrs. A. W. Jenkins, Westwood, Leamington (gr. Mr. M. Gobly), who had well-grown specimens 5-6 feet high covered with flowers from base to summit. 2nd, J. Murray Molesworth, Esq., Comyn Lodge, Leamington (gr. Mr. S. Bradshaw). 3rd, H. L. V. Pryse, Leamington. The same three exhibitors were placed as named in a class for 3 Zonal Pelargoniums, distinct. The 1st prize plants were splendidly grown and profusely flowered.

J. Murray Molesworth, Esq. (gr. Mr. S. Bradshaw), had the best of 5 exhibits in a class for 6 Tuberous-rooted Begonias, distinct, with 5 very large double-flowered varieties, and 1 single-flowered variety. The plants exhibited excellent culture. 2nd, Rev. F. W. Mason, The Firs, Warwick (gr. Mr. W. Philpot).

J. W. Lamplough, Esq., Leamington (gr. Mr. S. Vincent), won the 1st prize for 6 Gloxinias. 2nd, the Misses Robinson, Leamington (gr. Mr. A. J. Friend).

Sir George H. Kenrick had the best of 8 exhibits in a class for 6 table plants. 2nd, Messrs. W. Pemberton and Sons, Bloxwich, Walsall.

Albert Cay, Esq., Woodside, Kenilworth (gr. Mr. G. Marlow), won the 1st prize for three large handsome Ferns. The best specimen plant in flower was Pelargonium King of Denmark, bearing very large flower-trusses. It was exhibited by Mrs. A. W. Jenkins. 2nd, Alfred Holt, Esq., Leamington (gr. Mr. J. Fisher).

Cycas revoluta was adjudged the best foliage plant, and this was shown by C. C. Shaw, Esq. (gr. Mr. W Bartlett). 2nd, The Misses Robinson.

Roses (Open).

Roses have never been seen in better condition at Leamington. The quality of the flowers in the class for 24 Roses, distinct, shown by Mr. H. Drew, Farringdon, Berks, and Messrs. Gunn and Sons, Olton, Birmingham, were so extraordinarily good and evenly balanced that the judges had very great difficulty in separating the 1st from the 2nd prize lot. The decision was eventually given in favour of the first-named exhibitor, whose large shapely blooms were of good form and colour throughout. A few of the best varieties were Duke of Wellington, Dr. O'Donel Browne, Gloire de Chedane Guinoisseau, Edward Mawley, Caroline Testout, Comte Raimbaud, Maman Cochet, C. J. Grahame, George Dickson, Gladys Harkness, Frau Karl Druschki, Marie Baumann and Mrs. Stewart Clarke.

3rd Mr. W. H. Frettingham, Beeston, Nottingham, whose flower of Gustave Piganeau was one of the most perfect specimens in the show There were seven entries in this class.

Messrs. Chaplin and Collin, Leicester, exhibited the best 12 H.P. Roses, distinct. Included in this collection were superb specimens of Hugh Dickson and Countess of Rosebery.

The class for 6 H.P. Roses, one variety, was a good one, and here again Messrs. Chaplin and Collin secured the 1st prize with exquisite flowers of Gloire de Chédane Guinoisseau. 2nd, Messrs. Gunn and Sons, with Her Majesty.

Mr. Henry Drew showed the winning exhibit of 12 Tea Roses, distinct The varieties Bridesmaid and Mrs. Edward Mawley were the best of a really good lot.

Mr. W. H. Frettingham obtained the 1st prize in the class for 6 Tea Roses, one variety, showing Madame Jules Gravereaux in splendid condition.

Messrs Gunn and Sons, Olton, were the only exhibitors in an important class for a group of Roses—plants and cut flowers allowed—on a space of 12 feet by 4 feet. The conditions attached to the Silver Challenge Cup, value 25 guineas, offered as 1st prize, were that before becoming the absolute property of the winner it was necessary that it should be won three times in succession, or four times in all. The first-named condition having been complied with Messrs. Gunn and Sons now become the possessors of the cup. The flowers were beautifully arranged in vases, tall stands, and on arches, and included some of the best and latest varieties in cultivation.

Miscellaneous Flowers.

A Silver Challenge Cup of the same value, and under the same conditions as the last-named, was offered for 20 bunches of hardy flowers, distinct kinds (mixed bunches not allowed and Lilies and other bulbs, corms and tubers excluded). Here again Messrs. Gunn and Sons were the winners, and as they secured the trophy in 1911 and 1912 they enjoy the distinction of winning outright two cups in one year. Their exhibit included splendid bunches of Phlox Elizabeth Campbell, Lychnis chalcedonica, Scabiosa caucasica, Chrysanthemum maximum Mrs. Lowthian Bell, Campanula alliariaefolia and Anchusa italica Dropmore variety; 2nd, Mr. Frank Bouskell, Nuneaton, the winner of the cup in 1910. This exhibitor had a very fresh collection of flowers, but hardly displayed to the best advantage. He had beautiful bunches of Catananche cœrulea, Potentilla Marie Lemoine, Œnothera Fraseri, and a seedling Poppy raised from the variety Mrs. Perry; 3rd, Mr. C. H. Herbert, Acock's Green.

In a class for 12 bunches of hardy flowers, distinct kinds, Mr. Frank Bouskell was 1st and Mr. C. H. Herbert 2nd. The flowers of each exhibitor were beautifully fresh and well set up. Mr. Bouskell's examples of Papaver Mrs. Perry, Achillea Ptarmica The Pearl, Helenium cupreum and Gaillardia meteor were of outstanding merit.

Miss Greenfield, Leamington, excelled in a class for a bouquet composed of Orchids, and Messrs. Perkins won the 1st prize for a bridal bouquet. The Misses Robinson were awarded the 1st prize for three sprays of flowers suitable for a lady's dress. The same exhibitors were the only contestants in a class for 24 Dahlias to include 12 Cactus varieties. W. J. Gresson, Esq., Birlingham House, Pershore (gr. Mr. T. Parry), showed 12 bunches of annuals for which he was awarded the 1st prize.

Messrs. W. Pemberton and Sons, Bloxwich, Walsall, had some handsome Violas in a class reserved for 6 varieties, and they were deservedly awarded the 1st prize.

Carnations.

Messrs. Young and Co., Cheltenham, had a "walk over" in a decorative class for cut Carnations arranged in a space of 10 feet by 4 feet, for which a Silver Challenge Cup and £4 were offered as 1st prize. Messrs. Young's flowers were remarkable for good quality and artistic arrangement.

The 1st prize for 12 vases of Carnations, to include at least 6 varieties in a vase, was won by Messrs. A. R. Brown, Ltd., King's Norton, whose collection contained Border and Tree varieties of superb quality. The varieties Clement, Alba and Mandarin stood out well; 2nd, J. B. Akroyd, Esq., Birdingbury Hall, Rugby (gr. Mr. F. Daniel), who showed large Malmaison varieties.

Mr. R. G. Rudd, King's Heath, won the 1st prize in the next class, which was for 12 Border Carnations. He had shapely flowers of Etna, Titan, John Knox, Daffodil, Wyatt, Mrs. Robert Gordon and Lilian. 2nd, Mr. C. H. Herbert, Acock's Green, whose blooms were almost equal to those of the 1st prize winner, but lost points in arrangement. The varieties Mrs. George Marshall, Mrs. Robert Berkley, and Daffodil were very fine.

In a class for 12 fancy Border Carnations, Mr. W. H. Parton, Moseley, was placed 1st with exquisite specimens of Mrs. Leo Hunter, Linkman, Forester, Hercules, and Sam Weller. 2nd, Mr. C. H. Herbert, whose best flowers were Sam Weller, Melton Prior, Kingfisher, and Liberté. 3rd, Messrs. A. R. Brown, Ltd.

(To be concluded.)

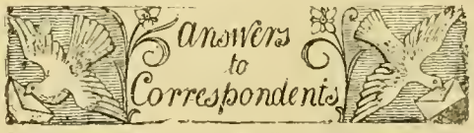
TRADE NOTE.

ROBERT SYDENHAM, LTD.

We understand that the business of Robert Sydenham, Ltd., will not be affected by the unfortunate death of Mr. Sydenham. A few years ago Mr. Sydenham founded a private limited company for the purpose of giving some of the older employees an interest in the business and of relieving Mr. Sydenham of some of the details in the management. Mr. Herbert Smith will act as managing director.

Obituary.

Leonard Lille.—We regret to record the death, at the age of eighty-two, of Mons. Léonard Lille, a well-known nurseryman of Villeurbanne, near Lyons. For some time past Mons. Lille had been unable to take an active part in the business, which is carried on by his sons, Louis and Jean Lille.



Clover on the Lawn : *W. T.* As lawn sand and nitrate of soda have proved ineffectual, you might try the effect of a plentiful dressing of finely-sifted manure applied towards the end of the year, and a dressing of sulphate of ammonia in the spring. These will promote the growth of the grass, and diminish the growth of the Clovers.

Correction.—In the obituary notice of Mr. Sydenham (see page 75), the last-mentioned figures at the bottom of col. 1 were given us in error; they should read 35,000.

Figs Falling : *P. H. R.* We think it probable that your Fig trees are attacked by a disease known as Cercospora Bolleana, which would have the effect of causing the fruits to drop. We are unable, however, to give a definite opinion unless you send us a specimen fruit and some of the leaves for examination.

Lavender Water : *H. S. B.* You must first extract the essential oil by the process of distillation. The flower heads should be placed in a receptacle either of iron, copper or glass, covered with a dome-shaped lid, and fitted with a pipe which is twisted like a corkscrew. The twisted pipe must be led into some receptacle which will hold cold water, the end of the spiral leading through the bottom, and fitted with a tap. The water in the still is made to boil, and, having no other exit, the steam passes through the pipe, which, being surrounded with cold water, condenses the vapour before it can arrive at the tap. The liquid which thus runs through separates on standing into two portions, the water being at the bottom. If it is placed in a glass funnel with a tap at the bottom it is an easy matter to run off the water A very concentrated perfume is made of Oil of Lavender 4 ozs., mixed with rectified spirit 5 pints, and Rose water 1 pint. This makes, when distilled, 5 pints of perfume. A simpler method is a mixture of Oil of Lavender, 4 ozs.; spirit, 3 quarts; and Rose water, 1 pint. This Lavender water is ready for use after it has been merely filtered.

Lily-of-the-Valley : *G. B. G.* Although the Lily-of-the-Valley is a shade-loving plant, a north aspect, such as you mention, is not entirely suitable. It must be remembered that spring-flowering plants, such as the Lily-of-the-Valley, which are found in woods, make their growth before the trees develop their full canopy, and that although the plants are shaded from the full sunshine, the broken rays of the sun reach them. A very sandy soil is not sufficiently moisture-holding, and it will be advisable to add a good proportion of loam and leaf-mould to the natural soil; making the three of equal proportions. The crowns may be lifted and transplanted at any time during their resting period, but the earlier in the winter the work is done the better will be next season's flowers. The bed may be left undisturbed for several years; an annual top-dressing of finely-broken loam, sifted leaf mould and fowl manure will be beneficial.

Name of Fruit : *H. W.* Apple not recognised. Probably a local variety.

Names of Plants : *H. W. Findon.* 1, Sedum spectabile; 2, Astrantia major; 3, Tradescantia virginica; 4, Artemisia abrotanifolium. —*Lucan.* Roses: 1, Bennet's Seedling; 2, Rosa lucida; 3, Léopoldine d'Orléans; 4, Flora; 5, Blush Boursault; 6, Queen Alexandra. — *North Devon.* Rose Crimson Damask. — *W. B. S.* Lonicera involucrata (Syn. Ledebouri). — *J. Bridge.* Rose Paul Lédé. — *Torboy.* Eriophorum polystachyum (Cotton Sedge).—*Constant Reader.* Photinia serrulata.—*Carnation.* We do not undertake to name varieties of Carnations or other florists' flowers. Send them to some grower who can compare them with varieties in his collection.—*Newlings.* Zenobia speciosa from S.E. United States. The name "Lily of the Valley Tree" is usually applied to Clethra arborea, a native of Madeira. Both plants belong to the Nat. Ord. Ericaceæ.—*H. T.* 1, Oncidium altissimum; 2, Brassia caudata; 3, Cœlia triptera; 4, Oncidium serratum; 5, Dendrobium Parishii. — *Foreman.* 1, Pteris arguta; 2, Adiantum formosum; 3, Blechnum occidentale; 4, Adiantum pubescens. —*C. G. A.* Genista tinctoria.—*J. S., Durham.* The trailer is Ceropegia Woodii, the other plant Ornithogalum longibracteatum.—*M. C.* The specimens are not numbered, and it is difficult to give you the proper names. The variegated plant is Euonymus latifolius variegatus; the double-flowered shrub Deutzia crenata; the single-flowered plant is a white-flowered hybrid variety of Veronica. Then there are some tiny crushed specimens of Campanula which we are unable to distinguish; and the remaining feathery-like plant is Artemisia pontica.—*W. J. M.* A species of Euphorbia; send when in flower.—*Kuro.* Danæa Laurus, commonly known as the Alexandrian Laurel.—*C. W.* Arthropodium cirrhatum, a native of New Zealand.—*P. R. C.* 1, Spiræa palmata; 2, S. Lindleyana; 3, Salix alba var. vitellina; 4, Rose, "Aimée Vibert."—*A. C. H.* 1, Pinus Pinea; 2, Thuya orientalis; 3, Abies cephalonica; 4, Cupressus macrocarpa; 5, Pseudotsuga Douglasii; 6, Abies nordmanniana.—*A. V. C.* Ulmus montana, not a Hornbeam.

Sweet Peas : *E. W. R.* It does not matter whether Sweet Peas are cut or pulled so long as they are carefully and regularly gathered. Probably cutting is of the two methods the less likely to be injurious to the plants, as leaves are sometimes pulled with the flowers, and if done carelessly the roots even may be strained. On the whole, therefore, we should advise cutting; moreover, the cut stalks absorb water more readily than pulled ones, and the flowers are thus likely to remain fresh for a longer period.

Vine Not Fruiting : *Col. D.* The Vine in question being in the middle of the house was probably shaded too much by its neighbours last season, which was very deficient in sunlight, hence the buds were not fully developed, and the growths were imperfectly ripened. As it is not bearing any fruit, we recommend you to shorten the lateral growths to about 1 foot in length.

AGRICULTURAL EDUCATION AND RESEARCH.

THE Board of Agriculture has summarised* the provision which has been made in the last few years for agricultural education and research in England and Wales. The grants which are now made for higher agricultural education amount to £18,500 per annum, and are distributed among the universities and agricultural colleges. Work of a less advanced character which is carried on in most of the counties is subsidised by the Board to the extent of £7,000 per annum. As the leaflet points out, grants are also available from the Development Fund for a further extension of this latter type of work, and particularly for the erection and maintenance of farm schools and farm institutes.

The leaflet gives an account in summarised form of the courses of study in agriculture provided at the several universities and university colleges. In addition to instruction in agriculture, courses in forestry are provided at the University College of Wales, Aberystwyth, which institution possesses at Chirk an experimental area of fifty acres for forestry purposes. The Cambridge school of forestry does not appear to possess at present any similar facilities, and students are required to attend a course of practical work for one long vacation in a British forest. Experimental plantations and tree nurseries exist at Cockle Park (Armstrong College), Newcastle-upon-Tyne, and H.M. Commissioners of Woods and Forests have placed the Chopwell Woods of 900 acres under the control of this College. A diploma of Forestry is granted by Oxford. At Cirencester the Royal Agricultural College has access to an area of 3,000 acres of woods, the property of Lord Bathurst, a forest garden of 10½ acres, an experimental area at Colesbourne, and two forest nurseries.

Horticultural instruction is provided at Wisley, Reading, Swanley, Wye, and Holmes Chapel; and at Wye attention is paid to commercial fruit growing. The National Fruit and Cider Institute at Long Ashton occupies about seventeen acres of land, two-thirds of which consists of orchards.

Of farm schools and similar institutions, the leaflet mentions the Bedford Agricultural Institute, Ridgmount, Aspley Guise; the Worleston Dairy Institute (Cheshire); the Farm School, Newton Rigg, Penrith (Cumberland and Westmorland); the Dairy School (Denbighshire); East Anglian Institute of Agriculture, Chelmsford (Essex); the Farm School, Basing (Hampshire); the County Council Farm, Hutton (Lancs); the Technical School for Girls, Redbrook (Shrewsbury); the Fixed Cheese School (Somerset); the Dairy School, near Nuneaton (Warwickshire); the Dairy School, Garforth, Leeds (Yorks); and the Droitwich Experimental Garden (Worcester).

For the purposes of agricultural research a sum of £31,000 per annum is distributed among some fourteen institutions. Of the latter the Imperial College of Science is responsible for research in plant physiology, the University of Cambridge and the John Innes Institute are named for plant breeding, Kew for plant pathology, Bristol University (and the National Fruit and Cider Institute) for fruit growing and the practical treatment of plant diseases, and Rothamsted for plant nutrition and soil problems. Provision is also made for supplying technical advice to farmers, and a grant of £12,000 has been made to eight of the University institutions to assist them in carrying on this advisory work in the regions in which they are severally situated. In addition to the provision for forestry referred to above, the Board refers to the Practical School of Forestry maintained by H.M. Office of Woods in the Forest of Dean and to the fact that £1,200 per annum is granted from the Development Fund in aid of research in forestry at Oxford, Cambridge, Bangor, Cirencester, and Armstrong College (Newcastle). From the same source £2,500 per annum is granted for the provision of technical advice in forestry. To give effect to this scheme England and Wales have been divided into five districts, and an advisory officer has been attached to a teaching institution in each district. In ordinary cases no charge is made for the services of the adviser. Those who wish for advice in forestry should apply to the advisory officer in charge of the district in which their woods are situated.

The districts and advisory officers are as follows:—

I. *Northern District.*—The Counties of Northumberland, Durham, Cumberland, Westmorland, Lancashire and Yorkshire. *Advisory Officer*—Mr. J. F. Annand, Armstrong College, Newcastle-on-Tyne.

II. *Welsh District.*—The whole of Wales (except Glamorgan), Cheshire and Shropshire. *Advisory Officer*—Mr. Fraser Story, University College of North Wales, Bangor.

III. *Central and Southern District.*—The Counties of Derby, Stafford, Leicester, Warwick, Oxford, Bucks, Berks, Surrey, Kent, Sussex, Hampshire and Dorset. *Advisory Officer*—Mr. B. B. Osmaston, School of Forestry, Oxford.

IV. *Eastern District.*—The Counties of Lincoln, Nottingham, Rutland, Northampton, Huntingdon, Bedford, Cambridge, Norfolk, Suffolk, Essex, Hertford and Middlesex. *Advisory Officer*—Mr. C. Hankins, 1, Free School Lane, Cambridge.

V. *South-Western District.*—The Counties of Hereford, Worcester, Gloucester, Monmouth, Wilts, Somerset, Devon and Cornwall; also the County of Glamorgan *Advisory Officer*—Mr. H. A. Pritchard, Royal Agricultural College, Cirencester.

* Leaflet No. 97.

STRAWBERRIES IN 1913.

THE strawberry season of 1913 has supplied a great contrast to that of 1912, and in almost every particular. Last year was one of the earliest—if not quite the earliest—season on record, outdoor English Strawberries being on the market well before the end of May, and a good supply of the fruit was available in the first week of June. This year picking began a full fortnight later in most cases, and in some of the usually early districts not until the middle of June. But whereas in the spring of 1912 much damage was done by frost owing to the exceptionally early blossoming of the plants, there was very little trouble of the kind this year. Up to the middle of May, however, the weather was by no means favourable for the development of the plants, for frequent rains had made the ground cold and sodden, and it was not until about three weeks before the time for gathering arrived that the plants really began to make the necessary headway. A sudden change of weather at that stage put matters right for the time being, but, as is so often the case in this country, extremes followed each other, and the plants soon suffered as much from drought as they had already suffered from an excess of wet and a lack of sunshine.

Strawberries have done best this year on the heavier and more retentive soils, where, during the hot and dry time of late May and June, they were able to obtain benefit from the coolness of the subsoil. But a good crop has only been obtained upon such heavy soils as have been kept well worked upon the surface, for the natural result of much wet followed by drying winds and hot sun was that the ground began to crack as the moisture was drawn out of it, and where the use of the hoe was neglected, things speedily went from bad to worse. Never has the value of hoeing been better exemplified than this season. To a lesser extent the same remark applies to the lighter soils, but on these, notwithstanding constant hoeings and application of mulches, the crop has been disappointing, except where the ground was heavily manured last autumn. It is, of course, inevitable that soils which are incapable of storing moisture should

yield less satisfactory results in a dry period than those of a heavier and more retentive character. But the grower who keeps his garden most free from weeds is the one whose crops suffer least on such occasions. After the middle of May there was no difficulty in keeping the weeds under, and where this was done, the Strawberry plants were able to hold out much longer than in those gardens where weeds had been permitted to rob them of a large proportion of the available moisture.

The quality of the fruit has been excellent this year, but both as regards size of berry and amount of yield the crop has suffered on account of drought. The berries matured with a rush, and in many cases were soon over, but at no time was the glut of fruit so bad as it was in 1911 and 1912. North of England and Scottish growers have done well this year owing to the short duration of the Southern crop, and prices all through the season have ruled a little better than usual. In a season such as this, it would have paid the South Country growers to have had a large acreage of late varieties, for the showers of July would have helped the plants, and the berries would have come in useful for late season functions. But, on the whole, the early crop will probably always be the most satisfactory for growers in the South, as competition from the North becomes keener every year. On the whole, it may be said that the Strawberry crop of 1913 has been satisfactory, for although the yield has been much lighter than that of last year, the harvesting of the berries has been a much more easy matter, and slightly better prices have helped out the ultimate result. *East Sussex.*

THE VILLAGE FLOWER SHOW.

SOME OF ITS LESSONS AND HUMOURS.

It is incumbent on everybody interested in "rural revival" to do his utmost to make the country-side yield profitable lines and side-lines to the workers who choose to remain there.

Begin at the beginning with the youthful minds. The children can win prizes at the village flower show without spending a penny. Purposeful flower-picking in the meadows, by the streams, or on the hill-sides contributes not a little to a life-long contentment with simple pleasures, and may likewise help to form the æsthetic sense. Some of the lads will become amateur, practical, or professional gardeners, and gardening is universally admitted to have an uplifting effect upon all those who engage in it. A young married woman will always encourage her husband to do his best in the flower or kitchen garden; and with such encouragement he most assuredly will, even if dead tired after a hot summer day's back-breaking toil, show much devotion to his flowers, fruits, or roots. Becoming enthusiastic over his paying hobby, and fully occupied while ever there is any daylight, he will rarely darken the doors of a public-house, or care what remarks the idlers at the village crossways pass about him. The consequence is that he becomes a better workman and a useful member of the village community.

Some people, who have not pursued the paths of horticulture so far as they might, feel a kind of revulsion against displays of gorgeous conservatory plants which have been trained into factitious types of excellence for the purpose of taking a prize. Horticulture has achieved some very wonderful results and unexpected triumphs among non-indigenous plants, but one cannot expect every observant show-goer to enthuse over monster blooms arranged with mathematical nicety and in other ways telling the story of their own assiduous teasing and coaxing into shape. We cannot endorse the statement that it has become fashionable to make things which are beautiful in themselves assume the appearance of monstrosities; nevertheless, some judges do now use a criterion which is inimical to true floral grace; they put on one side beauty in its best sense, and bring freakishness to the front, so that a large number of big, stiff blooms carrying some originality of colour, shade, or mark carry off the first prizes. We are more or less educated to this kind of thing, but some day, we suspect, the fashion will be radically changed. If we should happen then to go to the other extreme there will be no less carping, probably more.

Town shows and country shows occupy a somewhat different plane. Chelsea and York excite professional rivalry in floral exotics and quixotics. The country show is, for the most part, content with a development of the old-time simplicities; it exhibits very few departures from what may be described as the natural state of things. Townspeople sometimes marvel that the sweetly situated village at the end of lanes garlanded with Dog Rose and Honeysuckle—the village with red roofs, with Roses and Clematis on its front walls, with Ivied-green porches, with Pelargoniums, and Cinerarias in rows behind its windows, with gardens full of Lilies, Carnations, Picotees, Sweet Williams, Canterbury Bells, Aaron's Golden Rod, Petunias, Sweet Rocket, Pansies, and the like, should need any such stimulant to flower-growing as a show of that description is usually supposed to give. Actually, the more winning a rural place is the more industrious, thrifty, and contented its folk, the greater need is there of an annual show to demonstrate to the outside world what its folk are capable of producing within the narrow compass of their own pales or at the allotment after the regular hours of labour. One cannot positively say that gardening "runs in the blood" of some families, for the village florist or Onion grower is often a ploughman, carpenter, or blacksmith, whose sole hobby is gardening, just as a town dweller's sole hobby may be horse-racing or football. It is rivalry that "sets him on" to do his best. He wants to have finer Roses or Chrysanthemums, bigger Peas or Onions, or whiter Celery, than George, Joe, or Sam. Success in that direction will be hard to achieve. He will send a long distance, maybe, for what he considers to be the choicest strain of seeds, he will con the long list of insecticides, and pick up all the information he can on Saturdays and Sundays from more experienced men. A philosopher has well said that it is, perhaps, possible to get some things for nothing, but experience isn't one of them. Should Thomas fail to accomplish his purpose after two or three good tries there is some danger of his losing heart, but if a prize be not long delayed he will proceed to better things like a giant refreshed with wine.

Throughout June, and probably July, the prevailing weather and the forthcoming show provide leading topics of conversation over hedge and pale, at cottage door and gate, and on the allotments. More sunshine or more showers are wanted only as the prevailing weather affects a man's special line of flowers or vegetables. On the eve of the show there is not a lounger in the village who could be kept away from the entrance gate. Numerous exhibitors are now bearing their pots of flowers to the tents, each with his little regiment of followers. Wheelbarrows and trucks filled with vegetables are being pushed along in the same direction. To avoid confusion it is exhibitors only who are permitted to penetrate the tented shrine this evening. Every numbered item has to be placed in order by the busy members of the committee, whose word is law. Jealousy amounts to a scarcely suppressed clamour on the part of every exhibitor to appear on the front row. Obviously, this privilege cannot possibly be accorded to all, and, actually, there are many exhibits which would be quite out of place at the front. A well-behaved man knows better than to "chunter" or grumble because of the unwarranted notion that he is snubbed.

Done by various ladies who are quite beyond the reproach of showing favour, the ticklish work of judging takes up the whole morning. It cannot even be laid to their charge that they have a penchant for discovering the best exhibits in the front rows—or the back rows either. The coloured, printed cards are all set in order before lunch-time. By this time the workaday villagers are free to don their best clothes. No matter how warm it may be, neither George nor Joe would think of exchanging his black billycock for a hat of straw on this most important summery Saturday afternoon of the year. The band discourses indifferent strains, and the sun blazes down upon two or three white canvas tents. How eagerly everybody pays his or her shilling at the box beside the gateway, to come in contact next moment with tethered horses, carts, wheelbarrows, empty cases, sacking, and straw which are much too near the entrance. A continuous stream of people crosses the field in the direction of a wide-open flap door. Inside the tent there is a scrimmage to get round the stands and see everything on exhibition at close quarters, from almost every position and angle. With no ventilating fan the interior becomes a "summer stew," which the Sweet Peas and Pansies appear to bear moderately well. Faces flush like pæonies as country youths and wenches rudely brush past where least space offers a passage, knocking down one plant-pot here and another there, and apologising with the unfelt, formal apology, "I'm sorry."

Weeks ago most of the intending exhibitors took liberty to prearrange the bestowal of prizes. As the result of nightly gossip they apportioned out these bounties to friends and rivals, leaving none for the rank outsider. Their selfishness, or limited generosity, accounts for nearly all the tickets used by the adjudicators getting wrong! A preliminary survey denotes satisfaction in one or two cases, but dissatisfaction in five or six. One gentleman is positively elated, while three or four are dumbfounded. To be thrust into the background is bad enough, but to be passed over without comment by the judges is unbearable. I have frequently heard an aspirant for a prize declare that he would never again compete with anybody related to the squire's head gardener. To be utterly ignored at the finish is worse than total ignorance of flower shows and flowers! When Charles unexpectedly lands a 1st prize how could one possibly expect Henry to be satisfied with a "Certificate of Merit"? If poor Charles happens to hear any remark derogatory to his exhibit he preserves strict silence, looks surly and ill at ease, and has a secret desire to "get out of it." Nevertheless, the prize-winners contrive to be close at hand all the time, so eager are they to drink in the various complimentary comments which come as a matter of course. If Joe be one of the fortunates he will not scruple to introduce himself to people greater than himself. He may even assume the authoritative air of a specialist who has already made his mark.

We must pass over the bushels of big Green Peas in their "swads," and the heavy Broad Beans, the Tomatos, Cucumbers and Spanish Onions, the Potatos of "every description," the huge Cabbages and Cauliflowers and Vegetable Marrows, the Parsnips, blushing Beetroot, and thick-set, gold-green Carrots which taper to a needle point, the Strawberries, Raspberries and Currants, the honey, eggs and poultry. All these can be inspected in another tent not far from the refreshment buffet, where the caterer's busy young ladies from a town five miles off are getting used to the buffoonery of those gentlemen whose barometer runs up to very dry! Tea in a side tent appears to have the usual irresistible call for the ladies, many of whom will contrive to put in an appearance at the rural sports which are announced on the day's programme.

When the broad shadows of declining day begin to steal athwart the field there will be dancing to the strains of a tired band. At 9 o'clock the exhibitors have notice to take away as many of their belongings as they wish to retain. Any not appropriated by 11 o'clock will be packed and sent to the local hospital or sold in aid of the charities for which the proceeds of the show are destined. Many of the best flowers and most useful vegetables are cheerfully left behind in charity's sweet name.

One evening during next week the various prizes are distributed at a public meeting, attended by the squire, vicar and other local gentry, at the village schoolroom. Most of the faces of the people present we have seen before, for practically the whole village is here in no partisan spirit, be he either with or without a grievance or a direct personal interest. Probably it is the proudest moment that George, John, Joe or Sam ever had in his life when, attired once more in best suit and tie, he is called up to the platform to receive his prize-money from the lady of the manor. Each recipient, putting on a broad grin though still bashful, comes in for hearty applause as he subsides into a corner at the rear, there to be the centre of a hubbub which indicates that he is receiving congratulations from his bosom friends. *Harwood Brierley.*

THE DEVELOPMENT OF THE RED HYBRID TEA ROSE.

A REVIEW OF RED ROSES.

(Concluded from page 64.)

Besides the Roses of China-like habit, 1908 gave us Ards Rambler, a fine strong pillar Rose of fair size and good colour, but difficult to manage satisfactorily. Rhea Reid, which may perhaps be described as a fuller Lady Battersea, best under glass, and somewhat disappointing in the garden, and Commander Jules Gravereaux, a single H.P., said to have come from Frau Karl Druschki × Liberty; the colour is a fine crimson scarlet, but the flower has a somewhat dishevelled appearance. The best garden Rose of the year, apart from those resembling the Chinas, is G. C. Waud, a Rose with a flower somewhat of the shape of Laurent Carle, but orange-crimson in colour. It is very free and constantly in flower.

The only Red Rose I have down for 1909 is His Majesty. Some magnificent flowers of this variety have been shown from time to time, particularly by the trade growers. I have seldom seen more striking blooms of any Rose than were shown of this variety by two well-known Colchester firms recently at Canterbury, but somehow I have not found it a good garden plant. Its vigorous growth made me try it as a pillar Rose, and perhaps it resents this treatment; moreover, it suffers badly from mildew. It is free flowering, but the proportion of good flowers I have grown has been small. A climbing sport of Liberty appeared in this year.

1910 gave us more red varieties, but none, I think, of first-rate quality. Georg Reimers, raised from Richmond × Etoile de France, is extremely free flowering and a good coloured crimson Rose. Perhaps the season in 1912 was too wet for it; anyhow, by way of protest it produced a number of flowers with the petals curved over the centre like a "self-protecting" Lettuce or Cauliflower. Still, it may get over this with a more favourable summer, and it certainly has possibilities. Eugène Boullet has been with me rather too often of poor and dull colour, though, like the last, it flowers freely. Lieut. Chauré has shown the same fault, though not so badly. It is, without doubt, variable in colour, and in other gardens I have seen it much better than in my own. Its parentage is given as Liberty × Etoile de France, and the colour is much what might be expected from the combination. Mary Countess of Ilchester and Mrs. W. Easlea are both free-flowering Roses, but are of slightly different shades of carmine, which do not much appeal to my taste. Sheilagh Wilson was to have been a perpetual Carmine Pillar, and it is perpetual, but is not so strong a grower, nor, I think, quite so bright a colour as that excellent variety.

1911 was a year of progress, and produced five Red Roses all worth something more than passing consideration. First comes Edward Mawley, with rather large, shell-shaped petals of a rich crimson colour. It was recommended for exhibition, for the garden, and for culture in pots, but from my own observation I should doubt its often finding its way into the exhibition box. It is, however, very free in flowering, and if it will produce a fair proportion of good flowers, should be useful for the garden. Perhaps we are all a little jealous for the honour of the name it bears, and, in consequence, inclined to be more than usually critical of the performance of this variety. Florence Haswell Veitch is a fine Rose of a bright crimson colour, well shaped and free flowering. It is a big grower, and may perhaps make a good pillar Rose; certainly it is effective in a large bed, but is too strong a grower for small ones. Leslie Holland, however, may possibly prove useful for this purpose; it seems to be rather a dwarf grower, and to produce medium-sized and not very full flowers of a light crimson, which retain their colour well. But I think for this purpose the best Rose of the year is Mrs. Edward Powell, which has proved very successful with me as a bedding Rose. The flowers are scarlet crimson, with a purplish shading, and there is a suspicion of purple in the wood and foliage which is very effective. The flowers are of the true decorative type and carried erect; they are freely produced, and the habit of the plant is good. Othello is a very dark crimson, almost maroon, and seems a good grower.

Fig. 41.—Rose Annie Crawford: colour light pink.
(R.H.S. Award of Merit, July 29, 1913. See description on page 94, *ante*.

The last Rose of this year I shall mention is President Vignet. Coming from France, perhaps little is known of this Rose in this country as yet, beyond what we saw at the International Exhibition last year, where admittedly it was not at its best; but if it turns out to be the vermilion red which is attributed to it we shall all want to try it in our gardens.

Of the 1912 Roses I can only speak from my notes at the shows. The Irish raisers have sent us a goodly list of Red Roses for this year, for which we shall be grateful if the plants take kindly to this side of the water. The most notable among them is George Dickson, of velvety

crimson colour, and a curious veining in the petals.

The Earl of Gosford, a deeper crimson, was also a fine flower as shown, and a good crimson is to be found in H. E. Richardson. H. Vessey Machin was a big flower, but with a lake colouring in the crimson, which was to me less attractive than the others I have named above. Then there came two Geoffrey Henslows — one an H.P., said to be a sport from Mme. Victor Verdier, of a clear crimson shade, and the other an H.T. of a remarkably striking colour, as seen at Holland House. This was a glowing orange-crimson, which, if it is well retained, should be most effective in the garden. The plant is said to be of the "robust" type, an epithet used by rosarians in a somewhat technical sense, as indicating a plant with a sturdy, upright habit of growth like that of Mildred Grant.

King George V. is a very dark Rose, of rich, purplish crimson, a shade of colouring often apt to "burn" rather badly, but we may hope this variety may prove an exception to the rule. Mrs. Muir MacKean, another Rose said to have the robust habit, has a certain amount of pink in the crimson, and is therefore described as carmine crimson. Some of my friends tell me it is an improved Mrs. A. E. Coxhead. If so, it should prove useful to the exhibitor. Climbing Richmond, a sport from that variety, has also come this year, and will be welcome. Finally, we have another Red Rose from Luxembourg, Prince E. C. Aremberg, a crimson flower with purplish shading.

Photograph by Wyndham Fitzherbert.

Fig. 42.—Arundo conspicua in July.

This completes my list. It makes a notable collection for a single year, and we may feel some satisfaction that, save for one Rose, the whole have originated in Great Britain.

I suggested that as a decorative garden Rose the Red Hybrid Tea seemed to have culminated in Richmond, and I have named some three dozen Roses that have appeared since the year (1905) of that variety. I review the list again and enquire with some anxiety, is there any one of them which will prove superior to Richmond in the garden as a decorative plant, or even a serious rival to it? Let us look at some of the points of this Rose:—(1) Brilliance and decisiveness of colour may, no doubt, be found among the 36 as well pronounced as in Richmond; (2) so perhaps as to fragrance; and (3) in beauty of form there may be rivalry in the opinion of some, notwithstanding that a fresh cut flower of Richmond in early summer takes a lot of beating; (4) for hardihood of constitution we may well expect to find several of even superior merit; and (5) a few may be of equally good habit as garden plants; (6) for continuity of flowering it is difficult to believe that we can expect much improvement. But the combination of all these qualities! I look through the list again, and can put my finger on none that I have myself tried which is more useful in my garden than Richmond. The 1912 Roses remain to be tested, and much as I should welcome a real improvement on this fine Rose, I feel grave doubts whether there is at present "another Richmond in the field." *White Rose.*

ARUNDO CONSPICUA.

The New Zealand Reed, Arundo conspicua, is sometimes called a Pampas Grass, but the true Pampas Grass (*Cortaderia argentea*) bears erect and not gracefully bending shafts, and lacks somewhat of the delicate grace of Arundo conspicua, whose arching plumes spread on every side outward far beyond the limits of its narrow, drooping foliage. This latter species is slow in making growth, and when small plants are put out they will take from six to seven years before they form what may be termed good specimens, and therefore plants some years in age should be procured in the first instance. Arundo conspicua is one of the most graceful of all the grasses, bearing slender, arching, plume-tipped shafts 10 or 12 feet in height when grown in deep and rich soil. It attains the zenith of its beauty about the close of July, whereas the Pampas Grass is not at its best until October and November in most cases, so that in northern gardens its attractiveness is often destroyed by wintry storms almost before its plumes are expanded. The New Zealand Reed is not quite so hardy as the Pampas Grass, and in very cold districts is occasionally killed in a very hard winter; but a clump of fine size known to the writer has withstood 27° of frost without injury, although it is growing in deep, retentive loam of a clayey nature. The best place for it is an isolated position on the Grass, where it will at all times present a handsome appearance. For planting in masses on the margins of open woods and drives or in open spaces, when viewed from some little distance, this noble plant is very effective, and is equally valuable for growing by the margins of streams, being especially charming in such a site. In very cold districts it may well be grown in boxes or tubs, so that the specimens can be sheltered during the winter. Ornamental Grasses have been treated with unmerited neglect. Even the most graceful of all, the Bamboos, are not planted so largely as they should be. So it is with those elegant Japanese Grasses, the Eulalia or Miscanthus, of which there are green, barred, and striped forms, all hardy, graceful, and beautiful. *Wyndham Fitzherbert.*

REMARKS ON CONDITION OF THE FRUIT CROPS.

(*See Tables and Summaries, ante, pp.* 80-85.)

1, SCOTLAND, E.

Aberdeenshire.—Apples are a poor crop owing in a great measure to the wet autumn of last year. Strawberries were a good crop, and Black and Red Currants are plentiful. *James Grant, Rothienorman Gardens.*

—— An almost entire absence of frost during the spring months accounts for our fairly satisfactory crops. *John McKinnon, Haddo House Gardens.*

Banffshire.—The crops of Apples, Pears, and Plums promised well, but the fruits set badly owing to cold, wet weather when the trees were in bloom. Mildew affected the Strawberry crop and aphis was prevalent on Red Currants. The soil in this district is a stiff clay. *George Ogg, The Gardens, Netherdale, Turriff.*

—— The fruit crops, with the exception of Apples, are disappointing after the good show of blossom and the fine weather whilst the trees were in flower. Apricots and Victoria Plums appeared to "set" well, but the fruits dropped to a considerable extent after swelling to the size of peas. Insect pests have been most troublesome to keep in check, and fungus diseases worse than we have experienced for years past. *Chas. Webster, Gordon Castle, Fochabers.*

Berwickshire.—Of Apples we grow mostly Bramley's Seedling, which suits our light, gravelly soil, and the trees never fail to set a good crop. Pears will not succeed with us. Apricots are a poor crop, and we can never depend much on these fruits. Small fruits are looking well, and Strawberries are a very good crop. The varieties Royal Sovereign and Garibaldi do best here. The fruit generally is heavier and a better flavour than last year. *Peter Smith, The Gardens, Duns Castle, Duns.*

Haddingtonshire.—Raspberries are the one fruit which has failed; the canes appear to have been frosted in November. Some varieties of Apples and Pears have failed, others have done well, giving, on the whole, an average crop. The foliage of all fruit trees is large and healthy; but, unless we have heavier rainfalls than in the past month, all the crops must suffer. One reason for the paucity of fruit is doubtless the shortage of bees. I applied to a bee-keeper to give a reason why hardly any bees visited fruit blossoms this year, and he informed me that the majority of stocks had been almost wiped out by the Isle of Wight disease. The very extended period of drought through which we are passing in East Lothian is affecting the fruit crops injuriously. The later Strawberries never properly ripened, and a fine crop of Black Currants was largely lost, while Apples are dropping to an unprecedented extent. An abundant rainfall would swell up Apples, Peas, Plums, and Apricots to a splendid sample. *R. P. Brotherston, Tyninghame, East Lothian.*

Fifeshire.—Pear, Plum, and Cherry trees on walls promised good crops when in flower, but the fruits set very badly. Peaches and Apricots produced very few flowers, and these crops are almost a failure. Small fruits are, on the whole, plentiful, especially Strawberries, and the berries are of good quality. *D. M'Lean, Raith Gardens, Kirkcaldy.*

—— The Apple trees are cropping very unequally; some have abundant crops and others none. Pear, Plum, and Cherry trees were covered with blossom, but the flowers were destroyed by cold rains and sleet. Small fruits are over the average, and these crops promise to finish well. Ours is a good garden soil; but, unfortunately, on cold, clayey bottom. *W. Henderson, Balbirnie Gardens, Markinch.*

Midlothian.—This has proved a very disappointing season for hardy fruits. Apples are a large crop, but the trees are suffering for want of rain. Pears, Plums, and Cherries blossomed well and set fruits freely, but only a small percentage matured. Apricots are a disheartening crop after entailing a lot of labour in the spring, including the protecting of the blossom from threatening frosts and high winds. Small fruits are abundant, but slow to ripen, and large fruits of strawberries are rotting for lack of sunshine. The rainfall to the end of June this year measures 10.21 inches, against 15.59 inches for the same period last year, the average for the previous five years being 12.57 inches. The soil is a good, rich loam. *Benjm. B. Ness, Oxenfoord Castle Gardens, Ford.*

—— The fruit crops are above the average, with the exception of Pears and Plums, which were damaged by late frosts. Small fruits, including Strawberries, Gooseberries, Raspberries, and Black and Red Currants, are good and clean. Pears are scarce, but Apples are a good crop. The soil is a heavy loam with a clay subsoil. *D. Kidd, Carberry Towers, Musselburgh.*

—— Pear trees blossomed sparsely, and the few flowers set badly, so that this crop is a failure. Apple trees were full of blossom, and are carrying a full crop of fruit. Plums and Cherries were very promising in spring, but cold, sunless, wet weather spoiled the good prospects. Small fruits, including Strawberries, are a heavy crop. The soil is rather light, on a gravel subsoil. *James Whytock, Dalkeith Gardens, Dalkeith.*

Forfarshire.—Small fruits are a good crop. Apples, also, are good, as late frosts did not injure the blossom. The soil is loam, with a sandy subsoil, and dries very quickly. *A. McAndie, Ruthven House Gardens, Meigle.*

6. SCOTLAND, W.

Argyllshire.—The fruit crops were spoiled in May by a blizzard of wind and sleet from the south-west just when the flowers were setting. The storm lasted about a week. Two trees of Sweet Maple had the leaves damaged, and withered as though dead. *Henry Scott. Torloisk, Mull.*

Ayrshire.—Apples are an average crop, and the trees are cleaner than for many years past. Plums on walls are also good. Small fruits are heavy crops of fine fruits. Strawberries have never been better, and particularly the variety Royal Sovereign. No frost was recorded after April 12, and this immunity from severe cold, with an abundance of rains during May (3.32 inches fell during 20 days), accounts for the clean, healthy appearance of the fruit trees and the good crops of Strawberries and other fruits. We have not needed to spray our Rose trees this season, and they are very clean and healthy. *William Priest, Eglinton Gardens, Kilwinning.*

—— Strawberries are the most satisfactory crop here this season, and the fruits have been exceptionally large and highly coloured. Royal Sovereign and Bedford Champion have proved the best two varieties here. Apricots, Apples, Pears, and other fruit trees blossomed well, but a long continuation of cold, wet weather, with high winds, had an injurious effect on these fruits. *D. Buchanan, Bargany Gardens, Dailly.*

Dumfriesshire.—The crops of Apples, Plums, and Pears were very promising early in the season. The trees blossomed most profusely, but the fruits set very badly. At the time the trees were in flower we experienced cold, wet weather, with low night temperatures, which injured the blossoms. Small fruits are good crops, and Black Currants would have been a record yield had it not been for cold nights when the fruits were setting, but this frost caused about half the berries to drop when nearly the size of Peas. *James McDonald, Dryfeholm, Lockerbie.*

—— The following six varieties of Apples are carrying good average crops:—Bramley's Seedling, Hollandbury Lane's Prince Albert, Lord Grosvenor, Stirling Castle, and Tower of Glamis; whilst Alfriston, Peasgood's Nonesuch, Duchess of Oldenburgh, Ecklinville Seedling, Cellini, and Lord Suffield are small crops, but the fruits are good. *John Urquhart, Hoddam Castle Gardens, Ecclefechan.*

Kirkcudbrightshire.—The general condition of the fruit crops in this district is fairly good. Apple and Pear trees blossomed profusely, but owing to cold, dull weather the fruits failed to set well. The young growth on fruit trees is cleaner and healthier than it has been for some years past. Small fruits are very heavy crops, and especially Raspberries and Gooseberries. Insect pests have not troubled us this season, so that the trees and bushes are exceptionally clean and healthy. *James Douchars, Kenmure Castle Gardens, New Galloway.*

2. ENGLAND, N.E.

Northumberland.—The crops of Apples in the S. and S.E. districts of Northumberland are very variable. At the County Council's Experimental Plot at Cockle Park, Morpeth, with a cold, heavy soil, and at an elevation of 300 feet, the crop promises to be over the average. The culinary varieties are very good, with the exception of Ecklinville Seedling. Of dessert varieties, James Grieve, Irish Peach, and King of the Pippins are most satisfactory. Allington Pippin failed to flower. Considerable scab has been observed on the leaves of Apples, and spraying with the Bordeaux has been resorted to. Plums are sparse in this plot. Superlative Raspberries are looking well. *C. W. Mayhew, Morpeth.*

Yorkshire.—The best crops, both as to quantity and quality, are on trees on dwarfing stocks. It is possible that this is partly owing to the better ripening of the wood on these trees. In many quarters Gooseberries are carrying an exceptionally heavy crop. Black Currants are only fair, the big bud mite being very troublesome. Also, in many districts the bushes are grown on single clean stems. Last year's wet season caused them to make a lot of growth, so that foliage has been luxuriant, and the prevalence of heavy winds has completed the damage. Red Currants are only fair, and the disease Botrytis cinerea is troublesome in some districts. Raspberries promise to be a good crop, but rain is badly needed. Strawberries have been a lighter crop than usual, and ripened rather earlier. The berries were of excellent quality. *A. S. G., Roundhay, Leeds.*

—— The Apple crop is far lighter than was expected, considering the immense amount of blossom. Old trees have set very heavy crops, but young trees have few fruits. Pears are very scarce, for the trees developed scarcely any blossom. Gooseberries and small fruits generally are heavy crops. Peaches, Nectarines and Apricots are very poor; the wood did not ripen last autumn, which no doubt accounts for the failure of these crops. Our soil is a heavy loam resting on a layer of clay and red sand. *Jas. E. Hathaway, Baldersley Park, Thirsk.*

—— Apples, Pears, Plums and Cherries are much under the average. Pears are the worst crop. The trees, and especially Plums and Cherries, were harmed to a great extent by caterpillars and maggots. Strawberries and all other small fruits are abundant crops and of fine quality. Owing to timely mulching, they have not yet suffered from want of rain. All the crops need rain badly. I think we must look to the sunless and rainy season of 1912 for the cause of many of the failures in the hardy fruit crops. Our soil is light and shallow, with a chalk subsoil. *F. Jordan, Warter Priory Gardens.*

—— The Apple crop is somewhat variable; in some districts it is plentiful, in others not so good. Few sorts of Cherries are grown here, the Morello being the principal variety. Peaches and Nectarines are grown only in a few favoured districts. The young branches and buds of all kinds of fruit trees were harmed last winter by wet and cold. Gooseberries and Red Currants are plentiful. Red and Black Currants are healthier and cleaner in growth than in 1912. *Alfred Gaut, The University, Leeds.*

—— Apples are a very irregular crop in this district; here we have an average crop. The varieties Bramley's Seedling, Lane's Prince Albert, James Grieve and Worcester Pearmain are carrying good crops. Plums vary considerably; the variety Victoria seems to be the best. Pears are a complete failure, also Apricots. Strawberries were a good crop of fine fruit of good flavour. With the exception of Black Currants, all bush fruits are good. Early Potatos have been good, and late varieties are looking remarkably well. *A. E. Sutton, Castle Howard Gardens.*

—— Apples are a good crop, notwithstanding the rainfall has been below the normal. Small fruits are extra fine and clean, Black Currants being free from mite. The variety Booskoop Giant bears better than Baldwin's Black in the same conditions. *J. G. Wilson, Chevet Park Gardens, Wakefield.*

(*To be continued.*)

The Week's Work.

THE FLOWER GARDEN.

By Edward Harriss, Gardener to Lady Wantage, Lockinge, Berkshire.

The Rock Garden.—Many plants suitable for growing in the rock garden may be propagated from cuttings inserted as soon as flowering is over. Dianthuses are easily increased from cuttings, which should be inserted in sandy soil under a cold frame or hand-light, keeping them close and shaded until roots have formed. Primulas reproduce themselves freely from seed, which should be sown as soon as it is ripe. Many Campanulas on the rockery are now in bloom. Warley is one of the most beautiful of all the trailing varieties. The rock garden should be overhauled at regular intervals, cutting well back strong-growing species that might smother the weaker-growing species. Remove weeds carefully so as not to disturb the roots of tender flowering plants. It is also necessary sometimes to remove altogether plants which have become too large. Their places may be filled with others raised from seed or cuttings, and a stock of surplus plants should always be available for this purpose. The rock garden requires more than ordinary care in the matter of watering, as many of the plants may be situated in positions which seldom receive a wetting from the rains. Such plants need attention almost daily.

Narcissus.—It is necessary to replant bulbs of Narcissus as soon as they show signs of deteriorating, and the present is a suitable time to undertake the work. When lifted the bulbs should be graded, and those of a sufficient size for flowering re-planted. The smaller ones may be planted in well-tilled soil in the reserve garden, where they will eventually grow to a flowering size. Before re-planting the flowering bulbs dig the ground deeply and enrich it by adding plenty of well-rotted cow-dung.

THE ORCHID HOUSES.

By W. H. White, Grower to Sir Trevor Lawrence, Bart., Burford, Dorking

Cattleya Warscewiczii Sanderiana.—Whilst some plants of Cattleya Warscewiczii flower yearly, others, under exactly similar treatment, grow freely, but rarely bloom. Probably the greatest mistakes made in the cultivation of this Orchid is in growing the plant in a high temperature, a dark position, or a very close atmosphere. Many also afford too much water during the season of rest, which should be a long one. To grow this Cattleya well the plants should be placed close to the roof glass, where the leaves are fully exposed to the light and abundant ventilation, as these conditions are conducive to flowering. The plants having passed out of flower should be placed in a somewhat cooler position, but they should still be exposed to the light and fresh air. The amount of water afforded the roots should be reduced gradually. This treatment will harden and consolidate the young growths, and favour the development of roots. The best time for repotting is immediately the plants commence to develop roots from the base of the newly-made growths; the numerous fleshy roots will quickly enter the fresh potting compost. If the work of repotting is delayed there is a danger of many of the roots becoming injured. Afford ample drainage—to about one-half the depth of the pot for the smaller plants, and more for large specimens. For a compost use the best and toughest Osmunda-fibre, from which all the fine particles of brown moss have been removed, and an equal quantity of A1 fibre. Keep the rhizome of each plant about on a level with the rim of the pot, and pack the potting materials firmly in towards the centre. It is advisable to lightly shade the plants from strong sunshine for a few weeks after potting, but when the young roots appear through the surface more exposure to light and air will be beneficial. During this stage the plants should be watered with extra care, merely moistening the soil around the edge of the pot, and affording only sufficient water to encourage the new roots to enter and establish themselves in the rooting materials. Some of the pseudo-bulbs may become slightly shrivelled, but if the plants are not overwatered, and the roots remain healthy, the growth will become plump again when growth re-commences. Examine the plants frequently for the presence of cockroaches and woodlice, as these insects injure the ends of the young roots.

Disa.—Plants of Disa grandiflora are in bloom, or on the point of flowering. At this season they are liable to infestations of green fly and small yellow thrips, which soon spoil the beauty of the flowers and cause the foliage to become unsightly, especially where young offshoots are pushing up around the base of the plant. Remove the aphides by means of a brush and sponge, and afterwards place the plants on their sides, and syringe them with clear rain water until they are cleansed thoroughly. It is not advisable to fumigate or vaporise these Orchids, as they are very liable to injury. The most effectual way to destroy the thrips is to dip the plants occasionally in some weak insecticide. I have found Nicotine soap at the rate of about 2 oz. to one gallon of tepid soft water a safe specific. Care must be taken that none of the fluid reaches the roots. After dipping the plants the moisture may be allowed to remain on the foliage from five to ten minutes, during which time each plant should be laid on its side, and be so placed that the soapy water drains from the base of the plant to its tips, instead of into the roots. Before the mixture has time to become dry it should be washed off with warm, soft water. A good plan is to dip the plants when they are rather dry at the roots, so that if any of the mixture does get into the soil a thorough watering afterwards will wash most of the soapy extract through the drainage, and thus lessen its power for harm. Plants of this species that are coming into flower should be well watered, and as the buds commence to open the blooms will be benefited by exposure to strong sunlight, which will cause the colour to become more brilliant, but shade the foliage. As the plants pass out of bloom the amount of water should be reduced gradually, but the supply should not entirely cease. Stand the plants where their surroundings are always moist, and where plenty of light and fresh air can reach them. Should small thrips attack the young growing shoots, first destroy the insects and afterwards give the plants more shade. Plants of the handsome hybrid D. Luna that bloomed early last month are starting well into growth, and they may be re-potted or divided, as may be deemed necessary. The offshoots now starting should not be divided unless they have sufficient roots to support them. The divided portions should be placed in rather small pots, so that when they become well rooted they may be transferred to larger receptacles. Unless it is desired to increase the stock, old plants may be afforded pots two sizes larger, as they enjoy plenty of rooting space. The pots need only a few crocks placed over the bottom of each receptacle for the drainage. The soil should be of an open, yet retentive nature, and may consist of good fibrous, yellow loam, from which all the finer particles have been removed by sifting, Osmunda-fibre cut up into rather small portions, and Sphagnum-moss, also in a state of fine division. Use an equal quantity of each material mixed with a moderate amount of coarse silver sand, and some small crocks. Press the soil down around the plants with moderate firmness, but avoid making it so hard that water will not pass rapidly through. After re-potting, stand the plants upon inverted pots or pans placed on a cool, damp surface. In this way the plants will dry quicker, and allow more water to be used than if placed on a damp stage. The Odontoglossum house is a suitable place to grow these plants, and they will thrive well in a cold frame out-of-doors until cold weather sets in, when they should be afforded moderate warmth. When the plants are growing freely spray them overhead several times daily during times of warm, bright weather, and never allow the roots to become very dry. Disa grandiflora may be re-potted in the same manner in about a month's time.

THE KITCHEN GARDEN.

By John Dunn, Foreman, Royal Gardens, Windsor.

Cauliflowers.—There is still time to plant Cauliflowers for early winter supplies, selecting rich soil in a sheltered situation. If the variety Early London is planted now the plants should yield heads throughout October. The new variety, Great Dane, will come in about ten days earlier than Early London, yielding large heads with pure white curds. Fresh plantations of young Cauliflower should be watered freely with liquid manure, and the ground between the rows stirred frequently by means of a Dutch hoe.

Turnips.—Make a liberal sowing of winter Turnips, selecting a warm border if the district is late and cold. New White Model and Green Top Stone are suitable varieties. Sow the seeds in shallow drills at 1 foot apart, and thin the seedlings to nine inches apart. Dust the plants freely with wood ashes, and keep the hoe at work amongst them to promote a quick growth.

Sweet Basil.—If this herb is required during winter seeds should be sown now in a heat of 60°, covering the seeds lightly with fine soil. Prick the seedlings out into 6-inch pots, putting four or five in each pot. Provide the pots with liberal drainage, and use light, turfy loam for the rooting medium.

Mushrooms.—Make preparations for an autumn supply of Mushrooms. Cleanse the interior of the houses, and whitewash the walls with hot lime, taking care to reach every crevice with the brush. The horse droppings should be collected daily, and laid in a dry, open shed, to be turned frequently, until sufficient has been collected to form the first bed. The droppings should not be placed more than one foot deep during their preparation in the shed. When properly fermented they should be removed to the Mushroom house, and placed rather closer together until the heat reaches 85°, when the droppings should be spread out on the bed, and rammed tightly together, in such a way that when finished the bed will be not less than 12 inches in depth. As soon as the temperature has dropped to 80° the spawn should be broken up into pieces about the size of a hen's egg, and inserted two inches deep by means of a blunt dibber. After the lapse of a few days a covering of fine loam should be placed over the bed about one inch deep, and made firm by the back of a spade. Assuming that the atmosphere of the house will be kept moderately moist, the bed should not require water until Mushrooms begin to show, but after this stage a gentle watering with rain water may be applied if it is considered necessary. Fresh beds may be spawned at intervals of three weeks, according to the requirements.

FRUITS UNDER GLASS.

By James Whytock, Gardener to the Duke of Buccleuch, Dalkeith Palace, Midlothian.

Early Vines.—The present is a suitable time to renovate the border of early Vines that, from various causes, may have become exhausted, for while the vines are still in leaf they may be able to make fresh roots. If the latter are growing in both inside and outside borders, renew only one of the borders this season. The operation of removing the soil, beginning at the outside of the border, must be done with great care to preserve as many as possible of the roots from injury. Excavate the soil down to the drainage, and to within 3 feet of the stem of the vines. When the roots are bared they must be kept moist, and shade the roof-glass with mats or canvas. Place materials in the trench for drainage: if the subsoil is gravelly or of a porous nature, 9 inches of drainage, with a drain to carry away the water, will be sufficient. If the subsoil is of a cold and retentive character, cover the bottom with a layer of concrete, and on that place drainage materials to a depth of nearly 12 ins., with a drain made of pipes. Cover the drainage with sods placed grass sides downwards. The new soil for the border should have been prepared previously, and composed of fresh turfy loam, mixed with lime rubble and ½-inch bones—these mixtures added more or less according to the texture of the soil. The new soil should not be more than 3 to 4 feet wide and

2½ feet deep for a start, and it should be made very firm. Place the roots as near to the surface as possible, shortening the longer ones and cutting back those that are damaged. When the border is finished, well water it and cover the surface with dry litter. Continue the shading, and keep the house rather close for a week or so, syringing the foliage on the afternoons of bright days. The Vines should not be forced early the following season, and, if red spider or mealy bug be present, adopt measures to eradicate the pests. The foliage on early Vines from which the grapes have been cut should be examined carefully for the presence of red spider, and if this pest is detected, syringed. It is essential that the foliage remain in a healthy condition until it is matured. Unfavourable climatic conditions may render it necessary to promote a little warmth in the hot-water pipes at night, but let there be a constant circulation of air, increasing the ventilation as the wood matures.

The Orchard House. — Pot trees from which the fruits have been cleared may be plunged out-of-doors, and should be attended to daily in the matters of syringing and watering. In warm districts pot trees of Pear and Apple will succeed better plunged in the open, where they will ripen their fruit. They should be attended to at least twice daily for watering, affording the roots weak manure water on frequent occasions. Let the trees in the orchard house have plenty of air, and syringe them daily to keep the foliage clean. Feed the roots with liquid manure. When the fruit is ripening keep the atmosphere of the house rather dry. Guard against overcrowding by shortening the shoots, removing all unnecessary growths, and, in the case of planted-out trees, tie the shoots to the trellis.

PUBLIC PARKS AND GARDENS.

By Superintendent.

Attention to Trees. — It occasionally happens that during warm, still weather heavy limbs of such trees as the Poplar and Elm snap over without the slightest warning, and often to the danger of those who may be present beneath their shade. Several cases of this kind have occurred of late, and in two instances at least with fatal results. The reasons for this sudden snapping of branches are (1) disease or injury, (2) disposition and size of branch, (3) the extra weight of foliage during the growing season, and (4) brittleness of the timber caused by the flow of the sap. In some parks and gardens—the Royal Parks in particular — an annual examination of the trees is made, and all heavy and diseased branches either wholly removed or cut back to such an extent that their safety is ensured. But even with the most minute and careful examination it by no means follows that accidents will not and do not occur, for the simple reason that it is often impossible to detect flaws and disease which are not revealed outside the bark. This is especially the case with the branches of old Elm trees, the diseased centres of which often defy the most careful examination of the experienced woodman.

Disease or Injury.—These may arise from many causes, but probably the most prevalent are the after-effects of neglected injuries caused by wind or accident. Too often it is the case that branches which have been broken over during stormy weather receive no attention in the matter of pruning and dressing, with the result that water gains access by the fractured portion of the trunk or branch, and speedily a diseased condition of the part is brought about. This, in the case of the Elm at least, quickly spreads, fungus takes possession of the wood, and an unhealthy and unsafe condition of the tree speedily follows. Unfortunately, in many of our public parks and gardens the diseased condition of many of our old Elms and other trees can be distinctly traced to neglect when injury by storm or accident had occurred. For the safety and preservation of a tree it is always wise policy to smoothly cut across and paint or tar the wound that has been occasioned from whatever cause, and no time should be lost in carrying out this operation. It little matters, unless for appearance' sake, how the pruning is carried out; by all means prevent the inroad of water to the broken branch or stem.

The Size and Disposition of a Branch.—Apart altogether from disease or injury, a branch may, for the sake of safety, require to be pruned or lightened. Upright-growing branches are not so dangerous, but such as hang downwards from the horizontal and extend to a considerable distance from the main stem require judicious pruning. This should be carried out in such a manner that the general appearance of the tree is not damaged, the heavy top branches being neatly cut back at the point where the operation will be least readily detected. Here again a careful smoothing of the branch at the point where amputation took place is all-important, and tarring or painting should not be neglected, whether from the point of appearance or the health of the tree. The extra weight of foliage often causes a branch to become top-heavy and break across, this being accentuated by the presence of an unusually large quantity of sap, which naturally causes the timber to become brittle and more readily susceptible to accident.

Fungus and Insect Attacks.—The presence of fungus on a tree may be taken as a sure indication that all is not right and, as far at least as the public safety is concerned, the sooner such tree is examined and dealt with the better. Insect attacks, particularly that of the Goat and Wood-leopard moths, are frequently the cause of the sudden breaking of a limb or branch, especially when the tree is in full leafage or during stormy weather. The caterpillar of either insect tunnels into the wood and causes it to become so weakened at the point of attack that it readily breaks over when subjected to the extra weight of leafage or wind pressure.

THE "FRENCH" GARDEN.

By Paul Aquatias.

Old Manure Beds.—The Celery plants are well established, and the roots require plenty of water, which should be afforded, preferably in the evening. Care must be taken to keep the beds sufficiently moist, for once the black soil becomes very dry it will be an exceedingly difficult matter to render it absorbent of water until it has been soaked with rains. The Carrots sown a fortnight ago as a succession to the Cauliflowers on the old cloche beds are now well up. They should be thinned out at an early date. Their growth must not be impeded for lack of moisture, for though they only require superficial but frequent waterings, they will need a good soaking at least twice weekly from the middle of August.

Melons.— This crop has been very successful this season, and splendid fruits are being cut daily from those planted before the middle of May. The plants require plenty of moisture at the time the fruits are swelling. The lights may be removed to afford full ventilation. The pruning of the later plants should consist of occasional thinning of the superfluous growths, removing at the same time all weeds. The Melons, when ripe, should be cut and placed in a cold storage before they are despatched to market. They may be packed in "flats" or deep boxes; wrap each fruit in soft paper and place wood-wool or soft hay between them, to prevent bruising during transit.

Crops in the Open.—The only Cauliflowers now available for market are those set directly outside late in March or early in April. They should be liberally supplied with water; this crop will be especially valuable, as the field crop will be very late, and the plants are in several places badly attacked by caterpillars. The Ridge Cucumbers that were planted early in June should also be mulched whenever possible, not only to keep the ground moist, but prevent the fruits from becoming splashed by rains. If watering is done carefully the yield of this crop will be greatly increased. Tomato plants should be stopped to one leaf beyond the last fruit truss, as further blooms cannot be expected to set and develop ripe fruit after this date. As the berries are swelling the plants should receive an occasional dressing of superphosphate, alternated with some other fertiliser, such as Peruvian guano. The ground for planting Endive should be prepared at the earliest opportunity. The curled varieties are set 10 inches apart in the row, and at 1 foot distance in the rows. The Batavian Green variety should be allowed a space of 12 inches each way. The Beans are now well through the ground, which should be hoed frequently. It is essential that the plants develop as quickly as possible, so that they may be strong and robust before the cool nights set in, as the Beans will be developing early in October. A sowing of Onion, White Lisbonne or Little Vanguard, should be made broadcast in well-prepared ground. By making three sowings at intervals of a fortnight a succession of green Onions will be available from October and until the spring-sown plants are ready.

PLANTS UNDER GLASS.

By F. Jennings, Gardener to the Duke of Devonshire, Chatsworth, Derbyshire.

Pelargonium. — Cuttings of Pelargoniums may now be inserted, three or four around the edge of each pot, filled with a mixture of loam, leaf-mould and sand. After a thorough watering stand the pots on a shelf in a greenhouse or in a cold frame. Subsequent waterings should, at the present, only be given when moisture is necessary to prevent the cuttings from shrivelling, but later, after roots have formed, a more liberal supply of water should be afforded. Old plants in pots intended to be grown for another season should be placed on their sides out-of-doors to favour the ripening of the wood before cutting the shoots hard back. As soon as the shoots break into fresh growth place the plants in a cool house or frame and syringe them daily until growth becomes more general. At that stage shake the old soil from the roots and repot the plants into pots of a suitable size for each individual plant. Employ a compost consisting of three parts rich loam with leaf-mould and coarse sand in equal proportions, adding a little dried cow-manure and soot—say, a 9-inch pot full of each fertiliser to one barrow load of the mixture. Water the plants with extra care until they are re-established. It is advisable to shade the foliage during the hotter part of the day in the early stage of growth.

Fuchsia. Cuttings of Fuchsias may be inserted, selecting the stronger shoots for the purpose and placing them in pots. They should be rooted in a gentle bottom heat and be kept close and shaded.

THE HARDY FRUIT GARDEN.

By B. Goodacre, Gardener to Sir Ernest Cassel, Moulton Paddocks, Newmarket.

Strawberry Beds. — After Strawberries have cropped for three seasons the plants become more or less exhausted, and are better discarded. In gardens where rotations are practised one or more of the old beds may be destroyed each year, and this should be done as soon as the fruits are gathered. The plants and weeds may be destroyed by means of a sharp spade and thrown together in small heaps, then, if left exposed to the sun and air for a few days, they may be made into a heap and burned. This method not only saves labour, but the refuse, if scattered over the land, will be beneficial to the next crop. The ground may be cropped with winter Broccoli or late Brussels Sprouts, and will not need any special preparation, for solid soil is more suitable for them than that which has been disturbed much, for the plants grow sturdy and compact, thus enabling them the better to withstand a hard winter. Two-year-old beds should, after the necessary number of runners has been obtained, be cleared of weeds and dead leaves. Pinch off surplus runners. The decayed materials of the mulch may be allowed to remain, but the dry, loose litter should be removed and burned.

General Fruit Crops.—In most districts the fruit crops are suffering from drought, and more especially Apples and Pears growing on tilled land. Where practicable the trees should be watered, first loosening the soil, but always bearing in mind that the feeding roots are some few yards from the main stem. Unless attention is paid to the trees in this respect most of the fruits will fall, and the remainder fail to swell to a good size before ripening. Water first the more important and earlier varieties planted against walls, and next the bush trees growing round the kitchen garden plots.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication. *as well as specimens of plants for naming, should be addressed to the* **EDITORS. 41. Wellington Street, Covent Garden, London.** *Communicotions should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Editors and Publisher.—*Our Correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the* PUBLISHER; *and that all communications intended for publication, or referring to the Literary department, and all plants to be named, should be directed to the* EDITORS. *The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion orise when letters are misdirected.*

Illustrations.—*The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.*

Local News.—*Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, AUGUST 11—
United Hort. Ben. and Prov. Soc. meet.

TUESDAY, AUGUST 12—
Roy. Hort. Soc. Coms. meet. (Lecture at 3 p.m by Mr. Frederick Enoch, on "Fairy Flies and Their Hosts.")

WEDNESDAY, AUGUST 13—
B.G.A. (Watford Branch) Outing.
Carlisle and Cumberland Hort. Assoc. Sh. (2 days).

THURSDAY, AUGUST 14—
Taunton Deane Hort. Exhibition.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—62.4°.

ACTUAL TEMPERATURES:—

LONDON.—*Wednesday, August* 6 (6 p.m.); Max. 67°, Min. 53°.
Gordeners' Chronicle Office, 41. Wellington Street, Covent Garden, London, *Thursday*, August 7 (10 a.m.); Bar. 29.8°, Temp. 65°.

PROVINCES.—*Wednesday, August* 6, Max., Margate, 62°, Min., Aberdeen, 53°.
Weather—Sunshine.

Silver-Leaf Disease. A further contribution by Mr. F. T. Brooks to the study of this disease appears in the *Journal of Agricultural Science*. The results are a continuation of those published by the same author in 1911, and establish the view that Silver-leaf is a general pathological phenomenon of widespread occurrence which may be induced by different causes, though at present only one of them, the fungus Stereum purpureum, is known with certainty. Mr. Brooks considers, with Professor Percival and Mr. Spencer Pickering, that the chief cause of the malady in the fruit-growing districts of this country is Stereum purpureum, but he has seen specimens of silvered foliage which he is unable to attribute to the action of this fungus. Thus silvered plants of the White Dead Nettle have been seen which upon investigation exhibited no trace of fungus. Silvered Plum seedlings also failed to reveal any sign of fungus attack.

In considering Silver-leaf as a general pathological phenomenon, the writer points out that it is by no means unusual in the pathology of plants and animals for the same kind of morbid manifestation to appear as the result of different pathogenic agents, and he is inclined to regard Silver-leaf from this point of view, namely, a state due in some instances to the invasion of micro-organisms and in others to some other cause.

From the standpoint of the practical fruit-grower, however, it is the fungus Stereum purpureum which is of greatest importance, and Mr. Brooks' present paper deals chiefly with the rôle which this fungus plays in causing such serious losses in fruit plantations, particularly those of Victoria and Czar Plums.

Inoculations of Plum trees with the spores of the fungus and also with its mycelium grown in pure culture (and therefore free from contamination by other organisms) have resulted in the development of Silver-leaf, and the fact that the fungus causes infection after the manner of a wound parasite has become firmly established. It has been determined also that Stereum purpureum taken from a dead Birch stump in the midst of a wood is as effective in causing Silver-leaf as is Stereum purpureum taken from a silvered Plum tree. The fungus frequently attacks a single branch of a tree at first, and subsequently progresses into the main stem, after which the whole tree usually becomes silvered and begins to die back. Discoloured wood has been found to be constantly associated with the silvered foliage of Plum trees in gardens and fruit plantations, though the diseased wood is sometimes a considerable distance below the affected leaves.

Some interesting cases of the outbreak of Silver-leaf disease are described. In one of them twenty Plum trees which were cut back and regrafted all became silvered, and fructifications of Stereum purpureum developed in abundance on the trunk of each. Attention is also directed to the frequency with which regrafted Apple trees become silvered and die in consequence of attack by this fungus.

In regard to the treatment of the disease, Mr. Brooks would in the first place have war waged against the development of the fructifications of Stereum purpureum in fruit plantations. Experience has also shown that benefit is derived by cutting out silvered branches of trees in the early stages of attack, but in order for this operation to be successful care must be taken to cut back below the region of discoloured wood. Plum trees that are badly silvered and beginning to die back should be destroyed, as the chance of recovery in such cases is but slight. Experiments in plugging the trunks of silvered trees with sulphate of iron have been tried on a large scale, but so far this method of treatment has not given much promise of success.

Supplementary Illu tration.—The variety of tuberous-rooted Begonia known as Florence Nightingale, which forms the subject of the Supplementary Illustration, received the Award of Merit of the Royal Horticultural Society last year, when it was exhibited by Messrs. Blackmore and Langdon. The blooms of this variety are only of medium size, but they possess exceptionally good form; the petals are also of excellent quality and have a smooth texture. The variety is a good type of a modern Begonia and serves to show the great advance that has been made in recent years with this flower. The Begonia has provided many variations, and in any representative collection it would be easy to select flowers that resemble the Camellia, Pæony and Rose. So diversified is this free-flowering plant that it is not only decorative in the greenhouse and conservatory, but is also amongst the most valued subjects in present-day schemes of summer bedding.

Coloured Supplement.—The subject of the coloured plate to be published in the next issue is the Mediterranean Fruit Fly (Ceratitis capitata).

Royal Horticultural Society. — The next meeting of the committees will take place on Tuesday, the 12th inst., in the Society's Hall, Vincent Square, Westminster. At the three o'clock meeting in the Lecture Room an address on "Fairy Flies and their Hosts" will be delivered by Mr. F. Enock.

National Gladiolus Society.—At the meeting of this Society, held last Tuesday, Class 16, for amateur competitors, did not fill. A silver cup, value ten guineas, was offered for this class by Messrs. James Cartbr & Co., and they have consented to allow this cup to be competed for again on August 12. It is not necessary that competitors should be members of the Society. The class is for nine varieties of late-flowering Gladioli, one spike of each to be shown in nine vases. Entries should be sent to the Secretary, The Flagstaff, Locksheath, Southampton.

Report of the Parliamentary Committee on Seed-Testing Stations. — The enclosed is a copy of a resolution drawn up by the Parliamentary Committee of our Society and adopted by the President and Council on the 29th of last month:—"Understanding that a recent deputation to the Board of Agriculture and Horticulture recommended that a National Seed-Testing Station should be established where seeds could be tested if desired, your committee, whilst not wishing to object to the testing of seeds, desires to point out that any such station, if created, must provide a full and sufficient guarantee both to buyer and seller as to the identity of the bulk sold with the sample submitted for test." *W. Wilks, Sec. R.H.S.*

Rural Housing.—The Board of Agriculture and Fisheries wish it to be made known that they are desirous of obtaining information upon the subject of the erection of rural cottages for labourers and others. They will be grateful if any landowners or local authorities who have recently erected such cottages will furnish them with particulars of the cost of the cottages, and the results of their enterprises, both financially and otherwise. A form of particulars will be sent, on application, to any person who is willing to supply such information. Communications should be addressed to the Secretary, Board of Agriculture and Fisheries, 4, Whitehall-place, London, S.W., and need not be stamped.

Colonial Products. — On the occasion of the debate on the Colonial Office Vote in the House of Commons on July 31 last, the Colonial Secretary, Mr. Lewis Harcourt, gave the following interesting information, which we reproduce from the *Times* report:—"Jamaica had made great advances in the production of the Banana: in 1905 she exported £843,000 worth; in 1911 it had reached a value of £1,457,000. Jamaica and some of the other islands were in the hurricane belt, and Jamaica suffered from one of these visitations at the end of last year, which would perhaps for some years to come constrict her production. The export of Bananas from the West Indies had risen in the last seven

years from £880,000 to £1,500,000. Limes, Pine-apples, Oranges, and Grape-fruit constituted no small part of their fruit export. Cyprus in the last seven years had doubled the value of her exports of fruit such as Oranges, Pomegranates, and Raisins, from £31,000 to £62,000; and the total value of fruit exports from our tropical Colonies, in addition to the large figures given as to Bananas, had risen in those seven years from £611,000 to £689,000. Sugar had caused much anxiety both to our West Indian Colonies and the world at large. But production had progressed in spite of rainfall and politics. Those who thought at one time they would be ruined by conventions had come to the conclusion that they would be saved by inter-Colonial Preference. Negotiations had been concluded by which Canada and the West Indies had made arrangements of mutual advantage, which afforded a market for the commodities of each. The result, if not the intent, of this agreement had been a lowering of tariffs on both sides, with some approach to freer trade by each party to the Convention. Sugar was still the staple crop in several and a large crop in most of the West Indies. Improved machinery and the centralisation of factories had contributed to the economy of production. But in Trinidad, where six years ago sugar formed 56 per cent. of the total production of the island, it was to-day less in value and importance than cocoa. Fiji had enormously developed the industry of sugar and now exported—mainly to Australia—a crop of the value of £800,000, as compared with £540,000 six years ago. From our Eastern Colonies—Straits Settlements, Federated Malay States, and Mauritius—the value of the export was fairly stationary, though the quantity had increased; but conversely from the West Indies the bulk was somewhat less, and the value had risen from £2,500,000 to £2,800,000. The profits and produce of molasses—a by-product—represented a value of export from our Crown Colonies of £430,000, as against a previous export of £246,000. **Tobacco.**—Ceylon and the Straits Settlements had increased their export of tobacco from £380,000 to £780,000 in value; and in Nyassaland it was becoming the second in importance of its products. The amount exported had increased more than tenfold in the last seven years, from 199,000lb. to 2,147,000lb., and in value from £3,300 to £53,700, a large portion of it finding its way to the United Kingdom. On the whole, the export by our Crown Colonies of tobacco had grown from a value of £414,000 to one of £764,000. **Rubber.**—In rubber, which was subject to the fluctuations of market gambles, it would be prudent to test the progress of our Colonies rather by quantity than by price. From the point of view of production the progress of our rubber-producing regions had been abundantly satisfactory. The West Indies, British Guiana, and Honduras seemed well suited to the production of rubber, but the greater cost of labour there as compared with the East might affect their ultimate success. Their export in pounds had grown from 27,000 to 29,300, but this was no true test of their future, as there had been in the last few years a large experimental planting of trees, none of which had yet reached the tappable age. In West Africa the production maintained a fair average in quantity and price. The rubber production of Uganda had been mainly from the wild tree (Funtumia elastica). As this became exhausted, systematic planting of Para and other varieties had to be resorted to, and these had not yet come into bearing. And in addition the principal rubber areas, up to now, had been near the shores of Lake Victoria, and when this was discovered to be a "fly area" for sleeping sickness prevention, the commercial assets of that region were gravely impaired. Nyassaland was much more promising in this respect. Its export in pounds had risen from 18,000 to 48,000. Wild rubber—principally of the Landolphia species—was diminishing by exhaustion, but plantation rubber, though extensive in area, was not yet sufficiently mature for mercantile production. The East Africa Protectorate had managed to maintain a fair average of exportation. It was, however, in Ceylon and the Malay Peninsula that the great development of this production had taken place. From Ceylon and the Malay Peninsula in 1905 the exports were 6,500,000lb.; in 1912 they were 51,000,000lb. The value was, in 1905, £665,000, and in 1912 £13,700,000. With rubber should be included gutta-percha from the Malay Peninsula, where the export had grown in value by 50 per cent., and balata from British Guiana, a substitute for gutta-percha, obtained from the sap of Mimusops globosa. The export of this material had grown in value from £40,000 to £140,000 in six years."

"The Larger Fleas have Smaller Fleas . . ."—The large Larch saw-fly, which has done so much damage to the Larch of this country, is not to go on its destructive ways unchecked. Though man is able to do but little to prevent the depredation of the saw-fly, Nature herself is intervening with effect to redress her balance. An ichneumon, Mesoleius tenthredinis Mor, previously unknown to science, was discovered some time since to be actively engaged in "parasitising" the larvæ of the saw-fly. For a time this enemy did good service, and to its activities the Shoulthwaite plantation at Thirlmere won through an attack of the saw-fly. Recently, however, this plantation was attacked again by a vast swarm of adult saw-flies, and there was reason to fear that it would suffer irreparable damage. But, according to observations recorded by Mr. J. Mangan in *Nature* (July 24, 1913), the pest brought with it its own seeds of destruction, for an examination of the parasites which have emerged from the cocoons shows that, whereas the old ichneumon M. tenthredinis was scarce, another ichneumon, which till recently had taken but a languid interest in the destruction of the saw-fly, had become suddenly active, and had taken up its abode in some 25 per cent. of the cocoons. Another 24 per cent. had been chosen by a Tachinid Zenillia pexops as its residence. As Mr. Mangan suggests, these new parasites followed probably in the wake of the saw-fly, and are seeing to it that the pest shall not have things its own way for an indefinite time.

Turkish Preserved Fruits.—Preserved fruits are produced in Turkey in only three varieties—namely, "Pekmez," "Pestil," and Olives. Pekmez is made from the juice of Grapes. This is thickened by cooking over a slow fire and constant stirring, during which process certain sweet-smelling herbs are added. The thickened juice is either sold as syrup or the process is continued until the juice is thoroughly hardened. Then it is allowed to cool, and is laid out in thin cakes on boards to dry in the open air for several days. Then the substance which has cooled is mixed with walnuts and kneaded around strings, forming in this way a sort of sausage. In this form it is called "djevizpekmez." Pestil is prepared from Apricots and Plums. These fruits are cooked, their pits taken out and thickened. The cold resultant substance, which must not be burned, is then spread on zinc-plated copper sheets, and warmed from beneath by a slow fire. In this way the slices dry quickly, and are cut into strips and rolled together. Pestil keeps for a long time, and is eaten either raw or is soaked in water and made into sauce. Olives are laid either in salt water or in barrels in salted layers. In the former case they remain green and hard; in the latter they become black and soft. The consumption of Olives is very great in Turkey, as they are almost the only other food eaten by the poorer classes with their dry bread. *Journal of the Society of Arts.*

Cultivation of Vacant Land in London.—We have received the annual report of the Vacant Land Cultivation Society, established in London in 1908 to acquire vacant land for temporary cultivation by men out of permanent employment. The Hon. Secretary of the Society is Mr. Joseph Fels, the Hon. Treasurer Mrs. H. J. Tennant, and the Superintendent Mr. R. Lewis Castle. The report states that there is at the present time about 14,000 acres of vacant land in London, composed chiefly of sites awaiting the builder. The Society's Superintendent inspects these sites in order to determine which are most suitable for the purposes of the Society. Having done this, he approaches the owners and endeavours to get them to loan the land to the Society on the condition that the owners may enter into re-occupation at any time on giving a week's notice. Having obtained the land for an indefinite period, the Society prepares it for cultivation, and when this has been done it is measured out into plots, which are allotted to applicants, no charge being made for rent. The season of 1912 appears to have suited the gardens extremely well, and the report states that the results passed anything obtained in previous years. The Society has control over 50 acres, and 400 men and women have been allotted plots, but there are still 600 adult applicants, and in order to satisfy these 65 more acres of land is needed. It is stated that the gross value of the produce raised by the men in the past five years exceeds £9,000, and the produce raised last year was worth £3,000. The total income of the Society during the five years has been £2,000. The training which the men receive from the experienced Superintendent whilst cultivating these plots cannot fail to be of benefit to them, and from every point of view the public may well be asked to assist the objects of the Society. If visitors to the suburbs will take the trouble to inspect some of the gardens, and compare their appearance with other building sites which have not been brought into cultivation, they will appreciate the transformation the operations of the Society effect.

Nursery Employees Outing.—The annual outing of the members of the staff of Mr. Amos Perry, nurseryman, Enfield, took place on the 26th ult., when Yarmouth was visited. At the dinner Messrs. Amos and William Perry, who accompanied the party, were made presentations by Mr. Redmond on behalf of the employees.

Mr. H. Cutbush, Junr. — The *Morning News*, Jersey, of the 31st ult., contains the following interesting announcement:—"At St. Brelade's Parish Church yesterday morning was solemnised the marriage of one of the Island's most talented and popular professional singers, Miss Flora H. Vardon, A.R.C.M., only daughter of Mr. and Mrs. H. Vardon, of 72, Rouge Bouillon, to Mr. Herbert Wm. L. Cutbush, only son of Mr. and Mrs. Herbert Cutbush, of Normanhurst, Highgate, London."

A Gardener's Long Service.—Mr. Robert Anderson, gardener to Mr. Y. G. Lloyd-Greame, of Sewerby House, near Bridlington, has completed fifty years' service with Mr. Lloyd-Greame and his family. Mr. Anderson recently celebrated his eighty-sixth birthday. A native of Keith (Banffshire), he served his apprenticeship at Haddo House. Leaving Scotland at the age of about 21, he took a situation at Sion House. Afterwards he served at Blaise Castle, Trentham, Coney House and South Ella. On his thirty-sixth birthday he commenced his duties as head gardener at Sewerby House, and that position he still holds.

Fruit and Potato Crops in the Bruges Consular District.—The Board of Agriculture and Fisheries have received a further report, dated July 24, from his Majesty's Consul-General at Antwerp, on the fruit and Potato crops in the Bruges Vice-Consular district, from which the following are extracts:—Plums will only yield half a crop. It is impossible as yet to fix their approximate prices, but these will certainly run high. A poor yield of Greengages is expected and prices will be high, probably not less than about 4½d. per lb. Nuts will be an average crop. Apples will yield abundantly and prices will, in all probability, be lower than

last year, ranging from 6s. to 8s. per cwt. Pears are a good crop and prices will also be lower than last year, varying from about 1¼d. to 1½d. per lb. Potatos promise well, and at present an abundant crop is expected, but disease is feared if wet weather continues. The chief varieties grown in the district for table use are Walen and Fleur Blanche. Other varieties are L'Enorme de Veenhuizen, La Kruger, La Juillet de Poulsen, and L'Industrie. Prices for the better qualities now range from about 4s. 9d. to 6s. per cwt. and for ordinary Potatos from 2s. to 2s. 4d. per cwt.

Forecasting the Weather.—We have received a reprint of an article, by Andreas Voss, entitled 'Die Grundzüger einer praktischen Wettervorhersage" ("Principles of a Practical Weather Forecast"). The author criticises the weather-charts issued by the Prussian Agricultural Meteorological Service, at a cost of about 380,000 marks (approximately £19,000) annually, as almost useless, inasmuch as they are mere daily prognostications. He claims to have foretold, and to be able to foretell, sudden changes and the character of the weather of the yearly seasons at least a year in advance. Falk's theory of the great influence of the sun and moon is the foundation of Voss's forecast; but he also attaches great importance to eclipses of the sun in relation to the direction of the wind and other phenomena. He says the forecast of the weather for a lengthened period is based on the direction of the wind, caused directly by an eclipse of the sun, which controls atmospheric pressure, and the distribution of humidity over the earth. In proof of the soundness of his deductions he adduces his forecast for the year 1912, drawn up at the beginning of November, 1911, and his forecast for 1913, drawn up in August, 1912. No doubt the general character of the forecast for 1912 was correct. Harvest prospects for 1913 are thus briefly summarised: In consequence of unfavourable spring weather sowings would be delayed and summer grain crops below the average. Winter grain an average crop. Fodder crops, including roots, above the average. Leguminous crops and Cucumbers below average, in consequence of drought and mildew during month of June. Winter Potatos below the average in districts where wet or cold weather sets in too early. Fruit in many places short in consequence of a rainy flowering, otherwise better than in 1912. Plant diseases and enemies more abundant than in 1912. Of course, these forecasts relate to Germany, with Berlin as the centre.

ORCHID NOTES AND GLEANINGS.

MAXILLARIA FRACTIFLEXA.

Maxillarias are well represented in the famous collection of Sir Trevor Lawrence, Bart., K.C.V.O., at Burford (gr. Mr. W. H. White), and we have been indebted to him for the opportunity of illustrating some of the most remarkable, and notably the very extraordinary M. scurrilis (July 28, 1900, p. 65), and M. fractiflexa, illustrated in the *Gardeners' Chronicle*, May 31, 1902, p. 359, both species collected in Ecuador by the late Consul F. C. Lehmann.

M. fractiflexa was shown by Sir Trevor Lawrence at the meeting of the Orchid Committee of the Royal Horticultural Society, on July 29 last, in improved vigour, its slender erect spikes bearing several of its curious flowers about 6 inches across. The narrow, yellowish-white sepals and petals are curiously twisted, the petals being curled round at the outer half. The small labellum is white, spotted at the base with purple.

ONCIDIUM LIMMINGHEI.

This charming little Orchid is blooming in the collection of J. J. Neale, Esq., Lynwood, Penarth (gr. Mr. H. Haddon), and is well worth recording as few know that it is still in cultivation. It is a very small grower, of the Oncidium Papilio section, though totally different in habit, its small rugose, one-leafed greenish pseudobulbs, and leaves, marked with red, closely pressing against the block on which they are grown, the whole plant not more than 2 inches in height. The spikes are 2 to 3 inches in height, bearing two to four flowers, opening in succession. They are like small flowers of O. Papilio, the lip being yellow spotted with red. The species has always been rare, although it has been occasionally imported since it first appeared in flower at the Liege Botanic Gardens in 1855, the plant having been collected in Caracas. It grows best in the shady end of an intermediate house.

CATTLEYA WARSCEWICZII ALBA "MUESSER'S VARIETY."

A two-flowered inflorescence of a fine form of the rare and beautiful white variety of Cattleya Warscewiczii, together with a photograph of the plant, is sent by Mons. Arthur Muesser, Orchid importer and grower, Brussels, who collected it and brought it home with a fine importation of the best typical C. Warscewiczii, and of Cattleya aurea. M. Muesser writes: "The plant was nearly dead when it arrived, and I had to nurse it carefully, but, being a robust grower, it soon recovered, and is now flowering on one of its two strong leading growths. It has thirteen bulbs, seven with leaves. The flowers sent will show what a beautiful thing it is."

It is a true C. Warscewiczii in size and form, and of the clear whiteness of the superb C. Warscewiczii var. Firmin Lambeau, but the lip is longer and more crimped, and close examination shows a faint blush, like that on a pearl, on the front lobe. The disc of the lip is yellow, displayed on each side in a roundish, lighter blotch, after the manner of the species. The actual measurement of the flower is seven inches across, and the segments are of very fine substance. *J. O. B.*

ODONTADENIA SPECIOSA.

Odontadenia speciosa (see Fig. 43), is a beautiful flowering climber with thin, twining branches, reaching a height normally of 20 to 25 feet, and is suitable for training along horizontal wires in a plant house. The illustration is of a plant in the Royal Botanic Gardens, Peradeniya, Ceylon, where the plant is shown growing over a Cassia tree, which it has draped completely, forming graceful festoons from branch to branch. In Ceylon it blossoms profusely at least twice a year, usually after spells of dry weather. The large bell-shaped flowers, which somewhat resemble those of Allamanda, are of a beautiful salmon-yellow colour streaked with crimson on the throat and inner side of the tube, the corolla ending in a prettily scalloped and wavy margin. The blooms are borne in great profusion towards the ends of the branches, the latter being weighed down by the heavy trusses. The flowers are very

[Photograph by H. F. Macmillan.

Fig. 43.—Odontadenia speciosa flowering in Peradeniya Botanic Garden, Ceylon; colour of flowers salmon-yellow.

pleasantly and delicately scented, suggesting a strong Primrose perfume. The ground beneath the trees is often carpeted with the fallen flowers.

The plant is a native of Tropical South America, and in Great Britain requires the protection of a plant stove or warm conservatory. I have not known it to produce seed under cultivation; but it may be propagated by layering, or from cuttings placed under a bell-glass; the ends of healthy, vigorous branches should be selected for the purpose of propagation, as these not only strike root best, but plants raised from cuttings flower much earlier than those increased from seeds. *H. F. Macmillan.*

NOTICES OF BOOKS.

Vegetable Culture.

This is a small volume in its third edition, which treats in a brief, though perhaps not inadequate, manner of garden vegetables. The first part discusses these in alphabetical order, and the second is a calendar of operations in equally brief fashion and to the point. The author is Mr. Trevor Monmouth, and the publisher Mr. Upcott Gill, London. Price 1s.

Garden Work for Every Day.*

This little volume treats of gardening somewhat after the manner of Abercrombie, but, unlike the productions of that fecund scribe, it is inclined to be scrappy. At the best the method is of doubtful merit in presenting the pleasures and profits of gardening; it necessarily involves unprofitable repetition, and, as it seems to be the case in this volume, when more than one writer is employed in its production there is a perplexing diversity in the directions. Apart from these almost inevitable flaws the volume contains much useful information, conveyed in plain and easily understood language. A large number of cuts add to the educative value of the book.

Successful Gardening.†

This manual of gardening is now generally well known, and in this new edition we find many new writers and new articles. As a cheap review of everyday gardening it is first-rate, and on comparison with the first or earlier editions it will be found to have been almost entirely rewritten and the old items extended. The lists of varieties of the several plants treated have been suppressed, and others up to date substituted. Many new illustrations have been added, and the volume as a whole runs to three times the number of pages. If, therefore, the book as first issued was worth its money, it is clear that the present issue must be ridiculously cheap, which its purchasers will no doubt agree that it is. *R. P. B.*

PRICES OF ENGLISH TIMBER.

"Prospective work which is to be carried out by the Metropolitan Water Board on the Littleton Park Estate, Staines," writes W. D. in the *Kew Bulletin*, "necessitated the disposal of the whole of the timber growing on an area of 600 acres, which was sold by auction on February 12. The sale was particularly interesting, for it gave a good idea of the average value of the general timber growing in plantations, parks and hedgerows on well-placed estates. The volume of timber ran to approximately 111,000 cubic feet, and consisted of Oak, Ash, Elm, Horse Chestnut, Sweet Chestnut, Plane, Scots Pine, Larch, Spruce, Beech, etc., the first three kinds predominating. It may be said to be typical of the timber found on many estates throughout the country, some, more particularly the Ash, being of good quality, others being medium, and a fair percentage medium to poor, amongst the latter being aged, rough or immature trees. By a comparison of maximum and minimum prices a good indication is given of the difference in quality of the various lots. The estate is favourably situated for the removal of timber, for it is within one mile of one railway station, two miles of two others, is near a river wharf, and is but 15 miles from London. Moreover, nine months are allowed for the removal of the timber and facilities are granted for its partial working on the ground. Oak ran to about 54,000 feet and consisted of all classes of trees, from well-grown clean specimens containing between 60 and 110 feet of timber, to rough hedgerow trees of 20 to 40 feet, and a considerable number of small trees containing less than 20 feet each. About 18,639 cubic feet of Ash realised the best prices of the sale, and the general quality was more consistent than that of other kinds. Of 24,378 feet of Elm offered a good deal was small and prices generally were low. Horse Chestnut was in demand and sold well, and the same may be said of Plane. About 1,500 feet of Beech in several lots created little excitement, and neither lot secured a good price. Larch, Spruce and Scots Pine together were estimated to yield 4,319 feet, and all was knocked down below the average price. In a few cases the trees had been felled, but this fact did not appear to affect the prices to any appreciable extent.

"Taking the sale throughout the timber averaged about 11d. a cubic foot, omitting fractions, and the prices of individual kinds per cubic foot are given below. In each case small fractions are omitted :—

Variety of Timber.	Average price.	Maximum price.	Minimum price.	Remarks.
	s. d.	s. d.	s. d.	
Oak	10½	1 11½	4½	Young and rough trees seriously affected the average price.
Ash	1 9	3 0	11¾	Although the maximum price only once exceeded 2s. 5d., it only dropped below 1s. twice.
Elm	5¾	10½	2½	There was a considerable amount of small timber.
Horse Chestnut	1 2¾	1 11	1 0½	Appeared to be in good demand.
Plane	1 1½	1 4	1 0	A few buyers were eager to purchase.
Sweet Chestnut	8	1 3½	7	—
Beech	7½	1 0¾	4½	—
Scots Pine, Spruce and Larch	2¾	9½	1¾	The highest price was obtained for one lot composed chiefly of Larch.

HOME CORRESPONDENCE.

The Future of the N.E.H.S.—It is to be hoped that some portion of Mr. Bernard Hall's suggestions (p. 70) may yet be carried out. I allude more particularly to the fixing of a site for an experimental garden, or, if preferred, Northern school of horticulture—in Yorkshire. Something of this character was in view three years ago, when the discussion took place in the *Yorkshire Post* which gave birth to the N.E.H.S. I mention Yorkshire in particular as the best site, seeing there is already a good base in the excellent horticultural work done at Garforth and other places by the officials connected with the University, Leeds. I take it for granted that in any future developments the same authority would have a leading part. The Council of the N.E.H.S. would, of course, have their share, seeing that amongst its members are many of those most interested. No doubt the two authorities could get support from the Board of Agriculture and Horticulture or Development Board for a well-conceived plan of operations. None of the other public authorities connected with northern counties have so far done so much work on horticultural lines as Yorkshire has. Mr. Hall's suggestions as to a model rock garden can well wait, unless some person or persons will defray the cost. No doubt there is much interest shown in Rockeries nowadays. The same remark can fitly be applied to Rose gardens, hardy plant gardens and school gardens. His comparisons to the R.H.S. Hall and Garden are scarcely appropriate, seeing that the Society had been in existence a century before it came into its own fully. All the same it would be a misfortune to northern horticulture were the good work done already not followed up. The main obstacle has been its attack of mental indigestion. Let us hope that Mr. Hall's aphorism, namely, progress comes from suffering, may ere long make the N.E.H.S. strong and well. The concluding note as to lack of sympathy and help from adjoining counties somewhat confirms the ideas of some of us at the outset, that it would have been wiser to have retained its first name —Yorkshire Horticultural Society.—*Yorkshire Gardener.*

Disease in Peas (see pp. 21, 89).—I was interested to read the communication from "Correspondent" about disease in culinary Peas, and would be glad if you will allow me to use your paper as a means of getting in touch with Pea growers in different parts of the country. The diseases of culinary Peas are numerous, and seem to be getting more prevalent, and as I am making a special study of a bacterial disease of Pea which is causing considerable damage, I should be glad to examine any specimens of diseased Pea plants forwarded to me at the John Innes Horticultural Institution, Mostyn Road, Merton, Surrey. The specimens should be packed quite fresh, and the whole plant, including the roots, if possible, should be sent. Some of the symptoms described by your correspondent undoubtedly show that part of the trouble is due to bacteria, which require a warm temperature to develop rapidly. Hence early sowing should be practised to ensure the Pea plants being well established and growing rapidly before the attack becomes severe. *D. M. Cayley.*

How Plants are Named.—"Eavesdropper" (see p. 89) is obviously an optimist of the kind that does incalculable harm by maintaining that all things official and accepted are perfect and infallible. Let him go to Kew and look at the "collections of living plants maintained to enable them to identify plants," and he will find among Irises alone (1) an albino I. germanica exhibited as "I. pallida Princess of Wales"; (2) I. Monnieri as a Cretan plant, though the author of its name expressly says that it came from the garden of one Lemonnier at Versailles, and although Sieber's Cretan specimens are I. pseudacorus; (3) I. Kæmpferi grown as I. lævigata; (4) a variety of I. lævigata grown under the name of I. albopurpurea: (5) I. flavescens exhibited as a Caucasus plant, though it is a garden hybrid, and though the true Caucasus plant is also grown at Kew but under the name of I. obtusifolia, which was given at Kew, when all the time Lindley's name of I. imbricata was in existence; (6) I. tenax confused with I. Douglasiana. These are only a few of the errors that Kew seems doomed to spread and perpetuate by the inadequacy of its small trained staff to deal with what is probably the richest botanical collection in the world. *W. R. Dykes.*

Strawberry Propagation.—As an appreciative reader of your journal I may, perhaps, be allowed to offer the following remarks. As a boy I can well remember having to water the Strawberry plants layered as advised on p. 90. In those days I had hoped to find an easier way of raising these plants, and for some years I have practised the following method :—I prepare a bed of fine soil mixed with plenty of leaf-mould in a half-shaded position. Having made it firm by treading, I dibble in the young plantlets from 4 to 6 inches apart straight from the beds, leaving about 1½ inch of the sarmentum attached to keep them steady when being watered. The advantages of the method are, (1) runners may be taken from the most fruitful and healthy

* *Garden Work for Every Day.* Illustrated. By H. H. Thomas. (London: Cassell and Co.) Price 1s.

† *Clay's Successful Gardening.* By Professional, Amateur and Market Grower. (London: Clay and Son.) Fifth Edition. Price 1s.

plants very early in the season; (2) a saving of time in watering, preparing the soil and the pots; (3) the runners may be dipped in a specific to destroy insect or fungous pests before they are planted; (4) the roots, not being restricted, grow in a natural way straight from the crown of the plant; (5) should their planting-out be delayed by unfavourable weather or other causes, the young plants will not suffer as these in pots. As to catch crops between the newly-planted border, Onions and Shallots are suitable. Plenty of light and air are essential to healthy plants and good flavoured fruit, and it would be interesting to hear from growers who protect their fruit from birds with muslin in preference to netting. I prefer President to British Queen, notwithstanding the latter is the better cropper. Royal Sovereign is not nearly so good here as in gardens in southern counties. Elton Pine I would place before Given's Late Prolific. Louis Gauthier is the most vigorous and heavy cropping variety I know. When I saw it in Middlesex the fruit was white, but here it is tinged with pink; the flavour is good. Our next in vigour and productiveness is The Laxton, which took some years to get accustomed to our heavy, clayey loam. *John Edwards, Sylfaen Gardens, Welshpool.*

Fig. 44.—the red sunflower.
(R.H.S. Award of Merit, July 29, 1913.)

Poterium obtusatum.—The few species of Poterium hitherto cultivated have been of little horticultural value, and the genus is one from which little has been expected. This new Japanese species, however, is a noteworthy exception, and no more attractive border plant has been introduced for many years. P. obtusatum in habit of growth differs but little from P. sanguisorba, but the flower scapes are of a delightful shade of carmine pink—a tint most uncommon in herbaceous plants. It is a continuous blooming plant, throwing up several relays of leafy flower-stems during summer and autumn. The flower-stems reach the height of about 4 feet, are much branched, slender, and, if skilfully staked, present a charming and graceful picture. For the herbaceous border or for large groups this plant will take a prominent place. It flowered for the first time in this country in 1910, in the nurseries of Messrs. Barr and Sons, who are to be congratulated on introducing a plant of so much merit. The stock, I am informed, is still small, but no doubt it will soon be available in quantity, and at a price which will permit of extensive planting. *T. Hay, Superintendent, Greenwich Park.*

Late Flowering Iris.—We are sending you herewith a few blooms of an Iris now in flower with us. The variety is Mrs. Alan Gray, and is one of the many beautiful hybrids raised by the late Sir Michael Foster. It is not uncommon for some of the varieties of Iris germanica to throw an occasional bloom in late summer, but we have noticed in regard to this variety ever since it has been in our nursery that it flowers regularly twice a year, not here and there a spike, but nearly every plant. We have a bed containing some five or six hundred plants, and the effect at the present time is quite beautiful. *R. Wallace and Co., Colchester.*

Early Cultivation of Grapes for Market.—I was much interested to read in your last issue of the progress of Mr. Geo. Monro's business at Covent Garden, but there is one point in his address to his guests which is an error, and I am quite sure he will be glad if I correct it. He said, "The first person to undertake the growing of Grapes for market on serious lines was Mr. William Thomson, of Clovenfords." This is not so, as Mr. Joseph Meredith, of Garston Vineyards, Liverpool, was flourishing in business on the same lines long before Clovenfords was bought for a vineyard. I may say that Mr. Meredith, when a boy, was employed on a brickfield and attended the village church. The vicar gave him some employment in his garden for some time, and later took him to the late Mr. G. Fleming, of Trentham, and paid Mr. Fleming a premium to employ him in the gardens and prepare him for a good position. He remained there for several years, and then took charge of a place in Gloucestershire, and afterwards removed to Cliveden, and later to Liscard. Whilst at Liscard he purchased the land at Garston. He told me he was assisted by Mr. Littledale in developing the land as a vineyard, where he grew Pines, Grapes, Peaches, Nectarines, Melons, and Cucumbers for sale either to private people direct or to retailers. For some time he flourished beyond all expectation, and had he continued to stick tight to business he would have flourished until the end. He exhibited at all the leading shows, not only in this country but also on the Continent, and had the honour of presenting to many royal personages some of his produce, for which he held flattering letters and diplomas of which he felt justly proud. This is well known to the gardening fraternity of that time. I shall never forget the first time I saw his place, particularly his house of Muscats and his so-called "elephant" house full of splendid pot vines, a sight worth remembering by any young gardener. In 1869 I left Trentham to take charge of Kellermont Gardens and grounds, Glasgow. At that time Clovenfords was in its infancy, and in 1871, through a death in the family, Kellermont was closed. I visited a number of the leading places in Scotland, including Clovenfords, and found it rapidly developing. With all fairness Mr. Joseph Meredith was the pioneer of Grape-growing for market purposes in this country, and Mr. Thomson followed in his footsteps. *J. Ollerhead, Wimbledon.*

THE RED SUNFLOWER.

The Red Sunflower, exhibited by Messrs. Sutton and Sons at the last meeting of the Royal Horticultural Society, and illustrated in Fig. 44, shows a remarkable colour variation in Helianthus, and promises to provide a splendid new plant for the hardy flower border.

It is the result of a cross made between Helianthus annuus (the common annual yellow Sunflower) and Helianthus lenticularis (a wild Sunflower of North America) by Professor Cockerell, of Boulder University, Colorado, who handed over his stock to Messrs. Sutton and Sons for development. The colour of the band on the floral segments is a chestnut brown.

Prof. Cockerell has continued his work with the flower, and is said to have produced another hybrid of a brighter tone.

Scientific Committee.

July 29.—*Present:* Mr. E. A. Bowles, M.A., F.E.S. (in the chair), Sir J. T. D. Llewelyn, Prof. Boulger, Messrs. Fraser, Shea, Odell, Hales, Hooper, Bennet-Poë, Hooper Pearson, Fawcett, Holmes, Cotton, Rolfe, and Chittenden (hon. sec.).

Plum-boring Moth.—Mr. E. M. Holmes showed examples of the work of the larvæ of this moth, and commented upon the damage done and the differences he had observed (particularly in the amount of spotting) in the larvæ in life and as described.

Hybrid Pelargoniums.—Mr. A. Langley Smith showed a number of variations obtained from self-fertilising the plant obtained as a result of crossing P. crispum with an old hybrid fancy called the Shah, and by recrossing the forms among themselves. A summary of the results will be published in the *Journal* of the Society.

LEAMINGTON AND COUNTY HORTICULTURAL.

(*Concluded from page 96.*)

Sweet Peas.

The most important Sweet Pea class was one for a display of flowers to occupy a space of 20 feet by 4 feet. There were only two exhibits, but both of them contained flowers of great merit. The 1st prize was won by Mr. T. Jones, Ruabon, whose display was much admired. Many of the varieties were arranged in big bunches at irregular heights, relief being afforded by sprays of Asparagus and Smilax. The varieties of outstanding merit were Dobbie's Lavender, R. F. Felton, Sunproof Crimson, Elfrida Pearson, Edrom Beauty, and Hercules. Messrs. Bides, of Farnham, had splendid flowers of Edith Taylor, Lady Knox, Thomas Stevenson, Prince of Wales, and Blue Bell. The 1st award in this class was a Silver Challenge Cup.

Table Decorations.

Table decorations are always a feature at Leamington. Of the 8 exhibits in the 1st class (no restriction as to the kind of flowers used), the one that pleased the judges most came from Sir George H. Kendrick, Edgbaston (gr. Mr. J. V. Macdonald), and was composed of choice Orchids and sprays of Selaginella artistically arranged. 2nd, Mr. W. T. Mattock, Headington, Oxford.

Prizes were offered by Robert Sydenham, Ltd., for table decorations limited to two colours of Sweet Peas. The 1st prize was won by Mrs. Batchelor, Hampton-in-Arden, for a very charming arrangement of pale pink Peas and sprays of Selaginella.

Plants and Cut Flowers (Amateurs).

The class for a group of plants in a space of 13 feet by 10 feet is always well contested. The 1st prize—a Silver Challenge Cup, value 10 guineas, and £6—was secured by the Misses Robinson, The Newlands, Leamington. Orchids, Gloxinias, Streptocarpus, etc., were beautifully mingled with Caladiums, Ferns and Codiæums. A rustic bridge clothed with well-coloured foliage and flowering plants was much admired. As the Misses Robinson won the Cup in 1911 and 1912, it now becomes their property; 2nd, Alfred Holt, Esq. (gr. Mr. J. Fisher); 3rd, C. C. Shaw, Esq. (gr. Mr. W. Bartlett). The last-named exhibitor was awarded 1st prizes for (1) 3 Liliums; and (2) 6 miscellaneous plants in pots not exceeding 10 inches diameter.

Frank Dennison, Esq., Cranford, Leamington, had the best exhibit of 12 Roses, distinct, with flowers of superb quality. J. Booth, Esq., Claverdon, was awarded the 1st prize for 6 Tea Roses distinct.

Fruit (Open).

In a class for 8 dishes of fruit, distinct kinds, there were two splendid exhibits. The schedule required each collection to be decorated with foliage plants, moss or cut foliage. The 1st award was gained by the Earl of Craven, Coombe Abbey (gr. Mr. H. Chandler), who had Waterloo Strawberry, Royal George Peach, Pineapple Nectarine, Black Hamburgh and Muscat of Alexandria Grapes, James Grieve Apple, Brown Turkey Fig, and a seedling Melon. The other exhibitor, Hugh Andrews, Esq., Winchcombe (gr. Mr. J. R. Tooley), introduced cut flowers among his decorations which were not required by the schedule for which reason the 2nd prize was withheld and an extra prize substituted. His Brown Turkey Figs, Pitmaston Orange Nectarine, and Black Hamburgh Grapes were meritorious. In the next class, which was for 4 dishes of fruit, distinct, the last-named exhibitor was awarded the 1st prize with a handsome collection.

The Earl of Craven won the Silver Challenge Cup, value 15 guineas, and £2 offered as 1st prize for 4 dishes of distinct kinds of fruit; 2nd, W. E. Everett, Esq., Sherbourne Hall, Leamington (gr. Mr. E. Allaway).

His Grace the Duke of Marlborough, Blenheim (gr. Mr. G. Hunter), had the best exhibit of 2 bunches of Black Grapes with well-shouldered bunches of Madresfield Court.

The Earl of Craven (gr. Mr. W. Chandler), excelled in classes for (1) 2 bunches of White Grapes with Muscat of Alexandria; (2) 6 Dessert Apples; and (3) Black Currants. Mr. P. Lucas, Esq., The Oaks, Leamington (gr. Mr. W. Wright), had the best dish of Peaches, and W. J. Gresson, Esq., Pershore (gr. Mr. T. Parry), showed the winning dish of Nectarines. The Rev. F. H. Hodgson, Clopton House, Stratford-on-Avon (gr. Mr. W. Nicholls), had the best-flavoured Melon; 2nd, Hugh Andrews, Esq. (gr. Mr. J. R. Tooley). The best 3 dishes of cooking Apples were sent by the executors of Mr. Thos. Marsh, Warwick, and the leading dish of cooking Apples came from The Manor Fruit Farm, Knowle (gr. Mr. W. Wilkins). There were 10 excellent exhibits of Red Currants. 1st, Lord Willoughby de Broke, Compton Verney, Kineton (gr. Mr. J. Lloyd). The same exhibitor took the lead in a class for Cherries. Gooseberries were represented by 11 dishes.

Vegetables (Open).

In a class for 6 kinds of Vegetables, Lord North (gr. Mr. E. R. Jones), won the 1st prize. He had handsome specimens of Perfection Tomato, Ailsa Craig Onion, and New Red Intermediate Carrot; 2nd, Mr. J. Hudson, Leicester.

The last-named exhibitor gained the 1st prize in Messrs. Sutton's class for 6 kinds of vegetables with superb A1 Tomato, Magnum Bonum Dwarf French Beans, Gladiator Potato, Centenary Marrowfat Peas, Magnum Bonum Cauliflower and Ailsa Craig Onion; 2nd, Lord North. Messrs. Webb and Sons offered prizes for 6 kinds. 1st, Hugh Andrews, Esq. (gr. Mr. J. R. Tooley), with grand Tomatos, Celery and Cauliflowers; 2nd, Mr. J. Hudson, Leicester.

Messrs. Dickson and Robinson's prizes were offered for 6 kinds. 1st, W. J. Gresson, Esq. (gr. Mr. T. Parry); 2nd, Lord North.

Non-Competitive Exhibits.

Messrs. James Carter and Co., Raynes Park, exhibited a thoroughly representative collection of vegetables beautifully arranged. (Gold Medal.) Messrs. Webb and Son, Stourbridge, also had an extensive collection of vegetables. (Gold Medal.) Mr. P. J. Perry sent floral designs. Messrs. Pipers, Bayswater, showed border flowers, aquatic and bog plants, and clipped Box bushes. (Gold Medal.) Messrs. Hewett and Co., Solihull, had a large bank of hardy flowers and Roses. (Silver-Gilt Medal.) Mr. T. Smith, Newry, sent a very interesting collection of hardy border flowers, including many rare species and varieties. (Silver-Gilt Medal.) From The Clury Nurseries, Langley, Bucks, came an artistic arrangement of Carnations. (Gold Medal.) Mr. G. W. Miller, Wisbech, sent an extensive display of hardy flowers. (Silver-Gilt Medal.) Messrs. White and Co., Worcester, had a large exhibit of hardy flowers. (Silver Medal.) Messrs. Hinton Brothers, Warwick, showed rock garden plants. (Silver Medal.) Mr. D. Leigh, Hampton-in-Arden, sent miscellaneous flowers. (Silver Medal.) Messrs. W. H. Simpson and Sons, Birmingham, exhibited Sweet Peas and Antirrhinums. (Silver Medal.) Miss Smith, Stratford-on-Avon (gr. Mr. R. T. Law), was awarded a Gold Medal for a nicely-constructed rock garden. The finest exhibit of Phloxes in the Show came from Messrs. Wells and Co., Merstham.

The Silver Challenge Cup, value 30 guineas, offered for the most meritorious exhibit not entered in any class, to occupy a space of 250 square feet, was won by Messrs. Lane and Son, Berkhamsted, whose exhibit, consisted of Grapes and Roses.

ROYAL LANCASHIRE AGRICULTURAL.

July 31-Aug. 3.—The annual exhibition under the auspices of the Royal Lancashire Agricultural Society was held at Burnley on these dates. The number of entries was slightly below the average, although the quality of the exhibits was not less good than formerly.

Four classes were provided for plants in pots, including one for a group of miscellaneous plants arranged in a space not exceeding 300 square feet.

Messrs. J. Cypher and Sons, Cheltenham, won the 1st prize with a charming group. Codiæums (Crotons) formed the apex of numerous small pyramids, the ground work of moss and ferns being furnished with Odontoglossums, Cattleyas, Ixoras, Caladiums, Humeas, and other flowering plants; 2nd, Mr. W. Holmes, Chesterfield.

For twelve stove and greenhouse plants, not fewer than seven in bloom, the leading award was again secured by Messrs. J. Cypher and Sons, with admirable plants of Croton Sunset, C. Countess, C. Warrenii, three good Kentias, Clerodendron Balfouri, Statice intermedia, S. profusa, Stephanotis floribunda, and Bougainvillea Sanderiana; 2nd, Mr. R. Simpson. Messrs. J. Cypher and Sons were the only exhibitors in the class for twelve stove or greenhouse plants in pots not exceeding ten inches, and were worthily awarded the 1st prize, and they also excelled in the class for six Orchids in not fewer than three varieties, having Disa grandiflora, Cattleya aurea, Lælia Cattleya calliostoglossa, Odontoglossum Hallio-crispum, and Cypripedium gigas; 2nd, J. Butterworth, Esq., Burnley, (gr. Mr. J. Wilson).

Mr. W. J. Garner led in the class for a table of cut flowers with fine-coloured Crotons, Ixoras, Carnations and Roses; 2nd, Mr. J. Saul, Preston.

Sweet Peas, etc.

For eighteen distinct varieties J. R. Herron, Esq., Freshfield (gr. Mr. W. Bond), had the best of five exhibits. Royal Purple, a new variety, of distinct colour, was noteworthy in this exhibit; 2nd, A. E. Troop, Esq., Blackburn (gr. Mr. R. H. Jones).

Messrs. Dickson, Brown and Tait offered prizes for twelve bunches, and Messrs. J. Byers and J. T. Proctor were placed 1st and 2nd respectively in this competition.

For twelve varieties, open to amateurs, the Rev. A. R. Tomlinson, Carnforth, excelled with fine bunches of Aggie Elder, Mrs. E. Cowdy, Royal Rose, and Doris Usher. In the class for six varieties, distinct, Mr. T. F. Portnell showed the best exhibit of 21. Mr. R. Bolton offered prizes for six varieties, and there were 23 entries. C. E. Taylor, Over Kellet, was the winner of the 1st prize.

For a collection of Tree Carnations, occupying a space of 10 feet by 5 feet, Messrs. Young and Co., Cheltenham, won with grand blooms, including a new scarlet variety named Miss Hardcastle; 2nd, Mr. W. H. Dutton, Iver.

The best hardy perennials in a group measuring 15 feet by 5 feet were shown by Messrs. E. Gibson and Co., Bedale; 2nd, Messrs. Harkness and Sons, Bedale.

For twenty-four Roses Messrs. A. Dickson and Sons won with grand blooms of George Dickson, Mildred Grant, A. K. Williams, H. V. Machin, and others; 2nd, E. F. Harrison, Esq., Ulverstone. Messrs. A. Dickson and Sons also excelled in the class for twelve Roses, open to all growers.

In the amateurs' class for twelve Roses, G. Garnet, Esq., Lancaster, showed best of 17 entries.

Fruit.

For a collection of twelves dishes, not fewer than nine kinds, J. Brennand, Esq., Thirsk (gr. Mr. J. Hathaway), was placed first with excel-

lent bunches of Black Hamburgh, Foster's Seedling, and Madresfield Court Grapes, Bellegarde and Dymond Peaches, Humbolt Nectarines, and Royal Sovereign Melon; 2nd, G. Wilson, Esq.

For two bunches of Black Hamburghs R. A. Tatton, Esq., Clitheroe (gr. Mr. G. Marr), was placed first. Mr. Tatton also showed the best two bunches of any other black Grape. Mr. G. Wilson showed the best Muscat of Alexandria Grapes, and Mr. J. E. Newman the premier bunches of any other white Grapes with Foster's Seedling.

J. Brennand, Esq., had the best scarlet-fleshed melon, and R. A. Tatton the best white or green-fleshed Melon.

J. Brennand, Esq., led in the classes for Peaches, Nectarines, Apples, and Pears.

Vegetables.

For a collection of nine kinds, the Hon. Vicary Gibbs, Aldenham House, Elstree (gr. Mr. E. Beckett), led with magnificent produce; 2nd, T. Henshaw, Roby (gr. Mr. J. George).

In Messrs. Sutton and Sons' class for a collection of six kinds, E. R. Dickson-Nuttall, Esq., Prescot (gr. Mr. J. W. Barker), won the premier award.

In Messrs. E. Webb and Sons' class for a collection of six kinds, J. E. Battersby, Esq., Blackburn, was successful.

Messrs. Clibrans offered prizes in a class for a collection of eight kinds, and Mr. Battersby was again successful.

Non-Competitive Exhibits.

Messrs. Sutton and Sons, Reading, planted flower beds on either side of the entrance to their pavilion with Gloxinias and Begonias of their fine strains, and they also showed Melons and Sweet Peas.

Messrs. Dickson and Robinson, Manchester, showed vegetables, including nearly fifty varieties of Peas. (Gold Medal.)

Messrs. E. W. King and Co., Coggeshall, showed Sweet Peas. (Gold Medal.)

Messrs. Dickson, Brown and Tait were awarded a Gold Medal for Gladioli.

Messrs. A. Dickson and Sons, Newtownards, staged Roses. (Gold Medal.)

Silver Medals were awarded to Messrs. S. R. Compton and Sons for Violas and Pansies; Mr. S. Broadhead for a rockery exhibit; Mr. E. A. Le G. Starkie for stove and greenhouse plants; Messrs. Caldwell and Sons, Knutsford, for hardy flowers and Roses; and Mr. H. N. Ellison for Ferns.

Bronze Medals were awarded to Mrs. Hodgkins and Mr. W. Edwards.

Messrs. Dobbies and Co., Edinburgh, showed hardy flowers in variety.

Messrs. Dicksons exhibited Liliums, Gladioli, and other hardy flowers.

ROYAL ENGLISH ARBORICULTURAL.

Northumberland and Durham Branch.

July 5.—The annual summer meeting of the Northumberland and Durham Branch of the Royal English Arboricultural Society was held, by permission of the owner, Mr. Hector Christie, on the Jervaulx Abbey Estate, when a special forestry demonstration was given by Mr. J. F. Annand, of Armstrong College, Newcastle-on-Tyne, Adviser in Forestry for the Six Northern Counties, and his chief assistant, Mr. J. McLaren. The party numbered nearly 50, and were received by the agent, Mr. John Maughan, and his assistant, Mr. J. W. Mackay.

The following report of the proceedings appears in *The Darlington and Stockton Times*:—

Prominent attention has been drawn to the forestry operations on this estate by the successes obtained in the plantation competitions held in connection with the Royal Show at York last year. Previous to the purchase of the estate by the late Lord Masham in 1887 the Jervaulx Woods were managed purely with a view to æsthetic effect. A better system was then introduced, and the woods now form an excellent object-lesson in modern forestry. They are treated in two classes, those in which it is sought by the application of purely sylvicultural and commercial principles to obtain the most profitable crops of timber, and those devoted mainly to sporting purposes, the shelter of agricultural lands, and scenic effect.

Japanese Larch in Witton Fell.

The first plantation visited was a compartment of Japanese Larch on Witton Fell, three acres in extent, which was awarded the Silver Medal of the Royal Agricultural Society in the class for Exotic Conifers, and it is believed to be the finest of its kind in this country. The soil is a deep light loam on the millstone grit formation, and the altitude 850 feet. Attention was drawn to the fact that while young plantations of the European species on other parts of the estate are suffering more or less from stem canker, there is no sign of such disease here. The trees are growing vigorously, and special notice was taken of the excellent condition of the surface soil and the perfect canopy attained. Japanese Larch in this locality gives great promise of producing a valuable crop of timber, and in its younger stages the Japanese Larch is much superior to the European Larch as a soil improver. The adjoining compartment, consisting of a mixture of Scots Pine, Tyrolese Larch, and Silesian Larch, was next inspected. Canopy was formed somewhat more slowly in this plot than in the former, but the trees are very healthy, and the Larches comparatively free from canker. The Silesian Larch appears to be a much more vigorous grower at this stage than the Tyrolese. A newly planted area on a steep slope at an altitude of 950 feet to 1,000 feet was next visited. The trees used there are European Larch, raised from Scotch seed, and Corsican Pine, in alternate lines. Mr. Maughan's opinion is that although European Larch cannot be depended upon as a pure crop, it would be a mistake to give it up altogether, as, if it does succeed, it is such a profitable crop. If Larch does not become the final crop, there should be at least a proportion of healthy stems as a result of its association with the soil-improving Corsican Pine. Passing thence to the old wood on Witton Fell, planted about 100 years ago, at an altitude of from 800 feet to 1,200 feet, it was found that at the higher elevation the Scots Pine has reached a height of 50 feet, and has attained to good dimensions, but judging from the size of the Larch and Spruce it was suggested that these two species would probably have produced a heavier, and perhaps a more valuable, crop. At high altitudes Scots Pine often suffers from snow-break. The Beech had also attained to large dimensions, and it was considered that this species might have been introduced as pure groups with the Conifers, to the great advantage of the latter. At Thirsting Castle and Lamb Hill some very fine Larch, about 90 years old, were seen. Some of the largest trees growing here at an elevation of about 800 feet have a volume of from 150 to 200 cubic feet per tree, and it was understood that Larch timber from this part of the estate was always found to be perfectly sound, and the trees are still making considerable increment.

Grey Yaud Woods.

In the woods at Grey Yaud, at an altitude of about 1,000 feet, Mr. Maughan has laid down three fine experimental plots of Corsican Pine, Scots Pine, and Spruce, which were awarded a Bronze Medal in last year's competitions. The soil here is deep and light, and highly suitable for Pines. On the other hand, the altitude is high and the exposure severe, so that the Scots Pine may not give quite such good results as Spruce or Corsican Pine. The cooler atmosphere and the heavier rainfall are conditions suitable for Spruce. These woods should, therefore, be in the future a valuable object-lesson. They were laid down side by side in practically-identical conditions as to soil, and the future should show which species is capable of producing the heaviest and the most valuable crop of timber. The Adviser in Forestry expressed the opinion that the Corsican Pine would very likely prove to be much the better tree in the end. It is a much slower growth for the first few years than the Scots Pine, but the general experience is that it afterwards catches up to it, and maintains vigorous height growth for a longer period. The Spruce plot is now 16 years old, and the trees have established complete canopy, the average height of the dominant stems being 21 feet.

Mr. Annand suggested that planting distance was a question on which there was now such differences of opinion that it was a fit subject for experiment. Although he personally preferred close planting, there was no doubt that money might be needlessly spent on too close planting. Another point was the time and extent to which thinning should be carried out, and this wood provided favourable opportunities for experiments in that direction. Mr. Maughan thought that Scots Pine required closer planting than Spruce, as the latter clean themselves more readily.

The Estate Nursery.

A very interesting half-hour was spent in the estate nursery, which gained the Silver Medal in the competition for nurseries over one acre in extent, and Sandy Flat Plantation, which was awarded the Silver Medal of the Royal Agricultural Society in its class, was shown to the party on the way to the station. Here Mr. Annand raised the question of the advisability of pruning. The cost of pruning this plantation, it was stated, was 10s. per acre, which at the end of 80 years at 3 per cent. compound interest represented a sum of £2 3s. 8d. per acre. The question whether the improvement in the quality of the timber as a result of this operation would be such as to command a sufficiently higher price to make the outlay profitable needed careful investigation. Many arguments might be used for and against pruning. Pruning the whole of the stems was fairly costly. To select, say, 300 of the best stems for special pruning treatment, and leave all the others untouched, would save expenditure, and the unpruned trees would better serve the function of soil shading.

MIDLAND CARNATION AND PICOTEE.

July 30, 31,—This society's annual show was held at the Botanical Gardens, Edgbaston, on the above dates in delightfully fine weather, and attracted a good number of visitors on both days. The weather has been very trying to Carnations in the Midland counties, for which reason self-coloured varieties were below their usual standard of excellence, but yellow-ground fancies left little to be desired. The flowers shown naturally in vases with buds and foliage associated with them found many admirers among the flower-loving public not familiar with the "points" added by the aid of tweezers to dressed flowers. Nevertheless, the Carnation flowers shown with neat white paper collars on boards delighted the heart of the old-fashioned florist. With the exception of two exhibitors, Messrs. Mathias and Morton, from the South, all the Carnation competitors were Midland growers. Competition in the amateur classes was very satisfactory.

Sweet Peas of excellent quality and in great quantity were exhibited in the classes in which handsome prizes were offered by Robert Sydenham, Ltd. They made a show in themselves. A vote of condolence was passed with the relatives of the late Mr. Robert Sydenham, one of the founders and a good friend of the Midland Carnation Society, of which body he was chairman at the time of his lamented decease.

First Division (Open).
Flowers Shown on Cards.

Twelve Self Carnations.—1st, Mr. Hayward Mathias, Medstead, with a very even lot of flowers, in which the undermentioned varieties were meritorious: Titan, Daffodil, Mrs. G. Marshall, Etna, Crystal, Lilian and Elizabeth Shiffner. 2nd, Messrs. A. R. Brown, Ltd., King's Norton.

Twelve Fancy Carnations.—Mr. Hayward Mathias secured the 1st prize with shapely specimens of Lord Steyne, Linkman, Mrs. Leo Hunter, Devonian, Vandyck, D. O. Connor, Hercules, Skirmisher, Hecla, Pasquin, Bombardier, and Erl King. 2nd, Mr. A. W. Jones, Yardley, whose exhibit included large, fresh blooms of Linkman (Premier).

Twelve Yellow-ground Picotees.—Here again Mr. Hayward Mathias had the winning exhibit with clean, refined flowers of the following varieties: Togo, Esquisite (Premier), Alpha, Gloria, Puck, F. W. Goodfellow, Beta, Santa Claus, Corona, Dago, Jewel, and Gamma. 2nd, Messrs. A. R. Brown, Ltd.

Twelve White-ground Picotees.—Mr. C. H. Herbert won the 1st prize with grand blooms of the following varieties: Mrs. F. W. Twist, Mrs. Hammond, Ganymede (Premier), Fortrose, Mrs.

Gorton, Amy Robsart, Lady Sybil, Mrs. Openshaw, Beatie, Favourite, Mrs. Sharp, and Thos. William. 2nd, Mr. C. F. Thurston.

Twelve Flake or Bizarre Carnations. — The last-named exhibitor was placed 1st in this class with superb flowers of Master Fred, Gordon Lewis (Premier), Rowena, Cleopatra, Sportsman, J. S. Hedderley, Flamingo, Claude Lorraine, Mrs. T. Lord, Ophelia (Premier), Merton, and Robert Houlgrave. 2nd, Mr. C. H. Herbert.

Flowers Shown in Vases without Cards. Blooms Staged in Threes.

Six varieties were required in each of the four following classes. No wires except a mere support, which must not come beyond the base of the calyx, no paper collars, and no splitting or turning back of the calyx allowed. Carnation buds and foliage only permissible.

Self Carnations.—The 1st prize was won by Mr. Hayward Mathias. The varieties exhibited were: Titan, Wyatt, Sunproof Scarlet, Daffodil, Elizabeth Shiffner, and Mrs. G. Marshall. 2nd, Messrs. A. R. Brown, Ltd., who had splendid blooms of Mrs. C. Marshall alba and Britannia. 3rd, Mr. C. H. Herbert.

Fancy Carnations.—All the six exhibits in this class were excellent. 1st, Messrs. A. R. Brown, Ltd., with exquisite flowers of Becky Sharp, Forester, Skirmisher, Lord Steyne, John Ridd, and Linkman. 2nd, Mr. Hayward Mathias, with Queen Eleanor, Hercules, Pasquin, Father O'Flynn, Linkman, and Lord Steyne.

Yellow-ground Picotees.—1st, Mr. Hayward Mathias, with handsome specimens of Togo, Libra, Ariel, Santa Claus, Dago, and Exquisite. 2nd, Messrs. A. R. Brown, Ltd.

White-ground Picotees.—1st, Messrs. A. R. Brown, Ltd., with rather small but good quality flowers of the following varieties: Dorothy, Janet, Lavinia, Edmond Shorthouse, Mrs. Cooper, and Myra. 2nd, Mr. Hayward Mathias.

Second Division (Amateurs).

There was spirited competition in the classes reserved for amateurs, flowers shown on stands.

Six Self Carnations, dissimilar.—Mr. Robert Morton, Woodside Park, London, beat ten contestants. He showed unusually large, substantial flowers of Daffodil, Etna, Elizabeth Shiffner, Rosy Morn, Attraction, and Miss Willmott. 2nd, Mr. W. H. Parton, Moseley, whose specimens of Hadzor, John Knox, and Furthest North were very fine.

Six Fancy Carnations, dissimilar.—The 1st prize in this class was won by Mr. A. H. Birchley, Bournville. He had grand flowers of Linkman, Hercules, Queen Eleanor, John Ridd, Sam Weller, and Billy Barlow. 2nd, Mr. F. Bayliss, whose blooms of Linkman and Forester were noteworthy.

Six Yellow-ground Picotees, dissimilar.—The last-named exhibitor excelled in this class. His flowers were large, fresh, and of good form. The varieties exhibited were Margaret Lennox, John Ruskin, Onward, Togo, Gloria, and Mrs. J. J. Keen. 2nd, Mr. G. D. Ford, Acocks Green, who had excellent blooms of Gloria, Togo, and John Ruskin.

Six white ground Picotees, dissimilar.—The Rev. C. A. Gottwaltz, Hadzor Presbytery, Droitwich, was placed first in this class with rather small but refined flowers of Pride of Leyton, Lottie, Dorothy, Agnes Helen, Thos. William, and Lady Sybil. The 2nd prize was gained by Mr. G. D. Ford, Acocks Green, for a very handsome set of flowers.

Six Flake or Bizarre Carnations, dissimilar.—Two local exhibitors, Mr. E. J. Price, Bournville, and Mr. R. Bruce Waite, Harborne, were placed as named. Included in the 1st prize stand were splendid blooms of Gordon Lewis, Master Fred and Peter Pan.

Flowers Shown in Trebles (Amateurs).

Mr. Robert Morton was successful in a class for Self Carnations. His flowers of Rosy Morn, Elizabeth Shiffner and Etna were much admired; 2nd, Mr. E. J. Price, who had exquisite flowers of Solfaterra.

Mr. R. Morton again led in the next class, which was for yellow-ground Picotees. His vase of John Ruskin was particularly good; 2nd, Mr. W. H. Parton.

The last-named exhibitor had the best of ten exhibits in the class for Fancy Carnations; 2nd, Mr. R. Morton.

The best white ground Picotees came from the Rev. C. A. Gottwaltz, who had Margaret, Dorothy and Agnes Helen in superb condition; 2nd, Mr. E. J. Price.

Third Division.

Nine classes, i.e., three for flowers on boards and six for flowers in vases, were reserved for amateurs who do not grow more than 300 plants, who do not employ a gardener regularly, nor advertise plants for sale. The most successful exhibitors were:—Mr. J. Goody, Handsworth; Mr. F. E. Holland, Bearwood; Mr. P. J. Brookes, Bearwood; and Mr. R. Bruce Waite, Harborne.

Premier Flowers (Dressed).

Bizarre Ophelia, shown by Mr. C. F. Thurston; Flake Gordon Lewis, shown by Mr. C. F. Thurston; Heavy-edged white-ground Picotee Ganymede, shown by Mr. C. H. Herbert; Light or wire-edged white-ground Picotee Fair Maiden, shown by Mr. E. J. Price; Heavy-edged yellow-ground Picotee Dago, shown by Mr. Hayward Mathias; Light-edged yellow-ground Picotee Exquisite, shown by Mr. Hayward Mathias; yellow-ground Fancy Linkman, shown by Mr. A. W. Jones; Self Titan, shown by Mr. F. W. Goodfellow.

Premier Flowers Shown in Vases.

Self Furthest North, shown by Mr. W. H. Parton; Fancy Linkman, shown by Mr. F. W. Goodfellow; yellow-ground Picotee John Ruskin, shown by Mr. Robert Morton; white-ground Picotee Fair Maiden, shown by Mr. E. J. Price.

First-Class Certificates.

Picotee Dago.—A heavy red-edged, yellow-ground variety.

Picotee Jewel. — A yellow-ground Picotee marked with rosy scarlet.

Both shown by Mr. Hayward Mathias.

Winners of Medals.

The Silver Medal offered to the most successful exhibitor in the First Division was won by Mr. Hayward Mathias with 172 points. Messrs. A. R. Brown, Ltd., secured the Bronze Medal with 150 points. Mr. Robert Morton was awarded the Silver Medal, offered in the Second Division, with 89 points. The Bronze Medal was won by Mr. G. D. Ford with 56 points. The above medals were given by the Birmingham Botanical and Horticultural Society.

The W. Waters Butler Silver Medal, offered to the most successful exhibitor in the Third Division, was won by Mr. A. Goody with 68 points.

The "Carnation Brown" Medal, offered to the most successful exhibitor in the novice classes, was awarded to Mr. T. M. Tranter, who gained 52 points.

Sweet Peas.

Sweet Peas occupied nearly the whole of the sunken part of the Exhibition Hall. The vase classes were arranged along the sides of the "well," and the decorated tables on the remaining floor space. The prizes were offered by Robert Sydenham, Ltd.

There were ten competitors in a class for 12 varieties. The 1st prize was well won by Mr. Thomas Jones, Ruabon, whose handsome flowers—four on a stem—were unusually large, and possessed of great substance; 2nd, Mr. J. Haycock, Wrexham.

Mr. R. E. Fowler, Bournville, excelled in a class for six varieties, reserved for local growers; 2nd, Mr. James Dorell, Acocks Green. The class for decorated tables, 6 feet by 3 feet, was a good one, and although the exhibitors followed the usual style of arrangement, the effect as a whole was very pleasing. 1st, Miss F. Jenks, Codsall; 2nd, Mr. E. Deakin, Hay Hall.

Honorary Exhibits.

Messrs. Gunn and Sons, Olton, exhibited a collection of Roses (Gold Medal); Messrs. W. H. Simpson and Sons, Birmingham, display of Antirrhinums, Sweet Peas, and Gilia coronopifolia (Silver-Gilt Medal); Robert Sydenham, Ltd., Birmingham, Sundries, and Messrs. A. Welham and Son, Bridgnorth, Annuals.

BISHOP'S WALTHAM HORTICULTURAL.

July 16.—The thirty-ninth annual show of the above society was held in Swanmore Park, an ideal place for the holding of a flower show. On the whole, the entries were fewer, but the quality of the exhibits was good, and the show was a success. The sum of £5 was offered for the best decorated table, 6 feet by 3 feet, orchids excluded. Five contested, and the first prize was awarded for an arrangement of Rose Mrs. Alfred Tate in a low bowl centre piece, with corner vases filled with buds and blossoms associated with trails of Selaginella, tinted Rose foliage and Asparagus Sprengeri. The exhibitor was Miss Gertrude Saunders, Crumpherne, Fareham. The 2nd prize was awarded for a low arrangement of Irish Elegance Rose, most effectively arranged by Mrs. Edgar M. Burnett, Holly Lodge, Westwood Road, Southampton.

For a decorated dinner table of Orchids with any natural foliage, Miss Saunders was again successful with a low silver bowl and corner vases filled with Odontoglossums, Cattleyas, Oncidiums, with splashes here and there of Odontiodas and suitable greenery; 2nd, Miss Taylor, Bemerton Rectory, Salisbury.

For a similar-sized table arranged with Sweet Peas, Miss F. M. Molyneux, Swanmore Farm, excelled with Melba, effectively arranged in two low silver bowls and four small silver trumpet vases filled with suitable foliage; 2nd, Mrs. A. Bide, with mauve and pink flowers.

For the best arranged vase, Mrs. Burnett won the 1st prize with Rose Mme. Melanie Soupert, interspersed with young Rose shoots.

Mrs. Burnett, with a daintily-arranged exhibit of Lady Pirrie Rose, won the 1st prize in the class for a basket of flowers; 2nd, Mr. G. Ellwood, Swanmore Park, with a light arrangement of Bougainvillea, Gloriosa and Orchids.

Miss G. Saunders had the best vase of Carnations, and staged good blooms of R. F. Felton; 2nd, Mr. Ellwood. Miss Taylor, with the variety Barbara, won the 1st prize offered for a vase of Sweet Peas. Exhibits of bowls of Roses were numerous and good. Mrs. Bide, with the varieties Lady Pirrie and Lyon, was easily 1st; 2nd, Miss Molyneux, with Lady Hillingdon.

Roses were an important feature of the show. For six bunches, distinct, W. H. Myers, Esq., Swanmore House (gr. Mr. G. Ellwood), secured the leading place with good blooms of Liberty, Mme. A. Chatenay, and Kaiserin Augusta Victoria; 2nd, Miss Bashford.

Fruit was not shown largely, but the quality of the few exhibits staged was good. For a collection of four kinds Mr. Myers was placed 1st with Melon, Peaches, Figs, and Strawberries; he also won in the class for four dishes of fruit grown in the open. Cottagers contributed excellent Currants, Gooseberries, and Raspberries.

Vegetables made a fine display. Mr. Myers was unassailable in Messrs. Toogood's, Sutton's, Carter's, and Webb's classes, all of which were for six dishes. Mrs. Macrae was placed 2nd in each of these classes.

Mr. E. J. Wootten, Fair Oak, Eastleigh, had a fine exhibit of Carnations.

HAYWARDS HEATH HORTICULTURAL.

July 23.—The summer show of this society, held on the foregoing date in the Victoria Park, was a great success. There were a large number of exhibitors, and the plants shown attained to a high standard of excellence. Several of the leading nurserymen sent large exhibits of a highly decorative character, and Roses were especially well shown. In the class for cut Roses and herbaceous plants Messrs. J. Box, Lindfield, were successful in winning the Gold Medal, and they also gained a similar award for Sweet Peas. Some very creditable exhibits of hardy perennials were shown, the Rev. T. J. Wyatt (gr. Mr. Shirley) being the winner of the 1st prize, a Silver Cup. The Silver Cup for a table of fruit was awarded to W. A. Sturdy, Esq., of Lindfield; and for tables decorated with flowers Miss Prendegast Vereker, of Haywards Heath, won the 1st prize, her table being prettily dressed with climbing Roses. The Silver Cup for a collection of vegetables (given by Messrs. Sutton and Sons) was

awarded to L. E. Smith, Esq., of Handcross (gr. Mr. Manton), and this exhibitor also gained Messrs. Cheal's prize in a similar competition. Messrs. W. Wood and Sons, Ltd., gave the prizes for a competition for six bunches of climbing Roses in vases.

DUMFRIES SWEET PEA AND ROSE.

July 26.—A successful Sweet Pea and Rose show, organised by the *Courier and Herald* newspaper, was held in the Drill Hall, Dumfries, on this date. Lady M'Innes Shaw opened the show. Trade exhibits were of high quality. Messrs. Dobbie and Co., Edinburgh, exhibited Sweet Peas (Silver Cup); Messrs. Fairbairn and Sons, Carlisle, Sweet Peas and other flowers (Gold Medal); Messrs. T. Kennedy and Co., Dumfries, Sweet Peas (Silver Medal); Messrs. Barr and Hunter, Dumfries, plants; Mr. W. Smellie, Busby, Violas and Pansies; and Mr. H. Eckford, Sweet Peas. The exhibits of Sweet Peas in the competitive classes were of splendid quality. In the open class Mr. J. Smellie, Busby, was awarded the 1st prize. The silver cup offered for a display of Sweet Peas was won by T. Rankine, Esq., Dalswinton (gr. Mr. R. A. Grigor). Mr. J. Shaw was placed first for 12, and also for 6 and 3, and in the single vase classes. Messrs. T. Smith and Sons, Stranraer, won the chief prizes in the Rose classes.

Obituary.

W. Holmes. — All gardeners, and particularly Orchid growers, will learn with regret of the death, after a prolonged and painful illness, of this well-known Orchid grower. He will be best remembered as Orchid grower to the late Mr. George Hardy, of Pickering Lodge, Timperley, Cheshire, where his success as a cultivator and exhibitor was renowned. For some years past Mr. Holmes has been Orchid grower to J. McCarthy, Esq., of Hey House, Bolton, in whose service he ended his days. *P. W.*

F. Cooper. — We learn with regret of the death, on the 27th ult., of Mr. Frederick Cooper, of Birdhyrst, Upper Norwood. The deceased gentleman, who was seventy-three years of age, was a member of the Committee of the Gardeners' Royal Benevolent Institution. He was also a member of the Committee of the Royal Blind Pension Society, the Old Folks' Home, Norwood, and other kindred societies. The funeral took place at Elmers End Cemetery on the 31st ult. The first portion of the burial service was conducted at All Saints' Church, Upper Norwood, the large attendance, including representatives of the firm of Messrs. T. J. and T. Powell, of which the deceased was formerly a partner, the Gardeners' Royal Benevolent Institution, and Sir Harry J. Veitch.

Answers to Correspondents.

Book: *A. T.* There is no work dealing specially with the Orchids of the locality you mention. H. N. Ridley in the *Flora of the Malay Peninsula* (Orchids) enumerates the Orchids of the region generally, with such of those as were recorded from Negri Sembilan specified. However, it is doubtful whether this would help you.

Carnation Injured: *H. C. M.* The stem has been eaten by the mining larva of an insect. Dress the soil with sulphate of potash.

Caterpillar Feeding on Stinging Nettle: *H. R. Twickel.* The caterpillars are those of the Peacock Butterfly (Vanessa Io).

Culinary Peas: *W. R.* There is no fungus disease present in the plants sent.

Gooseberry Shoots Diseased: *A. W.* Both English and American Gooseberry mildew are present on the shoots received. The English mildew is not very harmful, but the American mildew is serious. You will find particulars of this disease, with a coloured plate of the same, in the issue for December 7, 1912, p. 421.

Grapes: *J. E. W.* The brown colour of the berries is not caused by a fungus disease, but is the result of some wrong cultural treatment.

Grapes Diseased: *R. B.* The trouble is due to grape rot, caused by Gloeosporium ampelophagum. The only thing that can be done now is to remove the diseased berries. In the winter thoroughly drench every part of the vine with sulphate of iron—1lb. in 25 gallons of water. Give two dressings at intervals of a month before the buds commence to swell.

Insect on Larkspur: *A. J.* The specimens were too dry and damaged to name. The fly sent could not bore its way into the buds. Some buds showed numbers of dead aphis—the Black Aphis (A. rumicis)—quite enough to kill the buds.

Insects in Mushroom Beds: *Grower.* It is a difficult matter to destroy the pests, as the spring tails and other insects are present in the soil, and their eggs will continue to hatch out. Sprinkle a little crushed sulphate of ammonia over the bed.

Laxtonberry: *C. M.* A good method of propagating this Bramble is by suckers, and November is the best time to sever them from the parent for planting. Those that grow close up to the base of the old stool will need to be separated with a sharp tool, taking care no injury is done to the bud, which is formed at the bottom of this year's growth, and on which depends next year's cane. The plantation can be made at the same time as division takes place. Brambles may also be raised from seed obtained from ripened fruit. The seed should be washed clear of pulp and dried. These will germinate in the spring if sown in pans of light soil, and be ready for transplanting next autumn.

Leaves Unhealthy and Curling: *A. M. D. Wiston.* The leaves are injured by insects. If the trouble continues, spray with an insecticide; Quassia extract would be suitable.

Melon Leaves: *R. H.* The spotted appearance of the Melon leaf is caused by an excess of moisture. Admit more ventilation.

Mildew on Vines: *T. M.* Flowers of sulphur will destroy mildew on Vines while there is sufficient sun heat to raise the temperature occasionally to 80° in the shade. There are several ways of applying the sulphur. It is not sufficient to merely dust it on the bunches, for the mildew attacks the leaves and stems as well as the bunches, and although very easy to destroy when it first appears, it is more difficult to combat when it becomes firmly rooted in the skin of either the berry, the stem or the leaves, and marks of it cannot then be effaced. Sulphur may be mixed with water, using a little soapsuds first to make it into a paste. Apply the sulphured water through the nozzle of a syringe, placing the finger against the nozzle to form a spray. Half-a-pound to one gallon of water is not too much, and the mixture requires to be kept well stirred from the bottom. Or sulphur may be applied in a dry state with the Malbec bellows; but both of these plans leave some sulphur in the bunches which can scarcely be washed out. The best plan is to use Campbell's Sulphur Vaporiser, the larger size will do for a house up to 6,000 feet, using 1 ounce of sulphur to each thousand cubic feet, and attending otherwise very strictly to the directions sent out with the machine. This quantity is not likely to cause any injury if used after stoning has commenced. A coating of dust will be left on the berries, but this can be easily removed early in the following morning with a pair of strong, ordinary bellows, or it can be washed off by a thorough drenching of soft water. If the dust remains for moisture to be condensed on it by rapid changes of temperature it cannot then all be removed. If the fruit is cut not later than the first week in September, a fresh treatment with sulphur should then be given, and the house closed while the sun is powerful during three or four days. When pruning is completed dress the Vines with soft soap, half-a-pound to a gallon of water, and as much sulphur as will make a thick paste. The Vines must not be syringed during the following spring or the sulphur will be washed off.

Names of Plants: *Roses T. V.* 1, Duchesse d'Auërstadt; 2, Kaiserin Friedrich; 3, Queen Mab.—*H. A.* 1, Prunus Pissardii; 2, Verbascum Chaixii; 3, Inula Helenium; 4, Eryngium Bourgatii; 5, Smilax sp.; 6, Ceanothus americanus var. opacus; 7, Aconitum volubile; 8, Campanula rapunculoides; 9, Cannot name without flowers; 10, Ranunculus Lingua.—*O. W., Windermere.* Campanula rotundifolia var. soldanelliflora.—*F. Zoebel.* 1, Spiræa palmata; 2, Spiræa japonica; 3, Galium verum; 4, Mimulus cardinalis; 5, Erythræa Centaurium; 6, Meconopsis cambrica.—*R. T.* 1, Send when in flower; 2, Spiræa Menziesii; 3, Thuya plicata; 4, Hypericum calycinum; 5, Euonymus japonicus variegatus; 6, Escallonia rubra.—*Blue Jay.* Probably a species of Verbascum. Cannot identify such a scrap. *B. H.* Hoya carnosa.—*Hops.* (1) Asparagus procumbens; (2) Origanum Tournefortii.—*Anxious.* Selaginella uncinata, more commonly known in gardens as S. cæsia. It is not a Fern, and, with the Asparagus mentioned, may be shown as foliage plants, unless the schedule contains any stipulation to the contrary.—*F. P. S.* (1) Cassinia fulvida; (2) Veratrum nigrum; (3) Berberis stenophylla; (4) Elæagnus pungens; (5) Linaria Cymbalaria; (6) Clerodendron Bungei.

Nectarines Shrivelling: *H. G. B.* Assuming the tree of Lord Napier Nectarine to be in a healthy condition, we attribute the cause of the trouble to excessive forcing. This variety is not suitable for forcing with Early Rivers, which, as its name implies, is an early variety. Overcropping would also cause the trouble; also a sudden change in the temperature when the fruits were swelling. We advise you to try the variety Lord Napier as a second early, to follow Early Rivers and Cardinal, which do well together, and bear hard forcing.

Peaches Splitting: *H. G.* The trouble is due to an excess of moisture at the roots. Keep the soil drier, and increase the amount of ventilation whenever the weather is favourable.

Peas: *W. H. W.* No fungus is present. The plant suggests injury by green-fly.

Potato Diseased: *E. C.* The injury is due to "corky scab," caused by the fungus Spongospora scabies. Treat the soil with quicklime.

Primula Hybrid: *R. S.* The failure of your plants of Primula japonica is partly due to the dry weather, but to a greater extent to the fact that they were old specimens. P. japonica usually dies after flowering, and even if some plants survive they seldom attain to the vigour of young plants. To obtain this Primula at its best seedlings must be raised annually. But where it is growing in moist positions it is not necessary to sow, for self-sown seedlings come up quite freely and take the place of the older plants. With regard to your query respecting seedlings, a mulch of dry manure and leaves would be beneficial, followed by a thorough soaking with water.

Roses Diseased: *H. W. F.* The Rose leaves are affected by the Orange rust fungus (Uredo rosæ). The only thing that can be done to check the disease is to burn infested leaves and shoots and spray the plants with potassium sulphide.

Rotting in Stems of Zonal Pelargonium: *J. L.* The injury is caused by the fungus Botrytis, which was present either in the cuttings or in the soil in which they were rooted.

Sulphate of Copper: *J. E. W., Northants.* Sulphate of copper in lump form is suitable. Place the chemical in a sack and draw the latter through the water. Sufficient of the copper sulphate will dissolve and answer the purpose.

Withering of Phlox: *W. W.* The Phlox is withering owing to the presence of eel worms at the root. For this pest there is no cure. Treat the soil with quicklime.

THE MARKET FRUIT GARDEN.

AFTER the drought of June a great excess of rain fell in our district, 2.37 inches having been registered in eleven days up to July 19 inclusive. Then drought returned, only 0.01 inch having fallen in the rest of the month. Previous to the 20th the sky had been almost constantly overcast, and the temperature was unseasonably low, but the remainder of July was generally sunny, with some approach to summer heat during the last few days. This drought has been common throughout Great Britain. Indeed, for the eight weeks preceding July 26 a considerable deficiency of rainfall is reported for every division of the United Kingdom named in the weekly and seasonal report of the Meteorological Office.

One effect of the June drought, together with the aphis blight, was to cause early varieties of Apples to be very small. Beauty of Bath, Mr. Gladstone, Lady Sudeley, Domino, and Lord Grosvenor with me set a great abundance of fruit, which was thinned as much as usual, but failed to come to the full size. Except on some young trees of Lord Grosvenor, indeed, these Apples were not half the usual size. Never before has there been so great a proportion of seconds and smaller fruit as there was this season. [The past tense is used, as these varieties will have been gathered by the time these notes are printed.] Consequently the return from the varieties named will be small in relation to the great number of fruits borne by the trees. Early Julians were both thin and small, and so were Golden Spires. There is grave reason to fear that the July drought will have a similar effect upon late Apples, though these have still some time to grow. Lane's Prince Albert is much smaller than usual for the date of season, and even Bramley's Seedling is not so big as a good sample in an average year. Turning to mid-season varieties, Queen, usually a remarkably fine Apple in my orchards, is not more than two-thirds of its usual size. Royal Jubilee, on the contrary, is bearing a great crop of fine fruit after a somewhat severe thinning. By the way, Royal Jubilee has the habit of bearing four or five Apples in a cluster, and thinning itself almost sufficiently, but it does not do this until the fruits have become large enough to crowd each other off the shoot. This season, as soon as the dropping of fruits of fair size began with the variety, I had the thinning done, and made as much of the thinnings as I made last year of the best of my culinary Apples before Christmas.

Neglect to Thin Apples.

Many market growers of fruit do not thin their Apples at all, and others thin them only when those they take off the trees are large enough to be sold as "scrumps." The entire neglect of thinning is a great mistake, and the late thinning prevents the fruits left growing from swelling to the size they would attain were the operation done when the fruits are quite small. I find it difficult to induce my woman pickers to thin severely enough. They are instructed to thin to singles, except on some varieties where two Apples may be left if they look like growing to a good size. This they interpret as singling the fruits on each spur, and where the spurs are only an inch or two apart, as they often are on free-cropping varieties, the pickers leave one on each, instead of denuding one spur out of two. Some of the best growers in the United States make a regular practice not only of thinning to singles but further of relieving every alternate spur of its burden of fruit. The results are fruits of fine size, and a good or fair annual crop, instead of only one crop in every other season. This severe thinning, it may be assumed, is done only when there is a thick setting of fruit.

Apples Dropping.

For the second season in succession half-grown Apples are, or have been, dropping extensively, particularly from early varieties. Beauty of Bath is one of the worst varieties for dropping, while Mr. Gladstone and the old Striped Joaneting are nearly as bad. This season, after every fairly-coloured Apple had been picked off the first two of these varieties, the ground was strewn with fruits by the following morning, and this occurred repeatedly. These Apples sell well, but require a great amount of labour in the picking, as they need to be gone over many times, which is slow and expensive work when the trees are high enough to necessitate the use of step-ladders. As the dessert Apples are of little value unless well-coloured, it will not do to strip the trees until nearly all the fruit is ripe. At the time of writing fruit from mid-season and late varieties has begun to drop, though not as badly as it did last year.

The Spread of Silverleaf.

In all the parts of the country which I have visited this season the spread of silverleaf among Plums, Victorias particularly, is extraordinary. Never before have I seen any approach to such a great extension. In one of my orchards nearly half my very fine and robust-looking Victorias, four to six years from the planting, have been attacked for the first time. Previous to this year there were only two trees attacked in the orchard, and these were recovering as the result of profuse manuring with a dressing containing nitrogen, phosphoric acid, and potash. The spreading obviously could not have been caused entirely by pruning, as infection could not have been carried on the knife up even one long row of trees, because the knife would have been cleansed of any infective matter upon it by the numerous cuts made on two or three trees. Moreover, I have some young Victorias affected in a field where there was not one silverleaf case before this season, so that there was nothing to infect the knife when the trees were pruned. In my opinion the epidemic of silverleaf is due to the extreme wetness of the late part of last summer, and the autumn, winter and the early part of the spring following. The silvered branches of the affected trees have been cut off, and 7 pounds of a mixture of two parts of superphosphate to one part each of sulphate of ammonia and muriate of potash has been spread around each tree to the extent of its branching. This treatment has caused the partial or complete recovery of several trees in an older plantation.

American Gooseberry Mildew.

Some idea of the extent to which this terrible disease prevails may be gained from the fact that every Gooseberry plantation which I saw in Kent or Worcestershire was more or less infested. Whether or not I brought infection home in my clothes I cannot say. The idea seems improbable, and yet there is no more plausible explanation of an outbreak in a young plantation of my own, which did not show a sign of the disease when it was pruned in the spring. The nurseryman who supplied the bushes assured me that he had never had the disease in his nursery, and my fruit farm is miles away from any other, so that there is no near source of infection, unless the disease exists in some cottage garden near by, which does not seem probable, as the hamlet in which the cottages are situated is an isolated one. The day after the disease was detected the bushes were profusely sprayed with lime-sulphur of summer strength, and they will be sprayed again as often as the inspector recommends, if he thinks that there is any chance of suppressing the disease. If not, the bushes will be grubbed up shortly. They were planted in the autumn of 1911, and have not been allowed to fruit because they were small, and it was desired to give them every chance of growing into good bushes.

Fungous Diseases.

The prevalence of brown rot, not only on Plums, but on Apples also, has been mentioned on a previous occasion. Never before has it been so extensive in my Apple orchards. As to scab, it shows on many varieties which have never been attacked to any serious extent. Irish Peach, as usual, is crippled with scab, the crop being almost without value. All the trees will be cut back and top-grafted with some other variety next spring. Irish Peach is not a profitable variety as a rule. Lady Sudeley also is badly affected with scab this year, instead of slightly as usual, and some very

fine fruits on young specimens of Lord Grosvenor is spotted to a considerable extent. Even Charles Ross, a variety that has been free from scab in previous seasons, has some of its fine fruit disfigured by the malady. Cox's Orange Pippin is almost entirely free from the disease, possibly in consequence of the immense amount of trouble taken in cutting off scabby shoots and winter and summer spraying with lime-sulphur.

Reverted Black Currants.

A good many of my Boskoop Giant Black Currant bushes in a plantation in the fourth season from the planting showed reversion to a worthless state this summer. They have been trodden down as a sign that they are to be dug up and replaced by fresh bushes. The reversion seems to show up at its worst in the fourth or fifth season from the planting, after which time, according to my experience, comparatively few bushes have to be dug up.

The Fruit Estimates.

As I understand it, the grand summary of the fruit estimates given in the *Gardeners' Chronicle* of August 2 indicates that all crops, except small fruit and Strawberries, are, or were, under the average, Pears, Plums, Cherries, Peaches and Nectarines, Apricots, and Nuts being very greatly under that standard. Even for Apples, the crop is put below average in 106 places, and over average in only 29, clearly showing that it is under average on the whole. But this is not all that is to be said on the subject, for there are vast differences in the values of the returns from different counties as indications of the total yield of the country, and still greater differences in relation to prospective market supplies. Some of the cider counties count for little in market Apples in comparison with their large acreage of that fruit. For example, Kent, with about 14,000 acres of Apples, probably sends to market four times the quantity of Apples that Devon supplies from nearly 26,000 acres. Taking Kent, Worcester, Hereford, Gloucester, Norfolk and Cambridge as the most important contributors of market supplies, there are 17 reports of under-average and only 2 of over-average crops. The first four counties contribute 16 under-average estimates and not one over. That the Apple crops of Kent and Worcester are very much below average I know from my inspection of many of the principal orchards, and from local reports on many others not seen. The general verdict in each county, so far as I could learn, was half an average. Moreover, the drought of the latter part of July and the beginning of August is likely to reduce the yield much below estimates made when the returns were collected.

Returns for Fruit.

Up to the present time the prices of fruit have been from fair to very good. Gooseberries, Strawberries and Cherries sold well throughout their respective seasons. Black Currants made good prices, except at a time when the markets were glutted with a sudden and liberal supply of French and Dutch fruit. But they did not make as much as in 1912. This year I had 200 half-sieves more than last year, but got no more money for them. Plums have started at prices fully 50 per cent. higher than usual rates, and Apples at quite one-third more than they made a year ago. The latter fact seems to support my contention that the crop is much below average in the country as a whole, at least so far as early varieties are concerned. *A Southern Grower.*

NEW OR NOTEWORTHY PLANTS.

LILIUM SUTCHUENENSE.

In the *Gardeners' Chronicle* of August 2 *W. W.* expresses the unqualified opinion that "enough is now known of the character and habits of this Lily to settle the question of its name and dispose of the several incorrect names that have been given it, such as Willmottiæ, pseudo-tigrinum and Thayeræ."

W. W.'s conclusions are apparently based on his observations of a batch of plants raised at Kew from seed of a Lily reputed to be L. sutchuenense (Franchet). The plant in question was obtained from Messrs. Veitch, of Chelsea, and was one of a parcel of wild bulbs they received in 1904 from E. H. Wilson, who was collecting for Messrs. Veitch at that time. Wilson gathered the bulbs in the country round about Tachienlu, in Western Szechuan, where, by the way, this Lily is grown by the natives as a vegetable, very much as the Tiger Lily is grown in parts of China and Japan, and L. speciosum magnificum in some of the Loochoo Islands.

The authorities at Kew appear to have been responsible for the original identification of the Lily in question as L. sutchuenense, and it has now been in commerce for seven or eight years bearing the Kew name. If the classification is correct there is nothing more to be said about the matter, but there seem excellent reasons for doubting the accuracy of the identification; indeed, it is difficult to understand how anyone giving the subject serious consideration could ever regard Wilson's plant as identical with L. sutchuenense.

Fig. 45.—Lilium sutchuenense (Franchet) showing creeping growth of stem.

When both Lilies are cultivated under identical conditions, the typical sutchuenense of Franchet is seen to be a comparatively dwarf and delicate plant with slender, dark-coloured stem, now and again perhaps a yard high, but commonly a couple of feet or less. A reference to fig. 46 shows that it is but sparsely leaved—an important point—and not floriferous; in point of fact, though five or more flowers have been recorded in cases where this Lily has been highly cultivated, it is usually content with three. The mature bulb is small—about the size of a peewit's egg—and the stem, which is only slightly pubescent, has a curious way of creeping about under the earth before pushing through (see fig. 45), a peculiarity it shares, so far as is known at present, only with L. Leitchtlinii, L. neilgherrense and L. philippinense.

The Lily collected by Wilson, on the contrary, far from being a pigmy, is a fine, upstanding plant from 4 to 4½ feet high and very floriferous; in fact, in ordinary seasons and without the stimulus of any special cultivation, it will usually carry at least sixteen or seventeen blooms. These are borne on pedicels a good deal longer than those of the true L. sutchuenense, and, though the point is not of importance, the pedicels are a different colour. The stem is green, and as often as not is noticeably covered by minute white hairs after the fashion of L. tigrinum Fortunei; it is clothed as densely as L. pomponium with long linear leaves, and this is the most characteristic feature of the plant; the stem rises straight from the bulb, which is from 2 to 2¼ inches in diameter, ivory in colour, and not at all unlike a small edition of L. tigrinum.

There are other differences of a botanical nature between the two Lilies, but it is unnecessary to refer to these in detail, as I understand the conclusions Mr. Wilson has arrived at in the matter, after an exhaustive analysis, are shortly to be published in the *Kew Bulletin*, along with the synonymity. Suffice it to say that one has only to have the two Lilies in cultivation to appreciate the difference between them.

Whatever the identity of the Tachienlu Lily may ultimately prove to be, Wilson considers it a good species and has named it L. Thayeræ. Time will show whether he is justified in separating it from L. papilliferum (Franchet), chinense (Baroni), his own Willmottiæ and pseudo-tigrinum; but for the present the proper course will no doubt be to defer any attempt at definite identification till the four Lilies named and L. sutchuenense can be cultivated alongside each other.

The feelings of regard and respect the amateur must perforce have for Kew are so great that one may perhaps be permitted an expression of regret that it should not have been possible to secure accuracy in the identification of several of the Lilies sent home by Wilson during his expedition. Apart from the confusion in regard to the Lily which forms the subject of this article, one remembers that for many years the Lily now known as Sargentiæ was in commerce as Brownii leucanthum, having been identified as such at Kew; while it has been evident for some time that the beautiful plant familiar to so many of us as L. myriophyllum has no right to the name given to it at headquarters. *A. Grove.*

A WINE-RED SUNFLOWER.

On July 16 we obtained our first wine-red or "old rose" Sunflower in the F_2 generation from a cross between the "primrose" Sunflower and our red strain. The red Sunflowers now being grown in various parts of England, derived from our Colorado stock, show chestnut-red on orange, but the red is due to an anthocyan pigment, and only appears chestnut on an orange background. We planned to bring out the true colour of the anthocyan by a cross with the very pale yellowish (primrose) variety sent out by Messrs. Sutton and Sons as "Primrose Perfection," but as red and orange are dominant to primrose (*i.e.*, their absence) the F_1 generation was not distinguishable from the ordinary "reds." In the F_2 the theoretical expectation is that out of every 16 plants 9 will be red (chestnut) on orange, 3 yellow, 3 wine-red, and 1 primrose. We have obtained all the expected forms, and so far as can now be judged the proportions may be expected to agree sufficiently with the expectation. The wine-reds vary like the chestnut-reds, some having exceedingly rich and beautiful colours. We call the wine-red variety, var. vinosus. *T. D. A. and W. P. Cockerell, Boulders, Colorado.*

ORCHID NOTES AND GLEANINGS.

TRIGONIDIUM OBTUSUM.

Sir Fred. W. Moore, Royal Botanic Gardens, Glasnevin, Dublin, the home of so many remarkable Orchids and other plants, sends flowers of this old but rare species from a plant received from Nicaragua several years ago, and which flowers regularly at Glasnevin. The habit of the plant is similar to some of the Maxillarias, the rather slender-sheathed inflorescence bearing a single erect flower at the apex about an inch and a half long. The spathulate sepals, which are the showier feature, are curved back, and coloured pale yellow tinged and veined with purple, the shorter petals similarly coloured, but bearing at the tips a metallic-looking bronzy-purple blotch. It was originally collected by Colley for Mr. Bateman in Demerara, in 1834, and is figured in the *Botanical Register*, tab. 1923.

DENDROBIUM LAMELLATUM.

A pseudo-bulb and two-flowered inflorescence of this singular species comes from the gardens of Sir Marcus Samuel, Mote Park, Maidstone (gr. Mr. Bacon), the specimen, with a number of other pretty species, having been imported from Borneo last year. The pseudo-bulb, which is three inches in height and over an inch wide, is curiously compressed and scarcely one-sixteenth of an inch thick; the colour is brownish-green, and the nodes are furnished with silvery sheaths, from which the dark-green leaves two or three in number had proceeded. The flowers are one inch long, waxlike in substance and yellowish-white tinged with buff on the outsides of the lateral sepals and mentum. The lip, which is shorter than the sepals, has a broad, rounded front, the margin of which is fimbriate and curved back, the centre having an orange-coloured bar of five keels. It is a very singular species, and the flowers are both curious and attractive. *J. O. B.*

CANADA.

POSSIBILITIES FOR GARDENERS.

Some details regarding the prospects which Canada holds out to horticulturists and market gardeners emigrating from this country may interest the readers of the *Gardeners' Chronicle*, especially as these notes are the result of actual experience. Although the present writer has only made his home in Toronto for a little over a year (after a period spent on an Ontario farm), exceptional opportunities of acquiring knowledge and experience have presented themselves to him. In the first place it may be said that it seems strange that Englishmen are not more inclined to spend their holidays in Canada. Canadian men and women of position, such as Sir Edmund Osler, Sir William Mackenzie, Sir Henry Pellatt, and Sir Donald Mann think no more of a trip to England than Englishmen do of visiting Scotland; yet Britons often spend much more on a holiday in Germany or the South of France than would enable them to pass a month in the beautiful and healthful surroundings of the St. Lawrence River.

Starting at Quebec, going on to Montreal, Toronto, Niagara, and extending the tour, if desired, to the "Golden West," there would still be time to spend a week or more in the great Niagara fruit belt, a marvellous extent of Peach and Grape orchards beneath the shelter of the mountain range which stretches from Hamilton to Beamsville, and is bordered by the waters of Lake Ontario. Of the vastness of Canada it

Photograph by A. Grove.

Fig. 47.— Lilium thayerae (Wilson).

is unnecessary to say much; an atlas and a few figures will convey a sufficient knowledge of its size. Its possibilities are boundless, for the right man or woman; and though emigration, even under the easiest circumstances, is a serious undertaking, it should be remembered that intelligent, industrious labour is always rewarded. Of course, there are some who, expecting to find the land "flowing with milk and honey," or with dollar bills, are disappointed, but those who come out with a knowledge of their craft, and a determination to work steadily and undauntedly in the face of difficulties, reap an abundant harvest. Canada needs the stout heart, the strong arm, the cheerful spirit, the intelligent understanding. Those who fail in this country, do so because they do not possess these qualifications. Only a few months ago a well-known Covent Garden florist, with a fair business in a suburban neighbourhood, emigrated to Canada with his wife and two little girls. He is thirty-five years of age, and has had a hard life. He spent a few days in Toronto, and then pushed on to Edmonton, in the West. Here several misfortunes came upon him; his children fell sick, and a position he had been promised fell through. He is now, however, in a fair way to succeed. He had the sense to take any job which offered itself when he first settled down; fastidiousness in this matter is often fatal. He possesses both skill and knowledge of his trade, and it was only the keen competition which prevails in the Old Country which drove him from the English markets. A young English University graduate came out to Canada not long ago with an introduction to one of the Canadian railway magnates. He was given a note to one of the superintendents of the line, who placed him in a somewhat menial position—which the young man wisely accepted, thereby laying the foundation of ultimate success. It is difficult to lay too much stress upon the point that what Canada wants is workers—intelligent workers certainly, but always workers.

Some of the first questions which may be expected from intending emigrants of the horticultural profession are: "What is the climate of Canada like? Is it favourable to health, and to the successful raising of flowers and fruits?" To these questions a fully satisfactory answer can be returned. At first the extremes of heat and cold may seem somewhat trying; but many an emigrant whose health was indifferent in the Old Country has gained a fresh lease of life in the clear, bracing air of Canada. The freedom of thought and will which prevails in the Dominion has also much to do with the physical and mental health of its inhabitants. The summer sun is often blazing; 1911 was wonderful, the thermometer often registering 104° in the shade. Many people slept in tents, pitched in the coolest spots they could find but nevertheless the mosquitos tormented them. 1912 was cooler, more like an English summer. The winter in Canada is long and cold, but splendidly dry and bracing. It is, however, a time of enforced idleness to those whose occupation is mainly out-of-doors, as everything is frost-bound. The winter before last the temperature in Toronto fell more than once to 23° below zero. The winter scenery is very beautiful: woods, fields and hills are covered with a mantle of soft, white snow, over which the moon sheds a clear, bright light.

Horticulture is practised to a considerable extent even on farms far distant from any town. The desire for a garden—at the least, a homely plot of vegetables and flowers—is deeply ingrained, not so much in the old settlers, but in the newly-arrived immigrants from England. The want of efficient labour is a great drawback to the pursuit of horticulture as a profession; but the true Canadian seems quite satisfied with his "homestead," solitary, treeless, exposed to

every wind that blows, without a single plantation or even flower bed to provide colour and beauty to the scene. In one farm, on which acres of Peaches and other fruits were grown, there were not enough vegetables to supply the table; and the only flowers near were those of the wayside bushes. To a farmer from the Old Country the contrast between such a scene and the Rose-covered cottage he has left is depressing in the extreme, but already the influence of British emigrants is becoming felt in this direction. Nearer to the towns, parks and gardens are springing up all over the Dominion wherever they are needed, and beautiful flowers, among which the Canna is conspicuous, reward the labour of the cultivator with their brilliant colours and luxuriant growth. Plants which can grow only in the hottest of English summers come to perfection under the clear, bright Canadian sun; and the authorities of the larger cities have realised in time the importance of proper town-planning and park-making before the land shall have become absorbed by the builder. Winnipeg, Calgary and Edmonton are good examples of cities where the open spaces are a triumph of gardening enterprise and skill. Toronto—the second city of the Dominion in point of size—is the most important from a horticultural point of view. Its rate of progress is astonishing, even in Canada, and it is estimated that within a few years the population will number a million. The establishment of the Ontario Rose Society, a notice of which appeared in these pages (Vol. LIII., p. 362), is a great success; already it numbers many growers among its members, and collections of considerable interest have been "discovered." In two gardens the new H.T. British Queen finds a place; and in Mr. Moore's garden the collection of Roses of all kinds is so extensive and representative that it reminds one forcibly of the Rose gardens of Waltham Cross and Cheshunt. It would be difficult to find better blooms of Betty, General McArthur (a great favourite here), and several of the Ramblers. One house here is approached by a little avenue of fine standard Roses, with a groundwork of crimson Chinas.

It is interesting to know that Canadian nurserymen frequently obtain their seeds from England, on account of their being high in quality and low in cost. British nurserymen as a whole have a good name in the Dominion, both for quality of stock and for integrity of business character. In a future article it may be possible to deal in detail with the prospects of horticulturists emigrating from Britain. *E. T. Cook, Ontario (late of London).*

DESTRUCTIVE INSECTS AND PESTS SCHEDULED BY THE BOARD OF AGRICULTURE AND FISHERIES.

XII.*—THE MEDITERRANEAN FRUIT FLY.

(*See Coloured Supplement.*)

A NUMBER of related flies are known as Fruit Flies, and of these perhaps the worst and most widely distributed pest is that known as the Mediterranean Fruit Fly (Ceratitis capitata, Wiedemann). It occurs as a pest in Australia, New Zealand, Tasmania, South Africa, St. Helena, Algeria, Tunisia, West Indies, Brazil, Hawaii, Spain, the South of France, and along the Mediterranean to Italy and Malta. As long ago as 1900 it reached the neighbourhood of Paris, where it attacked Peaches and Apricots, and has since been rather troublesome. Among fruits attacked are the Peach, Nectarine, Apricot, Orange, Lemon, Fig, Quince, Apple, Guava, Plum, Loquat, Mango, Banana, Pine-apple, Persimmon, South Africa Granadilla and many others. In a pamphlet issued this year by the Department of Agriculture for Bermuda a list of 45 fruit trees subject to attack by this fly is given, and the Grape and Mulberry must occasionally be added. French states that the Tomato and Pumpkin are attacked in Victoria.

The damage is done by the larvæ, which hatch out from eggs deposited in the fruit by the fly and subsist on the flesh of the fruit, which is rendered unfit for food. Very great damage has been done in the past, and at the present day widespread and serious loss is caused by this pest. Thus it was described by Wiedemann as an Orange pest in 1826, under the name Citriperda capitata, and a few years later Macleay stated that fully one-third of the Oranges shipped to London from the Azores were rendered unfit for use before reaching their destination owing to the presence of the maggot of this fly when they were packed, and for this reason Oranges were proportionately dearer than they might have been had the fly not existed. It would be difficult to estimate the damage done in all the countries mentioned above, but it must be very considerable.

It would appear that the fly has actually been found in England, as Froggatt says there are specimens in the Oxford Museum, and these were recorded by Westwood in the *Gardeners' Chronicle* in 1848 as "captured in Thames Street, London, 1848," while others were bred from maggots in imported Oranges. Even at the present day the maggots can be found in Seville Oranges in England, while recently the pupæ containing fully-developed flies were found in the paper wrappers of ordinary Oranges. There is reason to believe, therefore, that the fly may breed out naturally from cases of imported Oranges, though this does not imply that it is capable of becoming a pest in Britain.

There is some doubt as to the original home of this fly, but in 1903 Mr. G. Compère was commissioned by the Government of Western Australia to discover the native home of the pest, and to see if there were any parasites which would tend to limit its propagation; his researches appeared to show that its source is Brazil, where it is kept in check by a predatory beetle. Froggatt, however, writing in 1909,† says that "the original home of Ceratitis capitata is, probably, Spain, one of the great homes of the Orange."

The appearance of the fly, maggot and pupa, is shown in the Coloured Supplement. Following Froggatt's description, it may be said that the fly is about the size of an average House-Fly, the general colour being ochreous yellow, lighter on the sides of the thorax, with eyes of a reddish-purple tint, a blackish blotch in the centre of the forehead, with a number of black bristles about the head, fine white bristles on the lighter portions of the dorsal surface of the thorax, and black bristles on the black blotches. There are various ochreous to brownish blotches and bands on the broad semi-opaque wings. The upper surface of the abdomen is clothed with fine scattered black bristles. The male bears "a pair of stalked appendages standing out in front of the head in a line with the front margin of the eyes." "The living fly is an active little creature, running about over the foliage or fruit on the trees, with its wings drooping down on the sides of the body. When disturbed it has a short flight, seldom flying more than a few yards at the most, and it often returns to the same spot."

The larva is a dirty white, legless maggot, and the pupa is reddish brown and oval.

As regards the life-history, the females deposit their eggs in the flesh of green, ripening, or quite ripe fruit; the larvæ hatch out, feed for a time till full grown, leave the fruit, and enter the soil to pupate, and in a very short time the flies emerge. The period needed to complete the life-history is quite short. French quotes‡ various experiments conducted to ascertain the life-history of this fly. A number of eggs may be laid in a single fruit beneath the skin by the sharp ovipositor of the female, and indications of the presence of the maggots are not well marked, even when the maggots have fed for a few days, the fruit showing little or no signs of the infestation. The attacked spot, however, discolours as the larvæ become well grown. Farrell's experiments showed:—

1. That from the time the egg is laid until the larva is fully grown is 12 days.
2. That the pupa stage is 13 days.
3. That the life of the perfect insect when fed is 24 days.
4. That from the time the egg is laid until the insect which it contains dies of old age is 50 days.
5. That when the fly is not fed the 50 days are reduced to 29 days.

In French's experiments 60 flies were hatched from two Seville Oranges, and the perfect flies lived 10 days without food. French says that "the larvæ of the fly curl up and by a muscular movement jump fully 1 foot." Fruits which ripen in succession are attacked in turn in Victoria. The flies feed on fruit juices.

A Fruit Fly Destruction Act was passed in Bermuda in 1907, and £500 was granted for the purpose of combating the fly, the general plan being to collect and destroy all the mature fruits of all kinds known to be punctured throughout the country. The pest is doubtless often spread by means of marketed fruit, and, once it has obtained a footing, prevailing winds may assist. The most obvious means of combating this fly lies in destroying the maggots in the fruit and the pupæ in the soil, and in trapping the flies. Infested fruit should at once be destroyed. Digging in the soil fairly deep did not kill the pupæ in South Africa, but turning the surface soil 9 or 10 inches under, accompanied by heavy rolling, seemed likely to be effective. In South Africa netting has been used to place over the trees to prevent the females laying their eggs, but is expensive, costing about 3s. per tree. It appears that cold-storage of fruit proves fatal to the maggots. Imitation fruits covered with "tanglefoot" have also been employed to trap the flies.

The latest proposals for combating Fruit Flies, however, consist in spraying the trees every few days with a sweet liquid containing a poison, the idea being that in feeding on the sweet liquid the flies would be killed. Some mixtures suggested are:—(1) 5 gallons of treacle, 25 gallons of water, and 1 lb. arsenate of lead; (2) molasses 65 lb., honey 31 lb., glycerine 2 lb., and arsenate of potash 2 lb., the mixture being dissolved in water before use at the rate of 10 parts to 90 parts of water. It is stated that the most effective means for combating this pest consists in placing about the orchards small lots of pure kerosene, which was discovered to be very attractive to the flies in dry weather. (*Kew Bulletin*, No. 1, 1908, pp. 8-10.) *H. C. Long.*

ALPINE GARDEN.

PRIMULA PINNATIFIDA.

THREE plants of Primula pinnatifida were planted out last autumn, one in a bog, one in an ordinary border with heavyish loamy soil, and the third against a wall, facing north, in a mixture of loam and leaf-mould. The first two came through the winter (not a severe one, but marked by severe late frosts on two occasions) quite happily; the one in the Rose border flowered, but that in the marsh, although a fine healthy plant, has given no bloom; the one against the wall died. As this is at present a rare and very beautiful species, perhaps some readers may be glad of this information. In its native haunts P. pinnatifida grows in company with P. sikkimensis and P. secundiflora. *B., Reading.*

The Week's Work.

THE ORCHID HOUSES.

By W. H. White, Grower to Sir Trevor Lawrence, Bart., Burford, Dorking

Cattleyas and Brasso-Cattleyas.—Plants of Cattleya Rex, C. Dowiana, and its variety aurea, also the hybrids, C. Hardyana, C. Enid, C. Fabia, C. Maggie Raphael, Brasso-Cattleya Leemanniæ and B.-C. Mdme. Chas. Maron have their flower sheaths well advanced, and should be well exposed to the light and air. When grown in comparative shade and a close, stuffy atmosphere, an excess of moisture in the growths may cause the flower buds to decay. If the sheath encircling the base of the current season's growth becomes dark brown it should immediately be slit open to allow the moisture to evaporate, keeping the plant extra dry at the root for a few days afterwards. Should decay set in, nothing but the removal of the part affected and dryness at the root will save the plant. C. Rex, C. Dowiana and the others mentioned all require very similar treatment to that advised for C. Warscewiczii.

Terete-Leaved Vandas.—Such Vandas as V. teres and the hybrids Miss Joaquim and Marguerite Maron are rooting freely from the old roots and from the uppermost part of the stems, and it is a suitable time to attend to specimens that have grown to an inordinate length. Such plants should have the tops of their stems cut off to about 2 ft. 6 in. or 3 ft. and the young portions fastened to new teak rods from 5ft. to 6 ft. in length. Place about five of these rods with a stem attached to each in a 12-in. pot, keeping the rods several inches apart to allow the air to circulate freely. The rods may be fixed in the pot by means of clean crocks, covering them with a thin layer of Sphagnum-moss. As each young root attains to a sufficient length let it be tied carefully so as to press flat on the surface of the wood, to which it will quickly become firmly attached. Where there are no facilities for growing the plants by this method, or where space is limited, the severed stems may be inserted thickly in beds of living Sphagnum-moss, placing a strong stake to each plant to keep it in an upright position. The old, or lower stems, if afforded plenty of heat and moisture, will soon produce fresh growths, and in this way the stock may be further increased. These terete Orchids should be grown in direct sunshine, and syringed copiously overhead several times daily when in active growth, but the young portions that are now being divided should be shaded lightly until the roots have taken a firm hold of the new wood, when they may be exposed gradually to direct sunlight. Grow the plants at the lighter and warmer end of the East Indian house or plant stove. The present is the flowering season of V. Hookeriana, and as soon as the spikes are cut the plants should be treated similarly to the above. Plants of the pure white V. Watsonii, V. Kimballiana and its rare variety alba are growing freely in the cooler and more airy part of the Cattleya house. Continue to afford these species plenty of water at the roots, especially when the weather is warm and bright.

Dendrobium.—Several species of Dendrobium including D. Phalænopsis, D. superbiens, D. bigibbum, D. Goldeanum, D. taurinum, D. lineale, D. stratiotes, D. secundum, D. undulatum, and D. strebloceras, are growing actively and require plenty of light, heat, ventilation and moisture. In affording water, particularly to plants that are well rooted in small pots, the compost should be made moist throughout, but water should not be afforded until the rooting-materials have become dry. These species require plenty of sunshine and a hot, moist atmosphere.

Schomburgkia.—Schomburgkias require similar cultural treatment to the Dendrobiums enumerated above, especially in the matter of exposure to sunshine. Such species as S. tibicinis, S. Kimballiana, S. Sanderiana, S. Thompsoniana, S. Humboldtii, S. Chionodora, and its rose-coloured variety, are commencing to form roots freely from the bases of the young growths, and, if necessary, may be afforded fresh materials at the roots. These Orchids do not require much compost, a layer of about 3 inches of coarse Osmunda-fibre being sufficient. In potting it is advisable to make the compost firm about the base of the plants, which should be grown close to the roof-glass. Such distinct growing species as S. crispa, S. undulata, S. Lyonsii, and S. gloriosa require similar treatment as is afforded plants in the Cattleya house.

Lælia.—Such dwarf-growing Lælias as L. præstans, L. Jongheana, and L. pumila and its varieties that have been resting in the cool house are commencing to grow again, and it is advisable to remove the plants to a lighter position in the intermediate house. These Orchids need plenty of water at the roots until the new growths are matured. Plants that require larger receptacles or fresh compost should be attended to as soon as new roots appear at the base of the current season's growth. They are best grown in shallow Orchid pans that can be suspended close to the roof-glass. Weakly plants are almost always attacked by scale and mealy bug, and measures must be taken to destroy these pests.

Oncidium.—Such pretty-flowering Orchids as Oncidium Phalænopsis, O. cucullatum, O. olivaceum, and O. nubigenum require fresh compost. They thrive best when grown in small pots containing a shallow layer of Osmunda-fibre and moss. Grow them in a cool and shady position in the Odontoglossum house.

THE HARDY FRUIT GARDEN.

By B. Goodacre, Gardener to Sir Ernest Cassel, Moulton Paddocks, Newmarket.

Garden Nets.—When the nets have served their purpose for the season they should be dried and stored where they can hang clear of each other, away from floor and wall, if this be possible. Each net should have a label attached giving its dimensions.

Small Fruits.—Red and White Currant bushes intended for furnishing a supply of Currants late in the season should be cultivated in the more sheltered positions of the garden, and secure protection from birds provided in the shape of finely meshed tiffany. Stakes, weeds, and other rubbish which may have accumulated during the busy season should be removed, leaving the plot clear and tidy. Young bushes that are making strong growth should have the surplus shoots removed to expose the centre to the light and air. If time permits this treatment may be applied to older bushes with beneficial results, and cut out the old fruiting canes of Raspberries. The young rods also should be thinned, cutting clear away all weakly and deformed canes. Where the Raspberry is cultivated in rows and trained to a permanent wire or other trellis the canes should be tied out singly a few inches apart, leaving the tie secure to the wire but loose around the stem. This will prevent the shoot rubbing against the wire, which might cause it to become deformed. Similar remarks apply to Raspberries grown in clumps. Always prevent overcrowding of the young canes. It is not advisable to pinch or in any way shorten the cane at this stage. When the pruning, tying, and training of the plants is completed, and the rubbish cleared away, the mulching materials may be forked into the soil, but never allow the fork to be inserted more than a few inches deep, or the roots may be damaged.

Autumn-Fruiting Raspberries.—These plants are at the flowering stage. Soak the soil between the rows, thoroughly loosen the ground with a fork, and apply a mulch some few inches thick of well decayed manure. Secure the young, brittle growths to the trellis.

Loganberries and Newberries.—These brambles are now cleared of their fruits, and may be treated in much the same way as advised for the Raspberry. These plants, and especially those of the Newberry, send up strong side growths. Both these brambles will cover a large area of trellis work, and the growths should on no account be shortened. Where space does not allow for their extension, they may be twisted backward and forward along the wires. They make admirable subjects for covering pergolas or rustic arches in or about the kitchen garden, where the nets placed to protect the fruits are not considered unsightly.

Japanese Wineberry and American Blackberry.—These later brambles are only just ripening their fruits, which require protection from the birds. The scarlet, sweet fruit of the Wineberry is particularly attractive, and the plant forms a handsome bush with its red, spiny wood and silver-grey reverse of the leaves. Let the roots receive a good soaking of clear water, afterwards forking into the ground a little artificial manure and lightly watering the soil to soak the manurial properties to roots.

THE FLOWER GARDEN.

By Edward Harriss, Gardener to Lady Wantage, Lockinge, Berkshire.

Pelargonium.—In many establishments Pelargoniums have been almost discarded for bedding purposes, other and more useful subjects having taken their place. Like many other kinds of plants, these old-fashioned garden flowers have been improved, and some of the newer sorts are well worthy a place in any garden. They have flowered well this season; a bed of the variety Paul Crampel interspersed with standard plants of Veronica Andersonii is at the present time making a brilliant show in these gardens. This variety is also very useful for furnishing garden vases, and probably there is no more suitable plant for the purpose. It is time to commence propagating cuttings for next season's stock. Take care not to spoil the beauty of the flower-beds when obtaining the cuttings, which may be inserted in a sandy compost in pots or boxes and rooted in the open.

Propagating Bedding Plants.—The work of propagating summer bedding-plants should be proceeded with as circumstances permit The stocks of Heliotrope, Iresine, Mesembryanthemum, Gazania, Lantana, Lobelia and Coleus may all be increased from cuttings inserted now either in pans or pots, preferably the latter. Cuttings of Heliotrope inserted now should not be soft in texture, as they will not root so readily as those inserted in the spring. In gardens where only a few plants of Heliotrope are required the best plan is to retain some of the old plants for stock purposes and place them in heat early in the year to produce shoots for cuttings. Such cuttings will furnish good plants for bedding out if they are kept growing actively. Plants may also be raised from seeds sown early in the year. Madame de Bussy and President Garfield are two excellent and distinct varieties. Iresines, Lantanas, Ageratums, Alternantheras and Coleuses may all be propagated from cuttings inserted in pans filled with light, sandy soil. A shallow, heated pit furnished with a hot-bed of moderate warmth on which to place the cutting pans is an ideal place for rooting the shoots. Artificial heat will only be necessary during wet or cold weather.

Hollyhocks.—The Hollyhock disease has not been so prevalent this season as usual. This would seem to suggest that the fungus spreads much more rapidly in cold, wet conditions than in a season like the present. Much may be done to prevent the disease by sowing seeds annually. The seeds may either be sown early in the year and the seedlings grown on in heat until they have made good-sized plants, to be hardened subsequently and planted out in April; or they may be sown at the present time and the seedlings kept in cold frames until planting them out in their flowering quarters in spring.

Violas.—Remove the seed-pods from Violas daily and, in order to assist the plants to flower freely all through the summer, feed the roots occasionally with some mild stimulant. Keep

the growths pegged to the soil where they are required to furnish the ground. Cuttings inserted in cold frames in a sandy compost will form roots in two or three weeks. After that date remove the lights so that the plants may become hardened thoroughly before winter arrives.

The Water Garden.—At this time of the year the plants in the water garden should be examined frequently with a view to the removal of dead flowers and leaves. Ponds containing choice aquatic plants infested with water weeds should be cleared of the weeds early. See also that rank-growing plants do not smother smaller-growing species. Seeds of Primula japonica, P. pulverulenta and P. sikkimensis may be sown as soon as they are ripe. It is possible that some of the stronger seedlings of these Primulas will flower next season; all the species are excellent subjects for planting in moist, shady situations. Aponogeton distachyon is one of the most useful water plants for furnishing small pools or shallow streams. The plant is worth a place in any scheme of water gardening for the fragrance of the blossoms alone.

PLANTS UNDER GLASS.

By F. Jennings, Gardener to the Duke of Devonshire. Chatsworth. Derbysbire.

Gloxinia, Achimene and Gesnera.—These plants have finished or are on the point of completing their flowering, and water should be withheld gradually until the bulbs or corms are matured, when the pots should be placed on their sides under a stage in a cool house.

Winter-Flowering Plants. — By this date the principal batches of winter-flowering indoor plants should be established in their flowering pots. Such subjects as Salvias, Pelargoniums, Heliotropes, and Chrysanthemums will be greatly benefited by applications of manure water made from sheep or deer dung. The manure water may be made by placing the materials in a bag and soaking the latter in a tank of water. Soot water may also be made in the same manner. If these plants are standing out-of-doors where the wind may injure them, they should be secured to stakes. Keep the pots free from weeds. Chrysanthemums should be fed with artificial manure on frequent occasions, and kept clear of earwigs, as these pests may spoil the work of a whole season in a single night. Earwigs may be trapped by the old-fashioned method of pots filled with hay. The pots should be inverted on the tops of the stakes, and some of the hay should be placed on the tops of the pots, which should be inspected every morning for the pests. Richardias (Callas) planted in trenches as advised in a previous calendar should be afforded liberal supplies of water, supplemented by liquid-manure made from cow dung. The long, vigorous growths should be afforded supports. Pot Roses that have been neglected during the busy season should be overhauled, the drainage put in order, the weak shoots cut away, and a top-dressing applied. Plants of tuberous-rooted Begonias that have finished flowering should be placed out-of-doors and hardened gradually, to be ultimately placed under a greenhouse stage, or in a shed where frost will not be likely to injure them.

Violets in Frames.—Let the frames be prepared for the planting of Violets, arranging the soil so that the plants when set may be quite close to the glass. The soil should consist of good loam, old potting-materials and leaf-mould in equal proportions. Remove the runners from Violets growing in the borders, and keep the plants well watered, syringing them both night and morning, taking care to wet the undersides of the leaves as well as the upper parts. Loosen the soil frequently by means of the Dutch hoe.

Cleansing the Glasshouses. — At this time of the year many of the glasshouses are practically empty of plants, as the stocks of most winter flowering subjects are growing either in frames or out-of-doors. The present, therefore, affords a suitable opportunity to cleanse and wash the houses thoroughly in preparation for housing the various subjects in the autumn. Wash all the woodwork with soft, soapy water to which a little paraffin has been added, as this will destroy any insects that may be present. The gravel on the stages should be washed clean of dirt by means of a sieve and a tub of water. This will not only give the house a smart appearance, but will also be the means of destroying many insects. It will be an advantage to give the hot-water pipes a coating with some black material, or, if this is not necessary, they may be merely rubbed with a greasy rag. If this is done, the glass cleansed, and the walls lime-washed, the house will be clean and ready for a fresh start.

THE KITCHEN GARDEN.

By John Dunn, Foreman, Royal Gardens, Windsor.

Celery.— The early plants require earthing up, but before commencing this operation all side shoots and small leaves should be removed. The bed should then be watered thoroughly, as nothing is more harmful to this crop than insufficient moisture at the roots. The leaves should be drawn together carefully and tied with some soft material which may be removed after the soil has been carefully placed around the stems. See that none of the soil gets in between the leaves or into the centre of the plants, as this would result in deformed growth. While it is necessary to press the soil around the stems, it must not be made so tight as to retard growth. Do not place too much soil in position at one time, but leave the centre of the plants quite open. Later plantations should be watered freely, and the soil stirred to promote a free growth. If slugs are troublesome apply a good dusting of soot before the soil is placed about the plants

Lettuce.— Make frequent sowings of Lettuce during August to ensure a full supply of heads through the autumn. Much of the success with this crop depends on the weather during the next two months, and it is advisable to make small sowings at frequent intervals in order to have a selection of plants so as to choose those most suitable for planting. The seedlings should be transplanted when large enough to handle in a sheltered situation, and where the plants can be protected from early frost. Hardy White Cos, Brown Cos, All The Year Round, and Maximum, are good varieties for present sowing, as they will not be harmed by a few degrees of frost.

Endive.—If seeds were sown a month ago the young plants should be ready for planting, choosing a sheltered situation. Afford the roots plenty of water to favour a quick growth. Another sowing of this vegetable may be made now to furnish plants for wintering in cold frames. Let the bed on which this batch is grown be raised to within 18 inches of the roof glass, and when the young plants are transplanted from the open border to the pit make the soil moderately firm, planting at a space of 1 foot apart each way.

Cabbage.—Another sowing of Cabbage seed should be made with as little delay as possible. Sow in an open situation so that the plants may grow sturdy. After the seeds have been sown cover the bed with netting to protect them from birds.

Radishes.—Make sowings of Radishes at intervals of 10 days on rich soil, and give the crop a liberal supply of water to promote quick growth. If cold frames are available a sowing of this salad may be made at the end of August to furnish roots for use late in autumn.

Mustard and Cress.—This salad may be sown weekly in a cold pit, shading the seedlings from strong sunshine.

Winter Greens.—The work of planting all kinds of winter greens should be finished as quickly as possible. Every available space should be filled with something useful for winter supplies. The plants may be placed close together after this date, as it is not to be expected that they will grow as large as those planted a month ago. One of the hardiest green vegetables is Drumhead Hearting Kale, which will form compact heads and grow for a long time without running to seed. The soil between the plants should be hoed frequently in order to promote healthy growth and keep weeds in check.

Winter Spinach.—Make a good sowing of Spinach at once and another a week later to provide for a full supply of leaves throughout the winter. There should be no delay in sowing, especially in gardens in late districts.

FRUITS UNDER GLASS.

By James Whytock, Gardener to the Duke of Buccleuch, Dalkeith Palace. Midlothian.

Late Vineries.—The berries are colouring in late vineries, and the borders must be kept moistened with manure water. If not already applied cover the surface with a mulch of short manure. In districts where the rainfall is usually excessive it will be an advantage to cover the outside borders with either sheets of corrugated iron or wooden shutters. Warmth may be allowed in the water-pipes whenever the temperature is likely to fall below 65°. Artificial heat may also be employed at night-time to permit of the top ventilators being opened, as a constant circulation of air is essential. Directly red spider is detected sponge the foliage with a nicotine preparation, or sulphur mixed with water may be smeared on the hot-water pipes. Ripe bunches of Muscat Grapes that are required to hang for some time yet should be shaded, covering the glass lightly with some suitable material. Keep the ventilators open, but adopt some means to prevent wasps and flies entering the house. After the Grapes are cut it may be found that red spider is present on the foliage, but the leaves of Muscat vines being easily injured by insecticides only soft water should be used for syringing them, mixing a little soft soap in the water occasionally. At that stage the top and bottom ventilators should be thrown open, and should the inside border be dry, the soil should receive a soaking with clear water. The temperature should not be allowed to fall below 70°, but when artificial heat is employed the fire should be stopped early on bright days. If the roots are confined to inside borders it will be a less difficult matter to get the Grapes ripened. Expose the bunches fully to the sunlight, remove the surplus laterals, and draw on one side any of the foliage that may be shading the berries.

Fig Trees.—When the second crop of fruit is at the swelling stage the trees should be fed with manure water. Syringe the foliage frequently at that stage, but when the fruits commence to ripen keep the atmosphere drier and allow the air to circulate freely. Early trees from which the second crop of fruits has been gathered should be thinned of useless growths, and they may be syringed frequently. If the borders are not in a satisfactory condition early autumn is a suitable time to overhaul them. Fig trees need only a very limited root run, and the borders should be narrow and shallow, but ample drainage is necessary. The soil should not be too tenacious in character, but plenty of lime rubble should be mixed with it, for the Fig requires abundant supplies of water, and it is imperative that the surplus moisture shall be able to pass freely away.

THE "FRENCH" GARDEN.

By Paul Aquatias.

Nursery Beds.—Make a sowing of spring Cabbages within four or five days in beds previously well dug and copiously watered. Sow the seeds broadcast, very thinly, and mulch the bed with either black soil or well-broken manure. Keep the ground moist by light and frequent waterings during the period of germination. Where only a few thousand plants are needed they may be raised in frames, as it is an advantage to protect the seedlings during times of heavy rains or storms. Endive sown some time ago is well through the ground, and the seedlings should be thinned where they are too thick to make sturdy plants. It will soon be time to make preparation for a winter supply of Lettuces from November till Christmas. Cloches are the more suitable for the purpose, but as they are also needed for the Lettuces a well-sheltered and well-drained corner should be chosen for setting frames and lights instead. The frames should be overhauled and repaired; if necessary, the lights painted and washed.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the **PUBLISHER**, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, *as well as specimens of plants for naming, should be addressed to the* **EDITORS**, 41, Wellington Street, Covent Garden, London. *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Editors and Publisher.—*Our Correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the* PUBLISHER; *and that all communications intended for publication, or referring to the Literary department, and all plants to be named, should be directed to the* EDITORS. *The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.*

Illustrations.—*The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.*

Local News.—*Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

Special Notice to Correspondents. — *The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.*

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, AUGUST 18—
Pitsmoor (Sheffield) Hort. Soc.'s Sh., in conjunction with Artindale's Sweet Pea Sh.
TUESDAY, AUGUST 19—
Brighton and Sussex Hort. Soc. summer sh. (2 days).
WEDNESDAY, AUGUST 20—
Shropshire Hort. Soc. Summer Sh. at Shrewsbury (2 days). Wallingford Fl. Sh.
THURSDAY, AUGUST 21—
Aberdeen Hort. Soc. Sh. (3 days).
SATURDAY, AUGUST 23—
Hawick Hort. Soc. Summer Sh. in Town Hall.
Burnley and District Hort. Soc. sh. in the grounds of Bank Hall.

AVERAGE MEAN TEMPERATURE for the ensuing week deducted from observations during the last Fifty years at Greenwich—61.7°

ACTUAL TEMPERATURES :—
LONDON.—*Wednesday, August* 13 (6 p.m.); Max. 68°, Min. 57°.
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, *Thursday, August* 14 (10 a.m.); Bar. 29.7, Temp. 66°.
PROVINCES.—*Wednesday, August* 13, Max., Aberdeen, 64°, Min., Dumbarton, 57°.
Weather—Sunshine.

SALES FOR THE ENSUING WEEK.

MONDAY NEXT—
Dutch Bulbs, at 10. By Protheroe and Morris. At 67 and 68, Cheapside.
WEDNESDAY NEXT—
Dutch Bulbs, at 10. By Protheroe and Morris. At 67 and 68, Cheapside.
THURSDAY NEXT—
Dutch Bulbs, at 10. By Protheroe and Morris. At 67 and 68, Cheapside.

Partial Soil Sterilization.

The increased yields both of flowers and fruits which are obtained by the partial sterilization of the soil, at all events in the cases of such plants as Tomatos, Cucumbers and Chrysanthemums, suggest that this simple expedient will come more and more into general use. In the hope that those who have the facilities will carry ont experiments in partial soil sterilization we give briefly an account of some of the most recent observations which have been made by Messrs. Russell and Petherbridge* at Rothamsted, and we would suggest that among the plants in which similar experiments might be tried with advantage are pot Roses and Carnations. In suggesting cautions experiment with these plants we are influenced by the fact that in the case of Chrysanthemums partial sterilization appears to result undoubtedly in the production of larger and earlier flowers. If similar results are to be obtained with Roses under glass a definite encouragement will be given to the cultivation of these popular flowers. The advisability of attempting the application of the method to the cultivation of Carnations is also evident. In many places these plants suffer very considerably from an obscure leaf disease, apparently due to a bacterium. If the plants respond to partial soil sterilization by a more rapid growth in their earlier stages it may be that, as happens often when they are cultivated under favourable conditions and in the open ground, the Carnations will "grow out" of the disease. The more cautious experimenter may prefer to work with soil which has been only very partially sterilized—for example, by heating to 55° C. (= 131° F.). When plants are grown in soil previously heated to this degree the initial retardation which occurs frequently in the growth of plants in soil heated to boiling point is either nothing at all or only slight. But the final result is less remarkable than that obtained with plants grown in soil heated to 100° C. (= 212° F.). The increase of yield obtained in either case appears to be due to an accumulation of ammonia in the soil. The partial sterilization serves to destroy the nitrifying bacteria, and in the absence of these organisms ammonia is not oxidised to the form of nitrate. This reserve of ammonia may be held to act in two ways, first as a plant food and second as a stimulator of growth.

Since, however, heating to 55° C. suffices to destroy the nitrifying bacteria, it is not at present clear why heating the soil to the higher temperature should have such a much more marked effect on plant growth. No doubt the higher temperature causes more drastic changes in the chemical composition of the soil, but the way in which the changed chemical constituents affect growth is at present a subject only of conjecture. The experimenter must be prepared to discover an initial checking of growth in the plants grown in soil sterilized at 100° C.; but this check does not endure, and is succeeded by a phase of remarkable activity on the part of the plant. Moreover, instead of this activity leading to "leggy" growth, it results in the case of Tomatos, Cucumbers and Chrysanthemums in the "stocky" habit which the grower associates always with perfect condition.

So far none of the antiseptic substances, toluene, formaldehyde, etc., have given such striking results as are obtained by sterilization by heat at 100° C. Speaking generally, it may be said that the effects of these substances are between those of heat at 55° C. and at 100° C. Finally, as illustrating the advantages of soil sterilization in the case of the Tomato, we may mention that the authors cited already have demonstrated that these plants flower sooner, continue in flower longer, and bear more, earlier and sweeter fruit than the controls grown in untreated soil. Analyses of the plants show that these differences are not to be attributed solely to differences in the rate of absorption of nitrogen, for the plants grown in partially sterilised soil are richer not only in this element, but also in prosphoric acid than are those cultivated in the ordinary manner. To what this increase in intake of phosphoric acid is due is not clear, though it is by no means improbable that it is the result of the large production of fibrous feeding roots which occur in sterilized soil. This may in turn be the resnlt of the earlier check in growth, for we remember observing that when leguminous plants are grown in soil containing the nodule organism, their roots, becoming infected, suffer a check which is followed very soon by a very rapid and luxuriant formation of lateral roots. The physiology of partial sterilization is, however, still obscure. What is patent is that those who are concerned with practical horticulture can do a notable service by carrying out and recording experiments on partial sterilization with a large variety of the plants in general cultivation. To make snch experiments of general value it is necessary to grow plants in untreated soil side by side with others in soil which has been treated, to compare them with one another, and to put on record any noteworthy differences. Above all, it is necessary in carrying out such experiments for the operator to have no prejudice either for or against the method, for it is a commonplace that nothing is so readily seen as that which the mind wants to see.

* *Journal of Agric. Sci.* V., 3, June, 1913.

SHREWSBURY FLOWER SHOW. — The annual show of the Shropshire Horticultural Society, which will be held in the Quarry Grounds, Shrewsbury, on Wednesday and Thursday next, promises to equal the best of these famous exhibitions. Over £1,200 is offered in prizes, and the schedule includes no fewer than 198 classes. The presentation to the late Hon. Secs., Messrs. ADNITT and NAUNTON, will be made by the President, Mr. E. B. FIELDEN, in the Committee tent, on the first day of the show, at 3 p.m.

AUSTRALIAN KENTIAS.—An important industry in Lord Howe's Island is the gathering and sale of seeds of Kentia Belmoreana and K. Forsteriana, which Palms are indigenous to the island. The Government of N.S. Wales has, according to a note in *Le Jardin* (July 20, 1913), undertaken recently the regulation of the sale of these seeds, and has fixed a price for the current year. Communications on the subject should be addressed to the Administration of Lord Howe's Island, and sent to Sydney, Australia.

INTERNATIONAL HORTICULTURAL COMMISSION.—As an outcome of the International Horticultural Congress held at Brussels in 1910, it was resolved to found a permanent International Horticultural Commission, and two preliminary meetings have been held, one in Brussels, under the presidency of the Baron KERCHOVE D'EXAERDE, and the other in Paris, where M. VIGER presided. The Commission, at present only existing in a provisional state, will deal chiefly with international horticultural congresses, and will be composed of about sixty members of various nationalities, each country having representatives in proportion to its horticultural importance. The Commission will meet on every occa-

sion of an international congress relating to horticulture. Its duty will be to decide the date and place of the following congress. It will deal with scientific, practical and economic questions. A provisional meeting was held at Ghent on the 7th inst., and we await with some interest the news of the definite foundation of the Commission. The following countries have already nominated representatives:—Germany, Austria, Belgium, France, Great Britain, Italy, Holland, Duchy of Luxembourg and Russia.

Antwerp Exhibition.—On August 24 to 31 the Antwerp Society of Horticulture and Agriculture will hold a show of fruit, flowers and vegetables to celebrate the twenty-fifth anniversary of its foundation. Medals of honour, works of art, and other prizes are offered by the King and Queen of the Belgians, the City of Antwerp and others. The show will be held in the newly erected Orangery belonging to the Commune of Antwerp. The programme, printed in French and Flemish, includes some twenty-nine classes in the various sections. In addition to the purely horticultural classes there are others comprising apiculture, garden tools, manures and art exhibits. The secretary is M. Emile Nagels, 218, Chaussée St. Bernard, Antwerp.

"The Botanical Magazine."—The issue for July contains illustrations and descriptions of the following plants:—

Podachænium eminens. tab. 8,502.—This is the plant commonly grown in gardens as Ferdinanda eminens, to which genus it was referred by Lagasca. It is a useful subject for greenhouse decoration in the early spring, when it produces its lax terminal corymbs of Daisy-like flowers with white ray florets.

Sedum pilosum. tab. 8,503.—This species is illustrated and described in *Gardeners' Chronicle*, June 3, 1911, p. 347, Fig. 160. The species should prove an exceptionally good garden plant, as the head of rosy flowers are as handsome as those of a Crassula.

Cunonia capensis. tab. 8,504.—This South African tree is sometimes met with in conservatories, but it is not grown so frequently as formerly. The fragrant flowers are borne in dense axillary racemes and are of a yellowish tone. The material for the *Botanical Magazine* plate was obtained from a specimen in the Botanic Garden of Trinity College, Dublin, where it is grown in a cool greenhouse in a mixture of loam and peat.

Crotalaria agatiflora. tab. 8,505.—In common with most of the Leguminosæ the flowers of this plant are very showy. They are produced in terminal racemes from 8 to 14 inches long, and are coloured pale greenish-yellow, the keel being tipped with dull brownish-purple. The species was discovered growing in this country in a greenhouse at Pylewell Park, Lymington.

Vinca difformis. tab. 8,506.—This species of Periwinkle is a native of the Western and Central Mediterranean region, but is extremely rare in cultivation. The plant grows well in Canon Ellacombe's garden at Bitton, but it is not quite hardy. Specimens out-of-doors at Kew were taken up and potted and grown in the greenhouse, where they flowered freely during the winter. The flowers are solitary in the axils of the leaves, and, as shown in the plate, are pale mauve, although described in the text as blue.

—— The number for August contains the following:—

Stanhopea convoluta. tab. 8,507.—This Orchid is a native of Columbia, and first flowered in cultivation at Etterbeek, Brussels, in 1909. The species resembles S. tricornis, but it has larger flowers and there are differences in the structure of the lip.

Centaurea crassifolia. tab. 8,508.—This Knapweed is found only in Malta, and was introduced to this country by Professor George Henslow, who sent a plant to the Cambridge Botanic Garden in 1894. But this plant was lost, and was replaced by one from the gardens at La Mortola. The flowers are of a purple shade, and have the characteristic appearance of the Knapweeds. At Cambridge the species has been cultivated in the succulent house, under conditions such as are afforded Sempervivums.

Cytisus supranubius, tab. 8,509 (see also figs. 49, 50, pp. 121, 122).—This plant is endemic in the Canaries, where it forms a bushy shrub about 5 feet in height and nearly as much through. When in bloom the branches are covered with creamy-white blossoms that show just a tinge of rose. Although not quite hardy in this country the species would probably succeed against a sunny wall out-of-doors.

Grevillea bipinnatifida. tab. 8,510.—G. bipinnatifida may be regarded as the most ornamental of all the Grevillias, for in addition to its attractive inflorescences of reddish blossoms the foliage is beautifully dissected. The plant is a native of the Swan River, Western Australia, and forms a spreading or prostrate shrub some 3 feet high.

Solenostemon Godefroyæ. tab. 8,511.—This Labiate has some resemblance to a Coleus, to which it is allied. The species is a native of Angola, and was first discovered in 1873. Specimens at Kew have thriven well in company with Begonias in a house having an intermediate temperature. The flowers are described as blue, but in the *Botanical Magazine* plate they are coloured a shade of mauve or violet-purple.

Fig. 49.—Cytisus supranubius in Glasnevin Botanic Garden.

Potato Restrictions in Argentina.—The Board of Agriculture and Fisheries desire to give notice that they have received through the Foreign Office a copy of a decree governing the importation of Potatos into Argentina. The decree, which will come into force on August 29, 1913, provides that all Potatos imported into the Republic shall be accompanied by (a) "Sanitary-origin," and (b) "Sanitary" certificates, duly legalised by an Argentine Consular officer. Certificates issued by duly qualified persons who are authorised by the Government of the country of origin will be recognised as "certificates of sanitary origin," provided that they certify to the satisfactory sanitary condition of the land as regards the following diseases and pests.—Synchitrium endobioticum (wart disease), Phytophthora infestans (ordinary potato disease, or "blight"), Rhizoctonia solani, Heterodera radicicola (eelworm), Lita solanella (Potato moth), scabs and "dry rot" attributable to bacteria and fungi. The certificate must also show the date of the crop, the quantity or weight of the Potatos, the name of the grower and of the person to whom they will be shipped. In the event of any of the above diseases being discovered the affected consignment will be reshipped or destroyed. Certificates will be recognised as "sanitary certificates" which are issued by the foreign authorities referred to above, or by a technical officer of the Directorate General of Agriculture, provided that they state (1) That the Potatos appear to be free from the diseases and pests specified above; (2) the quantity or weight of the Potatos and the marks of the boxes in which they are packed; (3) the name of the steamer by which they will be shipped, the name of the person to whom they are consigned, or representative in the country of destination; and (4) the date of issue of the certificate. The necessary inspection for this certificate must not be made for at least a month after the date of issue of the certificate of sanitary origin. These certificates will suffice for Potatos landed at Buenos Aires, but if consignments are entered through any other port further certificates are required, particulars of which will be supplied by the Board on application. Persons desirous of exporting Potatos to Argentina should communicate with the Board in order that arrangements may be made for the necessary inspection of their crops.

CYTISUS SUPRANUBIUS.

This uncommon species of Broom (see figs. 49 and 50) is a native of Teneriffe, and coming from there one would scarcely expect it to be thoroughly hardy. Five or six years ago it was planted in the open ground in the Glasnevin Botanical Garden, and has never received any protection. During this time it has passed safely through severe winters when we have had 22° or

more of frost. The shrub is a quick grower, and has formed a bush 8 feet high by about the same through, growing in our ordinary garden soil. Rhododendrons and many Ericaceous shrubs are not a success here on account of the lime in the soil. Mr. Smith, of Newry, states that Cytisus supranubius is about 7 feet high with him, and is growing in an elevated part of the nursery in shallow, poor soil on the top of rotten granite; so apparently it will thrive in different kinds of soil.

This species resembles Spartium junceum in its leafless winter state, but the branches are stronger and a lighter green. In the seedling stage, and when making free growth in summer, the shoots bear tiny trifoliate leaves,

Fig. 50.—Cytisus supranubius : flowers creamy-white.

whereas the Spartium bears simple leaves, but in neither case are they borne very freely.

This Cytisus has also been known to botanists under the name of Spartium nubigenum and Cytisus fragrans. It is one of the most fragrant species, the creamy-white flowers having an almond perfume. Last year and this year about the end of June it flowered with unusual freedom, and was a most attractive shrub, and last autumn a fair crop of seed was produced. The pods are small, about three-quarters of an inch long, and usually contain only one seed. Down to the present cuttings have been a failure, but seeds germinate freely, and they provide the best means of propagation.

Like the Spartium and other almost leafless shrubs this Cytisus breathes and transpires through the numerous pores or stomata found in the epidermis or skin of the younger branches. As the shrub comes from a warmer climate than ours some protection in winter may be needed when it is planted in colder places than Glasnevin. *C. F. Ball.*

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

Hampton Court Gardens.—Although the palace and its famous picture galleries have for some time been closed to the public, there is no apparent diminution in the great numbers of persons who visit the grounds and gardens. If illustration were needed, this significant fact would suffice to show how general is the love of gardening. A decade and more ago the greater proportion of visitors would spend much more time in the picture galleries than in the gardens, but now the flower gardening is the attraction, and not only are the floral effects admired, but it is a common occurrence for visitors to take notes of favoured plants, and in this the praiseworthy practice of freely placing legible labels is of great assistance. It is generally assumed that the Londoner's favourite summer-flowering plants are scarlet "geraniums" (Pelargoniums), blue Lobelias and white Marguerites, and, as large numbers of the great holiday crowd were apparently from the metropolis, the present writer noted with interest the schemes which attracted most admiration. The "Long Border," with its wealth of flower, for the most part set out in colour blocks and decorously bordered with the variegated Dactylis glomerata, was freely admired, but the feature over which most people lingered was the pair of large circular beds which are planted with the soft pink-coloured Begonia Major Hope, rising from a groundwork of Alyssum maritimum and relieved by occasional little bushes of the silvery-foliaged Leucophytum Brownii—a pleasing and dainty mixture. There were passed in review other charming combinations of Lantanas and Heliotropes rising from the white, star-like blossoms of Bouvardia Humboldtii corymbiflora or Swainsonia galægifolia and the floriferous Salvia splendens Glory of Zurich, and a very large rectangular bed, 50 feet long by 12 feet broad, wherein the tall feathery plumes of Humea elegans half-veiled the gorgeous crimson and yellow spikes of Cannas intermixed with white and blue Campanula pyramidalis, and bordered by a broad band of white Violas. This display received its full meed of admiration, but it was another "pink and white bed" further on in which the Major Hope Begonias were replaced by taller plants of the same shade, and pegged-down Leucophytums supplied the groundwork with even greater effect, which arrested most attention. Although there is a magnificent bed of Sweet Peas containing fully 1,000 plants in full bloom, and averaging 7 feet in height, it received but scant notice; a fate which also befell the excellent herbaceous border. As is proper in a public garden, the planting is done in various styles, and, in addition to the charming combinations above noted, flower beds may be seen filled with only one kind of plant, as, for examples, Empress Pansy, Verbenas, Pelargonium Paul Crampel and Aubrietia Dr. Mules, which is even now a mass of flower, but the average visitor cared nothing for these, preferring the tasteful admixture of several distinct kinds. One of the most pleasant features of the gardens is the spacious lawns, where one may walk unchided, surrounded by old Yews, with dense rounded heads and clean, sturdy tree trunks, and the intervening flower beds of ample proportions. A visit to Hampton Court would not be complete without an inspection of the famous "Great Vine," which London records as having produced an annual crop weighing 2,200 lb. The present crop falls far short of that weight, but the bunches and berries are much larger than was the case twenty and more years ago. *A. C. B.*

The Prevention of, and the Artificial, Ripening of Fruits.—In Sir W. T. Thiselton-Dyer's remarks (*Gardeners' Chronicle*, August 2, 1913, p. 88), in speaking of the two processes of plant life, photosynthesis and respiration, he does not emphasise the necessity of light in the former, which brings about the development of the fruit while green. This first process involves the absorption of carbon dioxide with the giving off oxygen, but only under light. Darkness, therefore, will stop the ripening process, if the temperature be relatively low, as will be explained. If, therefore, unripe green fruits be surrounded by CO_2 in light, it would seem that the process of photosynthesis might be, perhaps, somewhat enhanced, provided the temperature be suitable. If, however, the fruit be enveloped in carbonic acid gas (CO_2) in total darkness, all further natural development is stopped. Then the fruit would probably be at once affected by enzymes (oxidases), thereby making its own oxygen for respiration, by the decomposition of starch, etc. The result would be a hastening of those chemical changes we call ripening; but a danger might follow by a rapid "bletting" or "over-ripe" condition may occur, especially if the temperature rises, internally by respiration, or externally by the weather. I suggested to a fruit-grower that this might have been the cause of his apples bursting when packed or heaped together and confined in a more or less darkened place—the rupture being due to an accumulation of CO_2 by internal respiration. My gardener once packed in a closed box some Jargonelle Pears, when on the verge of ripening. They travelled by rail for several hours, but they were uneatable on their arrival. They had reached and past the stage of ripening. As temperature stimulates respiration, the amount of CO_2 emitted increases proportionately to the number of degrees of temperature, till death ensues. There must be a circulation of cool air, as respiration itself increases the temperature within the fruit, and a rise of temperature hastens the

bletting process. If, therefore, total darkness be tried as an experiment for artificial ripening, the temperature must be comparatively warm, but accompanied with a circulation of air, for all parts of plants must breathe, and therefore need oxygen. The above suggestion is, of course, purely hypothetical, and therefore experiments alone will show whether total darkness and warmth would be sufficient to hasten the process of ripening. The above would seem to be, to some extent, the exact converse to that of Sir W. T. Thiselton-Dyer's, for the opposite process of arresting ripening. He says: "As far as I can see, the only mode of arresting ripening is by keeping fruit in a cold storage." Such arresting is presumably desirable for transmission of fruits from foreign countries and the Colonies. As the writer of the original article observes: "Picked green and packed [presumably in darkness in the hold of the ship and in cold storage], they may be shipped without danger, and then be ripened when wanted." So that the first requirement is that they should not ripen on the voyage. This appears to be secured by darkness, cold, and with some circulation of air—the darkness stops photosynthesis, and the cold checks a too rapid respiration. If experiments be made, I would suggest that they should be comparative, thus:—(1) In total darkness, and (2) in light, with the same temperature in each case. (3) If the carbonic acid gas (CO_2), or any other acid vapour be used to envelop the fruit, some should be in darkness and others in light, with the same temperature. Of course, I repeat all this is only suggestive and hypothetical. *George Henslow.*

The Future of the N.E.H.S.—I am asking myself where are the N.E.H.S. members who should have replied to the Rev. Bernard Hall's note on p. 70? Fourteen days go by and our old and valued friend, "Yorkshire Gardener," answers firmly and well. No doubt there is need for a Northern Garden Institute for experimental purposes, but surely we want no school, for there are plenty of such places. Let us deal with deeper things that cannot be touched upon in private gardens or trade establishments because of the expense. The future of the N.E.H.S. should be with this Horticultural Institute, but are not we travelling too fast? One fact must be faced: without our monthly show we shall go down, for it is the fortnightly meetings that make the R.H.S. what it is. Our monthly meetings, which should be addressed by a specialist, should be our chief consideration, for the intelligent horticulturists of the North would rally to it. I agree with the writer in a contemporary horticultural paper that we need no more committees, departmental rock gardens or side shows. Those who read the notice about the Garden Institute on page 252 of the *Journal* of the N.E.H.S. and the letter on page 70 of your paper may ask which was written first? The Council of the N.E.H.S. would be wise to give every fellow a vote (proxy), even though he were not able to be present at the meeting, for this would be a means of obtaining the opinion of the members. Mr. Hall will no doubt think of the parable of the sheep that was lost when he looks at the names of those who have, I hope only temporarily, left us, and use the powers he possesses, and which his northern friends value so much, to encourage them to return once again to the fold. *Another Yorkshire Gardener.*

Rose Edward Mawley.—In appreciative amplification of the notes by "White Rose" on the variety Edward Mawley as a red Rose, I would say that when the plant has regained a vigorous constitution I think it will be found one of the most splendid Roses ever grown. I was disappointed with it at first, but this summer I have had one bloom of the most exquisite beauty it is possible to imagine. The name is all right, and the Rose is all right, I feel sure. *F. Kitley, Bath.*

Pea Sticks.—It is asserted by some that Peas will not cling to certain kinds of sticks. I recently saw a row of culinary Peas that were staked with Ash branches, and the grower informed me that the tendrils refused to cling to the Ash, and that he had noticed the same thing on a previous occasion. The appearance of the plants seemed to support his statement. *Observer.*

REMARKS ON CONDITION OF THE FRUIT CROPS.

(*Continued from page* 101.)

(*See Tables and Summaries, ante, pp.* 80-85.)

3, ENGLAND, E.

Cambridgeshire.—Strawberries have been extra large and the quality very good; some of the berries weighed 5oz. each. On April 13 we registered 13° of frost, which damaged the Pear and Plum blossom considerably. Strawberries and Apples escaped injury from this cause. *R. Alderman, Babraham Gardens, Cambridge.*

—— Of stone fruits we have scarcely any. Pears also are very thin and of bad quality. Many Apples dropped, and we have only an average crop of this fruit. Our soil is heavy and low lying, with a chalky subsoil. It is sometimes very wet. *T. Spooner, Meldreth.*

—— Frost effected considerable damage to the Apple, Pear and Plum crops, early Plums alone escaping injury. Wall fruits, although protected, suffered from the same cause. The damage was not due so much to the severity of the frost as to the moisture-laden atmosphere. Small fruit seemed to have escaped the early and late frosts, and we have average crops of these. The soil generally around here is of a light nature. *A. Sewell, Palace Gardens, Ely.*

—— Trees of Lord Derby Apple, which missed cropping last year, have a good sprinkling of fruit, but the crop of Bramley's Seedling is a very sparse one, except on trees that cropped light last year. Trees of Lane's Prince Albert are almost barren. We do not grow dessert varieties of Apples, except Mr. Gladstone, and this has failed us. Early Rivers Plum is a failure, whilst Czar and Monarch are only lightly cropped. Raspberry Superlative is the best variety for this district. We have the county boundaries of Norfolk, Cambridgeshire and Lincolnshire in our own lands, a straggling farm of more than 100 acres. Bulbs do well here. Our wheat is specially fine, and oats are good. Beans for seed purposes are very promising. Clover and hay is heavy in weight, and was well harvested. The crops of Mangolds and Kohl Rabbi require rain. Cabbages have done well, Sutton's Harbinger being especially good. *Stephen Castle, Walpole St. Andrew, Wisbech.*

Essex.—The fruit crops are, on the whole, disappointing. Most of the Apple trees have set a large crop, but many of the fruits will fail to mature. Plums are a good crop. Peaches and Nectarines, as well as Apricots, are a failure. Small fruits generally are fairly good. Aphides have been very prevalent. The prolonged drought following on a wet winter and early spring has had a marked effect on fruit as on most crops. The damp, sunless summer of 1912 was responsible for unripened wood, which is, no doubt, a contributing cause of the poorness of the fruit crops. Our soil is a stiff, yellow clay. *Arthur Bullock, Copped Hall Gardens, Epping.*

—— Although the show of blossom on all kinds of hardy fruit trees gave early promise of bountiful crops of fruit, adverse weather conditions at the time the flowers were open are responsible for the failure of the good prospects, with the result that there are average crops of Apples, Pears, Plums, and Cherries. Here and there, trees of such varieties as King of the Pippins, Norfolk Beaufin, Bramley's Seedling, Hambledon's Deux Ans, Lord Grosvenor, and Early Victoria Apples, are bearing fairly good crops of clean fruit. Beurré d'Amanlis and Williams' Bon Chrêtien Pears are bearing only light crops, though in favourable situations as regards aspect and soil. *H. W. Ward, Lime House, Rayleigh.*

—— The crops of Apples in this district are not at all regular: in some places there is an abundant yield, whilst in other gardens there is only an average crop. Cox's Orange Pippin and Blenheim Pippin seem to have better crops than usual. Pears are very unsatisfactory; there was plenty of bloom, but the fruits did not set. What fruit we have seems to be of very good quality. Of Plums only the variety Victoria is satisfactory. Cherries are almost a failure, with the exception of Morellas, which were very good. Few Peaches, Nectarines, and Apricots are grown out-of-doors here. Strawberries were an abundant crop of very fine berries. Small fruits were abundant in places, and the fruits were of very good quality. Gooseberries seem to be the most irregular crop, there being large numbers in some places and very few in others. Of nuts there are scarcely any. *William Johnson, Stansted Hall Gardens, Stansted.*

Lincolnshire.—All kinds of fruit trees blossomed freely with the exception of Apricots. Peaches and Nectarines set but new fruit. Pears developed scarcely any blossom, and most of the few fruits that did set dropped later. The Apple crop is very uneven; some trees have liberal crops, whilst others have none. Much damage has been done by aphides. Strawberries were a heavy crop, especially the variety Given's Late Prolific. Gooseberries also were a heavy crop, especially on bushes in the open. The soil is a heavy loam overlying a clay subsoil. *F. J. Foster, Grimsthrope Castle Gardens, Bourne.*

—— The fruit crops are unsatisfactory. There was plenty of blossom, but the flowers were small and weak, which I attribute to an absence of sunshine in 1912. Ten degrees of frost when Pears and Peaches had just set accounts for the scarcity of these fruits. The Plum crop is a variable one; some trees are laden, whilst others are barren. Apples are an average crop, but the trees were much injured by blight. *H. Vinden, Harlaxton Manor, Grantham.*

—— Apple and Plum trees are much blighted, both green and black aphis being very troublesome, notwithstanding syringing with insecticide. Potatos, both early and late varieties, are suffering from drought. We are lifting tubers of fair table quality of the varieties Duke of York and Midlothian Early, but the yield is much under average. The soil is a dark loam, resting on clay. *Harry Louth, Boothbys Hall, Grantham.*

Norfolk.—Apples, generally, in all parts of the county are promising well. A few Plum trees are bearing heavy crops, mostly those growing on light soils, but in the majority of gardens the Plum crop is a very light one. Pears, generally, are a failure. There was a fine show of Pear blossoms in spring, but scarcely any fruits set. Gooseberries and Red Currants were good average crops of fine fruit. Black Currants were good in places. Raspberries were a poor crop on heavy soils. A number of growers complain of the fruiting canes dying back. Strawberries were satisfactory. *H. Goude, Myosotis, E. Dereham.*

—— Pears are the worst crop of the season, and in many gardens the crop is almost a failure. Small fruits, with the exception of Red Currants, were good. White Currants, especially, were both plentiful and good. Peaches, with the exception of those on trees growing on a south wall, are very scarce, and Apricots are a complete failure. Strawberries were plentiful and fine in flavour. *William Orr, Stow Hall Gardens, Downham Market.*

Hampshire.—Stone fruits are, on the whole, a very thin crop, whilst Pears are a failure, except on some of the older trees. The excessive rainfall of 1912 caused the trees, and especially the young ones, to make rank growth and develop plenty of fruit spurs, for I never remember seeing the trees flowering more abundantly. But the flowers were very thin and most of them dropped. *Lewis Smith, Cadland Park, Southampton.*

Suffolk.—Apples are an average crop, and the Pear crop also is not a bad one considering the wet, sunless autumn of 1912 and cold spring of 1913. Several severe frosts occurred whilst the Pear and early Apple trees were in blossom. But the nights were dry, and, consequently, no great amount of damage resulted. Apricots and Cherries are the worst crops. These fruits set freely, but many dropped at the stoning stage owing to drought. Small fruits and Strawberries have given abundant crops, and especially Black Currants. The American Gooseberry mildew has been very prevalent in this district, and many small market growers have been forced to destroy their bushes. The disease has not made its appearance in these gardens. Peaches out-of-doors have been badly attacked by blister, but, happily, the disease has disappeared, and the trees are looking healthy again. *Thos. Simpson, Henham Gardens, Wangford.*

(*To be continued.*)

SCOTLAND.

EFFECTS OF THE DROUGHT.

THE long-continued dry weather in Scotland is having serious effects in many gardens, while it has also been the cause of much loss to growers of Raspberries and other fruit crops. In gardens the effects of the drought are being experienced severely. The rainfall during July was exceptionally small, and none of the stations reporting to the Scottish Meteorological Society recorded as much as 2 inches, while many of them had less than an inch rainfall. In some parts there was less than half an inch of rain, and at Braemar the fall of about a quarter of an inch was the lowest for fifty years in the same month. In August up to the time of writing, the 9th inst., hardly any rain has fallen. Bedding and other plants have made but little progress, and lawns in many places are brown from drought.

PHORMIUM TENAX AS A COMMERCIAL CROP.

THE cultivation of the New Zealand Flax, Phormium tenax, on a commercial basis is being followed with much interest in some parts of Scotland. On the estate of Mr. J. A. Wallace, Lochryan, Stranraer, where the climate is exceptionally mild, the Phormium grows rapidly. Several acres were planted some time ago, and although at first difficulties were experienced in treating the fibre so as to make it suitable for manufacturing purposes, these appear to have been overcome, and the crop is being utilised for the market and is manufactured into rope and binder twine. The leaves are first treated by Wright's decorticator, and the fibrous matter is afterwards washed in pools for an hour or two previous to being bleached. After bleaching for some days the fibre is returned to the mill, in which the decorticator is placed, and scutched to make it ready for baling. It is believed that the crop will be a profitable one.

GLASGOW PARKS.

THE magnitude of the work of the Parks Department of the City of Glasgow and the amount of responsibility resting on the head of the department, Mr. James Whitton, V.M.H., may be gathered from the accounts submitted at a recent meeting of the Glasgow Town Council. The total revenue amounted to £108,301, as against £89,712 in the previous year. The expenditure was £108,364 as compared with £89,708. A revenue of £95,634 was received from a rate of 3.7d. per £, and other sources of income included the Queen's Park, £1,092; public bowling greens, £2,285; golf courses, £1,629; and Rouken Glen, £649.

PRIZES FOR COTTAGE GARDENS.

THE Countess of Selkirk has again given prizes for the best cottage gardens on the St. Mary's Isle estate, Kirkcudbright. The judges, Mr. W. Hutchinson, gardener to C. E. Galbraith, Esq., Terregles, and Mr. D. Hunter, of Messrs. Barr and Hunter, Dumfries, recently made the awards. *Correspondent.*

INCREASED RAILWAY RATES.

IN a recent issue we reported certain concessions gained by the Horticultural Trades Association through their opposition to the increased railway rates which the South-Eastern and Chatham Railway Companies sought leave from the Railway and Canal Commissioners to increase, so far as the clog imposed by the South-Eastern, London and Chatham and Dover Railway Co.'s Act, 1899, was concerned.

Those who are accustomed to forwarding small parcels of goods not exceeding 3 cwt. in extent by passenger train will be glad to hear that since the report in question further advantages have been gained in their favour.

Before the order was drawn up the legal advisers to the Horticultural Trades Association took the precaution of investigating the question of whether the increased rates proposed for small parcels would exceed the maximum fixed by the Act of 1899 referred to above, and it was found that such would, in fact, be the case. The attention of the Court was therefore called to the matter, and it was pointed out that the railway companies were, in fact, asking the Court to authorise them to charge more than the maximum fixed by Parliament, and that such an order would be obviously ultra vires.

To make the matter clear, it should be explained that the maximum charges which can be demanded by the railway companies for the conveyance of small parcels by passenger trains (at company's risk) are as follows:—

Distance.	For any Parcel not exceeding in Weight:—							
	7 lbs.		14 lbs.		28 lbs.		56 lbs.	
	d.		s.	d.	s.	d.	s.	d.
Not exceeding 20 miles ..	3		5		7		9	
,, ,, 30 ,, ..	5		7		9		1	0
,, ,, 50 ,, ..	7		9		1	0	1	6
Exceeding 50 ,, ..	9		1	0	1	6	2	6

And for any parcel exceeding 56 lb., but not exceeding 500 lb. in weight, the two companies, or either of them, and the managing committee acting on their behalf, may demand any sum they think fit; provided always that articles sent in large aggregate quantities, although made up in separate parcels, such as bags of sugar, coffee, meal, and the like, shall not be deemed small parcels, but that term shall apply only to single parcels in separate packages.

The following schedule shows the increased small parcels rates which the South-Eastern and Chatham Companies asked for power to charge, and we give in italics all those rates which would be illegal as being in excess of the maximum set out in the schedule shown above (no question arises as to parcels over 56 lb. in weight, as in such cases the Act of 1899 has fixed no maximum, but permits the companies to charge any reasonable sum):—

NEW GENERAL PARCELS RATES.

	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	
Not exceeding 20 miles ..	*1 0*	1 2	1 2	1 2	1 3	1 3	1 3	1 3	1 3	1 4	1 4	1 5	1 6	1 6	1 6	1 6	1 6	2d.
,, ,, 30 ,, ..	*1 2*	1 3	1 4	1 5	1 6	1 6	1 7	1 8	1 9	1 10	1 11	2 0	2 1	2 1	2 2	2 3	2 4	3d.
,, ,, 50 ,, ..	*2 0*	2 3	2 3	2 3	2 3	2 3	2 6	2 6	2 6	2 9	2 9	2 9	2 9	2 9	3 0	3 0	3 0	4d.
Above 50 ,, ..	*2 9*	3 0	3 2	3 4	3 6	3 6	3 6	3 6	3 6	4 0	4 0	4 0	4 0	4 6	4 6	4 6	4 6	6d.

In order, therefore, to ensure that the sanction of the Railway Commissioners to increase rates shall not enable the South-Eastern and Chatham Companies to charge more than the maximum fixed by the Act of 1899, the Court has included in the order a provision to the effect that all the above charges for any parcel not exceeding 56 lb. in weight shall include services beyond conveyance. In other words, where any excess is charged by the railway companies beyond the maximum rates set out in the first of the above two schedules, they must be prepared to perform extra services, such as loading and unloading or collection and delivery, up to a value equivalent to the amount of the excess. Those who consign small parcels by passenger train at companies' risk should, therefore, carefully check the rates charged them with the first of the schedules set out above, and if the rate demanded exceeds the maximum fixed by such schedule, they should take steps to ascertain whether other services are performed by the railway companies equivalent in value to the amount of such excess, as otherwise the rate charged would be illegal.

SOCIETIES.

ROYAL HORTICULTURAL.

AUGUST 12.—The usual fortnightly meeting was held on Tuesday last in the Society's Hall, Vincent Square, Westminster. The exhibition was the smallest of the year, and there were but few visitors.

The Orchid Committee recommended two Awards of Merit.

The Floral Committee granted five Awards of Merit to novelties and 12 medals to groups.

The only exhibit of importance in the fruit and vegetable section was a collection of pot fruit trees, for which a Silver Knightian Medal was awarded.

At the three o'clock meeting in the lecture room an address on "Fairy Flies and their Hosts" was delivered by Mr. FREDERICK ENOCH.

Floral Committee.

Present: H. B. May, Esq. (in the chair), Messrs. Chas. T. Druery, G. Reuthe, W. Bain, Chas. E. Pearson, J. W. Moorman, Chas. Dixon, J. T. Bennett-Poë, Arthur Turner, W. P. Thomson, E. H. Jenkins, H. J. Jones, William H. Morter, Chas. Blick, J. F. McLeod, C. R. Fielder, T. Stevenson, J. W. Barr, E. A. Bowles, B. Crisp, George Paul, John Green, and R. Hooper Pearson.

Mr. L. R. RUSSELL, Richmond, showed varieties of hardy Fuchsias, the dwarf-growing Acæna macrophylla and the silver-variegated variety of Dimorphanthus mandschuricus. The Fuchsias included the varieties Brightonensis, with large purple and scarlet blossoms, Riccartonii Enfant Prodigue, F. pumila with almost black corolla set off by scarlet sepals and F. gracilis and its variety variegata.

Messrs. W. CUTBUSH AND SON, Highgate, were awarded a Silver Banksian Medal for Gladioli and miscellaneous indoor plants. A batch of the rosy-leaved Coleus cordelia was attractive in association with the elegant-leaved Dracæna Victoria, Begonias, Caladiums, Liliums and Dracænas.

Messrs. JAMES VERT AND SONS, Saffron Walden, successors to Messrs. Webb and Brand, showed Hollyhocks. The varieties of this old-fashioned flower were all of the rosette type, and included: Lady Bailey, flesh-colour; Primrose Queen (new); Ovid, rose; Exultum, maroon; Peri Lena, purplish-maroon; and Constance, salmon. (Silver Flora Medal.)

Messrs. H. B. MAY AND SONS, Dyson's Road, Upper Edmonton, filled a large table space with varieties of indoor Ferns, showing excellent

plants of Osmunda palustris Mayi, Pteris cretica Childsii, Adiantum trapeziforme, Cheilanthus elegans, Asplenium formosum, Gymnogramme sulphurea and Microlepia speluncæ. (Silver Banksian Medal.)

Messrs. A. H. Cole Ltd., Swanley, Kent, were awarded a Bronze Banksian Medal for Zonal Pelargoniums, Gloxinias and Pentstemons.

Messrs. Dobbie and Co., Edinburgh, showed Collerette Dahlias and varieties of Scabious, the exhibit of Scabious being the most attractive in the Hall. They were arranged very lightly in vases and set off by fine foliage and plants of Kochia. The colours of these pretty border flowers were very varied, and the collection included varieties labelled Cherry Red and White, Black-Purple and White, White, Black-purple, Pompadour, Brick-red, Flesh, Lilac and Azure Fairy. Amongst the Dahlias were the following choice sorts:—Queen Anne, scarlet, tipped with gold; Holyrood, ruby-crimson, with gold tips and a yellow disc; Inchcape, chocolate-brown florets with rose and white tips; Yellow Queen, The Needles, rosy-claret with gold centre; and Princess Louise, blood-red with white tips. (Silver Banksian medal.)

An excellent exhibit of Delphiniums and Achillea Perry's White was shown by Mr. Amos Perry, Enfield. The group was arranged with excellent taste and included a large batch of the fine, semi-double form of Delphinium Belladonna. (Bronze Flora Medal.)

Mr. G. Reuthe, Keston, Kent, showed hardy border flowers and uncommon shrubby species. In the centre of the group was a large batch of Dierama (Sparaxis) pulcherrimum atropurpureum. We also noticed the new Anemonopsis californica, with white petals surrounding a cone of stamens, some of the latter being petaloid; Arctostaphylos californica in fruit, not unlike a Pernettya; and Rhododendron lepidotum obovatum, a tiny gem with flat, purplish flowers blotched with maroon on the upper petals. (Bronze Flora Medal.)

Mr. M. Prichard, Christchurch, Hampshire, was awarded a Silver-gilt Banksian Medal for hardy plants. This excellent exhibit was arranged as a floor group and included fine specimens of Achillea Ptarmica The Pearl, Delphinium Lamartine, Montbretia George Davidson, varieties of border Phloxes, Romneya Coulteri and showy Gladioli.

Messrs. T. S. Ware, Ltd., Feltham, were awarded a Silver Banksian Medal for a large exhibit of border flowers which included most subjects in season.

Messrs. W. Wells and Co., Merstham, Surrey, showed varieties of border Phloxes and Perpetual flowering Carnations. (Silver Banksian Medal.)

Messrs. Kelway and Son, Langport, Somersetshire, exhibited a large collection of excellent Gladioli spikes, which occupied two lengths of tablings. Besides a very large number of the best named varieties, Messrs. Kelway showed many novelties under numbers, and of these No. 13, a splendid, well-furnished spike of large orange-lipped yellow blooms, was especially meritorious. The dainty hybrids of G. primulinus, which are mostly of yellow and buff shades, were also very charming. Of the named varieties, Picotee (yellow, with a pink edge), Firedragon (yellow and deep orange), Field Mouse (pink suffused with purple), Marie Studholme and Peyman were especially noteworthy. (Silver-Gilt Flora Medal.)

Messrs. W. Cutbush and Son, Highgate, also contributed a large collection of Gladiolus spikes. This exhibit was displayed on a broad platform in an attractive manner. The centre of the group was composed of a very large number of the bluish-purple Baron Jules Hulot, and was flanked by large stands of Lucretia (a Brenchleyensis variety), Panama (a large-flowered pink), Europa (white), and Peace.

Awards of Merit.

Gladiolus Craiganour.—A bright coral-rose variety; the lower inner petal is of darker shade, and each of the inner segments has a white line down the middle. There is the faintest sheen of purple shading the rose, which becomes most marked on the lower petal. Shown by Messrs. Kelway and Son.

Dahlia Dungeness.—A crimson-scarlet Collerette variety, with pale-yellow collar. There are eight oval ray florets from the base of each of which spring small bunches of three to five quills, the quills being half the length of the ray. The individual flowers are 4 or 5 inches in diameter. Shown by Messrs. Dobbie and Co.

Caladium Mme. Renée Marot.—A variety with medium-sized leaves, notable for their fine colouring. The central ground colour is silver, or pinkish-white, veined brightly with carmine-crimson, but the dominant colouring is deep crimson, which towards the edge gains a sheen of bronze from the presence of green under the crimson. Shown by Mr. Hoffmann, Tower House, Streatham (Gr. Mr. Tomlinson).

Lysionotus Warleyensis.—A new sub-shrubby Gesneriad, with Foxglove or Streptocarpus-like flowers, collected by Mr. E. H. Wilson in China. The plants were dense little bushes of unbranched stems, about 9 inches high. The leaves are opposite, or more commonly in whorls of three, varying from oblong to lanceolate in shape, tapering to a short crimson stalk, and with a few irregular teeth, mostly in the blunter, upper half; generally about 2 by ½ or 1½ by ¼ inches. They are fleshy, almost white below, and with one central furrow. The flowers are white, tubular, about 2 inches long, expanding a little at the throat to ¾ inch, and with three purple guide-bands running up the tube. The corolla lobes are very small. They are borne singly on short stalks in the upper leaf axils, but the strongest stem had only five blooms and buds, so that the species is interesting rather than showy. Shown by Miss Willmott.

Agapanthus Weilligii.—A new deciduous species, which is as hardy as A. Mooreanus. The umbellate head exhibited carried about sixty flowers, which in bud were held erect, but when open drooped vertically in a characteristic manner, and gave the plant a denser head than A. umbellatus. The flowers are much more tubular, or rather sub-campanulate, than in the latter species, not exceeding ¾ in. in diameter at the throat at the end of a 1¼ inch tube, and the perianth segments are only half the length of the tube. The base of the flower is deep violet, but the rest of the perianth is a pale blue-violet, except for a dark line running up the inside of the very stout textured perianth. The bulb appears never to carry more than six leaves, which are short, rigid, erect, deeply channelled, and sub-glaucous. Shown by A. Worsley, Esq.

Other Novelties.

Mr. A. W. Chaplin showed a flowering specimen of Saxifraga florulenta which he had collected. The plant flowers every fourth or fifth year. It is found only in a very localised area on the Maritime Alps, and always on overhanging ledges, protected from drip and rain, and never exposed to the sun. It belongs to the encrusted section (Euaizoon). The plant shown had a close rosette about 3½ inches across, and a dense spike 6 inches long.

Orchid Committee.

Present: J. Gurney Fowler, Esq., in the chair, and Messrs. Jas. O'Brien (hon. secretary), Gurney Wilson, F. J. Hanbury, W. H. Hatcher, G. Hunter, A. Dye, J. Charlesworth, A. McBean, W. H. White, S. W. Flory, W. Bolton, De B. Crawshay, R. A. Rolfe, and Sir Harry J. Veitch.

E. H. Davidson, Esq., Orchid Dene, Twyford, was awarded a Silver Flora Medal for a group of choice varieties, all very finely flowered. The best were a very handsome Odontoglossum eximium, the fine O. Helene, with its large violet-and-white flowers, and for which Mr. Davidson had previously received an award; O. Woodroffeæ (Rossii rubescens × Queen Alexandra), which obtained a First-class Certificate, September 24, 1912, and now appeared still more beautiful; good Cattleya Hardyana and other Cattleya.

Messrs. Charlesworth and Co., Haywards Heath, were awarded a Silver Banksian Medal for a good group, the centre of which was of fine, pure-white Odontoglossum ardentissimum xanthotes, with O. Rolfeæ and other Odontoglossums; Miltonia vexillaria robusta, with large rose-pink flowers; and the small but brightly coloured M. vexillaria superba; the rare Stanhopea convoluta, Dendrobrium Sanderæ, Lælio-Cattleya Pelias and other Lælio-Cattleyas, Cycnoches chlorochilon, very fine masses of Cryptophoranthus Dayanus, Sophro-Lælia Felicia, and the new Cattleya Fauna (Chamberlainiana × Hardyana), with pretty yellow flowers marbled with violet, were also noted.

Messrs. J. and A. McBean, Cooksbridge, staged an effective group, for which a Silver Banksian Medal was voted. At the back was a very fine Vanda cœrulea, with some good Cattleya Dowiana aurea, in front being a selection of scarlet Odontiodas, including Charlesworthii, Lambeauana, Bradshawiæ, Keighleyensis, and the mauve O. Thwartesii.

H. I. Pitt, Esq., Roslyn, Stamford Hill (gr. Mr. Thurgood), was awarded a Silver Banksian Medal for a varied group of pretty hybrids and interesting species, among which were several Cattleya Dowiana and C. Source d'Or, C. Atalanta, good Miltonia Bleuana; a selection of Odontoglossums and several species.

R. G. Thwaites, Esq., Chessington, Streatham (gr. Mr. J. M. Black), showed a very interesting and pretty selection of hybrid Odontiodas, Cattleya Caduces, C. Pittiana and other hybrids.

Messrs. Armstrong and Brown, Tunbridge Wells, showed a finely flowered plant of the new yellow, fringed-lipped Dendrobium Hookerianum. It is an old species, which received a First-class Certificate in 1870, and the committee asked for flowers for a painting for the Society's collection. Also a very richly coloured hybrid between Lælio-Cattleya Gco. Woodhams and C. Lord Rothschild, with an intensely deep claret-crimson lip.

Messrs. Stuart Low and Co., Enfield, showed a selection of showy Orchids, including Cœlogyne pandurata, with a spike of eleven flowers; Lælia crispa, with two spikes each of seven flowers, a good specimen of Miltonia Phalænopsis, etc.

Messrs. Sander and Sons, St. Albans, showed Lælio-Cattleya Phœnix var. King George (L.-C. Hy. Greenwood × C. aurea), a handsome flower with cream-white sepals and petals tinged and veined with purple and dark mauve-purple lip with yellow lines from the base.

Mr. E. V. Low, Vale Bridge, Haywards Heath, sent a finely-flowered Cattleya Atalanta and Lælio-Cattleya Ophir E. V. Low's variety, with white sepals and petals and rose-purple lip.

De B. Crawshay, Esq., Rosefield, Sevenoaks (gr. Mr. Stables), showed a good Odontioda Leeana (Odontoglossum crispo-Harryanum × Cochlioda Noezliana), a flower of large size and fine shape, vermilion-red with pale lilac front to the lip; and another of his very fine forms of Odontoglossum Queen Alexandra very similar to that for which he received an Award of Merit at the last meeting.

AWARDS.

Awards of Merit.

Lælio-Cattleya Wellesleyi var. Flambeau (*C. Warscewiczii* × *L.-C. Martinetii*), from E. H. Davidson, Esq., Orchid Dene, Twyford. A very handsome Lælio-Cattleya, with strong indication of Cattleya Warscewiczii in its broad and richly coloured lip. Sepals and petals of a bright purplish-rose colour with a golden tint. Lip broad and finely crimped, deep purplish-crimson in front, changing to velvety ruby-red in front of the yellow disc, to which golden lines radiate from the base.

Lælio-Cattleya Ursula (*L.-C. Ingramii* × *C. Mantinii*), from Messrs. J. and A. McBean, Cooksbridge. A very pretty hybrid, flowering for the first time, and which should, from its parentage, develop much greater beauty. The flowers borne on the dwarf, compact plant had the colours of the best C. Mantinii, but formed more nearly like L.-C. Ingramii.

Cultural Commendation.

To Messrs. Charlesworth and Co., Haywards Heath, for a large specimen of the curious Cryptophoranthus Dayanus bearing about 150 of its singular claret and cream-white flowers resembling the head of a hawk. The species

was illustrated in the *Gardeners' Chronicle*, 1886, p. 428. It was formerly called Masdevallia in gardens.

Fruit and Vegetable Committee.

Present: Geo. Bunyard, Esq. (in the chair), Messrs. W. Bates, W. E. Humphreys, Wm. Pope, J. G. Weston, A. R. Allan, J. Willard, Owen Thomas, C. G. A. Nix, A. H. Pearson, J. Jaques, J. Davis, Ed. Beckett, A. Grubb, and S. T. Wright (secretary).

The only exhibit before this Committee was a collection of pot fruit trees from Messrs. J. Veitch and Sons, Chelsea. At the back of the group there were very large, splendidly grown Peach trees (Marquis of Downshire and Sea Eagle). Dwarf pyramid trees of Jeffersons and other Plums, also bearing heavy crops of ripe fruits, were equally attractive. Apples were represented by such varieties as James Grieve, and Pears by Marguerite Marillat, Souvenir du Congrès, Triomphe de Vienne, Dr. Jules Guyot and Doyenné du Comice. At the front there were dwarf pot plants of Figs (Negro Largo and White Ischia), which bore many ripe fruits, and fruiting sprays of the "Veitch Berry," a cross between Raspberry November Abundance and a large-fruited wild Blackberry. The large, good-flavoured fruits of this hybrid so impressed the Committee that they requested that plants be sent to Wisley for trial. (Silver Knightian Medal.)

GHENT EXHIBITION.

August 9 to 17.—This horticultural show, known as the "Van Houtte" Exhibition, was held in the same building as the Ghent Quinquennial in April last, from which it differed in many respects. As at the earlier show there were many splendid Palms, Cycads, Cordylines, Pandanus, Anthuriums, and other exotic foliage plants, and of better quality even. But the show as a whole was not nearly so brilliant or imposing as the "Quinquennial," although it was one of great interest. The flowering plants consisted chiefly of Orchids, tuberous-rooted Begonias, Zonal Pelargoniums, Salvias, and Heliotropiums, and all these subjects were shown excellently well. Of cut blooms Gladioli were remarkably good, whilst Roses were better than might be expected at this season. Carnations, though staged in fairly good numbers, were not quite equal to those shown at the exhibition in April. Bay trees (Laurus nobilis) were of splendid quality, and there were many other fine evergreen shrubs shown either in pots or in tubs. Specimens of Box, trained as pyramids, were exceptionally effective, also many plants of Euonymus radicans variegata shown as dwarf specimens trained in diverse forms. There were few exhibits of fruit, and the same may be said of vegetables, including salads. The spectacular effect of the exhibition arranged in this very large building was magnificent. The taller Palms and Tree Ferns were arranged along the sides, whilst along one end a very large exhibit was arranged by MM. Van Houtte to the upper tier of the building. At the opposite end Orchids were arranged on sloping stages. In the centre was a formal sheet of water planted with Nymphæas of diverse colours, but these were grouped too formally, being arranged with mathematical precision, and the effect was further spoiled by close crowding of the individual varieties. Hereabouts, also arranged in very formal order, were tall-growing aquatics. The building was filled in every part with exhibits, and we may congratulate M. Joseph de Hemptinne and the other members of the Council on the general success of the exhibition.

Orchids.

The exhibits of Orchids were arranged in three wide tiers, each higher than the other, with wide spaces for grouping and for promenade. These could not be seen in the distance, but upon inspection, both cultivation and choice variety were evident. There was only one exhibitor from Great Britain, Sir Jeremiah Colman, Bart., whose display, though not of great extent, contained many choice plants; the best of these were good examples of Bulbophyllum grandiflorum, with two fine spikes of flowers; B. virescens; Brassia Lawrenceana longissima, distinct; Catasetum Reichenbachianum; Phaius Ashworthianus, with golden sepals and petals; and a finely-flowered example of Cypripedium superbiens with a dozen flowers. No award was placed on this group when our reporter left the show.

Other amateurs, resident in Belgium, had magnificent exhibits, notably M. Lambeau and M. Jules Hye de Crom. The premier prize in the larger class was awarded to M. Lambeau for a group that was most effectively arranged. The finer forms of Cattleya gigas were prominent, as C. gigas Deweyi with intensely-coloured lip; C. Dupreana, like C. gigas, very fine; C. Hardyana was in evidence too in C. H. ardens of a deep golden colour in the sepals and petals, and in C. H. Vogelzang with even more intense colouring; C. Gaskelliana perfecta, a fine form with lightly-coloured lip; C. Comet, with golden veins on the lip; C. Pynaertiana, with extra large flowers; also Oncidium macranthum, and Dendrobium Phalænopsis Schröderianum.

M. Jules Hye de Crom staged a splendid group of Miltonia vexillaria, and hybrids, in which the lighter forms were predominant; the plants were in the best of health, and bore a profusion of flowers. Two distinct varieties were M. Hyeana Flambeau and M. Hyeana gracilis with the colouring running into the petals; M. Bleuana was also shown well.

M. Jules Hye de Crom also exhibited three new Orchids in Cattleya Dowiana Mme. J. Hye de Crom, a fine form; C. labiata Suzanne Hye de Crom with pure-white sepals and petals, and a well-defined lip with deep golden colour and broad margin of white; also C. Dupreana var. Hyeana, like C. gigas with broad petals somewhat incurving. Dr. Baillon staged a smaller group, in which Cypripedium Memoire Alma Gevaert, one of the "albino" forms, was very fine, better in fact than C. Maudiæ; here also were Cattleya Hardyana in remarkable colouring; also C. Myra Peeters, with a pale golden lip; some fine forms, also, were those of Odontioda multiflorum, Miltonia Queen Alexandra with very large flowers; a good example of Vanda cœrulea, and several specimens of Cattleya gigas. The award here was an Objet d'Art.

M. Beheils staged a mixed group that included a very fine Cattleya Gaskelliana, a freely-flowered plant; several plants of Oncidium varicosum Rogersii; Dendrobium Dearei, one of the very best Orchids in August; others staged, not in competition, included Odontoglossum Armainvillierense, a fine spike with pure white flowers and golden labellum; Aërides Lawrenceana, a fine spike; Vanda Sanderiana; Cattleya Lord Rothschild, and other good things. M. Dietrich had set up a fine group of Miltonia vexillaria in considerable variety, more deeply-coloured than in the group by M. Jules Hye de Crom, and a fine example of cultivation; here was noted M. v. Memoria G. D. Owen, a well-known and choice variety. A very fine exhibit that included several remarkable hybrids, wherein the influence of Odontoglossum Harryanum was distinctly apparent, and in varied shades of colouring, was set up, but the entry card bore no name.

M. Verdonck had a unique exhibit, in which Phalænopsis Rimestadiana was most prominent, having no fewer than 45 fine spikes on the plants, with here and there a few examples of Cochlioda Noezliana and Odontioda Charlesworthii, added to give a touch of colouring. These were staged on a groundwork of fresh-green moss, which added to the effect. (Gold Medal.)

M. Théodore Pauwels and Co. staged probably the largest group of Orchids, and were successful in winning the Premier Prix, an Objet d'Art of 200 francs, and two other first prizes in the trade section. Taking the group as a whole, the effect was fine. The best plants were of Vanda cœrulea, several good examples; Dendrobium Phalænopsis Schröderianum, very fine, both in colour and variety, one spike bearing as many as 19 flowers, highly coloured; Grammangis Ellisii with two fine spikes; Odontioda Charlesworthii, highly coloured; Dendrobium aggregatum in good form, and D. acuminatum. To these were added several fine forms of Cattleya gigas Sanderiana, and others of Odontioda and Odontoglossum hybrids.

M. Vuylsteke, whose exhibits of hybrids of Odontoglossum and of Odontiodas are so well known, contributed a choice selection which included Odontoglossum Hisionii, of a pale creamy colour, fine; O. azureum var.; Orion, of a dark lilac-purple shade; O. Themis, of even a deeper colour; O. Ariadne, with massive flowers; and O. ornatum, O. amabile and O. Minos, all fine forms; of the Odontiodas were O. Vuylstekeana var. Carmen and O. Flambeau. This very choice exhibit had not received an award when these notes were taken.

Nepenthes.

A choice exhibit of Nepenthes was staged near the Orchids, consisting in the main of N. Mastersii with large and highly-coloured pitchers. This was an exhibit of high-class culture, but no name could be found attached thereto. In the competitive class, M. Vincke du Jardin was first with good plants, chiefly of N. Sir Thiselton-Dyer, N. Mixta, N. Lewis Bradbury and N. Mastersii rubra, all being plants of medium size, but well pitchered.

New Plants.

For the most meritorious collection of new plants not in commerce, Messrs. Sander and Sons, of Bruges and St. Albans, were an easy first. The specimens consisted of well-grown examples of Trevesia Sanderi, of Aralia-like character with the leaves lobed in irregular fashion; Chamædorea pumila, a dwarf, but distinctly fine palm with a grey glaucous suffusion over the leaves; Dieffenbachia Sanderæ, a sturdy plant; Alocasia Micholitziana, foliage arrow-shaped, colour a dark, dull green and silvery venation and Eriobotrya japonica variegata, quite distinct in its profuse silvery markings. Others were Alocasia colossea, A. Warteli, Dracæna regalis, Phœnix andamanensis, Heliconia illustris, Socratea Forgetiana, a fine palm with noble leafage, and Polypodium irioides corymbiferum. Also two new hybrid Orchids, viz., Odontioda De Hemptinneana, a brightly-coloured form, and Brasso-Cattleya amabilis with golden veinings in the lip.

Palms and Cycads.

As may be surmised, these were most conspicuous features in the exhibition. Some remarkably large and fine specimens were staged. Of these, some of the finest came from M. Francoise Spae, who had a grand plant of Areca Baueri in its true character. Also excellent plants of Kentia Forsteriana, Thrinax Chuco (grand), Phœnix Roebelinii, Cocos Maximiliana, Cocos flexuosa (fine), and Chamærops Hystris (an immense plant). With these he was an easy winner in the class for large specimens. The Flandria Co. were the winners also for 25 specimen palms, with grand plants, Kentias here being a feature; also Rhapis flabelliformis, and huge plants of Latania and Chamærops. In another class the same firm won with a set of excellent plants, some of which are rarely seen, such as Kentia Forsteriana pendula (grand), K. aurea (distinctly good), Phœnicophorium Sechellarum, Phœnix Roebelinii, Areca lutescens, Rhapis flabelliformis, Livistona Dumoniana, Ravenea Hildebrandtii (of Kentia-like character), and K. Wendlandii. The same firm repeated its success with six Kentias, showing K. Dumoniana, K. Belmoreana pendula, K. nana compacta, K. Lindeni, and others—a fine exhibit. The Flandria Co. were again to the fore for Phœnix Roebelinii with plants in the best possible health and vigour, the growth compact and dark-green in colour. M. Adolphe-Delaruye was first with Phœnix canariensis, to which the foregoing remarks apply; this is about the hardiest and most enduring of all the Phœnix family. The finest specimen of Phœnix Roebelinii came from M. La Croux, an ideal plant, and well furnished. A fine specimen of the somewhat uncommon Brahea glauca was shown by M. C. Petrick, and won for him the 1st prize in its class; as did Areca sapida for M. Joseph Spae. Cocos Weddelliana was shown in fine condition by many exhibitors; some of these won the 1st prize in the class for specimens.

The finest Cycads, Zamias and Macrozamias came from M. Jules de Cock, who was invariably first in the classes for specimen plants, showing finely-grown examples.

Araucarias.

These are always features in Continental exhibitions, and at Ghent on this occasion they were beyond praise. The best collection, by a long way, of specimen plants, splendidly furnished, came from M. Hartman; these consisted of A. Reine des Belges (a noble plant), A. Rulei glauca (distinct), A. Goldieana, A. Leopold II., A. elegans, A. elegans compacta, A. Cunninghamii corneliensis, and A. Cookii aurea. Of smaller and possibly more useful plants there were numbers shown, and by several exhibitors; some of the best were A. excelsa compacta and A. e. glauca.

Cordylines and Dracænas.

In the schedule these all appear under the latter name. The Cordylines exhibited were very fine, sturdy, compact plants, and well coloured in their varieties. Undoubtedly these, in the newer kinds, will be more sought after. The Flandria Co., of Bruges, showed a good collection in the large class for the variegated or coloured forms of D. australis, and was awarded the Premier Award—an Objet d'Art. These comprised forms of D. lentiginosa and of D. Doucettii; varieties of the latter were noted, which included C. Leopoldii and C. Flandriana. A fine collection, not for competition, of C. Doucettii was also shown, but previous remarks apply, no name could be found. The stove Dracænas—so understood by gardeners in England—were also in fine form. These stood out prominently as useful decorative plants. Some of the best of these were shown by M. J. Ed. Story, to whom a Gold Medal was awarded; the best were D. terminalis, D. Lord Wolseley, D. Bergmanii, and many others, all well furnished, and equally well-coloured. For a group of 20 plants of a new variety, M. J. Ed. Story showed D. Marguerite Story, a well-defined variety of sturdy growth with carmine markings and dark bronzy-green; the 1st prize being awarded. M. Alexis Dallière showed 20 plants of D. Père Charon, semi-pendant in habit, and sturdy, with dark-reddish colouring, and received the 1st prize.

Pandanus and Marantas.

Both are in request evidently on the Continent, and though English gardeners grow Pandanus largely, they neglect, even if they do not despise, the Marantas. The best plants of Pandanus Veitchii were shown by M. Mélanie Carden. Some finely-coloured examples of Pandanus Sanderæ were arranged as single plants for effect, but the name of the exhibitor was not in evidence. Some of the best Marantas shown were M. Closonii, a dwarf plant, distinct and somewhat new; and M. Chantrieri, a promising variety.

Codiæums (Crotons).

These were very finely shown, much better than we usually see them in England. The broad-leaved forms are preferred to any other type. Some of the best varieties were W. Stroffregen, very highly coloured; C. Mme. Florin, of golden colour, distinct; C. Comte Hugo, a variety of deep, golden colour, and C. Paul Garnot. These were awarded the 1st prize. Exhibitor, M. Ernest Delaruye.

Groups of Foliage and Flowering Plants.

The finest group of foliage and flowering plants was the large group of 40 plants staged by the Société Horticole Gantoise, to which the 1st prize offered by H. M. the King of the Belgians was awarded. These comprised, of flowering plants, a fine mass of Dendrobium Dearei, a mass of white flowers; Crossandra undulæfolia, equally as showy, a mass of rich Apricot-coloured flowers (it ought to be more grown), and Acalypha hispida. The finest of the foliage plants, which were in many cases of huge dimensions, were Croton Reidii, fine in colour and leafage; Vanilla aromatica variegata, very distinct; Pandanus Veitchii and P. Sanderæ, both alike good; Dracæna Sanderiana, a finely-grown example; D. Godseffiana, a large bush; Caladium Raymond Le Moinier, well-coloured; C. Thomas Tomlinson; Aglaonema Curtisii, distinct silvery venations; Maranta Kegeljani, silvery markings on pale-green ground; M. insignis, fine, dark olive-green and lighter markings; Dieffenbachia Jenmannii, one of the best of the giant forms; Phœnix Roebelinii, a compact plant; several fine Kentias, as K. Belmoreana and K. Forsteriana; Anthurium Hookeri, massive foliage; a fine Thrinax elegans; Dieffenbachia imperialis nobilis; Croton Countess (the only good specimen of the narrow-leaved type in the show), and a fine example of Alpinia variegata.

M. Van Houtte's exhibit in another class, specially set apart for it, was a magnificent display, and one of the features of the exhibition. In outline it was quite informal in its arrangement, and unique in its conception, some rocks of huge size, entered into its composition. Here and there were finely-grown foliage plants, each one standing out by itself; these consisted of Phœnicophorium Sechellarum, huge Crotons and Dieffenbachias; a fine plant of Phœnix Roebelinii; another of Pandanus Sanderæ, and of P. Vander Meerchi, and finely-grown Cycads, all backed up with large Kentias. The groundwork consisted chiefly of flowering plants, amongst which a very striking mass of Bilbergia rhodocyanea superba, with pale, salmon-pink spikes, was most striking at the base of the group. Gladioli in pots, several good Gloxinias, and masses of Orchids, were also employed, and Ferns in quantity.

A somewhat unique exhibit was that of Vriesia hieroglyphica variegata, a fine plant, olive-green with pale-green bars and silvery venations. (The name of the exhibitor was not placed in time to note it.) M. Vincke du Jardin showed the best plants in spathe of Anthurium Andreanum in diverse colours.

Ferns.

Of these, the Tree Ferns were a grand feature, being most effectively grouped *en masse*, thus showing their true character. The 1st prize for these was awarded to M. de Smet Freres; it was a truly grand and imposing exhibit, the plants being in the best of health and vigour; Cyathea dealbata, Dicksonia fibrosa, and D. antarctica, were the most notable. Though 54 classes were set apart for Ferns, the exhibit as a whole was not commensurate with the encouragement given. Many of the groups were made up of easily-grown varieties. One of the best was that by MM. Bier and Ankersmit; this included Cibotium Schriedei, Alsophila australis, and some of the best of the newer and larger forms of Nephrolepis, as N. Piersonii compacta, N. superba and N. elegantissima. The grouping of these dwarf Ferns was somewhat dull. A little colour would have been appreciated.

Flowering Plants in Separate Classes.

Begonias (*tuberous*).—Of tuberous-rooted Begonias a large number was shown, arranged as for beds in the open, and as individual specimen plants. To the surprise of many, Messrs. Blackmore and Langdon sent over a magnificent collection, which was far and away the finest in the exhibition. It was quite wonderful to see these in such fine condition, scarcely showing any trace of the long journey they had undergone. It was a superb exhibit and the plants fine examples of cultivation and careful packing. The plants were of large size in many cases, and the individual flowers immense, also of exquisite colour and form. The best were Lady Tweedmouth, rose-pink, delicately shaded and with crimpled edges; King Alphonse, rich scarlet; Dorothea Watson, bright orange, of fine form; Empress Marie, a large pure-white flower; Mrs. Ainslie, chrome yellow, fine; Lady Cromer, extra large pink, shading off to white; Princess Victoria Louise, large soft pink, and of great beauty; Irene Tambling, brilliant orange; Mrs. R. Caulfield, large, round-petalled rose blooms; and the Duchess of Cornwall, rich cardinal. This exhibit was inscribed by the jury, "*le prix le plus élevé possible, avec acclamations unanimes.*"

The next most noteworthy exhibit in Begonias were the 100 single varieties shown by M. Le Saffre, handsome, clean, well-grown examples, not named; also 100 doubles by the same exhibitor, and of similar merit. Another group of at least 300 plants, shown by M. Van Speybrock, was excellent, large, sturdy plants, well-flowered, and a blaze of colour. These were awarded a Gold Medal.

Heliotropes arranged as beds formed an attractive feature. The best were those of M. Rigouts, of Ghent; the best kinds were Heliotropium Syringa, a pale lilac, fine; Albert Delaux, a dark var.; and Mathide Cremieux, intermediate in colour. M. Rigouts also showed an Ivy Leaf Pelargonium called La France, of a heliotrope shade, quite attractive.

Nymphæas.—These consisted of the best-known kinds that have been in commerce for some few years; the best were Jas. Bryden Chrisantha, terra-cotta pink; delicata, rosy-white; candidissima rosea, a soft pink; La Vesuve, dark-red; Colossea, pale-pink; and fulgens, purplish-red. These came from M. Alphonse Brockman.

Some attractive groups of Zonal Pelargoniums and Salvias made a good display in beds. Of the latter, one called S. Jewel, a sturdy grower, was noted, coming from M. Rigouts.

Hydrangeas.—Of these, there were several groups, the best coming from M. Schatteman, who won two first prizes; one for a group of one variety, viz., of Mdlle. René Gallard, dwarf, well-flowered plants, with fine trusses, and of a bluish tint with white. The other was for a collection of varieties, consisting of the best of the newer forms in diverse colours.

Cut Flowers.

Of these the Gladioli stood out most conspicuously in variety and extent. Specially noteworthy was the large group staged on the ground of G. primulinus hybrids, a charming exhibit in lovely shades of colour, being both graceful and delicate. MM. Vilmorin of Paris were the exhibitors of these. The same firm also showed a few other distinct varieties as G. M. Vilmorin (new), pale blush-pink; G. Commandant Marchand, a rich crimson with large flowers, and of strong growth; G. Admiral Cervera, crushed strawberry, shading to a purple, very striking; and Comtesse de Leake, a rich cherry colour, very strong and free, flowering all up the spike at once.

Roses.—These were shown both as pot plants, none of which were very striking, save in the form of training, and as cut flowers. In this latter section a Gold Medal was awarded to M. Klettenberg for a very fresh, bright exhibit, the best varieties being Rayon d'Or, Lyon Rose, Pharisaer, Abel Chatenay, Laurent Carle, and Jonkheer J. L. Mock.

Mr. James McDonald, of Harpenden, sent some of his well-known examples of Lawn Grasses, shown in his familiar style.

NATIONAL GLADIOLUS.

August 12.—The competition for the "President's Cup," which was continued from the last meeting in the R.H.S. Hall, evoked splendid competition on Tuesday last. It will be remembered that on account of the lateness of the Gladiolus season the executive of the Society decided not to award the cup at the exhibition of late-flowering varieties on July 29 last, but to award "points" to the exhibits, and to continue the competition, awarding the cup to the exhibit which received the greatest number of points on either day. On each occasion the best exhibit was made by Messrs. G. Zeestraten and Son, Oegstgeest, Holland. At the show now under notice Messrs. Zeestraten set up 20 varieties, 3 spikes of each, in excellent condition. The large, clean blooms on the well-furnished spikes were so fresh that it was difficult to realise that they were grown in Holland. This exhibit included such sterling varieties as Glory of Noordwijk, Pink Perfection, Red Emperor, Princeps, Moonlight, Europa, and Liebesfeuer. Other competitors were Messrs. Kelway and Son, Langport, Somerset, whose best spikes were of Friendship (a hybrid of G. primulinus), Snowbird, and General Kuroki; Messrs. K. Velthuys, Hillegom, Holland; and Messrs. de Ruyter and Hogewoning, Noordwijk, Holland.

The class for 9 varieties of late-flowering Gladioli was not so well contested; the bronze medal was awarded to Mr. G. Churcher, Woodcote, Alverstoke, for a rather unequal collection, but the spikes of Sea Mouse, King of the Gladioli, and Nezin Scott were excellent.

THE WEATHER.

The Following Summary Record of the weather throughout the British Islands, for the week ending August 9, is furnished from the Meteorological Office :—

WEEKLY REMARKS.

August 12, 1913.

Weather.—Until the week drew towards its close the weather continued dry in almost all parts of the Kingdom, but showers were experienced in some localities early in the period, and on Friday or Saturday most parts of the country had a little rain, a few places a considerable fall. Thunderstorms occurred on the 7th in the Metropolitan area, on the 8th at Southampton, and on the 9th at several stations in the south and east of England.

Temperature was below the average in all districts; more than 4·5° in England E. and S.E. The highest of the maxima were registered, as a rule, on the 3rd, and ranged from 82° in England N.E. and the Midland Counties, 81° in England S.W., and 80° in Scotland W., to 70° in Ireland N., and to 69° in Scotland N. The lowest of the minima which were recorded on irregular dates, varied from 35° in Scotland W. and England S.W., to 43° in Ireland S. and to 46° in the English Channel. The lowest grass readings were 27° at Rauceby, 28° at Shrewsbury and Markree Castle, and 29° at Worksop and Birmingham. The temperature of the soil was below the normal, both at a depth of 1 foot and 4 feet, at nearly all stations except Newton Rigg.

Rainfall was less than the average in all districts. Over the United Kingdom, as a whole, the fall was very slight, and in some localities there was no rain. At Bath, however, 1.0in. accompanied a thunderstorm on the 9th, and more than 0.5in. fell at some extreme south-western, north-western, and eastern stations.

Bright sunshine was less than the normal in Scotland E., the Midland Counties, England S.E., and the English Channel, but equal to it in Scotland N., and above it in all other districts. In England N.W. the daily mean was 7.6 hours, and the percentage of the possible duration 50; in the Midland Counties and England S.E. the corresponding values were about 4.9 and 33, and in Scotland N. 3·7 and 23.

Barometer and Wind.—During the early part of the week a large anti-cyclonic system extended over these islands from the Atlantic, and the wind was light from between north-west and north-east. Later, however, the high pressure retreated westward, while shallow depressions, secondary to a large disturbance over Scandinavia, moved southward and south-eastward over the North Sea, and others developed over Great Britain. The wind remained mainly northerly in the west, but became very variable elsewhere.

THE WEATHER IN WEST HERTS.

Week ending August 13.

A welcome rain.—Throughout the past week the temperature has remained, as a rule, low for the time of year, both during the daytime and at night. On no day did the highest reading in the thermometer screen exceed 69°, and on two consecutive nights the exposed thermometer fell respectively to within 6° and 7° of the freezing-point. The ground is now 2° colder than is seasonable, both at 1 foot and 2 feet deep. Some rain fell on three days, and to the total depth of ½ inch. Nearly the whole of that amount was deposited during some heavy showers on the afternoon and evening of the 11th, or more than was recorded here throughout the whole of the previous 26 days. During the heaviest of those showers, which took place shortly before 6 p.m., the rain was falling for 10 minutes at the mean rate of nearly an inch an hour. This rain has not proved sufficient to re-start the percolation through even the bare soil gauge, through which no rainwater at all has now passed for more than a fortnight. The sun shone on an average for 5½ hours a day, which is half-an-hour a day short of the mean duration for this period in August. Light airs and calms again prevailed during the week, the direction of the light airs being principally some point between south and west. The average amount of moisture in the air at 3 p.m. exceeded a seasonable quantity for that hour by 3 per cent. *E. M., Berkhamsted, August 13, 1913.*

Answers to Correspondents.

Correction.—In respect to the Hayward's Heath show report (see p. 111), we are informed that Mr. Manton is gardener to Mr. W. A. Sturdy, who won the Silver Cup for a collection of fruit.

Diseased Culinary Peas: *P. B.* Of the six plants forwarded, one had gnawed roots, one had the chrysalis of a stem-boring fly in the collar, which was quite sufficient to account for the weakly condition of the plant; three plants showed symptoms of the new bacterial disease, for which, so far, no cure is known; and the sixth plant was unhealthy from some cause undiscovered. The plants arrived in rather a wilted condition, which made a thorough investigation difficult. —*Corres.* The variety Michaelmas shows bacterial disease in early stages; Buttercup has disease at the collar, due to eelworm and the fungus Thielavia; Harvestman—no bacterial disease is observed, and the cause of the unhealthy condition of the plants cannot be determined.—*W. B., Stone Hall.* Bacterial disease is present in the variety Prodigy, also Thielavia at the roots; Maincrop and Chelsonian are both affected with bacterial disease; the cause of the disease in Autocrat is doubtful. There is no known cure for the bacterial disease, which is a soil organism, and so far as is determined lives part of its life history in the soil. The distribution in the interior of the seed is a very serious factor. One very characteristic symptom is discoloration of the tissue at the nodes when cut across.

Grapes Diseased: *J. B.* The Grapes are injured by the Grape rot, caused by Gloeosporium ampelophagum. The only thing that can be done now is to remove the diseased berries. In the winter thoroughly drench every part of the vine with sulphate of iron at the strength of 1lb. to 25 gallons of water. Give two dressings at intervals of a month before the buds commence to swell.

Loganberries: *H. R.* The Loganberries are attacked by the Raspberry Beetle (Byturns tomentosus). There is no remedy, as the eggs are laid deep in the unopen and open blossoms, and the larvæ live in the fruit. All you can do is to jar or shake the beetles off early in the year. The pest is so destructive to Loganberries that many are ceasing to grow them, and probably cultivated Blackberries will take their place, as they flower later and so escape attack.

Names of Plants: *J. Blade.* Rhus Cotinus, Whig tree.—*Corn Cockle.* 1, Lychnis alba (perennial); 2, L. coronaria (biennial); 3, L. Githago (annual). — *A. E. Downe.* Calycanthus sp., probably C. lævigatus.—*W. and S.* 1, Phacelia campanularia; 2, Asperula azurea; 3, Lobelia Erinus.—*W. N. W.* Spergula arvensis.—*J. K. Birch.* 1, Epilobium nummularifolium; 2, Polygonum affine. — *J. T. B.* 1, Origanum vulgare; 2, Hyssopus officinalis; 3, Hyoscyamus niger.—*H. M. Butler.* 1, Clematis sp. (cannot identify without flowers); 2, Polygonum Baldschuanicum.— *X. Y. Z.* Why not number your specimens? The small shrub with yellow under-side to the leaves is Cassinia fulvida; the narrow leaf, Veronica salicifolia; the other, Olearia Haastii. —*H. G. C., Barnet.* Angræcum Ellisii.— *R. Y.* 1, Comparettia macroplectron; 2, Lælia monophylla; 3, Oncidium excavatum; 4, Odontoglossum pardinum.—*E. B., Dorset.* 1, Justicia carnea; 2, Lantana hybrida; 3, Abelia triflora; 4, Lithospermum prostratum. —*T. T.* 1, Pteris cretica; 2, Adiantum hispidulum; 3, Lastrea rigida.—*J. O.* Mimulus glutinosus.

Nymphæas Not Thriving: *Tynwald.* Provided the water basin is not in a cold, shady corner, but where the plants are exposed to the sun's rays, we can only attribute the failure of the Water-lilies to insufficient root-room, especially in view of your statement that they are growing in pots. If it is not possible to place a layer of soil about 7 or 8 inches deep all over the bottom of the basin, in which to insert the plants, build up receptacles with loose bricks, say about 2 feet across, and three bricks deep, laid on the flat. Do not fit the ends closely together, but leave a space of about ½ inch, so that roots may penetrate through the apertures. There is no necessity to raise any of the Water-lilies near to surface of the water, as all varieties will do admirably in the depth of water you mention, namely, 2 feet. We do not consider that there is an excess of lime in the water, although Water-lilies will not thrive in water that is strongly impregnated with this substance. Destroy all snails, as they are not beneficial in any way. Gold fish may be introduced. The water may be kept clear of Flannel Weed by applying the Bordeaux mixture in powder form, occasionally sprinkling three or four handfuls over the surface, say, about once in two months, or as occasion requires. This fungicide will not harm the Water-lilies or the fish. The constant flow of water and insufficient room are the causes of the Villarsia not flowering. In re-planting the Water-lilies, allow them plenty of space, and do not employ freshly cut loam. It is not advisable to use manures in any form.

Peach Leaves and Fruits Falling: *Journeyman.* We do not think the trouble is caused by fungus disease. As you state that the trees have been planted about sixteen years the borders are most probably thoroughly exhausted, with the result that the roots are in a very bad condition. Lift the trees in the autumn and re-make the borders.

Peach Stones Splitting: *G. Henley.* This defect may be attributed to imperfect fertilisation of the flowers, but is usually restricted to a few varieties only. An excessively rich soil, over-supplies of food, and a moist and close atmosphere during the last swelling of the fruit accelerates the malady. As you state that the soil is of a light nature you should lift the trees in the autumn and re-make the borders, employing good loam of a heavy nature and adding a quantity of old mortar rubble and wood ashes. See also replies to *J. H.*, Vol. LIII., p. 444, and to *F. G. W.*, Vol. LIV., p. 40.

Pears Splitting: *Broadwater.* The fruits are affected with the Pear scab (Venturia pirina). If possible, remove and burn during the winter all the diseased shoots, since it is on them and on the leaves that the fungus develops and produces spores which infect the fruit. In winter thoroughly syringe the trees with a solution of sulphate of iron, and in the spring spray them with the Bordeaux mixture at half strength when the buds are beginning to open, repeating the operation when the petals are falling from the flowers, and again when the fruits have attained to the size of Peas. If the trees are very old, it will be advisable to replace them with younger specimens.

Poplar Seeds: *J. H.* The cottony substance covering the seeds of the Poplar is of no commercial value. It has, unlike cotton, no staple —that is, length of individual fibres, which is a necessary quality for weaving purposes. By twisting or rolling a small portion of the material between the thumb and finger it will be found to break off quite short, whereas in cotton the single fibres can be drawn out, sometimes to a considerable length, and twisted into a strong thread. The substance from the Poplar more nearly approaches that known as Silk Cotton, which covers the seeds of species of Bombax, and particularly those of Eriodendron anfractuosum—a soft wooded tree belonging to the same natural order as the cotton, and widely distributed in India, Ceylon, South America, West Indies, and tropical Africa. It is from this tree that the Kapok fibre of commerce is obtained and imported into this country in large quantities at the present time for stuffing mattresses, cushions, etc., against which the Poplar could never compete, either in quality or quantity.

Water Rats or Voles Attacking Water-Lilies: *W. E.* We are well aware the great damage these pests will do, more especially when the Water-lilies are in a dormant condition. You can trap, shoot, or poison the pests. Set the traps about their runs and haunts, baiting them with a piece of fish, such as the head of a bloater. If you decide to shoot them we would advise you to place food in one or two suitable places around the margin of the pond for two or three days. After that period, by concealing yourself within shooting range many may be destroyed as they come out to feed. Sanford's rat poison will destroy the creatures, but it must be used with caution, and not placed where it is likely to fall into the hands of children or poison domestic animals.

Wistaria: *R. C.* From your description we suspect the trouble is at the roots. It is most probable that the soil is exhausted of nourishment. In the autumn remove a considerable quantity of the old soil and replace with fresh materials. In the meantime apply a mulch of stable or farmyard manure and afterwards give the roots a soaking with clear water. No pruning is necessary.

GOLD MEDAL ROSES.

THE subject of the National Rose Society's Gold Medal Awards to new Roses is perhaps somewhat controversial, and, like the Rose herself, is rather thorny and difficult to handle. I have no desire to plunge into any controversy or to tread on anybody's toes, even in metaphor, but my object is rather to endeavour to show that the dissatisfaction with the present system, which undoubtedly exists, is often not directed into the right channel, and that it should be directed rather against the system, if faulty, than against the men who may be doing their best to administer it.

The fact is that the Gold Medal Awards are merely a particular example of the difficulty, well known to men of science, of endeavouring to make a measurement which may be even approximately accurate where no standard of measurement capable of application is in existence.

In the ordinary classes at a Rose show the judges, in making their awards, compare one box with another, or one group with a similar group, and, testing them by fairly well-known methods, generally arrive at more or less satisfactory conclusions.

In judging new seedlings it is quite otherwise; instead of the usual number of three, there may be ten or twelve judges, each exhibit is considered by itself, and is weighed not in comparison with another similar exhibit, but with a standard existing only in the imagination of the judges. Their discretion is unlimited, and their awards may be few or many. The judges may be severe or they may be generous. There is no rule to guide them, save that no award can be given unless it is agreed to by two-thirds of the judges. The imaginary standard may be high on one occasion and low on the next, or the judges may be guided by entirely different views. The award to Colleen at Gloucester is an instance of this. It has been shown twice previously in London, and on one occasion certainly was shown in magnificent form, but the award was probably withheld because it was thought too like Killarney. At Gloucester, however, this view was not adhered to, or other considerations were thought to over-ride it. It is not wonderful that the result is to some extent unsatisfactory, rather is it matter for congratulation that the awards are so good as they are.

I am tempted to quote Miss Austen's account of the after-dinner conversation of Mrs. Dashwood and Lady Middleton:—"One subject only engaged the ladies till coffee came in, which was the comparative heights of Harry Dashwood and Lady Middleton's second son, William, who were nearly of the same age. Had both the children been there the affair might have been determined too easily by measuring them at once, but as Harry only was present, it was all conjectural assertion on both sides, and everybody had a right to be equally positive in their opinion, and to repeat it over and over again as often as they liked. The parties stood thus: The two mothers, though each really convinced that her son was the tallest, politely decided in favour of the other. The two grandmothers, with equal partiality, but more sincerity, were equally in earnest in support of their own descendant. Lucy, who was hardly less anxious to please one parent than the other, thought the boys were both remarkably tall for their age, and could not conceive there could be the smallest difference between them, and Miss Steel, with yet greater address, gave it as fast as she could in favour of each." I would not, of course, for a moment suggest that the methods of the Gold Medal judges are in any way comparable with those of the ladies I have quoted, but their task is one of similar difficulty. I suppose they are expected to test the Roses produced before them with their memory or with some mental picture of the best Roses already distributed, but not present for comparison.

It may be of interest to glance at the history of the Gold Medal Awards. The first recorded in the N.R.S. Year Book is that awarded in 1883 to Her Majesty, and for my present purposes I assume this to be the earliest award, though it is quite possible there may be others still earlier which are not known to me.

In the years 1883-1897 sixteen Gold Medals were awarded, or an average of about one a year, and the varieties thus distinguished included some of our best Roses of to-day; thus besides Her Majesty there was Mrs. John Laing (1885), Souvenir de S. A. Prince (1889), Margaret Dickson and Mrs. Paul (1890), and though the latter two are disappearing from our gardens, yet in the ten years which elapsed before the appearance of Frau Karl Druschki, Margaret Dickson was perhaps the best white H.P., while Mrs. Paul was thought at one time to be likely to lead to a revival of the Bourbons, a forecast which has so far proved to be mistaken. Then we have Mrs. R. G. Sharman-Crawford and Crimson Rambler (1893), Helen Keller (1895), a well-shaped flower of the Mrs. J. Laing type still often seen; Muriel Grahame (1896) and Ulster (1897). The remainder, Sir Rowland Hill, Salamander, and the three Marchionesses, viz., of Downshire, of Dufferin, and of Londonderry, are now but little grown.

During the next period, which is the ten years from 1898 to 1907, the number of awards was materially increased, 36 Gold Medals being awarded in the ten years, the usual yearly award being three or four. Of these 36 Roses, 19, or just over half, are still of value. These are Bessie Brown, Mildred Grant, and Mrs. Edward Mawley (1898), all Roses at the very head of the exhibition lists, Alice Lindsell (1900), Florence Pemberton, Lady Roberts and Souvenir de Pierre Notting (1902), Hugh Dickson, Mrs. David McKee, and Blush Rambler (1903), Dean Hole and J. B. Clark (1904), Betty, Mrs. Myles Kennedy, Irish Elegance (1905), Dorothy Page-Roberts and William Shean (1906), and Avoca and Harry Kirk (1907).

The year 1908 marked another change, again an increase in the number of yearly awards, for in the five years 1908-1912 we find no fewer than 43 Gold Medal awards, or nearly 9 to each year. It seems quite possible that 1913 may prove the beginning of a period in which even a greater generosity may prevail, for the awards of this year already number twelve, three at the London show and nine at Gloucester, and the autumn show is yet to come.

It is too early as yet to pronounce with any degree of certainty how many of the 55 Roses which have received awards in and since 1908 will be found in our gardens in ten years' time, interesting though the inquiry might be. We can only record the fact that the awards of these six years already exceed in number the awards of the previous 25 years.

The list is as follows:—

1908.—A. Hill Gray, Dr. O'Donel Browne, G. C. Waud, His Majesty, Lady Alice Stanley, Mrs. Campbell Hall, Nita Weldon, Simplicity, White Dorothy.

1909.—Claudius, Countess of Shaftesbury, Cynthia Forde, Ethel Malcolm, Lady

Pirrie, Leslie Holland, Mrs. E. J. Holland, Mrs. Hubert Taylor, Mrs. Maynard Sinton.

1910.—Edward Mawley, Lady Hillingdon, Mabel Drew, Mrs. Amy Hammond, Mrs. A. G. Coxhead, Mrs. Cornwallis-West, Mrs. Foley Hobbs, Mrs. Herbert Stevens, Mrs. Joseph Welch, Rayon d'Or.

1911.—George Dickson, Mrs. Richard Draper, Mrs. Sam Ross.

1912. — British Queen, Coronation (H.P.), H. Vessey Machin, Irish Fireflame, Lady Mary Ward, Mrs. Andrew Carnegie, Mrs. Charles E. Pearson, Mrs. R. D. McClure, Old Gold, St. Helena, Sunburst, H. E. Richardson.

1913. — Brilliant, Colleen, Countess Clanwilliam, Florence Forrester, G. Amedée Hammond, Gorgeous, Iona Herdman, Mrs. Archie Gray, Mrs. George Linas, Mrs. F. W. Vanderbilt, Queen Mary.

It is difficult to avoid feeling a doubt whether these awards have not become too numerous, and indeed it must of necessity be the case that when awards are made with such freedom the Gold Medal cannot be the distinction that it was in the years when only one was given as a general rule in each season.

It was probably some feeling of this kind that led the Society in 1894 to establish the Card of Commendation and, in 1910, the Silver-Gilt Medal also to be awarded to Roses not up to the Gold Medal standard. If, however, the object was to restrict the Gold Medal Awards it has been without result.

The dissatisfaction with regard to the Gold Medal Awards which, if I may judge from my own experience, is rather general, is easily accounted for. The public see that the awards are not made in competition, and therefore treat them as awards for general excellence, and they think awards of this character should only be granted to a Rose which they may purchase with some confidence that it will prove a good garden plant, or at least be reliable in the hands of amateurs for exhibition purposes. This is an ideal which, so long as the Awards are made at the Society's shows, can never be realised. Under this system the Gold Medal Roses cannot be taken as the best Roses in cultivation—Caroline Testout, Frau Karl Druschki, Comtesse du Cayla, Gruss an Teplitz, Joseph Hill, Mme. Abel Chatenay, Mme. Ravary, Pharisaër, and Prince de Bulgarie, to name only a few really first-class Roses, find no place in the Gold Medal Awards.

It is the system that is in fault; it attempts too much, and in a manner impossible of securing satisfactory results. Very much might be done, however, with a comparatively small improvement. Let the Gold Medals be awarded to the best exhibit in the class for new seedling Roses, the Silver-Gilt Medal to the second best, and the Card of Commendation to the third best. The judges would then have a task they would know how to accomplish, and would discharge with satisfaction. The award to the best new Rose exhibited at that show would be readily understood. The value of the Medal would be increased by curtailing the wholesale distribution obtaining at present. The Gold Medal Rose of such a year would become a real distinction. Perhaps at the Metropolitan show there might be two classes, one for decorative and the other for exhibition Roses, and no doubt ample power would be given to the judges to withhold the award in case the exhibits were not up to the usual standard, and to give an additional medal in case of two Roses of equal and exceptional merit. This would not only reduce the Gold Medals to a definite number each year, but since the exhibits would be compared one with another, the probability is strongly in favour of a sound decision, while the object and purpose of the award would become clear to the general public.

White Rose.

RODGERSIA.

WHEN *Genera Plantarum* was published about thirty years ago only one Rodgersia, R. podophylla, was known to science, and that had only just been introduced to cultivation. Since that time, however, several new species have been discovered in Central and Western China. The first newcomer was R. pinnata, which has large, pinnate leaves consisting of three pairs of leaflets and one terminal blade. A striking peculiarity is that the two lower pairs are set closely together, but distant from the others. R. pinnata produced its handsome panicles of rose-coloured flowers for the first time in July, 1902, and was figured in the *Gardeners' Chronicle* of that year, p. 131, fig. 44. Mr. A. Henry, who sent seeds of this species from Yunnan, at the same time gave an account of four Chinese species, three of which are now in cultivation. The fourth, R. Henrici, is only known from dried specimens, collected in the mountains between the Salwen and Mekong in Yunnan by Prince Henri d'Orléans.

Photograph by Reginald A. Malby.

FIG. 51.—RODGERSIA TABULARIS, SHOWING THE HANDSOME PELTATE FOLIAGE.

The next Rodgersia introduced to cultivation was R. pinnata var. alba, which was received in 1904. The plant was collected by Mr. E. H. Wilson in Western China, where, he states, it is very abundant. The variety differs from the type in having larger and broader panicles of white flowers, and less distinctly pinnate leaves.

R. æsculifolia was introduced from Central China in 1906. It has large, handsome foliage resembling that of the Horse Chestnut, whilst the flower stems vary in height from 2½ to 5 feet. The pure white flowers are borne in panicles nearly 2 feet long when the inflorescence is fully developed. This is the commonest Chinese species, its habitat extending from Hupeh in Central China to the Tibetan border.

One of the most distinct species is R. tabularis from Northern China and Corea (see fig. 51). This plant flowered in Great Britain for the first time in July, 1907, having been introduced from St. Petersburg.

Photograph by W. Irving.

Fig. 52.—Rodgersia sambucifolia : flowers white.

R. sambucifolia (see fig. 52) is the latest addition to the genus. It was collected by Mr. Wilson in the forests of the Yalung Valley, 100 miles west of Tatien-lu in June, 1904, growing at an elevation of some 10,000 feet. No seeds being obtainable, Mr. Wilson despatched roots to Messrs. James Veitch and Sons, and plants flowered in the Coombe Wood Nursery of that firm in 1911. The plant grows about 3 feet high, and has red stems and petioles resembling those of R. pinnata. The leaves consist of four pairs of leaflets and a single terminal one, much narrower than in R. pinnata, whilst the pairs of leaflets are all equi-distant from each other. The flowers are white, and borne early in June in panicles one foot or more in length.

All the members of this family are handsome foliage plants, especially R. pinnata, and are of considerable value for planting in the bog garden or shady corners. The Japanese species are the more liable to be injured by strong sunshine, even when supplied with plenty of moisture at the roots. All the Rodgersias form large clumps and are perfectly hardy; they grow best in rich, well-drained soils. *W. I.*

KEW NOTES.

SUMMER-BLOOMING SHRUBBY SPECIES.

The following hardy shrubs and climbers are in bloom in the Gardens :—

Hydrangea arborescens grandiflora.—This is an attractive sterile form of the Eastern United States Hydrangea arborescens. The plant is hardy in Great Britain, and produces towards the end of July and August large corymbs of creamy-white flowers. Cuttings of this variety root readily in a close propagating frame during August and September.

Eucryphia pinnatifolia.—This is a comparatively little-grown shrub from Chili belonging to the N.O. Rosaceæ. Under ordinary conditions it forms an evergreen bush, though sometimes alternate spells of frost and mild wet weather in winter cause many of the leaves to turn brown and fall. Several bushes in a bed associated with the Mediterranean Heath are flowering freely. The plant grows best in a mixture of sandy loam, peat and leaf-mould. The blossoms are pure white, resembling those of a large single Rose, and were illustrated in *Gard. Chron.*, May 16, 1891, fig. 121.

Tamarix pentandra.—The fern-like light-green foliage gives to this plant a distinct and attractive appearance, and sets off the pretty feathery pink spikes of flowers which appear at the end of July or early in August. Cuttings root readily in borders out-of-doors. They should be inserted during October or November, and treated like cuttings of hybrid-perpetual Roses. Larger spikes of flowers and stronger growths are obtained by shortening the shoots of the previous year in early spring. Unfortunately some confusion exists as to the correct name of this plant, which has received the R.H.S. Award of Merit as Tamarix hispida æstivalis, while it is also known as T. Pallasi rosea.

Hypericum patulum var. Henryi.—As a decorative subject for the pleasure grounds this is one of the most useful of the St. John's Worts. It is rather hardier and a better garden plant than either H. patulum or H. Hookerianum, which are its nearest allies. The plant grows 2, 3 or more feet in height and bears yellow flowers from July to September. The rich yellow blossoms are about 2½ inches in diameter. Propagation may be effected by seeds or cuttings, the latter inserted in a close frame during August or September.

Olearia Haastii.—This New Zealand shrub is one of the very few shrubby Composites which are hardy at Kew. Olearia Haastii is a good town shrub, and its evergreen character makes it additionally valuable. Cuttings made from half-ripened shoots root readily under a bell-glass.

Spartium junceum.—The value of the yellow Spanish Broom for planting in shrubbery borders and pleasure grounds can hardly be over-estimated. The plant is best suited for poor soils, as in rich ground it develops an abundance of gross shoots and comparatively few blossoms. Seeds are produced freely and offer a ready means of propagation. This Broom transplants badly and should be grown in pots until set out permanently. The young plants soon become straggly, therefore the points of the growing shoots should be removed several times during the season to promote a dwarf, bushy habit. An annual thinning of the growths in early spring is desirable. Spartium junceum is a good town shrub, and should be freely planted in municipal parks and gardens.

Rubus ulmifolius flore pleno.—This pretty double pink-flowered Bramble is also known as Rosa fruticosus flore-roseo-pleno, and is suitable for planting in woodlands, the more natural parts of the pleasure grounds and shrubbery borders. The readiest method of propagating is by layering the long, outer growths; cuttings inserted in the autumn will also form roots. R. thyrsoidens (fruticosus) flore-albo-pleno has double white flowers.

Ceanothus.—Of the autumn-flowering Ceanothus there are several varieties; the best of those in flower at Kew are Gloire de Versailles, pale blue; Ceres, rose, indigo and deep blue; Perle Rose; Gloire de Plantières, purplish mauve; Arnoldii, greyish mauve; and grandiflorus, light blue. These, being hybrids between C. americanus and C. azureus, are hardier than most of the spring-flowering species. To obtain freely-branched plants some 3 feet in height, similar to those flowering at Kew, the growths made the previous year should be cut back fairly hard in early spring. The plants grow best in light,

rich soils, and should be planted in warm, sunny situations. Cuttings inserted during August and September root readily in a close frame, preferably with a little bottom heat

Æsculus parviflora.—This shrubby Horse Chestnut is known in nurseries as Pavia macrostachya. A native of the South-eastern United States, it forms a spreading bush 8 feet or more in height, and with age becomes considerably more in diameter (see fig. 53). The bushes have the familiar digitate leaves of the Horse Chestnut. The long, cylindrical inflorescences are 1 foot or slightly more in length, with a diameter of not more than 4 inches their whole length. The flowers are white with long, protruding stamens tipped with red.

Clematis Viticella.—This European species is a good garden plant, and has given rise to numerous valuable garden varieties, including the ever-popular C. Jackmanii. It is one of the best of the Clematis family for draping arbours, porches, verandahs and fences, whilst in the shrubbery borders the growths may be supported with rustic poles, placed three or four together tripod fashion. The type has purple, alba white, rubra, red and flore-pleno double

Fig. 53.—Æsculus parviflora flowering in the Royal Gardens, Kew.

light-purple flowers. Durandii is a deep violet purple hybrid between this species and C. integrifolia, whilst pallida is a paler-coloured hybrid. Other hybrids are Hendersonii, a particularly floriferous plant some 6 feet in height, with graceful, drooping flowers, dark purple in colour and moderate in size; intermedia, intermedia rosea, intermedia alba, Clocheton and globosa.

Late-flowering Spiræas.—The three tall-growing species, S. Aitchisonii, S. arborea and S. Lindleyana, may be taken together, as they are similar in habit and average 10 feet in height. Distinct from these are the dwarf, shrubby species and varieties, the best-known of which is the beautiful red variety Anthony Waterer. Other distinct varieties are Bumalda, pink, and alba, white. S. pumila var. superjaponica is a vigorous, pale-pink form with large flat heads of flowers; S. concinna, white, tinted pink; and S. albiflora, white. All the foregoing have the flowers arranged in flat inflorescences. There are others with upright heads of flowers; the best of these for August flowering are S. salicifolia, white, tinted pink, and varieties; S. nobleana, rosy pink; S. microthyrsa, rosy red; S. Menziesii Billardii, pink; S. bethlehemensis rubra, rosy red; and S. Douglasii, rosy red. These dwarf species and varieties produce suckers freely, and spread rapidly over the ground. The clumps may be lifted and divided for purposes of propagation. *K.*

TREES AND SHRUBS.

ENKIANTHUS CAMPANULATUS.

This handsome Japanese plant is not grown so extensively as its merits deserve, for where it succeeds it forms one of the handsomest of the hardy Ericaceæ. In its native habitat it is said to form a small tree 30 feet or so in height, but in this country it is usually a comparatively low-growing shrub. The largest plant I have seen was about 6 feet high, but the wood did not appear to ripen thoroughly in the autumn, so that the growths the following season came from near the base of the preceding year's shoots, and consequently the plant did not increase much.

The deciduous leaves are about 2 inches long, elliptic-ovate in shape, and finely serrulate on the margins. They are arranged in clusters on the ends of the shoots, and change to a reddish tint in the autumn. The flowers are somewhat like those of an Andromeda in size and shape. They are dark-red in colour, and borne in short, pendant racemes in the axils of the leaves.

The plant thrives best in peaty soils such as Rhododendrons grow best in. It should be planted in a sunny situation sheltered from cold winds, so that the wood may have opportunity for becoming ripened thoroughly. Propagation may be effected by seeds, which are somewhat difficult to obtain, and by layering. *J. Clark, Bagshot, Surrey.*

TREES AND SHRUBS AT ALDENHAM.

In presenting a list of the dimensions of some of the more interesting trees and shrubs at Aldenham, it is not suggested that all these plants are the finest specimens to be found anywhere, as the size of some of them is only remarkable if their youth be taken into account. For instance, I know of a finer specimen of Prumnopitys than the one given below at Tortworth, belonging to Lord Ducie, and I imagine the ages of the two plants are much the same. On the other hand I doubt if larger specimens could be found anywhere of Cratægus punctata, Berberis stenophylla, and Cotoneaster Simonsii than are to be found growing here; at any rate, I have never seen or heard of any such.

The new Paulownia was only introduced into this country five years ago, when Professor Sargent most kindly sent me the seed from the Arnold Arboretum, so there can be no older plants than mine. It is possible, of course, that Kew or some private collector may have one slightly taller, as my plant has lost about a foot each year of unripened wood, through winter frost; but, even so, a height of over 20 feet and a girth of 9 inches must be regarded as an extraordinary growth, for five years, in England. The size of the Pittosporum below mentioned would be nothing out of the common if it were growing south of London in some sheltered spot such as Leonardslee, but on a cold, clay soil north of London the wonder is not only that it should be so large and well-grown, but that it should be alive at all.

If other collectors were to follow my example and give lists in the columns of the *Gardeners' Chronicle* of their more important plants, stating the approximate age, I think they would prove most valuable and interesting records. I may mention that I was led to do this by noticing that Sir Edmund Loder had adopted this course in the introduction to his admirable, privately-printed, catalogue of the plants at Leonardslee. It will be noticed that hardly any Conifers, and no peat-loving plants at all, appear in my list, as our heavy Hertfordshire clay is unsuited to their growth. *Vicary Gibbs, Aldenham House, near Elstree.*

HEIGHT, ETC., OF TREES AND SHRUBS AT ALDENHAM, 1913.

NOVEL DESIGNS IN SUMMER BEDDING.

WOOTTON HALL, ASHBOURNE.

Some extraordinary examples of carpet bedding are to be seen this season at Wootton Hall, Ashbourne, the seat of the Hon. Mrs. Harry Bourke. One of the most striking designs represents a partly unrolled length of carpet, placed on a portion of the terrace at the end of the house, the appearance being remarkably realistic. The rolled portion is about 3½ feet in height, with a width of 4 feet, and an outspread portion of about 42 feet in length; realism is enhanced by the ground rising at a point about half-way along the outspread portion, giving a very natural undulation to the carpet, whilst at one of the extreme points the ground has been so planted that the end of the strip appears to overhang. A few details as to how the scheme has been carried out may be of interest. The design itself is simple. The chief feature is a series of circles of fairly large diameter placed down the centre, connected with one another by elliptic panels placed diagonally, and the carpet is bordered in the well-known "key" pattern. In the centre of each circle is a plant of Echeveria metallica. From this there are four radiating arms or "spokes" of curved form, composed of Begonia semperflorens Zulu and Little Gem; these are connected with a ring of Alternanthera aurea nana forming the circumference of the circle. The intervening groundwork is composed of Spergula pilifera aurea. The elliptic panels have a centre line of Echeveria farinosa enclosed in lines of Alternanthera paronychioides and aurea nana, finished off with a border of Mesembryanthemum vulpinum. The panels are laid on a ground of Leucophyta Brownii.

The "key" border is carried out in Cerastium tomentosum, filled in with a dwarf green Sedum and finished off with a continuous edge of Echeveria secunda glauca. The edging of the rolled-up portion of the carpet is done in Echeveria secunda glauca, with intervening lines of Saxifraga umbrosa.

The framework or foundation of the roll consists of two circular iron hoops comprising the ends, connected by iron rods, the whole forming a hollow drum. This is filled with soil and bound round with wire netting, the plants being pricked in between the meshes. About 10,000 plants have been used to carry out this piece of work.

Another effective bed is in the form of an unfolded ribbon, prettily undulating on the grass, and carrying the Irish motto: "Cead Mile Failte" (a thousand welcomes). The letters of the first and third words are picked out in small plants of Echeveria secunda glauca, the centre word in Echeveria farinosa, filled in with Pyrethrum aureum and edged with lines of Begonia semperflorens Little Gem, Echeveria and Sedum glaucum. The back portion of the ribbon is higher than the front, so that the design is more easily seen than if it were carried out on the same level throughout.

Another novelty is the facsimile reproduction of the handwriting of Mrs. Bourke, picked out in Echeveria on a ground of Spergula pilifera aurea, edged with Cerastium and crimson and gold Alternanthera.

A striking feature at one end of the broad walk on the upper terrace is composed of two large beehive-shaped mounds of crimson Pelargoniums. These are formed of two heaps of soil 5 feet in height and the same in width, kept in shape by an iron cage, between the bars of which the Pelargoniums are planted.

Standing as they do, at the east end of the terrace against a background of dark foliaged trees, their brilliance is shown to the best advantage. When seen by the writer they were a blaze of colour from base to summit. For spring effect, Wallflowers are planted.

A good example of sub-tropical bedding is also seen on the same terrace. Height is attained by tall plants of Eucalyptus globulus, Prunus Pissardii, Acer californicum aureum, Humea elegans and Japanese Maples. Plants of lesser height are Leucophyta Brownii (trained as pyramids), Abutilon Thompsonii, A. Savitzii, Ricinus Gibsonii, and Iresine Herbstii. The groundwork is carried out in Cerastium, Pyrethrum aureum, Fuchsia argenteum and various kinds of Alternanthera; whilst for later effects bulbs of Liliums and Gladiolus have been planted. A selection such as this will provide colour in flower and foliage throughout the entire season.

Dorothy Perkins Rose trained on chains forming a canopy in the shape of a bell tent, and sufficiently spacious to accommodate a seat inside, is another charming feature in the gardens at Wootton. The house, situated on an eminence, commands a glorious view of hill and valley; the ground itself immediately in front of the house falls away in three spacious terraces. Below, is a semi-wild portion planted with choice Conifers and other trees, interspersed with clumps of Gorse and Rosa canina. Grass walks winding at an easy gradient render access easy. This portion merges quite naturally into the valley below, the whole being an excellent example of good landscape work in perfect taste.

It may be, probably it is the case, if there is any truth in the saying "There is nothing new under the sun," that the bedding designs I have described briefly have been carried out elsewhere previously, but beyond doubt, as seen at Wootton, the designs and the method of carrying them out are the product of Mr. Cook's own brain. Many improvements have been effected since he has been in charge, and the condition of the gardens is an eloquent tribute to his zeal and ability. *C. G.*

NOTICES OF BOOKS.

Twentieth-Century Gardening.*

This is perhaps the cheapest book on gardening ever published; that is, comparatively. It runs to 311 pages in eights, is well bound in cloth, illustrated with pen-and-ink sketches throughout, and well printed on good paper. Mr. Weathers always writes well in the sense that he goes to the point, and, I had almost said "always" but "generally" will be a safer word to use, generally gives the right treatment and correct methods of growing plants. He does not fail in this book, though it is obvious that in one volume much of the material must be brief if all sections of horticulture have to be touched on. Brevity is no evil, if, as here, no superfluity of verbiage is indulged in, and so we get in each page the maximum of educative material, with the minimum of waste. Sometimes, however, one feels as if brevity were carried too far, this especially in the selections of plants which, in some instances, are too meagre to be helpful. It benefits nothing to be told that Anemone japonica is "white, purple" if we do not know which sorts to secure, and which to reject. That is one of the few faults that strikes one in its perusal. But on the whole the contents will meet the wants of the beginner in the happy art of gardening, for whom the book is primarily written. It tells him about soils and manures and how to use them, the proper methods of cultivation, the author being a believer in the old-fashioned method of superimposing the lower layer of soil in trenching on the upper; how to make walks and lawns and preserve them in fit condition; how to furnish a garden with hardy perennials, annuals hardy and little hardy, for rockery, wall garden and water garden; the Rose; trees; how to manage greenhouse plants and which to grow. The hardy and tender vegetables, herbs and fruits of the garden are duly treated, and the insect and vegetable scourges, which are one of the chief sources of harassment to gardenfolks, are named and means for their destruction recommended. The pages are illustrated with cuts elucidatory of the letterpress, and a good index furnishes a ready means of finding any subject at a glance

* *Twentieth Century Gardening.* By John Weathers. (London: Simpkin, Marshall, Hamilton, Kent and Co., Ltd., 1913.) Price 1s.

REMARKS ON CONDITION OF THE FRUIT CROPS.

(*Continued from page* 123.)

(*See Tables and Summaries, ante, pp.* 80-85.)

3, ENGLAND, E.

Suffolk.—The early expectations of a good fruit year have not been realised. The trees blossomed earlier than usual, but a heavy fall of snow followed by frosts on April 11 damaged the Pear and Plum blossom considerably. Attacks of aphis have been general and severe. Apples are generally well cropped, but Pears are very scarce. Victoria Plum trees are bearing well in some places, but other varieties of Plums are scarce. Bush fruits and Raspberries were abundant crops. Strawberries have been good, and their prices were well maintained. *E. G. Creek* (*Hort. Inst.*), *Shire Hall, Bury St. Edmunds.*

—— With the exception of Apples, all kinds of fruit trees gave splendid promise during the flowering period, and most kinds set fruit freely; but, owing to long-continued easterly and north-easterly winds, the young fruits turned yellow and dropped freely. Stone fruits, with the exception of Cherries, were almost a complete failure. Insect pests have been more numerous than usual, and spraying has been practised almost continuously. *W. Messenger, Woolverstone Park Gardens, Ipswich.*

—— The Apple crop is, on the whole, a good one. Pears and Plums on walls are good crops, but there are few fruits on standard trees of these. Cherries and Apricots are average crops. Small fruits were exceptionally abundant. Strawberries also were good, but, owing to continued drought, the berries of late varieties were of small size. Nuts are a complete failure. The soil is a light, calcareous loam, resting on gravel. *Thomas Stiling, Livermere Park Gardens, Bury St. Edmunds.*

—— The fruit crops, with the exception of bush fruits and Strawberries, are very light, owing to unripened wood. Apple, Plum, and Cherry trees flowered abundantly, but the fruits failed to set. Our soil is of a very light nature, with a shallow subsoil of chalk. *B. Goodacre, Moulton Paddocks Gardens, Newmarket.*

—— The fruit trees in this district showed great promise for good crops in the spring; but, owing to the cold weather experienced when they were in bloom, Pears did not set well. Plums and other stone fruits, with the exception of a few trees, are very poor crops. Apples are abundant on most trees. Raspberries and bush fruits generally were very satisfactory; whilst Strawberries also were plentiful and good. The crops are suffering from drought, and the trees are badly infested with aphis. Our soil is of a heavy nature, with a clay subsoil. *James Hilson, Flixton Hall Gardens, Bungay.*

—— The crops of stone fruits were destroyed on April 11 and 12 by snow, hail, and ice storms. All kinds of blight have been prevalent this season. The Pear crop suffered from the same causes, and these fruits are very scarce. The show of Apple blossom in this neighbourhood was a beautiful sight, the trees being hidden in magnificent bloom, which set well. Gooseberries were rather scarce, but Raspberries and Black Currants were satisfactory. The "mite" is still troublesome on Black Currant bushes. The Strawberry crop was a good one, both quantity and quality being excellent. *R. Evans, Gt. Barton, Bury St. Edmunds.*

—— The failure of the fruit crops is due to frequent frosts and north-east winds which prevailed in April. Apples are good, both in

quality and quantity. Pears are scarce but of good quality. Stone fruits also are scarce, Peaches and Nectarines being the best of these crops, owing possibly to the trees being protected whilst in bloom. Small fruits were exceptionally good, especially Strawberries. The first 14 days of April were very unfavourable to the crops: frost was recorded on 8 nights during this period, including 9° and 10° on the 12th and 13th respectively, with intermittent storms of hail, rain, and snow from the 3rd to the 14th. *A. K. Turner, Orwell Park Gardens, Ipswich.*

—— Owing to the mild winter Pears, Currants, and Gooseberries blossomed early, but a period of cold weather about the 11th of April caused the flowers to drop. *James A. Best, Easton Park, Wickham Market.*

4. MIDLAND COUNTIES.

Bedfordshire.—In many orchards Apple trees are bearing a record crop, whilst in others the yield is a very poor one. Apples are of exceptionally good quality. Victoria Plums have, on the whole, set well, but many of the fruits dropped, owing to a bad infestation of aphis. Other varieties of Plums are practically barren. Early varieties of Strawberries were a very light crop, owing to dry weather, but late varieties, and especially Givon's Late Prolific, produced an exceptionally heavy crop on heavy soils, although those growing in light greensand were not so good. *W. H. Neild, Woburn Experimental Fruit Farm, Ridgmont, Aspley Guise.*

—— Apples and Pears are both good crops, but Apricots and Peaches were much harmed by cold weather in the spring. We had an exceptionally fine crop of Strawberries. Most of the fruit trees that have not been sprayed with an insecticide are infested with aphis. The soil is very sandy, and the subsoil also is sand. *C. J. Ellett, Chicksands Priory Gardens, Shefford.*

Buckinghamshire.—The fruit crops generally were damaged by late spring frosts and continued hot, dry weather in June, and are, on the whole, much below the average. Both Pears and Plums are scarce, and Apples are much fewer than usual. Strawberries were of good quality and above the average in quantity. Small fruits were about average crops. Our soil is a heavy loam, resting on a cold clay, and the natural drainage is bad. During times of drought the ground cracks, so that moisture evaporates freely from the soil. *W. Hedley Warren, Aston Clinton Gardens, Tring.*

Cheshire.—The fruit crops are much under the average, both in quality and quantity, which is probably due to the abundant crops of last season. Apples and Pears are the least satisfactory crops. Small fruits were good crops of excellent quality. *Alfred N. Jones, Marbury Hall, Northwich.*

Derbyshire.—There was a fine show of blossom on Apple, Pear, Plum, and Cherry trees, but with the exception of Apples the fruit crops are disappointing. The season has been a remarkable one. March and April were very wet months. The rainfall for March was 3.62 inches, and for April 4.04 inches, and our heavy clay land could not be prepared for seed sowing. Strawberries were plentiful and of good quality. Gooseberries and Currants also have been very good, and Black Currants a much better crop than usual. Raspberries are not so extensively grown here as formerly, the Loganberry being planted instead, especially in cottage gardens. Peas, Beans, Potatos, and other vegetables are looking well. *Bailey Wadds, 181, Uttoxeter New Road, Derby.*

—— Apples are above the average and promise well, but Pears are very thin and of poor quality. Plums are scarce, whilst Cherries were a light crop, but the fruits were of good quality. Strawberries and Gooseberries were plentiful and good, and Raspberries, Red and White Currants above the average. The soil is of a heavy, clayey nature, on a gravelly subsoil. *James Tully, Osmaston Manor Gardens.*

Hertfordshire.—Plums and other stone fruits promised well early in the season, but the trees were damaged by aphides. Some Pear trees (varieties not known) are carrying fair crops, but this is exceptional rather than the rule. Apple trees promised a heavy crop, but many of the fruits dropped prematurely, which I attribute to drought. A few Gooseberry bushes were well cropped, but the others were a failure. Black Currants were above the average. *J. W. Bamber, 16, Briscoe Road, Hoddesdon.*

—— With the exception of Apples, Strawberries and small fruits, the fruit crops are much under the average. Peaches and Apricots are a failure; Plums, except in a few cases, chiefly Victorias, are very thin, whilst Cherries also were bad. Apple trees are carrying heavy crops, and although many of the fruits dropped, considerable thinning has been practised. The soil is a heavy, loamy clay. Strawberries withstood the drought well, and late varieties were very satisfactory. *Thomas Nutting, Childwickbury Gardens, St. Albans.*

—— The fruit crops are the worst I have known. The exceptional quantity of blossom gave promise of a particularly good fruit year, but the flowers set badly, and many of the fruits dropped, which suggests that the flowers were weak owing to immature wood, due to the unfavourable autumn of 1912. Last spring the weather was damp and sunless, and these unfavourable conditions were followed by a bad infestation of aphides on nearly all kinds of fruit trees. Apples are an average crop, but Pears are very scarce. There are but few Peaches, whilst Plums are a failure, except on young trees. Strawberries have never been finer nor the Strawberry season longer. Black Currants were exceptionally good, but other small fruits are only average. *H. Prime, Hatfield House Gardens.*

—— The fruit crops in this district are variable and generally disappointing. During the flowering period there was a good prospect for a bountiful fruit year; though we had but few late frosts and a fine set was assured, for some reason that I am unable to explain the fruits, particularly Pears, Plums, Apricots and Peaches, failed to swell, and in the majority of cases the crops are practically a failure. Victoria Plum trees are laden with fruit, and we have a fair crop of the Czar, Early Rivers, and Pond's Seedling Plums. Apples are excellent, with the exception of a few trees which carried very heavy crops last year, the majority of the trees being clean and healthy. Tower of Glamis, Small's Admirable, Cox's Orange Pippin, Dumelow's Seedling (Wellington), Lord Derby, Bramley's Seedling, King of Tomkins' County, and Annie Elizabeth are among the best varieties. Cherries, both sweet and Morello, were very good. Small fruits, with the exception of Raspberries, which suffered much from the effect of drought, were plentiful. The Black Currant crop was the best for years, and Strawberries were quite the best since I have been at Aldenham. Royal Sovereign, Givon's Late Prolific, Waterloo, and British Queen were the best varieties. The soil is a stiff clay. *Edwin Beckett, Aldenham House Gardens, Elstree.*

—— Stone fruits are much under the average. Peaches are patchy; some trees are carrying good crops, whilst others are fruitless. Apricots on south and east walls are a total failure, and Plums are not much better. Strawberries were a magnificent crop. Nuts are a failure. The soil is a good loam on a gravel subsoil. *J. G. Walker, Oak Hill Park Gardens, East Barnet.*

(To be continued.)

FOREIGN CORRESPONDENCE.

JAVA.

Several Acacia species will flower and fruit here, but Acacia Baileyana and A. melanoxylon only make flower buds which do not open.

I should like to know from any reader cultivating these plants in the open how they behave; perhaps they are grown by someone in the Scilly Islands or in the south-western counties. *M. Buysman, Jardin Botanique Lawang, Java.*

SAXIFRAGA LINGULATA AND S. COCHLEARIS.

I have already given (*Gard. Chron.*, March 16, 1912, p. 174) a few short notes on a subject similar to my present one, with reference to the articles by Mr. Reginald Farrer and Mr. H. Correvon. Mr. Farrer's interesting notes have also met with some criticism in an elaborate paper by Mr. T. A. Sprague (*Kew Bulletin*, No. 3, 1911, XII., with a plate showing leaves of several forms of Saxifraga lingulata from the Kew Herbarium).

In my opinion a really satisfactory account of the nomenclature, variability, affinities, and geographical area of the species included in the section Euaizoonia can only be given after a thorough examination of a number of well-flowered plants growing in their natural habitat. It will probably be found that under natural conditions specific names will be neither excessively multiplied nor unusually restricted. It should be remembered that a specific name does not verify any hypothesis, however probable. Certainly, all the Saxifragas of the group seem to be nearly allied, and had most likely a common ancestor; but it is not a demonstrable fact. Moreover, as S. Aizoon is found almost throughout the whole area of the section, one would be inclined to consider it the parent type; and the same would apply to S. cochlearis, a younger form developed from S. lingulata, whose area includes that of S. cochlearis. These hypotheses, however, although they may appear logical to the monographer working with herbarium material, do not agree with the actual distribution of the plants in this country. Fiori and Paoletti, in *Flora d'Italia*, have coupled S. cochlearis as a variety with S. crustata, a native of the Oriental Alps. Undoubtedly these two types are nearer one to the other than to S. lingulata; but S. cochlearis is very variable, and its direct descent from S. crustata is more improbable than from S. lingulata. I think it is the safest plan only to give specific names to plants which are actually and constantly different from each other, without dubious intermediate forms (except of hybrid origin) and without any indications of a common origin. For the present, at any rate, we may pass on to the subject of Euaizoonias in Provence and Ligury.

Saxifraga Aizoon, Facq.—This well-known and widely distributed polymorphous species, easily recognised by its dentate leaves and rather poor panicles of small, yellowish flowers, is common in the Maritime Alps. It shows great variability, from dwarf plants with nearly orbicular leaves (f. brevifolia, Engler) to large specimens of luxuriant growth (f. robusta, Engler). It is found on all soils, to a height of at least 2,700 metres, but is especially common on limestone. On this latter ground, however, it becomes rare or non-existent in the presence of S. lingulata, probably owing to the *primus occupans* of the latter plant, since the Aizoon, by its free habit of adaptation and propagation, should naturally predominate. Near the town of Tenda a few isolated plants are found, but west of the valley it grows only on rocks of quartzite and similar material, which is unsuitable for S. cochlearis and S. lingulata. Here it descends as low as 750 metres; I have even found it in the Verdon Valley at 700 metres, but this was quite an exception. Hybrids between this species and S. lingulata, as mentioned by Mr. Farrer, must be very rare. The two species are sometimes found at a short distance apart, but very seldom together, as the soil and conditions in which they grow are quite different. I know of only one instance—a rock west of Breil—where S. Aizoon, S. lingulata, and S. cochlearis are to be found all together; and their times of flowering are not the same. Indeed, near Tenda several weeks elapse between the flowering period of S. Aizoon and of S. cochlearis (type); and also between that of the latter and of S. lingulata. I once found a plant near Castellane, as mentioned in my first notes on this subject (see reference above), which was intermediate between S. Aizoon and S. lingulata, but quite distinct from either; it might be compared with

S. catalaunica (Boiss. and Reut.) from the Montserrat.

Saxifraga cochlearis, Reichenbach.—This is distinguished by its leaves, which are wide and rounded, and often indented at the top. The type, which is erroneously considered by Reichenbach to be a hybrid between S. lingulata and S. cuneifolia, has branching, ligneous root-stocks (at least, in older plants), very dense rosettes, thin, rigid, erect stems 15 to 25 centimetres high, covered, as are also the calyces, with brownish, viscous, glandular hairs. The flowers form a dense paniele, with large, white, obovate petals; the general effect is different from, and not inferior to, that of S. lingulata. The variety minor (or S. Probynii of M. Correvon), by some botanists confounded with S. valdensis, differs chiefly in being a small, thin plant (not exceeding 10 cm. in height) with few flowers. It grows abundantly with the type near Tenda; its flowering period is usually about a month later, so that they seldom bloom together. I think it probable that the same roots (which evidently live for many years) could produce successively the smaller and the larger plant; but the former must be considered in the light of a good variety, as in unfavourable regions it is the only one to be found. The variety major is a luxuriant, slender plant which grows in warm, damp ground, such as the gorge of Saorge and the Cairos Valley. It nearly resembles S. lantoscana, with its lax, shapeless rosettes and thick, pendulous stems. The branching of the panicles is unilateral, and the petals are elliptical, not contiguous; in one instance the petals were found to be linear, and entirely white. One plant which I measured was 47 cm. long. The natural habitat of the species (with almost the whole of which I am familiar) chiefly consists of limestone rocks, though it is found also near Briga on tertiary sandstone. The altitude varies considerably, ranging from 170 metres on the Italian boundary, near Breil, and at least 1,950 metres on the southern rocks of Monte Toraggio. It is limited to the valleys of the Roya from the Tenda basin downwards, the Nervia, and the Argentina. The distant region on the Monte di Portofino, near Genoa—an isolated mass of siliceous conglomerate 610 metres high—would repay examination. I have never yet been able to obtain any specimens from it, though I visited it once in June. In the Roya Valley the species abounds, and is only supplanted by S. lingulata (the type, or S. lantoscana) where the climate is cooler or damper. Where the two species grow together, S. cochlearis usually occupies the sunny slopes, the shady spots being preferred by S. lingulata. As this latter species grows in low, warm places outside the area of S. cochlearis, it must be assumed that this latter is the older inhabitant of the two. In fact, the flora of the Roya Valley is in general more ancient than that of the Vésubie and other Western Valleys (with the exception of the Alpine tract outside the limestone districts), which are deficient in remarkable limestone species such as Moehringia papulosa, Primula Allionii, Micromeria Piperella, etc.

(*Photo by F. Mader.*

Fig. 54.—Saxifraga lingulata var. bellardii on rocks behind Tenda.

Saxifraga lingulata, Bellardi.—I have not seen a plant of this species from the Northern Apennines, and am therefore unable to compare the different forms. Mr. T. A. Sprague, whom I have before quoted, admits the identity of the plant growing on the Apuane Alps, in Tuscany, with S. australis Moricand found in Southern Italy, Sicily and Sardinia. The figure he gives shows a plant with leaves somewhat similar to those of S. lantoscana, but wider towards the top. In our mountains the species is exceedingly variable; the extremes show wide differences, but it seems impossible to draw the line between them. Some characters they all have in common—thick, arched, horizontal or pendulous stems, branched only on the upper face. The variety Bellardii, Sternb. (or the type of Bellardi, not to be confounded with S. Bellardii Allionii, an Alpine form of S. adscendens Linné, near to S. tridactylites) bears long, linear canaliculate leaves, neither widened nor restricted at the top, the crustaceous margin (often very frail) figuring a dentation; even when not flowering it does not bear true rosettes, the basal leaves being crowded together in more or less pyramidal clusters. The colour of the stem is not characteristic, depending on age, damp or dry exposure. The narrow, linear or "lingulate" white petals, as described for the type, are very exceptional, being found only on slender plants in very damp, shady places; the petals are usually elliptical, with red spots. The only good differential characteristic of the variety S. lantoscana is in the arrangement and shape of the basal leaves, which form rosettes; the leaves are much shorter, widened near the top, with an obtuse conical tip; very little, if at all, sulcate, plane or convex in the upper half; the crustaceous margin is smaller, but more continuous and stronger. S. lantoscana grows chiefly in dry places; it is not absent from the Roya and Nervia Valleys, but becomes more common towards the west, as the lower regions there are not occupied by S. cochlearis, and the climate is on the whole drier. As I stated in my last article, all the plants I examined near Castellane in the Verdon Valley, near the western limit of the species, had the stalks and calyces covered with short, dense hairs, while in the east and in the Var Valley the species is generally glabrous. A similar plant, also hairy, but smaller and thinner, from the isolated chain of Sainte-Baume, near Marseilles, is described in a posthumous Latin monograph as Saxifraga Sanctæ-Balmæ by Mr. Shuttleworth, an English botanist living at Hyères. The range of the species is very wide—from 150 metres high, near the confluence of the Vésubie and the Var, up to 2,400 metres (the mountains west of Limone, etc.). The flowering period varies, in consequence, from April to September. Though properly speaking a limestone plant, and not found in the great central mass of crystalline rocks, S. lingulata is common on the red slates of the gorges near Daluis and Beuil, and even on the gneiss-like rocks, of unknown antiquity, between Tenda and Vievola. On the hot, sunny southern slopes of Mont Baudon or Aiguille, near Mentone, the plants are somewhat smaller, but not otherwise differing from S. lantoscana; while a form found on the northern side of the same mountain, and illustrated by Mr. Sprague in his Fig. 3, is hardly entitled to represent a variety, the irregularity of its leaves being obviously due to some damage—a frequent occurrence. A much more remarkable plant is that found near the summit of Cima Ciavraireo, between the Miniera and Fontanalba valleys, at about 2,350 metres above sea-level. This is perhaps the coldest situation in which the species is found, as the exposure is directly north; I found here in September flowering and fruiting plants only 5 to 10 cm. long. The leaves were similar to those of S. lantoscana, but measured only 1 to 2½ cm., while the stem bore only 10 to 20 flowers.

The variety Bellardii is a splendid plant (see fig. 54, representing a group of panicles 40 cm. long). In fact, I found a plant with two panicles, the total length being 64 cm., and the basal leaves measuring 23 cm.; and I saw others which were even longer. In general effect S. lantoscana is hardly inferior, but it is less luxuriant, and seldom exceeds 50 cm., even in its giant specimens. The panicles are, however, often more numerous in the same place, and the flowers comparatively larger. In the month of June the numerous feathery hanging tufts of this plant cover the walls of the western gorges, and fringe the cliffs around the characteristic rock-villages of this region, considerably enhancing the interest and heightening the beauty of a country already rich in all that appeals to the artist or the naturalist. *Dr. F. Mader, Nice.*

The Week's Work.

PLANTS UNDER GLASS.

By F. Jennings, Gardener to the Duke of Devonshire, Chatsworth, Derbyshire.

Begonia socotrana.—The main batch of these plants should be potted. Shake the old soil from the roots and re-pot them in a mixture of rich fibrous loam (if the loam is heavy in texture add a little peat) and leaf-mould in equal parts, with coarse sand, wood ashes and decayed cow manure added. The larger plants may be grown in 4-inch or 4½-inch pots, placing the tubers on a layer of sand and covering them lightly with soil. They may be stood on a shelf or in a frame in the stove or other warm house until they commence to grow, when the soil should be watered thoroughly. After they are established continue to grow the plants in a stove temperature. Care must be taken to support the flower-spikes, which are very effective and useful for decorative purposes, lasting for several days as cut blooms in water.

Schizanthus.—Sow seeds of Schizanthus in pots or pans filled with a compost of finely sifted loam, leaf-mould and coarse sand. Cover the seeds lightly with fine soil, afford a thorough soaking with water, and stand the seed-pans in a cold frame placed under a north wall for preference. As soon as the seedlings are large enough to handle prick them off singly into thumb pots and grow them in a cold frame or on a greenhouse shelf. When they are well rooted shift them into 4½ or 5 inch pots, and finally into 6 or 7 inch pots, whichever size is considered the more useful. The soil may consist of good loam and leaf-mould in equal parts, with coarse sand, wood ashes, dried cow manure and soot added. Grow the plants in a cold frame until there is a danger from frost, when they should be transferred to a cold house, such as a vinery or a Peach house. Keep the foliage free from moisture, and do not syringe, for one or two degrees of frost will not harm the plants, provided the foliage is dry. As the plants arrive at the flowering stage they should be staked and fed with weak manure water. At that stage they should be grown in a temperature of 50° to 55° until placed in the conservatory.

THE FLOWER GARDEN

By Edward Harriss, Gardener to Lady Wantage, Lockinge, Berkshire.

Lilium candidum.—The Madonna Lily will grow and flower well if left undisturbed for a number of years, but the bulbs should be dug up and replanted as soon as they show signs of deteriorating. So long as the plants continue to thrive it is not advisable to disturb them, for I have known cases where they have failed entirely after being transplanted, although they were in a perfect condition previous to shifting them. Where circumstances make it necessary to disturb the bulbs the present is a suitable time to carry out the work, provided the old flower stems have died down. If the bulbs are to be replanted in the same positions the work should be carried out as expeditiously as possible. Grade the bulbs, planting the larger ones in clumps by themselves at a distance of about 6 inches apart. There seems to be a difference of opinion in regard to the depth the bulbs should be planted, but I have known this Lily to thrive admirably when planted about 4 inches below the surface. If the soil is of a stiff, retentive nature add a small quantity of old mortar rubble. Plant the bulbs where they may remain undisturbed for a number of years.

Early-flowering Chrysanthemums.—The flower buds of early, outdoor Chrysanthemums are expanding, and the plants should be assisted by stimulants. Light dustings of artificial manure or well-seasoned soot, followed by a thorough soaking with clear water, will add considerably to the substance and colour of the flowers. Certain varieties need disbudding, but this is not necessary in all cases.

Plants in Tubs.—During hot, dry weather the watering of plants in tubs must be regularly attended to. The receptacles are filled with roots which have appropriated most of the nourishment in the soil, and therefore stimulants should be afforded at frequent intervals. Ivy-leaved Pelargonium Madame Crousse is a splendid subject for growing as a specimen in a tub. Sweet Peas in tubs are flowering freely from the base of the plants. If afforded plenty of water and food the plants will continue in flower all through the season, but they must not be allowed to develop seed pods. Keep the growth tied neatly to the stakes and turn the tubs occasionally to show the best side of the plants.

PUBLIC PARKS AND GARDENS.

By Superintendent.

Roads and Paths.—In our public and private parks and gardens few things add more to the comfort and convenience of visitors than well-arranged and well-kept roads and paths. For such situations no road, in my opinion, equals that made of granite, tarred roads and paths being not only unnatural and quite out of place in our parks and gardens, but in many instances they have been found detrimental to plant life in their vicinity. No doubt the initial cost of a road made entirely of granite is comparatively great, but if well formed at the first, the after-expense in the way of upkeep is by no means in proportion: while the cost of scavenging is reduced to a minimum. Then, as before said, the metalled road is not only of a more or less permanent character, but more in keeping with the surroundings of a park or garden, while that made of any of the tar compositions is usually disagreeable in hot weather and often highly injurious to plant life—the latter a most important point in connection with the vegetation of our open spaces. In the formation of new roads, after drainage has been attended to, the lower stratum of from 6 to 8 inches in depth of 2-inch granite should be thoroughly and evenly consolidated by a 10-ton roller, and as the work proceeds all faults should be made good by repeated feedings until the whole surface is uniformly hard and level. When quite level and to the proper camber ¾-inch granite siftings should be added to the depth of from ¼ to ½ inch, and the surface, after being well watered, thoroughly consolidated by repeated rollings. The roadway may then be finished off by the addition of a slight coating of fine granite siftings, say ¼ inch, and again rolled over. In carrying out the formation of new roads the depth of material must be proportioned to the traffic, whether light or heavy, while the camber of the road, that is the fall from centre to side, will require careful consideration. Where a quantity of stones or old building materials is at hand, or come across in the course of digging out the roadway, such may be economically utilised in its formation by placing them beneath (never above) the granite. Large rolling stones should be broken before they are used. Guernsey or Alderney granite is delivered by barge in London at from 8s. to 9s. per cubic yard, broken to the size of 2 inches, while siftings may be had at a smaller cost. No doubt these prices are comparatively high, but roads made entirely of granite are not only more lasting but require much less cleaning in the matter of mud and dust than those formed of perhaps any other material, points which should weigh heavily in deciding which class of road is to be adopted in our parks.

Making Footpaths.—In the formation of paths for pedestrian traffic granite foundations are by no means necessary. Brick rubbish from buildings that are being pulled down can generally be had in towns for nothing, or at a cheap rate, and this makes an excellent dry bottoming for paths and by-ways. Six inches in depth of broken bricks placed as a foundation, and, say, 3 inches of binding gravel atop and finished off with broken shells, will make a thoroughly efficient and dry pathway. The bricks at the bottom should be broken small and well solidified by means of a punnet. The gravel is then added and rolled when wet, and finished off with a coating of sand or powdered cockle-shells. Attention must be paid to the camber or fall of the path from crown to sides

Drainage of Roads and Paths.—Surface drainage, both in connection with roads and paths, should receive careful attention. In either case, built gulleys should be provided at certain distances apart along the sides, and these connected by socket pipes, the overflow being conducted to a sewer, main drain, or other source of outlet. The quantity of water to be dealt with will form the best criterion as to the sizes of gulleys and pipes to be used.

THE HARDY FRUIT GARDEN.

By B. Goodacre, Gardener to Sir Ernest Cassel, Moulton Paddocks, Newmarket.

Early Pears.—The varieties Citron des Carmes, Clapps' Favourite, and Jargonelle are on the point of ripening, and the fruits should be gathered and sent direct to the table, for they deteriorate if stored. Certain other early varieties, including Williams' Bon Chrêtien Jargonelle, Doyenné d'Eté, Beurré d'Amanlis, and Dr. Jules Guyot, may be stored on shelves in a cool place. By planting trees of these sorts in different aspects a succession of ripe fruits may be had over a long period. Pears should never be gathered before they are ready, and this may be ascertained by lifting the fruit in a horizontal position, when, if ripe, it becomes detached from the tree.

Early Apples.—Certain varieties of early Apples, including Irish Peach, Margaret, Mr. Gladstone, and White Joaneting, also should be eaten as soon as they are picked; but Beauty of Bath, Devonshire Quarrenden, and Lady Sudeley may be stored for a little time, although none of the earlier Apples improve in flavour by keeping after they are ripe. A good practice with freely-cropping, early culinary Apples, such as Keswick Codlin, Lord Suffield, and Lord Grosvenor, is to gather a few fruits from various parts of the tree, commencing at the topmost and outside branches.

Fig Trees on Walls.—Shoots that are crowded must be thinned, and the best plan is to pull the weaker growths clean away. Expose the fruits to the light, but not to injury by storms, as they are very easily marked when at the ripening stage. If the weather is fine syringe the trees in the early mornings, but not before the sun shines on them. The roots require very little water; if the tree is weakly and the border well drained diluted liquid manure made from cow dung may be applied when the fruits commence to swell finally.

THE KITCHEN GARDEN.

By John Dunn, Foreman, Royal Gardens, Windsor.

Winter Onions.—Make preparations for sowing Onions to stand over the winter and afford bulbs in April and May. This is an important crop, as it will furnish a supply at a time when Onions are scarce. The ground in which the seeds are sown should not contain much manure, as the plants will withstand the winter better than if grown in rich land. Prepare the soil in the same manner as for spring Onions, but the drills may be made a little deeper. As the largest and mildest-flavoured Onions are produced from seeds sown in the autumn and transplanted to rich soil in the spring, ground for the crop should be prepared by trenching in the winter. The work should be accomplished as early as possible, so that the soil may be exposed to the winter weather for a long time. When the season arrives for transplanting the seedlings the surface of the bed should be broken up carefully and the plants set out in rows made at 18 inches apart, allowing 9 inches distance between the plants in the rows. Ailsa Craig, Long Keeper and Giant Lemon Rocca are good varieties for the purpose. A small sowing of the White Lisbon variety may be made now to furnish spring Onions.

Carrots.—Carrots raised from seeds sown early in July are ready for thinning. A distance of 6 inches apart will be sufficient space. Dust the plants lightly with soot whilst the morning dew is on the foliage and also during times of rains.

Turnips.—Seeds of Turnip may yet be sown for spring supplies. Sow in shallow drills made at one foot apart, and dust the young plants with wood ashes as soon as they appear above the ground. If the soil is dry at the time of sowing, water the drills the night previous to

sowing the seeds. Green Top Stone and Golden Ball are good varieties to withstand the winter.

Tomatos.—Seedling Tomatos intended for cropping in the winter should be shifted into 10-inch pots. Grow the plants under close conditions for a few days after they are potted, but afterwards admit air freely, both night and day, to favour sturdy growth. This batch may be expected to furnish ripe fruits in December and January. For the present all the laterals should be pinched out, and, when sufficient fruits have set, the leading stems should be pinched and the roots fed with liquid manure once a week. As the season advances a little extra growth may be allowed to develop, as this will tend to keep the plants healthy.

Potatos.—All early varieties of Potato should be lifted as soon as possible and the tubers placed in a dry shed from which the light may be excluded. Do not make very large heaps or the Potatos may become heated and their quality affected. Tubers for next season's planting should be selected and allowed to remain in the open for a few days before they are placed in their winter quarters. A shed where light and air can be freely admitted is the best place in which to store them

THE ORCHID HOUSES.

By W. H. White, Grower to Sir Trevor Lawrence, Bart., Burford, Dorking.

Sobralia.—One or more of these plants has been in bloom ever since the middle of May. At the present time S. Veitchii, S. Lucasiana, and S. Colmanii are in flower here, and S. Warscewiczii will soon be opening its blossoms. The earlier flowering varieties included S. macrantha, S. m. alba, S. Cliftonii, S. xantholeuca, S. leucoxantha, S. virginalis; S. alboviolacea, S. Lowii, S. Liliastrum, and S. Ruckeri. The present is a suitable time to re-pot these plants, but it is not always advisable to do so immediately they become pot-bound, provided there is sufficent space for the young shoots to grow up freely, for being strong-growing and free-rooting subjects, they would soon become unwieldy if repotted annually. Plants that are in good health and not absolutely requiring re-potting will, if fed with weak liquid cow-manure, thrive for several years without root disturbance. Plants that appear to need a larger pot, or specimens that have become of an inconveniently large size, may be divided or re-potted soon after they have flowered. Employ plenty of drainage materials, and pot firmly in a mixture of good fibrous loam and rough, sandy peat in equal parts, with a small quantity of Sphagnum-moss and a moderate amount of small crocks. Keep the surface of the soil moderately damp until new roots appear through it, but later, when growth is vigorous, afford the roots an abundance of water. Sobralias grow best in a light position in the intermediate house, but newly potted plants should be rather more heavily shaded for a time than old-established specimens. It is a little too early to remove this year's flowering breaks, but as soon as the old leaves change colour cut the stems down to the roots, and tie the young growths clear of each other. If Sobralias are grown in a suitable temperature insect pests rarely trouble the plants.

FRUITS UNDER GLASS.

By James Whytock, Gardener to the Duke of Buccleuch, Dalkeith Palace, Midlothian.

Peaches and Nectarines.—The season in Scotland has been very favourable for the ripening of the wood of early forced Peach and Nectarine trees. It is essential for the foliage to remain in a healthy condition until it drops, and injury by red spider must be guarded against, for the conditions have been favourable to the spread of this pest. Syringe the foliage on frequent occasions with a weak solution of soft soap and sulphur to destroy the red spider. Surplus shoots that are not required for furnishing the tree should be removed to allow plenty of light and air to reach the branches. Keep the houses fully ventilated and see that the roots do not suffer from want of water. After the fruits have been gathered from trees growing in inside borders, give the roots a thorough soaking with water, and, if the foliage is infested with insect pests, spray with an insecticide sufficiently diluted with water. When the insects have been destroyed use clear water only for syringing, as this will assist in keeping the foliage healthy. Examine the trees carefully with a view to removing the old fruiting wood. Late varieties growing in cold houses should be syringed twice daily with clear water, and this should be continued until the fruits show signs of ripening. Old trees that are not making satisfactory growth may be fed liberally with manure water. Promote atmospheric moisture by damping the paths and bare surfaces frequently, and continue to do so until the fruit approaches the ripening stage, when both the borders and the atmosphere should be kept dry. Unheated houses require careful ventilation, regulating the amount of air according to the weather. To assist the fruit and wood to mature it is necessary to close the house in the afternoons, when the atmosphere is well warmed by the sun's heat. Expose fruits that are ripening in the sun's rays and thin the shoots to prevent overcrowding of the growths. In doing this do not make the ties too tight, but allow room for the young shoots to swell.

Fruit Trees in Pots.—Pot trees intended for early forcing should be re-potted. For Peaches, employ rich loam mixed with rough mortar rubble, bones and a rich fertiliser. Let the pots be cleansed thoroughly, and place plenty of materials in them for drainage. When potting see that the space between the ball of the plant and the side of the pot is filled with soil, and make it quite firm by ramming. It is not necessary to re-pot Fig trees every year, but only when the soil is exhausted. First remove as much of the surface soil as can be conveniently taken away, and replace it by good turfy loam mixed with lime rubble and concentrated manure. Make the soil firm by ramming, and, when the work is finished, stand the plants in a shady place until they recover from the disturbance. Guard against an excess of water at the roots until the latter are established in the fresh soil, but syringe the shoots daily for a week or so.

THE "FRENCH" GARDEN.

By Paul Aquatias.

Old Manure Beds.—Plants of the first batch of celery set in the middle of June are sufficiently advanced for blanching, which is done by covering them with light mats. Etiolation will be completed in from 14 to 20 days. During wet weather cover only the sides of the beds, or the plants may decay. Carrots raised from seed sown in the middle of July are growing fast; the only attention the crop requires is regular waterings. The roots will be ready for marketing in 8 weeks' time. Where a constant supply of new Carrots is in demand seeds of Early Parisian variety may be inserted in frames filled with black soil. Keep the ground moist to ensure quick germination, and when the seedlings appear thin them freely so that the foliage grows strong and stiff.

Crops in the Open.—As the frames from the Melon beds are at liberty during the next fortnight they may be set over the crop of Beans sown six weeks ago. If the plants are a success a second frame may be placed on the top of the bottom one, but this should not be done before the end of September, when the nights are cold. The Tomato fruits are changing colour, and some of the leaves may be thinned to let the sunshine reach the berries. Make the stems secure to the supports, as the trusses of fruits are becoming very heavy. Assist the plants by feeding, as the fruits are swelling fast. The spring Cabbages have been pricked out at 3 inches apart. Keep growth backward by giving only moderate waterings, or the plants will be liable to bolt in the early spring. Where vegetable refuse is used for manure the heap may be turned over to ferment, giving at the same time a good dressing of lime. The material will form a splendid manure for ground intended for planting spring Cabbages during the next month.

Lettuces.—If ground is available from September 15 next, and is suitable both for its quality and its position, it may be utilised for a winter crop of Lettuces. The variety Little Gott may be sown thinly under cloches, allowing 24 plants per glass. Afford shade until the plants are well established, when ventilation may be given both day and night in mild weather. The variety White Passion may be preferred, in which case the seed may be sown at once in the open, the seedlings to be transplanted under the cloches afterwards. During September the ground allotted for this crop should be heavily manured and well dug, as it will be the only opportunity for working this plot during the next twelve months. Set the frames in position on a dry day, allowing them to slope towards the front. Place six barrow loads of black soil in each frame, and, should the weather be wet, place the lights in position. Where mildew has been prevalent among Lettuces in previous seasons, spread half a pound of sulphate of copper, "Solubic Brand," along every row of frames before placing the black soil in position.

Melons.—Melons planted early in June have proved a very profitable crop. The plants will require less water as the nights get colder, but the side shoots still need pruning. Turn the fruits frequently so that they may ripen evenly.

Cucumbers.—The plants will need a moderate watering at least once weekly. All unnecessary shoots and leaves should be removed at an early date, and the lights placed in position at night.

THE APIARY.

By Chloris.

Driven Bees.—In some districts the honey-flow is over, and consequently stocks in skeps are being destroyed. In most instances the bees may be had for driving, and will prove, if quite free from disease, of great value in strengthening weak colonies, and are even more useful to unite to other stocks, because it is a well-known fact that the stronger the stock the better it will winter, provided there is plenty of food.

Driving.—When stocks have to be driven choose a fine evening. Place a bucket on a table or a tub at some distance from the stocks to be driven. Give the stock to be driven a puff of smoke through the entrance, wait a minute or so, then turn over the skep, standing at the back, and immediately give the bees another puff of smoke to drive them down. As soon as the skep has been removed place an empty skep on the stand to receive the flying bees. Place the full skep mouth upward in the bucket, which will act as a capital stand. Over the stock place an empty skep, and fix a portion of the edge by means of an iron skewer; raise the empty skep to form an angle of 45°, and fix it in position by two pieces of bent iron, one on each side. Strike the sides of full hive with the palms of the hands, gently, and very soon the bees will begin to rise. Should the bees collect at the junction of the two skeps they can be made to move by using a quill. If several lots be driven the youngest queen may be kept and others destroyed as they pass to the top skep. Should all the queens be valuable they may be retained to be united to other colonies not so well off. Several stocks may be utilised to form one colony.

Hiving.— When home is reached place a cloth on the alighting board, first having fitted up the hive with six drawn combs. The bees should be fed freely with warm syrup until they have stored 20 to 30 lbs., and always make the hive warm with good quilts of non-conducting material, taking great care that the corners are well closed.

Syrup for Feeding.— Take 10 lbs. of pure white lump sugar, and place it in 5 pints of boiling water to which has been added ½ oz. of salt, and 1 oz. (about a tablespoonful) of vinegar. Let it boil a few minutes, taking great care not to allow it to burn. Fill bottles to the brim and cover with cheese cloth firmly tied down, and overturn the bottles on the frames. Use the syrup while lukewarm, and perform the operation of changing the bottles in the evening, taking great care not to spill any of the syrup, and close the entrances so that one bee only can enter at a time, because when feeding is taking place the bees are liable to commence robbing.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the **PUBLISHER**, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, *as well as specimens of plants for naming, should be addressed to the* **EDITORS**, 41, Wellington Street, Covent Garden, London. *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Editors and Publisher.—*Our Correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the* PUBLISHER; *and that all communications intended for publication, or referring to the Literary department, and all plants to be named, should be directed to the* EDITORS. *The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.*

Illustrations.—*The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.*

Local News.—*Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

Special Notice to Correspondents. — *The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.*

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, AUGUST 26—
Roy. Hort. Soc. Coms. meet. (Lecture at 3 p.m. by Messrs. Blackmore and Langdon on "Begonias.") Roy. Hort. Soc. of Ireland Autumn Sh. Sandy Flower Sh.

FRIDAY, AUGUST 29—
Dunfermline Fl. Sh. (2 days). Dundee Hort. Exh. (2 days). Dumfries and District Hort. Sh. (2 days).

AVERAGE MEAN TEMPERATURE for the ensuing week deducted from observations during the last Fifty years at Greenwich—60.6°.

ACTUAL TEMPERATURES :—
LONDON.—*Wednesday, August 20* (6 p.m.); Max. 70°, Min. 55°.
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, *Thursday, August 21* (10 a.m.); Bar. 30.2, Temp. 70°.
PROVINCES.—*Wednesday, August 20*, Max., Spalding, 68°, Min., Shields, 56°.
Weather—Sunshine.

SALES FOR THE ENSUING WEEK.

MONDAY, WEDNESDAY, THURSDAY AND FRIDAY NEXT—
Trade Sales of Dutch Bulbs at 67 and 68, Cheapside, E.C., by Protheroe and Morris at 10 o'clock.

WEDNESDAY NEXT—
Dutch and French Bulbs, Bay Trees, etc., at Stevens' Auction Rooms, King Street, Covent Garden, at 12.30.

The National Botanic Garden of South Africa.

We rejoice to learn that the establishment of a National Botanic Garden in the Union of South Africa is assured. The Government has set aside Kirstenbosch, an estate on Table Mountain, for the purpose, and is prepared to make a grant, including £1,000 per annum for the upkeep of the garden, provided that additional funds be forthcoming from other sources. From a report in the *Cape Times*, in which these decisions are announced, it appears to be certain that the establishment of the garden will not fail for lack of support on the part of the people of the Union. As a first step to securing this support a National Botanical Society of South Africa has been founded, and subscriptions have been secured from a number of prominent citizens. The Government has appointed Sir Lionel Phillips and Sir D. P. de Villiers Graaff to act as trustees of the National Garden, and Professor Pearson has undertaken the honorary directorship. For upwards of 50 years the project of a garden has been under consideration, and it must indeed be gratifying to those who have worked so long and devotedly for this object that it has at last achieved fulfilment. As we mentioned on a former occasion, it is mainly due to Sir Lionel Phillips that the Government has been induced to give the financial support without which the National Garden could not have come into existence; but, as Sir Lionel insisted in the course of the meeting convened to consider the formation of the National Botanical Society, much credit is due to Professor Pearson, who has known how to communicate his enthusiasm for the preservation of the South African flora to those in authority. Some day an ingenious historian may be tempted to write the history of the rise and fall of Botanical Gardens in the British possessions. He will discover that some became ours by right of conquest, and that not a few languished because Governments and Governors lacked understanding of their importance and insight into the rôle which such institutions should play in the life of a tropical or semi-tropical country. It was not foreseen that with the progress of agriculture the native floras run the risk of being swept away; or if it was foreseen this fate was regarded not as a disaster but as a natural and satisfactory consequence of the progress of husbandry. Hence it came about that either the gardens fell from their once flourishing estate or they were so ill-staffed that but little could be done for their development or for the prosecution of the many lines of investigation of which such gardens permit.

Then came the discovery that it pays to develop tropical agriculture on scientific lines, and in not a few cases Governments, lacking in competent advisers, conceived the foolish plan of converting the Botanic Garden into an experiment station for all and sundry branches of agricultural research. Inasmuch as research of this kind is specialised, is concerned with comparatively few plants, and these of a commercial, rather than of a decorative, order, the gardens so converted ran the risk of presenting the unattractive appearance of allotments.

Now that the mistake of such a policy is beginning to be recognised, it should be the duty of those who direct the policy of the British possessions to define the rôle of the Botanic Garden, and to show what part it should play in the work of the country in which it is placed. Any such definition must start from the axiom that a Botanic Garden has work to do which is both important, definite and distinct from that which pertains to an agricultural station. That work consists in the discovery, classification, investigation and cultivation of the indigenous flora and in the introduction of plants from other parts of the world. It embraces, as Sir Lionel Phillips has pointed out, the æsthetics of horticulture. To cultivate plants, the contemplation of which may in turn cultivate the sense and love of beauty in those who see them, is no less important in a civilised community than to discover a cheaper way of tapping rubber or a combination of artificial manures which increases the yield of tea. Provided that the garden carries out its proper and essential functions, and provided that it be not starved in respect of them, it is desirable that it should have a relation, albeit not too intimate a relation, with such experimental stations as may be established in its vicinity or in other parts of the territory. The dangers of too close a relation are patent; for inevitably the head will be sooner or later an agriculturist, and not a botanical horticulturist, and with such a head it is only a matter of time for the prime functions of the Botanic Garden to be forgotten, its beauty diminished, and its rôle as an intermediary between man and nature ignored.

These dangers are forfended in the case of the South African garden. They are well provided against by the establishment of the National Botanical Society "to assist toward the establishment of the garden and to encourage the growth of the South African flora." Therefore we congratulate Sir Lionel Phillips, Professor Pearson and all associated with them not only on the success which has attended their efforts to establish a National Garden, but also on the fact that they have been among the first in modern times to perceive the true rôle which a National Garden should play in the life of a British Dominion.

Supplementary Illustration.—In the *Gardeners' Chronicle* for April 2, 1904, we published a description of Hewell Grange, the Worcestershire residence of the EARL of PLYMOUTH, P.C., and this we now supplement with illustrations of the gardens. The flower garden is a unique example of a most pleasing adaptation of the French style. Situated on the south-eastern side of the house, it is divided into four quarters, enclosed by well-trimmed hedges of Lime trees. The flower-beds are set out on grass and gravel, and are enclosed by well-defined Box hedges nearly 2 feet high. There is no rigid system of furnishing these beds; the largest are planted informally with annuals and herbaceous perennials, and present a pleasing variety. Another feature of the Hewell Grange flower garden is the many posts and chains flanking the various sections, and clothed with Roses, Clematises and other climbers. Such a garden, with its many arches, festoons, trimmed trees and enclosing hedges, does not present so magnificent a spectacle as when the design is on more formal lines, as at Longford Castle, for instance; but it possesses a rare charm. Anyone who visits the Hewell Grange flower garden sets out on a veritable voyage of discovery, passing with delight from one division to another and always finding new objects of admiration. On the opposite side of the house is the rock garden, which is depicted in the lower illustration. Like the flower garden, this portion is conventional. Its design would not satisfy Alpinists, who would doubtless demur to the intrusion of the central fountain and the Lily pond; nevertheless, although unorthodox, it is very beautiful.

Coloured Supplement.—The subject of the coloured plate to be published in the next issue is Cattleya Lawrenceana.

Royal International Horticultural Exhibition, 1912.—The following financial statement of the auditors, Messrs. Crewdson, Youatt and Howard, chartered accountants, has been sent by Mr. J. Gurney Fowler on behalf of the directors of the Royal International Exhibition, 1912, to the guarantors. The accounts cover the period from November 21, 1910, to April 9, 1913 :—

Royal Horticultural Society. — The next meeting of the committees will be held on the 26th inst. in the Vincent Square Hall, Westminster. At the three o'clock meeting of the Fellows a lecture on Begonias will be given by Messrs. Blackmore and Langdon.

Congress Lectures at Kendal. — The North of England Horticultural Society has arranged a series of lectures, to be held at Kendal on Wednesday and Thursday, September 24, 25. The first paper will be read on the opening day at 6 p.m., the subject being "The Organisation of the Fruit Industry in Westmorland, with special reference to Damsons." The chair will be taken by Lord Henry Bentinck, M.P. Mr. C. J. R. Tipper, B.Sc., Secretary to the Westmorland Education Committee, Kendal, will speak on the subject, and Mr. H. H. Mason, editor of the *Fruit Trades' Journal*, will open a discussion. At 8 p.m. Mr. R. A. H. Gray, M.A., Adviser in Agricultural Zoology, Armstrong College, Newcastle, will deal with "Fruit Insect Pests," woolly aphis or American blight, big bud, the codling and winter moths. On Thursday, at 3 p.m., Mr. W. F. Emptage, horticultural expert of the *Fruit Grower*, will deal with "Land Tenure and Fruit Culture" (chairman, W. D. Crewdson, Esq.), followed by a paper at 5.30 p.m. on "Potato Culture," by Mr. G. P. Berry, Chief Inspector of the Horticultural Branch of the Board of Agriculture. At 8 p.m. the chair will be taken by Alderman E. J. Abbatt, when Mr. W. B. Mercer, B.Sc., Lecturer in Agricultural Botany, Armstrong College, Newcastle, will deal with "Diseases of Potatos." Prizes are offered in five classes for Potatos. Mr. W. B. Little, Lecturer on Horticulture, Armstrong College, is organising an exhibit of Potato diseases. Mr. A. G. L. Rogers, head of the horticultural branch of the Board of Agriculture, and others are assisting in the collection of material. Those who can help with specimens are requested to correspond with Mr. Little, 40, Petteril Street, Carlisle. On Tuesday, September 9, there will be a council meeting at 2.15 p.m., and at 4 p.m. Mr. H. A. Gillingham, of Messrs. Clibrans, of Altrincham, will address the Fellows and members present on "Early Flowering Chrysanthemums." Messrs. Clibrans hope to arrange for an exhibit to illustrate the lecture.

National Botanical Society of South Africa.—The formation of a National Botanical Society of South Africa, to which reference is made on p. 138, was decided upon at a meeting presided over by the Mayor of Cape Town, Mr. H. Hands, on the 10th ult. The *Cape Times* of June 11 gives a list of those present and a report of the principal speeches. Both Mr. Hands and Sir Lionel Phillips referred to the natural beauties of Kirstenbosch, the site chosen for the Botanic Garden, and the latter gave a list of plants found growing wild there. These included Erica hirtiflora, Rochea coccinea, Disa uniflora, Virgilia capensis (Keaurboom), Lobelia coronopifolia, Roella ciliata, Erica purpurea, Halleria lucida, Oxalis variabilis, Protea grandiflora, Podalyria calyptrata, Erica viscaria, Liparia sphaerica, Erica baccans, Adenandra uniflora (Shepherd's Delight), Tetraria thermalis, Anemone capensis, Protea cynaroides, Rochea versicolor, Watsonia rosea, Gladiolus blandus, Harveya capensis, Disa Harveyana, and Watsonia Meriana.

"La Revue de Phytopathologie."—We have received the first number of a new fortnightly magazine, bearing the title of *La Revue de Phytopathologie, Maladies des Plantes*. It will be published on the 5th and 20th of every month, and is devoted, as its title indicates, to the study of plant diseases and insect pests. The number contains sixteen pages of text, and among the articles are one on crown gall, the novius cardinalis in the South of France, and insect pests of the Apple tree and Beetroot. The offices are at 3, Villa Hippolyte-Garnier, Paris (14e).

Appointment of a French Town Gardener.—The following announcement, which appears in a French contemporary, may interest some of our readers. It concerns a competition for a gardener, who will have the control of the public gardens, squares and promenades of the town of Rennes. The salary to start with is £140 per annum, rising by £12 increments every four years until a maximum of £200 per annum is reached after twenty years' service. A dwelling-house is included. The notice does not say whether a pension is granted. Candidates must submit their names to the Mayor by September 20; they must be of French nationality, not less than twenty-five years of age or more than forty years; they must supply testimonials of past services, and sit for an examination, the details of which are given. £200 a year and a house free in a provincial town like Rennes is an appointment, we should think, that will attract not a few French gardeners.

Imports of Potatos.—According to the Return of Market Prices issued by the Board of Agriculture for Scotland, imports of Potatos last week in the United Kingdom amounted to 2,207 tons, as compared with 575 tons in the corresponding week 1912. The exports last week amounted to ten tons; in the corresponding week in 1912 they totalled 1,451 tons.

Autumn Shows in France.—The autumn horticultural shows in France are announced as follows :—Paris (Concours-Exposition), September 11; Joinville (Haute Marne), September 13 to 15; Cartignies (Nord), September 14 to 15; St. Pierre-sur-Dives, September 21 and 22; Montmorency (S.-et-O.), September 28 and 29; Paris (Concours-Exposition), October 9; Montpellier, October 9 to 12; Bordeaux, November 6 to 10; Pau, November 6 to 10; Paris, the usual autumn show of the National Horticultural Society of France, October 24 to November 2; Le Havre, November 8 to 10; Rouen, November 8 to 11; Epinal (Vosges), November 8 to 15.

The Genus Primula.—M. S. Mottet, the well-known French horticultural writer, has recently published a little volume of about 100 pages, entitled *Monographie du genre Primevère*. It is neatly printed and contains a dozen plates of various species. The work was awarded a gold medal by the National Horticultural Society of France, at whose congress in May, 1912, the subject was dealt with, being the second question selected for consideration. The price is two francs, and the publishers the Librairie Agricole de la Maison Rustique, 26, Rue Jacob, Paris.

The Rev. J. Bernard Hall, secretary of the North of England Horticultural Society, has been appointed to the living of Farnham-with-Scotton, near Knaresborough. Mr. Hall was educated at Shaftesbury School, at St. John's, Leatherhead, and afterwards at Emmanuel College, Cambridge, where he took honours in the Mathematical Tripos. He was ordained deacon in 1896, became assistant curate of Holy Trinity, North Shields, and from 1899 to 1900 was curate-in-charge of Ninebanks-with-Carshield. From 1900 to 1904 he was a chaplain in the Royal Navy. He was curate of Corbridge-on-Tyne from 1905 to 1909, and of Dalston, Carlisle, 1909 to 1910. Mr. Hall's enthusiasm in the work of the N.E.H. Society, and his love of horticulture generally are well known. It is to be hoped that he will still find time to carry on his duties as secretary for the Northern Society.

The Toulon Flower, Fruit and Vegetable Trade.—According to a report from the British Vice-consulate, the flower-growing industry at Toulon in 1912 was well maintained, and the year was a good one. 1,313,272 kilos of cut flowers were despatched to Hyères a'one. A diminution in the exports of the larger varieties of Narcissus and Hyacinth bulbs was noticed, which probably accounts for the prices having been generally in excess of those of former years. About 3,000 acres are devoted to the culture of bulbs, and the annual production is estimated at 25,000,000 bulbs. The crop of flowers in the Var supplying the European markets was valued at 5,000,000 francs. The Immortelle crops show a slight falling off. The United States of America are still the chief buyers of Immortelles, and the shipments generally take place in the autumn. The prospects for this year are very unfavourable owing to the exceptional dryness of the winter. The crops of fruits in 1912 showed marked increases all round as compared with the previous year, the figures being :—

	1911. Quintals.	1912. Quintals.
Chestnuts	22,000	33,000
Cherries	10,859	28,000
Apples	1,298	2,370
Plums	607	800
Apricots	156	840
Peaches	4,784	7,500
Figs	3,500	6,000
Almonds	82	1,800

The production of vegetables was an average one. With the improvement of the transport facilities market gardening in this region is on the increase, especially as regards early vegetables (*primeurs*). Artichokes and Peas were very successful crops, and large consignments of these vegetables were made in the season to Paris, which is the principal market.

ALTHÆA FICIF LIA.

THE single yellow Fig-leaved Hollyhock is a welcome change from the monstrously double florists' flowers now so often met with in ordinary gardens, which appear unfortunately to have ousted the cottage garden Hollyhocks with their wide guard-petals and daintily clustered centres that were the pride of many a village in the old days. Of all the singles the most delightful is the species now under notice, the flowers, of exquisite shape, being of a charming clear, pale-yellow colour, and the plant is well worthy of inclusion in the best herbaceous border. The blossoms measure from 3 inches to 4 inches across, are of delicate texture and very refined in appearance. The leaves are large, palmate, and divided into from five to seven lobes, and somewhat resemble those of a Fig tree—hence the specific name. From shortly after midsummer until the late autumn this Hollyhock (see fig. 55) creates a charming picture in the garden, its towering stems, 10 feet and more in height, being studded with clear-coloured blossoms. Many aver that the Hollyhock should be treated as an annual, and that it is useless to retain old plants; but this particular specimen has now occupied its present position for very many years and annually throws up flower-stems that show no sign of decreasing vigour. It is apparently not so susceptible to the dreaded Hollyhock disease as are florists' varieties, for the plant here illustrated has never shown the slightest symptoms of being affected, though it must be said that no other Hollyhocks are grown in the same garden. Every year self-sown seedlings appear around the parent plant, numbers of which have been given away to those who did not possess it. Althæa ficifolia is a native of Siberia, and has been known in this country for over 300 years, having been introduced about twenty years after Althæa rosea, the parent of the garden Hollyhock. *Wyndham Fitzherbert.*

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

DWARF GAILLARDIAS.—For a long time Gaillardias were not in favour as border perennials, on account of their straggling and rather untidy habit, but this has all been changed. In Messrs. Veitch's nurseries at Exeter recently I saw a bed of charming very dwarf annual Gaillardias, under the name of Gaillardia Lorenziana picta nana compacta. There were six colours, and none of the plants was more than a foot high. They were so even in growth and so true that some pains must have been exercised in their selection. They were very charming indeed, and suggested great possibilities in beds and borders; and, knowing the long flowering period Gaillardias have, I can see how useful they could be made to those with limited accommodation and not too long a purse. The colours were in rows—red and yellow, pure yellow, red, tipped yellow, lemon or buff-yellow, the Bride, at first primrose then white, and Bordeaux Red—a rather dull, purplish red. Flowering from seed sown in March, there are few more useful or showy annuals. *Captain Cuttle.*

MEDITERRANEAN FRUIT FLY (see p. 117).—It may interest you to know that a fruit fly is a troublesome pest on the Gold Coast, and it is probable that it is the same species known as the Mediterranean Fruit Fly, although so far this has not been determined. Specimens, however, are under investigation. The life history is very similar; the fly lays its eggs in the Orange, Grape Fruit, Guava, Eugenia, Melon, Cucumber, and Vegetable Marrow. Owing to the pest it is almost impossible to grow the three members of the Cucurbitaceæ mentioned. The fruits continue to grow and flourish, and were it not for the puncture which may be observed on the fruit, one would not be aware that it had been attacked until the fruit is cut, when the white grubs may be observed inside, having eaten all the inner portion. It is mostly during the dry season that this pest is at its worst. Oranges attacked by the fly drop some time before they are mature and become yellow, and this also occurs in the case of the Grape Fruit. *Albert R. Gould, Agric. Dept., Gold Coast.*

MIDLAND DAFFODIL SOCIETY.—As the R.H.S. has responded to so large an extent to the wants of those who advocated a National Daffodil Society, and since, therefore, the foundation of such a society is likely to be postponed *sine die*, may I urge the claims of the Midland Society to all lovers of Daffodils and to the advantages that such membership confers? The Society, owing largely to the energy of the late Mr. Robert Sydenham, holds the premier position amongst Daffodil societies, and its shows have done much to encourage and popularise the love of the Daffodil. Further, the Midland Society has been the means of more new seedlings being shown than any other society. Membership means (1) joining the leading "Club" of the Daffodil world and bringing a member into touch with those who are the busiest workers amongst the Daffodils; (2) the right to attend and exhibit at the shows which are acknowledged to be the pleasantest gatherings of the kind, and where the leaders in the cult are always to be found with the latest up-to-date flowers. With a larger membership and more funds much could be done by the Committee on the lines of the suggestion of those in favour of a National Society.—*C. Lemesle Adams, Pendeford Hall, Wolverhampton.*

BABWORTH HALL, RETFORD.—On the occasion of a recent visit to Babworth, I was much impressed with charming Roses in rambler form in the gardens. Growing gracefully over arches in every direction were Gruss an Teplitz, Dorothy Perkins, Lady Gay, Hiawatha, and White Dorothy, whilst all the latest and best hybrid Teas were represented in bush form, full

of bloom, healthy and vigorous, every one of them. The borders are nearly two hundred yards long and ten yards wide, flanked on the one side with a 12-foot fruit-covered wall, and on the other by standard fruit and ornamental trees in variety. The extreme edge of each border is charmingly decked with puce Violas, whilst dotted thickly throughout the length and breadth of the beds are hardy annuals of many kinds, embracing Godetias, Lavateras, Jacobæa, Stocks, Asters, Arctotis, Arabis, Browallia, Brachycome, Calliopsis, Iberis, Chrysanthemums, Clarkias, Cornflowers, Dianthus, Machet Mignonette, and others in infinite and entrancing variety, not to mention many perennials, such as Anchusa italica and Galegas, and many Lilies, conspicuous among these latter being a good form of Lilium tigrinum splendens. Sweet Peas were well represented, and I have seldom seen these appear better anywhere in any season. Mr. Best has original ideas with respect to summer bedding, and he blends his Fuchsias and Dactylis, Begonias and Heliotrope, Snapdragons and Pelargoniums in excellent fashion. *A. F. U.*

Unwelcome Rain. — After two months' drought there comes a change, and every other person one meets has a smile on his or her face, and remarks, "A nice rain, it will do a lot of good." But the practical man has not yet made up his mind as to the results likely to follow. The rain continues to fall gently for two or three hours, some of the dust is washed off the leaves, there is a refreshing feeling in the atmosphere, the ground does not feel so hot to one's feet, and the birds are once more happy. Why should the plodding, practical man not throw aside his water-pot and join in the rejoicing? He prefers to wait a bit, and he has not to wait long. The clouds disperse, the sun comes out, and his plants, as ungrateful as himself, commence to droop. Decorative Chrysanthemums planted out, Turnips, and even Potatos, lower their heads as if in mourning for something lost. They had never drooped to such an extent before. Why is it? Well, the Dutch hoe had been vigorously plied at short intervals where there was room for it, the surface soil was well pulverised, and what water there was below the surface, except so far as the plants drew it up, remained there. Now all is changed. The leaves of the plants, to protect themselves from the arid conditions, had reduced the opening of their pores to a minimum, and transpiration was very feeble; but as the atmosphere became humid these pores automatically opened, and the next quick change found them unprepared. Besides this, the little moisture which had been locked up below the dry, pulverised surface soil was no longer locked up, and in 24 hours after the rain fell the soil contained less moisture than it had done before. In my own case Chrysanthemums which had never been once watered since planting had not drooped to any extent till after the rain, and in the course of a week of dry weather which followed they regained some of their former rigidity, although the soil, from the reasons stated, had become much drier. Happily, though the air has been dry, there has not been an abundance of sunshine, and the nights have generally been cool and still, thus causing a good deposit of dew on the leaves. Dew does not cause the stomata to open much, because the chief deposit takes place when there is little or no sunlight, and if the air remains still, although hot, its effects on plants which have *not* been kept watered are visible throughout the first half of the following day. I have nothing to say against a passing summer shower, when the humidity in the atmosphere does not last sufficiently long to cause much derangement in the stomata, and, like the average amateur's watering, is not sufficient to thoroughly wet the pulverised surface soil; but two or three hours' drizzling followed immediately by bright sunshine is a different thing, and I had rather my neighbour had my share as well as his own. But as this cannot be we have to consider what is best to do under the circumstances. My advice is to at once use the water-pot freely, for such is an ideal time for artificial watering. Rain, when it comes in sufficient quantity, is far more effectual than any artificial watering can be, for the humidity of the atmosphere which accompanies it, and which cannot be created artificially, is then a great advantage, and, especially after a dry spell, it adds some ammonia to the soil, while artificial watering washes it out. During the month of July we had less than half-an-inch of rain—.45 was the official measurement at our station—and it took seven days for this quantity to fall. Just compare this with our artificial watering. A plot of Cos Lettuces planted 12 inches apart has a quart of water given to each plant. A quart of water spread over a square foot gives nearly half-an-inch in depth, but as the Lettuces are planted in drills, less than half the surface is watered, so that part which is actually watered receives approximately what is equal to an inch of rain. This sometimes, but not always, suffices for 48 hours. It is true that not every plant requires as much water as a Lettuce, and there is frequently much time as well as water bestowed on subjects which would be as well, if not better, without it. Bedding Pelargoniums, for instance, when once established, will revel in hot, bright weather, and Wallflowers suffer very little inconvenience from it so long as you do not water them at all; but give them driblets and they almost cry for more. Some Antirrhinums in pots were turned outside in the spring because they had become too tall for the purpose required. They remained in the pots for several weeks without a drop of artificial watering, and though they flagged at first, they afterwards regained their rigidity, and not only flowered, but formed perfect seeds. Godetias were cast out for a like fault, and these were turned out of their pots and thrown on the rubbish heap. After a time they turned up their heads and produced a new crop of flowers, some of which were cut and placed in a sitting-room, where they remained in good condition for more than a fortnight. Plants of Borecole, which had never been watered in the seed bed till the day before they were lifted, were planted in drills which had been copiously watered, and the plants then had another watering, but none since. These never drooped at all, and although they have not made much visible progress, are quite healthy. As to sowing seeds, one is much more sure of success in dry, than in wet weather, the ground being sweet and warm, and there is no fear of slugs. Even with Parsley, which remains underground for two or three weeks, we are sure of success if we sow in well-watered drills and shade for a fortnight with old bags, mats, canvas, Potato tops, or Pea haulm. Sow any kind of seed and water every day with a rose on the water-pot, and you court failure. Sown in saturated drills, and covered with perfectly dry soil, very few seeds will require watering till after germination has taken place. After the seedlings appear, except for the first day or two, it is better to dispense with all spraying and apply water between the rows, not less than a foot apart, from the spout of a 3-gallon water-pot, which will quickly form furrows, and from these furrows the water will percolate the soil to the roots. I have a demand for a quantity of early flowering Chrysanthemums of the Masse type in pots. These are planted out of the boxes in which they were struck, watered once or twice, and then, with the exception of hoeing between them frequently, they are left to themselves. Some of these have lately been potted, as they were coming into flower. The ground being too dry for the water to enter freely, some soil was drawn up, so that the plants were in a sort of furrow, and these furrows were filled with water several times on the day before lifting the plants. The following morning and evening the plants were lifted and potted on the spot; they were then carried and placed on the shaded side of a wall and watered, while the wall, the surrounding soil, as well as the plants, were frequently sprayed for a few days. Never a leaf drooped, the plants commenced rooting immediately, and they will soon be fit for placing in a sunnier spot. It was found on taking them up for potting that no new roots were being formed near the surface because of the lack of moisture, but that the lower roots were active and were working downwards, not laterally. It was the same with later flowering varieties which had been temporarily planted out because one can obtain better shaped plants this way than when grown in pots. I have had much greater difficulty in wet, or even ordinary seasons, in getting such plants established in pots, because the roots had spread out laterally, were more numerous, leaving little room for soil, and the plants were altogether softer. It will be gathered from the foregoing remarks that although the drought has caused great inconvenience and much loss in many cases it is not an unmixed evil to the resourceful horticulturist, and when we consider that it has decimated the slugs, made it easy to free the ground from weeds, and sweetened it to such an extent that no artificial sterilisation is requisite, we find some points in its favour. *Wm. Taylor.*

BATTERSEA PARK.

THE "OLD ENGLISH" GARDEN.

A year hence, when the Oak posts and beams of the pergolas are furnished with Roses, Clematises, Jasmines, and Honeysuckles, it will be exceedingly difficult to realise that the "old English" garden in the L.C.C. park at Battersea was not commenced before the middle of March in the year 1912. Except for the unavoidable nakedness of the pergolas the garden already wears an air of having been in existence for generations. It was formerly the site of a "students' garden," a garden of very limited interest, so this educational feature was transferred just clear of its old position, and is now much more effective and useful. The place so obtained for the new garden is delightfully secluded, and surrounded by large, richly-foliaged forest trees. The central feature is a rectangular Water-lily pond, framed with weather-worn coping, and containing an old fountain which harmonises with the stonework. Broad gravel walks radiate from the pond, and at the corners of the garden there are comfortable semi-circular seats which invite the visitor to rest and contemplate a most pleasant scene. The flower-beds are of generous size without being unwieldy, and, although in planting them the old-world character of the garden has been observed, it was wisely considered unnecessary to exclude modern plants, but rather to illustrate the value and beauty of those of easy culture which will live and flourish in the metropolis. Roses play an important part in the scheme, and here may be seen the old Moss and the fragrant Cabbage Roses which are indispensable in an "old English" garden; but such recent varieties as Mme. Abel Chatenay, Richmond and Frau Karl Druschki are largely planted. For the most part the Roses are planted in beds of one variety, but, as the beds are carpeted with such annuals as Candytuft, Virginian Stock, Sweet Alyssum and Mignonette, there is no impression of laboured striving after colour effect. The most successful variety of Rose is Gustav Grünerwald, which bore a glorious profusion of bloom, Ulrich Brunner, Mme. Abel Chatenay, and the climbing La France, grown as a dwarf, were nearly as successful, but the variety Richmond, which is so popular with the florists, is not a good garden Rose in London; it flowers with fair freedom, but is only attractive in the bud state. The other beds are planted with a variety of herbaceous subjects—Gaillardias, Sweet Williams, Canterbury Bells, Hollyhocks, Anchusas, Antirrhinums, Geums, herbaceous Veronicas, and a quantity of splendid Delphinium seedlings. Amongst the annuals Sweet Peas, Coreopsis, and Clarkias are particularly successful. The edgings for the flower-beds have received especial attention, and no plant is more attractive than the grey-foliaged, lavender Nepeta Mussinii, which is used largely and which continues in flower for a very long time. Long rows of Messrs. Barr's strain of Pink "Cyclops," which bears large numbers of fragrant blossoms of various shades—pink, mauve, white-edged, and so on—have just completed their display, but the compact tufts of glaucous foliage possess considerable charm.

It is the boast of the Parks Committee of the London County Council that their Superintendents are all expert gardeners, and they will find ample justification in the work of Mr. J. Rogers at Battersea, for he is responsible for the making and keeping of this most charming old-world spot, which has been done with the permanent

staff. Battersea Park has long been noted for the excellence of its sub-tropical gardening, and this feature, where may be seen happy blendings of large Palms and various other fine-foliaged plants, as well as gorgeous summer-bedding schemes, is remarkably effective. *A. C. B.*

CAMPANULA ALPINA.

Campanula alpina, one of the smallest members of the genus, is known as the Alpine Bell Flower. The species is a biennial, which is a disadvantage for garden purposes; but plants are easily raised from seed, and succeed so well in gritty soil that the species is well worth

Photograph by W. Irving.

Fig. 56.—Campanula alpina: flowers violet. (natural size.)

growing among the choicer plants in the rock garden. Its nearest ally in the genus is the better-known C. barbata, but, unlike that plant, C. alpina prefers soil of a calcareous nature. The Alpine Bell Flower possesses a fleshy rootstock and forms a tuft of narrow leaves, from which the stem, only 3 inches or so in height, is produced. The flowers are produced in May and June, and vary in colour from pale to deep violet. C. alpina is found at elevations ranging from 6,000 feet to 7,000 feet in the Alps of Austria, Lombardy and Transylvania, so that it is not so difficult to manage in gardens as many other members of the genus. It has been in cultivation in this country since 1779, so that it is not by any means a new plant. There are many dwarf Campanulas of neat and compact habit, and one or more of the various species are in flower during a period extending over several months. *W. I.*

EUCALYPTUS.

More than two-thirds of Mr. Cambage's Presidential Address to the Royal Society of New South Wales on the occasion of the ninety-second anniversary of its foundation, May 7, 1913, is devoted to Eucalyptus, the paramount genus in Australian vegetation, to its development and distribution. The author deals with the development and distribution of the species in relation to geological changes, climate, and chemical composition of the substratum. Broadly speaking, he says, the Eucalypts distribute themselves under two extreme types of geological formations, the siliceous and basic, and there are numerous examples of two distinct floras approaching each other up to a common boundary without intermingling, the one growing, perhaps, on an acid granite or siliceous sandstone formation, with an abundance of free silica, and the other on a basalt or other basic rock producing a clay soil. He also discusses the classification and distribution of the species in relation to characters offered by: (1) The bark—whether smooth, scaly, scaly to subfibrous, fibrous, and hard-furrowed; (2) the timber—texture and colour; (3) the leaves—size, thickness, veration (transverse, oblique, or parallel); (4) anthers—parallel antheral, porantheral and renantheral; (5) oil constituents—pinene, eucalyptol (cineol), and phellandrene. We commend this essay to the consideration of all persons interested in Eucalypts. *W. B. H.*

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

August 12.—*Present:* Mr. E. A. Bowles, M.A., F.E.S., F.L.S. (in the chair), Messrs. J. Fraser, A. Worsley, E. M. Holmes, and F. J. Chittenden (hon. sec.), with Mr. R. Farrer, visitor.

Agapanthus Weilgii.—Mr. Worsley showed a specimen of this beautiful species of Agapanthus which he had obtained from Holland. It will be fully described in the *Journal* of the Society.

Double Cineraria.—Mr. Worsley also showed heads of a Cineraria with proliferation similar to that seen in the "hen and chickens" Daisies, but with the separate capitula more congested. He remarked that this type of doubling often occurred in forms that normally bear single flowers when they blossom in summer, as in the present instance, and that the normal type would be resumed later on.

Saxifraga florulenta.—This curious species of Saxifraga was sent by Mr. Chaplin, of Great Amwell, Ware, in whose garden it had flowered. It was collected by him and had apparently been growing in shade in cultivation, though it appears to grow alike in sun and shade in its home in the Maritime Alps, where it occurs at high altitudes. It has perhaps only once before flowered in this country, when it was shown by Maw and received a first-class certificate in June, 1872. Its foliage is more attractive than its flowers.

Rubus discolor double-flowered.—Mr. Chittenden showed from a correspondent at Haywards Heath a beautiful pink-flowered form of the common bramble with double flowers. It had been found in a hedge and was apparently wild. Several such forms are in cultivation.

Xanthorrhoea australis.—Mr. E. M. Holmes showed the lower part of the leaf-rosette of this plant, which is now being imported for cattle food on account of the sugar it contains.

Aphis on Picea.—Some shoots of the Piceas pungens glauca and magnifica were sent from Lexden attacked by the large aphis which has been so prevalent this year and last on these trees in several parts of the country, and has worked great damage to them. Mr. Chittenden said that several trees had been attacked at Wisley, but the insects had all been killed by one thorough spraying with "Niquas" in May, and the trees had quite regained their beauty. The winter is passed in the egg stage, and spraying should be resorted to as soon as the insects hatch out in spring, any wash containing nicotine being useful.

Apples Showing Glassiness.—Some specimens of the apple Lord Derby were sent from South Devon from some cordon trees, and showed the curious phenomenon known as glassiness in a marked manner. The cause leading to this peculiar condition is so far unknown, though it is often attributed to frost. It is evident that in this and in several similar cases that have recently come to notice this cause cannot have been acting.

Crown Gall.—Mr. H. T. Gussow sent a culture of the Bacterium tumefaciens which Dr. Erwin Smith has shown to be the cause of the disease known as Crown Gall. This disease attacks numerous plants, producing large swellings, generally of a soft nature, on the roots and lower parts of the stems, and in America it is frequently credited with doing damage to the plants attacked. The committee would be glad to learn whether any serious results have followed the occurrence of such swellings on the roots of plants. Instances have been brought to the notice of the committee of swellings on Apple, Plum, Birch, Cherry, Peach, Carnation, Marguerite, Blackberry, Loganberry, and Cupressus.

SHROPSHIRE HORTICULTURAL.

Exhibition at Shrewsbury, August 20 and 21.

THE exhibition which was held in the Quarry Grounds on Wednesday and Thursday last will rank as one of the most successful of the series held over a period of 39 years. Notwithstanding that these Shrewsbury shows have attained to such excellence as to become the most important horticultural functions of their kind in Great Britain, we are led each succeeding year to expect some new feature. This time the novelty consisted in a class for rock gardens, in which the first prize amounted to the substantial sum of £50. Great success attended the new class, and two of the exhibits were equal to any displays of this kind we have seen. The far-sighted policy of the committee in upholding all the best traditions of the shows, and their eagerness to keep abreast of the times, have contributed largely to the splendid success of the Shrewsbury shows, whose fortunes have been directed so ably from the very commencement by Messrs. Adnitt and Naunton. The resignation of these gentlemen last year from the secretaryship caused widespread regret, and a movement was set on foot to mark the close of their connection with the society in a fitting manner. The Veitch Memorial Trustees bestowed a Veitch Memorial Medal on each gentleman, and it was a gracious act of the Royal Horticultural Society to confer the Honorary Fellowship of the premier society in the country, together with the R.H.S. Diploma. A sum of £250 was also subscribed as a testimonial, and the presentations were made at the luncheon on the opening day, when the President of the Society, E. P. Fielden, Esq., referred in feeling terms to the absence of Mr. Adnitt owing to ill health. Mr. Fielden presented each gentleman with a cheque for £150, and Sir Harry Veitch bestowed the other awards on behalf of the Veitch Memorial Trustees and the Royal Horticultural Society.

With respect to the show itself, the exhibits of fruit were good, but not exceptional. Groups of plants were splendid, as were also the specimen plants, Begonias, Sweet Peas, Roses, and hardy flowers. The new class for rock gardens was very popular, and these exhibits attracted a large amount of attention. Vegetables were excellent. The exhibits by traders reached a high standard of excellence, and gold medals were awarded freely.

In the competitive classes the entries were numerous, and in nearly all cases the contest was keen.

The weather was beautifully fine, and the attendance on the opening day is said to have been easily a record one, although no figures were available.

The new secretary, Mr. W. G. Brazier, upon whose capable shoulders has fallen the task resigned by Messrs. Adnitt and Naunton, is to be congratulated on such a splendid initial year, and the thanks of all are due to him for his courtesy and ready help.

Champion Decorated Fruit Tables.

The exhibits of fruit were good, but scarcely equal to those of some previous years. The class for a decorated table of indoor fruit is, perhaps, the principal item in this section, and it attracts some of the best growers of fruit in the country, so that a good competition is always assured. On this occasion there were fewer exhibits than usual, and we specially missed the fine collection usually contributed from the Duke of Portland's garden.

There are only three exhibits, each consisting of 30 dishes of ripe fruit in not fewer than nine distinct kinds. Grapes were restricted to 14 bunches in not fewer than four varieties. The schedule also stipulated that not more than four varieties of any other kind of fruit, nor more than two dishes of any one kind, were to be included, and only one variety to be shown on a dish, but not more than four dishes of any one kind of fruit. The sum of £72 10s. was offered in four prizes, the winner to receive £25, the 2nd £20, and the 3rd £17 10s. On former occasions points have been awarded for the decorations, but this time the flowers and foliage did not count. The three exhibits were all good, and, after careful pointing, the judges awarded the 1st prize to the Duke of Westminster, Eaton Hall, Chester (gr. Mr. N. F. Barnes). The grapes in the premier exhibit were good, especially Madresfield Court. Eleven points were awarded for Muscat of Alexandria, 10 for all other Muscat varieties, both black and white, and 9 for all other kinds. We enumerate the varieties of fruits exhibited and the points awarded for each. Apples: Cox's Orange Pippin, Gascoyne's Scarlet Seedling, Cox's Orange Pippin, Chas. Ross (6½ points each). Figs: Brunswick (5½), Brown Turkey (6). Grapes: Muscat of Alexandria (8½, 6½, 7, 6½), Madresfield Court (8½, 8, 9, 7½), Appley Towers (7, 7, 6½, 7), Chasselas Napoleon (6½, 7½). Melons: Eaton Seedling (6½, 7), Eaton Green Flesh (6½), Hero of Lockinge (5½). Nectarines: Pineapple (7, 6), Dryden (5), Dymond (5½). Peaches: Merlin (6½, 6½), Royal George (6, 6). Pears: Marguerite Marillat (6½), Louise Bonne of Jersey (6), Doyenné du Comice (5½, 5). Plums: Jefferson (5½) The total number of points was declared to be 240. The decorations consisted of Francoa ramosa, Montbretias, and Oncidium incurvum, with light foliage. The 2nd prize was awarded to Lady Henry Somerset, Eastnor Castle (gr. Mr. G. Mullins), who gained 217 points. The Grapes included splendid bunches of Gros Maroc. Emperor Alexandria Apples, Marguerite Marillat Pears, and Elruge and Lord Napier Nectarines were other outstanding dishes. Peaches were not so fine as we have seen them The decorations were Souvenir de la Malmaison and pale pink Perpetual Carnations, interspersed with Francoa and relieved by sprays of Ampelopsis and greenery. 3rd, Earl of Harrington, Elvaston Castle, Derby (gr. Mr. J. H. Goodacre), with 213½ points. His best Grapes were Muscat Hamburgh, the four bunches of this variety having great excellence. The next best were Black Hamburgh, whilst the berries of Madresfield Court showed splendid finish. The Muscat bunches were unusually small, but the berries were very clean and well ripened.

Collections of Fruit.

Collection of 12 *Dishes of Fruit.*—There were only two exhibits in this class, which called for 12 distinct varieties in not fewer than nine kinds and not more than two varieties of a kind. Black and white Grapes were considered distinct kinds for purposes of the competition. It is a pity the contest was not keener, for the two exhibits shown set a remarkably high standard of excellence. A superb collection shown by the Duke of Newcastle was placed 1st. Humboldt Nectarines, Crimson Galande Peaches, Negro Largo Figs, Wealthy Apples, and a large yellow-skinned Melon were all superb. The Grapes were represented by Muscat of Alexandria, Madresfield Court, and Black Hamburgh; 2nd, E. Bewley, Esq., Rathgar, Dublin (gr. Mr. McIntosh). This exhibitor had exceptionally good Peasgood Nonesuch Apples, and Marguerite Marillat and Souvenir du Congrès Pears. The Grapes were very good, Madresfield Court and Muscat of Alexandria especially, but they were not quite ripe.

Collection of 9 *Dishes*—1st, Captain Heywood Lonsdale, Shavington Hall (gr. Mr. J. Mills), with Peaches Barrington and Royal George, Nectarines Stanwick Elruge and Pineapple, Apple James Grieve, Figs Brown Turkey, Melon New Peerless, Grapes Madresfield Court and Muscat of Alexandria. The Grapes were on the small side, but well finished. 2nd, Col. Mainwaring Jacson, West Felton (gr. Mr. W. Willdig). The Nectarines were the finest fruits in this collection. 3rd, A. Heber Percy, Esq., Hodnet Hall.

Grape Classes.

The Champion Grape Class, for twelve bunches in four or more distinct varieties, but not more than four bunches of any one variety, brought eight competitors and a keen contest. Taking the exhibits as a whole, they were of good average quality, but nothing remarkable. The black varieties were good generally, especially Black Hamburgh and Madresfield Court. There was rather a sameness about the decorations, as nearly everyone employed pink Carnations, interspersed with Francoa and Grasses. The exhibit that pleased us most was decorated with Gloriosas and two finely-coloured Codiæums (Crotons) at the back. The 1st prize was won by the Duke of Newcastle, Worksop (gr. Mr. S. Barker), and the award was made for the excellence of quality, as the bunches were much smaller than many others. The berries were clean, splendidly coloured, and well ripened. They were awarded 99½ points out of a maximum of 124.

The varieties and points were as follows:—

		Maximum No. of Points.		Points Awarded.
1.	Black Hamburgh	10	...	9
2.	Madresfield Court ...	10	...	9½
3.	Muscat of Alexandria	11	...	9
4.	Muscat Hamburgh ...	10	...	9½
5.	Muscat of Alexandria	11	...	9½
6.	Madresfield Court.....	10	...	8½
7.	Black Hamburgh	10	...	8½
8.	Madresfield Court.....	10	...	8
9.	Muscat of Alexandria	11	...	6½
10.	Madresfield Court.....	10	...	8
11.	Muscat of Alexandria	11	...	6½
12.	Black Hamburgh	10	...	7
	Total	124		99½

The 2nd prize was awarded to the largest bunches in the show, exhibited by Lord Rowallan, Kilmarnock (gr. Mr. J. Dixon), who was beaten by one point, his figures being 98½ out of a maximum of 123 points. The bunch of Gros Maroc was superb, and received the maximum number of points. Next to this was a splendid piece of Muscat of Alexandria, a trifle green in berry; Madresfield Court and Muscat Hamburgh dropped two points each for unripeness. The bunches of Madresfield Court were splendid in size of bunch and berry, and only needed a little longer time to assume a better finish. 3rd, Earl of Harrington, with 96 points out of a possible 122. 4th, Lady Henry Somerset, with 94 points out of 122.

Four Bunches of Grapes.—The schedule called for two bunches of a black variety and two of a white variety; competitors in the Champion Grape Class were excluded. There were five exhibits, and the 1st prize was awarded to Capt. Heywood Lonsdale, Shavington (gr. Mr. J. Mills), who showed Madresfield Court and Muscat of Alexandria. The Muscats were large, but rather irregular, bunches, with big, finely-coloured berries. 2nd, Col. H. C. Legh, Knutsford (gr. Mr. A. J. Cook), who showed the same varieties. The Muscats were large, "lumpy" bunches, with rather green berries; the black Grapes were excellent in shape and finish. 3rd, E. Bewley, Esq., Dublin (gr. Mr. D McIntosh).

Two Bunches of Black Hamburgh.—This popular black Grape was shown by ten competitors, the best by the Earl of Harrington, who had compact bunches with berries as black as Sloes and of good size. The 2nd prize was awarded to Lord Rowallan, Kilmarnock (gr. Mr. J. Dixon), whose bunches were much larger but not so well finished. 3rd, Lady Henry Somerset, Eastnor Castle (gr. Mr. G. Mullins).

One Bunch of Black Hamburgh.—The finest single bunch of this variety was shown by Lord Rowallan. The bunch was the largest of eleven and the berries were well coloured. 2nd, H. St. Maur, Esq., Newton Abbot (gr. Mr. G. Richardson). 3rd, The Duke of Newcastle, Worksop (gr. Mr. S. Barker).

Two Bunches of Black Grapes, Muscat Varieties.—Only four exhibits were forthcoming in this class, and the 1st prize was won by the Earl of Harrington with the variety Muscat Hamburgh of good average quality. 2nd, H. St. Maur, Esq., with Mrs. Pince variety. 3rd, Col. H. C. Legh, Knutsford (gr. Mr. A. J. Cook).

Two Bunches of Madresfield Court.—This splendid variety was also shown by four ex-

hibitors, and Col. Legh was awarded the 1st prize for shapely bunches, carrying good bloom on the berries, which were excellent in size and shape. 2nd, the Earl of Harrington, with less shapely, but finely finished, bunches.

Two Bunches of Black Alicante.—Lady Henry Somerset excelled easily in this class with very large bunches. The only other exhibit was shown by Lord Joicey, Newtown (gr. Mr. Jackson), and was awarded the 2nd prize.

Two Bunches of any other Black Grape.—This was a good class, and Lord Rowallan was placed 1st for Gros Maroc, with much the largest berries—a splendid exhibit. 2nd, Lady Henry Somerset, with the same variety, but much smaller in berry.

Two Bunches of White Muscats.—The Muscat Grapes generally had not the rich amber colour seen in some seasons, and the largest bunches were quite green. But those shown by Lord Seaforth, Braham Castle (gr. Mr. W. Campbell), were well ripened, and the bunches possessed good shape and size; the 2nd prize was awarded to the Duke of Newcastle, whose bunches, though the smallest, were splendidly finished; 3rd, Hugh Andrews, Esq., Winchcombe (gr. Mr. J. R. Tooley).

Two Bunches of White Grapes of any Other Variety.—The Duke of Newcastle won the 1st prize in this class with Buckland Sweetwater, superbly finished and perfectly coloured; 2nd, Mrs. F. Alderson, Oswestry (gr. Mr. G. Davies), with the same variety, larger in berry and bunch, but greener than those in the 1st prize exhibit.

Classes were provided for growers in the county of Salop, and the prizes were awarded as follows:—*Black Hamburgh*, 1st, Lady Mary Herbert, Market Drayton (gr. Mr. J. Birch); 2nd, Capt. Heywood Lonsdale. *Madresfield Court*, 1st, Capt. Heywood Lonsdale; 2nd, Col. Mainwaring Jacson, West Felton (gr. Mr. W. Willdig). *Any other black variety*, 1st, Col. Mainwaring Jacson, with Gros Maroc. *Muscat of Alexandria*, 1st, Captain Heywood Lonsdale. *Any other white variety*, 1st, Mrs. F. Alderson, Oswestry (gr. Mr. G. Davies), with, apparently, Buckland Sweetwater.

Other Kinds of Fruits.

Peaches.—The exhibits of Peaches were not so good as usual, except the winning dish (of the variety Bellegarde), shown by the Duke of Westminster, Eaton Hall, Chester (gr. Mr. N. F. Barnes); 2nd, Lady Henry Somerset, with Dymond. There were fourteen competitors in this class.

Nectarines.—These fruits were smaller than usual, but they were finely coloured. The 1st prize was awarded to the largest fruits, shown by Egerton Leigh, Esq., Holmes Chapel (gr. Mr. H. Bateman). The variety was Pineapple and the colour was excellent. 2nd, Duke of Newcastle, with the same variety.

Apricots.—The 1st prize for these fruits was won by A. Stanley Hughes, Esq., Bicton Heath (gr. Mr. J. Nuttall); 2nd, Major R. A. Newill, Admaston (gr. Mr. W. Ashwood). Neither exhibit was of more than mediocre quality.

Melons.—Prizes were offered for (1) green-fleshed varieties, (2) scarlet-fleshed varieties, (3) any other variety open only to growers in the county of Shropshire. The best fruit with green flesh was shown by Lady Henry Somerset; the variety was Emerald Gem, a large, finely-netted fruit. 2nd, Miss Baird, Malvern. For a scarlet-fleshed variety the 1st prize was awarded to Col. H. C. Legh; 2nd, Col. Mainwaring Jacson. The county prize for Melons was won by R. L. Kenyon, Esq. (gr. Mr. J. Durnall), for a very small, green-fleshed fruit.

Plums.—The exhibits of Plums were very few. There were four competitors in the class for Gages, and the 1st prize was awarded to Oullin's Golden, shown by the Earl of Harrington; 2nd, C. A. Cain, Esq., Welwyn (gr. Mr. T. Pateman), with Transparent Gage.

Mr. Cain was the only exhibitor in the class for twelve yellow Plums, and he was awarded the 1st prize.

In the class for purple or red Plums, the Earl of Harrington showed best of four competitors with the variety Kirks; 2nd, Mr. Kenyon, with the same variety.

Groups of Plants.

Group of Miscellaneous Plants Arranged in a space of 250 sq. feet.—Were it not for the excellence of the plants and the skill displayed in their arrangement the continued successes of Messrs. J. Cypher and Sons, Cheltenham, in this premier group class would be monotonous. Good as were the other two exhibits, there could be no question as to the judgment which awarded Messrs. Cypher the 1st prize. The cork-covered arch at the back of the group continues to play an important part in the design of these displays, but on the present occasion the skilful arrangement of the trailing plants, which formed a thin veil, and a few flowering plants—Ixoras, Liliums, and the bright-foliaged Nandina domestica—below and beyond the archway, gave the impression of distance, and instead of being at the back of the group this arch appeared to be in the middle distance. In the remainder of the group the first impression was that of gorgeous Codiæums (Crotons) rising gracefully from mounds of Oncidiums, Odontoglossums, smaller Codiæums, and Caladium argyrites.

The 2nd prize was won by Sir G. H. Kendrick, Whetstone, Edgbaston (gr. Mr. J. V. Macdonald), with a very bright and tasteful group arranged on lines similar to those which gained the 1st prize. The plants were every bit as choice as in the other—the Codiæums were even better—and it was a delightful group, but it fell short of first place in its perspective. 3rd, Mr. W. R. Manning, Dudley, who used splendid plants of Ixora Duffii and many good Orchids in a pleasing collection.

Group of Hardy Flowering Plants and Aquatics.—As with the group of tender exotics, the 1st prize exhibit in this class showed the effects of the master mind. Messrs. Gunn and Sons, Olton, Warwickshire, made one of the most pleasing groups of hardy flowers that we have ever seen. It has often been said, and with much truth, that the exhibits of hardy border flowers are, as a rule, painfully formal and overcrowded, but the most captious critic could not find this fault with Messrs. Gunn's contribution, which could be reproduced in the garden, where, indeed, it would be even more attractive by reason of the natural background it would have. Bold groups of double Hollyhocks, dwarfed but equally effective clumps of Liliums, of Campanula pyramidalis, Galtonia candicans, Gladiolus, and the like rose up amongst the dwarfer Gaillardias, Phloxes, Scabious, and other plants. The rock-bound pool containing good Nymphæa blooms was also a charming item; 2nd, Messrs. W. Artindale and Son, Sheffield.

County of Salop Class.—There were four exceedingly creditable groups in the county class, which allows a space of 100 sq. feet. The 1st prize was awarded to Mr. Bernard Howson, Market Drayton, whose design was somewhat on the lines of the groups in the open class. The rigid formality of the square archway at the back gave a quaint and distinctive character to the arrangement, which contained especially well-coloured Codiæums; 2nd, A. W. Barber, Esq., Wellington (gr. Mr. F. Bremmell), whose effort did not please us so much as that of Mrs. F. Burd, Shrewsbury (gr. Mr. M. Edwards), which received the 3rd prize.

Group of Begonias.—Messrs. Blackmore and Langdon, Bath, won the 1st prize with a splendid collection, which was composed almost solely of double tuberous varieties of excellent quality. Two little groups of the tall, single B. Martiana grandiflora gave an added interest to this superb collection. The hanging baskets of the varieties Lena and Golden Shower bore a profusion of blooms; 2nd, Messrs. T. S. Ware, Ltd., Feltham, Middlesex, who arranged a bank of magnificent double-flowered tuberous Begonias. The blooms were characterised by great size and rich, pure colouring.

Specimen Plants.

Fifteen Stove and Greenhouse Plants.—On this occasion Messrs. J. Cypher and Sons may well be said to have excelled themselves, for they exhibited what was probably the finest collection of trained plants which has ever been seen. The immense plants of Erica Ewerana, Ixora Duffii, and Statice Gilbertii, for instance, bore a profusion of bloom; 2nd, Mr. W. R. Manning, Dudley.

Thirty Stove and Greenhouse Plants.—The object of this class was to illustrate the ornamental value of tender exotics growing in comparatively small pots, and for this reason the maximum size of pot allowed was 10 inches in diameter. Messrs. Cypher won the 1st prize. Their collection was very rich in Ixoras, of which genus the large, vivid crimson trusses of I. Duffii, the orange-coloured I. Pilgrimii, and I. Regina, which bears compact round trusses of bright, terra-cotta-coloured blooms were exceptionally good; 2nd, Mr. W. R. Manning.

Major-General Sir Francis Lloyd, Aston Hall, Oswestry (gr. Mr. W. T. Stannard) exhibited 6 excellently Dracænas in relatively small pots, for which the 1st prize was awarded; 2nd, Mr. W. R. Manning.

Fuchsias were a strong class; Messrs. J. Wright and Sons won the 1st prize, and Mr. H. Howells the 2nd.

The class for 6 Zonal Pelargoniums was the best in these smaller classes, the 1st prize plants, shown by Messrs. J. Wright and Sons, being especially good; 2nd, Messrs. H. Cliff and Sons.

Tuberous Begonias were shown in very good condition; the best were from Mr. T. Hammond, Shrewsbury; 2nd, Messrs. J. Wright and Sons, Leicester.

Mr. F. Hammond, Shrewsbury, showed the best 4 Begonias. The 1st prize for single and double-flowered Zonal Pelargoniums in pairs was won by Messrs. H. Cliff and Sons, Salisbury.

There were many good exhibits of 4 Exotic Ferns; the 1st prize was won by Capt. Heywood, Lonsdale; 2nd, Messrs. J. Wright and Sons. For 12 Gloxinias the chief award was won by Messrs. J. Wright and Sons, Leicester; 2nd, Mr. J. Farrant.

County of Salop Classes.

Besides the competition in the class for a group of miscellaneous plants in a space of 100 square feet, the following classes were reserved for growers in the county:—

Twelve Miscellaneous Plants.—The 1st prize was awarded to Mr. B. Howson, Market Drayton, who showed a good variety of well-grown plants; 2nd, Mrs. F. Alderson, Oswestry (gr. Mr. G. Davies).

Six Stove and Greenhouse Plants.—The 1st prize was won by J. Farrant, Esq., Shrewsbury, who included especially good plants of Clerodendron Balfouri and Statice profusa in his collection; 2nd, G. Burr, Esq., Shrewsbury (gr. Mr. A. Jones).

Sweet Peas.

There were sixteen entries in the class for eighteen bunches, distinct. The 1st prize was won by Mr. T. Jones, Ruabon, with splendid blooms, including the varieties Melba, Thomas Stevenson, Dobbie's Cream, Prince George, R. F. Felton, Audrey Crier (a grand vase), Etta Dyke, Marjorie Linzee, Edsom Beauty, Marks Tey, Rosabelle and Agricola. This exhibit was noteworthy for fine colour and general good quality, while the arrangement was all that could be desired. 2nd, Mr. J. Haycocks, Welshpool, whose flowers, though good, lacked the large size and finish seen in the 1st prize exhibit. Duplex, Dorothy, Maggie Stark, Thomas Stevenson and Lady Miller being the best varieties. 3rd, G. H. Garnet Orme, Esq., Skipton. These blooms also were good, Doris Usher, Barbara, and Lady Miller being especially fine. 4th, Mr. G. Bowness, Bushby, Glasgow. This grower was placed 1st last year, but the variability of the season no doubt accounts for his being lower in the prize list.

The class for twelve bunches distinct was also very strongly contested, the 1st prize in this class being awarded to Mr. Stewart Robinson Kingdon, Hereford, who had a wonderfully even exhibit of clean blooms. The varieties were Mrs. C. W. Breadmore, King Manoel, Hercules, R. F. Felton, Lavender G. Herbert, Thomas Stevenson, White Queen, Mrs. Routzhan, Prince George, Elfreda Pearson, Lady Miller and Anglia Pink. 2nd, Mr. W. H. Holloway, Port Hill, who had Inspector, Mrs. E. Cowdy, John Ingman and Thomas Stevenson in excellent condition. 3rd, Colonel Cornwallis West, Ruthven Castle.

The class for six varieties produced very strong competition, Mr. J. Roberts, Grisford, winning with King Manoel, Melba, Hercules, Charles Foster, John Ingman and White Queen. 2nd, Mr. H. Robinson, whose bunches of Edith Taylor, Amber and Hercules were very good. 3rd, Mr.

E. Price, Skipton. The varieties Barbara and R. F. Felton were of outstanding merit in this exhibit.

Roses.

The competition for the Silver Challenge Bowl was exceptionally good, and there were many splendid collections. The 1st prize was awarded to Messrs. Gunn and Sons, Olton, Warwickshire, who tastefully arranged tall stands of Polyantha varieties and of Lady Alice de Rothschild, Lady Hillingdon, Molly Sharman Crawford. The groundwork was composed of a great number of distinct varieties, the most noticeable being Rayon d'Or, Geo. C. Waud, Lyon Rose, Mrs. Theodore Roosevelt, Juliet, Lady Ashtown, and Lady Pirrie; 2nd, Messrs. Hugh Dickson, Ltd., Dublin, whose collection was stronger in the large-flowered sorts, but not equal to the first in the Polyantha and other free-flowering varieties. Chief amongst the former were Wm. Cooper, Mrs. John Laing, Mrs. James Lynas, Charles H. Douglas, Muriel Dickson, and Hugh Dickson; 3rd, Mr. John Mattock, New Headington, Oxford, who set up tall stands filled with such varieties as Irish Elegance, Irish Glory, Lady Pirrie, Duchess of Wellington, as well as low bowls of cut blooms.

Eighteen Cut Roses.—The 1st prize was awarded to Mr. G. Speight, Market Harborough, for a praiseworthy collection, which included Mme. de Ganey, Mme. Jules Gravereaux, and J B. Clark; 2nd, H. Garnet Rolt, Esq., Hay

Twelve Vases of Decorative Roses.—Mr. J. Mattock, Oxford, who won the 1st prize, showed a beautiful collection, chief amongst which were Duchess of Wellington, Mrs. Alfred Tate and Irish Elegance; 2nd, Messrs. W. and J Brown, Peterborough. The 1st prize in a moderate class for 12 cut Roses was awarded to Miss H. Leeke, Shifnal, Byton.

The finest Zonal Pelargoniums in twelve trusses were shown by Mr. E. Bewley, Dublin (gr. Mr. D. McIntosh); 2nd, Mr. A. Myers, Shrewsbury. These exhibitors reversed positions in the class for double varieties.

The summer-flowering Chrysanthemums were a trifle disappointing. The exhibits did not display the value and beauty of this section. 1st, Mr. H. Woolman, Shirley; 2nd, Mr. G. Bowness, Glasgow.

The 1st prize for 12 bunches of hardy flowers was won by E. H. Shorting, Esq., Broseley (gr. Mr. H. Bentley). Messrs. G. Mair and Son, Prestwick, showed a very good collection of 24 Gladiolus spikes, and deservedly won the 1st prize; the Marquis of Northampton, Castle Ashby (gr. Mr. A. R. Searle) similarly excelled in the class for 12 Gladioli.

The best 12 Asters were shown by Messrs. H. Clark and Sons, Leeds.

Carnations.

Two classes were provided for Carnations, the one for a collection of American Tree or Perpetual-flowering varieties arranged in a space measuring 15 feet by 4 feet, the other for a collection of cut blooms arranged in a space 6 feet by 4 feet, Tree Carnations being excluded. In the larger class there were four competitors, and all showed finely. The 1st prize was won by Mr. Chas. Wall, Bath. The blooms of Lady Fuller, salmon pink (new), Mrs. C. W. Ward, R. F. Felton, Carola, White Wonder, and Scarlet Glow were uncommonly good and arranged with taste; 2nd, Messrs. Young and Co., Hatherley, who showed Mrs. Raphael, a variety of the perpetual-blooming type, with flowers like a "Malmaison" variety; the colour is cherry red.

In the smaller class the 1st prize was won by Mr. C. H. Herbert, Acocks Green; a well-arranged group of excellent blooms. 2nd, Messrs. A. R. Brown, Ltd., King's Norton.

Dahlias.

Messrs. Keynes, Williams and Co., Salisbury, were awarded the 1st prize in the class for a collection of Cactus or Decorative Dahlias. The exhibit appeared to be rather overdone with greenery, but the quality of the flowers was good; 2nd, Mr. J. E. Knight, Wolverhampton.

Messrs. Keynes, Williams and Co. showed the best 12 Pæony-flowered Dahlias, and Mr. T. Jones, Ruabon, the best 12 Collerette varieties, whilst Lady Florence King, Hereford (gr. Mr. J. Davies), won the 1st prize in the class for 12 Cactus varieties with a very good collection.

Twelve Varieties of Cactus Dahlias.—The 1st prize collection from Messrs. Bottomley and Burton, Elland, was a magnificent contribution; 2nd, Messrs. G. Fairburn and Sons, Carlisle. Messrs. Bottomley and Burton also won easily the 1st prize offered for 24 Cactus Dahlias; 2nd, Messrs. H. Clarke and Son, Leeds.

The Rock Gardens.

Although the Rock Gardens were placed in a far corner of the grounds, this new feature of the Shrewsbury Show attracted an immense amount of attention. Throughout both days a constant stream of visitors paid interested attention to the various gardens. It was instructive to note the discrimination displayed by the visitors, the majority of whom at once selected the best of the gardens. The 1st prize was awarded to Mr. T. R. Hayes, Keswick, Cumberland, who built an exceedingly pleasing low rockery; the old weather-worn stratified boulders were placed with art and planted with a pleasant variety of appropriate subjects. On the higher levels, at the back, small Pinus austriaca, Junipers, weeping Yews, and the like, simulated stunted Alpine trees. A large number of Heaths and Heathers (Erica Watsonii, E. vagans alba, E. mackaiana plena and others, as well as Menziesia polifolia) were effectively placed, as also were various Campanulas, Primula capitata, Sedums, and Alpine Poppies; 2nd, Mr. J. Wood, Boston Spa, who displayed great skill in placing the boulders, but whose planting was too thin, and the pool insufficiently furnished with Water-lilies; 3rd, Mr. J. E. Knight, Wolverhampton.

Hardy Flowers.

Messrs. Harkness and Sons, Bedale, led in the class for twenty-four bunches of hardy flowers, arranged in a space 8 feet by 4 feet. There were three other exhibits, and all were of excellent quality. Messrs Harkness showed splendid Oriental Poppies, large Gaillardias of the variety Mrs. Mackellar, Chrysanthemum maximum, Verbascum hybrids, Lupins, Phlox F. H. Buchner (a fine white variety), Gladioli, and Iceland Poppies; 2nd, Messrs. Artindale and Sons, Sheffield; 3rd, Messrs. Bull and Co., Frome.

The best twelve bunches of cut flowers of hardy or half-hardy annuals were shown by Mr. W. H. Banks, Kington; 2nd, Mr. A. E. Humphreys Owen, Berriew.

Decorative Classes.

The best bouquet of Roses was shown by Messrs. R. Felton and Sons, Hanover Square, who utilised the pretty Sunburst variety. The best hand bouquet (Orchids included) was also shown by Messrs. Felton and Sons. The best bouquet (Orchids excluded) was staged by Mr. A. Adshead; 2nd, Messrs. Felton and Sons, who excelled in the class for a shower bouquet of Carnations—a very charming bouquet made of the variety Empire Day, with contrasting ribbon of old rose colour. 2nd, A. Adshead, who employed the variety Winsor. For a basket decorated with Orchids Mr. J. Sherratt was placed 1st, with an enormous basket of Vandas, white Phalænopsis, Oncidiums, etc. 2nd, Messrs. Felton and Sons, with a smaller but very tasteful arrangement of Odontioda Charlesworthii, Cattleyas, and Charlesworth's Hybrid Oncidiums, with a suggestion of Thalictrum dipterocarpum. The best basket of flowers for the hand was shown by Messrs. Felton and Sons, who used Rose Sunburst and brown foliage. 2nd, A. Adshead, with Carnations and Francoa ramosa.

New Plants.

Certificates of Merit were awarded to *Rose Moonlight*, a free-flowering semi-double variety, in which the white petals delicately contrasted with the rich golden stamens, and *Rose Danae*, a pale yellow cluster Rose, which also has a very long-flowering period. Both were shown by the Rev. J. H. Pemberton.

Awards of Merit were granted to *Sweet Pea Constance Hinton*, shown by Hammond T. Hinton, Esq., Heytesbury, Wiltshire (gr. Mr. W. Kitlow); *Cactus Dahlia Grenadier* and *Collerette Dahlias Tusker* and *May*. All three varieties were shown by Messrs. Dobbie and Co, Edinburgh.

Vegetables.

Many of the exhibits in these classes were of splendid quality, and there were numerous entries in the various classes for collections. Of the single dishes the Peas, Beans, Celery, Cauliflowers, Tomatos, and Cucumbers were exceptionally fine.

Twelve Distinct Kinds.—In this open class the 1st prize was awarded to Hon. Vicary Gibbs, Elstree (gr. Mr. E. Beckett), for a splendid collection, in which the finest items were Peas, Runner Beans, Tomatos, Cucumbers and Leeks; 2nd, Mr. H. Andrews, Winchcombe; 3rd, Mr. T. Sanderson, Whittington. The best 9 distinct kinds in the open class were arranged by F. Bibby, Esq., Hardwicke (gr. Mr. J. Taylor), whose splendid Cauliflowers, Leeks and Potatos received the full number of points; 2nd, Capt. Heywood Lonsdale, Shavington (gr. Mr. J. Mills).

Messrs. Sutton and Sons' Class.—In this class, which required 9 distinct kinds, there were 9 exceptionally good collections. The 1st prize was won by Capt. H. Spender Clay, M.P., Lingfield, Surrey (gr. Mr. D. Gibson), whose exhibits were all well-nigh perfect examples; 2nd, Colonel Cornwallis-West, Ruthin Castle (gr. Mr. H. Forder); 3rd, Hugh Andrews, Esq., Winchcombe, Gloucester (gr. Mr. J. R. Tooley).

Messrs. J. Carter and Co.'s Class.—Of the 8 collections, each of 6 distinct kinds, the best was shown by Mr. F. Barnett, Ellesmere. The Peas (Carter's Quite Content), Tomatos (Duke of York), and Autumn Giant Cauliflower were splendid; 2nd, Mr. E. Deakin, Hay Mill, Birmingham; 3rd, Mr. T. H. Pugh, Newtown.

Messrs. Dickson and Robinson's Class.—The best collection of 9 kinds was shown by the Marquis of Northampton, Castle Ashby (gr. Mr. A. R. Searle), whose best items were long, clear Carrots, Celery, Peas, and Scarlet Runner Beans; 2nd, Mr. T. Jones, Bryn Penylan; 3rd, Mr. F. R. Owen, Haverfordwest.

Messrs. Webb and Son's Class.—The 1st prize was awarded to Mr. E. Winchester, Birmingham, who excelled with Celery, Peas, Tomatos and Cauliflowers; 2nd, H. Andrews, Esq., Winchcombe (gr. Mr. J. R. Tooley); 3rd, H. Watson Smith, Esq., Stourbridge (gr. Mr. H. Davis).

Messrs. Clibrans' Class.—The Marquis of Northampton, who showed magnificent Prize-winner Carrots, Autumn Giant Cauliflowers, and Triumph Tomatos, excelled in this competition; 2nd, Mr. T. Sanderson, Whittington; 3rd, F. R. Dixon Nuttall, Esq., Prescott (gr. Mr. J. W. Barker).

Messrs. R. Sydenham's Class.—Mr. F. Barrett, Overton, Ellesmere, won the 1st prize with the best Parsnips in the show, excellent Gladstone Peas, Autumn Giant Cauliflowers, the Lyon Leeks and Perfection Tomatos; 2nd, Lord North, Banbury (gr. Mr. E. R. James); 2nd, Mr. E. Deakin.

Six Dishes of Potatos.—The 9 collections were of such extraordinary high quality that the judges must have experienced considerable difficulty in awarding the prizes. The 1st was won by Capt. H. Spender Clay, who showed splendid dishes of Factor, Up-to-date, Windsor Castle, and Early Rose; 2nd, P. T. Davies Cooke, Esq.; 3rd, Mr. T. Bullock.

Single Dishes.

In the open classes the 1st prizes were awarded to the following exhibitors:—Mr. A. Bayley, Bayston Hill, for Peas; Mrs. Jenner, Wenvoe Castle, Cardiff, for Spring Onions; Mr. H. L. Collins, for a brace of Cucumbers; Marquis of Northampton, for Tomatos; Mrs. Jenner, for Autumn-sown Onions; Mr. James Wainwright, Nantwich, for Celery; Lady Mary Herbert, Styche (gr. Mr. J. Birch), for Cauliflowers; P. D. Davies Cooke, Esq., Mold (gr. Mr. W. Weaver), for Potatos; Capt. H. Spender Clay, for Runner Beans; Mr. F. Barrett, Ellesmere, for French Beans; Mr. H. L. Collins, Lindley, for Peas; Mr. Jas. Breeze, Coleham, for Turnips; Mr. E. Deakin, for Carrots; and Rev. J. Davies, Crowle Rectory, Worcester, for Parsnips.

Non-Competitive Exhibits.

Messrs. Sutton and Sons, Reading, made an admirable display of flowers, fruits and vegetables, representing the seed specialities of the firm. The exhibit included most vegetables in season—fine new red Intermediate Carrots, Purity Cauliflowers, Dwarf Gem Brussels Sprouts,

excellent Duke of Albany Peas, Tomatos in variety, Onions, Beets, Potatos and many other kinds. Melons were a feature on tall stands, and at the back were Antirrhinums, Asters, Scabious, Coreopsis and other flowers, with banks of Gloxinias at either end, and here and there vases of the Red Sunflower. (Large Gold Medal.)

Messrs. Pipers, Bayswater, exhibited border flowers in great excellence and variety. Liliums were represented by L. longiflorum giganteum, L. auratum, L. speciosum, and L. tigrinum; other features were the clear yellow Gaillardia Lady Rolleston, Lychnis chalcedonica rubra plena and Delphinium Moerheimii. This firm also showed numerous varieties of Pæony-flowered Dahlias. (Small Gold Medal.)

Messrs. Isaac House and Son, Westbury-on-Trym, staged border Phloxes in all the newer and choicer varieties; also other border flowers and pans of Alpines. (Small Gold Medal.)

Messrs. R. Wallace and Co., Colchester, exhibited hardy flowers. A large batch of Montbretias included most of the fine varieties raised by Mr. Davison, of which the beautiful Star of the East had no peer. Gladioli, Liliums, Phloxes, Tritomas, Delphiniums and other kinds were shown splendidly. (Small Gold Medal.)

Messrs. Forbes, Ltd., Hawick, contributed Pentstemons, Phloxes, Pansies, Violas, Gaillardias and other border flowers, also numerous varieties of border Carnations. This firm's Pentstemons and Phloxes were equal to any in the exhibition. (Small Gold Medal.)

Messrs. J. Gibson and Co., Bedale, Yorkshire, showed splendid border flowers, for which a Silver Medal was awarded.

Messrs. Dobbie and Co., Edinburgh, had one of the finest exhibits in the largest tent in their display of Collerette Dahlias, Sweet Peas and Roses. The Sweet Peas were magnificent, and arranged with fine colour effect. King White, Dobbie's Thomas Stevenson, Lavender George Herbert, Doris Usher, Edrom Beauty, Mrs. Cuthbertson, Edith Taylor and Melba are a selection of the best varieties. (Large Gold Medal.)

The fine exhibit staged by Messrs. Dickson and Robinson, Manchester, attracted more than usual interest as much for boldness of design as for the quality of the subjects employed. It consisted of a display of fruits, flowers, and vegetables arranged against a dark cloth background. In the centre was a mass of rosy-scarlet Larkspur encircled by an archway of Scabious; Liliums and Gaillardias were displayed similarly. In the front were many kinds of fine vegetables. (Large Gold Medal.)

Messrs. James Veitch and Sons, Ltd., Chelsea, filled a recess in the large tent with a crescent-shaped group of foliage and flowering plants of superb quality. Magnificent Pitcher plants (Nepenthes Curtisii superba, N. Sir W. T. Dyer, etc.) rose high from mounds of Liliums, of Cannas and the like arranged with Ferns and other foliage plants, whilst in the background there were many specimen foliage plants. A central collection of Orchids included Cœlogyne pandurata, Odontoglossum grande, Cattleya aurea, C. Gaskelliana, and many fine Cypripediums. (Large Gold Medal.)

Messrs. L. R. Russell, Richmond, displayed a unique collection of magnificent Tree Ivies, which contained a wonderful variety of form and colouring. (Small Gold Medal.)

Messrs. E. Webb and Sons, Stourbridge, filled a long stretch of tabling in one of the larger tents with a tasteful collection of flowers, fruits and vegetables. The first-named predominated, and included a central group of Liliums, chiefly L. auratum, and several arches of Sweet Peas. Many dishes of Tomato Webb's New Emperor, showed the excellent shape and colour of this splendid variety. (Large Gold Medal.)

Messrs. Alex Dickson and Sons, Newtownards, Co. Down, festooned a large number of cut Roses in a very attractive manner. The varieties used were Irish Fireflame, Lady Greenall, Red Letter Day, Carine, etc., whilst the show boxes contained a large assortment of H.T. varieties in splendid condition. (Large Gold Medal.)

Messrs. H. B. May and Sons, Upper Edmonton, sent a large and choice collection of their well-known indoor Ferns, including very many rare and valuable species. There were dainty little plants of Adiantum lineatum, Notholæna rufa, Asplenium Berlangeri and Nephrolepis Millsii, besides many Gymnogrammes and larger kinds. (Silver-gilt Medal.)

Mr. H. N. Ellison, West Bromwich, arranged on a semi-circular shaped table a collection of stove and greenhouse Ferns, and plants of the graceful Phœnix Roebelinii, the best Palm for dwelling rooms. (Silver Medal.)

Messrs. John Peed and Son, West Norwood, showed many excellent plants of various Caladiums, of which King George V., Madame Jules Picot, Rufus, Princess Olga and Red Indian were the brightest and most attractive. Along the front of these well-grown Caladiums there were boxes of Gloxinia and Streptocarpus blooms of very desirable strains. (Silver-gilt Medal.)

Messrs. Kerr and Sons, Liverpool, staged a collection of especially well-grown Codiæums (Crotons), all of a size suitable for table decoration, and of vivid colouring. (Silver Medal.)

Mr. Maurice Prichard, Christchurch, Hants, set up a fine collection of hardy border flowers. The quality of this exhibit was excellent, and the outstanding items were Kniphofia Glow, rich dark-blue Delphiniums, and splendid herbaceous Phloxes. (Silver-gilt Medal.)

Messrs. Hewitt and Co., Birmingham, staged a pleasantly arranged collection of cut border flowers. (Silver-gilt Medal.)

Messrs. James Vert and Sons, Saffron Walden, Essex, contributed double Hollyhocks of great merit. (Silver-gilt Medal.)

Mr. G. Reuthe, Keston, Kent, showed a great number of rare and uncommon shrubs and plants. Amongst the former we noted Indigofera Gerardiana, Eucrypha pinnatifolia, Potentilla humilis, Fagus fusca, F. Menziesii, F. cliffortioides and Arctostaphylos tomentosa. (Silver Medal.)

Messrs. Bakers, Wolverhampton, arranged a series of pools in front of rock work, and flanked by a large collection of hardy border flowers. (Large Gold Medal.)

The Craven Nursery Company, Clapham, Yorkshire, exhibited in a stand various Pines and rock garden plants. The latter included such rarities as Eritrichium nanum, Campanula Zoysii, Primula Auricula ciliata, and P. sibirica. (Silver Medal.)

Mr. Amos Perry, Enfield, Middlesex, filled a very large space with a raised Water-lily pool, groups of Delphiniums, an enormous quantity of the excellent Achillea Perry's White, and many choice hardy Ferns. (Large Gold Medal.)

Mr. James Box, Haywards Heath, Sussex, showed a very large collection of border flowers, which encircled a Water-lily pool. Chief amongst the border flowers were excellent spikes of herbaceous Phloxes, Gladiolus, and Delphiniums. (Small Gold Medal.)

Messrs. Caldwell and Sons, Knutsford, showed a variety of border flowers. (Silver Medal.)

Messrs. Rich and Co., Bath, also showed various border flowers. (Silver-Gilt Medal.)

Messrs. Bees, Ltd., Liverpool, showed various border flowers, and a very good collection of Cut Roses.

Messrs. W. H. Simpson and Sons, Birmingham, showed Antirrhinums, for which a Silver Medal was awarded.

Messrs. Young and Co., Hatherley, Cheltenham, showed Carnations of the perpetual-blooming type.

Messrs. A. R. Brown, Ltd., King's Norton, exhibited border Carnations. (Silver Medal.)

Sweet Peas were shown splendidly by Mr. R. Bolton, Carnforth. To enumerate the varieties would be to give a list of all the finer sorts in cultivation. (Large Gold Medal.)

Mr. A. F. Dutton, Iver, exhibited his new variety of perpetual-blooming Carnation, Mrs. A. F. Dutton, a delightful shade of pink.

Messrs. Stuart Low and Co., Enfield, showed Carnation Baroness de Brienen, for which a Silver Medal was awarded.

Messrs. Jarman and Co., Chard, exhibited Zonal-leaved Pelargoniums, Carnations, Roses, Centaureas and Dahlias. (Silver Medal.)

Mr. Albert Myers, Shrewsbury, showed Zonal-leaved Pelargoniums, against a background of Coleus plants, and interspersed with Eulalia japonica and Francoa ramosa. (Silver Medal.)

Messrs. Dickson, Chester, exhibited border flowers and Roses. Two magnificent clumps of Lilium auratum were arranged in the centre, and there were other tall stands filled with Gladioli and Pentstemons. The beautiful Romneya Coulteri was shown finely in association with the scarlet Geum Mrs. Bradshaw and Papaver nudicaule. (Gold Medal.)

Mr. Edwin Murrell, Shrewsbury, showed Roses and pot-plants of Clematis. The Roses were remarkably good, and the exhibit had the good point of not being crowded. Tall stands, filled with Mrs. John Laing, Lady Hillingdon, Sunburst—a delightful posey, Hugh Dickson and Kaiserin Augusta Victoria were excellent foils to the shorter vases. (Small Gold Medal.)

Mr. Henry Eckford, Wem, had a large exhibit of Sweet Peas, Gustave Hamel, Captain of the Blues, Spencer Pearl Grey, Senator Spencer, St. George Improved being the more noticeable varieties. (Small Gold Medal.)

Messrs. Jones and Sons, Shrewsbury, showed varieties of border Carnations, hardy border flowers, Sweet Peas and Violas, the last arranged as a floor group interspersed with Lilies and Roses. (Small Gold Medal.)

Hobbies, Ltd., Dereham, Norfolk, exhibited Roses and Dahlias. This excellent group was arranged in one of the side bays of the largest tent, and was a very effective display of bright flowers. Hanging baskets of Rayon d'Or Roses were a feature against a background of Pæony-flowered Dahlias. (Large Gold Medal.)

Messrs. W. Artindale and Son, Sheffield, showed a few varieties of Sweet Peas in the Sweet Pea tent.

Mr. Vincent Slade, Taunton, was awarded a Silver Medal for Zonal-leaved Pelargoniums.

A Silver Medal was awarded to Mr. H. Woolman, Shirley, near Birmingham, for Chrysanthemums.

Mr. A. W. Thorp, Lichfield, also showed Chrysanthemums, for which a Silver Medal was awarded.

Messrs. S. R. Compston and Son, Macclesfield, showed Violas. (Silver-gilt Medal.)

Mr. Geo. Underwood, Leicester, also showed Violas (Silver Medal), and an exhibit of these flowers was also staged by Mr. G. Weaver Price, Ashgrove, Brecon. (Bronze Medal.)

Mr. Vernon T. Hill, Langford, was awarded a Silver Medal for Alpines and hardy flowers, the former arranged in virgin cork.

Hardy border flowers were shown by Mr. G. W. Miller, Wisbech. (Silver Medal).

The National Gladiolus Society contributed a very good selection of cut spikes of Gladiolus from the Society's Trial Grounds at Southampton. (Silver-gilt Medal.)

Messrs. Fred. Smith and Co., Woodbridge, exhibited border flowers in variety.

Robert Sydenham, Ltd., Birmingham, showed Sweet Peas in rustic metal displayers. (Silver-gilt Medal.)

Mr. R. C. Notcutt, Woodbridge, was awarded a Silver-Gilt Medal for Apples.

The Hon. Vicary Gibbs, Aldenham House, Elstree (gr. Mr. E. Beckett) exhibited a superb collection of vegetables which rivalled his exhibit at the last Holland House Show; as then the various kinds shown nearly approached perfection. (Large Gold Medal.)

Messrs. Barr and Sons, Covent Garden, London, exhibited a very large collection of excellent vegetables. The novelties included Tomatos, Red Currant, Yellow Pear, Red Pear, Golden Waxpod Beans, and Blood-red Flat Onions. (Silver-gilt Medal.)

Miss S. Thompson, Handsworth, showed Cactaceous plants. (Bronze Medal.)

The King's Acre Nurseries, Hereford, staged pot-fruit trees of splendid quality and gathered fruits of orchard house produce in baskets. The Pears and Apples were well cropped. A small tree of Pear President d'Osmonville bore a marvellous crop. There were also Grapes, Plums, Peaches, and Figs. (Large Gold Medal.)

Messrs. Pritchard and Sons, Shrewsbury, were awarded a Small Gold Medal for miscellaneous flowers.

Mr. Vernon Hill, Bristol, showed flowers and Alpines, for which a Silver Medal was awarded.

Other awards included a Silver Medal to Mr. Jones for Gladioli, a Silver-Gilt Medal to Mr. Rideout for Carnations, a Small Gold Medal to Messrs. Fairburn for Sweet Peas, and a Small Gold Medal to Messrs. Smith and Chandler for miscellaneous flowers.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

July 3.—*Committee present:* Rev. J. Crombleholme (in the chair), Messrs. J. Bamber, Dr. Hartley, A. J. Keeling, D. McLeod, C. Parker, W. Shackleton, P. Smith, H. Thorp, Z. A. Ward, G. Weatherby, A. Warburton, and H. Arthur (secretary).

Silver-Gilt Medals were awarded to R. Ashworth, Esq., Newchurch (gr. Mr. Gilden), who staged a splendid miscellaneous group; A. Warburton, Esq., Haslingden (gr. Mr. Dalgleish), for Odontoglossums in variety.

Bronze Medal to O. O. Wrigley, Esq., Bury (gr. Mr. Rogers).

Other exhibitors were Mr. J. Birchenall, Alderley Edge, and Messrs. A. J. Keeling and Sons, Bradford.

BRITISH PTERIDOLOGICAL.

August 4.—The annual meeting of this Society was held, as usual, on August Bank Holiday, at Totnes, Devonshire. The balance-sheet was considered satisfactory, and it was stated that there were 160 members, compared with about twenty at the time of the reconstruction of the Society and the founding of the *British Fern Gazette*.

The Seven Stars Hotel was fixed as the meeting place, and prior to and after the meeting the members organised various hunting expeditions to Dartmoor and the surrounding district of South Devon, with very satisfactory results, notwithstanding a two months' drought, through which exposed Ferns had in many places been killed outright. A number of good varieties fell to the lot of the searchers, showing that Nature was still busy in producing "sports." A series of beautiful forms obtained by selective sowing was sent by absent members as a proof that in this direction also much had been done, and was still being done, to improve, if possible, the original wild varieties through their capacity of further variation by their spores. The hon. secretary is Mr. Druery, 11, Shaa Road, Acton.

DUMFRIES AGRICULTURAL.

August 5.—In connection with the annual show of the Dumfries Agricultural Society, held at Dumfries on the 5th inst., prizes were offered for Sweet Peas and other flowers. The Silver Cup offered for 12 varieties of Sweet Peas resulted in a capital competition, and many good flowers were shown. The Cup was won by Colonel J. K. Maxwell-Witham, of Kirkconnell, Newabbey (gr. Mr. Jas. M'Gill); 2nd, W. Keswick, Esq., Cowhill Tower, Dumfries (gr. Mr. C. G. M. Murray). In the amateurs' class for six varieties Mr. G. L. Moffat, Mayfield, Lockerbie, was placed 1st; 2nd, Mr. J. Crosbie, Dalswinton Village. In the open classes Jas. Brown, Esq., Knockbrex, Kirkcudbright (gr. Mr. F. France) was awarded the 1st prize. Mr. W. Anderson, Collin, showed the best hardy border flowers.

PERTHSHIRE SWEET PEA.

August 8, 9.—The annual show of this Society was held on these dates in the City Hall, Perth, and proved the most successful exhibition held under the auspices of this society. The entries showed a large increase over those of the previous year, and the exhibition was notable for the high excellence of the flowers staged by the competitors. A conference was held on the first day of the show, and was largely attended. The subject was "The Ideal Sweet Pea and How to Stage It." Mr. Harry Foster, in the absence of Mr. Walter Wright, opened the discussion, and was followed by Mr. Ed. Cowdy. A Gold Medal was offered for a display of Sweet Peas, arranged for effect on a table 12ft. by 6ft., there being no restriction as to style of arrangement, vases, and the number of sprays, etc. Messrs. Thyne and Son, Dundee, won the 1st prize with a pretty arrangement of fresh flowers; 2nd, Mr. D. McOmish, Crieff. A silver challenge cup, presented by Sir John Dewar, Bart., M.P., was offered for twelve distinct bunches of Sweet Peas. Mr. Edward Cowdy, Loughall, Co. Antrim, was placed in the first position, his varieties including Lavender George Herbert, Dobbie's Cream, and Audrey Crier; 2nd, Sir John Burnet, Bart. (gr. Mr. John Petrie), Crathes Castle, Aberdeenshire. Edrom Beauty was splendid in this exhibit.

There were numerous smaller classes for Sweet Peas, in all of which competition was very keen, Sir John Burnet, Crathes Castle, proving a very successful exhibitor.

In the classes open only to growers of from 15 to 50 yards or clumps of Sweet Peas, Mr. R. W. Duncan Kemnay, Aberdeenshire, secured the Society's challenge cup for nine bunches, distinct, and also the Society's Silver Medal for six bunches, distinct. Other leading prize-winners in this section were Mr. G. Milne, Montrose; Mr. P. Grant, Kennaway; Mr. A. Petrie, Larbert; and Mr. R. Grant, Clovenfords.

In the special division for small growers Mr. J. Glover, Colinton, Edinburgh, was awarded the National Sweet Pea Society's Silver Medal. In the floral decoration section the leading winners were Mr. and Mrs. George Reid, Downfield, Dundee. Sir John Burnet, Bart., was awarded the 1st prizes in Messrs. Dobbie and Co.'s, W. J. Unwin's, and Mr. Robert Bolton's classes respectively.

Non-Competitive Exhibits.

The only non-competitive display of Sweet Peas was set up by Mr. H. Sinclair, Aberdeen, who was awarded a Gold Medal.

Messrs. Dobbie and Co., Edinburgh, staged a large collection of Roses and Carnations (Gold Medal).

Messrs. R. Henderson and Sons, Perth, exhibited a collection of floral work and fruit (Gold Medal).

Messrs. D. and W. Croll, Dundee, showed Roses, for which they were awarded a Silver Medal.

SCOTTISH HORTICULTURAL.

On Saturday, the 9th inst., on the invitation of Lord Elphinstone, ninety members, including the president, Mr. King, paid a visit to Carberry Towers. The party was met by Mr. Kidd, the gardener, who conducted the visitors over the gardens and grounds.

A visit was afterwards paid to the new Experiment Garden of the Edinburgh and East of Scotland College of Agriculture at Liberton, where, in the absence of Mr. Chisholm, the party was shown over the establishment by Mr. J. Harris.

The monthly meeting was held in the Goold Hall, 5, St. Andrew Square, Edinburgh, on the 5th inst. Mr. King, the president, was in the chair, and there were 75 members present.

A paper, entitled "Villa Gardening from the Professional Gardener's Point of View," was read by Mr. John Highgate, Hopetoun Gardens, South Queensferry. One thing, Mr. Highgate said, which struck one more than any other in connection with villa gardening was the sameness of the subjects used in their embellishment. Possibly what attracted most attention was the lawn, no matter how small, and it added a charm to every flower and shrub around it; yet how often was it expected to thrive on impoverished soil? Like every other plant, grass required nourishment, and to keep a lawn in good condition it required to be top-dressed with some fertiliser annually. Next to the lawn, perhaps the most important feature of a villa garden was the trees and shrubs. Trees such as the Lime, Chestnut, and Elm were entirely out of place in the average villa garden, and when they were lopped to keep them within bounds they lost their true character, and often became unsightly. There was room for greater variety in floral decoration, and Begonias, Pentstemons, and Antirrhinums were mentioned as being well suited to the purpose. It was a common practice, said Mr. Highgate, to plant Apples and Pears on the walls of back gardens, with the view to obtaining fruit, but the walls were generally too low, and cordon Gooseberries and Red Currants would give more satisfactory results.

The exhibits were:—Lilium testaceum, L. Humboldtii magnificum, L. chalcedonicum, L. chalcedonicum maculatum, and Stenanthium robustum, from Messrs. Dicksons and Co., Edinburgh, who were awarded a Cultural Certificate for the Liliums and Astilbe Pink Pearl, from Mr. John Downie, Edinburgh.

At the meeting on September 2, Mr. J. Stuart, of the Edinburgh and East of Scotland College of Agriculture, will give a lecture on "Fruit and Vegetable Bottling" (with demonstration).

NATIONAL SWEET PEA.

August 13-14.—The provincial Show of the National Sweet Pea Society was held at Carlisle on these dates in conjunction with the Carlisle Horticultural Association. The show, taken as a whole, was very good. Sweet Peas were the main feature, and it is doubtful if finer blooms have been staged in the North. Upwards of 40 classes had been arranged by the N.S.P.S., the local association and its secretary, Mr. Thackeray, dealing with the staging and other matters of detail. Many well-known members of the Sweet Pea world were present, including the hon. sec. of the N.S.P.S., Mr. C. H. Curtis, Messrs. Horace J. Wright, A. Hallam, H. Tigwell, A. Ireland, T. A. Weston, E. Cowdy (Armagh, Ireland), Tom Jones (Ruabon), and A. Malcolm Duns.

A Sweet Pea Conference was held in the evening, when Mr. Alex. Malcolm Duns read a paper on "Sweet-Pea Breeding."

In the open classes competition was strong, and in those for 18, 12 and 6 bunches respectively, Mr. A. Smellie, Busby, won the 1st prizes with splendid blooms.

The seedling class brought only 2 entries, Mr. Robt. Wright, Formby, winning with Royal Purple and Josephine.

Classes 31 to 34 were open to the members of the N.S.P.S. only. For 12 bunches, Mr. Ed. Keith, Wallington Gardens, Morpeth, was awarded the 1st prize; the variety Lady Miller was shown superbly. Mr. G. Shaw excelled in the Northern Counties class for 9 bunches; his varieties, R. F. Felton and Hercules, were very fine. A class was open to Irish growers, and the 1st prize was won easily by Mr. E Cowdy, Armagh; whilst in the similar class open only to growers in Scotland Mr. James Kerr excelled. In the provincial championship class for 12 bunches Mr. Tom Jones, Ruabon, was placed first, and this grower also excelled in the class for 6 new Sweet Peas. The "International" class called for 12 bunches. The exhibitors competed by invitation, and the several countries were represented by Mr. Thos. Jones, Wales; Mr. Ed. Keith, England; Mr. E. Cowdy, Ireland; and Mr. J. A. Grigor, Scotland; the prizes being awarded in this order. Mr. Jones' exhibit easily surpassed those of his rivals, and included magnificent bunches of Etta Dyke (sunproof crimson), Thos. Stevenson, Mrs. Breadmore, King Manoel, Audrey Crier, May Campbell, Lavender George Herbert, John Ingman, and Prince George.

The 2nd prize exhibit was also very good, but the Irish flowers were a trifle uneven.

Non-Competitive Exhibits.

Mr. Robt. Bolton, Carnforth, showed Sweet Peas (Large Gold Medal); Messrs. Dobbie and Co., Edinburgh, were awarded two Gold Medals—one for Sweet Peas, the other for Dahlias and Roses; Messrs. G. Fairbairn and Sons, Carlisle, exhibited Sweet Peas (Gold Medal); Messrs. Herd Bros., Penrith, and Messrs. Thyne and Son, Dundee, were awarded Silver-Gilt Medals for Sweet Peas; Mr. Hugh Dickson, Ltd., Belfast, showed Roses, for which a Gold Medal was awarded.

ANNANDALE UNION FLOWER SHOW.

This show, which takes place on alternate years at Annan and Lockerbie, was held this year at Annan. There was a capital exhibition, although the number of entries showed a substantial decrease upon former occasions. In the vegetable section, open to gardeners and others, Mr. A. Currie, New Christilands, Annan, won the 1st prize in the class for a collection of vegetables, and was successful in several other classes. Jas. Davidson, Esq., Summerville, Dumfries (gr. Mr. J. Wilson), Major Critchly, Stapleton Tower, Annan (gr. Mr. W. Niven), and Mr. T. G. Grierson were other winners of 1st prizes in the vegetable classes. Major Critchly won the 1st prizes in most of the fruit classes, the next most successful exhibitor being Mr. J. French, Hightae. In the classes for pot plants almost all the 1st prizes were won by Major Critchly, who also showed the best decorative Roses and Pelargoniums. Mrs. R. Grierson excelled in the Dahlia classes. Other successful exhibitors with cut flowers were Mr. J. J. Tweedie, Mr. Jas. Davidson, Mr. W. Anderson, Collin, Mrs. Tweedie, Mouswald, Mr. J. G. Wright, Newhope, and Mr. A. Rutherford, Annan.

Obituary.

R. A. MILLIGAN HOGG.—We regret to record the death of Mr. Robert Alexander Milligan Hogg, B.A., in his sixty-fourth year, the only son of the late Robert Hogg, LL.D. The deceased suffered a paralytic seizure recently, and gradually declined thereafter. Mr. Hogg was proprietor of the *Journal of Horticulture* and *Poultry* from 1907, when Dr. Hogg died, until he disposed of his interest in these properties in November, 1911. The deceased gentleman also was editor of the *Journal of Horticulture* after the retirement of Mr. John Wright, V.M.H., until the change of proprietorship. He was trained to the law and was a Barrister of the Inner Temple and was a man of versatile tastes, delighting in music and literature. Mr. Hogg was educated at Westminster School and at St. Andrews and Cambridge Universities. As a traveller he had seen many parts of the world, including California, New Zealand, Australia and South Africa, in each of which countries he had spent several years. Indeed, there were few cities or interesting places in Europe he had not visited, and he was an accomplished linguist. For some years he was a member of the Floral Committee of the Royal Horticultural Society and of the Executive Committee of the Gardeners' Royal Benevolent Institution. He also supported the Royal Gardeners' Orphan Fund. The deceased, who leaves a widow, but no family, was interred at Brookwood Cemetery.

Answers to Correspondents.

CULINARY PEAS: *J. Dare.* The plants have been killed by a stem-boring insect, just below the level of the ground. The insect is in the chrysalis stage at present, so cannot be identified. The two plants of the unnamed variety are suffering from the new bacterial disease. (See reply to *W. B.* in the last issue, p. 128.)

NAMES OF PLANTS: *Rose.* 1, Ceanothus Gloire de Versailles; 2, Lythrum Salicaria. Roses: 3, Papa Gontier; 4, Natalie Bottner; 5, Caroline Testout; 6, Hon. E. Gifford; 7, Capt. Christy; 8, Mrs. J. Laing; 9, Marie van Houtte; 10, Souv. de Pierre Notting; 11, petals shattered; 12, Killarney.—*Havering.* 1, Physostegia virginiana; 2, Olearia Haastii; 3, Centranthus ruber; 4, Tamarix gallica; 5, Campanula garganica var. hirsuta; 6, Gilia tricolor.—*Co. Longford.* Veratrum nigrum.—*W. M. G.* 2, Gilia capitata: others too scrappy to identify.—*Lt.-Col. Briggs.* 1, Rubus fragariopsis; 2, Salvia leucantha; 3, Origanum microphyllum; 4, Priva lævis.—*J. B.* Verbascum nigrum.—*T. R. C.* Chenopodium capitatum.—*W. J. Greaves.* Fuchsia, probably Monarch variety.—*E. B., Horton.* Rose Mrs. Stewart Clark.—*Mossel Bay.* Tillandsia pulchella, a plant which has established itself on many trees, including the Orange, cultivated in South Africa. It is a native of S. America, and was imported with Orange trees.—*C. E. Bridget.* Your plant is not a Calabash Gourd, as you suppose, but is probably a species of the genus Lycium. The seedling Pelargonium we suggest you should send to a nurseryman who specialises with these plants.—*G. H. P.* 1, Ceanothus Gloire de Versailles; 2, Tamarix hispida; 3, Leycesteria formosa.—*B. L.* 1, Cœlogyne Parishii; 2, Epidendrum inversum; 3, Dendrobium clavatum; 4, Aspasia lunata; 5, Bletia hyacinthina. There are both white and coloured forms of this species. They may pass the winter outdoors in favourable situations if a layer of dry leaves be placed over the crowns; 6, Eriopsis biloba.—*Foreman.* 1, Adiantum formosum; 2, Pteris hastata; 3, Pteris geraniifolia; 4, Adiantum pubescens.—*Hort.* Dracæna marginata. It requires a warm house.

ONIONS: *Mr. C.* The most suitable ground for growing Onions is that which has been cultivated for several years, sandy loam for preference. The plot should be trenched two feet deep in early winter, and allowed to remain rough until spring. A good dressing of thoroughly decomposed farmyard manure may be mixed with the soil as the work proceeds, and a dressing of soot may also be applied with advantage as the soil is being forked over in spring.

PEACH TREE FAILING TO FINISH FRUITS: *H. G.* The roots of your Peach tree have evidently got away into the clay subsoil, and cause the trouble. We presume that during the five years it has been planted it has neither been lifted nor root-pruned; as a result the tree makes rank growth, taking all nourishment, and so causing the fruit to drop. Lift your tree in the autumn, prune off all the strong roots, and remake border, adding plenty of old mortar rubble; also place a few slates underneath the roots to prevent them penetrating into the subsoil. An overwatered border, a very high temperature, and a stuffy atmosphere when the fruits are stoning would also cause the trouble. During the resting period, in order to thoroughly ripen the wood, afford all the light possible, and ventilate the house freely, and on no account get the border too wet.

PEACH-HOUSE: *A. B.* Your 14-feet-high wall is well adapted for the support of a lean-to Peach-house. This house should be constructed as follows: Build a front 9-inch wall, 24 inches high, and resting on a 14-inch footing 17 feet from and, of course, parallel with the back wall. Wall plates and front ventilating sashes, measuring together 24 inches high, resting thereon will give a height of 4 feet from the ground line in front. Instead of constructing a Peach-house of sashes and heavy rafters, light rafters 1½ inch by 3 inches should be employed, these being secured at the top to a plate bolted to the wall under the coping at 18 inches asunder. A house of these dimensions will afford a roof angle of about 35° to the sun, and give a length of rafter of nearly 25 feet. Other items of wood necessary in the construction of a house of this description are as follows: Wall and end plates, 4 inches by 5 inches; end rafters 3 inches by 4 inches. The rafters, as stated, should be fixed to the wall plates bottom and top. A piece of wood, 2 inches by 3 inches, bevelled on one (top) side to the slope of the rafters, should be nailed on to the top of wall plate between each pair of rafters, and flush with the top surface of the latter and the inside edge of plating. These individual strips of wood should be rabbeted in a line with the bed of the rafters for the purpose of receiving the top squares of glass in the bays formed by each pair of rafters intervening between the individual ventilators. The ventilators, top and bottom, should open the full length of roof by machinery—Wolland's continuous ventilating gear is all that can be desired in this connection. The ventilators should be secured to the plating by watertight hinges. A dripboard, 1 inch by 3 inches, should be nailed on the plate at the bottom of the rafter, and flush with the rabbeted bar of same for the first squares of glass to rest on. Door frames, 3 inches by 4 inches (the lintel being bevelled to prevent water lodging thereon), with oaken sills of the same size; doors, 6 feet 6 inches by 2 feet 8 inches, the doors being either all wood or one-half made of glass, as may be desired, and hung on substantial brass butts, and provided with either a brass mortise or galvanised rim lock and suitable furniture. The roof should be covered with glass, 21 ounces to the square foot, 18 inches by 22 inches, bedded in good putty, and fastened on top with brass springs (like those shoemakers use). It will require about 286 squares of glass of the sizes given to cover the roof. The vents, top and bottom, should consist of three panes, each of the dimensions indicated, these being hung in the manner described at intervals of three bays, and worked throughout, as advised above, by continuous gear, having curvilinear lifting and lowering rods. The woodwork should receive two coats of good white-lead paint before being fixed and another afterwards. As you propose to plant the house at present, and there being practically no artificial heat provided, we do not think any advantage would now be gained by having a division in the proposed house; still, bearing in mind that the house might be differently planted in the near future, it might be as well to have the division made when erecting the house on the score of economy. The tree of Coe's Golden Drop Plum should be planted at the cooler end of the house.

PYRETHRUM ROSEUM: *P. T. Edwards.* In raising seedlings of named varieties of Pyrethrum roseum, the proportion that may be expected to come true to name will depend on various circumstances. The most important is, whether the seed-bearing plants are isolated, or growing near other varieties. In the former case, a far greater proportion may be expected to develop flowers resembling the parent.

WATER-LILIES AND GOLD FISH IN CEMENT TANK: *G. W. R.* Gold fish and Water-lilies will both live in your tank, but if it is newly constructed fill it with water for a few days before they are placed in it. Afterwards run off the water, and give the tank a thorough cleansing. Suitable plants for furnishing the "pockets" include Aubrietias, Achillea umbellata, Corydalis lutea, Sedums in variety, Campanula garganica, C. fragilis, Dianthus cæsius, D. deltoides, Armeria (Thrift), mossy and encrusted Saxifrages, Erinus alpinus, Iceland and Alpine Poppies, Wallflowers and Antirrhinums. The following Water-lilies are suitable for cultivation in the tank: Froebelii, Andreana, Marliacea ignea, M. sanguinea, Pygmæa, P. helvola W. B. Shaw, atropurpurea, and any of the Laydekeri section.

WIREWORMS IN VINE BORDER: *Troubled.* If you have conclusive proof that the injury is caused by wireworms drastic measures must be taken to rid the soil of the pests, but these insects sometimes get more credit for mischief than they deserve. We are not aware that they are ever numerous in borders long after the turf is decayed, from which it would appear that if they feed on vine roots they do not obtain from them sufficient nourishment to keep them alive. We were recently called to inspect a similar case to yours, and although wireworms were abundant and were thought to be the culprits the mischief was traced to another cause. Good vines were carefully planted last February, and a highly praised concentrated manure was mixed with the soil forming the border. The turfy loam used was of good quality, and was obtained at some expense from a distance of several miles. As it was fresh, and comparatively rough, some finer soil, with the fibre decayed, was applied round the roots, but none of the manure was mixed with it. The vines started well, and made good growth for a time, when growth ceased suddenly. On examination it was found that the roots, immediately they reached the extremity of the soil without the manure, had their tips burned, and grew no further. The vines are now useless, and they, as well as the border, will need to be replaced. No wireworms were found in the soil where the fibre was decayed. The manure when fresh had no particular scent, but after being mixed for a time with the soil it had a very offensive odour, and some of it applied in a top dressing for chrysanthemums burned their roots. Some Peach trees lifted from outside last autumn and planted in a house with similar soil, but without the manure, have done splendidly, and are bearing a heavy crop of fruit of the finest quality. As your vines are not worth keeping we advise you, if you are still convinced that the injury is due to wireworms, to obtain some perfectly fresh gas lime and mix with the soil at the rate of two pounds to the cubic yard, and add double this quantity of kainit, turn the whole two or three times during autumn and winter and expose it as much as possible to the air. Gas lime which has been exposed to the air for several weeks is useless for the purpose. Another plan is to thoroughly sterilise the soil.

THE HISTORY OF CULTIVATED FRUITS

AS TOLD IN THE LIVES OF GREAT POMOLOGISTS.

III.—Olivier de Serres.

THE inclusion of Olivier de Serres in this series of articles may perhaps be considered to place an unduly wide interpretation upon its scope and object. When, however, we see our leading daily paper referring to him as "an obscure provincial magistrate," it seems proper that de Serres' work as a pomologist should be brought to the notice of horticulturists. His famous book, the *Théâtre d'Agrieulture*, is notable in the history of fruit culture, as it was one of the first to place practical observation above the pontifical authority of the classic authors. As in botany, so in garden practice, the writings of Greek and Roman authors were considered for many generations as the source of all knowledge. The common gardener, happily ignorant of Latin, did no doubt proceed upon the oldest of all methods, that of trial and error, but even he was ruled by the traditional prejudices handed down from older times. The seasons of grafting, sowing and pruning were regulated by the phases of the moon, and even de Serres, sceptical as he was of this subtle influence in many cases, did not wholly break away from the accepted tradition. But in his book we find the dawn of the new spirit of experiment and inquiry, which, added to a passionate love of country life, makes him stand out as a prominent figure in the transition stage of horticulture.

The times were ripe for the restoration of agriculture and horticulture to their old position. The devastating religious wars which had for years turned France into a battlefield had almost destroyed the art of husbandry. The Edict of Nantes had brought peace, and Henry IV. and Sully wisely devoted their efforts to the re-establishment of the staple industries of the country. It was at this time (1600) that the *Théâtre d'Agriculture* appeared, and its influence was remarkable. By 1675 nineteen editions, pirated and authentic, had appeared, and de Serres was hailed as the restorer of French agriculture.

Before treating of his contributions to the art of fruit culture, a short account of his life may be given, most of the details of which are gathered from Vaschalde's authoritative memoir (*Olivier de Serres*, Henry Vaschalde, Paris, 1886).

OLIVIER DE SERRES.
1539-1619.

The father of de Serres owned estates in and around Villeneuve, and it was at Pradel, near this town, that Olivier was born in 1539. He was educated probably at Valence, and at the age of 19 was widely read in the Greek and Latin authors, a fact which doubtless had a great influence on his style. When 20 years old he married Marguerite d'Arcons, and seven children were born to them. An ardent supporter of the Reformed Church, he was chosen to visit Calvin at Geneva to engage a minister for the community of Villeneuve. An account of the expenses of this journey still exists at Pradel, in his handwriting, and gives a vivid picture of the difficulties of travel in those days. Though a thorough and convinced Protestant, he was broad enough to gain the esteem of the Catholics in his neighbourhood, as is shown by the fact that when the sackings of churches were rife he took charge of the articles of value belonging to the Roman Catholic church at Villeneuve.

Passages in his work indicate that he travelled in Germany, Spain, and probably Italy, and his knowledge of the local names used for fruits in the different parts of France shows that he did not neglect his own country. But his happiest days were spent at his home in Pradel. Here, in the tranquillity of a country house, he studied his favourite authors, Pliny, Columella, and Varro, and laid the foundation of the practical knowledge which was gathered together, after 40 years' experience, in the *Théâtre d'Agriculture*.

Pradel became what would now be termed a model farm, and to some extent an experimental station. New plants were tried, and many curious experiments were undertaken. The introduction of Maize into Provence was due to his example, and he clearly saw the great value of the Potato, then recently introduced from America. The planting of Mulberries for the use of silkworms owed much to his advocacy and, backed by the powerful aid of Sully, he thus laid the foundation of the silk industry of France. Among his experiments in vine culture was the sulphuring of the leaves, which was believed to keep away insects. His claims to remembrance as a pomologist rest mainly on the fact that he evidently tried many of the experiments mentioned by the classical authors, and did not hesitate to say if he found them to be fallacious. Up to the time of the publication of his work the available literature of fruit culture was small, and only one work of original matter can be found, that of David Brossard, published in 1552.

The careful and explicit directions of de Serres mark a great advance, and his instructions for planting, grafting and pruning are the result of close personal observation. His chapter on fruit gardens in general gives a good idea of the charming style in which the whole book is written—a style which has been considered equal to that of Montaigne.

The chapters on the culture of trees in the nursery and the numerous methods of grafting and budding contain the most minute directions, and could hardly be bettered after 300 years' more experience. Particularly interesting are the instructions for pruning espaliers. The espalier was then grown, as now, as a hedge or division in the garden, but trees were not at this time grown on walls, though the garden at Pradel was probably thus enclosed. The use of this form is recommended on account of the increased size of the fruit and the thorough ripening which it undergoes. The first tree to be treated thus was the Apple St. Jean, a very dwarf-growing sort which is recorded so far back as 1485. When it was found that other fruits would submit to this treatment, it was for many years kept a secret, and the grafts were said to come from the Indies, that home of the miraculous. Dwarf-growing fruits were also grown in pots and served to decorate the dinner-table, and doubtless to astonish the diners.

Of the bizarre grafting that occupied so prominent a place in the works of older

authors de Serres gives an account, but merely to satisfy the inquisitive, and he states that such things are curiosities only, and goes so far as to doubt their possibility in many cases. The grafting of Peaches on various Plums, such as is done to-day, he approved, but did not advise that Apricots be grafted on Almonds, as the former dislike water and manure, whereas the latter thrive on liberal supplies. The varieties of fruits are unfortunately only named and not described, and are a selection only; for we know from the remarkable catalogue of Le Lectier of Orléans, published in 1628, that the number of Pears, for instance, was very large. It is impossible to quote their names here, but it is interesting to see that many of the Apples, Pears and Plums still exist to-day. Court-Pendû Plat, the Wollaton Pippin of the Midlands, and the Api or Lady Apple, which is frequently sold on the London markets, are noticeable among the Apples, and among the Pears are the Bon Chrétien d'Hiver, Caillot Rosat, and many others which are still grown in France.

De Serres lived to see the great success of his work, and at his death in 1619 it had already reached the eighth edition. It is remarkable that no English translation was made of a book of such far-reaching influence. The chapter on the silkworms was, however, translated by Nicholas Geffe and published in London in 1607.

Many interesting relics of de Serres are still preserved at Pradel, and among them is a small portrait painted by his son, which is reproduced by Vaschalde in his work quoted above.

That Olivier de Serres is still remembered is due to the Pear named after him by M. Boisbunel, of Rouen, but he deserves to be better known as one of the great pomological authors. His greatness does not rest upon the introduction of new methods or upon voluminous writings, but to his placing of experience before authority, and in him we find the turning-point between the old and the new.

E. A. Bunyard.

CAMPANULA ISOPHYLLA ALBA IN THE OPEN.

This very attractive and interesting species of Bellflower was introduced into this country from Northern Italy in 1868. The type is blue in colour, but it is more seldom met with than the white variety, which has the additional merit of being more ornamental. Though the name of Campanula isophylla is very generally included in nurserymen's catalogues, a form of C. fragilis, differing somewhat in foliage from C. isophylla and bearing pale, lilac-blue flowers, is often sold for it. In the accompanying illustration the white variety of C. isophylla is shown growing in an open garden in South Devon, where it falls over a rocky ledge about 2 feet in height and makes a very pretty picture It is sometimes stated that this Campanula must be grown in the shade, but the plant illustrated is in the full sunshine for the greater part of the day, and has been left entirely untouched for some years. After the blossoms have withered the shoots gradually die back until not a particle of green remains on the plant, which appears quite dead. Later on in the season tiny rosettes of green appear at the bases of the shoots and attain a length of an inch or more before the winter sets in, remaining in this condition until the warmer weather of the early spring leads to renewed growth. When in full flower the plant furnishes a remarkably beautiful sight, and it is curious that it should be so little grown in the rock garden in the warmer localities of this country. Volume after volume of the horticultural Press may be consulted without a single reference being found to this Campanula except as a pot plant. For this manner of cultivation it is certainly the finest of all the Bellflowers, and may be seen in quantity, smothered in bloom, in cottage windows all over the country. It is best divided in the month of March, when a plant in a 7-inch pot will provide four or five divisions. A rich, porous, gritty compost is most suitable for this Campanula, which should be kept well supplied with water. Plants grown in 10-inch pots, over which a funnel of wire netting about 3 feet in height is fixed, form pyramids 4 feet in height clothed to the base of the pot with flower and foliage, and remain in beauty for a very long time. *Wyndham Fitzherbert.*

SOUTH AFRICA.

THE NATIONAL BOTANIC GARDEN.

The establishment of a South African National Botanic Garden, to which attention was drawn in a leading article last week, is an event which the horticultural world will note with interest. The South African flora has made many important contributions to the gardens of the world; those who know the country cannot but realise that it contains a great wealth of forms yet to be brought within the range of horticultural operations. Further than this, the varied vegetation of South Africa is of almost unrivalled scientific interest, and its

economic possibilities have hitherto been hardly considered. The range of the field which is thus opened for the proper activities of a botanic garden is wide, and everyone will realise that this long-desired establishment for botanical research has a very promising outlook before it.

Sir William Thiselton-Dyer, Mr. J. S. Gamble, and other authorities who at one time and another have written on this subject, agreed in recommending the lower eastern slopes of the Table Mountain Range as the most suitable site for a botanic garden. By a fortunate combination of circumstances an estate, occupying such a position, was available. This estate, known since 1811 as Kersten Bosch or Kirstenbosch, added to the Groote Schur Estates by Mr. Rhodes and bequeathed by him to the Nation, has been granted by the Government for the purpose. Its situation is indicated on the accompanying map (Fig. 59).

The area of Kirstenbosch is not yet precisely known; it is probably not far short of 400 acres. The eastern half, or rather more than half, lying about 60-200 feet above the sea, consists of somewhat undulating land sloping gently to the east. A considerable portion of this has been under cultivation until recently; the rest is thickly planted with Oaks and Poplars, the former, with few exceptions, in an advanced state of decay. The Poplars have taken complete possession of large areas, and offer a remarkable illustration of the success of reproduction by root-buds. A shoulder of the mountain running out, just within the southern boundary, towards the east, carries a very fine forest of Silver Trees (Leucadendron argenteum). This forest formerly extended beyond its present boundary towards the north, but it has been considerably encroached upon by a misplaced plantation of Cluster Pine (Pinus Pinaster).

The western half of the estate climbs the mountain slopes to a height of perhaps 1,000 or 1,500 feet above sea level, and includes the lower ends of three well-wooded mountain gorges. Here we have a rich growth of Cape trees and shrubs in its primitive condition—except where, here and there, it has been devastated by fire. It includes magnificent specimens of Virgilia capensis, Cunonia capensis, Brabejum stellatifolium, Ilex capensis, Kiggelaria africana, Curtisia faginea, Plectronia ventosa, Heteromorpha arborescens, Halleria lucida, etc. Podocarpus Thunbergii occurs in the kloofs above, though possibly it is no longer found within the limits of Kirstenbosch itself. The drier portions of the Kirstenbosch slopes are thickly covered with the characteristic low bush of the peninsular slopes among which Proteas, Heaths, members of the Natural Orders Thymelæaceæ, Santalaceæ, Restiaceæ, Selagineæ and smaller plants commonly associated with them, are conspicuous. Thus on these slopes there is already a well-stocked botanic garden, in which are many long-established and well-grown specimens of plants not commonly seen save by those who are acquainted with the recesses of the mountain ranges of the Cape Province.

One of the outstanding difficulties of South African gardening is the water supply. The drainage from the three gorges of the mountain flows through the estate in two powerful streams which run for 10 months in the year. There are also two perennial springs issuing, the one about 100 feet, the second 300 feet, above the lower (eastern) boundary. By the construction of not more than two comparatively inexpensive dams, the whole area can be placed under irrigation if necessary. The numerous stream beds lend themselves to most effective treatment in any scheme of landscape gardening.

The soil is extremely varied in composition—a fact of far-reaching importance in a botanic garden which must provide accommodation for a representative collection of South African plants. The subsoil, except at higher elevations, is granitic. Solid granite outcrops in many places. The upper levels are strewn with blocks of Table Mountain sandstone. Outcrops of Malmesbury slate are believed to occur locally. Enormous deposits of humus have accumulated on those parts which for many years past have been enriched by the leaves of exotic deciduous trees. Thick beds of gravel overlying or embedded in great depths of stiff clay constitute the feature of an extensive slope with a northern aspect. Owing to the numerous water-divides and minor undulations there is a great choice of aspect, only that towards the west being obstructed by the proximity of the mountains.

It is well known that the Cape Peninsula, like the rest of the South-Western coast belt between Port Elizabeth and the mouth of the Oliphant's River, has a winter rainfall. It has therefore been supposed by many that the cultivation in such a situation of native species from the summer rainfall districts of the north and east will prove impossible. Undoubtedly it is the case that many species which naturally flourish in regions in which the rainfall is confined to the vegetative and flowering seasons cannot easily be established in places in which the rain all falls in the winter. The Cape Peninsula, however, is not such a locality. Although the bulk of the rain falls between April and September, the summer season is very rarely marked by a prolonged drought. If therefore species accustomed to dry winters can be preserved through a wet season in inactivity, there is no reason why they should not flourish at Kirstenbosch. And, indeed, this is no longer a moot point; the Cape Peninsula already possesses both private and public collections in which are to be found hundreds of species of dry-climate plants from regions of rainless winters; and of common occurrence in the gardens of the Peninsula are very fine specimens of Sparmannia africana, Dombeya Dregeana, Tecoma capensis, Acokanthera venenata, Odina caffra, Aberia caffra, Adhatoda Duvernoia, Mackaya bella, Erythrina caffra, Gardenia Thunbergia, Encephalartos sp. and others—all more or less distinctly characteristic of subtropical districts with wet summers. Everyone will realise that in a country of climate so varied as that of South Africa, it is impossible to get together in any one place a completely representative and properly-balanced collection of native plants. On the contrary, no one will deny that Kirstenbosch lends itself to the establishment of a very varied display of South African plants, calculated to give to those who care to study it a reasonably accurate idea of the types of vegetation which prevail between the Cape and the Zambesi.

The success of the National Botanic Gardens depends in a great measure upon the sympathy and interest of the public in general, and, in particular, of those to whom the administration of its affairs is entrusted. The public interest has been manifested in many ways, particularly in the formation of a Botanical Society, with the primary object of affording financial and general support to the gardens. The control is vested in a Board of Trustees, to which the

Fig. 59.—NATIONAL BOTANIC GARDEN OF SOUTH AFRICA.

× The site at Kirstenboech.

Government has nominated the following:—Lord de Villiers, Sir David Graaff, Bart., M.L.A., and Sir Lionel Phillips, Bart., M.L.A.

The Botanical Society will nominate one trustee, and it is hoped that the Corporation of the Unified Cape Town and suburbs will appoint another. The three trustees whose names are already announced have supported the scheme almost from its inception, and Sir Lionel Phillips took a prominent part in carrying it through its final stages during the last session of Parliament.

The trustees have made the following appointments:—Honorary director, H. H. W. Pearson, Sc.D., F.L.S.; secretary, Miss H. J. Davison, B.A.; curator, J. W. Mathews.

Work was commenced on July 1, and it is hoped that considerable progress in the formation of the nursery will be made in the ensuing spring season. A botanical survey of those parts of the estate in which the native vegetation has not been displaced by exotics is being conducted by the staff of the Bolus Herbarium. As soon as possible it is proposed to begin a series of observations and experiments on members of the Rutaceæ and other South African families which include drug-yielding species. *H. H. W. Pearson, South African College, Cape Town.*

REMARKS ON CONDITION OF THE FRUIT CROPS.

(*Continued from page* 134.)

(*See Tables and Summaries, ante, pp.* 80-85.)

4. MIDLAND COUNTIES.

HERTFORDSHIRE.—The fruit crops, with the exception of small fruits, are most disappointing. Pear trees had an abundance of bloom, though the flowers did not appear strong and vigorous, partly owing to the abundant crops of last season and partly to bad weather whilst the trees were in bloom. The blossom appeared to set freely, but the fruits never commenced to swell; the same remarks apply to Plums and Cherries, except as to last year's crops. Apricots, Peaches, and Nectarines are practically a failure, though the few fruits we have are of good quality. Apple trees set an immense crop, but many of the fruits dropped, and we have only a good average crop. All small fruits, including Loganberries, were good and the plants cleaner than in some seasons. The soil here is exceptionally heavy, and rests on London clay. *E. F. Hazelton, North Mymms Gardens, Hatfield.*

LEICESTERSHIRE.—The Apple crop in this district is fully up to the average, and large numbers of the fruits are dropping, which will be beneficial to the trees and the remaining fruits. Pears are a total failure and disappointing after the quantity of blossom on the trees. I attribute the failure of the Pear crop to continuous cold north-east winds in April, and to the 10° of frost on the 13th of that month. Plums on walls are below the average, but orchard trees are bearing much over the usual quantity, and the branches require supporting. Peaches are very scarce; the trees flowered when the weather was very cold, and no bees were about to pollinate the blossoms. The trees have had one of the worst attacks of "blister" which I have ever seen, but they are now making a vigorous and clean growth. Raspberries, Gooseberries, and Red Currants were all plentiful, but Black Currants were a failure, and Strawberries disappointing owing to drought. *Daniel Roberts, Prestwold Gardens, Loughborough.*

—— With the exception of Pears, Apricots, and Gooseberries, fruit trees flowered abundantly; there was no frost during the flowering period, and the partial failure of the crops must be attributed to the very wet autumn of last year, whilst the unusually mild winter may also have contributed to the failure. Stone fruits have suffered more than others. Numbers dropped after setting, while the others are still very small; Peaches, Nectarines, Plums, Damsons, Bigarreau Cherries, and Morello Cherries are all much the same in this respect; one tree of Morello Cherry—a large one—moved early last autumn is carrying a good crop, while other trees near by have failed. Apples and Plums in grass orchards are not cropped so well as those in cultivated ground. The Strawberry crop was one of the best on record. The soil is heavy clay. The garden is situated 260 feet above sea level, on the east side of a hill, which rises 200 feet higher. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

NORTHAMPTONSHIRE.—Owing to the wet, cold season the fruit crops generally are very inferior on our cold clay soil. Apples are fair, but Pears are very poor and scarce. Apricots, Peaches and Nectarines out-of-doors are failures. Cherries were fairly satisfactory, Gooseberries and Currants were very good and Strawberries and Raspberries plentiful owing to the heavy rains in spring. *Thomas Masters, Lower Shuckburgh, Daventry.*

NOTTINGHAMSHIRE.—The hardy fruit crops vary considerably in these gardens. All fruit trees blossomed very freely, but owing to the wet and cold autumn of 1912 the wood did not ripen, and this resulted in many of the fruits dropping when they were small. Nectarines, Peaches, and Apricots are a failure out-of-doors. Apples are an average crop of good quality, but

FIG. 60.—STOVE AND GREENHOUSE PLANTS EXHIBITED BY THE SOCIÉTÉ HORTICOLE GANTOISE AT THE GHENT EXHIBITION.

(See page 127 *ante.*

CYCLAMEN.*

THIS booklet treats of the cultivation of this, to some, somewhat difficult flower. It extends to the length of an ordinary cultural article, and though brief the directions are in general sound. The author dislikes dried-off corms to be grown a second year, but the experience of others shows that no bad results follow where this practice is pursued.

* *The Cyclamen, and How to Grow Them.* By F. C. Edwards. Leeds. 1s.

Pears are a light crop. Sweet and Morello Cherries were splendid. Strawberries, Black and Red Currants, Gooseberries and Raspberries were all heavy crops, and the fruits were exceptionally clean. Dry weather set in on May 6 and up to the time of writing we have had only a few light showers. Our soil is of a light nature and rests on a subsoil of sand. *James B. Allan, Osberton Gardens, Worksop.*

——The fruit crop generally may be described as a failure — Apples, Strawberries, and small fruits excepted. Apples are patchy; there are good crops here and there, but the early varieties are poor. Pears are, generally, a failure; also Plums, with the exceptions of Victoria and Heron varieties. Damson trees, after, perhaps, the finest show of bloom ever seen, have very little fruit. Cherries, Peaches, Nectarines, and Apricots are not much grown here, and the few trees are a failure. Small fruits were average crops. Strawberries promised splendidly, but practically no rain falling up to the time of writing since May 9, they were quickly over and the late varieties dried up. Nuts are a total failure. The weather during the blooming season was cold and wet; few bees or other insects visited the trees, whilst much of the fruit which did set fell by reason of the drought. The following is the rainfall: From May 9-31, .11 inch; June, .38 inch; and July, .14 inch. *J. R. Pearson and Sons, Lowdham.*

—— The fruit crops are disappointing. Apples only are up to the average. Pears, Plums, Apricots and Cherries gave promise of abundant crops, but with the exception of Morello Cherries all these fruits failed to set. Damsons are very thin; we had a very heavy crop of these fruits last year. Bush fruits have been very good. Strawberries were exceptionally fine and of good flavour, but the season was a short one, owing to drought. The same remarks apply to Raspberries, which failed to swell. There are scarcely any nuts. *A. C. Lehane, Park Hall Gardens, Mansfield.*

Oxfordshire.—Although the trees blossomed abundantly the fruit crops are disappointing, especially in the case of Pears, Cherries and Apricots. Certain Apples are carrying good crops, whilst some have not a single fruit. Our soil is a light loam on gravel and chalk, and in dry seasons most crops are unsatisfactory, especially Potatos and Broad Beans. *J. A. Hall, Shiplake Court Gardens, Henley-on-Thames.*

—— There was plenty of bloom on Plum, Apricot and Cherry trees, but owing to cold nights and hailstorms there was little prospect of even a small crop of fruit setting. Pear and Apple trees had a poor show of blossom. It has been a bad year for vegetation generally, the weather having been hot and dry, whilst the nights have been cold. Our soil is of poor quality, being very stony, and crops only do well if plenty of manure is used and the weather is summer showery. *A. J. Long, Wyfold Court Gardens, near Reading.*

—— Cherries, Apricots, Peaches and Pears set very badly owing to cold nights and dull days when the trees were in bloom. No blossom could withstand the strong, cold winds which prevailed here at that time. The soil is a light loam. *C. E. Munday, Nuneham Park Gardens.*

—— The fruit crops generally, with the exception of bush fruits, are disappointing. A few Apple trees are bearing a satisfactory crop. There was a wonderful show of blossom on fruit trees, and I attribute the failure to cold nights and very hot days at that stage. Trusses of dry bloom may be seen hanging on the trees even now. Much of the fruit that escaped injury from cold was affected by blight and dropped. *T. W. Whiting, Shotover Park Gardens, Wheatley.*

Shropshire.—Frost on April 8 (5°), 13 (6°), and 17 (4°), when Pears, Plums, and other stone fruits were in full bloom, is the cause of the thin crops of these fruits. Apples bloomed a little later, and so escaped injury. *A. Haggart, Moor Park Gardens, Ludlow.*

—— The fruit trees generally are badly affected with blight. Many Apple trees, including those of the varieties Duke of Devonshire, Betty Geeson, Warner's King, Allington Pippin, D. T. Fish, Royal Jubilee, Lady Sudeley, Blenheim Pippin, Cox's Orange Pippin, Chas. Ross, Rival and Peasgood's Nonesuch set very large crops, and many of the fruits had to be removed. Pear trees are very healthy, and the fruits are swelling well. Peach trees are also in the best of health; leaf curl has not been detected, but Plums and Black Currants are much damaged by blight. *J. Taylor, Hardwicke Grange Gardens, Shrewsbury.*

—— Apples are very variable this year, the older trees being better cropped than the younger ones. The varieties Warner's King, Golden Spire, Bramley's Seedling and Lane's Prince Albert are the most satisfactory. Trees of Lane's Prince Albert have been attacked badly by aphis. Plum trees also were much damaged by aphis, and Plums are very scarce, although odd trees here and there have a fair crop. Strawberries have been very good, whilst Raspberries were satisfactory. *G. T. Malthouse, Harper Adams Agricultural College, Newport.*

Staffordshire.—The fruit crops are about an average. There is a good crop of Apples, and Pears and Plums are very fair. The Strawberry crop was very good; the berries were large and of excellent quality. Small fruits, such as Gooseberries, Currants and Raspberries, were also satisfactory. The soil is of a light nature, and the subsoil gravelly. *Edwin Gilman, Ingestre Gardens, Stafford.*

Warwickshire. — Stone fruits generally are very disappointing. Prospects in the early spring were extra good, for the trees blossomed freely, but owing to blight most of the fruits turned yellow and dropped when about the size of peas. Apples are an average crop. Strawberries have been plentiful, and of good quality. Nuts are a failure. Small fruits are average crops. *Chas. Harding, Ragley Hall Gardens, Alcester.*

—— After a bad infestation of aphis, the fruit trees are making good secondary growth, and, given favourable weather, the fruits retained should now swell more satisfactorily than at one time seemed probable. Bush fruits, Strawberries, and Apples are the best crops. The soil is a clay-loam on rich earth; deep loams with a slight admixture of gravel are giving the best results. *H. Dunkin, Mount Pleasant, Warwick.*

—— Peach blister has given much trouble this season. The crop of this fruit is a poor one, the worst for many years. The wood did not ripen, as the leaves remained on the trees until well into the winter. The Apricot crop is a poor one. Pears are very scarce. *Jno. Masterson, Weston House Gardens, Shipston-on-Stour.*

—— The Apple crop, which at one time promised to be a heavy one, was injured by dry weather in June. American blight is very prevalent, especially on trees of the earlier varieties. Pears are a failure, being the worst crop for some years past. Most varieties of Plums set very heavy crops, but, owing to the drought, numbers of the fruits dropped. The crops, on the whole, are equal to those of an average season. Raspberries were the best crop I have known, and other small fruits were well over the average. Strawberries were good, but soon over. *H. F. Small, Warwick Castle Gardens, Warwick.*

5.—SOUTHERN COUNTIES.

Berkshire.—Apples are very satisfactory. The trees are clean and healthy, the variety Cox's Orange Pippin being especially fine. Pears are a very poor crop. Plums also are very scarce. Cherry trees are clean, and gave good crops of choice fruit. Peaches and Nectarines are fair crops, and the trees look well. Apricots are very thin. All small fruits were very heavy crops. The soil is a heavy loam, on a clay subsoil. *A. Mackellar, Royal Gardens, Windsor.*

—— The fruit crops are again disappointing, with the exception of small fruits, which are generally good. Strawberries especially were a heavy crop, and the berries were of good quality. Apples are much below the average, although some varieties have a fair number of fruits. Pears and Plums, which promised well at the flowering season, are almost failures. Gage Plums did not develop a single fruit. Peaches, Nectarines, and Apricots are thin, but the finest fruit promises to be good in quality. These trees were much harmed by cold winds in the spring, but they have since made satisfactory growth. Walnuts are a complete failure, and Cobnuts are only a small crop. Gooseberries were very satisfactory, and the berries were of good size. The soil is a light loam resting on gravel. *J. Howard, Benham Park Gardens, Newbury.*

—— Apples, Strawberries, and all bush fruits have cropped well. The best varieties of Strawberries were Royal Sovereign, Reward, Utility, Epicure, Givon's Late Prolific, Waterloo and Latest of All. Givon's Late Prolific still gives the best returns as a late variety. Apples are a good crop of clean fruits. All vegetables have been good, especially Peas. The soil is light in texture, with a clayey subsoil. *A. B. Wadds, Englefield Gardens, Reading.*

Dorsetshire.—The scarcity of Pears, Plums, and Cherries is mainly due to the heavy crops which the trees carried in 1912. The unripened condition of the wood is accountable for the failure of the Apricot, Peach, and Nectarine crops. Apple trees which failed to bear last year are in most cases carrying very satisfactory crops; otherwise the Apple crop generally is much below the average. Bush fruits are average crops and of excellent quality; whilst the Strawberry crop was the most satisfactory for many years past. Nuts of all kinds are almost nil. *Thos. Turton, Sherborne Castle Gardens.*

—— After a wealth of blossom the fruit crops are disappointing. I attribute much of the failure to continued rains whilst the trees were in flower. Apples, with the exception of a few sorts, are a failure: also Pears and Plums. Gooseberries and Strawberries were good crops, and all kinds of Currants fair. Figs are very plentiful, but Nuts are scarce. *Thos. Denny, Down House Gardens, Blandford.*

—— The Apple and Pear crops are the worst known in this district. The blossoms were weak and many malformed. Moreover, during the blossoming period the weather was very bad. Cold winds prevailed, and the temperature at night dropped to within 4° or 6° of freezing point. There was also a notable scarcity of bees to effect pollination. Of bush fruit we had an abundance, Gooseberries and Black Currants in particular. Figs are showing well. The garden faces south-east, and slopes considerably in that direction. The soil is shallow, fairly stiff, with a subsoil of chalk. *J. Jaques, Bryanston Gardens, Blandford.*

—— The fruit crops, with the exception of Apples, are under the average. Blossom was very plentiful, but either set badly or dropped after setting. There was not sufficient frost at the flowering stage to account for the failure, but a lack of pollinating insects, or perhaps an excess of wet, may be responsible. Apples, in many cases, required thinning. Peach and Nectarine trees even under glass bore lighter crops than usual. Currants, Gooseberries, Raspberries, Strawberries and other small fruits were excellent crops of good quality. The soil is light and friable. The gardens are near to a river and low lying. *A. Shakelton, Ford Abbey Gardens, Chard.*

—— The fruit crops are amongst the most disappointing on record. The very general shortage of fruits is probably due to unripened wood owing to the wet and sunless season of 1912, coupled with a very unfavourable spring. Most top fruits carried a smaller amount of blossom than usual. Pear trees in many cases flowered well, but much too early, and the Pear and Plum crops are almost complete failures. Plum trees were badly infested with aphis, and there is reason to fear that in some cases the results will be seen in a light crop next season, as the leaves and shoots are seriously damaged. Strawberries promised to be an excellent crop, but owing to prolonged drought at a critical stage the berries were much smaller than usual, and the season has been a short one and not up to average, though the plants were watered. *E. C. Parslow, County Offices, Dorchester.*

Hampshire.—The fruit crops are, generally, disappointing. Small fruits were good crops, and of good quality. Strawberries were excellent, the fruits being large and of good quality, but Pears, Plums, and Apricots are practically failures, which I attribute to wet, cold, sunless weather in April when the trees were in bloom. A few sorts of Pears, including Doyenné du Comice, Conference, and Beurré Diel, trained on walls in sheltered positions, have fair crops, but the same varieties in exposed parts of the garden are fruitless. Of Plums we have a fair crop of Victorias on wall trees. All Plums appeared to set well, but the fruits turned yellow and dropped. Apples are a good crop, and the quality good. *A. Legge, Dogsmerfield Park Gardens, Winchfield.*

(To be continued.)

The Week's Work.

THE ORCHID HOUSES.

By W. H. White, Grower to Sir Trevor Lawrence, Bart., Burford, Dorking.

Miltonia vexillaria.— These Orchids have started to grow, and some of the plants need re-potting, but before this is done examine each growth for the presence of small yellow thrips that secrete themselves low down in the axils of the leaves. Similar measures may be adopted to destroy the pests as were recommended for the thrips on Disa grandiflora, but Miltonias are not nearly so liable to injury from vaporising compounds as Disas. M. vexillaria is a shallow-rooting plant, and requires a large surface-space to root in. The compost may consist of Osmunda-fibre, which should be cut into small portions; some growers employ compost consisting of Osmunda-fibre and Sphagnum-moss in equal parts, with small crocks and broken charcoal added; but the best plants that I have seen of late years were growing in Osmunda-fibre only. Arrange the base of each plant just a trifle above the rim of the pot, packing the material firmly. Afford water sparingly for a time, using a fine-rosed watering-can or sprayer. The plants will soon become re-established. They will do best in the cool house for the present, but when the nights become cold, and the inside temperature is likely to fall below 55°, they should be removed to a cool, airy position in the Cattleya or intermediate house. Any old plants that need dividing may be attended to, placing the portions in very small pots.

Dendrobium.—Many of the warm-growing species of Dendrobium, and especially those of the deciduous and semi-deciduous sections, are completing their growth, which is shown by the development of the terminal leaf at the apex of the new pseudo-bulbs. When this is observed afford the roots less water, but do not allow the soil to become excessively dry or the plants will receive a check, the new pseudo-bulbs will not attain to their full size, and the plants will be liable to start into growth prematurely. It is advisable to examine the plants frequently with a view to placing those that have completed their growth in a cooler house, where they may receive more light and air and less atmospheric moisture. After a few weeks the plants should be placed in an ordinary greenhouse or vinery from which the Grapes have just been gathered. The new pseudo-bulbs will soon become hardened, and many of the leaves will turn yellow and drop. Afford water with the utmost care whilst the plants are at rest, especially when they are exposed fully to the sun's rays. It is advisable to examine them at least once a day, and when a new pseudo-bulb shows the least signs of shrivelling the plant should be well watered. Where a large number of these Orchids are grown it seldom happens that all of them are ready for removal to a cooler house at the same time, and those that remain and are still growing freely must continue to have plenty of heat and moisture. But they may be hardened gradually by increasing the amount of ventilation and exposure to sunshine in the early morning, also by removing the shading before the usual time in the afternoons. This gradual maturation will enable the plants to be removed to cooler quarters later on. Certain species of the evergreen section, including D. thyrsiflorum, D. densiflorum, D. Schröderæ, D. Farmeri, and D. Griffithianum will soon be finishing their growths, but the plants do not need the decided rest that is generally afforded to those of the deciduous or semi-deciduous sections. When growth is completed arrange the plants in a cool part of the Cattleya or intermediate house, and, as they continue to make roots for some considerable time after the new growths are finished, afford sufficient moisture to keep the foliage healthy and the pseudo-bulbs from shrivelling. If, during the resting season, secondary shoots commence to grow, afford the plants more heat and an increased amount of moisture.

Catasetum and Cycnoches. – Catasetums and Cycnoches growing in the warmest house, being deciduous, require a season of rest, and immediately each plant has completed its growth it should be removed to a moderately warm, dry greenhouse. Let the plants receive plenty of sunlight, and as much fresh air as possible. Unless the pseudo-bulbs become thoroughly ripened it will be almost impossible to keep them plump and fresh during their long season of rest. An abundance of air and sunshine will cause the compost to dry quickly, therefore water must be afforded liberally until the leaves commence to turn yellow, when the amount should be gradually reduced, and later withheld entirely. Strong, healthy plants that absorb a large quantity of water during the ripening period seldom shrivel during the resting season.

Pleione.—Such Pleiones as P. maculata, P. lagenaria, P. præcox and its variety Wallichiana, need plenty of light, air, and water until the foliage begins to change colour, when the compost should be kept merely moist. Within a few weeks after the leaves have fallen the flowers will begin to appear from the base of the newly-made pseudo-bulbs, and if kept in a rather dry and cool position the pretty flowers will last for some considerable time.

THE FLOWER GARDEN.

By Edward Harriss, Gardener to Lady Wantage, Lockinge, Berkshire.

Climbing Plants.—The growths should be thinned regularly in order to avoid the unsightly gaps which are the result of sudden and severe pruning. Many climbing plants are subject to disfiguring attacks of red spider. The plants should be kept clean by syringing with clear water, but should the pest have become at all troublesome an insecticide will be necessary. Climbers growing against a wall should be watered regularly and mulched with short dung. Several of the ornamental vines are useful plants for covering a trellis, and except for a little judicious thinning of the shoots early in the season they require very little attention when once established. Vitis Coignetiæ can be used equally well for training over a trellis or for growing up a wall. In the autumn the leaves assume brilliant and attractive tints, as do those of V. Thunbergii and V. vinifera purpurea.

Spartium junceum. — This ornamental flowering shrub is usually known as the Spanish Broom, but unlike most Brooms it has a long flowering season, beginning early in the summer and lasting until late in the autumn. It is a useful subject for a shrubbery, and will thrive in almost any kind of soil. It is most effective planted in masses in open spaces in the woodland. A stock of plants may be easily raised from cuttings, which should be inserted at the present time, or from seed, which matures in large quantities. For planting out pot specimens are the best as the Spanish Broom resents being disturbed at the root. The plants should be put out when quite young or the growth will become straggling.

The Flower Border.—Dead flowers and foliage should be removed daily, and every effort made to keep the border bright and gay for as long as possible. Late-sown annuals, including Lavatera rosea, Godetias, Malope, Coreopsis, Cosmos, Larkspurs, Salvias and Alonsoas are making a brilliant show, and the plants should continue in flower until the end of the season. Annuals intended for flowering early next summer should be sown now in boxes and placed in a cold frame. Give the flower border a thorough soaking with water at least once a week in dry weather.

THE HARDY FRUIT GARDEN.

By B. Goodacre, Gardener to Sir Ernest Cassel, Moulton Paddocks, Newmarket.

Peaches and Nectarines.—The fruits of the earliest varieties of Peaches and Nectarines will now be ripening, and must be well protected from insects, which become increasingly troublesome as the fruit softens. The earwig is perhaps the most persistent; the best method of combating this pest is to trap the insects in hollow canes. Short lengths of the cane should be placed among the trees, and should be blown through or tapped each morning over a bucket of water. The insects will be found to have congregated in great numbers in these temporary shelters, and after a few days nearly all will have been destroyed. Wood lice and ants are frequently found in old, partially-decayed walls, especially in crevices where the mortar has become displaced. The wall should first be well syringed, after which the insects will probably be found sheltering in the soil at the base. This soil should be entirely removed, the wall scrubbed thoroughly, and fresh loam supplied in place of that which was taken away. When the wall has once been cleaned, a good preventive of damage by wood-lice to the trees is to peg the fruit-bearing branches away from the wall, and wrap each fruit in cotton wool. The whole of the fruit should be covered, and a small portion of the wood at the bottom. The wool should be placed with the rough side outwards, not next to the fruit; there will then be no danger of it adhering to the skin, and, moreover, the rough surface of the wool presents an obstacle to the lice. The fruits should not be allowed to remain on the trees until just before use, but should be gathered a day or two previously. They may be placed in the fruit room, but a better method is to place each one bottom upwards on a tray covered with soft packing material, and put the tray on a shelf near the roof-glass in a cool vinery or greenhouse. This will ensure the proper ripening of the under part of the fruit, which is usually not so soft as the face; and the flavour will also be improved. If the sun is hot the glass should be shaded partially. The stopping, tying and training of the leaders on wall-trees must be carefully attended to, as before advised, to encourage more vigorous growth on the part of undeveloped portions. As the work of training this year's shoots advances some of the ties may be removed from the older wood. It is well to support the trees as little as possible beyond what is really necessary. When tying young shoots the tie should be attached tightly to the support, but loosely around the wood; the soft bark, when once wounded by a tight ligature, seldom recovers from the disfigurement thus caused.

PLANTS UNDER GLASS.

By F. Jennings, Gardener to the Duke of Devonshire, Chatsworth, Derbyshire.

Freesia refracta alba.—If, when the corms are received from the bulb merchant, pressure of other work prevents these plants from being potted directly, take them out of the box and spread them thinly in sieves and stand them on a dry shelf. This precaution is necessary, for if the corms were allowed to remain in a heap fermentation would ensue and set up decay. The plants should be potted in either 4½ or 6-inch pots filled with a mixture of rich loam and leaf-mould with sand, decayed cow-manure and wood-ashes added in suitable proportions. Stand the pots in a cold frame and as soon as the corms commence to grow soak the soil thoroughly with water; as growth advances liquid manure and soot water may be afforded instead. The plants may be brought into an intermediate house in batches to furnish a succession of flowers.

Carnation Souvenir de la Malmaison.—Continue to pot layers of Malmaison Carnations, detaching them with great care from the parent plants. Dig up the roots with large balls of soil attached, and take care not to crowd them into small pots, a mistake that is often committed for the purpose of having all the plants in receptacles of the same size. Grow the layers in the best house or frame at disposal, so that they may have every opportunity to make a satisfactory growth. Should green fly be detected on the foliage when the potting is done take measures to destroy the pest.

Allamanda, Bougainvillea and Clerodendron.—As the foliage of these plants changes colour reduce the amount of water at the roots, and when the wood is ripened thoroughly remove the plants to a cold frame or store room, where they will be safe from frost.

The Conservatory.—Remove useless growths on plants of Cobæa scandens and train in young shoots to take their places. Afford the roots manure water, as this will cause the plants to make vigorous growth before the autumn. Roses trained on walls or the roof rafters should

be thinned of weak growth and receive less root waterings. Endeavour at this stage to get the wood of indoor Roses well ripened. Fuchsias on walls that have almost completed their blooming should be hardened gradually. Afford Camellias plenty of liquid manure, as this will cause the flower buds to become plump. Syringe the foliage of these plants occasionally with soluble paraffin to destroy insect pests.

THE KITCHEN GARDEN.

By John Dunn, Foreman, Royal Gardens, Windsor.

Cabbage.—Another sowing of Cabbage may be made in an open situation to secure hardy plants, which should be ready for transplanting at about the end of September. Seedlings of this later sowing may withstand the winter better than those planted a month earlier. Early Offenham and Flower of Spring are reliable varieties for present sowing. Cabbage plants may be put out now to supply heads for use during November. If summer-sown plants are available now they will prove a valuable crop at that time.

Cucumbers.—Seedling Cucumbers raised from seeds sown a month ago are ready for planting, which should be done without further delay, as it is necessary to have the trelliswork covered with short-jointed growth before the Cucumbers are required. The house in which they are grown should be cleansed thoroughly, and if a little sulphur is burned in it before the hot-bed is placed in position many insect pests will be destroyed. When the fermenting material has been prepared it should be trodden together tightly and the layer placed to within 18 inches of the roof-glass. Arrange the soil in small mounds and allow a day or two to elapse before planting, so that it may become warmed to the temperature of the house. Whilst cold soil is harmful care must be taken that the compost does not become too hot through excessive fermentation, as this also would injure the roots. The compost may consist of turfy loam two-thirds and leaf-mould one-third. Seeds of Cucumbers may be sown singly in pots to furnish plants for setting out about the middle of September.

Radishes.—Radishes may be sown as late as the middle of December, choosing a short-topped variety. Sow the seeds thinly in rich soil, and afford the roots water whenever moisture is necessary, otherwise the Radishes will be strong and tough.

Vegetable Marrows.—Marrows require liberal supplies of water at the roots during times of dry weather, and if manure water is available this should be applied once or twice each week. Keep the growth well thinned and cut the fruits as soon as they are large enough for use, whether they are required or not, or the plants may cease to bear before the season is over.

Leeks.—The earliest-planted Leeks should have more soil placed about the stems as the season advances and the roots watered on frequent occasions with liquid manure. The Leek is a gross feeding plant and requires liberal supplies of manure. During dry weather afford a thorough watering at least once each week. Further plantations may be made to furnish roots for use in the spring. The plants may be grown in drills made at 1 foot apart, allowing 6 inches between the plants in the row.

Lettuce.—Make a sowing of either Maximum or All the Year Round Lettuce to furnish a supply of this salad in December. The plants may either be lifted and placed in cold frames or protected by box-frames where they are growing. Small sowings of Lettuce should be made on frequent occasions during the present month to ensure a plentiful supply of plants in winter. If cold pits are available when the plants are ready for thinning, the seedlings may be set in the frames at 9 inches apart, arranging the soil so that the Lettuces are about 15 inches from the roof-glass. The lights should not be placed in position until there is a danger from frost. The varieties Brown Cos and Hardy White Cos are a longer time in maturing than some other sorts, but they are very valuable for furnishing winter salad. Plantations should be made now from seedlings of these varieties raised from former sowings. The variety Hammersmith Hardy Green may be included in the list of those sown now.

Endive.—Endive furnishes a valuable salad in winter and should be treated in a similar manner to Lettuces. Plants may be grown on a south border to furnish a supply in early winter, but protection must be afforded to later supplies, and brick pits are the best for the purpose. Place soil in the pit to within 18 inches of the lights and make it moderately firm; it will not be necessary to use the lights until several degrees of frost have occurred. Make a final sowing of Batavian Endive at once, and water the seedlings whenever the weather is dry, for with all salads, growth that develops quickly is the more tender. When the plants have attained to their full size tie the leaves together to blanch them; but this work should not be done when the foliage is damp or the leaves may decay, rendering the plants unfit for use.

FRUITS UNDER GLASS.

By James Whytock, Gardener to the Duke of Buccleuch, Dalkeith Palace, Midlothian.

Strawberries in Pots.—The dry weather has caused in many cases a shortage of early runners for potting, and late runners should at once be placed in fruiting pots. They should be kept in the shade until they begin to grow, and afterwards transferred to an open, airy situation. Those already in fruiting pots, which have made considerable root growth, should be placed on boards or a trellis a few inches from the ground. If the pots are placed on soil or gravel the roots are apt to grow through the pots. The plants should be kept a good distance apart, so that light and air may circulate freely. They should be kept moist, and frequently watered with weak manure-solution. All runners should be removed as soon as they appear, and the strongest crown only retained. An overhead syringing on warm days will be beneficial, but the pots must be kept clear of weeds, which will probably appear.

Melons.—The flowers on late plants must be carefully pollinated. The plants must be kept moist until the fruit is set and beginning to swell, after which they may be a little drier. Over-cropping must be avoided, and all superfluous shoots and leaves should be removed. On bright days the plants should be syringed overhead, and the damping of paths and surfaces will be of benefit while the atmosphere is to be kept moist. The beds in the Melon house containing plants with fruit well advanced should be given a top-dressing of loam mixed with artificial fertiliser, and a light mulch of decayed manure. When watering the bed it should be thoroughly soaked. Fruits which are now ripening should be fully exposed to the sunshine, and a free circulation of dry, warm air should be admitted. The roots, however, must not be allowed to become dry. Melons in frames have done well this year on account of the unusual amount of bright sunshine. When the fruits are approaching the ripening stage they should be raised on a pot above the foliage. A little air may be admitted continuously at the top of the frame, and no water should be applied to the roots, or the fruit will crack.

Winter Cucumbers.—Cucumbers should now be planted in the fruiting house, so that the plants may be well established and in a bearing condition before the winter. Before moving them, however, the glass and wood-work in the house should be cleaned with soapy water with a little paraffin in it, and the walls lime-washed. If the bed is a shallow one, with a hot-air chamber underneath, at least six inches of good drainage should be provided. Fresh sods, grass side down, should be placed over the drainage, and over this, just sufficient soil to establish the plants. As they make fresh growth small quantities of compost should be continually added. An equally good method is to make a hot-bed of leaves and stable litter well mixed together, allowing the extreme heat to escape before putting it in the bed. The soil should be light and open, consisting of equal parts of turfy loam and well-decayed manure. The plants raised from seed early in August should now be planted at a distance of two feet apart. Until the weather becomes cold, a good deal of air may be admitted in order to check red spider and enable the plants to withstand the winter.

THE APIARY.

By Chloris.

Robbing.—When combs have had the honey extracted from them they should be returned to the hives for the bees to clean them up, and on no account should they be left about to attract bees or this will cause robbing to commence. The best time to return empty combs is during the evening when the bees are not on the wing. For this reason it is best to do all extracting indoors after sundown. It is well known by all beekeepers of experience that when there is plenty of nectar bees are rarely guilty of robbing, and consequently as soon as the honey flow ceases they take every precaution to prevent bees commencing this practice. Should any honey or syrup be spilled or left carelessly about the bees seem to become thoroughly demoralised, and commence robbing, generally attacking the weaker colonies, and if not discovered clear out the whole of the stores.

Signs of Robbing.—The first sign of robbing is an unusual commotion in the apiary, for there is an unnatural agitation, and when the entrances are examined bees will be seen tightly embraced in some instances, in others rolling down and falling off the alighting board. The ground will be strewn with dead and struggling bees.

Cure.—Close the entrances so that one bee only may pass at a time, but in some instances this will not be sufficient; if this be so, then the entrances must be closed for the day, taking care to give ample ventilation. Then after sunset open the entrance about three-eighths of an inch, and place a piece of glass in front of the entrance hole, so that the bees will have to pass out at each end of the porch thus formed. The robber bees will be prevented from entering because they will make straight for the entrance, and in a few days the sheet of glass may be removed. In some instances it has been found necessary to keep a rag on the alighting board, which has been soaked in a weak carbolic solution. It will be necessary to repeat the soaking as the carbolic is very volatile. A few drops of carbolic only will be necessary in the water, so that the water is slightly scented, and keep the fluid in a well-corked bottle.

Re-Queening.—After a queen's second year her laying powers decrease, and in consequence the productive power of the stocks materially decreases. For this reason it is wise to kill all queens that have passed their most fertile period, and introduce others of this season. Wise apiarists raise their own queens, doing so on the principle of careful selection, *i.e.*, choosing those that produce the greatest number of worker eggs, those least given to swarming and producing bees that work hard and are easy to handle. Where queens are not raised they must be purchased if the hives are to be made to pay. At the end of the season queens may be purchased cheaply, but at the same time we must remember that they are not always so suitable as earlier in the season.

Introducing the Queen.—When it is known that the queen will arrive on a certain date the old queen should be removed, and the operation is best performed at mid-day, when the queen will often be found on the centre comb. Seize her by the wings and crush her by squeezing across the thorax. In the evening it will often be found possible to introduce the new queen by opening the box in which she has travelled and allowing her to run in at the entrance. There is always a risk that the bees may not accept her, for often they form a ball round her and kill her. To prevent this many bee-keepers place the queen in a cage on the centre comb and leave her there for twenty-four hours, after which she is released, and the behaviour of the bees carefully observed, and should they not molest her it may be taken for granted that they have accepted her; but should they seize her by the legs or wings she must be re-caged and left thus for another day.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the **PUBLISHER**, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, *as well as specimens of plants for naming, should be addressed to the* **EDITORS**, 41, Wellington Street, Covent Garden, London. *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

APPOINTMENTS FOR SEPTEMBER.

TUESDAY, SEPTEMBER 2—
Newcastle-upon-Tyne Fl. Sh. in Recreation Ground, North Road (3 days). Scottish Hort. Assoc. meet Nat. Amateur Gard. Assoc. meet. Forest Gate Chrys. Soc. meet.

WEDNESDAY, SEPTEMBER 3—
Glasgow & W. of Scotland Hort. Soc. Sh. (2 days).

FRIDAY, SEPTEMBER 5—
Ashton-under-Lyne and District Hort. Soc. Sh.

SATURDAY, SEPTEMBER 6—
Soc. Française d'Hort. de Londres meet.

MONDAY, SEPTEMBER 8—
United Hort. Ben. & Prov. Soc. meet. Nat. Chrys. Soc. Floral Com. meet.

TUESDAY, SEPTEMBER 9—
Roy. Hort. Soc. Coms. meet. (Lecture at 3 p.m. by Mr. C. Herman Senn on "Stem Vegetables: their Dietetic Values, and Various Ways of Cooking Them.") National Dahlia Soc. Exh. at Crystal Palace Sydenham (2 days).

WEDNESDAY, SEPTEMBER 10—
Roy. Caledonian Hort. Soc. Sh. at Edinburgh (2 days).

THURSDAY, SEPTEMBER 11—
Nat. Rose Soc. Autumn Sh. at R.H.S. Hall, Westminster (2 days). Messrs. Dickson and Robinson's Vegetable Sh. at Manchester Coal Exchange (2 days).

MONDAY, SEPTEMBER 22—
Nat. Chrys. Soc. Executive and Floral Coms. meet.

TUESDAY, SEPTEMBER 23—
Roy. Hort. Soc. Coms. meet and Special Vegetable Competitions. (Lecture at 3 p.m. by Mr. Bernard Crisp on "Autumn Border Plants.")

WEDNESDAY, SEPTEMBER 24—
Kendal Fl. Sh. (2 days).

THURSDAY, SEPTEMBER 25—
Roy. Hort. Soc. Exh. of British-grown Fruits (2 days).

FRIDAY, SEPTEMBER 26—
Ann. Conference of Affiliated Mutual Imp. Soc. at R.H.S. Hall, Westminster.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich, 59.7°.

ACTUAL TEMPERATURES:—
LONDON—*Wednesday, August 27* (6 p.m.); Max. 76°; Min. 58°.
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, *Thursday, August 28* (10 a.m.); Bar. 29.9°. Temp., 68°.
Weather—Sunshine.
PROVINCES.—*Wednesday, August 27*, Max., 69°, England, S.; Min. 60°, Scotland, E. Coast.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY AND FRIDAY NEXT—
Dutch Bulbs, at 67 and 68, Cheapside, E.C., by Protheroe and Morris, at 10.30 o'clock.

MONDAY, WEDNESDAY AND THURSDAY—
Dutch Bulbs, Bay Trees, etc., at 12.30. At Stevens' Auction Rooms, King Street, Covent Garden.

WEDNESDAY NEXT—
Bulbs in large quantities for the trade, at 67 and 68, Cheapside, E.C., by Protheroe and Morris, at 1.

FRIDAY NEXT—
Imported and established Orchids, at 67 and 68, Cheapside, E.C., by Protheroe and Morris, at 12.45.

National Diploma in Horticulture.

The committee which has been engaged during the past year in drafting a scheme for a National Diploma in Horticulture has completed its labours. Its report has been accepted by the Council of the Royal Horticultural Society, and the syllabuses drawn up by the committee have received the approval of the Board of Agriculture. Thus the National Diploma is in being. As will be seen by a perusal of the regulations and syllabuses which we publish on page 157, the examinations for the Diploma are essentially practical. This, we feel sure, will meet with the approval of all gardeners who recognise that workmanship is the only test of proficiency in any craft, and who are repelled by the idea of submitting themselves to an exclusively "written" examination. Although the test for the Diploma is essentially practical it is not exclusively so. This also is as it should be; for a man who would rise in his profession must have some knowledge over and above the vital practical knowledge of how to grow things. Into the description of the various kinds of knowledge which the successful gardener must possess we need not enter now—the less so since the syllabuses which we publish indicate the nature of that knowledge with considerable detail. We believe that the decision of the committee to require from candidates for the Diploma evidence of general education will meet with approval on all sides, and for our part we hold that if this decision leads young gardeners to spend a part of their leisure in continuing their general education, it will have done a very valuable piece of work.

We are aware that there exist among horticulturists men of position and ability who set but small store by Diplomas. If by Diploma is meant the generally inartistic piece of parchment awarded to successful candidates, we share that view; but if it be suggested that the steady application, the determination and self-sacrifice which a young man bestows on his work are naught, we dissociate ourselves emphatically from the suggestion.

The immediate success of the National Diploma depends largely on the attitude which young and old gardeners adopt toward it. We believe that that attitude will be cordial, and that the establishment of a National Diploma will be found to mark a notable step in the progress of horticulture. It remains to add that the Diploma scheme will remain incomplete until a well-considered and generous system of scholarships is established; scholarships which shall give an opportunity to the capable young gardener of studying his profession in divers places, and which will set him free for a period from the necessity to think first and last and all the time of the need of earning his living. Scholarships are often, it is true, a source of danger. The scholar may become proud; he may develop idleness; he is prone to acquire a distaste for manual labour; but the weak will always contrive to find temptations, and will always dig pits wherein to fall. On the other hand, scholarships of the kind we contemplate should prove the means of discovering talent and of providing avenues of advancement for the young, energetic, and intelligent gardener who desires to rise in his profession.

We trust that head gardeners, who can do more than anybody to make the scheme a success, will bring it to the notice of the young men under their charge, and encourage these juniors to enter themselves forthwith as candidates for the Diploma.

Coloured Supplement.—The subject of the Supplementary Illustration represents a fine specimen of Cattleya Lawrenceana from Mrs. BISCHOFFSHEIM'S collection at The Warren House, Stanmore. The plant, the largest spike of which bore 8 flowers, was in flower during the greater part of March and April. Cattleya Lawrenceana was first discovered by Sir ROBERT SCHOMBURGK during his exploration of British Guiana in 1840-44 on the Roraima, and was mistaken by him for a form of C. Mossiæ. Early in 1884 Mr. SEIDL, collecting for Messrs. SANDER AND SONS, rediscovered the species growing on trees on the river bank in the same locality at an altitude of 3-4,000 feet, and a consignment was despatched to England. The species was described in the *Gardeners' Chronicle*, March 14, 1885, p. 338, by the late Professor H. G. REICHENBACH, and an illustration of it was also given in the same year, p. 375. It is one of the most distinct and showy Cattleyas, but the scarcity of the plant at the present time indicates that it is not so successful everywhere as at The Warren House, where, however, it is merely treated like other Cattleyas. The flowers, each 5 ins. across, vary in tint from the rose-purple as shown in the illustration, with darker labellum, to a uniform rose colour. The albino form is extremely rare, the white variety, Mary Regina, with which Messrs. CHARLESWORTH AND Co., Haywards Heath, won the Davidson Cup offered for the best and most distinct Cattleya at the Chelsea show this year, being still unique. C. Lawrenceana has been crossed with most of the large-flowered Cattleyas, several Brassavolas, Lælias, Lælio-Cattleyas, and Sophronitis grandiflora. The hybrids are free-growing and very floriferous garden plants.

EXHIBITS OF PAINTINGS AT THE R.H.S. MEETINGS.—The President and Council of the Royal Horticultural Society have adopted the following regulations for the exhibit of pictures at the Society's fortnightly meetings at Vincent Square during the months of November, December, January, and February of each year, during which months only such exhibits can be received, the spring and summer shows of the Society excepted:—(1) The Council, though allowing the exhibit of pictures at the fortnightly meetings in November, December, January, and February, are unwilling to express any opinion on their artistic merit, and will consequently not make any awards unless on the basis of their interest from a purely botanical or horticultural point of view. (2) No exhibitor may exhibit the same picture twice during the four months. (3) The space to be occupied must be arranged with the superintendent at least a week before the show. (4) All paintings must be of definitely horticultural interest.

HORTICULTURAL SCHOLARSHIPS. — The *Directory for Higher Education* (1913-14), issued by the Education Committee of the Staffordshire County Council, contains the announcement of a major Horticultural Scholarship of the value of £45, tenable at an approved institution. The scholarship will be offered in 1914, and is open to candidates whose parents or guardians are or have been for a period of six calendar months immediately preceding the examination resident in the Administrative County of Stafford. Further particulars may be obtained from the Director, County Education Offices, Stafford.

LÆLIO-CATTLEYA URANIA.—Mr. EUSTACE F. CLARK, Evershot, Dorsetshire, writes that Lælio-Cattleya Ursula was recorded for his cross between L. crispa and L.-C. corbeillensis in the *Gardeners' Chronicle*, October 21, 1911, p. 284. Hence the name is not available for the hybrid between L.-C. Ingramii and C. Mantinii for which Messrs. J. and A. McBEAN, Cooksbridge, were given an Award of Merit at the last meeting of the Royal Horticultural Society. Messrs. McBEAN therefore alter the name to L.-C. Urania.

APPOINTMENT FROM KEW.—Mr. PHILIP VALENTINE OSBORNE, a member of the gardening staff of the Royal Botanic Gardens, has been appointed by the Secretary of State for India in Council, on the recommendation of Kew, a probationer gardener for service in India.

National Diploma in Horticulture.—In 1912 the Council of the Royal Horticultural Society approached the Board of Agriculture on the subject of a National Diploma in Horticulture, with the result that the approval of the Board was given to the proposal, and authority from His Majesty's Government was given for the Diploma to carry the title "National." The project has now taken definite shape, and examinations will, as far as possible, be held in the latter part of June of each year. Among those for whose benefit the diploma is established are the following:—Florists, fruit growers, gardeners, horticultural inspectors, horticultural instructors, landscape gardeners, market gardeners, nurserymen, public park gardeners, and seedsmen. Horticulture is defined as follows:—"Horticulture is a definite craft of itself and not a department of Agriculture. Horticulture as differentiated from agriculture includes the more intensive cultivation (as usually practised in gardens) of fruit, vegetables, flowers, shrubs, and ornamental trees."

The scheme drawn up by the Royal Horticultural Society and approved by the Board of Agriculture and Fisheries is as follows:—(1) Candidates for the diploma must (a) register themselves with the Society, and (b) pass two examinations, a preliminary and a final. (2) The examinations are open to both men and women. (3) Candidates must register themselves at least four months before the date fixed for the preliminary examination, and may do so at any time after they have attained the age of 19. (4) In order to register themselves candidates must supply the Council of the R.H.S. with (a) a birth certificate as evidence of age, and (b) some documentary evidence of the sufficiency of their previous general education (paragraph 5). (5) To satisfy the requirements under (4b), the certificate of the College of Preceptors, the Oxford and Cambridge Local Examinations Boards, matriculation at any British University, or any similar certificate which may from time to time be approved by the Council of the Society will be accepted; candidates who are unable to produce any such certificate must submit themselves to (and pass) a qualifying test established by the Society in the simple subjects mentioned in Syllabus 1. (6) Registered Candidates, before sitting for the preliminary examination, must, by the date of the examination, (a) have reached the age of 21 years, and (b) have served at least four years (1) in a public or private garden or nursery, or (2) in an approved horticultural institution, and have received a satisfactory report as regards conduct and work from the authorities of such institution, or (3) partly as in (1) and partly as in (2). It is absolutely necessary for all candidates for the diploma to pass the preliminary examination before they can enter for the final, but the preliminary examination by itself does not entitle those who pass it to any form of diploma. (7) The final examination is only open to those who have passed the preliminary examination and have subsequently been engaged for not less than two years in the practice of horticulture. The practice of horticulture includes the following:—Florists, fruit growers, gardeners, horticultural inspectors, horticultural instructors, landscape gardeners, market gardeners, nurserymen, public park gardeners, and seedsmen. (8) Candidates for the final examination must give at least four months' notice to the Society of their intention to present themselves in order that sufficient arrangements may be made. (9) In both examinations the principal part will consist of tests of the candidates' practical acquaintance with plants and general garden work and practical knowledge of horticulture. The practical tests will be conducted in a suitable garden or nursery, and will be supplemented by viva voce questions and written papers. Candidates will be required to pass in all three parts of the examinations—practical, viva voce, and written—but no amount of excellence in the written part will qualify a candidate if he fail in the practical. (10) The examinations will, as far as possible, be held in the latter part of June of each year. (11) The entrance fees, which are payable in advance, are (a) for the preliminary examination £1, (b) for the final examination £3. Half the entrance fee will be returned to candidates unavoidably prevented from attending the examination. There will be no fee for registration, or for the qualifying test when that is necessary. (12) The fees payable by rejected candidates entering again will be 10s. for the preliminary examination and £1 10s. for the final. (13) The examinations will be held at different centres in Great Britain, regard being had especially to (a) the number of candidates in any district, and (b) the suitability of a locality for the practical part of the examination. (14) All particulars, forms, etc., may be obtained from the secretary of the Royal Horticultural Society, Vincent-square, London.

The syllabus has been set out as follows:—Candidates requiring to take the qualifying test (paragraph 5) will be expected to (15) write an essay on some given subject of general knowledge, as a test of their handwriting, spelling, and ability to express themselves clearly and grammatically. (16) Show an acquaintance with arithmetic up to and including decimals and elementary mensuration. The questions asked will usually be such as might occur in ordinary garden practice. (17) Have a general elementary knowledge of geography, such as the relative positions of the principal countries of the world, with some knowledge of their climates and of the causes which determine climate. At this stage no special knowledge of plants will be expected of the candidates.

The PRELIMINARY EXAMINATION will be based upon the general principles of plant-growing, and will involve an elementary knowledge of botany, chemistry, and physics, so far as acquaintance with these subjects is essential to an understanding of garden practice. Care will be taken to ascertain that the candidate is able to perform the operations of gardening with proper skill, and also that he understands the reasons for the methods employed. The examinations will be based on the subjects mentioned in the following syllabus, many more questions being asked than will be required to be answered, so that candidates will be given considerable choice.

SYLLABUS.—(18) Choice of site, laying out, levelling, etc., of a garden. (19) Composition of soils, and the manner of their formation. (20) Cultivation of the soil: trenching, digging, hoeing, raking, rolling; drainage and its effects upon soil and crops; the relation of the plant to the soil. The making of composts. (21) Preparation of the ground for crops, and rotation in cropping. (22) Nature and uses of manures in the garden. (23) The part played by root, stem, leaf, flower, fruit, and seed, in the life of the plant. The effect of water, air, light and temperature on the growth of plants, and the influence of these on the choice of aspect and soil. (24) Seed sowing, transplanting, and permanent planting. (25) Cultivation of kitchen garden plants. (26) Care of lawns, paths, flower-beds, herbaceous borders, and rock gardens. (27) Methods of propagation by seeds and vegetative processes. (28) Cultivation of ornamental plants under glass: ventilation, watering, and regulation of light and temperature. (29) Fruit and vegetable cultivation under glass. (30) Planting, pruning, and training of fruit-trees and bushes, in the open, on walls and otherwise. (31) Planting, pruning, and training of ornamental trees and shrubs, including Roses. (32) Knowledge of the ordinary names, Latin or English, of garden plants, shrubs, trees, and weeds. (33) Symptoms and treatment of the commonest plant diseases and insect pests. Methods of fumigation and spraying. (34) Use and care of tools and implements employed in the making and maintenance of gardens.

The syllabus for the FINAL EXAMINATION will be divided into sections, each dealing with one particular branch of horticulture. Candidates may enter for the branch in which they feel themselves most proficient. Syllabuses will be published later.

The British Association for the Advancement of Science and the Royal Society of New South Wales.—From the presidential address of R. H. CAMBAGE we learn that comprehensive and liberal arrangements are being made by the Commonwealth and the separate States to render the meeting of the British Association in Australia next year a success, both from a practical and a scientific standpoint. In Sydney various committees are already at work preparing for the reception of the coming scientists. Among other matters a New South Wales Handbook of about 500 pages is in course of compilation, dealing with the social and natural science of the State. It has also been arranged by the Federal Council that a Commonwealth Handbook for Australia shall be published; and the Commonwealth Government, at the instance of a sympathetic Prime Minister and the general approval of Parliament, has undertaken to provide £15,000 towards the expense of taking out at least 150 leading scientists, and is also providing the funds necessary to send an organising secretary to England to confer with the British Association in regard to all arrangements. It has been decided that the main party will visit Adelaide, Melbourne and Sydney, and an endeavour is being made to arrange for some of the Association's members to visit all the remaining States of Australia and the Dominion of New Zealand. Indeed, everything connected with the meeting is being arranged on a most liberal scale, and it is to be hoped that there will be a fully representative response from this country.

"Horticultural Directory" for 1914.—We are desired by the Editor of this work to ask head gardeners if they will kindly inform him, at 10, Essex Street, Strand, of any change of proprietorship or address that may have occurred since October last.

International Horticultural Congress, Ghent.—Volume I. of the preliminary reports presented to this Congress on the 7th to the 11th inst. has just been issued to the members. A paper-covered volume, containing the programme, regulations, and names of the organising committee, also includes the text of many of the papers submitted. Horticulture, fruit tree culture, market gardening, and other allied subjects have been dealt with by such writers and authorities as Messrs. A. BUYSSENS, NOMBLOT-BRUNEAU, DACHY, LORGE, BUCKMAN, DE RUDINA, ICKX, DE ROOVER, VENDELMANS, CALLUMBIEN, LORETTE, HELLINCKX, IDE, GUILLOCHON, CHITTENDEN, BOS, A. DE SMET, DOP, CYRIL HARDING, VOULOIR, ABBÉ TORFS JADIN, SCHILLINGS, MARECHAL, LEFEBRE, and others.

Mérite Agricole.—The French Senate, states our Parisian contemporary, *Le Jardin*, has authorised the Minister of Agriculture to make new regulations as to the bestowal of this decoration upon persons worthy of the distinction. A decree has just been signed by the Minister, and published in the *Journal Officiel* of the 3rd inst., by which the Council of the Order has been reconstituted and the maximum number per annum of recipients of the various grades of Chevalier, Officier, and Commandeur fixed. Ten years' service is now a *sine quâ non* before a candidate can be decorated with this order. The nominations are made regularly on January 1 and July 14 every year, besides a few others that are made on the occasion of special gatherings, such as exhibitions, congresses, etc., where agriculturists and horticulturists assemble.

Chrysanthemum Society of America.—The proceedings of the eleventh annual meeting, which was held at the American Institute, New York, on November 6 to 8 last, have just been published. The frontispiece is a portrait of Mr. CHARLES H. TOTTY, the president of the society,

and the text consists of his presidential address, report of the annual meeting, balance-sheet, secretary's report, scales of points for plants and cut flowers, special prizes awarded, floral committee awards, novelties of American and foreign origin distributed during the past year, and list of members.

RELIEF FUND FOR NURSERY EMPLOYEES.—A committee has been formed for the purpose of raising a fund for the relief of the distress caused by the recent motor 'bus accident which befell a party of employees of Mr. W. HAMILTON, nurseryman, of Waltham Cross. As the result of this accident five persons were killed and twenty-five were more or less seriously injured. Subscriptions may be sent to the chairman of the committee, Mr. J. CULL, 26, College Road, Cheshunt, or to the secretary, Mr. G. J. KITTERINGHAM, The Hollies, York Road, Waltham Cross.

FIG. 61.—MESSRS. SUTTON AND SONS' EXHIBIT OF FRUITS, FLOWERS, AND VEGETABLES AT THE SHREWSBURY SHOW (see p. 145).

SPORTING CARNATIONS.—The occurrence of sports or "sudden variations" in Carnations is not uncommon, but a specimen sent by Mrs. JANE R. PHILLIPS, from Lemonfield, Holywood, Co. Down, illustrates the phenomenon in a striking manner. The inflorescence bears four flowers, of which three are deep crimson and one is pink—the latter being mottled or lightly flaked with crimson. The explanation of the sporting is probably as follows. The plant which bears these flowers is a hybrid. It contains a factor for pink for which it is pure, and another "darkening" factor which converts pink into crimson. For this darkening factor, however, the plant is "impure" or heterozygous. That is to say, it inherited this factor from one parent but not from the other. Instead, therefore, of having two doses it has only one. Ordinarily every cell of the plant contains this darkening factor as well as the factor for pink, and hence, ordinarily, the cells which give rise to the petals produce crimson sap. But in the cell divisions which preceded the formation of the pink flower it happened that certain cells failed to receive the darkening factor, and hence the pigment which they produce is not deepened in tint by the action of that factor. In other words, the same thing has occurred in the vegetative growth as occurs normally in reproduction. Thus if seed were saved from the crimson flowers of this plant we should expect—on Mendelian grounds—three out of four seedlings to produce crimson flowers, and the fourth to produce pink flowers. This expectation is based on the following argument. Since the plant is pure for the pink factor, all the germ cells will contain that factor; but since the plant is impure for the darkening factor, half of the germ cells will contain that factor and half will not. This applies to both the male and female germ cells. Hence, if we represent the pink factor by P, the darkening factor by D, and its absence by d, the germ cells will be —female, DP and dP in equal numbers; male, DP and dP in equal numbers; and hence when the germ cells unite there will be produced on the average 1 DDPP, 2 DdPP, 1 ddPP. The seeds belonging to the first category will give rise to pure crimsons, those belonging to the second category will produce plants which appear to be pure crimsons, but which carry only one dose of the darkening factor, and those of the ddPP type will produce pure pink flowers. This process of segregation, which occurs normally in reproduction, occurs occasionally during the vegetative growth, with the result—in the case under consideration—that the hybrid nature of the plant is revealed by its flowers. It should be added that the case may in fact be more complicated than imagined above, and that it would be interesting to self-fertilize the two types of flower (some pollen appears to be present), and to raise seedlings and record their colours.

SPORTING ANTIRRHINUM.—An equally remarkable example of a vegetative sport in a plant known to be of hybrid constitution is provided by an inflorescence of Antirrhinum Scarlet King, which is sent to us by Mr. A. WATKINS, and is unique among some 900 sister plants. On the inflorescence are a number of flowers, all but one of which are crimson with a suggestion of yellow at the lip. The remaining flower is particoloured; one longitudinal half is of a purple-

crimson colour and the other half is pure yellow. The example is rendered peculiarly interesting by reason of the fact that this particular race has been under Mr. Watkins' observation for some time, and the crimsons have been throwing yellows—to the extent of some 20 per cent.—during the past three years. The significance of the parti-coloured sport is therefore evident. It has done sporadically in the growing point which gave rise to the parti-coloured flower what it does habitually in the formation of its germ cells—namely, produced cells some of which possessed the crimson-sap factor and some of which did not. This segregation took place at a very early stage in the formation of the growing point, and occurred in such a way that the cells on one side of the flower rudiment contained the crimson-sap factor, and those on the other did not. Hence in the mature flower the left side, produced from the former cells, is crimson, and the right side is yellow.

Potato Crops in Holland and Germany (Hamburg).—The Board of Agriculture and Fisheries have received a report dated August 20, from His Majesty's Consul at Amsterdam, stating that the Potato crop in Holland is estimated at between 102,000,000 and 104,500,000 bushels, which is fair in comparison with previous years. Prospects are fair and no disease is reported. Present market prices are influenced by prices in Germany, where prevalence of disease is reported, but they are, on the whole, not above the average. A report of the same date from His Majesty's Consul at Rotterdam states that in the northern districts where the white varieties such as Up-to-Date, King Edward, Kruger, etc., are chiefly cultivated, the crop is not so abundant as it was last year, but the acreage is larger and the yield will not be very much below 1912. The Borgers, an important variety, partly exported to Germany, also look very well, and are already being harvested. Prices range from 1s. 9d. to 2s per cwt. On the heavy clay soils in the southern provinces Potatos are not so plentiful as last year, but where in 1912 they suffered considerably from disease they now appear to be healthy. The same prices are quoted for Borgers as in the northern districts. For the country as a whole, dry weather and sunshine are badly wanted; the yield will be an average one, and, unless there should be an extraordinary demand from the surrounding countries, prices will be moderate, and may probably be 2s. 3d. to 2s. 6d. per cwt. f.o.b. and bags included, and even lower should there be no outlet abroad. His Majesty's Consul-General at Hamburg (August 20) states that this year Potatos are at present sound and very large, and are therefore suitable for exportation. Prospects are good, and the yield should equal that of last year.

The Export of Potatos.—According to the Agricultural Statistics of the Board of Agriculture, the quantity of Potatos exported in 1912 was exceptionally large, and amounted to 360,685 tons, valued at £1,431,971, as compared with 116,828 tons, valued at £431,962, in 1911. It is interesting to observe that the export of Potatos in 1912 was in excess of import by nearly 1½ million cwt.

Primula Tewfikiana.—A new Primula, which originated with MM. Vilmorin, Andrieux et Cie. from a sowing of P. Bulleyana, is described in *Revue Horticole* (No. 16, August, 1913). The novelty known as P. Tewfikiana is believed to be a hybrid between P. Bulleyana and an unknown species. It is a vigorous grower, and produces inflorescences 2 feet in height with several tiers of flowers. The latter are salmon-rose with a yellow eye. The new hybrid is fertile.

Imports of Horticultural Produce.—The Agricultural Statistics (Board of Agriculture) for 1912 estimate the total value of raw fruit and nuts imported in 1912 at £11,210,000, which sum is practically the same as that for the previous year. Supplies of Apples, Pears, Oranges and Bananas were larger, but those of all other fruits were smaller than in 1911. Apples, of which 3,882,000 cwt. were imported, showed an increase of 549,000 cwt., and about seven million bunches of Bananas came into the market. Imports of raw vegetables were markedly greater than in 1911. Of Onions 9,353,000 bushels were received, as compared with 8,600,000; 1,425,000 cwt. of Tomatos, as compared with 1,362,000; and 5,828,000 cwt. of Potatos, as compared with 3,253,000 in 1911. The Netherlands increased their consignments of Potatos from 166,000 cwt. in 1911 to 1,499,000 in 1912. France also sent larger quantities (996,000 cwt. in 1911 and 1,425,000 cwt. in 1912), and Belgium increased her exports to this country from 29,000 cwt. to 912,000 cwt. Imports of Hops in 1912 were 244,000 cwt., or 75,000 cwt. more than in the previous year.

Virginian Poke as a Vegetable.—A writer in *The Field* signing himself "Ensign" gives the following interesting particulars on the value of Phytolacca decandra as a vegetable:—"An inquiry as to whether the berries are poisonous caused me to look the matter up. As anticipated, as usual in such cases, all the available authorities maintain a discreet silence on the desired point, though a statement that at one time the berries were much used in Portugal to give a deep colour to the red port, until the taste being much complained of the Government ordered the destruction of the plant, appears quite sufficient as negative evidence, and while one condemns the root as poisonous, another refers to it as highly nutritious. But I have obtained some unexpected information from an old gardening paper, in which there is a note 'lifted' from an American paper, which has it that the plant, known as 'poke,' 'pigeon berry,' 'garket,' 'cocum,' 'cancer root,' 'skoke,' 'skoka,' and 'pecatacelleloe' in different localities, is one of the choicest of vegetables. 'Sometimes compared to asparagus, but it is not like that; it is a thing by itself, and as good in its way as asparagus in its.' The tender, just developing shoots are dressed like asparagus or spinach; apparently its use as a wild vegetable ('poke greens') is, or at any rate was, familiar in America, but the note referred to urges its cultivation as something of a novelty, the plants being reduced to 3 feet to 4 feet in height after cropping to keep them within bounds. I should like to know if Phytolacca has any reputation as a vegetable in England. It is not included in Vilmorin's *Vegetable Garden*, which is not encouraging, but I am going to put the matter to the test."

Royal Visitors at a Nursery.—The young Kabaka of Buganda, who is at present on a visit to England, visited Messrs. Sutton and Sons' Nursery on the 22nd inst. The Kabaka succeeded Mwanga, the late King of Uganda, while a mere child, and attains his majority next year. He was accompanied by five of his chiefs, who travelled with him from Oxford, where he has been staying. The visitors were extremely interested in everything they saw, especially in the seeds which were being packed for despatch to Africa. After inspecting the trial grounds, they drove to Wargrave Manor, where they were entertained to luncheon by Mr. and Mrs. Martin Sutton.

The Ripening of Fruits.—As bearing on the remarks in the leader for July 19, and those of our correspondents in the issues for August 2, 16, pp. 88, 122, the following paragraph from *Nature*, August 14, is especially interesting:—"The brown discoloration and unpleasant flavour acquired by Peaches shipped for long distances has been attributed to so-called 'ice-scald.' That this injury is not a temperature effect is shown by recent experiments by Mr. G. R. Hill (Cornell University Agricultural Experimental Station Bulletin 330), and evidence is adduced indicating the harmful effect to be due to an accumulation of carbon dioxide within the paper wrapper round the fruit during transit. During the investigations it was found that growing tissues, such as green Peaches and germinating Wheat, respire more than twice as rapidly aërobically as anaërobically, whilst ripe fruits respire as actively anaërobically as aërobically. Ripe Apples lose their colour, texture, and flavour, and assume the qualities of half-baked Apples by being kept for a sufficient length of time in oxygen-free gases. The softening of Peaches (hydrolysis of pectose) appears to be decreased greatly by carbon dioxide and to a considerable extent by hydrogen and nitrogen; under similar conditions the fruit becomes brownish, and acquires a very bad flavour. Good ventilation and refrigeration, therefore, would appear to be the essential conditions under which this fruit should be stored."

AUSTRALIA.

GARDENING IN AUSTRALIA.

The figures quoted by *Colonial Gardener* (see p. 408, Vol. LIII.) are quite possibly correct; but it would have been well if he had intimated that the prices are not those usually obtained for the produce to which he refers. His remarks would seem to show that to grow fruit and vegetables in Australia necessarily leads to the amassing of great wealth; but, having myself had some experience in this pursuit, and being familiar with our market reports for the last ten years, I should like to supplement the paragraph to which I refer with a few facts which have come within my own knowledge. It is hardly conceivable that Tasmanian Apples could be cheaper in England than they are in Australia, since in the Melbourne market on July 12 Apples only brought in 1s. to 5s. per case of about 40 lbs.; the average price obtained being far below the actual cost of landing a case of fruit in England. Further, the Market Report in the *Gardeners' Chronicle* of July 11 puts Australian Apples at 12s. 6d. to 16s. a case, while on the same date our local prices were 1s. 9d. to 4s. 3d. a case. By means of cool storing, at a cost of 4d. to 6d. per case per month, for six months, a grower may obtain 10s. or 12s. 6d. a case for the percentage of fruit which survives the ordeal; but the grower is obliged, as elsewhere, first to purchase the land and wait years for the crop, or pay a higher purchase price for a bearing orchard. He has also the expense of cultivating, pruning, spraying, harvesting, and finally the freight to the market. Probably *Colonial Gardener* compared your wholesale reports with the prices paid here by the consuming public; for here, as everywhere, there is a large and excessive difference between the expenditure of the consumer and the receipts of the actual grower, which exists in spite of many unsuccessful efforts to do away with it. I remember one day, in February, 1906, when Williams' Bon Chrétien Pears only brought in 6d. to 8d. a case of first-class fruit, finding that in Echuca (a town of 5,000 inhabitants, 151 miles north, with daily trains to and from Melbourne) they were selling at 6d. a pound. Another such instance is that of a Chinese grower of Tomatos at Echuca, who sent to Melbourne a consignment of 1,000 cases, leaving the freight to be paid, as usual, at Melbourne. The price obtainable in the market not being sufficient to cover the freight (10d. per case!), the agents refused to accept the consignment. Plums sometimes drop to 9d. a case of 50 lbs., but the average price is about 2s. per case. Jam factories usually offer £4 to £8 a ton for Plums, and £2 for Apples, both to be delivered at their Melbourne factory. *Colonial Gardener* mentions Potatos at £18 a ton, but to-day's price for the *best* is 45s. to 55s. per ton, and an average price for the last four seasons would not come to more than 95s. to 110s. In 1911 we had a very wet season, in consequence of which Potatos rotted considerably more than usual. It was suggested that they were suffering from "Irish Blight," and the Inter-state Governments wisely pro-

claimed prohibitive conditions on all Potatos imported from Victoria or Tasmania. All Potatos, before being admitted to Western Australia, had to be peeled and dipped in a solution; the result being that native Potatos at once rose to £31 per ton. Now, however, the committee of experts who were appointed to investigate the disease are of opinion that it was *not* "Irish Blight" at all. It may be argued that *Colonial Gardener* was not referring to Melbourne prices; but the Melbourne dealers are in touch with all the Inter-state capitals, and have a habit of "rushing" even the most distant markets when prices will justify their action. Both Adelaide and Sydney are within twenty-four hours' rail journey from Melbourne, and by boat the distance is hardly longer; the rates ruling in the Adelaide and Sydney markets are not more than 35 per cent. to 50 per cent. in advance of Melbourne prices. By reason of their cool climate Tasmania and Victoria are the chief growers of the products I have mentioned. For Cabbages, 7d. each wholesale is an exceptionally high price, 1s. 9d. to 2s. 6d. per dozen being usual. There is, however, frequent scarcity in vegetable crops, when the prices naturally rise to extreme heights. Last year, for instance, consumers were paying anything up to 2s. 6d. each for Cauliflowers. French Beans fluctuate between 17s. 6d. and 4s. per 100 lbs., the earliest crops sometimes fetching as much as 4s. per dozen lbs. wholesale. Certainly the prices of fruits and vegetables are on the upward grade; but as this rise is due mainly to increased wages and cost of production in general, it will mean little or no extra profit to the grower.

I am a native of Australia, and the news I obtain from English and American papers helps to convince me that no other part of the world offers so many chances of advancement to good and intelligent workers as Australia at the present time. Taking one season with another, a plentiful living may be made in market gardening and fruit growing, even at the low prices I have mentioned. We also much prefer Britons to foreigners; but the men who come out here must not expect to make a fortune out of nothing, and must be prepared to sell their Potatos and Cabbages at prices considerably lower than those given by *Colonial Gardener*. *G. Errey, Victoria.*

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

The Artificial Ripening of Fruits.—Most plant physiologists will agree with Sir W. Thiselton-Dyer that if carbon dioxide does indeed bring about a rapid ripening of fruit the mode by which it does so is obscure. There is, however, one set of observations which may perhaps be destined to throw light on the subject. In their work on the oxydases of the flower, Keeble and Armstrong show that a plant may contain substances which arrest the oxidation processes of the cell. These substances, of unknown nature, are described as oxydase inhibitors. Now the authors just cited have shown that carbon dioxide possesses the power of destroying these inhibitors, and thus sets the oxidising agents free to act. Whether, however, the latter are able to carry on the work of ripening in an atmosphere of carbon dioxide remains to be discovered. In this connection, however, it may be mentioned that, according to the researches of the Russian physiologist Palladin, respiration, in the sense of evolution of carbon dioxide, may go on to a remarkably large extent in leaves contained in an atmosphere of hydrogen. It is easy to procure cylinders of liquid carbon dioxide, and it would be an interesting experiment for anyone who has some unripe Grapes and a strong box to ascertain whether or not ripening is accelerated by subjecting fruit to high pressures of this gas. From the reports of the horticultural shows which I read in your columns, it appears that marks are often lost to exhibitors by their Grapes being not fully ripe, and it would be amusing if the enterprising exhibitor of the future were to speed up the ripening process and secure premier awards by having recourse to this simple and inexpensive "dodge." It remains, however, first to show that the "dodge" works. *Plant Physiologist.*

Large Cabbage.—A Cabbage in these gardens is 10 ft. 6 in. in circumference. It was planted with the ordinary spring Cabbages in October last, and the leaves do not appear in the least coarse, but as crisp as any spring Cabbage. It was planted as Sutton's Flower of Spring, and is still growing, being one of 1,500 that were planted at the same time. All the plants have had the same treatment, but we commenced cutting last April, and this one always promised to develop into a large specimen. I should think it is a record for a Cabbage (not Cattle Cabbage—Flat Poles). An idea of the size may be obtained by drawing a circle 3 ft. 6 in. in diameter. *F. R. Staddor, Sydmonton Court Gardens, Newbury.*

Government Subsidies to Co-operative Organisations.—The President and Council of the Royal Horticultural Society have asked me to communicate to you the following report of their Parliamentary Committee on Subsidies to Co-operative Organisations. Your Committee, whilst welcoming the subsidies given out of public moneys to agricultural and horticultural organisations, when such organisations confine themselves to educational, experimental, and research subjects, deprecates any subsidies from Government, County Council, and other public bodies being granted to any organisation which is allowed to embark in trading pursuits, holding it to be manifestly unfair to private traders to allow such subsidised organisations to be financially helped to compete with the trade. Your Committee desires also to point out a further aggravation of the injustice—viz., that often such subsidised organisations do not pay local rates and taxes nor income-tax, whereas private traders have to bear their full share of such burdens. The Parliamentary Committee of the R.H.S. was established in March last. Its object is generally to watch over the interests of horticulture in all its branches, and to advise the Council of the Society of opportunities (1) for using the great influence of the Society either in initiating legislation in favour of horticulture or for influencing measures in any way affecting horticulture which may at any time be introduced into Parliament, and (2) for informing the Department of Agriculture and Horticulture of the views, wishes, and wants of horticulturists, and (3) for co-operating with the Department in any useful and desirable horticultural movement. *W. Wilks, Secretary, R.H.S.*

Wasps.—Below I give a record of the number of wasps that have been destroyed on this estate during the past three seasons. The figures given for the present season are to the second week in August. For a fortnight we have ceased to destroy the wasps, and are already suffering from their depredations. For queens, which are destroyed until the end of May, one penny each is given, and for the nests 6d. each. For destroying them, cyanide of potassium is used, and every nest is dug out and burnt. Epping Forest adjoins our estate, and is close to the gardens. We are unable to go beyond the border of Copped Hall, and no doubt, owing to this fact, we shall never do more than keep the insects in check. I was speaking recently to some fellow-gardeners on the matter, and each of them declared that he had never heard of such numbers destroyed in one place. It would be interesting to know the experience of others. 1911, 176 queen wasps, 600 nests; 1912, 746 queen wasps, 272 nests; 1913, 340 queen wasps, 720 nests. *Arthur Bulloek, Copped Hall Gardens, Epping.*

The Standard of Living.—It is a commonplace observation that the standard of living has increased greatly of recent years and that the luxuries of a previous generation have become the necessaries of the present. The degree of truth attaching to the observation may be gauged by an examination of the comparative table in the Agricultural Statistics of the Board of Agriculture, which sets forth the quantities per head of population of foodstuffs imported in each year from 1892 to 1912. Needless to say the growth of the imports outstrips in almost every case the growth of population. Only in the cases of oats, rice, bacon, cheese and lard are the amounts of imports per head about the same as they were twenty years ago; and of these commodities it may be surmised that the falling off in the importation of bacon is due not to change in our feeding habits but solely to the great enhancement in the price of that commodity. A glance at the contents of the statistical table reveals those of the average breakfast table of the present and the past. On that of to-day is more wheaten bread and more sugar, more butter, and of less bacon. Eggs are half as many again as they were 20 years ago. The same tale is told in yet more striking manner by the dinner table of to-day, for the amount of meat served to the individual is no less than three times as great in 1912 as it was in 1892. It is a peculiarly interesting fact that at a time when the more wealthy classes are eating less meat the rest of the community is becoming more and more meat-fed. *Observer.*

The Future of the N.E.H.S.—*Yorkshire Gardener* is a shrewd type who sees the forces at work, and, personally, the only solution I see is to have three centres for the N.E.H.S., Newcastle, Manchester and Leeds. Then the Yorkshire section will have its freedom. But unless Art. II. is done away with the N.E.H.S. must try to be as broad as the North of England, notwithstanding the strong jealousies to be overcome and the prevailing local ideas of those who at present run Horticultural Societies. The good ship has had a bad list towards Leeds since it was launched, and it is this list which has prevented progress and handicapped officers in charge. *Another Yorkshire Gardener* I fear does not quite understand the proposed scheme of a Horticultural Institute. The Government are now offering horticulturists public money. Are we to let the opportunity pass? The N.E.H.S. need have no financial responsibility at all—but surely it should try to obtain for northern gardeners an institute, say at York, where northern men may be trained under northern conditions? "There are plenty of such places"—*i.e.*, Horticultural Institutes! I have yet to learn that we have a "Wisley," a "Kew," or a "Reading" in the north. When private individuals have offered no less than £475 to get such an institute started is it policy to refuse the gifts? As to the N.E.H.S. monthly meetings, I fear my good friend is forgetful. What about the September monthly meeting, 1911? And where were the ninety and nine sheep at the lectures given by Professors Theobald, Priestley and Crowther? As to the future of the N.E.H.S., we are all free now to make up our minds. I sincerely appreciate all the kindness and courtesy I have received as paid secretary. I shall still offer my humble services in an honorary capacity, if requested to help, but do let us try to be true to name and Article II., *i.e.*, every branch of horticulture, not exhibitions only. Having been sentenced to penal servitude for life, for that is what "the parson's freehold" means, I shall be free to help on a cause which I know is one which has the warm support of my friends. *Yorkshire Gardener* and *Another Yorkshire Gardener*. *J. Bernard Hall.*

Gold Medal Roses.—As one of those who for many years has taken rather more than a passing interest in those classes of the National Rose Society's show schedules that invite entries for this award, I welcome your leader in the current number of the *Chronicle* as likely to help in the ventilation of this much-discussed problem. *White Rose* has handled the matter with the discretion and tact that one would have expected from him, and has endeavoured to show that the dissatisfaction which exists amongst rosarians should be directed against the system rather than against those who may have to administer it. So far as the latter phrase refers to the judges I am in agreement with him, but I think a great deal of the dissatisfaction alluded to is due to the ignorance of the individual who, wanting a Rose for garden decoration, plants a variety without any knowledge as to whether it is a garden or an exhibition Rose; but there is a margin over and above that, a dissatisfaction amongst rosarians who are not likely to make the mistake above referred to, so that I am not inclined to agree that those responsible for the present system are entirely blameless. They have made it what it is, and, if it is not as satisfactory as it might be, they should alter it. At

the same time it must be admitted that it is not exactly for the absence of endeavour to remedy the dissatisfaction that those responsible are to be blamed, rather I think it is in the direction that they have not had the courage of their convictions that one would say the fault lies. It is admitted by those who know, and the Council of the N.R.S. may be considered to come within that category, that the only satisfactory method of judging new seedling Roses is to judge them where they are growing; but it has been held by the majority of the Council and the various committees appointed to deal with the subject that that is impracticable. Personally, I do not think that this method should be so considered any longer. The arguments used against it have been three in number :—1. That it was too expensive; 2. That judges could not be found willing to devote the necessary time; 3. That the public desire to see the Roses. 1. To a wealthy society like the N.R.S. the expense is a small matter. 2. I believe competent judges could readily be found. 3. The awards made on inspection could be provisional, and subject to a subsequent exhibit by the raiser at a N.R.S. show the same or following year. I am convinced that no one can satisfactorily decide on the merit of a new seedling until he has seen it actually growing in some quantity. The number of the Visiting Committee could be small, but I need not go into details. I would prefer to indicate only the general lines of a scheme that should at any rate be an improvement on the existing system. To return to *White Rose*, there are one or two other points in his most interesting article that call for comment. With reference to his remarks as to the gold medal awarded to the variety Colleen at the recent Gloucester show, I am inclined to think that the award (withheld at Belfast and London) was given at Gloucester because some of the judges had since grown the Rose, and others had had an opportunity of seeing it growing at Portadown (its birthplace), and I suggest that it was because of the knowledge so acquired that the award previously withheld was given. The quotation from Miss Austen is apt and amusing, and the conclusion that it helped him to arrive at as to the duties of the judges is sound; but I cannot quite agree with him on the question of the increasing number of these awards. I think such an increase is right and natural, and is the legitimate outcome of the increased interest in the flower and the far greater number of legitimate entries for the award. I cannot agree to *White Rose's* suggestion that only one gold medal should be awarded at each show. I pity the judge who would have to decide between the respective merits of such Roses as Irish Fireflame, George Dickson, Mrs. James Lynas and Old Gold. *White Rose* recognises the difficulty by suggesting there might be two classes, one for exhibition and one for decorative Roses; but while all exhibition Roses might perhaps be placed in one class to compete for one award, decorative Roses are far too numerous and their respective uses too divergent for this to be feasible. Imagine a climber placed in competition with a dwarf, or a single variety against one with more petals! *White Rose* further weakens his case by saying that two gold medals might be awarded in the case of two Roses of equal and exceptional merit. If two, why not three or four? I agree that some method of elimination should be adopted, and all Roses examined before any award is made. I see a good many rosaries in the course of twelve months, and I am bound to admit that no subject is of more perennial interest or more frequently discussed, and I think the general feeling is that something should be done. But exactly what that something is or should be is not so easy to determine: but I am sure if you would open your columns to a discussion it would be of very material assistance to the desired end. *Herbert G. Molyneux, Brantwood, Highfield, Southampton.*

Cytisus supranubius (see p. 121).—Mr. Ball's note on Cytisus supranubius opens up an interesting question as to whether shrubs and plants of the Canary Islands are hardier than they are considered to be. Some years ago I raised a batch of Arbutus canariensis. One of the trees was planted on fairly high ground (about 400 feet). It was surrounded with plants of A. Unedo from Killarney. Three years ago all the specimens of A. Unedo were killed by frost, whilst A. canariensis is alive and flourishing to this day, quite unharmed by the weather. The hardiness of Cytisus supranubius was established long ago. I remember very well seeing an established plant on a wall at the Trinity College gardens 20 years ago, and in my own garden it grows alongside and in like conditions with C. virgatus. C. œstriensis and C. Furcea. *T. Smith, Newry.*

SOCIETIES.

ROYAL HORTICULTURAL.

August 26.—The usual fortnightly meeting was held on Tuesday last in the Vincent Square Hall, Westminster. There was an excellent display of exhibits in all sections, but very few visitors were present.

The Floral Committee recommended twelve Awards of Merit to novelties, five to Dahlias in conjunction with a Committee of the National Dahlia Society.

The Orchid Committee granted two First Class Certificates and three Awards of Merit.

The Fruit and Vegetable Committee had more to deal with than usual, and granted an Award of Merit to a seedling Apple and four Medals to groups.

At the 3 o'clock meeting of the Fellows in the Lecture Room, an address on "Tuberous Begonias" was delivered by Mr. Blackmore and Mr. Langdon, of the firm of Messrs. Blackmore and Langdon.

Floral Committee.

Present: Henry B. May, Esq. (in the chair), Messrs. Chas. T. Druery, J. W. Moorman, C. Dixon, William H. Morter, Wm. J. James, H. J. Jones, Arthur Turner, Chas. E. Pearson, J. T. Bennett-Poë, W. P. Thomson, George Paul, John Green, Thomas Stevenson, W. J. Bean, W. A. Bilney, Jas. Hudson, J. W. Barr, and W. Cuthbertson.

Mr. A. F. Dutton, Iver, Buckinghamshire, displayed in 10 large baskets Carnation Mrs. A. F. Dutton, a deliciously-scented rich pink sport of great merit (Silver Flora Medal).

Messrs. Blackmore and Langdon, Bath, Somerset, arranged a splendid collection of tuberous Begonias. The double-flowered varieties, which greatly predominated, included Sir Gilbert Greenall (deep crimson), Lady Dorrington (white), Violet Langdon (pink), Mrs. Robt. Morton (deep orange, with pinkish reverse), and F. W. Walker (bright red). Several baskets contained such bedding varieties as Argus (scarlet) and Marquis of Stafford (Silver-gilt Banksian Medal).

Messrs. T. S. Ware, Ltd., Feltham, also staged an exceedingly good collection of double-flowered tuberous Begonias. The blooms were of great size but free from the slightest suspision of coarseness. Such varieties as Lady Cromer (pink), Princess Ena (orange-yellow), Lord Hopetown and Dorando (rich reds), being splendid (Silver-gilt Banksian Medal).

Messrs. James Veitch and Sons, Ltd., Chelsea, showed their strain of Streptocarpus, which is characterised by flowers of clear colours and in many instances with pure white throats, which greatly enhances their beauty.

Messrs. Stuart Low and Co., Enfield, set up a little group of Chironia baccifera. The plants were well grown and freely flowered.

Messrs. H. B. May and Sons, Upper Edmonton, interspersed a good collection of greenhouse Ferns with batches of Codiæum (Croton) edmontoniense, Ixora Williamsii, I. Fraseri and Alocacia argyroneura (Silver Banksian Medal).

Messrs. Kelway and Son, Langport, again exhibited a large collection of cut Gladiolus. Besides many varieties which we admired on previous occasions we especially noted Mrs. F. Field (white, with a suggestion of pink), Darkness, Golden Measure (very large, yellow variety), Duke of Richmond (bright red, with a white throat), John Jongleux (rich cerise purple), and James William Kelway) (a superb crimson flushed with carmine). In another part of the hall Messrs. Kelway also showed Andrew Carnegie (pale mauve), Mrs. Coddington (mauve, with purple splash), Lord Milner (scarlet, striped with white) and many other good varieties of Gladiolus (Silver-gilt Flora Medal).

M. Jules Ragot sent from Paris a collection of cut Gladioli, which included several good hybrids of G. primulinus (Bronze Flora Medal).

Messrs. Dobbie and Co., Edinburgh, showed Collerette Dahlias, including the beautiful varieties which received Awards of Merit. Large stands of Queen Anne and Frogmore, two somewhat similar sorts, with harmonious blendings of scarlet and yellow, were exceedingly decorative. Other desirable sorts were Maurice Rivoire (claret-coloured and white collerette), Meteor (maroon and white collerette), Goldstein (yellow self), and Madame Jules Buyssens (mauve, edged purple, with a white collerette) (Silver Flora Medal).

Messrs. John Piper and Sons, Bayswater, also showed an attractive collection of Dahlias, specialising with the decorative varieties. The outstanding varieties were Geisha, Germania, Mrs. R. Cooke, Cæsar, Hortulanus, Buddii, Liberty and King Leopold (Bronze Banksian Medal).

Messrs. Carter, Page and Co., London Wall, London, showed especially good single-flowered varieties in their exhibit of Dahlias. The most effective of the Cactus varieties were Amos Perry, Arthur Pickard, Caradoc, and Golden Wave (Silver Banksian Medal).

Messrs. J. Cheal and Sons, Crawley, showed a very representative collection of Dahlia blooms. The single and the Pompon varieties were especially charming. A little group of the new Cosmea-flowered variety, Crawley Star, attracted a deal of attention (Bronze Banksian Medal).

Mr. Chas. Turner, Slough, presented novelties of Collerette and single-flowered Dahlias.

Messrs. J. Stredwick and Sons, St. Leonards, showed a small but choice collection of Cactus Dahlias. White Star, Starlight (yellow, with lighter tips) and Pierrot (pale buff with white tips) are the names of the very finest sorts shown.

Mr. James Box, Haywards Heath, Sussex, filled a large floor space with a magnificent collection of hardy border flowers, arranged with great skill in his best manner. Besides large groups of herbaceous Phloxes and a great variety of Delphiniums boldly arranged, there were smaller selections of Montbretias, Gaillardias, Liatris pycnostachya, Rudbeckia purpurea, and tall stems of Lobelia cardinalis bearing vivid crimson flowers (Silver-gilt Flora Medal).

Messrs. Wm. Cutbush and Sons, Highgate, contributed a desirable strain of Antirrhinums (dwarf and intermediate types) of good colourings; Pentstemons in great variety, and bearing large flowers, of which the best were Mauve Queen, Rev. Murphy (bright red), Bianca (white, tipped with pink), and Persimmon (purple). A distinguishing character of these Pentstemons was the pure white throat of the blossoms. This firm also showed many Gladioli, such as Hollandia (terra-cotta) and America (pale heliotrope). (Silver Banksian Medal).

Messrs. Barr and Sons, Covent Garden, grouped Nepeta Mussinii, Salvia virgata nemorosa and Statice Lilac Queen at the end of a good collection of Gladioli. The last-named included Canicule (scarlet, with white blotch on the lip), La Nuit (dark purple), and Madame Mounet Sully (pure white, with blood-red blotch at the throat) (Bronze Flora Medal).

Messrs. W. Wells and Co., Merstham, arranged a collection of herbaceous Phlox, which included such sterling varieties as Arthur Rane, Elizabeth Campbell, General von Hentsz, Iris, Selma, Pynstroom and Dove. At one end of the Phlox collection there were vases of Romneya Coulteri and Delphinium Moerheimii and a box of Nierembergia rivularis (Silver Banksian Medal).

Mr. G. Reuthe, Keston, Kent, contributed a great variety of uncommon trees and shrubs. The former included Phyllocladus rhomboidalis, a very interesting conifer, Berberidopsis corallina, Abelia triflora, Andromeda polifolia and Dacrydium cupressinum.

Messrs. Whitelegg and Page, Chislehurst, filled a length of tabling with border flowers, of which large stands of Lilium speciosum magnificum, L. s. album and L. tigrinum plena were very prominent. The herbaceous plants included good strains of Phloxes, Sidalcea malviflora Rosy Gem, Helenium cupreum, Salvia nemorosa virginica and Nepeta Mussinii (Silver Banksian Medal).

Messrs. R. Wallace and Co., Colchester, showed varieties of Montbretias and, besides last year's novelties Star of the East and

Queen Adelaide, which received an Award, Hereward, Lady Hamilton, Comet, Prometheus, and King Edmund (Silver Flora Medal).

Messrs. A. Ll. Gwilliam, Sidcup, Kent, staged a collection of hardy border flowers, in which prominence was given to Achillea filipendula Parker's var. and Phlox Sheriff Ivory. At one end of the herbaceous flower display Messrs. Gwilliam showed blooms of double and single-flowered tuberous Begonias (Silver Banksian Medal).

Messrs. T. S. Ware, Ltd., Feltham, Middlesex, showed an interesting collection of hardy border flowers, in which the Phloxes which predominated were effectively arranged with sprays of the double-flowered Gypsophila paniculata. This exhibit participated in the Silver-gilt Banksian Medal awarded to the Begonias.

Mr. Amos Perry, Enfield, arranged an enormous quantity of Achillea Perry's White, encircling groups of Delphiniums, Duke of Connaught, Mrs. Creighton, and Lizzie.

Mr. L. R. Russell, Richmond, showed a very interesting variety of Heaths, interspersed with plants of Eulalia japonica variegata. Amongst the Ericas we noted E. vulgaris Foxii, which forms a very compact tuft, suitable for the rock garden, E. tetralix Mackayana; the true Scotch Heather; Erica cinerea alba major; the double flowered Heath, E. vulgaris fl. pl. and the golden-foliaged E. vulgaris cuprea (Bronze Banksian Medal).

Awards of Merit.

The following varieties of Dahlias were judged by a joint committee of the R.H.S. Floral Committee and the National Dahlia Society. The latter society awarded a First Class Certificate to each variety.

Dahlia Lily Reed.—A Cactus variety with incurving and spirally-twisting, long, claw-like petals, of a bright lemon-yellow colour. The flower possesses a good centre, refined form, and is seven inches in diameter. Shown by Mr. Shoesmith.

D. Aphrodite.—A Pæony-flowered variety with two or three rows of broad, flat, pure white ray florets and orange-yellow centre. The flowers are six inches in diameter, and are borne on stout, rigidly-erect stalks. The variety represents a great improvement in form on the older sorts. Shown by Mr. C. Turner.

D. Regulus.—A Pompon variety of a rich purple-amaranth colour. The flowers are small, being only 1¾ inches in diameter, very neat, and densely packed with well-formed, curled florets. Shown by Messrs. J. Cheal and Sons.

D. Tusca.—A Collerette variety with crimson, oval rays and tufts of rather broad, white quills half the length of the rays and standing out at a sharp angle. The base of the petals shows a narrow band of yellow surrounding the disc, and this yellow runs up into the quills. The plant grows 3½ft. high, and is extraordinarily floriferous. The flowers are not large, being 4 inches in diameter, but the rays and quills are in bright contrast.

D. Prince of Orange.—A Collerette variety, with larger flowers than the last (5 inches across) and more pointed segments. The rays and quills are a bright and very pleasing orange-salmon self colour; the quills the merest shade paler, and rather more than half the length of the rays, and lying almost flat on them. The stalks are unusually wiry and stiff, and the whole plant very decorative.

These two shown by Messrs. Dobbie and Co.

Gladiolus Lady Faire. — This variety is notable for its striking colouring rather than its form or spike. The flowers open cream and become pure white, and are brightly blotched with crimson on the lower petals. The floral segments are pointed and the flower triangular in form; the spike also was weak, carrying only twelve flowers and buds, of which only three were open together.

G. Lady Northcote.—A charmingly coloured variety with a dense, handsome spike. The centre of the flower is coloured soft buff-yellow, which gradually shades to salmon-pink at the edge. Only one spike was shown. This had twenty-one flowers and buds, of which nine were open together. The flowers are not large, but rounded and very pleasing.

G. Mrs. Bromet.—The flowers are large and of good form, in colour a pale creamy-sulphur, the inner petal sulphur and touched with purple at the base of the throat. Only one spike was shown, which had ten expanded flowers and thirteen buds.

These three shown by Messrs. Kelway and Son.

Rose Mrs. Andrew Carnegie.—This handsome hybrid tea, derived from Frau Karl Druschki × Niphetos, has already won the N.R.S. gold medal. (See *Gard. Chron.*, July 13, 1912, p. 38). The flowers are a full cream, of grand form, and sweetly scented, and the habit is dwarfer and freer than that of Frau Karl Druschki.

Scabiosa caucasica magnifica.—A beautiful seedling variety with saucer-shaped flowers of excellent form, crenate and frilled at the margin and the outer petals very evenly overlapping one another. The colour is darker than the type. It matches the "lavender blue" of the *Répertoire de Couleurs* (204), the edge being Shade 3, and this shades down to 1 at the centre.

These two shown by Messrs. Cocker.

Montbretia Queen Adelaide.—The colours of this new seedling are those of the popular Germania, but the flowers are larger, being 3 and 3½ inches in diameter. The petals expand well, becoming almost flat, and are coloured deep orange, shaded outside with red. The eye of the flower is yellow with a small blotch of red on each segment. The stems are vigorous, dark, erect, and branching. Shown by S. Morris, Esq., Earlham Hall, Norwich. (Gr., Mr. Henley.)

Chrysanthemum Improved Northern Star.—This is a delightful vigorous and decorative form of the annual C. carinatum (syn. tricolor). The flowers are 3½ inches in diameter, the rays full, neat, and flat, pure white with a narrow band of clear yellow surrounding the silver-purple of the disc, which becomes brown as the florets open. The stems cut from the open field from an April sowing were three feet in length, and we were informed that some of the flowers shown had been cut for eight days. Shown by Messrs. Dobbie.

Other Novelties.

Handsome plants of the Dittany of Amorgos Origanum Tournefortii were shown by Miss Willmott. In habit and grace it is the equal of O. hybridum, and it is much hardier. Plants are extremely rare in nature, being found only "in the clefts or rents of a hideous rock that overhangs the sea," and are hardly known in cultivation.

Flowering sprays of Crotalaria agatiflora, a new species from Tropical East Africa, were shown by W. F. Hamilton, Esq. The flowers are greenish-yellow, and carried on spikes, resembling those of Erythrina Cresta-galli.

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the chair), and Messrs. Jas. O'Brien (hon. sec.), Gurney Wilson, W. H. White, W. Bolton, A. Dye, R. A. Rolfe, F. J. Hanbury, A. McBean, T. Armstrong, W. Cobb, J. E. Shill, R. Brooman White, Stuart Low, and Sir Harry J. Veitch.

There was an excellent show of Orchids, Lælio-Cattleyas being the chief feature. Messrs. Jas. Veitch and Sons, Royal Exotic Nursery, King's Road, Chelsea, were awarded a Silver Flora Medal for a very effective group, in which their new, dark type of Lælio-Cattleya callistoglossa, arranged with other showy Lælio-Cattleyas, made a fine feature. The new and fine L.-C. Etterick secured an Award of Merit. Brasso-Cattleya Ilene ampliator is a fine, bold rose-pink flower, with yellow disc to the fringed lip. Cattleya Hardyana, Epidendrum vitellinum, Miltonia vexillaria, Odontoglossum grande and other showy species were also well shown.

Messrs. Armstrong and Brown, Tunbridge Wells, were awarded a Silver Flora Medal for a group of fine hybrids, their showy Lælio-Cattleya Geo. Woodhams in several varieties being among the best of dark-coloured forms. Included in the group was a cross between the hybrid just mentioned and C. Lord Rothschild, of fine colour, Lælio-Cattleya eximia Orchidhurst variety, probably the largest and best form yet shown; L.-C. Baroness Schröder, and other Lælio-Cattleyas; the new Odontioda Seymouræ (Charlesworthii × Bradshawiæ), with equally broad Indian-red sepals and petals and lighter lip; and the fine Lælio-Cattleya Marquis de Wavrin Orchidhurst variety.

Messrs. Sander and Sons, St. Albans, staged an effective and interesting group, for which a Silver Flora Medal was awarded. In the centre was a good example of Vanda Sanderiana, two strong specimens of Anguloa Cliftonii, a distinct light form of Catasetum tabulare, the rare Stanhopæ Peruviana, Oncidium Sanderæ and other rare species. Among the hybrids were the new Odontonia Farnesiana (O. Edwardii × M. Warscewiczii), with densely branded spike of dark reddish-purple flowers, partaking much of the form of M. Warscewiczii; several of the fine dark Lælio-Cattleya Invincible, L.-C. F. Gott and other Lælio-Cattleyas; Cattleya Pittiana Colossa, a pretty hybrid Lycaste, Cattleya Mulleri, and another white Cattleya and other interesting hybrids.

Messrs. Charlesworth and Co., Haywards Heath, were awarded a Silver Banksian Medal for a group of well-flowered Orchids, including Lælio-Cattleya amabilis, L.-C. St. Gothard, L.-C. Eurydice and other Lælio-Cattleyas; Odontoglossum ardentissimum xanthotes, O. Phœbe, the very pretty Brasso-Cattleya Monetia, Paphinia cristata, some good Vanda cœrulea, and Dendrobium Phalænopsis Schröderianum.

H. T. Pitt, Esq., Rosslyn, Stamford Hill (gr. Mr. Thurgood), received a Silver Banksian Medal for a neat group in which were four plants of Cypripedium Baron Schröder var. ardens, several Cattleya Source d'Or, C. Venus and C. Gertrude Pitt; Lælio-Cattleya Argus, Miltonia vexillaria varieties, and M. Bleuana; the new Odontoglossum Dioscorides (crispo-Harryanum × Ruckerianum Pitts variety), a prettily-marked flower; Lælia monophylla and Bulbophyllum barbigerum.

Messrs. Hassall and Co., Southgate, were awarded a Silver Banksian Medal for a small group of well-grown Orchids, which included several Cattleya guttata; two very handsome C. Hardyana, C. Iris, C. Dowiana aurea, C. Gaskelliana alba, good Lælio-Cattleya callistoglossa, L.-C. Rubens and a fine specimen of Cypripedium A. de Lairesse.

Sir Jeremiah Colman, Bart., Gatton Park (gr. Mr. Collier), showed the orange-scarlet Lælia monophylla with 25 flowers and buds; a fine form of Brassia brachiata, Pleurothallis ve'aticaulis with a large number of elegant erect sprays of small greenish-white flowers, and a grand specimen of Ornithidium Sophronitis.

H. S. Goodson, Esq., Fairlawn, Putney (gr. Mr. G. E. Day), sent the handsome Cattleya Hardyana Goodsonæ, with cream-coloured sepals and petals and richly coloured lip.

Pantia Ralli, Esq., Ashtead Park, Surrey, sent a good red Odontioda Euterpe.

Awards.

First-Class Certificate.

Odontonia brugensis Eileen (*Odontoglossum Edwardii* × *Miltonia vexillaria Memoria G. D. Owen*), from J. Gurney Fowler, Esq, Glebelands, South Woodford (gr. Mr. J. Davis). A very remarkable and beautiful cross, in which the dark mask on the lip inherited from M. vexillaria Memoria G. D. Owen can be well traced. In the flat arrangement of the segments the flowers also adhere to the Miltonia. The spike bore six flowers, with nearly equal sepals, and petals of a clear lilac-purple colour with narrow whitish margins. The lip had the basal half dark rose-purple, the crest yellow, and the front half lilac. The original form was raised by Messrs. Sander at their Bruges Nursery.

Brasso-Lælio-Cattleya × *The Baroness* (*B.-C. Mrs. J. Leemann* × *L.-C. Ophir*).—This is one of the finest of yellow hybrids, its flowers are of good shape, fine substance, and delicate fragrance. The species involved in its production are Brassavola Digbyana and Lælia xanthina in each case, the other agent being Cattleya Dowiana aurea, so fine results were assured. The sepals and broad petals are clear, light yellow, the lip buttercup-yellow with red lines from the base, and a marbling of rose colour in front, the margin being lighter in colour and fringed.

Award of Merit.

Lælio-Cattleya Etterick (*L.-C. Bletchleyensis* × *C. Dowiana aurea*), from Messrs. Jas. Veitch and Sons, Chelsea. In this fine hybrid Messrs. Veitch have surpassed their famous L.-C. callistoglossa, which it may be said to resemble, but with larger and darker flowers. The broad

sepals and petals are purplish-rose, lip claret-crimson with gold markings at the base.

Laelio-Cattleya Marquis de Wavrin Orchidhurst variety (*L.-C. elegans* × *C. Hardyana*), from Messrs. Armstrong and Brown, Orchidhurst, Tunbridge Wells. A charming hybrid, with beautifully formed fragrant flowers of fine substance and glowing colour. Sepals and petals rose-purple, lip broad, purplish-ruby crimson, deepening to maroon in the centre, the base white to yellow, with red lines.

Cattleya Hordyana Mrs. Waters Butler, from W. Waters Butler, Esq., Southfield, Edgbaston (gr. Mr. R. H. Jones). A grand form, with novel features, the most striking being that the greater part of the fine lip is bright chrome yellow, the violet purple of the front being much restricted in area compared with other forms. The splendidly-grown plant bore a stout spike of four very large flowers, with rosy-lilac sepals and petals.

Cultural Commendation.

To Mr. Collier, gr. to Sir Jeremiah Colman, Bart., for a specimen of the dwarf Ornithidium Sophronitis, with a profusion of its pretty red flowers.

Fruit and Vegetable Committee.

Present: Geo. Bunyard, Esq. (in the chair), Messrs. Jos. Cheal, J. W. Bates, John Barham, Edwin Beckett, George Woodward, Henry Hooper, A. R. Allan, J. Davis, H. Markham, G. Reynolds, A. Bullock, J. Willard, Owen Thomas, John Harrison, W. Poupart, and A. H. Pearson.

Messrs. Geo. Bunyard and Co., Ltd., Maidstone, showed 50 varieties of Apples and Pears. Early dessert Apples were represented by Lady Sudeley, Langley Pippin, Red Quarrenden, Beauty of Bath, Venus Pippin, Hitchin Pippin and James Grieve. Amongst culinary sorts we noticed excellent fruits of Rev. W. Wilks, which is a variety of great promise. It is said to do best on the Crab stock. Gold Medal and Norfolk Beauty were other good sorts. The Pears included excellent fruits of Triomphe de Vienne, Clapp's Favourite and Souvenir du Congrès from wall trees. (Silver-gilt Banksian Medal.)

Messrs. Spooner and Sons, Hounslow, were awarded a Silver Knightian Medal for a collection of Apples. Prominent varieties were Lady Sudeley, Potts' Seedling, Frogmore Prolific, Ecklinville Seedling, Ringer, Lord Suffield, Grenadier, Domino, Castle Major, Duchess of Oldenburgh and Stirling Castle.

C. E. Baring-Young, Esq., Oak Hill Park, East Barnet (gr. Mr. J. Walker), was awarded a Bronze Banksian Medal for a small exhibit of Peaches, Nectarines, Pears and Plums grown out-of-doors.

Messrs. Bakers, Wolverhampton, exhibited a collection of vegetables, for which a Silver-gilt Knightian Medal was awarded. This fine exhibit included excellent Autumn Giant and Supreme White Cauliflowers, Codsall Gem Cabbages, Telegraph Improved Cucumbers, Lyon Leeks, Blood Red and Ailsa Craig Onions, extra long French Beans, Selected Intermediate Carrots, Lettuces, Beets, Parsnips, Potatos, Marrows, Tomatos, Radishes, Kohl Rabi, Cress and other kinds of kitchen-garden produce.

Messrs. Bucks, Ipswich, showed a very prolific variety of Tomato named Tresco. One truss of fruits weighed 7 lb. 3oz., and contained 100 berries. The fruits are perfectly round and of good colour, but rather small.

Awards of Merit.

Apple Maidstone Favourite.—This new variety was raised from Irish Peach and Beauty of Bath. The fruits are round and flattish, with a deep eye, and short stalk set in a deep cavity. The skin is streaked with red and highly coloured on the side next to the sun. The flesh is said to be solid, crisp and juicy. The tree has short-jointed growth and is a free bearer. The variety is recommended as a market Apple to follow Beauty of Bath. Shown by Messrs. Geo. Bunyard and Co.

The Sub-Committee of the Fruit and Vegetable Committee met at Wisley on the 22nd inst., when the following awards were recommended, which were confirmed by the Council on Tuesday last:—

Awards of Merit.—*Potato*, Irish King (Barr and Sons); *Tomatos*, Holmes Ideal (Robert Sydenham, Ltd.), Holyrood (Dobbie and Co.), Hurst Marvel (Drover), Liberty (Alex. Dickson), Lightning (Barr and Sons), and Pear-shaped (Barr and Sons).

Highly Commended. — *Tomatos*, Garland (Dobbie and Co.), and Golden Sunrise (J. Carter and Co.); *Potatos*, Great Scot (R. Veitch and Son), No 28 (J. Carter and Co.), and Southern Star (J. Veitch and Sons).

HORTICULTURAL TRADES' ASSOCIATION.

August 26-28.—The annual meeting of the Horticultural Trades' Association was held this week. The session began on Tuesday with a dinner at the Hotel Windsor, London, when about seventy members were present. The President, Mr. W. J. Jefferies, occupied the chair. The annual business meeting was held after dinner, the reports being read by the Secretary, Mr. Charles E. Pearson. The report showed that the past year had been one of activity, much good work having been accomplished by the Council in the interests of the Nursery and Seed Trades, Workmen's Insurance, Government Competition, Phylloxera Laws, Unfair Trading, Railway Matters, and Rating questions being the most important subjects dealt with. The membership of the Association embraces most of the leading firms in the country, and is over 400 strong. The financial position is also satisfactory, there being a balance in hand of £729 15s. 9d. The retiring President, Mr. Jefferies, proposed the election of Mr. W. Cuthbertson (of Messrs. Dobbie and Co., Edinburgh) as his successor, which was seconded by Mr. R. W. Wallace, of Colchester, and carried with acclamation. Mr. Cuthbertson then took the chair, and after thanking the members for electing him as their President, proposed the re-election of the retiring members of the Council: Messrs. Basham, Bunyard, Green, Mortimer, Pennell, and D. W. Thomson. The thanks of the Association were voted to the retiring President on the motion of the President, seconded by Mr. Stuart Low, and Mr. Jefferies' health was pledged.

Mr. Todman proposed and Mr. Chalcroft seconded a vote of thanks to the Council and Secretary, which was acknowledged by Mr. A. W. Paul, and the Secretary.

Thereafter a keen discussion took place on the question of Foreign Competition, which was ably introduced by Mr. J. Brown, Peterborough. The debate was continued by Messrs. Perkins, Cull, Wallace, Walshaw, Chalcroft, Lake, and Stuart Low, who said that if the British nurserymen maintained the English standard a clientele for their goods would always be forthcoming. The President said the evidence which could easily be obtained of foreign firms offering in their catalogues discounts to gardeners of 10 to 15 per cent. should be collected. A strong representation should be made to the Government that such firms are breaking British laws, and the Government should be urged to deal with the matter. The Council was requested to consider the important points which had arisen in the discussion.

Mr. F. Perkins (Northampton) introduced a discussion on the Insurance Act. Mr. Perkins submitted figures showing that the actual benefits received by workmen in the nursery trade worked out at something like 10 per cent. of the total contributions. The Secretary confirmed this statement. Mr. Jefferies suggested that a form be sent to the members asking for full information on this point, and Mr. Low suggested that unless some strong organisation was formed, such as that which watched the interests of agriculture, there was little hope of any redress being obtained. This view was held by several other speakers, the President remarking in summing up that the Act was, after all, one for the nation as a whole. The question of issuing circulars as proposed by Mr. Jefferies was remitted to the Council and is likely to be adopted. The meeting was adjourned till the following evening. On Wednesday the members visited Colchester and on Thursday Windsor.

Mr. William Cuthbertson, J.P.
The New President of the Horticultural Trades' Association.

TAUNTON DEANE HORTICULTURAL.

August 14.—The annual Floral Fête held at Taunton on the above date was a complete success, and the weather extremely fine. In point of quality of the exhibits, there was a distinct advance over last year, although in certain

classes the effects of the unusually dry weather were apparent. There were several non-competitive exhibits. Messrs. Isaac House & Son, of Westbury, showed Tomatos and hardy plants; and Messrs. Kelway and Son, Langport, staged a large exhibit of Gladioli of various shades with very pleasing effect. Other non-competitive exhibits were those of Messrs. Vernon T. Hill, Langford; R. Veitch & Son, Exeter; and A. W. Walters & Son, Bath. The Gold Medal in the non-competitive section was awarded to Messrs. Kelway & Son; and Silver-gilt Medals to Messrs. R. Veitch & Son, Vernon T. Hill, W. E. & T. Cousins (Taunton), and Isaac House & Son. Sweet Peas were well shown, especially by Mr. F. Tomkins. Messrs. J. Cypher & Sons were awarded the 1st prize for a group of miscellaneous plants, and also for the best stove plant (Ixora Duffii) and the best greenhouse plant (Statice intermedia). In the class for cut flowers, Mr. H. Clarke, of Taunton, won the 1st prize with a fine show of Gladioli and Lilium tigrinum. Mr. J. Mattock exhibited a superb collection of Roses, and Messrs. Jarman & Co., of Chard, made an artistic display of different varieties of Dahlia. Messrs. Arthur R. Brown, Ltd., of King's Norton, staged an exceptionally fine exhibit of Carnations, the colours ranging from white to the darkest red. The exhibits of Honey were uniformly good, and lectures on bee-keeping were given in the tent devoted to this section. In the fruit classes Mr. H. St. Maur (gr. Mr. Richardson) was placed first, and this gentleman also won the 1st prize for four dishes of fruit.

ABERDEEN AND NORTHERN COUNTIES SWEET PEA.

The third annual exhibition was held at Aberdeen, and proved a great success, the number of entries being the largest on record. The leading competition in the professional classes was that for the best twelve bunches of Sweet Peas with waved standards, distinct varieties; no fewer than 84 vases, approximating 1,600 blooms, being staged. Sir Thomas Burnett, Bart., of Leys, Crathes Castle, near Aberdeen (gr. Mr. John Petrie), was awarded the 1st and 2nd prizes for magnificent exhibits, of which the most admired specimens were Agricola, Lady Millar, Melba, Edrom Beauty, Rosabelle, and Dobbie's Cream. Sir Thomas Burnett was also the 1st and 2nd prize-winner in the class for six bunches, and he won the 1st and 2nd prizes for (1) the best three bunches, (2) three bunches of Sweet Pea, novelties of 1912 and 1913, catalogued and offered for sale for the first time during 1912 and 1913. In the last competition Sir Thomas showed fine specimens of Agricola, Melba, Kathleen, and Pedestal. Mrs. Dunbar Dunbar followed in all the foregoing competitions.

An outstanding feature of the show was the very fine entries in the competition for a display of Sweet Peas arranged for effect on a space 6 feet by 3 feet. Sir Thomas Burnett's exhibit was again the best. 2nd, The Countess of Aberdeen, Haddo House, Aberdeenshire (gr. Mr. John McKinnon).

The best dinner table decoration, arranged on a space 6 feet by 4 feet, was shown by Mrs. Porter, Monaltrie, Ballater, Aberdeenshire, her display being very artistic in design, and composed of delicate pink blooms.

The leading prizes in the amateur section were won by the Rev. E. V. Kissack, The Orphanage, Aberlour, and Mr. R. W. Duncan, Kemnay.

Obituary.

Rudolf Stoll.—We learn from our contemporary, *Die Gartenwelt*, of the death of Herr Dr. Rudolf Stoll, formerly Director of the Königlichen Lehranstalt für Obst- und Gartenbau at Proskau. Dr. Stoll, who was born in Rome in 1847, and who studied in France, Germany and Austria, devoted much of his life to the study and practical amelioration of fruit. He was the author of works on Austro-Hungarian pomology and on American Early Peaches, and was Editor of the Austrian *Obstbau-zeitung*.

Answers to Correspondents.

Beech Diseased: *W. H. H.* The Beech Coccus is often confined to the trunk and main branches of the tree, when it can be eradicated by scrubbing the bark with a strong insecticide. Scrubbing may not be practicable, in which case you must resort to spraying. The following is recommended in the Board of Agriculture leaflet on this subject:—(1) The trees should be sprayed, when in the dormant condition, with the following emulsion-soda wash, as used at the Woburn Fruit Farm: Paraffin, 2 gallons; soft soap, 1½ lb.; caustic soda (98 per cent.), 6 lb.; water, 28 gallons. In order to prepare the wash the soft soap should be dissolved in a gallon of boiling water; the paraffin should then be added, and the mixture churned thoroughly until a cream-like mass results. The thoroughness of the churning is important. The 6 lb. of caustic soda should next be dissolved in the remaining 27 gallons of water, and then poured into the paraffin emulsion. The whole should be well mixed and used immediately. Experimental work at Woburn, however, indicates that there are advantages in using a wash composed of: Sulphate of iron, ½lb.; lime, ¼lb.; paraffin (solar distillate), 5 pints; caustic soda (98 per cent.), 2lb.; and water to make 10 gallons. This may be prepared for use by proceeding as follows: (*a*) Dissolve the sulphate of iron in about nine gallons of water; (*b*) shake the lime in a little water, and then add a little more water to make into a "milk"; (*c*) run *b* into *a* through a piece of coarse sacking to remove grit; (*d*) pour the paraffin into the mixture (*c*) and churn the whole thoroughly; (*e*) add the caustic soda in powdered form just before using, and stir thoroughly. In using either of these mixtures the face and hands must be protected, as the mixtures are caustic in character. One advantage of the caustic soda is that it helps to clear the tree of such growths as lichens and algæ.

Correction.—Colonel Rideout, Clury Nurseries, Langley, was awarded a Gold Medal for his exhibit of Carnations at the Shrewsbury Show, not a Silver-gilt Medal as stated in our report.

Horticultural Sundries and Manures: *A Lover of Fair Play.* It would be a difficult matter to interfere with a firm's method of conducting business on the score of selling too cheaply. Any publicity afforded the matter would only be the means of affording opportunity to others to take similar advantage.

Insects in Chrysanthemum Pots: *W. H., Bromley.* The material was all dried up, and it is impossible to identify the insect.

Insects on Abies: *W. M.* The Abies is attacked by the Aphis Chermes piceæ. Spray with nicotine, soap wash or paraffin emulsion. This operation must be done thoroughly, and it is best done soon after the masses of eggs hatch out.

"Mud" from a Stream: *G. C.* The manurial value of the silt obtained from streams and ponds varies according to the local conditions, but is often considerable. This silt is generally composed of soil and decayed leaves which have been deposited in the water, and grit. The deposits from streams which flow through densely-wooded districts where the natural soil is deep and rich may often be seen supporting very luxuriant vegetation. When required for garden purposes it is advisable to first "weather" the silt by storing it in heaps in an open position. After most of the water has drained, the silt should be turned occasionally, adding a little lime, until it has become moderately dry and less adhesive. It may then be used as a top-dressing for lawns, shrubberies, flower borders, and suchlike, or be mixed with the soil in any portion of the garden.

Names of Plants: *Journeyman.* 1, Dactylis glomerata variegata; 2, Malcomia sp. (specimen too scrappy for identification); 3, Polemonium cœruleum; 4, Erigeron macranthus var.; 5, Lychnis coronaria var. oculata; 6, Hieracium aurantiacum; 7, Ixia (seedling variety); 8, Helenium autumnale var. striatum; 9, Corydalis lutea; 10, Lilium tigrinum; 11, Cephalaria alpina; 12, Bocconia cordata.—*A. B. H.* Amorpha fruticosa.—*F. T.* 1, Cœlogyne lentiginosa; 2, Cœlogyne Rossiana.—*V. O.* 1, Oncidium flexuosum; 2, Oncidium barbatum; 3, Sigmatostalix radicans; 4, Not recognised.—*R. O. Y.* 1, Sophronitis cernua; 2, Aërides japonicum; 3, Angræcum falcatum.—*J. O.* Teucrium Polium.—*H. J. B.* We do not undertake to name varieties of Gladiolus. Send to some grower, who can compare them with plants in his collection.—*Lucan.* The Rose blooms were shattered; 5, Spiræa chamædrifolia; 6, S. ariæfolia.—*T. H. F.* Bocconia cordata.—*H. S.* 1, Tamarix pentandra; 2, Rhus Cotinus atropurpurea; 3, Rhus Cotinus; 4, Hypericum elatum; 5, Eucryphia pinnatifolia.—*J. F. G.* Potentilla argyrophylla var. atrosanguinea.

Names of Fruits: *Apple in Tin Box.* Early Kerry.

Potatos Diseased: *G. A. U.* The plants are badly affected with Wart disease of Potatos (Synchytrium endobioticum) as you suspect. The subject of Wart disease formed one of the series of articles appearing in these pages entitled "Scheduled Pests." (See *Gard. Chron.*, November 2, 23, 1912, pp. 327, 391.)

Preserving Sprays of Beech: *L. S.* The branches should be cut as soon as the leaves are mature, tied into conveniently sized bundles, and pressed between two boards in a cool shed. The foliage of various trees and shrubs, e.g., the Beech and the Mahonia (Berberis Aquifolium) persist for a considerable time if they are cut before the ripening process commences.

Seedling Rose: *A. A. T.* The bloom is small, but the colour is rather pleasing, and the flowers may become larger if they are worked on some suitable stock. This might be done now if suitable buds are available, but if not you should continue to grow the plant, and assuming it is in a pot, it would succeed best in the greenhouse. If the Rose is planted out-of-doors do not disturb it until the leaves have fallen.

Sweet Peas: *C. M.* We suspect that one cause of the plant's failure is excessive manuring, considering that you not only dressed the ground heavily in the autumn with phosphatic and potash manures, but also applied another heavy dressing in the spring. Trench the ground well in the autumn and add farmyard manure, not in layers but well mixed with the soil. Incorporate with the top spit a quantity of bone meal and soot; this, with a light dressing of sulphate of potash in the spring, should afford sufficient nourishment for the roots until the plants commence blooming, when they may be fed with some special Sweet Pea manure or liquid farmyard manure, or these stimulants may be applied on alternate occasions. After trenching the ground sprinkle lime over the surface freely. Retrench the ground which has been planted with Sweet Peas for the past three or four years, and instead of manuring it apply a thorough dressing of lime.

To Preserve the Green Colour in Fern Fronds: *E. W.* The fronds should be cut when of full size, and after having been lightly pressed between sheets of blotting paper, dipped in a weak solution of gum arabic.

Tree for Wind Screen: *B. H. M.* The best evergreen tree for your soil and situation is the Evergreen Oak (Quercus Ilex), but if space permits, a much more effective wind screen could be made by means of a mixed planting, using such species as Pinus pinaster, P. austriaca, Populus monilifera, Cupressus Lawsoniana, Pseudotsuga Douglasii, and Ulmus cornubiensis, in addition to the Ilex Oak.

THE MARKET FRUIT GARDEN.

AT last the second summer drought has been substantially broken. In the five weeks which ended on August 23 only 0.12 inch of rain was measured at my station; the first considerable fall in August occurring on the 26th, when the measurement was 0.18 inch. A steady downpour began in the evening of the 30th, and continued almost without a break until 6 a.m. on September 1, amounting to 1.12 inch, which brought the total for August up to 1.85 inch, and to 1.86 inch for six weeks.

There has now been rain enough not only to refresh vegetable crops ,but also to penetrate to the roots of fruit trees. Whether it has come in time to remedy to any considerable extent the stunting effect of the two summer droughts upon late Apples remains to be seen. That it will do so completely can hardly be hoped, as the fruit is already nearly mature. Lane's Prince Albert, as a feeble grower and heavily cropped, has suffered severely, so that the fruit is much smaller than usual; and even Bramley's Seedling and Newton Wonder are also below their normal sizes.

One Advantage of the Droughts.

Against the disadvantages of the recent droughts must be set the great advantage of the early disappearance of the aphis. Last season Apple trees, and particularly young ones, were badly infested until late in the autumn. Indeed, one variety of the pest was persistent in its attack until it was destroyed by frost. The injury to the development of the young trees was incalculably great. This season, in spite of the dryness of the soil, the youngsters, cleared of the aphis, have made splendid growth. Many trees, almost given up in despair at the spring pruning, have become fairly furnished with long and vigorous new shoots starting from the points at which the branches were cut back below the parts twisted by the aphis in 1912.

Another Advantage.

The help of the drought in the destruction of weeds by hand and horse hoeing is another great advantage, though against it must be set the extraordinary expense of the work. That which was executed by hand is to be more correctly described as "stubbing" than as hoeing. Ordinary hoes could scarcely be made to enter the iron-bound soil of the orchards, and I had some heavy 6 inch mattock hoes made for the men to use, instead of the usual 9 inch light hoes. In spite of the loss of width the men found they could get over the ground more quickly with the mattock hoes than with the others. The work, however, was extremely hard, and the men earned less than they do in ordinary seasons at piece-work, although paid 50 per cent. more per acre than usual. My ordinary price for hoeing all the land under trees, where the horse hoe cannot be used, is 12s. an acre, and the men usually do well at that rate. This year they earned less than usual at 15s. per acre, and in one case two hard workers earned barely 3s. a day, when I made the price up to 20s. an acre, instead of the usual 3s. 4d. to 4s. a day, which I like to see good piece-workers earning. This last case was in an old orchard of bush-shaped trees, awkward to work under, very grassy, and extremely hard. The exceptional hardness of the soil, of course, was due to drought following flood, together with the results of much trampling when Apple trees were pruned, and when spraying and fruit thinning were done.

The Most and Least Fruitful Apples.

With me the best crops of Apples this season are or have been those of Mr. Gladstone, Beauty of Bath, Lady Sudeley, Worcester Pearmain, James Grieve, Charles Ross, Domino, Queen, Royal Jubilee, Lord Grosvenor, Lord Derby, Lane's Prince Albert, Bramley's Seedling, Chelmsford Wonder, and Dumelow's Seedling (Wellington). Varieties bearing half to three-quarter crops are Early Julyan, Warner's King, Allington Pippin, and Newton Wonder. Almost fruitless are or were Irish Peach, Cox's Orange Pippin, and Gascoyne's Scarlet. Entirely fruitless was Duchess of Oldenberg. Some of the half or wholly fruitless varieties blossomed profusely. Royal Jubilee has given the greatest weight of Apples per acre of all gathered varieties.

Yields of Plums.

Among mature trees Czar alone gave a fair crop, Rivers's Early Prolific, Gisborne, Victoria, Pond's Seedling, Black Diamond, and Monarch being nearly barren. On young trees Czar gave a partial crop, Early Prolific hardly any. Pond's Seedling a good crop, Monarch only a very slight sprinkling, Coe's Golden Drop, Greengage, Denniston's Superb Gage, Oullin's Golden Gage, and Reine Claude Violette being barren.

No Pears.

My Pear crop is practically *nil*. The only tree in my small Pear orchard bearing as many as a dozen fruits is the stewing variety Verulam.

Filberts and Cobnuts.

Hardly a nut can be found on the few Filbert bushes here. On sheltered Cobnut trees there is a fair sprinkling, but not on trees exposed to wind. That the nut crop is an extremely short one is indicated by 7d. to 8d. per lb. quoted for Kent Filberts, and 9d. returned for my first lot of Cobnuts, compared with 2d. to 3d. returned last season. Rail and market expenses, of course, are to come off. Presumably consumers are to pay at least 1s. a pound for Cobnuts, and it may be supposed that new Brazils, quoted at 80s. per cwt. wholesale, will be as dear. By the way, the catkins of Cobnuts for next season's pollination are already half-size, fully six months before their services will be required. It is almost pardonable to suggest that Nature made a blunder in this connection, as the vitality of nut catkins is frequently destroyed by winter frosts.

Advantages of Prompt Marketing.

For several reasons there is a great advantage in the speedy marketing of early and mid-season Apples after the gathering. In the first place, prices almost invariably fall for at least two months after the start, especially when autumnal gales cause the markets to be glutted with windfalls, a misfortune escaped this season up to the time of writing. In the case of dessert Apples, it is hardly necessary to say appearance and flavour are deteriorated by keeping after gathering, though improved by allowing the fruit to remain on the trees until dropping begins to become a source of loss. Further, there is a loss by rotting when Apples, other than late keepers, are held back from market. Cracked or otherwise flawed fruit, which can be sold at some price when fresh from the trees, quickly rots, and communicates rotting to sound fruit. Some varieties of culinary Apples, too, become flabby or turn yellow by keeping, and thus lose market value. There is not much need for advocating prompt marketing, however, as the common mistake of too many growers is the premature selling of long keepers, which usually pay to hold so long as they keep well, where there is storage room in a frost-proof fruit chamber.

Pollination Observations.

Except in relation to two varieties of Apples my observations have failed hitherto to support the statements of cer-

tain authorities as to self-sterility. In the case of Charles Ross I have a few isolated trees, planted about eight or ten years ago, which have never borne an Apple; and this season, for the first time, I notice Cox's Orange Pippin trees bearing more fruit on outside rows next to other varieties than in the inside rows 48 feet from any other kind. Last season, on the contrary, the middle row in a piece of five rows 12 feet apart in another field fruited as well as rows next to Worcester Pearmain on one side and Mr. Gladstone on the other, while the outside of another patch, 72 feet from any other variety, also fruited well for the age of the trees. Last year, however, was a good one for Cox's Orange Pippin, and I am disposed to believe that, taking one year with another, the variety fruits better when it is cross-pollinated. In this connection it is to be observed that Mr. Gladstone blossoms too early to be of much use to Cox's Orange Pippin, which is one of the latest bloomers. Worcester Pearmain and Lane's Prince Albert are among the varieties which blossom at about the same time as Cox's Orange Pippin, and it is my intention to plant a few upright cordons of one of these two varieties at regular intervals in places now occupied by Black Currant bushes among the Cox's Orange Pippin trees. Other evidence as to lack of self-pollination based on my own observations is of a negative character. Lord Grosvenor trees 156 feet from any other variety have borne heavy crops in three successive seasons. Bramley's Seedling has fruited as well 24 feet from any other variety as where next to Lane's Prince Albert on one side or Warner's King on the other. In the cases of Lane's Prince Albert, Gascoyne's Scarlet, and Allington Pippin similar observations have been made, the distances of all but Gascoyne's of the middle rows from any other variety being much greater than in the case of Bramley's Seedling. Worcester Pearmain, 48 feet from any other variety, has fruited as well in three successive seasons as in the row next to Blenheim Pippin, with Allington one row beyond Blenheim; and this year young Worcesters, 84 feet from any other variety, bore as well as where trees adjoined Beauty of Bath or Gascoyne's Scarlet. In two young plantations of Apples there are some very wide breaks of certain varieties, and next season should afford a good opportunity of making careful observations as to evidence of self-pollination or cross-pollination from a considerable distance.

With respect to Plums, the only variety as to which I have reason to suspect lack of self-pollinative capacity is Black Diamond.

It is desirable to mention that bees are kept somewhat extensively close to most of my orchards, and that the latter are situated in the "sunny South." Moreover, it does not follow that where varieties are well pollinated they are self-pollinated, as they may be cross-pollinated by the action of wind or insects. This last remark should be borne in mind in relation to what is written above. *A Southern Grower.*

NEW OR NOTEWORTHY PLANTS.

ROSA SERTATA, ROLFE.

R. SERTATA belongs to the Cinnamomeæ section, its nearest allies being R. Webbiana, R. Willmottæ and R. macrophylla. The type specimen, named and described by Mr. Rolfe, was raised at Kew from seeds collected by Mr. E. H. Wilson in China. The plants form shapely bushes 4 feet to 6 feet in height, with long, slender, gracefully arching shoots. Even when not in flower or fruit, the bushes are attractive by reason of the glaucous, green foliage. The delicate blossoms, coloured rose or rose-pink, are borne several together at the ends of short branchlets, developed along the young, vigorous growths of the previous year. They are 2 inches to 2½ inches across, and appear from mid-June onwards, the period of flowering lasting about a month. The slender, ovoid, beaked fruits are coloured rich vermilion-red, about ¾ inch long with persistent sepals, hanging singly or several together along the gracefully arched branches.

R. sertata differs from R. Webbiana in its laxer habit; the stems are armed with a few slender, straight thorns, whilst those of R. Webbiana are densely clothed with spines; it differed also in the long, slender-beaked fruits, which in R. Webbiana are almost round.

R. sertata would make an attractive and impenetrable hedge, and is a useful plant for grouping in the shrubbery borders. Seeds from isolated plants may be expected to come true, but, like wild Roses generally, it crosses freely with other species. The plant may also be propagated from layers or cuttings. *A. O.*

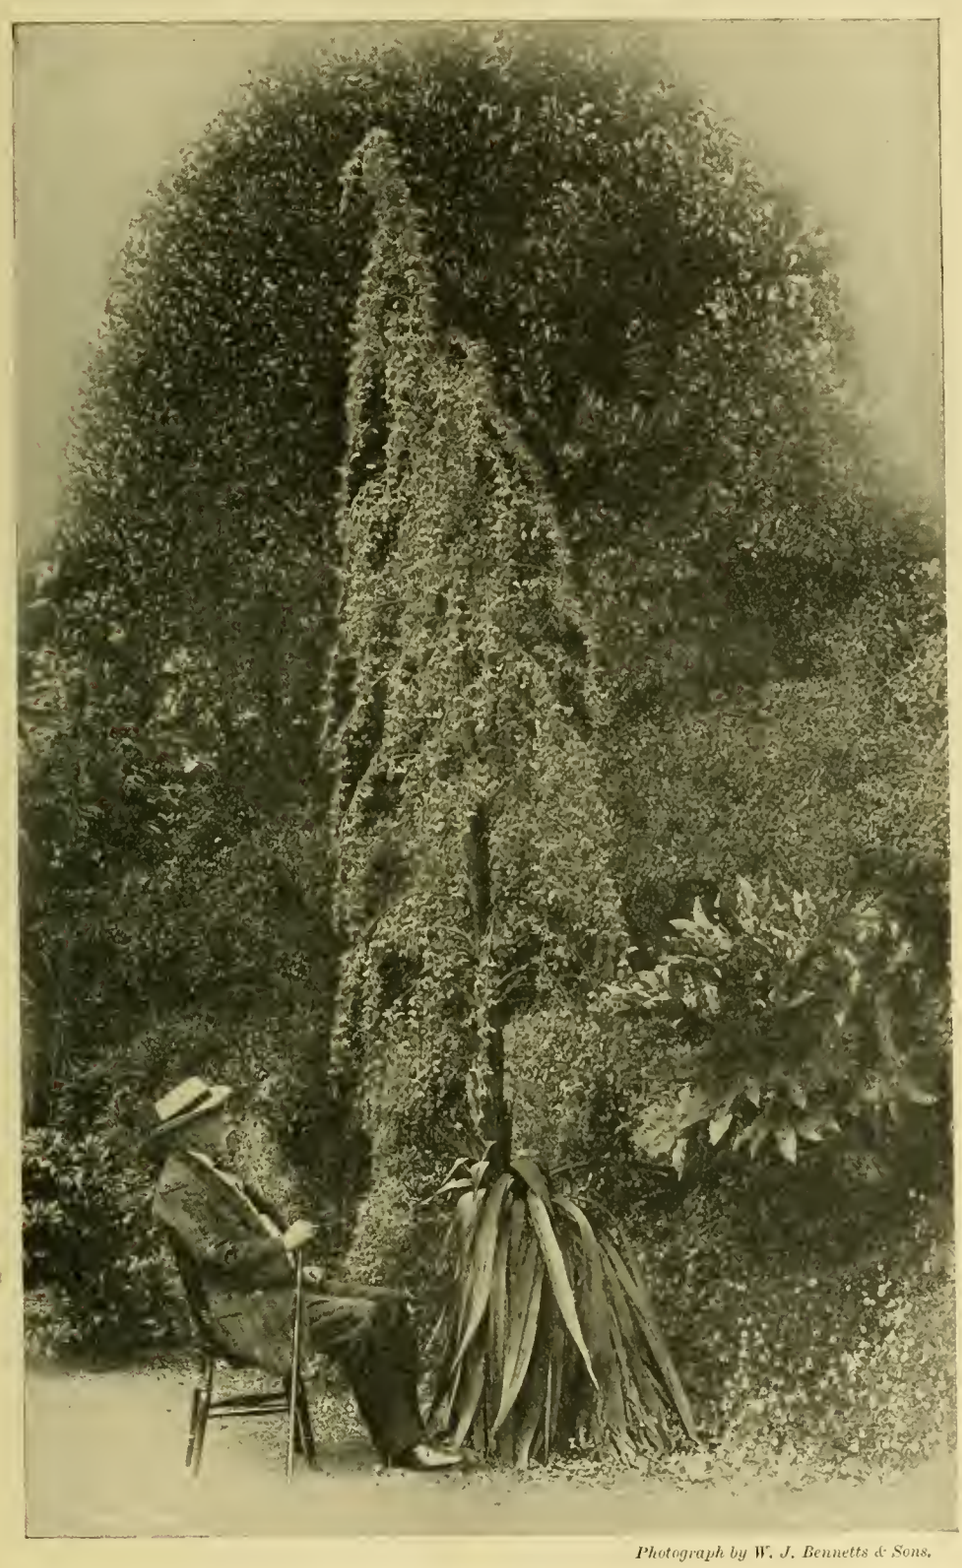
FIG. 63.—ROSA SERTATA: COLOUR OF FLOWERS ROSE-PINK.

FURCRÆA BEDINGHAUSII.

FURCRÆA BEDINGHAUSII was discovered in 1857 by the distinguished traveller and collector, Roezl, who found it growing on Mount Acusca in Mexico at an altitude of over 12,000 feet. The plant was shortly afterwards introduced into European gardens, and flowered for the first time in cultivation in the garden of M.

Bedinghaus, of Mons, in 1863, after whom it was named by K. Koch.

It is recorded as having flowered in several Continental gardens shortly afterwards, and in 1875 flowered in the famous garden of Mr. Dorrien-Smith at Tresco Abbey, Scilly. In these gardens, which are practically free from frost, although they are situated only 43 miles off the coast of Cornwall, the species thrives freely, and specimens there have flowered frequently. The plant illustrated in Fig. 64 was obtained from the Tresco garden some ten years ago, and planted in a sheltered position out-of-doors in the garden at Pendarves, Cornwall. It has thrived beyond expectation, and has recently flowered, sending up an inflorescence over 12 feet from the tops of the leaves, the total height of the plant being more than 16 feet, whilst the spread of the leaves exceeds 3 feet in diameter. The large, branching panicle bears many hundreds of pendulous flowers. These are 1½ to 2 inches in diameter, pale primrose on first opening, fading with age to pale greenish yellow. The perianth segments are spreading, ¾ inch long, elliptic-oblong, and hairy on the outside. The ovary is elliptic in shape and covered with short white hairs ¾ inch long.



Photograph by W. J. Bennetts & Sons.

Fig. 64.—Furcræa bedinghausii flowering in Mr. W. C. Pendarves' garden, Pendarves, Camborne.

The species seldom bears fruit, even in its native habitat, but in place of fruit many hundreds of small bulbils are developed on the inflorescence, and these furnish a ready means of reproduction. In some cases the bulbils are so numerous that their weight bears down the plant to the ground. Their development is rapid, and they are readily detached from the parent at an early stage of their development. The seeds when fully matured are black, prominently winged, and some ¾ inch in diameter.

The plant when not in flower has some resemblance to an Agave or Dracæna, the leaves being slightly glaucous-grey and finely serrate on the margins, in striking contrast to the generality of plants cultivated in the more favoured parts of the British Isles.

The Furcræas, of which there are about a dozen species in cultivation, are natives of the Andean region of Colombia and Venezuela, extending northwards into Mexico and southwards into Brazil. They are closely allied to the Agaves, but are not so succulent in their habit, and require moister conditions. Several species are largely grown on a commercial scale in tropical countries for the valuable fibre contained in the leaves, the best of these being F. gigantea and F. cubensis. *C. P. Raffill.*

DESTRUCTIVE INSECTS AND PESTS 'SCHEDULED' BY THE BOARD OF AGRICULTURE AND FISHERIES.

XIII.*—CUCUMBER AND TOMATO CANKER.

The disease to which the name "Cucumber and Tomato Canker" has been given in England was first known as a serious disease of Melons in the United States, where, so far as published reports show, it has not been found on Cucumbers or Tomatos. Tomatos and Cucumbers attacked by this disease, due to the fungus Mycosphærella citrullina, Grossenbacher, were sent to Kew in 1909, and since that date the disease has become more widely distributed and now does considerable injury to Tomatos. An investigation at Kew showed that "The spores from diseased Cucumber plants would infect young Tomato plants, and that spores from a Tomato plant would infect Vegetable Marrow plants." Thus Melons, Marrows, Cucumbers, and Tomatos may be attacked, though principally Tomatos in England. For example, the disease occurred on Tomatos at Waltham Cross in 1909, Bristol and Cambridge in 1911, and this year is common in Kent, where it is causing considerable loss. It is now widely distributed, although it is not infrequently overlooked or confused with other Tomato diseases. One grower lost hundreds of plants in 1909 and 1,000 plants in 1910, while another had a large number of houses devastated in 1909 and had not one per cent. of plants diseased in 1910.

The effects of attack are somewhat sudden, and the first indication of the disease is commonly the wilted foliage, at a stage when nothing can be done to prevent total loss of the affected plants. Wilting is followed quickly by the collapse and death of the plant. In America, Grossenbacher† noticed in regard to Musk Melons that "the dying petioles seemed to have a somewhat water-logged appearance at their junction with the vine. On a few nodes of this kind an oily-green coloured region was evident from which a few drops of resin-coloured gum had exuded." A week later he observed that "on the internodes beyond the fruiting zones the oily-green, water-logged character of the vine was very conspicuous."

* The previous articles appeared on September 27, October 12, November 2, and December 7, 1912; and on February 1, March 1, March 15, April 26, May 3, May 24, June 7, and August 16, 1913.

† *New York Agric. Expt. Sta., Tech. Bul.* No. 9, 1909.

The oily-green regions subsequently turned either "a dark and gummy or dry and grey colour, depending upon the relative quantity of gum presented and the extent of the cortical and sub-epidermal mycelial development that had taken place during the earlier stages of the disease."

Diseased Tomato plants are described ‡ as follows :—"In each case the base of the stem was considerably shrunken, and the cortex destroyed. . . . . In some specimens the nodes or joints of the stem were also attacked. Plants attacked as above promptly succumbed, a grower's statement being that they fell over like ninepins."

Another description illustrative of the attack on Tomatos is as follows§ :—"The symptoms which have most frequently been seen are the wilting of the whole or the top part of the plant, and the brown and sunken appearance of some part of the stem. Generally this patch is within an inch or two of the soil. It is dry and rather fibrous in texture, while the healthy part is rather green and sappy. In many instances the canker is found some distance up the stem, and here, as at the base, the stem shrinks inwardly."

The point of attack would appear to be a wound, such as an accidental injury, a puncture due to an insect, particularly near a node or joint, or a point where a leaf or shoot has been stopped. The disease has also been recorded by Brookes and Price‖ as attacking the fruits of Tomatos grown in the open. The fungus is now regarded as a wound parasite, though some doubt has been expressed as to whether it has not the capacity for direct attack without the medium of a wound. Experiments by Brookes and Price showed that "with green fruits infection would only result if the fungus, either in the form of mycelium from a pure culture on Tomato-gelatine, or of spores, was inserted into the wounded parts."

The discoloration of the stem externally is somewhat rough and has no marked boundary, but is "smudgy"; and the "shanking in" of the affected portion is usually well marked, while with a hand lens the pycnidia may commonly be seen as minute black specks. The disease is commonly mistaken for that caused by the wide-spread fungus Botrytis cinerea; in the cases of attack by the latter the affected points show as lesions clearly defined by an apparent hard line.

The fungus described as Mycosphærella citrullina, Grossenbacher, is now proved to be the pycnidial stage of Ascochyta citrullina, C. O. Smith, or Diplodina citrullina, Gross. On Melons in the United States two stages of the disease have been observed—a first, in which pycnidia are produced during the ashy-grey stage, followed by a second, in which perithecia with ascospores (resting spores) are produced when the host is dead or dying. Writing in January last (*The New Phytologist*), Brookes and Price stated that they could not find any record of the perithecia stage in this country, and perithecia were not produced in the course of their own experiments. It would appear therefore that in Britain the fungus is propagated by the mycelium or by the pycnidiospores.

The pycnidia (see fig. 65) are described by Grossenbacher as slightly depressed-globular and light brown to dark brown in colour, containing two-celled, more or less cylindrical spores with rounded or tapering ends. On germinating the pycnidiospores give rise to a dense mycelium. The perithecia are described as "roughish, dark-brown to black, depressed-globular to inverted-top-shaped." They produce somewhat cylindrical asci, each containing eight two-celled ascospores.

Comparatively little is known at present in regard to methods of remedy or prevention, and it is not yet clear how the disease is propagated from year to year, perithecia, which might otherwise survive the winter, apparently not being produced in this country. It is a safe measure, however, to burn all affected plants. The houses may be cooled down somewhat when plants are found to be diseased—since it is believed that the moist, warm condition of glass-houses is essential for the extensive development of the fungus. The plants should be repeatedly and thoroughly sprayed with Bordeaux mixture from the time they are quite young and before the disease appears, in order to prevent extensive infestation.

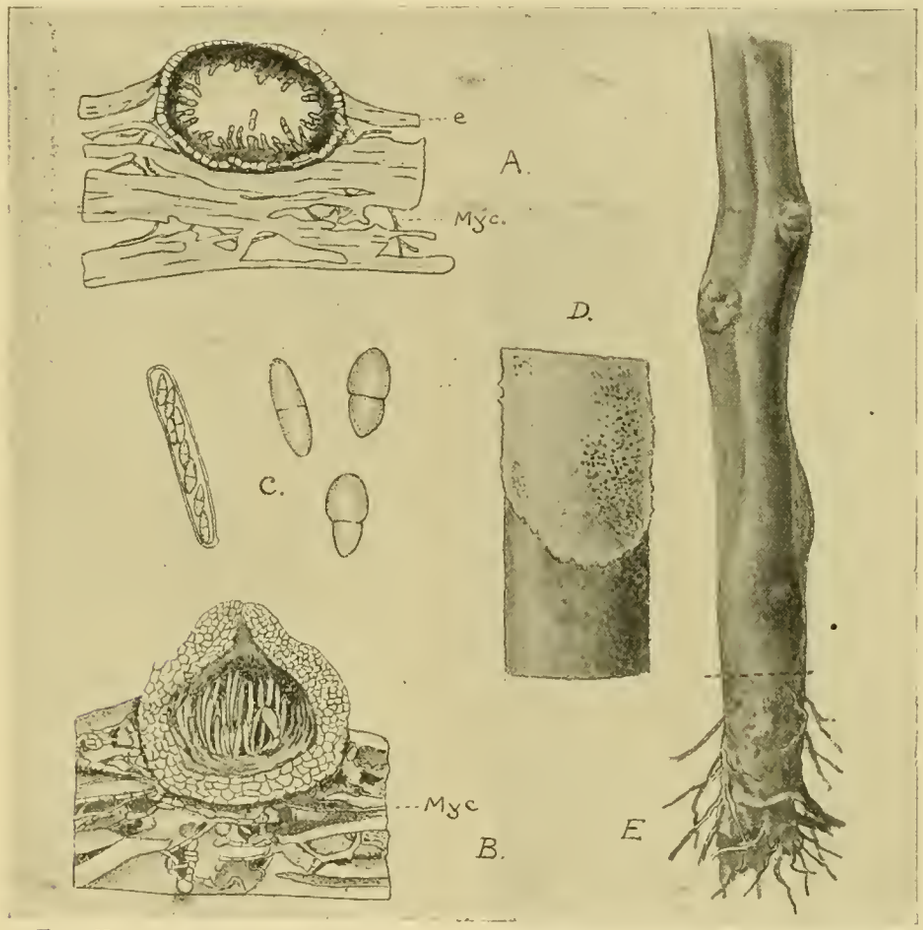


FIG. 65.—CUCUMBER AND TOMATO CANKER (MYCOSPHÆRELLA CITRULLINA, GROSSENBACHER).

A, Section of Musk Melon, showing pycnidium with spores: mycelium (*myc.*); epidermis of host (*e*). B, Section of perithecium with immature asci, on Musk Melon. C, An ascus with spores and three isolated spores. D, Portion of diseased stem, bearing pycnidia (enlarged). E, Diseased Tomato stem, showing the shrinking of the stem slightly above the ground level, and the darkened colour. (A, B, and C, after Grossenbacher.)

ORCHID NOTES AND GLEANINGS.

ORCHIDS AT MESSRS. CHARLESWORTH AND CO.'S NURSERY.

A VISIT to the extensive establishment of Messrs. Charlesworth and Co. at Haywards Heath, mainly devoted to the raising and perfecting of new hybrid Orchids, discloses evidence of the most remarkable advances in all the main branches of Orchid hybridisation, some of the most satisfactory results being attributed to Mr. Charlesworth's knowledge of the structural characters in their finer details which he has acquired since he took up scientific microscopic study of the subject, his room devoted to this purpose now containing a large and interesting collection of preparations, showing the process of fertilisation in all stages, and the progress of the seedling until its first rudimentary root appears.

Entering the commodious block of houses arranged for the raising and growth of the innumerable fine crosses which may be expected to give a greater proportion of distinct showy hybrids than formerly, we find that in the seed-raising house there is scarcely a failure in the thickly-germinating sowings on the seed pots. Here, too, experience has brought success, for the minute organisms which used to be so deadly are no longer feared. House after house in succession contains an immense quantity of sturdy little plants, Lælio-Cattleyas, Brasso-Cattleyas, Odontoglossums, Odontiodas, Sophronitis crosses, and Miltonias predominating, although there are small batches of experimental crosses between widely-separated genera, which, a few years ago, it would have been considered folly to attempt. In this block the most important batches are retained until the plants reach a flowering size, and the houses contain promising batches of new crosses of Cochlioda, Odontoglossum Cervantesii, O. Rossii rubescens, Lælio-Cattleyas, etc., some of them being the result of crossing the best new varieties of well-known species, with a view to obtaining improved forms of the earlier favourites, such as L.-C. callistoglossa.

At the end is a house containing rare and unique varieties of species, together with a collection of albino Cattleyas. In the main block containing the general collection, which has houses running on each side of a connecting corridor, the first house gives a striking example of the advantages to be obtained by seeding. This house had a beautiful show of seedling Miltonia vexillaria and its hybrids, the most beautiful of which is M. Charlesworthii with its large blush-pink to rose flowers with ruby-crimson mask to the lip. The duration of Miltonia vexillaria in bloom used to be very short, the only late-flowering forms being the small-flowered varieties, superbum and rubellum. Here are seedlings of the best large-flowered type still well in bloom, and with

spikes in all stages to keep up the show until winter.

In another house the improvement in Odontiodas is shown by the many good forms of O. Charlesworthii and O. Bradshawiæ. O. Charlesworthii was so good that it was crossed again with Odontoglossum Harryanum, and the deep, bronzy-red Odontioda Brewii resulted, a small lot varying in tint, but all good, especially one now in bloom. At the end of one house is a selection of wide crosses in bloom, all interesting and graceful in habit, and including Odontocidium Hebe, Oncidioda Bella, Cooksoniæ, Charlesworthii, and Odontoglossum Edwardii crosses, which invariably retain the violet-purple of the parent.

The several houses of Lælio-Cattleyas, Cattleya and Brasso-Cattleya, have the occupants uniformly furnished with flower sheaths, but few are at present in bloom. Several clear, yellow Cattleyas and Lælio-Cattleyas are in bloom, C. Fauna (Chamberlainiana × Hardyana) being a pretty novelty, the contrast between its bright, yellow sepals and petals and widely-expanded violet-mottled lip being very effective.

The Odontoglossum houses have still some plants in bloom, including the best type of blotched O. crispum, O. ardentissimum in good varieties heavily blotched, and several of the clear white variety xanthotes. A batch of O. Jasper has a good show of pretty evenly-spotted flowers, whilst O. Doris, O. Rolfeæ, O. Lambeauana, and occasional plants of many other hybrids are also in flower.

SPECIES AND VARIETIES.

Although the main interest is in the hybrids, the species and varieties occupy quite half of the block. To glance at the most striking objects: we noted in one house an interesting selection of pretty and curious species in flower, including Bulbophyllum, Cirrhopetalums, Waluewa pulchella, Nanodes discolor, Polystachya bracteosa, Promenæa stapelioides, P. xanthina, Masdevallia gemmata (trichæte), M. triaristella, M. O'Brieniana, M. ionocharis, M. calura, and a number of others not so popular now as formerly, but which have only to "bide their time" for a return to favour.

The next house has a show of scarlet Cochlioda Noezliana with the pretty lilac Stenoglottis longifolia, Odontoglossum Uro-Skinneri, Habenaria Bonatea, and at the end a very fine lot of Sobralias in bloom, including the best white S. macrantha alba, large yellow S. xantholeuca, the pink and yellow S. Veitchiana and S. Lowii.

Then follows a batch of the true Oncidium luridum guttatum with its reddish-brown, yellow-spotted flowers vastly superior to the ordinary form, if not botanically distinct as suggested by Reichenbach; Anguloa Ruckeri, A. eburnea, A. Clowesii, the new and fine A. Cliftonii, Spathoglottis plicata Micholitzii with its pretty rose sprays, the rare Houlletia Wallisii, and some pretty Cymbidiums.

The next house contains a collection of Catasetums, Cycnoches, Mormodes, etc., with some in flower. Others in bloom include Dendrobium Dearei, D. Sanderæ, a number of D. Phalænopsis, and other species; the rare Calanthe violacea, and Peristeria elata with two flower-spikes. A house of Lælia anceps varieties in spike, L. autumnalis, L. Gouldiana, and Vanda cœrulea, with cherry-red Broughtonia sanguinea, and other pretty species; a warm house of Aërides, Saccolabiums and Angræcums, with good specimens of Eulophiella Peetersiana, E. Elisabethæ, Cymbidium Humblotii, Grammangis Ellisii; a house of Phalænopsis with Paphinia cristata, Habenaria Susannæ, Aërides Sanderiana with three spikes, and others in bloom; several houses of the showy Cattleyas in fine condition; a collection of the showier Masdevallias, with large specimens of Cryptophoranthus Dayanus and Restrepias, Pleurothallis, etc.; a batch of the charming little yellow Oncidium cheirophorum, and of the orange-scarlet Epidendrum vitellinum; houses of Cypripediums, both species and hybrids, all telling the tale of good cultivation. Mr. Charlesworth's country house, with its beautiful old garden full of superb Roses, vies in attractiveness with the adjacent Orchid establishment. At a short distance he has built two blocks each of three well-appointed dwelling-houses for the accommodation of the staff.

ODONTIODA ST. FUSCIEN, BROADLANDS VARIETY.

E. R. Ashton, Esq., Broadlands, Tunbridge Wells, sends flowers of a very fine form of this pretty hybrid between Odontoglossum Adrianæ and Cochlioda Noezliana, the original form of which was raised by M. H. Graire. The flowers, which are over 2½ inches across, are of distinct colouring, the chrome-yellow ground giving an unusual tint to the bright vermilion surface colour. The sepals, which are the darker, show a broad band of yellow at the back, the colour being also slightly visible beneath the scarlet of the surface. The petals are similarly coloured, but with more yellow, which appears in very thin wavy lines in the centre. The lip is pale yellow at the base, light lilac in front, with a large red blotch in front of the four-ridged yellow crest. The column is white tinged with purple.

BULBOPHYLLUM HAMELINII.

A fine plant of Bulbophyllum Hamelinii is in bloom in Sir Trevor Lawrence's garden at Burford. It is bearing a strong spike with a large number of blooms; but the flowers are malodorous, and hence prevent the species becoming popular as a garden subject. A description of the plant was given in *Gardeners' Chronicle*, August 13, 1904, p. 118. The species grows freely when suspended from the roof of the Cattleya house. At Burford it is growing in a basket furnished with only a shallow layer of Osmunda fibre. The old back pseudo-bulbs were removed last year and placed on a flat teak raft with only a little fibre underneath the rhizome. When growth is completed the plant needs to be kept moderately dry, but when in full growth an abundance of water at the roots is necessary. It is a fine, strong-growing species, and of much interest botanically.

NOTICES OF BOOKS.

Garden Work.*

The author of this work is of the opinion that this volume is a necessity, and in its pages he provides a vast amount of information of a purely scientific nature relating to soils, bacteria, parasites, etc., not usually found in books on gardening, no doubt because it has been found to be more economical to keep these matters separate from the more practical parts. There is no gainsaying that these elucidatory pages will be most helpful to amateurs and young gardeners. At the same time, they have been introduced at the expense of a curtailment of the practical portions to a degree which seriously limits the book's utility, and, in a word, it may be said that a great drawback to the usefulness of this book is the brevity with which it treats nearly all subjects. Numerous illustrations illuminate the text, the more useful being those in the purely scientific parts. There are also illustrations from photographs and some coloured illustrations. The book is beautifully printed in large and wide-spaced type.

A Book about Hardy Flowers.*

The Editor introduces the author of this volume as a recognised authority on the subject to which it is devoted, and the reader who studies the book will find that the encomium is deserved, though it is painfully evident that the writer has been seriously hampered for space, thirty-two of the pages being appropriated to illustrations, and others reduced in extent by smaller illustrations. The plan of the volume is very simple, the work being divided into three parts, of which the first contains all too brief chapters on cultural matters, various ways of using hardy plants to advantage, insect pests, and other subjects. The second part is a brief descriptive catalogue with remarks on the plants which the author esteems the most worthy of cultivation; but one misses the names of such indispensables as Nepeta Mussinii, Papaver pilosum, Senecio tanguticus, Antholyza paniculata, and many others. The third part consists of lists of plants for various purposes and suited to positions, dry, moist, shaded or open.

One forms the impression that Mr. Jenkins believes that the treatment of hardy plants for garden decoration is very imperfectly understood by the majority of gardening people. Yet wherever one goes, south or north, one finds abundant examples proving just the contrary, quite small gardens as well as large ones being treated in a manner which is beyond criticism. To the beginner in gardening this book will afford a guide in the elementary principles of hardy plant growing. We would have liked a little more careful regard to the requirements of the King's English, some paragraphs being hard reading. Why this should be it is hard to say, because the chapter on "Hardy Plants for the Wild Garden" is a charming composition. There is also a number of mistakes in the genders of the plant names, and botanical names might have been added when the vulgar ones are vague. What, for example, does the author mean by King Cup? The volume is beautifully printed, and is bound in a neat blue-green cloth. *R. H. B.*

Vegetable Growing Made Easy.*

Written by Messrs. Owen Thomas, V.M.H., and George Wythes, V.M.H., the cultural treatment of vegetables is passed in rapid review in six chapters, with an extra one on "Insect Pests" and another on "Vegetable Cookery." The title though alluring is illusory, for dipping into the volume to discover how, without the sweat of one's brow and the ache of one's back, an abundant supply of vegetables is to be obtained, sad disappointment was the result. Trenching is not abolished, nor the importation of heavy animal manures, nor indeed any of the practices that generations of gardeners have found to be imperative in order to produce good vegetables plentifully. Page after page was read in the vain search for some indication of the means whereby an easier life in the future would be opened up to the hard-working gardenman, and the book was closed with the deepened impression that the heritage of work left by the First Gardener to his seed is not yet to be eased. This, of course, demonstrates the book to be written on recognised principles, here and there diversified no doubt by idiosyncrasies of the writers, for all capable gardeners have little ways of their own of doing things, which they presume are the best ways. This is observable in the space devoted to each kind. For instance, the Turnip gets 2½ inches of space, and over leaf the Yam begins and fills nearly two pages! Salad plants are also rather slightly treated, and comprise Lettuce, Endive, Chicory, Corn Salad, Dandelion, Mustard and Cress, Sorrel, Watercress, Tomato and Radish; and herbs are dismissed in half-a-dozen pages, though the introductory remarks would lead one to suppose herbs were to be particularly nicely done by. Here a lamentable slip occurs. "Vervain is another 'divine weed' and is the parent of our adored Verbena triphylla, or so-called Lemon-plant"! There is a vegetable time-table for beginners, and about three dozen pages on the "Cooking of Vegetables," by Mrs. Francis Keyser, so it will be seen that a good return is provided for the investment of a shilling. *R. H. B.*

The Week's Work.

THE ORCHID HOUSES.

By W. H. WHITE, Grower to Sir TREVOR LAWRENCE, Bart., Burford, Dorking.

CALANTHE.—The new pseudo-bulbs of deciduous Calanthes are developing considerably. In order to obtain strong flower spikes and clear, bright flowers the plants should be placed well apart near to the roof-glass, so that each may obtain plenty of sunlight. Under these conditions the plants will dry quickly, and plenty of water must be afforded the roots, in fact they need more moisture at this season than at any other time. On alternate occasions liquid stimulants made from cow-manure will be beneficial. Strain the manure-water through a very fine sieve or piece of coarse canvas, for particles of solid matter will after a few applications stop up the pores on the surface of the compost and make it extremely difficult to ascertain whether the soil underneath is wet or dry. Now that the new pseudo-bulbs are advanced in growth and the plants well rooted, the manure-water may be used at a strength of half its volume with an equal quantity of clear rainwater. Calanthes of the Regnieri section are not quite so forward as those of a deciduous character, but if the plants are well rooted they too will be benefited by waterings on alternate occasions with liquid manure. Plants of the evergreen section, including C. veratrifolia, C. Masuca and C. japonica are also making their growth and should be supplied plentifully with water. The plants will grow best in a shady part of the Cattleya or intermediate house, and the foliage must be very near to the roof-glass. Brown scale is a great pest of these Orchids, and measures must be taken to destroy it.

MISCELLANEOUS ORCHIDS.—Well - rooted plants of Peristeria elata (The Dove Orchid) that are growing freely in the same house as the deciduous Calanthes will also need plenty of water, and must be exposed gradually to more sunlight. Plants of Chysis bractescens, C. aurea, C. lævis, C. Limminghii, C. Sedenii and C. Chelsonii that have been growing in an intermediate temperature should be removed to a warmer house, where they will mature their growths more quickly. The roots will require plenty of moisture until the leaves commence to change colour, when the plants may be removed to a sunny position in the Cattleya or Mexican house. Lælia anceps, L autumnalis, L. Gouldiana, Odontoglossum citrosmum, Epidendrum radicans, the pretty Barkerias, including B. Skinneri, B. elegans, B. Lindleyana, and B. cyclotella, together with other sun-loving Orchids in the Mexican house are growing rapidly, and their development should be encouraged in every respect. Except during the hottest part of the day afford the plants but little shade. Draw up the blinds early in the afternoon, close the top ventilators, and when the sun is shining brightly syringe the plants freely overhead. Do not practise overhead syringings when the weather is dull, as the young growths are easily rotted by water remaining about them. These Mexican plants appreciate plenty of fresh air at all times, and especially when the nights are warm. The rare Odontoglossum Londesboroughianum, although a native of Mexico, thrives best in a position close to the roof-glass in the intermediate house. Do not grow this Orchid in either a pot or basket, but on a flat raft made of Teak wood, and suspended horizontally near to the roof-glass. The roots spread out in all directions, apparently in search of atmospheric moisture. It is a shy-flowering species, and after growth is completed requires a long rest, such as is afforded to deciduous Dendrobiums. Well-established plants of Cœlogyne cristata need an abundance of water at the root, and, as the new pseudo-bulbs commence to form, occasional applications of weak liquid manure made from cow-dung will be beneficial. Place the plants close to the roof-glass, and accustom them gradually to more light and air. Dryness at the roots or in the atmosphere at this season is almost sure to result in small, weakly growths. In the cool house the majority of the Lycastes are in full growth, and the plants require copious waterings from now until the pseudo-bulbs are fully made up; the same remarks also apply to Odontoglossum grande, O. Williamsii, O. Schlieperianum, O. Insleayi and its variety splendens. The growths of these plants should not be sprayed overhead too heavily at any time, as they are prone to decay if water remains in them. All weakly plants of these Odontoglossums should be relieved of their flower spikes, for if the flowers are allowed to develop the next season's growths will deteriorate considerably.

HOT-WATER SYSTEM.—Everything connected with the heating apparatus should be put in order. The boilers should be overhauled and cleared of sediment, loose joints and cracked hot-water pipes made good, valves oiled and overflow and feed pipes put in good order. The fire-bars, flues around and over the boilers, also the chimneys and ash-pit doors should receive attention. While the fires are out temporarily the inmates of the warmer houses should be allowed to become comparatively dry, but if it is feared they may suffer from over-dryness, water may be afforded in about one-half the usual quantity.

THE FLOWER GARDEN.

By EDWARD HARRISS, Gardener to Lady WANTAGE, Lockinge, Berkshire.

FUCHSIAS.—The liberal use of stimulants will be necessary to keep the plants in good flowering condition until the end of the season. Coralle and Göttingen are two useful bedding varieties, the former a fine coral red and the latter a deep salmon. They both bear long, pendulous blossoms, and are much alike in habit. They look well in masses either in a bed or in the mixed border. They are easily propagated from cuttings either now or in the spring. Some of the more promising among the old plants should be potted at the end of the season, or kept in a close pit until they have recovered from the check. If the latter method is adopted they can afterwards be placed in a cool house and kept rather dry throughout the winter. If introduced into a moderately warm temperature in the spring they will have become fine specimens by the time they have to be bedded out again. Fuchsias grown naturally, plunged in grass, or planted in a mixed bed, should last for many years if re-potted annually and given liberal treatment. They can be grown either as specimens or as standards; but if the latter form is to be adopted next season the cuttings must be rooted at once. Strong, healthy shoots should be selected and inserted round the side of 5-inch pots in a light, sandy compost. The cuttings will root more readily if the pots are plunged in a moderately warm hot-bed in a close pit.

GENERAL WORK.—The chief work to be done this month will be the propagation of bedding plants. The more tender subjects have been dealt with in a former calendar. Some, such as Calceolarias, will need only the protection of a cold frame during the winter; the cuttings will root readily in these circumstances in sandy soil. Veronica Andersonii should receive similar treatment—a useful plant which can be employed in various ways. Violas, Pansies, Lavender, Mesembryanthemums, Phlox and Pentstemons can all be propagated in cold frames; Antirrhinums used formerly to be propagated by means of cuttings, but most varieties now come true from seed. The early batches of Sweet Peas will now be of little value and should be rooted up and burnt unless required for seed. If another sowing is to be made in the autumn, the ground should at once be prepared. It should be well trenched and plenty of soot and well-rotted manure dug in.

PUBLIC PARKS AND GARDENS.

By SUPERINTENDENT.

TREE AND PLANT NURSERY.—There is no more useful adjunct to a park than a well-managed and well-stocked nursery, the value of which does not, however, so much depend on its use for the actual raising and rearing of young stock as its serving as a handy place in which surplus plants can be stored until required. Where extensive planting operations are being carried out there must of necessity be such a ground, the area of which need not be great, although proportionate to the size of the park and gardens that have to be dealt with. At the end of the planting season one often finds that there are a number of surplus trees, shrubs or other plants, all of which can be lined out in the nursery ground for future requirements. From the flower garden hosts of intermediate plants such as Doronicum, Delphinium and others that tide over the period between bulbs and bedding-out time have to be planted back in the nursery ground; while Saxifrages, Primula Sieboldii, Arabis, Daisies and other edging plants which were used in conjunction with the various kinds of Hyacinths, Tulips and Narcissus have to find a place till the following spring. It is always advisable to retain in the nursery a few well-grown shrubs in pots that can be used to fill up unexpected blanks in the shrubbery or flower garden. The Golden Privet is useful for this purpose. Of course, in country parks the raising of trees and shrubs, whether from seed or cuttings, can be readily carried out, and is to be recommended; but not so in large towns, where the atmospheric impurities tell hardly on the constitution of young and tender plants. The soil in a nursery ground should be retained in a high state of cultivation, well pulverised by exposure to the weather and kept free from weeds. Thoroughly decomposed manure or spent refuse from pits and lights are excellent for a nursery border, while deep trenching and exposing the soil to a winter's frost will both purify and pulverise it. An occasional dressing of the surface soil of beds and shrubberies, particularly such as are situated in smoky localities, is to be recommended. In town parks it has been found a good plan to buy in young standards, say 4 to 6 feet high, of certain trees such as the Plane, Acacia, Lime and Elm, and to keep them in the nursery, regularly transplanted, till they attain the height for planting out permanently. By doing so they, like town turf, appear to get accclimatised, and so thrive better when placed in their final positions. It will thus be seen that the home nursery is an indispensable addition to the park and garden. Its value, both as a reserve ground and for the temporary laying in of odd trees, shrubs and herbaceous plants, is in direct proportion to the area of land that it serves.

PLANTS UNDER GLASS.

By F. JENNINGS, Gardener to the DUKE OF DEVONSHIRE, Chatsworth, Derbyshire.

CINERARIA. — The early batch of Cinerarias should now be ready for transference to their final pots—6-inch or 7-inch size—and should be attended to before the old pots become too crowded. The compost should consist of three parts rich, fibrous loam and one part leaf-mould, coarse sand and decayed cow-manure in equal quantities. To each barrow-load of this soil a 7-inch pot of fine bones and soot should be added. The potting should be firmly done, and the plants finally replaced in the cold frame in a cool, shady position. A little soot should be sprinkled over the ashes in the frame under the pots, to destroy any slugs which may be present. While potting, the foliage should be examined, and if any signs of maggots are found the insects should be searched for and destroyed, removing and burning any badly infested leaves. A good preventive of the return of the pest is to syringe the plants late in the afternoon with weak soot water; the under-part of the foliage must be thoroughly wetted. Ventilation should be gradually increased as the plants develop, and finally, if the weather is warm enough, the lights may be left off throughout the night. As soon as frost appears the plants should be removed to a cold house, or slightly heated frame; but they should be kept as cool as possible, and artificial heat should not be used until absolutely necessary. Later batches of Cinerarias will be potted from boxes or pans as required.

CALCEOLARIA. — Plants which have been pricked off into boxes or pans will now be large enough to move into 60-size pots. The compost should consist of fibrous loam and coarse sand mixed with a little decayed cow - manure, the whole rubbed through a sieve. Before potting it is advisable to place the plants in a house which is being

fumigated to destroy any aphides which may be present. After potting, the plants must be thoroughly soaked with water and placed in a cool house.

CHRYSANTHEMUMS.—The large-flowering varieties of Chrysanthemums will now be making good growth. Disbudding should be practised and the plants regularly fed with artificial and liquid manure. Bush varieties should be disbudded according to the kind and the requirements of the grower. They should be regularly fed, and kept moist. If green fly should appear a syringing of Quassia extract will destroy the pest. The growths should be tied in to prevent damage by autumn winds. It is advisable to have the house ready for the reception of the Chrysanthemums at any moment. After the first week in September, especially in the North, frosts may be expected at any time. Last year much damage was caused by early and unexpected cold weather.

THE KITCHEN GARDEN.

By JOHN DUNN, Foreman, Royal Gardens, Windsor.

ONIONS.—Spring-sown Onions are ripening earlier than usual this season. They should be lifted at once, or a second growth may begin, which will injure the keeping qualities of the bulbs. All deformed bulbs should be placed by themselves, and used first, only those which are likely to keep throughout the winter being placed in the Onion loft. The bulbs should be exposed to full sunshine for ten days before being removed to their winter quarters.

CELERY.—Celery plants should be liberally supplied with water, and the soil between them stirred well with a Dutch hoe. The plants should be lightly sprinkled with soot in the early mornings as a deterrent to slugs and other insect pests. Plants in successional beds should be earthed up, but care must be exercised in order that no soil may penetrate to the heart. Celeriac should be frequently watered in dry weather, and the soil constantly hoed. Manure water may be applied with advantage.

CARDOONS.—As the plants become large enough for blanching the leaves should be carefully drawn together, and tied with some soft material. Brown paper bands should then be placed around the stems, and tied with hay bands, so as to exclude all light. The stems should be earthed up as in the case of Celery, several times during the season, the soil being arranged around them in pyramidal form, so that the rain may run off it. If the plants seem dry at the roots a thorough watering should be given them several days before earthing up.

FRENCH BEANS.—Further sowings of French Beans should be made in pits where a little fire heat is available in cold weather. The bed should be raised to within 18 inches of the roof glass, so as to prepare the plants for the lights which will be placed over them in the autumn. The seeds should be sown in drills 18 inches apart, and about 2 inches deep. The Belfast and Osborn's Forcing are good varieties; they are of dwarf habit, and can be grown without sticks if they are given sufficient ventilation in the autumn to keep them compact. Plantations made in cold pits last month will require plenty of water at the roots. Frequent light dustings of soot will keep red spider and other pests in check. Runner Beans should be kept moist; weak manure water may be freely given, and in dry weather it is difficult to over-water the roots.

WINTER SPINACH.— The ground between the rows of this crop should be constantly stirred with the Dutch hoe, and the plants thinned as soon as they are large enough. About 6 inches should be left between each plant. Frequent light dustings of soot will be advantageous in checking slugs and other insects.

TURNIPS.—Turnips for the winter should now be ready for thinning. Nine inches should be left between each plant, and the surface of the soil between the rows kept well stirred; frequent light applications of wood ash or soot will be found beneficial. Further sowings should now be made for a supply of Turnip greens in the spring. Advantage should be taken of the dry weather to hoe the earth between the rows of all growing crops.

FRUITS UNDER GLASS.

By JAMES WHYTOCK, Gardener to the DUKE OF BUCCLEUCH, Dalkeith Palace, Midlothian.

VINES.—The wood of vines grown in pots for early fruiting next season should now be completely ripe and brown. A constant circulation of air should be maintained, and the vinery kept rather dry. All young lateral growths should be removed, and the foliage should be occasionally syringed with a mixture of soft soap and sulphur, to prevent attacks of red spider. The roots should still be carefully watered, and when the canes are sufficiently hardened the pots can be taken out-of-doors and placed in a sheltered and sunny position. The young vines which were planted in the border this year will require a warm temperature, with sun and fire heat, until the wood is thoroughly matured. Long lateral growths, which may have been left hitherto to induce root action, should be removed, so as to admit more light and air to the foliage and wood. The atmosphere should be kept rather dry while the wood is ripening, and means must be taken to check red spider and other pests by frequently syringing the foliage. Freshly-made borders must be well watered if the weather is dry; the outside borders will benefit by a mulch of half-decayed manure. The permanent vines, from which the Grapes have been cut and which are intended to serve again for early forcing, should now be pruned. One or two more eyes should be left than in the case of late pruning; the long spurs which will result can be cut annually to within an inch of the main stem, and will break again, forming fruit-bearing wood. An alternative would be to train in young rods from the bases of the vines and cut out the old ones. The spent soil from the surface of the border should be removed down to the roots and replaced with fresh turfy loam, mixed with lime-rubble and some good vine-manure. After the pruning the vinery should be kept as cool as possible. Any necessary painting or repairs should be done now if the weather permits.

TOMATOS.—Tomato plants raised from seed sown in June, and now in 6-inch pots, should be transferred, if ready, into 8-inch to 10-inch pots for winter fruiting. The soil at this stage should not be too rich; manure and other stimulants can be given later. A suitable compost would be a mixture of fibrous loam, lime rubble, and a little bone meal. The plants should be placed when potted in a cool house or pit, with plenty of space and air. As the days shorten and the nights are colder, artificial warmth will be necessary; but the plants will still need plenty of ventilation. When they become larger, all lateral growths should be removed, and a good strong stake supplied.

THE "FRENCH" GARDEN.

By PAUL AQUATIAS.

OLD MANURE BEDS.—The crops of Celery and Carrots need copious waterings during September, especially as the mass of manure is entirely filled with the roots of these plants. When the first batch of Celery has been marketed the old bed should be broken up and placed in a ridge for 8 or 10 days, to be broken again until it is fine enough for use as top-dressings for seed beds and nursery beds. Remove all side growths carefully from the winter batch of Red Celery, and place a few inches of soil around the stems. A small dressing of nitrate of soda will stimulate growth.

CAULIFLOWER.—This crop has proved very profitable this year, and the last batch set on the old cloche beds or among the Melons in July will also be very remunerative, especially if the roots are afforded plenty of moisture. The first sowing of Cauliflowers intended for a spring crop to be grown on hot or cold beds or in the open ground should be made on the 15th inst. This crop is grown exclusively under the intensive system of culture, as it is the only method by which a regular supply of heads may be had from the end of May until the middle of October. There are many excellent varieties suitable for this planting, and the following may be recommended: Snowball and Salomon for home culture, as the small inflorescences permit of close planting and the heads mature early; Half-Hardy of Paris, Erfurt and Le Noir, all suitable for planting in soil of a light texture; Driancourt and All Year Round, these being preferable for heavy ground. When the approximate quantity of plants required is known (one row of frames of 15 lights will hold 2,750 plants), select the site and well manure and dig the ground. Set the frames in rows, allowing a path 1 foot wide between each row. Place six barrow-loads of black soil in each frame. The seed may be sown in one or two of the frames very thinly.

LETTUCES.—Transplant seedling Lettuces raised in August at 2 inches apart in frames or under bell glasses, where they may remain until the end of the present month. Afford ventilation in favourable weather, especially for the White Passion variety. In gardens on the south coast of England and the south-east and east coasts of Ireland, a sowing of the variety Winter Giant may be made in a sheltered situation in the open. Thin the seedlings and transplant the remainder in the early spring. This crop will not be so good as that grown under glass through the winter. Prepare the winter quarters of Lettuces intended for cutting in the spring. A quantity of well-decayed manure will be required for top-dressing the roots later. Wash the cloches and dip them in sulphate of copper to destroy any fungous spores that may be present.

BEANS.—This crop should be covered with lights within 8 or 10 days to prevent the young blooms damping. Do not commence picking the Beans before the end of September, when the ordinary crop out-of-doors will be over. The foliage may be thinned in places to admit plenty of air and light to the plants.

SPINACH.—Spinach sown three weeks ago should be thinned and the ground hoed at an early date, as this will strengthen the growth of the leaves and render them less liable to attacks of mildew in November and December. Another sowing of Spinach may be made at once in drills at 1 foot apart.

THE APIARY.

By CHLORIS.

END OF SEASON WORK.—The honey flow has practically ceased and all who desire success next year must now commence their preparations. The stocks must be thoroughly overhauled and note made of the quantity of stored food in the brood chamber, which should not be less than 25 to 30 pounds to be quite safe, although some noted apiarists aver that 20 pounds will suffice. If the floor boards have much débris on them, they should be scraped, because the waste matter is the home of disease germs, besides forming the happy hunting-ground of the wax moth. Many beekeepers are in favour of one overhauling of the floorboard per annum, but when we remember how prevalent disease has been of late years, extra care in the way of cleanliness cannot but prove beneficial. The strength of the colony should now be our chief care. If it be weak, perhaps the queen is not worth retaining; in that case replace her by one raised this season where possible, and when two or more colonies are weak, unite them to form one strong stock, if driven bees cannot be obtained. Feed so as to stimulate the queen to produce as many eggs as possible, but where there is plenty of stored honey then only permit the bees to obtain enough for their daily wants by leaving one or two holes open in the feeder, using ten pints of water and five pounds of sugar, instead of ten pints and seven pounds of loaf (white cane) sugar where the stores are low. We resort to feeding all stocks in the autumn because all the bees raised now are those on which we shall have to depend to raise brood next spring, and the stronger the colony the more brood will be raised, because the queen lays only that number of eggs which can be covered by the inmates of the hive. Further, a strong colony will consume, pro rata, less than a weak one, because the natural heat of a small cluster is less than that of a large one, and the deficiency has to be made good by consuming more food.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the **PUBLISHER**, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, *as well as specimens of plants for naming, should be addressed to the* **EDITORS**, 41, Wellington Street, Covent Garden, London. *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible and duly signed by the writer. APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, SEPTEMBER 8—
United Hort. Ben. & Prov. Soc. meet. Nat. Chrys. Soc. Floral Com. meet.

TUESDAY, SEPTEMBER 9—
Roy. Hort. Soc. Coms. meet. (Lecture at 3 p.m. by Mr. C. Herman Senn on "Stem Vegetables: their Dietetic Values, and Various Ways of Cooking Them.") National Dahlia Soc. Exh. at Crystal Palace, Sydenham (2 days).

WEDNESDAY, SEPTEMBER 10—
Roy. Caledonian Hort. Soc. Sh. at Edinburgh (2 days).

THURSDAY, SEPTEMBER 11—
Nat. Rose Soc. Autumn Sh. at R.H.S. Hall, Westminster (2 days). Messrs. Dickson and Robinson's Vegetable Sh. at Manchester Coal Exchange (2 days).

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich, 58.5°.

ACTUAL TEMPERATURES:—
LONDON, *Wednesday, September* 3 (6 p.m): Max. 67°; Min. 54°.
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London. *Thursday, September* 4 (10 a.m.); Bar. 30.2°. Temp., 64°. *Weather*—Overcast.
PROVINCES.—*Wednesday, September* 3, Max. 61° Valencia; Min., 55° Aberdeen.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY, AND FRIDAY NEXT—
Dutch Bulbs, at 67 and 68, Cheapside, E.C., by Protheroe and Morris, at 10.30.

MONDAY, WEDNESDAY, AND THURSDAY—
Dutch and French Bulbs, at Stevens' Auction Rooms, King Street, Covent Garden, at 12.30.

MONDAY AND THURSDAY—
Established Orchids and Stove Plants (without reserve) at Stevens' Auction Rooms, King Street, Covent Garden, at 4 o'clock.

MONDAY NEXT—
First Annual Trade Sale of Winter Flowering and other plants at The Nurseries, Swanley, Kent, by order of Mr. P. Ladds, by Protheroe and Morris, at 11.30.

TUESDAY NEXT—
Annual Trade Sale of Winter Blooming Heaths, at Burnt Ash Road Nurseries, Lee, Kent, by order of Messrs. B. Maller and Sons, by Protheroe and Morris, at 11 o'clock.

WEDNESDAY NEXT—
Twenty-eighth Annual Sale of Pot Plants, at The Nurseries, Chingford, by order of Messrs. H. B. May and Sons, Ltd., by Protheroe and Morris, at 11 o'clock.
Bulbs in large quantities for the Trade, at 67 and 68, Cheapside, E.C., by Protheroe and Morris, at 1.

THURSDAY NEXT—
Thirty-second Annual Trade Sale of Winter-blooming Heaths and Ferns at Longlands Nursery, Sidcup, by order of Messrs. H. Evans and Sons, by Protheroe and Morris, at 11.15.

The Summer Drought.

The drought from which our gardens have suffered has broken at last, and the recent rains have repaired some, though by no means all, of the damage done by that spell of curiously inclement weather. Such recovery as there has been has come with dramatic swiftness, and we have seen grass swards which looked brown and well-nigh dead recover their greenness in an incredibly short space of time; but the plants of the herbaceous border, "having passed but once their prime, may for ever tarry." Many of those plants—at least in the garden the vicissitudes of which we have watched and deplored—remained during the drought in a state of suspended animation. They grew but little, looked prematurely old, and flowered with a parsimony which made even their few blossoms unwelcome. The sight of that border not only depressed us sorely, but set us thinking hard. This summer's drought, it is evident, was not like other droughts. No hot and continuous sunshine accompanied it. It was a drought of dull grey skies. Notwithstanding the absence of fierce sunshine, and notwithstanding the fact that the soil below the surface was by no means dried out, the plants showed clearly by their aspects that they were suffering from the lack of rain. Some showed their suffering frankly by their wilted leaves; others presented less familiar symptoms—they just stood still and did nothing.

The gardener whose soil was well supplied with organic manures reaped the reward of his outlay, and in his garden the plants bore bravely up against the drought. Those gardens in which water and labour for applying it were available presented themselves as smiling oases in a desert country; but in the garden which we describe none of these antidotes was available, and there the droughty summer gave premature birth to autumn.

Contemplation of the sorry scene led to speculation as to the immediate cause thereof. How comes it that a rainless period not accompanied by hot sunshine is thus resented by garden plants? The answer would appear to be that during the droughty period the stomata of the plants are, so to say, thrown out of gear. In the best of times and seasons these myriad openings in the leaf have a difficult part to play. Through them diffuses the water vapour derived from the liquid water taken up by the roots, and through them also must diffuse the carbon dioxide gas which serves as the raw material from which the plant manufactures its organic food. When the stomata are wide open these diffusion processes go on freely, and the rate at which water vapour is lost is determined by air and soil conditions. The drier or warmer the air, the faster the leaves transpire, and the moister and warmer the soil the greater is the rapidity with which the roots absorb water and make good the loss from the leaves. This is true, however, only within certain fairly narrow limits, for the stomata, the microscopic pores of the leaf, are not always open. The size of the stomatal opening is controlled directly by the leaf, and indirectly, by the atmospheric and soil conditions. If the air be very dry, or if, from lack of water in the soil, absorption by the root falls off, the plant closes its stomata, and the amount of water vapour which passes from the leaf falls very considerably. Thus automatically the plant protects itself in some measure from the risk of withering which it would run were its stomata to remain wide open in a time of drought. Some water is lost perforce even when the stomata are closed: for leaves are delicate, their outer surfaces, though they may be varnished, are not waterproof, and water vapour evaporates from the general surface of the leaf. Hence in times of hot drought leaves may droop and wither and plants may die although their stomata are closed.

But it will be apparent that in protecting itself from drought by closing its stomata the leaf shuts itself off from the atmospheric supplies of raw material. When the stomata are closed, but small quantities of carbon dioxide may enter the leaf; the green chlorophyll granules, each a sugar-producing factory, remain idle, and the manufacture of organic food is suspended. If, then, day after day the stomata are compelled to shut, and if their closure entails the closing down of the sugar-making apparatus, the lack of organic food becomes serious. In course of time growth and development are arrested, and the plant betrays by its aspect the fact that it is half starved.

Herein lies the explanation of the listless standstill of the plants during the recent drought. In obedience to the dictates of dry soil and cold easterly winds they closed their stomata. Thus they preserved themselves from death from desiccation, but in doing so they courted starvation. Metschnikoff has written of the disharmony of Nature, and poets have composed harmonious songs lamenting this disharmony, but nowhere is it more patent than in the hard, and at times impossible, task which Nature has laid upon the leaves of plants.

Coloured Supplement.—The subject of the coloured plate to be published in the next issue is the Large Larch Sawfly.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the committees will take place on Tuesday, the 9th inst., in the Vincent Square Hall, Westminster. At the 3 o'clock meeting of the Fellows a lecture on "Stem Vegetables, their dietetic values and various ways of cooking them," will be delivered by Mr. C. HERMAN SENN.

R.H.S. BULB SHOW.—A special exhibition of forced spring bulbs will be held by the Royal Horticultural Society on Tuesday and Wednesday, March 10 and 11, 1914, the object being to demonstrate the varieties best suited for gentle forcing. Exhibits of small and large collections are invited from amateurs and the trade. R.H.S. medals will be awarded according to merit. The Council also offer (subject to the general rules of the Society) prizes presented to them by the General Bulb Growers' Society at Haarlem for 18 Hyacinths, distinct; for 12 Hyacinths, distinct; for 6 Hyacinths, distinct; for 4 pans containing Hyacinths, 10 roots of one variety in each pan—the blooms of each pan to be of distinctly different colour from those of the other three pans; the bulbs need not have been actually grown in the pans they are shown in; and for the finest decorative display of Hyacinths grown from first-size bulbs. The Gold Medal of the General Bulb Growers' Society of Haarlem is also offered for the finest decorative display of Hyacinths grown from first-size bulbs in a class open only to trade growers.

AUTUMN ROSE SHOW.—The National Rose Society's exhibition of autumn Roses will be held in the Royal Horticultural Hall, Vincent Square, Westminster, on Thursday and Friday, the 11th and 12th inst. Particulars may be obtained from the hon. secretary, Mr. EDWARD MAWLEY, Rosebank, Berkhamsted.

A DANISH COMMENT ON SMALL HOLDINGS.—A note in *The Times* (August 28) refers to a visit which the Danish Minister for Agriculture made recently to this country. In the course of his tour, which was made primarily with the object of observing the treatment accorded to Danish agricultural produce, the Minister visited a number of small holders in the North. His comment on these holdings that "they are either too small or too large" is worthy of careful consideration, if only for the reason that it comes from the official head of an industry which exports produce to this country to the daily value

of £50,000. The implication which the Danish Minister's comment carries with it appears to be that we are passing through a transition stage, and that our small holders have not yet made up their minds entirely in favour either of farming in the ordinary sense—for which their holdings are too small—or of intensive cultivation—for which they are too large.

Armour-Plated Plants.—In the course of an account in the June number of the *Journal of Ecology* of the various types of cushion plants mention is made of an Andine species, Azorella madreporica, the hardness of which is sufficient to justify the title of this note. The plant is proof against a shot fired at it point-blank from a revolver.

Killarney House Destroyed by Fire.—Killarney House, Lord Kenmare's beautiful seat in Co. Kerry, an illustration of which is reproduced in fig. 66, was entirely destroyed by fire on Sunday and Monday last. The erection of this splendid residence, which cost £200,000, was begun in 1875 and completed in 1881. The fire appears to have started in a room on the top floor of the right wing of the building. Great difficulty was experienced in obtaining sufficient water to cope with the outbreak—a remarkable fact considering the proximity of the Lakes—and the flames soon obtained the mastery, with the result that the greater part of the house was reduced to ruins. Many notable works of art were destroyed, although certain valuable objects of a portable nature were saved. The gardens and pleasure grounds of Killarney House, the beauty of which is famous, were illustrated and described in the issue for March 30, 1909, p. 180.

Tobacco-growing in England.—A valuable report of the state of the experimental plots of Tobacco which are being grown in this country is supplied by a correspondent to *The Times* (August 28). Certain of the areas have been laid down at the instance of the Tobacco Growers' Society—a non-profit-making co-operative association affiliated to the Agricultural Organisation Society and assisted by grants from the Development Commission. The society pays to approved growers their working expenses, including rent, manures, cultivation, and curing. It lends equipment and guarantees a minimum payment of £5 per acre. According to the report of *The Times* correspondent, some 130 acres of Tobacco are being grown in Great Britain. In England, Mr. Trevor Williams has a plot at Byfleet which promises to yield from 1,100 to 1,200 lb. per acre. Mr. Brandon, chairman of the Tobacco Growers' Society, has a large plot at Fleet, in Hampshire, and Mr. A. H. Clough is growing 3 acres of Tobacco at Burley, Ringwood. In Norfolk some twelve growers have about 10 acres under cultivation, and this experiment will be watched with much interest by those who believe that Tobacco is a promising crop for small holders. Lord Iveagh has 25 acres under Tobacco at Elvedon Hall, Suffolk, Messrs. Dennis and Son, of Kirton, Lincolnshire, are growing an acre, and 9 acres are being cultivated in Worcestershire. Generally speaking the crops are in excellent condition, although in some cases they have suffered from drought.

Fruit Trees in the City of London.—The City fruit crop is to have official recognition to-day (August 22). That is to say, this morning the head gardener of the pretty garden of Finsbury Circus will essay to pick a basketful of Mulberries to present to the Lord Mayor at the Mansion House. Seen yesterday, he was a little nervous about the adventure, for this is distinctly not a good City fruit year. The biggest collection of Mulberry trees in London is, of course, to be found in the Charterhouse, which, although not actually in the City, is right on its borders. Seventeen large trees can be discovered there. Eleven are in the master's garden, three in the entrance court, and three in other situations. The two little Service trees in Staple Inn have no fruit at all this year. In New Square, Lincoln's Inn, is but a single bunch of Grapes, while there are no Figs to be seen anywhere. *Pall Mall Gazette.*

Fig. 66.—killarney house, co. kerry (destroyed by fire on the 31st ult.).

Panama-Pacific International Exhibition.—An article in the *Florists' Exchange*, from which the following is an extract, describes the landscape-gardening preparations which are being made on the site of the 1915 exhibition:—"In addition to being strikingly beautiful and effective, the park system of the Panama-Pacific International Exposition in this city in 1915 will contain some features unknown to previous affairs of the kind, for the site chosen for the exposition and the rare qualities of the California climate will enable John McLaren, the landscape engineer, to carry out some ideas that will render the grounds singularly attractive. The great avenue will pass by the northern shore of the lagoon, separating

it from the broad, grassy esplanade, which will be a vast green park adorned with shrubs and plots of bright flowers. By skilful gardening this esplanade has been made green already. Where once was water, then sand from the bottom of the Bay, is now a fertile surface, where the grass and flowers spring up in tropical luxuriance. Tons of rich loam and clay have been brought from the interior valleys and placed thickly over the sandy subsoil, with plenty of fertiliser to start the verdure on its way. Automatic lawn sprinklers, continually in operation, have done the rest, and the final effect may be imagined from the present appearance of the broad and stately esplanade, which will be flanked on the south side by the great palaces of the exposition, with their noble architecture, and on the north side by San Francisco Bay, with the picturesque Marin Hills, Angel Island, Belvedere and Sausalito in the background. Of less extent, but no less beautiful, will be the garden in the great courts between the eight structures in the main group of exhibition palaces. These courts will be notable for their bright flower beds and pools with fountains designed by the ablest sculptors. On account of their special floral features one of these courts has been called the Court of Flowers and another the Court of Palms. While the vegetation of California will be most extensively represented in the parks, gardens and courts of the exposition, the whole world has been ransacked for special features to add to the arboreal and floral adornment of the grounds. Europe, Asia, Africa, Australia, North, South, and Central America, the tropical, the temperate and even the frigid climes, have been called upon to contribute their flora to the exposition park system. Thanks to the remarkable California climate this park system will endure, with blooming flowers and fresh green grass and foliage, throughout the period of the 'Winter to Winter' Exposition, one of the greatest of all the attractions of which will be the exhibit of the climate of 'California Evergreen, the Land of Fruits and Flowers.' A feature will be a lagoon, which is to be about 800ft. long with a varying width, and will have little semblance to an artificial lake. Natural effect has been sought in its design, the purpose being to produce a sample of the wilderness lakes of California. Natural rocks and boulders, appropriate and artistic shrubbery, Water-lilies and other marine plants, and plenty of deciduous flowers to give colour will be characteristics of the scene. At the north end of the lagoon there will be half a dozen islets with neither bridges nor balustrades to suggest the hand of man. Weeping Willows, Monterey Cypress, Italian Cypress, and other growths peculiar to waterways will predominate the shrubbery; the rocks will be mossy and the banks besprinkled with Ferns; creeping vines will be clustered here and there, the whole resembling a charming mountain pool in a shady glen. Midway on the lagoon's western shore will rise a rotunda, surrounded with thick shrubbery and lesser wild growths, the idea being to represent an ancient temple, weatherworn and overgrown with the vegetation of ages, somewhat after the last remaining structure of the old Panama city destroyed by Morgan and his pirates in the sixteenth century. This rotunda will be close to the entrance to the crescent-shaped Palace of Fine Arts, being really a sort of vestibule to it. It has been suggested that the lagoon be stocked with trout, steel head, salmon bass and other Californian fish, the better to give verisimilitude to the wilderness effect, which has been the aim throughout. At places along the banks there will be caverns and grottoes in the big rocks, with trailing vines and mosses and ferns about them."

CONSERVATORIEB ON STEAMSHIPS. — It is stated in the *Moniteur du Jardinier* that the *Cap Finistère* of the Hamburg South American line which plies between Hamburg and the Argentine is provided with a greenhouse for the cultivation of flowers during the voyage. The greenhouse is provided with heating and with cooling apparatus so that a uniform temperature may be maintained. It is added that on its arrival at Buenos-Aires, decked out with Lilac and Carnations forced during the voyage, the ship was greeted with amazement by the population, many of whom had never seen these flowers. All the town visited the ship, and the President of the Argentine congratulated the gardener on the success of his sea-gardening.

OTTO OF ROSE.—Bulgaria seems to be suffering to the full from the slings and arrows of outrageous fortune. Beside loss of territory, it appears that it runs the risk of losing its trade in Otto of Rose; for in Bulgaria's adversity the South of France has seen an opportunity to put on the market at a low price Otto of Rose of excellent quality.

POTATOS IN GERMANY. — His Majesty's Consul at Stettin (August 19) states that owing to the cold and wet weather experienced during the last few weeks the prospects of the Potato crop in Pomerania have become less favourable. The yield is, however, officially estimated at from average to good, and should the weather improve a good crop is generally expected. Present wholesale prices per cwt. in Stettin are as follows:—Early Red Potatos, 2s. to 2s. 6d.; Early White, 2s. 6d. to 3s.; Oval Blue, 3s. to 3s. 6d.; and Kidney, 2s. 6d. to 3s. Exports from this port in 1912 amounted to 139,934 cwts., of which 3,857 cwts. were exported to the United Kingdom. The corresponding figures in 1911 were 390,639 and 104,218 cwts., and in 1910, 625,542 and 2,274 cwts. His Majesty's Consul at Danzig, under date August 20, states that definite estimates of the yield of Potatos in West Prussia this year are not yet available, but if fine weather continues and disease does not set in good crops are expected. Current wholesale prices range from about 2s. to 2s. 6d. per cwt.

A NEW RACE OF HYBRID GLADIOLI.—A new race of early large-flowered Gladioli has been raised by MM. CAYEUX and LE CLERC. In drawing attention to this acquisition to gardens *Revue Horticole* points out that at present the Gladiolus which is earliest to flower in the neighbourhood of Paris is G. communis, a species which grows wild in the South of France. Like G. byzantinus, Miller, G. communis flowers in April to May. The hybrid Colvillei flowers next in the latter part of May. It is held to be a hybrid of the South African G. tristis and G. cardinalis, and is much grown for the supply of cut flowers. Early dwarf hybrids of doubtful, and probably much mixed, origin are also largely grown. Between the flowering of these strains and the most precocious of the gandavensis and Lemoinei sections is a long interval, during which gardens lack Gladioli. The new race of MM. CAYEUX and LE CLERC fills this gap. It originated in a cross between an early dwarf hybrid and a variety belonging to the Lemoinei section. The new hybrid has the stature of the Lemoinei parent, and bears large, brick-red coloured flowers, spotted in the three lower perianth lobes with dark carmine splashes.

KENT COMMERCIAL FRUIT SHOW.—The third annual show of the Association is to be held on Tuesday and Wednesday, October 28 and 29, in the Corn Exchange, Maidstone. The two previous exhibitions have been so successful that one may safely predict a satisfactory return for the care and pains so willingly and ably bestowed by the promoters. The schedule before us is an ample one, and provides classes to suit all kinds of growers. The number of classes for named varieties of Apples has been increased by two—for three boxes of Allington Pippin and Cox's Orange Pippin respectively. In all the classes for Apples (except those for small growers), the minimum quantity to be shown is three bushels. This enables a fairer decision to be made by the judges, and gives a better chance of effective staging. A new class has been introduced, in which the Apples exhibited are to be packed in three-bushel barrels. This is the first time that such a competition has been held in England, though in Ireland similar classes have been included in the schedule of the Ulster Fruit-growers' Show for two or three years. A competition for Apple-packing, divided into two classes, one for men and one for women, should prove of great interest, and indirectly of distinct utility. The Apples, packages, etc., will be supplied by the Association. The judging will be based entirely upon the quality of the packing, the time taken, and the general appearance of the box when finished. The prize list is an interesting one, and should prove effective in drawing a number of good exhibits. Messrs. COUPE AND SONS, of Covent Garden, offer a Challenge Cup, value twenty guineas, for the best exhibit of six boxes of named Apples in Classes 1, 2, 3, 4, or 6, open to Kent, Surrey, and Sussex market growers only. The Cup will become the absolute property of any exhibitor winning it three times in succession. Mr. T. J. POUPART, of Covent Garden, is presenting a prize of £10, and the proprietors of the *Fruitgrower* are giving a Silver Cup, to form together the first prize for Class 12, a combined competition for various kinds of Apples. Mr. GEORGE M. SMITH, of Maidstone, offers a Silver Cup for the best box of Apples in the show, and several other valuable prizes and medals will be given. The secretary is Mr. R. WELLINGTON, The College, Wye, and we may mention that the last date for receiving entries is October 1. On the first day of the show a luncheon will be given, at which the guest of honour is to be Mr. RUNCIMAN, the President of the Board of Agriculture.

THE LIFE HISTORY OF THE RED SPIDER.—In the course of a description of the mode of warding off attacks of red spider on Cotton, Mr. E. A. MCGREGOR mentions (U.S. Department of Agriculture Circular 172) the following interesting facts bearing on the life history of this pest: The female lays about 50 to 60 round, colourless eggs, which in summer-time hatch in about four days. The colourless, new-born spider has six legs, feeds at once, and moults in two days, becoming a primary nymph. The latter possesses eight legs, like the adult, and moults in two days, to form the adult. Mating and egg-laying then begin. Thus one generation matures in about 10 to 11 days, and there are probably 16 to 17 generations in a year. Spraying with flour paste or with lime sulphur and flour paste, as described already in these pages, checks the pest.

BRITISH ASSOCIATION BOTANICAL EXCURSIONS.— In connection with the Birmingham meeting of the British Association the following excursions have been arranged for those attending the Botanical section:—On the Saturday a half-day excursion to Sutton Park, and on the Sunday a whole-day expedition to Wyre Forest.

HORTICULTURAL AND AGRICULTURAL EXHIBITION, MALINES.—We learn from the director of the section devoted to horticulture that a sub-section in the forthcoming exhibition at Malines (Belgium) is to be devoted to horticultural literature. The exhibition will be held in September, and anyone desirous of obtaining further information should communicate with the secretary, Boulevard des Arbalétiers, 16, Malines, Belgium.

MONTBRETIA QUEEN ADELAIDE.— The new Montbretia Queen Adelaide, which received the R.H.S. award on the 26th ult., was shown by Mr. SYDNEY MORRIS, and not by Messrs. R. WALLACE AND CO., next to whose exhibit of Montbretias it was staged.

REMARKS ON CONDITION OF THE FRUIT CROPS.

(*Continued from page* 153.)

(*See Tables and Summaries, ante, pp.* 80-85.)

5.—SOUTHERN COUNTIES.

Berkshire.—Apples are plentiful, especially the varieties Peasgood's Nonesuch, Cox's Orange Pippin, Bramley's Seedling, The Queen, Belle de Pontoise, and that most useful late dessert Apple Fearn's Pippin. The fruits are very clean, but will be on the small side if the drought continues. Pears on an east wall are a fair crop, but the trees have been much infested with blight. Peaches on south and south-east walls are in splendid condition, after giving much trouble in the spring, owing to infestation of blister. The crop is very thin on most varieties, the fruits being chiefly on the top part of the trees, which points to ripened wood being a great factor in the cropping of this fruit. Bush fruits were a heavy crop, especially Black Currants, which do well on our heavy soil, the bushes being but little affected with big-bud mite. Both sweet and Morello Cherries have been good crops, the variety Guigne Annonay, grown as a cordon on a south wall, being very useful by the end of May. Plums on a west wall are good, but the orchard crop is very thin. The local market seems to have been well supplied with Plums up to the time of writing, but later varieties, I fear, are very scarce. *John T. Tubb, Bear Wood Gardens, Wokingham.*

Hampshire.—Although all trees blossomed abundantly we have a very poor show of fruit. Strawberries, Currants and Raspberries, however, were very good, otherwise it is the worst fruit year in this district for a very long time. *Henry Martin, Bartley Lodge Gardens, Cadnam, Southampton.*

—— Apples are a heavy crop of excellent quality, although some trees have been injured by aphis as well as Apple scab, notwithstanding systematic sprayings. Cox's Orange Pippin, Worcester Pearmain, Lane's Prince Albert, Bramley's Seedling, Lord Grosvenor and Ben's Red are the best cropped varieties. Strawberries were a large crop of excellent berries, Royal Sovereign and the Laxton being the finer varieties. Gooseberries and Red and Black Currants were full and good crops, but Plums and Damsons are a failure. The soil is of a heavy, tenacious character, overlying first a clayey pan and below a chalk subsoil. Much manipulation is needed to get the ground into working order. *E. Molyneux, Swanmore Park, Bishop's Waltham.*

—— The crops of hardy fruits are very disappointing, after such promise in the wealth of bloom earlier in the year. Of Apples some varieties are carrying good crops, notably those that bore lightly last season. The fruit is clean and of good quality, but the trees, as with all other kinds of fruit trees, were badly infested with aphis. Pear trees are almost fruitless, probably owing to the heavy crops of last year. Plum trees were badly injured by attacks of aphis, and, with the exception of the variety Victoria, are almost fruitless. Apricots are a failure with us, but a few fruits are observable in neighbouring gardens. Of Peaches and Nectarines we grow none outside, but the same remark applies to these, there being very few fruits, and the trees are suffering from aphis attacks. Strawberries have been abundant, and the fine, bright weather experienced during their season imparted a rich flavour to the fruit. Gooseberries, Black and Red Currants were good crops, but Raspberries were scarce. Our situation is low-lying; the soil is a clayey loam resting on a subsoil of London clay. *A. G. Nichols, Strathfieldsaye Gardens, Mortimer, R.S.O.*

Kent.—Apples, to use a Kentish expression, are "platty," which means that some orchards are bearing good crops whilst the next door neighbour has none or hardly any. Pears are nearly a failure. Of Damsons there are none. There were many more Cherries than was at first anticipated, and their prices kept up well. Raspberries, which are grown around here in great numbers, were very fine and of excellent flavour. The berries are dispatched in tubs to the London markets twice a day by motor-vans. Strawberries were a good crop of excellent berries. Loganberries, of which there are several acres in this district, are a heavy crop, and I should prophesy that when better known this fruit will become a most profitable crop. *G. Woodward, Barham Court Estate Gardens, Maidstone.*

—— The trees blossomed profusely, but severe frosts and cold winds in May destroyed the prospects. I never saw so few Pears. Apple trees that cropped freely in 1912 are bare of fruit, but an orchard of dwarf trees in 300 varieties is well cropped, and the fruit is very clean. The soil is lower green sandstone and very favourable for fruits of all kinds. *George Bunyard, Royal Nurseries, Maidstone.*

—— Apple trees are badly infested with vermin of various descriptions. Pear trees flowered well, and the fruits set freely, but the latter have fallen: in many instances, almost completely. Plum trees were badly attacked by blight, and the crop is almost a failure. Cherries dropped considerably during the time of long-continued cold, easterly winds. Strawberries were fairly abundant, but the season was exceptionally short. Nut trees were weakened by the heavy crop of last season, and nuts are very scarce. *Geo. Fennell, "Bowden," Tonbridge.*

—— Apples are a fair crop in some places, but in others they are very scarce, owing to the cold rains and dull weather when the trees were in flower. Plums and Pears are bad in most places, which I attribute to frosts in April. Cherries were good in most places. Raspberries were a heavy crop, whilst Strawberries also were very satisfactory. Gooseberries were a heavy crop, although in some places near here the crop was a poor one. Peaches are fair. Nuts are bad. *J. T. Shann, Betteshanger Park Gardens, Eastry.*

—— A mild winter, followed by an exceptionally wet and cold spring and prolonged drought in the late spring and early summer account for unequal and generally small crops of fruit. Strawberries were a poor crop owing to drought and cold winds, but Raspberries were better, as there were copious rains after picking had commenced. This crop totalled as much as two tons per acre. The soil is loam and gravel on "bull-head." *W. E. Humphreys, Blendon, Bexley.*

—— All top fruit was badly affected by aphis, and the crops suffered considerably for want of rain. The trees bloomed well, but the flowers were destroyed by 14° of frost in April. The crops of small fruits would have been fair if rain had fallen earlier. *H. Cannell and Sons, Eynsford.*

—— The fruit crops generally are disappointing. There was a marvellous show of blossoms on all kinds of trees, but long-continued damp, cold, and sunless weather spoilt the good prospects. In some cases the fruits appeared to set, but dropped later wholesale. Plums and most stone fruits, with the exception of Cherries, were practically a failure. Cherries varied considerably. Some of the orchards had excellent crops of good fruit. Pears are very scarce. Apples dropped freely in some cases before they started to swell. Strawberries were excellent. The soil, a clayey loam, is of a heavy, retentive nature. *J. G. Weston, Eastwell Park Gardens, Ashford.*

Middlesex.—All soft fruits were very satisfactory, and Apple trees are heavily cropped. Peaches are bad, the worst crop for many years past, whilst the leaves are badly blistered. The trees were never at rest in winter. Consequently the wood was soft and green, and the buds too forward. Although there was plenty of blossom the individual flowers were thin and weak. Plum trees on walls carried a mass of bloom and set ample fruits, which dropped later. The same may be said of Pears. We experienced 10° of frost when the trees were in full flower, but I do not think this is the entire cause of the Plum failure, as two standard trees in the open of the variety Gisborne are bearing good crops. *H. Markham, Wrotham Park Gardens, Barnet.*

—— There was early promise for a good Plum crop, but practically all the fruits dropped from the trees, and we have only a sprinkle of the variety Czar. This is the fourth year in succession that we have had no Victoria Plums. I am of the opinion that the wood did not ripen last autumn—hence the failure. *W. Poupart, Marsh Farm, Twickenham.*

—— The fruit crops are under the average, owing chiefly to the fact that they were caught in bloom by some of the early frosts. Apples appear to be the exception. There is a good average crop of these fruits in most places, and more than an average in some. Pears and Plums are particularly poor, and the failure will entail a severe loss to many market gardeners. Plums have not only been badly afflicted with silver leaf, but also with aphides, the latter pest being abundant in places where there is much weedy vegetation and lack of clean cultivation. *John Weathers, Talbot Villa, Isleworth.*

—— Notwithstanding an abundance of blossom on all Pear trees, the crops in this district are extremely light. On April 13 we registered 8° of frost, which proved distastrous to both Plums and Pears. But there are heavy crops of Apples, as the blossoms were not expanded at the time when frost appeared. The varieties Lane's Prince Albert, Peasgood's Nonesuch, Chas. Ross, and Allington Pippin are all carrying heavy crops. The crop of Strawberries was one of the best for some years past, and the quality of the berries excellent. We gathered our first berries out of doors on June 14, and the last (Laxton's Latest) on July 15. The new variety Utility is a Strawberry with a future. It combines the good qualities of strong growth and free cropping; it bears fine, glossy fruits of superior flavour, and is a mid-season variety. Small fruits were very good, but Cherries and Peaches are failures. *Jas. Hawkes, Osterley Gardens, Isleworth.*

—— Except for Apples and Strawberries this is the worst fruit season I have known for years. Plums in particular are very bad. The soil is a good holding loam on gravel. *J. W. Bates, Cross Deep Gardens, Twickenham*

—— The fruit crops vary. What promised to be a record year, judging by the amount of blossom, has in some respects turned out a failure. We have a large number of Apple, Pear, and Plum trees, and generally have a record crop of Pears, and an under-crop of Apples, but this year the usual order is reversed, for we have a good average crop of Apples and few Pears. Certain varieties of Apples, including Lane's Prince Albert, Lord Suffield, New Hawthornden, Frogmore Prolific, Warner's King, Newton Wonder, King of the Pippins, and Worcester Pearmain are carrying record crops. All young trees, which had a splendid show of blossom, have failed entirely. We registered no spring frosts, and there were scarcely any cold winds, yet the embryo fruits dropped from the trees. Plum trees, which showed an abundance of blossom on some trees for the first time during my five years here, set plenty of fruits, but when as large as Peas the latter turned yellow and dropped. We had an exception in the case of one tree, which bore 14lbs. of fruit. Cherries and Peaches also set well, but these crops have also failed. We had a record crop of Strawberries. Raspberries, Black and Red Currants and Gooseberries were under the average. We have a good crop of Cobnuts. The garden slopes to the north-east; the situation is cold and crops are late. The soil varies from light to good, yellow loam with a clayey subsoil. The crops usually suffer from late spring frosts and cold winds. *Wm. Bryden, Stone Hill Gardens, Winchmore Hill.*

Surrey.—Apples set well. The variety Cox's Orange Pippin had to be thinned. Pear trees blossomed profusely, but the fruits set poorly. Plums set abundantly, but a few cold nights caused the fruits to drop freely. Strawberries, Gooseberries, Raspberries, and Currants were all plentiful and of good quality. The weather of spring was very wet right into May, the rainfall for the first five months amounting to 13.91 inches, or 5.53 inches above the average. *James Watt, Mynthurst Gardens, Reigate.*

—— In some gardens in this district the Apple crop is over the average, and the fruits are of good quality. Pears blossomed profusely, but few of the flowers set, Williams's Bon Chrêtien being a notable exception, and of this variety an average crop is expected. Plums set well, but continued low temperatures at night caused the fruits to drop wholesale. Black Currants, Raspberries, Red Currants and Strawberries have yielded heavy crops of best quality fruits. Gooseberries yielded well in some gardens; in others, including Coombe Court, the crop was practically a failure. This I attribute to frosts while the bushes were in bloom. The soil is a medium loam over a clay subsoil. *Thos. Smith, Coombe Court Gardens, Kingston Hill.*

(*To be continued.*)

DITTON PARK, BUCKINGHAMSHIRE.

See Supplementary Illustration.

THE original residence at Ditton Park shared the unfortunate fate of so many of the country houses of England. In 1812 the mansion was burnt almost to the ground, and the present house was commenced in the following year. It is in the turreted or Tudor style, and, when viewed from across the broad moat and beyond a rich green lawn with a bordering of fine trees, presents a substantial appearance of spacious comfort. The moat at Ditton has no affinity with the moats of the tragic novelists, who delight in portraying a sombre, forbidding piece of water in whose depths danger lurks. At Ditton Park the moat is a wholesome and exceedingly pleasant feature, which, as is shown in the Supplementary Illustration, is of exceptional size, and furnishes a congenial home for various rushes and reeds as well as the white Nymphæa. Along its banks the pendulous growths of Bamboos, interspersed with the sweeping branches of Horse Chestnuts, Beeches, and Elms, add in a great degree to its attractions. The house and grounds in the moat enclosure occupy fully twenty acres, and the planting has been so skilfully done as to convey an impression of unlimited extent.

For many years Ditton Park, which is pleasantly situated about a mile from the village of Datchet, was the residence of the late Dowager Duchess of Buccleuch, but during the past few years it has been leased to Lord and Lady Wolverton. Mr. T. Foakes, who was gardener at Iwerne Minster, Dorsetshire, manages the whole of the Ditton Park estate with conspicuous ability. When in residence at Windsor Castle the late Queen Victoria was a frequent visitor to Ditton Park, and delighted in driving around the richly-wooded domain. Trees grow splendidly in the rich Thames valley soil, and in pleasing contrast to the lofty Elms and old spreading Oaks are many groups of shapely Thorn trees of great age, which are so characteristic of the older English parks in the home counties. Chestnuts and Walnuts also attain exceptional proportions; the latter and the sweet Chestnut usually fruit abundantly.

The south front of the house commands a splendid view across the moat to the richly-wooded ancient deer park, and on the western side there is an ample lawn bounded on three sides by mixed groups of Cedars and Yews, Beeches and Elms, with isolated specimen Tulip trees. On the left an inviting peep of the flower garden may be seen. Although of formal design this garden depends on the richness of the plants for its effect, as the design is for the most part a series of narrow parallelograms with Box-edging set out in gravel walks. The central feature is a Rose garden of rather more elaborate, yet on the whole simple, design. The season of the Rose is almost over at Ditton, but there remain ample evidences of a glorious summer display. The other beds are largely planted with distinct kinds of such herbaceous plants as the old favourite double Marigold, Pæonies and Michaelmas Daisies, whilst the larger, outer beds are of the nature of mixed herbaceous borders, where large clumps of Helianthus rigidus and rows of tall Hollyhocks rising from herbaceous Phloxes, Carnations, groups of Gladioli, notably of the variety America, supply abundance of floral beauty. Away to the right, past the eastern lawn, a small circular flower garden claims attention; here the planting is on conventional lines, such subjects as Pelargonium Paul Crampel, blue Lobelia, white Marguerites and Antirrhinums being used. From this point a splendid view of the moat and its attendant lake, through which the stream flows, is obtained. In the middle distance is a large island, effectively planted with forest trees and an occasional Cedrus atlantica, Taxodium distichum, and other exotics. This island contains the famous heronry where the herons build their nests and hatch their young. Along the inner bank of the moat, towards the boathouse, stands a row of tall Lime trees, which are heavily loaded on the upper branches with bunches of Mistletoe. Nearby the boathouse is an interesting Sycamore tree which long ago branched close to the ground, and in the fork seeds, apparently from the same tree, germinated, and now a younger tree, which girths 4 feet 4 inches at 6 feet from the ground, has grown straight up through the centre of the parent tree. The girth of the two trees is 27 feet 6 inches.

THE GLASSHOUSES.

Most of the glasshouses, frames, and garden buildings are situated alongside the walled kitchen garden in the park, and here are grown plants for supplying cut flowers, either for the house or to be sent to Queensberry House, Newmarket; or, as at present, to Scotland. Carnations are a favourite flower, and of them 1,000 "Malmaisons" are grown. The chief varieties are Princess of Wales, Duchess of Westminster and Coventry. Many of the plants, especially of the first-named variety, are grown in pots of unusually large size, Mr. Foakes being of the decided opinion that by this method more bloom is obtained, and the exceptional vigour and healthy appearance of the plants would seem to justify the practice. Rather fewer Tree Carnations are grown, but in order to obtain variety thirty-two distinct sorts are cultivated, the principal being Mrs. Burnett, May Day, Britannia, and Mrs. Clode. These plants are quite as promising as those of the Souvenir de la Malmaison type. Next in favour come Gardenias, which fill a span-roofed house where, in order to obtain a succession of blooms, a number of plants are set out in a prepared bed. Tuberoses are also grown in great quantities; fully 1,000 corms are potted each year. The plants find congenial surroundings in a Palm-house, where Kentias, Bamboos, Ferns, and similar subjects for house decoration are grown. Other glasshouses contained Campanulas, Liliums, Clerodendron fallax, Begonia Gloire de Lorraine, Cyclamen, and an excellent batch of Calanthes. Chrysanthemums are grown as bush plants to furnish cut blooms.

THE KITCHEN GARDEN.

In the four acres of walled garden many of the Peach trees which the late Mr. Lindsay used to crop with such conspicuous success still flourish against the south walls. Their present age one might safely hazard to be 50 years, and although they have now passed their prime a good crop was produced last season. This year, as has unfortunately been the case in so many gardens, the crop is decidedly "under." Greengages are also a failure, but many of the espalier Pears, especially trees of Doyenné du Comice and Catillac, are well furnished with fruits. A double row of bush trees of Cox's Orange Pippin Apple, about 10 years old, is heavily fruited. In the orchards the best crops are of Worcester Pearmain, Blenheim Pippin, and Cox's Orange Pippin. The vegetable quarters, both within and outside the walled garden, are filled with the customary crops in a healthy condition—Celery, Brussels Sprouts, Cauliflower and Dell's Crimson Beet are especially luxuriant. *A. C. B.*

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

GOLD MEDAL ROSES.—I am pleased to note that *White Rose* has had the courage to write on the subject of "Gold Medal Roses," and it is in the best interests of the National Rose Society that this question should be dealt with as soon as possible. It is part of my duty to correspond with enthusiastic amateur rosarians in all parts of the country and I also meet them at various shows. I am thus in a position to feel the pulse, as it were, of a by no means negligible portion of the Rose world. To say that dissatisfaction exists with the present system of granting awards to new Roses is putting it very mildly. On the principle of awarding medals or cards of commendation to flowers which are the produce of maiden plants, I may remark that two-thirds of the Rose-growing public can never hope to grow plants on any such system, but without further reference to this aspect of the question I will pass on to the subject of "Gold Medal Roses." If the National Rose Society expects the vast body of amateur growers of this country to appropriate new Roses at the present rate of output, it is, I venture to think, mistaken; and its present policy in this respect cannot be commended. The public is really suffering from a surfeit of new Roses, and the Society is on the point of losing its influence and authority upon the flower it has ably represented for so many years. Apart altogether from the question of merit or improvement upon existing varieties, how many growers are there in a general way, leaving cost out of consideration, who can find room for twelve or thirteen Gold Medal Roses every year? Had these newcomers been tested as cut-backs under some rational system of trial, there might be some encouragement to the amateur to buy them, but under the present method of granting awards there is no guarantee to purchasers that these Roses will displace some of the old and proved favourites. The problem of new Roses is a serious one also to the trade growers; but they have the remedy in their own hands, and this aspect of the subject need not concern us now. There was never in the history of the Rose a more numerous and enthusiastic band of cultivators than at present, and the National Rose Society should realise that it has to cater for a most intelligent public. If raisers of new Roses are inclined to increase their output of novelties in consideration of the immense popularity of these flowers, it behoves the National Rose Society to take measures to limit the number of awards. It seems to me that they might with advantage take example by the National Sweet Pea Society. That organisation has been called upon to deal with an enormous number of novelties during the past ten years, and it has power to award a Silver Medal to the best new variety every year. The novelties have been many, the Silver Medals have been few. The National Sweet Pea Society does not grant awards until the new varieties have been tested in a trial ground controlled by it, and few new sorts out of the many placed in commerce annually have passed this test. Is it impossible for the National Rose Society to initiate a similar test for new Roses? It is a wealthier and much more influential association than the National Sweet Pea Society, and has surely ample funds (or facilities for obtaining them) to start a trial ground under its control. France has now a successful and useful trial garden, but the Bagatelle results are not of much value so far as this country is concerned, since climatic conditions are altogether different. If the National Rose Society is to maintain its prestige and authority with the vast body of amateur Rose growers in these islands, it must adopt a more sensible method of making awards. In his notes upon the subject of "Gold Medal Roses" your correspondent *White Rose* observes that twelve premier awards have already been made this season by the National Rose Society—three at the London show and nine at Gloucester. I think only eight Gold Medals were given at Gloucester, not nine, which would make the total, so far, eleven. But your correspondent has evidently omitted to include the result of the Spring Show of the Society in London, at which three Gold Medals were awarded, so that the total for the year is now fourteen. Of course, as *White Rose* remarks, the autumn show is still to come, and more awards may be given there. I am not in accord with your correspondent's suggested alteration in the method of awarding Gold Medals to the best exhibit of new Roses. I am of the opinion that such a system would be no

improvement upon existing methods whatever, and trial by growth in a garden controlled by the National Society seems the best and most practical method *George M. Taylor, Mid-Lothian.*

———The growth and testing of new Roses is a subject in which I am much interested, and the practice gives me a good deal of insight into the habits and qualities of the plants. The subject of the awards given to the various new sorts has also received a good deal of my attention, and I am surprised to find so much dissatisfaction expressed at the manner of their making. For my part, I consider that the present system of award has much to recommend it, when the undoubtedly high quality of all the Roses so honoured is taken into consideration. It would be difficult to disparage any of the varieties to which Gold Medals have been awarded during the past ten years. Indeed, so far as I know, no complaints have been made against them by those who have grown them. Why, then, should a system so successful be supplanted? Take the list given by *White Rose* (p. 129). I would challenge any grower to point out real faults in any of those named. Moreover, the list is not confined to exhibition varieties; there are decorative Roses in numbers—and will anyone say that Old Gold, for example, has undesirable qualities? With regard to those which possess undoubted advantages, both for exhibition and for the garden I will briefly run through the list. A. Hill Gray is one of the best of the yellow varieties. His Majesty is a Rose of first-class form, fragrant and freely-flowering. Simplicity is a charming white-flowered single Rose. White Dorothy is at the moment (August 29) one of the most attractive Roses in the garden. Of the 1909 list Claudius is shapely and fragrant, and Lady Pirrie one of the finest of flowers, possessing all the points which should be found in a Rose. In the list for 1910 Edward Mawley is in every respect first-class, Lady Hillingdon possesses numberless advantages, and Mrs. Cornwallis-West is perfect in form, colour, and perfume. Mrs. F. Hobbs is unequalled for exhibition, and Rayon d'Or, for bedding or cutting, has no equal among the orange yellows. 1911 gives us George Dickson, the finest dark-red Rose in cultivation, and one of the freest growers. Mrs. Sam Ross presents a charming combination of colours, delicate and effective. The number for 1912 shows an increase over any other year, but it would be difficult to name one in the list which is not worthy of honour. British Queen is magnificent for any purpose. Mrs. A. Carnegie is both distinctive and beautiful; St. Helena is not only a first-class exhibition variety but is also freely-flowering, and suitable in every way for the garden; it has yielded this year in my garden a very large number of blooms. The colour of the variety Mrs. C. Pearson is quite dazzling; whilst Old Gold, as I have before implied, is in every respect satisfactory, continuously throwing up strong, profusely-flowering shoots. The current year has given us many charming varieties; Mrs. James Lynas has produced in this garden dozens of shapely blossoms, the petals of marvellously delicate colour and texture. Queen Mary, Gorgeous, and Brilliant all answer to one's expectations, and many others might be given which as fully justify the honour bestowed upon them. *E. Molyneux, Swanmore Park.*

——— There are too many Gold Medal Roses. I try nearly all the new varieties as they are sent into commerce, and find that quite half of them are not worth the coveted distinction. I am glad that *White Rose* has started a discussion. I think that the raisers might help a great deal in this direction. In my opinion a gold medal should never be awarded unless the variety is distinct in its class from any other in cultivation. *Red Rose.*

Peach Exquisite.—While staying in Kent I visited Kemsing Flower Show. One of the exhibits was a dish of Peach Exquisite, and I was informed that the average weight of each fruit was 12½ ozs.; the heaviest of the six fruits turned the scales at 14 ozs. Fruit had been picked from the same tree weighing between 15 and 16 ozs. The Peaches were beautifully coloured. *F. C.*

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

August 26.—*Present:* Mr. E. Bowles (in the chair), Dr. Bateson, F.R.S., Messrs. Bennett-Poë, John Fraser, W. Hales, J. W. Odell, W. Cuthbertson and A. Worsley.

Mr. Chittenden reported that the Violet leaves sent by Mr. Druery were attacked by the Gall Midge, Cecidomyia violæ.

Double Gladioli.—A letter from Col. Sandeman was read in connection with the alleged doubling of Gladioli. As no specimen came with the letter the Committee could not decide the point raised. Incidentally, Dr. Bateson remarked that if the fact were established it would be interesting, as there were several families or orders, such, for example, as the Labiatæ, that although having peloric forms do not show true doubling of the flower.

Campanula disease.—Mr. Edwards, of Sylfaen Gardens, Welshpool, sent leaves of Campanula persicifolia affected with Puccinia Campanulæ (Plowright and Berkley)

Late brood of Sawfly.—Mr. Edwards sent a brood of the Sawfly (Gooseberry) caterpillar, Nematus ribesii. The Committee thought this should be recorded owing to the very late period of hatching.

Matricaria suaveolens = M. discoidea.—Mr. Odell showed this little Composite from N.W. Middlesex. It is a recent immigrant to this country, and has been recorded by Mr. E. Bowles from Essex and Hertfordshire, and by Mr. J. Fraser from Aberdeen.

Fasciated Aloysia citriodora.—Mr. Odell showed stems of this plant fasciated, and having a very mixed phyllotaxis, with the terminal parts showing the normal terete stem and normal phyllotaxis. Dr. Bateson remarked that the condition was similar to that of the Crown Pea, Pisum umbellatum, where from a densely fasciated stem normal shoots were developed with flowers.

HORTICULTURAL TRADES' ASSOCIATION.

August 27-28.—The members attending the annual meeting, a report of which was published in the last issue, visited Colchester on the 27th ult. In the forenoon they visited the Rose nurseries of Messrs. B. R. Cant and Sons and Messrs. Frank Cant and Sons. Messrs. Bunting and Sons' nurseries were also visited before lunch, and several acres of Lilies inspected. Lunch was given by the Colchester nurserymen in the famous Moot Hall. Alderman Frank Cant presided, the speakers after lunch being the Chairman, Mr. Worthington Evans, M.P., Mr. Cuthbertson (the President of the Association), Mr. Pearson (the Secretary), Councillor R. W. Wallace, and other local gentlemen. The afternoon was spent in visiting the castle and museum, the nurseries of Messrs. R. Wallace and Co., and Messrs. D. Prior and Son.

On Thursday, the 28th ult., Windsor was visited. An hour was spent in the castle viewing the State and other apartments, Mr. MacKellar acting as guide. Thereafter the gardens of the castle and of Frogmore House were inspected. The extent not only of the gardens, but of the glasshouses, was a surprise to many of the visitors, and the signs of good cultivation everywhere testified not only to Mr. MacKellar's skill as a gardener, but also to his powers of organisation. The kitchen garden extends to sixty acres. The principal range of fruit-houses is 1,000 feet in length, and altogether the area under glass extends to several acres. Sir Dighton Probyn's rock garden (see *Gard. Chron.*, August 22, 1908, Figs. 59 and 60 and Supplementary Illustration) was much admired. Mr. MacKellar joined the party at lunch in the White Hart Hotel and was cordially thanked for his kindness.

PRESCOT HORTICULTURAL.

August 22 and 23.—This society has lately been reconstructed, and the show held on the above date is the first under the new auspices. Unqualified success crowned the efforts of the promoters, the attendance and the exhibits (both in quantity and quality) being most satisfactory. Mr. Rowed (gr. Mr. T. Taylor), of Eccleston Park, won the 1st prize for three Gloxinias, with some very well grown plants, and Mr. Crooks (gr. Mr. J. Barton) was second. In the class for a specimen Pelargonium Mr. Amos Worrell was placed first, his plant being an exceptionally fine one. Mr. Wareing obtained the 1st and Mr. Rowed the 2nd prize for six Cactus Dahlias; and for hardy cut flowers Mr. Rowed and Mr. Crooks were placed 1st and 2nd respectively. There were a number of very attractive exhibits of Sweet Peas, which made an effective show, and were displayed with much taste. Mr. Bullock obtained the 1st prize and Mr. Halsall the 2nd. The vegetable classes were well filled, and the quality of the exhibits was almost uniformly good. Mr. Bullock and Mr. Rowed carried off the chief honours for exceptionally creditable collections.

LITTLE THURROCK (ESSEX) AND DISTRICT HORTICULTURAL.

August 20.—The fifth annual show of the above society took place on the foregoing date, and was a great success; the weather was all that could be desired, and the attendance in consequence larger than on any previous occasion. The exhibits were on the whole very satisfactory, though the quality of some of the produce showed the effects of the drought. The cottagers' and allotment-cultivators' sections were the largest, and there were many creditable exhibits, especially of vegetables. Several local nurserymen staged trade groups not for competition, among them Mr. David Russell, who contributed a collection of Plums and some fine Roses and perennials.

CHESTER AGRICULTURAL.

August 27.—The horticultural show held in conjunction with the Cheshire Agricultural Society proved a great success; the exhibits, and especially those of cut flowers, vegetables, and hardy fruits, were exceptionally fine. The entries were well up to the average; in many of the classes they numbered more than twenty.

In the class for 6 stove or greenhouse plants, Orchids excluded, A. Tyrer, Esq., Chester (gr. Mr. A. Ellams), was successful with medium-sized plants.

E. Peter Jones, Esq., Chester (gr. Mr. W. Dodd) won in the class for 4 Ferns distinct.

The best Pelargoniums were shown by Mr. W. Dodd.

Mr. Thomas Coathup, Spital, excelled in the class for 12 Cactus Dahlias, showing well-coloured flowers, and in a similar class for 6 blooms Mr. C. Foster, Whitby, was successful.

For 12 Asters A. D. Pitcairn Campbell, Esq., Bangor-on-Dee (gr. Mr. E. Griffiths), was awarded the 1st prize.

For 12 Roses, not fewer than eight varieties, Mr. E. H. Herbert, Acton Bridge, was placed in the 1st position with charming blooms of lovely colour. In the class for six varieties J. D. Greenshields, Esq., Christleton (gr. Mr. H. Twiss), showed the best exhibit.

In the class for 12 bunches of herbaceous cut flowers W. G. Townsend Currie, Esq., Christleton (gr. Mr. T. Sanders), won with a choice collection, whilst Mr. E. Griffiths showed the winning six bunches.

B. J. Tanby, Esq., Sandiway (gr. Mr. Geo. Gears), excelled in the class for 12 vases of Sweet Peas, and in a similar class for 6 vases Mr. Jos. Roberts, Gresford, was successful. For 9 vases P. T. Davies Cooke, Esq., Mold (gr. Mr. W. Weaver), was placed in the 1st position. Mr. H. Twiss excelled in the class for 6 vases of summer-flowering Chrysanthemums.

In the Fruit section, Mr. W. Owen, Colwyn Bay, showed the best 2 bunches of black Grapes, staging Madresfield Court, which was good in berry and colour; for 2 bunches of a white variety the same exhibitor was successful with well-coloured Muscat of Alexandria.

P. H. Ashworth, Esq., Gresford (gr. Mr. H. Young), was awarded the 1st prize for 6 Peaches, showing good fruits of the variety Exquisite.

In the class for 6 Apricots the Rev. C. E. M. Wilson, Eccleston (gr. Mr. J. Youens), excelled. Mr. W. T. Roberts showed the finest Melon, and Mr. W. Dodd had the best Plums in Kirke's Seedling. Apples were shown in excellent condition. Mr. J. Beckett, Chester, staged the best culinary variety, and Mr. R. Clarke, Warrington, the best dessert variety.

For a collection of hardy Fruits, E. PERCY ECCLES, Esq., Caldy (gr. Mr. W. H. Faulkner), was successful.

In the Vegetables section there were no fewer than 37 entries for Peas. Six classes were provided by nurserymen for a collection of 6 kinds. The 1st prize-winners were Mr. C. GRIFFITHS (Messrs. Dicksons', Chester, class); Mr. E. DEAKIN, Hay Mills (Messrs. Sutton and Sons' class); Mr. W. WEAVER (Messrs. Clibrans' class); Mr. JOHN EDWARDS, Ruabon (Messrs. McHattie and Co.'s class); Mr. J. TOMLINSON, Northwich (Messrs. Ed. Webbs and Sons' class); and Mr. CHARLES PARKER, Waverton, Chester (Messrs. Dickson and Robinson's class). Messrs. DICKSONS were awarded a Silver Medal for a non-competitive exhibit of cut flowers, which included bold masses of Liliums, Gladioli, and Chrysanthemums.

ROTHESAY HORTICULTURAL.

AUGUST 19.—The annual show of the above Society was held in a marquee on the Esplanade. The chief feature was the display of cut flowers, the Sweet Peas and Roses being exceptionally fine. Large pot plants were also well represented, and many fine specimens were on view. Several well-known nurserymen competed, notably Messrs. LISTER, who won several first prizes. Mr. SMELLIE also made an excellent display. The entries for vegetables were numerous, but owing to the dry weather the exhibits were not quite up to the usual standard. Fruit was very well represented, and the agricultural section was a popular feature. The exhibition was in every way a success, and the proceeds amounted to slightly more than last year.

ABERDEEN ROYAL HORTICULTURAL.

AUGUST 21, 22, and 23.—The annual exhibition under the auspices of this society was held on these dates in the Duthie Public Park, Aberdeen. Rain fell on the opening day, but beautiful weather prevailed on the two following days. The entries numbered over 1,400, and were thoroughly representative of the north-eastern districts of Scotland. Three large marquees accommodated the exhibits, devoted respectively to cut flowers, pot plants and vegetables. The gate receipts during the three days amounted to £402.

CUT FLOWERS.

The displays of cut blooms proved one of the best features of the exhibition. The Silver Challenge Cup offered for the best 18 Rose blooms, distinct varieties, was won, after a keen competition, by Mr. JAMES IRELAND, Park Place, Brechin, who had splendid flowers of Gustave Piganeau, Hugh Dickson, Lady Ashtown, Beauty of Waltham, Dean Hole, Duke of Portland, Gladys Harkness, Lady Ursula, and Bessie Brown. 2nd, Mr. JOHN SIMPSON, Panmure Gardens, Carnoustie. Mr. CHARLES LAING, Derncleugh, Cults, Aberdeenshire (gr. Mr. Alex. Rose), excelled in the class for 12 Roses, distinct. It was a capital collection, and included fine examples of Beauty of Waltham, Countess of Gosforth, Countess de Moray, White Lady, Oscar Cordel, Dr. Amory, and Gustav Grünerwald. Mr. BARNETT, gardener at Summerfield Hospital, Aberdeenshire, was placed 2nd. Colonel GILL, of Dalhebity, Aberdeenshire (gr. Mr. Alex. Brebner), and Mr. J. IRELAND, Brechin, were prominent exhibitors in the class for decorative and Tea or Noisette varieties.

Dahlias were well shown. Mr. WILLIAM LOCKART, Craigiebuckler Cottage, Aberdeenshire, showed the best Cactus-flowered varieties and the best Collerette varieties. Lord SEMPELL, Fintray House, Aberdeenshire (gr. Mr. William Smith), was a notable winner in the class for Gladioli.

The finest exhibit of border flowers was from SUMMERFIELD HOSPITAL GARDENS, the 2nd and 3rd prize being won by Sir THOMAS BURNETT, Crathes Castle. For 20 distinct varieties of cut flowers and foliage Misses MCLENNAN, Springhill, Aberdeenshire (gr. Mr. William Sorgie), were placed 1st. Lord Provost MAITLAND, Rubislaw Den House, Aberdeen (gr. Mr. A. Duncan), was awarded the 1st prize for 6 bunches, trusses, or blooms of cut flowers; 2nd, Sir THOMAS BURNETT. Mr. JAMES ANDERSON, Constitution Street, Aberdeen, was easily 1st for Violas and Pansies, and this gentleman also led for Chrysanthemums. The most charming features in this section were the displays of Sweet Peas. As at the recent Aberdeen Sweet Pea Society Show, Sir THOMAS BURNETT was the most successful exhibitor. Some of the spikes shown by him carried no fewer than five blooms. The bouquets of Sweet Peas were much admired. Mr. JAMES SMITH, 210, Union Grove, Aberdeen, won both the 1st and 2nd prizes with fine entries.

An uncommonly fine feature in this marquee was the display made by nurserymen and florists. Messrs. JAMES COCKER AND SONS, Aberdeen, put up a grand collection of Roses for the Challenge Cup offered for the best 36 blooms H. P. and H. T., or either, and right worthily won the trophy. Messrs. ADAM AND CRAIGMILE, Rubislaw Nursery, Aberdeen, were placed 2nd. Mr. ALEX BURNS, New Market, Aberdeen, and his daughter, Miss ALICE BURNS, Victoria Road, Aberdeen, won the principal prizes in the decorative classes. Between them they gained no fewer than six 1st, five 2nd, and two 3rd prizes.

POT PLANTS.

Colonel GILL, of Dalhebity, who for many years has taken a prominent place in the prize list for pot plants at Aberdeen, gained the Silver Medal offered for the best specimen plant in flower with Disa grandiflora. Professor BAILLIE, Norwood, Cults, Aberdeenshire (gr. Mr. John Elder), won the 1st prizes for (1) best specimen foliage plant; (2) four specimen foliage plants; and (3) two specimen palms, with remarkably well-grown exhibits. Colonel GILL showed the best Ferns. Mrs. HUNTER, Temora, Cults, Aberdeenshire (gr. Mr. Alexander Leith), Ardo, excelled with Begonias. Carnations and early-flowering Chrysanthemums were best shown by Mr. COUTTS, Sunnybank Place, Aberdeen, while the best exhibit of Petunias came from the gardens at SUMMERFIELD HOSPITAL.

FRUIT.

The best collection of hardy fruits was shown by Mrs. DUNBAR DUNBAR, Seapark, Forres (gr. Mr. J. A. Grigor). Mr. G. MCLENNAN, Fetteresso Castle, Kincardineshire, had the best Strawberries. The finest Gooseberries were exhibited by Mr. FERGUSON, Linton House, Cluny. Grapes were shown in rather larger numbers than usual, the best by Sir THOMAS BURNETT. The Misses MCLENNAN, Springhill, had the best Melons, Peaches and Nectarines. Pears were not particularly noteworthy, but those shown by Mrs. DUNBAR DUNBAR, and from DALSWINTON, were good. Apples were fairly numerous and of good quality. Lord SEMPIL won easily in the class for Plums; whilst Professor BAILLIE, Norwood, excelled in the class for Tomatos.

VEGETABLES.

The display in the marquee devoted to Vegetables was quite up to the high standard expected at Aberdeen, and, as usual, the outstanding feature was the grand collection of Potatos. The 1st prize for the best collection of Vegetables was awarded to produce from DALSWINTON; 2nd, the Misses MCLENNAN, Other prominent prize-winners in the Vegetable classes were Mr. REITH, Fernbank, Crathes (Cabbage); Mrs. RIVIERE, Park House (Carrots); MCKENZIE, Lower Bucksburn, Aberdeenshire (Cauliflower); Colonel GILL (Cucumbers); Mrs. DUNBAR DUNBAR (Onions and Leeks) and Mr. LAWSON, Cornhill, Aberdeen (Potatos).

NON-COMPETITIVE EXHIBITS

Honorary displays were contributed by Messrs. DOBBIE AND CO., Edinburgh; Messrs. THYNE, Downfield Nurseries, Dundee; Messrs. COCKER AND SONS, Aberdeen; Messrs. W. SMITH AND SON, Aberdeen; Mr. M. H. SINCLAIR, Aberdeen; Miss BURNS, Aberdeen; Messrs. BEN. REID AND CO., Aberdeen; Mr. JAMES ROBERTSON, Aberdeen; Mr. PETER MCHARDY, Aberdeen; and Mr. WILLIAM A. DUSTAN, Aberdeen.

DUMFRIES AND DISTRICT HORTICULTURAL.

AUGUST 29, 30.—The two-day exhibition of flowers, pot plants and vegetables promoted by the Dumfries Horticultural Society was opened by the Duchess of Norfolk. Sir Mark McTaggart Stewart presided and was accompanied by Lady Stewart, the Duke and Duchess of Norfolk, and Sir James and Lady Crichton-Browne. The attendance at the show was very good and the number and quality of the exhibits most gratifying. All the classes were well filled, the entries numbering 660, and competition was exceedingly keen. The Drill Hall, a lofty and spacious building, is well suited to the effective display of the exhibits, and was tastefully arranged. The main feature of the show was the fine display of Sweet Peas, which occupied a considerable space and attracted much attention. The 1st prize for 12 vases was awarded to Mr. THOMAS CARRUTHERS, Cargenholm, and the 2nd to Mr. JAMES M'GILL, Kirkconnell Gardens. Hardy border flowers were also very good. In the class for a table of cut border flowers Mr. C. G. M. MURRAY, of Cowhill Tower, was successful in winning the 1st prize, while the 2nd was awarded to Mr. JAS. M'GILL. Early-flowering Chrysanthemums made a pleasing display; the prize for the best pot plant in this section was won by Mr. JAS. HENDERSON, of Elmbank. In the class for table decorations there were eight entries, all the tables being arranged in good taste. The best exhibit was that of Mr. W. J. NICHOLSON, Douievale. Two competitors entered for a group of cut flowers; the winner of the 1st prize was Mr. R. A. GRIGOR, Dalswinton Gardens, Dumfries. To this competitor was also awarded the Silver Cup as the most successful exhibitor in the show, winning no fewer than 22 1st prizes. The display of vegetables was a very fine one, and the competition extremely keen in most of the classes. Mr. R. A. GRIGOR won the 1st prize for a collection, but the 2nd prize display (Mr. C. G. MURRAY'S) was nearly equal to the 1st prize exhibit. In the amateurs' classes the 1st prize collection was shown by Mr. D. J. MAXWELL, of Newtownards. Fruit made a very creditable show, the number of amateur exhibits being especially gratifying. There were a number of fine trade exhibits which added considerably to the effectiveness of the general display. Messrs. BARR AND HUNTER, of Maxwelltown, arranged a beautiful stand of hardy and greenhouse flowers in great variety, and Messrs. J. PALMER AND SON, of Annan, showed Roses of the highest quality. Messrs. T. KENNEDY AND CO.'S stand was conspicuous from all parts of the hall, and comprised a large number of striking and beautiful floral designs; the same firm also showed choice collections of cut flowers of various kinds. Gold Medals were awarded to Mr. W. MYERS, Dumfries; Messrs. T. KENNEDY AND CO.; Messrs. J. BOGIE AND SON, Dumfries; Messrs. BARR AND HUNTER; Mr. W. A. MCALISTER, Dumfries; Messrs. G. FAIRBAIRN AND SONS, Carlisle; and Messrs. G. MAIR AND SONS, Prestwick.

DUNDEE HORTICULTURAL.

AUGUST 28, 29, and 30.—This annual exhibition was held on the Magdalen Green, Dundee, on these dates in beautiful weather. The entries were fewer than those of last year, when the British Association visited the city. Exhibits of Sweet Peas proved a great attraction.

PLANTS IN POTS.

The Dundee shows have a reputation for pot plants, and although some of the larger varieties lacked the size and profusion of those shown last year, others, and especially the Codiæums, were better coloured than usual. For the best table 12 feet by 7 feet, of stove and greenhouse plants, Mrs. W. L. BOASE, Binrock, Dundee (gr. Mr. James Beats), was, as has been the case for many years at this show, the 1st prize-winner; 2nd, Mr. C. E. GILROY, The Grange, Monifieth (gr. Mr. James Bethel). The best six stove or greenhouse plants were shown by Mr. G. REID, Inverstay Gardens. 2nd, Mrs. BOASE. Exhibits of Ferns were well up to the average. For four exotic Ferns, distinct, Mr. REID was again successful. 2nd, Mrs. BOASE. Begonias were well shown. For double-flowered varieties Mr. A. S. HENDERSON, Seathwood, Dundee (gr. Mr. George Scott), was awarded the 1st prize, whilst for singles Mr.

BROWN, Balcairn Gardens, was successful. In the class for foliage plants Mrs. BOASE secured the 1st award. The chief prizes for flowering Chrysanthemums were divided between Mr. HENDERSON, Seathwood, and Mr. JOHN M. NAIRN, Elmslea (gr. Mr. William Benvie).

CUT FLOWERS.

The first prize for a decorated dinner table was awarded to Mrs. BOASE; 2nd, Mr. HENDERSON, Seathwood, and this lady also excelled in the class for (1) hand bouquets and (2) a display of cut flowers arranged for quality and effect. The 1st prize for Sweet Peas was awarded to Mr. J. H. CROSBY, The Ross, Comrie; 2nd, Mr. GEORGE REID, Rouken Vale, Downfield. Chrysanthemums were well shown, the 1st prize being won by blooms from Invertay Gardens. The 1st prize for hardy herbaceous flowers was won by Mr. HENDERSON, Seathwood (gr. Mr. Scott). For annuals, 8 vases distinct, Miss GIBSON, Invertay, was the winner. Carnations made an uncommonly fine display, Mr. DAVID HALLEY, Roycroft, Broughty Ferry, being the most successful exhibitor. Mrs. BOASE excelled in the class for 12 trusses or bunches of stove or greenhouse plants, nine varieties, not more than two trusses or bunches of Orchids. Roses were not quite so good as in some former years, but Mr. JOHN IRELAND, Park Place, Brechin, well deserved the 1st prize. Mr. DAVID HALLEY was placed 1st for 12 Carnations of the Souvenir de la Malmaison type, with fine blooms. Begonias were well shown. Mr. A. DUNN, St. Ann's, Brechin, proved a good 1st prizewinner for these flowers. Mr. HENDERSON, Seathwood, showed the best Pelargoniums, and Mr. WILLIAM HENDERSON, West Park, Dundee (gr. Mr. William Nicholl), the best Asters. In the nurserymen and florists' classes for Roses, Messrs. ADAM AND CRAIGMILE, Aberdeen, were placed 1st for 24 H.P. or H.T. varieties, distinct; 2nd, Messrs. D. and W. CROLL, Dundee. This order was reversed for 24 Roses, Tea or Noisette, Messrs. CROLL gaining first prize.

FRUIT AND VEGETABLES.

In the class for a collection of Apples, grown in the open, 12 distinct varieties, named, there was a keen competition, there being no fewer than 9 entries, and the winner proved to be Mr. HENDERSON, Seathwood (gr. Mr. George Scott), who showed an admirable exhibit. Grapes have always been a strong feature at Dundee. The black varieties were very fine, but the Muscats should have been better considering the sunshine they have received. Mr. JAMES BEISANT, Castle Huntly Gardens, Longforgan, won many 1st prizes in these classes, and other 1st prizes were awarded to Mr. A. MONCUR, Rockfield, Dundee (gr. Mr. William Balfour), for Lady Downes variety; Mr. WILLIAM HENDERSON, West Park, Dundee (gr. Mr. William Nicoll), for Muscat of Alexandria; and JOHN BIRRELL, Glassingall House, Dunblane, for Black Hamburgh. Mrs. BOASE showed the best scarlet-fleshed Melon, whilst Mr. BIRRELL, Glassingall House, Dunblane, excelled for a white-fleshed variety. For Peaches and Nectarines the 1st prizes were awarded to Mr. D. A. MILN, Linlathen, and Mr. JAMES STEWART, St. Fort Gardens, Newport, Fife, respectively. Mr. HENDERSON, Seathwood, was placed 1st for orchard-house fruit. Mr. MILN, Linlathen, excelled for a collection of six dishes of hardy fruit. There were more than a dozen classes for Apples, the majority of which were well filled. 1st prizes were won by Mrs. BELL, Hazelwood, dessert; Mr. GEORGE FAIRWEATHER, Glencarse, culinary; Mr. WILLIAM GOODALL, Errol (Warner's King and Duchess of Oldenburg); Mr. C. WOOD, St. Ann's, Brechin (Lord Suffield); Mrs. BLACK, The Croft, Errol (Ecklinville Seedling); Miss GIBSON, Invertay (Lord Grosvenor); Mr. C. E. GIBSON, The Grange, Monifieth (James Grieve); Mr. JOHN SUMMERS, Broughty Ferry (Cellini Pippin); and Mr. HARRY TAIT, Cuba Villa, Errol (Worcester Pearmain). For Plums Mr. SHIELDS, Pitfour Castle, was successful for yellow and purple varieties, whilst the 1st prize for red varieties was won by Mr. HENDERSON, West Park. Pears were best shown by Mr. C. E. GILROY, The Grange, Monifieth; Pitfour Castle; and Miss NIVEN, Port Allan, Errol.

VEGETABLES.

Vegetables compared very favourably with those of former years. The blue riband of the show—the Dundee Corporation Cup—was offered for a collection of 12 kinds, distinct, arranged on a space 5 feet by 3 feet. The competition was very keen, but Mr. A. A. ALLAN, M.P., Tulliebelton, Perth (gr. Mr. William Harper), showed best, being awarded 65½ points. The produce of the kitchen garden at Tulliebelton has for years past taken a very prominent place in the prize lists of shows in Scotland. Cauliflowers, Peas, Celery and Onions were the best vegetables in the Tulliebelton exhibit; 2nd, Mrs. WEINBERG, Fernbra, Dundee (gr. Mr. James Kinnear), with 61½ points; and 3rd, Mr. J. B. MCNAB, Keithock, Brechin (gr. Mr. George Hendry), with 55 points. Among others who won prizes for vegetables were Mr. C. E. GILROY (Tomatos), Mrs. WEINBERG (Leeks), Mr. MCNAB (Cucumbers), Mrs. BOASE (Onions), Mr. D. HAMPTON, Pitmilly, Boarhills, Fife (Parsnips, Kidney Beans and Cauliflowers), Mr. DAVID MATHERS, Rocklodge, West Ferry (Beetroot), Mr. ALLAN, Tulliebelton (Peas), Mr. JOHN EDNIE, Carnoustie House (Potatos), Miss GIBSON, Invertay (Carrots), and Mr. BIRRELL, Glassingall House, Dunblane (Cabbages).

AMATEUR CLASSES.

The leading prize—the Corporation Cup—was offered for the best six stove and greenhouse plants, distinct, three foliage and three in flower. There was a keen contest for the trophy by Mr. WILLIAM ROBERTSON, Blyth Place, Dundee, and Mr. A. E. EASTON, Lochee, Dundee. For the past nine years the first-named gentleman has carried off the premier prize, invariably closely followed by Mr. EASTON. This year, however, the honour deservedly fell to Mr. EASTON.

HAARLEM (HOLLAND) GENERAL BULB GROWERS.

The following Awards were made at the meetings of the committees held in May and June last :—

FIRST CLASS CERTIFICATES.

Darwin Tulip Olifant, dark violet-blue; *D. T. Sir Trevor Lawrence*, violet-red; *D. T. Venus*, satin pink; *Iris Regelio-cyclus Cenaphore; I. Aphrodite*, standards light blue, veined dark velvet, falls yellow, maculated brown : a hybrid from I. Gatesii; *I. pallida Princess Royal*, violet-blue; *Anemone Single Feu Brillant*, fiery red, white centre; *Delphinium Princess Juliana*, semi-double, indigo-blue and dark purple, black centre.

AWARDS OF MERIT.

Darwin Tulip Anton Mauve, violet, bordered silvery-white; *Iris Regelio-cyclus Freya, I. R.-c. Isis, I. R.-c. Medusa, I. R.-c. Elvina; Camassia esculenta Orion*, dark blue; *Astilbe America*, Cattleya-red, *A. compacta rosea*, pink, *A. Rubens*, pink, obtained from A. Queen Alexandra; *Anthericum (Phalangium) algeriense major*, pure white; *Geum coccineum fl. pl. Mrs. Bradshaw*, semi-double, brownish-red; *Polygonum sericeum*, creamy white; *Hemerocallis Aureole*, flowers orange-yellow; *Iris Berkheyde*, standards blue, spotted yellow, falls dark blue; *I. van der Helst*, sulphur yellow, falls spotted dark yellow; *I. Jan Both*, standards creamy-white, falls canary-yellow; *I. Jan de Bray*, standards light sulphur yellow, falls yellow; *I. Kockkock*, standards light yellow, falls yellow; *I. Rachel Ruysch*, standards white, shaded lilac, falls orange-yellow, spotted; *Iris Hart Nibbrig*, standards violet-blue, falls clear light blue; *Anemone Double Carmine Queen*, carmine-red; *Ranunculus Sulpherine*, sulphur-yellow; *R. Salmonetta*, salmon-pink, striped lilac, yellow centre; *Iris hispanica Prins Hendrik*, a seedling of dark bronze colour; *I. anglica Loveliness*, light greyish-blue; *Delphinium Ida R. Elliott*, ultramarine blue; *Gladiolus nanus The King*, soft blush, spotted creamy-white, bordered carmine.

DEBATING SOCIETIES.

BRISTOL AND DISTRICT GARDENERS'.—The monthly meeting of the above society was held on the 28th ult. Mr. Barton presided. The evening was devoted to questions put by the members, and it resulted in good discussions on various subjects. The 1st prize offered by Mr. J. C. House for the most tastefully arranged vase of hardy flowers was won by Mr. H. Wiltshire.

THE WEATHER

GENERAL REMARKS.

September 2, 1913.

Weather was generally of a rather changeable character, but in the middle portion of the week nearly all districts experienced a large amount of bright sunshine, and a fairly high temperature. Thunderstorms occurred on Sunday in Eastern and Central England, and on Friday or Saturday in nearly all parts of the country. A faint aurora was seen on Monday night at Carrick-on-Suir.

Temperature was above the average, the excess ranging from about 3½° in most of the English districts to less than 1½° in Ireland. The highest readings occurred very commonly between the 27th and 29th, when the thermometer rose to 80° or slightly above it in many parts of England; in Scotland North and Ireland North it did not reach 75°. The lowest readings were observed mostly during the earlier half of the week, and ranged from 36° in England South-east and 39° in the Midland Counties to 47° in Scotland North and to 48° in the English Channel. On the surface of the grass the thermometer, early on the 25th, fell to 30° at Marlborough, and to 32° at Fulbeck. At a depth of 1 foot the temperature of the soil was above the average, but at a depth of 4 feet it was in most places slightly below the normal.

Rainfall was less than the normal, especially in the western and extreme northern districts; in Ireland North the total for the week did not amount to more than half-a-tenth of an inch. In the West and South of England considerable falls were experienced locally on the 29th or 30th, the largest daily amounts reported being 1.0 inch at Shrewsbury on Friday and 1.2 inch at Bognor on Saturday.

Bright Sunshine was in excess of the average in all districts, excepting Scotland North and England South-west. The mean daily duration ranged from 7.6 hours (56 per cent. of the possible amount) in England North-west, and 7.4 hours in England East to 4.9 hours in Scotland East, and to only 2.9 hours (20 per cent. of the possible) in Scotland North.

Barometer and Wind.—At the commencement of the week when a depression of moderate intensity lay to the northward of Iceland, and small secondary disturbances were passing eastwards across the United Kingdom, the prevailing winds were from between south-west and north-west, and light to fresh in force. After the 25th, however, a large anticyclone extended from the southern portions of the Atlantic over practically the whole of north-western Europe, the wind becoming variable, and afterwards shifting to the north-east over all the more southern portions of these islands. Towards the end of the period a shallow cyclonic system spread gradually northwards from the Bay of Biscay, the baric minimum reaching our south-east coasts on the 29th, and causing the heavy local falls of rain mentioned above. The wind at the same time backed to the north, but remained generally moderate in force.

THE WEATHER IN WEST HERTS.

Week ending September 3, 1913.

The Wettest Week for Four Months.—On the first day of the week the highest reading in the thermometer screen reached 82°, making this with one exception the hottest day as yet recorded here this year. On the contrary, on two days at the end of the week the same thermometer did not rise above 58°, or 10° below the average for the time of year. All the nights proved more or less warm. Both at 1 foot and 2 feet deep the ground is at the present time 1° colder than is seasonable. Rain fell on four days, and to the total depth of ¾ inch. This, although only a moderate quantity, was, however, sufficient to make it the wettest week since the beginning of May, or for nearly four months. Some rainwater came through the bare soil percolation gauge on each of the last two days of the week, but previous to this no rainwater at all had passed through either gauge for over five weeks. The sun shone on an average for 2¾ hours a day, which is only about half the usual duration at the end of August. On the one bright day the sun was shining for ten hours, but during the last three days of the week no sunshine at all was recorded. For the twelfth week in succession the winds have been very light, and on one day the mean velocity at 30 feet above the ground was less than a quarter of a mile an hour. The average amount of moisture in the air at three o'clock in the afternoon exceeded a seasonable quantity for that hour by as much as 13 per cent.

AUGUST.

Seasonable in temperature, very dry and gloomy, with an exceptionally calm atmosphere.—Taken as a whole, this was a month of about average temperature. On the warmest day the highest reading in the thermometer screen rose to 82°, a rather high extreme maximum for August. On the coldest night the exposed thermometer fell to 34°, which is a low minimum reading for the month. Rain fell on thirteen days, and to the total depth of 1¼ inch, which is less than half the mean quantity for August. The sun shone on an average for five hours a day, or for nearly an hour a day short of the usual duration for the month. This proved an exceptionally calm August—in fact, the calmest I have yet recorded here. In no hour did the mean velocity exceed eleven miles—direction S.S.W. The average amount of moisture in the air at 3 p.m. fell short of a seasonable quantity for that hour by 2 per cent.

THE SUMMER.

A cold, exceptionally dry, and gloomy summer.—June and August were of about average temperature, while July proved very cold. All three months were very dry, and more particularly was this the case in June. Taken as a whole it was with but three exceptions (1864, 1887, and 1898) the driest summer recorded here during the past 58 years. June was a bright month, but in both July and August there was a marked deficiency of bright sunshine. *E. M., Berkhamsted, September 3, 1913.*

Obituary.

RICHARD EVANS.—We regret to record the death, on the 29th ult., of Mr. Richard Evans, who was for some years gardener at Leaton Knoles, Shrewsbury. He was an active member of the Shropshire Horticultural Society, and contributed not a little to the success of the Shrewsbury Show in its early days, preserving to the last an unflagging interest in its affairs.

HUGH LEE.—*Horticulture* announces the death of Mr. Hugh Lee, originator of the Bridesmaid Rose. Mr. Lee, who was aged fifty-nine years, was a native of Ireland.

C. LESLIE REYNOLDS.—Mr. C. Leslie Reynolds, for thirty-nine years employed in the U.S. Botanical Gardens, Washington, died of heart disease on August 13, we learn from the *Florists' Exchange*. He was fifty-five years old, and a native of Silver Springs, Montgomery Co., Maryland. Mr. Reynolds worked in the Botanical Garden, being for thirty years assistant superintendent there. After the death of the late Wm. R. Smith, in July, 1912, Mr. Reynolds succeeded him as acting superintendent, and was given the position of superintendent by Congress in September, 1912. Mr. Reynolds was married twice. One son by his first wife, Mr. W. Reynolds, survives him, and also a widow and two brothers.

J. R. SHELDON.—*Nature* records the death of Mr. J. R. Sheldon, a well-known agriculturist, at the age of seventy-three years. Mr. Sheldon was appointed to the chair of agriculture at the Royal Agricultural College, Cirencester, in 1877, being subsequently lecturer on dairy farming at Downton Agricultural College. He was the author of *Dairy Farming* and *Live Stock in Health and Disease*.

ROBERT MACK, J.P.—It is with great regret that we have to announce the death of a well-known Rose-grower, Mr. Mack, whose name is familiar to every one connected with horticulture. A principal in the noted firm of seedsmen, Mack and Miln, of Darlington, Catterick, and Scorton, Mr. Mack had been for some time in failing health, but it was not known that his illness was of so serious a nature, and to his many friends his death came as a great shock. Mr. Robert Mack was the son of the late Mr. Robert Mack, of Newcastle. He was born in 1856, and was apprenticed when a youth to a firm of nurserymen and seedsmen. Later he entered business with his father, and acquired the Rose nurseries at Catterick, finally joining Mr. T. E. Miln in establishing the firm which bears their joint names. Mr. Mack was successful in both businesses, and won especial fame as a grower of Roses. His own Rose garden at his house in Catterick was an unfailing source of delight to him. He leaves a widow, but no children. We understand that the Catterick and Scorton Nurseries will be continued under the present efficient management.

JOHN M'CORMICK.—We learn with regret of the death of Mr. John M'Cormick, gardener at The Manse, Linlithgow. His death followed injuries caused by slipping on the stairs leading to his dwelling-house.

Answers to Correspondents.

ACONITUM ACKERMANNII: *B., Java.* Aconitum Ackermannii is a garden form of A. Napellus. It is not a species and has never been described as such. The plant grows about 2½ feet high and flowers in August.

APPLE LEAVES: *C. E. F.* Two species of fungi, viz., Cladosporium fulvum and a species of Phyllosticta, are present on the browned leaves. It is probable, however, that these attacked the leaves only when the latter were dead or dying. The disease, known as "fire blight," is of physiological origin. It is not due to fungous or insect pests, but to unfavourable conditions of soil or season.

BURNING BUSH: *Inquirer.* The plant is Dictamnus Fraxinella, and may be obtained from any nurseryman who deals in hardy border flowers.

CARNATIONS: *H. W.* The plants are affected with disease. Spray with potassium sulphide, ½ oz. in 2 gallons of water. Do not allow the specific to wet the woodwork, as it blackens paint.

CARNATIONS DISEASED: *Gardener, Dornoch.* The plants are attacked by Bacteriosis of Carnations (Bacterium Dianthi). They may be kept free from this disease if the foliage is kept dry and free from aphides. Spraying with potassium sulphide is to be recommended.

ELODEA CANADENSIS: *Elodea.*—Rake out as much of the weed from the pond as is possible, and then treat the water with copper sulphate. If there are no fish in the pond, 1 part (by weight) in 1,000,000 (or 1 lb. of copper sulphate to 100,000 gallons of water) may be applied without rendering the water dangerous for drinking purposes. Ordinary commercial copper sulphate should be used, and, in standing water, may be easily applied, the only important point being that the copper sulphate must be thoroughly and rapidly distributed throughout the pond. In small ponds, the copper sulphate, broken small, and enclosed in a bag of loose texture, may be tied to the end of a pole and drawn backwards and forwards through the water. In large ponds the bag should be towed behind a boat, which should be rowed to and fro along parallel courses not more than from 10 to 20 feet apart. The plant reproduces itself very rapidly: every portion of the stem that is detached will form a fresh individual. For further information on the destruction of pond weeds see *Gardeners' Chronicle*, August 3, 1912, p. 97.

FERN P. PARKERI: *Enquirer.* P. Parkeri is, we presume, Polypodium vulgari var. grandiceps Parkeri. This has very heavy crests, the fronds being usually merely stalked branching tassels. Like the rest of the species, it has a creeping, fleshy root-stock, and forms loose clumps of fronds, 9 or 10 inches high. The plant grows best in open soil containing plenty of leaf-mould.

FUNGUS ON GRASS: *L. D. K.* The grass is affected with the Red Grass Gelatinous Mould (Isaria fuciformis). Spray the turf with a weak solution of iron sulphate.

GRAPE ROT: *Berry* and *A. L.* The berries are injured by the Grape rot, caused by Gloeosporium ampelophagum. The only thing that can be done now is to remove the diseased berries. In the winter thoroughly drench every part of the vine with sulphate of iron at the strength of 1 lb. to 25 gallons of water. Give two dressings at intervals of a month before the buds commence to swell.

GRUBS ATTACKING CYCLAMEN: *W. E. B.* The grubs that are attacking your Cyclamen are the larvæ of the weevil. It is sometimes difficult to kill these pests without causing injury to the plants. Turn the plants out of their pots occasionally, and pick out all larvæ that are visible with a pointed stick and destroy them. If this treatment proves ineffective, shake the roots entirely free from the soil and larvæ, and then re-pot the plants in an uncontaminated compost. Place traps of pieces of vegetable, such as Carrot or Potato, near where the damage is done, and examine them at night, as weevils are most active when it is dark. Another way of killing the grubs is to turn the roots out of the pots and spray the soil with carbon-bisulphide.

GRAPE MUSCAT OF ALEXANDRIA: *A. W.* When your bunches of Muscat Grapes are gathered, or perfectly ripe, you may shorten the shoots as you suggest, leaving a couple of leaves beyond a bunch, and five or six on other laterals, also stopping the leaders.

MELON DISEASED: *Perplexed. Hertford.* The specimen was packed so badly that the leaves were covered with the soil from the roots, rendering investigation a matter of difficulty. The trouble is apparently due to the Cucumber White Mould. Badly affected plants should be destroyed, and the remaining plants dusted with flowers of sulphur.

NAMES OF FRUITS: *A. B. S.* Apple Lady Sudeley.—*A. Y. S.* The fruit reached us in a condition of pulp.—*G. A. C.* 1, Red Joaneting; 2, Margaret.—*Constant Reader.* The Plums were packed too ripe; send fresh specimens not so far advanced.—*P. Clow.* 7, Allington Pippin; 8, Yorkshire Beauty; 9 and 12, Worcester Pearmain; 10, Lady Sudeley; 11, French Crab.—*F. P.* Newberry Domino.—*A. K.* Resembles an imported fruit of Sturmer Pippin.—*W. G. W.* 1, Jefferson's; 2, Oullin's Golden; 3, Denniston's Superb; 4, Winesour.

NAMES OF PLANTS: *R. T.* 1, Oncidium concolor; 2, Neobenthamia gracilis; 3, Polystachya luteola.—*L. G. P.* Plumbago Larpentæ.—*R. S.* Daphne Laureola.—*D.* 1, Abies Nordmanniana; 2, Pseudotsuga Douglasii; 3, Abies nobilis; 4, Thuya plicata (Lobbii); 5, Abies Pinsapo; 6, Cupressus Lawsoniania.—*G. F.* Pentstemon barbatus.—*Old Subscriber.* 1, Chlorophytum elatum variegatum; 2, Nephrodium sp. (too scrappy to identify); 3, Leontodon autumnalis.—*J. M.* Santolina incana.—*Geranium, Yorks.* We do not recognise the variety. Send a specimen to some grower who can compare it with those in his collection.—*A. B. Steele.* 1, Euonymus europæus (Spindle Tree); 2, Orobanche minor; 3, Raphanus sativus (Radish); 4, Claytonia sibirica; 5, Lycium chinense.

NECTARINES: *Admiral G.* 1, The Nectarines arrived in too advanced a stage of decay for the original cause of disease to be ascertained.

PEACH DISEASED: *W. O.* The Peach is affected by the Peach mildew. As soon as the disease is detected dust the leaves with flowers of sulphur whilst they are damp; or, when the attack is serious, the water pipes should be painted with sulphur when they are very hot, closing the house for an hour or two afterwards, performing the operation when it is dusk.

PLUM LEAVES: *W. R. C.* The leaves are attacked by the Silver-leaf disease, which is caused by the fungus Stereum purpureum, but no certain method of combating it has been discovered. Stereum purpureum gains access to the plant through an injury to the superficial tissues, such injury being sometimes caused by cold winds. It has been claimed by New Zealand growers that sulphate of iron will check the disease. The spores of the fungus are developed on dead branches, therefore a vigilant watch should be kept on diseased trees, and their dead branches should be removed and burned without delay.

PRIMULA ROSEA DISEASED: *B. E. R.* The plants are attacked by the Primrose White Mould (Ovularia interstitialis). Spray the plants with a fungicide.

STOCKS: *J. G.* The fungus Rhizoctonia is probably responsible for the trouble, although we cannot determine this with certainty, as the fungus is not in the sporing stage. Remove all diseased plants and burn them, and spray the remainder with phenol, one ounce to one gallon of water.

TOP-DRESSING FOR CROQUET LAWN: *Bone Meal.* The old potting soil will be very suitable for top-dressing the croquet lawn, but wood-ashes, though beneficial in some respects, will tend to encourage the growth of clover. A suitable dressing would be obtained by mixing 1lb. of superphosphate with the quantity of soil and ashes to be spread over each forty square yards of the lawn. A dressing of sulphate of ammonia at the rate of ½oz. per square yard may be given in early spring. Soot may be freely applied; its fertilising value lies in the ammonia which it contains, and its use will improve the colour of the grasses.

LONDON AND WISE.

THESE two gardeners and nurserymen are famous for their translations with emendations of the three noted French works I shall refer to presently. Of their history not very much is known. London first attracted public attention as a nurseryman when, with three others, Lucre (sometimes Lukar), Field and Cooke, he established the long-famous, Brompton Park Nursery. He had been trained in the Royal Gardens under Rose, who sent him to the Continent for special instruction, and on his return got him appointed to the charge of the Bishop of London's celebrated gardens at Fulham Palace. He left there in 1681 to become a nurseryman along with the three above-named gardeners. In 1684, or, according to another report, in 1686, Messrs. Lucre and Field died, and by some accounts Cooke the same year sold his share of the business to Henry Wise, but by another account it was not till 1689 that Cooke disposed of his share to Wise. At the Revolution in 1688, while King James II. was at Salisbury the Princess Anne became so alarmed because of a dread of her father's anger on his return that she decided to remove out of his way. Bishop Compton was at this time in hiding, but Lady Churchill managed to find him, not improbably by the help of London, who accompanied the two with the Princess in her flight to Nottingham. This proved a fortunate step for London, who was shortly afterwards appointed superintendent of the Royal Gardens under William and Mary, with £200 per annum for his services as a page to the latter. The firm had the re-making of Hampton Court Gardens, and so great an influx of business among the nobility and gentry that many of the best gardens in England were placed under their care, while Blenheim Palace, Wanstead, Melbourne Hall, and others were laid out by them. Longleat was one of the earliest of their gardens, and was completed before the commencement of the Revolution. The nursery is one of the gardens mentioned by Gibson in 1691, and from his account we learn that it contained a large greenhouse for the preservation of the less hardy exotics over winter; here also were preserved "the King's greens which were in summer at Kensington." "Their garden," he also states, "is chiefly a nursery for all sorts of plants, of which they are very full." In extent it covered more than 100 acres, and the stock was valued, according to Switzer, at £30,000 to £40,000. Evelyn was highly interested in the nursery, and "carried" Waller, the poet, there in 1694, "where he was in admiration at the store of rare plants." In 1698 London paid a second visit to the Continent along with the founder of the Portland family. He there studied the French styles of designing and fruit culture; but, on the whole, he seemed to think England was quite the equal of France. Later in the same year, according to Evelyn's Diary, he, along with Sir C. Wren, estimated the damage done by Czar Peter to the gardens at Sayes Court. Evelyn calls him Sir C. Wren's gardener! In the following year Evelyn paid him a very high compliment by inserting a lengthy description of the nursery and its contents in his translation of Quintiney's book of fruit culture. London appears to have spent his later years in travelling, Wise having charge of the nurseries. Switzer notes that he would ride 50 to 60 miles a day on horseback visiting and inspecting gardens, and that he covered England twice annually. We know from a remark of Langley that it was customary for the upkeep of gardens to be let to an "Undertaker," who supplied labour and everything that was necessary, and probably these journeys and inspections of London would be taken to look to the proper upkeep of gardens which the firm had undertaken to manage. Johnson relates that the fatigue induced on one such journey culminated in a fever, of which he died after a fortnight's illness near the Christmas of 1713; but Switzer, one of his old pupils, says he languished for some months previous to his death. Following his death we find the nursery, or "Plantation" as they called it, in the hands of Smith and Carpenter in 1714, and through many vicissitudes it continued to be a nursery till 1851, when the ground was sold for building purposes, one of the last proprietors having been the late Dr. Robert Hogg, who was interested in it from 1845 to 1848. Here in 1847 emanated the *Manual of Fruits*, by Gray, Adams and Hogg, obviously *The Fruit Manual* of Hogg in its primitive form.

The first publication of London and Wise was "The Complete Gard'ner: or, Directions for Cultivating and Right Ordering of Fruit-Gardens and Kitchen-Gardens. With the *Gardener's Kallander*, directing what is to be done every Month in the Year. By Monsieur De la Quintiney. Now compendiously Abridg'd, and made of more Use, with very considerable Improvements. By George London and Henry Wise. To which is prefix'd an Address to the Nobility and Gentry. By J. Evelyn, Esq. London, 1699, with editions in 1701-4-6-10-17 and -19." The subject matter is preceded by an Advertisement to the Nobility and Gentry, in which they are put upon their guard against dealers who offer trees from their seed shops and others who "ply about the *Exchange* and *Westminster-Hall*," and against a sort of men who call themselves *Gardeners*, who, on the strength of having "exercised the *spade* and the *barrow* for twelve months, puts on an apron, sets up for a professed *Gardener*, and a *Place* he must have." This is followed by "An Advertisement of J. Evelyn," and by some Rules for the Defence of the Garden, in which London animadverts on the French gardens, and concludes by repudiating the desire of the editors to push their own goods, it being their "best and only true interest that all we do should prosper." Quintiney's chapters where they clash in their teaching with that which the compilers esteem suited to the English climate receive scant courtesy, many being suppressed and others abridged beyond recognition. The Catalogues of Fruits are given in full, with their description, and the pages are lavishly illustrated with French cuts, and show the various cultural methods recommended. The part devoted to vegetables is arranged in alphabetical order, and contains John Evelyn's "Directions Concerning Melons." Cauliflowers were lifted previous to winter to preserve the heads from frost, and perhaps the earliest distinctive remarks on Celery culture occur here. This part is followed by the *Gardener's Kallander*. Here and elsewhere the "Translator" exhibits difficulties in obtaining English equivalents to the French names, or even in identifying the plants referred to in the original edition.

The success of this volume may have been the means of inducing the firm to produce another translation from the French generally thought to be of one book, but really of two. This was *The Retir'd Gardener*, containing the Methods of Making, Ordering and Improving a Fruit and Kitchen Garden, etc., in two vols. Quarto. 1706. The first half is a translation (published also in the same year by the title of *The Solitary or Carthusian Gardener*) of a work called *Le Jardinier Solitaire*. The second part, all of which with the exception of the beginning, which

appears in the first volume, is a translation of Liger's, is the more interesting of the two. The first part is arranged as a series of questions and answers between a gentleman seeking information, and a gardener, and here, as in the former work, the two editors make free with the author, but not to such an extreme degree, interpolations of their own being made where the teaching is not in accordance with that which their experience had proved to be correct. Liger's portion is solely occupied with the flower garden and its furniture. It is profusely illustrated with plans of flower gardens, parterres, etc., and in the Appendix with the plan of a garden at Nottingham which the firm designed and laid out for M. Tallard, the French General whom Marlborough defeated at Blenheim. Many of the designs are foliated, but not to the same extent as in Le Blond's book. Here it may be noted that it is made clear that these elaborate designs were not intended to be furnished with flowers, but with coloured earths, with gravel and grass as the other furnishings. It is evident, therefore, that those who copy these designs to-day only partially carry out the intention of the designers when they lay them out in grass and use only grass, flowers and shrubs. But Liger was not simply a designer, he was also a florist, and he waxed very wroth sometimes with those who pretended to be florists but were not. In one place he says, "There are a sort of People who when they come into a Garden are never satisfy'd unless they can touch the Flowers they like with their Hands. They cannot be contented with barely looking on them, but must be feeling them too, which is an unsupportable Custom to all that are true Florists." And, the "sort of People" survive to this day! The Editors have very few remarks in this portion, but of these some are not without interest. Thus in a note on Candy-Tufts it is remarked, "The Plants of this sort we call Hardy Annuals," perhaps the earliest appearance of the designation. In the chapter on Bell-flowers there is an interesting note on the furnishing of the "Half-space before a Chimney" (fire-place), Campanula pyramidalis being placed in the centre, Scarlet Lychnis at each extreme, and between each a pot of tuberose, and in front low plants of sweet Basil and Marum syriacum (Teucrium Marum). Orange trees, we are informed, were imported from Genoa, that they were "three months in the passage," and the methods of packing are described. Of Myrtles it is stated that "In England we cultivate ten species," and the sprigs were used "to dress up Basons with variety of Flowers for the ornament of our Rooms and for Nosegays." As in "The Complete Gard'ner" so here the translator was puzzled with names, and it is strange that neither of the partners corrected his mistakes. Under Monkshood the Tropæolum is treated: the "Blew Polyanthus" is not, as at a first glance might be expected, an early and long-lost kind of Primula, but a variety of the Hyacinth. More exasperating still is the discovery that under "Carnations, otherwise call'd English Gilly flowers," the plant is not a Dianthus but Hesperis matronalis, and it is only when we arrive at the Pink that we are reassured that the Carnation is not neglected.

The Retir'd Gardener in six parts was republished in one volume 8vo in 1717 by Joseph Carpenter, who was a proprietor of the Brompton Park Nursery. *R. P. Brotherston.*

NEW OR NOTEWORTHY PLANTS.

PODANDRIA MACRANDRA, ROLFE.

Our illustration represents this curious and rare species now flowering in the gardens of Sir Frank Crisp, Bart., Friar Park, Henley-on-Thames (gr. Mr. Philip Knowles), famous for plants of remarkable structure. The various sections of the genus Habenaria which have flowered

FIG. 67.—PODANDRIA MACRANDRA, ROLFE (HABENARIA MACRANTHA LINDL.)
Upper segments and the lower filaments white, tinged with green; upper half of spur white, lower part pale green.

at Friar Park provide an interesting example of the diversity which exists between the members of the genus.

Habenaria macrandra was described by Lindley in the *Journal* of the Linnean Society, Vol. VI., 1862, p. 139, from a specimen collected by Mann on the banks of the Bonny River, West Africa. The specimen illustrated was found in Uganda, and the drawing made by Miss Alice L. O'Brien.

The flowers are white with a slight green tint on the sepals, and the plant is evergreen so far as it is known.

In growth and in some particulars of structure it is separated from other Habenarias of its section, so much so that Mr. R. A. Rolfe includes it in his monotypic genus Podandria (*Flora of Tropical Africa*, VII., p. 205).

It is a very singular species, and ornamental even when not in flower. The only other specimens appear to be in the collections of the Hon. N. Charles Rothschild and Mrs. Bergheim.

ORCHID NOTES AND GLEANINGS.

SPIRANTHES AUSTRALIS.

A spray of this elegant little orchid is sent by Mr. C. Wright, gardener to the Hon. N. Charles Rothschild, Ashton Wold, Oundle, who states that it came up with a specimen of Phalænopsis amabilis Rimestadiana, imported from Java. This accords with the only previously recorded flowering of the species with Messrs. Hugh Low and Co., March, 1906, the plant on that occasion growing on a tuft of Vanda tricolor, also received from Java.

At first it was taken to be Spiranthes gracilis, a North American species nearly allied, and it was believed to have been imported in the Osmunda-fibre, but after comparison at Kew the plant was identified as S. australis, a very widely-distributed species in the tropics, and extending from China to Australia.

The slender, erect inflorescence is nine inches in length, the numerous small snow-white flowers being arranged spirally on the upper two-thirds. The globose, green ovaries surmounted by the expanded segments of the small, white flowers are very prominent, and the novel arrangement makes it an attractive species.

Such small-growing species are not usually easy to cultivate, but in this case, as other plants of it are commencing to grow in the same pot, it may probably be cultivated successfully if properly rested after growth and flowering is completed.

DENDROBIUM CRUMENATUM.

Flowers and growths of this pretty Malay Orchid taken from plants collected in Borneo are sent by Mr. W. H. Bacon, gardener to Sir Marcus Samuel, Bart., Mote Park, Maidstone. The pseudo-bulbs are thick, grooved and brownish in the lower part, continued into a slender stem upwards 2 feet in length, the upper parts bearing at intervals singly, pure-white flowers with a yellow patch on the three raised ridges of the lip. It is a charming species, the only fault being that the flowers are fugacious. Mr. H. N. Ridley, in the *Journal of the Asiatic Society*, 1900, in a paper on the flora of Singapore, gives interesting particulars of this species:—"Very few plants have a definite flowering month. A large number flower more or less regularly throughout the year. Others flower at regular periods three or four times a year, almost every plant of a given kind flowering simultaneously in the district. This is best known in the case of the Pigeon Orchid, Dendrobium crumenatum. In this plant the flowers are produced at periods of a little over a month or two months. The exact day differs in different parts of the peninsula, but in each district they all appear on the same day, and it is remarkable that plants brought to Singapore, even from as far north as Siam, open their flowers on the day for Singapore, and not for that of Siam. It is not rare, however, to find certain plants of Pigeon Orchid which do not flower on the regular day, but have a distinct day, which they appear to keep with equal regularity. A curious fact is that another species of Dendrobium (D. criniferum) invariably flowers in Singapore on the day preceding that of D. crumenatum, whenever that happens to be. It might be thought that the weather in the district in which the plant was growing was the influencing agent, but this appears to have but little effect on the Orchids. On one occasion (December 5, 1893), the Pigeon Orchids developed their flowers so far that they were obviously ready to open them on that day, but an extraordinarily heavy rain retarded them and the flowers opened the next day; but, except in cases like this, the weather previous to the flowering does not seem to make any difference to the date of the flowering. It can easily be understood that it is very important to a plant that all should open on the same day, in order that they may be cross-fertilised by the insects that visit them, and this is especially the case in plants in which the flowers last but a single day, as in the case of the Pigeon Orchid, but it is difficult to see how this is brought about." *J. O'B.*

SAXIFRAGA × AMBIGUA.

Two very distinct Saxifragas, S. media and S. aretioides, which cross naturally and produce an interesting series of hybrids, are found in the Pyrenees. S. media has rosettes of crusted foliage and red stems and flowers, whilst the tiny S. aretioides forms a tuft of small rosettes and bears yellow flowers. Of the numerous offspring from these two plants there are three distinct forms. These are S. × ambigua (a fine form of which is illustrated in fig. 68), which comes nearest to S. media, with similar rosettes and inflorescences, but with more coppery red flowers. Intermediate is S. luteo-purpurea, with smaller rosettes and flowers, having red sepals and yellow petals. Nearest to S. aretioides is the form known as S. Lapeyrousei, and in which the red of the other parent is nearly eliminated. Besides these three there are many other pretty and distinct forms in cultivation resulting from the same cross. They have proved quite amenable to cultivation, and may be increased freely by means of cuttings inserted in the summer. As the plants flower somewhat early in the year they should be grown in a pan or pot in a frame where protection is afforded in bad weather. At the same time, they may be grown on sheltered ledges in the rock garden. *W. I.*

ARTHROPODIUM CIRRHATUM.

THIS Liliaceous plant from New Zealand is practically hardy in the south-west, as is proved by the accompanying illustration (fig. 69), which shows a plant which has been growing unprotected in the open for some years at Kingswear, South Devon, and was not killed even by the very severe frost of February, 1912. In colder localities it does best when treated as a greenhouse subject, for the ample foliage is then retained in all its freshness, whereas when out-of-doors it is often much injured by cold winds. It forms a clump a good deal after the manner of some kinds of Iris, but the leaves are broader and very gracefully recurved. So ample is the foliage that in this respect alone a flourishing mass is very ornamental. The flowers are star-like, pure-white, and are borne in large open panicles, which well overtop the foliage. A notable feature is furnished by the orange-coloured anthers, which stand out conspicuously against the spotless purity of the rest of the flower. Like the old-fashioned Agapanthus umbellatus, this Arthropodium will flower in a far more satisfactory manner when undisturbed at the roots, and when once established in good-sized pots or tubs may be kept in health for years together with but little trouble simply by protecting them from frost in the winter and standing or plunging them outside during the summer months. It succeeds best with fairly liberal treatment, so that when plants are kept year after year in the same pot or tub occasional applications of liquid manure are beneficial. In the shape of good-sized masses confined within pots a foot in diameter or thereabouts a number of flower-spikes will be produced, the blossoms being nearly an inch across, and in favourable conditions a specimen will remain in beauty for a considerable time. Seeds were borne in large numbers on the plant here illustrated from which many seedlings have been raised; propagation may also be effected by division of the roots. The species was introduced into this country in 1821. *Wyndham Fitzherbert.*

DESTRUCTIVE INSECTS AND PESTS
SCHEDULED BY THE BOARD OF AGRICULTURE AND FISHERIES.

XIV.*—THE LARGE LARCH SAWFLY.

(See Coloured Plate.)

THE Large Larch Sawfly (Nematus erichsonii) is a member of the Tenthredinidæ, a large group of insects included in the order Hymenoptera (ants, wasps, bees, etc.). It has not proved harmful in Britain until quite recent years. In 1904 it was observed in injurious numbers in Cumberland, and in 1905 it is reported as having wrought great havoc. In 1906 caterpillars submitted to the Board of Agriculture and Fisheries were identified as N. erichsonii, and Dr. R. Stewart MacDougall visited the infested area (near Keswick), and in October of that year contributed an account of the pest to the Board's *Journal*. Since that time, when very serious damage was done, the Sawfly has yearly caused damage to Larch woods, and in view of the latent powers for harm of this pest, it was scheduled as notifiable to the proper authorities. It is now known that at the present time the Large Larch Sawfly is distributed, though in varying degrees of intensity, throughout England, Wales and Scotland. In most localities, however, the damage done is so far not serious in character. In December, 1908, Hewitt reported that in the Dodd plantation, near Keswick, 200 acres were attacked, hundreds of the trees were already killed, and many were dying, 3,000 of these having been felled, while there were twice as many still to be felled. Hewitt states that in the Lake District over 15,000 trees had died by 1909 owing to repeated defoliation. It is stated (*Gardeners' Chronicle*, January 25, 1913) that on Skiddaw alone 30,000 trees have been felled on account of the pest in the past year.

As regards other countries this Sawfly has been recorded in Germany, Sweden, Holland, Denmark, Switzerland, Finland, United States of America, and Canada. In most of these countries it appears to have done no widespread damage, but it has at times been harmful on the Continent, and is a very serious pest in the United States and Canada. Indeed, in a memorandum issued by the Board of Agriculture and Fisheries in 1910 it is stated that "it is recorded that in the United States and Canada it did not stop till 50 to 100 per cent. of the matured Larch over vast areas was destroyed, with the loss of many billions of feet of timber."

The damage is done by the caterpillars, which feed voraciously on the foliage of the Larch; trees of any age from the seedling upwards may be attacked. Repeated defoliation may kill the trees. Since tall trees are attacked remedial measures against the infestation are rendered the more difficult.

The general appearance of the different stages of the insect is shown in the Coloured Supplement. The female Sawfly is ¼ to ½ inch in length, and nearly 1 inch in spread of wings. It is black as regards ground colour, but the middle joints of the abdomen are reddish. The abdomen is pointed. In further description MacDougall may be quoted as follows:—"The mouth parts, the two front pairs of legs, except

[Photograph by Wyndham Fitzherbert.

FIG. 69.—ARTHROPODIUM CIRRHATUM IN A DEVON GARDEN: FLOWERS WHITE.

* The previous articles appeared on September 27, October 12, November 2, and December 7, 1912; and on February 1, March 1, March 15, April 26, May 3, May 24, June 7, August 16, and September 6, 1913.

at the part next to the thorax, and the upper parts of the femora of the hind legs, are reddish or reddish-yellow. The tibiæ are yellowish or pale in the upper parts. The antennæ are nine-jointed, and somewhat thick, and taper towards the apex. With a lens the head and thorax are seen to be sparsely and finely pubescent, and the thorax is markedly punctured." The wings may be described as glassily iridescent with the front wings slightly clouded towards the central portion. The male is rather smaller than the female, and the end of the abdomen is rounded. The male is apparently very scarce, Hewitt finding only two emerge from 300 cocoons, the other 298 being females.

The eggs of the Large Larch Sawfly are described as white, longish-oval, and just over 1 millimetre in length. They give rise to minute caterpillars with dusky-green head and uniformly pale-green body. It is stated by Packard that the larvæ moult three times before attaining full size. Gordon Hewitt, however, found that the larvæ he kept under observation, several hundreds in number, moulted five times. There are three pairs of thoracic legs, and seven pairs of abdominal sucker feet—or twenty in all. Ultimately the full-grown finally moulted caterpillar is ¾ inch to 1 inch in length, has nearly black head and thoracic legs, the back is grey-green to blue-green (variable), the sides lighter or nearly grey, and the under surface yellowish green. "If one uses a lens," says MacDougall, "there will be seen on the abdominal segments transverse rows of minute warts with spines. The spiracles along each side are brown."

The larvæ feed voraciously on the Larch needles, especially the clusters of leaves, eating pieces out of them edgewise, and finally eating them right back, so much so that at the end of August badly attacked trees appeared browned and withered. Fresh leaves may soon give the trees the appearance they should normally have in April. The caterpillars assume characteristic curved positions, and when feeding cast a large quantity of excrement. Of the Cumberland attack of 1906 MacDougall wrote, "So numerous were the caterpillars in some parts of the attacked area that in July their excrement falling on leaves below suggested the patter of rain drops." The castings are described as "longish, cylindrical and somewhat square cut at the ends." The caterpillars wriggle and roll violently when handled.

On being full-fed the caterpillars leave the trees, enter the moss, light soil and rubbish below, and spin strong, brownish cocoons, cylindrical with rounded ends. In these they pass the winter, pupating in spring, and the Sawflies emerge over a considerable period, from May to July, when eggs are laid. Hewitt found that the females begin to deposit eggs almost directly they emerge from the cocoons, not waiting for pairing with the male, as they reproduce parthenogenetically. In his experiments, also, the eggs hatched eight to ten days after they had been deposited, and the caterpillar stage extended over three or four weeks, each larval stage (between moults) lasting three or four days. He gives a typical life-history as follows :—

Eggs deposited	May 31 to June 2.
Larvæ hatched	June 10.
1st moult	June 13 to 14.
2nd moult	June 18.
3rd moult	June 21.
4th moult	June 24.
5th moult	June 28.
Larvæ began to spin cocoons	July 2.

The Large Larch Sawfly is subject to attack by a number of parasites, chiefly the Ichneumon Mesoleius aulicus, which is responsible for the death of large numbers of the insect. Mangan found for a certain plantation in the Lake District that 6 per cent. of the cocoons were parasitised in 1906, 15 per cent. in 1909, and 62 per cent. in 1910. Recently, Mangan has found that this Ichneumon has in some cases accounted for more than 70 per cent. of the larvæ within the cocoons, cessation of the Sawfly attack coinciding with an overwhelming increase in the numbers of the parasite. In the present year 25 per cent. of cocoons collected at Thirlemere were parasitised by a new species of Mesoleius, and 24 per cent. yielded Tachinids of the species Zenillia pexops, B. and B. (*Nature*, July 24, 1913).

The fungus Cordiceps also infests the cocoons, and it was found in 1911 that in one case 5.8 per cent. of cocoons collected were parasitised by flies and 24.3 per cent. were attacked by Cordiceps (*Ann. Rep. Intel. Div., Bd. Agric.* Pt. II., 1910-11). Birds and voles also destroy very large numbers.

For those who desire to know more about this pest, its distribution and the damage it does, the following references are given :—

(9) Gard. Chron., Jan. 25, 1913—"The Larch Sawfly Pest in the Lake District," S. J. Hickson.

The means of combating this Sawfly include crushing the caterpillars when near enough to the ground; poisoning by spraying with lead arsenate or Paris green; and destroying the cocoons in the soil under the trees during winter by various means. Natural agencies tending to keep down the Sawfly may be usefully encouraged. *H. C. Long.*

NOTICES OF BOOKS.

The Daffodil Year Book, 1913.*

The *Daffodil Year Book* promised two years ago, has now appeared, and we are informed in the preface that this is due mainly to the efforts of the Rev. Joseph Jacob.

The volume is nicely got up and well illustrated, with two coloured plates and several photographs. It consists of 90 pages, of which the first 42 are devoted to accounts of shows and awards made thereat, matters usually of little interest except to the exhibitors, while the last 12 pages give the somewhat complicated R.H.S. classification and the schedule for the R.H.S. Daffodil show in April next. It is not suggested that these matters are out of place in a year book, but merely that we are only left with 36 pages of readable matter, the remainder, however necessary, rather coming within Charles Lamb's category of books which are not books.

The real book part begins with four short notices of celebrities of Daffodildom, John Pattinson, William Backhouse, Peter Barr, and G. H. Engleheart being the names selected. Then come two equally short obituary notices of W. Baylor Hartland and A. Kingsmill, and we begin the papers. First there is one by J. D. Pearson on the very curious Daffodil season of 1913, which began very early and gradually became later and later as it went on until the latest varieties came about the usual time, the result being a long extended and by no means a bad season for the Daffodil. Forming a sort of appendix to this paper we get records of the time of opening of a number of different varieties taken over the past few years at Forres in the north of Scotland, Brecon in Wales, and Bridgwater in Somerset. These records are likely to be of value to others besides exhibitors, and perhaps are as useful as anything in the volume.

"Notes on Hybridizing," by P. R. Barr, are followed by a table of considerable interest from C. Lemesle Adams, giving the result of a large number of crosses made by him. If, as we hope may be the case, he should continue these notes it would add greatly to their value if instead of stating the result of a cross as "good" or "bad" or "poor perianth," he would give us some general description of the seedling even when "bad." The pot culture of the Daffodils is treated by W. T. Ware, and C. Bourne gives some useful hints to beginners on keeping Daffodils for shows. Most people who have tried will agree that the trumpets seldom come large when cut early, and that to place the flowers in too low a temperature in order to retard development is fatal, but how much heat will they stand when, as sometimes happens, it becomes essential to "boil out" some of the Poeticus for an early show? The answer might differ with different varieties. Some varieties will open bright and stiff in a fairly warm greenhouse, where others if opened in the same temperature would come with creased and flabby petals, but the exhibitor soon learns what flowers he can trust to respond to a certain treatment.

Finally we get a descriptive catalogue by Mr. Jacob of seventy-five new varieties, which it will be interesting to notice at the shows, but which most of us will find it prudent to defer purchasing for our gardens for some years yet, and then the Voting List, with Mr. Jacob's comments thereon, which are perhaps of even more interest than the lists themselves.

The Voting Lists are five in number, the voters being asked to name the best varieties (i.) for the garden, (ii.) for growing in pots, (iii.) for planting in grass, (iv.) for a rockery, and (v.) for cut flowers.

It would seem that the Narcissus Committee and five other persons were invited to vote, making forty-two in all, but that only some twenty-five responded to the invitation. We are not told who these were, or what proportion were amateurs and what trade growers, but it is clear the voters are a somewhat restricted class. The voting list of garden varieties is, of course, the most interesting, and it may be worth while noticing those varieties which received ten votes and upwards in this class. In the Trumpets we have for yellows, Emperor, King Alfred, Golden Bell, Glory of Leiden and Golden Spur; for whites, Mme. de Graaff and Mrs. H. D. Betteridge; and for bi-colours, Empress, Weardale Perfection, Duke of Bedford, Victoria, J. B. M. Camm and Grandee. Mr. Jacob thinks the place taken by King Alfred a surprise, as it fails to do well in many places. In my own garden it has been a failure in some of the lower and damper parts, where I should have expected it to succeed, and yet has grown very well in the higher positions on lighter soil. Mr. Jacob would place Florence Pearson equal to Mme. de Graaff, but the flower is not so graceful, nor does it, I think, hold itself so well, being at times apt to look rather commonplace when grown in quantity. I am, however, quite in agreement with Mr. Jacob in thinking the position of Weardale Perfection "unexpected." The fact is this beautiful flower is hardly one of the best for decoration of the garden. It is a fine grower, and beautiful when cut, but in groups in the garden its stem seems scarcely strong enough to support the large flower, and the blossoms are apt to be seen lolling about in all directions. Turning to the Incomparables we find for yellow perianths which received ten votes and upwards were Gloria Mundi, Sir Watkin, Homespun, Frank Miles, Blackwell and Autocrat, and for the bi-colours Lady M. Boscawen, Lucifer, Whitewell, and Bernardino. Mr. Jacob queries Homespun, but its colour and habit are both good in the garden, and the list is a good one. In the Barrii section Barrii conspicuus has a unique position in the yellows, while for bi-colours we find Albatross and Seagull alone taking more than ten votes. For Leedsii, in the Giant section there is Lord Kitchener only, and in the General section White Lady, Duchess of

* Published by the Royal Horticultural Society. Price 1s. 6d. net post free.

Westminster and Evangeline. For Triandrus hybrids are selected Bennett-Poë and Queen of Spain. Jonquils hybrids, Buttercup; for Tazettas, Elvira and Aspasia; for Poeticus, Horace, Cassandra and Ornatus, Virgil receiving nine votes; and in the doubles Argent, Plenipo, Primrose Phœnix, Telamonius and Double White. Taken all round, we may agree that these varieties are bad to beat for usefulness in the garden, though perhaps we may doubt whether Buttercup, priced at four guineas a bulb, has yet been grown in sufficient quantity for anyone to pronounce on its garden value.

It would take too long to examine the other lists even cursorily and taking only the most successful in the competition, but enough has been said to show they may have some considerable interest for growers of the Daffodil. Like all lists of this character, the names at the head of the columns will, in most cases, be found to be the older and more popular varieties, but for the majority of gardeners they are none the worse for this.

For the past thirty years the Narcissus Committee have been occupied at their meetings during the Daffodil season in making awards and granting certificates to Daffodils they considered of sufficient merit. The result of their labours may be found scattered through the pages of the *R.H.S. Journal*, and it would be of considerable interest if these awards, together with the date of introduction and name of the raiser, could be brought together and published in some future edition of the *Daffodil Year Book*. *D.*

ROYAL BOTANIC GARDEN, EDINBURGH.

List of Plants in Flower.

The following new or uncommon hardy, or almost hardy, plants are now in flower in the Royal Botanic Garden, Edinburgh:—Adenophora ornata* and A. Bulleyana,* two good Yunnan plants with Campanula-like drooping blue flowers; Ainsliæa acerifolia, a distinct Japanese composite; Allium yunnanensis,* a dwarf plant 6 inches high, with whitish-pink flowers; Arenaria Bertolonii, a south European plant with large white flowers, a good grower, most floriferous, and deserving to be more generally cultivated; Brittonastrum ionocalyx, a peculiarly attractive Labiate from Mexico, with brick-coloured flowers; Campanula crenulata,* an excellent alpine species 6 inches high from Yunnan, with small, shining-green leaves and large, dark-blue bell-shaped flowers; Castilleja miniata—the yellow flowers and large scarlet bracts are very attractive; the plant continues in bloom for several months; Crepis incana, an uncommon pink-flowered species from Greece; Cyananthus incanus var. leiocalyx* and C. macrocalyx,* prostrate, free-growing plants bearing numerous flowers, which are coloured blue in the first-named, yellow in the second—both natives of Yunnan; Dracocephalum bullatum*: this plant may be propagated from the leaves; D. tanguticum, a species less than 1 foot in height; the light-blue axillary flowers are produced for a long period, and the plant is an excellent subject for the rock garden; Epilobium melanocaulon, one of the spreading New Zealand species, useful for planting at the foot of rocks or between the steps of a rockery; Erigeron flagellaris, a North American plant, throwing out long, stolon-like branches, and quickly covering a considerable space, flowers pinky white; Jovellana repens, a creeping Calceolaria from New Zealand with hooded, white flowers somewhat like those of Jovellana violacea; Lactuca repens, a desirable little rockery plant from China, with trifoliate, fleshy, grey-green leaves, not more than 2 inches high, amongst which the yellow flowers appear. The plant grows best in light, sandy soils and sunny situations. Laurentia tenella, a dwarf, campanulaceous annual with white flowers, from the Mediterranean region; Lesquerella gracilis, a pretty dwarf annual with graceful yellow flowers, an old garden plant, native of North America; Lysimachia amœna,* a Yunnan plant, very free-flowering, somewhat resembling L. Henryi, but not quite hardy; Mentha Cunninghamii, a prostrate, white-flowered species from New Zealand; Menyanthes Crista-galli, this North American species is smaller, more prostrate, and has whiter flowers than the British M. trifoliata; Nardostachys grandiflora, from China, a much more robust-growing species than the better-known N. Jatamansi; Onosma confertum,* a Yunnan plant with branching inflorescences and reddish, tubular flowers; Onobus spathulatus, a native of Asia Minor—the plant bears light-green leaves and abundant, pale-yellow flowers; Papaver triniæfolium, a Cappadocian plant with glaucous, finely-divided foliage and terra-cotta coloured flowers—the species deserves to be better known in gardens, as also does the yellow-flowered P. bracteatum from the Orient; Polygala major alba, a showy plant from Southern Europe, which has a long flowering period and is suitable for planting in walls or on overhanging rocks—the flowers are pink; Polygonum Emodii, the prostrate habit, narrow foliage, and deep-red spikes make it a good rock plant; P. sino-capitatum, evidently the Chinese representative of the Indian P. capitatum, but a larger plant with deeper coloured foliage, and the flower-heads are of a darker red; Potentilla fruticosa var. mandshurica, a dwarf, rather creeping form of the white-flowered P. Veitchii, a good plant for a sunny bank; Raoulia australis, a New Zealand plant, forming a dense, silvery carpet; Rubus parvus, a New Zealand species of dwarf, creeping habit, with narrow, bronze-coloured foliage and white flowers.

This is the period of the yellow-flowered Saxifrages. S. diversifolia is well known, but not its new variety S. foliata,* with brown, mottled leaves; S. turfosa* resembles S. diversifolia, but forms long stolons. The Chinese form of S. Brunoniana, named S. majuscula,* is a thriving plant, producing the red stolons of the type. More troublesome species to cultivate are S. filicaulis, S. Balfourii,* S. hispidula, S. macrostigma* and S. sediformis. Of other Saxifrages there are S. gemmipara and S. candelabra.* Scabiosa Hookeri, a sturdy Himalayan and Tibetan plant 1 foot high, with dark-coloured flower-heads; Scutellaria macrantha, a Chinese plant with numerous blue and white flowers, a charming little bushy subject for the rock garden; Selago corymbosa, a Cape plant forming dense foliage with large heads of white terminal flowers, not quite hardy here; Silene Keiskei, a dwarf, compact plant from Japan with red flowers; S. rosæflora,* a pink-flowered species discovered by Mr. Kingdon Ward in Upper Yunnan; S. Delavayi,* a plant with a brown, striped calyx; and S. tenuis.* Verbesina Purpusii, a Mexican plant with rosettes of leaves covering the surface of the soil, from which numerous yellow inflorescences rise about 1 foot or more. *R. L. Harrow, Curator.*

* Introduced by Bees, Ltd., through Forrest.

Documents pour l'Étude de la Géo-Botanique Congolaise.—This is the title of a series of contributions, edited by E. De Wildeman, constituting the third fascicle of the fifty-first, or jubilee, volume of the *Bulletin de la Société Royale de Botanique de Belgique*, a book of 406 pages of letterpress, illustrated by 117 plates. The whole is a valuable summary of all that has been accomplished in the botanical exploration of the Belgian Congo, and the excellent illustrations cover a wide range of subjects, from portions of plants to landscapes and physiographical maps. To give further details would occupy too much space, and we can only recommend the volume as a full source of information, dealing with some 4,000 species of vascular plants.

The Week's Work.

THE ORCHID HOUSES.

By W. H. White, Grower to Sir Trevor Lawrence, Bart., Burford, Dorking.

Masdevallia.—The collection of Masdevallias at Burford is a fairly representative one, and one or more of the plants are in bloom through the greater part of the year. There are few other Orchids which produce flowers of such brilliant colours, or more curious and interesting. The dwarf-growing M. muscosa is especially attractive by reason of the extraordinary sensitiveness of its labellum. The best Masdevallias for gardens include M. Harryana (coccinea) and its varieties, atro-sanguinea, acanthifolia, miniata, Dennisoniana, lateritia, luteo-oculata Gatton Park Variety and Temples variety; M. Veitchiana and several varieties of M. ignea. These are all of robust growth and very floriferous. Not infrequently a plant may send up a solitary spike during the winter months, but it should be pinched out at an early stage of development. Other strong-growing species are M. elephanticeps, M. Gargantua, M. ephippium, M. velifera, M. macrura, M. peristeria, M. Schilmii, M. coriacea and M. trochilus, but have quaint rather than showy blossoms. M. macrura is the giant of them all, the leaves resembling those of a Cattleya. Dwarfer-growing species embrace M. Arminii, M. Estradæ, M. caudata (Shuttleworthii), M. Wageneriana, M. ionocharis, M melanopis, M. polysticta, M. floribunda, M. hieroglyphica, M. polysticta, M. simula, M. trichæte, M. attenuata, M. nidifica, M. O'Brieniana and M. triangularis. A well-grown plant of any of these is a beautiful object when smothered with the pretty flowers. Owing to their compact habit of growth, these and similar species and hybrids should be grown close to the roof glass, and never allowed to become very dry at the roots. Other distinct species are the yellow-flowered M. Davisii, the pure-white M. tovarensis, M. amabilis, M. Schröderiana, M. rosea, M. racemosa, M. Mooreana, M. Burfordiensis; M. cucullata, M. calloptera, M. Barlæana, M. Rolfeana, and the rare M. deorsa, which has distinct, drooping foliage. Among the numerous hybrids are those following: M. Chelsonii, M. Chamberlainiana, M. Courtouldiana, M. Hincksiana, M. Stella, M. Gairiana, M. splendida, M. Parlatoreana, M. Henrietta, M. Rushtonii, M. Curlei and M. Bocking Hybrid. The whole of the Masdevallias mentioned grow best in a cool but not a cold house. During the summer they may be grown with Odontoglossums, but in the winter months they need a few degrees more warmth than the Odontoglossum house affords, or a place can generally be found for them at the warmer end of the cool house. Take care that the roots are not saturated with moisture in the autumn and winter, for an excess of moisture will cause the roots to decay and black markings appear on the foliage. Large specimens that have become bare in their centres may now be divided, and the best portions repotted separately into the smallest pots that will accommodate them. The smaller pieces may be inserted several together into small pots, and by next February they should be in a suitable condition for transferring to larger receptacles. Healthy specimens that need repotting should not be disturbed at the roots unless the soil is unsatisfactory; merely turning them out of their pots and carefully placing them into larger ones will suffice. Previous to overhauling the plants it is advisable to withhold water for a few days, for the drier the roots the less liable are they to be injured. The stronger-growing Masdevallias require plenty of rooting space, but the smaller or dwarf-growing varieties thrive best in pots proportionately small. Make the pots half full with materials for drainage, and use a compost consisting of Osmunda-fibre, leaf-mould and Sphagnum-moss in equal proportions, with a moderate quantity of small crocks to keep the soil porous. In potting arrange the base of the plant on a level with the rim of the pot, and

carefully work the compost between the roots. Pot moderately firmly, but not so tightly that water will not pass rapidly away. M. tovarensis will soon be showing its flower spikes; and the repotting of this species should be deferred until the spikes are cut.

THE FLOWER GARDEN.

By Edward Harriss, Gardener to Lady Wantage, Lockinge, Berkshire.

Border Carnations.—The earliest layers are well rooted, and may be either planted in their quarters or potted. When the circumstances are favourable it is best to plant direct into the flowering quarters, but even when this is done it will be necessary to pot some of the layers to furnish blank spaces in the spring where plants have failed. Let the ground be thoroughly prepared before the work of planting is commenced. Carnations grow best in stiff, retentive soils that have been lightened by plenty of well-rotted leaf-mould, refuse from the garden fire or the addition of compost from the potting-shed. A border facing south or west with good natural drainage is the best situation. Avoid planting when the soil is excessively moist, rather defer the work for a week or two, as it is most important to make the roots firm in the ground. It is an advantage to sprinkle soot over the soil before the plants are set in position. The soil for those grown in pots should consist of a mixture of three parts loam and one of sifted leaf-mould, lightened with a suitable quantity of coarse sand. It will be a great advantage to plunge the pots in ashes. Water the soil and keep the frame close and the glass shaded for a few days until the roots are re-established, when the plants may be accustomed to more ventilation and light, until finally they may be exposed fully and grown in these conditions until cold weather sets in.

Preparations for Next Season's Bedding.—Some thought must now be given to the system of flower bedding to be adopted next season. Certain changes may be contemplated, and they should be decided upon now, so that those responsible may have plenty of time in which to propagate the necessary stocks of different subjects. Salvia Glory of Zurich seems to thrive under any conditions, and should be grown largely, whilst Salvia Bluebeard is an excellent subject for massing in the mixed border. The plants should be in flower before they are planted in the beds or they may make an excessive amount of growth at the expense of blossom. A fine contrast is obtained by planting this Salvia with tall, white Antirrhinums or Hyacinthus (Galtonia) candicans. Perpetual-flowering Carnations have done remarkably well out-of-doors this summer, although certain varieties soon showed the effects of dull, wet weather. Antirrhinums seem little influenced by the weather; these flowers are most effective when massed in suitable colour combinations in a large bed or border; the intermediate and tall varieties only should be used for this purpose. Such sorts as Coral Red, Red Apricot, Fire King and Orange King provide brilliant patches of colour in the mixed border. Certain perennials and annuals are seeding freely this season, and the capsules should be gathered, dried, and the seeds stored for use next spring.

THE HARDY FRUIT GARDEN.

By B. Goodacre, Gardener to Sir Ernest Cassel, Moulton Paddocks, Newmarket.

Apples.—Both dessert and culinary Apples are ripening rapidly, especially on light soils. Most of the early culinary varieties, including Lord Grosvenor and Lord Suffield, are fit to gather, and no time should be lost in gathering them, as the fruits begin to deteriorate as soon as maturity is reached. In the case of other varieties the important point is to be quite sure the fruits are ripe before they are gathered; a good test is to examine the pips of a specimen, and if they are not quite brown to wait a few days longer. If large, perfect fruits are required for baking, the best plan is to gather these first and store them carefully by themselves, remembering that the least mark or bruise on the skin would render them useless later on for this purpose. Dessert varieties, especially Beauty of Bath, Joaneting, Margaret, Gladstone, Irish Peach, Devonshire Quarrenden, and Lady Sudeley, should not be gathered until just before they are required, as they keep very badly and soon lose their flavour. Apples should be stored on wooden shelves or trays in a house ventilated at the bottom. A thin layer of clean Wheat straw may be used to soften the shelves, but on no account should paper be employed, as it holds moisture, and tends to taint the under part of the fruits.

Pears.—As in the case of Apples, early varieties of Pears are not improved by being kept after they are gathered; but the supply of fruit can be prolonged by judicious planting and gathering. It is a mistake to gather the whole of the crop at once, even if all the trees of a particular variety are in a similar position. As soon as the fruits will part freely from the stem when gently bent upwards, a few should be gathered and laid in shallow boxes, or on warm (not hot) pipes, out of the way of damp or insects; or a warm dwelling room will answer the same purpose. They will soon become fit for dessert, and if the process is repeated every four or five days the season will be prolonged. Varieties of early Pears which should be gathered just before eating are Fondante d'Automne, Souvenir du Congrès, and Beurré Hardy. Beurré d'Amanlis is improved by keeping in a cool shed for ten days or a fortnight after being gathered.

THE KITCHEN GARDEN.

By John Dunn, Foreman, Royal Gardens, Windsor.

Cabbage.—The first plantation of Cabbage intended for an early spring crop should be made as soon as the plants are large enough for shifting. They may follow Onions, merely breaking the surface of the soil with the points of the digging fork. Set the plants in rows at 15 inches apart each way. As soon as fresh growth appears, hoe the surface of the bed, as loosening the surface will favour the development of the plants and destroy any weeds that may be present. Early Offenham and Milecross Marrow are two good varieties for present planting.

Mushrooms.—There will be no difficulty now that the days are becoming cooler in obtaining good supplies of Mushrooms. The materials for the hotbed should be collected and turned frequently in a dry, airy shed. The proper fermentation of the material is an important matter, for if this is neglected the crop will most probably be a failure. When thoroughly sweetened the manure should be removed to the Mushroom house and beaten together tightly to a depth of about 14 inches. As soon as the temperature of the bed has declined to 80°, and there is no prospect of it rising again, the spawn may be inserted. Place the spawn about 2 inches under the surface of the bed, and afterwards make the latter tight again by ramming. When the temperature of the manure has fallen to 75°, the surface of the bed may be covered with fine, new loam to the depth of 1 inch. Endeavour to keep the materials moist, but guard against a too frequent use of the watering-can. Promote atmospheric moisture by syringing the walls and floor of the house with rain water.

FRUITS UNDER GLASS.

By James Whytock, Gardener to the Duke of Buccleuch, Dalkeith Palace, Midlothian.

Pineapples.—Plants of Charlotte Rothschild and Smooth Cayenne varieties will now be swelling their fruit for autumn and winter supplies. They should be given as much encouragement as possible while the days remain bright and warm. The pits should be closed early in the afternoon, with a temperature of 90° to 95° (with sun heat), falling to 70° to 75° at 10 p.m. At the time of shutting the house syringe the plants lightly, but do not wet the crowns, as moisture tends to make them grow too fast. Maintain a moist atmosphere, and, if the roots seem dry, water them (but not too freely) with weak guano-water. Plants of Smooth Cayenne usually produce very few suckers, but Charlotte Rothschild is prolific, and suckers on plants of this latter variety should be detached before they grow very large. The offsets should be planted in 6-inch pots, and plunged in a shallow pit provided with bottom heat. Keep the atmosphere moist, and the plants shaded from bright sunshine. Suckers from these varieties which were potted early in the season and are now well rooted in 6-inch or 7-inch pots should be transferred to 11-inch fruiting pots. The potting soil should be fibrous, turfy loam of medium texture. Mix with it some bone-meal and a little vine manure. Pot firmly and plunge the pots in the bed of the Pinery. Very little water should be afforded until the roots have established themselves in the new soil. The top growth should be syringed lightly on bright days for the next week or two, and the house kept close and moist. Late plants of Queen Pines with the fruits colouring require an airy, warm atmosphere, and should be kept rather dry at the roots. If many fruits promise to ripen together, remove some of the plants to a cool, dry house, where they will be retarded for some time, and supply a succession. The remaining suckers on the Queen plants of which the fruits are ripe should now be secured for fruiting eighteen months hence. They should be placed in 6-inch pots and treated as advised above. Afford no water until some roots have formed, at which stage abundant ventilation should be admitted. Queen plants intended for fruiting early next year should, if strong and well rooted, be afforded plenty of fresh air on fine days. Manure-water should be withheld, and only sufficient clear water afforded to prevent drought. The atmospheric temperature should be kept rather low at night. Plants which are not so forward may be encouraged to grow freely for another month, making the most of the sunshine, keeping up a night temperature of 70° in warm weather, and giving manure-water at the roots.

PLANTS UNDER GLASS.

By F. Jennings, Gardener to the Duke of Devonshire, Chatsworth, Derbyshire.

Richardia africana (Calla æthiopica).—Plants which were placed in trenches as advised previously should be lifted and placed in pots. These should be large enough to allow of placing plenty of soil between the ball of the plant and the side of the receptacle; the soil should be composed of three parts rich loam to one of leaf-mould, some coarse sand and decayed cow-manure, with a 7in. potful of fine bones added to each barrowful of soil. After potting soak the soil with water and place the plants in a frame or cool house. Regulate the temperature according to the time when the flowers are required; but as cold, damp weather approaches the temperature should be at least 55°. Fumigate the house to destroy green fly and other insect pests, and syringe the plants on all bright days to prevent thrips.

Stocks.—Seedlings which were pricked off into 60-size pots early in August are ready for their final shift into 4 or 4½ in. pots. They should be firmly potted, in soil consisting of rich loam with a little leaf-mould, decayed cow-manure and wood ash. When potted they should be placed in a cold frame and soaked thoroughly with water. They should be kept in a light, airy structure until well established, when the lights can be removed. As soon as the first frost makes its appearance they should be placed in a cool house or on a shelf in a Peach house or vinery.

Double German Wallflowers.—The seedlings which were pricked out in an open border from the seed bed should now be ready for potting into 5-inch or 6-inch pots. The compost should consist of good loam, leaf-mould, and sand in equal parts, with some decayed cow-manure and wood ash added. Pot firmly, and stand the plants afterwards in a sheltered position under a north wall. The plants should be well watered, and when they are re-established stand them in a sunny position, but when the first frosts seem likely to occur remove them to a cold, airy house. As the winter advances they may be grown in a temperature of 45° to 50°, until they flower, when they may be transferred to the greenhouse or conservatory. A little artificial or liquid manure will be beneficial.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the **PUBLISHER**, 41, Wellington Street, Covent Garden, W.C

Letters for Publication, *as well as specimens of plants for naming, should be addressed to the* **EDITORS**, 41, Wellington Street, Covent Garden, London. *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Editors and Publisher.—*Our Correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the* PUBLISHER; *and that all communications intended for publication, or referring to the Literary department, and all plants to be named, should be directed to the* EDITORS. *The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.*

APPOINTMENTS FOR THE ENSUING WEEK.

THURSDAY, SEPTEMBER 18—
British Gardeners' Assoc. (Watford Branch) meet. (Lecture by Mr. John Weathers.)

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich, 57.3°.

ACTUAL TEMPERATURES:—
LONDON, *Wednesday, September* 3 (6 p.m.): Max. 64°; Min. 47°.
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London. *Thursday, September* 4 (10 a.m.); Bar. 30.1°. Temp. 63°. *Weather*—Fine.
PROVINCES.—*Wednesday, September* 3, Max. 60° Shields; Min., 57° Aberdeen.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY, AND FRIDAY NEXT—
Dutch Bulbs, by Protheroe and Morris, at 67 and 68, Cheapside, E.C., at 10.30.

WEDNESDAY NEXT—
Special Sale for the Trade of Bulbs, etc., at 67 and 68, Cheapside, E.C., by Protheroe and Morris, at 1.

FRIDAY NEXT—
Established Orchids, by Protheroe and Morris, at 67 and 68, Cheapside, E.C., at 12.45.

MONDAY, WEDNESDAY, AND THURSDAY NEXT—
Dutch and French Bulbs, Palms, Bay Trees, etc., at Stevens' Auction Rooms, King Street, Covent Garden, at 12.30.

Seed-Testing Stations.

There arises from time to time and in different quarters a demand for the establishment of a Government seed-testing station. This demand has reference generally to agricultural seeds, though doubtless those who make it would desire that the station should undertake the testing of seeds of all kinds. They support their proposal by various arguments, some of which are of considerable weight. They point to the indisputable fact that seed-testing stations are fashionable abroad, and enumerate the countries in which such stations exist. They appeal to statistics to show the enormous extent to which agricultural and other seeds are used in this country, and demonstrate that on not a few of the principal seeds—Wheat, Barley, Oats and Clovers—the annual outlay amounts in each several case to upwards of one million pounds sterling. Moreover, the advocates of a national seed-testing station present a somewhat distressful picture of the extent to which adulteration—intentional or accidental—occurs in certain kinds of seeds. Finally, they make appeal on behalf of the artless and unsuspecting agriculturist who is supposed to be constantly on the look-out for cheap—and therefore bad—seed, in order to produce a crop that fails.

Up to the present, however, and despite the arguments of its advocates, the seed-testing station has not come into existence in this country, though each sister country either possesses or is about to possess one. Inasmuch as it is sheer nonsense to suggest that our present lack is due to ignorance or stupidity on the part of Englishmen, it behoves us to inquire to what this lack is due. This inquiry involves another, namely—what should be the exact function of the testing station?—and the answer to the latter inquiry will in turn enable us to make up our minds whether in the present condition of the seed trade of this country a testing station is necessary at all.

When we seek for the reasons why, in spite of the recommendations of a Departmental Committee of the Board of Agriculture (1910), no seed-testing station has as yet been instituted, we find a clear indication of their nature in the arguments advanced by two members of the Committee, Sir William Thiselton-Dyer and Mr. Leonard G. Sutton, who dissented from the proposal of their colleagues. These gentlemen urged, first, that there was no strong case for the establishment of such a station, and second, that a testing of samples can give no guarantee of the bulk. There, indeed, is the rub! If a station were established solely to provide certificates of purity and of germinative capacity, with no powers of inspection or control, the hinges of the door to fraud would find themselves well oiled and a Government premium would be put upon dishonesty. Armed with his certificate of purity, an unscrupulous seedsman would embark on the nefarious mission of sowing—or rather, selling—"Tares" instead of Wheat. It is this contingency that those who are dispassionately interested in the subject have in mind when they refuse to assent precipitately to the establishment of a seed-testing station, and this contingency is clearly in the mind of the Parliamentary Committee of the R.H.S., which insists (see *Gard. Chron.*, p. 104) that "a seed-testing station, if created, must provide a full and sufficient guarantee both to buyer and seller as to the identity of the bulk sold with the sample submitted for test."

It seems impossible, therefore, not to concede that if a national seed-testing station be established that station must be provided not only with the paraphernalia for carrying out the simple germination tests, but must have attached to it a corps of inspectors, armed with the right of entry into seed stores, and fortified with parliamentary powers of prosecution. If it could be shown that this system of Government control—expensive though it must be—is the only system whereby the sale of inferior seed may be checked we should conclude in favour of the station. We incline to think, however, that a simpler and less expensive method would prove at least as effective. We stand on the threshold of great developments in agricultural instruction. The whole country is divided up into areas provided or about to be provided with agricultural institutes, farm schools, agricultural advisers, and the like. It should be part of the work of these latter missionaries of agriculture to preach the economic doctrine of pure seed, and it should be a part of the work of the farm institutes to demonstrate the cheapness of good seed. That good seed is available is not open to doubt. Everyone who has visited the establishments of the larger seedsmen knows what pains and money are expended on the cleaning and testing of the seed which is sold; everyone who has grown the seed sold by responsible seedsmen knows that it is good, and those who are most familiar with the vagaries of seed from harvests such as those of recent years wonders that the quality is so high. The conclusion, therefore, to which we incline is that whereas in countries of large area and in varied state of development or in those with a backward agriculture and without a highly organised system of agricultural instruction, a Government seed-testing station is a valuable means of improving the quality of commercial seed in England such an institution is not necessary. For it to be effective it must be fortified with considerable powers; it must be accompanied by the enrolment of a large number of inspectors; and it must entail therefore a very considerable expenditure. The final and desirable end which it might be expected to achieve may, we think, be attained by educative means.

SALE OF MESSRS. J. VEITCH & SONS' SEED BUSINESS.—We are informed that Messrs. SUTTON AND SONS, Reading, have purchased from Messrs. J. VEITCH AND SONS, LTD., the seed business carried on at Chelsea for the past sixty years, and this department, with the stocks of seeds and horticultural sundries, will be transferred to Messrs. SUTTON AND SONS as from October 1, 1913. Messrs. SUTTON have also purchased from Messrs. VEITCH AND SONS, LTD., the principal portion of the seed grounds at Langley, near Slough, adjoining the G.W. Railway, but Messrs. VEITCH'S nursery trade will still be carried on for some time to come at Chelsea, Langley, and Feltham, until Sir HARRY VEITCH retires altogether from business. The negotiations for the sale of Messrs. VEITCH'S seed business and the freehold land at Langley were carried through by Messrs. PROTHEROE AND MORRIS. It will be observed from our advertisement columns that the first portion of the stock at Messrs. VEITCH'S Coombe Wood Nursery at Kingston will be sold by auction by Messrs. PROTHEROE AND MORRIS on October 13 and following days.

A GRAFT HYBRID BETWEEN PEACH AND ALMOND.—A note in the *Jardin* describes the origin of a graft hybrid produced by budding a yellow Peach on the Almond. It is stated that the fruits obtained from the graft are more or less intermediate between those of the Peach and Almond, and that some shoots are intermediate in character, and others are either pure Peach or pure Nectarine. MM. DANIEL and DELPONT have germinated two seeds borne by the graft-hybrid, and have raised two trees, the leaves of which "show some resemblance with those of the Peach and Almond." The seedlings have not yet flowered. The graft hybrid is said by MM. DANIEL and DELPONT to resemble Amygdalus communis persicoides, which, though generally considered to have resulted from a cross, is in reality of unknown origin. They suggest, therefore, that this horticultural variety is a graft hybrid. It is noteworthy that the shoots of intermediate character referred to above have arisen at some distance from the junction of scion and stock.

A careful and comparative examination of the anatomy of the so-called graft hybrid and of the two constituent species is necessary before the views of MM. DANIEL and DELPONT can be regarded as established.

FERTILISERS AND FISH.—Inasmuch as the adage "all flesh is grass" is profoundly true, it is not surprising that the addition of suitable artificial manures to ponds should react beneficially on the fish contained therein. A note by N. LALLIÉ in *La Tribune Horticole* states that experiments made by M. KUHNERT demonstrate the usefulness of artificials in pisciculture. The addition of basic slag and kainit led to an increase in weight of the fish from 420 to 640 lbs., whilst by the addition of nitrate of soda also the weight of the fish rose to 800 lbs. Similar good results have, it is stated, been obtained with trout. Thus an increase in the aquatic flora leads to an increase in the minute fauna, and this in turn results in an increase in the fish.

THE TOMATO INDUSTRY IN AMERICA.—The rapid increase in Tomato growing in America is indicated by the following facts recorded in Bulletin No. 239 (College of Agriculture, Berkeley, California), which gives an account of the culture of this fruit in California. So late as 1829 the Tomato was in no demand in the States owing to the popular belief that it is poisonous. At the present time about 500,000 acres are under this crop. Although largely used for canning purposes, there is an increasing demand for fresh fruit, and the State of California alone sends out some 300 carloads to all parts of the States.

AN EXPERIMENTAL ROSE GARDEN. — The Society of American Florists, which has recently held a very successful meeting at Minneapolis, has appointed a committee to establish an experimental Rose garden on the Arlington Farms. We learn from the report in *Horticulture* (August 23) that the committee is impressing on the United States Government the desirability of such a garden, and that it has good hopes that the experimental Rose garden will become established in the near future. The society suggests that the garden shall be placed in the charge of the horticultural experts of the Government, and undertakes to supply stock true to name.

BANKRUPTCY STATISTICS: FAILURES OF GARDENERS, FLORISTS AND NURSERYMEN.—The report of the Inspector-General in Bankruptcy for the year ending March 31, 1913, shows a decrease of 341 in the number of receiving orders and deeds of arrangement in England and Wales, with a falling-off in the estimated loss to creditors of £2,418,300. The statistics for Scotland and Ireland are of an even more favourable character. The total number of cases in England and Wales was 6,351, the liabilities and assets as estimated by debtors being £8,053,900 and £3,481,700 respectively. The estimated loss to creditors was £6,452,200. These figures are not small, and should not be minimised, but we have to go back years to find as moderate a showing; whilst if we have regard to the enormously increased volume of commerce that has accumulated in the interval, it may be safely asserted that never has insolvency been at so low an ebb. The estimated losses to creditors in cases of bankruptcy proper—£4,304,900—are actually the smallest for any year since the 1883 Act came into operation, the nearest approach to them being those for 1903, which were £4,475,800. It appears from an appendix attached to the report that the total failures under bankruptcy and deeds of arrangement, in regard to persons carrying on business as gardeners, florists and nurserymen, were as follows:—In 1908 there were 48 failures, with total liabilities amounting to £43,811. In 1909 there were 48 failures, with liabilities amounting to £32,764. In 1910 the total number of failures was 55, and the total amount of liabilities in the aggregate was £68,144. In 1911 the number of failures was returned at 36, with a total indebtedness of £36,374. In 1912 there were 38 failures, with liabilities amounting to £38,008.

WEEDS IN PASTURES.—In the course of a survey of the botanical characters of grass land (*Journ. of Board of Agric.*, August, 1913), Mr. R. G. Stapledon observes that weeds in pastures are far more responsible for the poverty of grass than is commonly supposed. He finds that whereas in good fields the weeds may make up not more than 6 per cent., they rise in inferior fields to about 16 per cent. In another case a good field possessed a flora of mat-like herbs amounting to half a million to the acre, whereas the number in an acre of a poor field reached nearly one and a half millions. A dressing of sulphate of ammonia is to be recommended in those pastures in which the weeds are rife, the effects of the manure being in part at least to favour the growth of the grasses, and thereby to crowd out the weeds.

THE DISTRIBUTION OF THE GIPSY MOTH.—The mode whereby the Gipsy Moth (Liparis dispar) extends its range has been investigated by A. F. Burgess, a summary of whose work, published in Bulletin 119 (U.S. Department of Agriculture, 1913), appeared recently in *Nature*. The female, though provided with wings, is so heavy that she is unable to fly, and the larvæ are mainly responsible for the spread of the insect from place to place. Farm carts and motors passing along roads bordering on woods help in the distribution of the insects; but the young larvæ also secure dispersal by means of their long hairs, which enable them to be carried by wind for considerable distances.

MR. THOMAS CHALLIS, V.M.H. — Readers will join with us in offering sympathy to Mr. CHALLIS in the bereavement he has sustained in the death of his wife. Mrs. CHALLIS passed away on the 3rd inst. after a long illness, and the funeral took place at Fugglestone on Saturday, the 6th inst.

L'UNION HORTICOLE PROFESSIONELLE INTERNATIONALE.—We have received the first number of the Bulletin of this society, a publication which is to appear in future every three months. The Union was formed at Ghent in September, 1910 (see p. 268 in our issue of October 8, 1910), for the purpose of unifying the actions of horticulturists in the chief European horticultural nations. The Bulletin (which can be obtained from the secretary at 15, Molenstraat, La Haye, Holland), contains a list of affiliated societies (in which England is represented by the Horticultural Trades Association), a description of the constitution of the society and rules for its conduct, and an account of the Congress held on April 28 this year, in which the chief regulations were drawn up and the committee for the year appointed. M. RIVOIRE is president, M. Jos. PETER vice-president, and M. VAN LENNEP secretary. The chief function which the union will serve at present is the founding of an international registration list for new plants. Those who desire to have their novelties included in this list are asked to send a description containing not more than three lines in English, French and German, giving all necessary particulars (genus, if a hybrid, exact parentage, etc.), with a fee of two francs. A scheme of activity in the direction of phytopathology was formulated at the April, 1913, Congress, which aims at the solidification and association of the work now done in various countries. Such concerted action should be very useful in preventing the importation and spread of plant diseases. It is also to be the care of the union to equalise the prices of produce in the affiliated countries and generally to protect the grower.

POTATOS IN FRANCE AND BELGIUM.—The Board of Agriculture and Fisheries have received a report dated August 29 from His Majesty's Consul at Rouen stating that in the Department of Manche the 1913 Potato crop will be a very good one, yielding from 7 to 7½ tons per acre, compared with 5 tons per acre (about average) in 1912. In the Paimpol and Lézardrieux districts of the Department of Côtes-du-Nord the crop was good as regards both quantity and quality. In some districts, however, the tubers are not expected to keep well, and the yield will most likely be somewhat inferior both in quantity and quality to that of former years. Magnum Bonum and Institut de Beauvais now sell wholesale at about 4s. 5d. per cwt. There are already some Chardrennes on the market, the price being 3s. 10d. per cwt. In the Department of Morbihan the crop is expected to be less abundant than in 1912. The quality also is expected to be inferior. Prices will no doubt be higher this year than last. The variety known as Saucisse rouge is at present sold at 4s. per cwt. In the Department of Loire Inférieure the yield will be about the same as last year (average), but the quality will be very much better. The tubers are expected to keep well. Prices at present range from 4s. 10d. to 5s. 8d. per cwt. according to quality. In the Department of Maine-et-Loire the area is smaller this year than last. The yield also will be less, but the Potatos are sound and of a good average size. Present wholesale prices for the white varieties vary from 2s. 3d. to 2s. 8d. per cwt., for pink from 3s. 1d. to 3s. 6d. per cwt., and for yellow from 5s. 3d. to 6s. 1d. per cwt., Owing to the small quantity at present on the market prices are expected to rise before long. In the Department of Mayenne this year's yield is expected to be only half of last year's. His Majesty's Consul-General at Antwerp (August 27) states that, on the whole, the yield of Potatos in Belgium will be above the average and considerably larger than in 1912. Prices will be normal. In the Bruges district a much larger crop than last year's is expected, and there are scarcely any signs of disease. The probable price is estimated at from 2s. to 2s. 5d. per cwt., but will depend on the German crop. In the Ghent district the yield will be at least equal to that of last year. The tubers are sound. Wholesale prices are expected to range from 1s. 10d. to 2s. per cwt. In the Liége district also the yield will certainly equal last year's (6¾ tons per acre). Present wholesale prices range from 2s. 5d. to 2s. 10d. per cwt. In the Ostend district, given favourable weather, the yield is expected to be considerably in excess of that of 1912.

HOP PROSPECTS ABROAD.—His Majesty's Consul-General at Antwerp (August 27) states that the Hop crop in Belgium is considered to be of good average quality and quantity. Provided the weather remains favourable the yield is estimated at 50,000 cwts., of which perhaps 20,000 cwts. will be grown in East Flanders and 30,000 cwts. in Brabant. Prices at present quoted for Hops to be delivered in October and November are about £2 17s. per cwt. His Majesty's Consul at Portland, Oregon, states that the yield of Hops in Oregon is expected to be about 225,000 to 230,000 cwts., compared with 211,000 cwts. in 1912 and 129,000 cwts. in 1911. The yield in the State of Washington is estimated at about 70,000 cwts., compared with 59,000 cwts. last year, and that of California at nearly 200,000 cwts., compared with 209,000 cwts. in 1912. The crop in Oregon and Washington is in very good condition, but in California it has suffered somewhat from the weather.

CITY OF LONDON GARDENS. — The *City Press* is publishing a series of pictures illustrating the old City gardens, with a description of each. The garden illustrated in the issue of September 6 is the erstwhile graveyard of St. Botolph, now a pleasant, shady retreat. These gardens in the heart of the City are a real comfort to the workers of the City. Every day, when the weather is fine, the seats in the gardens are crowded with people—some resting from

their work, others having no work to do. The luncheon hour especially sees every seat full, and the pity of it is that these oases in a grey wilderness are so rare. Were twenty times as much space at disposal as at present the gardens would still be crowded.

PRIMULA RUSBYI.

ONLY twelve species of Primula are found wild in the North American continent, and four of these are endemic, namely, P. angustifolia, P. Parryi, P. Rusbyi, and P. suffrutescens. These are all confined to the Rocky Mountains, and, as some of them vary very much according to habitat, several forms have been accorded specific rank by some authorities. The finest of all the North American Primulas is P. Parryi, which is found along the banks of rocky alpine streamlets at an elevation of from 8,000 feet to 13,000 feet. It is somewhat difficult to cultivate in this country, although in the spring of this year I saw a fine example growing in the garden of Dr. MacWatt, Duns. When fully developed the leaves are a foot long, while the stout stems, which are much longer, bear large umbels of rose-purple flowers. It belongs to the nivalis section of the genus and this section embraces many fine species from the Himalayas, China and Northern Asia.

P. Rusbyi (see fig. 70) belongs to the cuneifolia section of the genus, which also includes the beautiful and better-known P. suffrutescens. It is a native of New Mexico and Arizona, growing on damp ledges on the north side of cliffs at an elevation of 8,000 feet on Mount Mongollon, among other places. It was first discovered by the traveller whose name it bears, and was introduced into cultivation in 1885. The specimen illustrated in fig. 70 is growing in a pot, and was sheltered in a frame during the winter. The flowers appeared early in June, while others which were planted out in a rocky crevice in the rock garden are still producing flowers. The plants produce tufts of narrow, spathulate leaves, 3 inches to 5 inches long, the umbel of beautiful flowers arising well above these. The petals are bright rose-red in colour, with a darker ring at the base, and the flowers have a yellow eye. *W. I.*

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

R.H.S. FRUIT SHOW.—I am interested to know for what reason the R.H.S. Autumn Fruit Show is being held three weeks earlier than usual this year. When I noticed, early in the year, that a show of British-grown fruit was announced for September 25 and 26 I concluded that it was to be an exhibition of early autumn fruits, but on receiving a schedule a few days ago I found there were classes for all the best late Apples and Pears, as usual. Surely these fruits, grown entirely in the open, as required by the schedule, will not be fit to gather by the date named. Here, in the south of Ireland, the best varieties of both dessert and cooking Apples will not be properly matured for quite a fortnight after the date of the show, and I have never known them to be ready before the time I mention. It is to be hoped that growers in other parts of the United Kingdom are more favourably situated, or the earliness of the show may make it less representative than usual. *T. E. Tomalin, Co. Kilkenny.*

FERN P. PARKERI (see p. 180).—Might not P. Parkeri be Pteris Parkeri, which was given an Award of Merit by the Floral Committee of the Royal Horticultural Society on March 5, 1912, and has been shown several times since then? It is apparently an extreme form of Pteris cretica, in which the pumæ are as much as 1½ inch in width, thus giving to a vigorous specimen quite a Palm-like appearance. *W. Truelove.*

STANDARD OF LIVING.—In the notes written by *Observer*, and published on page 160, facts are mentioned that are certainly of interest to others, especially to those engaged in any branch of horticulture, for employers of gardeners do not seem to realise how pressing is the need for extra remuneration for those in their employ so that they may have sufficient means to buy food. When an employee finds that wages do not suffice he aims at husbanding, rather than expending, his energy, and this many, with only a superficial knowledge of the cause, attribute to want of application. *Observer* mentions that what were luxuries are now considered necessities, and quotes oats, rice, bacon, cheese, lard, eggs, and meat. Such foods formed the staple articles of diet twenty years ago for gardeners. It would be more correct to say that the majority of them are luxuries for gardeners at the present time. Because the more wealthy are eating less meat, he truly mentions that the less wealthy are eating three times the amount consumed twenty years ago. This is a statement too elastic to define anything. The less wealthy may be

[Photograph by W. Irving.

FIG. 70.—PRIMULA RUSBYI: COLOUR OF FLOWERS ROSE-RED WITH PURPLE RING AROUND THE YELLOW CENTRE.

99 per 100 or 19 per 100 of population. I know that the least wealthy cannot buy a third of the meat which should form a well-balanced diet. My own position may be taken as a typical case of the state in which gardeners in large towns are placed. During the whole of my life I have never felt more acutely the necessity for an increase in wages to meet the extra cost of living and the responsibility that a family of normal size demands during youth. After the fixed weekly charges, such as rent, firing, light, insurance, and travelling, are met, the balance left to feed and clothe my family (five in all) amounts to fifteen shillings and one penny. For food alone, taking the number of meals at three per day, the allowance per head for each meal is approximately one penny and three farthings—consequently we are always living on starvation lines, and housekeeping is an unsolved puzzle at the end of every week, and enough to break the heart of the strongest wife, however capable a manager she may be. All gardeners with whom I come in contact seem to be living under stress of circumstances somewhat similar to my own, and the inevitable result is want of concentration, followed by inefficiency. I am not a member of any union or association, but I am not surprised that so many are advocating its principles to bring about a better condition of life. All men, for the work they do, should have a wage commensurate with their ability; the normal wage should certainly allow a margin above what is the bare minimum for sustenance. In cases where everything has to be paid for out of the wages, I have yet to learn that this can be accomplished on wages less than thirty-three shillings in large towns and twenty-seven in the country; this is the lowest estimate. I have had a thorough experience of living under varying conditions both in town and country, and can speak from direct knowledge. These remarks apply to a normal family of five in all, which may be taken as an average. This question of family touches upon another point that cannot be disproved by anyone who reads the advertisements in the Press. Employers usually prefer a gardener without any, or with only small family, consequently the man with an average family finds that the hope that stimulates all earnest men to action is gradually crushed out by the veto which employers place on the number of the family, and debars him from improving his position. This, combined with the high cost of living, makes the position of the married men doubly perplexing, and those who have it in their power to bring this to the notice of those employers who prefer gardeners without families will, in so doing, perhaps be the means of getting such employers to take different views when engaging men in the future. Other things—recommendations, etc.—being equal, surely it is more fitting to take the man with a family. Employers have the remedy in their own hands if they find their gardeners inefficient. When efficient men are engaged nothing is more worthy of master or man than liberal wages in return for honesty and capability. *Onward.*

LARGE PEACHES (see p. 177).—Arising out of the correspondence on large Peaches published in *Gardeners' Chronicle*, November 16, September 23, and October 7, 1911, pp. 209, 227, 262, I casually remarked to some gardening friends that I had not seen a Peach weighing one pound. Quite recently Mr. Anderson, gardener at Birdsall House, Walton, sent one for my inspection. He informs me that it was grown under the name of Late Admirable, and there were other fruits weighing 14 ozs. I replied that it was not as I thought correctly named, being of a somewhat different shape and colour to that variety as grown by myself and as I have seen it at exhibitions. I added that I felt almost certain it was a fine fruit of Exquisite, which I had seen exhibited at Harrogate several times some years ago. Exquisite is a very handsome fruit when well grown, though not so good in flavour as some of the older varieties of late Peaches. The fruit sent me by Mr. Anderson weighed within a ¼ oz. of a pound when put on my letter scales. *Yorkshire Gardener.*

CELERY DISEASE.—Celery "scorch" has been very prevalent in this neighbourhood again this season. Does not this fact favour the theory that weather conditions have far more to do with the spread of the disease than the reasons advanced in the autumn of 1911 by several correspondents in the *Gardeners' Chronicle*, viz., the use of pig manure and affected seeds? The season of 1911 was very dry and warm, and the same conditions obtained this year. Artificial watering does not have the same effect as a good cooling shower. *M. A., Co. Kerry.*

FURCRÆA BEDINGHAUSII.—(see p. 167).—A strong, young specimen of this species was planted in the "Duchess' Garden" here last autumn, but the plant failed to survive the mild winter. As many tender plants of other kinds are well established in this garden it seems probable that this Furcræa will only survive in a very few gardens in Britain in the extreme south. The late Mr. Hanbury, of La Mortola, spoke highly of its beauty when in flower. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

PUBLICATIONS RECEIVED.—***Transactions of the Scottish Horticultural Association.*** Second series, Vol. ii., Part I. Secretary, A. D. Richardson, 19, Waverley Market, Edinburgh. Price to non-members 2s. 6d.

REMARKS ON CONDITION OF THE FRUIT CROPS.

(*Continued from page* 175.)

(*See Tables and Summaries, ante, pp.* 80-85.)

5.—SOUTHERN COUNTIES—*cont.*

SURREY.—What promised to be a successful fruit season has proved rather disappointing. Late spring frosts following a mild winter, which caused the fruit buds to develop much too early, proved most disastrous to the Apple, Pear, Apricot and Plum crops. Cherries set freely, but this crop was spoiled by drought. Insect pests proved very troublesome. Only the early varieties of Strawberries reached a fair stage of perfection, the later berries being practically dried up. The crops on standard and pyramid Pears are a failure, but several wall trees are fairly well furnished with fruits. Currants were a heavy crop. The soil is of a very light, sandy nature. *J. Lock, Oatlands Lodge Gardens, Weybridge.*

—— The prospects for all kinds of fruits were excellent, but the cold weather in May caused most of the Apples, Pears, and Plums to fall, with the result that all crops are very light. *S. T. Wright, R.H.S. Gardens, Wisley, Ripley.*

—— The fruit crops are satisfactory, with the exception of Pears and Peaches. Apples are a good crop, and promise to be better than usual. Pears, Peaches, Plums, and Cherries all flowered abundantly, but on April 13 we registered 11° of frost, and this, no doubt, is the cause of the scarcity of these fruits. Apricots suffered in the same way, notwithstanding that the trees were protected with what is considered to be frost-proof canvas. Small fruits were good, Strawberries and Gooseberries exceptionally so. Our best sorts of Strawberries were Royal Sovereign (good for preserving, but too acid for dessert), British Queen (the best flavoured), then Waterloo, Givon's Late Prolific, Laxton's Latest, and Louis Gauthier in the order named. The soil is a light porous loam on a gravelly subsoil, and dries out very quickly. *Geo. Kent, Norbury Park Gardens, Dorking.*

SUSSEX.—Fruit trees blossomed abundantly, but the crops are disappointing, for after the flowers had apparently set well, Pears, Plums, Peaches, and Cherries dropped wholesale. Strawberries have been very good, and the variety Reward extra fine. Other small fruits are only moderate crops. Our soil is a heavy loam on clay. *Thos. Tyson, Wykehurst Park Gardens, Haywards Heath.*

—— All fruit trees bloomed profusely, but the blossoms on Apricot, Peach, Plum, and Pear trees were not of normal size, which I attribute to unripened wood, due to the dull, wet autumn of last year. A third of the blossom did not set, and the majority of the fruit that formed failed to swell. Insect pests were not in evidence until the end of June, and then only green and black fly. Apples are a fair crop. Small fruits, such as Currants, Raspberries, and Gooseberries, were above the average, whilst the Strawberry crop was a record one. *J. W. Buckingham, Milland Place Gardens, Liphook.*

—— All fruit trees flowered remarkably well, but frosts and cold winds during April caused much damage to the crops of Pears, Plums, Peaches and Nectarines. The soil is a heavy, cold clay, and this season it was a difficult matter to obtain a tilth fine enough for the sowing of small seeds in spring. *J. Muddell, Sedgwick Park Gardens, Horsham.*

—— Generalisation as to the quality of Apples, Pears, and Plums would be misleading, and nothing can be said at present as to the quality of the minute quantity of Nuts. Large proportions of Apples and Plums will be small and bad as the result of the aphis blight, while the fruits not affected by the pest may prove large and good now that the drought has been broken substantially. There are no Pears of any account. As to bush fruits, Gooseberries were of good quality, but hardly of full size, and this may be said of Red and Black Currants and Raspberries. *William E. Bear, Magham Down, Hailsham.*

—— Plum and Cherry trees flowered abundantly, but the blossom was crippled by severe frosts on April 13, when we registered 13° (the worst frost in April for many years). The Pear crop was also harmed by the same cause. Apples are a bountiful crop, and the fruits required thinning. The variety Cox's Orange Pippin set plenty of fruits, notwithstanding that the trees are isolated. Bush fruits of all kinds were good and plentiful. Raspberries and Gooseberries, especially, were excellent. Our soil is a retentive clay. *W. A. Cook, Leonardslee Gardens, Horsham.*

—— All stone fruits were under the average. Some attribute the cause to the wet, cold autumn of last year, as the wood did not ripen. In some gardens hailstorms damaged the Plum crop and early Pears. The soil is very heavy, but when well cultivated produces good crops of Strawberries, Gooseberries, and certain varieties of Apples. Cherries are not a profitable crop. *Wm. J. Langridge, Ote Hall Gardens, Burgess Hill.*

WILTSHIRE.—The fruit crops, generally, are the worst that we have had for many years past. Plums and Pears are especially bad. This is due to three or more causes: (1) Imperfect flowers, caused by the imperfectly ripened flower buds; (2) the extraordinary amount of blossom; (3) cold and otherwise unfavourable state of the weather during the flowering period, and the consequent low temperature of the ground. The temperature of the soil at 1 foot deep at the time of flowering was from 3° to 5° below the average. This season has conclusively proved the advantages of permanent or partial protection for fruit trees, for where protection was afforded the crops are wholly or partially satisfactory. *T. Challis, Wilton House Gardens, Salisbury.*

—— Nearly all fruit trees blossomed freely, but the flowers were small and thin. The blossom seemed to "set" satisfactorily, but cold winds and continued rains at the end of April and beginning of May caused the fruits to shrivel and drop. It has proved the most difficult season to keep the fruit trees clean that I have experienced. *A. J. Morris, Compton Bassett Gardens, Calne.*

—— Early in the season the Apple crop was over the average, but it is now slightly under, and fruits continue to fall. Pears are a failure, and Plums and Cherries were greatly below the average yield. Peaches, Nectarines, and Apricots are failures. Strawberries were plentiful, but the crop was soon over. This county has a remarkable variety of soils. *Thomas Sharp, Westbury.*

—— Plum, Pear, Cherry, Peach, and Nectarine trees all blossomed freely, and gave every promise of good crops, especially Plums and Cherries, but these latter fruits dropped at the stoning period. Green and black fly has been very prevalent. The soil is rather heavy and shallow, on a very cold, yellow clay. *Henry Gandy, Longleat Gardens, Warminster.*

7. ENGLAND, N.W.

CUMBERLAND.—When Apples and Plums were setting there was promise of good crops of these fruits, but unfortunately cold winds, and probably other unfavourable conditions, caused the embryo fruits to drop. In the Damson district of Lyth, Westmoreland, these fruits are very scarce indeed. Apples in Cumberland are a good average yield, some varieties being better than others. *W. B. Little, Carlisle.*

LANCASHIRE.—The Apple crop varies considerably. In the Fylde and Ormskirk districts it is of very fair promise. The Pear crop is a very poor one. Bush and soft fruits were good, especially Gooseberries and Black Currants. *A. J. Sowman, Hort. Dept., County Offices, Preston.*

WESTMORELAND.—All fruit trees are clean and vigorous, owing to plenty of moisture in the spring. The free-bearing kinds of Apples have satisfactory crops, especially Annie Elizabeth, Lane's Prince Albert, New Northern Greening, and Lord Grosvenor. Pears are thin, after last year's heavy crop, also Plums. Small fruits were very good. Royal Sovereign Strawberries were splendid. The soil is thin and gravelly, and fruit trees require frequent removal to produce satisfactory crops. Lime and sulphur spraying is successful in destroying insect pests. V2 fluid, and other proprietary washes, are also very effective in checking pests and diseases. *W. A. Miller, Underley, Kirkby Lonsdale.*

(*To be concluded.*)

SOCIETIES.

ROYAL HORTICULTURAL.

SEPTEMBER 9.—The usual fortnightly meeting was held on Tuesday last, in the Vincent Square Hall, Westminster. There were good exhibits in the various sections, but the attendance was again very small.

Orchids were fewer than usual, but twenty novelties were submitted to the Orchid Committee, and two received Awards of Merit.

The Floral Committee recommended three Awards to new plants, and awarded fifteen Medals to groups. In the Fruit and Vegetable section two Gold Medals were awarded for collections of fruits. At the 3 o'clock meeting of the Fellows a lecture on "Stem Vegetables, their Dietetic Values and Various Ways of Cooking Them," was delivered by Mr. C. Herman Senn.

Floral Committee.

Present: H. B. May, Esq. (in the chair), and Messrs. G. Reuthe, W. J. James, T. Stevenson, J. W. Moorman, J. Dickson, J. F McLeod, W. Howe, C. Dixon, C. E. Pearson, R. W. Wallace, E. A. Bowles, C. T. Druery, and H. J. Jones.

Messrs. W. CUTBUSH AND SON, Highgate, exhibited miscellaneous greenhouse plants, including Fuchsia Thalia, Hydrangea Mme. Monillère, and Coleus Cordelia. (Silver Banksian Medal.)

Mr. L. R. RUSSELL, Richmond, occupied a central ground position with a fine collection of Clematis in pots. Lady Northcliffe (violet-blue), Madame E. André (crimson), and Mrs. George Jackman (white) were among the best varieties. A few plants of Nicotiana colossea variegata were also staged by this nurseryman as a separate exhibit. (Silver Flora Medal.)

Messrs. STUART LOW AND CO., Bush Hill Park, Enfield, staged Carnations, including Baroness de Brienen (pink), Princess Juliana (orange), and a new crimson variety named Pocahontas.

Carnation Enchantress Supreme, a new American sport from Enchantress, was shown finely by Messrs. ALLWOOD BROS. It is a very pleasing shade of pink, with a touch of salmon. It is slightly fragrant, and has large flowers with a rather bunched centre and flat guard petals around them.

Mr. C. ENGELMANN, Saffron Walden, showed Carnations, for which a Silver Banksian Medal was awarded.

Messrs. H. B. MAY AND SONS, Upper Edmonton, exhibited a choice collection of greenhouse Ferns, with a few Veronicas and Bouvardias. (Silver Banksian Medal.)

Messrs. DOBBIE AND CO., Edinburgh, again exhibited Collerette Dahlias, tastefully arranged. Queen Anne (bright orange-scarlet tipped with yellow) and Princess Louise (dark crimson with white collar) were noticeable. (Silver-gilt Banksian Medal.)

Messrs. CARTER PAGE AND CO., London, filled a large table with Dahlias of all types. (Silver-gilt Flora Medal.)

MESSRS J. CHEAL AND SONS, Crawley, staged a small collection of Cactus and Pæony-flowered Dahlias. The centre of the exhibit was occupied by a few vases of Dahlia Crawley Star.

Mr. J. BOX, Haywards Heath, arranged a very effective group on the floor, consisting principally of Phloxes, and edged with dwarf herbaceous plants. Tritoma Ophir and Lilium sulphureum were well shown, and a bold mass of Liatris pycnostachya, with its purple rocket-like spikes, made an effective corner-piece. (Silver-gilt Flora Medal.)

The GUILDFORD HARDY PLANT NURSERY showed hardy border flowers. Salvia angustifolia was particularly good. (Bronze Banksian Medal.)

Mr. A. LL. GWILLIM, Sidcup, exhibited hardy plants, including Asters, Heleniums and Solidagos, also finely flowered plants of tuberous-rooted Begonias. (Silver Banksian Medal.)

Messrs. WHITELEGG AND PAGE, Chislehurst, Kent, exhibited a selection of hardy plants, including Delphiniums, Phloxes, Lilium speciosum and L. tigrinum. (Bronze Flora Medal.)

Messrs. W. WELLS AND CO., Merstham, Surrey, arranged a fine exhibit of Phloxes, including the varieties Le Mahdi (violet), Elizabeth Campbell (pink), and Dr. Königshofer (orange-scarlet). (Silver Flora Medal.)

The WARGRAVE HARDY PLANT FARM, Liverpool Street, London, staged a collection of hardy herbaceous plants, principally Phloxes and Asters. Helenium Riverton Gem was well shown. (Bronze Banksian Medal.)

Mr. G. REUTHE, Keston, Kent, arranged a collection of hardy plants and some shrubs. Sprays of Lapageria rubra superba were very attractive. (Bronze Banksian Medal.)

Messrs. RICH AND Co., Bath, exhibited a collection of Phloxes, including the variety Comtesse de Jarnac, with variegated foliage.

Mr. G. W. MILLER, Clarkson Nurseries, Wisbech, exhibited hardy herbaceous plants, including Kniphofia Nelsonii major, Lilium sulphureum, Iceland Poppies and Verbascums New Departure, and Harkness Hybrid. (Silver Banksian Medal.)

Mr. W. PETERS, Givons Gardens, Leatherhead, showed about a dozen vases of a new Aster, Dorothy Sturgis. It is pale rosy-mauve in colour and very stiff in habit.

Messrs. T. S. WARE, Ltd., Feltham, were awarded a Silver Banksian Medal for an exhibit of hardy flowers.

Mr. J. MACDONALD, Harpenden, staged a striking exhibit of ornamental grasses of great interest botanically. (Silver Banksian Medal.)

AWARDS OF MERIT.

Aster Feltham Blue, a vigorous variety of the Novi-Belgii section, with dark, wiry, erect stems and very freely-branched, broad panicles of flowers. The individual flowers are about 1¼ inch in diameter, with lavender-coloured ray florets. (No. 204, shade 1, of the *Répertoire de Couleurs*.) Shown by Messrs. T. S. WARE, LTD.

Dahlia Inchmarnock.—A Collerette variety, with eight oval, salmon-scarlet ray florets, each with a small bunch of creamy yellow quills at its base. The quills are about half the length of the rays and are mostly lightly touched with red. The whole flower is about 4 inches in diameter, so that the variety is more notable for freedom and neatness than size. Shown by Messrs. DOBBIE AND Co.

Salvia uliginosa.—This species is a native of the marshes and river banks in Brazil, but Mr. Turner describes it as a hardy herbaceous perennial, and as it is a near ally of S. azurea and S. Pitcheri, also American species, it may prove, like these, hardier than a knowledge of their homes would suggest. It is a vigorous grower, reaching 4 to 6 feet in height, with close Betonica-like heads of flowers in long, dense spikes terminating the growths. The lip of the flower is about ½ inch in diameter, and is of a delightful shade of pure blue. The foliage is Mint-like, thin-textured, glabrous, about 3 inches long by ½ inch wide, and sharply serrate at the margin, each pair of leaves being separated by long internodes. Shown by Mr. C. TURNER, Slough.

CULTURAL COMMENDATION.

This award was made for a fine specimen of *Brunsvigia Josephinae* (see *Gard. Chron.*, March 25, 1905, fig. 74), shown by Mr. G. W. TYSER, Oakfield, Mortimer, Berks (gr. Mr. S. W. Sherlock). The stout, erect stem, 2 feet high, carried a hemispherical umbel, 2 feet in diameter, of some forty flowers, each held out rigidly by stout glaucous purplish pedicels. The species was given a First-Class Certificate in 1895, and is of special interest as a reputed parent of the very fine seedling Amaryllis Belladonna which was given an Award of Merit under the name "Kew variety" in 1911, but is now in commerce as A. Parkeri.

Awards to Antirrhinums.

The following Awards to Antirrhinums grown under trial at Wisley, and recommended by a deputation from the Floral Committee on the 29th ult., were confirmed by the Council on the 9th inst.

AWARDS OF MERIT.

No. 3, Amber Queen (BARR AND SONS, Covent Garden); No. 4, Amber Queen (WATKINS AND SIMPSON, Covent Garden); No. 12, Beacon (J. VEITCH AND SONS, LTD., Chelsea); No. 13, Beauty (BARR AND SONS); No. 17, Bonfire (SIMPSON, Birmingham); No. 18, Bonfire (ROBERT SYDENHAM, LTD., Birmingham); No. 37, Carmine Queen (WATKINS AND SIMPSON); No. 41, Coccinea, No. 56, Crimson King, No. 67, Daphne (these three, HURST AND SONS, Hounsditch); No. 69, Defiance, No. 80, Fire King (these two, R. H. BATH, LTD., Wisbech); No. 89, Golden Morn (WATKINS AND SIMPSON); No. 90, Golden Queen (R. H. BATH, LTD.); No. 104, Maize Queen, No. 111, Moonlight (these two, DOBBIE AND Co., Edinburgh); No. 122, Pink, No. 135, Queen Victoria (these two, J. VEITCH AND SONS, LTD.); No. 149, Rosy Morn (WATKINS AND SIMPSON); No. 151, Salmon Pink (R. VEITCH AND SON, Exeter); No. 164, Sunset (DICKSON AND ROBINSON, Manchester); No. 178, White Beauty, No. 182, White Queen (these two, DOBBIE AND Co.); No. 185, Yellow (J. VEITCH AND SONS, LTD.); No. 186, Yellow King (BARR AND SONS); No. 193, Yellow Queen (HURST AND SONS).

HIGHLY COMMENDED.

No. 1, Albino (F. C. HEINEMANN, Erfurt); No. 21, Brilliant (BARR AND SONS); No. 24, Brilliant Rose (R. H. BATH, LTD.); No. 30, Buff Queen (WATKINS AND SIMPSON); No. 45, Coral Red (J. VEITCH AND SONS, LTD.); No. 58, Dainty (DICKSON AND ROBINSON); No. 63, Dainty Queen (ROBERT SYDENHAM, LTD.); No. 82, Firelight (R. H. BATH, LTD.); No. 83, Galatea (BARR AND SONS); No. 112, Nobile (HURST AND SONS); No. 126, Pink Beauty, No. 128, Pink Queen (these two, WATKINS AND SIMPSON); No. 145, Roseum (J. CARTER AND Co., Raynes Park); No. 155, Scarlet-Carmine (DICKSON AND ROBINSON); No. 183, White Queen, No. 189, Yellow Prince (these two, HURST AND SONS).

Orchid Committee.

Present: J. Gurney Fowler, Esq., in the chair; Messrs. Jas. O'Brien (hon. secretary), J. Wilson Potter, R. G. Thwaites, A. McBean, T. Armstrong, W. Cobb, C. H. Curtis, J. Charlesworth, W. H. Hatcher, H. G. Alexander, W. P. Bound, W. H. White, S. W. Flory, W. Bolton, Gurney Wilson, R. A. Rolfe, Stuart Low, F. Sanders, and Sir Jeremiah Colman, Bart.

There was a bright and interesting display of Orchids, and twenty new plants were submitted for awards, but only two Awards of Merit were granted.

Messrs. ARMSTRONG AND BROWN, Orchidhurst, Tunbridge Wells, staged a fine group of splendidly-grown plants, for which a Silver-gilt Flora Medal was awarded. The leading feature was a number of specimens of their dark and finely-shaped Lælio-Cattleya Geo. Woodhams, which secured an Award of Merit. With them were the very handsome Lælio-Cattleya Baroness Schröder Orchidhurst Variety, probably the best L. Jongheana hybrid, the large blooms having broad sepals and petals tinged and veined with rose-pink, the petals also having purple striation and veining. The lip is rich buttercup-yellow, with a clearly-defined, ruby-crimson front; L.-C. Armstrongiæ Orchidhurst Variety (L.-C. Geo. Woodhams × C. Iris), a beautiful rosy-mauve flower; L.-C. Rainbow (C. Iris × L.-C. Phryne), yellow-tinged lilac, and of good shape; Cattleya Prince John (Hardyana × Dowiana Rosita), a fine selection of Cattleya Iris, and several other showy hybrids, including the pretty Miltonioda Harwoodii, and the singular little Kefersteinia laminata.

Messrs. CHARLESWORTH AND Co., Haywards Heath, were awarded a Silver Flora Medal for an excellent group, at the back of which were the graceful sprays of white and purple Oncidium incurvum, with a selection of Dendrobium Phalænopsis Schröderianum of various tints of rose. Several brightly-coloured Odontiodas, the rare Epidendrum costa-ricense, with white, fringed-lipped flowers; the remarkable Ornithidium coccineum, with two totally dissimilar forms of growth, the elongated leafy growths bearing a profusion of pretty red flowers; the rare Calanthe violacea, whose flowers are violet colour, the bracts also being red; Cycnoches Egertonianum, of the dark purple type; and Spathoglottis plicata Micholitzii.

Messrs. HASSALL AND Co., Southgate, were awarded a Silver Banksian Medal for a compact group of finely-grown hybrids, in which were a clear white Brasso-Cattleya Queen Alexandra, some good C. Iris, C. Lord Rothschild albescens, several of the pretty and fragrant C. iridescens, C. Nestor (Harrisoniana × Iris), and C. Euphrasia, of very fine colour.

Messrs. J. AND A. McBEAN staged an effective group of bright-red Odontiodas, the best of which was O. Vuylstekeæ Brightness, a large flower with a clear white ground, showing up the deep scarlet markings; Brasso-Cattleya Digbyano-Mendelii Distinction, a large, white flower, with a purple line on the front of the lip; B.-C. Madame Chas. Maron, the richly-coloured Lælio-Cattleya Geo. Woodhams, and other Lælio-Cattleyas; a good selection of finely-grown Odontoglossums, the white Dendrobium Dearei, and their remarkable new bigeneric hybrid, Adaglossum Juno (Ada aurantiaca × Odontoglossum Edwardii), which was referred to the Scientific Committee.

R. G. THWAITES, Esq., Christchurch Road, Streatham (gr. Mr. J. M. Black) sent Odontoglossum Wilsonii (Vuylstekei × Rolfeæ), a perfectly-shaped flower of large size, the sepals and petals being clear yellow, with the inner two-thirds blotched and banded with chocolate-red. Lip broad, white, with violet markings in front of the crest.

H. T. PITT, Esq., Rosslyn, Stamford Hill (gr. Mr. Thurgood) showed two well-flowered specimens of the handsome Cattleya Warscewiczii Countess of Derby, with pure-white sepals and petals, and rich-purple lip; Brasso-Cattleya Pittiana, B.-C. heatonensis, Cattleya Thayeriana albens, and C. Sonree d'Or.

FRANCIS WELLESLEY, Esq., Westfield, Woking (gr. Mr. Hopkins) showed Lælio-Cattleya Mrs. Donald Macmaster (L.-C. luminosa × C. Dowiana aurea), an attractive flower, with Indian-yellow sepals and petals with thin light purple lines; lip ruby-red, with thin gold lines at the base.

PANTIA RALLI, Esq., Ashtead Park, Surrey, sent Lælio-Cattleya Anthela (L.-C. Phryne × C. Warscewiczii), a pretty hybrid with some resemblance to Cattleya Rex. Sepals and petals greenish canary-yellow, lip light rose with paler margin, and yellow lines from the base.

Mr. E. H. DAVIDSON, Orchid-grower, Orchid Dene, Twyford, showed a selection of rare hybrids, which included Sophro-Cattleya Saxa Orchid Dene Variety, a large flower of a clear salmon colour, with darker veining; S.-C. Thwaitesii, darker in colour; a beautiful example of Odontoglossum Ceres (Rossii rubescens × Rolfeæ), and a brightly-coloured Sophro-Lælio-Cattleya.

Lieut.-Col. Sir GEO. L. HOLFORD, K.C.V.O., Westonbirt (gr. Mr. H. G. Alexander) sent a fine form of his Lælio-Cattleya Lustre, for which awards had been given to three forms. The present flowers were large and of fine substance, white tinged and veined with rose, a purple line on the petals, and with a fine claret-crimson lip.

Messrs. SWAN AND PRICE, St. Albans, sent two interesting hybrid Cypripediums.

Sir JEREMIAH COLMAN, Bart., Gatton Park (gr. Mr. Collier), showed a fine mass of Spathoglottis Zebrina (Fortunei × plicata), with numerous sprays of pale yellow flowers, some of them tinged with lilac.

HYBRID-ORCHID REGISTER.

The honorary secretary, Mr. JAS. O'BRIEN, called attention to the inconvenience caused by the want of a proper record of new hybrids flowering for the first time, and which were passed unnoticed unless sufficiently developed to secure some award. Later the same cross may be shown again, probably by another raiser, under a different name, and in some cases awards have been secured which had to be altered when the prior name had been discovered.

He, therefore, proposed the following resolution to go before the Council, which was seconded by Mr. J. WILSON POTTER, and carried unanimously:—

"In view of the necessity of securing the earliest possible records of new hybrids, and to supplement the list of plants which have received Awards, the Orchid Committee recommend that a new Record, to be called the Hybrid Orchid Register, be established, and that Orchid-raisers and growers be asked to bring their new plants when in flower for the first time, even although they may not be sufficiently developed to enter for Awards, and to enter the name, parentage, and name of the exhibitor of the plant on a Registration form, to go before the Committee. After testing to prove that the name is in order, it shall be entered on the Society's Hybrid Orchid Register, and, once recorded, the name must be recognised for all crosses of similar parentage when subsequently shown, unless valid reason can be given to prevent it."

Awards of Merit.

Laelio-Cattleya Geo. Woodhams (*C. Hardyana* × *L. purpurata*) from Messrs. Armstrong and Brown, Orchidhurst, Tunbridge Wells. One of the showiest of Lælio-Cattleyas, a fine grower and free bloomer, one of the compact specimens having three spikes, with twelve flowers—four each. The sepals and petals, which vary in tint in different specimens, are of a bright mauve colour, the large and finely displayed lip almost entirely deep claret-crimson, with some yellow markings at the base.

Odontioda Seymourae Orchidhurst Variety (*Charlesworthii* × *Bradshawiae*), from Messrs. Armstrong and Brown. A brilliant flower of the fine substance of O. Charlesworthii, and of an intense vermilion-scarlet, the colour on the reverse side being rather the darker, the crest yellow. The flower is broad and well displayed.

Cultural Commendation.

To Mr. W. H. White, Orchid-grower to Sir Trevor Lawrence, Bart., for a fine plant of the rare Zygopetalum maxillare Sanderianum, which had received an Award of Merit, Sept. 24, 1912.

To Mr. W. H. White for Zygopetalum maxillare, with seven spikes.

To Mr. G. B. Lees (gr. to E. de Quincey, Esq., Oakwood, Chislehurst) for a fine specimen of Bulbophyllum Medusæ, with many spikes of cream-white flowers.

Fruit and Vegetable Committee.

Present: W. Poupart, Esq. (in the chair), Messrs. W. Bates, A. Grubb, J. Willard, W. Pope, A. R. Allan, H. Markham, A. Bullock, W. Crump, G. Reynolds, Geo. Wythes, John Harrison, H. Somers Rivers, J. Davis and S. T. Wright (hon. sec.).

The exhibit of fruit shown by Lady Nunburnholme, Warter Priory, York (gr. Mr. F. Jordan), was the outstanding feature of the show, and was awarded a Gold Medal. It consisted of a representative collection of choice dessert fruits, the produce of pot-grown trees, and was admired as much for excellence of arrangement as the high quality of the various dishes. Yorkshire is not generally regarded as a suitable county for fruit growing, yet rarely has such a magnificent exhibit of fruit been seen at these shows. At the back were well-grown bunches of Muscat of Alexandria, Black Alicante, Madresfield Court, Black Hamburgh and Barbarossa Grapes—in all sixteen bunches. But the premier dishes were of Apples and Pears. Peasgood's Nonesuch Apples were beautiful specimens, and many of them turned the scale at 1lb. Fruits of Cox's Orange Pippin were coloured to a high degree, whilst Gascoyne's Seedlings were also very meritorious. The fruits of Triomphe de Vienne and Marguerite Marillat Pears were magnificent, and there were good dishes of Conference, Doyenné du Comice and Louise Bonne of Jersey. There were also excellent Figs, Plums, Peaches, Nectarines, and seventeen splendid Melons.

A Gold Medal was also awarded to Cecil F. Raphael, Esq., Porter's Park, Shenley (gr. Mr. A. Grubb), for a collection of fruits—Grapes, Nectarine, Peaches, Melons, Cherries, Plums, Pears and Apples. This very large exhibit included numerous varieties of the various kinds of fruits enumerated. There were Muscat of Alexandria, Madresfield Court and Lady Downes Grapes; Souvenir du Congrès, Beurré Diel, Williams' Bon Chrêtien and Doyenné du Comice Pears, Pineapple Nectarines, Royal George Peaches, Kirke's, Lawson's Golden Gage and Late Transparent Gage Plums, and numerous sorts of culinary and dessert Apples.

Messrs. Laxton Bros., Bedford, showed several seedling Apples. The most promising was a pretty red-streaked variety named the Cropper, raised from Potts's Seedling × Lady Sudeley.

Messrs. Stuart Low and Co., Enfield, staged numerous Figs and Vines in pots, for which a Silver-Gilt Knightian Medal was awarded.

Messrs. Herbert Chapman, Ltd., Rotherside Gardens, Rye, exhibited fruits of Tomato Autumn Dainty.

Cultural Commendation.

A Cultural Commendation was awarded for a dish of Figs exhibited by Sir Albert Rollitt, Chertsey.

NATIONAL DAHLIA.

September 9-10.—The exhibition of the above Society, which was held at the Crystal Palace on these dates, proved to be very successful. The quality of the blooms was superior to that of last year, and the exhibits were sufficiently numerous to comfortably fill the transept. Although large numbers of seedling blooms were presented, the Society exercised a wise discretion in strictly limiting the certificates. Mr. G. L. Caselton arranged many plants from the Palace Gardens, and materially assisted in making an attractive show. The Society and Mr. J. B. Riding, the new hon. secretary, are to be congratulated on having so fine a show in this unfavourable season.

NURSERYMEN'S CLASSES.

Show and Fancy Dahlias.

Forty-eight Blooms of Show Dahlias.—The only exhibitor in this class was Mr. S. Mortimer, Rowledge, Surrey, who arranged a noteworthy collection. The very finest blooms were those of yellow, purple, and of deep red colours. The first-named included Wm. Powell, Esmond, and Buttercup; the purples were Wm. Rawlings and F. W. Girdlestone; whilst the pick of the deeper shades were Standard, George Rawlings, and James Vick.

Twenty-four Blooms of Show Dahlias.—Of the four exhibits in this class the best was from Messrs. Keynes, Williams, and Co., Salisbury, who staged a very even collection of fresh blooms of such varieties as Colonist (shaded crimson lake), Gracchus (buff yellow), Emin Pasha (crimson), and Agnes (yellow); 2nd, Mr. C. Turner, Slough, who had exceedingly good blooms of Colonist, R. T. Rawlings, Marjorie, and Seraph.

Twelve Blooms, Fancy Dahlias.—Mr. C. Turner, Slough, who showed a very good dozen, was a fairly easy first; his best blooms were of Wm. Pemberton, F. W. Girdlestone, Roy Seale, W. G. Head, and Dandy; 2nd, Mr. M. V. Seale, in whose stand Thos. Saunders and Duchess of Albany were conspicuous.

Cactus Dahlias.

Eighteen Varieties in Bunches of Six Blooms of Each.—For 12 consecutive years the first prize in this important class was won by Messrs. J. Stredwick and Son, but this year the honour deservedly fell to Messrs. J. Burrell and Co., Cambridge, who showed an excellent collection of large, fresh blooms of the best varieties. The white varieties (Albatros and Prima Donna) and Red Admiral were especially fine. Although his collection was second, Mr. Stredwick exhibited several vases of great value; 3rd, Messrs. J. Cheal and Sons, Crawley.

Twelve Varieties in Bunches of Six Blooms of Each. — The quality of the blooms in Mr. M. V. Seale's exhibit, which received the first prize, was not quite equal to that of the foregoing, but many of them were very fresh and bright; there was no competition.

Forty-eight Blooms, distinct varieties. — Messrs. J. Burrell and Co. won the 1st prize with an exceptionally fine collection. The blooms were so large that the regulation space of 6 inches from cup to cup on the show boards was scarcely adequate to display them. The individual flowers were in such magnificent condition as to render a selection difficult, but if a choice had to be made it would probably include Olympic Monarch, New York, H. H. Thomas, Prima Donna, Julia, Glory of Wilts, and Herod; 2nd, Messrs. Keynes, Williams, and Co., whose blooms were not quite so large or so bright, but still of much more than average quality; 3rd, Messrs. J. Stredwick and Son.

Twenty-four Blooms, distinct.—The quality of the first prize exhibit in this class was also excellent. Messrs. C. Carrington and Sons, Vicarage Avenue, Derby, won the premier award, and showed such splendid varieties as Kingfisher, Mrs. Stredwick, Nantwich, New York, and J. B. Bryant; 2nd, Mr. H. Woolman, Shieley, Birmingham, who could not have been very many points behind the winner; 3rd, Mr. M. V. Seale.

Twelve Varieties Garden Cactus Dahlias.—The two exhibits which were arranged in vases on separate tables were very attractive features of the show. The first prize was awarded to Messrs. J. Cheal and Sons, who exercised taste in arrangement. The most valuable of the varieties shown were Golden Eagle, Rose Queen, Hon. Mrs. Greville, Snowdon, Mrs. Freeman Thomas, Mrs. F. Paton, and Helene; 2nd, Mr. M. V. Seale, who showed Coral, Lightship, Mary Pourrier and Golden Plover in very good condition.

Twenty-four Bunches of Pompon Dahlias.—Mr. C. Turner won the first prize with a wellnigh perfect collection of these charming little flowers. The brightest blooms were of Little Beeswing, Bacchus, Phyllis, and Cyril, whilst Nerissa (rosy mauve), Ideal (yellow) and Glow were also very attractive; 2nd, Messrs. J. Cheal and Sons, whose collection was strong in whites and the yellow shades; 3rd, Mr. M. V. Seale.

Twelve Bunches of Pompon Dahlias.—The collection which won the 1st prize for the only exhibitor (Messrs. J. Burrell and Co.) was composed of exceedingly dainty blooms. The varieties Little Beeswing, Eros, and Bacchus were very bright.

Twelve Varieties Collerette Dahlias.—Mr. Charles Turner, Slough, was a very easy winner in this class, which requires 10 flowering stems of 12 varieties arranged in separate vases; 2nd, Mr. J. Emberson, Walthamstow; 3rd, Messrs. J. Cheal and Sons.

Twenty-four Bunches of Single Dahlias.—Messrs. J. Cheal and Sons, who showed a very bright collection of well-formed blooms, won the 1st prize in this class; 2nd, Mr. M. V. Seale.

Vase of Pæony-Flowered Dahlias.—Mr. C. Turner continued his successes with the decorative varieties by winning the 1st prize with a boldly-arranged vase of fine blooms; 2nd, Messrs. Keynes, Williams and Co.

Amateurs' Classes.

Twenty-four Show or Fancy Dahlias.—There were three exhibitors, and the 1st prize and Silver Challenge Cup were deservedly awarded to Mr. S. H. Cooper, The Hamlet, Chippenham, whose exhibit compared favourably with those in the open classes. Prince of Denmark, Mrs. Saunders, Tom Jones, Mrs. Gladstone, and Chieftain are the names of the outstanding varieties; 2nd, Mr. G. Densley, Nag's Head Hill, Bristol, who showed a fresh and bright collection of slightly smaller blooms.

Twelve Blooms of Show or Fancy Dahlias.—Mr. S. H. Cooper also won the 1st prize and Silver Challenge Cup in this class, showing another exceedingly good collection of similar varieties; 2nd, Mr. G. Densley.

Six Varieties Garden Cactus Dahlias.—The collection from the Rev. A. Bridge, Worth Rectory, Crawley, included especially-good blooms, but the effect was marred by too much greenery; 2nd, Mr. W. Howard, Wood View, Chesham, Buckinghamshire.

The Silver Challenge Cup offered by the Crystal Palace Co. for the best 9 varieties of Cactus Dahlias in bunches of 3 each, was again won by Mr. F. W. Fellowes, King's Walden, Hitchin, who showed an especially fine collection; 2nd, Rev. A. Bridge.

The best 24 Cactus blooms were shown by Mr. H. Pearman, Glenross, Nantwich; this splendid collection included such varieties as John Riding, Harold Pearman, Etruria, Glory of Wilts and Advance, in very fine condition; 2nd, Mr. A. H. Farmer, Walthamstow.

There were 9 exhibitors in the class for 12 blooms of Cactus Dahlias, and each stand was worthy of a prize. Mr. H. Pearman won the premier award; 2nd, Mr. R. C. Unwin, Histon, Cambridge.

Although the Pompon Dahlias in this section were not quite equal to those in the open classes, the 12 bunches which won the 1st prize for Mr. H. Brown, Luton, Beds, were a very praiseworthy collection; 2nd, Mr. A. P. Ironsides, The Hamlet, Chippenham.

The Rev. A. Bridge won the 1st prize for 12 bunches of single Dahlias with a very attractive set of blooms; 2nd, Mr. A. Brown, Seagrave, Bedfordshire. Of the 4 exhibits of 12 Cactus Dahlias in 3 blooms of 4 varieties, the best was shown by Mr. A. H. Farmer; 2nd, Rev. A. Bridge.

In the classes confined to competition amongst amateur growers who do not employ a whole-time gardener, the 1st prizes were won by Mr. A. F. Tofield, Chandlersford, for 2 vases of garden Cactus Dahlias, for 12 blooms, and for 6 blooms

of Cactus Dahlias; Mr. C. LUCKIN, Pullborough, for 6 varieties of Cactus, and for 6 of single Dahlias; Mr. J. A. JARRETT, Anerley, London, for 6 vases of Collerette, and for 6 of any distinct varieties of Dahlias arranged with appropriate foliage; Mr. A. JEFFRIES, Chippenham, for 12 blooms of show or fancy Dahlias; Mr. R. BURGIN, Bedford, for 6 blooms of show or fancy Dahlias; and Mr. G. DAVIDSON, Thornton Heath, for 6 bunches of Pompon Dahlias.

OPEN CLASSES.

Messrs. J. CHEAL AND SONS, showing Freedom, Martha, Queen of Pinks, The Bride, Firefly, and similar varieties, were awarded the 1st prize for 12 bunches of Pompon Cactus Dahlias; 2nd, Mr. M. V. SEALE, who included Mrs. Brandt, Brilliance, and Modesty.

The best 6 blooms of any one Cactus variety were of F. Wenham, shown by Mr. H. PEARMAN; 2nd, Celestial, shown by Messrs. KEYNES, WILLIAMS AND CO.

Mr. S. MORTIMER won the 1st prize in Class 46 for 6 blooms of Show or Fancy Dahlias.

The 1st prize shower bouquet was arranged by Mr. M. V. SEALE, who used the miniature Cactus variety Mrs. Brandt with very good effect; 2nd, Mr. C. J. BLAKE, West Hill, Putney.

Mr. A. BROWN arranged a charming basket of Dahlias; 2nd, Mr. J. EMBERSON.

Messrs. J. CHEAL AND SONS showed the best 12 bunches of Fancy Single Dahlias.

Messrs. J. STREDWICK AND SON'S 1st prize exhibit of Fancy Cactus Dahlias included Tango, Pierrot, Magic, and Jupiter; 2nd, Mr. M. V. SEALE.

There was a good competition in the class for 6 vases of Decorative Dahlias. The 1st prize was awarded to Mr. CHAS. TURNER; 2nd, Messrs. J. CHEAL AND SONS.

First-Class Certificates

were awarded to the following varieties :—

Dorothy Hawes: A Cactus variety with narrow, pointed, incurving and interlacing florets of uncommon rosy-purple colouring. The Gold Medal offered for the best seedling was also bestowed on this splendid show bloom.

Pierrot: A well-formed Cactus variety with white-tipped yellow florets, which are flattish and slightly incurved.

E. F. Hawes: A flesh-pink-coloured Cactus variety, which has exceptionally long stout stalks. The nearly straight florets will not commend this variety to the exhibitor, but it possesses considerable decorative value.

John Green: A Pæony-flowered variety that may be described as the most attractive in the show, and was said to have excelled all the other varieties at the Cardiff trials. It is somewhat suggestive of Bayard and of Geisha, the colours being bright yellow at the base and vivid scarlet on the outer halves of the florets. The blooms are set at right angles to the long stalks, which bear them well above the foliage. The above varieties were raised and shown by Messrs. J. STREDWICK AND SON.

Rosa: A well-formed Pompon variety of rather large size, and of a bright mauve shade of colour. The growth indicated that it is a good garden variety. Shown by Messrs. KEYNES, WILLIAMS AND CO.

Wee Gracie: A dainty little Pompon variety, also of the ideal shape; the mature florets are white, and the blooms have pale heliotrope centres. This also appears to be suitable for garden decoration. Shown by Mr. J. T. WEST.

NON-COMPETITIVE EXHIBITS.

Messrs. HOBBIES, LTD., Dereham, set up a collection of cut blooms in which the Collerette varieties predominated. (Gold Medal.)

Mr. J. T. WEST, Brentwood, filled his accustomed place with a very bright display of the various types of Dahlias, the Pompons and Miniature Cactus varieties being especially attractive. (Small Gold Medal.)

Mr. J. B. RIDING, Chingford, Essex, specialised the decorative varieties, and the arrangement of these fully illustrated their great ornamental value. Amongst the Collerette varieties we noted Giant of Lyons, a velvety, chestnut-red, with flushed, straw-coloured quills. (Small Gold Medal.)

Messrs. T. S. WARE, LTD., Feltham, Middlesex, filled the front of a large exhibit with an array of exceedingly good Cactus blooms, arranged in batches of distinct varieties. The tall stands in the background were attractively arranged with decorative varieties and sprays of Michaelmas Daisies. (Small Gold Medal.)

Messrs. A. H. COLE, LTD., Camberwell New Road, London, and Mr. H. WOOLMAN, Shirley, Birmingham, showed good collections of Cactus and Collerette Dahlias. (Silver Medals.)

NORTHUMBERLAND, DURHAM, AND NEWCASTLE-ON-TYNE BOTANICAL AND HORTICULTURAL.

SEPTEMBER 2, 3, and 4.—The annual show of this Society was held on these dates in the Recreation Grounds, Newcastle-on-Tyne. The Society has been entirely reorganised, the date of the show being altered from July to September. This latter alteration seems to have acted in a favourable manner, for the exhibits in general were much more satisfactory than usual, and in most of the classes there was keen competition. For a group of miscellaneous plants, arranged in a space of 12 feet by 10 feet, Mr. H. H. HILLIER, Green Park, Darlington, obtained the 1st prize with a very tasteful collection, chiefly of various Orchids. Messrs. CARNEGIE AND CO., Newcastle, were awarded 2nd prize, their group containing some very fine foliage plants. In the class for a decorated dining table Earl GREY, of Howick House, Lesbury (gr. Mr. W. H. Lambert), was placed 1st, and Sir R. J. GRAHAM, Carlisle (gr. Mr. G. F. Hallett), 2nd, out of thirteen competitors. For twelve bunches of hardy flowers, Messrs. HARKNESS AND SONS, of Bedale, Yorks, obtained the 1st prize. Their exhibit consisted of fine specimens of Helianthus, Gladioli, Gaillardias, Poppies, etc. Messrs. GIBSON AND CO., of Leeming Bar, were placed 2nd. For the class open to amateurs for three bunches of herbaceous flowers the 1st prize was won by Mrs. MAYNARD PROUD, of East Layton Hall, Darlington (gr. Mr. G. Finlay); 2nd, Mr. J. W. SMITH, Wensleydale, Aysgarth, Yorks. For a collection of Tree Carnations in vases, occupying a space of 6 feet by 3 feet, F. STRAKER, Esq., Angerton Hall, Morpeth (gr. Mr. C. L. Cawkill), obtained the 1st prize for a very fine collection; 2nd, W. E. HEDLEY, Esq., Dilston, Corbridge (gr. Mr. J. Shaw). In the class for six vases of border Carnations the Rev. W. MCLEAN BROWN, Gosforth, gained the 1st prize, and J. R. SCOTT, Esq. (gr. Mr. R. Elliott), Binton, was placed 2nd. For 12 bunches of distinct varieties of Sweet Peas O. W. E. HEDLEY, Esq., was again successful. His specimens of Barbara, Dobbie's Cream, May Campbell, John Ingman, Flora Norton, Nation, Hercules, Sutton's Sunproof Crimson, and R. F. Felton were all of the finest quality; 2nd, Mrs. MAYNARD PROUD. There were good exhibits in the Rose classes, the general quality being excellent. Messrs. HUGH DICKSON, Belfast, won the 1st prize for 24 blooms in not fewer than 12 varieties; 2nd, Messrs. HARKNESS AND SONS. Messrs. DICKSON also won the 1st prize in the class for 12 blooms of not fewer than eight varieties; 2nd, the Rev. R. HEDLEY, Kirkwelpington. For 12 hybrid Tea Roses in not fewer than six varieties Mr. T. PARK, of Bedale, was awarded the 1st prize.

The classes for cut flowers were well contested, especially those restricted to local growers, which excited keen competition.

The fruit classes were not quite so full, but the quality of the exhibits was well up to the standard for these shows, and the interest well maintained. For six dishes of fruit, distinct, the Rt. Hon. the Earl of LONDESBOROUGH, Market Weighton (gr. Mr. J. C. McPearson), won the 1st prize. His exhibit consisted of Muscat of Alexandria and Madresfield Court Grapes, Clapps' Favourite Pears, Pineapple Nectarines, Violette Hative Peaches, and Melons. In the class for four bunches of Grapes the Earl of LONDESBOROUGH was again successful with fine bunches of Madresfield Court and Muscat of Alexandria; 2nd, Lady COWELL, Clifton Castle, Bedale (gr. Mr. J. R. Gardiner), the bunches of Gros Colman in this exhibit being especially fine. The Earl of LONDESBOROUGH again carried off the 1st prize for two bunches of white Grapes; whilst for two bunches of black Grapes Lady COWELL was 1st.

In the open vegetable classes Leeks were a new feature. There were a large number of exhibits in these classes, well grown and neatly staged, contributed chiefly by pitmen. Mr. J. WEAR, Felton Mills, Felton, showed specimens of this vegetable 14 inches long and 3 inches in diameter, for which he was awarded the 1st prize; 2nd, Mr. THOMAS SMITH, Frarstones. For three Parsnips the Earl of DEVON gained the 1st prize, and this nobleman also excelled for Beans and Onions. For two Cauliflowers Miss MUSCHAMP, Corbridge (gr. Mr. W. Mark), was placed 1st, and for Celery Mr. W. BEAN, Colchester, took the first place. For a collection of vegetables of six kinds Mr. J. WEAR was successful, Mr. R. SHIELD, of Swalwell, taking the 2nd prize. The local classes, chiefly consisting of single dishes and nurserymen's produce, were well contested, and some of the exhibits were highly satisfactory as to quality and arrangement.

NON-COMPETITIVE EXHIBITS.

Messrs. LAING AND MATHER, of Kelso, exhibited hardy flowers, annuals, Alpines, Carnations, and Ferns. Messrs. C. IRVINE AND SONS, Jedburgh, showed Phloxes and Pentstemons, for which they were awarded a Gold Medal. Messrs. JOHN FORBES, LTD., of Hawick, staged a group of border flowers, Phloxes, Violas, Pentstemons, and border Carnations (Gold Medal). Messrs. KENT AND BRYDON showed a well-arranged rockery garden, the border at the back being filled with herbaceous flowers, and a Gold Medal was awarded to the exhibit. Messrs. ED. WEBB AND SONS, Stourbridge, exhibited an attractive collection of Sweet Peas, Gladioli, Liliums, and hardy flowers, grouped round a fine exhibit of fruit and vegetables. A Gold Medal was awarded to this group, and also to that of Mr. LAWRENSON, of Yarm-on-Tees, who showed a collection of hardy herbaceous flowers and a rockery arranged with a variety of Alpine plants. Mr. LAWRENSON also exhibited perpetual-flowering Carnations. A Gold Medal was awarded to Messrs. DICKSON'S, Chester, for hardy border flowers. Messrs. YOUNG AND CO., of Cheltenham, showed well-grown Carnations, and Messrs. FINNEY'S, of Newcastle-on-Tyne, staged floral designs. To both these exhibits the Gold Medal was awarded. Messrs. MICHIE AND CO., of Alnwick, showed hardy shrubs and flowering plants, and were awarded a Silver Medal.

LANCASTER AGRICULTURAL SOCIETY.

SEPTEMBER 3. — The Lancaster Agricultural Show, held on the above date, was distinguished by a large number of very creditable exhibits. The number of entries was higher than last year, and a marked improvement in quality was to be seen in several of the classes.

In the class for twelve Roses, Mr. GERALD GARNETT, Wyreside, showed a collection far in advance of any other. It included first-class specimens of Dean Hole, Leslie Holland, Jonk. J. L. Mock, and White Maman Cochet. Messrs. BARWISE, of Burnley, were placed second for good, though rather small, blooms. In the competition for six Roses Mr. GARNETT was again first, and was followed by Mrs. RUSHTON, of Garstang, who showed some very fine specimens. In the class for vases of Roses, Mr. GARNETT headed the list, followed by Messrs. BARWISE. Cactus Dahlias were well shown, Mr. T. HUNTINGTON, Bay Horse, taking first place, and Mr. A. CORLESS, Scotforth, second. For show Dahlias this order was reversed, and for Pompon Dahlias, Messrs. ROBINSON took the first prize. Carnations and Picotees were good, but not strikingly so. Mr. GARNETT won the first prize, and Mr. G. HOLME, of Bolton-le-Sands, the second. In the class for twelve Sweet Peas, Mr. S. F. CURTIS was placed first for a fine collection, Barbara and Thomas Stevenson being especially meritorious. Mrs. PORTNELL, Preston Patrick, took the first prize for six vases, but not many of the other exhibits showed exceptional merits. For hardy herbaceous flowers, Mr. GARNETT was successful in obtaining the first prize with a representative collection. Mr. G. BARROW gained the first

prize for Asters, and Mr. Carradice for single Asters. The class for six vases of Hardy Annuals brought some considerable competition. Mr. W. Goodwin was placed first, and Mr. J. Sturzaker second. Miss Foster gained a first prize for an épergne of Sweet Peas, very tastefully arranged, and for a vase of the same flowers the Rev. A. R. Tomlinson was awarded a medal. There were many creditable exhibits in the fruit section, as fruit is grown to a large extent in the district. Mr. A. Corless won the first prize for both dessert and culinary Apples.

Vegetables were on the whole very fine, the root-vegetables being the weakest. In the Potato classes the chief winners were Messrs. W. Hockin, Scotforth; J. Bleasdale, Nether Kellet; and T. Brighouse, Winmarleigh. In other vegetables, the successful competitors were Messrs. W. Goodwin, Robinson, Barrow, Parkinson, and Shakeshaft.

Several competitors took part in the contest for Table Decorations, and there were some very well-arranged and artistic exhibits. Mrs. S. F. Curtis was awarded the first prize, and Miss Foster, whose table was very nearly as good, took second place.

SCOTTISH HORTICULTURAL

September 2.—The monthly meeting of this Association was held in the Goold Hall, 5, St. Andrew Square, Edinburgh, on the 2nd inst. Mr. J. Phillips, the senior vice-president, was in the chair, and there was an attendance of ninety members.

Mr. George Stuart, Lecturer in Horticulture at the Edinburgh and East of Scotland College of Agriculture, gave a lecture and demonstration on "Fruit and Vegetable Bottling." The preserving of fresh fruit and vegetables by means of sterilisation was, Mr. Stuart said, comparatively little known in Scotland, and our supply of these came chiefly from the Continent and America. If the small grower would realise how simple the process was, he could add considerably to his income by adopting it, and at a very small cost, the necessary appliances consisting of bottles, steriliser (which might be a pot or other suitable vessel large enough to hold sufficient water to cover the bottles up to the necks) and an ordinary floating dairy thermometer. The most serviceable bottle was the quart size, which held about 2lb. of fruit. The essential thing in bottling was that when the bottles were filled they were perfectly air-tight. By raising the temperature of the water in the steriliser gradually and keeping it at 150° (Fahr.) for a sufficient time all the organisms capable of producing fermentation were destroyed, the air was drawn out, and when the bottles cooled, the lids, which rested on rubber rings, were quite air-tight, and the contents would keep in perfect condition for any length of time.

The exhibits were :—New Collerette Dahlias, exhibited by Messrs. Dobbie and Co., Edinburgh (the varieties Eddystone, Tuscan and Dungeness were awarded First-class Certificates). New seedling Pelargonium, Little Nan, exhibited by Mr. Wm. Cunningham, Bella Vista, Duddingston. Spikes of Gilia coronopifolia, exhibited by Mr. Alex. Porter, Davidsons Mains (awarded a Cultural Certificate). Decorative Rose, Léonie Lamesch, exhibited by Mr. J. Alexander, Niddrie, Midlothian. Spikes of Brugmansia Wrightii and Eucomis punctata, exhibited by Mr. Alex. Johnstone, Hay Lodge, Edinburgh; and autumn-sown Trebons Onions, exhibited by Mr. C. Comfort, Broomfield, Davidsons Mains (awarded a Cultural Certificate).

At the meeting to be held on October 7, Mr. D. Armstrong, Kirknewton House Gardens, Midlothian, will read a paper on Salvia splendens.

GLASGOW AND WEST OF SCOTLAND HORTICULTURAL.

September 3 and 4.—The annual show of this Society was held on these dates in the Zoological Buildings, Glasgow. The attendance of the public was very gratifying, and the exhibition was a great success financially. The entries numbered 1,200, those in the cut-flower section showing a marked increase, but fruits and vegetables were fewer than usual. The Royal Horticultural Society exhibited a collection of Grapes from the Wisley Gardens, notable varieties being Duchess of Buccleuch, Chasselas Napoleon, Syrian, and White Nice.

Pot Plants.

The principal class in this section was that for a collection of stove or greenhouse plants, arranged on the ground in a circle 9 feet in diameter. The 1st prize was won by Sir Wilfrid Lawson, Bart., Brayton Hall, Carlisle (gr. Mr. A. Knight), for a pleasing arrangement in which Clarkias, Liliums, Spiræas, and Codiæums were prominent subjects; 2nd, W. Beattie, Esq., Milngavie (gr. Mr. A. Kelly), in whose exhibit a free use was made of Celosias, Amaranthus, Gloxinias and Coleus; 3rd, Sir A. H. Pettigrew, Lanark (gr. Mr. A. Davidson). There were numerous classes in this section for all descriptions of pot plants, the Liliums, Begonias, and Chrysanthemums being particularly well grown.

Cut Flowers.

The displays of cut flowers were remarkably good, and in most of the classes there was keen competition, especially in those for Sweet Peas.

Messrs. A. Campbell and Son, Gourock, excelled in the class for 24 spikes of Gladioli, staging grand examples of Bernina, white; Charles Berbier, pale rosy-pink with white throat; and Etoile de Soir, salmon pink; 2nd, Messrs. Geo. Moir and Sons, Prestwick.

There was a fine display of Roses, Messrs. Hugh Dickson, Ltd., Belfast, proving winners in the principal open classes, followed by Mr. Wm. Ferguson, Dunfermline. In the classes restricted to amateurs Mr. Frank Watt, Kilbirnie, was the chief prize-winner.

Dahlias always provide a good display at this show, and in the open classes Mr. John Smellie, Busby, proved most successful for Cactus-flowered varieties. The same grower also excelled in the class for 24 show or fancy Dahlias, and he had also the premier Pompon Dahlias.

Mr. Alex. McAlpine was placed 1st for 24 blooms of Fancy Pansies; 2nd, Messrs. A. Lister and Sons, Rothesay. Mr. McAlpine also showed best in the class for 48 Viola blooms.

The principal prizes for Sweet Peas were presented in a class known as "The Citizen Collection," and this attracted a good competition. The *Evening Citizen* of Glasgow took a plebiscite of its garden-column readers as to the most popular varieties, and the proprietors awarded handsome prizes for the best exhibit of the leading 12 sorts. Mr. J. H. Crosby, Comrie, was placed 1st, and Mr. Geo. Bowness, Busby, 2nd.

The decorated dinner-tables were very beautiful, and the 1st prize was won by S. G. Bishop, Esq., Helensburgh (gr. J. Hood), for a charming arrangement of Mrs. A. R. Waddell and Irish Elegance Roses, lightly interspersed with Codiæum and Selaginella foliage. In the classes for bouquets Sir W. Lawson was the principal prize-winner.

Fruit.

A. A. Hagart Speirs, Esq., of Houston (gr. Mr. Jas. Brown), was easily first for a collection of 12 dishes of fruit in 12 varieties. For the collection of six dishes E. Bewley, Esq., Dublin (gr. Mr. D. M'Intosh), was placed 1st, and T. M'Lellan, Esq., Helensburgh, 2nd.

For a collection of eight bunches of Grapes R. M. Donaldson, Esq., Row (gr. Mr. R. Geen), excelled, showing excellent examples of Madresfield Court, Black Hamburgh, and Appley Towers. 2nd, W. M. Craig, Esq., Rothesay (gr. Mr. D. Halliday).

E. Bewley, Esq., Dublin, was the most successful exhibitor in the larger class for Apples, and he won the 2nd prize in the leading Pear class, in which Miss Hamilton, Rozelle, Ayr (gr. Mr. A. Harvey), was placed 1st.

Vegetables.

The vegetable classes were notable for the general excellence of the exhibits; the principal honours fell to S. Mitchell, Esq., Kippen (gr Mr. C. Shaw). Potatos were a strong class, and a remarkable fine collection of 12 round varieties was staged by Sir Wm. Dunbar, Kirkcowan (gr. Mr. Jas. Kidd). The same exhibitor excelled in the class for 12 kidney varieties.

Trade Exhibits.

Gold Medals were awarded to Messrs. Austin and McAslan, Glasgow; Blackmore and Langdon, Bath; Malcolm Campbell, Ltd., Glasgow; Dobbie and Co., Edinburgh; Geo. Fairbairn and Sons, Carlisle; D. G. Purdie, Glasgow; Ransomes, Sims, and Jeffries, Ipswich; Sander and Sons, St. Albans; and Sutton and Sons, Reading.

Silver Medals were awarded to M. Campbell and Sons, Blantyre; Hughes, Bolckow and Co., Ltd., Blyth; Alex. Shanks and Son, Ltd., Arbroath; and Thyne and Son, Dundee.

In addition many First-Class Certificates and Awards of Merit were given to the other smaller trade displays.

The following Awards were given by the Society to new flowers :—

Mr. Amos Perry, Enfield, Award of Merit to Helenium autumnale rubrum and Achillea Perry's White.

Messrs. Dobbie and Co., Edinburgh, First-Class Certificates for Collerette Dahlias Tuskan, St. Abb's and Skerryvore.

Messrs. Mason and Co., Jamestown, First-Class Certificate for Chrysanthemum Mrs. Mason.

Messrs. Gemmel Bros., Kilwinning, First-Class Certificates for Pentstemons Scarlet Glow and Alexander Cullen. Awards of Merit to Pentstemons Jas. Henderson and Gladys.

BRITISH GARDENERS' ASSOCIATION.

A meeting of the British Gardeners' Association will be held at the Wentworth Café, Pinstone Street, Sheffield, on Saturday, the 13th inst., for the purpose of forming a branch for Sheffield and District. The chair will be taken at 8 p.m. by Mr. S. Livsey, Cassick Grange Gardens.

The general secretary will deliver an address to the members of the Leeds branch at the Paxton Society's Room, Leeds, on the 15th inst. at 8 p.m.

NEWTOWNARDS HORTICULTURAL (CO. DOWN).

September 4.—The fifty-eighth annual exhibition of this society was a distinct success, the produce, especially in the sections for fruit and cut flowers, being exceptionally good. The exhibition was held in the grounds of Messrs. A. Dickson and Sons, and many visitors were attracted to the show partly on account of the opportunity thus afforded to see Messrs. Dickson's nursery, and to revel in the sight of the celebrated Irish Roses "at home." Messrs. Dickson not only provided accommodation for the show, but also took an active part in exhibiting. Their beautiful group of stove and greenhouse plants occupied the whole of one end of one of the large tents, and was deservedly awarded the society's large Gold Medal.

The cut-flower section contained some very fine exhibits, and competition was keen. In the nurserymen's class, Messrs. Alex. Dickson was placed first for a collection of Roses which can only be described as magnificent. It contained, among others, Red Letter Day, a brilliant red variety of vigorous and profuse habit; Chrissie McKellar, a clear salmon pink; Irish Fireflame, an improvement on Irish Elegance; Queen Mary, a clear, pink-shaded yellow; and George Dickson, the large, perfect flowers of which seemed to take precedence over all the rest. Messrs. Dickson also won the 1st prize for a splendid collection of thirty-six Dahlias (distinct), for forty-eight Gladioli, perfect in form and colour; for a very attractive collection of mixed hardy flowers, and in several other classes, Messrs. Frank E. Smith and Co. were placed second in each case. The fruit classes were well filled, and the quality was almost uniformly good. The chief prize in this section was awarded to a de-

corated dessert table, containing 14 dishes of fruit, and adorned with flowers; there were two separate prizes for fruit and decoration, but they were both awarded to the Earl of HARRINGTON, Elvaston Castle (gr. J. H. Goodacre). The chief dishes consisted of fine, well-coloured Grapes—Black Hamburgh, Muscat of Alexandria, and Madresfield Court. There were also good specimens of Peaches, Nectarines, and Cox's Orange Pippin Apples. The decorations were charming, and could hardly have been improved upon, either for quality or for arrangement. The flowers used were Burnett and White Wonder Carnations, relieved with long trails of bronze and pink Selaginella. The 2nd prize was awarded to Lord O'NEILL, Shane's Castle (gr. W. G. Fadge), who won the first prizes in the classes for six bunches of Grapes, two bunches of black Grapes and various other fruits. The foregoing classes were for amateurs keeping a gardener, but there were also a number of classes for those who do not employ a gardener, and these were well contested, the quality being of a satisfactory nature. Most of the fruits in this section were hardy, but there was one class for two bunches of Grapes, which was won by Mrs. JAMES MILLING, of Comber. The prize for six dessert Apples was awarded to R. THOMPSON, of Newtownards, whose exhibit was decidedly above the average. The vegetable section comprised a large number of classes, one of which was for a collection of nitrate-grown produce. The prize was awarded to HERBERT BROWN, Esq., of Helen's Bay, the same exhibitor being successful in winning 1st and 2nd prizes in a number of other classes.

TRADE NOTE.

H. CANNELL AND SONS.

WE are informed that the business of H. Cannell and Sons has been transferred from Swanley to the premises at Eynsford, from where it will in future be conducted.

Obituary.

WILLIAM BULL.—We regret to record the death, at the early age of forty-six years, of Mr. William Bull, elder son of the founder of the celebrated nursery and seed business of William Bull and Sons, King's Road, Chelsea. After the death of Mr. William Bull, sen., in 1902, the business was carried on under the title of William Bull and Sons, but continued ill-health prevented the elder son from taking an active part in the management, especially of late years, and in 1909 he retired, and went to live at Brighton, where he died on Monday, the 8th inst. Mr. Bull was formerly a member of the Executive Committee of the Royal Gardeners' Orphan Fund.

Answers to Correspondents.

Owing to pressure on space we are compelled to hold over our report of the Royal Caledonian Society's Exhibition, which the Countess of Wemyss opened on Wednesday last at the Waverley Market, Edinburgh.

BEGONIA SEEDLING: *A. W. M.* The seedling possesses considerable merit, but we are unable to say if it resembles any variety already in cultivation. Send specimens to some grower who specialises in these flowers.

CHRYSANTHEMUMS UNHEALTHY: *H. W. H.* The collapse of the Chrysanthemum is probably due to the ball of soil getting too dry before watering. After potting Chrysanthemums in their flowering pot they are liable to become dry at the roots, unless the watering is done very carefully. The roots should be quite moist at the time of potting, and both the old and new soil must be thoroughly soaked a day or two after potting, for if this is not done the old ball of soil, which is full of roots, gets so dry that when water is afforded the moisture will not wet the ball through, and simply soaks through the new soil without doing much good. The roots are then reduced to such a state that when the soil does eventually get soaked the plant cannot assimilate the moisture, and collapses, causing rotting of the stem at the surface of the soil, which has happened in the case of the specimen sent us.

CHRYSANTHEMUM SHOOT: *H. J. S.* The shoots of Chrysanthemums are damaged by earwigs. Examine the plants each evening with a lamp, with a view to killing the pests; also place pieces of hollow bamboo cane against the stem of each plant, and if these are blown through each morning you will probably destroy many of the pests before they cause much harm.

CORRECTION.—In Messrs. Sutton and Sons' class for a collection of nine dishes of vegetables at the Shrewsbury Show, Lord North (gr. Mr. E. R. James), was awarded the 2nd prize. Colonel Cornwallis-West, whom our

THE LATE WILLIAM BULL.

reporter credited with the 2nd prize, was placed 5th.

IRISH IVY: *F. J.* The larva on the specimen of Ivy sent for examination is the Swallow-Tail Moth (Urapteryx sambucaria). Spray the foliage with arsenate of lead.

IVY-LEAVED PELARGONIUM: *Old Reader.* The gold variegation in the foliage appears to be the result of an enfeebled root action or impoverished soil, and we should be surprised if cuttings did not grow out of the condition. However, this may be easily determined. If the plant has sported, the sport should certainly be perpetuated, with a view to ascertaining its value.

LOGANBERRIES: *C. B.* The Loganberries are attacked by the Raspberry Beetle (Byturus tomentosus). There is no remedy, as the eggs are laid deep in the unopen and open blossoms, and the larvæ live in the fruit. All you can do is to jar or shake the beetles off early in the year. The pest is so destructive to Loganberries that many are ceasing to grow them, and probably cultivated Blackberries will take their place, as they flower later and so escape attack.

NAMES OF FRUITS:—*Hevering.* 1, Beurré d'Anjou; 2, Red Doyenné (Doyenné Gris); 3, Bellissime d'Hiver; 4, Van Mons Léon Leclerc; 5, Black Worcester; 6, Duchess of Oldenburgh.—*T. F. A.* Pear, Williams's Bon Chrétien; 1, Lane's Prince Albert; 2, Domino; 3, Prince Bismark; 4, Williams's Favourite; 5, not recognised; 6, Worcester Pearmain.—*W. B.* 1, Pile's Russet; 2, Hoary Morning; 3, Lady Derby; 4, Royal Russet.

NAMES OF PLANTS: *F. W. N.* 1, Aralia chinensis; 2, Nandina domestica; 3, Spiræa japonica alba; 4, Trachelium cœruleum; 5, Verbena venosa; 6, Lobelia laxiflora; 7, Cotoneaster frigida; 8, Tanacetum vulgare; 9, Campanula persicifolia var. alba; 10, Picea pungens; 11, Trichosanthes anguina; 12, Cupressus Lawsoniana aurea.—*W. K.* 1, Hyssopus officinalis (Hyssop); 2, Origanum vulgare (Marjoram); 3, Satureia montana (Savory).—*R. E.* 1, Rehmannia angulata; 2, Aster Thomsonii var.; 3, Origanum hybridum; 4, Chelone Lyonii; 5, Olearia Haastii. — *Eden Phillpotts.* Lagerstræmia indica, a Chinese shrub. *J. H. B.* Bignonia Cherere — the yellow-tubed flower — and Tecoma (Bignonia) grandiflora. *A Long Subscriber.* 1, Pernettya mucronata; 2, Rhododendron blandfordiæflorum; 3, Rhododendron ferrugineum; 4, Photinia serrulata; 5, Cercis Siliquastrum (Judas tree); 6, Ptelea trifoliata; 7, Clerodendron Bungei; 8, Pittosporum undulatum.—*D. P. G.* 1, Scolopendrium vulgare multifidum; 2, Nerine Fothergillii; 3, Thalictrum minus; 4, Nephrolepis todæoides; 5, Nephrolepis exaltata; 6, Cyperus alternifolius.—*R. A.* 1, Odontoglossum Lindleyanum; 2, Oncidium barbatum; 3, Ada aurantiaca; 4, Brassia verrucosa; 5, Pleurothallis Scapha.—*W. Payne.* Bocconia cordata, obtainable at any hardy plant nursery.—*O. R.* 1, Catasetum macrocarpum; 2, Stelis ophioglossoides; 3, Oncidium abortivum.

NEW ROSES: *Mrs. K.* Rose Miss Flora Mitten can be obtained of Mr. Elliot, Hassocks Nursery, Sussex. The variety Paul's Lemon Pillar is not yet in commerce. It was raised and exhibited by Messrs. Paul and Son, the Old Nurseries, Cheshunt.

ONION BED: *F. J. L.* The damage is caused by Springtails (collembola). Water with lime-water now, and dig Vaporite into the soil when the crop is lifted.

SPECIES OF ROSA FOR THE GARDEN: *X. Y. Z.* You would find the following species of Rosa suitable for your purpose: — Climbers, Rosa brunonis, R. macrophylla Korol Kowi, R. rubrifolia (for its foliage), R. setigera, R. sinica, on a warm wall. Bushes, well isolated, R. alberica, R. Andersonii, R. Ecæ, R. hugonis, R. lucida, and its double-flowered form, R. microphylla × rugosa, R. Moysei, R. nitida, R. ochroleuca, R. sericea Pteracantha and macrantha.

TOMATOS: *G. T. E.* The hard, yellow patches in the fruits are not due to disease, but to lack of sufficient potash in the soil. Next season mix wood ashes with the compost in which they are grown, and sprinkle a little kainit as a top-dressing occasionally.

VINES DECAYING: *H. H. S.* The worms in your vine rods are not the cause of the decay, but the sequence. The probable cause is a faulty rooting-medium. The border may have been suitable when first made, but it has been spoiled by subsequent treatment. The failure of the vines may be due to starvation, over-feeding, or the application of something harmful. Trouble would also arise from continuous heavy mulching or anything which would hinder aëration of the soil. There is the possibility that an unsuitable or too strong a dressing of the rods may have caused the mischief. A mixture containing tar is used by some careful growers, with no bad results, but we have known cases where vines have been killed outright by such an application. The same may be said of paraffin, which may be used to a limited extent, but only when the greatest care is exercised. Whatever the cause, any attempt at renovation would now be useless. We advise you to make fresh borders and plant young vines. You need have no fear of healthy plants being attacked by worms, as these creatures only feed on decaying materials.

SEPTEMBER IN THE ROSE GARDEN.

THERE is plenty of work to keep the Rosarian occupied in September. In the early part of this month it is not too late to put in a few buds, particularly in the dwarf stocks and where the earlier buds have failed to take. In many gardens the budding this year was rendered more difficult than usual at the ordinary time by the appearance of a very minute aphis, accompanied by a sooty mould, that had a disastrous effect upon some of the stocks, almost defoliating them and making them unworkable for a time. The pest has yielded readily enough to syringing with Cyllin, soft soap, Abol, or other insecticides, but syringing Rose stocks is an undertaking Rosarians do not usually consider it necessary to concern themselves with, and probably in many cases the damage has been done before the cause was discovered. When, however, the evil was discovered and removed, though too late for the summer budding, the stocks have grown again and may be worked for a short time, the rains of the early part of the month helping to keep the sap running.

The unusual dryness of July and the unfortunate conditions above mentioned have made the completion of budding in many cases far from easy. If the sap is not running and the bark refuses to lift easily the operator must wait until it does so, even if he has to wait till next year. To attempt budding when the bark has to be forced open can only cause disappointment.

Then there is much to be done in the established beds, beside the ordinary routine of hoeing and syringing. The removal of dead Roses is a daily task which cannot be neglected if the garden is to look bright and cheerful. Probably there are few who have not themselves attempted it who know what a long time this takes up even in a moderate-sized Rose garden, how large a receptacle is required for the dead blooms, and how soon neglect of picking becomes apparent. In carrying out this operation the flower head should not be merely broken off as is frequently done, but the stalk should be cut off with a sharp pair of secateurs just above the highest promising bud. Then there is the removal of the briar suckers wherever they appear, and here again trouble will be saved if the work is done thoroughly and the sucker traced to the briar root and cleanly removed. There is usually a plentiful crop of these wild briar suckers during early autumn, not only on newly budded Roses, but also on plants in the established beds. If the tops were merely hoed off in the way often noticed when they appeared earlier in the year, many of them will have sprouted again and, if allowed to grow, will appropriate the sap to the detriment of the Rose plant. It would be difficult to remove these suckers too frequently or too early, for if once allowed to attain any size they seem inclined to induce the plant to persevere in its evil ways, and send up a fresh crop at inconvenient times and places.

This month is convenient also for autumn pruning, wherever this is practised. So far as concerns the growing branches of the H.P.'s and H.T.'s and save the operation of cutting off the flower heads as above mentioned, summer pruning is perhaps generally more honoured in the breach than in the observance, but in early autumn it is permissible to shorten slightly the long H.P. shoots which have flowered and may get unduly disturbed by the winds. In the case of some of the tea-scented Roses, where the growth has become unusually crowded it is also beneficial to take out a branch here and there in order to prevent overcrowding, and secure a better ripening of those that are left. Moreover, there are some varieties among the Tea group of which I like to grow a few plants without any spring pruning. The Maman Cochets, pink and white, Marie van Houtte and Souvenir de Pierre Notting, after a mild winter, often do surprisingly well when treated in this manner, and where this is practised August or early September is a convenient time in which to take out some of the oldest and most barren wood.

The pruning of the climbing and pillar Roses should now be seriously taken in hand. For purposes of pruning, climbers may conveniently be divided into three groups: (1) Teas and Hybrid Teas of climbing habit, which are pruned in spring; (2) Wichuraianas, such as Coquina and Dorothy Perkins, which give a certain number of autumn flowers, the pruning of which will usually be left till late autumn or Christmas, and (3) the multiflora group, such as Crimson and Blush Ramblers, some Wichuraianas, Lady Gay, and Roses of similar habit, e.g., Gruss an Zabern, which have no second flowering. It is this last group that may be pruned at any time from August onwards till the end of January, or even, at some sacrifice of buds, somewhat later. I am sometimes asked whether it is not wrong in principle to prune these Roses of the third group at this time of the year when the sap is still running. In my own case I have for some years pruned Roses of this class in late summer or early autumn as a matter of convenience, and with satisfactory results. I have not known Roses pruned at this time to become less vigorous than those pruned later, and the question of convenience is in its favour, for it enables us to tie up the young stems which start from the base of the plant and spread over the neighbouring dwarf plants, and one does not lightly discard a method that has proved both convenient and satisfactory. Perhaps, also, it is possible this early pruning may be defended on principle. Lindley (*Theory and Practice of Horticulture*, second edition, p. 365) points out that pruning in early autumn is often advisable "in the case of the Gooseberry and of the Vine, when weak, and the effect is found to be that the shoots of such plants in the succeeding season are stronger than they would have been had the pruning been performed at a much later season. This is necessarily so," he adds, "as a little reflection will show. During the season of rest (winter) a plant continues to absorb food solely from the earth by its roots, and if its branches are unpruned the sap thus and then introduced into the system will be distributed equally all through it. If late pruning is had recourse to and branches are removed, of course a large proportion of the sap that has been accumulating during the winter will be thrown away." The physiological botanist would nowadays express this somewhat differently, but from the gardener's point of view it would come to much the same thing.

The pruning of group 2 is left till late autumn, not because earlier pruning would be injurious to the plants, but because we wish to enjoy the few flowers they will produce and the beauty of their autumn foliage, which, in the case of Dorothy Perkins and some others, is well worth notice. The foliage of the multiflora group not only falls early, but is of less interest. One of my commonest difficulties is to find myself asked to prescribe for a plant, say of Crimson Rambler, that has been allowed to remain for years without having its old wood removed, and has ceased to make any appreciable quantity of new growth. The difficulty lies in the knowledge that the proper treatment will seldom be carried out. To deal with such a case we may begin in August and remove all the old barren wood, leaving, as there are few

young growths, a very few of those of the previous year. Next, in a year like the present, give the plant a thorough soaking of water, not a waterpotful, but 30 gallons or so. Later on in October mark a space 6ft. by 4ft. on one side of the tree, take out the soil three feet deep and fill in with a compost made of turf and old manure, with a liberal dusting of half-inch bones and bone dust as each layer of fresh soil is filled in. In the next autumn this process should be repeated on the other side of the tree. It must, however, be remembered that fresh soil brought in in this fashion will, if a drought supervenes in the following spring or summer before it has settled, become dry rather suddenly, and then one or two heavy waterings may be required.

This treatment is generally effective, always provided that the tree is not affected with fungus, and even then if all the fungus is carefully removed I have found it give good results. The question, however, always remains whether it would not be better to make the bed afresh and start again with a young plant. To answer this in any particular case one must see the tree and its surroundings, but perhaps in five cases out of six a new bed and new plant would prove most satisfactory. *White Rose.*

NEW OR NOTEWORTHY PLANTS.

PRIMULA VINCÆFLORA, FRANCH.

In the *Gardeners' Chronicle* of April 30, 1887, M. Franchet described and figured this remarkable new Chinese Primula, P. vincæflora (see fig. 72), of which dried specimens had been recently received from the Abbé Delavay. M. Franchet held out the expectation that seeds would arrive shortly thereafter, so that the plant might be brought into cultivation. Only now, after thirty years, and through Bees, Ltd., and their indefatigable collector, George Forrest, is the expectation realised, and it is fitting that record of the fact and a figure of the living plant as it is in flower now in the Royal Botanic Garden, Edinburgh, should find a place in the journal in which the plant was described thirty years ago. The illustration (natural size) is of the first plant, which flow red about a fortnight ago. The flower is not of the size (2 inches long) seen in dried specimens from the native habitat, but as the plants strengthen the flowers will, as is usual in Primula, be larger and fuller, and they may be expected to develop the indentation at tip of petal shown in collected specimens. The feature of the plant is the solitary large flower directed obliquely downwards on a stout scape, which continues to elongate during flowering to a length of a foot or so. The whole plant has quite the facies of a Pinguicula. The corolla is violet-coloured, with a deeply tinted eye. The lobes in native specimens are much broader than in the plant illustrated. The stamens have an interesting and unique disposition for a Primula. They have long filaments, and those on the posterior side only are erect; the whole of the anterior ones are bent across the corolla tube, so that all the anthers are brought together in a cone at the back of the flower. A form of apparent zygomorphy is thus developed. Native plants have the flowers preceding the leaves in evolution; so far in our cultivated plants leaves and flowers are coetaneous. There are two other Chinese species of the section Omphalogramme to which P. vincæflora belongs, P. Delavayi, Franch., and P. Franchettii, Pax., which have more beautiful flowers, and one Indian species, P. Elwesiana, King. Of this last some healthy plants at Edinburgh should flower ere long. P. vincæflora forms a large resting bud with fleshy scale leaves covered with yellow oily secretion. During the growing period, when forming its rosette of broad leaves, it thrives with copious root waterings, but resents overhead watering. The plant produces lateral buds freely, and forms a tuft which lends itself readily to division. *I. B. Balfour.*

ORCHID NOTES AND GLEANINGS.

THE POLLINATION OF DISA UNIFLORA.

The mode of reproduction of this Cape Orchid has been a subject of controversy. Dr. Bolus, the monographer of the Orchids of the Cape Peninsula, held that it reproduces itself vegetatively by tubers, a conclusion to which he was led by the fact that he had never been able to discover a ripe pod. An article in the *Cape Times*, summarised in a recent issue of the *Orchid Review*, supplies good evidence that Disa uniflora propagates itself not only by tubers but also by seeds. So long ago as 1895 Dr. Marloth recorded the facts that fully developed fruits had been found by various observers, and that he himself had captured near a group of Disas a butterfly, Meneris Tulbaglia, (the Mountain Pride), to the leg of which a pollinium was attached. A similar observation was made two years ago by Mr. Phillips. Perhaps the most interesting part of the story lies in the facts that the plucking of the flowers of Disa uniflora on Table Mountain is now prohibited, that in consequence of this prohibition it has blossomed profusely and according to Mr. E. D. Phillips considerably over 50 per cent. of the plants which were examined were found to be bearing fruits.

THE BULB GARDEN.

A GATHERING OF AMARYLLIDS.

With the exception of Hippeastrums and Eucharis grandiflora, how seldom do we see any of the lovely Amaryllids at our shows? And yet for elegance of form, purity of colour, and richness of fragrance what flowers can surpass those which I have just cut in my houses? In the hope that others may cultivate them more than at present, I will enumerate them.

Crinum Powellii album (*Gard. Chron.*, Aug. 3, 1912, fig. 39), from a pot standing outside, with eight tall clusters of snow-white flowers. A plant which in warmer districts is hardy, though here I find it flowers better in a large pot kept dry in winter.

Crinum Moorei fol. var. (*Gard. Chron.*, July 23, 1910, fig. 24), is well worth a place in every greenhouse for its foliage alone, though its flowers are as beautiful as those of the type.

Crinum H. J. Elwes (*Gard. Chron.*, July 20, 1907, fig. 19), a hybrid of my own raising, so named when first shown at Holland House, four or five years ago, with flowers the colour of Amaryllis Belladonna on a tall crimson stem. A plant sent me as Crinum belladonna from Van Tubergen's nursery is very like it, though not so good as mine, which grows in a warm greenhouse.

Hymenocallis macrostephana.—For size and beauty of flower and rich, aromatic scent, which is almost too strong except for a large hall or room, this lovely plant surpasses any other in its family, and is very easy to grow and increases fast by offsets.

Fig. 72.—Primula vincæflora in the Royal Botanic Garden, Edinburgh. Colour of flower violet.

Hymenocallis ovata or speciosa.—I do not exactly know how to distinguish them, but this has very broad, oblong leaves, and a huge umbel of large flowers as richly fragrant as those of the last. It is the best form I have seen.

Hymenocallis species.—The smallest of the genus, but as fragrant and beautiful and elegant in shape as any. It has very small and delicate leaves in comparison with the others, and these are perfectly deciduous. Its pure white flowers grow 3 or 4 in an umbel, on perianth tubes 2½ inches long, and have narrow, recurved twisted segments, and a large toothed cup. It grows well with me in an intermediate house, and requires a long season of rest. I do not know its origin or name, as I find nothing agreeing with it in Baker's *Handbook of Amaryllideae*, and there is nothing in the Kew Herbarium like it.

Hæmanthus Katherinæ (*Gard. Chron.*, Feb. 1, 1908, Supplementary Illustration).—I never quite mastered the cultivation of this beautiful plant till I planted out some surplus and rather sickly bulbs under the stage in the corridor of a range of Orchid houses, where it never gets a ray of sun, and little water beyond the drip from the

pots above. Under these seemingly very unfavourable conditions it grows stronger and flowers better than in pots. It is perhaps the best of all the Hæmanthus of its section.

Griffinia dryades.—Probably the best of its genus and easy to grow in a shady stove, but except for the blue colour of its flowers—a very rare colour in the Order—not so desirable a plant as those above named.

Gastronema sanguinea.—A lovely Cape bulb, with small leaves and a very large flower, in colour like Vallota purpurea, with which lovely plant it hybridizes freely. But I think it is superior to the hybrid, and is easier to grow and flower well than Vallota, which is a plant whose culture I have never been able to understand rightly. I keep Gastronema on a shelf at the top of a vinery, where it gets lots of sun and air and very little water.

Nerine Fothergillii.—The first Nerine to flower this year and still one of the finest.

CLEMATIS INDIVISA LOBATA.

Clematis indivisa is a native of New Zealand, where it forms a stout, woody climber with glabrous, trifoliate, usually entire leaves. It bears its fragrant, white flowers in large, axillary panicles, the individual blossoms being from 2 inches to 4 inches in diameter. The species is a native of the North and South Islands, Three Kings' Islands, and Stewart Island, in which latter district it is somewhat rare. The native name is Puawananga. Three varieties occur wild, including lobata (see fig. 73), in which the leaflets are toothed or lobulate. The other varieties are decomposita, with leaflets two-ternate, and linearis a form with narrow, linear leaflets, entire, or with two lateral lobes at the base. C. indivisa lobata has rather smaller flowers than the type, but they are very freely produced. In most districts it makes a first-rate greenhouse plant, and in favoured localities, such as Devonshire or Cornwall, it grows and flowers well out-of-doors, as may be seen from the specimen illustrated in fig. 73. In the greenhouse the plant makes an excellent subject for covering pillars or training along the roof rafters. Being an evergreen, the plant is additionally valuable for indoor decoration, as it affords pleasant greenery in the winter. The blossoms are produced so freely as to be suitable for cutting for decorations, and we know one instance in which thousands of flowers have been sent to Covent Garden every spring from a private garden in Staffordshire. Sometimes this Clematis is grown in pots, the growths being cut back to the hard wood, which is twined around a suitable support to form a bushy head. Grown in this manner it makes a beautiful subject for the table or stage of a conservatory, as the flowers show in bold relief against the glossy green foliage. Occasionally the plant is employed for growing in baskets in lofty conservatories. When utilised for this purpose, the main stems need to be restricted, but as many as possible of the flowering branches should be encouraged to droop over the baskets.

[*Photograph by Wyndham Fitzherbert.*

Fig. 73.—Clematis indivisa lobata in a Devon garden.

Zephyranthes macrosiphon, Baker.—A beautiful pink flower as large as that of Z. carinata, which is perhaps the best of the genus and easy to grow in a cold greenhouse.

Urceocharis Clibranii (*Gard. Chron.*, Sept. 23, 1899, fig. 86).—A reputed hybrid between Eucharis and Urceolina aurea, and, though not so beautiful as either of its parents, a very free flowerer, and easy to grow in a cool stove.

Hippeastrum hybrid between H. reticulatum and H. Ackermannii pulcherrima, which was raised by the late Sir Charles Strickland, and has proved with me easier to grow than any others of the autumn-flowering hybrids which have reticulatum as a parent. All these require quite different treatment to the spring-flowering Hippeastrums, and, though not so large and showy, are to my taste on account of their autumnal flowering and lovely shades of colour at least as beautiful. *H. J. Elwes, Colesborne.*

FORESTRY.

PRICES OF TIMBER IN SCOTLAND.

From returns to hand the home timber trade in Scotland would not appear to be in a very flourishing condition. As usual, the timber of Scots Pine is plentiful, vast quantities having been uprooted by recent gales, and thus, in some districts at least, causing a glut on the market. In Perthshire the demand has been good and prices quite equal to those of recent years; but here again large quantities of Larch and Scots Pine have been levelled to the ground, and thus suddenly thrown on the market. Larch has fetched 10d. to 1s., Spruce and Scots Pine 5d. to 6d., while Douglasii brought 8d. per cubic foot. Ash is in demand at 1s. 3d. to 1s. 5d. per foot, but Oak sells at a lower figure, usually about 1s. per foot. In Aberdeenshire the industries of box-making and barrel-making use up a quantity of wood, and large numbers of Larch are sent to the Fife and Lanarkshire pit districts. Whole plantations in Argyllshire were blown down by the gales in November, 1912. On the Donside one of the largest lots of timber that have been sold in Scotland for several years, consisting of about 20,000 Larch and 30,000 Spruce, was disposed of during the past season at Kildrunney. In Inverness-shire the home timber trade has of late been in an unusually busy condition, the demand for staves, headings, and packing-case boards being very good, while prices were about the average. Larch is sent in quantity to the colliery districts, and fetches 1s. 3d. to 1s. 6d. per cubic foot; while heavy Oak, at about 1s. 6d. per cubic foot, was in demand for boat-building purposes round the Moray Firth. A quantity of very good Larch and Scots Pine, 16 miles from a railway station, was sold in Sutherlandshire last year at 7d. to 8d. per cubic foot for the Larch and 4d. per foot for the Fir. In Elginshire there is little or no variation in the home-grown timber

trade, and for large trees the demand and prices were fair.

For providing railway sleepers and boarding large Scots Pine timber is much in use, while that of a lighter class finds a ready market for staves and pit sleepers. This timber averages 5d. per cubic foot, and Larch from 8d. to 10d., according to size. Aberdeen is the principal market for heavy Scots Pine timber for boarding, while the Fife collieries absorb what is suitable for pit props. *A. D. W.*

MOSSY SAXIFRAGES.

THE Rockfoils constitute the most valuable family of plants for the rock garden, the plants exhibiting most diverse forms and sizes, from the tiny S. cæsia, only an inch or two high, to the giant Californian S. peltata, which has large, round leaves on stalks 3 feet or more in length. Between these two extreme forms there is a vast range of species suitable for all positions in the rockery, from a hot, sunny ledge to a cool, shady bank. Some grow best when their roots are among stones in water, whilst others, such as S. hirculus, make delightful bog plants. Saxifrages generally are easily cultivated, but their requirements in the matters of situation and soil must be studied. A good general guide is to plant those with hard encrusted and leathery foliage in full exposure to sunshine, although there are some exceptions, notably S. florulenta, which grows best in shade, and shade or half shade is desirable for those of the mossy or soft-leaved section. Many of this latter type form lovely carpets or mounds of emerald-green foliage, which are very beautiful in winter, and in spring and early summer are hidden with masses of pure white or rosy-pink flowers.

The group of mossy Saxifrages illustrated in fig. 74 shows how these plants may be used to advantage on stony banks or ledges in half-shady positions. Planted in masses, they produce a delightful effect, the flowers on some being so numerous and close together as to quite obscure the foliage. During the past few years numerous hybrid Saxifrages of the mossy section especially have been raised. The following six species embrace the best of this section, and they are among the easiest to cultivate.

S. CÆSPITOSA.—A species found over the whole of the Northern and Arctic regions and showing considerable variations in a wild state. Many names have been applied to the different forms, among them S. decipiens and S. sponhemica, but although the extreme forms may be quite distinct they are linked up by a chain of intermediates that makes it difficult or even impossible to draw a line between the so-called species and varieties. Little success has attended the efforts made to classify the numerous kinds, the distinctions being more or less of a geographical character that are not constant when the plants are growing side by side. The simplest plan is to lump all these forms under the one species S. cæspitosa. One of the most marked varieties is S. c. var. hirta, with very hairy foliage. Many beautiful varieties have been raised in gardens in recent years, several with charming red flowers. The red colour in the newer forms of S. cæspitosa (a white-flowered species) is due to the influence of S. muscoides var. atropurpurea, a charming little plant with bright-red flowers. One of the first was Guildford Seedling, a dwarf carpeting plant with bright crimson flowers. S. Clibranii is of rather stronger habit with red flowers; as also is S. bathonensis, which grows nearly 1 foot high, producing much-branched stems and large, brilliant-red flowers. S. sanguinea superba is of neat habit, with ruby-scarlet flowers, and is amongst the best of its class.

[Photograph by W. Irving.

FIG. 74.—MOSSY SAXIFRAGES ON ROCKERY.

S. EXARATA is a distinct and beautiful species from the Alps and Pyrenees. It forms a compact carpet of bright-green foliage completely covered when in bloom with a mantle of white flowers. The thin, wiry stems are rigid, only two or three inches high and freely branched.

S. HYPNOIDES.—"The Dovedale Moss" with its emerald-green carpet is a well-known plant in gardens. During the winter months it is a valuable plant in the rock garden, the beautiful tufts of foliage being attractive. In the spring and early summer the plant is studded with white flowers. S. hypnoides is a very rapid grower and makes a fitting background for spring flowering bulbs. There is a prettily variegated variety.

S. MUSCOIDES.—This is a dwarf, dense, carpeting Saxifrage with yellowish flowers and forming a mossy turf only an inch or so in height. S. m. var. atropurpurea, with bright-red flowers, is one of the sources of all the fine red hybrids that we possess. There are numerous other varieties, and all are useful for planting in half-shady situations.

S. TRIFURCATA.—A taller-growing plant than S. muscoides, native of Northern Spain. It makes a carpet of rosettes with three parted leaves of a stiffer character than most in this section. The attractive and pure-white flowers are borne in graceful sprays on stems 3 inches or more high. S. t. var. ceratophylla, known as the Stag's Horn Rockfoil, has more deeply-parted leaves, and even more rigid in character than those of the type.

S. WALLACEI.—For planting with spring bedding in borders or rock gardens this is one of the best in this section. The foliage is distinct and of a light green colour, whilst the large, white flowers are sweetly scented. The plant is of garden origin, but was considered at one time to be synonymous with S. Camposii, a Spanish plant with less hairy stems and leaves.

All the members of the mossy section of the genus Saxifraga grow well in light, rich and well-drained soils. They prefer half-shady situations where the sun does not burn the foliage. Division is the safest means of increase where it is desired to keep the particular form or variety true, as the plants cross so readily and the seedlings may not be true to character. *W. I.*

REMARKS ON CONDITION OF THE FRUIT CROPS.

(*Concluded from page* 191.)

(*See Tables and Summaries, ante, pp.* 80-85.)

8. ENGLAND, S.W.

CORNWALL.—Apples are very scarce, although the following varieties are carrying fair crops in these gardens: Ecklinville Seedling, Lord Derby, Small's Admirable, Sandringham, Grenadier, Gold Medal, Tom Putt, Lady Sudeley, Worcester Pearmain, Jas. Grieve, and Allington Pippin. All bush fruits were plentiful and good. Strawberries were very good. Plums set well, but after a time the fruits turned yellow and most of them dropped, owing, I think, to winds. Pears are very scarce. Cherries are not much grown in this district. Peach and Nectarine trees were badly "blistered" in the spring. Our soil is light, and crops suffer quickly from drought. *W. Brown, Prideaux Place Gardens, Padstow.*

—— The fruit crops are the worst for ten years past. Owing to the wet and sunless autumn of 1912 the buds were not properly ripened, consequently the blossom was weak. Then followed a stormy, sunless spring, and any hopes of average fruit crops were destroyed. *Wm. Andrews, Tregothnan, Truro.*

DEVONSHIRE.—The fruit crops are much below the average. Apples set in thick bunches, but many have fallen. Cherries, Pears, Peaches, and Nectarines did not set. There was an abundance of blossom, but very little pollen. The cause of the failure is unripened wood. The rainfall in 1912 amounted to 52 inches. *Geo. Baker, Membland Hall Gardens, near Plymouth.*

—— The noted orchards of the West are scarcely carrying half a crop. Cold, westerly winds whilst the trees were in bloom caused much damage. Pears are practically a failure; but there was a record crop last year, which doubtless accounts partly for this season's failure. Plums also are very scarce. Strawberries suffered from continued drought, the late varieties being small in berry. Gooseberries, Currants and Raspberries were plentiful. I never remember Filberts and Cob Nuts being so scarce; many bushes have not a single nut. *James Mayne, Budleigh Salterton.*

GLOUCESTERSHIRE.—Fruit trees blossomed in perfection, and there were no spring frosts, but owing to a continuation of cold winds, many of the fruit trees have not a fruit on them. Absence of sunshine last autumn is the main cause of failure, as the wood did not ripen. The gardens are situated in a valley, and the subsoil is cold and heavy. *Wm. Keen, Bowden Hall Gardens, near Gloucester.*

—— Apples, which promised to be a good crop, became infested with aphis in the trusses of bloom, and many of the fruits dropped. Plums also were much affected with aphis. Pears are scanty after last year's heavy crop. Cherries were almost a failure. I have never known Morello Cherries to fail here before. Gooseberries and other small fruits were very good. Strawberries were a very heavy crop and of excellent quality. Nuts are a failure. *John Banting, Tortworth Gardens, Falfield.*

—— Pears are scarce, as was expected after the heavy crops of last year. Plums promised splendidly, but adverse climatic conditions and a bad attack of aphis at a critical period spoiled the good prospects. Cherries suffered severely through attacks of black aphis. Peaches and Nectarines were much injured by leaf blister. We had good crops of Currants, Raspberries, and Gooseberries; but many Gooseberries were unsaleable owing to infestation of American Gooseberry Mildew. Strawberries were the best fruit crop of the year. *G. H. Hollingworth, County Education Office.*

—— Apricots, Pears, Peaches, and Plums are failures, notwithstanding that the trees flowered profusely. Cherries were a fair crop, and Apples are satisfactory. All kinds of small fruits were above the average and of good quality. We have practised spraying continuously to destroy blight. *F. C. Walton, Stanley Park Gardens, Stroud.*

—— Peaches, Nectarines, Apricots, and Pears are complete failures owing to unripened wood. Though the trees flowered profusely, the blossoms were weak, and soon succumbed to the cold winds and spring frosts. Apples are an average crop. Bush fruits were above the average. Strawberries were an abundant crop, the fruits large and clean. Royal Sovereign and Givon's Late Prolific are the two best varieties for our soil. Cherries were an average crop, but many of the fruits dropped during the stoning period. Nuts are very scarce. *A. Chapman, Westonbirt, Tetbury.*

—— Strawberries, Raspberries, Gooseberries, and Black and Red Currants were average crops of clean fruits. Plum trees set a fair crop, but the fruits dropped after setting. Some Apple trees are carrying average crops, especially the variety Lane's Prince Albert. Pears are very scarce. Our soil is light, on a sandy subsoil. *W. H. Berry, Highnam Court Gardens.*

Herefordshire.—Apples are patchy. Blenheim Pippin, Lane's Prince Albert and Worcester Pearmain are good crops, and the trees are fairly clean; most of the other varieties are scarce. We have no fruit on the outside Peach walls, and the trees have been badly infested with blister, in some cases completely spoiled. The Pear crop is a complete failure, although the trees had plenty of bloom. Strawberries have been good, especially Givon's Late Prolific. The soil is heavy loam, on limestone. *George Mullins, Eastnor Castle Gardens, Ledbury.*

Monmouthshire.—Apples are considerably under the average, though some varieties of bush trees required thinning. Lane's Prince Albert has especially heavy crops. Pears, Peaches, Apricots and Cherries are very deficient. Some varieties of Plums, notably Victoria, bore fair crops. Small fruits generally were satisfactory: Raspberries were particularly good. Strawberries were a fair crop. Aphis has been troublesome upon Apples, Plums and Currants, and has entailed much labour and expense in spraying. The trees escaped damage by frost whilst in blossom, but rain fell heavily almost daily during that period. *Thos. Coomber, The Hendre Gardens, Monmouth.*

Somersetshire.—Early fruit trees commenced to bloom abundantly at the end of February. The weather of March, April and May was very wet and cold, but there were no severe frosts. The rainfall for those three months was more than double the average, and to that cause I attribute the very poor crops of fruit. *George Shawley, Halswell Park Gardens, Bridgwater.*

Worcestershire.—Pears, Damsons, Apricots, Peaches, and Nectarines are practically failures, which I attribute primarily to the wet, cold and sunless period while the trees were in blossom. Choice dessert Plums, both in the open and on walls, are a failure, whilst culinary varieties in the open, such as Victoria, Pershore, Early Prolific, and Mitchelson's, are bearing good average crops. Pears have failed badly, although the trees are healthy. Morello Cherries were an average crop. For Peaches and Nectarines the season of blossoming was most disastrous. I never saw trees more severely injured; the young growing buds were killed, and the trees had to start into growth afresh. Apples set most profusely, for good weather prevailed whilst these trees were in bloom. The soil in this district is the new red sandstone. *A. Young, Witley Court Gardens, Worcester.*

—— Hardy fruit trees, when in bloom, gave every promise for good crops, but the results were probably never worse, Apples excepted. The cause of failure was persistent showery weather during the whole blossoming period. The flowers were never dry, consequently fertilisation was impossible. Moreover, we have never had more persistent and repeated attacks of every type of aphis on all kinds of trees. Even Apple trees which had been several times sprayed with lime-sulphur, nicotine and other insecticides, were just as badly infested. Probably the rainy weather being so continuous neutralised the effect of the insecticides. *W. Crump, Madresfield Court Gardens, Malvern.*

—— Soft Apples, such as Keddleston Pippin and Lord Suffield, are a thin crop. Damsons are almost a failure. Pears set well, and looked remarkably well at one time, but later they dropped. Egg or Pershore Plums are a good crop in some places. Of other varieties of Plums some few are bearing. It is somewhat difficult to estimate the Plum crop, for where the variety Pershore only is grown they are in one case an average crop and a failure in another. Cherries were good and clean. Gooseberries were satisfactory, but Black Currants were a thin crop. Strawberries were excellent in every way, and, strange to say, three-year-old plants bore the finest fruits. *Thos. Watkins, The Grange Gardens, Claines.*

—— There was an abundance of blossom on the Pear trees in these gardens, but the fruits set badly, and are very scarce; this I attribute to the wet, sunless season of 1912, as the wood was unripened. The Strawberry crop was a very heavy one, and the fruits were of good quality. Currants, Raspberries and Gooseberries were all very plentiful. Our soil is a good medium loam resting on sandstone. *Ernest Avery, Finstall Park Gardens, Bromsgrove.*

—— In some districts and on some trees Apples are plentiful, but the crop generally is under the average. Of Pears there are scarcely any. Choice varieties of Plums are scarce, but the popular Worcestershire Plum, Pershore, is plentiful, the flowers being less easily injured by frost than many varieties. Gooseberries, Strawberries and Raspberries were plentiful, but below the average in size. Black Currants were abundant, but rather small. Red Currants and Loganberries were also equal to the average in quantity. There are no Damsons. *James Udale, Droitwich.*

WALES.

Cardiganshire.—The fruit crops generally are below the average. The weather conditions were unfavourable when the trees were in flower. The cold weather and a continuance of rain prevented the pollen from drying and becoming distributed. The soil is very cold and heavy, overlaying slaty rock. The growth on Apple and Plum trees is very much injured by aphis. *W. Phillips, Derry Ormond, Cardiganshire.*

Carnarvonshire. — The fruit crops are amongst the worst on record. Apple trees flowered profusely, but only certain varieties have any fruit. Worcester Pearmain, Mère de Menage, and Keswick Codlin are the best varieties. Pears are almost a failure. Peaches are very badly infested with blister. Morello Cherries were a beautiful sight when in blossom, but all the fruits dropped. Small fruits were a wonderful crop, especially Gooseberries. The soil is very gravelly, and the crops are soon affected by drought. *J. S. Higgins, Glynllivon Gardens, Carnarvon.*

Denbighshire.—After a wealth of blossom, which was badly injured by cold winds, the fruit crops are under average with the exception of bush fruit and Strawberries. Apples and Pears are scarce but good. Plums, Peaches and Nectarines, notwithstanding that the trees are protected when in flower, are scarce but good. Apricots were almost a failure. Scarcely a bee was to be seen during the time fruit trees were in flower, and although means were taken to assist fertilisation, very little fruit set. Strawberries have been a heavy crop. Royal Sovereign was a good first, with large, evenly-ripened fruit, followed by Sir Joseph Paxton and Givon's Late Prolific; bush fruits were average crops and very good. Nuts are scarce. Our soil is a good heavy loam resting on clay. *Hy. Young, Horsley Hall Gardens, Gresford.*

Flintshire.—Apples are very irregular, Irish Peach, Worcester Pearmain, Warner's King, Cox's Pomona and Letty Geeson are good crops. Lord Suffield, Ecklinville Seedling, Blenheim Pippin, Dumelow's Seedling and Keswick Codlin are very scarce. Pears are practically a failure. Peach trees were nearly killed by the cold, wet spring. Small fruits were fairly good. *J. Barnard, Mostyn Hall Gardens.*

Glamorganshire.—The fruit crops are most disappointing, especially Apples, Pears, Plums, Peaches and Nectarines. The two last-named are the lightest crops I remember during the past 24 years. The cause of failure was the wet, cold, sunless summer of last year, as the bloom this spring was very weak, and to make matters worse they were scarcely ever dry, owing to continuous rains. Pears are the most disappointing crop, as the trees were literally clothed in strong, healthy bloom, but all the fruits dropped. Apples are also very thin, and I account for the failure in this case to blight affecting the young growth last summer, which was so bad that many trees were killed outright. All small fruits were plentiful and good. Strawberries have been excellent, both in regard to crop, size and quality. *R. Milner, Margam Gardens, Port Talbot.*

Pembrokeshire.—The fruit crops are a failure. There was a very fair promise when the trees were in bloom, especially for Apples, but during the month of May the country was swept with wind storms, with disastrous effects. The fruit trees not only lost their fruit, but their foliage as well. The storms had the same effect on the forest trees, and a vast number of them, at the present, are looking as they usually do in November. It may be interesting to note what varieties of fruit withstood the storm best:— Apples: Lord Grosvenor, King of the Pippins, Lane's Prince Albert; Pears: Emile d'Heyst; Plums: Victoria; and Cherries: Biggareau Napoleon. The Morello Cherry failed here this season for the first time on record. *Geo. Griffin, Slebech Park Gardens, Haverfordwest.*

—— The fruit crops generally are not up to the average. Apples are the worst crop I have seen for many years, and the same may be said of Pears. Peaches are plentiful and good. Plums are a heavy crop, and most varieties have had to be thinned. Sweet and Morello Cherries were very bad. Wall trees are free from insects and are making good clean growth. Royal Sovereign Strawberry has been remarkably good, but later varieties were not so satisfactory. Gooseberries and Currants were both very plentiful, but Raspberries fall short of the average. The soil is a light loam resting on slate stone. *Wm. A. Baldwin, Clynfiew Gardens, Boncath.*

Radnorshire.—Apples are an average crop, although quite half the early sorts were fruitless. Pears are very few, and Plums have but a thin crop, trees of the variety Victoria being quite barren; Peaches and Nectarines are again a failure, being the third year in succession. Small fruits seem to have made up for other deficiencies, although Black Currants were none too plentiful. Strawberries were a very heavy crop of good berries. The soil is a deep loam of medium texture. *J. MacCormack, Maesllwch Castle Gardens.*

9. IRELAND, N.

Meath.—The fruit crops are amongst the worst in the memory of the oldest fruit grower. There was very great promise for a good fruit year up to the end of May, but cold, sunless weather lasted for a long time, and when growth commenced at the end of May the fruit turned yellow and dropped. This part was formerly one of the most extensive fruit-growing districts in Ireland, but owing to poor prices many of the orchards were laid down in grass for grazing young cattle. This year fruit-preserving works have been started at Julianstown, so that growers may give fruit-growing better attention

in the future. *Michael M'Keown, Julianstown, Drogheda, Meath.*

Tyrone.—Apples are very thin, and of Pears there are scarcely any. A few Victorias are all the Plums we have. Cold and stormy weather at blossoming time is the cause of the failure, rain and hail with high wind occurring daily at that time. Apple scab is rather prevalent, also American Blight. *Fred W. Walker, Sion House Gardens.*

Westmeath.—Plum and Pear trees set heavy crops, but only a small proportion of the fruits swelled, and the others turned yellow and dropped; I attribute this to badly-ripened wood, as Peaches under glass behaved in a similar way, and they could not have been affected by the weather. Apples also blossomed profusely, but the fruits set badly. *Geo. Bogie, Pakenham Hall Gardens, Castlepollard.*

10. IRELAND, S.

Cork.—The weather in spring was cold and wet, and scarcely any Apple blossom developed. Pear trees blossomed well, but were badly blighted in May, although insect pests were not so bad as usual. Crops in grass orchards are complete failures. Bramley's Seedling, Newton Wonder and a few other Apples are bearing fairly well on the Paradise stock. *M. Colbert, Aghern Gardens, Conna.*

Waterford.—The fruit crops are disappointing. Apples, Pears and Cherries are scarce. Lane's Prince Albert is the best cropped variety of Apple. Fruits on standard trees of the variety Bramley's Seedling are very scarce. Pears also are a thin crop, the earlier varieties being best. Cherries were poor, and many of these fruits dropped during the stoning stage. All small fruits were fairly good, Raspberries being an exception. *D. Crombie, Curraghmore Gardens, Portlaw.*

CHANNEL ISLANDS.

Guernsey.—The fruit crops promised well in early spring but heavy gales and very cold nights in April destroyed the blossom, including that of early Strawberries. *C. Smith and Son, Caledonia Nursery.*

Jersey.—The fruit crops are very bad indeed. The trees flowered well and looked most promising, but the blossom was all cut off by cold winds. *T. Sharman, The Imperial Nursery, St. Helier.*

FLORISTS' FLOWERS.

SWEET PEAS.

The last week of September or the first in October is the time to make a sowing of Sweet Peas for flowering under glass in April and May or out-of-doors in June. There is an increasing demand for flowers of Sweet Peas in the spring. Then their freshness, fragrance and beauty make them specially charming, and their culture presents no great difficulties. The best place to sow now is in a perfectly cold greenhouse or frame in boxes or pots. What is wanted is a short-jointed, stocky growth, which will winter without running up. It must have been observed that plants raised in the open ground branch out quite close to the ground. This condition is also the proper one to obtain under glass, and it can only be done by cool treatment. When the main shoot gets three or four inches long the top should be pinched off to encourage the side-growths if they have not already appeared, as they are invariably stronger than the centre one. With the exception of the finer orange and scarlet coloured varieties, young Sweet Pea plants will stand any amount of cold weather, but for the sake of these more tender varieties it is advisable not to allow a mixed collection to get frozen. Remember that it is hardly possible to keep them too cool until after Christmas. The pots or boxes should stand on a well-drained base, and water should only be given when it is absolutely required. In the selection of varieties for flowering under glass avoid purples and crimsons. All other colours do well, especially salmons, lavenders and cream-pinks. It is much better to have half-a-dozen sorts in quantity than many sorts represented by only a potful or two of each.—*Cultivator.*

The Week's Work.

THE ORCHID HOUSES.

By W. H. White, Grower to Sir Trevor Lawrence, Bart., Burford, Dorking.

Odontoglossum.—The present is the best season of the year to overhaul the inmates of the cool Odontoglossum house with a view to undertaking any necessary potting operations. Many fresh growths are developing, and from the bases of these shoots roots will appear that will establish themselves in the new compost before the winter. In a general collection of Odontoglossums, both species and hybrids, at Burford we find that at no period of the year are the plants all ready for re-potting at the same time, but the work is spread over almost the entire twelve months; even during the hotter part of the summer well-established plants that need larger pots are given them, but the roots are scarcely disturbed in the process. If the work is done carefully loss of foliage or shrivelling of the pseudo-bulbs seldom ensues. Any specimens that have deteriorated through exhaustion from excessive flowering or other causes, also special varieties, the stock of which it is desired to increase, may be divided. Plants that are sending up flower-spikes and those which have not yet started to grow should not be disturbed at this season. Their re-potting should be deferred until new growths appear and the roots become active. In overhauling the plants with a view to selecting those that need immediate attention select any that are well on the dry side, as the roots are less susceptible of injury when in this condition. Unhealthy plants may be turned out of their pots, and, after removing dead roots and sour compost, re-potted into as small receptacles as will accommodate them. Healthy, well-established plants with several leading growths that need increased root room should be merely turned out of the old receptacles and placed into larger pots without otherwise disturbing the roots. There will probably be several back pseudo-bulbs on such plants, and if the rhizome of these be severed partially with a sharp knife sound buds at the base will soon develop into growths, thereby increasing the size of the specimen. Moderate-sized plants growing in 4½ or 6-inch pots with a single lead or a double break may have the old back pseudo-bulbs removed, and these will root on damp Sphagnum-moss, or they may be placed in pots filled with small crocks, to be potted when the new growths appear. Do not unnecessarily disturb the roots of the leading portion of the plant that has been divided. Weak specimens that are to be divided and potted into small pots should be placed together at one end of the house, which may be kept, not necessarily warmer, but a trifle closer than the other part. Also keep the atmosphere fairly moist, but do not afford much water at the roots. In all cases the pots should be clean and about half-filled with crocks. Pot each plant with moderate firmness, keeping the base of the young growth about on a level with the rim of the pot. A suitable compost for small plants and seedlings, also for those that have deteriorated and are in small pots, consists of small portions of Osmunda-fibre and Sphagnum-moss in equal parts, with small crocks to keep the soil porous. For moderate-sized plants and large specimens Osmunda-fibre only should be used, for when Sphagnum-moss is employed, unless it is cut up very small, the compost does not dry quickly, but becomes sour and stagnant. Five or six weeks after re-potting is a critical time for Odontoglossums. Afford water sparingly, merely keeping the surface of the compost fairly moist; then, as time goes on and the plants are making suitable progress, the amount of water may be increased gradually, always allowing the compost to become moderately dry before it is again wetted. A moist atmosphere should be maintained and plenty of fresh air admitted, especially when the outside temperature is about 50° and there is not sufficient wind to cause draughts. Admit plenty of air at night whenever the weather is mild, and for the present shade the plants from strong sunshine.

THE FLOWER GARDEN.

By Edward Harriss, Gardener to Lady Wantage, Lockinge, Berkshire.

Violets.—The plants should be lifted from the open ground and planted in cold frames. Should the ordinary soil of the garden be unsuitable a fresh compost should be prepared of finely-chopped loam and decayed leaf-mould: if the loam is poor in quality it may be enriched with the addition of cow manure. Place sufficient soil in the frames so that when the plants are set they will be only a few inches from the top of the frame. Should any trace of red spider be detected on the foliage dip the plants in an insecticide before planting them. Preserve a good ball of soil about the roots and replant with the least possible delay. Set the roots firmly in the soil and soak the latter with clear water when the work is finished. The lights may remain closed on the frames for a few days, and during bright weather a light shade afforded, but afterwards admit fresh air.

Climbing Roses.—Cut out all useless, weakly spray-growth at once, for it is only by doing this that the plants may be kept in a flowering condition. Give moisture at the roots when required, as growth is still active, taking especial care to see that plants growing against walls are well watered. If the young shoots are affected with mildew syringe them with a specific.

Planting Bulbs.—Bulbs intended for naturalising in grass should be planted, and the sooner the better. Daffodils thrive best in fairly-moist, partially-shaded situations in the woodland. Where large supplies of cut flowers are required batches of Tulips and Narcissi may be planted in the reserve quarters in ground that has been thoroughly well dug, and enriched with manure and soot.

Specimen Plants in Tubs.—With a continuation of fine weather summer flowers may continue to make a brilliant show for some time to come. It is always a matter for regret when beds of flowers, which are perhaps at the height of their beauty, have to be uprooted at the end of the season. Should frosts appear likely protection should be afforded the more tender subjects, and sheets of tiffany placed lightly over the beds will be a sufficient protection at this time of the year. Tender plants in tubs may remain out-of-doors for several weeks to come if provision is made for covering them during times of frost. To preserve a tidy appearance in the flower garden for the next few weeks the beds should be examined almost daily, with a view to removing dead flowers and foliage.

Spring-Flowering Plants.—Stir the ground between the plants frequently with the hoe. The plants will not need much watering after this date, as an excess of moisture may cause them to become unduly coarse and sappy, conditions that make them unfit to withstand a severe winter.

FRUITS UNDER GLASS.

By James Whytock, Gardener to the Duke of Buccleuch, Dalkeith Palace, Midlothian.

The Orchard House.—Fruit trees growing in pots or planted out under glass must not be neglected after the crops are gathered. The foliage of Cherry and early Plum trees should be syringed frequently with clear water, and, if attacked by insect pests, sprayed with an insecticide. The borders of late varieties which were kept dry whilst the shoots were ripening should now be soaked, and applications of manure-water will be beneficial. Fruit trees in pots should be watered with extra care during times of dry weather. Late varieties of the best kind of Plums will continue to yield supplies of ripe fruit for a short period. The roots should be kept moist with clear water only and a free circulation of air admitted. Damp the paths and bare surfaces of the house on bright days.

Peach Houses.—There has been little difficulty in ripening fairly strong growths on mid-season and later trees this year, but where the wood is not so ripe and firm as may be desired a little warmth may be allowed to circulate in the hot-water pipes and air should be admitted freely. Owing to the dry summer red spider has been unusually troublesome, and if any of the pest is still present on the foliage syringe the trees vigorously on fine afternoons. The

fruits in late houses where no fire heat is used are ripening, and the trees require careful attention. Expose the fruits as much as possible to the sunshine, placing a leaf aside here and there, and bringing the fruiting-twigs well up to the trellis. Whilst making the most of the sun's heat for the purpose of ripening the fruits, do not neglect to keep the air in constant circulation. After the fruits are gathered syringe the foliage on bright afternoons to keep the leaves clean and healthy. A little soft soap and sulphur in solution will be valuable for destroying red spider. As no artificial warmth is employed, make the best use of the sun's heat, in order that the wood may be ripened thoroughly. Examine the inside border, and, if found to be dry, soak the soil with water. If it is found that the trees in the Peach houses are not doing well, because of unsuitable borders, let there be no hesitancy in renewing the latter, either during the present month or whenever the foliage parts easily from the shoots. Start the work at a good distance from the trees—at about where the roots have reached their limit, removing the soil carefully with a fork, taking care to preserve the roots from injury. Work towards the stem of the tree, and when all the roots are bare wrap them in wet garden mats.

New Borders.—The first thing to consider in the new border is efficient drainage; should the subsoil be a cold clay, cover it with cement, sloping it in the direction of the drain, so that the water may pass away. Next place a layer, 9 inches deep, of broken bricks or stones, and cover these with fresh sods, placed grass-side downwards. The Peach gives the best results when grown in a heavy loam, and this material should be mixed with portions of brick broken finely, and lime rubble to keep it open. If only light loam is available, use that containing plenty of fibre, and mix with it lime rubble, and to every barrowful of soil add a little bonemeal and artificial manure. Place the soil to the depth of 2½ feet; the width of the border should be a little more than the length of the longest roots, making provision for extending the border when the roots require increased room. Arrange the roots in layers, and place them near to the surface. Any roots that are very strong and bare of fibres, also any that are damaged, may be shortened, but preserve all the small roots. In arranging the soil in the border, also in planting the trees, make the compost very firm.

Lifting Peach Trees.—Young trees in fresh borders make vigorous growth for the first season or two afterwards, and in consequence produce little or no fruit. The best treatment is to lift the trees completely out of the border and replant them, but this should not be done until the foliage parts freely, otherwise the shoots may shrivel. Start at the extremity of the roots, and remove the soil carefully with the fork until it is safe to lift the base of the tree with a ball of soil attached. All strong-growing roots, including tap roots and those growing in a downward direction, should be cut back. In replanting take care to keep the roots near to the surface, and make the soil very firm, both under and over the roots. Water the border sufficiently to wet it thoroughly to the bottom, and keep the house rather close for a short time afterwards.

PLANTS UNDER GLASS.

By F. Jennings, Gardener to the Duke of Devonshire, Chatsworth, Derbyshire.

Bouvardia.—Bouvardias which have been planted out in the open ground or in cold frames should we watered and placed in a close pit, light, fibrous loam and leaf-mould in equal parts, with the addition of some coarse sand and wood ash. If the loam is heavy a little peat will be beneficial. When potted, the plants should be watered and placed in a close pit, frame or house, shaded from the sun. They should be syringed to prevent their flagging, and as soon as they have recovered from the disturbance at the roots they should be placed in their flowering quarters and afforded a temperature of 50° to 60°, in a house where the atmosphere is kept moist.

Housing Tender Plants.—Tender plants that have been growing out-of-doors during the summer should be brought into the glasshouses for the winter. First wash the pots, then sprinkle a little artificial manure on the surface of the soil and water the plants by means of a rose-can.

Tree Carnations.—These plants should be afforded a night temperature of 55° to 60°. Damp the bare spaces of the house and syringe between the pots on bright days to promote atmospheric moisture. It is preferable to stand the plants on a layer of ashes; if the ashes are objected to as being unsightly a light covering of gravel will give the bed a smart appearance. Before throwing away the old stock plants take a further batch of cuttings and insert them in frames or boxes provided with bottom heat, as advised in a previous calendar. I find that at Chatsworth cuttings rooted at this time of the year give far better results than those struck in January. I am not advising this practice for the South of England, where those inserted in January and February are preferable. It is because cuttings cannot be obtained in this district until the latter end of February, whereas in more southern gardens there are plenty of cuttings available just now. See that the shoots are free from red spider before they are inserted, and it will be wise to dip them in an insecticide, afterwards immersing them in cold water.

Begonia Gloire de Lorraine.—Where large batches of this Begonia and its white variety, Turnford Hall, are grown, some of the plants may be allowed to develop their flowers now. Let the plants be placed in a house having a temperature at night of from 60° to 65°. These Begonias, when in flower, should not be kept in such a damp, close atmosphere as in the earlier stages. Specimens that are well rooted may be top-dressed with a little fertiliser. Syringe between the pots to destroy red spider and fumigate the house occasionally.

Coleus thyrsoides.—Plants of this species require a temperature at night of 55° to 60°, and the roots should be fed with a fertiliser or liquid manure when nourishment is required. Admit plenty of air during the daytime, so that the growth may be sturdy, and do not syringe the foliage.

The Stove House.—Codiæums (Crotons), Dracænas, Pandanas, and Browallia speciosa major are suitable plants for furnishing the mixed stove, and they should now be established in large pots, ready for placing in the warm house. Early batches of Clerodendron fallax are on the point of flowering, and these plants also will add to the attractiveness of the stove. Plants of the later batch of Browallia intended for decorating the stove in the winter should be stopped for the last time.

Hot-Water System.—Let the flues of the furnace be swept and overhauled thoroughly. Place new firebars where the old ones are worn or rendered useless by the heat of the furnace. Flush all the pipes and cleanse the boilers, so that everything will be in perfect working order when cold weather sets in.

THE KITCHEN GARDEN.

By John Dunn, Foreman, Royal Gardens, Windsor.

Cauliflowers.—By making a sowing this month and wintering the plants in cold pits a good supply of Cauliflowers may be had next June. The exact date on which to make the sowing will depend on circumstances; nothing will be gained by starting too soon, as the plants will become so forward as to be too large when the time arrives for planting them out, whilst if grown in pots they would almost be sure to become stunted. Sow the seeds thinly in a cold pit, which will provide protection for the seedlings during times of frost before they are potted. The soil should not be of too rich a nature, and must be made moderately firm, so that the plants may grow compact. When large enough for transplanting the seedlings may be repotted singly into large 60-sized pots. Stand the receptacles on a bed of ashes, which should be about 18 inches from the roof-glass. There will be no need to place the lights in position until the weather becomes cold or excessively wet, and even then they should only be used when absolutely necessary. The soil for potting may consist of a mixture of three parts sandy loam, and one part leaf-mould; it should be made moderately firm about the roots. Many growers have discontinued sowing Cauliflowers in autumn, depending entirely upon plants raised in the spring. But I still obtain the best results from autumn-raised plants. At Frogmore we grow the varieties Magnum Bonum, Walcheren and Early London, and they mature in the order given. Our stock consists of 8,000 plants, which are grown in pots throughout the winter and planted out-of-doors as early in April as the weather permits.

Lettuce.—Plants raised from seeds sown early in August are ready for transplanting on a sheltered border where protection may be afforded them in November. Lettuces are often harmed by an excess of moisture in early winter, when the sun has but little power. In these circumstances it is necessary to cover as much of the crop as possible, so that a supply may be maintained well into the winter without drawing upon those in pits. All that is necessary is to provide some covering which will ward off rain water without producing a stagnant atmosphere, but it should not be placed in position before it is necessary. Spare lights or box frames will answer the purpose well. A sowing of Brown Cos, Stanstead Park, and Maximum may be made now in a cold pit for planting out next March, or earlier if the weather is favourable.

Mid-Season Potatos.—This crop should be lifted and the tubers stored as soon as possible, The tubers should not be allowed to remain exposed to sunshine. Unless there is a suitable house for storing the tubers they are best wintered in pits in the open, covering them with sufficient soil to prevent frost. The tubers should be perfectly dry before the final covering of soil is placed over them. If it is necessary to save seed tubers these should be selected now and placed in a dry shed where air is admitted freely. The haulm of late varieties is still green, and the tubers will require to be left in the ground for some time to come.

THE HARDY FRUIT GARDEN.

By B. Goodacre, Gardener to Sir Ernest Cassel, Moulton Paddocks, Newmarket.

Late Plums.—Many late varieties of Plums, such as Grand Duke, Monarch, Coe's Violet and Coe's Golden Drop, will, if protected from birds, wasps and other pests, hang on the trees until the end of October. It is a good plan to wrap each fruit separately in cotton-wool, rough side outwards, tie up the end lightly, and secure the fruit to the wall. See that the tree does not suffer for want of water at the roots or the fruit will become unduly shrivelled.

Wall Trees.—The bright, warm weather is very beneficial to fruit trees on walls in ripening the wood. Soft growths should be pinched persistently, so as to allow the sunshine to reach and ripen next season's fruit buds. Many trees are cleared of their fruits, and should be syringed thoroughly, using soft water for preference. The work should be done in the early part of the day, so that the wood may become dry before night. The fruits of fan-trained Peach, Nectarine and Morello Cherry trees have been mostly gathered, and special attention should be devoted to ripening the growths of the current season, as these will be the fruiting shoots of next year. In most of the trees more shoots may have been trained in than are likely to be required; the superfluous growths, together with older wood, should be thinned out, leaving such shoots as are left thinly and lightly tied and fully exposed to light and air. Preparations may be made for root-pruning such trees as require this operation. If the tree is a young specimen it is best to lift it to make an examination of the root system, but this cannot be practised with large trees. In this case a wide trench should be cut a good distance from the stem of the tree. This will permit of the spade being used in a horizontal direction under the roots. All tap roots and those growing in a downward direction should be cut clean through. The root-pruning must not be carried out in too drastic a manner, or more harm than good may result. Old trees, which have furnished fair crops of fruit for several years, seldom need root-pruning.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the **PUBLISHER**, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, *as well as specimens of plants for naming, should be addressed to the* **EDITORS**, 41, Wellington Street, Covent Garden, London. *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Editors and Publisher.—*Our Correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the* PUBLISHER; *and that all communications intended for publication, or referring to the Literary department, and all plants to be named, should be directed to the* EDITORS. *The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.*

Illustrations.—*The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.*

Local News.—*Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, SEPTEMBER 22—
Nat. Chrys. Soc. Executive and Floral Coms. meet.

TUESDAY, SEPTEMBER 23—
Roy. Hort. Soc. Coms. meet. Special Vegetable Competitions. (Lecture at 3 p.m. by Mr. Bernard Crisp on "Autumn Border Plants.")

WEDNESDAY, SEPTEMBER 24—
North of Eng. Hort. Soc.'s Fruit and Potato Congress at Kendal (2 days).

THURSDAY, SEPTEMBER 25—
Roy. Hort. Soc. Exh. of British-grown Fruits (2 days).

FRIDAY, SEPTEMBER 26—
Ann. Conference of Affiliated Mutual Imp. Socs. at R.H.S. Hall, Westminster.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich, 55.5°.

ACTUAL TEMPERATURES:—
LONDON, *Wednesday, September* 17 (6 p.m.): Max. 61°; Min. 52°.
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London. *Thursday, September* 18 (10 a.m.): Bar. 29.6°; Temp. 58°; *Weather*—Overcast.
PROVINCES.—*Wednesday, September* 17: Max. 58°, Valencia; Min. 52°, Aberdeen.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY, AND FRIDAY NEXT—
Dutch Bulbs at 67 and 68, Cheapside, E.C., by Protheroe and Morris, at 10.30.

WEDNESDAY NEXT—
Special Trade Sale of Bulbs, Lilies, &c., Palms and Bays, at 67 and 68, Cheapside, E.C., by Protheroe and Morris, at 1.

MONDAY, WEDNESDAY, AND THURSDAY—
Dutch and French Bulbs, Palms, etc., at Stevens's Auction Rooms, King Street, Covent Garden.

The Lawes and Gilbert Centenary Fund.

The year 1814 saw the birth of the late Sir John Lawes, and 1817 was the year of birth of the late Sir Henry Gilbert. These two dates are so important in the history of horticulture and agriculture that arrangements are being made to organise a centenary fund by which an appropriate memorial may be set up.

Every cultivator of the soil has heard of Rothamsted, and many hundreds have visited the experimental plots and seen something of the work that has been done there. Very many more, however, are unconsciously utilising the results of the labours of the Rothamsted investigators, and are getting better crops at less expense than could have been obtained had the Rothamsted Experimental Station never existed.

When Sir John Lawes came into the Rothamsted Estate at the age of 19 years agriculture was still rather in the depressed state into which it fell after the Napoleonic wars. Some of the large landowners were taking a serious view of their responsibilities, but many others were careless and negligent, and there would have been nothing unusual in the circumstance had Sir John taken to the easy-going life of the English country gentleman. But he did not; instead, he began to make experiments, and in doing this he went further than such of his predecessors and contemporaries who were also experimenting, for he realised that two men are better than one at the business. He found as colleague a young chemist, Joseph Henry Gilbert, who after studying under Thomson, Graham and Liebig, had turned to calico printing near Manchester. The two men were particularly well fitted for each other; Lawes had a thorough practical knowledge of farming, while Gilbert had a thorough knowledge of chemistry; Lawes was a quick thinker given to generalising, and Gilbert was a most careful and painstaking investigator who always insisted on ample proof before he accepted anything, and compiled abundant evidence in proof of the statements he made. Thus right at the outset the work represented that combination which is rightly looked upon as necessary for horticultural and agricultural experiments: a combination of practice with science. Landowners before Lawes had made experiments, and chemists before Gilbert had attacked agricultural problems. But no one before or since has done quite so much as these two investigators, because no one man could have the combination of qualities they jointly possessed.

The first big problem they studied was: what are the substances that plants feed upon, and how may the farmer increase the supply of them in the soil? Liebig had done much to clear up the problem from the theoretical side, but the practical problems remained largely unsolved. Lawes and Gilbert therefore set out field experiments to study the requirements of the four members of the old Norfolk rotation: Wheat, Barley, Clover and Swedes, to which they later added Grass, Oats, Potatos, Sugar Beets and Mangolds. Lawes had already found that bones, so useful on other lands, were ineffective on his own, and he traced this lack of action to the insolubility of the phosphates. When the bone was treated with sulphuric acid it proved very active. Lawes understood chemistry sufficiently to know that calcium phosphate from any other source after treatment with acid would give the same result, and so he was led to the discovery of superphosphate, a valuable manure made out of two substances of less direct value to the farmer, namely, sulphuric acid and insoluble rock phosphate, both of which can be obtained in practically inexhaustible amounts.

They soon found that all crops excepting clover must have a sufficient supply of nitrogenous food or they will not grow.

But nitrogen manures alone would not give satisfactory results. Complete success was only obtained when phosphates and potash salts were applied in addition. Some crops wanted more of one than of others: Barley and Swedes wanted more phosphate; Mangolds and Clover wanted more potash; but each crop needed all these constituents in some proportion or other. When these are provided the nitrogen supply becomes the determining factor in regulating the size of the crop: as the nitrogen supply is increased so the crop is increased, so that a grower can get any sized crop he wants up to a certain point by increasing the nitrogen supply. The limit is only set when the selling value of the crop is below the cost of manure and cultivation. The best nitrogenous and other fertilisers, and the best ways of using them, were all carefully investigated.

It was also found that the crop did not take up anything like all the nitrogen supplied in the manure; there was considerable loss. In view of the great cost of these manures it became necessary to discover how the losses arose. A very ingenious field experiment showed that a winter's rain would wash out from a piece of fallow land as much nitrogen as would give a four-quarter crop of wheat. The discovery was followed by further investigations which led to much useful work on drainage water. Another source of loss was also discovered which is now being further studied.

The development of these experiments led to a complete study of the effect of manures on crops, and the general relationships existing between the soil and the plant. Many of the results of the labours of Lawes and Gilbert have passed into common horticultural and agricultural practice; they have been summarised in a convenient form in the books on soils and manures that have been published from Rothamsted during the past seven years.

Every horticulturist knows that there is no such thing as finality, either in science or in practice. If any sceptic thought there was he would only have to go for two years in succession to the horticultural exhibitions to see the advances made even in a single season. It is especially true of the science of the soil and of plant nutrition — the subject particularly associated with Rothamsted—that the pioneering work so ably done by Lawes and Gilbert has to be followed up. Fortunately an enthusiastic body of investigators are uniting at Rothamsted to carry on this work, and in order to facilitate their researches it has been decided to build a commemoration laboratory, adequately equipped and affording the necessary accommodation for future developments. For this purpose £12,000 is required, but if half this sum is raised by subscription the other half will, it is anticipated, be provided by a grant. Thus, £6,000 is asked for from the public, and of this it is hoped that £1,500 will be raised in subscriptions from growers. Rothamsted has supplied the model on which agricultural experimental

stations all the world over have been formed. No better memorial to the genius of the founders of Rothamsted could be made than the addition of a commemoration laboratory to this historic station.

The Admission of the Public to Private Grounds.

The leading article in the *Times* (August 19) referring to the gracious act of Queen Alexandra in opening the gardens and grounds of Sandringham to the public on one day a week, and applauding the growth of similar generous practices, has led to an interesting correspondence.

Sir Frank Crisp, whose generosity in this as in all other respects is so well known, gives his personal experience, stating that during the past fifteen years, though Friar Park has been visited by more than 100,000 persons, only three cases of definite damage have been recorded. He would be indeed a vandal who, after being met at the entrance gate with the welcome "Don't keep off the grass," could do other than treat these wonderful gardens with a respect equal to the courtesy which the owner of the gardens bestows on his guests. In the same issue of the paper already cited, however, is another letter from the owner of a place in Ireland, deploring the fact that the Killarney Fern which grew on the estate has disappeared at the hands of Fern-hunters. It is only too true that such things will happen; yet, much as we deplore such a loss, we concur with the writer of the *Times* leader in holding that there is "much nobility . . . about the owner who took no notice of damage beyond the repairing of it, believing that in time example would tell and confidence be repaid." It is, of course, easy to offer advice and to preach an altruism for the exclusive practice of others; nevertheless it cannot be gainsaid that the more the practice of admitting the public to private grounds becomes general the rarer will be the occasions when through carelessness, levity, ignorance or naughtiness the privilege will be abused. The letter addressed by the Hon. Vicary Gibbs to the *Times* is a generous testimonial from one of the most distinguished amateurs of horticulture to the proper consideration shown by the numerous public which is welcomed to the gardens at Aldenham House. "They are admitted every Saturday and on Bank Holiday in August to every part of the garden, kitchen garden, park, without restrictions or any special supervision. They avail themselves very freely of the privilege, and no wilful damage of any kind has ever been committed, except that on one occasion some youthful vandal scratched his initials with a nail on a Græco-Roman bas-relief."

Coloured Supplement.—The subject of the Supplementary Illustration is Nymphæa Masaniello, one of M. Latour-Marliac's hybrids, which has not yet become so well known as some others. The plant is described by Mr. James Hudson as a vigorous grower and one that should be numbered with the best hybrids in cultivation. The Coloured Plate well depicts the fragrant, brilliantly-coloured flower as cultivated in Mr. Leopold de Rothschild's garden at Gunnersbury House, Acton.

Royal Horticultural Society.—A meeting of the committees will be held on Tuesday, the 23rd inst., in the Vincent Square Hall, Westminster. Special vegetable competitions will be held, and at 3 o'clock in the Lecture Room Mr. C. Bernard Crisp will deliver an address on "Autumn Border Plants."

The House of Veitch.—A contemporary has a paragraph referring to the purchase of Messrs. James Veitch and Sons' seed business by Messrs. Sutton and Sons, in the course of which it states that "two members of the Veitch family are among the long list of those who lost their lives in the service of the firm. One was Peter C. Veitch, a son of the founder of the business, who was shipwrecked off the Australian coast, and another was his cousin, John Gould Veitch, who succumbed to lung disease brought on by the exposures and hardships of travel." This report, as most of our older readers know, is inaccurate. The two members of the Veitch family referred to were grandsons of the founder of the firm of Veitch in Exeter, Mr. James Veitch. Mr. John Gould Veitch was a son of Mr. James Veitch the younger, founder of the Chelsea firm, Mr. Peter Veitch being a son of Mr. Robert T. Veitch, who carried on the original business at Exeter after his father's death. He, in turn, was succeeded by Mr. Peter Veitch, his son. Mr. P. C. M. Veitch was, it is true, shipwrecked off the Australian coast, but he was not drowned. As a matter of fact, Mr. P. C. M. Veitch, who is head of the old Exeter firm, is much alive. He is an active member of the Fruit and Vegetable Committee of the Royal Horticultural Society, was one of the jurors at the Ghent Exhibition a few months ago, takes his place regularly on the Bench of the Exeter City magistrates, and controls personally the large nursery and landscape and seed business of the Exeter firm with vigour and success. He is, of course, a first cousin of Sir Harry Veitch. The transfer of the Chelsea seed business does not in any way affect the Exeter firm, whose business is carried on as usual.

National Sweet Pea Society.—The annual general meeting of this Society will be held at the Hotel Windsor, Victoria Street, Westminster, on Monday, the 20th prox., at 2.30 p.m. A Sweet Pea Conference will be held at 7 p.m., when Mr. J. S. Brunton will deliver a lecture on "The Sweet Pea Industry." Applications for dinner tickets must be made to the hon. secretary, Mr. C. H. Curtis, Adelaide Road, Brentford, on or before October 18. The Society will hold trials of Sweet Peas at the Burbage Experiment Station, Leicestershire, conducted by Major C. C. Hurst in 1914. No certificates or awards will be granted to novelties unless they are sent for trial. For the novelty trials a charge of 2s. 6d. per variety will be made, and novelties will be accepted only from the raiser or introducer. As all the trials will be sown this autumn, thirty seeds of each novelty must reach the hon. secretary not later than October 4, 1913. The seeds must be placed in plain packets, but each packet must bear a number or letter for purposes of identification. With the seeds there must be a letter bearing the sender's name at the top, the number or letter of each novelty sent, and opposite such letter or number the name of the variety (if any), the colour section to which it belongs, and, if orange or salmon, whether it should be shaded. Sweet Peas will also be tested for purity at a charge of 10s. per stock or variety sent. Not fewer than two dozen seeds should be sent. In every case the amount due for trials charges must accompany the seeds. Every sender will receive the report of the Floral Committee in the autumn of 1914.

——We have received a circular letter on the subject of the National Sweet Pea Society from Miss Hemus, of Holdfast House, Upton-on-Severn. It is dated September 20, and relates to proposed changes in the constitution and government of the society, for which she asks the support of the members at the annual meeting of the society, which will take place next month. The letter states that the proposed changes are for the purpose of placing the government of the society in the hands of independent amateurs, to reduce the number of varieties of Peas to a trustworthy and comparatively short list, and to control the introduction of alleged new varieties. Amateurs, it is said, will benefit because they will be protected against being asked to buy as novelties things that are not novelties, while the honest trader will be secured against the appropriation and re-naming in the future of anything good that he may have produced. Those who are willing to join the general committee are asked to inform Miss Hemus accordingly when they have seen the proposed rules.

Perfume in Sweet Peas.—The Duchess of Hamilton, in her speech in opening the Glasgow Flower Show on the 3rd inst., said if she might make a suggestion it would be that she hoped the future propagators of Sweet Peas would turn their attention to keeping the scent of the flowers. The Peas shown that day were very lovely, but she thought a great many of them had not got much of that very excellent quality of scent. The Duchess thus called attention to a fact which has become very obvious in recent years. Ever since the introduction of the large waved Sweet Peas the decline of perfume has been marked. In this the modern Sweet Peas resemble many of the finer Roses, and we are glad there are signs of a reaction. When a new Carnation or a new Rose is presented to the Floral Committee of the Royal Horticultural Society the first thing many members do is to smell it, and if this quality is lacking it influences the votes of a number. So long as the demand has been for varieties of flowers to win on the exhibition table raisers have kept the qualities of form and size continually before them to the almost entire exclusion of others such as habit and scent. In discussing the question of scent in Sweet Peas, a well-known raiser said that the attainment of greater perfume in the giant waved forms would require some years of work. To cross the best waved forms with such sweet-smelling old varieties as Lady Grizel Hamilton and Princess Beatrice might result in increased perfume, but it had yet to be proved that the delightful perfume of the old sorts would associate with the waved form. The first result of crossing will be a backward step, because a mixed progeny will be the result, and several years will be required to fix the new waved forms if the raiser is fortunate enough to get a greater degree of perfume introduced into them. The effort is well worth making, because every cultivator who is not an exhibitor would be be well content with sweetly perfumed flowers, though they did not measure 2½ inches across the standard.

Is Fragrance in Roses Desirable?—The following is an extract from a trade catalogue recently sent us:—"The most general fault with our modern Roses from the popular point of view is their want of perfume. How they have lost their fragrance is very simple. Most of our best Roses are hybrid Teas, and the Tea Rose has very little scent, and what little it has is apparently easily lost by hybridisation. Fortunately, nearly all our red Roses are still fully fragrant, and when any other varieties carry any perfume to speak about I will take care to mention it in my description. Scent was useful once to attract the fertilising insects, but it has no effect on the camel-hair pencil of the hybridiser, and, alas! little more on the hybridiser himself; he is after something of so much more moment. The new break in colour or extra length and special curve of petal are altogether too precious to let any consideration of perfume come in. Of course, fragrance is the

only excuse for the existence of the commoner flowers. We should consider Mignonette a hopeless weed if it were not so sweet; many way-back Roses have no other excuse for their place in our catalogues to-day than their perfume. In the old days, before the Rose had been developed in the exquisite varieties it has to-day, perfume was half—and admittedly a large half—of its delight. You have necessarily sooner or later to give up this association of scent with the best Roses, and I should like you to do it without much regret; it is one of our senses, of course, but it is the most primitive, and the most animal of the five."

ROSE PRINCESS MARY.—Mr. ELISHA J. HICKS informs us that he has obtained PRINCESS MARY'S consent to name a seedling Rose after Her Royal Highness. Mr. HICKS describes the novelty as resembling Irish Elegance, except in colour, the flowers being scarlet.

HOP PROSPECTS AT HOME.—The Board of Agriculture and Fisheries inform us that the crop is nearly everywhere lighter than was expected, particularly in the western counties. The chief reason is the smallness of the Hops, which, although healthy, have not developed to their full size, and they are weighing badly; but the actual quantity is also, in many cases, short of expectations. The quality of the Hops is, however, regarded as very good. No part of the country is expected to show an average yield. Kent as a whole may have about 80 per cent. of an average, while the yield in Hereford and Worcester is less than this, and may possibly not exceed 60 per cent. in the two counties. The average yield per acre throughout England may be put at about 72 per cent. of the average of the last 10 years.

HOPS IN RUSSIA.—The Board of Agriculture and Fisheries have received a report, dated September 8, from His Majesty's Consul at Warsaw stating that, according to a circular issued by the Ersten Hopfen Gesellschaft at that town, the weather in Poland and Volhynia during the last few weeks has been favourable to the development of Hops, and numerous gardens which were in a backward condition have considerably improved. Picking has already begun in several districts and will be general next week. The total Russian production is expected to be less than last year, and is estimated at about 50,000 cwts.

APPLE BEDFORD PIPPIN.—We have received a fruit of a seedling Apple raised by Messrs. LAXTON BROTHERS, and described as a cross between Ribston Pippin and King of the Pippins. It is 8 inches in circumference, almost yellow on one side and prettily marked with red on the other. In appearance it is fairly intermediate between Ribston and King of the Pippins. We are informed that the fruit was accidentally knocked from the tree, and has ripened rather earlier than usual, the proper season being October, in which case the novelty may have much value, as it will come into use for dessert earlier than Cox's Orange Pippin. The flesh is softer than either of its parents and very sweet, whilst the flavour, so far as we can judge from one specimen, is good. Another season is required to further test the fruits.
