

THE

GARDENERS' CHRONICLE

A Meekly Illustrated Journal

OF

HORTICULTURE AND ALLIED SUBJECTS.

(ESTABLISHED IN 1841.)

VOL. XXXV.-THIRD SERIES.

JANUARY TO JUNE, 1904.

LONDON:

41, WELLINGTON STREET, COVENT GARDEN, W.C.

Jan - Je

1904

BRADBURY, AGNEW AND CO., LTD., PRINTERS, LONDON AND TONBRIDGE.

INDEX OF CONTENTS.

JANUARY TO JUNE, 1904.

(FOR SPECIAL HEADINGS SEE UNDER BOOKS; CERTIFICATES; LAW NOTES; NURSERY NOTES; OBITUARY; PLANT PORTRAITS; PLANTS NEW; SCIENTIFIC COMMITTEE; SOCIETIES; AND ILLUSTRATIONS.)

ABERDEEN, hurricane at, 406; resuscitation of Horticultural Association at, 380; the weather at, 394 Abies concolor, 58; A. Nordmanniana injured by insects, 336
Abronia, fossil fruits of, 345
Acer palmatum, 298 Acetylene gas refuse, 108 Acineta Barkeri, 389 Acokanthera spectabilis, 4 Acridocarpus natalitius, 403 African garden, observations on an equatorial, 115, 130, 165, 182 Agricultural Association, an American, 10 Agricultural College, a proposed, 393 Agricultural correspondents of the Board of Agriculture, 377 Algerian Sweet Peas, 284

Allamanda grandiflora, 389; A. seedlings, 156 Aloe Baumii, 226

Alpine garden, the, 150, 181, 214, 236, 267, 277, 310, 388

America, severe winter in, 368

American blight, cure for, 200

Amherstia nobilis, 314

Ampelopsis and a Vine, a cross between an 20 tween an. 89

Ancistrochilus Thomsonianus var. Gentili, 274 Androsace pyrenaica, 310

Anemone angulosa alba, 181; A. Pulsatilla, 267 Anona Cherimolia [?], 223

Antarctic regions, gardening in the,

Ants, a cure for, 80 Apiary, the, 87, 119, 215, 231, 279, 335, 381, 405

Apple, a new species of, 280; crops contrasted in garden and orchard, 13; pests of the, 299; some recent varieties of, 133; two late-keeping varieties of, 118

Apples, Ecklinville Seedling, 149, 203, 219, 234, 267, 292, 330, 348, 375, 396; Lane'a Prince Albert, 10; Newton Wonder and Annie Elizabeth, 118, 395, 409; storing surplus, 406

Appley Towers destroyed by fire, 201

Arabis albida flore-pleno var. corbeille d'Argent, 214 Araucaria imbricata, 45, 99 Arbutus Unedo, 11, 46 Ardwell, flowers at, 252 Arethusa sinensis, 403 Arizona, Cacti in, 181 Arnold Arboretum, the, 200 Artichokes, Globe, 276

Arundinaria Falconeri, 305; A. nobilis, 305, 408
Asparagus-fly, the, 377
Asparagus, propagation and culture of 16

of, 16
Atlantic Mail Service, the, 201
Auricula, the, 65, 316; prospects of
the, 236; Show, the, 244, 282
Australia, fruit from, 39
Azalea Indica, "rose de Noel," 105 Azaleas, cultural notes on, 144, 320

BACILLUS solanacearum, 257 Bamboos, Himalayan, 305, 325, 340, 356, 409 Bambusa palmata, 280

Barringtonia samoensis, 266 Barringtonia sameetas, 28 Barr, Mr. Peter, 328 Bedding-plants, raising spring, 315 Begonia Avalanche, 396; B. Gloire de Lorraine, 90, 123, 139, 203, 220,

Begonia disease, treatment for, 95 Begonia polyantha, 3 Begonias and Gladioli as bedding

plants, 239 Belgium, fruit crops in, 71

Belvoir Castle, 264, 313 Benevolent Institution, Gardeners' Royal, 12, 25, 27, 40, 45, 125, 280, 316, 341

Berberis Darwinii, 341 Beasborough Gardens, Piltown, Ireland, 324

Bird-lime, mode of making, 144
Birds, fish-destroying, 42, 75; protection of, 250; protecting vegetable crops from, 317

Birmingham, a new park at, 345 Birmingham Botanical Gardens, 281,

Black Currant bud mite, 48, 236, 304, 330, 375, 396 Blackmore, memorial to the late

R. D., 281 Blossom, protection of, from birds, 95

Bluebells, 291 Blue Primroses, notes on the cul-

ture of, 221 Boardman, Mr. A., presentation to,

234

Board of Agriculture and Market Returns, 281; Correspondents, 377 Boll-weevil, the, 380

Magazine, 25, 104, 169, 233, 298, 380; Bulletin of the Nice Agricultural and Horticultural Society, 218; Cassell's Popular Gardening, 234, 298; Chrysanthemum Culture (W. COMBE ROYAL.

IN one of the most favoured spots in South Devon, midway between Start Bay and Bigberry Bay, but some five miles inland, at the head of a broad and many-branched estuary which, passing Salcombe, opens to the sea, with Prawle Point on the east and Bolt Head on the west, stands the town of Kingsbridge, the surrounding country of which is known as the South Hams. The district is famous in the West Country for the beauty of its landscapes, its varied coast-line, and the numerous rivers which drain the water-shed of Dartmoor, giving to this part of South Devon its well-known fertility.

The railway communication to Kingsbridge is by a branch single line from South Brent, which is on the main Plymouth line of the Great Western Railway. The short line of about ten miles passes through some of the most beautiful scenery imaginable. It is in the midst of such attractive surroundings, and distant about one mile from Kingsbridge itself, that the estate known as Combe Royal is situated, and so sheltered from the north and east that the climate of

the estate itself is popularly described as almost semi-tropical. The present owner of the property is E. J. Bowring, Esq., who, however, is non-resident. For the past twenty years the house has been occupied by two ladies, Mrs. Eady-Borlase and Miss Emily Turner, to whom I wish to express my thanks for permission both to visit the gardens and grounds and to have the accompanying photographs taken by Messrs. Balley & Flower, of Fore Street, Kingsbridge. The place has many attractions, but it is not in the ordinary sense of the term a show-place. The present occupiers, however, readily grant the use of the grounds for local flower-shows and various charitable purposes for which it would be difficult to select a more delightful spot.

Esq., took an especial delight in forestry and horticulture; notat Combe Royal alone, but elsewhere it is easy to trace his influence as you observe in neighbouring estates the startling variety of trees and shrubs, such as are found in large numbers planted by his hand at Combe Royal.

The visitor may take a long walk in what is called the American garden, and his eye will rest on little else than American vegetation the whole way, and he will see in fine growth many things the sight of which would otherwise cost him a voyage across the Atlantic, or at the least a visit to Kew Gardens. No doubt many of the seedlings and saplings which are now in maturest beauty were imported from that place, for Mr. Luscombe was a distinguished member

FIG. 1.—VIEW OF THE MANSION, COMBE ROYAL.

With regard to the early history of the mansion or estate I was unable to obtain any very definite information. It is stated, however, that a portion of an old document, dated 1373, still exists, upon which "Roger Efford remits, releases, and for ever cries quits to Richard Chiceli of all his right and claim in Kingsbridge, Dodbrooke, and Come Royel." As the date is contemporaneous with that of Archbishop Chicheley of Canterbury, it would seem probable that the family of the Archbishop had some right in Combe Royal. The mansion has had some changes effected in it in modern times, being "enlarged and restored some years ago."

The name of Luscombe will be familiar to many in connection with this estate, the family having acquired it in 1722. The following paragraph, from an excellent little guide-book written by the Rev. W. T. Adey, will show how highly the Luscombe family was appreciated at the time of their occupation and how much the people of Kingsbridge valued the garden and grounds almost in their midst. "The late J. Luscombe,

of the Horticultural Society of London, and received from them the Banksian Medal for Oranges, Lemons, and Citrons, exhibited by him in 1827; and well he might, for the Citron trees have borne specimen fruit, and do still, 17, 18, and even 19 inches in circumference. Shaddocks, Lemons, Limes, and Oranges may all be seen in finest perfection. In 1850 specimens of such fruits were presented to her late Majesty, Queen Victoria, and elicited from her much admiration and surprise on account of their size and beanty."

After passing the entrance-lodge on the main road from Kingsbridge to Totnes, the carriage-drive turns to the right and runs nearly parallel to the high road; but between it and the drive is a high and broad bank thickly planted with trees and shrubs mixed with magnificent growths of Rhododendrons and Hydrangeas edged with Hypericum. On the left side the grounds slope to a considerable depth, forming a beautiful valley diversified with wood and water. The carriage-drive gradually dips down to the

extremity of this valley, where on a fine open space surrounded at the back and on either side by rising ground covered with a rich arboreous growth, the mansion is placed (fig. 1). Though situated in this valley, the place is 280 feet above the sea-level, and is screened by the hills both from the prevailing south-west winds as well as from the north and east.

ing Orange garden is on a raised terrace facing south, and at right angles with the front of the mansion. It consists of a long wall formed of light Tudor-shaped arches or recesses, each about 15 feet wide and of similar height, the recesses being about 1 foot deep. It is in these recesses that the plants are trained flat against the walls (see fig. 2). The bay or arch occupied by the old

uniformly grown plants of Retinospora obtusa var. aurea (see fig. 2). On the slope behind the Citrus wall, which is the lower part of the pleasure-ground, jotted about in positious amongst other shrubs, are some very fine bushes of Hydrangea, completely covered with flowers of the most intense blue, the probable cause of which has been so frequently discussed of late in the pages

FIG. 2.—COMBE ROYAL: THE ORANGE GARDEN.

THE ORANGE GARDEN!

Though Combe Royal has many attractions for the lover of trees and shrubs, its popularity lies in its successful culture of plants of the Citrus genus, the luxuriance and fruitfulness of which are most striking, and are said not to be equalled in England, when it is remembered that no protection is afforded them beyond the walls upon which they are trained and the use of recd blinds during the coldest winter nights.

One Seville Orange tree, from which I was informed large quantities of fruit are annually gathered, is traditionally stated to be 250 years old. This peculiar and interest-

Seville Orange referred to above had upon it, at the time of my visit, about 200 fruits of all sizes, from that of a pea to a full-grown yellow-skinned ripened Orange. I was informed by Mr. Horsman, the gardener, that all the varieties fruit abundantly, except the Shaddock, and that the fruits when ripe are regularly used in the house for culinary purposes. At the time of flowering the perfume emitted from these plants was described as being very powerful.

The broad gravel walk on the top of the terrace, from which this Orange-wall garden springs, is, on the opposite side or front, planted with a row of eighteen fine and

of the Gardeners' Chronicle, but which could only be accounted for at Combe Royal by the presence of iron in the soil.

lifere also in close contiguity were several big trees of red and white Camellias, which I was told flowered profusely every season. Near to these grows a very large Loquat, which, though blossoming freely, does not ripen its fruit. A little lower down, and outstanding by themselves, are two stately and perfectly-formed Plane-trees, and around use note the following, all of exceptionally fine proportions: Japan Allspice (Chimonanthus fragrans), Sciadopitys verticillata, Cryptomeria japonica, about 60 feet high

and full of cones; Embothrium coccineum, which flowers from May till quite late in the season.

Bamboos flourish luxuriantly everywhere; immense clumps of Arundinaria falcata, forming almost miniature jungles, grow on the elevated slope at the side of the house, as well as in the deep dell or American garden, where are many fine things, some of which were in flower or fruit at the time of my visit, amongst which the following may be mentioned: Halesia hispida, which was covered with masses of flower, but which, however, never fruits (the tree is about 20 feet high); Elæagnus latifolius is also a very fine and striking tree, from the silvery underside of its leaves; this plant never flowers. On the other hand, Pieris formosa, a very beautiful evergreen shrub, was covered with large bunches of berry-like fruits, and is perfectly hardy. This plant was figured in the Gardeners' Chronicle for April 30, 1881, N.S., vol. XV., p. 569. Another Ericaceous plant much in evidence was Gaultheria Shallon, which luxuriates to the height of about 2 feet. Magnolia conspicua was said to be a fine sight about Easter, when it is covered with blossom. Here were also trees of Sequoia gigantea, some 60 feet high, with stems about I feet 6 inches through at the base; the plants are, however, much injured in their shape by the too close proximity of some trees of Araucaria imbricata.

In this dell, on some rising ground, were pointed out to me some Eucalyptus-trees, now about 35 feet high, which were said to have been brought by Mr. Luscombe from Kew some twenty-eight or thirty years ago. Before leaving this delightful part of the grounds for a visit to the garden proper, my attention was directed to a view from the upper slope of the broad estuary which runs up to Kingsbridge from Salcombe, the view extending to the heights of Salcombe itself.

In the kitchen-garden there is nothing out of the ordinary way. It is much shut in between walls, and being on a very steep slope consists in fact of a series of terraces. On an espalier Apple-tree, however, I was much struck with such a vigorous growth of Misleto that the stock was completely hidden in the parasite, giving to it the appearance of a Misleto-bush which had been trimmed with a perfectly rounded head. The seeds were planted on the Apple-tree some years back, but the plant, I was told, never produces berries; further, I was informed that it was the only example of Misleto on the estate, and that the plant was seldom or never seen in the locality.

In the large conservatory attached to the house is a plant of Acacia dealbata, which, planted about ten years ago, has now spread over the whole roof, forming a complete shade, and covered with blossom each year about Christmas time.

The front of the mansion is partially covered with climbing plants; amongst those in flower at the time of my visit being Myrtles and Magnolias, both of them growing to a height of about 25 feet.

Though Combe Royal cannot be included amongst large estates where perfection of culture and the possession of horticultural or scientific rarities are aimed at, inasmuch as this is impossible with the smallness of the garden staff, Mr. Horsman, the gardener in charge, is to be congratulated not only

on inheriting a complete knowledge of the place from his father, who had charge before him, but also for his familiarity with and love for the trees and shrubs which are features of the estate. J. R. Jackson.

ODONTOGLOSSUM × VUYLSTEKEI V1VICANS.

The beautiful hybrid Odontoglessum shown in fig. 3 was exhibited by Baron Sir Henry Schroder before a meeting of the Reyal Horticultural Society on December 15 last, when the novelty was awarded a First-class Certificate. The flowers are large in size and of perfect form. The sepals and petals are broad and nearly equal to each other, their colour being canary-yellow, very heavily blotched with dark purplish-red. The lip is white, with one large brown blotch in the centre and some smaller ones on each side, and the margin is prettily crimped.

KEW NOTES.

IPOMÆA HORSFALLIÆ VAR. BRIGGSI.-This plant is certainly one of the finest winter-flowering climbers in cultivation, giving as it does a great profusion of flowers in November and December. In the Victoria Regia - house a fine old specimen is at the present time making a good display; the growths hang down from the roof in festoons 3 to 5 feet long, with almost every growth crowded with bright red flowers about 11 inch in diameter. Although the individual flewers only last one day, yet a good succession of bloom is maintained, owing to the manner in which the buds are developed upon the large dichotomous cymes. Plants are easily raised from either seeds or cuttings, and should be grewn in an intermediate-house or stove. Under such conditions large plants can be grewn in one season, and if planted in a border and trained up the roof will well repay the cultivator for the space occupied. The species I. Hers-

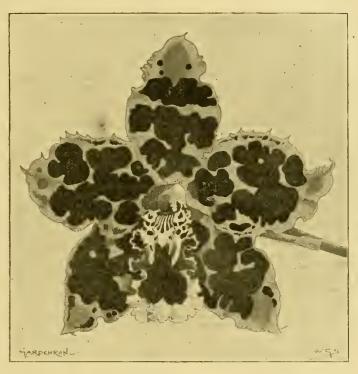

FIG. 3.—ODONTOGLOSSUM X VUYLSTEKEI VIVICANS.

THE ROSARY.

"LE LIVRE D'OR DES ROSES."

This is a French treatise in quarto, published in parts by Lucien Laveur, 13 Rue des Saints-Pères, Paris, and illustrated by sixty coloured plates. The text is provided by M. Paul Hariot, and comprises sections on classification, hybridisation, propagation, culture, and various other matters which will be of value to the amateur. The book is nicely got up, and will be an acceptable addition to the library of the rosarian.

"PERPETUAL" CRIMSON RAMBLER.

The Journal des Roses for November gives a coloured figure and a description of a Rose called Madame N. Levavasseur. It was obtained by crossing the Crimson Rambler with Gloire des Polyanthas. It is, very free-flowering, and continues to produce flowers till checked by the frosts of autumn. It is sent out by M. M. Levavasseur, of Orleans, and received a First-class Certificate from our National Rose Society in June, and from the Royal Herticultural Society in April of last year.

falliæ may be seen flowering in the Palm-house; it is a native of the West Indies.

EUPHORBIA (POINSETTIA) PULCHERRIMA VAR.

Flowering in the steve is a group of this seldom-seen variety. It certainly cannot claim rank with its more showy relative as a decorative plant, yet it is one which might be more commonly grown, its creamy-white bracts forming a pleasing contrast to the scarlet ones. Many cultivators make a practice of growing the species in a cool frame during the summer months, but it is best to grow the white form in an intermediate-house.

BEGONIA POLYANTHA, Hort.

In the Begonia-house may be seen several good specimens of this useful winter-flowering Begonia. The plants are 2 to 3 feet high, with the habit of the well-known B. fuchsioides, but having leaves 4 inches long and about 2 inches across; each plant is carrying a fine show of light-pink flowers about three - quarters of an inch in diameter. It is apparent to all who see these plants

that this variety is a very fine flowering one for winter decoration. Cuttings rooted in the spring and grown-on in a cool greenhouse through the summer, with plenty of feeding, may be grown into plants 3 to 4 feet high, and be had in flower at Christmas, with every branch producing a fine show of flowers. A native of Mexico.

ERANTHEMUM TUBERCULATUM, Hooker.

This delightful species is now flowering in the stove, and is probably the prettiest of the whole genus to which it helongs. The plant is of a shrubby nature, the branches very slender, the leaves small and ovate in shape; the flowers are axillary and generally solitary, pure white, linch to 1½ inch across, the corolla tube being 1½ to 2 inches in length. The flowers are freely produced, and last for a considerable length of time, making an elegant and very desirable plant. Neat little bushes can be grown from cuttings in twelve months. According to Nicholson's Dictionary, it was introduced from New Caledonia in 1863.

ACOKANTHERA SPECTABILIS, Don.

Trained up the roof of the Palm-house is a large example of this lovely plant, which is at the present date a mass of snow-white flowers, which are freely produced in large clusters in the axils of the leaves. They are very fragrant. Though the plant now in bloom is trained on the roof, it is not really a climber, and it is usually grown in bush form, to which mode of cultivation it is well adapted. After flowering, the growths should be cut down to a point below the flowers; the plants should then be encouraged to make plenty of shoots, which should be well-ripened, and under such treatment every shoot will afford a quantity of bloom. It is a native of Sonth Africa, and is also known in gardens as Toxicophlæa spectabilis.

LIVISTONA AUSTRALIS, Mart.

A noble specimen of this Palm is now in flower in the Palm-house. This plant has a stem about 35 feet in height, and $1\frac{1}{2}$ foot in diameter at the base, and has a head of leaves some 14 feet across; it is best seen from the gallery. The large branched spikes of flowers measure about 3 feet in length; the branches of the inflorescence are drooping, like the branches of the funeral Cypress; the flowers are creamy-white. The plant is carrying six of these large inflorescences, and forms a striking object, giving one a good idea of a Palm in its native state. W. H.

QRCHID NOTES AND GLEANINGS.

ORCHIDS AT HAREFIELD HALL.

Although the Orchids in Mr. Elijah Ashworth's collection at Wilmslow, Cheshire, do not seem to grow so rapidly or so vigorously as those in some other collections do, they remain sound and healthy, and there are many plants in the collection which were in the garden when Orchidgrowing on an extensive scale was commenced at Harefield. The fact is that the glass accommodation, extensive though it be, has been overcrowded, and the recent attempt to make space by a sale has not given much relief. Here, too, as in some other places, the encroachment of the homeraised seedlings, in the production of which Mr. Holbrook, the gardener, is becoming expert, presses more heavily on the general collection every year.

In the small block of houses joined on to the end by the corridor, in which Lælia anceps autumnalis, and similar subjects are suspended from the roof, some interesting subjects were recently noted by the writer. Many of these were in flower, some of the best hybrids having

Cypripedium insigne Harefield Hall variety as one of the parents. The largest and most distinct of these was C. × Fulshawense (C. Boxalli × C. insigne Harefield Hall), and which was remarked on when it obtained an Award of Merit at the Royal Horticultural Society, November 10. Several pretty C. × Haynaldo-Chamberlainium, and other hybrids of C. Chamberlainianum were also in bloom, including the pretty C. × Mrs. A. W. Sutton (C. niveum × C. hamberlainium). Other good hybrids were C. Charlesworthii x niveum, and C. callosum x C. insigne Harefield Hall; while of better known varieties in bloom were C. x vexillarium Rougieri, C. \times Niobe, C. \times Olenus varieties, C. \times Marshallianum, a good selection of the best forms of C. x Leeanum, C. x Arthurianum, and C. insigne, &c.

In the Odontoglossum houses were numbers of the much-coveted spotted O. crispum, the best of which is O. c. Ashworthianum, which was illustrated in the Gardeners' Chroniele, Feb. 15, 1896, p. 197, which has the greater part of its flowers of a rich claret-purple colour. Like some other Orchid gems, it does not appear to be a strong grower. Some forms of O. crispum were in bloom, and O. Halli, O. Uro-Skinneri album, O. Andersonianum, and some others, and with them Mesospinidium vulcanicum (Cochlioda); Sophronitis, Masdevallia tovarensis and other Masdevallias, including the somewhat showy M. angulata; some Maxillaria grandiflora, Lycastes, &c.

In the Cattleya houses C. labiata made a good display, together with a few of each of the other species flowering in autumn. In an intermediate-house a good specimen of the singular-looking, fringed-lipped Chondrorhyncha Chestertoni was in bloom; and the rare Trevoria Chloris had sent out a fine inflorescence, which failed, however, to expand its blooms. Other plants noted in bloom in the intermediate-houses were Dendrobium Phalænopsis, D. spectabile, D. formosum, and a few other Dendrobiums; Lælio-Cattleya × Decia alba, L.-C. × exoniensis, L.-C. × Tresederiana, L.-C. × elegans, Calanthe madagascariensis, Lycaste lasioglossa, Cattleya × fulvescens, varieties of Lælia pumila and L. anceps.

In another part of the garden the old ornamental house still contains the foliage and flowering stove plants for which it was designed, and the large Bananas, which bear good bunches of fruits regularly. From the roof hang Lælia anceps, &c. The adjoining Cypripedium-houses have a good show of varieties of C. insigne, C. Leeanum, C. × Ceres, C. Spicerianum, C. Charlesworthii, C. Curtisii, and some hybrids, the best of which is a fine C. Rothschildianum cross which resembles C. × Lord Derby at its best. Its flowers seem darker than in C. × Lord Derby, and if of the same parentage it is an improved form.

SOME FINE CYPRIPEDIUM INSIGNE PLANTS.

Calling at Homewood, Beckenham, where these useful winter-flowering plants have been grown with unusual success for a number of years, I was shown six plants in 9-inch pots with masses of foliage 3 feet through. The flowers were notstaked, but stood out naturally, giving each plant a circumference of 12 feet; one of the plants carried fiftyeight blooms. These plants have not been potted for eight or nine years; one plant has carried eighteen twin blooms; they are not quite so numerous this season. Mr. Crosswell feeds with weak farm-drainage, Clay's Fertiliser, soot-water and guano. Some useful plants for furnishing indoors are growing in $4\frac{1}{2}$ -inch pots, carrying nine strong blooms. Mark Webster, gr., Kelsey Park, Beckenham.

VANDA MARQUERITE MARON.

The Revue Horticole devotes an article and a coloured illustration to this hybrid Vanda, raised

by M. Maron from V. teres, fertilised by the pollen of V. suavis. The flowers of the hybrid are intermediate in character between those of the parent plants, but most nearly resemble those of V. suavis. Other hybrid Vandas mentioned are V. amæna × (cærulea × Roxburghii); V. Charlesworthii × (cærulea × Bensoni); V. confusa × (cærulescens × parviflora); and V. Moorei (Kimballiana × cærulea).

PROPOSED GARDENERS ASSOCIATION.

I HAVE been deeply intorested in reading your report of the meeting, held on the 15th inst., to discuss the desirability of forming an association, having for its object the protection and betterment of the bond-fide gardener. The subject is a large one, and much discussion and consideration are necessary before it can be placed on such a. satisfactory basis as will ensure success. Referring to control, I may at once say that, being an inveterate opponent of anything savouring of trades-unionism as at present interpreted, I, in accord with some of the speakers, deprecate any such idea. Nor do I think the subject comes within the province of the Royal Horticultural Society, the Council having duties sufficiently important already to occupy its time and talents. It appears to me to be totally outside the object in view, which is essentially a question for gardeners themselves, except in sofar as the Council may be induced to view the proposals with sympathy. One thing should, I think, be dominant at the outset—viz., the definition of a bond-fide gardener. The class is a large one, and may be divided into many degrees of varying importance and efficiency. The multifarious duties in a large establishment are such that no one man's life is sufficiently prolonged to allow of his becoming proficient in every department. There is one quality he should possess in a pre-eminent degree; he should be a competent leader of men. He may require his foremen for the various branches—the Orchids, stoves, fruit, greenhouses, ferneries, decorations, pleasuregrounds, kitchen-garden, woods and roads, &c. In such a case, provided he keeps a tight hold upon the reins, and has had good experience himself, and is endowed with tact, judgment, and good health, success is practically certain.

Coming to the subject of education, the matter becomes more difficult. Very much must depend upon the capacity, assiduity, and inclination of the individual. If he is of a studious turnof mind he will gain much useful and necessary knowledge by study and observation which will be conducive to his welfare in after life, for to become a competent gardener in the accepted sense of the term, like a fiddler, he must begin very young and give his whole attention to his work. Weeding walks, washing and crocking pots, learning the names of a few plants, &c., form by no means a bad start for the young gardener. I have in my mind's eye some who from such beginnings are now men of position. Of course, a knowledge of botany, the physiology of plants, chemistry, Latin, landscape work, is useful, and would render him morefit; but on the principle that a little knowledge is a dangerous thing, it would probably, in the majority of instances, be better for him to devotehis attention to his proper duties as cultivator ... We know that there are and have been in the past many successful cultivators with no pretence to education, as it is generally understood, nevertheless they have had the best-possible education for their purpose. This brings me to the subject of examinations. Such a man as I have described would entirely fail where the younger man with little or no practical experience to speak of would answer questions by rote and succeed; again, if answers in an examination have to be written in a given time from printed questions, such a man would again fail because he can neither write well nor quickly nor put his knowledge into proper or intelligible language.

Let it be distinctly understood that I am not against examinations; on the contrary, I am decidedly in favour of this test of fitness so long as they are conducted in such a manner as to ensure that the result shall be a true reflection of the knowledge and capabilities of the candidates; and in order to arrive at this, my view is, that the examinations should be mainly, if not wholly, oral. My own type of a good gardener is the man who, in addition to long experience in good places, possesses a good address, good business habits, competence in the management of men, and the knowledge how to deal fairly with those under his charge. There are worthless men, and there are employers unworthy to be served. Such an association as is proposed could do much to ascertain where these drawbacks to progress were to be found. The keeping of a register would no doubt induce many employers in quest of a competent gardener to apply to an association in which they could place confidence; whilst those gardeners in search of employment could be graded according to their merits. The best places are and have long been filled mainly by the recommendation of one employer to another, or by the recommendation of our more important nurserymen and seedsmen, whose interest it is to recommend good and competent and trustworthy men. advice to young men seeking to become head gardeners is to keep a clean character, to be civil to their superiors, assiduous in their duties. and solicitous to retain the friendship of those in good positions under whom they may have served.

The proposed association could not but result in benefiting the genuine and deserving gardener; but there are some tough problems to be solved. A word on the sentimental aspect of the subject. Are there any gardeners who can really be in earnest when it is suggested that they consider their designation of domestic servant infra dig.? Surely they would not be prepared to go to Parliament to seek an alteration! In any case, I do not think that knight of the waterpot, or any similar appellation, would be an improvement, or more euphonious; it would, on the contrary, he a eacophony; and such an innovation might well include other upper servants. We might, for example, have knight of the knife-and-fork and wine-cellar; lady of the comb-and-brush and acent-bottle, and so on ad infinitum. As the gardener's duties are principally for the house and in the house, I think the designation given to him by the Legislature-one for whom a tax is paid—is the correct one. After all it is the employers who should be approached if alteration were desirable, and should an employer think well to flatter his servant-" for be it remembered, he who serves is a servant"-by calling him his estate agent, steward, manager, or what not, that is his business. It will be difficult to replace the honourable titles of head gardener and good servant, for there are more pegs than there are holes, and then it follows that some must remain out. The difficulty is that there are too many square pegs in round holes. too many gardeners are so ambitious and anxious to have control that they profess to have the necessary knowledge to undertake all the duties indispensable on an estate, including gardens. farm, woods, roads, water-works, &c. The subject is so large, however, that it cannot be dealt with in the confines of a single letter; nevertheless, I wish the association, if formed, success in clearing the grain from the chaff. Charles Dennis.

NOTICES OF BOOKS.

"THE GARDEN DIARY AND CALENDAR OF NATURE." With gardening directions by Rose Kingsley, and preface by G. A. B. Dewar. Frontispiece by Mrs. Allingham. (London: George Allen, 156, Charing Cross Road.)

This is a charming little book with a page for garden and nature notes for every day in the year, headed by an apt quotation from the nature-loving poets. These extracts are from many writers, from Spenser to Wun. Morris (as to date), and chosen with due regard for the particular day for which each one is given. Dewar, in his preface, says that the blank pages are for recording such facts as "when we began to make the herbaceous border or pruned or pegged down the Roses, the day when that choicest of very early things, Mezereon, that comes before the Daffodil dares, scented the air; the last of the Gladieli and the first of the Pæonies-this with entries about the goldfinch's nest in the shrubbery, the leisurely red-admiral butterflies sailing among the Michaelmas Daisies, or the humming-bird hawk-moth whirring round the Fuchsia or annual Phlox." Miss Kingsley contributes a page of brief gardening notes for each month in the year, intended more as a reminder of work to be done than as minute directions concerning it. There is, further, a short history given of the names and special associations of each month.

THE HORTICULTURAL DIRECTORY AND YEAR-BOOK FOR 1904. (London: Journal of Horticulture and Home Farmer Office, 12, Mitre Court Chambers, Fleet Street, E.C.)

This is the forty-fifth annual issue of a handbook containing a calendar, postal rates, useful garden receipts, lists of instructors in horticulture appointed by the County Councils in the United Kingdom, Victorian Medallists, Royal Horticultural Society Certificates, London and Provincial Nurserymen, Seedsmen and Florists, Seats of the Nobility and Gentry, Gardeners and their Addresses, Botanical, Horticultural and Floral Societies, Gardeners' Associations, Metropolitan and other Parks and their Superintendents, &c. A great deal of useful information is here given in a short space, but a few slips may be pointed out. Mr. A. Pettigrew is still entered as gardener at Cardiff Castle. The address of the Secretary of the Gardeners' Orphan Fund is 30, Wellington Street, Covent Garden, not as printed at p. 470.

THE GARDEN ANNUAL, ALMANACK AND ADDRESS-BOOK FOR 1904.—Prepared under the direction of W. Robinson. (London: Gardening Office, 17, Furnival Street, Holborn, E.C.)

A publication of much value to all gardeners, amateur and professional, containing a calendar and notes on work for each month, and on the flowers, fruit and vegetables in season; as well as information of the same general character as in the Horticultural Directory above mentioned. Some revision is required at pp. 360, 361, 367 and 374, but we have so painful a sense of the difficulties in the preparation of such lists, that if we call attention to deficiencies it is with no desire to depreciate the value of the directories, of which we have daily experience, but only in order that the necessary corrections may be made in another edition.

"THE JOURNAL OF THE KEW GUILD."

Among horticultural periodicals there are few, if any, that can equal this for interest. Naturally limited to Kew and "Kewites," it affords a striking illustration of the enormous influence

for good exerted by Kew. Despite its limitations, it can be as heartily appreciated by those who have had ne official connection with Kew as by those fortunate enough to have received some part of their training there. The present part opens with a portrait of Mr. Latham, the late Curator of the Botanic Garden at Birmingham, and an account of his work at Kew and elsewhere. Then follow notes concerning the doings. of old Kew men, and items of information relating to Kew which will be eagerly perused by those who have now taken up work elsewhere. In 1902, we are told, the number of visitors was neted as 1,323,376, a diminution as compared with those of the p ceding year, no doubt due to a wet summer. The maximum number on any one day was 63,257 on March 31, the minimum 85 on February 3. Why the numbers for March should have been as high as 156,409 is probably due to the Easter holidays. In April, 1902, the numbers dropped to 95,408. In February and December the numbers visiting the gardens were at their lowest for the year, i.e., 19,502 and 19,569 respectively. For the ten years the average annual number of visitors is 1,355,503. An illustration of the new bridge over the Thames is given, together with some account of its opening by the King. Old Kewites will misa the high-vaulted arches of the old bridgea favourite subject for the brush of the late Walter Fitch. Pictural as it was, the bridge was worse than inconvenient, and its replacement by a wider structure with easier gradienta had become a necessity. In the meantime, the severe simplicity of the new bridge and its obvious suitability for its purpose are satisfactory features. But perhaps the most interesting part of the journal is constituted by the "notes from old Kewitea" scattered all over the world. It would be difficult to exaggerate these simple records of impressions and of work done or in progress in every quarter of the globe. We do not know whether the journal is on sale to other than members of the Guild, but it is so full of interest to gardeners in general that we should like to see it widely circulated. It is necessary to say that it is not an official publication, but managed exclusively by and on behalf of members of the Guild.

SMALL FRUITS AS CORDONS UNDER WIRE - NETTING PRO-TECTION.

THERE are many gardens, suburban and rural, where the culture of Strawberries, bushfruits and Raspberries has been abandoned, the reason being that birds are so numerous that even before the crop comes to maturity the blackbirds and thrushes, reinforced by a large army of smaller birds, get the major part of the produce. There is little doubt but they will do so, if the culture be on the old lines, on bushes, for even where nets are freely used (a most expensive plan) they must be sound and free from renta, which they seldom are, or "blackie" will find his way in to the tempting banquet. As birds are very early risers, they will get a good breakfast before even the early-rising gardener is about.

This happens year after year, the plundering feathered thieves taking the greater part of the crop, till at last the patience of the grower is exhausted and the fiat goes out, "Grub the bushes and dig-in the Strawberries, for it is useless to try to grow any here." But there is yet another plan to grow these indispensable fruits and to insure the safety of the crop when it is ripe, to explain which is the object of this article. It is called the cordon system, and by its use not only is the crop certain, but finer fruit and greater facilities of pruning the trees and gathering the produce are obtained than in the old-fashioned bush plan.

Gooseberries and Currants as single and multiple cordons on walls and wooden fences are frequent in gardens, but not every garden has walls that can be spared for these fruits; and even the wood fences are occupied with some sort of stone fruit, or with Apples or Pears; whereas good fruit can be taken from cordons of Gooseberries in the open, while the method secures complete immunity from the attacks of bird and other enemies at all seasons of development from the dormant bud to the fully ripened fruit. In many districts "Pickabud," as the handsome bullfinch is derisively called, helped by other finches, and of course by the ubiquitous sparrow and by most members of the tit tribe, make such havoc among the buds as to reduce the crop by at least one-half, while in severe winters there is hardly a fruit-bud left to develop. Greengage growers know this too well, as this fruit is particularly liable to attack.

Having selected a suitable spot of ground, proceed to set it out in dimensions suitable to the needs of the establishment by driving down four stout Larch poles with their points well creosoted and thus form a square or oblong enclosure. Between these, at about 5 feet apart, drive down Bamboo canes in a line with the four uprights. The height of the corner posts and intermediate canes should be at least 6 feet. Then stretch upon these uprights galvanised iron wire netting, with 3-inch mesh, leaving a space at the most convenient angle of the structure for a framed door, which cover in like manner with the netting. Next proceed to roof in the structure with the same wire netting, and when this is completed planting may be at once proceeded with. First plant at 8 inches apart on the four walls of the enclosure, single or double cordons of Gooseberries and Currants, which all the leading nurserymen keep in stock, and fasten these perpendicularly to the wire netting with two-ply tar twine, reserving a 2-feet path round the outside of the enclosure. Next plant double rows at right angles to the enclosing fence across the plot. Eight inches is enough space to allow between the trees of either Currants or Gooseberries, and a foot for Raspberries, but the number will of course depend on the area of the enclosure, but do not leave less space than 2 feet between the double rows to make pruning and gathering an easy task. Staking may now follow, using, as before, Bamboo-canes, because they are light, neat, and durable, though very rigid.

When all the planting is done, the canes cut of such length that they are at least 3 inches above the level of the sides, the points will project above the roofing netting, and they must now be bound with soft galvanised wire to the meshes of the roofing netting. This will not only prevent the roof from sagging or bending down by its own weight, but will make the whole structure firm. If this part of the work be done properly, strong winds, or indeed a heavy snowfall, will do no harm to it, but for further security let diagonal bars be fixed at the angles of the enclosure and roof, in the same way as the cross-stays of field gates.

This would be better done early in November, before the winter sets in, but pruning should be left till the end of February or the beginning of March. This operation may be done on the same principle as adopted for bush culture in the open, but the fruiting branch should be left shorter in the Gooseberry, and so finer fruit will be secured, because no buds need be left for the bullfinch or other bud-eating birds.

Of sorts there is ample choice, but if a good succession is secured this is of most moment, especially in small gardens. To start with, take the new May Duke, which is two to three weeks earlier than any other, for picking green for tarts, and is a thin-skinned red berry, fit for

dessert when ripe and of good flavour; of other reds there are Warrington and Whinham's Industry; yellow, Berry's Kent or Keepsake, and the old Yellow Rough and Golden Drop for late. But among the white kinds we find the finest flavour, White Swan, Early Whitesmith and Cheshire Lass; of green berries there is the old Early Green Gage and Veitch's Langley Green.

Those who aim to exhibit must fall back on the larger kinds, called Lancashire, which are, either from the weight of their large fruit or by nature, of a pendulous and spreading habit of growth, and admirably suited to the sort of culture here suggested. Judicionsly thinned and well manured, they will grow fine and heavy fruit that will rarely fail to secure a prize when on the exhibition table. A selection of the best of these may be found in any leading fruit-list, but as they are not often so fine in flavour as the smaller kinds, are not recommended to amateurs and small gardeners.

Raspberries are veryamenable to this method of culture, and the canes may be trained on trellises made of bamboo, in my opinion much preferable to wire, and almost as lasting. Strawberries also, but they are more cheaply protected by movable frames of deal covered with wire netting. These can be put on as soon as the fruit begins to colour, and retained till all is gathered; at the same time there is no objection to a few rows being planted along the sides of the Gooseberries and Currants. but do not let them be too near, and select small-foliaged kinds like Dr. Hogg or British Queen, and for late, Waterloo.

The various Blackberries are now well established in favour, and the hybrid kinds, as the Loganberry and the Mahdi, as well as the Japanese Wineberry, may be introduced under the wire structure, as birds are as fond of these as of the ordinary small fruits here indicated, and some are well worth the trouble and outlay. Experience, November 10, 1903.

The Week's Work.

THE FLOWER GARDEN.

By A. B. Wands, Gardener to Sir W. D. Pearson, Bart., Paddockhurst, Sussex.

Herbaceous Border. - If not already done this should be cleaned, all decayed stems and redressing of short decayed manure. All plants intended to be removed in the spring will have been labelled before they had died down. Everything in the border should be plainly labelled. Here we use deal labels measuring 14 inches by 2 inches; and the height to which Asters, Solidagos, &c., grow should be placed on them, so as to be easily distinguishable when replanting. These can be written on wet days, when the men cannot work outside. Deal stakes should be squared, and made ready for next season for staking them, as no part of the flower-garden requires more attention than a large border when the blooming period is getting past. At this season Asters, Solidagos, and Delphiniums may be planted in mild weather, Whenever possible herbaceous hardy perennials should be planted in good-sized clumps or masses, as the plants are then more effective than if dotted about singly, and also more easily dealt with. Where shrubberies exist at the back of the herbaceous border it is good practice to dig a trench of about 3 feet deep and 1 foot wide, as close to the shrubs as practicable, and fill in with one-half gas-lime and one-half soil in order to keep the roots out of the border. On heavy clayey soil trench-in plenty of lime and brick-rubble, and afford a good dressing of half-decayed manure. Double-flowered and French Anemones are still throwing up a few flowers, and the foliage keeps green and fresh. Ground that is intended to be planted with Hollyhocks should have some fresh lime afforded where the soil is heavy and wet (this is an excellent remedy for club-root). Young plants that are being wintered in cold frames should be cleansed of decayed leaves and be dusted with brown sulphur, which will keep them free from the rust. Old plants should have a few clean coal-ashes placed round the stems; it does not hurt them like long litter.

Lity of the Valley, Montbretias, Ixias, Pæonies, both Moutan and herbaceous, are benefited by good top-dressings of rough peat; if not peat, then moss-litter fresh from the stables; but I do not recommend the use of peat-moss, for when it gets dry great quantities of water are required to moisten it in the summer season, besides, it harbours insects during the winter. These plants are better for being planted in beds or bold masses so as to afford good effect.

Rock Garden.—Remove all tree leaves and rubbish which may have blown into the more tender or delicate plants, they having a tendency to set up decay in the hearts of the plants. Some woodashes placed among or round them will keep them dry and free from the various insects which infest them. Field mice often make havoc amongst alpines and rock plants, and means should be taken to trap or otherwise get rid of them. Aubrietia Dr. Mulus is still in flower here, and is a variety I would recommend gardeners to plant largely, for it is one of the best. Primula purpurea and P. cashmeriana, now throwing up their flower-spikes, should be afforded some slight protection in severe weather. The bronzy-tinted foliage of Tellima and the bright green of the Saxifrages, and the leaves of the beautifully marked hardy Cyclamens, make the rockery bright. Offsets and cuttings that are being wintered in cold frames will need attention, clearing away anything that is decaying, pressing down the soil, affording a sprinkling of woodashes amongst them, and applying fresh air on all favourable occasions. These small plants and cuttings should be correctly labelled, using the neat and durable Acme label.

THE ORCHID HOUSES.

By W. H. White, Orchid Grower to Sir Trevor LAWRENCE, Bart., Burford, Dorking.

Miltonia vexillaria.—It is owing, probably, to the mildness of the season that many plants of Miltonia vexillaria are found on which the young growths have made considerable progress, and which will soon commence to push forth a quantity of new roots. With this advanced state of growth, it will be advisable to repot those plants that require fresh material at the root; but before this operation is begun the grower should make sure that the plants are free from thrips or redspider. It is not easy to eradicate these pests with brush or sponge, nor is it advisable to make the attempt, the foliage being so tender as to be easily broken and disfigured. The best method is to dip or wash the growths in a solution of nicotine-soap, in the proportion of 2 ounces to a gallon of water, heating the water to about 90° F., afterwards laying the plants on their sides for several minutes, then rinsing the mixture off in tepid rain-water. This preparation is chiefly to cleanse the foliage of red-spider, while the well-known XL-All compound is an effective destroyer of thrips. M. vexillaria being a surface-rooting plant, it should have larger space in which the roots may ramble than is generally afforded. I put strong, healthy plants with about four or five young growths into 8-inch pots, and so on in proportion to the sizes of the plants. Shallow pans may also be used if considered preferable; but whichever be used, ample drainage is essential, using the Fern rhizomes which are taken from the peat to fill about one-half of the depth of the receptacle; over this place a thin layer of rough sphagnum-moss. Carefully spread the living roots over the drainage, and work in amongst them a mixture of one-fourth turfy peat, one-fourth leaf-soil, one-half chopped peat, one-fourth leaf-soil, one-half chopped sphagnum, and a small quantity of coarse silver-sand. Fill up to within half an inch of the rim with this compost, and then surface the whole with clean picked sphagnummoss, taking care to press it with moderate firmness up to the base of the young growths. Previous to repotting, the plants should be allowed to become moderately dry at the root; but when that operation is completed they should be well watered, afterwards affording just suffibe well watered, afterwards affording just suffi-cient moisture to keep the sphagnum in a growing condition. The distinct hybrid M. Bleuana, its

variety nebilior, and M. Phalænepsis will require similar attention; but M. vexillaria rubella, M. v. superba, and M. v. Leopoldi, being later flowering varieties, their young growths are not so ferward, therefore a month or six weeks hence will be soon enough to repot them. M. Endresii, formerly known as Odentoglossum Warscewczii, is now sending up its flower-spikes, and should not be disturbed by repotting. Plants of this section of Miltonias that have become unhealthy should be repotted into pots as small as it is possible to put them in, and with careful treatment they will in a short time commence to grow and make roots, and if satisfactory progress is made the plants will require to be placed in larger pots by the beginning of March. The temperature of the intermediate or Cattleya - house will suit these Miltonias, if a position be chosen for them where plenty of fresh air will reach them at all times.

Fern rhizomes should be thoroughly well dried or baked before using them for drainage purposes, because if used as pulled out fresh from the peat they are frequently productive of fungus in the compost and at the bottom of the pots, which is detrimental to the welfare of the plants. For mixing with the potting materials, I am now collecting quantities of fallen Oak leaves and laying them together in a large heap out-of-doors, placing coarse wire netting around the heap to prevent the leaves being blown about, and thin boards over the top to avoid their becoming too wet. To keep them sweet and always ready for use they should be frequently turned over with a fork; this will at the same time prevent fermentation.

FRUITS UNDER GLASS.

By W. FYFE, Gardener to Lady WANTAGE, Lockinge Park, Wantage.

Vines.—Vines forced with the ebject of procuring ripe Grapes in the months of April and May should consist of Black Hamburgh, Foster's Seedling, Madresfield Court, and Buckland Sweetwater, which will be found to give perfect satisfaction under one kind of treatment. The Vines in the early vinery having by this date reached the stage when the bunches may be perceived, too nunch moisture in the atmosphere should be guarded against, as being favourable to the production of tendrils instead of fruit. During the light hours of the day, when forcing should be carried on, take advantage of all the sunlight and warmth procurable in that way by keeping the lights closed; admitting air at this season, and for some time to come, being avoided. Be not too careful in regard to allowing the temperature to rise during the day, but avoid high night temperatures. A night temperature of 55° will be found sufficient, and with a rise during the day of 15°, 20°, or even 25°, good results will follow.

The Grape-room.—Preserving bunches of Grapes in bottles partly filled with water is a practice which may be commended, inasmuch as the Grapes can be kept in better condition in a sweet, dry, cool, airy room, where a temperature of about 45° is maintained than on the Vines. It is only necessary to examine them occasionally, and to remove decayed berries. Nothing is gained by allowing Grapes to hang on the Vines after this date; moreover, the Vines will be relieved from a severe tax on their energy. At Lockinge Grapes are not left hanging after the end of the month of November, and the best results have been reaped when all the bunches were bottled in October. When this is done, rest can be afforded the Vines, and few plants respond to good liberal treatment more readily than Vines.

Peaches and Nectarines.—These may be termed the most popular fruits which the British gardener is required to produce, and in the production of early supplies of fruit caution is a necessary qualification. High temperatures and a too close atmosphere at this season should be rigorously avoided. The middle of May may be considered sufficiently early to have ripe fruits of high quality, and even for that date a proper selection of varieties is of considerable importance. For that date Hale's Early Peach and Early Rivers Nectarine are very suitable varieties. The buds on the trees in the earliest house are about to burst, and before the blossoms expand let the

house be vaporised with XL-All for the destruction of aphis. By the neglect of this simple precaution much damage may result. With the continuance of the present mild weather only sufficient artificial heat should be employed as will keep the night temperature at 50°, with front and back ventilators sufficiently open as to cause a circulation; and by day to 65° with sunheat. Never allow the air to become very dry, but keep it moist by damping the paths and borders occasionally during the day. By the use of a camel's-hair pencil or a whisk of Pampas-grass the fertilisation of the flowers may be assured.

PLANTS UNDER GLASS.

By C. R. FIELDER, Gardener to Mrs. Burns, North Mymms Park, Hatfield, Hertfordshire.

House Cleaning.—Of late, almost every year seems to bring with it its own particular plant pest; and it is to-day, more than ever before, imperative that every effort should be made to give each plant-house a thorough cleansing at least ence a year. This operation is usually performed during the winter season, and on these occasions when weather conditions render outdoor work impossible. The glass, sash-bars, stages, &c., should be well scrubbed with soft seap of sufficient strength and warm water to make a good lather. will loosen all green scum, &c., and syringe with clean water be used to rinse down as the work of scrubbing proceeds, the glass and woodwork will be well cleansed. Afterwards it is advisable to well syringe the whole of the glass, stages, and walls of the compartment with paraffin and hot water, at the rate of a quarter of a pint of paraffin to three gallons of the unixture at the same time being kept well stirred with another syringe. The walls should then be lime-washed, to each pailful of wash half-a-pint of parassin being added. Before being returned to the house the plants should, if necessary, be afforded a thorough cleansing. or other material is used on the stages this should either be cleared away and replaced by fresh materials, or it should be thoroughly saturated with boiling-water, or some other strong course taken which may be depended upon to destroy the many insects which lurk therein.

Hyacinths.-With the approach of the new year the growth of these useful and showy bulbs will advance mere rapidly. No attempt should, however, be made to hurry the growth at this early stage. After the bulbs are removed from the plunging material they should be placed in a cool pit or frame where protection from frest can be afforded them, and lightly shaded for a few days until the blanched growth becomes green. At the end of a fortnight, if the pots are well filled with roots, a portion of the stock may be placed in warmth of 45° to 50°, placing the pots as near the roof-glass as possible. They should be brought forward gradually in successional batches, so as to allow time for them to develop their flower-spikes under comparatively cool conditions. Weak manurial aid should be applied freely when growth has become active, and care should be taken net to allow them to suffer lack of water at the root. Should it be necessary to postpone the flowering of a pertion of the bulbs to the latest possible date, the bulbs should be removed from the plunging material when sufficiently well rooted, and placed in a cold pit or frame and pretected from frost.

THE KITCHEN GARDEN.

By John Pentland, Gardener to C. H. B. Firth, Esq , Ashwicke Hall, Marshfield, Chippenham.

Work in General.—At the beginning of another year let us take early measures to combat the gardener's natural foes while shelter for them is scant. Take advantage of fine days to rake out all edd corners and vacant spaces where slugs and other pests are likely to be found, and let the rubbish thus collected be taken to the refuse heap and burned. Give the ground thus cleared a dressing with lime, which has been slaked under cover and kept dry, at the rate of a peck to the square yard. This dressing is necessary after so much rain, as a close examination ten minutes afterwards of the surface of the ground will show; and it is much better to kill the pests now than to dig or trench

them into comfortable winter quarters, to rise again at their own convenience. Should the spring of 1904 be similar to that of 1903, every precaution will be necessary to save young crops from destruction.

Seed Drawers.—On wet days the seed drawers may be overhauled, and useless seeds thrown away, as they would otherwise afford breedingbeds for moths, &c. Make a list of seeds that will be required for future use, that they may be obtained from the seedsman in readiness for sewing at the proper time. In making out such a list do not include many nevelties, unless for trial purposes, but choose varieties which, having been well tried in the district in which you reside, may be relied upon to succeed. Take Peas for instance. In the middle of January, 1903, we put in several early varieties on a warm border, and the only one that afferded acrop was William the First. Soil and situation have so much to do with the success of early crops that it is only the man on the spot who is able to choose varieties that will be suitable. In regard to times for sowing, there is nothing to be gained by undue haste; better keep the seed in the bag than lose the crop by sowing too soon.

Seakale.—Get up sufficient roots for several weeks' supply before hard frost sets in. They will then be ready to take the place of those that are now in the forcing-house.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, gr. to LORD STRAFFORD, Wrotham Park, Barnet.

General Work.—If through pressure of other kinds of work the fruit garden proper has so far been neglected, I would strongly urge the gardener to push forward all tree and bush planting, the pruning and nailing of all sorts of wall fruit trees, excepting Apricots and Peaches, so that the work be finished by an early date, the trees thoroughly cleansed, the roots top-dressed, and the borders made tidy.

Morello Cherries.—These trees, if planted against walls having a northern aspect, should be amongst the first of the kinds to be taken in hand, so as to finish the work needed before the coldest weather sets in. But assuming that these trees have not as yet received attention, when pruning them let plenty of young fruiting wood be laid in, but avoid crowding the shoots, as this not only prevents the wood ripening but weakens the trees, and the fruit in consequence is rarely of large size. The Morelle bears also on spurs, but owing to heavy cropping these soon get exhausted; whereas when trained in the fan shape, and the young wood is laid-in like that of the Peach, the trees will fruit abundantly for many years in succession. Spur back to a couple of buds all weak shoots, and those not required for filling spaces bare of shoots; and lay in at intervals young, medium-sized, well-ripened shoots at a distance of from 4 to 6 inches apart. that all old shreds and ties that pinch the bark be replaced with new ones, allowing ample room for the shoots to increase in girth. should, if not well balanced, be removed from the wall and the branches regulated. In doing this, first fasten the main branches at equal angles and distances apart, and then fill in with the younger shoots; but do not make use of too many nails, only just sufficient to keep the branches in their respective positions. When drawing strong wood to places required use-either thin withes er tarred twine (strong), placing a piece of cloth beneath it to save the bark from injury. In the case of well-formed trees and where much nailing and training have to be done, there is no need to take the whole of the branches from the wall annually, it usually sufficing to make an examination of the shreds and ties, loosening them if there is danger of the bark being injured. When the nailing of the trees is finished, thoroughly wash them with a mixture of soft-soap and paraffin, or moderately strong soap-suds. Should a heavy top dressing be required, remove a part of the top soil, and then apply a moderately heavy dressing of bone-meal, pricking in this with a four-tined digging-fork, and affording a covering of loam and wood ashes, and mulching with short dung.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the Publisher. Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be Welltran on one bids only of the Papez, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editor does no undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.

Illustrations.—The Editor will be glad to receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

APPOINTMENTS FOR THE ENSUING WEEK.

JAN. 5 Royal Horticultural Society's Committees. TUESDAY.

SALES FOR THE WEEK.

SALES FOR THE WEEK.

MONDAY AND FRIDAY NEXT—
Hardy Border Plants and Bulhs, Azaleas, Roses, &c., at 67 and 68, Cheapside, E.C., by Protheroe and Morris at 12

WEDNESDAY, JANUARY 6—
At Steveos' Rooms at 12 30, Roses, Azaleas, Rhododendrons, Gladioli. Hardy Plants, &c. — Palms, Azaleas, Rhododendrons, Perennials, Herbaceous Plants, &c., at 67 and 68, Cheapside, E.C., hy Protheroe and Morris, at 12 At 5 o'clock, consignment of Japanese Liliums, Tuberoses, Lily of the Valley, &c., at 67 and 68, Cheapside, E.C., by Protheroe and Morris.

FRIDAY NEXT—
Imported and Established Orchids at 67 and 68.

RIDAY NEXT—
Imported and Established Orchids at 67 and 68,
Cheapside, E.C., by Protheroe & Morris, at 12 30,
(For further particulars see our Advertisement columns.)

AVERAGE TEMPERATURE for the ensuing week, deduced from observations of Forty-three Years at Chiswick —36.5°. ACTUAL TEMPERATURES :

PROVINCES.—Dec 30 (6 P.M.): Max. 35°; Mln. 30°,
Dec 31 (noon); Dull, frosty.
PROVINCES.—Dec 30 (6 P.M.): Max. 36°, Ireland;
Min. 32°, South Coast.

THE review of a past year must 1903. always be of a mixed character. There is always matter for regret; there is always something to look back upon with satisfaction and gratitude. Bad even as the "environment" has been in 1903, it might have been worse, or our powers of adaptation might have been less effective.

As to the weather and the crops, the first subjects of interest to cultivators, the year has established a "record," as the phrase goes. We used to look back upon 1879 as the worst within living memory; but 1903, so far as damaging frosts in spring, excessive rainfall, and relative absence of sunlight are concerned, must be written down as worse even than that very dreary year 1879. Never since we began our annual record of the fruit crops in every county of the British Islands some forty years ago have we had to record so complete a failure. And the failure was not merely local, it was universal-here less, there greater, but, on the whole, everywhere disastrons. As with fruits, so with seeds, in almost all quarters we hear of deficient quantity and inferior quality.

Potatos were wofully diseased, though happily some progress has been made in raising disease - resisting varieties. This relative failure of our own home-grown supplies should surely form a subject of the gravest concern, when the expediency of imposing duties on colonial or foreign produce is under consideration. But there seems to be a pretty general consensus of opinion that whatever alterations be made in our fiscal system, necessary articles of food and raw materials shall not be taxed. This, however, is a matter for the future and need not detain us in our retrospect of the past. No casual observer who saw the wonderful collection of fruit and vegetables at Chiswick in the autumn would have supposed that there was anything to complain of, but to experts, fine as the display was, there were indications, especially among the fruits, that the quality was not up to the ordinary standard. Flower shows and fruit shows, valuable as they are as object-lessons, are, as in the case we have alluded to, misleading to the general public, who do not see the failures, and are apt to judge of the whole from a part.

We have mentioned first in order the Chiswick Show, but in sequence of time it came almost last, being but little in advance of the Chrysanthemum shows. For sentimental reasons, in view of the approaching abandonment of the historic garden, Chiswick has a right to the foremost place in the estimation of gardeners. This feeling was emphasised also by the great social gathering of gardeners, which took place at the same time, and which, owing to the zeal of Mr. A. Dean and his sympathetic committee, proved so great a success. If there were nothing else to signalise 1903, the gardeners' dinner would have marked it out distinctly from ordinary years.

The great Ghent Quinquennial in April was as large and important as ever, perhaps more so. In accordance with the spirit of the times, the scientific element was more than usually prominent; and if we are to advance beyond our forefathers, and meet new contingencies as they arise, we must take to heart the exhortations of the Count DE KER-CHOVE and imitate his practice. Unfortunately, the weather at Ghent was atrocious; but at least it afforded an illustration of the power the gardener has of dealing with adverse conditions.

Of the other great shows of the year, that at the Temple, that at Holland House, and that at Shrewsbury, all we need say now is that they were all up to average. The Temple Rose Show, owing to the untoward weather, was less good than usual; but that held at Glasgow a few days later was an unequivocal success.

The question as to how best to celebrate the centenary of the Royal Horticultural Society, which occurs this present year, was much debated in former years, and after repeated discussions it was, as will be remembered, decided in 1902 by overwhelming majorities to secure a proper home and exhibition hall for the Society. During the past year the work of building such a home has been in progress. No one doubted the necessity for a garden also, and many were disposed to put the claims of the garden in the first rank. This appeared the less desirable as the lease of Chiswick had several years to run, and it seemed the better policy to complete the offices and hall before launching out into expenditure on a new garden at a distance from London. Such was the condition of affairs when the horticultural world was startled by the offer to the Society, by Sir Thomas Hanbury, of the famous wild garden and its surrounding acres at Wisley, near Weybridge, formerly the property of that keen horticulturist, the late Mr. GEORGE WILSON.

This munificent offering of course at once altered the conditions, and there is no longer any question how the Centenary is to be celebrated, for at the beginning of its second period of a hundred years the Society finds itself virtually in possession of a home, a hall, and a garden, in addition to the Lindley Library-a remnant from the famous 1866 exhibition. The income of the Society is larger than it ever was, but it is avowedly precarious, whilst all these possessions necessitate outlay for completion and upkeep.

It is most earnestly to be desired that the offices, hall, and provision for the library may be completed, and the Society freed from financial obligation before serious outlay is made at Wisley. Circumstances have rather retarded the flow of subscriptions towards the erection of the hall, but the generosity of Baron Schroeder and his associates, and the munificence of Sir Thomas Hanbury, must surely induce the rank and file to do their duty in the matter. There was a large outcry for the hall; let those who advocated its erection come forward and complete it. There was a protest among those who favoured the garden scheme; thanks to Sir Thomas HANBURY they have seen the fulfilment of their wishes. Now it is for them to do their part, and round off the celebration of the Centenary in the most effectual manner by. launching the Society into an unruffled sea so far as finance goes.

One of the greatest needs of horticulture at the present time is the establishment, under competent direction, of a research laboratory. The Royal Botanic Society has set an example by establishing such a department in the Regent's Park, and we trust the experimental garden at Wisley will not be suffered to remain long without such an adjunct. In addition to the requirements of pure science, which are attended to elsewhere, the requirements of commercial horticulture are constantly becoming more urgent. Time was when horticulture was a luxury for the well-to-do, a matter of practice and experience only. It is so still; but it has become a huge commercial industry as well, and the capitalists who have invested their money and are utilising their brains in commercial gardening have a right to be benefited by the results of scientific research, and not only by exhibitions, of which it may be doubted whether the value is in due proportion to the cost.

The practical value of the Mendelian hypothesis in hybridisation experiments, the use of ether for forcing purposes, the employment of electric light in the dull season, the need for better means of prevention against insect-attacks and fungus pests in Potatos, Grapes, Tomatos, Cucumbers, and other crops—all these are points which are of the greatest concern to the grower, and they are points, some of which at least could be elucidated at little proportional cost in a properly equipped scientific experiment station.

The Sale of Poisons Bill, the Bill introduced to check corrupt practices in trade, may be passed over with the mere mention; for, although much discussed during the past year, little or no practical result has yet been arrived at, but no doubt substantial progress in these matters will shortly be made.

The Gardening Charities have fulfilled their beneficent mission as well as circumstances permit. They are well managed. but their powers for good are limited by those who might control the circumstances mentioned to a larger extent than they do. It is pitiful to see each year the applications of deserving candidates necessarily passed over.

During the year that has passed we have lost from our ranks many a good man and true. Of such were Barron, of Chiswick, and Smith, of Mentmore, McKenzie and PETTIGREW, ADLAM, of Johannesburg, and others whose names are in our obituary list. The veteran meteorologist, JAMES GLAISHER, for years acted as our referee in matters relating to the weather, and furnished us with weekly records. The great philosophical thinker, HERBERT SPENCER, was at one time an occasional contributor; and in HERMANN WENDLAND, of Hanover, we lost a friend of long standing and an acknowledged expert in Palms and other tropical plants. loss of Crozy, of Canna fame, causes a break in the ranks of original experimenters.
Of the "new plants" of the year we pro-

Of the "new plants" of the year we propose to speak in subsequent issues. The advances made in the past year enable us to look forward with hope and confidence to

the New Year just dawning.

OLDENBERGIA ARBUSCULA.—THE hills near Grahamstown in South Africa are or were rich in plants of exceptional interest, and two of the most striking of these are the big-flowered Protea cynaroides and the remarkable woody Composite here illustrated (fig. 4). The flowering of the latter for the first time at Kew was noted in September last (see p. 178). From the altitude at which it is found on the Grahamstown hills the Oldenbergia will probably prove hardy in the warmer parts of this country, such as South Cornwall. The late Miss North made two pictures of dt, which are to be seen in the collection of her paintings at Kew, and in her Recollections she mentions it in a description of a railway journey from Port Elizabeth to Grahamstown:—

"The railway took me through the Adda Bush, a flat, swampy locality, full of Spekboom trees (Portulacaria afra), which are said to tempt the elephants down close to civilisation, and herds of them are still found there. Some 20 miles of dense tangle prevents mankind from interfering with the poor beasts, and the climate suits them better than it does their enemies. It was a great relief to begin ascending, and the road became very steep and wonderfully made. The views got wider and wider, over hare hills covered with coarse yellow grass sprinkled with pink Watsonias, with green trees only in the cracks, of which the Aloes, Euphorbias. and Aralias [?] tower above the rest, some of the Aloes splitting into branches like the Doum Palm or Dracena, with slender curved stems. At the top of the pass we came to groups of the Oldenbergia, a most striking shrub which grows only on these hills, and on the very tops of them; its stalks and young leaves are of the purest white velvet, the older leaves lined with the same, but the upper sides resemble the leaves of the great Magnolia. The flowers are like Artichoke Howers, purple, with white calyx, stalks and buds, growing in a noble bunch. The whole bush is under 6 feet high." W. W., Kew.

ROYAL HORTICULTURAL SOCIETY.—The first meeting of the Committees of the Royal Horticultural Society in 1904 will be held as usual in the Drill Hall, Buckingham Gate, Westminster, on Tuesday, January 5. An election of new Fellows will take place at 3 o'clock. To prevent misunderstanding, it may be mentioned that the Committees of 1903 do not vacate office until the date of the annual meeting, 1904; and, in like manner, all Fellows' tickets of 1903 are available until the end of January, 1904.

— At a general meeting of the Royal Horticultural Society held on Tuesday, December 15, seventy-two new Fellows were elected, making a total of 1,412 elected since the beginning of the year 1903.

HORTICULTURAL CLUB.—The next House Dinner of the Club will be held on Tuesday, January 5, at 6 P.M., at the Hotel Windsor. Mr. George Gordon, V.M.H., has kindly promised to read a paper, entitled "The Experimental Garden of the Future."

MR. LEO GORDON GODSEFF, son of Mr. JOSEPH GODSEFF, manager to Messrs. SANDER & Sons, St. Albans, has been appointed by the

in the gardens of the late Baron Ferdinand Rothschild, at Waddesdon Manor, and in the nurseries of Messrs. Backhouse & Sons, of York. Wishing to learn Continental methods, he went to the Continent, and passed two and a half years with M. Cochet, at Suisnes, Seine et Marne, France. From thence he went to Germany with Messrs. Haage & Schmidt, then back to France with Messrs. Crousse et Fils, Chatenay. During these years he not only obtained exceptional experience in gardening, but also attained fluency in the French and German languages. Returning to England,

FIG. 4.—OLDENBERGIA ARBUSCULA, FLOWERS PURPLE, ROYAL GARDENS, KEW.

Liverpool Corporation head gardener of the Calderstones Estate, Allerton, Liverpool, where he has already commenced his duties. His success should encourage other young gardeners to work, for in these open competitions for public posts nothing but sterling merit tells. In this case Mr. Goddeff secured the appointment out of about one hundred applicants. The Calderstones Estate, a beautiful property of about 100 acres, with mansion, gardens, and planthouses, formerly belonged to Mr. McIver, the head of the great shipping firm, and a little over a years ago the Liverpool Corporation purchased it for £43,000, with the object of turning it into a public park. Mr. L. G. Goddeff began his gardening career in Messrs. Sander & Sons' nursery, and afterwards gained much experience

after a spell at the Royal Gardens, Kew, he was appointed head gardener to A. K. Bulley, Esq., Mackwell Brow, Ness, Neston, Cheshire, who is the possessor of a remarkable garden, rich in hardy plants, bulbs, and trees, and one which the proprietor generously throws opens to the public; so that during his three years' tenure of office there Mr. Godseff has learnt much which will be of value in the management of a public garden. That his service at Ness has been satisfactory the recommendation which Mr. A. K. Bulley gave to the Liverpool Corporation proves: a passage in it runs, "Briefly, I think if you travelled the length and breadth of the land you would fail to get anyone more admirably fitted for the position. I look on him more as a friend than an employé."

M. DANIEL.—The Academy of Sciences has recognised the importance of the labours of M. Daniel, Professor at the Faculty of Sciences at Rennes, by awarding him the Philippeaux Prize for physiology, heretofore always bestowed upon an animal physiologist.

DISTINCTIONS TO HORTICULTURISTS.—Among recent promotions in the order of the Mérite Agricole, we find the names of M. Aug. Nonin, and M. R. Salomon, among others less well known on this side of the Channel.

THE RIVIERA AND ITALY.—The Brighton Railway Company is publishing a tempting prospectus of circular tickets from London and back along the French and Italian coast line from Marseilles to Genoa vià Newhaven, Dieppe, and Paris, the entire trip to cost but £10 for sixty days' first-class travelling. The booklet sent out shows pictures of some of the most beautiful spots along this route, and mentions recent improvements in the train service and the new turbine steamer Brighton.

A CHRISTMAS GIFT. — If it be a timely act at Christmas to help hospitals by means of donations of money—and it is so—it must be at the least as praiseworthy an act to contribute towards the preservation of health, and this has just been done by Mr. Elliman, a solicitor of Slough, who has just offered to the Urban Council at Slough 26 acres of land, with horticultural adornments, to be used as a recreation ground. The land is situated centrally and is admirably suited for the purpose, besides being of great money value. In addition to the land, the donor proposes to spend £5,000 in laying out the ground, and also intends to invest some £10,000 to endow it. This is no new action on the part of Mr. Elliman, who has already given many bequests to Slough.

CHERRIES IN NATAL.—In the early days of November samples of Cherries in baskets were placed on the market in Pietermaritsburg, the white variety being Elton, and the black Bedford Early. So unusual an occurrence led to inquiries as to the place of origin, which was soon found to be the nursery of the Trappist Fathers at Centvery, Donk Vlie, where great attention has been paid to the cultivation of home-raised standards and German bushes. The whims of the fruit have been carefully studied by the Fathers, and they expect soon to be able to send out thoroughly trustworthy plants, situation and cultivation being of course carefully copied by intending growers.

THE CRYSTAL PALACE CHRISTMAS TREE.

The giant Christmas trec which is such a source of great pleasure to the thousands of youngsters who visit the Crystal Palace during the holidays, has again been presented by Mr. J. Colman, of Gatton Park. The tree has been placed in a new position in the south nave, and is an imposing addition to the many other good things provided for the Christmas fare at Sydenham.

FRENCH CHRYSANTHEMUMS. - M. ERNEST COUTANT, Chrysanthémiste, Douai, sends us the following list of first-class novelties selected out of a thousand varieties. Each has received a First-class Certificate, and from 90 to 100 per cent. points:-Aigle d'Or, Mr. Francis Engler, Mme. Marie Miller, M. Japonais, Poupoule, Souvenir du Président Brisse, Pourpoint, Souvenir de Mme. Buron, Albert Maumené, Professeur Tillier, Amateur Marchand, Mme. Jules Gruel, Mdlle. Marie Chantrier, Vallée d'Ordessa, Daïmio, Mousmé, Tokio, Yézo, Alexis Dessarts, Artilleur Dessarts, Joseph de Laurens, Mme. Jne. Réaud, Alliance, Préfet Boncourt, Amateur, Conseil, Comtesse de Grailly, Chrysanthémiste Montigny, Femina, Anna Debono, Mme. R. Oberthur, Marquise Visconti-Venosta, Maurice Rivoire, Roi d'Italie, Soleil d'Or, Souvenir de Victorine Calvat, Sparklets.

IMPORTS OF FRENCH HORTICULTURAL PRODUCTS.—The Jardin for November 20 comments upon the importance of the horticultural trade with Great Britain, and of the importance of continuing and improving friendly relations with our country. Statistics show that the exports from France to Great Britain in 1902 included 33,000,000 of Strawberries, Cherries, Plums, Pears, Gooseberries, Almonds, Apricots, Peaches, Grapes, fresh Walnuts, and Chestnuts; and 28,000,000 of fresh, salted, dried, and preserved vegetables, including more than 15,000,000 of Potatos, 8,000,000 of flowers, 2,000,000 of greenhouse plants, Onions, and flower seeds.

THE COSMICAL FUNCTION OF THE GREEN PLANT.—Prof. TIMIRIAZEFF, in his Croonian lecture, thus spoke of the work done at Kew:—

"When a botanist on a tour in the Botanical Garden of Geneva stops to admire the row of marble busts of famous botanists born in Geneva, Senebler in the foreground, he may feel sure that he stands at the very cradle of the physiological research of the nineteenth century, just as in our days, if he would see the place from which will surely spring the physiological movement of the nascent century, he must hend bis steps to another botanical garden much nearer to us, and salute in the Jodrel Laboratory the starting point of quite a new departure on the way first trodden by Senebier and Saussure.

It was the prism which more than two centuries ago revealed the inner nature of the sunbeam. It is the prism again which continues in our President's, In Sir Norman Lockyer's and other able hands to unravel the mysteries of the origin of this sunbeam, and I am confident that it will still be the prism which will some day fully disclose the ultimate fate of this sunbeam on this our earth, 'its transmutation juto bodies.'

this our earth, 'its transmutation into bodies.'

Thus we arrive at the final conclusion that in Newton's book of Opticks we not only find the first and broadest statement of our problem in its actual state, but likewise the surest means towards its probable solution in the future. Little did Jonathan Swift suspect, when writing his envenomed satire on the Royal Society, that that which he took to be the vagarles of a madman was prophetic of Newton's immortal genius."

The full lecture is reported in the Proceedings of the Royal Society, December 19, 1903.

BRITISH FRUIT CULTURE.-The President of the Board of Agriculture and Fisheries has appointed a Departmental Committee to inquire into and report upon the present position of fruitculture in Great Britain, and to consider whether any further measures can with advantage be taken for its promotion and encouragement. The Committee is constituted as follows:-Mr. A. G. Boscawen, M.P. (Chairman); Mr. C. W. RADCLIFFE COOKE, Mr. J. M. HODGE, Colonel CHARLES W. LONG, M.P.; Mr. GEORGE MONRO, Mr. P. SPENCER PICKERING, M.A., F.R.S.; Dr. W. Somerville (an Assistant Sccretary of the Board of Agriculture and Fisheries); Mr. EDWIN VINSON, and the Rev. W. WILKS, M.A. (Secretary of the Royal Horticultural Society). Mr. ERNEST GARNSEY, of the Board of Agriculture and Fisheries, will act as Secretary to the Committee.

EXHIBITIONS AND CHARITY: AN EXAMPLE.—The Chesterfield Chrysanthemum Society, though it has not met with unusual financial prosperity during the past season, has nevertheless decided to present ten guineas to the Gardeners' Royal Benevolent Institution, £15 to the Royal Gardeners' Orphan Fund, and £10 to the Chesterfield Hospital.

ASSOCIATION OF AMERICAN AGRICULTURAL COLLEGES AND EXPERIMENT STATIONS.—The objects of the proposed association are to study the laws of heredity, to devise better methods of breeding plants and animals, to bring about cooperation in breeding, testing and increasing the use of improved animals and plants, and to better develop the work of registry associations and competitive shows of animals and plants, and in general to perfect the knowledge of breeding and to aid in the better organisation of the business of plant and animal breeding. It was suggested

that the proposed association be divided into two sections, a Plant section and an Animal section; and that the president, vice-president, secretary, treasurer, also the presidents and secretaries of the two sections, constitute an executive committee, and that a meeting be held annually. The appointment of numerous committees was suggested to bring about co-operation among biologists, horticulturists, agriculturists, and live-stock specialists, in the study of problems in heredity in relation to breeding, and among plant and animal breeders to improve the systems of herd books, score cards used in judging, methods of conducting competitive shows, and to encourage the breeding of animals and plants. by institutions, co-operative organisations, and private parties. The programme at St. Louis, December 29, 30, will provide general sessions for perfecting an organisation and for the discussion of topics of interest alike to animal breeders, plant breeders, and biologists, and sessions of the-Plant section and of the Animal section. The effort will be to secure papers from prominent animal breeders, plant breeders, zoologists, and botanists, blocking out the problems pressing for solution in the advancement of plant and animal improvement and to bring about a better understanding of the biology and the business of breeding. Correspondence is solicited from those interested. (Committee: W. M. Hays (Chairman), Thos. F. Huut, H. J. Webber, L. H. Bailey, and C. F. Curtiss). W. M. Hays, University Farm, St. Anthony Park, Minn., U.S.A.

NEW ENGLAND ASSOCIATION OF PARK. SUPERINTENDENTS .- The park superintendents of New England have formed themselves into anassociation, designed to bring the different menibers into communication so that mutual benefit may accrue as regards their work. The association publishes a bulletin, which is circulated. among the members, all of whom are invited tocontribute papers or notes to it detailing their experience and opinions in the various technical matters under discussion. A recent bulletin deals with the question of street-planting, and the park superintendents of different districts inquire for and supply information bearing upon. their respective localities and circumstances. Many trees are suggested as suitable for streetplanting, and their advantages are discussed; also the proper way to start and maintain them in position. Such a circular as the one before ns should be of great use in suggesting how toperform intelligently operations too often rendered ineffective by carelessness or ignorance.

M. ANDRÉ.—The friends of the eminent landscape gardener, who is also the editor of the Revue Horticole, will deeply sympathise with him in the grief occasioned by the sudden death of Madame André on December 5 last.

LANE'S PRINCE ALBERT APPLE is the subject of a coloured illustration and description in the Bulletins d'Arboriculture, &c., of Ghent. It was exhibited by Messrs. Lane of Berkhampstead in 1857, and has long been recognised here as an excellent Apple, of which a description is given in Hogo's Fruit Manual, as well as a figure in our columns, September 17, 1892, p. 333.

ITALIAN AGRICULTURE.—We are favoured with the prospectus of the Scuola Superiored'Agricultura di Portici, illustrated with numerous cuts, showing the laboratories, dairies, breeds of cattle and other matters relating to the School, showing how well equipped it is. Lists of the professors and students are also given.

CUTTING DOWN TREES BY ELECTRICITY.—Successful experiments are reported from France with regard to the felling of trees by electricity. According to a recent issue of Le Jardin, invarious forests the plan has been tried of using a platinum wire heated to a white heat by an

electric current instead of a saw. By this meaus the tree is severed more easily and rapidly than by the older methods; no sawdust is made, and the slight charring produced by the burning wire preserves the wood. The new principle is said to be eight times as speedy as when a saw is used.

LONICERA.—In the fourteenth annual Report of the Missouri Botanical Garden, St. Louis (1903), is a valuable monograph, by Mr. A. Rehder, of the Arnold Arboretum, on the genus Lonicera. One-hundred-and-fifty-seven species are enumerated, with full bibliographical details, synonyms, localities, &c. Numerous hybrids are also described. Many are crosses from L. tatarica. These hybrids, we are told, fruit as profusely as the species, and seedlings show almost invariably a reversion to L. tatarica. This is a very valuable monograph which will be indispensable to all students of the genus.

POTATO £160 PER POUND, £358,400 PER TON .- Messrs. E. W. King & Co., seed growers, Coggeshall, Essex, inform us that they recently purchased a few pounds of Findlay's latest Potato, the Eldorado, at the high price of £150 per pound, and of which they have sold some at £160 per pound, or at the rate of £358,400 per ton. This is probably the highest price ever paid for Potatos. The raiser, Mr. Findlay, does not intend to offer this Potato until the spring of 1905, and then his price will be £3 3s. per pound; the few pounds there are about the country are from a few samples Mr. FINDLAY sent to two Potato growers last spring for trial. The Potato has proved itself to be a great disease resister, prolific, and of very fine quality. Messrs. E. W. KING & Co. further tell us that they were booking orders for 1905 at 50s, per pound, but owing to the demand they had to increase the price to 55s., and now to 60s. per pound, and in all probability this Potato will be £5 per pound in the spring of 1905.

NATIONAL POTATO SOCIETY .- A large and enthusiastic meeting was held at the rooms of the Horticultural Club, Hotel Windsor, Victoria Street, S.W., on Wednesday last. It was summoned by Mr. W. P. WRIGHT, and presided over by Mr. A. D. HALL, of Rothamsted. A large number of letters expressing sympathy was read. and a very long and complex resolution was proposed by Mr. W. P. WRIGHT, the full terms of which will be given in another issue. This was seconded by Mr. A. DEAN, and supported by other speakers. As a result it was resolved that the Society be established, that a provisional committee be appointed to hold office for a year, and that Mr. WRIGHT act as secretary. We take it that the general principle is estabdished, but that no one is pledged to the details as set forth in the multiform resolution, as these will have to be more fully considered at subsequent meetings. It was suggested that a series of trials of different varieties be carried out in different counties, and that more care be exercised in details of cultivation and storage, so as to eheck the so-called deterioration of varieties, and to prevent the access of disease. necessity for a more perfect system of classification of varieties was emphasised by various cultivote of thanks to the Chairman, gave a very vivid account of the disease as it first appeared in Lincolnshire in 1845, and pointed out that these Potatos which had the mest robust habit, firmest stems, and shiny-looking foliage, were then, as now, the varieties least liable to attack. Nothing was said about the extravagant prices paid for certain varieties; indeed, the meeting was pervaded with a sound, business-like spirit, which augurs well for the success of the Society. Lord ROSEBERY is to be asked to become the President.

PUBLICATIONS RECEIVED.—Carters' Practical Gardener, and List of Tested Seeds for the Garden, 1901 (James Carter & Co., High Holborn). This, as its name implies, is a publication that contains useful gardening instructions as well as illustrated lists of vegetables and flowers to be grown from seed and otherwise. The directions are thoroughly to be trusted, and are clearly given. The coloured illustrations are sure to find favour, and many of the black-and-white reproductions are truly pietures. The representations of plant diseases (Finger-and-Toe, Asparagus-beetle, &c.), give an additional value to a useful publication.—Sutton & Sons' Amateur's Guide to Horticulture for 1904 (Sutton & Sous, Reading). The newest issue of this Guide contains additional and excellent illustrations of some of the best vegetables and flowers grown. Photography and colour-printing are employed in the coloured plates with good results. The cultural notes are plain and concise, and the whole volume is quite up to the high standard of those of previous years, and amateurs and professionals alike will welcome tt.

A FINE TREE OF ARBUTUS UNEDO.

A PHOTOGRAPH of a fine specimen of this ornamental tree was kindly sent by Mr. R. W. Richards, of the Priory, Usk, Monmouthshire,

they are most wanted. I cannot say that this is the experience of all growers, but several that I have met with have referred to the earliness of what should have been the latest varieties; and niveum, which is essentially a December variety, has been coming into market for several weeks. Euphorbias (Poinsettias) appear to be rather earlier than usual this season. It is one of those plants of which it is difficult to alter the natural season of flowering. There may be a little variation; it is rarely we see much of them before the middle of November, but there were some well-finished heads of bracts to be seen the first week in November. The latest time that I have known these to be kept over to has been the second week in February. These were the variety plenissima, which is naturally later than the ordinary form of pulcherrima. The earliest variety is kermesina, which is of a lighter shade of colour and the bracts are broad but not lobed. It is not often that distinctive names are given, but there are several various shades obtained by crossing the white variety with the

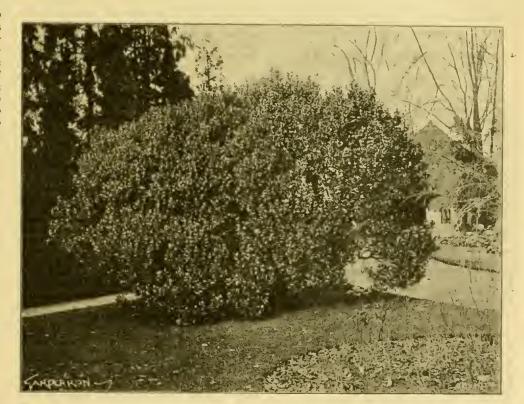

FIG. 5.—ARBUTUS UNEDO, AT THE PRIORY, USK, MONMOUTH.

and accompanying the photograph the following note:—"I send you herewith a photo. of a very compact (and for an inland county) large Arbutus unedo growing in our grounds. The tree was seriously injured by hard frost about seven years ago, and we feared it was ruined, but since then it has made wonderful growth, and this last summer has especially suited it."

MARKET NOTES.

CHRYSANTHEMUMS.

The past season has been a most difficult one for all growers, and more particularly those who want to time plants to be in flower at any particular date. Chrysanthemums have given some trouble. The early varieties were later than usual; now it is found that the late varieties which should have come in for the Christmas and New Year's trade are much earlier; and it has been difficult to keep them over until the time when

red. With a little care in fertilising, seed may be had, and it will germinate freely, and flower the following winter. A. H.

COVENT GARDEN FLOWER MARKET.

The supplies for Christmas trade were in most instances equal to the demand, and there was a very good business done, and a general advance in prices noted, especially in cut flowers. When trade buyers have to pay from 8s. to 10s. per dozen for blooms of Lilium longiflorum, and nearly as much for Richardias, it does not give them a chance of making a very big profit from the retail customers. Good Roses made high prices. Carnations were much in demand, and were among the few flowers that were cleared out early in the morning. Bright colours in Chrysanthemums were making much higher prices than white; and growers would do well to look after the late crimson-coloured varieties, deep bronzes, and other bright shades, but which generally begin to get scarce in December. English forced

Lilac has been good, but Mr. Drost seems to be the only grower who flowers it really well. Lily of the Valley made higher prices than usual. In fact, most of the choicer material was disposed of at good prices.

Flowering plants in pots sold at good prices. Azaleas, well flowered, were plentiful. Genistas were fairly good. Euphorbias were good and sold at satisfactory prices. Cyclamens, Cinerarias, Hyacinths, Daffodils, Richardias fetched high prices, but they did not sell freely. Tulips are now mostly grown in small boxes close together, and can be used for "making up" pots or for cutting, and the yellow, white and red varieties were plentiful, especially the last. Flowering plants were more in demand than Palms, Ferns and other foliage plants. The supply of small Ferns was enormous. In a chat with one grower I learned that he had been sending up three vanloads at a time; this represents over 300 dozen plants, and sometimes he has had as many as 500 dozen for one market. There are many other growers who send in large quantities. It has often occurred that they have run short about the time that the bulbs come in, but it does not seem likely to occur this season. A. H.

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his Correspondents)

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—Referring to the note by your correspondent "R. D." on the above subject, with which I was very much interested, I must say that it is deplorable to receive so many applications for votes from apparently very necessitous persons, many of whom must be some long time before they succeed in getting on to the funds. It is a great pity indeed that more cannot be done in the way of money for this noble Institution. Having been invited to act as a steward for the last dinner, I wrote to most of my influential neighbours, and I was greatly grieved not even to receive a reply out of a score, "save one." It is, to say the least, disheartening; even a reply would have been something; and although there has been a great deal of "begging" this year, 2s. 6d. or 5s. would not be missed by any one of those referred to. It seems there are those who think that if they cannot give largely they must not give at all. F. S. J.

— I was very pleased to read the remarks of "R. D." in reference to this Institution for gardeners. I am grieved to hear of the lack of support "R. D." received from gardeners. As an old gardener and supporter of the Institution, I do most earnestly appeal to young gardeners to do something in aid of this most decoration observing absorption of the support of the deserving charity. My own experience dates from the year 1862. I was foreman at 16s, per week, and the head-gardener brought the claims of the Institution before me. I might have said I could not afford it, for it is not difficult to spend 16s. a week on necessary articles; there is much left for charity, I admit, but I subscribed my guinea a year from that date. After acting for some time as head-gardener I brought the claims of the Institution before my employer, and he thought a guinea a year was too much for me to pay, so he gave £10 10s. donation for himself and £10 10s. for me. I therefore urge upon and 210 los, for me. I therefore lings upon gardeners who are in constant employment to help in this good cause. I know how greatly money is needed; I served on the Committee thirty years ago, and now know a good deal of the workings of the Institution, and of other similar institutions, and can safely say that no charitable institution known to me is more economically worked; and it is all done to aid gardeners in their old age, if they happen to be in distress. Not far from where I live a gardener's widow is receiving support from the funds; her husband received the pension until he died, and I know how much it was appreciated by him, and he felt on his death-bed the happiness of knowing that his widow would be provided for as long as she lived. I have been a sup-

porter of the society for forty years, and am truly thankful that I have not needed to make any claim upon its funds; but it is a great comfort to me to feel that I have been the means of helping other gardeners not so fortunate as I have been. Our life in this world cannot be long, even the youngest must go. I well remember a most pathetic appeal from the Treasurer at the annual festival. He said, "We brought nothing into this world, and it is certain we can take nothing out." We are thankful for the large number of large-hearted gardeners who not only spare subscriptions out of their own sometimes too scanty incomes, but bring the claims of the Institution before their employers and others who can afford to give. It is sad to read of the large number of candidates at the annual elections—I may say increasing numbers who are disappointed. There are thousands of gardeners who can afford to give who refrain from doing so, and who by a little self-denial would satisfy their conscience; for a gardener cannot be easy in his mind when he knows that many of his brethren are in distress and wanting help, and refrains from holding out a helping hand to them. An Old Gardener.

In a recent issue of the Gardeners' Chronicle, p. 427, a correspondent, "R. D.," appeals to gardeners and to others interested in gardening for support of this gardening charity. I should like support of this gardening charity. I should like to give "R. D." a brief outline of what has been done in the neighbourhood of Reading since 1900. An auxiliary was formed at Reading through the kindness of that well-known firm, Messrs. Sutton & Sons, who called a meeting of gardeners, and a large committee was formed, which is called the Berkshire, Reading and District Auxiliary of the Gardeners' Royal Benevolent Institution. It comprises the whole county of Berkshire, and a radius of 20 miles round Reading. I was elected on that large representative committee, which numbers about fifty. I made up my mind to work, and to do all I possibly could to get in subscriptions to belo my need bother condenses. subscriptions to help my poor brother-gardeners in distress. In those four years I collected £40 14s. 6d., and I intend to keep on as long as I am able. This sum I have paid into the Reading Auxiliary, and indirectly it goes to the Gardeners Royal Benevolent Institution. I am also an annual subscriber of £1 ls. I should like to impress on those gardeners who are taking good wages and are not subscribers to do something, if it be ever so little. It is astonishing what can be done with tact and perseverance. We have in Wargrave village a gardeners' association called the Wargrave and District Gardeners' Association. tion. On November 19, 1902, we had a Chrysanthemum, Fruit and Vegetable Show, and it was a success. No prizes were given, and all worked with a will, for we all knew what we were worked with a will, for we are know what we were working for. It was simply a work of love. The takings were £11 19s, and it was all sent to the Treasurer of the Gardeners' Royal Benevolent Institution. That was, I think, very good for a small village. This year, on November 18, 1903, we had a similar show, and the takings were £15 13s., which we sent to the Gardeners' Orphan Fund. What I would say to all the gardeners' associations in the United Kingdom is, "Go thou and do likewise." William Pope, The Willows, Wargrave, Berks.

with some interest the remarks of your correspondent, Mr. F. Streeter, on the above subject, will you kindly permit me to state in reply that I cut a perfectly finished fruit of the variety Sutton's Ringleader, weighing about 5 lb., on December 5, it being the last fruit of a perfectly finished crop of the above variety, from which, in addition to Sutton's Hero of Lockinge, I have been cutting fruits since the second week in November, all of which were pronounced to be excellent, both in colour and flavour? And may I be permitted to add that in June last I cut a Ringleader weighing 9 lb. 8 oz. from a plant carrying three fruits, the smallest of which weighed upwards of 7 lb.? I mention this as I consider Sutton's Ringleader one of the best Melons in cultivation. Arthur Read, Gr., Onslow Hall, Shrewsbury.

CHRISTMAS GRAPES.—Whilst it is always interesting to know what prices English-grown Grapes will obtain in the market, it is always

more so to learn at what prices they are retailed to the consumer in the shops. I have been looking at the samples seen in the best shops here in Kingston, Surrey, and have noted very bad samples of Gros Colmar offered at 8d. and 10d. per lb. These must have been badly grown, the bunches being small, berries the same, and very red in colour. I should not care to purchase themat even lower prices. On the other hand fairly well-finished Alicantes of good dark colour were priced at 1s. 9d. to 2s. per lb. That shows that cheap as Grapes relatively may be, a good sample will secure a good price, and, after all, bad for table as may be the cheap ones, they are better at 8d. and 10d. than are the Spanish Grapes sovery plentiful at 6d. per lb. When, as sometimes, we hear serious wails raised over low Grape prices, we may take it for granted that they denot reflect credit on the grower or the British, Grape trade. A. D.

MELTON CONSTABLE GRAPE.— "E. M.'s" knowledge of this Grape seems to be limited to-hearsay. My experience is that of a member of the Fruit Committee, who has both seen and tasted the Grape at the Drill Hall two or three times, when presented both as cut and as hanging on a pot-vine. The bunches were small, the berries of Black Hamburgh size, quite black, and of exceedingly pleasant flavour. In that condition the Grape was greatly liked; but the large-berried bunches had quite red berries; and the bunches shown later were equally red, and somuch like Gros Colmar that no one could discernthe difference. If this new Grape colours so-casily, how was it these large-berried bunches shown were so badly coloured? If these bunches were not of the real Grape, then is some explanation needful. If they were, then it is absurd to-write of its readiness to put on colour. A. D

count althann's Gage. — As there seems to be a very wide range in the spelling of the name of this red Gage Plum recently introduced into this country, I have written to Mr. L. Späth, of Berlin, who is kind enough to reply as follows: "Althann's Reineclaude was obtained from a stone of the Green Gage by Mr. Prochaska, gardener to the Count Michael Joseph Althann, at Swoyschitz, in Bohemia. The correct spelling is therefore Althann's Reineclaude." I do not know that I need have called attention to thismatter, as the name is correctly entered in the last edition of The Fruit Manual "Count Althann's Gage;" but having looked into five catalogues (our own included) and found every one of them incorrectly spelt, I thought I might mention it in order that some kind of uniformity may be arrived at. Personally I dislike the German style of writing "Reineclaude" as one word, and much prefer Dr. Hogg's translation; but it is obvious that we must have it either one or the other; a mixture like Comte Althann's Gagewill not do. A. H. Pearson.

ANTHURIUM SCHERZERIANUM WARDI.—Theremarks by Mr. Marshall in reference to this plant in a recent issue are very interesting. I did not know the history of it; but I knew that it was an imported plant, and not a seedling raised by Mr. Ward, therefore I did not introduce it into the few remarks I made about my old friend. The editor, presuming that as it wasnamed Wardi it must have been raised by him, inserted it as something worthy of notice. I had not forgotten that excellent cultivator, Mr. Thomas Baines; I knew him well. I have judged his plants, and frequently acted as co-judge with him. I may safely say, as a cultivator of stove and greenhouse plants, he has never been surpassed. Mr. Marshall will remember the competition wherein all the exhibitors had to start with plants of the same age and size; they were sealed by the soal of the Royal Horticultural Society, after being purchased in the nursery; but Mr. Baines had no faith in plants he did not propagate, and requested permission to take cuttings from his plants. Whether this was done I do not know; but Mr. Baines was easily first in the competition. But the two famous plantsmen did not often meet in competition. Mr. Baines had given up exhibiting hefore Mr. Ward was at his best, and I was thinking of his culture of Odontoglossums (O. crispum espe-

cially) and other cool-house Orchids, as well as Heaths and New Holland plants. He used to grow and flower yearly a splendid plant of Oncidium macranthum. The plant was tied on to the cleft of a log cut from an Apple-tree, and hung up close to the glass-roof in the coolest end of the cool-house. Odontoglossum Uro-Skinneri, O. Hallii, and O. triumphans were splendidly grewn. The Cape Heaths at the Poplars were admired by everybody. No fewer than seventy-three species and varieties of the summer-flowering Cape Heaths were grown; a large, well-ventilated span-roofed house being set apart for their culture. Where could such a collection be found now? And if we had them, the men who had the art and patience to cultivate them as they were then cultivated are perhaps not now to be found. Jas. Douglas.

HONEY POISON.—Although I have frequently noticed remarks concerning the occasionally poisonous nature of honey gathered by bees from poisonous plants, I have never come across a reference to the undoubted fact that honey of any kind exercises a toxic effect upon some constitutions. In this particular connection I myself am so susceptible, that when visiting friends l am obliged to enquire whether honey is present in any confections which might possibly contain it, since on more than one eccasion I have suffered seriously by an oversight. As a child 1 had more than one attack of honey sickness, which, being remembered, induced me to refrain from touching honey for many years; but after twenty years or more, being with some friends in the country, a plate of fresh honeycomb and honey was produced of so tempting a nature that I tasted a spoonful, thinking that probably I had grown out of the susceptibility. No sooner, however, had I swallowed it than an intense feeling of nausea was followed by violent vomiting, and for fully a fortnight I suffered internittently in the same way with a violent burning pain. Some years later visiting some German pain. Some years later visiting some German friends I partook of some German gingerbread, and shortly afterwards was attacked in a similar but milder way, when on enquiry I learned that the so-called gingerbread was really honighrot or honeybread. Twice since then I have suffered similar symptoms from taking liqueurs in which however I can only assume, though I do not doubt, the presence of honey as an ingredient. I find also, on mentioning this susceptibility, that I am by no means alone in it, a lady friend, not a bleed relation, suffers precisely in the same way, and several other friends have known of like cases. This heing so, I think the matter should be better ventilated than it is, since the illness induced is by no means slight, and might even be dangerous, while at the same time altogether unaccountable where, as in the liqueur and the henigbrot cases, the honey is taken unwittingly. Furthermore, the sufferer may not even be aware of his susceptibility, and impute the ailment to a wrong source. The fact, too, that quite casual references to my cwn case have elicited confirmatory evidence in at least half-a-dozen instances, proves that the susceptibility cannot be rare. Chas. T. Druery, F.L.S., V.M.H.

APPLE CROPS IN GARDEN AND ORCHARD.—What a contrast there may be from an orchard sheltered from the north and east by a helt of trees, and a garden sheltered from the north and west by the same, and less than 200 yards apart! In 1902 cur orchard here, which contains a lot of old, gnarled, mossy trees, bore a splendid crop of fruit, while in our kitchen-garden we had very few. The orchard contains mostly old varieties that are unknown to me, and these flowered at the same time as the trees in the kitchen-garden, which contains mostly newer varieties. At the time of flowering we had a long apell of east winds, which utterly destroyed all fruits in the kitchen-garden, but spared the orchard. Now last season, when the trees were in flower, we had a spell of cold winds from the north, and very severe from the west; from these two points we are very well sheltered. Now, I am pleased to say, we have had an extra good crop in the kitchen-garden, but not one Apple in the orchard. Doubtless this was owing to the trees in the kitchen-garden having borne no fruit the preceding year, and the heads being well thinned-

out, the buds were harder and stronger than in the orchard; but to all outward appearance they flowered at much about the same time, so that it must be put down to the shelter that is afforded the trees. J. F. M., Barnet.

FICUS PARCELLI.

In this country we are accustomed to view Ficus Parcelli as a decorative greenheuse plant having prettily decorative leaves, but in South Africa it is a noble and ornamental tree for the pleasure-grounds, as is shown by the illustration at fig. 6. For the photograph we are obliged to our correspondent, Mr. C. E. Butters, of Prince Alfred's Park, Port Elizabeth, Cape Colony, who states that the tree is a very fine specimen, about

conditions mentioned by Mr. Coleby sirke me as being exactly such as to maintain the power of germination for a very long time—i.e., absence of stimulating moisture or warmtb. I have no doubt that the Fern arose from dormant spores. It is remarkable that only one kind of Fern germinated, though we must assume that other Fern-spores were present in the old Dicksonia stem." It was suggested, however, that the Dicksonia stem might have been previously utilised for growing only the Gymnogramma.

Ash wood with Grubs.—Specimens were received from Mr. G GREGORY, Croydon, with live grubs two years after the tree had been cut down. The wood outwardly showed no signs, but on being sawo asunder both dead and living grubs were frequently found. Mr. SAUNDERS contributed the following observations: "The insects found in the Ash timber are bestles belonging to the family of Longicorns, and to the genus Clytus; but not being an English species, but probably American,"

Fig. 6.—Ficus parcelli, growing at fort elizabeth, south africa.

25 feet high, and that the leaves become beautifully coloured towards autumn. It is sheltered from the worst winds, which are so productive of injury to South African gardens.

SOCIETIES.

ROYAL HORTICULTURAL. Scientific Committee.

DECEMBER 15 -A D. MICHAEL, Esq , in the Chair.

Violets diseased.—Mr. Worsley showed specimens which Dr. Cooke pronounced to be attacked by Urocystls viole, recently figured in the Journal of the Royal Horticultural Society, "Pests of the Flower Garden," plate i., fig. 19.

Longevity of Fern spores—A communication was received from Mr. H. Coleby, Wargrave, describing an instance of a piece of a stem of a Dicksonia, possibly twenty years old, on which, when broken off and kept moist, seedlings of Gymnog anima aurea began to appear. It was suggested that the spores of the latter had lain dormant for that length of time

Mr. DRUERY contributed the following note: "I have raised Ferns from spores seven to eight years old. The

have not yet been able to obtain the specific name. The grubs of these beetles are sometimes very long-lived, and they remain for years in wood where their presence is quite unsuspected. A specimen of Longicorn beetle has been known to emerge from furniture, the wood of which was felled twenty-eight years previously. It is now supposed that the grubs which take such a long time in undergoing their metamorphoses have been hatched from eggs which were laid in a tree which had just been felled, or was cut down shortly afterwards, so that the grub was soon obliged to feed on very dry wood, from which it obtained but little nourishment."

Albinism in Shirley Poppies—A communication was received from Mr. J Biddood, of which the following is a brief abstract. It will appear in full in the Journal of the Royal Horticultural Society. He would recognise four forms of albinism in flowers—viz., incomplete, complete, partial, and local. After giving illustrations of the first three from Orchids, the last was taken from Popples. The original plant of the Shirley Poppies had a white edging to the petals. It was evident, therefore, that this plant had a teodency towards albinism. The black blotch has disappeared from all Mr. Wilks' stock, heing replaced by white. Other growers have experienced reversion to the black blotch. This is caused by a very strong solution of a dark red pigment

contained in the epidermal cells on each surface of the petal, the usual cause of black being dark red overlying green, as on the leaves of Arum maculatum. The colour in the outer portion of the petals was also in the epidermal cells. On applying micro - chemical tests the behaviour of the colours of the two regions in question was very different. Strong sulphuric acid changed the black blotch to pink, brick-red, and orange; the outer part the same, but passed on to yellow, finally disappearing. Iodine in potassium iodide changed the blotch to port wine colour; the outer part slowly faded. Solution of caustic potash changed the blotch to a deep blue, then faded out; the outer part to greenish yellow, then faded out. Neither of the pigments shows the typical reactions of the cyanic series, and still less of the xanthic.

Supertuberation in Potatos.-The following communication was received from Mr. F. C. Davinson, Wickham Bishops, Essex :- "M. Bernard propounded the theory, in Rev. Gen. de Bot., that tuberisation was due to the irritation set up by a furgus, and he had found that in the Potato there was a relation between the date of infection of the soil and the date of tuberisation. I would suggest a practical application of this theory.' Referring to Dr. B. Dyer's and Mr. Shrivell's paper on "Manuring Market Garden Crops" (Journal of the Royal Horticultural Society, xxvii., p. 995), he observes:—"That whereas such crops as Cabbages may be grown as well with artificial manure as with dung, indeed, it would seem better and far more economically; yet this does not hold true of root crops, especially of Potatos. For instance, in the early varieties the average crop for some years was-from 50 loads of dung, 7 tons 7 cwt.; from 25 loads, 5 tons 14 cwt.; from (no dung) phosphates and 4 cwt. of nitrate of soda, 3 tons 6 cwt.; and from the same, with potash, 4 tons 10 cwt. The gap here, though potash fills it up a little, is most striking. If dung be favourable to bacteria they may infest the soil and promote tuberisation. If this conjecture prove to be a fact, it might have a very great influence on the methods of cultivating root crops." Mr. Worsley thought it important to have the desiccated weight given, as the additional moisture in dung manuring would assist to swell the tubers. Mr. BAKER sa'd that Potato crops showed the greatest weight when planted in ground when manured with dung in a previous season for Cabbage crops.

HULL AND DISTRICT HORTICUL-TURAL ASSOCIATION.

DECEMBER 15 - At the fourth meeting of the winter session, Mr. J. Donoghuc, of Bardon Hill, Headingley, session, Mr. J. Donoghuc, of Bardon Hill, Headingley, Leeds, read a paper on the "History and Culture of the Amaryllis (Hippeastrum)." In the absence of Mr. J. P. Leadhetter, of Tranby Crofi, the chair was occupied by Mr. G. Tattersall. The essayist dwelt primarily on the history of the Amaryllis, and explained its real name and the authorities for it. Much interest was evoked by Mr. Donoghue's reading an extract from a correspondent's letter to the Gardeners' Chronicts of 1841, in which the writer advocated repotting the plants when in full growth. Naturally Mr. Donoghue disagreed with this method, as also did the subsequent speakers. The cultural details given were worthy of the greatest consideration, and if carried out prudeotly and minutely the results would prove highly gratifying. A discussion followed, and it was clearly shown that the essay was appreciated. A hearty vote of thanks was accorded Mr. Donoghue, and a hope expressed that he would at a not distant date favour the members with another visit. We Roules. the members with another visit. If m. Rowles.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

DECEMBER 18. - A fine collection of plants was brought together at this meeting, and, as at the previous one, Cypripediums were in strong force.

previous one, Cypripediums were in strong force.

A. Warburton, Esq., Haslingden, exhibited a fine hybrid, viz., Cypripedium × Archimedes, which received a First-class Certificate. The parentage of this cross was stated to be C. insigne Harefield Hall var. × C. × nitens var. magnifica. In habit it is intermediate, and the parentage fairly well marked.

E. ROOERSON, Esq., Didshury, obtained a Silver Emediate for a group of plants, Cypripedium × bingleyense var. Hilda obtaining an Award of Merit.

WALTER LAVERTON, Esq., Victoria Park, Manchester, was awarded a Brouze Medal for a group of miscellaneous plants, and an Award of Merit for Cypripedium.

laneous plants, and an Award of Merit for Cypripedium

X Evelyn Ames.
G. W. Law-Schoffeld, Esq., Rawtenstall, exhibited
Cypripedium x Rossendalense, the parents of which
are unknown. It was given an Award of Merit.
Messrs. Charlesworth & Co., nurserymen, Brad-

ford, staged a very fice group of plants to which a

Silver-gilt Medal was awarded. Cypripedium × Thalia was voted an Award of Merit. The parents of this variety are C. insigne var. Chantini × C. × Baron Schroder. A plant of Odontoglossum crispum var. xanthotes was noted in the same group, and obtained much admiration. much admiration.

R. Le DOUX, Esq., West Derby, exhibited a peculiar and distinct form of Odontoglossum crispum, called Marefieldense, its peculiarity consisting of the possession of what are apparently three lips; this is a constant feature of the plant, and adds some distinctness to an otherwise ordinary form (Award of Merit).

Mr. W. OWEN, Hartford, exhibited a collection of varieties of Cypripedium insigne (Vote of Thanks).

Messrs. A. J. KEELING & SONS, Bingley, Yorkshire, obtained an Award of Merit for Cypripedium Leeanum Keeling's var. (Vote of Thanks for group).

Mr. J. Robson, Altrincham, exhibited a few good

Cypripedes.

JOHN COWAN & Co., Ltd., Gateacre, exhibited a fine plant of Cypripedium insigne var. MacNabiana, for which an Award of Merit was voted.

W. E. BUDGETT, Esq., Bristol, was awarded a Silver Medal for a group of Cypripediums, and C. insigne var. gigantea and C. x Mrs. Cary Batten received Awards

Mr. D. McLeon, Chorlton, exhibited a few good plants of hybrid Cypripediums, for which he was awarded a Vote of Thanks. P. W.

LEE, BLACKHEATH, LEWISHAM, & WEST KENT HORTICULTURAL.

DECEMBER 18. - The General Committee of this Society met on the above date, when it was arranged to hold the show for 1904 on July 6 and 7. After the usual busicess, Mr. J. Pearce, of Belmont Hill, Lewisnsual business, Mr. J. Pearce, of Belmont Hill, Lewisham, gave an interesting lecture on "Horticultural Exhibitions." The lecturer said that all Horticultural Societies did a good work amongst professional and amateur and cottage gardeners, but in these days of manifold attractions, the shows laboured under the disadvantage of the public being drawn away from their local shows, and he said that it was a well-known fact that very few Societies, such as Blackheath, which is one of the oldest in this peichburghood are supis one of the oldest in this neighbourhood, are supported as they should be, considering the good that they do in their several districts. II. J. H.

READING AND DISTRICT ROSE.

DECEMBER 18 .- The first annual meeting of this Society was held in the Mayor's Parlour, Town Hall, Reading, on the above date. The President of the Society, Mrs. Benyon, Englefield House, occupying the chair, and a goodly number of resarians were present. Mr. W. L. Walker, the hon, tecretary and treasurer, presented a satisfactory report and financial statement, the latter showing a balance in hand of £11. Mrs. Benyon was unanimously elected President, and the committee appointed is a strong one, as it contains the committee appointed is a strong one, as it contains the names of such well known rosarians as Mr. J. T. Strange, Aldermaston; the Revs. F. Page Roberts, Allan Cheales, and C. S. Turner; with Messrs. R. C. Mount, Rigg, Dunlop, Ashby, &c. It was agreed to hold a show in 1901, July 13 being the date named, to take place in that part of the Abbey ruins in which the Southern Section of the National Rose Society held such a successful arbithiting in 1804.

NATIONAL AURICULA AND PRIMULA.

DECEMBER 19.-The supporters of this Society held their general meeting at the Horticultural Club Hotel, Windsor, on the above date, when Mr. J. Douglas presided over a good attendance.

Mr. T. E. Henwood, the Hon. Secretary and Treasurer, presented the Annual Report, which set forth the fact that the Society is in a satisfactory position, the fact that the Society is in a satisfactory position, there being an appreciable gain of new members during 1993, bringing the total up to 91. The show held in April, 1993, was one of the most extensive as well as the best held for many years, and nearly the whole of the prizes offered in the schedule and in the majority of cases to exhibits of excellent quality were taken, and especially was this true of the show Auriculas—they were both numerous and particularly good. The Alpines were also of fine quality and Auriculas—they were both numerous and particularly good. The Alpines were also of fine quality and striking in appearance. The other forms of Primula were somewhat sparingly shown, though there are a number of beautiful types well worthy of cultivation. The coloured Primroses and Polyanthus were not so numerous as usual, the weather having injuriously affected them.

Some interesting additions are made to the schedule of prizes. Mr. William Smith, Bishops Stortford, an enthusiastic cultivator of the show Auricula, by way of bringing into the Society exhibition recruits, offers five prizes in each of two classes, and the competition is open only to those who have never won a prize at an exhibition of the Society. These classes are for a pair

of show Auriculas, and for a single specimen. Douglas offers four Medals of the Royal Horticultural Society, viz., a large Silver Medal for the exhibitor who Society, viz., a large Silver Medal for the exhibitor who gains the greatest number of points in the larger classes, and a medal of the same value for the highest number of points in the smaller classes; also a Silver and a Bronze Medal for seedlings raised from the seed of Alpine varieties Mr. Douglas so generously gives to members of the Society, provided that the seedlings are considered worthy of awards. A member who does not wish his name mentioned offers four prizes for single specimen plants of fancy Polyanthus, and the same for a specimen single Primrose. The class in the schedule for six grey-edged show Auriculas is withdrawn. The report alludes to the death of Mr. William Beale, a young and very successful exhibitor, whose loss is deplored. Mr. J. Douglas continues his liberal offer of a packet of seed of the best exhibition varieties of the alpine Auricula, if those members who apply for it will sow the seed and cultivate the plants. The thanks of the Society are given to Mr. Douglas for his generous support, to Miss Willmott and Mr. W. Smith for special prizes, to the Horticultural Club, the Council of the Royal Horticultural Society, and other supporters.

prizes, to the Horticultural Club, the Council of the Royal Horticultural Society, and other supporters. The financial position is satisfactory.

Sir Jehn T. D. Llewelyn, Bart., was re elected President, and the eight vice-presidents were also reelected; also the committee, with Mr. James Douglas as chairman. One change only was made—the substitution of the name of Mr. C. Blick for that of Mr. H. J. Heading, who retires. Mr. T. E. Henwood was relected by the secretary and treasurer.

elected hon, secretary and treasurer.

NATIONAL CARNATION AND PICOTEE.

(SOUTHERN SECTION.

DECEMBER 19.-The annual general meeting of the members of this Society took place at the Horticultural Club on the above date, this being the twenty-seventh annual meeting. There was a large attendance of members, Mr. E. Colby Sharpin presiding.

members, Mr. E. Colby Sharpin presiding.

The Annual Report, read by the Secretary, Mr. T. E. Henwood, showed that up to the present time the progress of the Society was very gratifying. There had been a slight falling off in the number of members during 1903, the number on the hooks at the present time being 317. The general depression throughout the country had, no doubt, something to do with this. It was with unfeigned regret the Committee had to announce that the President, Mr. Martin R. Smith, can no longer continue to distribute seeds of Carnations, owing to the large increase of

Mr. Martin R. Smith, can no longer continue to distribute seeds of Carnations, owing to the large increase of members; the labour involved in doing so is too heavy. The exhibition in 1903 was held at the Drill Hall, Buckingham Gate, by permission of the Royal Horticultural Society, and was generally admitted to be a very good one indeed; the exhibits were numerous, and the quality of the flowers excellent. The Cup given by the President in the first division was won by Mr. F. A. Wellesley, but the donor of the Curran bim given by the President in the first division was won by Mr. F. A. Wellesley, but the donor of the Cup ran him very close for the coveted honour of possessing it. Great credit is due to Mr. Wellesley, especially as this is the first time Mr. M. R. Smtth has failed to secure the Cup. In the second division the winner of the Cup was Mr. W. Spencer, with a wide margin of points in his favour; Mr. Spencer is all the more deserving of congratulation as this was his first essay as an exhibitor in Division III. The winner of the President's Cup in Division III. The winner of the President's Cup in Division III. Was Mr. R. C. Cartwright; and that of the Cup in Division IV., Mr. E. J. Wootten.

The financial statement submitted by the Treasurer

The financial statement submitted by the Treasurer was of a satisfactory nature, there being a balance in hand of £116 88 10d. The outgoing officers and Committee were re-slected, Mr. T. E. Henwood continuing as Secretary and Treasurer. The schedule of prizes remains as last year, with the addition of two new classes in Division IV., for single blooms, one for fancies, and one for Y.G. Picotees. It was also decided to conflue the competition in Division IV. to amateurs only. The financial statement submitted by the Treasurer only.

READING & DISTRICT GARDENERS' MUTUAL IMPROVEMENT ASSO-CIATION.

AT the last fortnightly meeting of the above Association, Mr. F. BRIGRT, gr., Whiteknights, Reading, dealt in a practical manner with the cultivation of the Fuchsia. Mr. Bright is well known as a competent cultivator of this plant, and these, standing from 8 to 10 feet high, prove a leading feature at the Reading horticultural shows. A discussion followed the reading of the paper. The varieties recommended for growing into specimens were.—Dark colours, Charming, Elegans, Brilliant, Masterpiece, Clipper, Wlitshlre Giant; light colours—Western Beauty, Miss Balfour, White Queen, Jubilee Queen, Mrs. Bright, Grand Duchess. The only exhibit was a collection of variegated Kales, from Mr. J. Gibson, gr., Danesfield, Mariow.

Obituary.

JOHN MACFARLANE.—The sudden death of this highly-respected gardener occurred on the night of December 17, in his seventy-seventh year. He was born at Crail, Fifeshire, and for the last thirty-one years acted as gardener to Mrs. Curling, Breoklands, near Welshpool. He was interred in Guilsfield churchyard, December 22, leaving two daughters and one son to mourn his loss. J. L., Powis Castle Gardens.

JOSEPH FITT.-The death occurred, on December 21, after a long and painful illness, of Mr. Joseph H. Fitt. He was for the long term of fifty-three years head gardener at The Frythe House, near Welwyn, owned by C. W. Wilshere, Esq., by whom and his family Mr. Fitt was held in high esteem. He was a good all-round gardener, and noted for his knowledge of trees, shrubs, and hardy plants, including Ferns; evidence of this is conspicuous at The Frythe. Mrs. Fitt survives him, as also a large family, all the members of which are grown up, including three sons who are head gardeners. Joseph, during his father's illness, has been managing the work at The Frythe; while Arthur and Robert fill good situations in Sussex.

The late Mr. Fitt for many years was a member of the Floral Committee of the Royal Horticultural Society. As a judge at flower-shows his services were also often in request. In this way he rendered services to the Royal Horticultural Society and at many local shows. Mr. Fitt was a good example to many gardeners for his support to two institutions, from which less fortunate members of his fraternity benefit. For many years he was a subscriber to the Gardeners' Royal Benevolent Institution and to the Orphan Fund.

ENQUIRIES.

MOTOR LAWN-MOWER. - Would Mr. Lamb kindly say whether the mower he has found so satisfactory has been worked by a trained mechanic, or by a gardener, and whether he thinks any practical man would soon learn how to use it, if taught at first? E. S. R.

Passiflora W. H. Mort.-A correspondent, "W. M.," would be glad if some reader of this note would kindly inform him whence he could procure the plant named above.

TRADE NOTICES.

JOHN ATRINS & Co.—The above-named company has been registered with a capital of £16,000, in £1 shares, for the purpose of acquiring as a going concern and carrying on the business as a going concern and carrying on the business of seed merchants and agricultural implements now carried on by John Atkins & Co. and Joseph Wolfe, in the city and counties of Cork and Kerry, under the style of John Atkins & Co. The first directors are John Atkins, merchant, Dumanway, Co. Cork, and Joseph Wolfe, Douglas Road, Cork. Registered office: 6, Camden Quay, Cork. The signatories to the articles are:—

7 14hina 1 G 1	Shares.
J. Atkins, merchant, Cork	1

MILL HILL VINEYARD, LIMITED.—This company has been registered with a capital of £5,000, in twenty-five preference shares of £100 each and 250 shares of £10 each. The object is to adopt an agreement with P. E. Kay, and carry on the business of fruit and flower growers, nurserymen, rearlest cardeners, seedement surveyers, valuers market gardeners, seedsmen, surveyors, valuers of property, farmers, fruit and vegetable preservers, &c. No initial public issue. The first directors (to number not less than three nor more than seven) are P. E. Kay (managing

director), R. James, and A. J. Monro. Remuneration as fixed by the company. Regioffice: Claigmar, Church End, Finchley, N

We are informed by Messrs. Hugh Low & Co., of the Royal Nurseries, Bush Hill Park, Enfield, that Mr. Cornelius Barnard, who has been with them for a great many years, and recently employed as wholesale traveller, is leaving their service at this season.

NEW INVENTIONS.

A WHITE-WASHING MACHINE.

In the Gardeners' Chronicle for Sept. 6, 1902, p. 183, we illustrated a machine for applying white-wash to walls, &c., manufactured by Messrs. Wallach Bros., 57, Gracechurch Street, London. The same firm has recently invented another machine (see fig. 7) for the same and other purposes. Like that already illustrated, this one is constructed on the compressed - air principle. Messrs. Wallach describe it as being composed of heavy galvauised iron, and the pumping apparatus is made of solid brass, which will not corrode from the use of any liquids. It also has an agitator, which keeps the liquid in motion while working the machine. It is said that one man can pump and spray with this machine at

FIG. 7.—A NEW WHITE-WASHING AND SPRAYING MACHINE.

the same time, and 100 to 125 lb. pressure can be easily carried. It can be used for whitewashing, painting, spraying of fruit-trees, and many other disinfecting works. The capacity of the tank is equal to 7 gallons of liquid, and the capacity of the machine is equal to the work of five men with brushes in the same time.

MARKETS.

COVENT GARDEN, December 31.

COVENT GARDEN, December 31.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but often several times in one day. En.]

Remarks.-The weather has again been dull and very dark

GENERAL OBSERVATIONS.

THE FOLLOWING SUMMARY RECORD of the weather threughout the British Islands, for the week ending Dec. 26, is furnished from the Meteorological Office:—

"The weather during this week was extremely dull in all hut the western districts. Very little rain was experienced, however, except in the most western and north-western districts, and even there the amount was small except locally at some Irish and Scotch stations.

"The temperature was a little above the meau except in Ireland, S., where that value was only just equalled. The highest of the maxima were recorded either on the The highest of the maxima were recorded either on the 21st or 22od, when the thermometer rese to 57° in Scotland, N. 56° in England, N.W., and Ireland, S., and to 50° or above in all other diatricts except England, E. The lewest of the minima, which were generally registered on Friday or Saturday, ranged from 18° in Scotland, E., 22° in Scotland, N., and 23° in Ireland, S., to 34° in England, E., and 36° in the Channel Island. "The rainfall was less than the mean in all districts. Over the greater part of England the fall was very

Over the greater part of England the fall was very slight.

slight.

"The bright sunshine was just equal to the normal amount in Ireland and the western districts of Eagland, but ever Great Britain as a whole there was scarcely any. England, E., and the Midland Counties were entirely without bright sunshine; England, N. E., had less than 1 per cent. of the pessible amount, while in England, S., there was just 1 per cent. In Ireland, S., there was 20 per cent., in Ireland, N., and England, S.W., 17 and 16 per cent, respectively, and in Scotland, N., 13 per cent., the last quoted value being 3 per cent. N., 13 per cent., the last quoted value being 3 per cent. above the normal."

THE WEATHER IN WEST HERTS.

Another absolutely sunless week .- During the past fortnight the day temperatures have been nearly all below the average, while the nights, on the other hand, were, with but two exceptions, unseasonably warm, the exposed thermometer on no night registering more than of 5° frest. At 2 feet deep the ground is still of about seasonable warmth, but at 1 feet deep is 2° colder than the average. Light falls of rain, hail or sleet occurred on all but two days of the week, but the amounts deposited proved insignificant. Small quantities of rain-water still continue to come through the hare soil percolation gauge, but no measurable quantity has now come through the gauge on which short grass is growlng for more than a week. Throughout the last fourteen days no sunshine at all has been recorded. This is the longest period of sunless weather experlenced during the eighteen years over which my records at Berkhamsted extend. Light easterly airs and calms have again prevailed. This proved another very damp week, the amount of moisture in the air at three e'cleck in the afternoon being on an average 5 per cent, in excess of the mean for the end of December. E. M., Berkhamsted, December 29, 1903.

ANSWERS TO CORRESPONDENTS.

Address: W. Brooks. Geo. Frederick Strawson, T. A. "Strawsoniser," 71A, Queen Victoria 71A, Queen Victoria Street, E.C.

ASPARAGUS: J. L. W. You should find little difficulty in successfully raising seedling plants of Asparagus, providing you are in a position to afford the soil which is suitable and a site that slopes very gently to the south, which site that slopes very gently to the south, which is exposed to full sunshine, but is protected from the prevailing winds. The soil should be sandy and well drained, the very worst being that of a stiff, retentive nature and resting on a wet or clayey subsoil. The seeds must be fresh, and should be sown as early in spring as fresh, and should be sown as early in spring as the state of the ground will permit, say the middle of March, in drills not more than 2 inches deep and 12 inches apart from each other. Sow the seeds thinly, it being difficult to thin out the young plants and obtain the same amount of growth in the first season if they come up too thickly. Unless the ground is fairly free from the seeds of weeds, there will be trouble with these before the Asparagus be trouble with these before the Asparagus seeds have germinated, but if the lines are kept and the weeds removed as soon as they are well through, it will be possible to give the Asparagus plants opportunities for growing quickly. If the soil of the seed-bed is not moderately rich, a little chemical manure containing kainit and sulphate of ammonia may be put in the drills after the seeds are sown, or if growth be slow during the first summer a slight dressing of nitrate of soda will be useful. the March following the plants will be in ondition for removal to a permanent planta-tion. The site should be similar to that described above, and the soil a rich sandy or friable leam. If there is not perfect natural drainage, artificial drainage becomes impera-tive. In cold districts, or in cases where the soil is heavy, it is usual to plant in beds raised above the level and beging allows between above the level and having alleys between them. In more favourable circumstances this is not necessary, and the year-old plants may be put into rows 3 feet apart, and each root 18 inches from the other. The best Asparagus 18 inches from the other. The best Asparagus is afforded only by plants that have ample space for the development of their roots. Some of the best growers who have stiff soil to contend with place each plant upon a separate hillock, and prefer this method to that of beds with intervening alleys. Future work will consist in keeping the ground clear of weeds, affording a little support to the growths until they are not down in anything a description. they are cut down in autumn, and supplying suitable manures, which will vary in character and quantity according to local conditions. On all soils that are not heavy, or unusually wet or cold, a mulching with rich dung in mid-winter will do good. Good varieties are Connover's Colossal and the Argenteuil Early and Late Giants. For further information you might consult 'The Book of Asparagus, by Charles Ilott, published by John Lane.

Books: Cape Reader. You should obtain How to Lay-Out a Garden, by Kemp; new edition, published by Bradbury, Agnew & Co., Ltd., Bouverie Street, Fleet Street, E.C.—A. D. B. The Complete Measurer, by Richard Horton; published by Lockwood & Co., 7, Stationers' Hall Court. If out of print, try the second-hand book-shops, or at the Bazaar Office, Drury Lane.—T. We think that Wall and Water Gardens, by Gertrude Jekyll, will most likely suit your requirements. It is published by George Newnes, Ltd., Southampton Street, Covent Garden. Covent Garden.

CHRYSANTHEMUMS: Constant Reader. Try Messrs. Boehmer, Nos. 5 and 28, Bluff, Yokohama, a firm long established in Japan.

COAL-TAR AS A DRESSING FOR VINES WHEN Leafless: J. V. Take 2 quarts of dried clay and $\frac{1}{2}$ pint of coal-tar; put them into a vessel, after reducing the clay to powder, and mix them together intimately, finally add as much hot water as will make 2 gallons, and stir well together; if too thin, add more clay.

EARLY GRAPES: J. H. P. Besides those mentioned in your note, you may include Duke of Buccleuch, Royal Muscadine, and Madresfield Court.

GARDEN WALLS OF BRICK-WORK, AND OF CEMENT AND BREEZE: A. P. If cheapness of construction be the first consideration choose the cement and breeze wall, but it will have to be furnished with perpendicular wires to which to fasten the fruit-trees; and when everything must be secured by ties more labour has to be expended on the trees in so doing, perhaps to the extent of one-quarter more in point of time. As a set-off to this, ties do not harbour insects as do shreds, the surface of the wall does not suffer, and the whole has a neater appearance. A wall built of red porous bricks is more retentive of sun-heat, hastens flowering and ripening; and because it is retentive of heat, is a better protection against spring frosts than is a wall built of cement and breeze, hesides having a more pleasant colour. It may be wired or not. If built on a good broad footing, and afforded 14-inch pilasters 30 feet apart, and a good stone or fire-brick coping, the courses pointed at intervals of twenty years, such a wall will stand for two or three centuries. Cement walls, on the contrary, are apt to warp, settle, or crack, and give a lot of bother as time goes on.

GRAPES A NON-SUCCESS: J. Brown, Malton. fault seems to us to be due to the bad condition of the soil of the border, which is a matter yen should give attention to forthwith. riety being Gros Colmar, the Vines should be afforded heat from early in March to early in June, and then for about six weeks in September and October, that is till the fruit is quite ripe. In a wet year like the present the border, if partly outside, should be shielded from the late rains by means of sheet-iron or wood shutters.

LAWN-MOWER DRIVEN BY ELECTRICITY: C.D. H. The maker of the machine figured in the Gardeners' Chronicle of March 28, 1896, is Mr. W. J. Stephenson-Peach, M.I.M.E., of Askew Hill, Burton-on-Trent.

LILY OF THE VALLEY: C. N. A. We cannot say definitely what is the cause of the crowns failing to flower satisfactorily. Being "re-tarded" crowns they may have been subjected to too great a degree of cold, or they may not have matured perfectly before subjection to the retarding process. The water-pipes were the retarding process. The water-pipes were painted with lamp-black and oil a considerable painted with lamp-back and off a considerable time since, and we should think there have been no fumes from these to injure plants in December. It is very important that in the forcing of retarded crowns very little fire-heat be employed; and if your temperature had been 5° lower, it would have been better. The season being now somewhat advanced, you will soon be able to obtain hetter results from crowns lifted from the open than from those which have been retarded.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number. — C. S. B. Cattleya labiata, value five to ten shillings, according to size. The Pelargonium is a very good one, but not better than others.

PECULIAR SPIDER: E. Bland. A species of Epëira, infected with a peculiar grey scurf-like disease, which has completely covered its body.

Skeletonising Leaves: C. C. Immerse them in water till the thin parts decay; then remove these carefully with a soft brush, and dry under pressure.

SWEET-SCENTED TREE-CARNATIONS: names will very probably be afforded in the promised article on "Winter-flowering Carna-tions at Sandringham."

VINES PLANTED IN A VINERY IN FEBRUARY LAST: E. Stone. Cut them back to the top of the front (upright) lights. It would not be prudent to take even one bunch this year, should the Vine throw any, which is improbable.

NOVELTIES OF 1903. ORCHIDS.

THE hybridist still maintains the supremacy, and the novelties to be recorded are mainly of home production. Spotted forms of Odontoglossum crispum have advanced in favour, and fine forms of Cypripedium insigne and of hybrid Cypripediums, and other hybrid Orchids, have formed the bulk of the most favoured Orchids shown at the Royal Horticultural Society's meetings, and of which the certificated plants may be taken to indicate the pest plants of the year. Some few stand out prominently in each section, and in that most important class, the blotched forms of Odontoglossum crispum Cooksoniæ of Norman C. Cookson, Esq., stands decidedly first, a position it will in all probability retain for a ong time. Next comes the O. crispum Persimmon of H. T. Pitt, Esq., a very pleasing flower, which caused quite a stir among Orchidists when it appeared.

The most remarkable new species of Orchid of the past year is the Angræcum Rothschildianum, from Lake Victoria, of the Hon. Walter Rothschild; and beyond that very few new and pretty species of Orchids have been reported.

Sir H. Schroder, Bart. (gr., Mr. Ballantine), whose wonderful collection of Orchids at The Dell, Egham, contains many beautiful plants, and especially Odontoglossums, unapproached by the novelties, has during the year shown many remarkable specimens, the best of those selected for awards being Odontoglossum × Vuylstekei vivicans, a grandly-coloured hybrid, shown at the last meeting of the year; and O. crispum Truffautianum, Lælio-Cattleya × Bletchleyensis Ruby King, Cattleya × Gautheriana, and other good novelties appeared at The Dell.

Sir Trevor Lawrence, Bart., Burford (gr., Mr. W. H. White), is credited with the fine Lælio-Cattleya × Gottoiana regalis, Dendrobium × Wiganiæ xanthocheilum, which, now perfected, received a First-class Certificate; Masdevallia × Veitchiano-Wageneri, which with other hybrids were raised at Burford; and of "botanical" species Bulbophyllum suavissimum, Polystachya Buchanani viridis and Cælogyne fuscescens.

Captain G. L. Holford, Westonbirt (gr., Mr. H. Alexander), has been one of the best exhibitors of the year, his collections showing the perfection of cultivation throughout. Of the many good things shown by him and selected for awards were Odontoglossum x Loochristyense Lord Howick, O. × Adrianæ Lady Wantage, Lalio-Cattleya x Cassiope Westonbirt var., Cymbidium x eburneo-Lowianum concolor, the yellow Dendrobium x Ophir and Cypripedium × Leeanum Staffordianum. As an indication of the good cultivation of Captain Holford's Orchids, it may be recalled that his Orchid-grower, Mr. Alexander, showed on May 5, and received a Cultural Commendation for an Odontoglossum crispum with 129 flowers, and a still finer plant of O. luteo-purpureum was shown by him.

Norman C. Cookson, Esq., Oakwood, Wylam (gr., Mr. H. J. Chapman), has a brave show of novelties to his credit, including the phenomenal Odontoglossum crispum Cooksoniæ before alluded to, the very fine O. c. Grairianum, O. c. Mariæ, O. c. Harold, Phaius × Clive, P. × Harold, P. × Chapmani, and the still finer P. × Chapmani superbus; Dendrobium × Venus grandiflorum, Cypripedium insigne Sanderæ, Oakwood seedling, and C. × Leeanum Clinkaberryanum, the award for which was also given to Sir Henry Schroder and O. O. Wrigley, Esq.

Sir Frederick Wigan, Bart., Clare Lawn, East Sheen (gr., Mr. W. H. Young), has for his best Cattleya × Whitei magnifica, Lælio-Cattleya × Canhamiana Rex, and Cymbidium × Wiganianum.

H. T. Pitt, Esq., Rosslyn, Stamford Hill (gr., Mr. Thurgood), with a keen eye for the best of the showy species obtainable, and a refined taste for pretty and singular species of Orchids, always stands in the front rank for sterling novelties. His best new plant of the past year, Odontoglossum crispum Persimmon, and O. c. alpha, O. cirrosum Pitt's variety, and Cypripedium Mrs. Pitt, are all showy and distinct flowers. His "botanicals" were Bulbophyllum occultum, Megaclinium Imschootianum, Trigonidium spatulatum, and Oncidium triquetrum; none of them new to science, but all rare.

· Other noteworthy novelties of 1903 credited to our leading amateurs are Cypripedium × Minnie, and C. × Ville de Paris; and the showy Lælio-Cattleya × Wellsiana of Francis

Wellesley, Esq., Westfield (gr., Mr. Hopkins); the fine yellow hybrid Odontoglossum x Waltoniense and O. cordatum aureum of W. Thompson, Esq., Walton Grange (gr., Mr. Stevens); the new and showy Odontoglossum × Bradshawiæ, and the gorgeously tinted Lælio-Cattleya × Haroldiana John Bradshaw of J. Bradshaw, Esq., Southgate (gr., Mr. G. G. Whitelegge); the fine Cypripedium × J. Wilson Potter, and Cattleya × Pittiana J. Wilson Potter of J. Wilson Potter, Esq., Croydon (gr., Mr. W. H. Young); the very remarkable Phaio-Cymbidium x Chardwarense of G. F. Moore, Esq., Bourton-on-the-Water; Cattleya × Warscewiczii White Queen, shown by W. P. Burkinshaw, Esq., Hessle, Hull; Dendrobium × Wiganiæ album, and the handsome yellow and purple D. x Thwaitesia of R. G. Thwaites, Esq. Beyond these, Cypripedium × Ultor, a very fine hybrid of C. Sanderianum, raised by Reginald Young, Esq. (gr., Mr. Poyntz), whose other fine Cypripedium × Minos, Young's variety, also secured an award when shown by R. Briggs-Bury, Esq.; Cymbidium × Lowgrinum of R. J. Measures, Esq.; Odontoglossum triumphans Crawshayanum, and O. x Wattianum Crawshayanum of De B. Crawshay, Esq. (gr., Mr. Stables), and some pretty hybrid Dendrobiums of Mrs. Haywood (gr., Mr. C. J. Salter), should be mentioned.

NURSERYMEN.

On the commercial side the records indicate that Messrs. Sander & Sons, of St. Albans, take the lead. Their superb groups at the Temple and at Holland House were among the best of the year. The fine spotted Odontoglossums and other new plants in their group at the Temple were not entered for awards; but at Holland House the novelties were submitted to the Orchid Committee, and a good number of First-class Certificates and Awards of Merit were secured. Of the best were Odontoglossum × Wilckeanum Rex, O. × ardentissimum Fascinator, O. × Rolfeæ majesticum, Lælio-Cattleya × Bletchleyensis Illuminator, the richest in colour and best of its class (now in Sir Henry Schroder's collection); L.-C. × Martinetii Flambeau, and L.-C. × M. ochracea; the neatly-formed and richly-coloured Cattleya × Roehrsiana, the pretty C. × exquisita, Cypripedium × Hindeanum, and C. × Empress Alexandra; the violet-lipped Zygopetalum × Sanderi; and of very rare and pretty small species, Walnewa pulchella and Cirrhæa Warreana. Of white Cattleyas, C. Mossiæ Alexandræ was good enough to secure a First-class Certificate.

Messrs. Charlesworth & Co., Heaton, Bradford, received awards for Lælio-Cattleya × Dora magnifica, Cattleya × Enid magnifica, C. × Fascinator nobilior, and C. × F. splendens; Brasso-Cattleya × striata, Odontoglossum crispum The Kaiser, the remarkable and delicately tinted Cypripedium × Queen of Italy, and Zygopetalum crinitum cœruleum.

Messrs. Jas. Veitch & Sons, Chelsea, to whose early efforts in hybridising many of our finest hybrids are due, have to their credit as novelties Cattleya × Atlanta superba, Lælio-Cattleya × Norba superba, Epi-Cattleya × matutina, and Lælio-Cattleya × Wrigleyi.

Messrs. Stanley, Ashton & Co., Southgate, produced good things in Lælia × Iona Southgate variety, and Cattleya × Tanker-

villiæ.

Messrs. J. & A. A. McBean secured awards for the finely-spotted Odontoglossum crispum Grace Ruby, and the florallyperfect O. c. Diana.

Messrs. Hugh Low & Co. for the greenand-white Odontoglossum Rossii Low's var., and the crimson Dendrobium glomeratum, introduced by Messrs. Veitch some years ago; and various other Orchidists produced novelties of merit.

CONTINENTAL EXHIBITS.

M. Chas. Vuylsteke, of Loochristry, Ghent, one of the best known and most successful Continental Orchid growers and hybridists. who has wrought wonders in the genus Odontoglossum, comes first; his best things which seeured awards in England being the finely-spotted Odontoglossum × ardentissi-

developed and shown and sold in England, the proceeds to be handed to the Royal Horticultural Society for the New Hall Fund. This is Zygopetalum × Roeblingianum, of C. G. Roebling, Esq., Trenton, New Jersey, U.S.A. (gr., Mr. Clinkaberry), one of the most beautiful novelties of the year, and which secured a First-class Certificate and brought the Hall Fund an increment of fifty guineas.

The following new or rare Orchids have been illustrated in the *Gardeners' Chronicle* in 1903:—

Angræcum Rothschildianum, August 22, p. 131. Bouquet of Transvaal Orchids, March 21, p. 179. Calanthes (hybrid) at Oakwood, Supp., June 27. Cattleya × Pittiana J. Wilson Potter, September 12, p. 189.

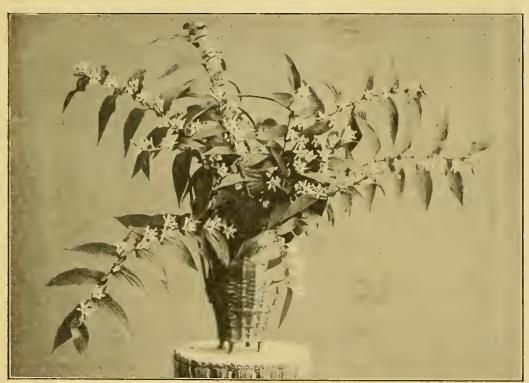

FIG. 8.—TRICYRTIS HIRTA (JAPONICA).

mum exquisitum, O. × a. concinnum superbum, O. × Wilkeanum venerandum, O. × Vuylstekei exquisitum, and O. × Harryanoerispum ridens.

M. A. A. Peeters, Brussels, created admiration at Holland House with the fine white Cattleya Warneri alba, and also secured awards for the white C. × Hardyana albens, C. × Fabia Mary de Wavrin, C. × F. W. Wigan Peeter's var., Cattleya × St. Gilles, and Lælio-Cattleya × Wrigleyana.

M. Jules Hye de Crom, Ghent, secured an award for Odontoglossum × ardentissimum numosum; M. Draps - Dom, Laeken, for Vanda tricolor tenebrosa; Mr. Chas. Maron, Brunoy, France, for the remarkable Vanda × Marguerite Maron; and M. Otto Beyrodt, Berlin, for the pretty Odontoglossum × Adrianæ Swoboda.

From the United States of America there is one exhibit to be recorded, worthy not only for its own merit, but for the kind motive which prompted its raiser to have it

TRICYRTIS HIRTA.*

The species of this Colchicaceous genus are, according to Baker, but six in number. The species, of which we give a figure, is distinguished by its deeply cordate, stem-clasping leaves, which, like the stem, are covered with soft spreading hairs. The stem is 2 to 3 feet high, with a terminal raceme of six to eight flowers. The perianth is about an inch in length, bluish-grey with purple spots. Franchet and Savatier say the plant is widely distributed, and very variable in the foliage and in the arrangement of the flowers. They also say that the ovary is glabrous; whilst in T. hirta, which they treat as distinct, the ovary is bristly. Mr. Baker, however, in his most recent monograph, considers the two as specifically identical. Messrs. Boehmer & Co., of Yokohama, who furnish us with the photograph, tell us that the plant flowers in Japan in October, and that it is common in woods and shady places in the mountains. In this country it is occasionally grown in the cool greenhouse, but is not so commonly met with as might be expected from its elegant and distinct appearance. Mr. Unger (Boehmer & Co.) expresses the opinion that it would be hardy in this country if a little protection were accorded it. Indeed, unless our recollection is at fault, we think we have seen it. on the rockwork at Kew (see fig. 8).

WINTER-FLOWERING CARNA-TIONS AT SANDRINGHAM.

In response to the Editor's request, I will explain the chief details in the system of cultivation afforded the variety Winter Cheer and other tree Carnations, at Sandringham, the results of which were described by your correspondent on p. 406. As far as Winter Cheer is concerned no "special culture" beyond a strict attention to details is necessary to produce from cuttings rooted in January plants capable of bearing fifty flowers during the following winter months.

PROPAGATION.

The first cuttings are put in about the middle of December, but early January cuttings make equally good plants. Four strong-growing shoots, with or without a heel and about 4 or 5 inches in length, are inserted around the sides of 3-inch pots, in a compost consisting of 2 parts loam, 1 part leaf-mould, and 1 part sharp sand. To every barrow-load of this compost we add a 2-inch potful of Veltha powder, and a 10-inch potful of fine ash from burnt garden refuse. The loam and leaf-mould at this and subsequent pottings should be sterilised, and the Veltha is added to prevent fungoid diseases. The pots are thickly surfaced with sand, a little of which is forced into the holes made by the dibble, upon which the base of the cuttings should rest. Plunge the pots up to the rims in a bed of moist cocoa-nut fibre, in a propagating pit having a bottom heat of 65°, and an atmosphere of the same temperature. Afford water when the cuttings have been put in, and no more will be necessary until they have made roots. Shade them from bright sunshine, and wipe the moisture from the inside of the lights of the propagating pit each morning and afternoon. Should excessive vapour rise in the pit, afford a little ventilation until it is dispelled, and thus prevent damping. In three weeks' time most of the cuttings should be rooted, when the pots may be stood upon the surface of the hed, and by degrees the lights may be tilted and the young plantlets inured to the general atmosphere of the house. After a few days in this position they should be removed to a stage close up the roofglass, in a house having a night temperature of

* Tricyrtis hirta.—Hook. in Bot Mag., t. 5355; Baker in Journ. Linn. Soc., xvii., 464 (1879); T. japonica Miquel, Franchet & Savatier, Enum Plant. Japon., vol. ii. (1879), p. 74.

55°, and 60° to 65° by day. Syringe the young plants freely twice each day in bright weather, and maintain the atmosphere moist.

POTTING.

The first potting may then take place, using clean, well-drained 21-inch and 3-inch pots. The compost may consist of two parts best loam, pnt through a 1 inch riddle, one part leaf-mould, and one part of equal portions of coarse sand and fine old mortar-rubble. To every barrow-load of this add a 5-inch potful of soot, a 7-inch potful of bone-meal, and a 3-inch potful of fungicide. Keep the plants in the same house and temperatures, shading them from bright sunshine until established, when they may be afforded air upon every favourable opportunity. The next shift will be into 4-inch and 5-inch pots, using a similar compost to that described already, except that the loam may be chopped roughly. At the beginning of the month of May, if all has gone well, the plants will be ready for their final potting into 6-inch and 7-inch pots. Use the same potting compost, with the addition of a 5-inch potful of Bentley's Carnation manure to each barrow-load of compost. After this potting, our plants are placed upon a base of fine gravel in a low spanroofed pit, where they are gradually deprived of all artificial heat, and by the beginning of July the lights are entirely removed, cultivation being continued in the open. The plants having been well established, the excessive rainfall of the past summer seemed thoroughly to agree with them, as the strong dark-green foliage indicated. The plants remained in such a position until the beginning of September, when they were removed to the houses for the winter. By that time they should be throwing up their flower-stems, it being important to have them at this stage, when an early winter supply of flowers is desired. Until colder weather sets in they are afforded all the ventilation possible, and later on a temperature of 50° is maintained.

STOPPING AND DISHUDDING.

When the young plants have attained a height of 6 inches, and while in their 2½ or 3-inch pots, they should each have the point cleanly removed, by which means shoots are induced to form in the axils of the leaves below. These in their turn must be similarly treated, when they have grown to a suitable size. Beyond this no precise rule can be laid down for stopping, as everything depends upon the progress of the plants, and not a little upon the variety, but, generally speaking, no stopping should take place after the first week in July if the plants are to flower in early winter, or ten days later for a successive batch.

WATERING, FEEDING, AND STAKING.

As a matter of course, watering must be intel-Rigently carried out at all times, but after each potting great care should be taken that the plants be not afforded too much, as this would cause the soil to become sour and sodden, which may result in the plants damping at the collar. Although less water is required in the winter, the pots being full of roots the plants must not be permitted to suffer from want of moisture, otherwise deformed and shrivelled flowers will result. The Carnation being a gross feeder, I look upon the careful use of stimulants as one of the principal items in its successful culture. In many cases the food is not afforded until the plants have become in a starving condition and unable to assimilate the rich food suddenly supplied. As soon as the roots are well around the sides of the floweringnots, commence with applications of weak farmyard liquid manure and soot-water twice a week, and as the plants gain in vigour increase the strength of the manure. The best artificial stimulant I have tried is Bentley's Carnationmanure, and in addition to the foregoing manures

this should be supplied every ten days from the first week in July until the flowers commence to open. In wet weather the manure may be pricked into the surface-soil at the rate of about $\frac{1}{4}$ of an oz. to each plant, allowing the rain to wash it down to the roots. In fine weather it may be dissolved, at about the same rate, and watered in. Soot-water alone should be given after the flowers begin to open, stronger manures causing them to damp and lose colour.

The flower-stems should be neatly secured to a central stake, each stem being slung loosely and not all tied together in a bundle. Green painted spiral wire stakes are excellent when used one or more to each plant, being neat and durable.

DISEASES AND INSECT PESTS.

The most troublesome insect pests are green and black fly, but these need not prove destructive if preventative measures are taken to combat them. When the plants are in a pit or house, plants of Winter Cheer, Duchess of Devonshire, Mrs. L. de Rothschild, or Flora Hill. The following are a few excellent, strong-growing and free-flowering varieties in their respective shades of colour, and may be depended upon to afford a good and continuous show of flowers.

Shades of Scarlet.—A. de Rothschild, America, Wm. Robinson, G. H. Crane, Yuletide, Triumphans, and Winter Cheer.

White.—Mrs. S. J. Brooks, Norway, Mrs. Moore, Virginalis, Miss Mary Godfrey, and Flora Hill.

Crimson Shades.— Lord Kitchener, Generals French, Buller, and Gomez, Mrs. H. J. Jones, Uriah Pike, and Governor Roosevelt.

Pink Shades. — Hon. A. Fellowes, Lady de Ramsay, Ethel Croker, Lady Carlisle, Mrs. T. W. Lawson, Marquis, Melba, Floriana, Pride of the Market, and Duchess of Devonshire.

Rose.—Halton Rose, Rose Queen, Winter Green and Mrs. Leo. de Rotbschild. T. H. Cook.

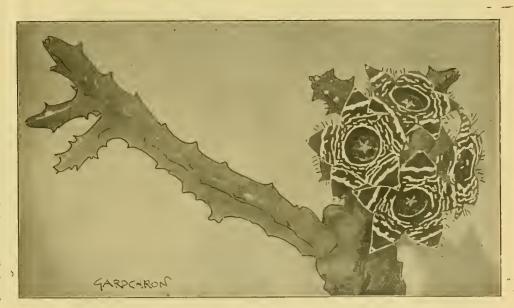

FIG. 9.—CARALLUMA CRENULATA, FROM SIR THOMAS HANBURY'S GARDEN AT LA MORTOLA.

nothing is more effectual than vaporising with XL-All directly the first sign of fly is observed; but if growing in the open, spray them once every few days with diluted quassia-extract. dipping in this liquid any plants badly affected, or that have the aphides concealed in the points of the shoots where spraying cannot reach them. Do not disfigure the foliage by using tobacco or other powders.

Of diseases the Carnation-rust (Helminthosporium echinulatum) is the most dreaded, but it seldom affects strong, well-grown plants to any great extent. Sulphide of potassium dissolved at the rate of 1 oz. to 3 galls. of water, and sprayed at intervals of a few days over the diseased parts, is a good remedy. Isolate affected plants, as the disease spores quickly contaminate others that are in the least weakly. Upon no account propagate from such plants, it being more profitable to burn them, and make a clean and fresh start. A preparation called "Carvita" as well as "Veltha" Emulsion, are excellent remedies for all fungoid diseases of the Carnation, if applied according to directions sent out with each.

SELECT VARIETIES.

Many of the recent introductions are great mprovements on old varieties, but among the latter it is hard to find one that will give the grower greater satisfaction than well-grown

CARALLUMA CRENULATA, WALLICH.

LAST May I received from Calcutta, through Mr. David Prain, a few plants of Caralluma crenulata which had been collected on the Shan plateau in Burmah. The tiny plants had not suffered much from the long journey, and soon started to grow when I planted them, together with other Stapelias, under the shelter of a big rock in a warm and sunny place. Now we have had the pleasure to see it in flower, and I presume for the first time in a European garden. The stems are diffusely and irregularly branched, from 2 to 6 inches long, and 1 to 3 of an inch large, tetragonal, furrowed between the angles. The margins are sinuate dentate, the teeth about of an inch apart, patent, with a little deltoid leaflet at the top.

There were nine flowers in a terminal umbel, with short subulate bracts. The pedicels were of of an inch long, somewhat thickened above. Sepals is of an inch, deltoid, acute. Corolla campanulate-rotate, nearly an inch in diameter, with short deltoid-ovate lobes, yellow, but nearly completely covered with dark brown-red spots and lines, especially in the bottom of the corolla and at the top of the lobes. The margins of the lobes fimbriated, with clavate purplish hairs from the base to the middle, the rest of the flower totally glabrous (see fig. 9).

The inner segments of the corona are linear, obtuse, incumbent on the anthers and shorter than these; on their base they are united with the outer corona. This latter is cup-shaped with five lobes, each with two small recurved subulate teeth, one to the right and to the left of the inner segment.

This little Caralluma belongs to the group with terminal umbellate flowers out of the subgenus Boucerosia (K. Sch. in Engler and Prantl. Nat. Pfinln.), together with Caralluma campanulata,

PRIMULA FORBESI.

On December 2, 1893, we illustrated this beautiful annual species from a plant grown in the gardens of Sir Trevor Lawrence, Burford, Dorking. Our present illustration (fig. 10) has been reproduced from a photograph taken in the gardens at Trinity College, Dublin, where Mr. Burbidge cultivates it very successfully. The species was found in Yunnan, China, by the Abbé Delavay, and has pale lilac flowers arranged in whorls, the

FIG. 10.—PRIMULA FORBESI IN TRINITY COLLEGE BOTANIC GARDEN, DUBLIN.

(Photograph by G. E. Low, Esq.)

umbellata, diffusa, lasiantha, retrospiticus, &c., which occur from tropical East Africa to South Arabia, to India, Burmah and Ceylon. The fimbriation of the margins of the corolla lobes is very characteristic in this species.

The colour and shape of the flowers are very pretty and the scent is not at all disagreeable. I hope to be able to propagate the species, as it makes subterraneous shoots which soon make roots and help to increase the plants. This species has only been figured in Wallich's Plant As. Rar, T. t. 7, therefore a photograph will prove to be of interest to all lovers of Stapeliæ. Alwin Berger, La Mortola, Italy.

flowers in the lower whorls being expanded simultaneously with those in the upper. It is a desirable plant for the rockery, and was shown in flower amongst the alpine plants from Messrs. T. S. Ware, Ltd., at the Drill Hall on Tuesday last, see p. 30.

COTTON IN THE W. INDIES.—About a thousand bushels of Cotton-seed, says the Agricultural News (Barbados), were distributed to various persons in the West Indies in September last. "Sea Island" Cotton of fine long staple is the variety most in favour.

KEW NOTES.

FOUR NEW AFRICAN PLANTS.

KEMPFERIA ROSEA.—This plant is related to what used to be cultivated as Cienkowskia Kirkii, one of the most attractive of the Kæmpferias, which was introduced to Kew from the coast opposite Zanzibar, thirty years ago. I am informed by Mr. Mahon that K. rosea is plentiful in open forest in the Shiré Highlands, where he always looked upon it as K. Kirkii, from which, however, it is quite distinct, K. rosea being certainly the more beautiful plant. It has a short fleshy rootstock and numerous thick string-like roots; the leaves are about 18 inches long, half their length being narrowed to a petiole, and the other half a bright green plaited blade with an acute point and 4 inches wide; the scape is 18 inches high and bears six flowers which open one at a time, and are over two inches across, their colour being a brilliant rose-red with a conspicuous eye-like blotch of orange at the throat. There is a nice batch of plants of it now showing flower in a stove at Kew; they were received a short time ago from Mr. McClounie, of the Scientific Department, Zomba, British Central Africa. A third species, viz., K. æthiopica, which appears to be common in the same region and which has still larger flowers of a bright redpurple colour, has not yet been introduced. Some years ago Messrs. Sander & Sons distributed, under the name of K. Ethelæ, and said to have been imported from Natal, a Kæmpferia with large handsome flowers described as "a lovely flesh-rose, shaded with lilac, violet, and crimson, the labellum bearing a broad yellow crest." I never saw this plant in flower, but it may have been K. æthiopica.

IPOMŒA MAHONI.

There are very few Ipomœas of shrubby habit, and those that we know are chiefly Mexican. But two years ago Mr. John Mahon, when in charge of the Botanic station in the Uganda Protectorate, sent to Kew seeds of an Ipomœa which he had found at a high altitude and which he recommended as a good garden plant, as it formed a large woody shrub of pleasing habit with clusters of large purple and white flowers. A small plant raised from these seeds flowered at Kew in the spring of 1903, and as it proved to be new Mr. Wright named it 1. Mahoni (See Gardeners' Chronicle, vol. xxxiii, 1903, p. 257). It was then only a few inches high, but it has since grown to a height of 3 feet, the branches clothed with oblong green leaves 2 to 4 inches long, and bearing terminal clusters of as many as a dozen flowers and buds. The plants were at their best in mid-December, when they were most attractive, the flowers being as large as those of I. Batatas and coloured bright red-purple and grey-white. Two of the Mexican "Tree Ipomeas," viz., I. arborescens and I. Wolcottiana, are in cultivation at Kew, but neither has as yet flowered. These two are said to form trees 30 feet high (see Garden & Forest, 1894, p. 363), whereas I. Mahoni, according to Mr. Mahon, grows about 12 feet high, and as it grew at an altitude of 7000 feet it. should thrive in temperate conditions.

PLECTRANTHUS CHIRADZULENSIS.

A pretty blue winter-flowering plant for the greenhouse, of recent introduction from British Central Africa, has the misfortune to bear the above name, in consequence of its having been found on the summit of Mount Chiradzulu in that country. It has been in bloom for about a month in the Cape-house at Kew, and whilst it is not so showy as Coleus thyrsoideus, it has an elegance in its loose panicles and a charm in the colour of its flowers that entitle it to favour. The largest plant at Kew is 3 feet high, with slender branches, opposite-stalked toothed green leaves not unlike those of the common Nettle, and terminal

loose panicles 6 inches long and wide, of longlipped, light-blue flowers. The leaves have a strong agreeable odour of ripe Apples. It was sent to Kew by means of seeds in 1898 by Mr. John Mahon.

PLECTRANTHUS CRASSUS.

This is a new species lately described from plants in flower at Kew, and which were raised from seeds sent by Mr. McClounie, of Zomba. It forms a stout, herbaceous shrub, and Mr. Mahon says it is used in British Central Africa for garden fences, as it soon grows into a thick, wall-like mass. The whole plant is covered with

very much deeper in colour than the type. There are also a few plants of L. Gouldiana flowering, the shape and colour of the flower suggesting that it might be a natural hybrid between L. ancaps and L. autumnalis. L. albida and the variety bella with the piuk lip are also flowering. Several varieties of the very pretty and distinct L. rubescens (peduncularis) are worthy of notice, the shape of the flowers being very much like Bletia hyacinthina.

Calanthe microglossa is a distinct evergreen species from Sumatra, having white sepals and petals and a yellow lip. Bulbophyllum auricomum, although belonging to the section of sepals and petals are pure white, the lip being orange-yellow colour and brown; the diameter of the flower about 2 inches. The leaves are very narrow, and 12 to 18 inches long.

Epidendrums are well represented just now, amongst which is a small plant of the charming E. Endresii, which is not seen often although it flowered in the country in 1883. E. Wallisii is another fine species now in full flower; E. tovarense and E. chioneum have their creamywhite flowers at the apex of the stems. E. (Barkeria) Skinneri has borne a profusion of flowers for the past six weeks and is still good. Miltonia Clowesii is a distinct species, with

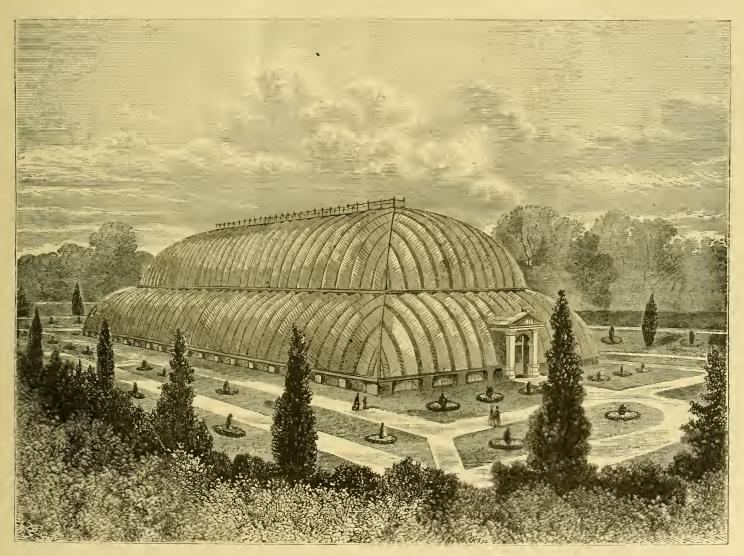

FIG. 11.—THE GREAT CONSERVATORY AT CHATSWORTH,

The Residence of the Duke of Devonshire, visited by their Majesties the King and Queen during the present week. (See p. 26)

velvety hairs; the leaves, which have short petioles, are ovate, 3 to 6 inches long, the margins regularly crenate, the upper surface rich velvet-like green, the under side grey, with very closely reticulating prominent nerves. The flowers are borne on stout, erect terminal panicles a foot or more long, sometimes shoully branched at the base; they are purple-blue, and in effect not unlike the Meadow Sage. The plant is likely to be useful in subtropical gardening. W. W., Kew.

ORCHIDS IN FLOWER.

Lælia anceps and L. autumnalis are making a fine display. A fine specimen of the former species is carrying fifteen good spikes of flowers; amongst the latter species are several varieties Bulbophyllums having deciduous leaves, is a pretty plant when in flower, and it flowers freely. The inflorescence droops slightly, and is about 6 to 8 inches long; the flowers are white and very fragrant.

Amongst the Odontoglossums is a good spike of O. triumphans about $3\frac{1}{2}$ feet long and carrying over thirty flowers. O. pardinum is a nice species with a dense, erect inflorescence, forming quite a pyramid of chocolate and yellow-coloured flowers 18 inches high. O. aspirhinum is another pretty species, and one not commonly grown. There is a very good variety of O. maculatum in flower, and a spike of O. Andersonianum. Ceelogyne graminifolia is represented by a specimen in a 10-inch pan carrying thirty-six spikes of flowers with three to six flowers on each; the

golden-yellow-coloured flowers about 2 inchesacross, barred with chocolate colour. It is much more vigorous than most of the species. Oncidium macranthum is now in full beauty, as also is O. suave, a much less known species than the former; the spike is about 2 feet long and very slender; the flowers scattered, and about ½ inch in diameter, light-brown blotched with yellow. A charming little specimen of O. ornithorhynchum. in a 5-inch pot is carrying eighteen spikes of its delicate pink-coloured flowers. Tainia penangiana, an Orchid not much cultivated, is now freely flowering; the erect spike of yellowish flowers 18 inches high are produced from the pseudo-bulbs made in the previous year; it flowers when the plant is denuded of foliage. Several species of the much-neglected genus Masdevallia are making a good display, especially M. ignea with its bright orange-red-coloured flowers. M. tovarensis, probably the favourite of the genus, is also flowering freely. Other Orchids in flower and not generally grown, are Platyclinis cucumerina, P. glnmacea and P. rufa; Stetis tristyla, with rather insignificant flowers, but a very interesting Orchid nevertheless; Restrepia striata, with its numerous boat-shaped flowers striped with red and bright yellow; Listrostachys hamata, a charming Orchid, with rather large, white, almost stellate flowers produced in axillary spikes; L. pellucida, having pendulous spikes about 9 inches long, with flowers 3 of an inch in diameter, creamy-white, slightly fringed, somewhat fleshy and pellucid; Cryptostylis arachnites, an interesting Orchid, having a rosette of green leaves about 6 inches long, the peduncle arising from the centre carrying about a dozen flowers, the sepals and petals of which are very narrow and of a greenish colour; the lip is densely blotched with ruby-red, and instead of being anterior, as in the majority of Orchids, it is posterior, giving the flower an inverted appearance, due to the non-twisting of the ovary, which occurs in nearly all Orchids. Many species, varieties and hybrid Cypripediums are making a good show, amongst which may be noted C. Laynoldianum, C. Fitchianum, C. Appletonianum and C. Deedmanianum. W. H.

MARKET NOTES.

CUCUMBER CULTURE.

WHILE some growers are preparing for the planting of the new year crops, others are content to leave the houses just as the old crops were taken out. Now, whether Cucumbers or Tomatos were the last crop, no time should be lost before washing and scrubbing, not only the woodwork, but also the glass in each house. walls should be thoroughly disinfected, for which purpose there is nothing better than a coat of hot slaked lime with a good dash of sulphur in it. As a disinfectant in house washing, I still adhere to the old-fashioned, ever-ready hot water, soft soap and paraffin. This is cheap and most effective. Care should be exercised in so disposing of the old soil that it does not come in contact with compost to be used during the present season. Stephen Castle.

COVENT GARDEN MARKET.

Thips in boxes were very plentiful, Proserpine, Chrysolora, La Reine, Cottage Maid, Scarlet Van Tholl, and Thomas Moore being the chief sorts. Roman Hyacinths and Lily of the Valley are also in pots. Begonia Gloire de Lorraine and the Turnford Hall variety were looking fresh, and seemed to stand the cold weather fairly well. There is more trade now for small Ferns, as they are used extensively with the Tulips, Hyacinths, and other bulbs. The trade for larger Ferns and Palms was very dull. In cnt flowers trade was better, and for most fresh material high prices were being made. I say "fresh," for there appeared to be a good deal of rough and stale stock, especially in Chrysanthemums, though there were some good flowers.

High prices were asked for Lily of the Valley. Lilium lancifolium was good, and L. longiflorum not quite so plentiful. Callas were good; Eucharis are still plentiful. Good Roses are now scarce, also best English Carnations. Narcissus obvallaris is making a good price.

The French Market presented a very deserted appearance, Violets being alone plentiful. Paper-white Narcissus was making 20s. per pad. Safrano Roses are not quite so plentiful. Scarlet Anemones were in the market last week, but the cold weather seems to have stopped them.

In the Fruit Market all supplies were very plentiful, and trade rather quiet. Most of the samples of Gros Colmar Grapes were very poorly coloured. The St. Michael Pines were good and cheap. Apples were particularly abundant, and most of the samples seen were of good quality. English consumers have the advantage when our own crop is short, for then we get imports more than sufficient to make up for the shortage. A. H., January 2.

The Week's Work.

THE KITCHEN GARDEN.

By John Pentland, Gardener to C. H. B. Firth, Esq., Ashwicke Hall, Marshfield, Chippenham.

Mint.—Those who struck cuttings in boxes during August will now be reaping their reward in a supply of fresh growths. Keep such in a temperature of 50°, and afford plenty of air on favourable occasions and sufficient water to keep the plants growing. Take up healthy roots from the reserve garden and lay them in boxes containing a moderately rich compost, covering the roots about three-quarters of an inch with equal parts sifted sandy loam and ashes to ward off slugs. Place them in a sheltered spot free from frost for introducing into heat as required.

Preparing ground for crops.-After affording the dressing of lime advised last week, take every opportunity in frosty weather, when the ground is hard, to wheel on manure to every vacant plot in the garden where it will be required, commencing with that part which will be dug or trenched first. The quantity of manure necessary will depend upon the nature of the crop that will follow and upon the condition of the soil. Manure that is already well decayed is often preferred to that fresh from the farm, yet for soil on a dry or gravelly bottom t fresher the manure the better; for if it afforded in quantity, and is covered rather deeply with soil, it will retain the moisture longer than manure of a more solid nature. If, in addition to such manure, a mulching be applied afterwards at the proper time, the crops may be expected to mature evenly in the event of dry weather. It is in gardens that are not fitted up with every convenience to help Nature, when she is not in the mood to help herself, that long manure, dug or trenched in now, will be in that state of decay for retaining moisture when most required. The sooner all vacant ground is turned-up roughly, that the frost and air may have more influence upon it, the better. If digging is to be done well, it requires to be looked after. When the digger does his work with his legs in such a position that a wheelbarrow might pass between them, depend upon it he is only turning up a few inches of the surface. He should stand up to the spade, arrive it in to the treads, lever down the handle, lift the spadeful, and with a jerk turn the bottom soil to the surface.

Peas.—Where there is no convenience indoors or in frames for a crop of Peas, it will be necessary to use pits. Select a sheltered spot that slopes to the south, and measure out the dimensions required. Then dig out the soil in the centre and place it round the edges, making it firm. Raise these banks to a height of 16 inches at the back, and slope them to about 8 inches at the front. Cover the area confined by these walls with ashes. The next thing to do will be to get pieces of fibrous turf 16 inches long, 6 inches wide, and 4 inches deep. Lay these on slates, placing the grassy side underneath. Then cut a groove up the centre of the earthy side of the turf with a trowel, sow the Peas in this groove and cover them in the usual way. When this has been done, lift the slates and turves, and place them in the pits; cover the pits with wooden shutters or galvanised iron sheets, to shelter from rain or snow, and provide an additional cover with mats or straw to protect from frost. These means will suffice until the Peas are through the soil, after which time they will need light and air. Although an old plan,

the one just described will enable you to produce an early crop of Peas without incurring the risks that are attached to sowing in the open. A few reliable early varieties may be sown now.

Forcing.—See that the supplies of Asparagus, Seakale, Rhubarb, and salads are kept up by introducing fresh batches into heat when needful.

FRUITS UNDER GLASS.

By W. FYFE, Gardener to Lady WANTAGE, Lockinge Park, Wantage.

Figs.—Pot trees that are intended to ripen fruits in April should be started into growth, affording them a gentle bottom-heat. Whether the heat be derived from a bed of leaves or from hot water, it should be kept at about 65° to 70°. The atmospheric temperatures should be 50° at night and 60° to 65° by day; but when growth has advanced a little the temperature at night may be increased gradually to 60°. Successional trees in borders should now be subjected to any degree of pruning that may be necessary, and the house and trees will need to be cleansed thoroughly with soft-soap and water. The system of training practised here is as nearly natural as is possible in a glasshouse with a leanto roof. It consists in arranging the main branches at a distance of about 4 feet from the glass, and allowing all fruit-bearing wood to be perpendicular. By this system the wood ripens well, being subjected to a greater degree of light. We gathered our last dish of fruits last week from a tree of the variety Brown Turkey, trained upon this system.

Strawberries.—Where early fruit is expected from plants placed under glass in November, the beginner need not be discouraged if he finds that upon the plants opening their flowers about one-half of them are useless. For plants in flower maintain a circulation of warm dry air, and do not afford too much water to the roots. About noon each day go over the plants with a camel's-hair brush to distribute the pollen. Make the most of bright sunshine by allowing the temperature to rise by its means, closing the house early in the afternoon. Should the weather b come cold, a night temperature of 50° to 55° will be sufficient. Introduce another batch of plants for succession, placing them near to the glass, and affording them a temperature at night of 50°, which by day may be increased by sun-heat to 60°. Remove all decayed or damaged leaves, clean the pots, and examine the drainage for worms. Press the plants and roots firmly in the pots, but do not remove any of the surface soil, which ought to be a mass of root-fibres. If there is sufficient space, top-dress the plants with fine loam and a pinch of artificial manure.

Melons.—To produce plants for ripening fruits in May, sow seeds at once in 3 inch pots, which should be three parts filled with good friable loam, in a warm, moderately dry condition. Insert one seed in the centre of each pot. A satisfactory practice adopted here in raising early Melon plants is to plunge the pots in movable evaporating pans filled with Cocoanut fibre or fine soil, and placed on the pipes near to the glass.

THE FLOWER GARDEN.

By A. B. WADDS, Gardener to Sir W. D. PEARSON, Bart., Paddocknurst, Sussex.

Wild Garden.—If it is intended to make a "wild" garden, select a piece of ground and clear away the underwood; then trench and manure the land. Do not clear away too much at once, or a bare appearance would be the result and let in cold winds, but leave a few shrubs to provide shelter and appearance. All bulbs will have been planted out by this date in the grass or in other positions. If they have been planted in the grass, cut off the old tufts of strong-growing grasses before the bulbs appear above the surface, and do not again cut the grass until they have died down. Bulbs should be planted in masses for effect in about 500 of a sort—Aconites, Snowdrops, Narcissus, and any that have done blooming from the houses; they will give a little bloom for a few seasons, and help to cover the bare ground with their foliage. Where Camellias will thrive, they should be afforded a large pro-

portion of peat or leaf-mould and road-scrapings, especially if the ground is of a heavy nature. the Camellias irregularly at distances of 12 to 14 feet apart. Cydonia japonica and its varieties, Daphne Mezereum and D. M. alba, Azaleas, Prunus sinensis and P. triloba, and Andromeda japonics, all require rough peat or leaf-mould. Clumps may be planted of hardy Fuchsias, Forsythia suspensa, Clethra alnifolia (very sweetscented), Staphylea colchica Kerria Any sur-plus canes of Wineberry, Raspberry, Blackterry, from the kitchen-garden may be grouped together. If these are permitted to grow wild they will soon furnish the wild-garden and make it bright. A few rustic chairs should be placed in secluded spots, reached by winding paths made of rough stones laid flat and irregularly. The sides of some of these paths may be planted with Ligustrum elegantissimum, and a few tall standards should be put at the back of the chair. Between the shrubs plant Anemones, Rhododendrons Early Gem and Præcox, Lily of the Valley, Moss Roses, &c. Violets, or any Violas left from the autumn planting in the flower-garden, can be planted between the stones. Where there are sloping banks, a rustic chair can be let into the bank so as not to be seen from the main path, and planted up at the back with Brambles, variegated or green Hollies, and Veronica Traversii. One of the prettiest walks here is planted with Cytisus [every other one being a standard] variety; the colours are very bright, and last a long time. In the background are Foxgloves.

Dahlias.—If these have been stored away in a shed and covered with coal ashes, look over them and cut away any decaying tubers, then dust a little slacked lime over them. Frost must also be excluded from them by covering them with dry Fern or similar material.

Aquatics should have 12 to 18 inches of water over the crown of the plants. If the water is covered with ice break it each day.

Roses.—Severe weather having set in, a little dry bracken may be placed over the Tea varieties. The variety Mme. Lumbard afforded us flower-buds on Christmas day. See that standard Roses do not rub against the supports.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, gr., Wrotham Park, Barnet.

Morello Cherries.—For mossy trees apply quicklime to the branches, when in a short space of time the moss will have disappeared.

Orchard-trees .- It is seldom these trees continue to be fruitful if left entirely to themselves. It is best to look over such trees annually, and thin out the branches according to the degree necessary. If the trees have been neglected for a long time do not thin them severely at one time, but reduce the heads gradually, taking out some of the branches each season until they are in a condition that light and air may circulate easily amongst the branches. When thinning out the branches remove first all those which cross and interlace each other, using a pruning-saw for the purpose, and smoothing the edges with a keen-edged knife. After this, scrape the moss from the thick stems and the bole of the trees with a piece of iron hoop or scraper made for the purpose, then dust over the whole some fresh lime, or syringe the trees with a solution of caustic soda and potash at the rate of $\frac{1}{2}$ lb. of caustic soda, and $\frac{1}{2}$ lb. of crude potash in 5 or 6 gallons of water at a temperature of 100°. As a rule, however, a heavy dressing of good lime will be sufficient to cleanse the trees, and it should be applied during dull, foggy weather, when the branches are damp. Another good plan is to mix lime with water to the thickness of paint, and syringe the trees all over with this. Do not neglect the roots, but remember that manure-water from the farmyard will always be helpful to orchard trees, especially those on light shallow land, no matter when it is applied. Young trees that produce good crops of fruit annually may be afforded a heavy top-dressing of manure before they become stunted in growth. Look over the heads annually and keep the centres open. Leading shoots should be shortened, according to

their strength and length, to about 15 inches of the previous season's growth. Any side-shoots not required may be spurred back to within two buds from the base,

Gooseberries.—Prune and dress the bushes, remembering that it is on the young wood that the best and most abundant fruits are produced. Do not hesitate to thin the heads freely; crowded bushes produce small berries only. Evenly-balanced, well-thinned Gooseberry bushes, when heavily laden with fruit, will assume a pendulous habit, and the centre of each being partly open, the crop can be more conveniently gathered. When pruning, reserve any young growths that may be required to fill gaps, shorten slightly those long and weak, and spur back to two buds the side growths; then remove the prunings and scrape a few inches of the top soil from under the bushes, replacing same with good loam and manure. Dust the branches over with soot and lime, and repeat this at intervals. Applications of manure-water during winter will be beneficial.

THE ORCHID HOUSES.

By W. H. While, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Dorking

Oncidiums. - The distinct O. Lanceanum has always been considered a difficult one to grow well, and large, healthy specimens are rarely seen. It is difficult to keep the leaves free from spot, and when once infected with the the plants seldom recover good health. During the past six or eight weeks the plants at Burford have been kept rather dry at the roots, and in a temperature averaging about 60° day and night; the hygrometer has shown the atmoconditions to be from 4 to 6° below saturation-point, and at present there is no spot. Growth has commenced, and new roots are pushing from the base of the young leaf; if therefore a plant requires more rooting-space it should be afforded at once. O. hæmatocheilum grows in the same native habitat as the above species, and requires similar treatment. O. carthaginense, O. splendidum, O. pumilum, and O. luridum will also thrive under the same conditions. Pot the plants in a compost consisting of three parts leaf-soil to one of peat, adding a little finely-chopped sphagnum - mosa. Press the compost rather firmly down among the roots and nearly up to the rim of the pot, surfacing the whole with fresh green moss. Afford but little water until the roots are re-established and the leaves well advanced; a slight increase may then be allowed, but at no season must the compost be saturated. Place them in a light position in the warmest house, and if it be naturally damp do not syringe between the pots at present. Plants of O. Caven-dishianum that have spikes of flowers now opening should be in the plant-stove or East Indian house, but when the flowers fade, remove them to the intermediate-house. O. pulvinatum is now at rest in the intermediate-house, and is rather dry at the root, but will be repotted when growth has recommenced. The pretty O. phymatocheilum is a species well adapted for table decoration. Little water has been afforded it for several weeks past, but more generous treatment is now called for. Re-pot or top-dress the plants if necessary, and place them in a warm corner of the Cattleya or intermediate house.

Such Brazillian Oncidiums as O. Forbesii, O. crispum, O. prætextum, O. varicosum, and its variety Rogersii, that have recently passed out of flower, should be suspended or stood upon a shelf near to the roof glass of the Odontoglossumhouse, and be sparingly watered at present. Having sustained for several weeks past gigantic, many-flowered spikes, these plants will be in a more or less shrivelled condition, but it is a mistake to deluge them with water at the root, with the idea of assisting them to regain their former plump condition. It is better practice to sprinkle the pseudo-bulbs and leaves occasionally, using a fine rose watering-can for the purpose, or the fine patent sprayer now so much in use.

Cypripediums.—C. purpuratum, C. Arthurianum, C. Spicerianum, C. Albertianum, C. Creon, C. Leeanum, C. Niobe, C. Actæus, C. Hera, C. Prospero, C. Sallierii-Hyeanum, C. vexıllarium, C. Charlesworthii, C. insigne, and its many distinct

varieties, including C. i. Sanderæ, C. i. Sanderianum, C. i. punctatum violaceum, C. i. Maulei, C. i. Harefield Hall, &c., are of comparatively easy culture, and have recently made a good show of flowers. The majority of those enumerated have now passed their flowering season, and should, if the plants have become pot-bound, be given more root-room. Strong, healthy plants may be placed into pots two sizes larger than those they are growing in, using a compost of fibrous peat, good fibrous yellow loam, leaf-soil, and sphagnum moss, in equal proportions, which should be mixed thoroughly together. Place a few pieces of crocks or fern rhizomes in the bottom of the pots for drainage, and pot the plants in the same manner as an ordinary stove or greenhouse plant. All the above species and hybrids require a plentiful supply of water at all times, especially when well rooted and in full growth; a shady part of the intermediatehouse will suit them admirably throughout the year.

PLANTS UNDER GLASS.

By C. R. FIELDER, Gardener to Mrs. Buans, North Mymms Park, Hatfield, Hertfordshire.

Propagating-house.—Bottom-heat is necessary for the successful propagation of many plants, especially during the winter and early spring. Where the bottom-heat in the propagating-house is derived from hot-water-pipes, which is the case in most gardens, the material used for plunging the pots into ouly will need attention. Cocoanut-fibre is the best material for the purpose, and being inexpensive, should not be left in the propagating-frame so long as to become rotten. In view, therefore, of the approach of the propagating season, clear out the old material, thoroughly cleanse the frame, and replace with fresh fibre. Where the bottom-heat is not supplied by means of hot-water-pipes, it will shortly be necessary to collect fermenting materials for making up a hotbed, which, if properly prepared, will be effective for a considerable time. If dry Oak or Beech-leaves and fresh stable-manure, in the proportion of two parts leaves to one part manure, be well mixed together and turned frequently to allow the bulk of the ammonia to escape, it will be in a suitable condition, and may then be wheeled into the house and made up into a hotbed. The hotbed should be in readiness by the end of the present month.

Euphorbia (Poinsettia) pulcherrima and E. jacquiniæflora.—As the bracts of E. pulcherrima fall, and the plants become useless for decorative purposes, water should be gradually withheld, ultimately allowing the soil to become quite dry. In cases where pot-room is required, the plants will take no harm, when dormant, if the pots are laid on their sides under the stage in any house where a temperature of from 45° to 55° is maintained. E. jacquiniæflora, when resting, does not require to be quite so dry at the root as the Poinsettia, and should therefore be afforded an occasional watering. As the plants pass out of flower they may be cut back sufficiently to remove the old flowering growths, and then be placed to rest in a temperature of from 55° to 60°.

Caladiums, Achimenes, Tydxas, &c.—Tubers and corms of these, if stored under stages and in other places not immediately under the eye, should be examined occasionally, and their condition noted, for should they be subjected to drip from the stage, or other moisture, the corms will decay, or be started prematurely into growth.

Hippeastrums. — Old bulbs of Hippeastrums should be quite dry and at rest at this season, and may be wintered quite safely in a house or pit having a temperature of from 40° to 45°. Unflowered seedlings should be kept growing in a temperature of 60° to 65°, and a moist atmosphere. By keeping the young plants in a growing condition the bulbs will the sooner be in a condition to flower, and any worthless varieties can then be thrown out. Hippeastrums require liberal cultivation. Young seedlings should be shifted into larger pots as soon as the pots havo become filled with roots, but a 6-inch pot is sufficiently large for a bulb to flower in for the first time.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the Publisher.

Cetters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London, Communications should be WRITTEN ON ONE SIDE ONLY OF THE FAREA, sent as early in the treek as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.

Illustrations.—The Editor will be glad to receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers. — Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

PROVINCES.—Jan. 6 (6 P.M.); Max. 50'. off Land's

End; Mln. 25', Yorkshire Coast.

DURING the last season much National attention was given to matters Society. relating to Potatos. From all parts of the country reports of immense crops and still more immense prices have found their way into the daily Press, while the correspondence in the Horticultural papers has proved that expert interest in the matter was keen. These and many other things concurred to suggest that a Society devoted exclusively to the Potato was desirable. Mr. W. P. WRIGHT, therefore, set inquiries on foot to ascertain the state of feeling in the country, and the replies he received were so encouraging that he decided to eall a meeting to discuss the whole affair.

With a view to secure the presence and cooperation of members of the County Councils this was held on Wednesday, December 30, at the Hotel Windsor. The Chair was taken by Mr. A. D. Hall, Rothamsted, and there were between fifty and sixty persons present.

In opening the proceedings, of which we gave a summary in our last issue, the Chairman referred briefly to the many points of interest in connection with the culture of the Potato as well as to its value as a food. He thought that a society such as the one it was proposed to institute could not fail to be of the utmost benefit to every one in the

country. It might be made the means of distributing information upon this the most important of all our vegetable crops to the small and to the large grower, not only on the cropping properties of the several varieties, but also on the cooking qualities and the adaptability of certain sorts to particular soils and climates. The difficulty which always presented itself to those who were desirous of furnishing useful information was to reach the proper people, and the speaker was of the opinion that a society of this nature would aid materially through its members and the local committees it was proposed to establish in attaining this end. The Chairman adverted to the difficulties he had constantly experienced during the time that he was making certain experiments with Potatos in securing the precise material that was necessary, and thought that had a Potato Society been then established it would have been in a position to render him invaluable assistance. Mr. Hall persistently kept to the fore his sympathy with the movement, and concluded by requesting Mr. W. P. WRIGHT to bring forward his resolution.

At the outset Mr. Wright enlarged at some length upon the importance of the Potato erop of this country, and called attention to the fact that our imports of tubers during the past season approximated in value to £2,000,000, and evidently considered that, with accurate knowledge on various points, much of this enormous sum might have been kept at home. He held in his hand a thick bundle of letters, from which he proceeded, after his introductory remarks, to make some extracts. These breathed a uniform spirit of encouragement, and contained promises of support.

Having proved to the satisfaction of all present that he had the support of growers from all quarters of the United Kingdom, Mr. Wright proceeded to move what may be considered one of the most comprehensive resolutions that has ever been placed before a meeting.

It embodied the reasons why the Society should be formed, propositions for the establishment of central, local, and commercial Committees, the nomination of officers, and a suggested code of rules. Of this resolution, of which we were last week unable to give the text, as our pages were in the press at the time, we now give full details:—

"That this meeting is of opinion that in view of the national importance of the Potato as a food crop, the dangers which assail it from various diseases, the urgent want of diseaseresisting varieties of high-cropping qualities and good flavour, the necessity for a system of classification, the desirability of establishing trial stations in various parts of the country, and the educational value of exhibitions, it is desirable to form a National Potato Society. And the meeting agrees that such Society be hereby formed.

"And the meeting further agrees that with a view to immediate action the following gentlemen be appointed a Committee:—Mr. A. D. Hall, Rothamsted, Chairman; Mr. G. Gordon, V.M.H., Kew, Vice-Chairman; Dr. Maxwell T. Masters; Professor Percival, Reading; and Messrs. Edwin Beckett, Aldenham; R. Lewis Castle, Ridgmont; E. T. Cook, Chiswick; A. Dean, Kingston-on-Thames; M. J. R. Dunstau, Wye; and Charles Foster, Reading.

"And the meeting further agrees that the following gentlemen be appointed Secretaries or

Joint-Secretaries of Provincial Trial Sub-Committees, to be formed on their recommendation, with seats and votes on the Central Committee ·-Messrs. G. Barry, Northumberland; A. Dean, Surrey; H. Dunkin, Warwickshire; J. Ettle, Somersetshire; W. Goaring, Sussex; W. A. Howman, Gloucestershire; S. Heaton, Oxfordshire; E. Hobday, Cambridgeshire; David Houston, Dublin; C. Ilott, Cornwall; P. Mann, Bucking-hamshire; A. J. Manning, Herefordshire; J. Newsham, Hampshire; W. Neild, Cheshire; Thos. Redington, Yorkshire; J. B. Riding, Kent; Robert Cock, Staffordshire; T. Sharp, Wiltshire; Smith, Midland Agricultural Institute; J. Udale, Worcestershire; C. Wakely, Essex; J. H. Walker, Northants and Rutlandshire; J. Weathers, Middlesex; and Horace J. Wright, Kent.

"And the meeting further agrees that the following gentlemen, growers of Potatos for sale or dealers in Potatos, be appointed a Sub-Committee for the purpose of advising the Central Committee on all commercial questions connected with Potatos:—Messrs. W. J. Atkinson, Spalding; T. J. Blaydes, Epworth; G. Bunyard, Maidstone; C. W. Breadmore, Winchester; H. Cannell, Swanley; W. Cuthbertson (Dobbie & Co.), Rothesay; E. J. Deal (W. W. Johnson & Son, Ltd.), Boston; Robert Fenn, Sulhamstead; — Marsh (Fidler & Son), Reading; A. Findlay, Markinch; John Green (Hobbies, Ltd.), Dereham; Ed. Owen Greeoing (One-and-All), London; W. L. Malden, Ham; George Massey, Spalding; E. Miles, Leicester; and P. M. Miller, Worcester Park.

"And the meeting further agrees that the Earl of ROSEBERY, K.G., be requested to become President; failing him, a president to be selected by the Committee.

"And the meeting further agrees that a number of patrons be elected, at a minimum subscription of one guinea per annum.

"And the meeting further agrees that, in order to encourage cottagers to become members, the minimum subscription for active members shall be 2s. 6d. per annum."

"And the meeting further agrees that the following shall be the rules governing the Society"

These rules, which we do not reproduce, are ten in number, and have the respective titles: Title of the Society, Objects of the Society, Membership, Privileges of Members, Officers and their Election, the Committee, Annual General Meeting, Alteration of Rules.

Mr. ALEXANDER DEAN seconded the resolution. This great authority upon Potatos said that before being called upon to second the resolution, he had no knowledge of what it contained, but he was so convinced of the necessity of establishing a society of the nature suggested that he was pleased to be able to give it his entire support. He referred to one or two cultural matters and considered that the Society would be able to distribute much valuable information. Mr. THOMAS REDINGTON, Yorkshire College, Leeds; Mr. G. MASSEY, Spalding, and Dr. M. T. MASTERS, all supported the resolution, which, upon being put to the vote, was carried without a single dissentient.

Mr. George Gordon proposed, and Mr. C. Wakeley seconded, and it was carried unanimously, that Mr. Walter P. Wright,

be appointed Secretary.

Thus one more "special Society" is added to the list. Evidently the growers think that a good case has been made out for its establishment. If the purely commercial element is not allowed disproportionate importance, nor too much stress laid on exhibitions as such, then there is a wide field

of usefulness open to the Society in the way of selection of appropriate varieties, in the prevention of disease, and in the precautions to be taken against the spread of disease which are now often so carelessly ignored.

CHRYSANTHEMUMS AT MOOR HALL, HAR-LOW, ESSEX. — The supplementary illustration to our present issue is reproduced from a photograph of Chrysanthemums grown for the production of exhibition blooms in the gardens of JOHN BALFOUR, Esq., Moor Hall, Harlow, Essex. The photograph was taken on November 2, 1903. Mr. and Mrs. Balfour, who purchased their Moor Hall estate just over four years ago, take a keen interest in Chrysanthemums, and are fond of first-class blooms, which are used for decorative purposes in the dwelling-house. The gardener, Mr. JEFFERIES, seen in the photograph, commenced his career as an exhibitor of Chrysanthemums three years ago, at the National Chrysanthemum Society's November show in the Royal Aquarium. He won the 1st prize for twenty-four Japanese flowers, distinct; the 2nd prize for twelve Japanese varieties, distinct; and two 1st prizes for single vases of six flowers. In 1900 he won two first prizes, and last November at the Crystal Palace Show he gained a 3rd prize for forty-eight Japanese flowers, distinct; the 2nd prize in Mr. Godfrey's special class for ten vases of his seedlings, three blooms in each vase; and the 1st prize for a vase of six flowers of the variety J. R. Upton, which were among the best ever staged of this variety at a National Chrysanthemum show; also the 1st prize for twenty-four Japanese flowers distinct, this being the special prize of five guineas given by the President, Mr. C. E. SHEA. About 400 plants are grown at Moor Hall, including those trained as bushes. The plants are freely shown to visitors on the Saturday and Sunday, when the flowers are at their best, and some hundreds of people in the locality appreciate this kindness of Mr. and Mrs. BALFOUR.

THE ROYAL HORTICULTURAL SOCIETY. -The Committee meetings held on January 5 are reported in another column. The exhibition in the Drill Hall was large for the time of year, bright, and interesting. Orchids were in fair proportion, Messrs. Bunyard's apples remarkably well kept, Chrysanthemums made a brave show, and Mr. Russell's display of small ornamental shrubs amply worth notice. Colour was supplied by groups of Justicia coccinea (pink), J. chrystostephana (yellow), Moschosma riparium (white), Coleus thyrsoideus (blue). Groups of these plants were shown by Messrs. Veitch and by Messrs. Cannell. Mr. Ware, Feltham, had a large and varied group of alpine plants, arranged according to their genera. Although not in flower, this group was especially instructive from the manner in which it was arranged, and rich in Saxifrages, Sedums, Sempervivums, hardy Cacti, and similar plants. Messrs. Cutbush had a similar but smaller group, in which some of the spring Irises-I. histrioides, 1. sophemensis, and others-gave promise that spring is not very

THE NEW HALL is progressing satisfactorily. The roof is in course of construction. The building is plain, and though much cannot be said in favour of its appearance it hardly deserves the severe criticisms passed on it, whilst so far as utility is concerned it appears satisfactory. There is urgent need of funds to complete the building.

CHISWICK is practically abandoned, and a substantial sum for the surrender of the lease is anticipated, but not yet obtained. Most of the dabourers are already dismissed. Arrangements are being made at Wisley for the reception of the students.

PLANT AND ANIMAL BREEDING.-A meeting was called at St. Louis, Missouri, on December 29 and 30, 1903, by the American Association of Agricultural Colleges and Experiment Stations to organise a Plant and Animal Breeders' Asso-

The following is a list of papers and addresses that were promised:

Dr. Davin G. Faiachild, U. S. Department of Agri-

culture, "Plant and Animal Introduction."

of the Organising Committee.

"THE BOTANICAL MAGAZINE."—The January number opens with a coloured figure and description of Cymbidium rhodocheilum, Rolfe, tab. 7932 and 7933. This curious orchid is a native of Madasgascar and always grows on masses of Fern, Platycerium, itself growing as an epiphyte upon a tall tree, Albizzia fastigiata. Mr. Hemsley tells us that "all the species of Phacellaria, a small genus of shrubby parasites belonging to the Santalaceæ, are parasitic on different species of the equally parasitic genus Loranthus." We seem here to have a state of things analogous to double grafting as practised in fruit-trees. The Cymbidium above-mentioned flowered at Kew in May, and has elongate spindle-shaped pseudo-bulbs, linear leaves 2 to 3 feet long, and stalked erect racemes of numerous green flowers, with a lip bearing scarlet blotches. Each flower is about

4 inches in diameter. The sepals are oblong, green, spreading; the petals ascending, green, with numerous purplish spots. The lip has two spreading lobes of a deep pink colour with a central yellow blotch also spotted.

Prostanthera denticulata, R. Brown, t. 7934.--A shrubby Australian Labiate, suitable for greenhouse culture, with small linear leaves and racemes of small purplish flowers. Temperatehouse, Kew.

Arethusa sinensis, Rolfo, t. 7935.-A Chinese terrestrial Orchid, with broadly-ovate plicate leaves, and stalked racemes of sub-cylindric tubular flowers, the segments cream-coloured edged with pink. Kew.

Passiflora vitifolia, Humboldt, Bonpland, and Kunth, t. 7936.—A very handsome species introduced under various names, and although very beautiful yet rarely met with. It has deeply three-lobed leaves, and large brilliant scarlet flowers. Kew. It would be convenient if the names of the plants and some scale of magnitude were given on the plates as well as in the text.

THE GARDENERS' ROYAL BENEVOLENT IN-STITUTION. - The sixty-fifth annual general meeting of the members and subscribers of this Institution will be held at the Covent Garden Hotel, Southampton Street, Strand, London, W.C. (adjoining Covent Garden Market), on Thursday, January 21, 1904, at 3 P.M., for the purpose of receiving the report of the Committee and the accounts of the Institution (as audited) for the year 1903; electing officers for the year 1904; and for the election of twelve pensioners on the funds. The chair will be taken by HARRY J. VEITCH, Esq., Treasurer and Chairman of Committee, at 3 o'clock. The Poll will open at 3.15 o'elock and elose at 4.30 o'elock precisely, after which hour no voting-papers can be received. The voting-papers have all been issued. Any subscriber entitled to vote and not having received a proxy should communicate with the Secretary, at 175, Victoria Street, Westminster. The annual Friendly Supper will take place afterwards in the same Hotel, when the chair will be taken at 6 P.M. by LEONARD SUTTON, Esq., of

THE IMPORTATION OF POTATOS .- At the inauguration of the Potato Society, referred to in another column, whilst reference was made to the enormous importations from the Continent, the fact that a very large supply is derived in early spring from our own Channel Islands was overlooked. A good deal was said about the necessity for raising disease-resisting varieties, and no doubt that is a matter of great importance. Very little, if anything, was said about those hygienic precautions which are so necessary to prevent the access of disease or check its spread. The most culpable carelessness still exists in the disposal of diseased tubers and rotting haulm. Spraying two or three times in the course of the season is a good investment, but the destruction by fire of diseased tubers and foliage is even better.

THE FRUIT COMMISSION. - Some of our correspondents express surprise that we, and other organs of the Horticultural Press, have not expressed ourselves with enthusiasm over the appointment of this Commission. So far as we are concerned, there are various reasons for this. In the first place, we were allowed to remain in ignorance of the proposed [Commission, and to get what modiculu of information we possess from the daily papers. Some experience, moreover, of Commissions leads us to doubt whether much good comes from them. We hope it may be otherwise in this case. Some of our correspondents also point out that the eider-making interest is too prominent, and that the real fruitgrowing industry is not adequately represented. Some assert that if there is sufficient financial

inducement there will be no lack of growers, whilst others see in our existing land-laws a great obstacle to the formation of small holdings on which the growers could plant for their own benefit and not for that of posterity. A great gardener is said to have expressed the opinion that the only means of reducing the present overcrowding among gardeners is to enable many of them to become the possessors of small holdings on which to exercise their skill and labour in a profitable manner. Whether small holdings are suitable for commercial fruit growing on a large scale is a point, we think, open to much doubt.

NOTES FROM LA MORTOLA. - Sir THOMAS HANBURY writes:-"Fortunately we have had no cold weather up till now, although the temperature is rather low, owing to so many rainy days. Roses were very abundant during December. Carnations and Mignonette are covered every night and are doing well; and of Narcissi, the common purs white form (N. Tazetta papyraceus) is just beginning to open. The number of different species of plants now in flower at La Mortola is certainly not inferior to that of other years. Of those published in former years at this time in the Gardeners' Chronicle, all are flowering again, with a few trifling exceptions. Of monocotyledonous plants two fine specimens of Agave Scolymus, a form with rather thin but large leaves and strong brown spines, deserve special notice. Aloe Schweinfurthii is finer than in former years. It is generally in flower at Christmas - time. There is certainly no other specimen like this in any other garden, and it will remain so, as it never produces seeds nor offshoots. Aloe pendens and rubroviolacea, which have been figured lately in the Botanical Magazine, are earlier this year than before. Besides these, Aloe Peacockii, A. ciliaris, A. socotrana, and A. arborescens, are beginning to open their first flowers. Of Palms, Archontophænix Cunninghami has a spadix with male flowers only. A male Phonix macrocarpa (Hort.), is also flowering. The principal trees now in flower are Eucalyptus Globulus and E. sideroxylon, Banksia marcescens and B. integrifolia, Schinus molle, Oreopanax Epremesnilianum, dactyliforme and Thibauti, three fine Araliaceous plants, Casimiroa edulis of the Rutaceons family, with fruits resembling Oranges, but with palmate leaves, from Mexico. Most of the Acacias are not yet out, but A. Farnesiana and A. subcœrulea have been flowering since October. Of our numerous climbers Bignonia buccinatoria, with its large, trumpet-shaped corollas, has been a long time in flower. It never fruits on the Riviera, but it does so in Sicily. Tacsonia van Volxemi, Passiflora racemosa, Hexacentris coccinea, Cobæa scandens, Tecoma capensis, Solanum jasminoides may be seen during the greater part of the year. The little climber Manettia bicolor from South Brazil, with its bright scarlet flowers, is very pretty. The shrubs in flower now are too numerous to be mentioned here. There are several Grevilleas and Hakeas, Dodonæas, &c., from Australia, shrubby Salvias, Daturas, Streptosolen, Cantua, Montanoa, Cassias, Tagetes, &c., from Mexico and South America; Loiseleuria coccinea, a Polemoniaceous plant, from Mexico and Dermatobotrys Sandersi from Natal, are flowering for the first time here. Succulents do not seem to like the continual wet of this last month. Cotyledon macrantha shows everywhere its terra-cotta-coloured buds; C. fulgida and retusa, and several others of the Echeveria section are in flower. Sempervivum arboreum has just formed its pyramidal inflorescence. Bryophyllum crenatum from Madagascar is always out at Christmas; here it assumes a brighter colour than in the North. Mesembryanthemum stellatum is quite a gem; its comparatively large crimson flowers cover the whole plant when it opens in the sun. The plant is so small that it can easily be covered with a hand. Several Stapelias are still in bloom—for instance, S. grandiflora, variegata, mutabilis, discolor, &c.; Huernia Penzigii and H. aspera, and a curious hybrid between these two; Caralluma maroccana, europæa and Simonis. T. Hanbury, La Mortola, January 1, 1904."

COCOANUT BUTTER !- It having appeared to some concerned in the manufacture of margarine that the available stocks of raw material were becoming somewhat circumscribed, considering the demand for the finished article, an enquiry was made, and Cocoanut-oil was sent to the laboratory; success was reported, barring the odour. As with many other subjects, the chemist was equal to the occasion; the disagreeable ingredient has been removed, and the vegetation of every warm clime is at the service of the margarine manipulator, who, we have been told, operates in Belgium and Holland. The principal supplies of the raw material come from London and Marseilles. In connection with this matter it may not be out of place to note that, according to a report just recently published, the acreage under Cocoanut Palms in the Solomon group has increased one-third within the past three years.

CHATSWORTH.—In connection with the Royal visit we reproduce from our Chatsworth Supplement, published some years since, an illustration of the great conservatory (see fig. 11, p. 21), designed by the late Sir Joseph Panton, and which furnished the model for the great Exhibition of 1851 in Hyde Park, afterwards removed to Sydenham. The Chatsworth conservatory is about 300 feet in length, 145 feet in breadth, and 65 feet in height, covering 1 acre of ground, and is planted with Palms, Musas, and other tropical plants. The Emperor fountain is a simple jet, rising to a height of 296 feet. (See fig. 12, p. 27.)

COLONIAL NOTES.

PINEAPPLES IN SINGAPORE. — A recently-published report of the Straits Settlements states that in Singapore the Pineapple industry continues to prosper; the area planted with Pines being still further extended. Notwithstanding this, the price of the fruit has risen. Some 426,000 cases of the fruit were sent to Europe and America during the year—an increase of 25,000 cases.

TEA IN CENTRAL AFRICAN PROTECTORATE. -Mr. McClounie, an official of the Government, writes, under recent date, that the progress made by the Tea plants during the past year shows that there is little difficulty in the successful cultivation of the plant on the deep black soils of Zomba. The question of success is therefore not one of cultivation, but depends on rainfall. It is only a very limited area of the Protectorate that has a suitable rainfall—that is, approaching 110 inches annually with an altitude of 3,000 feet above sea-level, and an annual normal rainfall of 50 inches, such as Zomba obtains, and also the greater part of South Uganda. It is only from such districts as south-east Ulange and northwest Nyasaland that Tea may ever be expected to become a successful commercial product. The altitude of the latter district is from 1,500 feet to 2,500 feet, and obtains an annual normal rainfall of 76 inches.

WEST AUSTRALIA.—The report of the Government botanist, Mr. ALEX. MORRISON, mentions the fact that an excursion for the study and collection of the native flora was made in September and October to the Stirling Range in the south of the state. The district is an arid one, but nevertheless a large number of specimens was collected, the detailed study of which has been

deferred owing to the pressure of routine work, which might be done by trained assistants. Western Australia is the only Australasian statethat has not had its botany worked out in detail, although its large area and peculiar flora render it peculiarly favourable for the study of problemsin the biology of plants that have a direct bearing on the growth of the plants cultivated in their vicinity.

RUBBER PLANTING IN THE FAR EAST .- It isstated in the India Rubber World, of November 1, that an estimate has recently been made by the publishers of the Tropical Agriculturist of the extent of Rubber planting in Ceylon. The total area planted in Rubber trees (chiefly Hevea) isestimated at 11,630 acres. The number of treeson this area is believed to be from 3,500,000 to 4,000,000; but it is difficult to obtain an exact estimate on this point, because the distance at which the trees are planted varies, and alsobecause more than half the area mentioned is alsoplanted in Tea. The Tropical Agriculturist alsoestimates that there are about 3,000,000 Rubber trees in the Straits Settlements (including the Federated Malay Straits) covering some 16,600 acres. Of these trees probably a third are five years old or over. The Agricultural News.

HYBRIDISATION OF PINE-APPLES. - Before reaching that part of the garden [Hope Garden.. Jamaica] where the pinery beds are located. Mr. FAWCETT treated us to a most impressive sight-that of witnessing the progress which is being made in the experimental hybridisation of Pines. The superior qualities of the Ripley varieties as to flavour, and the excellent qualities. of the Smooth Cayenne as to large size and weight, good keeping, and ability to bear long. transport, gave rise to the idea that if the two varieties could be crossed, the hybrid product. would most likely partake of the mixed qualities of both parents. At Hope, during the present year, it is gratifying to observe that these operatious are on a scale at least large enough to deserve, if not, indeed, to command, success. That this delicate operation has been skilfully performed at Hope is shown by the abundance of the seed obtained and the large number of seedling. plants procured. I estimated that there are this. year hetween 1,500 and 2,000 seedling plants thus cross-fertilised, and known as Cayenne × Ripley, growing in the nurseries at Hope; so that there is surely a hopeful chance of more than one superior variety being evolved. Cited in the "Agricultural News," Dec. 19, 1903.

COLONIAL PUBLICATIONS RECEIVED.—The Australian Garden and Field (Agelaide and Melbourne), the official journal of the Royal Horticultural Society and the Horticultural Improvement Society of Victoria, and the Victorian Gardeners' Association. Devoted to agriculture, horticulture, and viticulture. A useful publication.—Indian Planting and Gardening (Calculta). Editor and proprietor, H. St. John Jackson, F.L.S. A. journal dearing with Tea, Coffee, Indigo, Economic Products, and Gardening. This advocates scienlificas apposed to rule of thumb and traditional methods of horticulture, and is full of valuable information concerning the products above-named.—Agricultural Bulletin of the Straits and Federated Malay States. October. Contents: Cotton, the Mosquito Plant (Ocimum viride); notes on Rubber from different districts, an Abnormal Cocoanut &c.—The Agricultural Journal of the Cape of Good Hope December. Contents: Rural Cape Colony (Houstraied), New Oak-tree Pest, the Great Drought, &c.—Proce-dings and Journal of the Agricultural and Horticultural Society of India. Con-aius a description and plate of Cassia nodosa.—Bulletin of Miscellaneous Information, Rotanical Department, Trinidad. October. Contents: Management of Lawns, Mango and Lime, Collear robusta, Marina settgera, Fruit Trade, &c.—Hest Indian Butletin, vol. iv., No. 3. This number is entirely devoted to the Cot on Industry in the West Indics.—Jamaica Board of Agriculture: Report on Manurial. Experiments during 1902. These experiments were made with Sugar-cane, Banana, Pineapple, Coffee, and Tobicco. The report is turni-hed by H. H. Cousius, M. A.—The Journal of Agriculture; Receat Field Experiments, Commercial Horticulture in Victoria. November. Contents: Need for Sill Investigations, by S. W. Wallace, Omecon of Agriculture; Receat Field Experiments, Commercial Horticulture in Victoria. &c.—The Queens and Agricultural Journal. November. Contents a useful article on Eosilage, and much other matter connected with crops and stock. The Opter for a disastrous.

drought.—Appendix to the Report of the Minister of Agriculture (Ottawa), Experimental Farms Reports, 1902. This contains the reports of the Director, Wm. Saunders, the Agriculturist and the Horticulturist:—"Notwithstanding severe frost on May 9 the season, on the whole, was satisfactory, and good progress was made in the work of this division." Notes are also furnished by the Chemist, the Entomologist and Botanist, and the Poultry Manager.

HOME ECORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his Correspondents.)

TAILBY'S NEW HYBRIO LILY.—In a recent issue there is mention made of Tailby's new hybrid 'Lily' and as the statement there made is mis-

ground until the tops are killed down by frost, then cleaned and stored as Potatos until planting time again. There is a great future for Calla Mrs. Roosevelt, as it is adapted to so many decorative purposes, as single specimens in pots or tubs, large masses in park or garden, for border culture, or indeed any form of summer decorative work, where a minimum of storage room in winter is available. Curiously enough, this plant comes true from seed; these are sown outdoors in May as one would sow garden Peas, and they germinate at once, flowering the third or fourth year. We have tubers of this Calla that could not be potted in 8-inch pots owing to their large size; in shape and method of increase they exactly resemble Caladium tubers. J. Tailby & Son, Wellesley, Mass.

dils are beiog raised all over England, and, in fact, all over the world. In the Christmas number of a New Zealand paper, four new seedlings are figured, and look promising. My impression is that all the "i's" and the "iis" will have to be abandoned as sectional names, and the varieties so called to go into the magni, medii, and parvi classification, with perhaps one or two additional classes. The Royal Horticultural Society's Narcissus Committee should decide in an arbitrary way to which class a variety belongs, as is done by the Dahlia Committee in the case of the Cactus Dahlias. The honour to the raiser could not and need not be overlooked. The method of the old florists was to write the name, followed in brackets by the

FIG. 12.—THE EMPEROR FOUNTAIN, DISPLAYED BEFORE THE KING AND QUEEN AT CHATSWORTH ON MONDAY LAST. (SEE P. 26.)

deading, it is desirable to correct the same as soon as possible before it becomes a matter of record. As a matter of fact, the plant noted is not a Lily, but a cross-bred Calla, the result of crossing the common Calla or Richardia albo-maculata with the fine C. Elliottiana. The result being as to colour of blooms exactly intermediate, that is to say, a beautiful lemon yellow with the characteristic deep brown base to the flowers. In vigor the new variety exceeds all expectations in that it exceeds the common R. æthiopica in growth, vigorous plants bleoming with the first leaves, these being beautifully spotted in both parents, and attaining a height of 3 to 4 feet during the season. It should also be said that the plant is no mere bardy than a Potato; the tubers, in fact, are treated exactly as Potatos in their culture. Being planted out in settled, warm weather here in May, they are left in the

NARCISSUS NAMES.—I read the article in a recent issue by Rev. G. H. Engelheart, and am very glad he has taken up the question of the classificatiou of Daffodils. With his remarks I am entirely in agreement, and think that the simpler the classification the better. Professor Hillhouse at Birmingham suggested that a separate class (the flat-crowned sorts) should be called Engelhearti, in honour of the immense improvement that gentleman has made in this flower. Personally, I do not think it is necessary, for as long as the Narcissus is grown, so long will Engelheart's name be known. If this system is to be continued, it would only be fair to make Graaffii include all the white trumpets, and Wavereui all the giant trumpets. Now there are the green crown varieties which have been already raised at two separate places; they could claim insertion in a new class. Seedling Daffo-

raiser's name. I am sure all Daffodil growers are greatly indebted to such men as Barr, Burbidge, Horsfield, Backhouse and others; and that it is in no other spirit than that of simplifying the classification that the omission of "i" and the "ii," &c., is suggested. John Pope.

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—In the face of the melancholy fact that the voting-paper for the next annual election to the above Institution on the 21st inst. contains the names of fifty-three candidates, of which number only twelve can be elected, it is incumbent upon all who take an interest in so excellent a charity to open up as far as possible new channels by which increased means may flow into the treasury. There are about the country a large number of gardeners' societies, the members of which meet weekly or less often; and it seems

to me there is thus effered opportunities for the collection of small sums, say, one penny per week from each member. So far, I am not aware that these societies have rendered assistance in this direction as bodies, though individual members may have done so. In the course of the next few days I shall be addressing two such societies, and it is my intention to make an appeal for weekly contributions. Members of the Committee of the Institution and others who reside in or near London are occasionally invited as lecturers, and thus have an opportunity of setting forth not only the objects of the Institution, but also the means by which increased support might be obtained. I think, also, that if leaflets were prepared having on one side, in a condensed but clear form, some account of the objects of the Society and its work, and on the other side a subscription-form, with an intimation that small sums are acceptable, and such leaflets distributed at our large provincial flewer-shows, some increased support would be forthcoming. It would not, I think, be difficult to organise a small band of gardeners, having hearts touched by deep sympathy with the objects of the Institution, who would be willing to under-take such a work. What is required are labourers in the vineyard of charity. R. D.

RIPE MELONS IN DECEMBER.—I was recently in the gardens at Petworth Park, and was surprised to find a batch of winter Melons. Mr. Pull, the gardener, had cut the first fruits that morning (December 24) to send into the house. The variety grown is Petworth Park Green-flesh, and the fruits weigh on an average 2½ to 3 lb. each; they are evenly netted and of a grand flavour. Mr. Pull told me that he grows the variety early and late. F. J. Foster.

— I have had the variety Duchess of York produce ripe fruits in December and January; but the usual colour and flavour were absent. It is a white-fleshed Melon with golden-coloured exterior. I cannot understand how your correspondent, A. Read, could obtain colour or flavour as he would in May or June. Melons not only want heat, but sunshine [or electric light. Ed. . Before writing as "A. Read" did, he should send a fruit to the Editor, that its flavour might be tested. J. S. A. K.

REMARKABLE PLANTS OF CYPRIPEDIUM INSIGNE.—In reference to Mr. Webster's note on p. 4, I saw the same plants two years ago. They are certainly unusual examples of cultural skill, but they are of the old type. I doubt if anyone could get such fine plants of first-class varieties, or whether they would stand the amount of feeding that Mr. Crosswell gives his plants. Mr. Chapman, when lecturing to the Beckenham Horticultural Society, strongly condemned the feeding for Cypripediums. I should be glad to know the kind of potting compost Mr. Crosswell uses. G. Stratford, Totteridge, Hove.

WINTER-FLOWERING CARNATIONS.—Having read with interest the notes that have appeared in the Gardeners' Chronicle upon Tree-Carnations, may I ask Mr. Knellar, of Penrhyn, to kindly explain his method of obtaining such a large quantity of flowers of that useful Carnation Mrs. Leopold de Rothschild at such a dull season of the year? We cultivate a few hundred plants of that variety, but I am sorry to say they do not open their flowers satisfactorily during December and January. A. W. [See Mr. Cook's article on p. 18. Ed.]

MOTOR LAWN - MOWER. — In answer to "E. S. R.'s" enquiry on p. 15, I beg to state that the motor lawn-mower was worked by a gardener after having had two days' training under a motor engineer who came with it. He had worked a steam lawn-mower for about three years previously, but had not had anything to do with a motor. I think that any practical man would soon learn how to use it. O. L.

THE RAINFALL IN COUNTY KILKENNY DURING 1903.—We had '01 or more of rain on 232 days, the driest months of the year being April with 1'09 inch and November with 1'34 inch, the latter month, taking the season into account, being the nicest month of the year. In March we had rain on twenty-seven days, with a total

of 7.02 inches; and in October rain on twentyseven days, with a total of 5.03 inches. As I write (on January 4) we have had already this year nearly 1½ inch of rain:—

			Total depth.				Total depth.

J. G. Weston, gr. to Lord Duncannon, Bessborough, Co. Kitkenny.

A NATIONAL GARDENERS' ASSOCIATION.—
It was with great interest that I followed various proposals, especially those put forward by Mr. Divers, for a National Gardeners' Association, but by the information I obtained from your issue of December 19, regarding their meeting, I for one must say that I am off. To begin with, a lady-gardener puts forth the claims of her sex. Now the first question I would put to her would be, "Madam, do you consider yourself qualified to use a No. 4 spade?" I italicise the word "use" because we all well know that there are two ways of using a spade. If the champion of the fair sex can do what is asked of her, I say by all means give her the rights she is entitled to. Mr. McIndee says he found it difficult in the North to obtain young men, as the pay did not tempt them. Does he mean Scotland? If so the sooner he gives an explanation of the words "did not tempt them" the better. We Scotchmen need no tempting, and so far as the profession is concerned, we are not afraid of our honour. Norman says he would like to see young men compelled to spend time in learning farming, forestry, and general work. If we try to keep labourers out of our trade, what right have we to become Jacks-of-all-trades? Mr. Willard says a very wise thing when he asserts he would like to see gardeners doing all in their power to raise themselves. Mr. Fielder speaks the right-down honest truth when he says head gardeners are often too liberal with their recommendations. Any attempt at an examination other than in pure practical work is all very good in its way, but the man who can show good work with hands and brains is the gardener that I would encourage; and I think that others will agree with me. J. C. S., Dupplin, N.B.

The world seems never to be tired of running after novelties, and good gardeners are not exempt from craze-mongering. I, for one, should be deeply grieved to possess the knowledge that any association was established which would take away the sole prerogative of a wise and responsible head gardener, that is, his ability to judge of the fitness of any of his assistants, as to their character, practical knowledge, qualifications, and aptitude for the proper management of the neverceasing duties involved in new and higher appointments. Head gardeners and their assistants who do not see their way so clearly as they ought to do, should at least be a little more charitable in thought towards both employer and employed, the one in the up-keep of his establishment, and his humble and solitary gardener, who may besides his legitimate duties have to milk a cow or attend to a horse and trap; but so long as the lonely disciple of Adam performs his duties cheerfully and with that spirit of attention to duty which the humblest situation claims, that individual should not be denied the good wishes which are often bestowed on higher and sometimes less unworthy workers. Again, with regard to those fallen sons of the profession, from my own sad experience I may with all truth say that it has been generally through some inherent fault of their own that they are under the necessity of earning a precarious livelihood as "jobbing gardeners." Young gardeners would do well to remember that they are not mechanics, who, if they he but skilful workmen, can get employment without any character at all; the gardener is, as it were, direct from Eden [!],

and has a name and a character to uphold. If he fails to do that, then he cannot claim the distinctive title of being a true gardener. A. M.

distinctive title of being a true gardener. A. M. I notice in your issue of Dec. 19, 1903, the references to the proposed Gardeners' Association. For many years this subject has occupied my attention, and in connection with the comprehensive scheme of a "Home for Horticulture" which I formulated and published plans of some years ago, the needs of the under-gardener were duly considered. The [present] project does not appear to include under-gardeners, but, if I understand it properly, principally aims at more intimate intercourse between head-gardeners and employers; it is also too local. My conception is that of a great organisation with its contral control department at some convenient spot in the Metropolis, say the new hall in Vincent Square, and provincial offices in various parts of the country, and in Scotland and Ireland, which would be in close touch with it. The branch provincial offices being widely spread, country gardeners will in all parts easily communicate with them, and thus, united by their common interests, a bond of brotherhood will be established. To some this proposal may appear Utopian and incapable of accomplishment, but with united action, under the direction of a gentleman of position, influence, and business ability, who-might be induced to control the acting executive, difficulties would soon vanish and an amalgamation of horticulturists be founded. Suppose now the Royal Horticultural Society or other great representative body should resolve upon the accomplishment of this scheme, probably the first step would be the election of a general secretary, competent to deal with every question involved. Having secured such an official, the general council would probably mark out the country in districts or circuits, in each of which a thoroughly representative gardener would be appointed to act in the interests of the association and its members. This local secretary or agent woulds acquaint gardeners and others in the neighbourhood with the general intentions of the society,. and the special advantages it would provide. It may be thought that a long time must pass before this scheme could take form, but the more difficult the task, the stronger the start which should at once be made to evercome it in order to better the prospects and widen the opportunities of the gardening fraternity generally. No doubt the committee who propose to move in this direction are using every effort in their powerthis direction are using every enorth their power to further the undertaking, but their hands require strengthening, which would be effected by the co-operation of a representative body of thoroughly practical business men. More helpers are needed and capital for initiatory outlays absolutely necessary. How are these to be provided? The former will probably follow a systematic and the properties of the factor in the horizontal trunk. matic publication of the facts in the horticulturals papers, and I think the latter may be found if periodical sales of work, Rose fetes, concerts, and other pleasant and fashionable reunions be organized not only in towns in England and Wales, but also in Scotland and Ireland. Very much has been accomplished in this way by ladies in aid of Very much has charities of various kinds. It is not for charity that this movement has originated, but with the object of improving the social conditions of gardeners. and others and of helping them in times of need, and also for the betterment of those whose circumstances appeal to their sympathies, and why not the establishment of old-age pensions also? I have known instances of the most gratifying character, and well remember a highly successful Rose fête at the Mansion House during Sir David Rose fete at the Mansion House during Sir David Evans' year of office. The fête was a brilliantaffair, opened by the late Duchess of Teck, and attended by a a bevy of titled ladies, several of whom had stalls. Under the patronage of the nobility and gentry, such enjoyable reunionsmight frequently be held with great advantage. Ladies who are enthusiastic in their admiration of the heautiful will remarker the under gentless that the partial will remark the under gentless that the partial will remark the partial will be the partial w the beautiful, will remember the under-gar-deners whose labour does so much to produce it. Respecting the organization of the Association, supposing all the members of the Royal Horti-cultural and other kindred Societies were appealed to on behalf of this undertaking, and asked to allow their names to be enrolled as patrons, a nominal subscription of 5s. per annum might be mentioned; and in connection with the

sales of work already referred to, there might be one at which the 5s. would be returnable, if desired, as part payment for goods purchased, and a membership might be established at an annual payment of 2s. 6d. Again, it might be possible to have a picture gallery on the official premises where new works could be exhibited and offered for sale from time to time, and also, if a suitable structure were available, perhaps an auxiliary gallery to the Royal Academy might where pictures refused be instituted, Academy might be hung. As is well known, many very good paintings are rejected by these recognised official combinations. In this saloon, thus temporarily stocked with Roses and other flowers, the upper parts of the walls might be adorned with good pictures, and with the aid of professional music would blend with the other beauties displayed, and prove a delightful tout ensemble. The trades, particularly those interested in horticultural produce and distribution, might be solicited to allow donation boxes to be on their counters or other convenient places. I hope the correspondence and interchange of ideas now appearing in your columns will lead to this desirable consummation—the establishment of a National Gardeners' Association on a good financial basis. The few thoughts embodied herein are merely offered as suggestions. James L. Wood, F.R.H.S., Wood Green.

[We have received so many letters upon this subject that, in future, it will only be possible to insert such as are very brief and to the point, and which suggest some matter not discussed hitherto. Ed.]

NOTICES OF BOOKS.

LA THÉORIE DES CAPACITÉS FONCTIONNELLES
ET SES CONSÉQUENCES EN AGRICULTURE.
(The Theory of Functional Capacity and its
Results in Agriculture.) Studies in Applied
Vegetable Anatomy and Physiology. By
Lucien Daniel, Professor of Applied Botany
at the University of Rennes.*

THIS is one of those excellent treatises of the author containing the results of his experiences in applying an adequate knowledge of botanical anatomy and physiology to the common everyday practical work of horticulture. All gardening practices, however simple, e.g., the growing of Mustard-and-Cress or Cabbages, require, in order to be successful, a certain amount of scientific knowledge, although this latter is often unconsciously inherited or otherwise transmitted. The florist or kitchen gardener may boast his independence of, and sheer contempt for, this scientific knowledge; while all the time he is (consciously or unconsciously) possessing and using it. Few indeed are the intelligent men, especially in this country, who are able to keep a fully conscious eye and mind directed to both the scientific and practical aspects of horticulture. How much more might be accomplished than is accomplished if a wider and a deeper scientific knowledge could be mingled with our hackneyed and rule-of-thumb operations in the garden!

The general nutrition of a plant depends on the due proportion between root-action and leafaction in the living plant, in other words on the proper distribution of the sap between the roots and the foliar organs, the two chief factors herein concerned being (1) the total absorption from the external surrounding, or what our author terms the "functional capacity of absorption," denoted by the formula ca; and (2) the total consumption at the points where the sap is used up, or the "functional capacity of consumption," cv.

When the plant is in complete equilibrium as regards its general nutrition, the relation $\frac{cv}{ca} = 1$ is obtained, i.e., the condition in which consumption and absorption are equal. But under the influence of natural or artificial variations in the external circumstances, or in the respective dimensions of the acrial or subterranean apparatus of the plant, this equilibrium may become upset.

The absence of equilibrium in the nutrition, $\frac{c}{ca} > 1$, or the condition in which the acrial consumption is greater than the (usually) subterranean absorption, will correspond to growth in a dry or poor soil; the absence of equilibrium, $\frac{c}{ca} < 1$, or the condition in which the absorption is greater than the consumption, will correspond to growth in a moist or rich soil.

In the first case, seeing that the leaves and young shoots are the chief organs concerned in the consumption of the sap, and the roots are those occupied in its absorption, it is evident that the activity of the former overrides that of the latter-i.e., that the leaves consume more than the roots absorb. So that, in order to restore the balance transpiration must be reduced by diminishing the leaf-surface of the plant, and absorption enhanced by increasing the production of roots; and this latter will probably result in some measure from the former. In the second of our two cases the reverse process must take place. If the limits of desiccation or inanition on the one hand, and of watery repletion or indigestion on the other, be passed, the plant must die. It is invariably found that slightly accentuated changes in the media in which the plants grow induce a partial diminution in their normal resistance to parasites. A drier medium is favourable to the action of animal parasites; a moister medium contributes to the more rapid development of vegetable parasites, especially those of a cryptogamic nature.

The absolute value of the "functional capacity" of a given plant—i.e., the capacity of its leaves, &c., to assimilate, or of its roots to absorb, is shown especially in trees under cultivation, in the relative thickness of the wood formed at the moment under consideration, in the relative diameter of the vessels, and the thickness of the cell-membranes.

The boughs, branches, and buds, e.g., of a Peartree, possess functional capacities depending on the rapidity of arrival of the sap and the number of vessels engaged in conveying this latter, these two factors themselves bearing a definite relation (1) to the successive angles which the organ (branch or bud) makes with the vertical; (2) to the facilities afforded for the performance of its vegetative functions.

Hence arises a distinction between the form and structure of woody and of fruiting branches, as also the possibility of creating transitions between the two by inducing a rational variation in their functional capacities. The fruiting branch, with its smaller draught of sap, is distinguished from the woody branch by a diminution in its woody conducting tissues, and by an increase in its cellular or spongy tissues and starch-productoin. For example, if a transverse section be taken below the level of insertion of, say, three branches or twigs whose functional capacities are of a very different nature (e.g., vigorous and vegetative, or weak and fruit-bearing), the hard woody tissue will often be found to be divided up into islands, the respective dimensions of which are proportional to the functional capacity of the organs (twigs) to which they correspond and below which they occur.

This is proof of the correctness of the theory of functional capacity, which can also be experimentally verified by means of various horticultural practices based either on an increase or diminution in the absolute value of the normal points at which a draught on sap is effected (as in forcing, and the various methods of training branches, &c.), or on variations in their number (different kinds of rationally performed mutilations, &c.).

When an inequality in the work of the members (leaves, &c.), going on at the surface of an organ is artificially provoked (as in one-sided illumination, local wounding of the cortex, unilateral

suppression of the roots, buds and leaves, &c), or if the work of a lateral is transformed into that of a terminal member (as in various methods of pruning and grafting, &c.), the phenomenon of "dorsiventrality" appears, which is faithfully registered in the formation of the secondary wood of the plant or organ concerned.

Another phenomenon to be noticed is the following: If a sudden decrease or increase in the functional capacity of an organ be brought about by cutting or breaking the latter during the period of active growth, this will be registered in the annual zone of secondary wood by the formation of as many zones of harder or softer wood as there have been successive fractures or loppings.

(To be continued.)

MISSOURI BOTANICAL GARDEN.

The fourteenth annual Report (1902) has been recently published, and furnishes an encouraging record of progress. The present volume contains a monograph of the Honeysuckles (Lonicera), by Mr. Rehder, elsewhere alluded to, and a supplementary catalogue of the Sturtevant pre-Linnean Library. The term "pre-Linnean" is extended to include Miss Amherst's History of Gardening in England, probably on account of the bibliographical details it contains. The Report was, of course, issued before the fire which recently caused so much destruction to the houses.

"THE HEATHER IN LOVE, LYRIC, AND LAY."

When at the first glance of this book we saw that it emanated from the land of the almighty dollar, we were somewhat surprised, so different is it, in the style in which it is written, from what we are accustomed to in American books, whilst the sentiment is equally strange as coming from so severely practical a people. A little further examination showed that, though written, printed, and published in America, the book is to all intents and purposes Scotch. The editor of the Florist's Exchange, who is the author of this book, may be, for aught we know, a naturalised American, but for all that he is a perfervid Scot. To him may fitly be applied Horace's statement: "Calum non animum mutant qui trans mare currunt." He may in crossing the Atlantic have changed his environment, but his heart is in the Highlands still. He speaks of himself as an expatriated Scotsman and as a happy exile; and that is so in part no doubt, but nobody but a Scot could have written this book. Of course, Scotland has no monopoly of the Heather; there is happily plenty of it on our Surrey commons, close to London, and scarcely an English, Welsh, or Irish county is without it. In America, however, it is very rare. It occurs in Newfoundland, and we well remember the sensation produced when the plant was discovered in Massachusetts. "What next!" writes Asa Gray to Engelmann. "A young gardener has found a locality for Calluna vulgaris, covering almost an acre, within twenty - five miles of Boston; a case to add to Scolopendrium, Marsilia, &c., but most of all striking and unexpected. It grows in low ground and has every appearance of being indigenous." Mr. Wallace's enthusiasm has led him to examine every corner, as it were, of literature in search of information relating to the Heather. He has dug down to the roots of the plant itself to ascertain whether the statement is true that the roots are associated with a fungus without whose co-operation (symbiosis) it will not thrive. But the statement is not confirmed, and remains open for enquiry. He has examined the thatch of the Scottish cottages, he describes the beds of Heather and the couches whereon the sportsmen rest; besoms and scrubbing brushes, dyes, medicines, forage, beverages, peat, and we know not what beside are included in the inventory of things useful furnished by

^{*} Imprimerie Fr. Simon, successeur de A. Le Roy, Rennes, France, 1902 Price 20 francs.

the Heather. As to Heather-lore and Heatherlays the author waxes enthusiastic; and well he may, for many of the lays will be new to our

readers and are most touching.

The book is a delightful one to those born north of the Tweed, but no Southron into whose hands it may fall will allow them to have a monopoly of it. It is well illustrated, and is published by the De la Mare Publishing Company, of New York.

HOOKER'S "ICONES PLANTARUM."

The last part of this publication, dated November 1903, has lately reached us. It is chiefly of botanical interest, but contains several articles of economic importance, such, for instance, as the illustration and description of Landolphia Kirkii, tah. 2755; an Apocynad yielding india-rubher, of which Sir William Thiselton-Dyer thus speaks: "The development of the important india-rubber trade of East Africa was entirely due to the energy and sagacity of Sir John Kirk. As early as 1868 he sent specimens of the present species and rubber made from it to Kew. This is collected in a way which is perhaps unique in any rubher-ylelding plant. Some of the milk from a wound is allowed to coagulate. The pellet so obtained is applied to a fresh cut, and being turned with a rotary motion, the exuding milk is drawn off like silk from a cocoon. . . Sir John Kirk long endeavoured to induce the natives to collect the rubber. Everyone was engaged in the slave trade, and the experiment in consequence failed. But it eventually created a new trade for all those classes whose means of subsistence came to an eud with its suppression."

Landolphia Petersiana, tab. 2756, also furnishes a rubber of inferior quality, which does not coagulate spontaneously but by the agency of heat. Carolinella cordifolia, tab. 2775, is a pretty new Primulad from the mountains of Yunnan. Bambusa Oldhami, a Formosan species, is in cultivation in S. California. Two or three Bignoniads, such as Xylophragma pratense, and Paragonia pyramidata Sprague are worthy of cultivation.

SOCIETIES.

ROYAL HORTICULTURAL.

JANUARY 5 .- The first meeting of the Committees in 1904 took place on Tuesday last in the Drill Hall, Buckingham Gate, Westmioster. There was a moderate display of exhibits that filled the body of the Hall, but the sides of the building were not furnished as they are generally, though on one side there were stands were shown samples of "Junofloris," a liquid for adding to water with a view to prescrying cut flowers; "Beetlecute," a powder for destroying beetles; and "Floral aids," which are stands for arranging flowers.

There were few noveltles before the Committees, but the FLORAL COMMITTEE recommended an Award of Merit for Moschosma riparium, which has been shown on some previous occasions.

The Orchin Committee recommended four Botanical Certificates.

An excellent collection of Apples was shown by Messrs. GEO. BUNYARD & Co., of Maidstone. There appeared to be fewer visitors to the Hall than usual.

In the alternoon there were fifty-two candidates elected to the Society's Fellowship, which is certainly a good commencement for the new year. The exchange of New Year's wishes was the principal topic of conversation.

Floral Committee.

Present: W Marshall, Esq., Chairman; and Messrs. C. T. Druery, H. B. May, R. Dean, Jno. Green, A. Perry, G. Reuthe, C. J. Salter, R. W. Wallace, R. C. Notcutt, H J. Jones, C. E. Shea, W. P. Thomson, E. H. Jenkins, W. J. James, C. Blick, George Paul, W. Howe, Charles Dixon, Geo. Gordon, Jas. Walker, and H. J. Cutbush.

Messre. Jas. Veitch & Sons, Royal Exotic Nurseries, King's Road, Chelsea, exhibited several good flowering species in excellent condition. First may be menthoused Moschosma riparium (fig. 13), which received an Award of Merit, the plants being dwarf, and bearing

abundant panicles of white flowers; Coleus thyrsoideus (fig. in Gard Chron., Jan. 19, 1901), Jacobinia (Justicia) coccinea, an effective red-flowered variety; Peristrophe speciosa, and Jacobinia chrysostephana (fig. in Gard, Chron, July 13, 1872), a valuable winter-flowering plant with orange coloured flowers. It blooms best in a temperature of 55° to 60° (Silver Banksian Medal).

Mr. JNO. RUSSELL, Richmond Nurseries, Surrey, exhibited a very large group of evergreen plants in pots, suitable for planting in beds for the winter, or for furnishing window-boxes, &c. There were many choice and variegated varieties of Ivy, Euonymus, Eleagnus pictus aureus, Ligustrums, Eurya latifolia, Garrya elliptica, &c. Such plants as Aucuba japonica, Skimmias, &c., were abundantly covered with berries, and all the plants were perfect little specimens (Silver Flora Medal).

Messrs. W. Cutbush & Sons, Highgate, London, had pretty though small exhibit of alpine and other hardy plants. In the centre was a group of stronglyflowered plants of Tussilago fragrans, the perfume being very noticeable; double-flowered Primroses, Sternbergia Fischeriana, Iris histrio and I. histrioides, Daphne Blagayana, D. Mezereum alba, Sarracenias, &c, backed by a few shrubs, including Skimmia japonica. Messrs. Curbush had also a very pretty exhibit of flowers of winter-flowering Carnations, including the varieties Mrs. S. J. Brooks (white), Sir Hector McDonald (white ground flaked with pink), W. H. Cutbush (crimson), Lady Smith (salmon-pink), &c. (Silver Banksian Medal).

Messrs. H. CANNELL & Sons, Swanley, Kent, exhibited a group of plants in which the following useful flowering greenhouse plants were used to good effect, Coleus thyrsoideus, Moschosma riparium, and small well-flowered plants of Begonia Gloire de Lorraine, which were placed along the front of the group. Three plants of a rich starlet-flowered Canna, named Jean Tissot, brightened the centre. Messrs. Cannell showed also flowers of their strain of Primula sinensis, of which the following varieties were some of the best-Swanley Giant (rosy-red) White Swan, Swanley Purple, 11. Cannell (crimson), Duchess of Fife (pale mauve), Cannell's White, Avalanche (white), &c. (Silver Banksian Medal).

Messrs THOS. WARE, LTD., Feltham, exhibited a group of alpine plants, comprising many of the most useful of this interesting class of plants. The Succulent section, Crassulas, Sedums, Sempervivums, also the genus Tnymus were presented in numerous species. Rock-roses, which later will furnish a pleasing effect with their pretty flowers; the tiny Draba, and other alpine Crucilers. Phloxes, Pinks, Primulas, St. John Worts, and hardy Cyclamen were all represented. The interesting little Polygala chamæbuxus was in flower. Mecanopsis nepalensis was very striking with its silky adpressed leaves. Saxifrages were numerous. many of them giving signs of pushing forth their flowering spikes. That interesting little plant Primula Forbesi (see fig. 10, p. 20) was shown in flower on its long slender peduncles. This would be pleasing to find anywhere at this season of the year. Its beautiful mauvecoloured petals must brighten the rockeries and alpine gardens wherever it has been planted (Silver Flora

Messrs, Hugh Low & Co., Bush Hill Park Nurseries, London, N., exhibited a group of Cyclamens in flower, the plants bearing good flowers of the florist type, and others of the "Papilio" section.

Oce-half of one of one of the long tables was furnished with a collection of cut Chrysanthemum flowers shown by Lady Plowden, Aston Rowant House, Tetworth, Oxon. This exhibit was a good representation of most of the the late-flowering varieties, including Mrs. H. Weeks (white), King of Plumes (yellow), Glorious (red and bronze colour), Harold Wells (lemon colour), Mrs. Bantry (large single white), François Pilan (rich yellow), W. H. Lincoln (yellow), L. Canning (white), &c. an unusually large display to come from a private garden after the commencement of the year (Silver Flora Medal).

Mr. J. G. Lowe, Shrewley Nursery, Warwick, exhibited plants of a rosy-red-flowered Japanese or decorative Chrysanthemum, the flowers about 4 inches across. similar in form to those of Framfield Pink and rather deeper in colour.

Chrysanthemum Harry Whateley was shown by Mr. WHATELEY, of Keoilworth, who had numerous flowers. This variety is a sport from niveum, and was given an Award of Merit on January 13, 1903. The flowers are white like the type, but the florets are much forked and this gives an appearance of fimbriation to the flowers.

Mr. DUNCAN, of Mint's Feet Nurseries, Kendal, exhibited another late-flowering Chrysanthemum named Mrs. A. Duncan, colour greenish-white; and Messrs. H. CANNELL & Sons, Swanley, showed the White Bonaffon, which has flowers of a good substance, and in whiteness almost or quite as pure as Elaine.

Mr. F. W. MOORE, of the Botanic Gardens at Glasnevin, Ireland, exhibited a spike of flowers of Lachenalia tricolor superba, a very fine form with large, boldly-coloured flowers.

Bryophyllum crenatum was shown by Messrs. H. CANNELL & Sons. This Crassulaceous plant was about t feet high, with leaves about an inch across, and terminal cymes of brownish-red flowers, less conspicuous than those of B. calycinum. These stove-flowering plants are interesting because young plants develop from the notches in the leaves, some of which could be seen on the specimens shown.

AWARD OF MERIT.

Moschosma riparium (see fig. 13, p. 31).-A labiate shrub from South Africa, having hairy stems, stalked, ovate cordate, crenate leaves, and very numerous small cream or white-coloured flowers in erect panicles. Specimens in pots, exhibited by Messrs. Jas. Veitch & Sons, and Messrs. H. Cannell & Sons, proved that the plant is exceedingly useful for decorating the greenhouse ln the dullest winter months. It must not be grown in too high a temperature, or the plants become leggy, but if cultivated so as to develop sturdy, dwarf plants, it is evidently a first-rate garden plant.

Orchid Committee.

Present: Harry J. Veitch, Esq (in the chair), and Messrs. Jas. O'Brien (Hen. Scc.), De B. Crawshay, R. B. White, H. Ballantine, W. Cobb, H. T. Pitt, A. A. McBean, F. W. Ashton, J. W. Odell, E. Hill, W. Boxall, W. H. Young, W. H. White, J. W. Potter, H. Little, J. G. Fowler, J. Douglas, W. A. Bilney, H. A. Tracy, and F. Wellesley.

There was a much smaller show of Orchids than at the last two meetiogs, but Cypripediums still predominated.

Messrs. Jas. Veitch & Sons, Chelsea, were awarded a Silver Flora Medal for a group, principally of hybrids, the newest of which was Sophro-Cattleya × Saxa (S. grandiflora × C. Trianæ), a pretty dwarf variety with pink flowers and rose front to the labellum. The group also included some fine forms of Cypripedium × Euryades, C. × Prospero, C. × Niobe, and C. × Baron Schroder. Also Læ'lo-cattleya × Clonia, L.-C. × Epicasta, L.-C. × Coronis, L.-C. × Cappii, L.-C. × Bryan, L.-C. × Pallas, Lelia × Icarius, L. × Mrs. Gratrix, Catlleya × Miranda, Masdevallia × Imogen, and Epidendrum × Endresio-Wallisii.

Messrs. Sander & Sons, St. Albans, were voted a Silver Flora Medal for a very good group, in the centre of which were three plants of Cypripedium insigne McNabianum, a very fine dark variety of excellent shape. With them were the new C. x Masterso-villosum, a large flower, yellowish tinged with purple; C. \times robustum, forms of C × Euryades, C. × Annie Measures, C. x aureum, Maxillaria elegantula, Cymbidium Tracyanum, a finely flowered Aogreecum sesqui pedale, and a fine specimen of Gomeza planifolia.

Messrs. Charlesworth & Co., Heaton, Bradford, secured a Silver Flora Medal for a group containing the showy Cypripedium imes Dora Crawshaw (bellatulum x Charles worthii mosaicum), much like C. bellatulum in form but white beautifully tinted with rose: C. x Enid (Spicerianum x bellatulum), C. x Hera Lucienianum, C. xaureum, C. insigne Dorothy, Odontoglossum crispum, O. x Hallio-crispum, O. x loochristiense, Lælio-Cattleya × Violetta, several of the showy L.-C. x Charlesworthii, and the pretty Lælio-Cattleya x Andromeda (L. flava x C. aurea), light yellow with a reddish-rose-tinted lip.

C. J. LUCAS, Esq. Warnham Court, Horsham (gr., Mr. Duncan), showed a good collection of cut spikes of Calanthe × Veitchii, C. × Sandhurstiana, C. × Regina, C. × Bryan, C. × Wm. Murray; and various Cypripediums arranged with Maidenhair Fern (Silver Banksian Medal).

FRANCIS WELLESLEY, Esq., Westfield, Woking (gr., Mr. Hopkins), showed the finely-coloured Cypripedium × rubescens Raujitsinhji, which had previously secured an Award of Merit; C. × Ilera Charlesworthii, and C. x Celeus superbum, both good; and Lælia autumnalis Westfield variety, a very large dark rose flower with white base to the llp.

II. T. Pitt, Esq, Rosslyn, Stamford Hill (gr., Mr. Thurgood), showed Cypripedium insigne Monkholme variety, like C. i. Sanderæ, but with some small blackish dots on the dorsal sepal; C. i. Rosslyn variety; a light-coloured flower of the C. i. Bohnhoftianum class, and $C. \times gigas$ Rosslyn variety.

H. Whateley, Esq., Kenilworth, showed Cypripedium \times Varney, and C. \times Amy Robsart, the last a very prettily-marked flower.

Messrs. Stanley, Ashton & Co., Southgate, showed Miltonia × Cogniauxiæ Stanleyl, a natural hybrid between M. Regnelii and M. spectabilis Moreliana, with flowers nearest to the former in shape, but of the purple colour of Moreliana.

Mrs. Harwood, Woodhatch, Reigate (gr., Mr. C. J. Salter), showed Cypripedium × Mrs. Haywood (× T. B. Haywood × Charlesworthii), a very dark-coloured and distinct bybrid, showing strong indications of C. Drurii, which was one of the parents of C. x T. B. Haywood; slso C. x Hitchinsie maculata.

Messrs. Hugh Low & Co., Enfield, showed fine plants of Cypripedium x Minos, Low's variety: also

C. insigne Sanderianum and C. callosum Sanderae.

Awards.

BOTANICAL CERTIFICATES.

Maxillaria macrura, irom F. W. Moore, Esq., Royal Botanic Gardens, Glasnevin, Dublin. $-\Lambda$ rare species allied to M. longissima, with purple tinted flowers having long, narrow segments, the upper one arching forward, and yellowish lip veined with red-brown. Syn. M. longlsepala, Lindenia, vi., p. 19; and Gardeners' Chronicle, July 26, 1890, p. 94.

Maxillaria cucullata, Irom F. W. Moore, Esq., Glasnevin .- Flowers an inch across, brownish with chocolate-coloured lip.

Bulbophyllum micropetalum, from F. W. MOORE, Esq., Glasnevin.-Flowers in slender racemes, the sepals (which are the showlest part of the flower) green with purple stripes.

Epidendrum Cooperianum, from F. W. Moore, Esq., Glasnevin .- Flowers in dense racemes, the prominent large, bright rose-coloured labellums rendering it very attractive. An old Brazilian species of great merit, and one of the finest of its class.

Fruit and Vegetable Committee.

Present: George Bunyard, E.q., in the Chair; and Messrs. H. Eslings, W. Bates, S. Mortimer, A. Dean, Ed. Beckett, H. J. Wright, H. Markham, Geo. Kelf O. Thomas, G. Reynolds, F. Q. Lane, J. Willard, G. T. Miles, George Norman, A. H. Pearson and J. Jaques.

Upwards of three dozen ripe fruits of Tomato Winter Beauty were shown by Sir W. D. PEARSON, Bart., Paddockhurst, Worth, Sussex (gr., Mr. A. B. Wadds).
Mr. J. Willard, Holly Lodge Gardens, Highgate,

exhibited good fruits of the two excellent varieties of Pear Easter Beurré and Bergamotte Esperen.

Mr. GEO. SCHNEIDER, 17, Ifield Road, Fulham Road, London, S.W., exhibited fruits of Pomme de Flandres and Pomme de Flandres blanche, two varieties of

culinary Apples not common in this country.

Messrs. George Bunyard & Co., Royal Nurseries, Maidstone, made an exhibit of 100 dishes of Apples, that were quite wonderful, seeing the excessively bad fruit season through which we have passed. Many varicties were so fresh in appearance they might have been gathered but recently. The following varieties wese amongst those that were most prominently good: -Allington Pippin, Lane's Prince Albert, Emperor Alexander, Baumann's Winter Reinette, Gascoyne's Scarlet Seedling, Bismarck, Sandringham, Hormead's Pearmain, May Queen, Golden Spire, Stirling Castle. Peasgood's Nonsuch, the highly-coloured Calville Rouge Précoce, and others. There were several varieties of Pears, as Easter Beurré, Josephine de Malines, Beurré Rance, &c. (Silver gilt Knightian Medal).

Some very well-coloured bunches of Black Alicante Grape were shown by W. Shuter, Esq., 22, Belsize Grove, Hampstead (gr., Mr. T. Armstrong). They were prettily surrounded by growths of Myrsiphyllum asparagoides, and backed by decorative plants. was a creditable exhibit, especially remembering that the garden is situate within three miles from Charing Cross (Silver Banksian Medal).

ROYAL HORTICULTURAL SOCIETY OF IRELAND.

THE annual meeting was held recently in the Central Lecture Hall, Westmoreland Street, Dublin. report of the past year showed a total deficit of £294 138. To remedy this the Council proposed that two shows only be definitely arranged for 1904, namely, the spring show and the autumn show; that the spring show he

FIG. 13.-MOSCHOSMA RIPARIUM: FLOWERS WHITE OR PALE. Obtained an Award of Merit on Tuesday last. (See p. 30.)

extended to two days, and a floral sale be incorporated with it; that promenade concerts be held on both nights of the show, and that an outside Committee be formed to secure assistance. Mr. Ramsay, in seconding the report, said that the Dublin public and not the Council were responsible for the unfavourable condition of affairs shown in the report.

GARDENERS' DEBATING SOCIETIES.

BECKENHAM HORTICULTURAL. — On Friday, January 1, Mr. John Gregory, by the aid of some beautiful lantern-slides illustrating the subject, "Wall and Water Gardens," provided an interesting and instructive evening. Illustrations of ancient ruins, towers, broken arches, &c., before planting, and at various short periods after, showed how quickly they could be transformed. Water gardening in all phases, from growing the smaller Water-Lilies, &c., in a half paraffin cask to the beauty of reflection with light and shade in a large lake, provided some lovely effects.

BRISTOL GARDENERS' MUTUAL IMPROVEMENT.—DECEMBER 30.—This Society held its usual meeting on the above date, when Mr. Clarke, representing the Bath Association, gave a lecture on "Rock Plants." He carefully explained how to form a rock-garden, dealing with the proper soils, aspects, &c.; plants most suited for planting in crevices, niches, ravines, &c. Several members of the Bath brethren accompanied Mr. Clarke, and they received a warm welcome from their Briatol friends.

HULL HORTICULTURAL .- At a meeting on December 29, Mr. Gaut, from the Agricultural College, Leeds, delivered a lecture on the subject of potting plants, soils, and watering. In his opening remarks, Mr. Gaut said he did not come to teach the members how to pot a plant, but simply to introduce to their notice some of the general principles underlying the practice. The lecturer dwelt at some length on the three principal parts of a potting-soil, viz., peat, loam. and leaf-soil. Peat was, he explained, deficient in potash, but used in a compost, acted largely in the acration of the mass. The loam was valuable principally for its fibre, and in order to possess a large amount of this it should be cut from an old pasture in the autumn and stacked, so that much of the vegetable growth might be stifled before it was required for use in the spring. The fibre being the essential part of the loam, it should not be allowed to remain stacked sufficiently long to destroy this. Leaf-soil was largely used in potting-soils, not only on account of its nitrogenous value, but also on account of its capacity for retaining moleture. The lecturer, proceeding, strongly emphasised the acration of the soil as a sine qua non in plant culture, and this, he explained, could only be effected by good drainage in combination with an intelligently mixed compost. On the subject of watering, the advice was to study the structure of the plant, and to act in accordance with a knowledge of the plant in its native habitat. W. R.

Obituary.

GEORGE PRIOR.—Mr. Harry Turner informs me of the death of this aged gardener, who he thinks must have been one of the oldest in the profession—not far short of ninety-five or ninety-six years of age—and who died on the 29th ult. He had been a gardener all his life, though never occupying a position of any note, but during his career he must have had very varied experiences. He died at Norwood after being laid up for two years; but up to that time he had been in possession of his faculties in spite of growing infirmities. R. D.

W. HORNE.—We regret to hear of the death, on Saturday last, of Mr. W. Horne, senior, of the firm of W. Horne & Sons, Nurserymen and Fruit Tree cultivators, at Perry Hill, Cliffe, near Rochester. Deceased was 54 years of age.

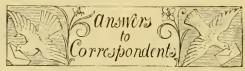

J. C. Fidler.—Mr. J. C. Fidler, head of the firm of Messrs. Fidler & Sons, Seed and Potato Merchants, Friar Street, Reading, died, on the 26th ult., from pneumonia.

THE LATE JAMES SMITH, OF HOPETOUN.—So recently as December 5 we published a short account of the retirement of Mr. James Smith, of Hopetoun House Gardens, Linlithgowshire. It is now our sorrowful duty to record his death, which took place at Hillview, Maryfield Place, Bonnyrigg, N.B., on December 27. After what was said of Mr. Smith in the issue referred to, it is unnecessary to recapitulate the story of his career, or to say anything about the respect and esteem in which he was held. Many will grieve to know of his death, and many will sympathise with Mrs. Smith in the bercavement she has sustained. His remains were interred in Abercorn Churchyard on December 30.

JOHN FINDLEY.—Mr. John Findley, gardener to Mrs. Heywood-Jones, Badsworth Hall, Yorks, when returning from Pontefract on December 29 last, lost his life through an accident. The coachman, from an unknown cause, suddenly lost control of the pony, which came into collision with a vehicle it was passing, throwing both riders out; one escaped, but Mr. Findley almost instantaneously died. Mr. Findley was well known throughout the North of England as a thoroughly good gardener, a successful exhibitor, and he was oftentimes called upon to adjudicate at exhibitions. We can ill spare such a faithful and valued friend. T. R. C.

ENQUIRY.

Narcissus nutans.—Can anyone say what this plant is? At an exhibition in 1837 it was awarded a special prize. J. P.

** EDITOR AND PUBLISHER.—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all communications relating to financial matters and to advertisements should be addressed to the Publisher; and that all communications intended for publication, or referring to the literary department, and all plants to be named, should be directed to the Editor. The two departments, publishing and editorial, are quite distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Asparagus Beds: A. N. We should not be inclined to put leaves on the beds to a depth of 2 feet, and then a covering of manure over this, from an idea that such treatment would hasten the crop by three weeks. Instead of this, we would advise you to afford the beds a heavy dressing with good manure; and, if you want early Asparagus, lift some of the roots and plant them in frames.

BEGONIAS: E. J. There is no means of satisfying yourself with certainty. The deeper the colour of the flesh of the tubers the less likely will they be to produce white flowers, but the variety of shades cannot be determined, and the rule itself is by no means absolute. Cultivators find that it is necessary to label the colours whilst the plants are in flower, and you must wait until you can do this in your own instance.

BOOKS: M. & S. The Botanical Magazine is published by Lovell, Reeve & Co., Henrietta Street, Covent Garden. The monthly parts are 3s. 6d. each, or 42s. for annual subscription.—
J. C. H. The book you mention is in French Paul's Rose Garden, 10th edition (Simpkin, Marshall & Co.), is more suitable for you.

Callas: E. J. P. We observe the disfigurement you mention, but there is no evidence to lead

us to determine the cause. If it develops further, or there are more marked examples, be good enough to send us specimens.

CARNATION: N. D. P. The plant sent is in a bad condition from eelworms and fungous disease. It will be better to burn such and obtain a fresh stock.

Double-flowered Calla: T. P. Many thanks; but we have seen very many specimens just as double as that you send.

FREESIAS: Round Oak. The comparative failure is doubtless due to the dull season in 1903, when the bulbs were unable to perfectly mature; but Freesias take a rest in some seasons, even in their native habitat. We expect those under cultivation to flower every year, and they will not always do this.

Head Gardener's Expenses for Removal:

A. B. Unless there was an agreement made at the time of your engagement we do not think your employer is bound to pay your expenses in returning from Ireland to England, although he engaged you from England, and you are leaving your master's service at his instance. It is, however, a matter in which your employer should be willing to assist you from motives of common fairness, if, as we suppose, you have endeavoured to do your duty loyally and well whilst in his employ.

Names of Plants: Correspondents not answered in this issue are requested to be so good as to consult the following number.—Ignoramus. 1, Nephrodium (Aspidium) molle; 2, Adiantum capillus-Veneris; 3, Ruellia Portellæ; 4, probably Begonia fuchsioides; 5, Dictyogramma japonica variegata; 6, Polypodium aureum.—L. E. Veltheimia viridifolia (see below).—V. I. 1, Lachenalia aurea; 2, Lachenalia tricolor; 3, Ornithogalum lacteum.—A. R. A. 1, Gomeza planifolia; 2, Lycaste Deppei.—W.S. C. P. Not a Crinuu, but Hippeastrum aulicum, more often called Amaryllis aulica in gardens.—J. H. The flower seems to be an imperfectly developed Lælia purpurata. The imperfection is caused by its flowering out of season.—F. A., Epsom. Ruseus racemosus (Alexandrian Laurel).

Palm: N. D. P. This is a case of "found dead."
We are quite unable to say from such a specimen what the cause may have been, whether drought at the roots, drip, or the use of strong insecticides, or cold.

Pelargonium: Zonal. If you require but one truss of flowers you should keep the plant to one stem only, and afford good cultivation, pinching out the flower-stems as they appear until some time in June, timing as well as you can do so the one you leave to develop, so that it will reach perfection at the necessary date. In the other case it is very different, and by stopping the shoots frequently you must endeavour to obtain the plants as bushy as possible, for the more shoots each plant develops, the greater number of flowers there will be eventually. For both purposes it is necessary that you should start with modern, large-flowering varieties, which you may select from a grower's catalogue.

Roor: S. R. C. The root is more probably that of Bryonia dioica, which may have been mistaken for a Convolvulus when growing.

VELTHEIMIA VIRIDIFOLIA: L. E. This is a well-known S. African bulbous plant. It grows well in a greenhouse or conservatory if potted in sandy loam. During the summer the plant may be placed in the open air, under a shady wall, or in a frame. The species requires a rest, and water should be withheld from the roots for a time after it has completed its growth.

PUERILITIES OF HORTICULTURE.

THERE are some practices in horticulture, and more especially among a certain class of exhibitors, that to the philosophical student must seem not only trivial but puerile. Such, one may at once say, are the "collaring" and "dressing" of flowers intended for exhibition. Such artificiality, strange to note, is not only tolerated among judging committees, but seemingly encouraged! One even finds at the ends of great catalogues of eminent nurserymen announcements of boxes of flower - dressing tools, including ivory tweezers, &c.

Competitors for prizes, certificates, &c.,

evidently think that these artificial methods of showing flowers are quite legitimate to take the eye of the judges or the public. The judge may well know that it is a show sort of thing that is exhibited, but the public may in most cases be quite ignorant that there is such a practice as dressing Carnations, Chrysanthemums, &c.

To see a grown-up man taking his tweezers out of his pocket and plucking out a petal here and twisting or smoothing another there in the Carnations he is exhibiting, recalls the days of one's childhood, when to make-believe was quite a natural feature of one's developing brain.

If such artificiality in exhibiting flowers be allowed, why not go a little further and get up boxes complete with paints and brushes for touching up the colours of flowers where Nature has, in the opinion of the exhibitor, made some mistake? Such an appliance would appear just as legitimate as the one for plucking out petals and smoothing them in Carnations, Chrysanthemums, &c. The unfortunate Carnations, besides dressed, must have a white paper collar on, over which their petals are flattened, and made to look symmetrical and as ridiculous as the exhibitor can make them. Prettiness to the eye of exhibits is surely not the only thing to be striven for, otherwise artificial flowers can be made most beautiful. It is the trouble and the skill of producing the real and not the "faked" articles that are commendable.

Once upon a time, in the Wingfield Park of Lucknow, there was a fashion of making large elongated beds in various patterns made out of broken glass and broken stones of various colours, with here and there rows of plants and some Rose bushes in the middle. A more puerile innovation could hardly have been conceived.

Carpet-pattern beds, which required an enormous amount of trouble and labour to make and keep up, have fortunately gone out of fashion; the consciousness of their puerility may have helped their extinction, although I believe here and there one may still see an occasional specimen.

This is what the Standard of October 29 says of them under the heading of "Garden Notes":-" Elaborate carpet-pattern beds in our gardens to-day remind us too much of the framed wool 'samplers' of our grandmothers, which once proudly adorned their living-rooms. We have outgrown both these features of indoor and outdoor decorations."

But presumably the same writer, under the same heading of the same paper of November 19, with reference to the Chrysanthemum show at the Crystal Palace says:-"An exhibitor must 'dress' his beauties for the exhibition stage as skilfully as a great actress dresses for her triumphal performances. In some varieties the dressing of the florets is a work of art (!) Florets which are hopelessly misplaced must be removed; those which are twisted must be put into position with the tweezers, or carefully drawn out before the flowers come before the eyes of the judges. It is not all natural beauty unadorned which we behold with such delight at the great show; art plays its part, and he who would win honours in the show-ring must give himself time to do all things well." This perhaps would mean that the art of "faking" should be brought into play to produce a false impression on the judges [No] and on the public.

All these artificialities are unhealthy features in floral exhibitions. The true art consists in transforming a flower and perfecting it by selection and cross-breeding to force it to produce a flower that does not need either tailoring or "faking" to correct some defect that the florist may not like. Defects should be bred out. But this may take a long time, and may require a great deal of trouble; but the honour would be correspondingly great.

It is hoped that some day exhibitors may come to see how ridiculous the collaring

and dressing of Carnations and Pansies and similar puerilities are, and must appear to Continental growers of these pretty things. E. Bonavia, M.D. [Happily the tricks mentioned by our correspondent, together with other exhibition abominations, are gradually but surely being abandoned. ED.]

ORCHID NOTES AND GLEANINGS.

VANDA CŒRULEA.

Many fail to grow this beautiful Orchid satisfactorily, but we are very successful with it here, as the enclosed photograph will show. When well grown, it is undoubtedly one of our finest Orchids. The plant was a small one with eight leaves when we bought it in 1895. At the present time it is 4 feet 4 inches high from base of plant, 4 feet 8 inches across from tip to tip of flower-spikes. It possesses fifty-two leaves and one young growth at the base of the plant with ten leaves, and has five flower-spikes, two with thirteen, two with twelve, and one with ten flowers-sixty flowers in all. A. Taylor, Brougham, Penrith, Cumberland. [A magnificent specimen. We regret that we are unable to reproduce the photograph, having previously given many illustrations of the plant. Ep.]

EPIDENDRUM VIRIDIPURPUREUM.

A fine inflorescence of an Epidendrum with elongated leafy stems and terminal nodding racemes of rather conspicuous flowers, with green sepals and petals and greenish labellum tinged with dark-purple, is sent by Mr. Geo. Matthews, gr. to Lord Auckland, Kitley, Plymouth, who states that the plant was received from Jamaica two years ago.

It agrees with E. viridipurpureum, Hooker, in Botanical Magazine, t. 3666, the botanical standing of which is rather intricate. Lindley, in Folia Orchidacea, places E. viridipurpureum as a variety of E. fuscatum, with which he also iden-tifies E. anceps, Jacq. The Index Kewensis gives priority to E. anceps, and refers E. fuscatum and E. viridipurpureum to it. Looking up the references, too, brings complications with varieties of E. nutans, and seems to indicate that the author was well advised in making E. viridipurpureum a species.

Lord Auckland's plant is well grown, and one of the best forms of the very variable section to which it belongs, and shows wider differences to the species cited than does the plant which has been illustrated.

EPIDENDRUM PANICULATUM.

An inflorescence of this graceful, tall-growing Epidendrum is sent by Mr. J. W. Odell, gr. to Mrs. Brightwen, The Grove, Stanmore. species varies so much in the form and colour of its flowers as to lead one to suppose that all the varieties cannot belong to the same species. The form of the flowers, however, is the same, the chief difference being in the colour, the prettiest variety having dense heads of rose-pink flowers with white labellums. Mr. Odell's plant has a branched inflorescence, with whitish sepals and petals tinged with brown, and a white labellum. These tall-growing Epidendrums are graceful plants even when not in flower.

VANDA KIMBALLIANA.

The terminal portion of a very long spike of exceptionally large and beautifully-formed flowers is sent by Eustace F. Clark, Esq., Chamouix, Teignmouth, who states that the plant, which has been in his collection ten years, but has never flowered with him before, although it has grown in a most satisfactory manner, is about 3 feet in height. The sepals and petals are white slightly flushed with rose, the showy front lobe of the lip bright rose-purple, the side lobes yellowish,

streaked with dotted brownish lines. It often happens that when this pretty Burmese Vanda is grown on the staging in Orchid-houses that it grows on but fails to bloom, but when suspended in a similar situation to that given to Lælia anceps (as in Captain Holford's garden) it blooms

regularly and freely.

That Vanda Kimballiana is not a delicate plant is shown by Mr. Clark's experience of the plant under notice, which, during the exceptionally cold weather of January and February, 1895, was in a very low temperature for some time, the thermometer in the house in which the plant was for several nights ranging between 39° and 34° Fahr., and on one occasion a minimum of 33° was recorded. Although anything approaching such a low temperature could not be recommended for this pretty Burmese Vanda, the incident plainly indicates that the plant does not require the high temperature given it in most collections during winter, and that the cause of its failure and of the failure of many other Vandas, Aërides, Saccolabiums, &c., may be traced to too much heat during their inactive period.

NEW OR NOTEWORTHY PLANTS.

OPUNTIAS.

THREE new Opuntias, named by the late Dr. Weber, which were never published, ought now. after his lamented death, to be brought before the public, to prevent his names from becoming nomina nuda.

OPUNTIA BERGERIANA, Weber, spec. nov. (fig. 14).

This species is very common in cultivation in the gardens of the Riviera, especially in Bordighera, where Mr. L. Winter has the finest plants of it. It is very showy, and often completely covered with its fiery flowers and deep-red berries. It stands next to Opuntia nigricans, from which, however, it is quite distinct.

Dr. Weber had this plant for a long time under his consideration. He named it in a letter to mo

on November 14, 1902.

This species forms a tall shrub of 5 to 10 feet. Joints in well-grown plants 9 inches long and 4½ inches broad, obovate or oblong-ovate, fleshy, bright green. Areolæ about 1½ inch apart, roundish, with short grey down and yellowish glochids. Spines vary in number and size, one or more over 1 inch long, spreading, at first yellowish, when old greyish.

Flowers at the top of the joints very numerous. Ovary 1½ inch long and 1 inch broad, obovate, brilliant green; areolæ slightly elevated, distant, roundish, with numerous straw-coloured glochids. Outer leaves of the perianth fleshy, carinate and mucronate, greenish red. Inner leaves spatulate at the base, much constricted, rounded at the top and mucronate, over

an inch long, deep, bright red.

Bottom of the perianth conically excavated for about 4 lines. Filaments very numerous, 8 to 9 lines long, violet-rose. Anthers linear, yellowish. Style overtopping the anthers, above the base clavate, whitish, with six green ereot stigmata.

Fruit 1½ inch long, and nearly as broad, obovate, truncate, with a conical excavation at the top. Pulp and juice dark red. Seeds nearly orbicular with a narrow brownish border.

OPUNTIA HANBURYANA, Weber, spec. nov. (fig. 15).

This Opuntia is not common in the gardens of the Riviera. It is very distinct through its habit, the long-spreading spines and the small ovary and fruit. It was named by Dr. Weber in his letter of September 23, 1901.

A shrub of 3 to 5 feet, of a straggling growth. Joints variable in size, the largest 11 inches long and scarcely 4 inches broad, lanceolate-oblong,

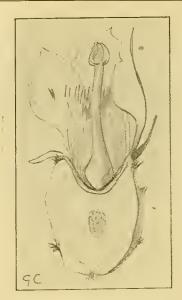

FIG. 14.-OPUNTIA BERGERIANA.

bright green. Areolæ numerous, about $\frac{3}{4}$ of an inch apart, round, with black down when old, and short glochids. Spines several, large and spreading, somewhat compressed and twisted,

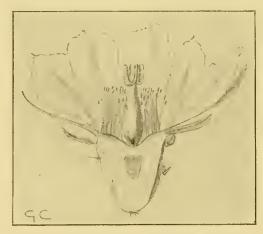

FIG. 15.-OPUNTIA HANBURYANA, Weber.

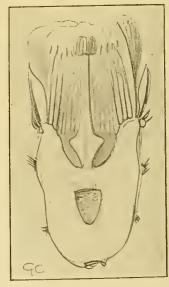

FIG. 16 .- OPUNTIA SCHUMANNI, Weber.

amber-coloured, the centre one upright, the longest $1\frac{1}{4}$ inch long.

Ovary small, \(\frac{1}{4} \) of an inch long, obconical, with little elevated areolæ. Outer leaves of the

perianth deltoid, the following broader, the innermost obovate, obtuse, mucronate, canary colonred. Bottom of the flower little excavated. Stamens numerous yellow, half as long as the petals. Style clavate at the base, whitish, with five greenish-white stigmata.

Fruit roundish, yellowish-red, 11 inch long; pulp greenish, juice watery; seeds thick, roundish, with a narrow margin, nearly 3 lines.

broad.

OPUNTIA SCHUMANNI, Weber, spec. nov. (fig. 16).

This plant, with its upright petals, is intermediate between Opuntia and Nopalea, which, however, has longer stamens and style; it is near to Opuntia nigricans, under which namethis garden received it in 1899 from Mr. Winter in Bordighera. Dr. Weber named it in a letter

to me, September 23, 1901.

A shrub growing 4 to 5 feet in height. Joints 12 inches long, about 5 inches broad, and nearly of an inch thick, obovate, oblong, on the margins somewhat sinuate, slightly glaucous, with about twelve areolæ on each side. These are about-2 inches apart, slightly elevated, elliptical, with grey down and with short brown glochids. Spines several, blackish-brown with a brighter point, slightly compressed and twisted, the centre one being the longest, upright, 11 to 2 inches long, the next two to three spines 1 to 14 inch long. curved above their base and spreading; besides these there are six to nine shorter setulose spines. Flowers terminal and lateral, 2} inches long. Ovary obovate oblong, 11 inch long and 1 inch broad, bright green, with distant, slightly elevated areolæ with numerous glochids. Outer periantb leaves deltoid fleshy, inner ones nearly quite upright and little expanded, obovate-spatulate, yellowish turning into a dull red. Bottom of the perianth conically excavated. Stamens numerous, greenish at the base, reddish above, three-quarters of the length of the perianth; anthers whitish. Style at the base suddenly thickened, white, with seven green stigmata.

Fruit obovate, truncate, with a flat excavation at the top; brown-red. Pulp and juice scarlet-red. Seeds nearly round, with a narrow reddish

border. Alwin Berger, La Mortola.

KEW NOTES.

DEDALACANTHUS MACROPHYLLUS, T. Anders .--This Acanthaceous plant ranks amongst the very finest members of an order that is very rich in beautiful flowering subjects. Its horticultural value is such that it should be grown by all who have conservatories. In the Begonia-house at. Kew there are now about a dozen specimens in full beauty. Growing in 6-inch pots, the plants are 2 feet 6 inches high, and 1½ foot across; the leaves are elliptic-lanceolate, 3 to 5 inches long, and 2 to 3 inches broad; every growth terminates in a large panicle of light blue flowers, the lower lobe of the corolla being violet-blue. The panicles are from 1 foot to 11 foot in length; the individual flowers about 3/4 inch across, having a tube 1½ inch long. At the base of each flower is a. greenish-white bract, which gives to the plants a striking appearance even before the blooms are developed. The flowers expand from the base of the panicle upwards, and afford a succession of flowers lasting from six weeks to two months. The culture is as simple as that given a Fuchsia. Take cuttings from the old plants about March or April, and root them in a brisk bottom-heat; then remove them into an intermediate temperature, where they may be potted and repotted, and remain until they have become established in the flowering pots. Very little stopping of the shoots is necessary, as the plant is naturally bushy in habit. Throughout the summer the plants succeed well in the temperature of a greenhouse, and should be syringed in bright weather, and

supplied with some kind of manure. In October turn the plants to an intermediate temperature, where they will soon begin to develop their flower-spikes; when in flower a rather dry atmosphere suits them best. The species is a native of Burma, and was figured in the Botanical Magazine, t. 6686. W. H.

BOOK NOTICE.

LA THÉORIE DES CAPACITÉS FONCTIONNELLES ET SES CONSÉQUENCES EN AGRICULTURE. (The Theory of Functional Capacity and its Results in Agriculture.) Studies in Applied Vegetable Anatomy and Physiology. By Lucien Daniel, Professor of Applied Botany at the University of Rennes.*

(Concluded from p. 29.)

The author's theory of "functional capacities" is not only capable of explaining the variations in the form and structure of the isolated individual plant, but also a number of phenomena which are to be observed in grafting, i.e., in plants which are caused to live associated together by the will of the grafter.

Now, amongst the effects of the grafting process we have to distinguish those resulting from cicatrisation or healing of the wound, and those proceeding from the fundamental relationships existing between the functional capabilities peculiar to the grafted plants (stock and scion).

The author points out that the scar of cicatrisation causes a fatal change in the conduction of the sap, because of the fact that cellular tissue becomes intercalated between the conducting tissues of the stock and the scion, and because the conducting tissues which eventually unite these two latter are comparatively few in number and more or less contorted. The sap passing along them will, therefore, be modified both in quantity and quality. This is, for the scion, equivalent to existence in a drier and poorer medium than the normal. This was demonstrated by grafting the black Belgian Haricot Bean, which is a dwarf form, on that of Soissons, of taller habit and greater functional capacity; in this case the development of the scion is always more insignificant than that of a normal ungrafted control-specimen, this being due to the fact that the tissues of stock and scion unite with difficulty.

With regard to the second of the two effects of grafting above-mentioned, we have to distinguish between (1) the grafting of a plant of greater functional capacity upon a plant possessing this latter in a less degree, i.e., the case represented by $\frac{cv}{ca} > 1$; (2) the grafting of a plant of smaller upon a plant of greater functional capacity, i.e., the case represented by $\frac{cv}{ca} < 1$.

case represented by $\frac{c \cdot v}{c \cdot a} < 1$.

In the first case, to the effect produced by the primary inequality in the respective functional capacities is added that of the scar of cicatrisation, so that the two work harmoniously together towards producing the condition of existence in a medium drier or poorer than the normal. A striking example of this state of things is afforded by grafting the Forget-me-Not (Myosotis palustris) upon the Heliotrope. The functional capacity of the former is very high, i.e., it has need, as its specific name indicates, of a large amount of water; the stock plant, on the contrary, as the hard wood constituting its conducting-system reveals to us, lives in a dry soil, and hence cannot furnish the necessary water to the scion, which, therefore, rapidly blackens and perishes. But if the limit of desiccation causing death be not attained, the variations characteristic of growth in a dry or poor soil will be exhibited, such as diminution in size, modifications in the period and character of flowering, hastening of sexual maturity, improvement in the fruit and tubers. increase in hardness of the tissues, decrease in the resistance offered to parasites, shortening of life, &c.

In the second case it is clear that the effects resulting from the scar and from the difference in the functional capacities of stock and scion are in disharmony. The former may override the latter, as in the case of the Haricot Beans mentioned above. A good example of this is seen in the case of the Deadly Night-shade grafted on the giant Tobacco-plant; although the latter possesses a much greater functional capacity, i.e., greater absorptive power, than the former, the scion grows into a dwarfed and almost stem-less specimen, due to the fact that the affinities of the two plants are not sufficiently close to admit of a proper union of their tissues, hence defective cicatrisation and osmosis result. Yet the Belladonna "takes" easily on the Egg-plant or Tomato. But should the graft "take" well the reverse will be the case, and stock and scion will therefore inevitably be situated in the equivalent of a moist rich medium, and will continue to live if the limit of watery repletion is not passed. An example of this is afforded by the grafting of the French Vine upon an American variety, the other conditions of soil and climate being suitable, Under these conditions the variations characteristic of growth in a moist, rich soil will be shown, e.g., increase in size, changes in the mode of flowering, retardation of sexual maturity, lessening of the quality of fruit, increase of liability to cryptogamic diseases, diminution in the amount of stereome or woody tissue, and roundingoff of the prominences in angular stems, &c. Many interesting examples of these are given.

It must be understood, of course, that the intensity of the effects resulting from these two inverse cases of variation will vary with the character of the scar of cicatrisation and the primary value of the functional capacities of the plants concerned, as also with the conditions of the external medium of soil and air. The latter have naturally a more pronounced effect upon the grafted than upon the normal plant.

The author shows besides that the resultant of the effects brought about by the scar of cicatrisation and the functional capacities of the grafted plants will vary with the age of the plant (senility or youth), the kind of medium in which it has lived (health, bringing-up), as also with the hereditary functional capacity of the organ which is chosen as stock or scion (adaptation to the function of forming reserves, natural etiolation, geotropism, adaptation to wood or fruit production, &c.

All these data have a special practical interest as furnishing the gardener with the opportunity of making a rational choice of stocks and scions by resting that choice upon a measurable scientific basis. And, what is of great importance, they afford the opportunity of foreseeing the modifications in the habit, &c., induced by the process of grafting between plants the characters of which are known, and of treating the same in a rational manner, viz., by combining systems of pruning and manure-outlay, while bearing in mind the value of the relationship $\frac{cv}{ca}$ in the particular medium under consideration.

The evil effects of a grafting operation in which the absolute value of the relationship $\frac{cv}{ca} < 1$ is exaggerated can be modified by employing the process of mixed grafting; if, e.g., it happens that the consumption of sap is greater than its absorption, one method of increasing the latter is that of allowing adventitious roots to develop on the scion, which then is enabled to receive crude sap along two distinct avenues; as in the case of old Apple-trees when the adventitious roots of the scions were observed to penetrate the decomposition of the scions were observed to penetrate the

posed wood of the stock and to exist then as if in solid earth.

Another method consists in inserting one and the same scion on two or more different stocks. If. on the other hand, it happens that the absorption is greater than the consumption, the methods of restoring this disturbance in the equilibrium of nutrition will be the inverse of the preceding. The following experiment is forcible in this connection: Vernonia præalta was grafted on seedlings of Xanthium macrocarpum; when the ordinary method was employed, viz., by radically suppressing all the supplementary shoots sent up by the stock, the scions inevitably died, but when, on the contrary, these supplementary shoots of the stock were maintained, i.e., when the process of mixed grafting was employed, the scions "took." In this case the small degree of consumption by the scion caused by inefficient union of the two plants is supplemented by that of the shoots from the stock, hence equilibrium is restored, and aqueous repletion of the stock, causing the death of the scion, prevented.

Another method consists in "multiple grafting," where several scions of the same varieties or of varieties of different species are inserted on the same stock. In this case each scion will be subjected to the conditions peculiar to its relationship $\frac{cv}{ca}$ and to a variation with regard to the way in which its fellow-scions comport themselves in relation to ca, i.e., to the stock charged with providing the nutrition common to all. Experimentation shows that it is the scion exhibiting a relationship $\frac{ev}{ca}$ equal or approaching to unity which ends by gaining the upper hand and annihilating the rest. On one of three equal shoots of Anthemis frutescens were grafted three equal scions taken from three plants differing more or less as to their functional capacities: Tanacetum Balsamita, Leucanthemum, and Artemisia Absinthium.

From the commencement it was found that Tanacetum "took" better than Leucanthemum, while Artemisia Absinthium was the worst in this respect. Owing to the discrepancy in the union and in the functional capacities of the three scions, the sap from the common stock was distributed proportionally to the respective values of the new areas of consumption. The aforesaid discrepancy will continue to increase until the life of the scions of Leucanthemum and Artemisia will at length be equivalent to that in a soil becoming ever drier and drier, resulting finally in complete desiccation. The Tanacetum, on the other hand, will grow healthily ahead.

The above is an interesting practical case, and has important bearings.

In conclusion, the author states that "the theory of sap-draining areas (points d'appel) and of functional capacities can alone explain the

effects of the various operations performed in agriculture (pruning, grafting, &c.), and of deducing in a rational manner practical appli-

cations therefrom."

"It explains, besides, quite as easily the variations in structure observed in normal plants as a result of the variations produced by the external medium during the performance of their functions."

Besides numerous figures in the text, there are twenty plates containing photographs of transverse and other sections of stems, showing how the effects of operations and other variations from the normal life-history of the plant or plants concerned are registered accurately in the structure of the wood. W. C. W.

MR. MAYCOCK, who is leaving Luton Hoo Gardens, Bedfordshire, has been presented with an address and a silver teapot by the employés in Luton Hoo Gardens, accompanied by their good wishes

^{*} Imprimerie Fr. Simon, successeur de A. Le Roy, Rennes, France, 1902. Price 20 francs.

A CURE FOR CHLOROSIS.

Chlorosis is very common in the Vine and in fruit trees, particularly in those grown upon very calcareous soils. Full-grown trees and young seedlings in nurseries alike succumb to it. It usually appears in spring, say at the beginning of May, when the foliage is not fully developed. Leaves affected with it hegin gradually to turn yellow, their growth is arrested, the edges become brown, turn up, wither, and finally fall off. The growth of the stems, runners, shoots, and the

phate) is introduced into the soil. With the solution of these salts the leaves were sprayed, and in the autumn cuttings and stems were smeared with it also. But all these efforts gave only partial results, as the cure was not always secured, as I myself had very often proof. But if some means could be found to introduce iron directly into the trees, independently of the roots, which are unable to absorb the requisite amount of iron owing to the large percentage of lime in the soil, or on account of their weakened condition, then the needed

FIG. 17.—CHLOROSIS IN APPLES.

- A. Portion of one-half of the tree affected with Chlorosis and Apple-blight.
- B. Portion taken from the other half of the same tree six weeks after the introduction of the iron-salts.

development of the fruit is also soon arrested. The branches droop, wither, and in a short time they die. There are many causes teuding to develop chlorosis in plants; but in Southern countries (France, Caucasus, Crimea) we are inclined to ascribe it chiefly to the large percentage of lime in the soils, hindering the plants from absorbing the necessary amount of iron. This opinion may be fully verified by the following means. It is a well-established fact that chlorosis in plants is due to the lack of iron, and for the purpose of cure a certain amount of green vitriol (iron sul-

amount of iron may be secured and a cure guaranteed. The possibility of this is illustrated by the following facts:—In order to restore the trees to health, I bored from one to four holes in the trunk of the tree, I to $1\frac{1}{2}$ cent. in diameter, and deep enough to put 4 to 12 grammes of green vitriol (sulphate of iron). These holes were smeared over with cement. These little wounds readily heal towards the autumn. The ascending sap carries up with it the iron in solution to the tips of the leaves, and the trees begin to improve wonderfully; the bright greeu colour soon appears, and in size and any

other relation it is difficult to distinguish them from those not affected. Other salts of iron (such as the phosphate and chlorate) do not affect the cure so readily. Spring (May) months are the most appropriate time for this operation. By this method I have effected a permament cure on many hundreds of trees of different varieties, not excepting coniferous or evergreen trees. deforming anthracnose of the Grape-Vine rapidly disappears under the influence of sulphate of iron, the leaves acquiring their normal size and colour. In other experiments of this internal method of nourishing the plants, not directly through the roots, by means of various combinations of salts, dry or in solution (using for this purpose a small and very simple apparatus), I succeeded in increasing their size and improving their colour, thus effecting a cure * (see figs. 17, 18). S. Mokrzecki, Simferopol, Crimea, Russia, Government Entomologist of the Natural History Museum.

MARKET NOTES.

TOMATO-SEED SOWING.

No time should be lost in making preparations for sowing Tomato-seeds. Use clean new loam and plenty of sand, especially around the seeds. Do not use dirty pots, and have the house cleaned before starting. Let the soil be in the house for a few days, that it may be warmed, then put it into the pots and afford water, and defer sowing the seeds until the following morning. Sow the seeds thinly. Tomatos will grow under almost all conditions, but to obtain best results good culture must be afforded. Stephen Castle.

COVENT GARDEN MARKET, JANUARY 9.

The market presents a very dull appearance. The supplies are not large, many of the stands remaining empty since Christmas. In pot plants, Cyclamen are more plentiful, and some are very good; the best, in 48-sized pots, have been making from 15s. to 18s. per dozen. There are still some Chrysanthemums in pots; some are rather poor. The yellows are the best. Solanums are still coming in, but in many of them the foliage is not very good. Poinsettias are lasting out longer than usual; some good dwarf plants with broad heads of bracts were seen. There are still plenty of good Erica hyemalis and some E. gracilis. Marguerites are not quite so plentiful. Begonia Gloire de Lorraine and some very fine plants of the Turnford Hall variety were seen. Genistas are very good, but there seems little trade for them at present.

Azaleas, chiefly Deutsche Perle: a good many of these were left on the stands at closing time. There are some good Rhododendrons coming in. Callas in pots are plentiful, and there is little trade for them. Hyacinths, these mostly with three in a pot, are now good. There are also plenty of good Tulips in small boxes. Roman Hyacinths are also brought in boxes, about a dozen bulbs in each box. There are not so many Ferns in now, but more than enough for all demands; the smaller Ferns are more in demand just now, and some sorts are beginning torun a little short. Ficus elastica, which at one time sold so well, seems to have almost gone out of demand. Aralia Sieboldi sell rather better,

^{*} See my works on "The Internal Application of Remedies of Plants" (illustrated), "Ueber innere Therapie der Pflanzen"; "Zeitschrift für Pflanzenkrankheiten," "The Description of the Disease in Plants"; and also "Ueber eine neue Methode die Biume zö nähren, und zu Neilen"; "Travaux de la Société Impériale des Naturalistes de St. Pétersbourg, Comptes Rendues de Séances, Janvier, 1903"; "No. 1 of the New Method of Nourishment of Plants and their Cure"; "Transactions of the Imperial Society of Naturalists in St. Petersburg"; "Report of the Séances in January, 1903, No. 1"

but these do not make a high price. Palms go very slowly, and prices are much lower, such as would formerly make 18s. and upwards now move slowly at 12s. per dozen. A. H.

VEGETABLES.

DISEASE-PROOF POTATOS.

I am rather tired of the term "disease-resisting" as applied to any variety of Potato now, because the expression has been in use so many years in relation to a multitude of varieties, yet somehow we find ourselves no forwarder. It might have been imagined that we had now some absolute paragons in new varieties when it is realised that prices (at least some are told in the general Press) have been paid for them that entirely out-Herod Herod in costliness. A few days since I was favoured with a letter from the editor of a prominent American paper asking for information as to these greatly boomed varieties, they having read of them on the other side of the Atlantic. How disappointing is it to learn that, call the new variety by what designation you may, the weakness of Potato nature still remains! A Kentish grower told me a few days since of the severe attacks of disease which had resulted to his costly novelty, and the same report comes from many other directions. Even whilst we are being constantly told by bold advertisement that such an one is disease-resisting, growers, having no primary objects to serve, tell us otherwise, and that it is no more disease-resisting than any other that has been put into commerce so described for the past thirty years. Very likely it may be said in apology, "Look what a wet, cold season we had last year." Just so; but if a wet, cold season is the weak link in the chain. and just there the chain snaps, of what use are all the other links? There are plenty of fine varieties of Potatos in commerce that in ordinary warm seasons give no disease; but where is the variety, new or old, that exhibits no disease whatever in a cold, wet season such as last year was? What we want is not uncertain, unreliable disease-resisters, but "disease-proof" Potatos. If anyone can give us those they will indeed deserve well of their country. I should like to see Government offering a premium of £100 to anyone who should raise a variety that proved to be, over five years of trials, in diverse parts of the kingdom, impartially conducted, absolutely disease-proof. Perhaps the new Potato Society can help to that end. A. D.

NOVELTIES OF 1903.

(Continued from p. 18.)

Although "trade" is reported to have been bad even in horticultural circles, those engaged in it have displayed unusual activity in the production or introduction of new plants, the home-made article, the work of the hybridist's skill, largely predominating. Nevertheless there is evidence in the fine plants introduced by Messrs. Jas. Veitch & Sons from China and other parts, that many of them are likely to prove quite hardy in the British Isles. many fine new plants with which Messrs. Sander & Sons have enriched our plant-houses, which were so well shown at Ghent and at the Temple and Holland House, show that enterprising nurserymen have not abandoned their researches in distant climes for new plants.

In private gardens but few new species have appeared, but in the Rt. Hon. Lord Rothschild's gardens the fine crimson Gloriosa Rothschildiana makes a red-letter event in that rare class of showy warm-house trailing or climbing plants.

Most of the best novelties, where material has been procurable, have been illustrated in the Gardeners' Chronicle, and therefore if the references given in the appended list of illustrated plants be referred to, full information of them can be obtained.

STOVE AND GREENHOUSE PLANTS.

Among these the Hippeastrums, or Amaryllis, as they are usually called in gardens, seem to have come more generally into culture with a view to improvement, Messrs. James Veitch & Sons, Captain Holford, Messrs. R. P. Kee & Sons, Lord Rothschild, and others having worked on them successfully. Of the best new ones of the year are Hippeastrum Black Prince, from Captain Holford; H. Fair Lady and H. Julius, from Messrs. Veitch; and a

Other noteworthy, new, or re-introduced plants which have received Awards in this class during the year are the Nymphæa gigantea Hudsoni, and Lowrya campanulata of Leopold de Rothschild, Esq. (gr. Mr. J. Hudson); the Pinguieula caudata superba, and Kniphofia longicollis of J. T. Bennett-Poe, Esq. (gr. Mr. Downes); Kalanchoe Felthamensis and K. kewensis, from Messrs. Veitch; Lachenalia Ruth Lane from F. W. Moore, Esq., Glasnevin; Caladium Mossamedes from Messrs. Wm. Bull & Sons, and various novelties.

FERNS

In decorative Ferns, as might be expected from the large quantities grown by him, Mr. H. B. May, of Edmonton, takes the lead, having secured awards for Nephrolepis Mayii, N. Piersoni, N. cordifolia crisputa congesta, Adiantum scutum

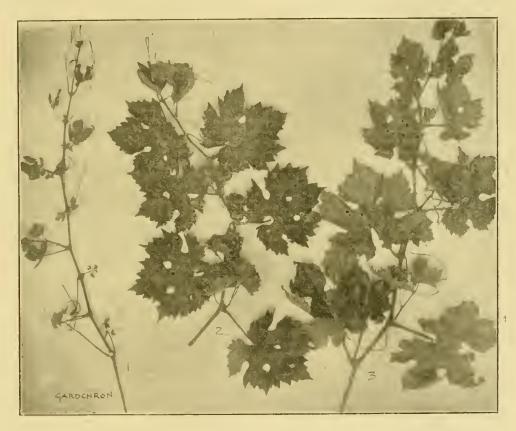

FIG. 18.—CHLOROSIS IN GRAPE-VINE.

- Branch of Grape-Vine strongly affected with Chlorosis and Anthracnose. (The plant was under my personal control.)
- 2. A branch of Grage-Vine after the treatment.
- 3. A Grape-Vine Branch affected with Chlorosis. (See p. 36.)

splendid pure white form and a variety named Exquisite, shown by Messrs. R. P. Ker & Sons in their Gold Medal group at the Ghent Quinquennial.

Messrs. Sander & Sons, at the same great show, exhibited in their first prize group of new plants - Dracæna Broomfieldi superba, Selaginella Watsoniana, Polypodium Knightiæ, Alpinia Sanderæ, Heliconia Edwardus Rex, Phrynium Micholitzii, Drymophlæus Mooreanus, Dracæna Kewensis, Bilbergia Forgetiana, Pandanus Wavrinianus, Linospadix Leopoldi, Retinospora Sanderi (of gardens), Alocasia Wavriniana, Ficus pandurata, Asparagus myrioeladus, A. Sprengeri variegata, Dracæna Victoriæ, Pteris Maissonieri, Fourcroya Watsoniana, and other novelties, most of which have also been exhibited here, and many illustrated in the Gardeners' Chronicle; one of the finest flowering plants for greenhouse or out-door decoration in summer being the floriferous magenta rose-coloured Nicotiana Sanderæ.

ramosum, and Pteris metallica, all excellent novelties. Messrs. Sander & Sons showed one of the most beautiful new Ferns in Polypodium. Knightiæ, and Messrs. J. Hill & Sons, of Lower Edmonton, a graceful plant in Nephrolepis Fosteri.

BEGONIAS.

Messrs. Veitch & Sons continue to improve their useful decorative winter-flowering strain; Messrs. Sander & Sons have produced good novelties in handsome foliaged kinds, and the tuberous-rooted section have been recruited. Of the best of those certificated were B. Mrs. W. P. Neal, blush-white; B. Mrs. Portman Dalton, rose; B. Mrs. Moger, carmine-rose; B. Sir Thos. Lipton, bright red—all fine doubles from Messrs. Blackmore & Langdon, Twerton Nurseries, near Bath, the same firm also securing an award for the glowing orange-scarlet B. Countess of Warwick.

Messrs. R. B. Davis, Yeovil, were successful with B. Gipsy Girl, B. W. Sparshott, and others;

Messrs. J. Laine & Co. with B. The Queen and B. Lady Howe; and the quality of each section has been improved by other raisers, although the excellence of the old forms renders it difficult to show great difference in the novelties.

CHRYSANTHEMUMS.

These useful autumn and winter flowers, which nothing in the whole range of floriculture could replace, have been augmented by many new and good varieties. Among the best of those certificated were F. S. Vallis, Miss E. Helding, W. A. Etherington, Kitty Bourne, Mrs. J. Dunn, Dorothy Pywell, Allman's Yellow, The Champion, Edith Davy, Harry Whateley, Ruby Martin, J. H. Spilsbury, Lady Cranston, Maude du Cros, Miss A. Dighton, Jessie Dean, Mrs. Barnard Hankey, Mrs. J. P. Bryce, Pink Beauty, C. W. Pascoe, Pink Pet, Polly and Souvenir de William Clibran. Opinions differ as to their relative merits, but all are good, and some will be standard varieties in their classes.

DAHLIAS.

Among these the "Cactus" varieties are decidedly and justly the favourites. Of the best are Miss F. M. Stredwick, white with lemon centre; Mrs. H. L. Broussen, bronze-buff; George Gordon, yellow and bronze, of Mr. J. Stredwick St. Leonards-on-Sea; Dainty, mauve and prim rose; Spotless Queen, white; and Sweet Nell, mauve with light centre, of Messrs. Hobbies, Dereham; and Spitfire, scarlet, and Amos Perry, crimson and red, of Messrs. Dobbie & Co., Rothesay. Two good Pompons were San Toy and Queen of Whites, of Mr. Chas. Turner. Darkness, a chocolate-maroon-coloured single, of Messrs. J. Cheal & Sons, was a marked improvement; as also was the single-flowered Rosebank Scarlet of Mr. Ed. Mayney.

HARDY AND HALF-HARDY PLANTS.

Of these, the introductions of Messrs. James Veitch & Sons are the most remarkable. Of proved and certificated nevelties introduced by this firm are Vitis Thomseni, V. sinensis, V. armata, V. flexuosa Wilsoni, and V. megaphylla; Rehmannia angulata, Jasminum primulinum, and Senecio tanguticus.

THE NARCISSUS.

No class of flowers is better worthy of the florist's care than the Narcissus, and it is one of the few flowers which the florist, in his struggles for large size and shewy colours, cannot render coarse or anything but beautiful. The Narcissus Committee of the Royal Horticultural Seciety is now a recognised authority, and exhibits from all parts come before them. During the past year fine exhibits came from the Rev. G. H. ENGLE-HEART, Dinton, Wilts, who is the champion worker in their development; from Miss WILLMOTT, of Warley Place, who seems to grow the plants inte even greater beauty than do the raisers; from Mrs. Backhouse, of Sutton Court, Hereford; Miss CURRY, Lismore, Ireland; Messrs. BARR & Sons, Covent Garden; Messrs. Vettch; Messrs. Hogg & Robertson, Dublin; Mr. W. B. Hartland, Cork; Messrs. Bath, Wisbech; Messrs. Pope, King's Norton; Mr. REUTHE, Keston, and others; and the leading exhibitors have secured awards for nevelties, among the best of which were Red Disc, Lady Gore-Booth, and Symmetry, from the Rev. G. H. ENGLEHEART. Miss WILLMOTT also gained awards for The Moonstone, Lilian, Rev. Chas. Digby, Count Visconti, Countess Visconti, Valeria, Occident, and Astrardente, all raised by the Rev. G. H. ENGLEHEART; also Viscountess Falmouth and Adour. Mrs. Backhouse received awards for Zingara, Firelight, and Mohican. Messrs. BARR & Sons, Covent Garden, for Cleopatra, Mrs. Geo. Barr, and Janet Image; and Messrs. Pope for King's Norton.

(To be concluded)

The Week's Work.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, gr., Wrotham Park, Barnet.

Pears.—Probably the finest and best-flavoured Pears are these produced from trained trees on walls or hearded fences; but excellent fruits may be cultivated on espalier, pyramidal, or bush trees, provided the roots are in a suitable soil and are near to the surface. Old, worn-out trees, that rarely, if ever, produce good fruits, should be grabbed up, and, after preparing the ground, plant healthy young trees of good and useful varieties, selected with a view of maintaining a long supply of fruits. For covering a wall space quickly and for fruiting early, plant cordon trees, and train them either in an upright or oblique walls or boarded fences; but excellent fruits may and train them either in an upright or oblique direction, at distances of about 18 inches apart. The border for these should be about 5 feet wide. Trench the soil and thoroughly break up the subsoil to a good depth, and substitute for the staple as much good loam (in which fruit-trees have not yet grown) as is practicable, mixing with this a good sprinkling of bones, wood-ash and old mortarrubble, &c. In preparing the stations for the roots of the trees, open a shallow trench about 2 feet in width, tread the bottom moderately firm, then slightly loosen the top with a four-tined fork previous to resting the roots on the soil. All the damaged roots should be cut smoothly over. I always cut on the upper side of the main roots to encourage the fresh feeders. to a good depth, and substitute for the staple as of the main roots to encourage the fresh feeders, &c., as near to the surface as possible. Spread the roots out evenly over the border, and sprinkle some fine, moderately dry soil amongst them. Then give the tree a slight shake and cover up, making the soil firm about the roets, which will complete the work for the time being, except that the trees should be tied loosely to the wall, that the ties may allow the trees to sink with the soil. Good varieties include Marie Louise, Doyenné du Comice, Triomphe de Vienne, Pitmaston Duchess, Durendeau, Emile de Heyst, Beurré Bosc, Beurré Superfin, Glou Morceau, Josephine de Malines, Olivier de Serres, Passe Crasanne, and Duchesse de Bordeaux.

Pruning.—A good portion of this work is done in summer by preserving suitable shoots for different purposes, and cutting and pinching young wood that is not required. Pruning at this season will consist in cutting back to within a couple of buds all side growths, and removing or thinning out old snags, so as to encourage plenty of strong fruit-buds nearer to the main branches. This work may be extended over a few seasons in preference to severely pruning a tree at one time. In cases of aged trees some cultivators remove old branches entirely and successfully train young wood to fill their places, while others encourage young shoots along the lower tiers of branches at a foot apart and train them vertically, removing other branches to give the young wood more room, as may be needed. All trees when they have been pruned should be afforded a top dressing with a suitable compost after as much of the eld soil has been removed as can be done without causing injury to the roots. If, in cases of large trees, the roots have got down into the cold subsoil, root pruning may still be carried out, but only half of the roots of a particular tree should be so treated this season, the other half may be done early in autumn.

THE FLOWER GARDEN.

By A. B. Wanns, Gardener to Sir W. D. Pearson, Bart., Paddockhurst, Sussex.

The Wild Garden.—On the slepes of banks and under trees where the ground is unfurnished, plant Hypericums, Periwinkles (Vinca) and Ivies. Other spots can be made bright with Foxgloves, Honesty, Primroses, and Forget-Merout (Myosotis palustris). When these have become established they will seed and cover the ground each year. Plant groups of Lilacs, Syringas, Ribes rubrum, and standard Laburnums; and for obtaining coloured foliage in autumn, Scarlet Oaks, Acer variegatum and Arubrum, Prunus Pissardi, Cornus florida, Viburnum Opulus, Liquidambar styraciflus. In a sheltered place, where the wind will not be felt

much, Chamerops excelsa may be added. A cool spot in partial shade may be made interesting by planting it with a collection of Heaths. The ground must be well trenched for these, adding plenty of sandy peat and leaf-mould. Place a few rough, large, moss-covered stones amongst the plants, partly covering the stones with earth. Some of the Heaths may be planted against these. One plant of each variety should have a label attached to it, with the name of the species and variety written thereon. In the wild garden may be planted any surplus shrubs, if these are crowded in the flower garden, and any hardy plants from the forcing-house when these have been hardened sufficiently. Stumps of trees that have been cut down to within 12 feet of the ground may be covered with creepers, planting Ivy and Clematis Jackmani together, and restrict ing the Ivy until the Clematis gets established. Aristolocha Sipho, Clematis viticella rubra, variegated Ivy, Passiflera cœrulea (requires protectien in severe weather), climbing Roses (Dorothy Perkins, The Garland, Leuchtstern, Pelyantha grandiflera, Crimson Rambler) and Wild Hops may be used for the same and similar purposes. A summer-house should be erected and afterwards covered with Clematis vitalba (Old Man's Beard or Traveller's Joy). A stream of water is necessary to complete this garden, and preferably one that has shaped its own course. If there is such an one it will have washed its way down and left the sides bare, but this can be remedied by building dams of stiff clay and boulders; and the water thus made secure may be planted with Water-Lilies; but a look-out must be kept for water-rats, which are very destructive to the bulbs. Plant the sides of the stream with Willows, Sambucus, Dogwoed, Primulas, Iris, Trollius europæus, Polygonum sachalinense, &c. Have rustic bridges planted sachalinense, &c. Have rustic bridges planted with creeping and climbing species, and de net make the paths less than 5 feet wide. Use broken sandstone, which gets quite hard and have a bright, clean appearance. Where the banks are loose some logs of wood about 7 feet long may be laid roughly at the side, and planted with Ivy. These will hold the bank up and screen it. Old stumps of trees put up in round heaps in a few bad places may be planted with Honeysuckle or Ground Ivy. Plant a few Conifers. Conifers.

Bedding Violas that were struck in a cold frame in the autumn will require to be pinched new previous to planting them next month. By that time they will produce off-sets and make nice plants to fill up gaps in the beds that were planted last autumn. Stir the surface soil of these with a stick, and remove all green moss and decayed leaves. Plants put out in the autumn should be pressed into the earth and afferded a good dressing of wood-ashes.

PLANTS UNDER GLASS.

By C. R. Fielder, Gardener to Mrs. Burns, North Mymms Park, Hatfield, Hertfordshire.

Chrysanthemums.—Continue to put in cuttings of these as fast as good suckers can be obtained, rejecting those cuttings which proceed from the stem above the surface of the soil, or only using them as a last resource. Where many plants are grown, it is seldom that the whole of the cuttings are inserted on the same date, and therefore they will become rooted at different times. In order to prevent the earliest cuttings from becoming drawn, remove them from the close frame as soon as they have made roots, and this allows the frame to be kept close for the benefit of the later cuttings.

Tree or Winter-flowering Carnations.—Tree-Carnations may be prepagated at any time throughout the year, but for the purpose of affording flowers during the winter and early spring menths the cuttings should be taken during January and February, and provided that suitable cuttings are obtainable the earlier the better. The best cuttings are made from the young and quickly-grewn side-shoots, which are produced on plants that have been in flower. If these shoots be pulled off the plants when about 3 inches in length they will be ready for insertion into pots with little further preparation, but longer shoots should be shortened to about that length to

ensure that the base of the cutting he not too woody. Insert the cuttings round the sides of small pots, which have been previously filled with a compost consisting of three-parts leam, one part leaf-soil, and a liberal allowance of silversand. Such cuttings will strike readily if they can be accommodated with a hand-light or frame, on the stage of a house having a night temperature of 55° to 60°. The pots should be plunged to the rims in cocanut-fibre or ashes, and, if the soil and plunging material be then given a thorough watering through a fine rose, the cuttings will require but little if any more water until they have made roots. The plunging of the pots is important, as by that means an even and moist condition of the soil is maintained. When the cuttings have rooted, which should he in from three to four weeks, gradually admit air to the frame for a few days to harden them, after which the cuttings may be taken out and afforded a position as near to the light as possible in the same house, or in another having the same tem-As soon as sufficient roots have been perature. made, pot the cuttings singly into small 60-sized pots, using a little more leaf-mould in the compost than in that recommended for rooting the cuttings.

Nerines.—The most important point in the culture of Nerines is to afford them all the light possible. Keep them throughout the winter and early spring months on a shelf near to the roof-glass in a house where a night temperature of 45° or 50° is maintained. While the plants are making their growth an occasional watering with weak liquid-manure is beneficial, especially if the plants were not repotted in the autumn. Repotting, when necessary, should be done at the end of July, before the flower-spikes begin to show. When the bulbs begin to lose their foliage, lessen the water supply gradually, and at the beginning of May place the plants in a cold frame and expose them to full sunlight, the soil being allowed to remain quite dry until the flower-spikes begin to appear, at the end of the summer.

THE KITCHEN GARDEN.

By John Pentland, Gardener to C. H. B. Firth, Esq., Ashwicke Hall, Marshfield, Chippenham.

Trenching.—Before commencing to trench a piece of land, consider the nature of the soil. No harm can be done if it is open in character, and capable of being easily worked, but years of labour may result from the trenching in one year of stiff clay. On such aoil the top spit is usually workable, and should be kept at the top. In starting to take out the first trench upon such soil, wheel the top spit to the end at which you will finish, after which turn over the bottom to the depth required, mixing in ashes, roadscrapings, and manner as the work proceeds. When starting to take out the second trench, turn the top spit on to the bottom of the first trench, which has been prepared, then turn up the bottom as before, and so on, until the work is finished. This will be found to answer better than turning unworkable clay to the surface. Before coming to this neighbourhood I always thought, when trenching, of the father's advice to his sons to dig for the buried treasure, but experience has taught another lesson.

Peas and Beans.—Keep a sharp look-out over November-sown Beans and Peas for slugs, and if any be found apply a good dressing of soot, after which spread about ½ an inch of dry ashes, sawdust, or dry sandy soil along the lines, working it well between the plants and to at least 6 inches on either side. Finely sifted ashes from anthracite coal we find an excellent harrier to slugs.

Forcing.—Where hot-heds have been got ready and the heat has declined to 70°, sow seeds of early Carrots, Radishes, Cauliflower, Onions and Leeks, also a few seeds of Tomatos. The quantity of each will depend upon the demands that are likely to arise, and upon the conveniences at hand for growing all to perfection without overcrowding.

Potato-tubers in heaps should be looked over frequently, and the most forward placed in boxes on their ends, the sprouts upwards, exposing them to the light in a position where frost is not likely to reach them. Plant tubers of Sharpe's Victor on mild hot-beda or in pots,

Mushrooms.—If any of the beds are showing signs of exhaustion, a watering with tepid liquid-manure obtained from cow-dung and a little salt will probably excite a considerable quantity of dormant spawn into growth. Beds that are quite spent should be turned out, and new ones made in their place. Protect beds out-of-doors with sufficient covering to ward off frost and snow. Collect droppings as they are turned from the stables, and spread them out on the floor of a shed until a few days before they are required. They should then be thrown in a heap and turned over several times before being placed in the bed.

Celery.—If this is not already protected from rain and frost, let it be afforded such protection at once.

Asparagus.—If roots will be required from the open beds for forcing, cover the ground over them with long litter, to prevent the soil from being frozen hard, which would make the operation of lifting the roots very difficult.

FRUITS UNDER GLASS.

By W. FYFE, Gardener to Lady WANTAGE, Lockinge Park, Wantage.

Vines intended to afford ripe Grapes in June should be started at once. In order to obtain compact well finished bunches with good berries, prune the canes on the "close spur" system. In the case of Vines with well ripened wood that have had adequate rest, it will not be necessary to dress the wounds with "styptic." We never make use of this at all. Strip all the loose bark from the Vines, but make no attempt to scrape them. The bark is Nature's protection from atrong sunshine, and a means by which moisture is retained upon the Vines. Wash the canes thoroughly with soft-soap and water, and treat the woodwork and glass in the house similarly. We employ no mixture for the painting of the rods, its use being unnatural and unsightly. If mealy-bug is at all troublesome, all holes are closed by the use of Gishurst Compound. Do not afford water to the borders until the Vines are in active growth, or unless the soil greatly needs moisture. Damp the house and rods occasionally, but remember that an excess of moisture will tend to encourage weak growth. The temperature by artificial means should range from 50° to 55°, and it may rise 10° or 15° more from sunheat.

Raising Young Vines from Eyes.—The present is a suitable time to do this. Select the varieties and choose good plump buds, cutting the wood about 1 inch in length with the bud in the centre. Take out a small slice of the wood from the side opposite the bud, and place the piecea singly on the flat side in 3 inch pots, which should be three-parts filled with light loam, with a little bed of sand for the eye to rest in. Plunge the pots in a temperature of from 80° to 85°, and afford water as may be necessary.

Peaches and Nectarines.—Start the second early house to produce ripe fruits in June. It will only be necessary to employ fire-heat to maintain a day temperature of 50° to 55°, with sufficient ventilation to cause a circulation of air, and allowing an advance of 10° from sun-heat, with additional ventilation. Until the flower-buds are well advanced, a night temperature of 40° to 45° will be sufficient, and it may be then raised gradually to 50°. Syringe the trees each morning in bright weather until the buds are upon the point of bursting, then cease to syringe the trees overhead, and damp the borders and paths only. The water-pipes should always have a little warnth in them, and there should be a slight circulation of air in the house. Suitable varieties for ripening in June are Stirling Castle Peach, and Lord Napier Nectarine.

Cucumbers.—In raising young plants we adopt the same practice for bottom heat as advised for Melons in a previous Calendar, sowing the seeds in 3-inch pots in a compost of two parts light friable loam and one part leaf-mould. Fill the pots half full with the compost and put one seed in each pot, covering it with fine moist soil that no water may be required until the seeds have germinated. A little top-dressing may be afforded them subsequently. Keep the young plants near to the glass, which should be covered at night.

THE ORCHID HOUSES.

By W. H. While, Orchid Grower to Sir Trevor LAWRENCE, Bart., Burford, Dorking

Lælias.—There are now some plants of the well-known Lælia anceps in bloom, including such distinct varieties as L. a. Barkeriana, L. a. Protheroeana, L. a. Leeana, L. a. Veitchii, L. a. alba, L. a. Dawsoni, L. a. Percivaliana, L. a. Schroderæ, L. a. Hillii, L. a. Williamsi, L. a. Schroderæ, L. a. Hillii, L. a. Williamsi, L. a. Stella, L. a. Sanderiana, L. a. Chamberlainiana, &c. Orchid cultivators have held for a long time past that to grow these Mexican Lælias thoroughly well the plants require a great amount of sunlight; but notwithstanding the great deficiency of sunshine during the past year, the plants at Burford have made better progress and are blooming more profusely than for several seasons past. While the plants are in flower, and until growth has recommenced, keep the temperature of the house at about 55° hy night, and the atmosphere comparatively dry. Let the hot-water pipes be made moderately warm, so that fresh air may he admitted through the lower ventilators in proportion to the condition of the weather out-of-doors; and whilst taking care that the pseudo-hulbs do not shrivel, do not afford much water to the roots. When the flowering stage is past, examine each plant for scale insects, and otherwise thoroughly cleanse them. L. autumnalis, L. albida, and L. purpuracea, coming from higher elevations than L. anceps, are perfectly safe if suspended in the cool-house while they are at rest. The distinct L. rubescens (L. acuminata or L. peduncularis) is a good "basket" plant for cultivation in the warmest house; it has now passed out of flower, and should be placed with L. anceps.

Vandas.—V. Amesiana, a lovely Orchid, now in bloom, may also be stood in the cool, dry atmosphere of the Mexican-house, and if no water be afforded the plant the fragrant flowers will last along time in good condition. Such tall and stately-growing plants as Vanda suavis, V. tricolor, and their varieties, thrive well in the ordinary temperature of a Cattleya-house. Place them together at one end of the house, and as the planta are in full growth and rooting freely afford them a little extra water, and keep the stages, &c., constantly moist.

Deciduous Calanthes of the vestita section require a thorough rest after they have done flowering, and should be placed on a dry stage or shelf well up to the roof-glass of the plant-stove or warmest house. Previous to removal to their resting quarters thoroughly cleanse each plant from white and brown scale insects which commonly infest them. Do not afford water to the roots while the plants are dormant. Calanthes of the Regnieri section, as C. Regnieri, C. Sanderiana, and C. Stevensi, are now opening their flowers-Gradually decrease the supply of water, so that when all the flowers are unfolded it may be discontinued. When in flower the long arching spikes of these Calanthes show to the best advantage if the plants are stood upon the ground and interspersed with Palms, Cyperus, and Ferns.

Sophronitis violacea. — Among dwarf-growing Orchids that bloom at this season Sophronitis violacea stands out prominently, and when a healthy plant is seen, as we have it here, with about forty violet-magenta flowers open, it is a pretty object. Block treatment suits its requirements admirably. Select a nice smooth piece of Apple-wood, take off the bark, and previous to fastening the plant on the block dry or bake the wood thoroughly well. Suspend the hlock in a horizontal position in a shady part of the Cattleya or Intermediate-house, and keep it moist at all times, even when the Sophronitis is at rest.

Odontoglossum coronarium.—In the cool-house plants of Odontoglossum coronarium miniatum are now sending up their flower-spikes, and should receive copious root waterings until the flowers open.

FRUIT FROM AUSTRALIA.—The Manager of the "Orient" R.M. Steamship Company has sent us particulars of the amount of Apples it is expected will be sent us from Australia between the dates February 13 and May 7. The estimate includes 200,749 cases from Hobart, 34,900 from Melbourne, and 28,450 from Adelaide—making a total of 264,099 cases.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the Publisher. Letters for Publication, as well as specimens and plants naming, should be addressed to EDITOR. 41, Wellington Street, Covent Garden, London. Communications should be WEITTEN ON ONE SIDE ONLY OF THE PAPEE, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself re-sponsible for any opinions expressed by his correspondents.

Illustrations .- The Editor will be glad to receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY, JAN. 16-German Gardeners' Club Meet.

Gardeners' Roy. Benev. Inst. Annual Meeting and Election of Pensioners at Covent Gar-den Hotel at 3 P.M. Brighton Horticultural So-THURSDAY, JAN. 21 Brighton

ciety Meet.
Linnean Society Meet.

JAN. 22 1 Royal Botanical Society, General Meeting. FRIDAY.

SALES FOR THE WEEK.

MONDAY AND FRIDAY NEXT— Border Plants and Perennials, Azaleas, Roses, &c., at 67 and 68, Cheapside, E.C., by Protheroe & Morris,

at 12
WEDNESDAY, JANUARY 20—
At 12.30 at Stevens's Rooms, 500 cases Japanese
Lilies—At 1.30 at Stevens', Roses, Fruit Trees,
Azaleas, Gladioli, Begonias. &c.,—Azaleas, Rhododendrons, Palms, Plants, Roses, Liliums, Herbaceous Plants. &c., at 67 and 68. Cheapside, E.C., by
Protheroe & Morris, at 12.—1 706 cases Liliums from
Japan. Pearl Tuheroses, Palm Seeds, &c., at 67 and
68. Cheapside, E.C., by Protheroe & Morris, at 3.

FRIDAY NEXT—

Imported and Established Orchids at 67 and 68,
Cheapside, E.C., by Protheroe & Morris, at 12.30.

(For further particulars see our Advertisement columns.)

AVERAGE TEMPERATURE for the ensulng week, deduced from observations of Forty-three Years at Chiswick

ACTUAL TEMPERATURES :-

London.—Jan. 13 (8 p.m.): Max. 55°; Min. 44°.

Jan. 14 (noon): Showery, windy, mlld.

Provinces.—Jan. 13 (6 p.m.): Max. 48°. South Coast
of England; Min. 40°, West Coast of
Scotland.

THE near approach of the "The annual meeting, which is to be Gardeners' held at the Covent Garden Benevolent." Hotel, Southampton Street, Covent Garden, on the 21st inst., has been heralded, as it usually is, by the receipt of numerous letters concerning the Institution. For the most part these are of an encouraging and laudatory character. In others objections are raised. For the most part these objections are based on misconceptions, and all are, we believe, capable of explanation.

We will give the first place to the following letter from Mr. HARRY J. VEITCH, than whom no one is more interested in the Institution, no one has done, and is doing, more for its welfare. It is not only his active sympathy with the objects of the Society, but it is specially his business capacity which gives him a claim to be heard. When a working Committee is headed by such a man with the assistance of such colleagues, and the aid of such a Secretary as Mr. INGRAM, it is certain that the wishes of the subscribers and the requirements of the candidates will be as thoroughly well considered as they can be, and as a matter of fact we know that they are. Here is Mr. VEITCH's letter:-

"I have read with much pleasure the correspondence which has taken place in the recent issues of the Gardeners' Chronicle, and it is ex-

ceedingly gratifying to find how much interest is being shown in the affairs of the Institution. Whilst I feel very thankful for the help the Institution is at present able to give to more than 200 pensioners, of whom eighty-eight are the widows of gardeners, much more could be done had we more means at our disposal. Having, at the request of the Committee, consented to take the Chair at the Annual Festival Dinner on Tuesday, June 28 next, I venture to ask all who have the well-being of the Institution at heart, and who are desirous of assisting their less fortunate brethren, to help to make the Festival the most successful which has ever yet been held, both by contributing what they can themselves and by soliciting donations from all lovers of gardening with whom they may be acquainted.

"If any who are willing to assist me in this will kindly communicate with the Secretary, Mr. G. J. INGRAM, at 175, Victoria Street, Westminster, S.W., or with me at 34, Redcliffe Gardens, S.W., either of us will be very pleased to furnish all desired information and also to forward collecting cards.

" HARRY J. VEITCH,

"Treasurer and Chairman of Committee."

We earnestly trust Mr. VEITCH's appeal will be as well responded to as it ought to be. The applications for relief unfortunately are out of proportion to the means of alleviation. This disproportion was becoming more and more accentuated, so that in order to check the progress of a condition of affairs which could only end in the future in a serious curtailment of the benefits of the Society, some changes in the rules had to be made last year. These changes were the result of long and anxious consideration, and they were accepted at the annual meeting without a dissentient vote.

To show how matters stand, we may say that at the next election there are about fifty-three candidates (the exact numbers are immaterial for our present purpose). Of these fifty-three, thirty-one, including seventeen who were unsuccessful at the last election, have subscribed for fifteen years and upwards; thirteen have subscribed for a shorter period than fifteen years, and eleven have not subscribed at all. Now it might reasonably be expected that the thirty-one who have subscribed for fifteen years should take precedence over those who have not subscribed at all, and that they should be elected at once on to the pension list. Alas for reasonable expectations! There are but twelve vacancies. If the objectors would furnish the means to secure the election of those who are now, perforce, left to await the chances of another election. how happy the Committee would feel! In the meanwhile the Committee do what they can to equalise matters. They investigate each case brought before them. They, of their own initiative, credit each accepted candidate with a number of votes, proportionate to the length of his subscription, so that old subscribers, if they cannot all be placed on the pension immediately, have a great advantage in the future over those who have not subscribed at all. For instance, a man who has subscribed forty years would be credited with 100 votes for each year that he has subscribed, amounting in the aggregate to 4,000 votes, a number which would ensure his election without further effort.

One of our correspondents complains that at the last election half the successful candidates had not subscribed to the fund. If this had been true the fault would have lain with the subscribers, not with the Committee; but it is not true. We are informed that of the fifteen elected ten had been subscribers and five had not. Again, we are told that some of the unsuccessful candidates last year had been subscribers for twenty years, and thought, other things being equal, they would certainly have been placed on the pension list-a not unreasonable expectation; but what could be done when the number of candidates over sixtyfive years of age, and who had subscribed fifteen years, was twenty-three, and there were only fifteen vacancies?

Again it is suggested for the consideration of the Committee that the age limit of potential candidates should be raised, and that the amount given annually by the Institution should be proportionate to the income of the candidate. Thus, if one man has thirty-five pounds a year, he ought to be able to claim fifteen pounds; whilst another with forty pounds per annum should only be allotted ten pounds from the Insti-tution, and so on. We have not tested the accuracy of these figures, which is a matter for the accountants to advise upon; we merely cite them to show what some gardeners are thinking.

Of the method of voting, with all its unnecessary trouble and expense to candidates and their friends, and the inconvenience to the subscribers, we have often spoken, but always to find ourselves in a minority. Nevertheless, we are still so struck by the cumbrousness of the present system that we again suggest that the Committee, who already are responsible for so much, and who, as we have said, already allot a proportionate number of votes to each candidate according to the length of the period during which they have been subscribers, should go a little further, accept a little more responsibility, and themselves recommend to the subscribers the candidates for the pension according to the number of vacancies or the means at disposal. The names of the candidates recommended for election might be submitted to a general meeting, by whom the list could be accepted or amended by the voters at their discretion. All that would be then necessary would be for the Committee to prohibit canvassing for votes; to circulate a list, first, of all the eligible applicants; and, secondly, of those whose claims appear to the Committee to be most urgent, leaving it to the individual subscribers to accept the names proposed to them, or to give their votes to others, as they might think fit. This is a detail that may be left for future consideration. What is urgent is that the gardeners of the country should support their own Institution more freely than they do, and exert themselves to the utmost to reduce that saddening disproportion between the number of applicants and the means of satisfying them. Annual subscriptions should be very largely increased, whilst from those prevented by circumstances from subscribing regularly, donations of any amount, large or small, to those two excellent auxiliaries, the Victorian Era Fund, for the benefit of unsuccessful candidates at each election who have previously been subscribers to the Institute, and the Good Samaritan Fund, for the immediate aid of others in need and distress, would be most acceptable.

Gardeners are so isolated that they do not realise to the full extent either the necessities of their less fortunate brethren, or the efforts that are made by the Committee of the Gardeners' Benevolent to afford relief. But in these days of postal orders the facilities for the transmission of even small amounts are greatly enhanced. Let us all see to it that our Benevolent Societies profit accordingly.

DEDICATIONS.—Following the practice of the Botanical Magazine, it has become customary to dedicate the annual or half-yearly volumes of garden periodicals to some distinguished craftsman or scientist. Thus the current volume of the Garden is dedicated to Dr. Alfred Wallace, who has a charming experimental garden at Parkstone; whilst Le Jardin pays a similar compliment to M. Nanot, of Chrysanthemum fame.

MR. CHAMBERLAIN'S COMMISSION.—Among the members of this Commission we find the names of Mr. J. W. Dennis, of W. Dennis & Sons, of Covent Garden, one of the largest firms handling market-garden produce, Potatos, and fruit.

A GARDENER'S CALLING.—It is most unusual for us to have to record the death, by suicido, of any one engaged in horticultural work. With all its alleged disadvantages, a gardener's calling is one that affords infinite interest, and in most cases tends to keep the mind and body healthful and happy. It is therefore with the greatest regret we publish the cases of suicide related on another page. In both instances the deaths were due to mental depression.

THE ROYAL GARDENERS' ORPHAN FUND.— Sir TREVOR LAWRENCE, Bart., K.C.V.O., President of the Royal Horticultural Society, has kindly consented to preside at the next annual Festival Dinner of this Fund, which will take place at the Hotel Cecil on Tuesday, May 17.

The Secretary announces the receipt of £23s. from the office of the Gardeners' Chronicle. This sum represents the amount deposited in the collecting-box in our office for six months, together with various small donations made on account of services rendered by us to gardeners and others for which no payment was expected.

LINNEAN SOCIETY OF LONDON.—An evening ameeting will be held on Thursday, January 21, at 8 P.M., when the following papers will be read:
—(1) "An Account of a Plankton Expedition to the Bay of Biscay in H.M.S. Research, in 1900," by Dr. G. HERBERT FOWLEE, F.Z.S.; (2) "The Crustacea obtained by Dr. G. H. FOWLER in the Biscayan Plankton," by Rev. T. R. R. STEBEING, F.R.S., Secretary of the Linnean Society.

THE GRAPE MELTON CONSTABLE. — On another page appear two letters respecting this new Grape, upon which there has been some correspondence in previous issues. As the matters under debate cannot be settled until another season it will be better to discontinue the correspondence. Those who are anxious to test the variety may soon do so in their own gardens.

THE RAINFALL IN 1903.—In last week's issue we published particulars of the excessive rainfall of last year in County Kilkenny; and we shall shortly give details of the year's weather at Rothamsted, where observations are made of a very complete nature. Our valued correspondent Mr. Mawley has also kept our readers informed in regard to the weather experienced in West Hertfordshire. If our columns were elastic we should have pleasure in publishing similar details very kindly supplied by a large number of correspondents whose

contributions are still upon our table, but of which under present circumstances we cannot avail ourselves fully. Among these the following totals may be noted: From the Royal Gardens, Windsor, by Mr. T. EDWARDS, total for the year = 36:31 inches, as against 22:07 inches in 1902; from the gardens at Hampton Manor, by Mr. Neil Sinclair, = 33.07 inches; from D'Abernon Chase Gardens, Leatherhead, by Mr. J. B. Lowe, 42 47 inches; from Norbury Park Gardens, Dorking, by Mr. G. Kent, 52:58 inches, as against 24.04 inches in 1902. Mr. VERT, gardener at Audley End, near Saffron Walden, has sent us a table in which the monthly rainfall during a period of thirty-seven years is given. The average for those years is 23.99\frac{1}{3} inches, but the fall in 1903 was equal to 3484 inches. In the well-remembered dreary year of 1879 it was 28.5 inches; and in 1872 it was 34.4 inches. In 1903, therefore, the amount was greater than in any of the thirty-seven years.

—— It appears from Nature that the greatest fall, 67 inches, in the year, was at Valentia, S.W. Ireland; then comes Stornoway, 62 inches. The smallest falls were in East England—Yarmouth, 248 inches. In London 38 inches fell, more than half as much again as usual. At Greenwich 35.5 inches fell, 11 more than the average; and there were 184 rainy days.

NATURE-STUDY.—The Bath and West of England and Southern Counties Society propose to hold a Nature-Study Exhibition in connection with their agricultural show at Swansea in May next.

KEW SEED LIST.—We have received from the Royal Botanic Gardens, Kew, Appendix I. (1904) of the Bulletin of Miscellancous Information, which is a select list of seeds of hardy herbaceous plants, and of trees and shrubs, which for the most part ripened at Kew during the year 1903, and are available for exchange.

LA MORTOLA SEED LIST.—We acknowledge the receipt of a list of seeds collected during the year 1903 in the garden at La Mortola, Ventimiglia, Italy.

FORESTRY.—"F. R. S.," writing in the Times, says that for those who wish to profit from treeplanting there is "no tree worth a minute's consideration excepting the common Larch." Is this not a too "sweeping statement"? The Larch is no doubt excellent, but it is subject to disease. The Japanese Larch (L. leptolepis) is well spoken of. The Douglas Fir certainly deserves more extended trial. Thuya plicata (gigantea) should also not be overlooked. Abies Nordmanniana, Cupressus Lawsoniana, Abies brachyphylla and Thuyopsis borealis should certainly not be condemned off-hand. The writer in the Times is speaking of the South of England particularly, and has in view the production of wood suitable for the builder. The Larch has had the start of the species we have mentioned, but we suspect that experience will prove that some of them are equal to or even better than the Larch.

New Propagating Department in Hyde Park. — A new range of glasshouses for propagating, &c., in Hyde Park, having become necessary, it has been decided to transfer the present one in Kensington Gardens to a more open and central position in Hyde Park. For this purpose about three acres of ground have been selected near the old leaf yard, and enclosed by a mound of suitable size for shelter and privacy, which will be planted with groups of shrubs, trees, &c. Accommodation will be found for three fine ranges of pits for propagating, growing on, and hardening bedding and other plants, while other houses will furnish space for wintering Palms, Bamboos, Musas, and other plants used in suh-tropical bedding in summer.

Enclosures sheltered by wind-screens for hardening plants and for raising and increasing stock will also be included. The saving of cartage in the summer bedding time will be very appreciable, a distance of over two miles being saved in the journey to Park Lane alone, while the fine open situation, together with every modern convenience, will make this new growing establishment a distinct acquisition to the welfare of the various parks and open spaces supplied from it. The whole has been designed and is being carried out under the direction of the new superintendent, Mr. C. Jordan.

DOBBIE'S MEMORANDUM BOOK AND POCKET GUIDE TO GARDENINO is a convenient and useful pocket-book, with calendar. A page is given to each month, three-parts being reserved for the making of notes, and one-third is printed matter explaining very briefly the current work in the garden. There are also short notes upon the cultivation of flowers and fruit-trees, and at the end a number of blank pages for entering notes. It is published by Messrs. Dobbie & Co., Rothesay, price 1s.

WEBSTER'S "FORESTER'S POCKET DIARY," published by RIDER & SON, 164, Aldersgate Street, London, is a very handy and serviceable little book. A monthly calendar of operations precedes a variety of notes, of which the forester is likely to appreciate the value. A list of foresters is appended, and the whole forms one of the most compact and convenient of similar annual publications.

My Garden Diary for 1904.—This is a handy little publication sent out by Messrs. Sutton & Sons, of Reading, giving in wonderfully small space an epitome of the year's work in the garden. Various notes concerning the calendar are also included, and there is space for daily memoranda. The booklet has a pretty coloured cover and a frontispiece.

South African Flowering Plants.—Prof. Henslow has just published a small volume relating to the manners and customs of certain representative plants of the Cape Colony, and the way in which the plants are constructed so as to be able to adapt themselves to the conditions under which they grow. Messrs. Lonomans are the publishers of the book, to which we shall take an early opportunity of referring at greater length.

PERPETUAL MALMAISON CARNATIONS.—M. GRIGNAN, in the Revue Horticole, makes mention of two varieties, named Chatillon and Mme. Bixio. They were, with others, raised by IM. Nonin, of Chatillon-sous-Bagneux, Paris, by the use of pollen from Malmaison varieties on flowers belonging to the tige de fer or stiff-stemmed section. The crosses retain the size of flower and vigour of the Malmaison, combined with the property of flowering at any season, by means of pinching and appropriate cultivation.

SPARTIUM JUNCEUM. — In this and some other species characteristic of dry climates, the leaves are small and soon fall, while the rind of the shoots remains green. It is generally assumed that the leaves in these plants are relatively of little importance, as their work is done by the green rind; but Mr. Bergen, in the Botanical Gazette, says, from experiments made at Naples on three species, that during the leafy season the leaves transpire much more than the rind does from a like area, and photosynthetic action (assimilation of carbonic acid under the influence of light) is also probably greater. Leafless plants of Spartium grow but little at any season.

PRESENTATION TO MR. A. D. CHRISTIE.—After upwards of fourteen years' service as headgardener to the Marquis of Hertford, Ragley

Hall, Warwickshire, Mr. A. D. Christie left that place in December, on which occasion he was presented with a marble timepiece, inscribed "To A. D. Christie' from the Marquis of Hertford, Christmas, 1903." Mr. Christie's fellow-servants at the Hall, the employés in the gardens, and the members of the Arrow and Ragley C.C., of which he had been treasurer for many years, presented him with an English lever watch suitably ongraved, a silver chain and pendant. Mr. Christie was well known in South Warwickshire, and horticultural societies have repeatedly requested him to judge at their shows. His many friends in Aleester and district, at a public gathering held in the Corn Exchange under the presidency of the

strongly adverse to the extinction of wild birds, but it was certainly never the intention of Parliament to cause the destruction of millions of young salmon and other fish annually by allowing worthless birds to increase as they have done." It is a curious fact that at this season more sea-gulls can be seen at any one time over the Thames, even in the centre of London, than can be witnessed on the coast. We have lately had an opportunity of testing this statement. This looks as if food were more abundant in London; whether there is a corresponding deficiency of fish in the sea we do not know. We should in any case be very sorry to see the gulls ousted from London.

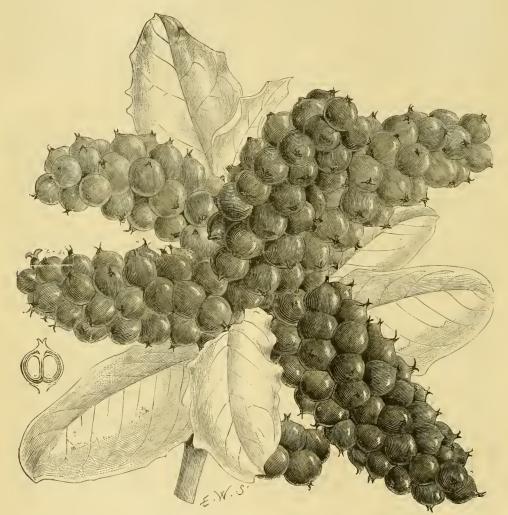

Fig. 19.—Fruits of Garrya elliptica, purplish in colour. (see p. 44.)

High Bailiff (Mr. E. A. Jephcott), recently presented Mr. Christie with an illuminated address, together with a purse of sovereigns. Mr. Christie was also a member of the Arrow Parish Council. It is hoped that this good gardener will soon obtain another appointment. His successor at Ragley, as we have already announced, is Mr. Harding, for the last eight years foreman in the Royal Gardens, Sandringham.

FISH-DESTROYING BIRDS.—In the January number of the Nineteenth Century, Mr. Marston, the editor of the Fishing Gazette, has a paper, in which he says that the protection of wild birds has been carried too far; the effect has been to increase nearly all kinds of birds, including many which destroy grain, fruit, vegetables, and fish. The increase of sparrows is indeed deplorable; if their numbers and those of a few other birds could be reduced it might be better. Mr. Marstone in the state of the

THE BATH WATERS.—The cause of the healing properties of the Bath hot springs has always been more or less of a mystery. Possibly in the future the explanation may be found in the more minute analysis that is now possible. Already we are told that the newly discovered substance helium has been found in the vapours from the spring, and now radium has also been discovered in infinitesimal quantities. Sir WILLIAM RAMBAY has found that helium is evolved from radium, and hence Mr. Strutt considers that the helium at Bath is derived from large quantities of radium at a great depth below the surface. A similar discovery has been made at Buxton.

THE CODLIN MOTH.—The best remedial measures, according to a *Bulletin* of the U.S. Department of Agriculture, are spraying and the application of grease-bands, by which means the damage has in one case been reduced from 40—60

per cent. to as low as 10 per cent. The annual loss to American Apple-growers from this pest is estimated at 11,000,000 dollars.

THE SUPPLY OF NITROGEN TO PLANTS.—MM. BOUILHAC and GIUSTINIANI, in the Comptes Rendus, give an account of their experiments ingrowing Buckwheat in a soil destitute of nitrogen, but with which had been incorporated certain algæ and bacteria. These latter speedily enriched the soil to such a degree that the Buckwheat flourished, and its analysis showed a large-percentage of nitrogen, though, as we have said the soil was originally destitute of that ingredient. The matter is in the experimental stage-purely, but there are great hopes that the resources of science will shortly place at the disposals of the cultivator sources of nitrogen at a cheap-rate.

THE BATLEY AND DISTRICT CHRYSANTHE-MUM SOCIETY will hold its annual show on. November 5.

THE ACTION OF LIME.—A certain proportions of lime is necessary to the health of many plants. If that proportion be exceeded, says M. AMAR in the Comptes Rendus, the excess is eliminated in the form of crystals of oxalate of lime. These crystals may therefore be regarded as excretions of the waste lime. Others think the crystals are excreted to get rid of the oxalic acid.

Publications Received.—From the Board of Agriculture and Fisheries, Leaflet No. 98, Grading and Packing Fruit and Vegetables. This should be studied by all who grow garden crops for market, as careless handing is a prime source of failure.—Farm and Home Year-Book and Farm Trade Directory, 1904, for the farmer, stock-keeper, and housekeeper. A storehouse of information on matters connected with live stock and crops of a farm.—Journal of the Scottish Meteorological Society, with tables for the years 1900-1901. This deals with the rainfall of Scotland in relation to sunspots, by Dr. Buchan; Temperature Observations on Ben Nevis, by T. S. Muir; and Meteorology of Scotland for 1900 and 1901, with tables.—From the Imperial Department of Agriculture for the West Indies: Summary of the Results of the Cultivation of Scedling and other Canes at the Experiment Stations in the Leeward Islands, 1802-1903.—The Agricultural Gazette of New South Wales. November Contents: Letters on the Diseases of Plants, Macaroni Wheats, Late Grapes for Export, Vegetable and Flower Growfug, &c.—The Year-Book of New South Wales, 1904. Gives particulars concerning the Government, and Legal, Military, Commercial, and Historical Notes. Describes also the Geographical Characteristics, Water Supplies, Railways, &c., with chapters devoted to Crown Lands, and Professional and other Prospects; information invaluable to intending colonists.—Agricultural Bulletin of the Straits and Federated Malay States. November. Contents: Cultivation of Cotton in the Federated States; Notes on Rubber, Coffee, &c.—The Agricultural News, a fortnightly Review of the Imperial Department of Agriculture for the West Indies, Barbados, Dec. 19, 1903. Deals with Cotton Seed, the Sugar Industry, Cacao, Tobacco, &c.—Fertilisers and Federated States; Notes on Rubber, Coffee, &c.—The Agriculture for the West Indies, Barbados, Dec. 19, 1903. Deals with Cotton Seed, the Sugar Industry, Cacao, Tobacco, &c.—Fertilisers and Federated States; hopening Poeket Diary and Note Book for 190

DESIGN FOR PARTERRE GARDEN.

[SEE SUPPLEMENTARY ILLUSTRATION.]

The garden plan shown in the Supplementary. Illustration differs from most others, which generally include elaborate and, of course, expensive Box or worked stone edgings and narrow gravelled walks. The designs which I favourare cut out simply on grass; they require no-Box or stone edgings, and are much lighter in appearance than the forms of squares, oblongs, stars, ovals, &c., usually adopted. The grass-throughout and also in the narrowest spaces-forms the groundwork of the design, and is easily kept mown by the frequent use of those very perfect machines which are now made to cut into the smallest spaces imaginable.

The design is one of many that I have drawn and which are similar in general features but different

in detail; it is drawn to no particular scale, but it may be assumed that to carry out such a design with any pretence to dignity an area would be required of from 3 to 10 acres or upwards, that is, of course, exclusive of the more sheltered shrubbery, wood and water generally found forming the immediate surroundings of such formally laid-out, gardens. As there can be no

Box or stone edgings, and also of those most unmeaning, narrow, Lilliputian gravelled walks we generally find forming part of the design of most of our existing parterre gardens. With such a choice of plants as we now have, the planting of these designs is reduced to a very simple matter. Unlike the neat but expensive and laboured carpet hed, the 'design for which has to be

selection of Crocuses, Pansies, Tulips, Hyacinths, and such bulbs. A parterre garden of this type I designed and laid down for the Countess of Craven at Coombe Abbey many years ago, and the Countess and her friends were very much pleased with its effective simplicity.

The work of forming these designs is to me a labour of both love and pleasure. They

Fig. 20.—Garrya elliptica (hardy shrub): male catkins. (see p. 44.)

large trees introduced into such a garden, I have, as may be observed, arranged along the outsides some shady pergolas for use during days of very hot sunshine.

I had long thought that free-and-easy scroll designs of this kind, simply cut out on grass, might be carried out with advantage, and be appreciated all the more for the complete absence of

renewed every year, this design, once formed, is there always, or until a fresh design is wished for, and then the work is merely one of moving the turf to form new scroll figures.

When the summer flowers are past, and the beds (which are never very wide) have been digged, they can be made effective for the winter and spring months hy planting them with a

are chiefly the work of winter days and wet summer weather; but so seductive is this kind of labour that I confess to often finding myself busily at work even when the sun is high in the heavens. I shall continue the work of these parterre scroll designs, for which I believe there is a great future. W. Miller, Berkswell, Coventry.

TREES AND SHRUBS.

THE SPECIES OF GARRYA.

In the Botanical Gazette (Chicago) Miss Eastwood describes several species of Garrya. The plants are dioecious, and are madequately represented in herbaria. They bloom in the depth of winter, when few people collect; they fruit in August and September, when it is dangerous to explore the dry hills of California on account of the absence of water and the density of the The species are arranged as follows:—
Aments not branched—

Pubescence of tangled or wavy hairs:
G. Veatchii, G. elliptica, G. Congdoni, Eastwood (sp. n.).

Pubescence of straight hairs: G. buxifolia, flavescens, pallida, rigida
Eastwood (sp. n.), Fremonti (fig. 21).

Aments more or less branched—

Pubescences of curly hairs: G. ovata, Lindheimeri, macrophylla, oblonga longifolia, Rose in herb.

Pubescence of appressed silky hairs: G. laurifolia, salicifolia, Eastwood (sp. n.), Wrightii, and Fadyeni. ment to the report of the Conifer Conference held at Chiswick in October 1891, particularly as, in some instances, measurements of the same trees are given, so that the rate of growth in twelve-years can be estimated.

It is not quite clear what tree is meant by the author under the name Libocedrus decurrens, Torrey, as the synonym Thuya gigantea of Carrière is attached to it. We are unable to find that Carrière used that name for a species. Libocedrus decurrens of Torrey is one thing, and for some time it was erroneously called in gardens. Thuya gigantea. Thuya plicata is the true name

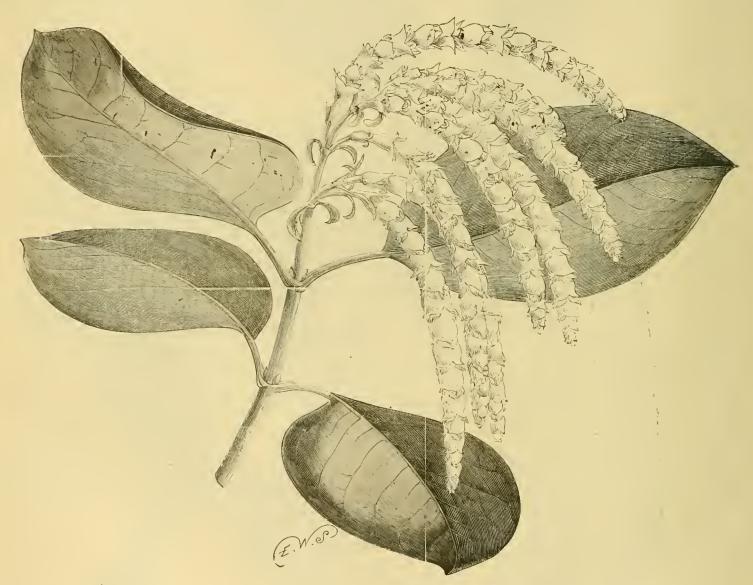

FIG. 21.—GARRYA FREMONTI (HARLY SHRUE): MALE CATKINS.

"brush." Garrya elliptica, the best known species, has peculiar pubescence, consisting of curly hairs on the lower surface of the leaves and on the young fruit. The berries when ripe are not unpalatable (figs. 19, 20).

Garrya rigida has sparse pubescence of straight silky hairs, regularly appressed upward, and a fruit so bitter that one taste will suffice for a lifetime, hence the name "quinine bush." The northern section of the genus has unbranched catkins, as in G. elliptica; the species of the southern parts of California have more or less branched catkins. In each division the pubescence is either of curly hairs, as in G. elliptica, or of straight hairs, as in G. rigida.

Plagiospermum sinense, Oliver.

A spiny shrub with alternate, narrow, lanceolate leaves about 2 inches long; and stalked, yellow, five - petalled flowers in axillary tufts. Each flower is about ½-inch across. The shrub is described by Mr. Purpus, of Darmstadt, as hardy. It is related to the Spiræas. Mittheil. der Deutschen Dendrologischen Gesellschaft, n. 12, 1903, p. 1.

EXOTIC CONIFERS IN BRITAIN.

A paper, read before the Forestry Conference in Vienna in September, 1903, by Dr. Somerville, is printed in the *Journal of the Board of Agriculture* for December last. It a useful supple-

for T. gigantea, which is also known in gardenss as T. Lobbi. This is quite a different thing, and for timber purposes probably better than the-Libocedrus. The T. plicata of gardens is a form of T. orientalis.

Many of the specimens of Libocedrus have been grafted, and that may be true of Thuya gigantea, though it produces seed freely. At any rate, in estimating rate of growth and suitability for timber, the possibility of any particular specimenhaving been grafted should be borne in mind.

FORSYTHIA EUROPÆA, Degen.

Two species of Forsythia, natives of China and Japan, are known in English gardens, but it will be news to many to hear that a third species.

F. europæa, has been discovered in Albania. It was described originally in the Oesterr. Botan. Zeitschrift (1897), and is the subject of a note in the Mittheilungen der Deutschen Dendrologischen Gesellschaft for 1903. The plant has been in cultivation in the Berlin Botanic Gardens for some years, but has not yet flowered. A hybrid between F. suspensa and F. viridissima, named F. intermedia ×, is also in cultivation.

CALLITRIS QUADRIVALVIS

has lately been discovered in Eastern Spain by M. Ch. Pau, having previously been known in the wild state only in Algiers, Morocco, and the Barbary States. We prefer to call it Tetraclinis articulata, because the species of Callitris differ in structure and are all Australian. The tree furnishes a wood which is highly ornamental. The record is furnished in the Botanisches Centralbiatt.

THE SPECIES OF CORNUS.

Dr. Koehne, in the Mittheilungen der Deutschen Dendrologischen Gesellschaft for 1903, gives an elaborate paper with analytical tables of the microcarpum section of the genus Cornus. Twentynine species are enumerated, many of which are in cultivation.

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his Correspondents)

ARAUCARIA IMBRICATA.—A very fine specimen of this tree is growing in the grounds of Pulford Rectory, North Devon. It is upwards of 65 feet in height, is in robust health, and, with the exception of a branch which has been broken off (probably by wind), perfectly furnished from top to bottom, the lower branches, indeed, lying on the grass in a circle some 30 yards round. The upper branches are carrying many cones. The trunk measures 68 inches in circumference 3 feet from the base. The tree is a very beautiful object, and its semi-wild surroundings add to its effect. C. H.

RIPE MELONS IN DECEMBER.—I have grown Melons for many years, and have tested many of the new varieties so highly recommended. I have had ripe fruits in April and December, but during those months both flavour and appearance have been defective, consequently I conclude that very early and very late Melons "are not worth the candle." T. Lockie, Senr., Diddington Hatl Gardens, Huntingdon.

PRIMULA FORBESI. — Unfortunately this pretty little Primula, illustrated in your last issue, is not hardy enough for the average rockgarden in Great Britain, and we cannot grow it outside as it is shown in the illustration. It is, however, a charming plant for the cool greenhouse, where it is most at home, and where it is very heautiful. S. Arnott, Carsethorn-by-Dumfries, N.B.

GRAPE MELTON CONSTABLE .- I am reluctant to write, being the exhibitor and owner of this Grape, but "A. D.'s" letter on p. 12 compels me to do so. I am sending the Editor two berries of the bunch that was exhibited three times at the Drill Hall, also at Cambridge, the Crystal Palace, and Edinburgh. [We did not receive them till they were decayed, owing to an accident in the Post Office. ED.] The large bunches had not red Post Office. Ed. The large bunches had not red berries; one of the bunches, I remember, had one or perhaps two berries at the shoulder rather red, but the remainder were beautifully finished for a Grape that was not then ripe, as I explained to the Fruit Committee. When the two large bunches were first submitted, I was asked by the Fruit Committee to let them see the variety again later. I did so, viz., on November 10, and was then asked to submit it again next year alongside with Gros Colmar, and the foliage of both. had made such demands on the raiser for bunches for exhibition (and unfortunately three bunches on two separate occasions were stolen in transit) that I could not again show it this season. However, I was fortunate enough to get another bunch from Mr. Shingler for the Edinburgh Show

(which was exhibited there with the two large bunches exhibited at the Drill Hall and elsewhere), and brought some back, and submitted it on November 24 at the Drill Hall alongside a bunch of Gros Colmar and foliage of both. I was then asked to submit it again in February, as it was claimed to be a very late Grape. The Fruit Committee knew full well the reasons why I could not do this. I am not protesting or complaining as to the action of the Fruit Committee, but I do most emphatically protest against "A. D.'s "statements. Jabez Ambrose.

— I saw this Grape exhibited at the Drill Hall, and am very much surprised at "A. D.'s" assertion that the large bunches had red berries. In my opinion this statement is contrary to fact. Anyone who has grown Gros Colmar, as I have done for years, knows full well the difficulty in colouring. I have seen Gros Colmar exhibited many times this year, but not once has it been coloured to any degree approaching Melton Constable as exhibited. "E M." in his letter distinctly stated, "I have known this Grape for several years, and its raiser"; therefore "A. D.'s" remark that "E. M.'s' knowledge seems to be gathered from hearsay." is inaccurate. E. H.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—"R. D.," p. 27, writes feelingly on the claims of the above Institution. But surely he has not found time to follow up the work of the excellent Committee and their hardworking Secretary (Mr. Ingram), or he would have come across such leadets as he suggests. The writer has distributed a number of them (say has distributed a number of them (say within the past ten years) both at York and other exhibitions. Others whom he knows well have dono the same. Boxes, too, have been used at some gardeners' societies' meetings. All the same, there is room for more effort. Here I would suggest that no one should be disheartened if the immediate results are not thought good. Please permit me once again to appeal to all my fellow-gardeners to do their very best to become either life members, annual subscribers, or both. I know something of the difficulties of life, but must say that at least one thousand more gardeners might become either one or both if only the resolve was made in earnest. What a consolation it will be, if circumstances should compel any of us to come on the pension list, to feel that at any rate we have done something towards helping the funds when we were able. No one can say for certain what the future has in store for him, as witness the many deserving cases that must be disappointed next week. Few, if any, non-subscribers will be elected in the near future. Life Member and Subscriber for twenty-four years.

THE LATE JOHN WARD.—As the eldest son of the late John Ward, I thank Mr. Douglas for his kind obituary notice of my father. Mr. Baines exhibited stove and greenhouse plants only, whilst my father, at the time when wrestling with him for premier honours in that class, was also taking Ist prizes for Orchids, show Pelargoniums, and Heaths. Whilst Mr. Baines was exhibiting in London only, my father was at the same time exhibiting at Romford, Chelmsford, Brentwood, Colchester, Bishop's Stort-Saffron Walden, Tunbridge In this connection I should like to mention that on one occasion I remember him leaving Leyton one Monday, showing at various towns through Essex, and returning on the following Friday, having been in a bed during the whole of that time. As Mr. Douglas truly says, he was a splendid cultivator of cool Orchids. I have heard him relate with great glee a story of how, in the early days of cool Orchid culture, the Royal Botanie Society offered a prize at Regent's Park for six Odontoglossums (open). It was thought that no amateur could put up six distinct varieties at that time, and apparently the only two exhibitors were Messrs. Linden and Bull, until at the last moment my father put up six, and took the 1st prize, no mean honour with such redoubtable adversaries. I have known him to show in the old days at the Royal Horticultural Society's gardens in thirteen classes, and carry off thirteen lst prizes, but he always considered his greatest coup was the day the Westminster Aquarium was opened with a huge flower-show, under

the management of the late John Wills, but although I was present I regret I cannot remember the details. That he could also grow stove Orchids is proved by the fact that I have in my possession two photographs of plants cultivated by him over thirty years ago—one of Angræcum sesquipedale, with eightern flowers expanded, and one of Phalænopsis grandiflora with sixteen flowers on a single spike; and these, I think, would be hard to beat even in these days of highly specialised Orchid culture. George Ward.

TRICYRTIS HIRTA.—This plant, so well figured in the Gardeners' Chronicte of January 9, p. 18, is quite hardy here, but unfortunately it flowers too late in the open to be of any use as a garden flower. It has seldom flowered with me, and only in very warm seasons. S. Arnott, Carsethorn-by-Dumfries, N.B.

— You are quite right in remarking that you may have seen this plant and some other species on the Kew rockery; but are you equally small tribe of Liliaceæ, of which Colchiceæ, a small tribe of Liliaceæ, of which Colchicum is the head? [Yes.] This small group of perennial herbaceous plants is well known to hardy plantsmen; the several species and forms, too, are quite hardy and most vigorous when grown in moist peat and sandy loam in about equal parts. In the note on p. 18 it is stated that "the stem is 2 to 3 feet high, with a terminal racemo of six to eight flowers." Some thirty years ago I grew a plant, probably a variety of T. hirta, that would exactly answer this description; but all others known to me have the flowers more or less in the leaf axils, as shown in your illustration. respect to the hardy character of the plant in country, I may say I have never yet known a plant to suffer from frost. Between 1872 and 1882 there were some severe winters, and in the long frost of the winters of 1878-1879, when I had a large batch of plants, none was lost. It is not usual that true herbaceous perennials suffer from frost. In respect to these plants there would appear various misapprehensions, Dictionary of Gardening (Nicholson) all the species are cited as flowering in May. I have never yet seen one in flower, except in late September or October, and this, from your note, is the natural flowering period in Japan. In the month of May the plants are barely moving. I am strongly of opinion that the lateness of flowering, with the often wet season and frequently sharp frosts experienced in October, are chiefly responsible for the rarity of these plants in gardens. The flowers are barely expanded before they are ruined from these causes. Formerly I grew several varieties of T. hirta, and in particular T. h. nigra and T. h. Formerly I grew several varieties grandiflora. There was also a somewhat varie-gated-leaved kind. At this distance of time I am unable to describe the varieties more fully than in the names cited, yet they were ever a most interesting assembly of plants, and for which the popular name of "Japanese Toad-Lily" is by no means inappropriate. E. H. Jenkins, Hampton Hill. [Quite appropriate; but it is not a toad, nor a Lily, except in a very broad sense, nor a Toad-Lily! Mr. Baker refers Tricyrtis to the tribe Uvularieæ of the sub-order Colchiceæ. ED.]

— I have had a clump planted out in a border here for two years, and it has stood safely through the winter (although I do not think it would stand a very severe winter). We, however, moved the clump when the border was reconstructed last spring. Those we grow in pots we always winter in a cold frame, covering about 2 inches deep with litter. Richard F. Martin, Ware's Nurseries, Feltham.

TREE CARNATIONS.—In reference to Mr. Jenkins's letter on Tree-Carnations in the Gardeners' Chronicle on p. 441, December 26, 1903, that I would not grow Carnation cuttings in like manner to Chrysanthemums, I maintain that I could, and get the same percentage of results as in Chrysanthemums, but bottom-heat, which Chrysanthemums do not require, will hasten the rooting of Carnations with good results. I will not say that gardeners will be so successful at first with American Tree-Carnations as they now are with Chrysanthemums, as the former are of recent introduction, and their habits are not yet so well known. I am quite sure if the few hints I gave in my last letter are fol-

lowed, the gardener will have proof of their easy culture and free-flowering qualities. It is a fact that each of my men unassisted grow and attend to 8,000 plants—no great wonder, as Mr. Jenkins My letters have been written purely for the benefit of your readers, and not in a spirit of controversy. A. F. Dutlon.

ARBUTUS UNEDO.-There was a fine specimen of this shrub illustrated in a recent issue. There are two good specimens growing here on gravel soil. One is 6 feet from the ground, it measures 13 feet high, 66 feet in diameter, and the other is 56 feet in diameter and about the same height. These are clipped annually, and this year they have flowered and fruited freely. W. Hinton, The Oaks, Hanworth, Middlesex.

图 A NATIONAL GARDENERS' ASSOCIATION. There is to be a sifting of the chaff from the wheat. Who is to constitute the council to decide such matters? And who is also to compile the gardeners' peerage, and describe the royal man down to the humble commoner? the matter of horticultural examinations, which have been recommended, by all means have them, and combine the theory with practice; but give me the young man who has brains, and uses them, with his practical knowledge, rather than rely on his certificate. Young gardeners should not think any matter pertaining to the profession beneath their notice or attention. T. H. Slade.

As a trade employé I am not a little surprised that no mention has been made of asking the trade to join such an association. If Mr. Deunis's excellent ideas may be taken as embodying in a general way the basis of the proposed Association, then surely it must be approved by hundreds of the most capable nursery-hands. Can it be that to include trade those "horrid" trade-unions? and do thoughts of trade-hands prompt thoughts of strikes, &c.? If that be so, I think the fear groundless, and that it is, moreover, unfair to those men. H. J. Gillingham.

Ten years ago a conference was held at Tunbridge Wells of representatives of gardeners' societies to consider the desirability of forming a central organisation of delegates from gardeners societies for the South of England. broader platform than that suggested in the proposal to form a Gardeners' Association iu London, as it was to be representative of gardeners of every degree; while, as I understand it, the London organisation is to be confined to head gardeners only. The groundwork of the Tun-bridge Conference, as laid down by the chairman, was "to help and encourage the industrial classes connected with the various branches of professional and amateur gardening, to make use of the advantages within their reach, to improve the conditions of their occupations, and to assist them in recognising more fully than they have them in recognising more runy than they have hitherto done their position in the state as be-longing to an industry calculated to be of the greatest possible good to the future welfare of this country in relation to the utilisation and cultivation of the soil," all objects to which little, if any, serious objection could be taken. These points the chairman, Mr. D. C. Cornwell, temperately and lucidly expounded, dwelling fully upon the social aspect of the matter, and suggesting a bond of union and a channel of communication whereby not only the horticultural trader and merchant can the more easily reach and be in touch with the workers, buyer, and consumer, but also create a channel into which the philanthropic interest can best flow to benefit the particular industry of gardening. The suggestion of a bond of union naturally enough conveyed to the minds of many of those present the idea of a trades-union, one of the chicats of which would be to course a higher objects of which would be to secure a higher scale of payment to the working gardener; and though the meeting was assured the idea of a trades union was never contemplated, yet the bettering of the condition of the worker appeared to be the dominant idea in the minds younger members present. A committee was appointed to draw up a constitution for a central organisation, but it would appear the matter never got much beyond this stage. I recall this circumstance to point out that though the

interests of horticulturists may, to a certain extent, be characterised as communal, yet in the case of a proposal of so wide a scope as that contemplated at the Tunbridge Conference, there would be also isolation of interests—on the part of the trader on the one hand, and the worker on the other, and a clashing of these which would probably result in sharp and regrettable conflict between the two. I was present at the Conference, and took much interest in the various points advanced; at the same time I felt that if the rank and file of the gardening profession could become a part of such an organisation, something in the way of a tradesunion would be insisted upon. I am therefore anxiously awaiting some details of the probable programme of the proposed association. I am doubtful both of the appropriateness and the utility of an association formed wholly of head gardeners. R. D.

- During my experience I have been hit pretty hard by one employer whom I served faithfully for a number of years, and studied his interest night and day, and was often out of pocket to save him expense. When the screw got too tight I sent in my resignation. I was then paid a retaining fee for a few weeks by a gentleman who was away in Scotland. I had an interview, I was engaged, the day was settled when I should start, but my reference was needed; and my late employer's last words to me had been, "I will back you up in anything." I received a note from my new employer some few days after this, saying, "I have come to the conclusion you will not suit me as a head-gardener, and as I have paid you a retaining fee I think I am exempt from all further obligations." So was the bread taken from my mouth. I feel sure all right-thinking men, both employers and em-ployed, would welcome an Association that could prevent such cases as this. A gardener is quite at the mercy of his employer, but a willing horse does not like the spurs too much. Gardeners are not so bad that they require anything so severe as trades-unionism. A Sufferer.

The word "Gardener" covers a very wide field. It would doubtless be interesting to many readers of the Gardeners' Chronicle to know which or if all the different sections of gardeners outlined below would be eligible as members of the Association :-

CYPRIPEDIUMS AT HOMEWOOD (see pp. 4,28).— Respecting the appreciative note by Mr. Webster of the plants of Cypripedium insigne grown here, I send a few flowers for your inspection. The compost used for potting our plants was one of turfy yellow loam, peat, and chopped sphagnum-moss, with a good sprinkling of broken soft brick and silver-sand. Thos. Crosswell, Homewood Gardens, Beckenham. [Exa good form of C. insigne. Ed.] [Excellent flowers of

TRADE- NOTICES.

BEDFORD & Co., LIMITED.—The above-named company has been registered with a capital of £4000 in £1 shares. Its object is to carry on at Shiplake-on-Thames or elsewhere in the United Kingdom the business of raisers and growers of and dealers in fruit, flowers, plants, shrubs, trees, bulbs, and vegetables of all kinds; nurserymen, seedsmen, florists, market and landscape gardeners, horticulturists, &c. No initial public issue. The first directors (to number not less than two or more than five) are R. A. Budicom and F. W. Norsworthy. Qualification £250. Registered office, Shiplake, Oxford.

MR. GEORGE I'ANSON, for the last twenty-seven years with Messrs. Hugh Low & Co., Bush Hill Park, Enfield, has entered the service of Messrs. Charlesworth & Co., Bradford, taking the entire charge of their growing departments.

Obituary.

WILLIAM GIBSON.-We regret to record the loss of a useful and much respected public servant by the untimely death, on the 17th inst., of Mr. William Gibson, aged 58 years, for many years gardener at the Royal Hospital, Chelsea. It appears from the evidence given at an inquest held on Tuesday last that he had been suffering from rheumatism and neuralgia, and for a month past had been very depressed. On the previous Thursday evening he was missed from his house, in the gardens, and next morning his body was found hanging from a strap in the greenhouse. A verdict of suicide whilst temporarily insane was recorded. The deceased, who was for some time under the late Mr. John Fleming, at Cliveden, and afterwards went to Battersea Park, under the late Mr. Roger, was a very clever draughtsman, and in his day had few equals as a designer of carpet - bedding patterns, as our columns often bore witness during the period of Mr. Roger's service at Battersea Park,

CHARLES FRANCIS SAUNDERS .- Deceased, who was a nurseryman and seedsman at Abergavenny, Monmouthshire, succeeded to the management of the business a year ago, upon the death of his mother, the family having been engaged in this business for a century. Mr. Saunders was recently travelling to Minehead to lay out some gardens, and shot himself in a train when passing through the Severn Tunnel. Deceased, who was 41 years of age, had been much depressed since the death of his mother.

SOCIETIES.

ROYAL HORTICULTURAL. Scientific Committee.

JANUARY 5.-Present: Dr. M. T. Masters, F.R.S. (in the Chair); Messrs. Gordon, Baker, Saunders, Hooper, Veitch, Hudson, and Massee; Drs. Conke and Rendle; Prof. Bou'ger; Revs. W. Wilks and G. Henslow (Hon.

Pear-shoots Diseased .- Dr. Cooke reported upon some samples sent by Mrs. CURE, of Coombe, Oxon. They were attacked by Cystospora in patches. This lungus would subsequently pass into the Eutypella stage. The trees should be sprayed with Bordeaux-mixture at intervals, and if this was unsuccessful the places should be cut out and burnt, the wounds well protected with tar.

Proposed Scientific Investigations at Wisley .- The following is the substance of the reply received from the Council to the renewed communication addressed to them by the Scientific Committee on this subject: The Council appreciate the desirability of almost all that was urged therein, and they hope that the day is not far distant when much of it may be accomplished. They feel sure, however, that the Scientific Committee will understand that all the desirable things cannot be carried out simultaneously, and that financial considerations compel them to see the new hall finished and paid for before embarking in new projects.

The Codlin-moth.-Mr. HOOPER raised the question as to whether the grease bands, if kept till the end of May, would catch the caterpillars at that time. It was the opinion of Mr. SAUNDERS that the caterpillars would not have left the Apples in May; but Mr. Massee observed that there is a spring brood in America, but he was not aware of its existence in Eng'and, and recommended observations to ascertain

Camellia leof discased .- Mr. SAUNDERS showed specimens badly attacked by Pestolozzia Guepini, a fungus which damages the Tea plant. It has been known here for the last fifty years. Spraying would only partially arrest it, as the fungus is below the epidermis.

Orchids malformed. - Mr. Bidgood, Saltwell View, Gateshead, sent some excellent coloured photographs of Orchids, showing certain peculiarities: (1) An Odontoglossum citrosmum had the basal flower of a raceme with two well-formed columns, three labella, and eight other perlanth segments. The ovarian section had no ovary cells, but numerous clusters of fibro-vascular

cords, showing that it was a "multifold" flower, the cords of each perianth-segment branching and entering two instead of a sing's segment; so that excepting one, all the parts of the perianth were doubled. (2) Phaius Humblotti × P. Wallichi, received from Mr. Cookson's collection. One photograph showed the inflorescence, one flower of which had the lower portion of one of the lateral sepals petaloid like a labellum; the placenta of the ovary next to the position of the labellum was absent. A second flower had no labellum, the lateral sepals were fused, making one wide, median sepal, and both the lateral petals were slightly labellate.

HORTICULTURAL CLUB.

JANUARY 5. — Subsequent to the usual monthly dinner on the above date, at the Hotel Windsor, under the Chairmanship of Mr. Harry J. Veitch, Mr. George Gordon, V.M H., io an interesting paper gave expression to his views as to the manner in which experimental gardens should be conducted. The large majority of Horticultural Societies outside the Royal, took, he considered, far too narrow views of their functions, confining themselves almost entirely to exhibitions, and doing little or nothing to contribute to the extension of knowledge. Mr. Gordon considered that a minimum area of about 30 acres should be devoted, in various parts of the country, to the cultivation of fruits and vegetables in conjunction with standard typesof recognised superiority, without which little is to be learned.

standard typesof recognised superiority, withoutwhich little is to be learned.

The cultivation of luferior forms was strongly deprecated; but in the subsequent discussion, in which Messrs. Bunyard, Munro, Wright, Veltch, and Molyneux took part, it was pointed out that in this latter respect the public were largely to blame, since they would not accept the experts' assurance of the superiority of certain varieties, but insisted on receiving old-fashioned and inferior ones, which consequently had to he grown to meet the demands. The importance of making all comparative tria's on the same kind of soil was insisted upon, as very misleading results were obtained when the soil factor was ignored and no note taken of the inevitable difference which was caused by previous cultivation on the same area on different lines, exhaustive or the expessite.

by previous cultivation on the same area on different lines, exhaustive or the opposite.

Mr. Gordon also advised care in sowing seeds, say of successional Peas, at different times; but Mr. Bunyard stated that in his experience sees of early, medium, and late Peas, all sown at the same time in February, asserted their special periodicity in spite of their being started at the same time. The various forms of training trees should be shown for educational purposes.

started at the same time. The various forms of training trees should be shown for educational purposes.

Mr. Bunyard and Mr. S. T. Wright remarked that the experiments at chiswick had been conducted for some time precisely on the lines indicated; at the same time they and others cordially appreciated the necessity, pointed out by Mr. Gordon, for students who really mean to adopt horticulture as a profession to hegin at the bottom, and to be prepared to work hard, not only in the latter part of the day, but in the morning, when so much of the gardening work can be most advantageously done. There was too great a tendency on the part of students to treat the business in a dilettante fashion. To a very large extent the moral of the paper was the need of thoroughness first of all in arranging the proper basis of the experiments themselves; next in carrying them out and making systematic records of results; and lastly, but not least, of earnest work and conscientious study on the part of the young men whom it is desired to educate to become the gardeners of the future.

UNITED HORTICULTURAL BENE-FIT AND PROVIDENT. JANUARY 11.—At the monthly committee meeting,

JANARY II.—At the monthly committee meeting, held on Monday evening last, seventeen new members were elected. The death of two members was reported (Mr. Charles Brown, and Mr. Henry Sheppard). The Secretary was directed to pay to their nominees the amount standing to their credit in the Society's books. Three members applied to be allowed to pay the higher scale of contribution, which was granted. Nine members were reported on the Sick Fund, the amount of sick pay for the month being £23 188 Messrs. W. Gunner and T. H. Puzey were appointed to audit the accounts for the past year.

GARDENERS' DEBATING SOCIETIES.

CROYDON & DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT.—The annual general meeting of this Society was held on the 5th inst., Mr. W. J. Simpson presiding. The report of the Committee showed the Society to be in an excellent financial condition, and able to carry forward a substantial balance for the coming year. Nineteen meetings were held during the past year. The exhibition on April 22 was a success. The prize essay was won by Mr. A. Middleton, the 2nd place being secured by Mr. T. Briscow. The resignation

of Mr. F. Lloyd as President, owing to pressure of time, was deeply regretted, although he has accepted the Vice-Presidency. Mr. Bunyard, in submitting the balance-sheet, showed the receipts had amounted to £55 163. $2\frac{1}{2}d$, leaving a halance to the good of £3 78. 3d. The report and balance sheet were adopted. Mr. J. J. Reid was elected President; Mr. P. F. Bunyard, Hon. Treasurer; and Mr. H. Bushier, Hon. Secretary. The annual dinner will be held on February 10.

ABINGER AND DISTRICT GARDENERS' MUTUAL IMPROVEMENT.—On Monday, January 4, 1904, a lecture was given by Mr. F. W. E. Shrivell, F. L. S., of Golden Green, Tonbridge, Kent, in the Abinger Institute. Mr. Payne, head-gardener to Lord Farrer, In introducing the lecturer, asked that all present should bombard the lecturer with questions. The lecturer dealt with the use of chemical and farmyard manures, speaking from several years of practical experimental work carried on by Dr. Bernard Dyer and himself on kitchengarden, fruit, and farm crops. Mr. Shrivell spoke first on the importance of lime in the soll, adding that soils that had had heavy dressings of farm manure for several years in succession and had become sour needed lime as a corrective. Diagrams were shown proving that after several years experiments, better results were obtained in the kitchen-garden by employing a small quantity of dung with chemicals, than by heavy dressings of dung without them. An area of 100 square yards should be given half a load of farmyard manure, 11 ibs. of superphosphate of lime, and 10 ibs. of kainit. This should be dug-in in the autumn or early spring. Later in the seasoo, when crops are growing, sow on the surface 10 ibs. of nitrate of soda in two or more dressings. The lecturer gave several other recipes for use in Vine-horders, herbaceous-borders, and for fruit-trees, lawns, &c., for supplying all the constituents of plant-food required at less than half the cost of patent compound manures.

THE FELTHAM, BEDFONT, AND HANWORTH MUTUAL IMPROVEMENT.—This Society has just been established, and has thirty members. Mr. R. F. Martin (of Messrs. T. S. Ware, Ltd.) opened the session on January 6 hy reading a paper on "Plants for Cultivation on Rockeries." The hon. sec. is Mr. J. Tait.

ENQUIRY.

Bone Manure.—Assuming that I am able to offer ½-inch bones and fine bone-meal at the same price as basic slag, in bags of 28 lb., 1s 6d.; 56 lb., 3s.; I cwt., 6s., would there be sufficient demand to warrant me in going to the expense of the necessary machinery fer crushing? Could a living be made out of it? C. E. P.

*** Editor and Publisher.—Our Correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all communications relating to financial matters and to advertisements should he addressed to the Publisher; and that all communications intended for publication, or referring to the Literary department, and all plants to be named, should be directed to the Editor. The two departments, Publishing and Editorial, are quite distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Address of Messes. Williams & Norgate:
M. Chart. Henrietta Street, Covent Garden.
London, W.C.

Apple-shoots Injured: R. G. The injury appears to have been caused by frost. We do not see any fungus, but there may be some.

Books: M. C. The Fruit Growers' Guide, by John Wright, was published in 3 vols., price ene guinea each, by Messrs. Virtue & Co., Ltd., City Road. We believe this firm is now merged into another whose title is different, but an enquiry at that address would settle the matter. This standard work is sometimes advertised secondhand.—N. H. R. Hextable. The Australian Garden and Field is published weekly at 81, Grenfell Street, Adelaide, S. Australia, price twepence; and the Agricultural

Journal, Cape of Good Hope, may be obtained from the printers, Messrs. Townshend, Taylor & Snashall, Loop Street, Capetown, price sixpenco menthly.

CALVARY CLOVER: C. O. This is the popular name for Medicago echinus, an annual species, introduced from the South of France in 1818. If your seeds are good and you sow them en some other day than Good Friday, you will witness the explosion of the popular fallacy to which you refer

CAMELLIAS: R. H. You ask merely if Camellias would flower in a dwelling-room? If you mean plants that are not removed to the dwelling-room until the flowers are commencing to open, the answer is in the affirmative. But Camellias cannot be cultivated and flowered in a dwelling-room satisfactorily. They are good decorative plants for the greenhouse or conservatory, but even when in full flower they are not the most suitable for the dwelling-rooms, owing to the habit they have of shedding their petals or dropping their flowers.

CARNATIONS: Anxious. You do not give the dimensions of the house, so that we are unable to say if the 3-inch flow-and-return pipes mentioned are sufficient to maintain the heat essential to the production of Carnations in winter. To flower Tree-Carnations during winter. To flower Tree-Carnations during winter is a very simple matter, provided the plants are in a healthy condition and have been duly prepared. They need a well-ventilated structure, with a night temperature of 50°, with a corresponding rise by day, due attention to water, and not too much moisture in the structure. These are the chief factors to success. In the case of Souvenir de la Malmaison Carnations, however, it is quite a different matter, as they are certainly not adapted for winterflewering; and while much can be done by early propagation, the flowers produced during October, November, December, and January, are anything but satisfactory; and if the system is persisted in, and no provision made for the maintenance of a healthy stock from mere naturally-grown plants, the stock will seon diminish, as the heat to which the plants are perferce subjected will soon lewer the vitality of the plants. There is no gain in removing side-growths in young stock, as these stimulate root action and tend to produce strenger flowers (see note en p. 41).

COLLECTING AND DRYING BRITISH PLANTS: Thomas. This is generally an easy process, but much pains must be taken to secure a good result. First get some sheets of thin paper, and then some leaves of soft thick paper carpet paper is very good, but ordinary news-paper will do). Select as good a specimen as possible to show all the parts of the plant. Spread it out carefully in one of the sheets of spread it out carefully in one of the sheets of the thin paper, then put the sheet of thin paper with the specimen in it, between four or five leaves of the thicker paper. On the top place another specimen in thin paper, covering it as before with sheets of thick paper, and so en till you have a packet say 12 or 18 inches thick. On the top of this place a thin beard with a heavy weight on it—a brick will do. After twenty-four hours take awayall the thick papers twenty-four hours take away all the thick papers and replace them by others. If these have been heated before the fire so much the better. Yeu need not interfere with the specimen between the thin sheets at all unless it be necessary to unfeld a curled leaf or to arrange the plant better. In another 48 hours repeat the process, and continue it at intervals of two or three days till the plants are dry, but not so dry as to be brittle. In the case of most plants, a few days suffice to dry the plants sufficiently if kept in a warm, dry room; but if the plants are of fleshy texture, much more time is required. When the plants are dry sprinkle them with a little naphthaline to preserve them from insect attacks.

Currants, Gooseberries, and Sparrows: J. W. Your garden being in a town, we have much sympathy with you. The same sparrows that are now taking your fruit-buds may be expected presently to destroy the flowers of your Crocuses, especially the yellow ones. If you have not many bushes you might fasten threads of

black cotton about them, and the sparrows, when pulled up suddenly by these, will be scared for a time; but they will continue to have some of the buds, unless you can put the bushes under permanent netting.

Currant Bun Mite: E. B., Abbott, J. A. L., &c. Yes, certainly, in each instance the swollen condition of the buds is due to the mite (Phytoptus ribis), figured and described in the Gardeners' Chronicle as long ago as August 7, 1869. The best policy is to dig up and burn all badly infested plants, and cut away the shoots upon other bushes where only an occasional bud is affected. Take away the surface soil from under the remaining bushes and burn it on a smouldering fire, then afford a top-dressing of good soil that may reasonably be supposed to contain no infection. Some growers have found a new variety known as Boskoop Giant, to be more or less resistent to this pest, and it may be worth your while to give this a trial.

Cyclamens: T. D. Weevil grubs, very destructive. Trap them with slices of Carrot or Potato and destroy them. Your potting-soil should be baked before using it.

EUCHARIS: R. W. K. You will find an exhaustive article upon Eucharis species and hybrids, also details of cultivation, in the Gardeners' Chronicle for September 23, 1899. In the same issue were published excellent illustrations of E. grandiflora Lowi, E. Mastersii, E. × Stevensii, E. Bakeriana, E. × burfordiensis, and Urceocharis Clibrani, a bi-generic hybrid from Urceolina pendula and Eucharis grandiflora (amazonica).

FRUIT-TREE SHOOTS: J. H. P. The shoots are affected by the fungus known as Nectria ditissima, a wound parasite, whose spores usually germinate in the first instance on some wounded surface, but afterwards invade healthy tissue. Cut away all badly affected branches and shoots, and burn them at once. Shoots not so badly attacked may have the affected parts scraped or cut out, and the wound dressed with a coating of tar. This disease is generally present in cases of canker.

HIPPEASTRUM (AMARYLLIS) JOHNSONI: R. H. M.
This hybrid resulted from a cross made over 100 years ago between H. Reginæ and H. vittatum, both deciduous species, the latter especially so. If your plant is of the original type it requires to be dried off after the leaves have withered, and to be kept dry until the flower-spikes appear, or it is seen that the plant is not going to flower.

Hybridising Begonias: Omicron. There is no special book on the subject, but nothing can be easier than to do this in Begonias, in which the male or pollen-bearing flowers are so different in appearance from the females. You will require to impregnate the female blossoms early, before they have had time for the pollen of some other flower to have been deposited on them. You can arrange this by covering up the young unexpanded female flower in bags of muslin, to prevent access of pollen-bearing insects. When the flowers are ready apply the pollen from another flower with the aid of a camel's-hair brush.

Hydrangea paniculata grandiflora: G. W. This species may be cut back pretty severely and it will flower in summer from the growths of the current year. The plauts are very suitable for growing in pots to flower in the greenhouse, but you could not get plants that are now being potted up to flower in March, even if forced. It will be better to let them make their growth slowly, for Hydrangea does not take kindly to forcing; and in order to get large trusses of flowers, it is necessary that the new growths should be made firmly and strong. The plants like a tolerably rich soil, such as one of fibrous-loam, sand, and decayed manure to the extent of one-third of the whole.

INSECTS: E. T., Warwickshire. The branch sent is infested with the red globular eggs of Bryobia pruni, one of the family of the Trombidiidæ, and is closely allied to the common

harvest-bug (Leptus autumnalis). It is an extremely abundant and wide-spread insect, affecting various fruit-trees, but it is not so destructive to them as the well-known redspider is. As a remedy use a dressing of limewash at the rate of 2 lb. fresh lime to each gallon of water, and apply while hot. The lime and sulphur solution is perhaps the best, but it is somewhat troublesome to make. The usual proportions are 30 lb. lime and 20 lb. sulphur to 60 gallons of water. The mixture should, if possible, be steam-boiled for four hours, and the mixture applied while hot.

LOAM: Anxious. Without analysis we cannot tell you the exact value of the sample you send, but it is moderately rich, possesses good fibre, and in fact is exactly the kind of loam a gardener would like to use. In London it would be very valuable.

Mealy Bug: Mon. Before applying the dressing described in the issue for January 2, take away all the loose bark which would help to screen the bugs, but do not scrape the rods unmercifully. The other mixture you mention, of Gishurst Compound with clay and soot, is a very old remedy and a very good one.

Names of Plants: Correspondents not answered in this issue are requested to be so good as to consult the following number.—M. Buysman. Astelia Menziesiana.—F. B. 1, Pinus, perhaps monticola; 2, Abies grandis; 3, Retinospora filifera of gardens; 4,Retinospora squarrosa of gardens; 5,Thuya occidentalis; 6,Thuiopsis dolabrata.—R. V. Zygopetalum Mackaii.—J. S. 1, Jasminum Sambac; 2, Strelitzia Regina; 3, Acokanthera spectabilis; 4, not found; 5, Adiantum capillus-Veneris; 6, Pteris longifolia.—H. W. The specimens you send are quite insufficient; No. 4 is a Statice.—J. M., Nottingham. 1, Polypodium venosum; 2, P. longipes; 3, P. nigrescens; 4, not found; 5, Nephrolepis ensifolia; 6, Adiantum Capillus Veneris.

ORCRIDS: R. T. H. The 50° to 60° Fahr. would be a sufficiently high temperature for Sophronitis grandiflora, Cologyne cristata, and most of the other species you name, but for the winter it would be better to be careful, and keep the plants rather dry. The ventilators should not be opened, or only an inch or so when the weather is mild, but in sunny weather the bottom ventilators may be freely used. If the pots in which the plants are growing and the staging and interior of the house are thoroughly cleansed, it will ensure a healthy atmosphere in the house, and give the plants a better chance of passing through the winter in the low temperature you anticipate. The Cattleyas and Lælias should be kept tolerably dry. Angræcum sesquipedale should be placed in the warmest position.

Peach-trees: Borderer. If you have to lift Peach-trees from open walls now to fill vacancies in the forcing-house, the forcing will need to be done very gently indeed, and the results could hardly be good. If you could let the trees come along naturally we should advise you to do so; but this may not be possible.

Potato: W. H. S. The variety of Potato is Vicar of Laleham. The tubers are rather longer than usual, but soils and seasons produce diverse forms. The variety was raised some thirty years since by the Rev. — Peake, then Vicar of Laleham, Middlesex. One of its parents was the old Red Emperor, a small but very handsome round variety. The Vicar of Laleham has had a long innings, as it is still much grown, but in the matter of table merit it is beaten by one of its own progeny, the Dean, which has a violet-coloured skin and is always round. Coloured varieties now have not much favour shown them. They do not seem to possess the strong constitution the finest white tubers possess.

Schizanthus in Soil: R. N. The soil you forwarded contained grubs of Millipedes and other insects. These would be injurious to the plants. They probably originate in the leaf-mould. Use fresh potting soil, and bake the compost before use.

Sowing Tree Seeds: J. T. For sowing Larch seeds prepare a bed by putting a layer of crocks or rubble at bottom, and cover with good ordinary soil. Then make a light compost of leaf-mould and fine sand in equal proportions. Spread a layer of this on the bottom soil, and gently roll or pat down smooth with a spade. Next, fan or winnow the Larch seeds thoroughly, as a third of it is generally light and useless, and sow evenly on the soil of the prepared bed, sifting over it some of the same to the depth of about 11 inch, so that when this is pressed down it remains not more than 1 inch in thickness above the seeds. Water thoroughly but lightly through a fine rose, and cover over with flat boughs of Spruce Fir or other like material, or a bast mat, so as to slightly shade the soil and prevent its baking hard in the sun. Keep a sharp look-out for mice, both field and common, which are very fond of the seeds when about to germinate. The best time to sow is from the end of February to the middle of March; and this applies to most Conifer seeds. Birch: fan the Birch seeds well, and prepare your bed in a similar manner to that for Larch seeds, but add powdered chalk or spent lime to the soil; scatter the seeds evenly and lightly on the surface, and water thoroughly. the surface, and water thoroughly. It sufficient water be given there is no need to soak the seed in water. Merely hide the seeds with a very thin layer of the sifted soil. Alder seeds are best sown in drills in light, moist soil, and just covered with a light compost, the operation being done in March or early in April. The small, white slug is very partial to the record souldings but a watering with lines. the young seedlings, but a watering with limewater once or twice will prevent injury from this mollusc. Seedlings of all the above trees are best left in the seed-bed until the second year before lining out in the nursery quarters. Refer also to our article on "Propagation of Wood and Coppice Plants" in the Gardeners' Chronicle, December 19, 1903, p. 414.

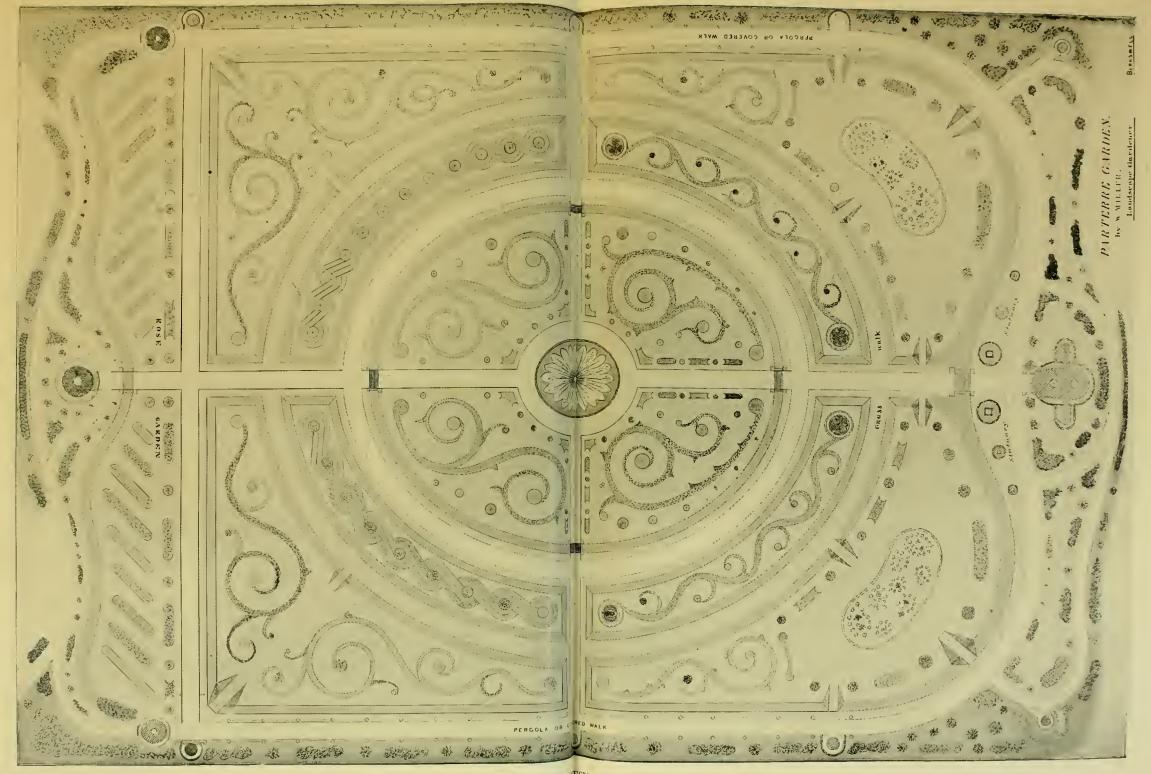

Surface of Soil in Pots: G. W., Stonehaven. The substance on the surface of the soil is neither a fungus nor a poison, but a low form of plant-life belonging to the Algæ, and its presence is a pretty sure indication that the soil is in a sour and sodden condition through over-watering or other cause. If you do not wish to repot the plants, scrape off all this Alga, removing as much soil as can be done without injuring the roots of the plants; then afford a top-dressing with fresh compost, consisting of fibrous loam, peat or leaf-mould, and sand, broken rather finely. The brown spots on the leaves of several species of plants sent are due to drip and a too moist condition of the atmosphere of the house. It is necessary during the winter months to take care that the temperature of the house is not permitted to fall suddenly or very low, and also that the atmosphere be not very moist when the temperature from any cause is lower than usual. The white substance upon the Codieum (Croton) leaves is merely a deposit of lime from the hard water that has been syringed over the plants, and may be removed readily by the use of a sponge.

Tulasi Tree: R. H. The Tulasi tree that you describe as being worshipped by Indians is Michelia champaca (Magnoliaceæ), the Chumpaka of the Hindoos. It is cultivated commonly in India for the powerful fragrance of the flowers. The tree is sacred to Vishnu, and is therefore an object of superstitious regard on the part of the Hindoos, who adorn their dark hair with its rich orange-coloured flowers. The root, like all parts of the tree, has bitter properties, and is used medicinally. There are many varieties, and some are cultivated, though rarely, in English hothouses.

THE SWEET PEA: AN APPRECIATION.

THE Sweet Pea is the queen of annuals no other is comparable to this flower, whether in fragrance, in purity or in grace. If all other annuals disappeared from my garden and this one remained, I would be quite satisfied with my floral possessions for along the half-shaded borders, with an environment of Roses and Oriental Lilies, it blossoms everywhere, and "nothing can stale its infinite variety." Fair to the eye, it is still fairer to the memory. There is no other flower, with the exception of the Rose, that so tenderly links the pensive present to the fadeless past. Ever since I can remember, it has been one of my favourite flowers, and I used to envy those cottagers in this picturesque parish whose limited enclosures it adorned so gracefully, long before I began to grow it myself. It was the first flower that awakened in my nature that gardening enthusiasm which has descended to me by ordinary generation. But the Sweet Pea was not in those days what it is now; it has emerged from its comparative obscurity and become a florists' flower. By the hybridising genius of that floral magician, Mr. Henry Eckford, of Wem

(a native of Midlothian), it has developed capabilities undreamed of by our ancestors, who were for the most part quite satisfied with flowers hardly more than half the size of its modern representatives. Its colouring, one of its finest attributes, has also been intensified in a marvellous degree. It ranges from the purest, snowiest white to the deepest shade of crimson—from Sadie Burpee to that latest and grandest Eckfordian introduction, the incomparable Scarlet Gem.

Grown in "hedges," which is the olden conventional custom, whether with mingled varieties or in separate colours, Sweet Peas have an invariably impressive effect; but they never have such an artistic appearance as when they are seen climbing upwards, and flowering profusely through the branches of venerable fruit-trees-as they do in my own garden-to a most commanding height. Alike in colour and in fragrance they are attractive. Even at our grandest floral exhibitions the Eckford Sweet Peas, by virtue of their lustrous beauty, arrest attention, notwithstanding counter attractions of the most engrossing description. This I can testify from personal observation.

The reign of the Sweet Pea is considerably longer than that of the great majority of its floral contemporaries; its first blooms often appear before the middle of June, and we find it making heroic efforts to flower on the confines of December. The only flower that blooms for a longer period is the richlyodorous Viola, which not seldom begins to unfold its floral treasures in the beginning of May. The culture of Sweet Peas, when sown not too numerously in suitable situations and in fibrous, fertile soil, has only one great initial difficulty, so far as I am aware; and that is the preservation of the germinating seeds from the insidious attacks of the rapacious regiments of blackbirds and voles. Even when carefully coated with red-lead, I have found them, as I did in April last, entirely destroyed, and the only alternative is to sow them again, perhaps too late; for under such conditions they are not always (to use a Wellerian expression) "very conformable," as I know from sad experience.

Of the many superb varieties of the Sweet Pea raised or introduced by Mr. Henry Eckford, the following are supreme favourites with the majority of cultivators: Dorothy Eckford and Sadie Burpee, pure white in colour, of satin-like texture, and exquisitely hooded form: Blanche Burpee, almost equally effective, though without its successor's unique formation; Navy Blue and Emily Eckford, rivals in renown; Hon. Mrs. E. Kenyon and Queen Victoria, the former the nearest approximation to a yellow Sweet Pea yet produced; Lord Kenyon, Prince of Wales, Her Majesty, and Royal Rose, varieties of carmine and roseate shades; Miss Willmott and the radiant Countess of Powis, orange-pink in colour, and bearing flowers of enormous size. Prima Donna, Lovely, and the Hon. Mrs. Bouverie are the predominating pink-coloured introductions of the Man of Wem; Lady Grizel Hamilton, Countess of Radnor, and Lady Nina Balfour are the leading representatives of lavender Sweet Peas. Supreme among crimson hues are Salopian and Mars; blush is well represented by the Duchess of Sutherland; while Black Knight and

Stanley are splendid specimens of the deepest maroon. Other notable introductions are Dorothy Tennant, a highly distinctive manve; Duke of Westminster maroon shaded with tenderest rose; Prince Edward of York, Triumph, Gorgeous, and Lady Skelmersdale are bicolor varieties of beauty and distinctiveness. Up to this period Scarlet Gem is probably Mr. Eckford's most brilliant creation. It is certain to prove an abiding acquisition.

Lord Rosebery has asserted that to him the Sweet Pea is more fascinating than the Orchid. It is not, indeed, so aristocratic or prohibitive in price; nor does it require a heated conservatory for its adequate cultivation; but, on the other hand, it is within the power of the humblest cultivator to acquire and grow exquisitely this finely-formed, delicately - coloured, and richly fragrant flower. David R. Williamson.

FIG-TREES ON WALLS OUT-OF-

I have in my mind's eye a length of hrickwall, from 9 to 12 feet high, and about 350 feet in extent, furnished from base to summit with healthy, fruitful branches. Two of the Figtrees in question are of great age and size, having stems nearly three feet round, and branches extending from 35 to 40 feet therefrom on each side. Yet, owing to the method of training practised, the wood forming the individual tree is, with the exception of a few thick branches proceeding from the base, such as may be found in a six-year-old tree.

SELECTION OF VARIETIES.

The varieties best adapted for culture against walls in the open, or under glass for that matter, are the following:—

Brown Turkey, a free-bearer with large turbinate fruits, with grooved surface, skin brown with a slight purplish tinge next the sun, flesh tinged with red at the centre, rich and sugary.

White Marseilles, a free-bearing variety, producing fairly large roundish-obovate and slightly ribbed fruit having a pale green skin, which is very thin and becomes yellowish-white when the fruit is ripe, flesh opaline, juicy, aweet and rich.

Castle Kennedy, a rather shy-bearing variety, a fact which may account for the great size to which its obovate and handsome fruit attains to on vigorous trees—skin greenish-yellow, pale brown towards the eye, flesh whitish, with stains of red near the eye.

Brunswick is another somewhat shy-bearing variety, with pyriform, very large and handsome fruits; skin pale-brown next the sun, and yellowish-green where shaded; flesh opaline outside, reddish-brown at the centre, and fairly rich and sugary. The fruits of the Castle Kennedy and Brunswick Figs, which were included in my prize collections of fruit at the annual fruit shows held at the Crystal Palace and in the South and West of England, prior to September, 1896, I have reason to know, were the means of these two Figs being introduced into many gardens and glasshouses in this country for the first time.

THE ROOTING MEDIUM.

The rooting medium for Fig-trees should consist of moderately good loam and one part of old mortar rubble and wood-ashes well mixed. When Fig-trees are planted in borders of such compost, about 5 feet wide and 2 feet deep, including where necessary, about 6 inches of brick rubble as drainage, they make short-jointed and firm growths, having an embryo fruit in the axi of every leaf. Copious supplies of water and

liquid manure should be afforded the roots during the summer months in the absence of heavy rains. In ordinary garden soil resting on a gravelly or chalky sub-soil well above the water line Fig-trees may be planted without any preparation other than the excavation of holes of the proper size and bottoming of same with a layer of brickbats, clinkers, or stones, covered with thin turf or long litter. The roots of the trees should not be buried too deeply in the soil, but a few inches above the ground line may be allowed for the freshly disturbed soil's settling down within a few weeks from the time of planting.

TRAINING AND PRUNING.

A wall having a south, south-east, south-west, or west aspect is suitable for the growth of Figtrees, and the trees may be planted at distances of 30 feet from each other. The intervening spaces may be utilised for a time for the cultivation of young fruit-trees; but they must be removed as soon as the permanent trees require more space. The branches should be trained in a fan-shaped manuer, securing them at regular distances on the wall, and at the same angle on either side the centre of the trees, allowing space for two or more young shoots that will grow therefrom during the summer to be trained in. To maintain a proper balance of growth, pinch out the points of strongly-growing shoots. The temporary check thus given to the flow of sap will tend to the formation of fruits on the shoots as stopped. In the case of established trees a space of 6 inches should be allowed between the branches of the previous year's growth, and between these one of the current year's growth should be laid-in during the summer and be stopped when it attains to a length of about 20 inches, pinching all other shoots out as soon as they appear. The practice of taking down, bundling together, and covering the branches of Fig-trees with Fern or mats during the winter and early spring months is unnecessary in the southern, western, and eastern counties at any rate, and is calculated to hinder the prospect of a good crop of fruit.

When the trees begin to push forth leaves, as they usually do in the southern and western counties early in May, they should be pruned somewhat after the fashion of the Peach or Morello Cherry-that is, as many of the old branches as can be dispensed with should be cut out to make room for a like number of young ones of the previous year's growth, retaining, however, the necessary number of branches to form the trees, and selecting those shoots which have most young fruits upon them, which will be obvious at the time. For this reason, and because the shoots will not bleed so much owing to the absorption of the sap by the leaves, it is advisable to defer the pruning of Fig-trees growing against walls cut-of-doors till May.

January is a good month in which to plant Figtrees, as well as every other kind of fruit-tree. Where wall space is not available for the growth of Fig-trees, they may be grown in the form of bushes in sunny positions in the open, sheltered from north and east winds. The judicious pinching and thinning of the shoots will be necessary to the attainment of good results. As I write I know of several huge bushy Fig-trees growing in a park in one of the home counties which produce heavy crops of fruit; and the only attention bestowed on the trees after the initial stage of training is that given to the gathering of the fruits. H. W. Ward, January 2.

NEW OR NOTEWORTHY PLANTS.

HUERNIA PILLANSI, N. E. BROWN.*

WHEN out of flower, this novelty is so unlike any other known member of the genus that no one would be likely to recognise it as a species of Huernia, and would in all probability imagine it to belong to the genus Tavaresia (Decabelone), so very distinct is it in the character of its stems, which are covered all over with bristle-tipped tubercles and are like those of a Trichocaulon on a small scale. The flowers, however, are distinctly those of a Huernia; they have nothing remarkable about them and somewhat resemble those of H. hystrix. It was discovered by Mr. N. S. Pillans (No. 23) near Matjes Fontein, in South Africa, where Dr. R. Marloth (No. 3308) has also collected it, and both gentlemen have transmitted specimens to Kew, where it is in cultivation. N. E. Brown.

THREE NEW BORNEAN PALMS.

When one first visits Sarawak after a long residence in the Malay Peninsula, one is at first sight struck with the small feature (comparatively) that Palms make in the landscape. This is, however, chiefly due to the comparative scarcity of some of the bigger Palms, such as Oncosperma, Orania, Arenga, Caryota, Livistona, and Pholidocarpus. But in the woods themselves many of the smaller Palms are quite as abundant as they are in our Malayan forests: Iquanuras, Licualas, Calami, are plentiful and of very varied forms. Although Dr. Beccari paid much attention to the Bornean Palms, he by no means, it appears, exhausted those of Sarawak. In a recent expedition to that charming country I obtained a number which I am unable to identify with any hitherto described; and then comes Mr. Micholitz with excellent specimens of three more very beautiful species which we may hope ere long to hear of in the conservatories of Europe. The following are descriptions of them :-

LICUALA ELEGANTISSIMA, Ridley (n. sp.).+

Almost stemless, the short stem covered with the red-brown rete of the leaf-sheaths. Leaves numerous; petioles very slender, 12 inches long,

* Huernia Pillansi, N. E. Brown (n. sp.). — Plant tuited, with erect or ascending stems, $\frac{3}{4}$ to $1\frac{1}{2}$ inch in diameter, the younger sub-globose, becoming cylindric, densely covered with bristle-pointed conical tubercles 1½ to 2 lines long, arranged in 20 to 24 crowded spiral series, with the bristles recurving; glabrous, green or becoming dull purplish when exposed to the sun; cymes progressively 2 to 3 flowered, sessile near the base of the young stems; pedicels 1½ to 2 lines long glabrous; seems [sqlabrous 3 to 2 lines]. Iline long, glabrous; sepals glabrous 2 to 3 lines long, glabrous; sepals glabrous 2 to 3 lines long, glabrous; sepals glabrous and smooth officerm recurving tips; corolla glabrous and smooth outside, thickly covered on the inner face of the lobes and in the throat of the tube with fleshy, terete, very solution recovered to the long otherwise glabrous and in the intent of the tube with fleshy, terete, very obtuse processes \(\frac{1}{2}\) to \(\frac{1}{3}\) line long, otherwise glabrous and not ciliate; tube about \(\frac{1}{2}\) inch long, \(\frac{1}{2}\) inch in diameter inside, campanulate, smooth in the lower part, pinkish cream-coloured dotted with crimson; lobes to 6 lines long, 3 to 3\(\frac{1}{2}\) lines broad at the base, whence they taper in a straight line to a fine very much recurved point, slightly convex at the base, pale yellow marked with small crimson spots and with the tips of the processes also crimson the angles between the the processes also crimson, the angles between the lobes produced into short, subulate, abruptly reflexed processes; outer corona with 5 subquadrate, shortly bifid lobes or subequally 10 toothed, blackish purple, teeth deltoid; inner coronal lobes 1 line long, conniventerect, linear, somewhat dilated and thickened at the base, shortly recurved and papillate at the obtuse apex, dark purple-brown, glabrous; staminal-column i line long.

† Licuala elegantissima (n. sp.) - Subacaulis, caule † Lecuda elegantissima (n. sp.) — Subacaulis, caule brevissimo rete rufo tecto. Folia copiosa, petitolis tenuissimis 12 poll. longis, aculeis minutis ad bases, lamina 13 partita, 8—9 poll. longa, segmentis anguste linearibus $\frac{1}{3} - \frac{3}{2}$ poll. latis, duobus exterioribus et duobus mediis 2—3 nerviis, aliis uninerviis apicibus truncatis, dentibus inequalibus obtusis 2 vel pluribus. Spadices graciles 3 pedales, spathæ glabræ tubulatæ superne

with minute thorns at the base; blades 8 to 9 inches long, the leaflets forming three-quarters of a circle, about thirteen in number, narrowly linear, $\frac{1}{4}$ to $\frac{1}{2}$ inch wide, the outer two and middle two the widest, two to three-nerved, the others one-nerved; tips of leaflets truncate, with two or more unequal bluut teeth; spadices very slender, 3 feet long; spathes glabrous, tubular, swollen upwards, quite smooth, bifid at the top, and shortly Branches of spadix four, the lowest three-branched a little more than an inch long, upper brauches simple. Flowers sessile on a small callus; bracts lanceolate, acute, deflexed; calyx cylindric, narrowed a little at the base, three-lobed for one-third of the length, minutely pubescent, ribbed; corolla lobes lanceolate, obtuse; short staminal cup hardly toothed; anthers linear, nearly sessile. Borneo, Sarawak, Sempadi, river Lundu (Micholitz). Allied to L. bidens, Beccari.

LICUALA MICHOLITZI, Ridley (n. sp.)*

Leaves simple, petiole over 3 feet long, 1/6 inch through at the base, triquetrous, with very short recurved thorns (hardly more than very small tubercles) at the base, blade rhomboid, base cuneate, plicate, and many nerved; edge crenulate, 16 inches long 12 inches wide at the widest part, in tint of a light green; spadix [with a] peduncle 10 inches long, compressed, slender, silky-woolly; branches four, rather thick, 2 to $2\frac{1}{2}$ inches long, tomentose; spathes not seen; flowers spiral in pairs, stalked; calyx cup-shaped, obscurely threelobed, tomentose 1 inch long. Borneo, Mount Brooke, Lundu and Sarawak (Micholitz).

IGUANURA SANDERIANA, Ridley (n. sp.).+

Stem about a foot high, 1 inch through, distinctly ringed. Leaves large, crowded; sheaths of lower leaves broad, 5 inches long, petiole 4 inches blade entire, base cuneate gradually dilating upwards, apex rounded, acute, almost entire, or cleft into three unequal acute lobes, plicate, with numerous veins. Spadix 6 inches long; spathes two, narrow, acuminate, flattened, 2 to 3 inches long; branches of spadix two, rather thick, 2 inches long, covered with fugacious red tomentum. Flowers spirally arranged, solitary, rather distant, sunk in a deep foveola; sepals broad, ovate and rounded; petals twice as long, oblong lanceolate, strongly ribbed; stamens linear, filaments vory short. upper reaches of the Lundu river (Micholitz). Henry N. Ridley.

Unfortunately it has not been possible for Mr. Ridley to see the proof before publication,—ED.]

dilatatæ laeves, apicibus bifidis. Rami spadicis 4 imoramis tribus pollicaribus, superiores simplices. Flores sessiles in callis parvis impositæ. Bractæ lanceolatæ acutæ deflexæ. Calyx cylindratus basi angustatus trilobus minute pubescens. Corollæ laciniæ lanceolatæ obtusæ breves. Andrecium vix dentatum, antheris linearibus subsessilibus. Sarawak (Coll. Micholitz).

* Licuala Micholitzi n.sp.-Folia integra petiolis tripedalibus triquetris † poll. crassis, aculeis brevibus minuiis recurvis ad bases, lamina rhomboidea basi cuneata plicata multinervia margine crenulata 16 poll. longa 12 poll. lata et ultra. Spadix pedunculo 10 poll. longo compresso gracile, sericeo lanuginoso, ramis 4 crassiusculis 2 2 poll. longis tomentosis. Flores spiraliter ordinatæ pedicellati. Calyx cupulata vix trilobatomentosa ‡ poll. longa. Bornco, Sarawak ad Lundu. Coll. Micholitz).

† Iananura Sanderiana, n.sp.—Caulis pedalis † poll. † Iguanura Sanaeriana, n.sp.—Caulis pedalis § poll. crassus, annulatus. Folia magna, vagiuis inferiorumlatis 5 poil. longls, petiolis 4 poil. longls, lamina integra, hasi cuneata superne dilatata, apice rotundata, subacuta, subiniegra, aut in tribus lobis inequalibus acutis fissa, plicata; spadix 6 poll. longa; spathæ 2, anguste acuminatæ complanatæ, 2—3 pollices spains 2, anguste acuminate companies, 2—spaines longe; rami spadicis 2, validuli, 2 poll. longi, ruio tomentosi. Flores subremoti, spiraliter ordinati, in foveolis subprofundis; sepala late ovata, rotundata; petala duplo longiora, oblonga lanceolata; stamina linearia, filamentis brevissimis. Borneo, in flumine Lundu (Coll. Micholitz).

THE RAINFALL AT ROTHAMSTED IN 1903.

The rain-gauge at the Rothamsted Experimental Station, Hertfordshire, was constructed fifty years ago, and is one-theusandth part of an acre in dimension, standing 2 feet above the surface of the ground, and about 420 feet above sea-level. The rainfall for the year 1903, recently ended, amounted to more than 38 inches, 10 inches in excess of the average record for this district extending over the period of fifty years for which the records are available. In no other year of the fifty has there been so large a rainfall, the nearest approach being in the year 1879, when 36 inches were measured.

The following table shews the rainfall of each month for the past year at Rothamsted, with the average amount of rainfall for each month of the previous fifty years and the difference of 1903, above or below the average:—

Rainfall at Rothamsted, Herts, for each month of the year 1903, the Total for the year, the Average Rainfall of fifty years, 1853-1902, and 1903 above or below average.

Months.		Rainfall,	Average rainfall of fifty years.	Above or Below the Average.**
January		Inches.	Inches.	Inches. + 0.20
February		1.07	1.49	0 12
March		3.46	1.78	+ 1 68
April		1 53	1.86	- 0 33
Мау		2.23	2:23	- 0 01
June		6 11	2 31	+ 3 80
July		4 09	2 55	+ 1:51
Augnst		3.56	2.65	+ 1 31
September		2.75	2 50	+ 0 25
October		6:32	3.08	+ 3*23
November		2 21	2 58	- 0:37
December		2 42	2 3t	+ 0.11
Yearly	total	38 69	28 00	+ 10 69

* The sign (-) signifies below the average, and the sign (+) above the average.

The above figures show that the yearly total of rain, frost, and melted snow, of which latter there was a very small quantity, in the past year amounts to 38.69 inches, against an average of 28 inches for the previous fifty years, showing an excess in the twelve months of 10.69 inches. And as 1 inch of rain represents 101 tons of water on each acre of land, the results show that the enormous quantity of 3,907 tons of water per acre has been contributed during the year, or very nearly 1,080 tons per acre in excess of the average of the past fifty years. It is seen that eight months gave an excess of rain, while the four months of February, April, May, and November gave a deficiency of rain compared with the average.

Water is an essential factor in the life of a plant; if moisture is wanting, or if the roots do not transmit to the leaves water in quantities sufficient to provide for losses due to transpiration, the plant is endaugered, and ceases to grow. If the scarcity of water continues, the crops dry up rapidly, and yield but a poor return.

But it may be objected that excess of rain is more often injurious in the climate of England than drought; but in wet seasons plants suffer owing to want of light and generally of warmth. During the past year of 1903 there have been recorded at Rothamsted only 1,450 hours of bright sunshine, the usual growing months of the year being particularly noticeable for the deficiency of sunshine.

It is very probable that if the same quantity of rain which the soil receives in our wettest summer were to fall only between the hours of nine o'clock in the evening and three o'clock on the following morning, and if the sun were to shine brightly and warmly through the whole of

the day, no injurious effects would follow; and every experienced gardener knows with what luxuriance and rapidity plants of every species grow in hot and bright weather after the ground has been drenched with water by thundersterms. J. J. Willis, Harpenden.

CHRYSANTHEMUM MARGINATUM.

This fine dwarf species is a comparatively new plant, having been introduced from Japan about the year 1888. It has been cultivated for a number of years in the open border in the herbaceous ground, Kew, where it formed dense bushes 3 feet high and 3 feet in diameter, but failed to produce perfect flowers before being cut down with frost. An effort was uade last season to induce it to bloom by growing it as a pot plant, and the success of this method of treatment is evident from the several fine plants which were lately in bloom in the Temperate-

FIG. 22.—CHRYSANTHEMUN MARGINATUM IN THE TEMPERATE-HOUSE, KEW.

house. The plant is naturally of a free-branching habit, with stiff, erect stems, covered with a white tomentum. The leaves are ovate, pinnatifid, slightly hairy on the upper surface, densely tomentose beneath and on the margins. The whitish margins give to the plant a very pretty appearance, as its specific name. The flowers are borne in reunded corymbs of from three to eight flower-heads, each of which are 1 to 1½ in. in diameter. Ray florets pure white, disc florets bright-yellow.

As a decorative plant it should become a popular one among gardeners, as it blooms naturally about Christmas, requiring only the protection of a cold frame until it flowers, when it may be taken into the greenhouse. It is useful to supply cut flowers for the decoration of vases. &c., on account of its light and graceful habit. For such purpose the plant might be grown in the open border during the summer and autumn menths, and be then lifted with good balls and planted in shallow frames when the danger of frost becomes apparent. Chas. P. Rafill. Kew.

MARKET GARDENING NOTES.

CHANGE OF SEED.

THERE is not the slightest doubt but that the interchange from one district to another of seeds of Tomatos and Cucumbers is beneficial. Seed of my own saving, after being sent back from a district where it has been grown for a season, was much improved.

Tomato-seeds are sent not only to the Canary Islands, but also to Australia, by some growers, and the exchange is productive of good results. Much of the disease commonly seen is the result of the in-and-in seed-raising and cultivation. Worthing Cucumber-seed is being exchanged with that from Middlesex and Midland growers with decided advantage.

LATE VINE PRUNING.

Vines pruned after this date will be far safer if the cuts are touched with some styptic (see contrary opinion on p. 39). The best and most simple, yet cheap and effective material, is "knotting," as used by the carpenter and painter for stopping. To ensure the regular break of each rod, prune from bettom to top in one day. When the pruning is done well the breaks should be regular and grow evenly. Stephen Castle.

MARKET NOTES.

CUT FLOWERS AT COVENT GARDEN.

In cut flowers the chief supply is in Dutch bulbs and imported flowers. Tulips are very plentiful, and vary from 6s. to 12s. per dozen bunches; a few extra fine whites were making 15s. Double yellow Daffodils, 8d. to 1s. per bunch of about twelve blooms. Paper-white Narcissus very plentiful; also other Polyanthus Narcissus. A good many of these are now ceming from the Scilly Islands. Yellow Soleil make 4s. to 5s. per dozen bunches. Lily of the Valley is much cheaper, some very fine being offered at 10d. per bunch. Callas are plentiful, and are down to about 4s. per dozen for very good blooms. Good English Carnations are still scarce, and make about 4s. per dozen blooms. Tuberoses are plentiful and cheap. Liliums are not quite so abundant just now. There are still a good many Chrysanthemums coming in, and the best blooms make good prices, but there are now a good many small blooms, and these do not sell so well. The supply of French flowers was very plentiful lately, but the new French market was not very attractive, for there was a good supply of almost all imported flowers in the ordinary flower market. Yellow Marguerites, blue Coruflower, scarlet Anemones, also mixed colours, Ranunculus, Violets (immense quantities), Roses (plentiful, but many of them very poor). Acacia (Mimosa) is now plentiful and good. A. H., Jan. 9.

COVENT GARDEN FRUIT MARKET.

Large quantities of Gros Colmar Grapes are now on the market. Though some are not well coloured, there are many of excellent quality. Perfectly coloured examples are being sold retail at 3s. and 3s. 6d. per lb., and Alicantes of fine quality at 2s. 6d. per lb. There is plenty of very fair quality priced much lower than those I have quoted.

APPLES.

The market is well stocked with Apples. The Cauadian Apples in barrels are the most prominent, and the samples are of very good quality. Much trouble is taken in the packing, for when opened the fruits do not appear to have moved in the least, and all are almost free from bruises. A. H., January 16.

THE GARDENS OF THE ROYAL HORTICULTURAL SOCIETY.

The Society's Gardens were established at Chiewick in 1822, and since that time they have been looked upon as a leading and important help to horticulture. Of recent years the difficulties to be contended with at Chiewick, arising chiefly from the excessive surrounding drainage

a school of practical and scientific horticulture, and of increased value and interest to the Fellows. Mr. Wilson's wild-garden will be carefully preserved and continued, whilst other parts of the site will be devoted to the cultivation of all such trees, shrubs, fruits, vegetables, stove, greenhouse an I hardy plants and flowers as are found to be most generally useful or ornamental; to the trial

FIG. 23.—RHODODENDRONS IN THE ROYAL HORTICULTURAL SOCIETY'S NEW GARDEN AT WISLEY.

(From a photograph by F. Mason Good.)

and from the London smoke, have increased with tremendous rapidity. In consequence of which a desire for a better situated garden has been freely expressed, and, thanks to Sir Thomas Hanbury, K.C.V.O., this desire is in process of being gratified. Sir Thomas has purchased 60 acres of and, including the celebrated wild-garden of the late Mr. G. F. Wilson, V.M.H., at Wisley, and has given it in trust for the Society's use.

The Council are anxious to make the Gardens (as far as the funds at their command will allow)

of new varieties side by side with old established ones; to the hybridisation of plants and the raising of new varieties; to experiments in the culture and treatment of those plants which possess a floral or decorative as distinguished from a merely scientific value and interest. To these may be added the trial of such horticultural appliances and materials as may from time to time be submitted, and if funds be forthcoming it is hoped to add a practical Scientific department, with laboratory, &c.; this, however, will

largely depend on the liberality of Fellows interested in scientific research.

The cultivation, trial, &c., of Fruits have always been considered as of the utmost importance, and will form one of the most valuable features of the Gardens, and it is intended to establish and maintain a collection of all the best varieties of fruits, and extend it from time to time by the trial of such novelties as the raisers may be good enough to bestow on the Society.

A collection of standard and typical varieties of different Vegetables will also be grown for comparison with new varieties, both to assist the Committee in recommending their awards and for the general information of the Fellows. Besides this general collection, specially exhaustive trials of certain classes of fruits, flowers, and vegetables will be made every few years in rotation, and descriptive reports given in the Society's Journal.

The Floral department will include trees, shrubs, plants, and flowers of a distinctly decorative garden character, whether for cultivation under glass or out-of-doors. A few classes only can be illustrated each year.

Wisley may be reached from the under-mentioned stations, all of which are on the London and South-Western Railway. Starting from Waterloo Station, most of the trains stop at Clapham Junction, about eight minutes afterwards, but it is not quite safe to reckon on this without first ascertaining the fact; nor must the times of the trains given below be trusted without verification, as they are liable to alteration:

Weybridge.—19 miles from Waterloo (Central Station), and $5\frac{1}{2}$ from Wisley. Return tickets: 1st class, 5s.; 2nd class, 3s. 6d.; 3rd class, 2s. 10d. Carriages will be found at the station. Trains leave Waterloo 9.30, 10.5, 11.22, reaching Weybridge 10.19, 10.44, 12.1. Returning from Weybridge 3.34, 4.8, 4.25, 5.26, reaching Waterloo 4.15, 5.5, 5.18, 6.10.

Horsley.—22 miles from Waterloo (South Station), and $2\frac{1}{2}$ from Wisley. Return tickets: 1st class, 6s. 4d.; 2nd class, 4s.; 3rd class, 3s. 6d. Carriages can be procured by writing beforehand to the Manager, "The Hut Hotel," Wisley, Cobham, Surrey. Trains leave Waterloo 9.2, 9.35, 10.20, 11.2, reaching Horsley 10.15, 10.34, 11.35, 12.12. Returning from Horsley 3.29, 4.56, 5.12, reaching Waterloo 4.24, 5.49, 6.20.

Effingham Junction.—21 miles from Waterloo, and 3 from Wisley. No carriages here; only useful for pedestrians. Return tickets: 1st class, 6s.; 2nd class, 4s.; 3rd class, 3s. 4d. Trains from Waterloo 9.35, 10.20, 11.2, reaching Effingham Junction 10.30. 11.28, 12.8; returning from Effingham Junction 3 33, 4.59, 5.16, reaching Waterloo 4 24, 5.49, 6.20.

Byficet.—This station may be of use to visitors coming from the Portsmouth or Windsor directions, instead of going on to Weybridge. The distance to Wisley Common is 4 miles, and the road is exceedingly tortuous on account of the river.

Nota Bene.—Anyone liking to spend a day ortwo near the Garden, and in lovely scenery, will find an excellent country hotel, called "The Hut," situated in the middle of Wisley and Ockham Commons, on the main London to Portsmouth road, and only three-quarters of a mile from the Garden. The postal address of "The Hut," which is carried on by the Surrey Publichouse Trust, is "The Hut," Wisley Common, Cobham, Surrey.

The Gardens will this year (1904) be closed until after March 25. After March 25, 1904, on showing their tickets, Fellows of the Society will have free personal admission to the Gardens on all occasions when the gates are open, including all exhibitions and meetings. Visitors will be admitted on presenting a Fellow's transferable

ticket. Children will not be admitted unless accompanied by an adult, who will be held responsible for their conduct while in the Gardens.

Students and gardeners may obtain orders on application to the Secretary of the Society, Vincent Square, S.W., which will secure them special facilities for observation and study.

The gates will be open daily after March 25 (Sundays, Good Friday, and Christmas Day excepted) at 9 AM, and will be closed at sunset. On Sundays, Good Friday, and Christmas Day the Gardens are closed, but not on Bank Holidays. Extract from "Book of Arrangements" just issued by the Royal Horticultural Society.

NOVELTIES OF 1903. (Concluded from p. 28.)

OTHER HARDY FLOWERS

have been steadily recruited by the several showy specialities of Messrs. Kelway & Sons, Langport; Messrs. Cutbush, Highgate, in florists' Carnations; Mr. Jas. Douglas, Edenside, with Carnations of all classes, Auriculas, &c., Roses, especially of the rambler class, and other good novelties, many of which will be found in the following list.

The following novelties and noteworthy plants were illustrated in the Gard. Chron. in 1903:-

Æsculus indica, Supplement, Feb. 28. Allium albo-pilosum, Supp., July 18. Alpinia Sanderæ, Supp., April 18. Alpinia tricolor, Supp., April 18.

Clerodendron myrmecophilum, May 9, p. 291. Coffea Laurentii (robusta), May 16, p. 306. Coriaria terminalis, October 24, p. 282. Crinum rhodanthum, May 16, p. 315. Chrysanthemum Mrs. J. Dunn, Dec. 5, p. 385. Chrysanthemum Miss Elsie Fulton, Dec. 19, p. 424.

Crocus caspius, December 26, p. 443. Crossosoma californicum, August 22, p. 130. Dahlia (Cactus) Cheal's White, Supp., Sep. 5. Dahlia imperialis, September 5, p 178. Davidia involucrata, April 11, p. 235. Dracæna Broomfieldi superba, Supp, April 18. Dracæna kewensis, Supp., April 25 Echinocactus Delaetii and others, Supp., March 14.

VEGETABLES.

DISEASED POTATOS.

I HAVE never yet lifted a crop of Potatos that showed any signs of disease in the haulm, and only in very few instances have I found any diseased tubers. The chief reason for this I believe to be early planting. I make a special effort to get the main crop planted as early in March as possible. They are ready to lift early in the autumn, before the disease is widespread. I noticed several crops this year that showed signs of disease, and in most cases they were not planted until May. They were lifted in October and even November. I have had charge of four gardens in different parts of the county, and the soil has been of various kinds. Some good varieties are Up-to-Date, Windsor Castle, Evergood, Duke of York, Duke of Albany, Ninetyfold, British Queen, and Harbinger. I do not see how the spraying of Potato crops can be carried out on a large scale, owing to the expense, which would be very heavy where large quantities are grown for market. But I do believe that early planting, combined with the thorough cultivation of the soil, is the best preventative of disease at the present time. H. Green, The Gardens, Nocton Hall, Lincolnshire. [The spraying of Potatos will pay far better than the loss of the crop through disease. En.

WINTER SALADS FOR AMATEURS.

If one cares to go to the expense of sixpence and invests half of it in a packet of Endive-seed and half in Lisbon Onion-seed, he may have salad galore through November and December in any ordinary season, and with very little trouble. Sow Endive-seed from the beginning to the middle of July in drills 15 inches apart, and as soon as the plants are large enough, hoe, and thin out to 10 inches. Hoe the surface of the soil frequently, and in October, or sooner if the plants are large enough, tie them up tightly with raffia, rather near the top; this should be done when the plants are perfectly dry, or they may go rotten. In a fortnight the hearts will be bleached, and as tender as a Cos Lettuce. The Onion-seed should be sown thickly in drills 9 inches apart, about the middle of July, and will only require to be kept clean with the hoe. C. Myatt.

COLONIAL NOTES.

FOREST FLORA OF NEW SOUTH WALES.

The fifth part of this publication, edited by the colonial botanist, Mr. Maiden, contains plates and descriptions of Tristania conferta, which yields valuable timber when properly treated, and is largely planted as a shade-tree in Sydney; Lagunaria Patersoni, or, as Mr. Maiden prefers to write it, Patersonii; also of Eucalyptus gonio-calyx, which furnishes second-class timber, and Cupania anacardioides, a handsome tree for planting in parks in N. S. Wales.

FOREIGN CORRESPONDENCE.

THE name Strawberry-Grape, as applied to the American Fox Grape, by Mr. Bailly Wadds, on page 426 of your issue of December 19, 1903, is new to me. The Fox Grape is very common in the Eastern States, and from it have been derived many of our best varieties. Indeed, it is the basis upon which our American Grape culture is chiefly built. I am pleased to know that some of its offspring, as, for example, Isabella, find some favour in Britain. We have on our nursery lists some hundreds of varieties of similar parentage, and among them many which we consider superior to Isabella-at least as regards the general results of outdoor culture. I should think that those British gardeners who have found Isabella worth their while would be inclined to test other American varieties, such, for instance, as Delaware, Catawba, Niagara, Wilder, and Brighton. F. A. Waugh, Massachusetts Agricultural College, U.S.A., Jan. 6.

The Week's Work.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, gr., Wrotham Park, Barnet.

Strawberry Beds.-If it is intended to plant new beds with Strawberry plants which are being moderately forced and will be properly hardened off, prepare a suitable piece of land some weeks previous to the time for planting, so land some may become moderately firm. If depth of good soil is sufficient, have it trenched to the depth of 2 feet, supplying at the same time and at various depths plenty of well-decayed manure. It is not advisable to bring the bottom spit of soil to the surface when it is very heavy, yet it is essential to break up the subsoil to a great depth so as to allow the water subsoil to a great depth so as to allow the water to pass through it freely. Heavy land may be greatly benefited by a good dressing of wood-ashes, old lime, soot, or old potting soil. When the land has been properly prepared, the surface should be left rough for the time being. If the permanent beds have not already been mulched with manure, they should be afforded some at once. This work is best done in summer, as soon as the fruits have been gathered, especially if the land is light and gravelly. applying manure at this season, cover the surface thialy with strawy litter; the rains will wash this cloan, and it will preserve the fruits at the proper time from dirt, grit, &c., no more bedding-down being required.

Bush Fruits.-When pruning Black and Red Currant or Gooseberry bushes, select moderately-strong shoots for the purpose of cuttings. In gardens, large and small, a few cuttings should be rooted each year for the purpose of filling gaps or making new plantations. In cuttings of Gooseberries, and Red and White Currants, remove several of the lower buds, so as to allow a clean stem of 6 inches from the ground-level to the first set of branches. Plant the cut-tings firmly in a well-prepared piece of land, resting the base on a moderately firm bottom, in rows 15 inches apart, and 4 inches apart in the rows. Examine them occasionally to ascertain if they are firmly embedded, as frost is liable to loosen them. Lift and transplant those that were planted last year, allowing them more room for development. A little pruning may be required to keep them in shape. Cuttings of Black Currants do not require to have any of the buds removed. Do not propagate any but the best fruiting varieties. Red and White Currants are sometimes grown as standards, and they are very prolific. The cuttings for these should not be stopped till they have reached the proper height, out prune back all side-growths. When the but prune back all side-growths. When the heads have been formed they are usually spurred back, and if the growths be kept within bounds, the fruits are very fine. Red and White Currants when trained to walls may be netted easily, and the fruits thus protected from birds will keep sound and fresh for a considerable time.

FRUITS UNDER GLASS.

By W. FYFE, Gardener to Lady WANTAGE, Lockinge Park, Wantage.

Pines.—The culture of Pines here is done on a very limited scale. If the number of plants be small and the aims of the cultivator high, strict attention must be given to every detail. When ripe fruits are expected about the end of May or early in June, it will be necessary to maintain a bottom heat of from 75° to 85°, and a moist atmosphere by damping every available surface, except in dull, damp weather. The atmospheric temperature at night should be from 60° to 65°, varying in accordance with the weather, and rising 10° in the morning before admitting air. Do not afford water very liberally until the plants show fruit. Then thoroughly moisten the soil with water well coloured with Peruvian guano, and of 80° in temperature. Plants upon which fruits are swelling should be afforded an atmospheric heat of 65° to 70°, and a bottom-heat of 85° to 90°. When the fruits are partly coloured, only sufficient water will be necessary to keep them from shrivelling; and to secure high flavour less moisture in the atmosphere and more air will be necessary.

Succession Plants —Preparations may be made for potting succession plants into larger pots. Put the turf under cover, and pick it well over, as only the fibrous portion should be used. The plants need only a night temperature of 55°, and by day with sun-heat 70°, the bottom-heat being about 75°

Inside Vine-borders.—There is much difference of opinion with respect to the management of Vine-borders, but I think all agree that the nearer the roots are to the surface the greater the success that will follow. By annual applications of small quantities of plant-food, the roots may then be supplied with constituents necessary to the plants. About eleven years ago the borders here were reduced to skeletons in our search for roots. We then afforded them lime-rubble, broken bricks, charcoal, and ½-inch bones, together with Thompson's Vine Manure. These were spread over the surface amongst the roots in considerable quantity, and fresh turves about 4 inches in thickness, and as whole as possible, were placed grass side downwards, about 2 feet separating each turf, and made firm by treading, by which process the above-named ingredients had almost become covered. We then spread a good covering of sweet horse-droppings over it. At the present time we are sweeping up the spent manure applied last season, and adding one more turf, the whole being again covered with droppings from the stable. Three or four years is required in this way to cover the border one turf thick, the roots on the surface multiplying rapidly. We are not concerned that the surface presents a somewhat uneven appearance.

THE ORCHID HOUSES.

By W. H. WHITE Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Dorking.

Disas.-Plants of Disa grandiflora (scarlet), D. racemosa (rose-purple), and the hybrids D. × Kewensis, D. × Veitchii, D. × Langleyensis, D. × Premier, &c., that were repotted in November will be making progress with their new growths. Prick-in some living heads of sphagnum-moss thickly over the surface of the compost if this has not been done. When Disas are growing strongly afford them a good supply of water at the root, and when the weather is fine and bright lightly syringe the plants overhead with the fine sprayer two or three times a day. In some localities Disas will grow very well in cold frames, but they succeed best here in the temperature of an ordinary greenhouse, and where the atmosphere is moderately dry during the winter months. No artificial heat is used unless it be to keep the temperature of the house up to 36°. The atmosphere of the Odontoglossum-house appears to be too moist, and the temperature a trifle too warm for them. When the plants are in full growth they require a good clear light, but strong direct sunshine is harmful. Green flies frequently attack Disas, and must be cleaned off brush or sponge immediately they make their appearance.

Vanda cærulea.—Plants requiring fresh rooting material should be afforded this at once, for new roots are being made already. Cockroaches will destroy these young roots if not kept under. I am now using "Beetlecute," "Beetawline," and phosphorus-paste in turns, each proving effective. This lovely Vanda has always been very difficult to grow under our artificial conditions, but in Belgium, where the plants are potted in leaf-soil and surfaced with sphagnum-moss, they thrive splendidly and produce such spikes of bloom that have rarely been seen under our former methods. We have plants similarly potted at Burford, but it is yet too early to express an opinion as to their real progress. I advise cultivators to give a few plants a trial in the leaf-soil. The Mexican-house will suit Vanda cœrulea at present, but in summer they require a cooler temperature and more ventilation.

Cattleya Mossie. — Plants recently imported must be thoroughly cleansed of dirt and rubbish, cutting away all dead parts. Fix them in pots containing nothing but crocks. Water may be poured two or three times a week through the crocks to keep them moist, which will induce the plants to make fresh roots. When these appear the plants should be repotted, using a mixture consisting of one-half leaf-soil and the other half of equal parts of peat and sphagnum-moss, mixing the whole well together and surfacing with clean picked moss.

Dendrobiums.—Such species as D. Wardianum, D. crassinode, and the following hybrids, D. Clio, D. melanopthalmum, D. Juno, D. micans, D. Aspasia, D. Wardiano-japonicum, and D. crassinode-Wardianum, generally commence pushing new growths just when the flower-buds appear on the last-made pseudo-bulbs. Special attention must now be given to these plants, and water should be afforded only at long intervals, or the growths that are now breaking very slowly will start away and the flower-buds turn yellow and fall. Other Dendrobiums that have been rested in the cool-house and are now showing their flower-buds may be placed in more heat. The Cattleya or intermediate-house will be warm enough for a week or two, afterwards they will require the temperature of the East Indian-house. Place them on the lightest side, and well up to the roof-glass.

PLANTS UNDER GLASS.

By C. R. FIELDER, Gardener to Mrs. Burns, North Mymms Park, Hatfield, Hertfordshire.

Clerodendron Bulfourianum.—Where specimens are required to he in bloom early, plants which have been rested may be placed at the warmer end of the stove, and when an inch or two of new growth has been made repot the plants, using a compost of two parts good peat, and one part loam, adding a little leaf-soil and coarse silversand. Thin out the weak growths and train the shoots equally over a halloon trellis or around stakes. Afford water carefully until the plants are growing freely. Specimen plants are very effective for house decoration, and may be stood in trays with a few Ferns arranged around the base, or be placed in large vases. This Clerodendron may be easily increased by means of cuttings if the shoots be removed with a heel when about 3 inches in length, and inserted around the sides of small pots containing light soil. Plunge them in the propagating frame or under a handlight on a hothed having a temperature of 75° to 80°.

Seedling tuberous - rooted Begonias.—Seed of tuberous-rooted Begonias should be sown forthwith if the plants will be required to flower the first year. Use seed pots or pans with good drainage, and fill them to within half-an-inch of the rims with a finely-sifted compost consisting of two parts sandy-loam, one part leaf-soil, and some sand. Press the soil down evenly, and then water it by holding the pot in a pail of water, allowing the water to soak upwards through the hole in the pot until it can be seen on the surface of the soil. Then sow the seeds carefully and evenly, and sprinkle a little silversand on the surface. Cover the pots with a piece of glass, and place them in a moist atmosphere of stove temperature, where they may be shaded.

Gloxinias, Streptocarpus, and Begonia Frabeli.— Sow seeds of these plants this month, affording

them the same kind of soil and treatment as that recommended above for Begonias. In the case of all such minute seeds as these the safest plan is to divide the seed among several pots, in preference to sowing the whole of it in one. Until the seedlings are firmly rooted water must be afforded very carefully, or the tiny plants will be washed out of the soil, however fine the rose may be.

Forcing Shrubs.—Introduce batches of these into heat in such numbers as the requirements of the establishment demand. The forcing must be gradual. Ghent Azaleas, Lilac, Staphylea, Spirma arguta, Deutzia gracilis, D. Pride of Rochester, &c., may be placed in a vinery or Peach-house which is being started, where the moist atmosphere and gradually increasing temperature will meet their requirements perfectly.

Malmaison Carnations.—Where from any cause the young plants have not yet been placed in their flowering-pots, this should be done without further delay. A strong well-grown plant will require a 6-inch pot, and the soil may consist of three-parts fibrous loam, one-part flaky leaf-soil, and plenty of coarse silver-sand, together with a 6-inch potful of bone-meal to each barrow-load of compost. If the loam be deficient in fibre, then two-parts loam, one-part peat, and one of leaf-soil, with the sand and bone-meal, will be preferable. See that the compost is in a sufficiently moist condition before using it, and in potting make the soil moderately firm. Water must be afforded sparingly until the roots have taken possession of the new soil. Afterwards thoroughly soak each plant as required when it is watered, and avoid frequent dribblets.

THE KITCHEN GARDEN.

By John Pentlann, Gardener to C. H. B. Firth, Esq., Ashwicke Hall, Marshfield, Chippenham.

Preparing for Crops.—When all vacant ground has been dug or trenched, the gardener must exercise forethought in respect to his crops. It has been said that a gardener has but two things to please—the eye and the stomach. Our first duty is to try to produce, according to the means at our disposal, at all seasons in quantity and good quality, everything required for the supply of the table.

Jerusalem Artichokes are sometimes planted in some out-of-the-way corner year after year, yet show no sign of deterioration in the quantity or size of the tubers. If the weather remains open, take up the tubers and grade them. Place the largest in a heap in some convenient place for supplying the kitchen, covering them with soil or damp litter that is not likely to heat, that they may keep plump and crisp. The smaller tubers should be used for the purpose of seed, and may be planted now in rows $2\frac{1}{2}$ feet apart, and the sets 18 in. apart in the rows. If it is intended to plant them in the same ground manure it well and dig them in, which will be better than treading over wet ground.

Stachys tuberifera (Crosnes or Chinese Artichokes) should also be taken up and graded. If a border is ready and the soil in perfect condition, plant the tubers at once in lines 16 inches asunder, putting the sets 8 inches apart from each other. Cover them about 3 inches deep with rather fine soil. This Stachys is easily grown, and the tubers afford a little variety to winter vegetables. The demand for them here is increasing.

Parsnips.—Nothing will be gained by keeping Parsnips in the ground any longer; therefore lift the roots at once and place them in a heap, putting a few shovelfuls of damp soil or ashes amongst them as the heap rises, and covering the heap several inches deep with soil or straw. Have the ground thus cleared turned up roughly as soon as possible. In wet weather write or print labels, look over Onions, and take away any bulbs that are decaying; prepare Pea-stakes, and have any other work done that is convenient, for a busy season is approaching.

Growing Crops.—Observe these closely. Remove any Broccoli that are turning-in to a shed or cellar where they will be safe from frost. Admit fresh air to Cauliflowers in frames on all favourable occasions, and remove any decayed leaves from them.

Forcing.—Introduce into heat fresh batches of vegetables and salads. Cut Seakale when it is short and crisp; it is useless when long and stringy.

THE FLOWER GARDEN.

By A. B. Wadns, Gardener to Sir W. D. Pearson, Bart, Paddockhurst, Sussex.

Climbers and other Plants ogainst Walls.—In exposed and windy positions climbing plants need to be frequently inspected and made secure, but the necessary pruning and thinning out of shoots it may be assumed was done in autumn. Afford Magnolias and Camellias a good top-dressing of rough peat, loam, and brick-rubble. or charcoal and soot. Akebia quinata, Chimonanthus fragrans, and Tropæolum speciosum should be included in all collections. The Tropæolum may he easily increased by seeds sown as soon as ripe in the autumn, but off-sets or roots taken up and potted now will make nice plants by the summer. They should be planted in partial shade on the north side of a Yew-hedge, where the growths will get the benefit of the sun, or on a north-east wall. The plants like a rich soil, such as peat, rich loam, and sand; also in the summer, when well established, a liberal supply of farm-yard liquid-manure.

Calceolarias may be stopped to four leaves if required to flower late, not otherwise. Afford them a watering of soot-water on a dry day, and remove the green surface-soil and decayed leaves. Beds to receive these should be afforded some good loamy soil, digging it in now.

Lobelia cardinalis, lifted in the autumn, will be making fresh roots, and can be increased easily if the young side-shoots be broken off and potted-up. Keep them moderately dry, and afford them a little warmth through the winter months.

Echeverias.—Look over the stock, and shorten back any long roots. Pot-up suckers in order to-increase the number of plants.

Tender Bedding Plants. — Abutilon Thomsoni, Fuchsias, fibrous-rooted Begonias, Lantanas (Drap d'Or), Verbena venosa, and Heliotropes may be placed in heat, where they will make new growths for use as cuttings. Repot Pentstemons, take cuttings of border Chrysanthemums, or divide the roots. If there is not sufficient accommodation for striking cuttings in pits, a hot-bed had better he made up in a sheltered position outside for use in a few weeks' time. Let it be composed of leaves and long stable-manure in equal portions. There is nothing to be gained by starting too soon, if an outside hot-bed has to be used, as the weather may be very bad for some time to come.

The Sub - Tropical Garden. — Sow seeds of Grevillea robusta, Centaurea candidissima, Chamæpeuce Casabonæ, Eucalyptus, Ricinus, and other species required for the sub - tropical garden.

General Work.—Finish the pruning of shrubs, cut away the growth of Laurels if more space is required for choice evergreens to develop perfectly. The borders may then be forked lightly, or hoed to give a tidy appearance. The lifting and laying down of turf should be pushed forward. Low spots may require to he raised, and grass verges to be edged up. Roll the walks, and make good such as are in bad condition. Lawns that are badly affected with moss should be afforded a good dressing of finely-sifted wood-ashes.

PUBLICATIONS RECEIVED.—Willings' Press Guide and Advertisers' Directory and Handbook. This reference book (published by James Willing, junr., Lim., 125, Strand. W.C.), has now attained its thirty-first annual issue. As a "concise and comprehensive index to the Press of the United Kingdom, containing [the names of] all the newspapers, magazines, reviews and periodicals, annuals, guides and directories, journals, proceedings, reports and transactions of learned and other Societies issued in England, Wales, Scotland, Ireland, and the British Isles," the volume is valuable, not to say essential, to all connected with journalism. A list of the principal Colonial and Foreign journals, and a variety of general information are included, and the whole has been brought up to the present year of 1904.—England's National Flower, by George Bunyard.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the Publisher. Letters for Publication, as well as epecimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London.

Communications should be WEITTEN ON ONE SIDE ONLY OF THE PAPEA, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, JAN. 25 (Royal Horticultural Society's Committees meet.

SALES FOR THE WEEK.

BALES FOR THE WEEK.

MONDAY AND FRIDAY NEXT—

Hardy Border Plants and Perennlais, Azaleas, Roses, &c., at 47 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.

TUE3DAY NEXT—

Unreserved Clearance Sale of Nursery Stock at The Nurseries, Church Road. Leyton, by order of Mr. J. Fraser, by Protheroe & Morris, at 11.

WEDNESDAY, JANUARY 27—

At Stevens' Rooms, at 12 30, Roses, Rhoddendrons, Azaleas Palms, &c. — Palms, Plants, Azaleas, Lil.ums, Roses, Herbaccous Plants, &c., at 67 & 68, Che. pside, E.C., by Protheroe & Morris, at 12.

WEDNI SDAY AND THUR 'DAY NEXT—

Unreserved Clearance Sale of Nursery Stock at The Nurseries, South Woodford, by order of Mr. J. Fraser, by Protheroe & Morris, at 11.

FRIDAY NEXT—

Importation of Odontoglossum Harryanum, &c., at

Importation of Odontoglossum Harryanum, &c., at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12 30.

(For further particulars see our Advertisement columns.)

AVERAGE TEMPERATURE for the ensuing week, deduced from observations of Forty-three Years at Chiswick

ACTUAL TEMPERATURES :-

LONDON.-Jan 20 (6 P.M.): Max. 38°: Min. 34°. Jan. 21 (noon): Frost last night, wet and

cold. Provinces. - Jan. 20 (6 P.M.): Max. 45°, N.E. coast of Iroland; Min. 34°, S. coast of England.

Some documents have reached The Royal Horticultural us, including the Report to be Society. presented to the annual meeting on February 9. From them we make copious extracts. They show that this year, 1904, is likely to be an annus mirabilis for the Royal Horticultural Society. The extraordinary growth of the Society during the last few years may be traced to the determination of the Society to stick to matters horticultural, to the undeviating persistence and courtesy of the President, and the perseverance, industry, and organising talent of the Secretary. We are sure that all members of the Council will substantiate this statement. As the centenary of the Society approached there were various proposals as to the best method of celebrating so auspicious an occasion. The scheme, launched by Baron Sir HENRY SCHRODER, for the erection of a home for the Society, including an exhibition hall, rooms for the Lindley Library, and for the offices of the Society, now more than overcrowded, was the one that found most favour. There were some who would have preferred the formation of a new garden in the country in place of the honoured establishment at Chiswick.

The provision of a suitable home for the Society seemed to the majority to be the most urgent necessity of the two, particularly as the lease at Chiswick had still several years to run. However, a considerable amount of subscriptions were received, and the foundations of the Hall were laid, when Sir Thomas Hanbury most unexpectedly came forward to fulfil the aspirations of those who preferred the garden

scheme, and presented to certain Trustees for the benefit of the Society the garden at Wisley, which the late Mr. George Wilson had rendered famous. And so it happens that the Centenary Year opens, not with the prospect, but with the certainty that a suitable Hall and Offices and a fine garden will become the property of the Society. The most brilliant imagination could not have predicted such an issue, and to those who laboured in the service of the old Society during the many years when ruin seemed ever imminent, the present condition of affairs is simply astounding. Not that the prospect is even now quite unclouded. Many more thousands are still required for the completion of the Hall; correspondingly large sums will be demanded for the new installation at Wisley, and for its permanent maintenance.

The usefulness of the Library must be enhanced, the income of the Trustees must be rendered less pitiful in amount, and the necessities of scientific horticulture must be provided for. To those who have eyes to see, it is more than evident that the claims of science are peremptory and inexorable, that is, of course, if the Society is to make progress, enrich its supporters, and benefit humanity. If the Society is only to exist for the sake of getting up flower-shows, awarding prizes for exhibitors, providing advertisements for the trade, and catering for the gratification of sightseers, the present arrangements will suffice. But we have the future to look to; and even the commercial fraternity has its own interests to consider, and to meet the ever-increasing competition from some foreign nations wiser and more foreseeing than ourselves.

On these grounds we are glad to see reference made to the subject in the statement that the Council has not overlooked its importance, and that in the near future, if not at present, we may see a laboratory placed under the direction of a competent director conversant with the needs of borticulture, and properly equipped for the purposes of scientific research into the many matters which concern the practical cultivator.

The celebration of the Centenary Year by means of a dinner at the Metropole in March is decidedly a British proposal, but it may be questioned whether this is the best way of getting the Fellows together to "talk over the affairs of the nation," and exchange opinions. A reception in the new Hall, such as proposed by one of our correspondents, would meet these requirements much better than the solemn formality of a public dinner, to which only a few would go unless they were obliged, and from which most people are glad to escape when the time comes to break up. Be this as it may, there is ample occasion for both functions, for the more opportunities of meeting in social gatherings the better for the Society.

Another matter referred to in the Report demands still more serious consideration. It is, we observe, proposed to enact a byelaw raising the minimum subscription from £1 1s. to £2 2s. to all but bona-fide gardeners, residents abroad—and journalists (!).

We cannot, of course, doubt that this proposal has been duly considered in all its aspects by the Council, and that they will be able to adduce good reasons for what seems an extraordinary reversal of a policy which has so obviously been beneficial.

CHRYSANTHEMUM LADY CRANSTON (See Supplementary Illustration). - The Japanese Chrysanthemum shown in our supplementary illustration this week has been seen at some of the large exhibitions during the past season, and was awarded a Silver Medal at Edinburgh. It is a sport from the popular variety Mrs. Barkley, and originated in the collection of Mr. R. E. N. MURRAY, Edinburgh. The florets are longer and broader than those of Mrs. Barkley, and the flower is white, except that the uppermost florets have a pink blush upon them, which increases the attractiveness of the flower. The variety is among the largest of those grown for exhibition, our illustration having been reduced about onehalf. The novelty has received Awards from the Royal Horticultural Society and the National Chrysanthemum Society, and will be distributed by Mr. W. J. Godfrey, Exmouth Nurseries, Devonshire.

ROYAL HORTICULTURAL SOCIETY.-The next meeting of the Committees will be held on Tuesday next, January 26, in the Drill Hall, Buckingham Gate, Westminster. A lecture on "Oranges" will be given by Mr. H. Somers RIVERS at 3 o'clock. At a general meeting held on Tuesday, Jan. 5, 53 new Fellows were elected.

THE GARDENERS' ROYAL BENEVOLENT IN-STITUTION .- On Thursday last, as these pages went to press, the supporters of this Institution met at Covent Garden Hotel for the transaction of the business that is necessary at an annual meeting, and to elect a number of pensioners to the Fund. Following this business, the Committee and friends met at the annual Friendly Supper. In former years we have been able to record the names of the successful candidates in our current issue, but the necessity for printing a larger number of copies, owing to our largely increased circulation, has compelled us to go to press earlier. A report will be given

FIRE AT KNEPP CASTLE.—We regret to hear that Knepp Castle, the residence of Sir Merrik BURRELL, Bt., at West Grinstead, has been almost destroyed by fire. Sir Merrik and Lady Burrell had a narrow escape. The Horsham Fire Brigade was assisted by Mr. Lucas's steam fire-engine from Warnham Court, the beautiful gardens of which have been described frequently in these columns. The firemen had an excellent supply of water from Knepp Lake, a large sheet of water.

MR. A. W. METCALFE, who has filled the situation of gardener to the Marquis of Exeter, Burghley House, Stamford, for the last eight years, and has carried out many improvements there, has been appointed gardener to J. H. WERNHER, Esq, Luton Hoo, Luton, Beds.

MR. J. BURN.-Many readers will regret to hear that Mr. J. Burn, who has had charge of Leicester Parks and Public Gardens for the last twenty-two years, has resigned. The large flowershows that have been held in the Abbey Park, which Mr. Burn kept so well, have been the subject of numerous notes in these pages.

ROYAL MEMORIAL TREES .- During the recent visit of the King and Queen to the Duke and Duchess of Devonshire at Chatsworth, the Royal party motored over to his Grace's historic Elizabethan mansion of Hardwick Hall to lunch, and while there planted in the garden two memorial trees (Cedar of Lebanon), which had been prepared for planting by Mr. Wilson, the head gardener.

PACKING AND SELLING FRUIT AND VEGE-TABLES .- His Majesty the King has accepted a copy of the Gold-medal Essay on Packing and Selling Fruit and Vegelables, by Mr. R. LEWIS Castle, of Ridgmont. The book was bound in purple morocco, and was presented by the Worshipful Company of Fruiterers.

SURVEYORS' INSTITUTION .- The next Ordinary General Meeting will be held in the Lecture Hall of the Institution on Monday, January 25, 1904, when a paper will be read by Mr. RALPH NEVILLE, K.C., entitled "The Garden City Scheme and First Garden City, Limited."

- The Annual Dinner of the Institution will be held at the Grand Hall, Prince's Restaurant, Piccadilly, on Friday, February 12, 1904, at 7 o'clock precisely.

GARDENING FOR AMATEURS .. - Following the example set in these columns by Mr. H. A. Вклонт, in his "Year in a Lancashire Garden," and followed here and elsewhere by a host of imitators, Mr. RIDER HAGGARD is now contributing to the Queen a series of articles on "Gardening for Amateurs." It is refreshing after the pages of --- (well, we need not particularise) to read of the clearly told experience of a genuine gardener. Doubtless, when the series is complete, a separate volume will be issued. If so, we predict that it will be very serviceable.

STERILISATION OF SOIL.—The practice of sterilising the soil by means of steam or by baking is often recommended as a means to destroy eel-worm and other pests, and it is no doubt efficacious. But the soil, we have been taught to recognise, contains countless bacteria, by whose beneficent agency the insoluble and therefore useless ingredients of the soil are converted into those that are soluble and nutritious, and the inert nitrogen is rendered available. But what if the sterilisation destroys those humble enicrobes which play so large a part in the nutrition of the plant?

SCIENCE HAS NO NATION.—The Chrysanthème motes that M. MAURICE MADELIN, a Frenchman, lately in the service of Mr. Wells at Earlswood, has been elected Secretary of the Wanstead and District Chrysanthemum Society. Our contemporary appears to think this a unique case in the horticultural world, but we think it can be paralleled in several of our scientific societies. It is not long since Dr. GÜNTHER resigned the Presidency of the Linnean Society. M. WAD-DINGTON, an Englishman by birth, was Ambassador for France at the British Court.

GARDENING IN THE ANTARCTIC REGIONS .-When the s.s. Discovery was taken to the Antarctic regions by Captain Scott, Messrs. James CARTER & Co., High Holborn, London, conceived the idea of sending some seeds to supply the sailors with something green while passing the time frozen up within the regions of the Antarctic oircle. An intimation of this, given in the Daily Telegraph on May 11 last, was that "the only bit of green vegetable seen on the Discovery was a crop of Mustard and Cress grown by the officers on a wet blanket. This information was brought back to England by the relief ship Morning, and it shows that the officers had been successful in growing a little bit of green hy following the instructions given by the Messrs. Carter, while passing the time in that dreary land. Another communication came through Admiral Sir CLEMENTS MARK-HAM, K.C.B., F.R.S., who heard that the Mustard and Cress supplied to Captain Scott, of the s.s. Discovery, was a great success and much appreciated. A further consignment of seeds, specially treated by an original process and packed in air-A further consignment of seeds, specially exhausted receptacles, has been taken out in the relief ship Terra Nova, which has lately left Hobart to seek for the whereabouts of the

A STRAIN OF PRIMULAS.—Primula sinensis is once again brightening our greenhouses and conservatories. A few days ago we were shown flowers representing the strain of Messrs. W. Bull & Sons, of King's Road, Chelsea. A variety named Duke of York, with fimbriated flowers of intense madder-crimson, was particularly noticeable by reason of the depth of colour. Other good single flowers were Comet (crimson), fulgens, Ruby Queen, Pink Beauty, Imperial Blue, alba oculata-lutea, also the old fimbriata alba and rubra. Of the semi-double varieties, Blushing Beauty was very large and full; and rosea and rubra, &c, were good. The strain generally may be recommended.

STOCK-TAKING: 1903.—At the close of a year characterised by unusually wet weather some naturally look with apprehension at the solid mass of figures in a volume of 240 pages relating to the Trade and Navigation Returns for 1903the "some" are those who have not taken stock as the months rolled past of the figures presented in these columns, which indicated the gradual piling up of a colossal total, which has never anywhere had its equal, and triumphantly proclaims this old land to be the Colossus of Commerce. The proof is to be found in the figures; but let us record the totals for December. first The imports were valued at £52,319,618, against £48,170,628 for the same month in 1902-a difference of some £4,148,990-due to great imports in grain and flour, in Cotton, and other items. The exports for the month reached a total of £24,612,503, against £24,208,533 for the corresponding period in 1902-a gain of £403,970. The total, adding imports to exports, foots up at £833,796,606, against £871,815,240 for the same period in the previous year-a difference of £21,981,366. Adding the ships to the goods carried, we have for last year's work the astonishing sum of £903,000,000. We give the following dissection of the "summary" table for the year :-

IMPORTS.	1902.	1903.	Difference.
Articles of food	£	£	£
and drink—duty free	109,684 688	114,109,426	+4 424,738
Articles of food & drink-dutlable	108 926,617	114 218 387	+5.291,770
All other Imports	309,779 969	314 578 512	+4,798,543

We turn now to the division devoted to the imports of fruit, roots, and vegetables :-

IMPORTS.	1902.	1903.	Difference.
Fruits, raw-	Cwt.	Cwt.	Cwt.
Apples	2,843,517	4,568,413	+1,724,896
Apricots and Peaches	16,112	9,578	- 6 534
Bananas bunches	2,804,700	3,087,516	+282,816
Cherries	166 359	110,192	56,167
Currants	76,080	76,419	+339
Gooseberries	27,564	34,312	+6,748
Grapes	632,932	687,938	+55 006
Lemona	1,003,298	978,318	-24,980
Nuts-Almonds	149 574	157,159	+7,585
Others used as fruit	783,788	791,278	+7,490
Oranges	6 518 107	6,176,789	-341,318
Pears	491,906	271,483	-220,423
Plums	541 136	596,182	+55 046
Strawberries	40 211	32,644	-7,567
Unenumera.ed	500,679	688,876	+188 197
Vegetables, raw-			
Onionsbush.	7 605 489	8 619,719	+1,014 230
Potatos cwt.	5,699,090	9 150,202	+3,451 112
Tomatos ,,	783,894	1,068,435	+ 284,541
Vegetables, raw, un- enumeratedvalue	£468,411	£396,957	−£ 71,454

In taking stock of Consular and other reports issued during the year, it is pleasant to see the interest displayed in the fruits of the different countries. Concerning Cape fruit, up to the time of writing, 968 boxes of Peaches and Apricots have been landed and sold. In the face of the above-noted figures, and of the great complexity of the conditions, it is evident that careful enquiry should be made before any change in our fiscal system be introduced.

THE WEYBRIDGE AND DISTRICT HORTICUL-TURAL SOCIETY'S summer show will be held at Duneevan, Oatlands Park, on July 14, and the autumn exhibition on November 3.

FARM AND GARDEN INSECTS.-To those conversant with the French language, and interested in the manners and customs of the insects injurious to the plants of the farm, the trees of the forest, or the flowers of the garden, we commend a little treatise entitled Entomologie et Parasitologie Agricoles, by M. GEORGES GUÉNAUX, Demonstrator at the National Agronomic Institute of France, and published by MM. J. B. BAILLIÉRE ET FILS, of Paris. Not only are the insects described, but also the means of destroying the pests. The book is freely illustrated, and has a table of contents, as well as a good index, so that its contents are readily accessible.

TURIN INTERNATIONAL HORTICULTURAL EXHIBITION.-M. Raduelli, Vice-President, and M. Roda intend to visit London shortly to ascertain how many of our British horticulturists are likely to take part in the exhibition in May next, and to give all requisite information. The King and various members of the Royal Family offer medals and other prizes. The Editor will be glad to receive the names of those who propose exhibiting. All enquiries should be made to Sig. Palestrino, Rue Stampatore, Turin.

THE DEPARTMENTAL COMMITTEE ON FRUIT GROWING. - We have received the following communication from the Secretary of the National Fruit Growers' Federation :-

"Every member of the National Fruit Growers' Federation must heartily welcome the decision of the Board of Agriculture to hold a Departmental Enquiry into the condition and prospects of the Fruit Growing

Industry in this country.

"Of course, it is a matter which affects every Grower, but Members of the Federation will be justified in

but Members of the Federation will be justified in feeling with some pride that they have had a hand in bringing it about, for without wishing to claim more credit than fairly belongs to it, there can be no doubt that it was the agitation act on foot by this National Society which brought to the minds of the powers that be the necessity for an exhaustive enquiry.

"It is a well-known fact that Government Departments rarely take action of this kind without spontaneous evidence from the particular interest concerned that such action is really required, and in this instance the National Federation has undoubledly furnished such evidence. By its deputation to the Board of Railway General Managers, which led to some very satisfactory results, and [by] the public meetings it Board of Railway General Managers, which led to some very satisfactory results, and [by] the public meetings it has held in various parts of the country, it has called attention to the needs of the industry; and especially by its frequent communications with the Board of Agriculture have these needs been impressed on the late and present heads of that Department. At the west gathering at Maidstone in August last, the great gathering at Maidstone In August last, the President of the Board was present in person, delivered a most sympathetic address, and himself joined tha Federation. Then we have the fact that the President Federation. Then we have the fact that the President and two other leading members of the Federation are appointed as members of the Committee of Enquiry, which alone should convince the growers in general as to what influence is possessed by their representative combination. Indeed, it is difficult to see how any grower can conscientiously withhold his support from a body which is so manifestly working for his best interests. interesta.

'I shall be glad to answer any enquiries and to receive any auggestions with regard to the work of the forthcoming Enquiry Committee, which will be forwarded to the proper quarter. A. T. Matthews, Secretary, N.F.G.F., 28, Eaton Rise, Ealing, London, W."

IRISH FORESTRY .- Lord POWERSCOURT had a very instructive article on this subject in the Times of the 15th inst. In it he gave particulars of the large share he has himself taken in planting on the mountain-sides in his estate; of the way in which it has been done, and of the average cost of the transaction. For three-years seedlings twice transplanted the cost of notch-planting per acre works out at £4 13s. 11d. As many as 300,000 to 400,000 plants were planted - out annually. The species planted were Larch, Scotch Pine, together with thousands of Douglas Fir, Thuya gigantea, Cedrus Deodara, C. atlantica, Pinus insignis, Cupressus Lawsoniana, Wel-

lingtonias, and Araucaria imbricata. In one place a hundred Araucarias were planted in a group, nursed up with Scotch and Larch for shelter. The nurses have now been cut away, and the Araucarias stand by themselves and form a remarkable feature. The trees are not much injured by wind, though the Douglas Firs are apt to lose their leaders from this cause. The Corsican Pine is spoken of as one of the best trees for exposed places. Nothing is said about the Sitka Spruce, though this is one of the most promising of timber trees. The Land Act is said to work detrimentally so far as afforestation is concerned, and the land sold to the farmers is being at once denuded of its timber. This would furnish an argument for the establishment of State forests, so managed that the peasants might, directly or indirectly, have some share in the proceeds, and

particularly as a good index is supplied. The book is a veritable ouvrage de luxe, and will be welcomed as a "precious" possession by those endowed with artistic perceptions.

ROYAL HORTICULTURAL SOCIETY OF IRE-LAND.—An effort has been made to revive the fallen fortunes of this Society. Lady Ardilaun took the chair at a meeting held in Dublin, and Mr. F. W. Moore, Glasnevin, and other speakers advocated measures to put the Society in a more stable financial condition. It was arranged that a spring fête be held in the Rotunda on April 14 and 15. It was also resolved that the following executive committee be appointed, with power to add to their number, viz.: Lady Arnott, Miss Pim, Mrs. Domville, Mrs. John Jameson, Mrs. T. Talbot Power, Mrs. Moore, Mrs. Howard Guinness, Colorado, and even in New Mexico and Arizonabeing thus able to maintain itself in hot, dry regions. It was introduced into cultivation by Jeffrey and Lohb. It was formerly confounded with A. lasiocarpa (= subalpiua), with A. grandis and other species, as owing to its widely extended habitat it varies much in character.

A long-leaved form was long thought to be distinct, and is still cultivated in many gardens under the names of A. lasiocarpa, A. Lowiana, or A. Parsonsi; but there is now little doubt that all these are but forms of A. concolor. Some of the forms of concolor from Colorado possess a very heautiful bluish tinge; the best-coloured of these are called P. concolor var. violacea, but the seedlings vary greatly in colour, so that those who desire a fine form should visit the nurseries and pick them out for themselves.

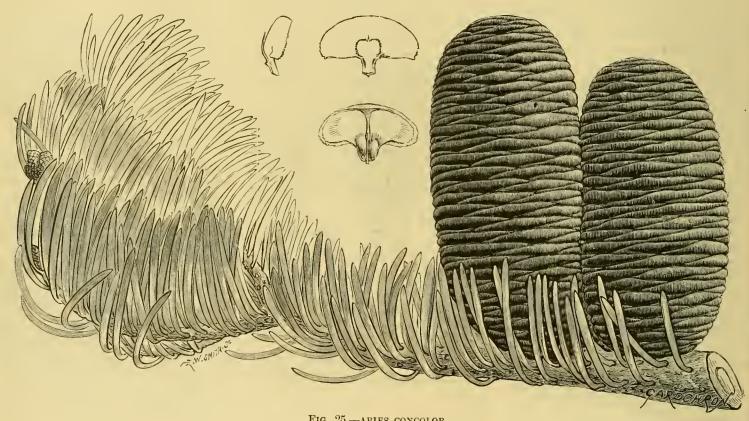

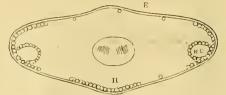

FIG. 25.—ABIES CONCOLOR.
Fruiting branch with upturned leaves; above are shown fruit-scales with bract, and seeds, cones brown.

thus be induced to protect and take a personal interest in property in which they had a heneficiary interest; otherwise "accidental" fires are apt to break out.

"FLORA AND SYLVA."-The first volume of Mr. Robinson's new publication is now issued in a very elegant form. Binding, paper, and type are luxurious; the woodcuts' are luminous, the coloured plates "impressionist," though lacking in utilitarian detail. Any reader who desires to make a comparison between the effect of glazed and unglazed paper, or between woodcuts and process-blocks, can easily do so in this volume; and he will probably come to the conclusion that, as regards merit and suitability, there is something to be said on both sides. . Much attention is given in the text to] trees and tree-planting, and several of the more newly introduced plants are the subject of coloured illustrations, such as Hidalgoa Wercklei, Fritillaria askabadensis, Pæonia lutea, Lilium Grayi, and an excellent figure of Inula Roylei, or Royleana, for it is spelt both ways. There are uumerous "monographs," if we may venture to use such a term, relating to particular gener which are suitable for reference

F10. 26.—ABIES CONCOLOR: SECTION OF LEAF.
E, epiderm; H. hypoderm; R.C, resin canal; in the centre the vascular cylinder.

Miss Constance Greene, Mrs. W. W. Goodhody, Miss Hutton, Miss Hone, Mrs. Riall, Mrs. J. G. Jameson, Miss H. Goodhody, with Messrs. Moore, Robertson, Drummond, D'Olier, Bewley, Ross, and Goodbody.

ABIES CONCOLOR.

This is a noble tree, attaining, according to Sargent, a height in the Sierra Nevada of from two hundred to two hundred and fifty feet. It grows on the mountains at altitudes of from 4,000 to 8,000 feet, and occurs not only along the Californian Sierras but also in Utah, Western

In the young state it is highly ornamental, as our figure of a tree at Linton Park, near Maidstone, the residence of F. S. W. Cornwallis, Esq., shows (fig. 27). This tree, we are told by Mr. F. Kneller, the gardener, is now 80 feet in height. We have no experience of it as a timber tree, but the wood is soft and white, and said by Sargent to be deficient in strength and durability. Theresin canals are sub-epidermal.

The hotanical history may be gleaned from the following references, and is summed up in Sargent's Silva, vol. xii., p. 121, tab. dexiii. (1898).

Figures of A. concolor, and of the species allied to it, have been given in the Gardeners' Chronicle as under:—

Abies Lowiana, branch with chestnut-brown concs, 1886, December 11, p. 753. A specimen in the grounds of the late Sir John Walrond was 60 feet high in 1886. May 22, 1880, p. 648.

Abies concolor, twigs of. May 21, 1881, p. 661.
Abies (Picea) concolor violacea, Roezl., 1879.
Nov. 29, p. 684.

Abies grandis, 1881. February 5, p. 179; Cones bronzy-green. See also 1885, October 31, p. 561.

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his Correspondents.)

BONE MANURES (see enquiry on p. 47).—
Assuming that "C. E. G." can give a good analysis with each parcel, I do not think he would have much difficulty in selling a quantity of hone manures at the prices he quotes. At any rate they are a good bit below those quoted by respectable dealers in these articles. H. J. C.

TRICYRTIS HIRTA.—This plant is hardy here, but has not flowered during the last six or seven years, owing chiefly probably to our cold clay. I remember how well it flowered at Linton Park, Kent, under the charge of the late Mr. J. Robson, in the years 1872-1874; but one or more of those summers was exceptionally hot. It was very late in the year before the flowers opened. W. H. Divers, Belvoir Castle Gardens, Grantham.

enclose one bract of Poinsettia that was grown out-of-doors from the middle of June to the middle of September, and considering the cold, sunless year (1903) I do not think it is at all bad; the temperature repeatedly fell to 35° during the latter part of the time they were out. The bracts are not quite so large this season, as the wood did not get so well ripened. In the two previous years we had them 13 and 15 inches across, which, I think, proves that Poinsettias will grow for the period mentioned entirely without protection, and do not require a frame. J. S. [The head of bracts was 10 inches across, and the foliage large and finely developed. ED.]

—— I have twelve plants of Poinsettia pulcherrima now in full bloom bearing over 200 magnificent scarlet heads, many of which pulcherrima now in full bloom bearing over 200 magnificent scarlet heads, many of which measure 16 inches across, and are composed of as many as forty-eight bracts. They fill one-half of a stove measuring 31 feet by 28 feet. Some of the leaves measure $7\frac{1}{2}$ inches in length and $4\frac{1}{2}$ inches in width, and the main stems of some of the plants are $6\frac{1}{2}$ inches in circumference. They were originally placed in pots on a bed of soil, but their roots are now firmly fixed in the bed of soil 26 feet by 2 feet, and the depth of soil 18 inches. Johnson Mayhew, gr. to H. Marsland, Esq., Woodbank, Stockport.

FORESTRY.—Referring to your note, p. 41, I may mention that the Japanese Larch (Larix leptolepis) grows very freely on our stiff limestone loam. About seven years ago my employer had a small packet of seed sent from Japan, from which we raised a small batch of plants. When large enough we planted them out in a not too favourable position in the grounds here; they have grown very well, some of them heing fully 8 feet in height. So far there is no sign of disease. It is only right to say that the common Larch is practically free from disease so far as this particular district is concerned. I should be disposed to agree with "F. R. S." as to the advisability of planting fully 80 per cent. with the common Larch if any new plantations were to be made with the sole view of ultimate profit. The most useless tree to plant is the common Spruce, if the latter object is in view. I agree in thinking that given suitable positions beth Chaptered Levenille. to plant is the common Spruce, if the latter object is in view. I agree in thinking that given suitable positions both Cupressus Lawsoniana and Thuyopsis borealis (= Cupressus nootkaensis) are likely competitors with the Larch as timber producers. I have this evening put the tape round one of each of them at 3 feet from the ground. The former girths 4 feet, the latter 2 feet 8 inches; one of them is from 36 to 40 feet in height, the other about 6 feet less. They are growing near together on stiff, clayey limestone soil, and have been planted about thirty-five years. I ought to mention that the Cupressus carries its I ought to mention that the Cupressus carries its aximum girth much higher up the stem than the Thuyopsis. Supposing an acre of land had been planted at the time and thinned out to, say, 8 to 9 feet apart, it is easy to see what an immense quantity of useful material would have been produced. Other plants of this Cupressus planted out about the same time, but in a somewhat drier soil, do not girth so much as the one already mentioned. As is well known, the home covers on most estates are not judged mainly from covers on most estates are not judged mainly from a timber-producing point of view, but more as shelters for game-preserving. So far as my ex-perience and observation go, this view of the

matter is, if anything, on the increase. Hence the necessity of finding some other evergreen conferous tree that when freely grown will be of more service than the common Spruce or its near relatives. Pseudotsuga (Abies) Douglassi will not grow well here. I saw recently a fine lot of ance. I lost sight of them for some years, and was much surprised a few days since to find several of them 30 feet and upwards in height, being beantiful specimens of a fine dark healthy colour. Mr. Metcalfe expressed the opinion that they had rooted through the unsuitable soil into

FIG. 27.—ABIES CONCOLOR AT LINTON PARK, MAIDSTONE, THE RESIDENCE OF F. S. W. CORNWALLIS, ESQ.: ABOUT 80 FEET HIGH. (SEE P. 58.)

trees of it at Condover Hall, in Shropshire, where

the soil is of a red sandstone nature. H. J. C. Grimston, Tadcaster, Yorks.

—— The Douglas Fir (see p. 41) does not succeed well in all soils. I remember some trees at Burghley, near Stamford, twenty years since, which were then about 10 feet in height. They had a miserable, stunted, rusty appearother soil they liked better. Trees not far distant, planted five or six years since, were sibkly in appearance, as the large ones were formerly. W. H. Divers.

TO VARIATION IN SEEDLINGS.—Among the seed-lings I have obtained from Campanula Barelierii, a variety which has glossy green leaves perfectly bare, are several with distinctly woolly leaves—one particularly so, and presenting to view a remarkable departure from the type. As soon as it comes into bloom I will submit it to the Floral Committee with a plant of C. Barelierii. The woolly character is not unknown in C. Mayii, but it is much more evident in the seedling above referred to. R. D.

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—I intended no slur on the "excellent committee and hard-working secretary" of the above Institution. I am aware of the existence of leaflets—I doubt if they are "catching" enough —yet I find a lamentable indifference to, or a profound ignorance of, the objects of the charity among many gardeners. I attend not a few of the larger exhibitions about the country, and I fail to perceive any effort whatever being made to distribute leaflets of any kind on such occasions. My aim is to stir up some of the local gardeners who are interested in the welfare of the Institution to undertake some missionary work. A small tent as a base of action, or, better still, one for the sale of flowers, with a free distribution of attractive leaflets—these are among the means which could be adopted with a certainty of success. What is the action of local or district committees, where they exist, on such occasions? Are they in evidence at all? R. Dean, Subseriber and Life Member for Forty Years.

LABELS.—I send you a new form of ticket for plants, which was got by a friend in Paris. I think if the strip inside the tube were of zinc sheet, written with sulphate of copper solution, the writing would be more permanent. Writing on cardboard with ordinary ink disappears in time by the action of sunlight or other similar influence. George Bonavia, M.D. [The glass tube containing a piece of cardboard, with a cork at one end and a hole for wire to be passed through at the other end, is by no meaus a new device, but its use might be extended with advantage in this country. Ed.

CLETHRA ARBOREA.—In a recent issue of the Gardeners' Chronicle Mr. FitzHerbert mentioned that a large tree of Clethra arborea had been blown down on Valencia Island. I think this happened about thirty years ago. A tree over 30 feet high was destroyed here (Co. Kerry) by the gale of December 29, 1903. H. Hallett, gr. to the Knight of Kerry.

A NATIONAL GARDENERS' ASSOCIATION.—
"J. C. S.," on p. 28, has evidently misunderstood your excellent report of the meeting held on December 15. Being the first meeting to consider the subject, it was only natural that speakers should express various—and in some cases divergent—views. The letter from the lady-gardener (which "J. C. S." specially objects to) was merely received by the Secretary in the ordinary way, and it was his duty to bring it before the meeting. I do not suppose a majority of head gardeners are in favour of admitting ladies; my own opinion is that they are not required in private gardening. Much good might be done in raising the social and professional status of the gardener by lessening the present overcrowding of the profession, and by securing a general course of action on many points, if all would join and work together for the common good. Why should gardening be the most disorganised and the worst paid of all the professions? The Committee will endeavour to draft a basis of rules, to enable all head gardeners who have had a professional training to join the Association. When this is completed it is proposed to submit it to as large a meeting of gardeners as can be got together in London, and it must rest with that meeting whether the Association is to be started or not. We want a central rallying-point in London, with representatives in all the districts of the United Kingdom. If this is well supported by gardeners we should be able to speak effectively on all matters relating to private gardening. Matters of detail can be considered afterwards. As soon as we can get a good list of members it will be possible to make arrangements with some hotels, whereby members coming to London from the country districts will be able to obtain board or lodging at greatly reduced rates, similar to those now arranged by the Cyclists'

Touring Club. My own opinion is that the Association should be managed by a committee of private gardeners, for the benefit of private gardeners only. Subscriptions should be kept as low as possible in order that all may be able to join. Honorary subscriptions should be accepted, but should carry no right to intervene in the business of the Association. The Association should be carried on in harmony with but independently of the Royal Horticultural Society. No trades-unionism to be encouraged in any form. W. H. Divers, Belvoir Castle Gardens.

- Respecting Mr. Wood's letter in a recent issue, I would say, first, that the great majority of gardeners are not overburdened with money, neither have they much spare time at their disposal; and there are already charitable institutions to which they can well apply their few spare shillings for the benefit of the garden fraternity. Secondly, such an expensive scheme as suggested would not and could not meet with the willing co-operation of the immense body of men who call themselves gardeners; the management call themselves gardeners; the management and control would be far too costly an undertaking. Thirdly, the shows, concerts, sales, and picture galleries suggested must be few and far between, seeing the number already held that do not always result in profit. Fourthly, neither employers nor gardeners are over-anxious to exhibit their produce, seeing the expense and displacement exhibiting involves. Their object is to get the greatest possible amount of enjoyment and pleasure out of their work for themselves and personal friends. Fifthly, the patronage of the nobility and gentry could hardly be expected except in a very limited degree for the purpose of a national association of gardeners. It must be admitted they do very much alroady for the welfare of the gardener. Their proper sphere is the exercise of charity, and not the aggrandisement of gardeners. The whole subject seems to me to be one for gardeners themselves, always, of course, looking for sympathetic support in other quarters. My conception of a scheme is that it should be one that would facilitate intercommunication between gardeners; in other words, enable them to render each other mutual assistance and benefit. Gardeners in good positions should be appointed in as many districts as possible, whose duties would be to report vacant places and those likely to become vacant, and unemployed gardeners, also any particulars appertaining to them. These reports would, of course, apply to any under gardeners in the same degree as head gardeners. I feel sure there are many who would undertake such duties out of pure sympathy with the object in view. By all means have your central authority, but beware of excessive administrative expenses; some there must inevitably be. whole work should be conducted by bond-fide gardeners. Do not let it be said that the gardener is incapable of taking care of himself.
Begin slowly, and first find out what is the general feeling on the whole subject. Acceptable additions to its efficacy may always be made, whereas it is difficult to rescind rules which may have been accepted by any section. Charles Dennis.

THE ROYAL HORTICULTURAL SOCIETY'S MEETINGS.—Assuming that the new Horticultural Hall will be completed by midsummer next, the National Carnation Society will probably have the honour of holding the first exhibition within its walls. No one will grudge the Carnation, or the Society that is identified with its interests, that honour. That show is fixed for July 26, so that there is yet a clear six months for the Hall to be completed. But, should no such suggestion be already in the minds of the President and the Council of the Royal Horticultural Society, I would submit that the most desirable first assemblage in the new Hall should take the form of a reception, by the President and Council, of all who have subscribed to its erection, and representatives of the general and of the gardening Press. Were it widely intimated that such a reception would be held, the first evening of the Holland Park show, fixed as late this year as July 12, would doubtless suit admirably for the purpose. The desire to be amongst the invited would doubtless cause many who can, but have

not yet done so, to subscribe to the building fund. The Council certainly might expend £100 in a far worse way than in holding the reception here suggested. The Council may well desire that all horticulturists should, through the gardening papers, know of the completion of the Hall and offices, and of their capacities. Equally it would be good policy to utilise the London papers by circulating widely the information that so fine and roomy a hall is available. When its character and area, as well as its convenience, become well known, and especially its freedom from the noise of London traffic, it should, assuming that the Hall's acoustic properties are good, let for many diverse objects, when not required by the Society. Without imposing exorbitant charges, the new Hall could be made a source of income of a distinctly lucrative kind. A. D.

Obituary.

F. C. LEHMANN. — We regret to see an announcement of the death by drowning of our esteemed correspondent, Mr. F. C. Lehmann, the well-known botanical traveller and explorer. Should the bad news be unfortunately confirmed, we shall give some particulars of Mr. Lehmann's interesting career in a future issue.

HUGH FRASER.—It is with regret we record the death of Mr. Hugh Fraser, who passed away on the 13th inst., aged seventy years. For fifty years Mr. Fraser was in the employ of Messrs. To Methyen & Sons, Edinburgh; and for a period acted as their traveller, making many friends over all the country. Mr. Fraser was the author of The Book of Conifera, which had a large sale. His knowledge of Rhododendrons and American plants was extensive. It was under Mr. Fraser's care that Rhododendron Thomsoni first flowered in Europe, and from that splendid Himalayan species many of our rich crimson Rhododendrons originated. By the death of Mr. Fraser the Scottish Horticultural Association has lost one of its original members, and one who filled the posts. of Vice-President and President with conspicuous success. His genial face will be missed by a large circle of friends, among whom his reminiscences of the old nursery trade of Edinburgh, told in his inimitable way, were always appreciated.

GEORGE WILLIAMS.—On the 18th inst., at Croydon, aged 59, George Williams, gardener to the late Ludy Louisa Ashburton, Addiscombe Park, and formerly gardener and bailiff for many years to the Right Hon. Lord Carew, Castleboro', Enniscorthy. He succumbed from shock following an operation, after a short but painful illness. Of sterling worth and exceptional attainments, his high sense of duty commanded the respect of his employers, while his genial character endeared him to all those with whom he came in contact. Interred at Mitcham Cemetery.

DR. FRANCIS.—Old members of the Linnean Society will learn with regret of the death of this gentleman on the 19th inst. at Richmond. Dr. Francis was eighty-six years of age, and was for many years head of the printers' firm of Taylor & Francis, Red Lion Court, Fleet Street. As a Fellow of many scientificsocieties he was thrown in contact with a large circle of friends and acquaintances, by whom he will be sincerely mourned.

JAMES MELODY.—On January 7. at 15, Cicada Road, Wandsworth Common, S.W., in his fifty-ninth year, James Melody, for many years manager of the seed business of the late firm of Thomas Gibbs & Co., 24, Down St., Piccadilly, W.

ENQUIRY.

A. B. Lousada.—Can any reader give particulars respecting a botanist named A. B. Lousada, who lived in Devonshire Square, London? In a copy of Sweet's Hortus Suburbanus Londinensis, used by Lousada, appears the following note at Draba alpina: "See my account of the large and beautiful state of D. alpina, with its three varieties, found in the arctic regions of America, as described by Dr. Hooker in the Linn. Trans., vol. xiv." P.

SOCIETIES.

ROYAL HORTICULTURAL.

REPORT OF THE COUNCIL FOR THE YEAR 1903 (ABRIDGED).

- 1. The One Hundredth Year.—The year 1903 will long be noteworthy in the Annals of the Society. Not only does it complete (i.) One hundred years of the Society's existence, but it has also seen (ii.) the commencement of the New Hall and Offices, (iii.) the inauguration of a New Garden, and (iv.) the largest numerical addition to the list of Fellows that has ever taken place in the Society's history.
- 2. To celebrate the One Hundredth year of the Society, it has been decided to hold a Centennial dinner at the Hotel Métropole on Thursday, March 3, the nearest convenient date to the actual completion of the centenary, which will take place on Sunday, March 6 next, the Society having been founded, on March 7, 1804, by Mr. Charles Greville, Sir Joseph Banks, Mr. Richard Anthony Salisbury, Mr. W. T. Aiton, Mr. W. Forsyth, Mr. James Dickson, and Mr. John Wedgwood. The Rt. Hon. the Earl of Onslow, Minister for Agriculture and Horticulture, will preside at the dinner, and the Council hope that a very large number of the Fellows will join in the celebration. The Dinner Tickets, which the size of the room unfortunately necessitates being confined to gentlemen, will be 21s.
- 3. New Hall.—While the Centennial Dinner is the social commemoration of a striking anniversary, the Council have had under consideration, for not less than five years, in what way the Centenary could be most worthily celebrated.
- 4. Two projects speedily came into prominence—(1) a New Hall and Offices for the Society's Exhibitions and Shows and for the accommodation of the Library and of the Office Staff; and (2) a New Garden less exposed to London smoke, fog, drainage, and crowding, than Chiswick has of late years become.
- 5. These projects having been very deliberately considered, the Fellows finally decided in General Meeting assembled to adopt the proposal of a Hall.
- 6. The site in Vincent Square, almost exactly midway between the Abbey and Victoria Station, having been approved by the Fellows in General Meeting, the Council were instructed to push matters forward, so that the buildings might be opened in the centennial year. This they have done, and the Great Hall (containing, with its two annexes, a floor space of almost 13,000 square feet) is now ready for roofing, and the Council are promised that the whole building shall be finished in July. The Hall and Offices, when completely furnished, will, it is estimated, cost nearly £40,000, of which upwards of £24,000 has been received or promised.
- 7. It is impossible to estimate what income may be derived from letting the New Hall, when not required for the Society's use, but when it has become known what a fine and spacious hall it contains, this will probably be a considerable asset. In this matter the Council ask the Fellows to help them by using their influence to get the Hall let for Concerts, Meetings, Bazaars, and suchlike purposes.
- 8. New Garden Meanwhile, several influential Fellows, who preferred the establishment of a New Garden as the celebration of the Society's Centenary, had been urging their views in certain quarters, and on August 4, 1903, Sir Thomas Hanbury, K.C.V.O., having asked for an interview with the Council, offered to purchase the late Mr. G. F. Wilson's famous Garden and Estate at Wisley, comprising 60 acres of land, and to place it in trust for the use of the Society as a Garden as long as the Society desired to retain it.
- 9. It is needless to say that the Council accepted this timely and generous offer, which came as a complete

- surprise both to themselves and to the geoeral body of the Fellows. It had the signal advantage of affording a solution of the rival claims of a New Garden as against a New Hall as the Centennial Celebration of the Society.
- 10. Wisley is some distance from a railway station, and two miles from the village of Ripley. Full directions for reaching it will be found on p. 15 in the Specity's Book of Arrangements for 1904.
- 12. The Garden has no glasshouses upon it, being at present only a very beautiful and well-placed wild garden, stocked with a large number of rare plants. It will therefore be necessary to build a couple of small dwelling-houses for the Superintendent and Foreman, a room where the Council and Committees can meet, and suitable ranges of glasshouses and pits. The water supply and drainage will also require careful attention. By limiting the glasshouses as far as possible at present, the Council estimate that the necesary equipment of Wisley can be carried out within the means of the Society, supplemented by the aid which they expect to obtain from the reliaquishment of the Cluswick lease.
- 12. There are many other objects which will hereafter be desirable at Wisley, such as a Scientific Department, with residence for a Professor and laboratory attached, bothles for young gardeners, rooms for students, &c. But the Council feel it imperative to allow these matters to wait until the New Hall is paid for and furnished and its upkeep expenses provided.
- 13 INCREASE OF FELLOWS.—The exceedingly rapid increase in the number of Fellows (1412 having been added during the last twelve months), gratifying as it is as a proof of the appreciation of the Society's work by the lovers of gardens, appears nevertheless to the Council to contain an element of dauger inasmuch as it is becoming more and more difficult at times for Fellows to see the flowers, &c., without serious discomfort from crushing and crowding.
- 14. New Bye-Law.—After very grave consideration the Council have decided to advise that the minimum rate of Fellowship should in future be raised to £22%, except in the case of bond-fide gardeners, persons living abroad, and journalists writing for provincial or foreign newspapers. The existing £11% Fellows will ni course be under no compulsion to change the rate of their subscription, though it is hoped that not a few will voluntarily do so. The Council have therefore directed a new bye-law to be drawn up and submitted to the Meeting for approval, the effect of which will be, if carried, to make the lowest subscription for Fellows in future £22%, except in the cases mentioned.
- 15 It may be as well to point out the return value which a Feliow will receive for his £22s, subscription:—
 3 Tickets admitting th: The Temple Show—1st day, £12s, ed.; 2nd day, 7s, ed.; 3nd day, 8s. The Holland House Show—1st day, £12s, ed.; 2nd day, 7s, ed. Seventeen Exhibitions at Drift Hall or Vincent Square at 2s ed., £67s ed.; eight exhibitions at Drift Hall or Vincent Square at 1s, £14s. The Society's Journal, £110s.; Total, £124s, ed.
- To this must be added, free advice on all ordinary garden subjects; lovestigation of Plant diseases, &c., by the Scientific Committee; a share of Plants at the Annual Distribution; Facilities for [obtaining] Chemical advice. &c.
- 13. MEETINGS.—Twenty-two Fruit and Floral Meetings have been held in the Drill Hall, Buckingham Gate, Victoria Street, besides the larger Shows in the Temple Gardens on May 26, 27, and 28; at Holland House on June 25 and 26; at Chiswick on September 29 and 30 and October 1. Lectures or Demonstrations have been delivered at almost all of the Meetings.
- 17.—AWARDS.—The number of awards granted by the Council on the recommendation of the various Committees [amounts to 1180, full details of which are given in the Report].
- In addition to the above, a Silver-gilt Flora Medal was awarded to Miss W. E. Brenchley for having passed 1st in the Society's Examination. One hundred and twenty-three Bronze Banksian Medals have also been granted to Cottagers' Societies.
- 18. TEMPLE SHOW.—The Society's Great Show held in May in the Inner Temple Gardens (by the continued kindness of the Treasurer and Benchers) was as successful as ever, and was visited by a very large number of Fellows and their friends. It is a matter of satisfaction to the Council to find that this Meeting is universally acknowledged to be the leading Horticultural Exhibition of this country.
- 19. HOLLAND HOUSE SHOW.—The best thanks of the Society are due to the Rt. Hon. the Earl of Ilchester for his kindness in allowing a Show to be held in his park at Holland House, Kensington, on June 25 and 26. Financially the Show was not a conspicuous success, but from every other point of view it more than fulfilled expectations. The Fellows will be pleased to know that his Lordship has consented to another Show heing held [in the grounds] at Holland House in the ensuing year on July 12 and 13. Fellows are requested to inform their friends of this Show, so as to make it this year a financial as well as a floral success.

- 20. SPECIAL SOCIETIES.—At the request of the various Societies concerned, the Council have arranged as follows:—April 19. National Auricula and Primula Society's Show; May 7. National Tulip Society's Show; July 6. National Carnation Society's Autumn Show; September 20. National Bose Society's Autumn Show; September 20. National Dahlia Society's Committee Meeting. These will be held in conjunction with the Society's usual Fortnightly Meetings, and full particulars of the Prizes, &c., will be found in the Book of Arrangements for 1904. 21 The Council greatly regret that the National Dahlia Society should not have seen their way to accept the same terms of co-operation as the other Special Societies, and they hope that next year a mutual agreement, satisfactory to buth sides, may be arrived at.
- 22. FBUIT SHOW.—The Exhibition of British-grown Fruit and Vegetables held in the Society's Garden at Chiswick, September 29, 30, and October I, was, from an educational point of view, most satisfactory. Full particulars will be found in vol. xxviii., part 3, of the Journal, which will be issued in the course of a few weeks. 23. It is intended to hold a similar Show of British-grown Fruit in the New Hall on October 4. 5, and 6, 1901, but inasmuch as it is calculated that such a Show cannot be held under an expenditure of £330, if the intention is to be carried into effect it will be necessary for all who are interested in the encouragement of the growth of good Fruit within the United Kingdom, now largely dependent on external and foreign supplies, to combine in raising at least half the amount of money required. The Schedule of the Show is being proceeded with and will be ready for issue on Aprit 2, should the list of subscriptions prove satistactory. The List of Subscribers to the 1903 Show will be given in vol. xxviii., part 3, of the Society's Journal.
- 21. Examinations.—An examination in the principles and practice of Horticulture was held on April 22, concurrently in different parts of the United Kingdom, a cantre being established wherever a magistrate, clergyman, schoolmaster, or other responsible person, accustomed to examinations would consent to act on the Society's behalf, in accordance with the rules laid down. No limit as to the age, position, or previous traiting of the candidates presented themselves for examination. The names and addresses of those who succeeded in satisfying the examiners, together with the number of marks assigned to each, will be found in the Society's Journal, vol. xxviii. p. 119. It is proposed to hold a simitar examination in 1904, on Wednesday, April 20. Candidates wishing to enter for the examination should make application during February to the Secretary, Royal Horticultural Society Office, 117, Victoria Street, Westminster. 25. The Council have also consented to hold an examination on Tuesday, June 21, 1904, in Cottage and Allotment Gardening. It is intended for, and will be confined to, elementary school-teachers shall be competent to teach the elements of Cottage and Allotment Gardening, and of the absence of any test whatever of such capacity. The general conduct of the examination will follow the lines of the more general one, save in obvious points to which they would not apply.
- 26. THE LIBEARY.—Valuable books have been presented to the Society during the past year by the Director of the Royal Gardens at Kew, Dr. Maxwell Masters, F.R.S., Rev. Prof. Geo. Henslow, V.M.H., Miss Willmott, Mrs. Langridge, the Trustees of the British Museum, Rev. W. Wilks, Mr. A. D. IIall, and othere, to all of whom the best thanks of the Society are due. A full list will be published in March, 1901, in the Society's Journal, vol. xxviii., part 3.
- 27. COMMITTEES.—The thanks of the Society are due to all the Members of the Standing Committees—viz., the Scientific, the Fruit and Vegetable, the Floral, the Orchid, and the Narcissus and Tulip Committees, for the kind, patient, and often laborious attention which they have severally given to their departments. Many of the members of these Committees have to travel long distances to attend. The thanks of the Society are especially due to all who are so good as to serve under these conditions.
- 28. PLANTS, SEEDS, &c.—The Society has also to thank all those who have kindly presented plants or seeds to the Gardens. A list of the donors has been prepared, and will be included in the next issue of the Society's Journal.
- 29. JOURNAL.—The reception which has been accorded to the Society's Journal during the past years, not only by the great mass of the Fellows, but also by various scientific bodies and individuals, both at home and abroad, competent to speak with authority on such subjects, has been exceedingly gratifying to the Council. The Fellows may be proud of their Journal, and feel that they are issuing a periodical which will compare not unfavourably with that of any other Scientific Society. At the same time it must not be for one moment forgotten how very deeply we are indebted to the small body of scientific experts who so kindly volunteer their services in making the "Notes on Research" and "Abstracts," which form one of the

Journal's most remarkable and useful features. gentlemen indeed descrive well of the whole horticul-tural community, and the Council are glad to take this opportunity of recording the grateful sense of the appre-ciation which they feel for their invaluable services. The Council also desire to express their best thanks to all who have so kindly delivered Lectures during the year. The Lectures themselves form a most valuable portion of the Journal.

- 30. OBITUARY.—The Council have the sad duty of recording the death of ninety-six Fellows during the year, and among them they regret to find the names of the Right Hon. R. W. Hanbury, Sir Joseph Pease, Bart., Sir Colley II. Scotland, Mary Countess of Galloway, the Countess Spencer, Louisa Lady Ashburton, Mrs. Willoughby Smith, Surgeon-Major Bedford, Captain Alfred Torrens, Captain Cecil Drummond, L. Lindley Cowan (Australia), L'Abbé Dupny (France), Charles Naudin (France) [M. Naudio died March 19, 1899, Ed.], Hermann Wendlaud (Germany), John C. Lanyon, John D. Pawle, E. P. Youell, A. F. Barron, V.M. H., James Smith, V.M. H., William Thompson, V.M. H., William Fell, A. Pettigrew, William Beale, J. McKenzie, J. Peed, and J. H. Fitt.
- 31. ANNUAL PROGRESS .- The total number of Fellows, Members, Associates, and Affiliated Societies is now 7,337 [details omitted].
- 32. Affiliation of Local Societies —Ascheme for the affiliation of local horticultural societies was put forward a year or two since, and 159 local societies have availed themselves of it. In order to enhance the utility of the Society, the Council have caused a special card to be prepared suitable for use by affiliated societies, for the purpose of granting certificates or awards, or for complimentary cards of thanks, commendation, &c. They have also caused a new medal to be struck which is to be used by affiliated societies only. Details regarding the prices of the medal and cards will be found in the book of the Society's Arrangements, 1904, or they can be obtained from the Society's office, 117, Victoria Street, S.W. The Council express the hope that Fellows will schizzly my most the officient of leach borriesty and the officient of leach borriesty and the officient of leach borriesty and the second of the council express the hope that Fellows will schizzly my most the officient of leach borriesty and the second of the council express the hope that the second of the council express the council expre actively promote the affiliation of local horticultural or Cottage Garden societies in their own immediate neighbourhood.
- 33. Notice of Shows. -At the request of some of the 33. Notice of shows.—At the request of some of the Fellows, the Council have arranged to send (in the week preceding it) a reminder of every show to any Fellow who will send to the Royal Hortcultural Society's office, 117. Victoria Street, Westminster, twenty-four Post Cards, fully addressed to himself, or to whomsoever he wishes the reminder sent.
- 34. DEPUTATIONS.—In January, 1903, the Council re-34. DEPUTATIONS.—In January, 1903, the Council received an invitation to send a deputation to the Cardiff and District Local Horticultural Society's Show, held on July 22, which they accepted. The Earl of Hehester, Mr. F. G. Lhoyd, J.P., Mr. James H. Veitch, Mr. A. L. Wigan, Mr. Wright and the Secretary, were appointed for the purpose. The Council wish to express the pleasure with which they received the very satisfactory report of the deputation, and also to thank the Cardiff Society for the kinduess and courlesy shown them.
- 35 A deputation was also sent to the Great Quinquential Show at Ghent, consisting of the Jtt. Hon, the Lord Rede dale, Mr. F. G. Lloyd, J.P., Mr. James Hudson. V M H, and Mr. Charles Pearson. Nothing could exceed the heartiness of the welcome and the abundant hospitality extended to the deputation by our Belgian friends. our Belgian friends.
- 36. The Couocil have been asked to nominate a representative to serve on the Board of Directors of Lady Warwick's Hostel, and they have had great pleasure in nominating Dr. Burtt, of the Botanical Laboratory, Holgate, York, for this purpose.
- 37. PRIZE ESSAY.-In the hope of encouraging and promoting better cultivation in Cottage and Allotment Gardens, the Council have offered a Prize of £10 for an Essay on the subject, which they propose to publish in an inexpensive form as a pamphlet.
- as Meteorology.—Special thanks are due to Mr. Edward Mawley, Fellow of the Royal Meteorological Society, both for his annual kindness in drawing up the Meteorological Report for the Journal, and also for so kindly superintending the removal of the instruments from Chiswick and their re-erection at Wisley.
- 39. Scottish Arboniculture. The Council have received a courteous invitation to send a representareceived a courteous invitation to send a representa-tive of the Society to the Jubilee of the Royal Scottish Arboricultural Society, which takes place on Feb. 16, and they consider themselves fortunate in having obtained the consent of Mr. A. D. Webster, F.R.H.S., to represent them on this happy occasion.
- represent them on this nappy occasion.

 40. VEITCHIAN CUP—In celebration of another Jubilee, viz., that of the establishment in London of the o'd West-country firm of Messrs. Veitch Messrs. James Veitch & Sons have presented to the Society 5 Silver-Gilt Cups, each exceeding 55 Guineas in value. One of these magnificent Cups, which have been specially made after an antique pattern, will be awarded to the best individual exhibit, be it a sirgle plant, or group, or specimen of culture, shown at the Temple Show, 1904.
- 42 The usual Revenue and Expenditure Account, with the Balance Sheet for the year ending December 31, 1903, are also given.

LINNEAN.

DECEMBER 17 .- The General Secretary exhibited a copy of a Lexicon generum phanerogamarum, by Tom von Post, revised and enlarged by Otto Kuntze, which he had received from the author a few days before. He gave a succinct account of the labours of Dr. Kuntze (from the time he worked up his collections at Kew), in the matter of nomenclature based solely upon priority, and set forth in this volume by his colleague priority, and set forth in this volume by his colleague at Upsala. The introductory matter was entirely due to Dr. Kuntze, who was also responsible for the French and English versions; besides the preface, were included a "Codex brevis maturus," in which Dr. Kuntze postulated his requirements as to names, spelling, and signs, and his ideas as to the regulations for a Botanical Congress, with the class of persons permitted to record their votes, but naturally without any power to penalise those who declined to accept the suggested trammels.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

JANUARY 8 -There was a capital display of plants at the meeting held on the above date. A number of groups for display were given awards, as follows:— Messrs. Charlesworth & Co. (Silver Medal); Messrs. GRATRIX, LAVERTON, SANDER, CYPHER, SCHOFIELD, VUYLSTEKE (Bronze Medals); Messre. Robson, Keeling, COWAN and McLEOD (Votes of Thanks).

An interesting exhibit of half a dozen seedling Odontoglossums, of which the seed was sown less than four years ago, came from W. Thompson, Esq., Stone, whose gardener (Mr. Stevens) was awarded a Silver Medal in acknowledgment of his skill as a raiser and cultivator.

The following plants were granted awards:—Cypripedium × Minos, var. Youngii. a very fine hybrid (First-class Certificate); C. × aureum, var. Great Rex (First-class Certificate); C. × Latho-Thompsoni and C. × Lathomianum, West Point var. (Awards of Merit), to S. Gratrix, E.q. (gr., Mr. Cypher).

Messrs. Charlesworth & Co., Bradford, eelected from their group Odontoglossum × Wilckeanum, var. Alexandre (a magnificent form), Cypripedium × Dora Crawshaw, both of which received First-class Certificates; and Miltonia × Cogniauxiæ (Award of Merit).

Mrs. Gratrix exhibited Odontoglossum crispum, varlety Geo. Cypher. a well-shaped and distinctly marked flower, which the Committee desired to see again. The following plants were granted awards :- Cypri-

marked nower, which she can again.

M. VUYLSTERE, Ghent, obtained a First-class Certificate for Odontoglossum×Vuylstekei var. percultum(?).

Messrs. J. Cypher & Sons, Chellenham, received an Award of Merit for Cypripedium × Charlesianum var.

superba. G W. I W. LAW-ICHOFIELD, Esq., Rawtenetall, exhibited a

distinct form of Cypripedium × Euryades, called New Hall Hey variety (Award of Merlt).

A. WARDURTON, Esq , Haslingden, exhibited Odonto-gloseum crispum var. Mariæ, which has been previously certificated.

W. LAVERTON, Esq., Manchester, gained an Award of Merit for Cypripedium × Lathamianum, Redclyffe var.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.

JANUARY 9.-The Worcester Auxiliary held their annual meeting on the above date, at the Guildhall, Worcester. Sir Frederick Godson, M.P., presided over a large attendance of members.

Several new subscribing members were enrolled; and it was stated that upwards of £600 had been collected and forwarded to the parent society since the

branch was formed.

The officers were all re-elected; and Mr. W. Crump The omeers were all re-elected; and Mr. W. Crump brought forward a motion to increase the Committee from "seven in number to twelve, with power to add to their number," the object being to seenre more numerous representatives in the county. Messrs. A. A. Pettigrew, of Hewell: Robertson, of Croome: Dames, of Ledbury; Charlton, of Malvern Woods; and Parsons of Worrester, were elected. sons, of Worcester, were elected.

When the routine business had been done, the

meeting resolved itself into an informal gathering, Mr. Dawes taking the chair. Short speeches and facts incidental to the good work in hand were given, and many questions were asked and explained in regard to the working of the new rules, about which there have been misgivings.

NATIONAL CHRYSANTHEMUM.

JANUARY 11 .- A meeting of the Executive Committee took place on the above date, Mr. Thomas Bevan in the chair. A financial statement was submitted, showing, with the balance in hand at the beginning of the year, an income of £801 18s. 4d., and an expenditure of £722 88. 5d, carrying forward a balance in hand of £79 98. 11d. A good sum is due as realisable assets, with but a small amount in the way of liabilities. The

Reserve Fund shows a balance in hand of £115. Considering the loss of Income the Society had to sustain in leaving the Aquarium, the state of the finances was considered decidedly satisfactory.

A report was brought up from the Finance Sub-Committee recommending that the sum of £50 be added Committee recommending that the sum of 250 he added to the November schedule of prizes, which was adopted. A draft report prepared by the Secretary was submitted, and with a few minor additions adopted as the Report of the Committee for presentation at the Annual General Meeting, at which the President will preside. A census of Japanese and incurved blooms shown in November last at the Crystal Palace, prepared by Mr. Young, of Dulwich, was accepted with thanks thanks

The Secretary was instructed to urge the Crystal Palace authorities to settle as speedily as possible the dates of the three shows in the present year. Mr. Joseph Lake was nominated for election as Auditor at the Annual General Meeting.

SOCIÉTÉ FRANÇAISE D'HORTI-CULTURE DÉ LONDRES.

JANUARY 16 .- The Imperial Restaurant, Strand, was on Saturday evening last the scene of a very pleasant international horticultural gathering. Under the chairmanship of Mr. Percy Waterer, there was a goodly representative meeting of members and supporters of the Society, among whom were Mr. George Nicholson, Mr. S. T. Wright, Mr. W. Howe, Mr. T. Bevan, Mr. Witty, Mr. A. Taylor, Mr. Harman Payne. Mr. Hiehle, Mr. Cutbush, and Mr. Drost, who kindly furnished the dining saloon and staircase with flowers, Palms, and

According to custom, the usual loyal toasts of "The King" and "The President of the French Republie" were duly honoured.

The Chairman proposed the toast of the evening. a rapid survey he reminded those present of the humble origin and modest pretensions of the few who founded the Society in 1889. Financial progress and great numerical strength had characterised the work of those who had undertaken the duty of labouring on of those who had underlaken the duty of labouring on behalf of the Society. He was pleased to say that the balance in hand for the current year was £150, that the membership amounted to upwards of 650, that the Society's Bulletin had a greatly increased value, and that the library of the Society had been largely augmented by gifts of valuable books. The Society had been the means of helping many young French-speaking gardecers, who he was sure had made lasting friendships while here in England, and many of whom now occupied positions of responsibility in various parts of the world. parts of the world.
On behalf of the officers, Mr. George Schneider said

they were all grateful for the kindly interest and support of many of their English friends, some of whom he was pleased to see present. A new feature during the past year had been introduced by the invitation the past year had been introduced by the invitation the Society had received to visit the establishment of Mr. Peter Kay. It was gratifying to be able to say that other friends had followed that example, notably Mr. Harry Veitch, whose place in the country they hoped to visit next summer. He had much pleasure in proposing the health of their English friends and supporters, coupling with it the name of Mr. Thos.

Bevan.

Mr. Bevan referred in friendly terms to the excellent relations that always existed between English and Continental gardeners, amateur or professional, wherever they met. On behalf of the Committee Mr. Guillond responded, and concluded his remarks by acknowledging their indebtedness to the English Horticultural Press. Mr. Harman Payne in reply said he felt sure that they could depend upon a continuation of this friendly feeling on the part of the Gardening. of this friendly feeling on the part of the Gardening

Press of this country.

A presentation to Mr. Schneider was made in the name of the membres titulaires in recognition of his efforts on their behalf.

ABERDEEN CHRYSANTHEMUM.

JANUARY 16.—The Annual Meeting was held in the Union Hall Buildings on the above date Mr. William Bisset presided. In submitting, and moving the adoption of the Annual Report, the Chairman congratulated the Society upon the result of the year's work, the finances showing a credit balance. Mr. Esslemont was unanimously elected president for the year. The Society's generous hop, president, Lord Provost Walker, was re-elected unanimously. Mr. Sinclair was re-appointed secretary and treasurer.

BECKENHAM HORTICULTURAL.

LECTURE ON NEW FRUITS.

ON January 18, at the Church House, Mr. G. Bunyard, V.M.H., met the members and had "A Talk on New Fruits." A. J. Baker, Esq., J.P., K C.C., took the chair. The lecturer said he felt bound to speakagainst some new varieties, but, of course, others might have

different views to himself. Some of our hest Apples had been raised, not by careful hybridisation but by chance; but he urged all present to raise a few at

chance; but he urged all present to raise a few at least in the hope of raising something good. The following are some of the varieties spoken upon:

APPLES. - Allington Pippin (Thomas Laxton), Nevember to February, excellent; Baron Wolseley, a late Warner's King; Ben's Red, good for market; Charles Ross, too large for dessert, and not good enough for the kitchen; Christmas Pearmain, very promising; Coronation, very like Cox's Orange Pippin; Diamond Jubilee was, in his opinioo, synenymous with Bedferdshire Foundling; Edward VII, a cross between Bleneim Orange and Golden Noble, an excellent kitchen Apple, which had the advantage of blooming late; Early Victoria promises to be one of our hest early kitchen varieties; King Acre, an excellent late-keeping dessert; varieties; Kirg Acre, an excellent late-keeping dessert; Northern Beauty, excellent; Prince Edward, first-rate; Sanspareil, one of the best, which will keep til

The best new BLACKBERRY was the Logan-berry; no other was worth cultivating as compared with our own native Bramble.

CHERRY. — The best new one is the Noble, which keeps well; also Windsor, a very heavy cropper.

CURRANTS. — Red: the American Wonder is best.

Black, the Boskoop Giant.

GRAPES.—Appley Towers, highly recommended; Prince of Wales, very good; Melton Constable, not sufficiently tested.

GOOSEBERRIES .- May Duke, very early indeed.

NECTARINE.-Cardinal (Rivers), grand, and certainly one of the best.

PEACH.-Duchess of Corowall, good, and stands forcing well; Duchess of York, late, fine, and good flavour.

PEARS.-Beurré Perran, Charles Ernest, and Michaelmas Nelis were among the best.

PLUMS.—President, Rivers' Primate, and Rivers' Late Orange were among the best; also Giant Prune. Good dessert Gages were Transparent and Burbank.

RHUBARR.—Daws's Matchless and Crimson Winter were both good.

STRAWNERRIES.—Mentmore is not good; Trafalgar, rather better; The Laxton had disappointed the lecturer so far, but might be better in a mere favourable season; Queen of Denmark, good flavour; Givon's Late Prolific, one of the best late varieties.

THE WEATHER.

GENERAL OBSERVATIONS.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending Jan. 16, is furnished from the Meteorological Office:—

"The weather was sgain of a very unsettled character throughout our Islands. Considerable falls of rain were experienced in the west and north, and lesser falls in the south-east and east. Showers of hail and snow were not infrequent in Scotland, Ireland, and . Thunder and lightniog occurred in several of Eogland and Ireland on Wednesday and narts

Thursday.
"The temperature was again above the mean over "The temperature was again above the mean over England and in the west of Scotland, but only just equalled the normal in Ireland, S., and was slightly below it in Scotland, N. and E., and Ireland, N. The highest of the maxima were registered either on the 12th or 13th. In England, N. E. and E., the thermemeter rose to 5%, and in England, S. and S.W., to 55°; In Ireland, N., the highest reading was 50°, and in Scotland, N., 46°. The lowest of the minima, which were recerded at the end of the period, ranged from 23° in Scotland, N., and 26° in Scotland, E. to 31° in England S. and S.W., and to 35° in the Channel Islands. "The rainfall exceeded the mean in all districts. In the east and north-east of Great Britain, and in Scotland, W., and Ireland, S., the excess was slight, but in the other districts it was rather large. "The bright sunshine varied a good deal in different localities, some places showing an excess and others a deficit as compared with the normal. The percentage of the possible duration ranged from 27 in Ireland, S., and 22 in England, E., to 12 in England, N.W., and to 5 Scotland N.W.

and 22 in England, E., to 12 in England, N.W., and to 5 in Scotland, N.

THE WEATHER IN WEST HERTS.

TEMPERATURE VERY CHANGEABLE. - On the first day of the week the highest reading in the thermometerscreen was 54°, and on the last day but one 19°, whereas on one day in the middle of the week the temperature at no time exceeded 39°. The lowest temperatures registered at night by the exposed thermometer were equally variable, ranging as they did hetween 12° of frost and 17° above the freezing-point. At 2 feet deep the ground is now 1° warmer, and at 1 feet deep 3° warmer than is seasonable. Rain fell on five days to the total depth of about three-quarters of an inch. As yet there have been only live days without rain this month, but on the other hand the fall on no day exceeded a quarter of an tuch. Nearly the whole of the week's rainfall has again come through both percolation gauges. The sun shone for altogether 15 hours during the week, or for as long a period as in the whole of the five previous weeks put together, and yet the record only exceeded the average for the month by jabout three-quarters of an hour a day. On three days the wind was high, but of only moderate strength during the rest of the week. It is now eight weeks since the air has been as dry, although the amount of meisture in the air at 3 o'clock in the afternoon was only about average. The Winter Aconite first opened a flower in my garden on the 13th, which is a week earlier than its average date of flowering in the pre-vious fifteen years. The last Rose of the past scason growing in the open ground was destroyed by frost on the 17th, which is thirty-seven days later than the average date of its destruction in the previous eighteen years, and eleven days later than in any of these years. TUE RAINFALL FOR THE 40 DRAINAGE YEARS ENDING

SEPTEMBER, 1902.

The total rainfall for the first twenty years of the period exceeded the average quantity by 38 inches, whereas during the second twenty years of the period there was a deficiency of 48 inches. I have here reckoned each drainage year as beginning with October in one year and ending with September in the next. The following figures will show how much greater the excess was in the summer half of the year as compared with the winter half during the twenty years of wet weather, and how much greater the deficiency was in the summer half of the year during the dry twenty years which followed :-

THE RAINFALL IN RESPECT TO A SEASONABLE QUANTITY.

The Winter half of the year The Summer half of the year (October-March). (April-September). 1862-3 to 1881-2, excess 1863 to 1882, excess $27\frac{1}{2}$ 10^3_1 inches. inches. 1882—3 to 1901—2, deficiency 1883 to 1902, deficiency 43^3_2 4 inches. inches. If our underground water supply has suffered from

the recent long series of dry years, as it undoubtedly bas done, how much more must our trees and gardens have been injuriously affected during the same dry period? E. M., Berkhamsted, January 19, 1984.

MARKETS.

COVENT GARDEN, January 20.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

POTATOS.

Home-grown, 90s. to 120s. per ton; foreign, 80s. to 120s. do.; Dunbars, 120s. to 130s. do. John Bath, 32 & 34, Wellington Street, Covent Garden.

SEEDS.

LONDON, January 19.—We have to report that the demand for Clover seeds continues good. Chilian Red Clover has advanced considerably, and the better grades are now almost exhausted. Supplies from Russia show a falling off in quality, and prices in this market, as well as in France, are high. White Clover fields a ready sale at full prices. Alsike is in good request. Trefoil meets a better demand at unchanged figures. Ryegrasses in fair request. Hurst & Son, Houndsditch.

FRUITS AND VEGETABLES.

GLASGOW, January 20.—The following are the averages of the prices during the past week: Apples, Maine, U.S., 15s. to 20s. per barrel; Californian Newtown Pippins, 8s. 6d. to 10s. per box: other sorts, 14s. to 25s. per barrel; Oranges, "420's," 9s. 6d. to 11s. 6d. per box; do, large, 15s. 6d. to 17s. 6d do; do, "714's," 9s. 6d. to 12s. do.; do, large, 19s. 6d. to 23s. 6d do.; Lemons, 12s. 6d. to 18s. per box, and 18s. to 25s. per case; Grapes, home, 9d. to 2s. per lb.; do., Almeria, 8s. to 25s. per barrel; do., Guernsey, 4d. to 8d. per lb.; Pears, 6s. to 24s. per hox; Tomatos, 5d. to 9d. per lo.; do., Tenerifie, 3s. to 8s. per hox; Onions, Valencia, 6s. 6d. to 8s. 6d. per hox; Mushrooms, 1s. to 1s. 6d. per lb..

88, 6d. per hox; Mushrooms, 18, to 18, 6d, per In..

LIVERPOOL, January 20.—Wholesate Vegetable Market (North Hay).—The following are the average of the current prices during the past week—prices varying according to supply:—Petatus, per cwt., Main Crop, 48, 9d, to 58, 3d; British Queen, 48, 2d, to 48, 9d,; Upto-Date, 48, 2d, to 48, 9d; Bruce, 48, 6d, to 58.; Turnips, 6d, to 8d, per dozen bunches; Swedes, 18, 1d, to 18, 6d, to 10d per dozen bunches; Onlons, foreign, 48, 3d, to

48. 6d. per bag; Cauliflowers, 1s. to 2s. 6d. per dozen; Cabbages, 6d. to 10d do.; Celery, 9d. to 1s. 9d. do. -8t John's.-Potatos, 10d. to 1s. per peck; Cucumbers, 6d. to 10d. each; Grapes, English, 1s. 6d. to 2s. 6d. per 1b.; do., foreign, 8d to 10d. do.; Pines, foreign, 4s. to 6s. each; Musbrooms, 1s. per 1b - Birkenhead: Potatos, 1s. to 1s. 4d. per peck; Cucumbers, 6d. to 10d. each; Grapes, English, 1s. 6d. to 3s. 6d per 1b.; do., foreign, 4d to 6d. do.; Tomatos, English, 6d. do.; Pines, foreign, 2s. 6d to 4s. each; American (Maine) Apples, 15s. to 26s. per barrel; others, 14s. to 26s. do.; Californian Newton Pippins, 6s. 6d. to 10s. per Box; Canadisns, 16s. to 28s. per barrel.

CORN.

AVERAGE PRICES of British Corn (per imperial qr.), for the week ending January 16, 1904, and for the corresponding period of 1903 together with the difference in the quotations. These figures are based on the Official Weckly Return:—

ANSWERS TO CORRESPONDENTS.

BOOKS: W. P. Freston. The Country Gentlemen's Estate Book would furnish the intermation you require. Subscription, including the Estate Booklet, a monthly supplement, 6s. 6d. per annum, post paid. The publishers are the Country Gentlemen's Association, 16, Cockspur Street, Pall Mall, S.W.

CLIMBINO PLANT FOR INSIDE WALL: A Reader-Though not a climbing plant, the Ivy-leaved Pelargonium would probably be the best plant for you to select for the purpose. If a good variety, such as Souvenir de Charles Turner, be trained up the wall and grown well, it will afford you an abundance of flowers for cutting.

Cypripedium calceolus: A. H. W. This is not an easy plant to cultivate, but it has been often grown successfully in sheltered rockeries, or borders in the open ground. Plant in a compost of equal parts of peat, loam, leaf-soil, and sand; and in such a way that the plants do not run the risk of being dried up in summer. The lower parts of rockeries, where moistnre is always assured, is best. The roots may be planted in the above compost in pots, and the plants grown in cold frames if desired. In any case they must be kept cold while at rest, and protected by a couple of inches of dry leaves over the surface.

Dissolved Bones: Old Subscriber. Apply these as soon after the ploughing has been done as possible. You do not state what the crop is to be.

FLOWER BEDS: A Reader. The system of mixed bedding would be best suited for the design you send. Place taller-growing and graceful plants, such as Abutilons, Cannas, Albizzia, Fuchsia, dwarf Palms, &c., at intervals, and fill the ground surface with dwarfer plants, as Begonias, Violas, Ageratums, or whatever decorative plants you can obtain conveniently. If you wish to follow the "massing" system, the beds No. 4 might be planted with Violas, 3 with tuberous-rooted Begonias, 2 with the variegated Flower of Spring Pelargonium, and 1 with Fuchsias.

FOREMAN GARDENER: E. G. In the absence of any agreement to the contrary, a weekly notice is generally considered to be sufficient. He is not a domestic in the sense that the head gardener is.

GARDENER UNDER NOTICE: Woodbine. As a domestic servant, you are entitled to one month's notice.

GLORIOSA SUPERBA: A. H. W., Croydon. A very old plant in English gardens, belonging to the order Liliacea, and requiring the temperature of a stove. It is a bulbous plant, and may be propagated by offsets from the bulbs or by seeds. It is usually grown in pots, and the growths trained to pillars or wires, where the somewhat singular-looking, red and orange-coloured flowers show to good advantage. If your bulbs are dry, you may pot them up into

a compost of peat and loam in equal proportions, mixing some old mortar-rubble with it, and start them in a temperature of 65° to 70°. When the plants are growing freely, they must be afforded abundance of water and heat, and they will then flower from most of the leafaxils. It is necessary that the pots should be thoroughly well drained. When the growths show signs of ripening at the end of the summer, the water must be gradually withheld and the bulbs rested in a warm house. The roots are very brittle, and impatient of interference.

Grapes: H. There is no evidence of disease upon the fruits, and the reason is most likely to be due to the canes failing to ripen perfectly. By careful firing and ventilation get the wood to ripen as much as possible, and next season, if the Grapes appear to be going back before they are perfectly ripe, afford the house a little extra warmth, remembering that it is the imperfectly finished Grapes that will not keep well.

ILLUSTRATION: New York. We had intended to publish your photograph, but fortunately for us we saw it in another journal. You should

us we saw it in another journal. You should have stated at the time that you had sent it elsewhere, otherwise it is unfair to all parties, and may lead to unpleasantness. No journal wants to publish the same things that appear in its contemporaries, either in the text or in the illustrations, unless, of course, in the case

of news items, or for some other special reasons.

Land Agent: F. D. Apply to the Surveyors'
Institution, 12, Great George Street, Westminster, where you will be likely to obtain
information respecting the examination necessary. The Secretary is Mr. J. C. Rogers.

LADY FOREMEN: Foreman. We do not interfere with the wording of advertisements, but the reading given is in accordance with the practice of the University of London, which confers the degree of "Bachelor" in the various faculties on spinsters and even on married women.

LICHENS ON FRUIT-TREES: W. J. When fruittrees generally, and even Conifers and deciduous ornamental trees, are affected with Lichens
to the extent you describe, it is pretty certain
that the local atmosphere is exceedingly damp.
Parts of South Wales near to the Channel are
nearly as bad. The hest practice to adopt in
the case of established fruit trees is to have
hot-water and soft-soap, and wash the bole
and stems with a scrubbing-brush in winter,
and apply the caustic alkali over the branches
and shoots. The difficulty you have in syringing is probably due to not keeping the mixture
stirred properly the whole time, assuming that
you have used the ingredients in the correct
proportions.

Names of Plants: Correspondents not answered in this issue are requested to be so good as to consult the following number.—No name on cardboard box. 1, Abies Nordmanniana (?); 2, Pinus excelsa (?); 3, Pseudotsuga Douglasi; 4, Pinus silvestris; 5, Cupressus pisifera plumosa; 6, Abies excelsa. We name these under reserve, as the specimens are so bad.—W. L. Cypripedium barbatum.—Hants. 1, Dendrobium pulchellum; 2, Dendrobium bigibbum.—H. J. P., Ripley. Asparagus Sprengeri.

New Potatos in Magazine: Subscriber. The

New Potatos in Magazine: Subscriber. The old tubers would attempt to make growths, and new tubers having been formed, they would feed upon the substance of the parent tubers. With soil to root into, new tubers would undoubtedly be formed, but they would be small and few. The process would be costly and unremunerative.

PLUM-TREE: Phil. Your seedling Plum-tree will certainly flower if it is allowed to grow sufficiently long. Thin out the weaker growths in order that the sun and air may easily reach every part, and wait. The other alternative would be to cut the tree back and graft it with a known variety. The latter method would probably be quicker, but it cannot be followed by cultivators who wish to raise new varieties of fruit.

POND "CLEANINGS": Jno. S. If the cleanings bave been taken from the pond recently, it

would be better to put them into a heap and mix with them a similar quantity of roadscrapings, wood-ashes, lime, &c., turning the beap over occasionally. The material would then become valuable as manure, and be less dangerous than it would be, used in a fresh condition, upon borders containing herbaceous plants.

Red Spider on Arums and Tea Roses: L. B. W.
Fumigation with the XL-All vaporiser, if repeated occasionally, will kill the spiders; but that the fumes may have their proper effect, the plants, if in pots, should be put upon a shelf, or otherwise raised, because the fumes will not be so dense near to the floor of the house. They might be syringed with weak tobaccowater, if you prefer this method to that of the vaporiser. That you are so troubled with spider may be due to the atmosphere of the structure being kept too dry. Do not use too much fire-heat, and in proportion to the degree employed damp the surfaces in the house, which will improve the atmosphere.

Saintpaulia ionantha: W. This Gesneraceous plant was exhibited at the Quinquennial Exhibition at Ghent in 1893 by Dr. Wendland, and was figured in the Gardeners' Chronicle for June 10, 1893, p. 685. It is a native of the Usambara mountains in Central Africa, and was discovered there by the son of Hofmarschall St. Paul-Illaire, of Fischbach, in Silesia, then President of the German Dendrological Society. The plant was cultivated in England in 1894. Sir Trevor Lawrence showed a plant at a meeting of the Royal Horticultural Society on July 10 that year, and a Botanical Certificate was awarded. Later, on October 23, the plant was awarded a First-class Certificate.

SITUATION FOR NURSERY: X., Hampton-on-Thames. Send to Messrs. Protheroe & Morris, 67 and 68, Cheapside, London, E.C., and they will send you a copy of one of their registers of nurseries for sale.

TENNIS COURT: Tweedside. You would be able to get York paving stones through a contractor, who would also give you an estimate for asphalting the court. A double court is one that is large enough for the use of more than two players at the same time.

Vines and Peaches in Pots: A. E. C. We do not advise repotting if you intend to force at once, as this would involve a check to the roots. You might leave the plant in the old pot, but knock out the bottom and place the pot on to some rich soil, with drainage provided underneath. Into this soil the roots will soon find their way. If you afford a good top-dressing as well, and plenty of manure-water after the fruits commence to swell, the plants should do well.

White Insects on Fern Leaves: J. Spicer. The minute white objects are the male scales of Chionaspis aspidistræ. By carefully examining the fronds you will also find the palebrown scales of the females. The latter are much larger than those of the males, and they somewhat resemble the common musselscale, but are more pyriform in shape, and rarely curved. This insect is by no means generally distributed in the British Isles, but is abundant where it occurs. The XL-All vaporiser will destroy the active larvæ or young forms, but it has not been known to kill the adult females. Careful and frequent sponging with soft-soap and water at the rate of 2 oz. to the gallon is the only safe application for such tender foliage. In the process of sponging remove as many of the females as possible, and all the old fronds should be cut away and destroyed. Fumigation with hydrocyanic acid gas would be the most effectual remedy, but this treatment has not found favour with the horticulturists of this country, owing to its dangerous nature.

RIVIERA NATURE-NOTES.

A SECOND edition of a charming book with the above title has been published by Bernard Quaritch, of 15, Piccadilly, London. It has no author's name on its title-page and only initials to the preface. It is appropriately dedicated to Sir Thomas Hanbury. The notes, we are told, were written at different times and in different moods during a long residence on the Riviera. Twelve summers were spent in the mountains and sub-alpine villages of the Maritime Alps, and lengthened sojourns have been made in the narrow coast strip where strangers congregate. The book deals with the general natural history of the Riviera in a literary rather than in a severely scientific manner, so that the book is eminently readable, but without, so far as we can see, any sacrifice of scientific accuracy. There are chapters on the Palms, the Olives, the Oranges and Lemons, the Pines, the Carob, and other trees so characteristic of the district, some native, others naturalised. We have not met with the word "Ecology' in its pages, but there is much in the book which will appeal to lovers of that old but newly-named branch of nature-study. It is not trees and flowers only that are subjects of comment, but animals, butterflies, shells, and a host of matters which occur to the intelligent visitor or resident who knows how to use his eyes.

Concerning the Arbutus (lay stress on the first syllable and shorten the second, please), the author says:-"It seems to me that certain plants, of which the Arbutus is one, have a perception of the picturesque. Mark well the spot where this tree loves to grow, and you will find it has a special charm. Name the most lovely scenery in the British Isles, is it not where the evergreen foliage and the waxen bells of the Arbutus are reflected in the crystal waters of Killarney? And when you find among the Olive hills some charming nook, and you exclaim, 'Ingulus ille ridet!' be sure that the nymph of the Arbutus haunts that unfrequented spot. She is too wild and too highspirited to be tamely imprisoned by the railings of every suburban villa, like a Lilac or a Laburnum or a Hawthorn. It is difficult to transplant an Arbutus; gardeners rarely attempt it on the Riviera." We sympathise with the author's meaning, but writing within sight of numerous forecourt gardens in a London suburb, in some of which the Arbutus flourishes, as well as another Riviera plant, the Laurustinus, we think the author has allowed his imagination to outrun his facts. Nor can we quite agree that Styrax is not "admitted to rank as a garden plant." It may be rare, but it is certainly not unknown in our gardens in one or more of its forms. But these are trifles which do not in the least interfere with the interest attaching to this volume. Those who do not know the Riviera will find numerous matters to attract their attention; whilst to those more fortunate ones who have some knowledge, however slight, of that lovely shore, the book will supply the most delightful recollections. The Agaves and Palms, excepting the dwarf Chamærops, are naturalised aliens, which give a very characteristic appearance to the landscape. Some purists who object to any but indigenous vegetation would banish these plants. Fortunately, they are not likely to have their way. Equally unlikely is it that that true native and, in its own quaint way, most attractive of plants, the giant Euphorbia E. dendroides, will be banished, for though it is attractive to the connoisseur, it does not appeal forcibly to those who put beauty, as they conceive it, in the first rank, and place every other attribute anywhere or nowhere. If the majestic Olive trees of the coast inspire one with wonder and veneration, the smaller trees up in the hills, with their undulating sea of grey foliage, produce an impression that is not easily forgotten.

We must not linger over this seductive book, but we cannot help calling attention to the amusing chapter on Mosquitos as a test of character. A list of problems to solve is given at the end of the book which might satisfy the craze for competitions, were it not that no pecuniary inducements are held out! As in the case of other competitions, some of the problems are easy enough to solve; but they are lures to draw one on to the consideration of the more abstruse problems.

In an appendix is given a list of "books useful for the study of the flora." To the list given may be added, for the benefit of those who read German, the second edition, just published, of Prof. Strasburger's Streifzüge an der Riviera (Jena, Fischer), illustrated with numerous coloured plates.

FLORISTS' FLOWERS.

THE AURICULA.

A LETTER from the Rev. F. D. Horner reminds me that the Auriculas will soon he commencing growth, and that they need a surface dressing. The plants having made growth during the dullest and dreariest summer and autumn we have known for many years, it is possible that many plants may want bottom as well as topdressing. The cultivator of any pot-plants should see to it that the roots are right. Top-dressing an Auricula may become a delusion and a snare to the inexperienced cultivator if he has no knowledge of the state of the roots. If the soil in which the plants are growing has become of a dense, pasty consistency, it is a sign that something is wrong with the roots, and top-dressing after removing part only of the surface soil will but deceive the unwary. It can do the plant no harm to turn it out of the flower-pot carefully and examine the roots; there may be an earth-worm in it, and the drainage may be choked-this must be remedied by removing all the crocks. Have a clean pot ready supplied with fresh drainage material, and turn the plant into it, pressing the roots down firmly, and finishing off with fresh compost. If the compost is very bad and contains few roots, remove as much of it as may be deemed desirable and replace with fresh material. The surface-dressings ought to be afforded before the end of February, as the plants make rapid growth in March. The dressing should be of yellow fibrous loam two-thirds, and decayed manure one-third; to this a little coarse white sand may be added, or, what is better, ground oystershells. The outer leaves continue to decay, especially after each severe frost, and such leaves must be removed at once.

I keep the ventilators open night and day, except when there is danger from frosts. Those who are desirous of exhibiting Auriculas would do well to keep the self-coloured varieties out in the frames a few weeks longer than the edged varieties, as the selfs have a tendency to flower rather earlier than edged sections; nor will a self Auricula remain in good condition so

The good old grey-edged variety George Lightbody will remain in fair condition for six weeks; but I do not know any self-coloured varieties that will stand good a third of the time. Those who have charge of Orchids know how carefully they must be watered, especially now that leaf-mould is so extensively used in the compost; but during the next three months care in the watering of Auriculas is even more important, and after the surface-dressing has been afforded it is very difficult to know when to give and when to withhold water.

THE QUESTION OF VARIETIES.

There have been a few amateurs added to the Auricula cult during the last few years, and some of them are greatly in doubt as to the best varieties to cultivate. The fact is, there are very few varieties of show Auriculas to be had in comparison with those that were grown thirty or forty years ago. I have been turning over the pages of Gossip for the Garden for 1856, and 1 find one grower states that he possesses 150 varieties. My own collection is a very good one, but does not exceed seventy-five varieties, new and old, of the show section. It is generally thought that there have been no improvements in the Auricula in these forty or fifty years, but it is a fact that none of the varieties which won the leading prizes in 1860 would have a chance now.

Raising seedling Auriculas requires much atience. A seedling may give splendid promise in the first year, but fail the next season, even though it has been awarded a First-class Certificate from the National Society. The following varieties are of proved excellence. I have selected six in each class:—

Green-edged.—Abbé Liszt (Douglas), Abraham Barker (Lord), Mrs. Henwood (Barlow), Gladiator (Simonite), Rev. Francis D. Horner (Simonite), Shirley Hibberd (Simonite).

Grey-edged.—George Rudd (Woodhead), Marmion (Douglas), George Lightbody (Headley), Lancashire Hero (Lancashire), Mabel (Douglas), Richard Headley (Lightbody), White-edged Acme (Read), Conservative (Douglas), Heather Bell (Simonite), Mrs. Dodwell (Woodhead), John Simonite (Walker), Smiling Beauty (Heap).

Selfs. — Black Bess (Woodhead), Heroine (Horner), Mrs. Potts (Barlow), Lord of Lorne (Campbell), Ruby (Simonite), Gerald (Bentley), Favourite (Horner). A new variety will probably head the list as the best self, but it is still scarce.

I believe the above to be the best twenty-five varieties that can be purchased at present. There are now many raisers of seedling Auriculas in the London district, and I am hopeful that during the next few years we shall see some fine varieties. A celebrated cultivator in the North has just informed me that there has not been a single good self-coloured Auricula raised from seed south of Yorkshire. Surely some of the younger cultivators, with the best years of their life before them, ought to do something to remove this reproach.

In cross-fertilising green, grey, and white-edged Auriculas, many of the seedlings will produce self-coloured varieties, but they are always of poor quality. I am sure Mr. Horner and others of the best raisers will bear me out in this. If good seedling selfs are to be obtained it must be by crossing the best selfs at present in cultivation with each other. Black Bess, Heroine, and Mrs. Potts are the three best that are available at present. Favourite might be included, but it is now worth a guinea and a half.

There is still room for much improvement in the green, grey, and white-edged varieties; and the interest in the cultivation of any plant is greatest when the seedlings are flowering for the first time. The seed should be taken from vigorous plants, and the pollen parent should possess flowers of the highest order of merit. A perfect circular tube of a good yellow colour, a clear, dense, white paste, the edge of the corolla circular; if a green-edge it must be a good decided green, free from dots of farina, with a rich black zone well defined between the grassgreen margin and the snow-white centre - a delightful combination of colour. The same remarks apply to the grey and the white-edges. The grey is intermediate between the white and the green.

POTTING AND REPOTTING.

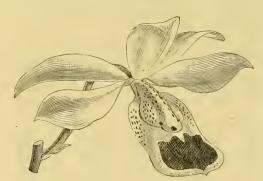

Those who possess small seedling plants should not suffer them to die through being forced out of the ground by frost. I have had much success in flowering them by being careful to prick out a dozen small plants into a 60-sized flower-pot. I let them grow until the leaves meet together, and repot them, three plants this time in the same sized pots. As soon as the plants have grown so much as to need repotting, one plant should be put in each flower-pot, and then repotted as may be required. The seedlings are ready to be potted off as soon as the first leaf is formed after the seed leaves. Some growers may think so much repotting rather tedious. I do not say it is not, and I have noticed that the champion seedling raiser, Rev. F. D. Horner, pricks a large number of seedlings out in seedpans rather thickly at first, and re-pans them a second time, leaving the plants to flower in the seed-pans, or plants them out in the open garden when they are very numerous and cannot be afforded room under glass.

I will only add that the plants must be kept quite free from insect-pests. Green-fly is the most troublesome, and it must be destroyed by using XL-All fumigating material. The Auricula-aphis is also rather troublesome, although it does not do so much damage as green-fly. It can be destroyed by clearing the roots of it when repotting, and keeping it from the neck of the plant by dipping a small brush in tobacco-powder and brushing it off; the insects not brushed out will be killed by the powder. J. Douglas.

ORCHID NOTES AND GLEANINGS.

EPIDENDRUM ELEGANS.

A NUMBER of plants of this handsome, slender-growing Barkeria, as it is more commonly called in gardens, have been in bloom in Mr. H. A. Tracy's nursery, Amyand Park Road, Twickenham, for several weeks past. The species, like all the other Barkerias, has a reputation for being difficult to grow, and the appearance of such a pretty and rare plant so well cultivated is worth recording. The slender-stemmed plants are growing, several together, in small Orchid-pans, which are suspended in a light intermediate-house. They have been watered freely until the flowers appeared, and it is intended to keep them

F16. 28.—EPIDENDRUM (BARKERIA) ELEGANS.

dry and cool like resting Dendrobes until they commence to grow again. The non-observance of the resting season, and the fact that the plants are usually kept too warm and shady at all seasons, goes far to account for the poor condition of the specimens usually found in gardens. These Barkerias in their native habitat in Mexico grow on the twigs and smaller outer branches of trees, often overhanging streams, and always exposed to a large amount of sunlight.

The plants referred to have slender spikes of pretty flowers, each about 2 inches across, white more or less tinged with purplish-rose, the showy labellums having a large crimson blotch in front, and some small purple markings on the base and column. There is great variety in colour, and also variation in form.

ODONTOGLOSSUM X WILCKEANUM ALEXANDRÆ.

A flower of this very fine Odontoglossum from the collection of J. Wilson Potter, Esq., Elmwood, Croydon (gr., Mr. W. H. Young), shows it to be a noteworthy addition to the favourite class of Odontoglossums. The plant was obtained from Messrs. Charlesworth & Co., of Heaton, Bradford, who obtained a First-class Certificate for it at Manchester, January 8. The flower is large and of good shape and substance; the greater part of the sepals are heavily blotched with confluent chestnut-red blotches, the tips being pale yellow, and a small area at the bases white; the broad petals are deeply fringed, white with an irregular ring of reddish spots on the middle. The lip has the spiny yellow-and-brown crest indicative of O. luteo-purpureum; the fringed, apiculate blade white, with a large reddish-brown blotch in front of the crest.

CYPRIPEDIUM × MAHLERIANUM, FEILING'S VARIETY.

A very desirable hybrid between a good Cypripedium villosum and C. x Sallieri aureum, has been raised by C. H. Feiling, Esq., Southgate House, Southgate (gr., Mr. Stocking), and is now flowering there. In its general features and colouring it approaches C. villosum singularly closely, but is much finer in every respect than even the best forms of C. villosum, all the parts being larger and broader, and the substance much thicker than in that species. It has also a strong resemblance to C. × Beekemanni. The fine dorsal sepal is emerald green with a pure white margin a 1 inch wide, a broad purple band up the middle, and lighter dotted purple lines on each side. The broad petals are yellow, the middles having a dark purplish-chocolate band, above which the upper half of the petal is reddish brown, the lower half being yellow slightly tinged with purple. Lip and staminode whitish-yellow slightly tinged with purple.

NOTICES OF BOOKS.

South African Flowering Plants, &c. By Rev. Prof. G. Henslow, M.A. (Longmans, Green & Co.).

This little book is written for the benefit of beginners and of those, whether resident in or visitors to the Cape Colony, who require to know something more than the names of a few plants. The South African flora is very rich, very beautiful, and very peculiar. It therefore offers to the intelligent observer endless sources of interest. The structure and conformation of the plants are such as are met with in dry climates. The modifications and adaptations, though extremely varied, all have reference to the same conditions. The conditions are much the same as in S.W. Australia, and the "adaptations" are similar, but yethow different are the two floras!

Professor Henslow would like to have the pupils taught [or, better still, be enabled to find out for themselves] why one plant is hairy or woolly, why another is quite smooth, why some flowers are "regular," others "irregular"; how it comes about that some plants are spiny, others not at all, and so forth. It is obvious that information of this kind would be very valuable to the cultivator in any country, and furnish him with endless hints by which he might profit.

The Professor begins his book with a detailed examination of Oxalis cernua as a common Cape plant, and then goes on to consider the methods by which the pollen is conveyed from one part of a flower to another, or to another flower. The manner in which stems and foliage are adapted to a dry climate is the subject of a short chapter, wherein the structure and mode of growth of bulbs is explained. The different forms of flowers are then described, and attention called to the circumstances which caused all these modifications.

After an explanation of the system of classification adopted by Bentham and Hooker, the author passes in review several of the principal and more conspicuous natural orders. In the selection of plants for comment, Prof. Henslow has had the advantage of the assistance of Prof. McOwan and Dr. Schonland, and has turned his own visit to the Colony to advantage. The stamens of Malvaceæ are described as numerous, but it would be more consistent with their development to speak of the andræcium of these plants as consisting of five stamens, each one much divided.

In many cases popular names are used, and this is no doubt desirable where such names have the sanction of custom or convenience, but to coin such appellations may be misleading or even dangerous. Thus we find the Amaryllidaceæ called the "Belladonna" family, an appellation that is not required and may be confusing. Again, why call the Aroidaceæ by the name of Trumpet-Lily family? Surely it is no more difficult to speak of the Aroid family, and thus avoid the too prevalent confusion of these plants with Lilies! The sheaths which invest the stalks of the Restiaceæ are said to remain on the stem till the linear blade has fallen; but in these plants it is exceptional for the leaf-blade to be formed at all.

The book is clearly written, freely illustrated, and well adapted for the purpose for which it is written. The examples are well selected, and have the advantage of novelty. Though primarily intended for South African readers, it can, with the necessary modifications, be used anywhere with advantage as an elementary text - book introductory to more advanced treatises.

THE CULTURE OF VEGETABLES AND FLOWERS FROM SEEDS AND ROOTS. By Sutton & Sons, Reading. (London: Simpkin, Marshall, Hamilton, Kent & Co., Ltd.)

This is the eleventh edition of a practical book, so often appreciated by us that we have little more to say about it. Suffice it, that it is the work of men of experience both in cultivating and in instructing, and that the present edition has been brought well up to date. The several chapters deal with: The Culture of Vegetables, Year's Work in the Vegetable Garden, Rotation of Crops, Chemistry of Garden Crops, Flowers from Seeds, Flowering Bulbs, Flowers all the Year Round, Lawn and Tennis Grounds from Seed, Pests of Garden Plants, and Fungus Pests.

We are pleased to notice that the vegetables enumerated include not merely the most familiar kinds, but also those less well known to the ordinary grower: Cardoons, Corn-Salad, Chou Tronchuda, Kohl Rabi, &c.; though we find no mention of the Crosnes or Chinese Artichokes, popular in France, and now sometimes obtainable in English markets. They are easily grown, and by many highly esteemed. The agency of bacteria or other microbes in enhancing the fertility of the soil should have a mention in a future edition, as it is more than likely we are on the threshold of discoveries which will be eventually of the greatest benefit to practical horticulture.

ENGLAND'S NATIONAL FLOWER.

"A book for all garden-lovers" needs no introduction, especially when it deals, as this does, with the Rose. It might be thought that the literature of the Rose was already ample, but people never tire of the Rose; and then we must remember, as is well said in the preface, that the Rose is constantly changing. Not our grandfathers only, but our fathers, would be not a little astonished at the changes that have taken place in the Rose. Few, indeed, of the Roses of our childhood remain. Each season fresh beauties are developed, and for the last half-century the Rose has become more than ever the national flower. Up to the middle of the last century our choicest acquisitions came from France; nous avons changé tout cela. England and Ireland have of late years been the sources whence we have obtained most of our best Roses. There was room then for yet another book about Roses, and Mr. Bunyard has supplied the vacancy. No one who knows the author and his Rose nursery will consider him (as he seems to fear) presumptuous in undertaking the task. Indeed, there are cases in which the well-trained, all-round man is likely to be a better adviser to the ordinary Rosegrower than the specialist with exhibitions on the brain. Mr. Bunyard, while in no wise disparaging exhibition Roses, addresses his book more particularly to those who do not grow for exhibition—the majority, in fact. Cultural details are giveu-needless to say they are trustworthy in no ordinary degree. We might think the statement that a well-grown standard Rose "is a very pretty object" requires considerable modification—the flowers are lovely, but the bush! Full lists of varieties belonging to the several sections are given, as well as select enumeration of Roses intended for special purposes, which will be of service to the lovers of the so-called garden Roses. Photographic illustrations are given, which show how very beautiful Roses are when lightly arranged in vases and not throttled in the regulation boxes; but if we have to pick out one portion of this book for special commendation it must be that devoted to cultural details, so clearly and tersely are they set forth. The book is to be had from the Royal Nurseries, Maidstone.

MR. H. TRETHEWY.

At the "George Hotel," Silsee, Bedfordshire, en January 18, the tenantry and other friends on the Wrest estate combined to celebrate the eve of the ninetieth birthday of H. Trethewy, Esq., J.P., the highly-respected agent for Earl Cowper's Bedfordshire estate. Upwards of thirty of the tenant-farmers and friends dined together, and

MR. H. TRETHEWY.

the chairman, Mr. Crouch, of Camhow, the oldest tenant-farmer on the estate, made some observations on Mr. Trethewy's estate management during the past fifty-eight years, and subsequently presented to him, on behalf of the tenantry and other well-wishers on the estates of Wrost and Blenham, some silver-plate bearing a suitable inscription. Mr. Trethewy on receiving the presentation thanked those present for their gift and kind appreciation of his agency. He recalled the many changes he had seen on the estate during his fifty-eight years' stewardship.

Mr. Trethewy is not only a model agent and successful agriculturist, but an enthusiastic arboriculturist, and what is of more interest to the readers of the Gardeners' Chronicle, he has been all his life an ardent herticulturist. His gardens and fruit-trees are tended with no stinted hand, and his principal hobbies are kitchen-gardening and his excellent stock of Apple and Peartrees. Those who have had the privilege of meeting him in or about the garden have found in him an intelligent acquaintance with all the best varieties under cultivation.

It may be mentioned that Mr. Trethewy is still active, and may be seen daily riding about

on his thirty-year-old cob inspecting the stock in the deer park, &c., and it is to be hoped that his remaining years may be free from care. George MacKinlay, The Gardens, Wrest Park, Ampthitt.

FORESTRY.

CONIFERS FOR TIMBER-PRODUCTION IN ENGLAND.

In your remark on The Times correspondent who signs himself "F.R.S.," you mention several conifers as likely to prove of value for timbergrowing in this country. While admitting that little time has elapsed to prove the qualities of many trees introduced within the last fifty years, I think there is little chance of three of those you mention ever turning out superior to our native trees in the way of timber producers, even if they should prove to be their equals. These three are Thuya gigantea, Cupressus Lawsoniana, and Thuyepsis borealis. I believe all of these have been introduced into this country within the last fifty years, and therefore no great time has elapsed to prove their value or the reverse. But compared with the growth of such species as the Douglas Fir, the Sitka Spruce, or the Redwood (Sequoia sempervirens), the growth of those above-named is distinctly disappointing. Probably Thuia gigantea shapes better than the other two, but even that species does not appear to be capable of attaining any great size in this country. For the first ten years it grows rapidly, but after that its growth is very uncertain, and it does not give one the impression of being a long-lived tree even when grown under favourable circumstances. When grown, as all timber trees must be grown, in close order, I do not believe it will ever attain a large size, unless it be on the best of soils. But the worst feature of this tree in my opinion is the shape of its bole. This, in a good timber tree, should be full and round, whereas the bole of most specimens of Thuia gigantea that I have come across are irregular and fissured, partly due perhaps to the presence of branches. That this is not entirely the result of conditions of growth, however, may be gathered from the statement made a few years age by Forst-Meister Punnebaum, in his account of his North American tour. He states that this tree does not possess a particularly cylindrical stem, and is apt to exhibit a spiral growth. Again, in a more recent paper by Forst-Assessor Bohm, on Investigations on the Timber of North American species grown in Germany, while admitting that the timber is durable in spite of its extreme lightness, the author considers that its use is excluded for all purposes where hardness is necessary, and that it does not give any promise of proving more valuable than indigenous species.

In the paper contributed by Dr. Somerville to the Congress of Forestry in Vienna last year, the dimensions are given of two specimens of Thuya gigantea 40 and 42 years of age respectively. The former is 52 feet in height, and 7 feet 8 inches in girth at 4 feet 6 inches from ground, and the latter 69 feet, and 7 feet 4 inches in height and girth. The growth of the former is not remarkable, but that of the latter is fairly satisfactory, being practically an average of 2 feet per annum. But as bearing out to some extent my belief that the tree is not likely to be a long-liver in this country, the fact may be mentioned that this same tree was 65 feet in height in 1891, and therefore has only added 4 feet to its height in twelve years. But the worst feature of these particular measurements is that of the smallness of girth. About 7 feet in girth at 4 feet 6 inches from the ground would not be amiss in a tree with a cylindrical bole, but in one which drops off rapidly as it ascends it cannot be considered a fast growth compared with Douglas' Fir or other species which drop off comparatively

little. I do not know of any tree in this country which would contain, by the ordinary method of timber measuring, more than 25 cubic feet of timber, which, at forty years of age, falls a long way behind many Conifers grown in the open, although it may be a fair growth for trees in a close wood.

With regard to Cupressus Lawsoniana and Thuiopsis borealis, present appearances are still more doubtful of their ever becoming more than ornamental trees with us; although, should that only be the case, this country is the gainer by their introduction.

With "F. R. S.," I agree that the Larch, given the right soil and situation, is the only tree that Is this variety as productive as Lee's Prolific and Champion, which are considered here to be the two best varieties? Black Naples seldom sets a crop of fruit, seeming to be deficient in pollen. John Charlton & Sons, Rochester, N.Y., U.S.

MARKET NOTES.

COVENT GARDEN FLOWER MARKET.

During the previous week trade revived a little, yet the market still presents a rather dull appearance. On Saturday there was a large increase in the supply of Daffodils; the Spur and bicolor sections being very plentiful

Fig. 30.—LEMONS IN LADY PLOWDEN'S GARDEN, ASTON ROWANT. (SEE P. 78.)

can show good returns within a period of thirty or forty years. But to state that it is the only tree worth growing is, as you remark, a little too sweeping, unless qualified by some such proviso as that above. A. S. Forbes.

FOREIGN CORRESPONDENCE.

BLACK CURRANTS.

Boskoop "Mammoth" Black Currant.—In the Gardeners' Chronicle for August 29, 1903, was a communication from Mr. Harrison Weir, speaking highly of this variety, as being superior to all the other Black Currants. Would some of the market growers and others, if they can, give us some information of their experience with it?

also Narcissus Telemonius plenus and the polyanthus Narcissus. The very large importations of paper-white bring down the price of Englishgrown flowers of this variety. Hyacinths, chiefly whites and pinks, grown three in a pot, are now very good, and make about 12s. per dozen. There are very fine Tulips coming in; for those grown and sold in boxes the highest prices would hardly average 1s. per dozen for the best blooms. Good Indian Azaleas, mostly white, make from 2s. 6d. to 3s. 6d. each. More growers are now bringing in Cyclamen, but the best still maintain a good price.

Pot Chrysauthemums are nearly past, but cut blooms were plentiful, though rather high prices were asked for flowers of good quality. Erica hyemalis is still abundant, the prices ranging from 8s. to 15s. per dozen. There are some of good quality, but others are past their best. White Margnerites continue to come in, though they are not quite so plentiful. Begonia Gloire de Lorraine and its varieties may be said to have become thoroughly established as market plants. Several growers continue to bring in good plants, and there are very pretty small plants. Cyclamen, Heaths, and Primulas are among those which may be seen in 3-inch pots almost every market morning, and are popular.

Of Orchid flowers, Cypripediums and Dendrobiums are most plentiful; Odontoglossums are rather scarce. Some fine Pancratium blooms were seen on Saturday, the price asked being 3s. 6d. per dozen; white Camellias are plentiful, also Azalea. Callas are seen everywhere; Lilium longiflorum and L. speciosum are fairly plentiful. White flowers are much more abundant than those of good, bright colours. During the week red Roses were very scarce, and all good Roses command high prices. Carnations continue to make high prices. There are now a few good Malmaisons to be seen. The supply of hardy green foliage is plentiful, but is chiefly confined to Berberis Mahonia and Ivy; this may be had in long trails with the beautiful bronzy leavesthe small, bronzy leaves which are now so much used in sprays and button-hole bouquets; also the short, thick shoots of the Tree-Ivy. Hardy Ferns are good; Polystichum angulare, Blechnum spicant, and Polypodium vulgare all being plentiful. Good green Moss may also be had. A. H., January 23.

THE PUBLIC PARKS IN LEEDS.

[See Supplementary Illustration.]

The whole of the parks and open spaces of this city, comprising an area of 1,200 acres, are under the supervision of Mr. Arthur J. Allsop, who, during the few years he has filled this position, has spared no effort to produce in the city parks the best effects of modern horticulture. That he has succeeded is clearly proved by the general appreciation of the public of the work Mr. Allsop has carried out, and he has justly gained a very high local reputation for his originality in designing flower-beds.

The Property Committee, under the presidency of Councillor Boston, are a progressive body, and thorough enthusiasts in horticulture. The city is exceedingly fortunate in possessing such public parks as Roundhay and Potternewton, which have very favourable positions. The official Handbook or Parks Guide, by Mr. Allsop, is an ideal one to help the visitor to see the most interesting features in the parks, and to know something of their history. I am indebted to the author for permission to copy historical information.

ROUNDHAY.

Roundhay is undoubtedly one of the finest public parks in the Kingdom. It became Corporation property in 1868, at a cost of £139,000; was formally opened September 19, 1872, by H.R.H. the Duke of Connaught in the name of Her late Majesty Queen Victoria. The Copper Beech which flourishes near the mansion was planted to commemorate this event. The present park comprises an area of 370 acres of greensward, timber, and water, and is sufficiently remote from the city to avoid the deleterious effects of its pall of smoke. The name Roundhay (Rundhaeg) implies a round enclosure, and is derived from Anglo-Saxon days. There is no mention of Roundhay in Doomsday Book, but it is stated that King John with his retinue visited Roundhay in 1212 and spent three days hunting. Prior to this, in the reign of King Henry II., a charter was granted by Robert de Laci, Earl of Lincoln, giving rights of timber and pasturage at 'Rundhaea" to the monks at Kirkstall. Coming to more recent years, the estate part of the ancient manor of Roundhay, 770 acres in all, was purchased in 1804 by Mr. Thos. Nicholson, of Chapel-Allerton, a London banker, and by him was laid out as a park.

The mansion, at present licensed as a refreshment-house, is a building of pseudo-classical appearance, and stands at an elevation of 400 feet. From its position and size it derives a certain amount of dignity; but its stone is weathered to a sombre tint, and seems to wear a sullen look, as if resentful of its fall from the position of a

are the paths that meander round the lakes or along the gorge, or lead boldly up to the mansion.

With such beautifully-kept pleasure-grounds and valuable landscape, one may venture to hope that in the near future the mansion may be transformed into a museum, which would be more in keeping with its surroundings.

The numerous flower-beds and borders are fine examples of the skilful taste as well as the originality and ability of the superintendent. The old formal stereotyped methods of flower-bedding these form an attractive addition to the flower-garden during autumn.

Apart from the many floral attractions of the Park are the canal gardens, which form a chief centre of interest to the horticulturist. Near the entrance is a selected stock of Roses, all correctly named, planted in 1901, and furnish a floral picture which cannot fail to command the appreciation of the public.

The herbaceous gardens are well worth the attention of the visitor. Here are to he seen some good varieties of perennials, grown prin-

Fig. 31.—orange-house in messrs. rivers' nursery. (see p. 78.)

family residence to its present democratic use. More of the beauties of the park are due to the handiwork of the landscape gardener. The magnificent lake, which forms such a factor in most aspects of the park, owes its origin to the skilful designer, Mr. Thos. Nicholson. The task of making the lake occupied two years, and was completed in 1815, about the time of the Battle of Waterloo, from which it received its present name of Waterloo lake. The waterfall is a cascade of some 60 feet. The ivy-clad ruins, which wear an air of antiquity, the rustic building dubbed the "Hermitage," are no less he handiwork of the landscape gardener than

have been entirely superseded by a more artistic and natural one of massing together suitable flowering plants, but interspersing them with some well-grown plants of a sub-tropical character.

At Roundhay Fuchsias are a great feature; the colour and general effect of the variety Wave of Life are seen to perfection; other varieties are also used, principally Rose of Castile and Marinka, with suitable varieties of Violas as groundwork, including marginata, Queen Victoria, and Duchess of Sutherland. Scarlet bedding Begonias form a magnificent display, and are very attractive. Several beds were well filled last summer with Hyacinthus candicans;

cipally for stock. Sweet Peas are well cultivated. The most attractive display is to be found in the show-house, which is the principal of twelve glasshouses. Throughout the year are to be seen most attractive displays of various plants.

The drinking fountain presented to Roundhay by Sir John Barran is a piece of work, of which the city is justly proud. To addit more to the educational value of the park, all specimens of trees, shrubs, and flowers are distinctly labelled, as far as possible giving, in addition to the Latin generic and specific names, the common English ones.

POTTERNEWTON PARK.

This magnificent Park is one of the Corporation's latest acquisitions. Purchased from R. B. Jovitt, Esq., in 1901, it has a very pretty parklike character, with a creeper-clad mansion. The purity of the air and its pleasant surroundings add much to its value as a public park, its area being 27 acres. There are some finely developed specimens of timber, Beech, Ash, and Elm being well represented.

A charming and interesting addition was made to this park about a year ago in the nature of an alpine rockery. Already a number of the less exacting denizens of the Alpine regions have found a local habitation in a suitable position near the mansion.

Sempervivums and Sedums, the succulent representatives of the higher slopes, and minute imitators of the tropical Aloes of Southern lands, hardy Saxifrages and Drabas, Primulas and Ericas, are with many other varieties now well established. The rockery is made of rough stone found in the neighbourhood, laid in imitation of the stratification of natural rocks, with suitable crevices and pockets, and sheltered nooks to suit the varying requirements of the different species. There are also some very fine examples of semi-subtropical flower-beds; these have been cut out of the grass with an irregular outline, which gives the flower-beds a more natural character.

In a suitable position on the lawn near the mansion there was a flower-bed last season representing a half-unrolled piece of carpet; this is a carpet-bed in a double sense, and is quite as novel as it is attractive. On the south side of the mansion is a very pretty Antirrhinum garden, studded with well-developed specimens of standard Bays, the whole of which forms an attractive addition to the mansion. C.

The Week's Work.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, gr., Wrotham Park, Barnet.

Raspberries.—If the canes that fruited last year were cut away after the fruits were gathered, and the young canes then growing were thinned out, these canes may now need a little further thinning, so that they may not be crowded after training has been done. Although there are various methods of training the Raspberry, I prefer to have them in rows 6 feet apart, wires being stretched from end to end and made secure to stout posts sunk well into the ground at either end, being further supported at intervals along the rows with stout stakes. The fruiting canes should be trained at 6 inches apart. The ground amongst: Raspberries should not be dug, as the roots are, or should be, very close to the surface. A good top-dressing and a mulching of manure should be applied annually. If this has not yet been done, but training is completed, scrape off the manure put on last year and a portion of the surface soil to the middle of the alley, and then dig this into the centre; top-dress with good loam and wood-ashes, and cover with a dressing of well-decayed farmyard manure, but rather less if the soil is rich or heavy. There is yet ample time to make fresh plantations. The land should be well trenched and heavily manured, and given some time to get settled before planting. The variety Superlative is first-rate. There are two methods of increasing stock—first by planting one-year-old canes, and secondly by planting young green suckers when about 6 inches high. If young green suckers when about 6 inches high. If young green suckers are planted, and supplied afterwards with sufficient water, some capital fruiting canes will be produced by the end of the growing season.

General work. — Take advantage of frosty enornings to get manure, &c., wheeled to any of the fruit quarters where it will be needed. Any grubbing to be done should be proceeded with when other work is more or less at a standstill. Burn prunings, &c., also rough loamy soil

and other rubbish, so that wood-ashes may be available for use as top-dressings. Get plenty of shreds in readiness for Peach, Nectarine, and any other wall-fruit tree training which still remains to be done. See to the labels upon fruit-trees, and renew them when necessary.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevon LAWRENCE, Bart., Burford, Dorking.

Neottia picta.—Amongst the plants in flower in the intermediate - house Neottia (Spiranthes) picta is conspicuously attractive. It has broad spotted leaves and erect spikes about 2 feet high, with numerous coral-red bracts and paler-coloured flowers. The plant may be easily cultivated, and ought to be added to an Orchid collection if possible. Put the plant into large well-drained pots, and use a compost consisting of fibrous loam with leaf-soil and coarse silver-sand. When the plants are growing abundance of water may be given, and, after the flowers fade, the plant will

MR. A. J. ALLSOP, SUPERINTENDENT OF THE PUBLIC PARKS, LEEDS, (See p. 68 and Supplementary Illustration.)

take a very short rest; but do not permit the compost to become too dry even then. N. picta will thrive luxuriantly if placed with such plants as Miltonia vexillaria.

Epidendrum ciliare is generally despised, but when seen with half-a-dozen good spikes carrying about fifty greenish-white flowers, it is an effective object. The flowers emit a powerful perfume at night, and last a very long time, in good condition. This species succeeds best with Cattleyas and Lælias, and should be treated in the manner generally advised for those species. Several hybrids obtained from E. ciliare, as Epi-Lælia Wallisii-ciliare, Epi-Lælia Eros, &c. are pretty and interesting.

Sophronitis grandiflora.—Nearly all the hybrids obtained from this Orchid should be in select collections. At the present time some of them, as Sophro-Cattleya Calypso, S.-C. Chamberlainiana, S.-C. eximia, Sophro-Lælia Marriottiana, S.-L. heatonensis, and S.-L. Psyche, are starting to grow, and it is a good time to repot them. Pot them in a mixture of fibrous peat, moss, and leaf-soil in about equal parts, with a top-dressing of clean picked sphagnum-moss, never thoroughly soaking the plants, or the roots will be liable to decay; hut instead, frequently moisten the surface-moss through a fine sprayer, and thus keep the moss in a growing condition. After being repotted suspend the plants near to the roof-glass at the coolest end of the intermediate-

house, and where they may be conveniently shaded from strong sunshine at all times.

Two pretty and distinct Orchids from Central America, Miltonia Endresii and Epidendrum Endresii, are in flower; the former species grows well under the same conditions as M. vexillaria. Epidendrum Endresii should be grown in the same house; but unfortunately it is a plant seldom seen in good health, the principal cause being, as I believe, that the stems and leaves are attacked by a species of red-spider. To remedy this we dip the foliage into tepid rain-water every day during winter, twice or thrice each day in summer; and about once a month each stem and leaf is carefully sponged. The same remarks also apply to such hybrids as Epidendrum Endresio-Wallisii, E. Clarissa, E. elegantulum, and E. e. leucochilum.

Plants of Epidendrum Stamfordinum now showing their flower-spikes should be stood or suspended well up to the roof-glass in strong sunlight, which will greatly assist their development. Afford water freely until the flowers open.

Masdevallias.—Afford more root-room to all Chimeroid Masdevallias, as M. Chimera, M. Carderi, M. Houtteana, M. radiosa, M. bella, M. Backhouseiana, M. stupenda, M. trinema (Lowii), M. erythrochete, M. Gaskelliana, and M. Winniana. These plants should be grown in shallow teak-wood baskets, and as the flowers are generally produced in a downward direction no crocks should be used, but a few pieces of Fern-rhizome may be placed across the bottom of the basket merely to prevent the potting material from falling through. Let the compost consist of peat, sphagnunu-moss, and leaf-soil in equal parts, adding a little coarse silver-sand during the potting process. Avoid pressing the soil too tightly about the roots. Masdevallias of this section should be kept a trifle warmer during winter than other Masdevallias. A cool position in the intermediate-house will suit them, but as the days lengthen and the weather becomes warmer remove them to the cool-house. Abundance of root-moisture is always necessary, and the plants must be shaded from direct sunshine. To keep the foliage clean, and free from red-spider and other insects, it is good practice to syringe the under sides of the leaves at least once each day.

THE KITCHEN GARDEN.

By John Pentland, Gardener to C. H. B. Firth, Esq., Ashwicke Hall, Marshfield, Chippenham.

Differences in locality.—Knowing how climate, soil, and the situation of gardens vary in different localities, those who read a calendar of outdoor operations should consider their own conditions before carrying out the work recommended to be done, postponing it if necessary for a week or more if needful during the early spring months. To show young men why this may be necessary, I may state that we are situated on a hill, and there is more than a week of difference in vegetation here and that in the valley below (only 3 miles away); I have seen the Chestnuts in full leaf there when the buds upon ours were but bursting. At Torquay (Devonshire) I have seen tender plants put out in the last week in February and flourishing without protection, whilst I have had to protect similar plants from a July frost in Dumfriesshire. Do not get on to the ground to plant or sow while it is in a wet condition and likely to bind together after being trodden.

Shallots.—Plant these in well-prepared ground, in lines 1 foot apart and 5 inches between the bulbs in the line. Garlic, where in demand, may be treated in a similar way.

Chives.—If this hardy old favourite is in the garden at all, it is most likely in some out-of-the-way corner, yet there is nothing more useful for salads and for flavouring. It may be easily forced, and one can cut-and-come-again. By some cooks it is preferred to young Onions Plant now in lines 1 foot apart, and leave 6 inches between the plants in the line, or they may be planted on the edges of alleys.

Horseradish.—Make fresh plantations on well-trenched ground, using roots 1 foot or more in

length. Dibble them in in double lines 9 inches either way, and 18 inches between the double lines.

Peas.—On a border with a southern aspect, in light soil, sow the varieties William I., Ringleader, and Early Sunrise; also some of the newer sorts, as Oxonian and Gradus. Sow the seed in lines a similar distance assunder as the Peas will be in height, and for these early crops smooth over the ground in the line, making a depression 1 inch deep for the seeds, and cover with the soil from the sides, finishing with a light layer of fine ashes over all. The seeds being thus placed above the water-level will not be so likely to rot.

Broad Beans. — Sow the varieties Mazagau, Johnson's Longpod, or Green Windsor, in rich, light soil, on a border facing south.

Forcing French Beans.—Sow the variety Fulmer's Forcing for succession. Assist those now cropping with manure-water. A temperature of 60° to 65° with a buoyant atmosphere is best for these; higher temperatures encourage red-spider and thrip.

Cucumbers. — Sow the varieties Telegraph or Tender-and-True in 3-inch pots three-parts filled with damp fibrous loam. Press two seeds, putting, the long pointed end downwards, into each pot. Cover the seeds slightly, and place the pots in a hed having a temperature of 70° to 75°. Afford no water until the seeds have germinated, unless needful, the seeds being liable to rot if kept too wet.

FRUITS UNDER GLASS.

By W. FYFE, Gardener to Lady WANTAGE, Lockinge Park, Wantage.

The Early Vincry.—It will now be necessary to give close attention to the stopping and tying of shoots. The best practice where space will admit is to stop shoots at two joints above the flower. Remove all laterals below the bunch, but retain the two that will grow from above, stopping them after the first leaf. Close stopping is not good practice, and does not encourage root activity, but the extension system must not be adopted, if there is not sufficient space to do so except at the expense of the principal foliage, which should be fully exposed to the light. Let the temperature at night be 60°, falling 5° if the weather be very cold. Look after the fires early each morning that the temperature may be raised to 70°, and this may increase afterwards by sunheat to 80°.

Early Peaches.—The pollination of the flowers is important at this stage. Let there be a slight rise in the temperature to secure a free circulation of warm air, and the pollen being thus matured, it will be easy to pollinate the flowers by the use of a camel's-hair brush at noon each day. The temperature at night should be 55°, with a corresponding rise by day. Damp the surfaces in the house occasionally; we never syringe until the fruits are well set and visible, and the blooms have nearly disappeared. The border having been watered and mulched with stable droppings previous to the Peach trees being started, we do not afford much at this stage.

Muscat Vines.—The house or houses devoted to the variety Muscat of Alexandria, from which ripe Grapes are expected early in August, should be prepared for starting. Thoroughly cleanse all wood-work and glass; lime-wash the walls, where this is the practice, with newly-slaked lime, to which may be added flowers-of-sulphur. The walls here being of cement, we simply wash them with paraffin and water. The treatment of the Vines themselves should depend upon their condition. If they are infested with mealy-bug, remove all loose outer bark, and thoroughly wash the rods with warnu water and soft-soap, repeating this operation before the buds burst into growth. The brush we have found the most suitable for this purpose is what is termed a pantry or sink-brush, about 4½ inches long by 2 inches wide, and made of the best material. Stop all holes with Gishurst Compound. Muscat Vines delight in a moderately heavy and firm soil, which should be kept in a porous condition by sufficient quantities of charcoal,

lime-rubble, broken bricks, and \(\frac{1}{2} \)-inch bones, to which may be added wood-ashes [supplying potash] and vine-manure. All inside borders here are managed as described in the calendar last week, and in the case of the moderately free-rooting variety Muscat of Alexandria, the treatment is visibly satisfactory. All vines being pruned before Christmas, we bend no rods with the object of securing a more even "break." We use no fermenting materials on the borders, but rely upon mulchings from the stables used in moderate quantities. Allow no traffic on the borders after the addition of the whole turves considered necessary, and the firming of these by treading has been done. The supply of Muscat Grapes will finish here by the beginning of February. They have kept well, although we scarcely expected them to do so after the sunless season of 1903, with a rainfall here of 39.59 inches.

THE FLOWER GARDEN.

By A. B. Wadns, Gardener to Sir W. D. PEARSON, Bart., Paddockhurst, Sussex.

Roses.-Although Roses are best planted in November before the ground is extremely cold, it is sometimes necessary, on wet, clayey soils, to postpone the operation until the soil is in a better condition for being worked. Roses should be ordered in early autumn, as "first come, first served." Any beds or borders that planted next month, or when the soil becomes moderately dry, should be prepared at once to allow the soil to settle. Trench the ground not less than 2 feet deep; if the soil is of a heavy nature freely mix with it some manure from the stable, but if the ground be light or sandy use cowmanure instead, and if clearings from a pond that have been laid up for a few months are available, mix in this material also, using a quantity of \(\frac{1}{2}\)-inch bones and bone-meal. The best effect will be obtained by planting one variety only in each bed, putting the plants 2 feet apart if strong growers, and 18 inches apart if less vigorous. Choose a dull quiet day for planting, so that the roots may not suffer from the wind. If these are at all dry dip them in water. Any broken roots should be cut back cleanly with a sharp knife, and long shoots also may be shortened. Insert the plants to such a depth that the point at which they were budded will be several inches below the surface of the soil, and they will eventually make roots from the scion. Where there are beds of old plants that have been top-dressed occasionally, branches will be found to have taken root. If the plants require more room such branches may be severed with a sharp knife, and planted at once in a fresh bed. Mulch all the beds as soon as they have been planted. Afford Teas and other tender varieties some protection from cold winds. Standard Roses look best when planted in the same bed with dwarfs, provided they are needed, and they should be of the same variety. Place stakes or other supports in the ground previous to planting. In cases of Tea varieties place a little dry bracken between the branches, and tie up securely. Climbing Roses being pruned less severely require more root-room. Dig holes 3 feet wide and 2 feet deep, especially if the soil is not suitable for Roses, and plant in fresh soil. Secure the plants to the wall or trellis as soon as If there is a large iron trellis to be covered, black Bamboos wired on to the trellis 12 inches apart square will be a great help to the plants. They are warmer in winter and cooler in summer than the iron, and the Roses will not be so liable to canker if they get rubbed or blown about by the wind.

Bedding Pelargoniums.—If there is insufficient stock, cuttings may be taken now. Where it is possible to have a thumb-pot for each cutting, this system is best; as an alternative, put several cuttings around the sides of a larger pot. Do not use boxes at this late date. Pot the cuttings on when they have rooted. Do not cut the plants below all appearance of growth, but any that will not afford a cutting may be stopped. They will all be ready to pot-on next month. Do not stop a plant and repot it at the same time. Old plants that were lifted last autumn may be afforded heat if it is necessary to have cuttings from these.

PLANTS UNDER GLASS.

By C. R. FIELDER, Gardener to Mrs. Burns, North Mymms Park, Hatfield, Hertfordshire.

Herbaceous Calccolarias .- It is essential that these plants be afforded a position near the roofglass in a cool and moist atmosphere, where they may make steady and hardy growth. Such a position is found in a low pit provided with a hotwater pipe, into which heat may be turned when water pipe, into which heat may be turned when necessary. Let the night temperature be from 38° to 45°, according to the weather, and afford ventilation when the temperature of the pit reaches 40°, increasing the quantity as the temperature rises, otherwise the growth will be flabby, and will droop with the advent of the brighter days and drighter days and drighter days are discontinuous. brighter days and drier atmosphere of spring. Examine the under sides of the leaves frequently for green-fly, and if necessary fumigate the pit. The repotting of the plants should be so ordered that they will be kept steadily growing, neither performing those operations too soon, which would result in the plants being ultimately overpotted, nor delaying them too long, which would entail the loss of the bottom leaves, and cause the flower-spikes to appear prematurely. A suitable compost for Calceolariss may consist of three-parts loam and one-part rotten manurefrom an old hot-bed, with some coarse silver-sand. If extra-large plants are required, the flower-stems should be removed as soon as they appear, and the plants given a shift into larger pots. In the case of etrongly-grown plants an 8-inch pot will not be too large for the final potting; useful decorative plants may be grown in 6-inch

Richardia Elliottiana. - Tubers which have been well rested and are showing signs of starting into growth should be repotted, affording them a compost of two parts loam, one part peat, and one of leaf-soil, together with sufficient silversand to keep the soil open. Half fill the pots with soil, and upon this place the tuber, and after surrounding it with a little silver-sand, add the remainder of the soil, taking care to keep the top of the tuber well below the surface. Place the pots in a temperature of from 55° to 60°. and afford water sparingly until the roots reach and allord water sparingly than the roots reach the sides of the pots. When growing freely the plants require plenty of water at the root, with manure-water occasionally. When in bloom the flowers will remain much longer in perfection if the plants are removed to a cooler house. As soon as growth is complete and the foliage turns yellow, decrease the supply of water gradually until it ceases altogether. During the winter the pots containing the dormant tubers may be laid on their sides under the greenhouse stage, or placed in any dry structure from which frost is excluded. Those who wish to raise seedlings should sow the seed with as little delay as possible. The seeds may either be placed singly in 60-size pots or sown in 48's, using plenty of drainage, and filling the pots to within an inch of the rim with a finely-sifted compost of threeparts loam, one part leaf-soil, and plenty of sand. Cover the seeds with half-an-inch of soil; afford the soil a good watering, and plunge the pots in the propagating pit. Germination will take placein about a month.

Winter-blooming Begonias.—As fast as plants of Gloire de Lorraine and Turnford Hall pass out of bloom, they should be cut back to within 4 or 5 inches of the soil. This gets rid of the useless flower-stems and encourages the production of young shoots from the base of the plants for propagation. The supply of water to the roots must be reduced until signs of new growth appear. The same remark also applies to the varieties Ensign, Mrs. Heal, Winter Cheer, &c. Begonia Gloire de Sceaux is still in full flower; Begonia Socotrana will shortly go to rest, when it should be placed on a shelf in a stove temperature and be kept quite dry at the root till midsumer.

THE FRUIT CROPS in Belgium last year were as deficient as they were here. Pomological exhibitions and pomological studies were alike restricted to their lowest limits. The Pear Admiral Cecile succeeded in ripening its fruits in spite of adverse conditions.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the Publisher. Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR. 41, Wellington Street, Covent Garden, London. Communications should be WEITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Newspapers. — Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Special Notice to Correspondents .- The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.

Illustrations.—The Editor will be glad to receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Local News .- Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

sale of Nursery Stock at The Royal Berkshire Nursery, Maidenhead, by order of Mr. E. F. Such, by Protheroe & Morris, at 12.

WEDNESDAY, FEBRUARY 3—
At Stevens' Rooms, at 12 30, Roses, Azaleas Rhododendrons, Begonias, Gioxinias, Carnations, Fruit Trees, &c.—Azaleas, Rhododendrons, Palms, Roses, Hardy Bulba and Plants, Perennials, &c., at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12—
Consignment of Japanese Litiums, Palms, Seeds, &c., at 67 and 68, Cheapside, E.C., by Protheroe & Morris, at 3

FRIDAY NEXT—
Imported and Eatablished Orchids, at 67 and 68,

Imported and Established Orchids, at 67 and 68, Cheapside, E.C., by Protheroe & Morris, at 12 30.

(For further particulars see our Advertisement columns.)

AVERAGE TEMPERATURE for the ensuing week, deduced from observations of Forty-three Years at Chlawick

-392.
ACTUAL TEMPERATURES:-

London.—Jan. 27 (6 p.m.): Max. 51°; Min. 48°.

Jan. 28 (noon): Dull, wet, mild.

Provinces. — Jan. 27 (6 p.m.): Max. 49', Dover;

Min. 42', N.E. Scotland.

WE extract from a private letter certain remarks appli-Progress. cable to the country at large,

and specially to the Royal Horticultural Society at this juncture. The writer is a man of eminence, who made his mark in the scientific world here before he migrated to the United States. He is familiar with

the conditions, horticultural and botanical, on both sides of the Atlantic, and, as will be seen, he strenuously backs up the injunction which the Prince of Wales brought as the result of his observation in his tour throughout the Colonies, to the effect that if we are to hold our own, not to say to make progress, we must "wake up":-

"I read lately your vigorous statement regarding the necessity for immediate action and liberal contribution toward the fund for an experimental garden, as well as for the new horticultural hall. The next work I took up was Galloway's Report on the progress of the Agricultural Department here, and the different lines of investigation and experiment now being pursued under direct supervision of the Department.

"Naturally, I could not refrain from making comparison of the two outlooks, even though 'comparisons are' supposed to be odious.' The outcome of the comparison was my resolve. My letter, I am sure, will not be a growl over 'decadent Britain,' for I still love and believe in my country as of old. But possibly a few statements from me, who have seen and can compare both countries and their methods, may encourage you to continue in your work of hammering truth into the minds of those you reach by the Gardeners' Chronicle. A motto often repeated-and neededhere is, 'Eternal vigilance is the price we pay for liberty.' A motto for the much more honest but sluggish old country needs to be, 'Eternal agitation is the only agent for advancement.'

"Needless to say, I read Sir Norman Lockyer's British Association address with the highest satisfaction; and just last night, in glancing over a home paper, I noted that a few Press representatives are still inclined to depreciate, fewer to 'pooh-pooh,' but, mostly-and herein is consolation—to praise.

"With the fairly accurate knowledge I have of the development going on in American universities and colleges, I would emphatically say that at least Sir Norman Lockyer's programme has to be worked out, and that within a short space of time, if Britain is not to decay.

"To cite from our own university, which is nearest to my thoughts, buildings are proceeding at present which will be all finished at different times within the next eighteen months, and whose cost will be about 2,000,000 dols., all contributed from private sources. When I joined the university a dozen years ago there were fourteen buildings; now there are thirty-one, including some of the largest buildings anywhere extant, for library, law, museum, hygiene, medicine, physics, chemistry, engineering, dentistry, &c. They now cover an area of about 60 acres.

"This advance, however, is being equally, or more than duplicated at Harvard, Yale, Cornell, Columbia (N.Y.), Chicago, Stanford, and half-adozen other centres. To be quite honest and plain, much of it comes from continuous exercise of what some would generously call healthy competition, but which others might designate by harder terms. Still, the great result is that genuine education advances by leaps and bounds.

"Fully two years ago I was also fairly impressed with the development going on in many of the German, Swiss, and (to a much less degree) French universities. Sir NORMAN LOCKYER'S proposition, then, is not only sane at the present time—it is necessitous for England.

"A colleague of mine who visited London lately was disappointed with 'the whole outfit,' as they say here. A week or two ago he described to me some of the makeshifts used in laboratory work in one of the London colleges. Now, while the good worker will always manage to evolve his tools, and while fine results can often be got from simple apparatus, as Wollaston and DARWIN showed, Americans are coming to

believe so much—and rightly so—in accurate, handy, and even sumptuous equipment, that only the best satisfies. My friend then slipped over to Germany, and spent most of the time there. 'But,' he exclaimed, 'they can't teach us much, and we can easily excel them when we want to.' This is one illustration of a good many such that have come directly under my acquaintance.

"Now you may ask what are some of the methods that enable rapid advance to go on here. It always seems to me that, contrary though it may appear to the spirit of the 'cute Yankees, they adopt the good old Cromwellian motto, 'Trust in Providence and keep your powder dry. And mark, the latter is not the bit of the motto that bulks most largely. They practise the former by always affirming-and I have had manifold experience of the truth of it-that a good cause will command support if vigorously commended.

"Let me give you a little of the inside history of our small Botanic Garden, which I started eight years ago. It covers nearly 5 acres around our department, and was a dump-heap at that time. We now have eleven greenhouses, abundant vegetation and vistas outside, rich groups of plants, and ponds with aquatics, &c. As a start, our Provost secured 3,000 dols. from university friends, and he-a wealthy man-gave nearly the same amount, so that within three years we had six houses and a good beginning of a garden. Seven years ago I organised a Botanical Society, which attracted many plant-lovers, who became sympathetic friends. We hold weekly meetings, with attendances of 30 to 120, and from some of them the greater part of the money needed for annual support as well as many of the plants have come.

"Our annual garden expenses are about 3,000 dols.; of this amount our Provost kindly undertook to secure donations to the extent of 1,000 dols.; the rest I get by faith and works. Yearly one of our lady members sends me an unsolicited cheque for 850 to 1,000 dols.; yesterday one of them sent one for 20 dols. as a small New Year's gift. When such or the annual fees run out, I 'have to hustle' and beg for what does not come voluntarily; but many of those who are thus begged from develop into our warmest helpers, for they become sleeping partners, so to

"One of our members is an enthusiastic Orchid-grower, and gave us a collection of 230 species, while in his travels over the world he remembers us by a collection of 1,000 Japanese herbarium specimens at one time, a collection of living Sandwich Ferns at another, or of alpine plants from Norway at another. The financial side of it, it must be confessed, is at times worrying, alongside the abundant class work, organisation work, &c., that one has to carry forward; but even this will in time disappear, for one of our douce members has quietly made provision for 50,000 dols. being left to the garden after certain life-contingencies are fulfilled.

"Then, while the garden is being steadily evolved, we are already in possession of a fine botanical library of 5,000 volumes, herbarium, alcoholic preserves, lantern slides, &c., not to particularise superior instruments for all our microscopic and physiological class-work.

"The picture I give you here is essentially that now being worked out in most of the live institutions of this country, and only varies in minor details. The principle on which it proceeds, then, if I may put it in rather militant theological phraseology, is an aggressive trust in Providence and the generosity of the people.

"It would startle Old World University principals to be face to face with an annual deficit of 40,000 to 60,000 dols., but here such is little thought of, for the people are soon persuaded to make it good.

"The principle I have tried to put into words above seems to be what you are emphasising for the Royal Horticultural Society's hall and garden; and persistent effort will surely bring the result. It seems to me that Britons must more and more cease to roll up broad acres into estates that they selfishly keep within themselves, and to invest cash in foreign securities which they could more patriotically and with equal good to their children invest in building up the country's institutions. Not that the Government should be allowed to escape its full share of supporting and extending these. But when taxes fall so heavily, as they now do, on the less wealthy classes, the rich should step in and do the work. You chronicle Lady This and Sir That joining the Royal Horticultural Society. Well and good; but it would be much better if the chronicle recorded that they showed their sympathy in the form of guineas.

"I trust, therefore, that you will steadily and on no uncertain voice proclaim the need for private liberality, as well as, with Lockyer and others, Government support for British institutions. Both are needed, and by persistent effort both will come.

"This is a long yarn, but I trust you will not regard it as an impertinent one. Britain and America have much to be thankful for, but both have many problems that need earnest effort and self-denying spirit. My aim in writing you as above has been to encourage you in your vigorous stand."

LINNEAN SOCIETY.—The next meeting will take place on Thursday, February 4, 1904, at S.P.M., when the following papers will be read:—
1, "Account of Researches in the Physiology of Yeast," by Prof. Sydney H. Vines, P.L.S., F.R.S., &c.; 2, "Further Researches on the Specialisation of Parasitism in the Erysiphacee," by E. S. Salmon, F.L.S., &c.

VEITCH MEMORIAL FUND.—At the annual meeting of the trustees, held on January 26, it was decided to offer the large Silver Medal for distinguished service to horticulture to Sir Thomas Hanbury, K.C.V.O., for valuable services to horticulture in general, and in appreciation of his munificent gift of the garden and estate at Wisley to the Royal Horticultural Society; and a similar Medal to Professor Daniel, of Rennes, in recognition of the valuable results obtained by his experimental researches on grafting. It was also decided to make a grant of £25 to the Lindley Library.

REV. H. H. D'OMBRAIN.—The Journal of Horticulture for the 7th inst. contains once more a "New Year's Message," sent by the veteran florist whose name heads this paragraph. For how many years a similar message has been sent we do not care to recall, suffice it to say that in his eighty-sixth year the message comes to us as distinctly cheery and encouraging. Brain-power and memory are reported to be as good as ever, and it is clear that though sight may be dimmed age has not dulled sympathy. For him, as for others, the charms of the garden, and the entrancing interest of the plants in it, have constituted a solace and refreshment throughout life. So may it be to the end!

THE ACTION OF ETHER ON PLANTS.—
M. Maumené discusses this subject in the Revue Scientifique, t. xx., 1903). The use of ether in the forcing of plants, as has been stated in our columns, was first practised by Johannsen, of Copenhagen. By exposing in autumn branches of Willow and Potato tubers to the vapour of ether, they were immediately thrown into growth. Lilacs subjected to ether in summer lost their leaves, but were soon covered with new foliage and a profusion of bloom. By the methods now in use Lilacs can be brought into flower

much sooner than by ordinary means. Is there any acceleration of the stages of growth, or is the arrest of natural growth prevented? The phenomena can as yet be explained by hypotheses only.

THE SOUTH-EASTERN AGRICULTURAL COL-LEGE.—The Secretary informs us that a meeting of the Governors of the South-Eastern Agricultural College was held at the Westminster Palace Hotel on Monday, January 25, when there were present Earl Stanhope, Col. Holland, the Right Hon. Sir W. Hart-Dyke, M.P.; Prof. Liveing, F.R.S.; Dr. Clowes, and Messrs. G. Marsham, F. S. W. Cornwallis, J. Sayer, W. Ashcroft, J. A. Anderson, G. M. Arnold, W. Chambers, E. J. Halsey, W. Welch. On the motion of Earl Stanhope, Mr. E. J. Halsey (Chairman of the Surrey County Council) was elected chairman for the ninth time, and Mr. Geo. Marsham (Chairman of the Kent County Council) vice-chairman. The Principal (Mr. M. J. R. Dunstan) reported that seventy-four students were at the college, the highest number yet recorded, and the Governors adopted the recommendation for the establishment of a practical course of forestry instruction, which will include the planting up for demonstration purposes a considerable area of land, and the pure and mixed plantation of forest trees, and the provision of the necessary teaching staff.

THE ROYAL BOTANICAL GARDENS at Manchester are not flourishing. The receipts from all sources were lower than in the previous years, leaving an adverse balance on the year's working of £1,518. The total adverse balance now amounts to £9,722. The Society offered to transfer the gardens to the Stretford Council for £20,000, being anxious to preserve the open space from the builders. The ratepayers have refused to accept the offer.

THE NATIONAL POTATO SOCIETY, whose inauguration we chronicled a short time since, has set to work. At a committee meeting held on Saturday last, Mr. HALL, of Rothamsted, presided, and there was a good attendance (especially when the state of the weather is considered) of those interested in the subject. Various suggestions were made, but until these assume a definite form it would be premature to allude to them in detail. Suffice it to say that, among other things, it was resolved to have trials of certain selected varieties, say ten in number, in as many districts as possible, grown on experimental plots. Two plots, each of to acre, are, it is suggested, to be devoted to each of the varieties. The Secretary, Mr. W. P. WRIGHT, of Postling, Kent, to whom the Society owes its genesis, would be happy to receive the names of subscribers and also practical suggestions as to the best means of carrying out the objects of the

PRESENTATION TO MR. A. W. METCALFE.—
On the 19th inst., on the occasion of his leaving
Burghley Gardens, Stamford, Mr. Metcalfe was
presented with a handsome timepiece by the whole
of the garden staff. Mr. H. Turner (general
foreman) made the presentation, and expressed
the respect and esteem in which Mr. Metcalfe
was held by all present. After referring to the
many improvements in the gardens carried out
by Mr. Metcalfe, he expressed the wish of those
present for his success in his new appointment
at Luton Hoo.

POTATOS.—Mr. W. J. Malden, the late Principal of the Colonial College, Hollesley Bay, Suffolk, has published an illustrated account of some of the newer varieties likely to be most remunerative in the immediate future. Eldorado is reported to have produced from seventy-two plants raised from single eyes 436 lbs. of sound tubers. The good qualities of Sir John Llewelyn, Discovery, and Evergood are emphasised.

THE COMMITTEE UPON FRUIT CULTURE.—We are informed that the Departmental Committee of the Board of Agriculture and Fisheries appointed to enquire into and report upon the present position of fruit-culture in Great Britain, and to consider whether any further measures might with advantage be taken for its promotion and encouragement, held their preliminary meeting on Friday the 22nd inst. The method of procedure at future meetings and the nature of the evidence to be taken were discussed.

PROF. SARGENT.—It seems scarcely more than a few weeks since we had the pleasure to see our distinguished friend, and now we hear of him back in Boston after a tour of six months in Russia and Siberia, including the Crimea and parts of the Caucasus, the flora of which is described as enchanting. Twenty-eight days were passed in the train in traversing Siberia. In Manchuria it was observed that preparations for war were being quietly made by the Russians. In Korea large collections of plants were amassed, of which we may expect to hear more shortly. Japan, Java, Singapore, and other Malayan countries were also visited.

THE NATIONAL CHRYSANTHEMUM SOCIETY.

—The annual meeting will take place on Monday,
February 1, at 7 P.M., in Carr's Restaurant, 265,
Strand. Mr. Chas. E. Shea, President, will
preside.

RAMIE - FIBRE (BŒHMERIA) is now being utilised in the manufacture of "mantles" for incandescent gas-burners in place of cotton.

JAPANESE LILIUMB AT THE SALE ROOMS .-Mr. A. HEMSLEY writes :- "On January 20 there was a very large consignment of the above sold at Messrs. PROTHEROE & MORRIS' auction rooms. There have been several sales previously, but they continue to attract large numbers of buyers. Among the buyers on the above date were several from long distances. Some of the bulbs offered were the largest I and others have seen. In the catalogue they were aptly described as "mammoth No exceptionally high prices were made, bulbs." unless it was for L. speciosum album; for bulbs of this there was lively competition, the largest being particularly in demand. In all other varieties it was the largest bulbs that attracted most attention. The medium-sized bulbs were bought in large quantities by market growers. Judging from these sales, it would appear that though the trade may be dull just now, growers anticipate a better time later on. American Pearl Tuberoses were sold in large quantities. In all there were upwards of 200,000 sold. These fetched about 26s. per 1,000. Palm-seeds sold well, especially Cocos Weddelliana and Kentia Belmoreana, but Kentia Forsteriana did not make quite such high prices, although the samples were very good. Lily of the Valley "Fortin's Giant" sold well at about double the prices made by the ordinary Berlin crowns."

CHRYSANTHEMUMS.—The new varieties raised by the Marquis de Pins, which have attracted so much attention in Paris, are to be distributed by MM. ANATOLE CORDIER ET FILS, of Bailleul (Nord), France.

SEED LIST.—We have received a copy of the list of seeds offered for exchange at the Botanic Garden, Cambridge. It is a very full and carefully compiled list, and is signed by the Curator, Mr. R. J. LYNCH.

CANKER IN RUBBER-TREES.—Mr. J. B. CARRUTHERS, lecturing on this subject in Ceylon, advises frequent inspection of the plantations, and the instant removal by the knife of diseased branches, destroying the affected branches by fire, and smearing the wound with sulphate of copper. The fungus (Nectria) is the same as

that which causes canker in Apple-trees. By inoculating healthy trees with the fungus Mr. Carruthers was able to prove the guilt of the fungus.

KEW NOTES.

Brownea Crawfordi X .- This plant is flowering freely in the Palm-house. It is a garden hybrid between B. grandiceps and B. macrophylla, and is by far the most floriferous of all the Browneas. Unfortunately, few gardens can afford the amount of head room required by this glorious plant in a hot-house. The specimen now in flower is some 25 feet high, with long spreading branches that cover a large area. The pinnate leaves ofttimes measure 2 feet in length, having nine pairs of large leaflets. The inflorescence is a dense terminal head, some 6 to 8 inches across, composed of from fifty to sixty bright-red flowers about $2\frac{1}{2}$ inches long; the stamens are of the same bright colour, and almost twice as long as the corolla, giving the ball-like inflorescence a feathery appearance. At the time of writing the plant carries fifteen heads of flower.

CLERODENDRON CEPHALANTHUM

is also flowering in the Palm-house. It is one of the many fine plants introduced from Zanzibar by Sir John Kirk, and was sent to Kew in 1886, and was figured in the Botanical Magazine, t. 7922. The plant now in flower is trained up the roof, and is a very vigorous grower after the blade has fallen away, climbing by means of the stout hooks formed by the hardened petioles; the leaves are dark green, elliptic, and from 4 to 6 inches long. The large terminal heads of flowers are produced freely. The calyx is about \(\frac{1}{2}\) inch long, white when young, turning red with age; corolla white, with a slender tube 3 inches long. It is a handsome stove climber, giving a good show of flowers, and should be more widely known and cultivated.

CYNORCHIS VILLOSA

is an interesting Orchid in flower in the Orchid-houses. It was introduced by M. Warpur from Madagascar in 1901, along with those two fine Orchids Cymbidium rhodochelum and Cynorchis purpurascens. C. villosa is a small-growing species, having usually two or three leaves, some 4 to 6 inches long and 2 inches broad. The spike of flowers arises from the centre, being 6 to 8 inches high, bearing about fifteen to twenty rather small rose-purple flowers, somewhat tubular in form, and covered with stiff whitish hairs; the lip is pure white. Although not comparable with C. purpurascens as a decorative plant, it is nevertheless a pretty and very distinct species. Botanical Magazine, t. 7,845, W. H.

EUPATORIUM VERNALE.

This fine species has been cultivated under several names for about forty years. It appears to be commonly known as E. grandiflorum, under which name it has been cultivated at Kew for some fifteen or more years. this name was looked upon as a doubtful one is shown by the statement in the Kew list of new plants for the years 1876 to 1896, where it is described as "an ornamental species probably known already under some other name." A plant of this species was received at Kew from a nurseryman in the Riviera in the early part of last year under the name of Ageratum grandiflorum. It has also been known as Conoclinium grandiflorum. Lately, however, the whole history of the plant has been investigated by the authorities of the Kew Herbarium, and the plant proved to be identical with the E. vernale of Vatke and Kurtz, figured in Gartenflora, xxii. (1873), p. 36, t. 750, where it is said to be probably a Mexican species.

It is by far the best of the shrubby species of Eupatorium, and as it produces its flowers in mid-winter, its value as a decorative plant for the greenhouse should be more generally known. The plant is of quick growth, forming a large spreading bush with terete stems, covered in the upper parts with a brownish tomentum. The leaves are opposite and decussate, cordate, acute, with serrate margins and vary in size considerably, being frequently 7 inches long and 5 inches broad, in a well-grown specimen.

The flower heads are about $\frac{1}{2}$ inch in diameter, pure white, shortly stalked, and borne in large terminal corymbs. The florets are tubular, about $\frac{1}{2}$ inch long and protrude beyond the involucre for a little over half their length. The styles are also long and give the flowers a somewhat feathery appearance. There are a number of specimens in bloom at Kew at the present time, including one which is planted out in a border in the temperate-house and which has attained a height of 6 feet.

In common with most of the Eupatoriums, the plant is of very easy culture, thriving in most soils, but prefers a light rich compost. Being a gross feeder, copious supplies of liquid-manure should be given the plant during the growing season. Propagation is effected by cuttings of the young growths, which root readily at all times of the year. C. P. Rafill. [Some good specimens of this plant were shown by Messrs. Veitch at the last meeting of the Royal Horticultural Society. Ed.]

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his Correspondents.)

PUERILITIES.—The article in the Gard. Chron. of the 16th inst. from the pen of Dr. Bonavia, backed by editorial authority, must have amused many a florist. It is true we are getting away from paper collars for Pansies and Carnations, and we are trying to show Dahlias and Chrysanthemums "as grown," but we are returning to clipped shrubs and Japanese dwarf trees. Even so up-to-date a man as Mr. Chamberlain, one gardening journal man as Mr. Chamberlain, one gardening journal assures us, is going in for Japanese dwarfs! I firmly believe that the paper collar and the tweezers had much to do with giving us the splendid Pansies, Carnations, and Dahlias we have to-day, and the time will come again when, I hope, they will be wanted. The dicta of Jeans and Glenny are no more popular to-day than crinolines, but we still wear top-hats and grow big Onions. Let Dr. Bonavia and Mr. Editor think how much genuine love for flowers, especially in the breasts of the working-men of the North, has been nourished on paper collars and tweezers, and they may yet thank heaven for it! It was a phase of floriculture, a most useful one too; and how else did these old-fashioned florists strive for perfection in the form of their flowers than by selection and cross-breeding? Verily, many an individual among them knew more about these processes than many a dozen of their modern successors. What I deplore is, to-day's methods may be new and may be better, but the love—the old kind of love is gone. William Cuthbertson.

must have read with astonishment Mr. Green's statement that "he has never lifted a crop of Potatos that showed any signs of disease in the haulm." What kind of elysium does he grow Potatos in that his tops always escape attacks of the Potato fungus? and how can it be, as is again written, the product of planting early in March? How do his tender Potato tops escape harm from late froats? Also, how is it that others who do plant in March, as many Potato-growers do more or less, either have their early plantings suffer from frost or from some form or other of disease, unless in the case of frosts they give some special protection. Why in one garden planting at the same time as is done in others, or perhaps a week or two earlier, should lead to immunity from disease is difficult to understand. As a rule Potatos are not planted in May, but in April, certainly the best month southwards. A. D.

— Will Mr. H. Green, Nocton Gardens, Lincoln, who appears to have been very successful with his Potato-crops last year, when the majority of others were so unfortunate, kindly state what has been his average tonnage per acre? Interested.

— Your correspondent, "A. D.," stated in the Gardeners' Chronicle, p. 37, "I am tired of the term disease-resisting as applied to any variety of Potato, because the expression has been in use so many years in relation to a multitude of varieties, yet somehow we find ourselves no forwarder." I planted last year thirteen varieties, twelve of which were old standard sorts, and one was a variety called Evergood, which is a comparatively new sort; they were all planted under exactly the same conditions, and on the same land side by side. The result was that without exception the twelve old sorts were so badly diseased that they did not pay for the cost of planting, but Evergood produced an enormous crop, which was entirely free from disease. I would not like to assert that on all soils the same result has been obtained. "A. D.'s" assertion that we are no "forwarder" needs qualification. F. C. Edwards.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—I am ignorant as to the general working of this Institution, but think that if one who could not afford to subscribe a guinea sent a smaller amount, he would merely receive a receipt from the Secretary, whereas for a guinea the subscriber would be given four votes. I suggest that a vote he given for 5s., and one vote for every additional 5s., because four members at 5s. would be more easily obtained than one at a guinea. D. D. [If our correspondent will read the article in the Gardeners' Chronicle, p. 40, and the report in our present issue (p. 87), he will see that the rest of his letter has no application. Subscribers have an immense advantage over non-subscribers.

MANURES FOR NURSERY LAND.—Referring to the very instructive articles by Mr. Willis on "Potash Manuring and Worn-out Nursery Land," which appeared in the Gardeners' Chronicle, December 19, may I ask if Mr. Willis will kindly afford further information through your columns—1st, What mixture of salts would be of service, used either alone or along with a moderate dressing of farmyard-manure, in the case of sandy land just cleared of nursery trees—say Larch, and upon which a crop of Potatos is to be grown, followed again by trees. The object of growing the Potatos is, of course, to clean and prepare the land for the trees, which would remain upon it for two years, and probably some simple compound could be suggested which would not only help the yield of Potatos, but have a beneficial effect upon the trees following them. 2nd, What compound of salts would be of value applied in the spring to Strawberries on similar land? Many of the advertised manures are excellent in their way, but expensive to use on a somewhat large scale, while farmyard manure is costly and difficult to procure in remote country districts, besides entailing a great amount of labour as compared with fertilisers in a more concentrated and portable form. 3rd, Is the use of basic slag advised in the nursery, either for fruit trees or forest stuff? W. H. Bewlay, Hall-Santon Nurseries, Holmrook, S.O.

Reply.—(1) As the greatest deficiency of sandy land is humus matter, and as the production of abundance of surface root-fibres is also largely dependent upon the supply of humus, I would advise a liberal dressing of farm-yard manure, to which should be added the following manurial mixture in quantities per acre: 4 cwt. superphosphate, 3 cwt. sulphate of potash, and 1 cwt. nitrateof soda. The artificials can be mixed together and sown broadcast either by hand or machine; the dung then carted on and spread, and all ploughed in together. The nitrogen of the nitrate of soda would mostly be used up for the Potatos, but the phosphate and potash not so used would be available for the succeeding trees. These minerals acting upon the humus supplied by the dung would provide assimilable food for the young trees. (2) A useful Strawberry manure for such land would be a mixture comprising, 3 cwt. superphosphate, 2 cwt. sulphate of potash, and \(\frac{1}{2} \) cwt. nitrate of soda, per acre. A dressing

of peat moss manure applied between the rows of plants might also be given. It is not advisable to use low-grade superphosphates, but one containing from 30 to 37 per cent. of soluble phosphate. (3) Basic slag is an excellent manure for fruit-trees and shrubs, but it is slow of action. It gives its best results on moist soils, and those containing both humus matter and potash, the latter being especially important. Basic slag should be applied in the winter or very early spring, and be well incorporated with the soil. It is further necessary to use double the quantity of basic slag per acre than of superphosphate, so that when freight and the cost of distributing are a consideration, the superphosphates would probably be the less expensive manure. J. J. Willis, Harpenden.

AN EARLY CROCUS.—I send two flowers of a white Crocus, of which several are now in flower. All of them—the increase of one bulb—have always flowered about this time of year. R. W. Rickards. The Priory, Usk, Monmouthshire, Jan. 19. [The Crocus sent is a garden form of C. vernus. There are too many varieties named for us to say exactly which it is. Probably the warmer climate of Monmouth, and perhaps a very cosy corner to grow in, have induced the early-flowering habit; but unless tested in other localities one cannot be sure, so many plants show a precedity for several seasons, and then suddenly lose it with but slight apparent change of environment. E. A. B.]

THE PROPOSED OARDENERS' ASSOCIATION.—
Not a few critics seem to take it for granted that this talked-of association really exists, and is based on wrong lines. The promoters have gathered up a cartload of stones flung indiscriminately at their airy structure, but hardly a single brick helpful in building it as a solid material erection has been furnished. If the only thing needed to secure its formation were criticisms it might be formed with great success. Something very much more tangible than these airy nothings are essential, and these solidities have not yet been forthcoming. Those who have met on several occasions and thoroughly discussed proposals have not failed to realise that certain things are essential to the formation of such an association. Those are absolute necessity, prospective benefit, and certain unanimity in acceptance. To establish an association without showing absolute need for its existence would be folly. To establish it without its being shown that positive benefit to the garits being shown that positive benefit to the gardening community would follow would also be folly; and, not least, to attempt to do it without certain assurance that the gardeners of the kingdom would unite heartly in supporting and utilising it would still be folly. The fact that not only has there been, on the part of gardeners, a comparative absence of real suggestion, or desire to see an association formed, but, also in spite of the critics, an absence of interest in the proposal, has naturally led the promoting committee to regard the proposal as being materially ahead of the times. It may be well for all to wait until the meeting of those interested in the matter at the Horticultural Club on February 23, when a report will be presented. A. Dean.

TOMATO SUTTON'S WINTER BEAUTY.—Early in the present month, Mr. A. B. Wadds sent me from the Gardens, Paddockhurst, Sussex, a box of fruit of this Tomato. The fruits sent were not quite so symmetrical as some varieties, but the colour was bright, and the flesh and flavour excellent. The fruits were produced by plants raised from cuttings struck in the first week in July, and they have been useful for furnishing a winter supply daily and will do so for some time to come. Mr. Wadds has just potted-on cuttings struck last month into 32-sized pots, and these plants will furnish a spring supply. He finds that plants raised from cuttings fruit earlier than those obtained from seeds, and that they must have some watching in winter, and require more looking after than Grapes. R. D.

FISH-DESTROYING BIRDS. — Many lovers of our most useful and beautiful British birds are greatly indebted to the Gardeners' Chronicle for publishing from time to time notes of great interest upon matters that have appeared in other papers, but which, as in my case, would not otherwise have been seen. The paper of Mr. Marston

on the above subject which you have noticed, and which appeared in the January number of the Nineteenth Century, will surprise many who know anything at all about bird life. I have for nearly forty years studied our birds and their usefulness. What lover of birds does not know that many birds created for our good live on fish, as well as others which live on corn, fruit, insects, and so Sparrows, mentioned as increasing in such large numbers, are not protected by the Wild Birds Act, and can be destroyed as mice, rats, and other vermin can be. They prefer corn, seeds, and scraps, to young live salmon and other fish. As for gulls, which visit the Thames in wintertime, the good these levely birds do as scavengers in clearing the river of scraps, &c., cannot be over-rated, as these scraps which the gulls devour would otherwise become putrid, and poison in some degree the water, the fish, and in many cases the air one breathes. Any expert on birds or fish knows full well that gulls may rob fish of many tit-bits, otherwise they are of great usefulness as well as ornament. I would like to ask Mr. Marston, or anyone else who condemns some birds, if he will state how many of our beautiful birds, if he will state how many of our beautiful insectivorous birds, which never touch corn or fruit, are destroyed annually by hundreds that their feathers may be used to make artificial flies for fishing? The lovely kingfisher, which, by-the-bye, does not fish, is fast becoming extinct, owing to this artificial-fly business; while scores of other species of birds that are, apart from their heavity of the greatest use to make from their beauty, of the greatest use to man-kind, are used by thousands for this purpose. Were the feathers of the common sparrow more attractive, their number would soon decrease. William Charles Leach, Albury Park Gardens,

THE CONSERVATORY IN WINTER.-At this season the plants best appreciated are light in character, that produce brilliant flowers, and continue in bloom for a number of weeks, requiring only small pots for their cultivation. Coleus thyrsoideus is such a plant. Its flowers are of a most cheerful blue colour, welcome at any season, and especially in winter. We make no attempt to grow this plant in the form of specimens, but have three shoots to a plant in a 7-inch pot. The plants vary in height from 3 to 7 fect, and retain their foliage even at the base. The spikes of flowers are from 12 to 18 inches in length. Their persistency in flowering is remarkable, for as fast as the spent flowers drop they are suc-ceeded by others on the same spike. They are ceeded by others on the same spike. They are splendid when intermixed with Euphorbia (Poinsettia) pulcherrima in 6 - inch pots, cultivated upon single stems from 2 to 8 feet in height, with bracts 12 to 18 inches in diameter; and Eupborbia Jacquiniæflora in proportion, the old yet valuable white Arum and Little Gem, Begonia Gloire de Lorraine, Primula sinensis, and Cyclamen in variety. With such plants very bright groups may be arranged in the dullest season of the year. W. Fyfe, Lockinge Gardens.

SOCIETIES.

ROYAL HORTICULTURAL.

JANUARY 26.—The usual meeting of the Committees took place on Tuesday last in the Drill Hall, Buckingham Gate, Westminster. There was a good display of exhibits, amongst which Orchids formed a prominent feature. The collection of Dendrobiums from JEREMIAH COLMAN, Esq., Gatton Park, Reigate, was remark able, and well deserved the Gold Medal awarded it. There were many Interesting novelties, and the ORCHID COMMITTEE recommended three Awards of Merit.

The FLORAL COMMITTEE recommended two Awards of Merit to varieties of Chrysanthemum only. There were several displays of Cyclamens, one in particular from Messrs. Sutton & Sons, and a large exhibit of Chinese Primulas from Messrs. H. Cannell & Sons. A few more hardy flowers were shown than on the previous occasion, but most of them had been afforded a little protection. Carnation flowers from Messrs. Cuthush & Son; Jacobinias, Eupatoriums, Moschosma riparium, &c., from Messrs. Jas. Veitch & Sons; Chrysanthemums from several exhibitors, and hardy shrubs from Mr. J. Russell, were all interesting.

The Fruit and Vegetable Committee had not a great deal to concern themselves with, but the exhibits included a bunch of English-grown Bananas, some examples of Muscat of Alexandria Grapes, showing how well they are kept until this late date by the Earl of Harrington's gardener, and a most interesting collection of Oranges, Lemons, and Citrons from Messrs. T. Rivers & Son, in illustration of the lecture delivered in the afternoon upon this subject by Mr. H. Somens Rivers. The Committee recommended an Award of Merit to a variety of Orange known as "Egg' Orange (fig. 35).

As many as 116 new Fellows were admitted to the privileges of the Society.

Floral Committee.

Present: H. B. May, Esq. (in the chair); and Messrs. Chas. T. Druery, Geo. Nicholson, R. Dean, J. F. McLeod, Wm. Howe, G. Reuthe, Chas. Dixon. R. Wilson Ker, Chas. Jeffries, J. H. Barr, Chas. E. Pearson, Wm. Cuthbertson, Chas. E. Shea, W. P. Thompson, E. H. Jenkins, Wm. J. James, Chas. Blick, Edw. Mawley, (Rev.) F. Page Roberts, George Gordon, and John A. Nix. Mr. G. REUTHE, The Fox Hill Hardy Plant Nursery.

Mr. G. REUTHE, The Fox Hill Hardy Plant Nursery, Keslon, Kent, exhibited a few nice little plants of Shortia galacifolia, also Saxifraga floruleuta, a very rare species that produces pink-coloured flowers; also the new little Saxifraga Griesbachli, one of which was as regular io its rosette-like growth as a show Dahlia; Iris alata and I. histrioides major were in bloom.

Messrs. Surron & Sons, Reading, made a very large exhibit of Cyclamens, the plants being grouped together in separate colours. Some of the varieties were White Butterfly, a very well-known white variety with spreading segments; Vulcan, the deepest coloured variety amongst the reds; Giant White, an excellent variety with erect segments, large and bold flowers; Salmon Queen, one of the prettiest as it is certainly one of the most distinct varieties; Improved Giant Pink, &c. A few plants were shown of a derk rose-coloured variety, in which the follage was most conspicuously marbled, evidently selected with a view of increasing this characteristic. A few plants of Chinese Primula (Reading Blue) were shown. All of the Cyclamens were beautiful specimens, of good cultivation and excellent strain, and were flowering profusely (Silver Flora Medal).

Chrysanthemum Polar Star, a white flower with reflexed florets, a good decorative variety, was shown from the garden of Lady PLOWDEN, Aston Rowant House, near Wallingford.

Chrysanthemum Winter Queen is a very fine white Japanese, the flowers being 6 ioches or more across, with slightly twisted, drooping florets. Mr. W. J. Gorg Frey, Exmouth Nurseries, Devonshire, exhibited seven huge bouquets of this, the flowers being set up in tubes.

Mesers. W. Cuthush & Son, Highgate, London, and Barnet, Herts, exhibited a number of little Irises in flower, including I. Histrio (yellow), I. histrioides, and the new hybrid I. × Sind-pers, from a cross between I. sindgarensis and I. persica. There were also in flower Sternbergia Flscherlana, several varieties of Snowdrop, Tussilago fragrans, the slender little Corydalls augustifolius, Saxifraga Burseriana, Hellebores, Daffoe dils. &c.: Jasminum nudiflorum, and other shrubs, Messrs. Cutbush also showed a number of plants of Rhododendron Jacksoni in bloom, a variety with white or pale pink flowers. The plants were standards 3 feet high, and had good "heads." A number of plants o Citrus sinensis bore an excellent crop of fruits, but many of them were still green in colour. Cut flowers of Carnations from the same firm looked very bright and pretty. Most of the varieties have been referred to on previous occasions. A new one, named Chas. H. Curtis, is elmilar in colour to Mrs. T. W Lawson, and has longer stems, but the flowers, as shown, are scarcely so good as those of that variety or of Wm. H. Cutbush (Silver Flora Medal).

Six very well-grown plants of a white variety of Primula sinensis were shown by Colonel Webb, Woodfield, Wordsley (gr., Mr. Joiner).

Mesers. H. Cannell & Sons, Swanley, Kent, exhibited cut sprays of Coleus thyrsoideus, arranged in upwards of a dozen vases. The inflorescences were very strong, and the flowers much deeper in colour than they are sometimes seen.

Messrs. W. Seward exhibited a group of Cyclamens, ranging in colour from pure white to rich crimson. They were well cultivated, and made a bold show. A variety named Dorothy Seward had a robust habit and flowers of a light salmon colour (Silver Flora Medal).

Mr. JOHN RUSSELL, of Richmond, again exhibited a collection of ornamental and flowering shrubs in pots (Silver Banksian Medal).

Alpine plants, this time in flower, were again shown by Messrs. Ware, Feltham. Eranthis hyemalis, with its collar of green beneath its golden petals; Christmas Roses, coloured Primroses, Irises. Crocuses. Cyclamens, &c., all presented themselves in their most attractive colours.

Quite a gay appearance was given to Messer. Jas. Veitch's exhibit by masses of flowers of Coleua thyrsoideua and Eupatorium vernale (dwarf plants with large heads of woite flowers), flanked by Jacobinia chrysostephaoa and J. coccinea, the tall heads of Coleus thyrsoideus, with its lovely blue, harmonising well with the red and white of the other members, the whole having a groundwork of small Adiantum Feros. Cheiranthus kewensis, with its more modest display of pale orange flowers, was also staged by this firm (Silver Flora Medal).

Galanthus robustus præcox, Iris persica Heldreichii, and Fritiliaria oranensis, the latter being very pleasing with its pendulous flower of brown-purple striped with broad bands of green.

Awards.

Chrysanthemum Mdlle Louise Charvet.—This is a large reflexed flower, of bold character, produced on stout stems, colour piok and bronze. The variety should make a capital one for market growers. Shown by Measra. H. HENDERSON & SONS, Elmhurst Nursery, Cheshunt (Award of Merit).

Chrysanthemum ll'inter Cheer.—This is a first-class decorative variety, with reflexed flowers, 4 to 5 ioches a cross; colour rich cerise-pink. Shown by Mr. J. E. Low, Hatton, Warwick (Award of Merit).

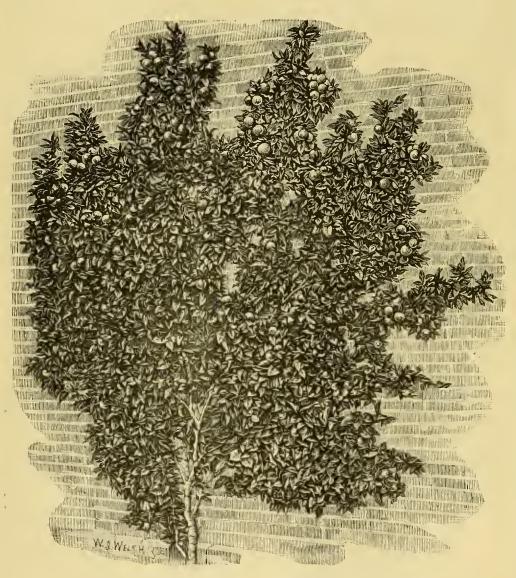

FIG. 33.—ORANGE-TREE IN FRUIT GROWING AGAINST A WALL IN THE KITCHEN-GARDEN AT OSBORNE, ISLE OF WIGHT. (SEE P. 78)

Miss Ethel M. Bablow, floral artist, had present some framed examples of her art. These were very cleverly executed.

Messrs. Cannell & Sons, Swanley, had an exhibit of their well-known atrain of Primulas, running the whole length of one of the centre tables, which included new seedlings and many of their best named varieties. The plants were sturdy in habit, and most of the flowers of good form and colour. Among others we noticed Charming, a free-growing spike, flowers white tinged with purple; Champion, a good white; Swanley Blue, a novelty, having very dense flower heads; Sirdar, flowers large and good form; Eynsford Yellow, a distinct variety with a yellow centre, merging to white outside (Silver Flora Medal).

Messrs, Barr & Co., King Street, Covent Garden, London, had a small group of hardy spring-flowering plants, among which was Sternbergia Fischeriana,

Fruit and Vegetable Committee.

Present: George Bunyard, Esq. (Chairman); and Messrs. J. Cheal, Henry Esling, W. Bales, S. Mortimer, Alex. Dean, II. J. Wright, E. Beckett, George Kelf, Geo. Thos. Miles, Hy. Parr, G. Reynolds, F. L. Lane, J. Jacques, J. Willard, J. McIndoe, J. H. Veitch, A. H. Pearson, and H. Somers Rivers.

A bunch of green Bananas was shown by S. HEILBUT, Esq., The Lodge, Hayport, near Maidenhead (gr., Mr. H. B. Westropp). The fruits would have been better in flavour had they been left upon the plant until ripe.

Apple Lake's Kernel was shown by Mr. John Watkins, Pomona Farm, near Hereford. The fruits are of moderate size, rich red in colour over three parts, and yellow on one part. The variety was described as being a free grower and cropper, and the fruits of fine flavour, in season from December to March.

Tomato Winter Beauty was shown well by Sir W. D.

PEARSON, Paddockhurst, Worth (gr. Mr. A. B. Wadds), who had a box full of fully-ripe fruits (Cultural Commendation).

Six bunches of well preserved Muscat of Alexandria Grapes were shown by the Earl of Harrington, Elvaston Castle, Derby (gr. Mr. J. W. Goodacre). They were equal in condition to what could have been expected two months ago (Silver Knightian Medal).

Messrs. T. RIVERS & SON, Sawbridgeworth, Herts, exhibited home-grown fruits of varieties of Orange. These were "Egg" St. Michael's, Sustain, remarkable for delicacy and high flavour; Brown's Orange, Embiguo or Navel Orange, a singular variety with nipple-like depression at the top of fruit, White Orange, having white pulp; Bittencourt, Achilles, Silver or Plata (delicious), Excelaior, and Tangierin (excellent flavour). Fruits were also shown of the White Lemon and of Citron; also trees in pots of Citrus corniculata [Horned Orange], Egg Orange, Seville Orange, and Myrtle-leaved Orange (Silver-gilt Banksian Medal).

Some of these are figured in our present issue, and others will be represented subsequently.

Awards.

AWARD OF MERIT,

Orange "Egg."—This is a variety of the Orange of commerce (Citrus aurantium). The fruits shown by Messra. Rivers were considered to be specially good in texture and flavour of pulp, and the variety is therefore distinguished by an Award of Merit (see illustration at fig. 35, p. 77).

Orchid Committee.

Present: Harry J. Veitch, Esq., in the Chair; and Messra. Jas. O'Brien (hon. sec.), de B. Crawshay. R. Brooman-White, Norman C. Cookson, W. Cobb, J. Colman, W. A. Bilney, F. Wellesley. H. T. Pitt, A. A. McBean, H. Ballantine, T. W. Bond, M. Gleeson, J. W. Odell, W. Boxall, W. H. Young, W. H. White, F. Sander, E. Hill, F. J. Thorne, W. Bolton, H. A. Tracy, and J. Gurncy Fowler.

There was a very fine show of Orchids, a magnificent group of Dendrobiums, extending the whole length of the central staging in the hall, came from JEREMIAH COLMAN, Esq., Gatton Park (gr., Mr. W. P. Bound), and secured a Gold Medal, as prothe best collection of Dendrobiums ever shown in January. The group, which was very effectively staged, contained a very large number of varieties of Dendrobium nobile, including the fine D. n. Colmanianum and D. n. Ballianum; a great quantity of forms of D. × Ainsworthii, D. × splendidissimum and similar crosses, including D. x Snowflake, D. × Artemis, D. × Othello glganteum, D. × rubens grandiflorum, D. × Apollo, &c.; also the pretty D. × Juno, D. × Schneiderianum, D: × pallens, D. Curtisii, and numerous others. Arranged with the Dendrobes were some finely-flowered Lulia anceps, of which the best were L. a. Mrs. Jeremiah Colman, L. a. Sanderiana, L. a. Stella, and L. a. Hilliana Enfieldiense; Cymbidium Tracyanum, &c. The whole of the plants were excellently well grown and profusely flowered.

Messra. Charlesworth & Co., Heaton, Bradford, were awarded a Silver-gilt Flora Medal for a very bright group, principally of their hybrids. In the centre were a number of the bright reddish-orarge Lælio-Cattleya × Charlesworthil, one of the showiest plants of the season. Of similar colour was a profusely flowered dwarf Sophro-Lælia × Psyche, and effective were L.-C. × Andromeda, L.-C. × Cappei, L.-C. × luminosa, L.-C. × Sunray, and the bright chromeyellow L.-C. × Myra Charlesworthil (see Awards). Also noted were several good Cattleya × Enid, Cypripedium × Helen II., C. × Lillan Greenwood, C. in signe McNabbianum, C. × Hera varieties, and several Odontoglossums, including O. × Queen Alexandra, a fine yellow heavily marked purple-brown.

Messra, JAS. Vettch & Sons, Chelsea, secured a Silver

Measra. Jas. Veitch & Sons, Chelsea, secured a Silver Flora Medal for a good group of hybrids. including the handsome Lælia × Digbyano-purpurata, L. × Olivis, Lælio-Cattleya × Cappei and its yellow variety aurea, L.-C. × Lucilia, Cattleya × Elvina, two forms of Calanthe × gigas, Dendrobium × Scylla, some showy forms of Cypripedium × Hera, the variety excelleds having a very large white dorsal sapal evenly spottad with purple; C. × Catherine, C. × Gertrude, varletes of C. × Lecanum, C. × Prospero, C. × Clinkabertyanum, C. × Troilus, C. × aureum virginale, and others.

Messrs. Sander & Sons, St. Albans, were awarded a Silver Flora Medal for a group principally hybrids, of which the novelties were Ledio-Cattleya × Dr. R. Schiffman (L.-C. × callistoglossa × C. Mendell), the plant of which, though searcely developed, showed

Fig. 34.—Home-grown malta blood orange. (see p. 76.)

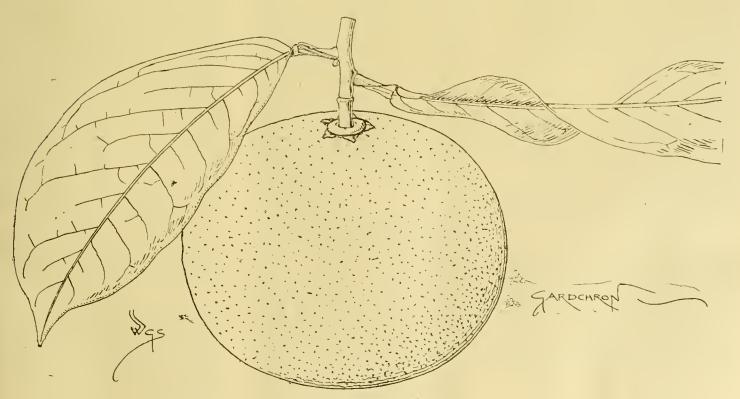

FIG. 35.—HOME-GROWN ORANGE "EGG."
One of the Fruits exhibited by Messrs, Rivers and certificated by the Fruit Committee on Tuesday last. (See p. 76.)

owersapproaching the beautiful L.-C.xcallistoglossa but jwith thicker texture, the front of the labellum being of a rich purplish-claret, the sepals and petals white tinged with purple: Cypripedinm x Leeanum "Purity," with pale flower, the fine white dorsal sepal being only sparsely spotted, and Lælio - Cattleya > Bletchleyensis vivicans, with bronzy-rose sepals and petals and rich dark purple lip. Also in the group were two very fine forms of Odontoglossum × Wilckeanum, the plant with two ficwers being remarkably handsome. Also noted were Zygo-Colax × Amesiana Chrysis × Sedeni, a pretty wax-like white flower tipped with rose, and several good hybrid Cypripediums.

Lady Chicele Plowden, Aston Rowart House, Oxon (gr., Mr. W. H. Clark), was awarded a Silver Banksian Medal for a group of well-grown Lælia anceps, most of the plants having seven or eight

flower-spikes.

Messrs. Hugh Low & Co., Enfield, staged a group in which were Cypripedium villosum Low's variety, a distinct form of the C. v. aureum class; C. × Sallieri Hyeanum; varieties of C. x Hera Euryades; C. Tityus, C. x Minos Low's variety, C. tonsum, and the showy dark-rose C. × Watsonianum (Harrisianum nigrum × concolor). With these were arranged Dendrobium Wardianum, D. aureum, Sophronitis grandiflora, and Oncidium ornithorhynchum.

GEO. SINGER, Esq., Coundon Court, Coventry (gr., Mr. Collyer), showed a small group of Cypripediums, including C. × chrysotoxum var. Earl Leofric (vil-Iosum giganteum x Lathamianum superbum), a very large flower of C. villosum shape, with light greenishyellow lip and petals, the latter tinged with brown on the upper halves, the dorsal sepal being green at the base, and white on the upper half of the middle area, marked with purple. Also C. x Penelope, a dark coloured cross between C. Lawrencianum and C. Charlesworthii; varieties of C. x Lathamianum, C. x Deedmanianum. &c.

H. T. Pitt, Esq., Rosslyn, Stamford Hill (gr., Mr. Thurgood), showed Lælia autumnalis alba with a spike of six fine flowers; Cypripedium x Edithæ, and Lælio-Cattleya × luminosa Rosslyn variety.

J. RUTHERFORD, Esq., M.P., Beardwood, Blackburn (gr., Mr. Lupton), sent two Odontoglossum x Beardwoodiense (elegans, Eastwood Park variety x Pescatorei), but which the Committee thought were forms pi O. x Hallio-crispum.

C. J. Lucas, Esq., Warnham Court (gr. Mr. Dunean), showed Cypripedium x Lathamianum Warnham Court variety, a fine large flower; and C. x Almos Warnham Court variety.

W. M. APPLETON, Esq., Weston-super-Mare, showed Cypripedium \times Edithæ bellatulum \times Chamberlainianum); C. x Garret A. Hobart (Lathamianum x insigne giganteum) : C. x Mons. de Curte and C. x Morteni (see awards).

Mr. CHAS. VUYLSTEKE, Loochristi, Ghent, showed two varieties of his pretty Ondontoglossum × Vnylstekei: two 0. \times Loochristiense and a nice variety of 0. \times Wilckeanum named "Argus."

Mons. Jules Hyr de Crom, Ghent, sent Cypripedium × Mad. Jules Hye.

The Right Hon. Lord ROTHSCHILD, Tring Park (gr., Mr. E Hill) sent a fine spike of Phalænopsis amabilis Rimestadiana, with eight large white flowers tinged at the back with Roses and some bnds. It is the finest form of the plant usually called P. grandiflora in

Sir H. SCHRODER, Bart., The Dell, Egham (gr., Mr. H. Ballantine), showed spikes of the beautiful purpleblotched Odontoglossum Pescatorei Schroderianum and Veitchlanum, the fine O. crispum Stevensi and O. Pescatorei melanocentrum.

AWARDS OF MERIT.

Lelia anceps Schrodere Theodora, from FRANCIS WELLESLEY, Esq., Westfield. Woking (gr., Mr. Hopkins). -A fine flower, in advance of the richly-coloured L. a. Amesiana, to which it bears a resemblance, but the flowers are larger. Sepals and petals white flushed with magenta-rose, the tips being the darkest. Front of lip dark claret-purple. The plant was first flowered and named by DE B. CRAWSHAY, Esq.

Lalio-Cattleya x Myra Charlemorthii (L. flava x C. Trial æ), from Messrs. Charlesworth & Co., Heaton. Bradford - A very desirable hybrid, with showy flowers, intermediate in size and form between the true parents. Sepals and petals bright chrome-yellow;

front of lip ruby purple.

Cypripedium x Mirtemi (Lecanum Masercelianum x Chamberlainianum), from W. M. APPLETON, Esq., Weston-super-Mare.—Flowers produced, as in 1.0st Chamberlainianum hybrids, several on a spike, and with the unmistakable characters of C. Chamberlainianum. Upper sepal green at the base, with chocolate lines and white margin; petals greenish, striped chocolate: lip rosecoloured, with yellow upper margin.

MISCELLANEOUS EXHIBITS.

Examples of the cooper's craft were displayed by Messrs. Champion & Co., of Old Street and City Road. in their tubs for planting shrubs, &c. They were admirably adapted for such positions as conservatories and halls, but would be too elaborate for general use. They are made of Teak or Oak, beautifully polished, with bronze fittings.

"LUBROSE," a paint preparation recommended for greenhouse and horticultural use generally, was shown by means of models and samples of colours.

The Partison Patent Lawn Boots for horses, with model of boot attached to the hoof, were shown, as well as details of construction and attachment.

A useful device for the protection of seeds and seedlings from birds, and another for arranging flowers in vases and bowls, the "Floral Aid," were displayed.

A system of shading glasshouses by means of a roller-blind, worked with a cord through pulleys, was shown by Messrs. Walters & Co., of Croydon. The blind was made of laths, and rolled up similar to those in use for shop-fronts. This firm also showed a number of Orchid-baskets of teak-wood.

An improved device for distributing insecticides, MURATORE'S "Improved Automatic Sprayer," has claimed for it that an extremely fine spray can in a short time be diffused over all the plants in a large plant-house. Being made of copper it should prove very durable.

Lecture on Oranges.

In the afternoon, Mr. H. Somers Rivers delivered a lecture on "The Cultivation of Oranges in England," explaining the system practised in the nurseries at Sawbridgeworth. Mr. Rivers commenced by denouncing the mansoleum-like structures that were built for Orange-growing many years ago, and recommended instead a span-roofed orchard-house for the purpose, such as that shown in fig. 3t, p. 69. In this structure trained trees planted in borders, and standard trees in pots, might be cultivated together, and when the brilliantlygreen foliage was studded with golden-coloured fruits the effect was very gratifying. The temperature, when the fruits were ripening, should not be permitted to fall below 50°, and it may rise to 60° or 65° in the day by sunheat. When the fruits have been gathered the temperature may decline to 45° or 50°, but be raised at the end of February to 65° or 70°. The trees should not be syringed when in flower, but afterwards, when the fruits are swelling, they might be syringed. The operation should be done early, and by admitting air assist evaporation to prevent the leaves being scalded by sun. As soon as the fruits commence to colour, said Mr. Rivers, the syringe must be again laid aside.

The matter of affording water to the roots was an important one, and bad results would follow if the soil was allowed to become too dry, or if it was over-watered. The rooting compost should consist of good fibrous loam and leaf soil in equal quantities, with a little charcoal added. Trees planted in borders should be topdressed every alternate year, and pot trees should be repotted one year and top-dressed the next. In re-potting it would be a mistake to give the plants too large a shift. If sufficient space were provided for one inch of fresh soil around the roots that would be ample. The collar of the tree should be kept well to the surface, as the Orange dislikes to have its roots buried deeply. After three days afford water to newly-potted trees. No manures must be added to the soil, for Oranges are not benefited by manures, but when the fruits are colouring, a little soot water or soapy, water, would help, them. Soapy water especially would help to increase the size of the fruits.

Orange trees on trellises should be trained with their shoots 1 foot apart, and the stronger shoots In pots the trees naturally should be "stanned." become half standards. In Messrs. Rivers' House (see illustration at fig. 31). 54. excellent fruits are grown The house is 60 feet long, and runs from east to west.

If a house cannot be devoted to Oranges, said Mr. Rivers, they may be grown perfectly on the back wall of a plant-house, where the temperatures already mentioned can be maintained. Such plants as Encharis, that are specially liable to mealy-bug, should be excluded. Ferns would be congenial.

The sooty gloss that was frequently seen on the leaves, said Mr. Bivers, was a fungus growing on the Honeydew exuded by scale-insects. By vaporising the

plants they could be kept perfectly clean of insects, then there would be no black on the leaves. Mr. Rivers proceeded to speak of some varieties of Oranges, Lemons, and Citrons, the best of which are mentioned above as exhibited by Messrs. Rivers. In conclusion, Mr. Rivers said that experiments were bein? made in America with a view to obtaining Orange-trees that will iruit in a temperate climate. They are crossing the sweet Orange (Citrus aurantium) with C. trifoliata. Some day perhaps we may have Oranges that will produce crops of fruit in England under the same conditions as Pears fruit now.

A few remarks were made by Mr. A. H. Pearson (Chairman), Mr. Roupell, and Dr. M. T. Masters.

In connection with Citrons growing in Lady Plowden's garden, the following particulars kindly supplied by the gardener, Mr. W. H. Clarke, are interesting:—

Citrons are successfully cultivated here. Two large plants covering the back wall of a cool greenhouse each year carry good crops of fruit, and it is seldom we are without ripe fruits. Directly the ripe crop is finished a successive crop of green fruits follow, and at the same time there are fruits just set and commencing to swell, and flowers in abundance. A Cultural Commendation has been awarded by the Royal Horticultural Society for fruits exhibited from these trees; and a dish of fruits was amongst the collection of fruit exhibited at the Drill Hall from these gardens, and which gained a Silver Banksian Medal. The fruits far surpass in size and quality those obtainable in the shops, and are always pronounced 'excellent' for cooking and other purposes. Citrons can be grown in any house just frost-proof, the chief points being to keep the foliage clean and the growths thinned-out.

ROYAL CALEDONIAN HORTICUL-TURAL.

JANUARY 14.—The annual general meeting of this Society was held in Dowell's Rooms, Edinburgh, on the above date, Mr. D. P. Laird, Vice-President, in the chair. The Secretary submitted the report of the Council, which stated that being satisfied with the result of having held the spring show last year in the third week of May, they had resolved to hold the spring show of least at the same time of the month. The net gain in membership during the year was 120.
The report also referred to the five international exhibitions already organised by the Society, and stated that the Council were making arrangements for holding another International Exhibition in September, 1905, at which they hoped to be able to offer about £1,500 in premiums. Advance particulars of some of the principal competitions are in preparation, and will be shortly issued. His Majesty the King hadaccorded his patronage to this exhibition, and had given a valuable Silver Cup to be awarded at it. The abstract of accounts showed considerable improvement in the position of Society, the excess of income over expenditure for the society, the excess of income over expenditure for the year being £126 182. 2d., and the funds of the Society £928 5s., compared with £115 172. 7d. at the close of the previous year, this result being attained without restricting the scope of the Society's exhibitions. The prize-money paid at the spring show amounted to £176 3s. 6d., and at the autumn show to £328 13s. 6d. The retiring President, Lord Balfour of Burleigh was nearly regulated. Mr. W. Burleigh, was unanimously re-elected. Mr. W. H. Massie, nurseryman, was elected a Vice-President in room of the retiring Vice-President; and Messrs. Daniel Kidd, The Gardens, Carberry Tower, Inveresk; Mr. James Grieve, Redbraes Nurseries; and Conncillor Mackenzie, Edinburgh, were elected Councillors in room of those retiring.

GARDENERS' ROYAL BENEVOLENT INSTITUTION,

ANNUAL MEETING.

JANUARY 21 .- The sixty-fifth annual meeting and election of pensioners took place on the above date at Covent Garden Hotel, Covent Garden. The meeting was presided over by Mr. Harry J. Veitch (Treasurer). The Chairman, in moving the adoption of the Annual Report, referred briefly to the present circumstances of the Institution, stating that at the beginning of the year 2014 persons, being fourteen more than at the corresponding period in the previous year, viz., 116 men and widowa, were receiving life annuities of £20 and £16 respectively. There were thus at the close of the year 192 pensioners on the Funds. The Committee much regretted that they were unable to recommend a larger number of candidates for election that day, but it should be remembered that in 1992 no fewer than twenty-eight new pensioners were put upon the Funds in honour of the Coronation of the

The Committee has distributed during the from the Samaritan Fund £-1, and from the Victorian Era Fund £135 10s.; more money was required for this Fund. Mr. Veitch on behalf of the Committee thanked Mr. N. N. Sherwood for his generous gift, on the occasion of the last election, of £5 to every unsuccessful candidate who had been a subscriber or was a widow of such. Thanks were also given to the Earl of Warwick, who presided at the Annual Festival Dinner; and to Lord Ilchester for his kindness in throwing open his Lord Ilchester for his kindness in throwing open his beautiful gardens at Holland House for the benefit of Gardening Charities on the occasion of the Royal Horticultural Society's exhibition there. The Bristol, Worcester, Devon, Walverhampton, Reading, and Liverpool suxiliaries were spoken of in most apprecisive terms, and the Institution has evidently benefited much from their work. The alterations made in the rules had worked well; there had been few complaints, though some thought that they might have done better. Rules, however, were not made to last "for ever and a day," and if it seemed desirable in the future, the Committee will ask the subscribers to again future, the Committee will ask the subscribers to again alter them.

after them.

Since the alteration had been made in the rules each year's subscription counts, so that if a gardener commences to subscribe whilst young, and continues to do so, he would be nearly certain to be put on the funds if in his oid age he required help, for a subscriber is now credited with 100 votes for each year's subscription, and thirty years would therefore entitle him to 3,000 votes before election.

Mr. Veitch announced that since the Committee had decided to recommend the election of twelve pensioners that day, two of their pensioners had died, and they therefore recommended that the number to be now elected be increased to fourteen. The Committee had also taken into account the circumstances of Thomas Cridland and had decided that the their conditions of the committee had also taken into account the circumstances of Thomas Cridland, and had decided that if this candidate was not amongst those elected the Committee would exercise the privilege they have, and place him upon the funds. The reasons that led them to do this were (1) he was 74 The reasons that led them to do this were (1) he was 74 years of age; (2) he was totally blind; and (3) he had sought election and help for seven years past. Later, Mr. Veitch announced that Mr. Arthur W. Sutton (Reading), having regard to the large number of disappointed candidates there would be this year, had generously offered to subscribe sufficient to place another candidate upon the Fund, and the candidate was to be the one the Treasurer (Mr. Veitch) thought to be most deserving. There were therefore sixteen new pensioners added during the day.

The report and baisnee-sheet baying been accented

The report and baisnoe-sheet having been accepted with satisfaction, the next business was to elect or re-elect the officers. All were re-elected, except that Mr. J. A. Laing and Mr. J. H. Veitch have retired from the Committee, and Mr. J. McIndoe and Mr. H. W. Nutling were elected in their stead.

The several resolutions were proposed and seconded by Mr. A. W. Sutton, Dr. M. T. Masters, Mr. Vailance, Mr. Baker, Mr. S. M. Segar, Mr. Geo. Mouro, Mr. Denning, &c.

RESULT OF THE BALLOT.

The result of the election was declared at 5 45 P.M., to

HENRY CROSS			 3923 v	otes.
WILLIAM CHAMBERS		***	 3545	22
ABRAHAM STANSFIELD			 3444	2.2

ANDREW ARMSTRONG			 2838	20
GEORGE DALE	•••		 2796	34

The Committee's decision to elect the unsuccessful candidate, Thomas Cridiand, was then ratified, and the candidate selected to benefit by Mr. Sutton's liberality was William Smith, whose votes (2784) were the highest polled by the thirty-nine unsuccessful candidates.

CONTRIBUTIONS FROM AUXILIARIES.

We believe the actual sum contributed by the auxiliaries during last year were as follows:—Devon and Exeter, £60; Bristol and Bath, £105; Liverpool, £50; Reading, £109; Wolverhampton, £2t; and Worcester, £75. In addition £55 has been received since from Worcester, which amount will go into the accounts for the following year. the following year.

THE FRIENDLY SUPPER.

THE FRIENDLY SUPPER.

In the evening the Committee and friends of the Institution met in the same Hotel on the occasion of the Annual Friendly Supper. Mr Leonard Sutton (Reading) presided, and there were about sixty gentlemen present. The Royal toasts were honoured, and then the Chairman proposed "Continued success to the Institution," and suggested that more auxiliaries should be formed. That at Reading was instituted upon the suggestion of Mr. H. J. Veitch. Mr. Sutton thought that at present the bulk of the amateurs have not been properly canvassed for support. He emphasised this, and suggested that if the Committee will think the matter over and adopt a scheme for advertising the

Institution that would have this effect, he would be

happy to pay the cost of same.

Mr. H. J. Veitch responded, giving some interesting particulars of the death-rate among pensioners; and in the course of his remarks alluded to the fact that the Committee had invited him to preside at the annual Festival Dipper, and begged those present to help him

Festival Dinner, and begged those present to help him to make the event a greater success than ever.

Mr. Geo. Monno proposed "Our Country Friends and Supporters," and spoke in the highest terms of the value of the auxiliaries, all of which have been established during the past ten years. Since their institution, Bristol had sent £951, Worcester £750, and Reading (in one year) £110. Mr. Vallance (Bristol) responded. Mr. Geo. Paul proposed the toast of "Committee and Honorary Officers," and said that forty-four years ago he used to carry the pension-money to two old pensioners in his district, and the joy it gave them he remembered still. His toast only meant. "thanking men who have done thoroughly well the work entrusled to them." Other toasts included "The Chairman," "The Secretary," &c.

EAST HAM AMATEUR CHRYSAN-THEMUM.

This flourishing Society, the last new creation of the kind in the East End, which was started in January, 1903, has proved so successful that, after defraying the expenses of the year's working, which included a successful exhibition, the Committee have handed over to the East Ham Hospital the sum of £18158, 3d., and carry forward a balance of £278, 2½d. Evidently there is no misgiving as to the future of the Society.

BRIGHTON AND SUSSEX HORTI-CULTURAL.

THE report for 1903, presented at the annual meeting held on January 21, showed a substantial increase in the list of members. There was a profit on the year's working of £32 128. 9d, leaving a total balance at the hankers of £193 148. 6d. The Committee deeply regret the loss, through death and other causes, of several the loss, through death and other causes, of several Vice-Presidents and subscribers. New features were introduced into the summer show, but the weather was detrimental to the receipts.

GARDENERS' DEBATING SOCIETIES.

CHESTER PAXTON .- The opening meeting of the CHESTER PAXTON.—The opening meeting of the present session was held in the Grosvenor Museum on January 16, when Mr. J. D. Siddail delivered a lecture, with illustrations, entitled, "Living Pictures of Living Organisms." The American Water-Weed (Anacharis Alsinastrum, Bab.) was described very fully. By the aid of sides and pictures the lecturer was enabled to show the plant in all its stages of growth; but the cause of its gradual disappearance from Great Britain was admitted to be an unsolved mystery. The freshwater Hydras were dealt with in a similar manner. cheese-mitesand mites generally came next. concluding cheese-mites and miles generally came next, concluding with chameleons and toads.

BRISTOL AND DISTRICT GARDENERS' .- A meeting BRISTOL AND DISTRICT GARDENERS.—A meeting of this Society was held recently at St. John's Parish Room. Lientenant-Colonel Cary Batten presided. there being a large attendance. Mr. Davy, of the Cardiff Gardeners' Association, read a paper on "Orchids." He spoke of the increasing love for Orchids amongst horticulturists, and gave much valuable information as to the kind of structure best suited for their culture—shading, heating, ventilating, and temperature alike receiving attention; also dealso and temperature alike receiving attention; also dealing with many of the varieties in cultivation, and giving directions with regard to potting, watering, and treatment generally.

HULL AND DISTRICT HORTICULTURAL.-DEC. 12. -A paper was read recently before the members of the above Society by Mr. Picker, of Hessiewood, on "The Herbaceous Border." His hints on the selection of a Herbaceous Border." His finite on the selection of a suitable site for the ground, the form of the border, preparation of the ground, sowing of seed, planting, and after-culture, were replete with practical suggestions, especially as coming from one who has proved himself successful in this branch of gardening. Herbaceous successful in this branch of gardening. Herbaceous subjects suitable for being planted in beds, and accomsubjects suitable for being planted in beds, and accompanied, if desired, with bulbous plants, were Asters, Phlox, Anemones, Tritomas, Genista præcox, Doronicums, Philadelphus, Spirieas (shrubby), double Gorse, Deutzias, Hydrangeas, Hollyhocks, Syringas, Berberis Darwinii, and Delphiniums. A good top-dressing of farmyard manure was advocated as heing by far the best manure for the border. Mr. Picker recommended a reserve ground, in which pot plants could be plunged in coal-ashes, and used as required to fill vacancies.— The discussion which followed showed general agreement with the paper. W. R.

BECKENHAM HORTICULTURAL.—At a meeting on January 15, Mr. J. Lyne, "Foxbury," Chisleharst, lectured on "The Strawberry. He advocated deep cultivation, a good, stiff, chalky loam being the best

soil to grow them in. Never keep a bed more than three years. In forcing, start with a temperature of 40° to 50°, increasing to 60° to 70°. When the plants are in bloom keep the atmosphere dry, and avoid draughts from north-east wind. When the fruits have set, feed the plants with some approved chemical manure, and if large fruits are wanted, thin them out to four fruits on each plant. Mr. Lyne recommended having a special house for Strawberries—alow, span-roofed one like the market men use being best. The lecturer said it was best to ascertain which varieties were best suited to the locality. Royal Sovereign was the only variety of Strawberry he himself forced.

CROYDON AND DISTRICT GARDENERS.—we have received a programme of meetings to be held by this society during the coming season in the "Sunflower" Temperance Hotel, George Street, Croydon. The sylvania comprehensive and interesting. The chair labus is comprehensive and interesting. The chair will be taken at 8 P.M. Members are invited to bring exhibits to the meetings, for which purpose the room

will be open at 7 o'clock.

At the meeting on Tuesday, January 19, a paper was read by Mr. H. J. Jones, of Lewisham, his subject being "Chrysanthemums." An excellent attendacce of members assembled, and followed the lecturer through all details of cultivation of this popular flower. Time would only allow a short discussion, but what questions were asked Mr. Jones replied to clearly. Mr. W. TARNEY, Station Road Nurseries, staged wellgrown Primulas; and Mr. P. F. Bunyard exhibited a new plant label, the "Eclipse."

EAST ANGLIAN HORTICULTURAL CLUB. - In presenting their report for the year ended November 27. 11843, the Committee record a busy and important year. Thirty-three members were enrolled during the past year, the net membership now being 279. The balance to the credit at the last audit was £112 168. 4d., the receipts during the year amounting to £83 38. 10d. The receipts during the year amounting to £83 3. 10d. The figures relating to the monthly exhibitions show an increase in entries, number of exhibitors, and points awarded. Mr. C. Burtenshaw was the leading exhibitor, winning 15s points. The Silver Challenge Bowl was won by Mr. Hines, who holds the prize for the first year. The schedules for the mouthly exhibitions for the coming season include prizes for fruits, flowers, and vegetables, and for special classes. The list of lectures include subjects of general interest to gardeners. The fourteenth annual dinner took place at the Club Room on the 13th inst.

SUTHERLAND MUTUAL IMPROVEMENT .- Accordto the thirteenth annual report of the above Society, the past year has been the most successful since its inception. The financial conditions of the Club are in a satisfactory condition, with a useful balance in the hands of the Treasurer. They have held about twenty six meetings during the year, the exhibits being more numerous and of better quality than previously. Mr. T. W. Bolam was re-elected chairman, this making the twelfth year he has occupied the position. Mr. A. Brunston, gr. to Joseph Short, Esq., was again successful in winning the 1st prize for the greatest number of exhibits in the competitive classes during the year. The Annual Dinner was held on the 10th inst, Alderman Burns, J.P., presiding, over 100 guests being present. The secretary, Mr. J. T. Richardson, was the recipient during the evening of several presentations.

READING MUTUAL IMPROVEMENT.-The annual meeting was held on the 11th inst. The Committee, in submitting the annual report for 1903, congratulated the members on the continued prosperity of the Assothe members on the continued prosperity of the Association. The meetings throughout the year have been well attended. Particular mention was made of the display on April 20, when more than 100 bunches of cut flowers were staged. The balance-sheet showed a credit to the Society of £26 78. 6d.—The first fortnightly meeting in the new year was held on the 18th inst, when Mr. J. Woolford gave a paper entitled "A Chat on the Small Border System for Fruit under Glass."

FRUIT REGISTER.

PEAR, CHARLES DE GUELIN.

THE January number of the Bulletins d'Arboriculture contains a coloured figure and a description of this Pear. The fruit is described as of large size, turbinate in shape, of a smoky-brown colour externally, with yellowish-white, melting, perfumed, and juicy flesh. It ripens in January and February. M. Burvenich speaks highly of it for its cropping qualities and its general excellence.

CALIFORNIAN HOLLY .- For decorative purposes the scarlet berries of this tree or shrub are very largely used in California. The shrub producing them is no Holly, but a Rosaceous plant, Heteromeles (Photinia) arbutifolia.

Obituary.

WILLIAM RATCHELOUS .- This well-known and highly-respected townsman of St. Neots, Hunts, died there on the 22nd inst., after a long and painful illness, his age being about fifty-eight years. For thirty years he had filled the post of manager of the branch nurseries of Messrs. Wood & Ingram, of Huntingdon, at St. Neots, and was a man of remarkable energy and active habits. For many years he was the Secretary of the St. Neots Horticultural Society, and at the time of his death Hon. Sec. of the Chrysanthemum Society there. A native of the district, and a member of a much-respected family residing in it, he appears to have commenced his gardening career under his father, who was the gardener at Priory Hill; he eventually became gardener at Waresley Park, and from there he assumed the post of manager for Messrs. Wood & Ingram, and became particularly successful as a cultivator of Cucumbers for seed. Mr. Thomas Lockie, the well-known raiser, always spoke of him as "probably one of the best seed Cucumber growers in England." He leaves a wife and grown-up family. R. D.

BENJAMIN WELLS.—We regret having to record the death of this old-established nurseryman of Crawley, who, while suffering from a fit of depression, ended his life by drowning himself in a well on Saturday last.

SEED-SOWING.

WHATEVER may have been the difficulties incidental to seed-saving out-doors in 1902, it is certain that those troubles were even greater last year, for a worse season for seed-production has rarely been experienced here. This is but one more evidence, if such were needed, of the disastrous effects ungenerous weather can produce on the products of the soil. Practically horticulture has rarely been worse hit for many years by climatic conditions than it was in 1903. It is but natural therefore that seeds purchased this spring may to some extent show the ill-effects of an adverse summer and autumn. They may be less plump, be indifferently matured, be stained, show lack of germinative quality, and much may be rather old. That our seed trade will do its utmost to supply its customers with the best seeds obtainable there can be no doubt, and it is well for all who sow to obtain crops, that great quantities of seeds are raised for our use in distant lands where sunshine generally prevails, and where conditions exist which are eminently favourable to seed-maturation. Here at home a warm, dry summer is very favourable to seed ripening, but if it be very hot and dry, as sometimes is the case, then drought at the roots checks growth, and a crop of finely-matured seed is often much reduced in bulk because quantity is absent. We have not many ideal seed-producing seasons. If in anticipation of a dry season ground be deeply worked and well manured, and a dripping summer follows, growth is excessive, whilst seed-production is restricted. But if the season be a dry, warm one, the special preparation the soil has received is then well repaid. As we cannot possibly have seasons to order, and sometimes, as last year, we must suffer severely from bad ones, it is indeed a matter for the greatest satisfaction that under conditions that otherwise would be productive of much trouble in garden cropping, we have the whole world ready to produce for us the best seeds to supply our needs. But it will be wise for all who garden to remember that much seed may have inferior germinating power, and that in consequence it will be well to wait until the soil has become fairly warm ere sowings are made. Where the soil is naturally stiff or clayey,

it will greatly help germination if some fine gritty soil, old pit soil, wood ashes, soot, and other material, be mixed, screened, and kept ready to top-dress seed-beds or drills. It may even be desirable to sow a little thicker than usual. Still, any gardener having glass and a little heat can soon, by counting 100 seeds, sowing them in a shallow pan of fine soil, and then counting the resultant growth, test for himself the germinative capacity of the seeds he has to sow. A. D.

TRADE NOTICES.

Mr. George Watson, who has managed the business of Messrs. Edmondson Brothers, Dublin, for the past nine years, has become a partner of that firm.

Messes. Fava & Radl, Naples. — Owing to the death of the late Mr. Giuseppe Fava, on September 28 last, the above firm has taken into partnership Mr. George Trache, and will be known henceforth as Messes. Trache & Radl, San Giovanni a Teduccio, Naples.

STOP-PRESS NOTE.

THE PROPOSED ALTERATION OF THE SUB-SCRIPTION AT THE ROYAL HORTICULTURAL Society.—As a member of the Council of the Royal Horticultural Society when the Guinea Fellowship was first adopted, and having been a strong advocate for it at the time, I was ill-pleased to see in the report of the recoumendation of the Council that in future only Fellows paying two guineas should be accepted. The new class of Fellows have not only brought funds for the use of the Society, but they bave added to its strength by their number and enthusiasm. It is true that they get exceptional value for their money, though the picture is somewhat overdrawn, few Fellows attending all the meetings or going two or three times to the large shows, or, indeed, making use of all their privileges. The question of crowding, which is the ostensible excuse for the measure, will be met by the larger space in the new Hall, and the room required for lectures being found elsewhere. It may be that the cost and postage of the Journal to guinea Fellows may over-tax the Society. If this is so, would it not be better to allow the future Guinea Fellowships to remain, with the understanding that the Journal be not sent except upon the payment of an additional guinea, which it is well worth? I ventured on Tuesday to suggest this to one or two members of the Council. As a trade member of the Society and frequent exhibitor, I also deprecate the step. George Paul.

ANSWERS TO CORRESPONDENTS.

CHINESE PRIMULA: H. F., Swansea. The flowers of a pink-coloured variety of Primula sinensis are very good, being of extra size and substance, and much fimbriated. From their appearance, and that of the leaves also, it is obvious the plants have been well cultivated in rich soil. Why address the Publisher on a matter so obviously one belonging to the Editor?

CHICKEN AND SHEEP MANURES: Chicken. These manures are of very great value for all kinds of fruit-trees. They are both of considerable strength, and if used in a fresh state should not be applied too liberally. If soaked in a tub of water they will afford capital manurewater for any crop.

Cupressus: B. S. H. The two sprays you send represent immature forms of some Cypress. It is difficult or impossible to say which from the specimens sent, but probably they are juvenile forms of C. sempervirens. If so, after a short space the trees will show their true character.

CUBE FOR ANTS: J. M. "The Ballikinrain Ant Destroyer" is a good exterminator of these pests, and may be obtained from the horticultural sundriesmen. Remember it is a violent poison to other creatures as well as to ants.

DRESSING FOR FRUIT-TREES: Tree-wash. A good wash for spraying Apple-trees can be had readily and cheaply by mixing four parts of lime (quick or unslaked), and one part of flowers-of-sulphur; break the lime into small pieces, then mix the sulphur with it in an iron vessel, pour on them enough boiling-water to slake the lime to a powder; cover in the vessel close as soon as the water is poured on. It should be used fresh. Some recommend ½ oz. of carbolic acid to each gallon of liquid. It may be applied at once.

MARGUERITE (CHRYSANTHEMUM FRUTESCENS):

Butler Bros. There is no fungus present. The
fading and disfigurement of the foliage seem
to be due to the punctures of some insect.

Spraying with an insecticide or fumigation
would be beneficial. We have the plant still
under our observation, and will refer to the
matter next week.

MUSHROOM BED: Amateur. Your difficulty is in keeping the atmosphere of the house in a suitable condition. There is no fault in the bed, or the Mushrooms would not show so plentifully, but in future it would be as well to spawn the bed when the temperature has declined to 75°. But above all give sufficient ventilation to keep the atmosphere pure, and avoid excessive dampness, which in itself is frequently a cause of the young Mushrooms decaying.

Names of Plants: Correspondents not answered in this issue are requested to be so good as to consult the following number. — Frank Welstead. Azolla Caroliniana.—Nestor. Phylica ericoides.—J. H. B. Chimonanthus fragrans.—Zola. Sophronitis grandiflora rosea.—H. S. S. Not Ceologyne cristata, but Ceologyne lactea of the Ceologyne flaccida section.—Green Tree. 1, Cupressus dolabrata; 2 and 3, forms of Cupressus Lawsoniana; 4, Prumnopitys elegans; 5 and 6, forms of Juniperus virginiana; 7, Cupressus, perhaps C. Goweniana.—G. H. 1, Photinia serrulata; 2, Cupressus sempervirens; 3, Cryptomeria japonica; 4, Tsuga canadensis; 5, Polypodium cambricum. Abies Pinsapo is spring-tender; perhaps the roots are too dry, or the soil too sodden; either cause would bring about such results.

PLANT ENQUIRY: P. Madeira. Randia Fitzalani an Australian Rubiaceous plant; Buckinghamia celsissima, an Australian Proteaceous tree; Harpullia pendula, an Australian Sapindaceous tree; Hernandia bivalvis, an Australian Lauraceous tree. All the above-mentioned are described in Bentham's Flora Australianis. Cedrela fissilis, a Brazilian Meliaceous tree, in cultivation at Kew: Lincciera is a genus of Oleaceous trees, natives of eastern tropical regions. One species is Brazilian. With the exception of the Cedrela, which is mentioned in the Kew Hand-List, we are not aware that any of the plants named are in cultivation here.

Propagatino Potatos: A. G. The report may be true; but the methods of propagation are not exhausted, as you seem to suppose, when the tubers have been cut into pieces. When trying to increase the stock in the smallest possible time, each "eye" is taken from the tuber with a little flesh attached, and a plant is grown from each "eye" the tuber possessed. This is done in the winter, and the plants so raised are "topped" the tops are inserted as cuttings, and these make roots readily. Further cuttings are afterwards taken from the plants that were topped, &c. Procure a copy of the Gardeners' Chronicle for October 3, 1903, and you will see such methods described and illustrated.

THE GARDEN RUBBISH-HEAP.

SOME of the readers of the Gardeners' Chronicle may wonder what any one can have to say on this subject, but perhaps I may be allowed to present it in an aspect in which it has not been looked at before. It has been suggested by the fact that private gardening has to be conducted on much more economical lines in these days when almost all garden products are brought to our doors as cheaply as or even more so than we can grow them, and often of better quality.

The garden "rubbish-heap" has been and still is a great institution in most gardens, but is probably the most wasteful and expensive of any. I was brought up in the idea that the rubbish-heap was indispensable, but later experience taught me differently, and for many years I have done away with it altogether as a receptacle for garden refuse of any kind except in the case of ashes.

What caused me to do that was the difficulty of procuring sufficient manure for a large kitchen-garden, of keeping expenses within the desired limits, and the labour and waste involved in having such a heap

outside the garden. Let me give the readers some idea of what I mean.

In the garden where I was a learner, the kitchen-garden was about 10 acres in extent and had to supply a very large establishment in the North for two or three months in the antumn only. All the usual crops were grown extensively, and of course there was annually a great amount of what is usually called "rubbish" produced, consisting of weeds, Peaand Potato haulm, quantities of old Brassica tops and stumps, loads of shearings from the long herbaceous borders in autumn. leaves and much other vegetable refuse of various kinds. All these bye-products were carefully collected at much labour, and wheeled a distance of about 400 yards to an out-of-the-way corner where the heap would not offend the eye or the nose. Here they lay for a long period till more room was wanted, by which time the heap had rotted away until the largest portion of its manurial value had disappeared. In fact, a ditch had to be cut to carry the soakings of the heap away to the nearest stream. When the heap got to this stage of decomposition and waste it was wheeled back again into the garden for what it was worth; but much manure had to be bought as well to make np. What the making and unmaking of this heap cost to the proprietor I could not exactly say, but I have often roughly calculated since that the mere labour attending it would alone have gone far to have supplied all the vegetables needed at the mansion when the actual quantities consumed were reckoned up. One of the most striking facts, when one looks into it, in a kitchen-garden, is the exceedingly small proportion the vegetables actually consumed bear to the quantity of refuse produced along with it in the shape of straw, tops, leaves, stumps, stems, and roots, &c. In reckoning up this matter years ago, I made out that from a three-acre kitchen garden, closely cropped all the year round, the amount of plant food taken out of the ground by the vegetables and out-door fruits removed for use was, when reduced to its essentials, comparatively almost infinitesimal. The most exhaustive crops were Peas, Beans, Potatos, Cabbage, Cauliflower, and Strawberries, and of these a large portion of their food was derived from the atmosphere as well as from the soil, and a large portion of their substance left in the garden to be returned to the soil again unless it went to the rubbish-heap.

Viewed in that light, therefore, and considering the expense of the "rubbish-heap," I calculated that if I could return to the soil that portion of each crop that was not needed for consumption, such as stems and leaves, &c., and in the green state if possible, I should be putting back almost as much, if not more, than had been taken out of it, and that next to no other manure would be needed. I acted on that principle, and for over twenty years I never allowed a barrowful of weeds or other vegetable refuse to be removed from the quarter where they grew, or if it was not convenient to use it in that place it was used on the next plot for another crop. The saving in labour alone, by not having to collect this refuse and wheel it a long distance to a rubbish-heap and wheel it back again, or cart it away as waste, amounted to a considerable sum, and good mannre was saved.

Of course, in conjunction with such a system, it is advisable to follow some kind of rotation system, but that cannot be done in anything like the periodical way that rotation is carried out in agriculture, for the variety of crops required in a garden and the limited space at disposal prevent a very systematic rotation. But putting back into the soil an equivalent for what is taken ont of it makes rotation of less importance, as I found in the application of garden

I had one long north border, not of much use except for winter Greens and Turnips. and these crops were repeated year after year for some fifteen years without any appreciable difference in the quality and weight of the crops, and all the mannre applied consisted of the stumps and tops left on the borders of the previous crop, the difference, if any, being made up from the pleasure-ground compost heap, consisting mainly of grass and leaves and cleared off frequently, everything in the shape of prunings and sticks being converted into wood-ashes, and used mainly for the Strawberry quarter. In restoring this vegetable refuse to the soil again, I was careful not to bury it too deeply, as I considered it pure waste to trench rough green manure deeply into the soil. If a very rough lot of old vegetable refuse had to be dug in, the plan was to take out a good single-dig opening and bury the refuse as the digging proceeded. This was done in autumn, or early winter, and when the ground was cropped the following season the soil was not turned over again but only deeply loosened by the fork and sown or planted. At other times the ground was donble-dug, if the refuse was too rough to dig in one spade deep, but this double-dig rarely exceeded an actual rooting depth of 18 inches. During the number of years stated above I never bought any manure for kitchen-garden crops, except once or twice that I tried a little of a special manure on Potatos and Strawberries. I had also a very small share of stable litter, from which the droppings had been carefully sifted for mushroom beds, but that was hardly worth mentioning, and reliance was placed on the carefully-husbanded refuse annually returned to the soil.

There is one other important economical consideration, however, in the culture of shallow-rooting vegetable crops of all kinds that must be taken into account. The roots are always near the surface, and the soil between the plants being always bare, the evaporation is far greater than is generally imagined. No matter how richly the ground may be manured, if the moisture is deficient the crop will be deficient also. It was the culture of Celery that first drew my attention to that fact. Celery is usually a very heavily and expensively manured crop, often it is far too heavily manured, for, after all, the plant only demands a certain quantity of food, and to put more than that into a celery trench, in the form of a thick layer of good dung, as is usually done, is waste. What the Celery does not use is washed into the subsoil and lost. It is moisture in abundance that Celery wants more than anything else, and the rain will usually provide sufficient after the first waterings, and be more than equivalent to a large amount of rich manure, and will save the cost of providing it. To prove this I once planted two rows of the same kind of Celery in the

ordinary soil at the same time and otherwise under equal conditions except that one row was liberally manured from an old compost heap and the other was not manured at all. The manured row was left bare on the surface between the plants, and the unmanured row was thickly mulched with short grass from the lawn. Both rows grew fairly well, but the mulched, unmanured row certainly took the lead at the beginning, and kept it for the greater part of the season, the roots being always cool and moist under the grass, while the other was often parched, unless watered, which meant expenditure of labour and wages. Towards autumn, when the weather was more moist, the manured row began as I like with. It is three years since I took it in hand, not an inch of it is vacant. not a weed has been carried out, and not a morsel of manure brought in. came there was a good supply of garden rubbish of all sorts, including sticks and wood. I burned what I could, scattered the ashes on the plots, and buried all the rest in the first winter, and have had a record crop of Strawberries and Potatos, &c.

Included, I should state, under the head of garden rubbish are soap-suds and suchlike slops, which are all emptied at once on any quarter that happens to be vacant, and though the quantity may be small it is invaluable as a manure. J. Simpson.

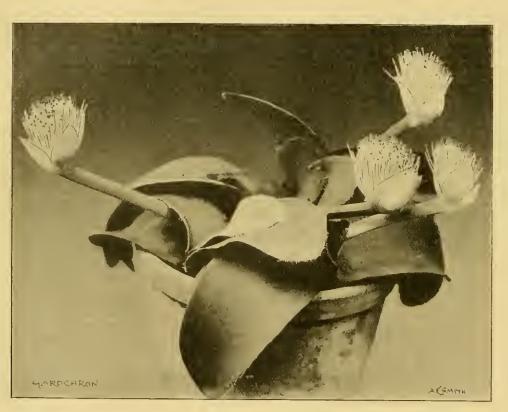

Fig. 36.—Hæmanthus virescens var. albiflos, trinity college botanic garden, dublin. (Photograph by Mr. G. E. Low.)

to make headway; but there was not much difference in the two at the end, only the mulched row eost considerably less. After that I gave up heavy manuring, and mulched all the rows, thus saving much artificial watering and manure.

Then there are the weeds. My plan of keeping all the rubbish where it grew and digging it in green or dead, I was told, caused more weeds to grow, but my experience was that it did not do so; although I was not one of those who were always hunting after every weed as fast as it appeared, because I think the cleaning and raking among vegetable crops are often overdone when much more important work is waiting. Once a member of one of our agricultural colleges, looking round, made the remark to me. "I see you have all the gardener's prejudices against weeds," and on my replying that I might have a worse fault, he added, "Yes; but it is overdone.

I find my system very useful and economical now that I have a garden I can do

HÆMANTHUS VIRESCENS VAR. ALBIFLOS.

ALL the South African Blood Flowers are very interesting greenhouse plants, varying considerably in size and habit; and several of them, such as H. cinnabarinus, H. insignis, H. Kalbreyeri, H. Katherinæ, H. multiflorus, H. natalensis, H. punicens, H. sanguinens, and H. tigrinus, have scarlet or crimson-red bracts or flowers. H. incarnatus has flesh-coloured flowers, and the plant illustrated, as well as H. hirsutus, has white flowers. All endure fresh and fair a long time in flower, and it is rarely that one can visit the greenhouse devoted to Cape bulbs, Heaths, &c., in the T-range at Kew without seeing some one or more of these species in bloom. We have heard these plants when in bloom irreverently referred to as "Paint-brush" or "Raddle-brush" flowers, but "Blood-flower" is even a more appropriate name. Even when out of flower their foliage is as a rule very distinct and effective, especially in the case of the larger-growing kinds. They grow freely in well-drained pots of fibrous loam intermixed with coarse sand or grit, and require plenty of water when growing or flowering; but

the deciduous kinds may be dry at resting time, or when the leaves turn yellow and decay. our old friend the Scarborough Lily (Vallotta purpurea) the Blood Flowers flower most freely and regularly when root or pot-bound; and I have seen both H. sanguineus and the variety now illustrated do well for years in a sunny window-garden near the sea. H. albiflos was originally introduced from the Cape of Good Hope in 1791, and was figured in the Botanical Magazine, t. 1239. The accompanying illustration is from a photograph taken by Geo. E. Low. Esq., in the College Botanical Gardens at Dublin, and shows the plant about two-thirds its natural size. F. W. Burbidge.

ORCHID NOTES AND GLEANINGS.

ODONTOGLOSSUM CRISPUM.

THE question, before asked in the Gardeners' Chronicle, "When is a crispum not a crispum?" is being frequently revived, the large importations of Odontoglossum crispum from different localities and their complications with other species growing with them supplying ample material to enlarge upon. Approaches to O. × Wilckeanum are the commonest; varieties with a snggestion of O. × Andersonianum have also flowered, and now F. Menteith Ogilvie, Esq., The Shrubbery, Oxford, sends a very pretty spotted form about which, after asking the question above referred to, he says, "In my opinion it is a true crispum; but experts differ very widely as to when a flower is a crispum and when it is an Adrianæ. The flower is off a miserable little bulb, and is no sort of guide, I imagine, to what it should be if we can grow the plant strong; but it has some obvious merits even now; the shape is very good, and the spots stand out very distinctly against the nearly pure white ground."

The flower is of that neatly-formed class of which a small importation, some of which flowered with Sir Trevor Lawrence, Bart., appeared several years ago. It has a profusion of reddish-purple blotches, and when perfected will be a very handsome flower. The only suggestion of O. × Adrianæ is in the crimped and fringed lip, which also bears a row of small reddish spots on the upper edges. It is a very pretty flower, and appears to be as good a "crispum" as some others

to which the name is accorded.

CYMBIDIUM GRANDIFLORUM.

The fine flowering of a moderately-sized plant of this grand Cymbidium by Mr. W. P. Bound, gr. to Jeremiah Colman, Esq, Gatton Park, especially after such a protracted spell of dull weather, is a commendable cultural event. The plant, which is often called C. Hookerianum in gardens, is one of the finest of the genus, but it has always had a bad reputation for being difficult to flower, and for coming deformed when flowers have been produced. It often sends out the inflorescence in autumn or early winter, and buds appear which seem to remain in the same condition for several months, and then do not develop properly. The delay in expanding the flowers is due to the absence of the necessary sunlight in all probability, and the consequentimperfect development of the flowers.

The specimen shown by Mr. Bound in Mr. Colman's Gold Medal group at the Drill Hall on January 26 was also a very fine variety, the lip being large and finely spotted. .The basal flowers, from which the pollinia had been removed, also showed a great difference in the colour of the lip, which was changed to a reddishpurple tint. The change of colour in fertilised flowers is not uncommon.

It is a native of the Eastern Himalaya, altitude 5,000 to 7,000 feet, and it grows well in an intermediate-house.

MUSA SUPERBA.

Mr. W. S. Millard, writing from Malabar Hill, Bombay, obligingly sends us photographs of the Wild Plantain of the Western Ghats (figs. 37, 38). The Palm in the background is Caryota urens, about 40 feet in height, and covered with Bignonia venusta. The second illustration shows the flower-stalk with its enveloping bracts. The photographs were taken by Mr. N. C. Macleod. Musa superba is fully described in Hooker's Flora of British India, vi., 261; and in Schumann's monograph in Engler's Pflanzenreich (Musaceæ). (1900). It produces no stolons, and dies after flowering. The flowers are ten to twelve in number in the axil of each bract, the bracts themselves being dull red; see Bot. Mag., t. 3849. The fruit is not edible.

NOTICES OF BOOKS.

THE FLORA OF THE SUNDRIBUNS.*

THE name given to the immense area forming the delta of the Ganges and the Brahmaputra

ward to Chelmsford, St. Albans, Oxford, and Bristol, the whole nearly covered with forest, and traversed from north to south by a dozen large rivers or, in some instances, arms of the sea, connected and cut up by innumerable rivulets and creeks, and you will have an idea of the Sundribuns. Practically the whole area, which Prain estimates at 7,000 square miles, is under tidal influence, and large tracts are submerged at every tide. The banks of the rivers and the margins of the islands are the highest land. Frequently spring tides break through the banks and open fresh channels, and sometimes tidal waves devastate large tracts. Thus in October 1876, a wave 10 feet high swept over the islands at the mouth of the Megna, the eastern boundary of the Sundribuns, and 98,000 persons were drowned. The river Hughli, on which Calcutta is situated, forms the western boundary of the Sundribuns.

Major Prain has brought together the data and materials of previous explorers, and consolidated them with the results of his own investigations.

shrubs, and herbs, common on other parts of the Bay of Bengal, is not so easily accounted for. Prain gives a list of 35 species of this category, most of which have a very wide range on tropical shores and are characteristic throughout tropical Polynesia, both on volcanic and coral islands. Calophyllum Inophyllum, Heritiera littoralis, Suriana maritima, Sophora tomentosa, Guettarda speciosa, Scævola Kænigii, Cordia subcordata, Tournefortia argentea, Hernandia peltata, and Cycas Rumphii are among the absentees Possibly they will only thrive in shingle or sand, of which there is comparatively little on the surface of the delta, though Prain describes a line of low sandhills as existing on various parts of the coast where it is subject to the influence of the waves.

The composition of the forest varies considerably in different parts, and offers some anomalies of interest to the cultivator. For example, Heritiera minor, which abounds almost throughout the Sundribuns, except in the coast-belt, does not thrive so well in the Calcutta garden as

FIG. 37.—MUSA SUPERBA, THE WILD PLANTAIN OF THE WESTERN GHATS.

FIG. 38.—MUSA SUPERBA, SHOWING THE END OF THE SPIKE WITH THE BRACTS ENVELOPING THE FLOWERS.

has as many variants as Maulmain, otherwise Moulmein, &c. Most of us of the older generation learnt to write it "Sunderbunds," but Mr. C. B. Clarke, who dealt with the subject in a presidential address to the Linnean Society, discusses the derivation of the word, and explains that it is from Sundri, the Bengali name of Heritiera minor (syn. H. Fomes), and bun, a forest—that is, Sundri-forest. He transliterates it "Soondreebun," which, in his opinion, more nearly expresses the native pronunciation, and he rejects the terminal "s" as a spurious and unwarrantable addition: but Major Prain retains it.

So much for the name; now for the place. Imagine the south coast of England, from Beachy Head, in Sussex, to Start Point, in Devonshire, as that throughout as Pevensey Marsh, between Eastbourne and Bexhill, and extending north-

If his "Flora" is not absolutely exhaustive, it is sufficiently so, I believe, for all practical purposes and theoretical deductions. The total number of species of flowering plants and Ferns is 334, belonging to 245 genera and 75 natural orders. The number of species, small as it is for so large an area, would be considerably reduced by the elimination of those intentionally or unintentionally introduced by man. Prain estimates these at 36 and 58 respectively, which leaves 240 species only in the natural flora of the delta. It is assumed that these 240 species arrived by various animate and inanimate agencies; aquatic and frugivorous birds being responsible for 30 and 23 respectively; winds for 50; rivers, 41; and tides, 96. The preponderance of species from tidal-borne seeds is interesting, and may be accounted for by the fact that of the numerous seeds brought down by the rivers, and just as likely to be cast ashore at the meeting of the waters, few would grow in the brackish mud of the delta. The absence of a very considerable number of essentially or exclusively littoral trees, H. littoralis, a species more tolerant of salt water. Again, Phenix paludosa, the only palm of the district, and common everywhere on or near the banks of the tidal rivers, grows much taller in the Calcutta garden than in a wild state.

Excecaria Agallocha grows equally well in the Mangrove and Sundri forests and at Calcutta. Sonneratia apetala, which practically ceases where the Mangroves begin, survives, but does not thrive at Calcutta. Major Prain's paper abounds in information of this kind. A section on "root-suckers" and their functions is specially interesting.

The most remarkable feature of the Sundri forest is the crop of vertical, blind root-suckers emitted by the roots of various trees, notably by those of the Sundri (Heritiera minor) itself, but also by Amoora cucullata, Carapa gangetica, Sonneratia acida, S. apitali, Avicennia officinalis, and Phenix paludosa. The root-suckers of different trees vary considerably. In Phenix paludosa the roots, which pass almost vertically downwards, give off numerous branches that pass

^{*&}quot;Records of the Botanical Survey of Iudia," Vol. ii., No. 4, with a map. By D. Prain.

[†] Proceedings of the Linnean Society of London, 1894-5, pp. 16-29.

vertically upwards. The vertical branches are usually small and somewhat inconspicuous, differing little in appearance from those growing downwards; but their structure is peculiar, and it is supposed that their function is respiratory. The root-suckers of Avicennia are also small, but more conspicuous as they appear in lines from the long horizontal roots. They are soft and pith-like, and much too flexible to serve either as mechanical supports to the tree, or to any great extent in arresting silt or rubbish. They rise well above the mud in which the true roots are buried.

The root-suckers of Sonneratia apetala and the rest of the trees named above exercise a decided mechanical effect. They appear in long, close lines, stretching 150 feet or more from the trunk of the tree, and they vary in size and height according to their position. When roots and suckers are buried by accumulations of silt, fresh roots and suckers are developed at a higher level, and the buried ones decay. In all cases it seems their tips are above high-water level, and it is assumed that they always act as respiratory organs. IV. Botting Hemsley.

"WHO'S WHO" is a very serviceable publication, as it not only tells us who's who, but what he is. It now forms a thick volume of of 1,700 pages in double column. In addition to this volume the publishers, Messrs. A. & C. Black, now issue a Year-Book at the price of 1s., containing the tables formerly inserted in the larger volume, but deleted to afford more space for biographical details. It contains all that any one ordinarily wants of the information found in the various Year-Books, Parliamentary Annuals, the Foreign Office, Colonial and Indian Lists, besides including much miscellaneous information usually only to be gathered from very many different sources. Among the contents are tables of pseudonyms, peculiarly pronounced proper names, professors, societies, academic degrees, Government officials, and many others.

THE ENGLISHWOMAN'S YEAR-BOOK AND DIREC-TORY, 1904. Edited by Emily Jones. (Adam & Charles Black, London.)

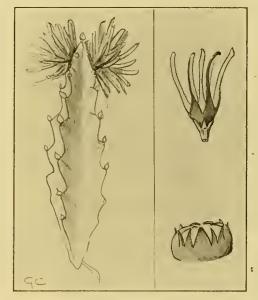

This is the twenty-fourth annual issue of this useful publication, concerning which it is truly claimed that no other handbook covers the same ground. It deals with women's work in education, medicine, science, literature, art, philanthropy, &c.; and, as a reference book, should be in the hands of every working woman. Under the heading of "Agriculture and Gardening" we find enumerated the various institutions admitting female students and workers, including the Horticultural College, Swanley, now wholly devoted to the instruction of women; the Royal Botanic Society of London's Practical Gardening School for Ladies, and the Royal Botanic Gardens, Glasnevin, Dublin, where two ladies are admitted to work, no payment being given or received. The examinations of the Royal Horticultural Society are also mentioned, as are the Edinburgh School of Gardening for Women, the Women's London Gardening Association, the Countess of Warwick's Agricultural Scheme for Women, and the Women's Agricultural and Horticultural International Union. All these Associations do but prove what we have frequently said before, that for the lighter work of horticulture and agriculture, for delicate experiments and florists' work, there is an excellent opening for women. Heavy outdoor labour in all seasons and under all conditions is not a fit occupation even for the strongest woman, though a short experience of it may be necessary for those who intend to make their living by such branches of the subject as are within their capability.

ONE AND ALL GARDENING.

This publication for 1904, edited by Mr. Edward Owen Greening, is now ready, and is procurable from 92, Long Acre, W.C. The contents are, as usual, very varied, and include practical information on gardening as well as articles and notes of more popular interest. The pages are profusely illustrated, and as the price asked for the book is but 2d., it may be considered to be cheap as well as attractive.

A TREATISE ON MANURES.

A third edition of Dr. Griffith's work on this subject has been published by Whittaker & Co. It is intended as a practical handbook for the agriculturist, manufacturer, and student. The gardener too will find it a useful book of reference. Dr. Griffith is, as will be remembered, a great advocate for the use of iron sulphate in proper proportions as a fertilising agent, when used together with artificial manures or farmyard manure, and with lime when that substance is deficient in the soil. As a preventative of Potato-disease, Dr. Griffith recommends a top-

F10 39 —CARALLUMA MUNBYANA AND PLOWER.

dressing, consisting of $\frac{1}{2}$ cwt. iron sulphate per acre mixed with five or ten times its weight of sand, when the haulms are a few inches above ground; or a solution may be used containing from 1 to 5 per cent. of the iron salt, and distributed by means of a Strawsoniser at the rate of 2 gallons an acre. If this result is confirmed, the use of the iron sulphate would be much more convenient than the employment of Bordeaux-mixture.

CARALLUMA MUNBYANA.

THE drawing I am sending you represents a single stem of this species in natural size, which grows in patches, like most Stapeliæ. The stems are 4-angled, the sides between the angles flatly canaliculated, and the angles are serrato-dentate, each tooth being terminated by a well-formed though very little cordate triangular leaflet. The colour is pale greyish-green. The flowers spring from near the top of the stems, about 4-6 together, from an extremely short extra-axillar peduncle. The buds are cylindrical obtuse, and the open flowers do not differ greatly. The pedicels are very short and angular; the sepals more than half as long as the tube, but not reaching the sinus between the segments of the corolla. Corolla very shortly campanulate, deeply divided into very narrow linear segments with replicate margins, glabrous throughout, chocolate-brown. The form is shown in the drawing; it is cupular, the inner lobes are triangular, incumbent, and shorter than the anthers; between them rise two other smaller lobes, which are upright. The smell of the flowers is very disagreeable.

It is a native of Algiers, where it grows on rocks near Oran, &c. Prof. Trabut, Algiers, told me that the natives eat the stems of this plant. It usually flowers at La Mortola at the beginning of October. Alwin Berger, La Mortola, Italy.

TREES AND SHRUBS.

ERICA LUSITANICA.

Whilst this Heath is only suitable for the warmer parts of the British Isles, it is, in places where it succeeds, perhaps the most beautiful of all the taller species. In some parts of our south-western coasts—South Dorset, for instance—it thrives to perfection. In parts of that county it has become almost naturalised, reproducing itself from self-sown seed. But owners of gardens farther north will find it a charming plant to have. In most districts south of London it is hardy, surviving all but the severest winters if given a sheltered place—protection, that is, from north and east winds. It is a native of Spain and Portugal, but has also become naturalised in parts of France.

From the remainder of the hardy Heaths this differs in the beautiful plume-like character of its branches, these being thickly furnished with rather pale but vivid green leaves, linear, as are those of all Heaths, but finer and less rigid than those of the other species. The branches are erect, and the shrub growe to be 6 to 8 feet high in time, unless cut back by exceptionally hard frosts. The flowers usually commence to open about the present time, perhaps earlier in the south-west, and, being produced in astonishing profusion over all the small twigs, they transform the whole branch into one enormous panicle of blossom. The flowers are white, touched with rose, individually small and campanulate. They remain in beauty till well into April. It should be mentioned that this Heath is also known in gardens by Lindley's name, E. codonodes (see fig. 41, p. 91).

PHYLLOSTACHYS CASTILLONIS.

During the past two or three years several hardy Bamboos have flowered, but I do not remember that any record has been made of the flowering of Phyllostachys Castillonis. It flowered during the past autumn in the Bamboo-garden at Kew. The distinctive characters of this Bamboo are its frequently variegated leaves (which are striped with yellow); and still more, its beautiful yellow stems. These latter are more decidedly yellow than those of any other Bamboo we cultivate in the open air, the yellow being relieved by a broad band of dark green, which traverses the flat side of the stem from one node to another on opposite sides of the stem alternately. Having had hitherto only vegetative characters such as these to distinguish most hardy Bamboos one from another, their real affinities could only be guessed at. Now that several have flowered we find (as has, indeed, been all along suspected) that several of the so-called species are in reality merely forms of one species in the eyes of the botanist. Thus, Phyllostachys nigra, P. nigra punctata, and P. Henonis are exactly alike in floral characters; and now that P. Castillonis has flowered, it proves, according to the determination of Dr. Stapf, to be one of the same group, the flowers being indistinguishable from those of P. nigra and P. Ilenonis. W. J. Bean, Kew.

THE MANGO (MANGIFERA INDICA).

THE Mango (Mangifera indica) is almost as well known by name in this country as though it were a native plant, a fact due to the reputation the fruit has in India, not only amongst the native population, but also amongst Europeans. To an ordinary Englishman, however, the taste of a Mango is quite unknown, as it is one of the tropical fruits that has still to take its place in the English fruit-market, though in small quantities it may be had preserved in syrup. Its appearance as an imported fruit in its fresh state may be anticipated when it is considered how widely spread the tree has become in the tropics. Of the varieties of cultivated Mangos in India, Mr. Maries states, as quoted by Dr. Watt in his Dictionary of Economic Products, that they have arrived at a great stage of perfection, and consist of very numerous races, although these are unknown to most people except as Bombays, Lungrahs, and Maldas. The many dozens of sorts sold in the bazaars under these three names have given rise to the idea that there are only three kinds of Mangos fit to eat. These three names really represent three distinct strains of cultivated fruits. It is interesting to note the changes that have taken place in these fruits. The form or shape has continued almost the same as that of the wild varieties, but the flavour has developed from "toward turpentine" to something too exquisite to express in words, each good variety having a flavour of its own. Of the cultivated sorts of Mangos, as many as 500 have been collected, from which a selection of 100 good kinds has been made. Besides the value of the Maugo as an edible fruit, it is also used in curries, salads, for making chutney and for various other uses.

The Mango is mostly propagated in India by grafting, and bearing upon the importance of this system of cultivation, we may draw attention to the following paragraphs from some recent numbers of the Agricultural News of the West Indies: "The regular and permanent improvement of West Indian fruit of all kinds is a matter of the utmost importance. It is desirable in these days we should steadily keep in view that to continue to grow from seed such fruits as Mangos, Oranges, Avocado Pears, Sapodillas, Guavas, Star Apples, and the various fruits known in the West Indies as Plums and Cherries, is not only a waste of time and opportunity, but it is a contession of our want of appreciation of the advantages to be derived from the skilful utilisation of our surroundings. It is hoped that at all botanic stations, agricultural schools, and experiment plots throughout the West Indies special attention will be devoted to budding and grafting fruit-trees, and that only budded and grafted sorts of known merit will be planted-out at these institutions.

"The Mango is possibly the most popular of West Indian fruits, and when of really good quality the most highly esteemed of all tropical fruits. There is no difficulty in propagating the best sorts, and we trust to see the day when budded and grafted Mangos will occupy the place of the thousands of useless Mango-trees that now cover the land. We are led to these remarks by the receipt, from the Curator of the Botanic Garden at St. Vincent, of a delicious grafted Mango known as the Peach Mango. It is a large plump fruit weighing 10 to 12 oz. yellow when ripe, juicy, of a delicate flavour, and free from fibre. It well answers its name of Peach Mango."

On the subject of extending the Mango season, the following remarks further occur in the same journal: "Sufficient attention does not seem to have been directed to efforts for extending the Mango season by selecting early and late sorts, and cultivating them with the special view of producing fruit earlier or later than the ordinary sorts. It is suggested that a list be prepared of early and late varieties of Mangos, and when this

is done it would be well in grafting them that early-fruiting sorts be grafted only on seedlings of early-fruiting sorts, and vice versa, instead of promiscuously, as at present. We commend the business of raising grafted Mangos to some of the more enterprising of the small proprietors in the West Indies. Grafted Mango plants of first-rate quality and true to name would readily sell for a dollar a-piece."

It is to be hoped that these endeavours to improve the Mango cultivation in the West Indies will be fraught with success, and lead to a large shipment of the fruits to this country. John R. Jackson, Claremont, Lympston, S. Devon.

THE BRUSSELS BOTANIC GARDEN.

THE LATE M. CREPIN.—It is proposed to place in the Brussels Botanic Garden a bust of the late Professor, who did so much for the flora of his native land, and who will be long remembered for his indefatigable researches in the genus Rosa. A summary of his classification was given

M. LEO GENTIL,

CURATOR OF THE BRUSSELS BOTANIC GARDENS.

in our own columns, and it is thought that some of our rosarians, to whom his stores of knowledge were always at command, might like to contribute to the memorial. The minimum subscription is fixed at 5 francs. Those who subscribe 10 francs and upwards will receive a photograph of the bust when placed in position. M. Durand, the Director of the Botanic Garden, is the treasurer to the fund, and we shall be happy to transmit to him any sums we may receive for the purpose.

We take the opportunity of presenting to our readers a portrait of M. Leo Gentil, who has recently succeeded to our old acquaintance, M. Lubbers, as Curator of the Botanic Garden. M. Gentil has many friends here, where he passed some time in the propagating department of the Royal Botanic Gardens at Kew. For some time he held an important post as chief forest inspector in the Belgian-Congo provinces and was successful in promoting the culture of rubber and other useful trees, and in enriching the Brussels garden with numerous introductions, some of which have been described by M. De Wildeman.—The effects of ether in the forcing of plants have lately been tested with success in the Brussels Botanic Garden.

VEGETABLES.

POTATOS.

Mr. II. Green (p. 54) is certainly to be congratulated on his experience. I have a lively recollection of a promising patch of Ashleaf in a southern county, planted on a south border early in March, that when well advanced in growth was greatly checked by frost. A few years back, in Northamptonshire, the main crop planted in April was cut down twice by frost, the couse-quence being a poor crop and small tubers.

I have a pleasaut remembrance of some Potatos grown in a garden near the downs, a few milee from the south coast, the produce of which played a creditable part at the first show of the International Potato Society held at the Alexandra Palace. The sets were carefully selected and prepared, the ground well worked by trenching. They were planted in the first week of April, the rows 3 feet apart, and not so close in the rows as Potatos are ordinarily put. The crop was a good one, and the tubers were of clean skin, large in size, and good in quality, being free from disease. I think that close planting, superabundance of haulm, and unfavourable climatic influences are conducive to disease, which, if spraying will check, is labour well expended. Geo. Potts, Streatham, S.W.

AMERICAN GRAPES.

I was interested some time ago in the discussion in the Gardeners' Chronicle as to the merits of the "Strawberry-Grape," but was in hopes some abler pen than mine would have given Dr. Bonavia information upon the less known varieties, that he rightly assumed must be grown in private gardens in this country.

I have grown about ten of the American varieties for some years, and have no doubt that the liking for them has to be acquired, as all have that peculiar flavour and aroma which some gentleman so facetiously described as like that of a "scented slug."

My own opinion is that they are not to be compared with our best flavoured English Grapes; but all tastes are not alike, and anything that makes an addition to our dessert should be welcomed. They are much appreciated here by my employer and the numerous visitors, and every season I am ordered to send some to my employer's friends by special request. A well-known Baronet some three years ago was so much taken up with them that he wished to procure canes to plant a new vinery, but though his gardener appealed to all the leading nurserymen in England, I believe he had eventually to get them from America. The following are the varieties I grow:—

Blacks.—Worden, Concord, Emmelan, Isabella, and Strawberry. These differ very little in flavour, bunches and berries (with me) smaller than the Hamburgh, but vary in the order of ripening, Worden and Concord being considered the earliest. All carry a rich bloom.

Reds.—Delaware, Brighton, and Iona. I have put these in their order of ripening. Delaware is very small in bunch and berry, but will crop at every joint. Brighton and Iona are larger in bunch and berry than Delaware, and I consider the last-named variety one of the best to grow, as it will hang longer fit for use than any of them.

Whites.—Winchell (or Green Mantain), similar to Delaware in size, but colour of a greenish-white. Niagara I consider the best in appearance and size of berry and bunch; in appearance similar to Foster's Seedling.

All these I have grown for several years in an unheated lean-to house with a west aspect, and considering the bad season last year, I think it speaks volumes for their constitution when I say that most of them set and ripened crops without showing a speck of mildew or other disease. Of course they grow much better and finer under more favourable conditions; but I have given my experience to show that they may be grown by any novice. If I remember rightly, there used to be some planted on one of the outside walls at Chiswick, but I could find no Grapes on them at the time of my visit. I remember reading at the time of the Phylloxera scare that the French growers were experimenting with them as stocks for their Vines, to ward off the attacks of the unsect at the roots (these being of a more fibrous nature than our own). It would be interesting to know if this was successful. [Eminently so.—Ed.]

Perhaps Messrs. Veitch, of Chelsea, will correct me if I am wrong; but I believe they are now stocking most of the varieties, and would no doubt be able to supply anyone with plantingcanes. W. Peters. Givan Gardens, Leatherhead.

FRUIT PROSPECTS FOR 1904.

FRUIT trees of all kinds in these gardens look very promising for fruit-buds. Our trees are greatly improved by the rains of last season, judging by present appearances; but they may suffer yet, if severe weather comes later and injures the wood, which in some trees is not so hard as one would wish. During the last four or five years, in gardens not provided with an abundant supply of water, and where the trees have cropped heavily, the more than average rainfall must have considerably benefited fruit trees. A very heavy rainfall has been recorded in many districts during 1903, yet from the various returns which I have seen it appears to have been partial to some districts. Many times last year rain fell within two or three miles, when we had none. Our measurements for the year are 32.55; the wettest months being January, March, October (5.77), and December. I find, on referring to data, that in 1899 we registered 32.75, but at stations a few miles distant from Poltimore several more inches are recorded for last year.

A noticeable circumstance among our trees, and in others which I have seen, is the absence of strong shoots or exuberant growths; many trees have not made more than 6 inches of growth. Where this is the case I find fruit-buds more abundant. I think the small quantity of wood made in proportion to the amount of moisture received is due to lack of sun, the land not having been warmed sufficiently. The fruit-trees that suffered most with us were the Peaches and Nectarines on the walls; many of the trees had quite half of the branches killed back by the severe weather last spring. They have, however, made plenty of shoots since. But they grew until quite late in the season, and though there is plenty of buds I fear the wood is too soft and unripened to yield a large crop.

Last year many of our Pears never grew larger than Walnuts, they attained to that size and there stopped, and although they remained on the trees, no further swelling of the fruits happened. exception was Pear Charles Ernest, and at the risk of digressing may I be allowed to say another word in favour of this variety, which I think may be aptly described as a late Doyenné in flavour, size, and appearance? I had it up to twenty ounces in weight.

While established fruit-trees of all kinds made no extraordinary growth during the past season, those planted in the autumn and winter of 1902 and 1903 made still less. The principal shoots of such young trees never started into growth, nor was there much lateral growth; all these trees appeared to do was to plump up the buds of the previous season. T. H. Slade, Pollimore Gardens, Exeter.

The Week's Work.

THE KITCHEN GARDEN.

By John Pentland, Gardener to C. H. B. Firth, Esq., Ashwicke Hall, Marshfield, Chippenham.

Hotbeds.-Prepare hotbeds for Cucumbers and Vegetable Marrows if early supplies are needed. We have had Marrows fit for use in the last week in April. If brick pits are not available, adopt the method explained in a previous Calendar for erecting frames for Peas. Take out the soil 2 feet deep over a space 2 feet longer and wider than the area covered by the frame. Make a bed of manure and leaves in the frame, making the back 5 feet deep, the front of the bed 4 feet deep. Beds made in this way retain the heat longer, and the frames are not so difficult to manage.

Seakale.—When taking up crowns for forcing there are usually several long roots broken off. These should be collected and cut into lengths, then dipped in dry lime and put thickly in boxes of sandy soil with the thick end of the roots up. Remove the boxes to a cold frame, and protect them from frost. These cuttings will be useful for making fresh plantations. Introduce fresh batches into heat as required to maintain a supply for the table. If it is intended to force any roots where they are growing in the beds, put a few shovelfuls of ashes or cocoanut-fibre round each crown, and, after putting pots over the crowns, cover with a few barrowfuls of manure, sufficient only to generate a mild heat, as this will be sufficient to excite them into growth at this season.

Parsley.—If the supply is not sufficient, sow seeds in boxes or on mild hotbeds, and seeds may also be sown out-of-doors in favourable localities. also be sown out-or-doors in invourance localities. If frames have been placed over plants which have been "hard pulled," bank sufficient stablemanure round the frame to raise the temperature. Ventilate the frame sufficiently, but "husband as much sun as possible in the afternoons. Such herbs as Parsley and Mint, which are almost in daily demand, should be grown in sufficient quantity to meet any requirements that may arise. Plant new beds of Mint out-of-doors on well prepared soil. Should the soil be of a heavy nature, afford a covering of used soil from the potting shed.

Thyme, Common and Lemon.-Should the stock of these be short put a few plants in a box or in pots of sandy soil, spreading the shoots well out, and work the soil amongst them. Afford a temperature of about 55°, when they will soon produce cuttings, which may be taken off and rooted in the usual way. Prick out the rooted cuttings into boxes of soil, and gradually harden the plants for putting into beds, or "edgings" to beds containing other plants.

Sweet Basil is another favourite with cooks-Never allow the supply to run short. Sow seeds in boxes at intervals. Provide these boxes with Sow seeds good drainage, covering the crocks with rough material. Then fill to within $\frac{1}{2}$ inch of the top with a porous compost. Sow the seeds and cover them 1 inch. Afford a temperature of 60°, and let water be given carefully, for although of easy culture under proper conditions, Basil soon becomes yellow and sickly if kept too moist.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, gr., Wrotham Park, Barnet.

Apricots.—As Apricot-trees flower very early in the year, they should be pruned early, that the branches may be trained before the buds become too advanced. Use planks for the men to stand upon when doing this work, especially if it is done when the soil of the borders is wet. Training a sufficient emptity of suitable shoots to make in a sufficient quantity of suitable shoots to make good any gaps there are, and to replace worn-out, unfruitful branches. Prune back to a couple of visible huds all fore-right shoots, shorten leading growths to a point where the wood is thoroughly ripened, and endeavour as far as possible to secure plenty of fruiting spurs close to the wall. In securing the branches and young shoots to the walls or wires, let the shreds or ties be sufficiently large to allow the shoots to swell without be-coming pinched. Avoid bruising the bark with

the hammer. Old walls should be thoroughly "pointed," and all crevices, &c., made good, to prevent harbour for woodlice and other insects destructible to ripe Apricots. When the training of the trees has been done, clear away the prunings, and pick up old shreds and any nails. Afterwards remove a portion of the top soil, and then afford the border near to the roots of the trees a good dressing of bone-meal and woodashes, pricking this in lightly among the roots with a fork, and finally top-dress with sweet pasture loam cut a year ago, and old mortar-rubble and burnt earth. If the trees are young and very vigorous, no bone-meal need be applied. Young trees may still be planted; but before planting see that the borders are well prepared by being provided with good drainage, and made of brown, fibrous loam, with additions of old mortar-rubble and a little well-decayed manure. The soil should be made moderately firm previous to planting the trees. Good useful varieties of Apricot will be found in Moor Park, Blenheim, Grosse Pêche, St. Ambroise, and Large Early.

Plums.—We have still a few of these left unpruned, but they will be attended to without delay. Probably the most profitable system of training these on walls is that of the fan, for gaps caused by branches dying may be more quickly refilled if trained in this manner. Prune weak shoots not required for training to a couple of eyes, but preserve any that will be required to fill up bare spaces, shortening such in a more or less degree as appears desirable. Wood two years old usually fruits best when nailed close to the walls. Do not hesitate to grub out any trees that are unfit for hearing crops, and replace them with young trees of useful varieties. Monarch is a grand kitchen variety, and a sure cropper; Coe's Golden Drop should be grown for dessert in any collection.

PLANTS UNDER GLASS.

By C. R. FIELDER, Gardener to Mrs. Burns, North Mymms Park, Hatfield, Hertfordshire.

Moschosma riparium.-Plants that are out of bloom should be cut back slightly, at the same time reducing the supply of water to the roots, and they may then be placed in a greenhouse to rest for the next two or three months. May or June is quite early enough to propagate this winter-blooming plant, in fact this year we shall put in a batch of cuttings even later than that. This species makes growth and roots very freely, and when propagated too early becomes root-bound, and consequently loses its foliage.

Bouvardias and Fuchsias.—Let some strong plants of these be placed in heat to produce cuttings. After pruning the Bouvardias sufficiently to remove the dead portions of the shoots, place the plants in the stove or propagating-house and afford a watering. When the young shoots are 2 inches in length, cut them off with a heel and insert them around the sides of pots filled with sandy soil. Afford a watering, and plunge the pots in the propagating frame. Bouvardias may also be propagated by means of root-cuttings, but for this purpose two-year-old plants with strong roots are necessary. The soil plants with strong roots are necessary. The soil should be shaken from the roots, and the strongest of these cut into lengths of an inch and a half. The pots for root-cuttings should be filled to within au inch of the rim with sandy soil; lay the cuttings on this and cover them with $\frac{1}{2}$ inch of soil, then plunge the pots in the propagating-frame. A few Fuchsias should also be pruned slightly and placed in gentle warmth, and they will soon make growths. Remove the best of these when about 2 inches in length, and insert them in pots filled with a light sandy soil, then place the pots under a handlight or in the propagating-frame.

Allamanda nebilis .- If plants are required to bloom early, some that have rested should now be cut back and introduced into heat. Let the cut back and introduced into heat. Let the current season's growth be shortened to within 12 inches of the old wood, except where longer shoots are required for furnishing the trellis, when the unripened portions of the shoots only need be cut away. Place the plants in a temperature of 65°, and plunge the pots in bottom-heat if this is convenient. When the plants have made 2 or 3 inches of growth turn them out of their pots, and reduce the size of the ball considerably; then put them into pots sufficiently large to afford the plants a good shift. A suitable soil may consist of three parts good loam and one part leaf-soil, adding some silver-sand and crushed charcoal or burnt ballast, and a 6-inch potful of bone-meal to each barrowload of compost. The smaller-flowered variety of A. cathartica, known as Williamsii, may by frequent stopping he made to grow in bush form without the aid of a trellis. If young shoots be taken off with a heel at this time, when about 3 inches in length, and inserted in small pots filled with light sandy soil, they will root freely if the pots be plunged in a hotbed or propagating-frame; and if when rooted they are potted into larger pots, and the points of the shoots taken out several times during the season, nice bushy plants will be formed by the end of the summer that will afford a truss of flowers on each shoot. Six-inch pots are sufficiently large for the final potting. When fully established the plants should not be shaded.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor LAWRENCE, Bart., Burford, Dorking

Temperatures .- During the month of February the night temperatures of the various divisions may range as follows: East Indian-house 68°, Cattleya-house 63°, Mexican-house about 55°, Intermediate-house 53°, and the Odontoglossum-house 50°. These figures should be adhered to in mild weather, but sharp frost or cold piercing winds prevail the warmth may be allowed to decline a few degrees from the temperatures indicated If by early morning the thermometer in either house shows a fall of 5°, the temperature should be raised by small sharp fires, so that should the sun make its appearance during the morning the fires will be small that they may be easily cheeked. It is a mistake to make up large fires in the furnaces during the early hours of the day at this time of the year, because if the sun shines out suddenly the increased warmth in the houses is not at all suitable for the plants. In such circumstances it will be necessary to draw out some of the fire as speedily as possible, and throw in a moderate quantity of damp ashes. Afford a little extra air also to every department through the hot-water-pipes. those ventilators nearest When it is felt that the heat in the pipes has declined, let the fires be thoroughly cleaned, and restart them again gently. The day temperatures must be maintained to the above figures so far as fire-heat is concerned, but a rise of several degrees by sun-heat is beneficial to Orchids generally, and at the same time a good opportunity is given to gradually increase the amount of ventilation in every house.

Atmosphere.-In the stove or East Indian-house the paths and stages should be damped down in the morning as soon as the proper temperature is reached, always thoroughly soaking the ground immediately under the hot-water-pipes. Damp well between the pots of all plants that are in full growth, as Cypripediums, Vandas, Aërides, Angræcums, Anæctocbilus, &e., both at morning and evening. The atmosphere near such plants as the deciduous Calanthes, Habenarias, and Dendrobiums that are at the flowering stage should be kept comparatively dry. Since the beginning of November the floors of the Cattleya and Mexican-houses have not been damped, the usual watering of the plants being sufficient to keep the pseudo-bulbs and leaves plump and healthy; but as the days lengthen and the weather becomes warmer, a gradual increase of atmospheric moisture will be afforded. Young seedling Cattleyas and Lælias, which are nearly always in a growing condition, require rather more heat and moisture. The intermediate-house, which contains such plants as Cymbidiums, Epidendrums, Sobralias, Cœlogynes, Maxillarias, Cypripediums, Vandas of the tricolor section, and numerous other species, will require a thorough damping between the pots in the morning, but less will suffice in the afternoon; plants of Miltonia vexillaria also occupy a position on the stage in this house, but during dull or wet weather we do not damp between them, as by so doing the leaves are apt to damp off at their points. The cool or Odontoglossum-house with a northern aspect will require but little damping at present; but where a considerable amount of fireheat is required to maintain the correct temperature an occasional damping-down will be necessary. A span-roofed house running north and south will require a light or heavy damping according to the state of the weather outside.

FRUITS UNDER GLASS.

By W. FYFE, Gardener to Lady WANTAGE, Lockinge Park, Wantage.

Melons.-In planting Melons at this season a regular and lasting bottom-heat is necessary, and it should be provided by hot-water-pipes. Before making a flat bed 2 feet wide upon the grating over the hot-water-pipes we place whole turfs 4 inches thick, grass-side down, and upon these are spread lime-rubble with some approved fertiliser. Then a layer of one more turf is made, which makes the bed 8 inches deep. Along the middle under the wires single turfs are placed 2 feet apart, into which the balls of the plants when turned from the pots are halfway inserted when the bottom-heat has reached 75°, distances of 2 feet separating each plant, and they are trained on the one-stem system. If the loam is moderately moist it will not be necessary to water the plants until the roots have obtained a "hold." as roots may be seen, afford them a light covering of warmed loam, and repeat these applications each time the roots make their appearance on the surface until the original bed is 12 inches deep, with the ball from the pot standing 2 or 3 inches The night temperature after the plants are planted should range from 70° to 75 the house with sun-heat equal to 85° to 90°. Cover the roof-glass at night. I can recommend no better all-round variety than Hero of Lockinge.

Cherries.—Trees placed under glass during December will now be unfolding their buds. Furnigate the house at intervals of a few days to make sure that the trees are free from insects before the flowers are fully expanded. Give attention to pollinising the flowers on fine days with the camel's-hair brush. Ventilate the house freely, as few fruit-trees are less able to endure a close atmosphere or high temperature raised by artificial means. Do not let the roots suffer from drought. A night temperature of 40°, rising 10° or 15° with increased ventilation by day, will be sufficient. We are now taking under cover for starting gradually the following varieties: — Empress Eugènie, May Duke, Black Bigarreau, Governor Wood, Frogmore Early Bigarreau, and Bigarreau de Schreken. We thoroughly clean both trees and pots before removing them.

Early Fig-trees in Pots.—A bottom-heat of 70° to 75° should be maintained, and an atmospheric heat at night of 60°, which may be increased by day to 75°, and with sun-heat to 85°. Syringe the trees frequently, but let it be done early in the day. Afford the border a watering if necessary, attend to disbudding, and stop the shoots at the fourth or fifth leaf, but if here is room for further extension the fruit will be finer.

THE FLOWER GARDEN.

By A. B. Wadns, Gardener to Sir W. D. PEARSON, Bart., Paddockhurst, Sussex.

Carnations.—Where these were not planted-out last autumn owing to unsuitable weather, let the beds or borders be prepared for them at once. They should be raised slightly above the ground-level if the situation is a wet one, and some mortar-rubble, bone-meal, old spent Mushroombed, and a little soot may be forked into the ground. The varieties Gloire de Nancy and the old Crimson Clove keep best during winter if potted-up and put into a cold frame. Carnations that were planted-out last autumn should be looked over and all decayed leaves cut away. Afford a slight dressing of soot, and loosen the surface-soil by the use of a hoe. A somewhat sheltered position is best for such beds; ours are surrounded by a Yew-hedge, which suits them admirably.

Anemones and Ranunculus that were planted last autumn and were top-dressed with some

suitable compost, will require assistance to break through the soil as soon as the young growths appear. These may still be planted.

Gladiolus and Lilium auratum may be planted now in beds or borders, or the Gladiolus may be planted in new beds of Ghent Azaleas, and bulbs of Lilium auratum amongst Rhododendrons, where they will succeed for years, if not disturbed, continuing to throw up spikes 6 to 8 feet high. A bed of L. lougiflorum is very effective in summer. Good sound hulbs should be planted at about 12 inches apart.

Dahlias.—Seeds of single Dahlias may be sown. Ground intended to be planted with Dahlias in May or June should be thrown up roughly. If it is in good condition, and was manured last-season, none will be required now, as its use would tend to make the plants grow very strongly and produce coarse flowers. It will be better to feed them occasionally in summer. When the ground has been dug, afford a good dressing of lime and soot, which, when the rains have washed in, wilk keep slugs and grubs at a distance. Dahlias require shelter from strong winds.

Cannas may be sown in heat, but the seeds should first be well soaked in water. Old roots may be divided up where the stock is short.

Hollyhocks that have been wintered in a cold frame should be planted in ground previously prepared for them; offsets may be taken from any old plants, and they will soon make roots if afforded bottom-heat. Seeds may be sown, and the consequent plants will flower well in the autumn.

Planting.—Finish planting deciduous trees and shruhs during this month, mulching them and making them secure against the winds.

Swect Peas may be sown round the sides of pots or in narrow boxes shaped like a V, with one side that will take out. The plants may be transferred from these without suffering much root disturbance. Place the boxes in a cold frame. Seeds of Everlasting Pea (Lathyrus sylvestris) can be sown in a sunny position. This plant may also he increased by dividing the roots. Seeds of this variety that had been kept five years, and were sown last summer, germinated without exception.

THE APIARY.

By EXPERT.

Purchasing Becs .- More than ordinary care nust be exercised in purchasing bees in winter season. As the bees are clustered up together it is not convenient to take out the frames for examination in cold, frosty weather. A warm day should be selected, so that each comb can be examined carefully. In doing this In doing this slide the dummy back as far as possible without upsetting the bees, to allow of more freedom in examining the frames. I would strongly recomintending purchasers, if they are not mend to well up to bee-keeping, to secure the services of a good bee-keeper. He will have a better idea of the cost of each stock, which must of course depend on the strength of the colony and the condition of the hive; he will also be able to say if the bees are healthy, a most important factor to a beginner; and where possible, have a written guarantee that they are free from disease. stocks may die, however good they may seem to be, and the cost of removing bees, which is sometimes considerable, should be considered.

Re-place all wel quilts as soon as old ones have become wet and show mildew. These can be dried in the oven and brushed ready for further use. Traps should be set for mice, and if any are in the hives have them removed at once, and place a piece of wire over the entrance to prevent them re-entering. Replace candy-cake in stocks where stores are getting short, but do not disturbthe bees in doing so.

Honey.—Unsold sections should be sold without delay, unless they are being kept for exhibition next season. In all cases they should be earefully gone through, and placed in a warm room to prevent them from getting candied. When they are becoming so, it will be best to sell them off a little cheaper.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the Publisher. Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London.

Communications should be WHITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Newspapers. — Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself re-sponsible for any opinions expressed by his correspondents.

illustrations.—The Editor will be glad to receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

APPOINTMENTS FOR THE ENSUING WEEK.

 $\begin{array}{lll} \textbf{SATURDAY,} & \textbf{Feb.} & 6 \\ \begin{cases} \textbf{Socié} : \text{f-rançaise} & \textbf{d}' \textbf{Horticulture} & \textbf{de Londres meet.} \\ \textbf{German Gardegers' Club meet.} \end{cases}$ FEB. 8 United Horticultural Benevo-lent and Provident Society's Committee meet. MONDAY. FEB. 9 Royal Horticultural Society's Committees meet and Annual Meeting of Fellows. THESDAY. FEB. 12 Royal Gardeners' Orphan Fund, Annual Meeting and Election of Penstoners at Cannon St. Hotel, City, at 3 P.M. FRIDAY.

BALES FOR THE WEEK,

BALES FOR THE WEEK,

MONDAY AND FRIDAY NEXT—
Perennials, Border Butbs and Plants, Roses,
Azaleas, &c., at 67 & 68, Cheapside, E.C., by Protheroe
& Morris, at 12.

WEONESDAY NEXT—
Palms, Plants, Azaleas, Roses, Fruit Trees, Herbaceous Plants, Liliums, &c., at 67 & 68, Cheapside,
E.C., by Protheroe & Morris, at 12—At Stevens'
Rooms, at 12 30, Roses, Lilacs, FruitTrees, Palms &c.

THURSDAY NEXT—
Sale Nursery Stock at Woodville, Kirkstall, near
Leeds, by order of Mr. J. Wood, by Protheroe &
Morris, at 11.

FRIDAY NEXT—
Orchids in variety, at 67 and 68, Cheapside, E.C.,
by Protheroe & Morris, at 12 30.

(For further particulars see our Advertisement columns.)

AVERAGE TEMPERATURE for the ensuing week, deduced from observations of Forty-three Years at Chiswlck -39.2'. ACTUAL TEMPERATURES :-

London. -Feb 3 (6 P.M.); Max. 48°; Min. 41°. Feb. 4 (noon); Fige.

PROVINCES. - Fe Feb. 3 (6 P.M.): Max. 45°, Dover; Min. 35', N.E. Scotland.

More than usual interest is Horticultural felt as to the proceedings at the annual meeting to be held Society. on Tuesday next. It is the Centenary year. The new Hall is more than half completed. Possession has been entered into of the new garden at Wisley. These are all matters of the first moment. As to the Hall, a large sum is still needed for its completion; and it is suggested

that those members of the trade who avail themselves so freely of the exhibitions held by the Society at the Drill Hall, the Temple, and Holland House, and who have not already subscribed, should contribute handsomely to the Hall Fund, or pay for the space allotted to them. As the space is occupied mainly for advertising purposes, this suggestion is not unreasonable. Some few of the exhibits are novel and of great horticultural importance, whilst others, though adding to the attractions of the Show, are mainly of commercial interest. Whilst the Society exists specially for the purpose of fostering the former class of exhibits, there is no reason why the others should not be treated on the same commercial lines as those which are followed by

the exhibitor himself. It might be difficult in some cases to draw a definite line, but where, on the one hand, an exhibitor occupies the whole length of a table in the hall with specimens the like of which can be seen at any time in Covent Garden Market or at the nearest florist's shop, it is not unreasonable that he should be asked to pay for the space occupied. On the other hand, the Society cannot do too much to encourage the exhibitor of promising novelties or of objects calculated to promote the progress of the science and art of horticulture and their applications to the benefit of humanity.

At Wisley we cannot expect everything to be done at once, but some trials should at once be instituted, if only for the purpose of settling the nomenclature of synonymous varieties, and an earnest effort should be made to give a more useful and especially a more progressive aspect to practical horticulture by the institution of carefully conducted experiments.

The question of the value of ether in operations of foreing could have been settled at Chiswick in a few weeks at an expenditure of five or ten pounds, but we are content to let Danes, Germans, Americans, French-any one, in fact, get in front of us and reap the reward. On this subject we commend to the notice of the authorities the letter published in our last week's issue from one who has had exceptional opportunities of seeing and taking part in what is done here and in the United States. It is clear that the Society must at the beginning of its second centenary avail itself much more largely of the aid which definite knowledge gained by experiment is calculated to give.

As to the proposed change in the amount of subscription, alluded to in a letter which appeared in our columns last week, we hear nothing in favour, but everything in deprecation of such a scheme. There is, of course, no doubt that the advantages offered in the aggregate far outweigh the amount of the subscription, but then it must be remembered that very few, if any, can avail themselves to the full extent of their privileges, and that the great majority of the Fellows would not care to do so if they could.

Lastly, we would allude to the financial condition of the Lindley Library, in the hope that some of our readers who appreciate the value of that fine collection and the necessity of keeping it in proper order and of developing it as it should be, will help the Trustees and the Society by substantial aid. From this point of view the action of the Trustees of the Veitch Memorial Fund, who at their last meeting contributed the sum of £25 to the Library Fund, was as praiseworthy as it was acceptable.

LÆLIO-CATTLEYA X BLETCHLEYENSIS RUBY KING .- Our Supplementary Illustration represents this beautiful Lælio-Cattleya, for which Sir H. Schroder, Bart. (gr., Mr. Ballantine), received a First-class Certificate at the Royal Horticultural Society, November 10, 1903. Like its companion, L.-C. × Bletchleyensis Illuminator, which has also received a First-class Certificate, and is included in Baron Schroder's collection, it was raised by Messrs. Sander & Sons, of St. Albans; and the pair, although differing widely in point of colour, form two of the showiest of the now numerous Lælio-Cattleyas. These two hybrids, in their relation to the original form, point to the usefulness of re-raising out of

finer parentage a cross which, when made with ordinary varieties, did not give very good results. The original hybrid, raised from crossing ordinary varieties of Lælia tenebrosa and Cattleya Warscewiczii, by Mr. A. Hislop, gr. to H. S LEON, Esq., Bletchley Park, was shown at the Royal Horticultural Society, August 29, 1899, but the Orchid Committee did not give it an award. At the meeting of the Orchid Committee, October 21, 1902, however, J. Gurney Fowler, Esq. (gr., Mr. J. Davis), showed a much finer and stronger plant, which was awarded a First-class Certificate. This plant was of the original type, but with much larger flowers. In 1903 Messrs. SANDER flowered out of their cross between a fine reddish - petalled Lælia tenebrosa and Cattleya Warscewiczii Sanderiana several hybrids with much broader segments and very rich colours, two of the best being those mentioned above, and which are in Sir H. Schroder's collection. Lælio-Cattleya \times Bletchleyensis "Ruby King" has the sepals and petals of a clear light purple, darker on the veining, and with a slight golden-yellow glow. Lip ruby-purple coloured at the base, changing to rose-purple towards the front. Lælio-Cattleya × Bletchleyensis "Illuminator," which secured a First-class Certificate July 21, 1903, has flowers in shape similar to Ruby King, but with the sepals and petals orange-salmon with a purple glow. Lip dark velvety-purple with maroon veining.

ROYAL HORTICULTURAL SOCIETY. - The next meeting of the Committees will take place on Tuesday, February 9, in the Drill Hall, Buckingham Gate, Westminster. The annual general meeting of the Fellows of the Society will also he held in the Drill Hall, at 3 P.M., on the same date. Fellows attending the meeting are invited to inspect the new Hall now building in Vincent Square. At a general meeting held on Tuesday, January 26, 119 new Fellows were elected, making a total of 172 elected since the beginning of the present year.

THE EARL OF DEVON .- The death of this nobleman, in his ninety-third year, is announced. He was much respected in Devenshire as a clergyman and a citizen. Powderham Castle, the seat of the Earl, has often been mentioned in these columns, but has not been tenanted by the Earl of late years. The fine specimen of Eucalyptus coccifera in the grounds of the Castle has often been illustrated.

DR. GARCKE.—The death of this gentleman, in his eighty-fifth year, is announced in the Garten Flora as having taken place at Berlin on the 10th inst. He was the author of a Flora of Middle and North Germany, and other works of a like character. Originally in the Berlin Botanic Garden, he became subsequently an assistant in the herbarium, Extraordinary Professor of Botany in the University, and Keeper (Custos) of the Royal Botanical Museum.

THE NATIONAL CHRYSANTHEMUM SOCIETY. -Mr. R. DEAN has sent us revised dates for the exhibitions of this Society at the Crystal Palace. They are as follows: -- October 5 and 6, November 2, 3, and 4; and December 7 and 8. As these alterations have been made since our Almanac went to press readers would do well to make a note of them, or we may be unjustly blamed later in the season for sending folk to the Palace on fruitless journeys. A report of the successful annual meeting appears on p. 94.

ROYAL BOTANIC SOCIETY OF LONDON .- We have received the following letter from the Secretary:-"It is proposed that a grand Horticultural and Gardening exhibition shall take place in the month of June this year under the auspices of the Society. It is intended that the exhibition shall be held in the New Exhibition Grounds of the Society, situated in the centre of the beautiful gardens in Regent's Park; the exhibition to be open for one week, or possibly longer. The proposed scheme embraces Horticulture, Forestry, Botany, Educational Methods, Nature Study, and a special section for Colonial produce. In addition to the exhibition, lectures, conferences, and conversazione are in course of arrangement. The President of the Royal Botanic Society is Major His Serene Highness the Duke of Teck. All communications respecting the gardens and exhibitions, &c., should be made to Mr. J. Bryant Sowerby, the Secretary."

MR. JOSEPH KENT.—Visitors to the Floral Fêtes held annually in the Public Park, Hanley, Staffordshire, and other readers will sympathise with Mr. Joseph Kent, the Secretary for those fêtes, who had the misfortune to lose his wife on January 25. Mrs. Kent, whose death was caused by a trap accident, was buried in Hanley Cemetery, there being a number of horticulturists present.

A CROSS BETWEEN AN AMPELOPSIS AND A VINE .- M. MILLARDET, to whom we owe the introduction of the Bordeaux-mixture, made sundry attempts to cross the Vine with the pollen of the Virginian Creeper (Ampelopsis kederacea). None of the resultant seedlings, fifty in number, showed any external trace of the action of the pollen parent. All were true Vines. M. GRILLE has repeated the experiments, and gives an account of them in a recent number of the Comptes Rendus. He fertilised some Chasselas Grapes with the pollen of the Ampelopsis. Five of the seedlings showed no sign of the crossing; they were what MILLARDET called "false hybrids"; but the sixth showed itself as a true hybrid by the production of leaves of varied character and colour. The growth of the hybrid was very slow, and no details other than those relating to the foliage are supplied.

INFLUENCE OF THE POLLEN ON THE MOTHER PLANT.—The action of the pollen on the embryo plant is of course well known, but the question is often asked whether the pollen exerts any influence on the mother plant. M. Leclerc de Sablon says that flowers of white Grapes fertilised with pollen of black varieties may produce black berries. M. Leclere du Sablon, leaving aside the morphodogical question, has endeavoured to ascertain whether by crossing varieties of Melons and Cucumbers he could bring about any variation in the chemical constitution of the fruits. Melons orossed reciprocally with Melons or with Cucumbers, and varieties of Vegetable Marrows reciproeally intercrossed, produced no change in the appearance of the fruits, but on chemical analysis it was found that the fruits fertilised by the foreign pollen suffered a diminution in the proportionate quantity of reserve material, starch, &c., so that their nutritive value would be im-These experiments show the desirability paired. of isolating particular varieties and of not cultivating others in the immediate neighbourhood.

STROPHANTHUS.—A monograph of the African species of this genus of Apocynaceæ has just been published at Leipsig, by Wilhelm Engelmann. It has been elaborated in the Berlin Herbarium by Prof. Gilo, and is enriched with ten lithographed plates. A few species are in cultivation, but the genus is most remarkable for its poisonous qualities.

MANURE IN NATAL.—It is pleasant to note that the efforts of the Agricultural Bureau in Natal to secure for farmers and others what they pay for in the matter of manure have during the past year been very successful. Out of a total of sixty vendors only two or three have neglected to have their wares tested officially, and all manures tested have been found to be what they were sold as. Price also has been lowered, and so

it is satisfactory to know that the example set by our Royal Agricultural Society so many years since continues to benefit imitators in the Colonies.

THE CONGO FLORA .- M. DE WILDEMAN has published on behalf of the Congo State Notices sur des Ptantes intéressantes de la Flore du Congo. In it we find numerous details relating to the botany and economic uses of various plants, such as Bosqueia Angolensis, used for its timber and also for dyeing purposes; Musanga Smithii, the fruits of which are edible, whilst the wood is so light that it is used instead of cork. It is so full of watery juice that large quantities exude when the roots are cut-a property of which the natives and travellers avail themselves when water is scanty or not readily obtainable. Numerous Orchids are mentioned, but none of them, so far, of much horticultural value. Many other plants are mentioned which we cannot further allude to on this occasion, though we may refer to some of them, such as the species of Musa, at another time. It is unfortunate that neither table of contents nor any index is given. On p. 199 an absurd printer's error has escaped notice. The Jute fibre is referred to as the product of various species of Corchorus, a genus belonging to the Tiliaceæ, and not to the Liliaceæ, as published. Numerous illustrations add to the value of a very interesting publication, prepared with all the completeness and accuracy of detail which M. DE WILDEMAN has led us to expect in his monographs.

RAINFALL.—Our correspondent, Mr. W. CORNFORT, has sent us particulars of the rainfall in the gardens at Kylemore Castle, County Galway, during 1903. As we have stated in a former issue, our space will not permit us to give the details for each district; but we are glad to publish the total amount for the year, which in this case was no less than 92:17 inches.

Our correspondent, Mr. S. W. FITZHERBERT, of Kingswear, S. Devon, has obligingly sent us particulars of the rainfall for last year, the total of which was 50.09 inches, or 15 inches above the yearly average for the district. The fall during the month just closed (January) was 7.28 inches, and this is said to constitute a record.

— The aggregate amount for 1903 at Alton, llants, was 46'85 inches as registered by Mr. F. Crowley, the average being 325 inches. More than 10 inches fell in October; but in November only 1'92 inch was recorded. At Eveley the total measured in the year was 47'12 inches, as recorded by Mr. T. Carter. At Headley Park 42'92 inches, was measured by Mr. Glayshyer, gr. to Mr. Justice Wright.

CHRYSANTHEMUM RUST.—At the meeting of French Chrysanthemum growers at Lille a brisk discussion arose as to the best methods of preventing the Chrysanthemum-rust. Some speakers advocated sulphide of potassium (liver-of-sulphur), some pinned their faith to precipitated sulphur. When the question was put to the vote the majority of growers pronounced in favour of sulphur as a preventative. The method of employment is to fill a pail with water, and throw in a quantity of precipitated sulphur. Cuttings of the Chrysanthemums are then dipped in the water and allowed to remain for some minutes. When they are taken out they are covered with a fine film of the sulphur, which is allowed to remain on the foliage.

ACTION OF RADIUM ON FUNGUS MOULDS.—
M. DAUPHIN relates in the Comptes Rendus the results of experiments with radium on the growth of a mould, Mortierella. The growth both of the threads (hyphæ) and of the spore is arrested, but not entirely annulled, so that when placed under normal conditions growth is renewed.

HORTICULTURAL CLUB.—The annual dinner of the Club will be held on Tuesday, February 9, at 6 P.M., at the Hotel Windsor. Ladies are specially invited. After dinner there will be music by the Georgian Singers, under the direction of Mr. H. Stubes, of St. Paul's Cathedral. The annual meeting will take place at 5 P.M., and it is hoped that all interested in the Club will be present. Mr. E. T. Cook is the Hon. Secretary.

Messrs. Geo. W. Bellorove & Co., Hammersmith, inform us that they have been entrusted with the entire contract for laying-out the grounds at Earl's Court for the Italian Exhibition. The scheme is entirely sub-tropical, and the effect of the Palms, some of them upwards of 20 feet in height, is described as calculated to eclipse anything ever attempted before at Earl's Court.

CARRIAGE OF FRUIT BY SHIP.—The screw steamer Matona, designed for the carriage of fruit to Manchester, per Canal, was launched recently at Wallsend. The whole interior space will be devoted as a cool-chamber, through which cooled air will be perpetually driven by means of properly-designed engines. Three years since the export to this country of Bananas was some million and a half bunches, now the export is about five million bunches. This is surely sufficient encouragement for the future of Eltons and Fyffes, who are very sanguine of the success prophesied for them.

THE PROPOSED GARDENERS' ASSOCIATION.

—We continue to receive a large number of letters upon this subject, so numerous indeed that it would be quite impossible for us to print them in full in these pages. One of the letters is from a correspondent in France. The tone of most of them is not encouraging, and little or nothing is added to what has already been said; and in view of the meeting to be held shortly at the Hotel Windsor, to discuss the question, we have thought it better to await the decision that will then be made.

THE KINGFISHER.—By a printer's mistake on p. 75, Mr. Leach was made to say that the lovely kingfisher "does not eat fish." It is, of course, very well known that this bird does eat them, and in quantity. Though most of our readers would probably conclude that an error was made, we desire to make it clear that it is not claimed that the kingfisher goes fishing for mere love of the sport.

SURVEYORS' INSTITUTION.—At the ordinary general meeting held on January 25, a paper by Mr. RALPH NEVILLE, K.C., entitled "The Garden City Scheme and First Garden City, Limited," was read by the Secretary in the absence of the author through illness. A discussion ensued, and was adjourned to the next meeting, which will be held on Monday, February 8, 1904, and the discussion will then be resumed at 8 o'clock.

TRINITY COLLEGE, DUBLIN: CHAIR OF BOTANY.—The Provost and Senior Fellows will proceed to the election of a Professor of Botany on March 19, 1904, in succession to Dr. E. PERCIVAL WRIGHT, who has resigned. Applications for the Professorship should be sent to the Registrar of Trinity College, Dublin, and to the Registrar of the Royal College of Physicians in Ireland on or before March 7, 1904. Dr. HENRY DIXON is a candidate for the appointment. Irish Times, February 1, 1904.

SEED LISTS.—We have received a copy of the Index Seminum, or list of seeds available for exchange at the Paris Museum. Applications should be made to Prof. COSTANTIN, Jardin des Plantes, Rue Cuvier, Paris. We have also received a similar list from M. POIRAULT, the Director of the Villa Thuret.

BROWN ROT OF SWEDES AND CABBAGES.—Prof. Potter, in the Journal of the Board of Agriculture for December, gives an account of a disease affecting Swedes, Turnips, and Cabbages, and caused by a bacterium. This microbe has been isolated, and when healthy Swedes were inoculated with it the disease was shown in them by a brown discoloration, beginning along the course of the vascular bundles. Cruciferous crops should not be taken from the same land for several years, the rotting plants should not be given to stock, nor should the manure from animals who have eaten the plants be used.

WARTS ON VINE LEAVES .- We frequently receive specimens of these productions, which are not unlike the outgrowths caused by the Phylloxera. They are usually attributed to a too humid atmosphere and to defective ventilation. Messrs. Viala & Pacottet have lately studied the subject exhaustively, and have come to the conclusion that they are induced by excess of light in a hot damp atmosphere. They further state that the palisade layers are increased in number. In a healthy Vine, beneath the skin of the leaf, is one single layer of palisade cells, so-called, because they are of elongated form, and placed vertically like palings in a fence; these cells are usually full of chlorophyll. In the warts there are two or three layers of these palisade cells formed at the expense of the spongy cells which occupy the greater part of the substance of the leaf, and the interspaces between which are usually filled with water. In addition to a freer current of air shading therefore is necessary to prevent the formation of these warts. As a rule, however, they are not productive of serious mischief, nor do we as a rule in this country suffer from excess of light.

EUCALYPTUS.—The beneficial effect resulting from the plantation of these trees in marshy localities is now generally recognised, and is attributed to the way in which, by their rapid growth and powerful transpiration, they effect the removal of the superfluous water from the soil. The balsamic emanations from the leaves have no real effect in counteracting the malaria poison, and it has also been ascertained that they do not drive away the gnats that are the carriers of the poison. Now M. GRIFFON tells us (Académie des Sciences, January 18) that the leaves individually have no special evaporating power, but they are produced quickly and in large quantities. In any case the fact remains that swampy localities are really rendered more wholesome by the growth of Eucalyptus.

LAWNS.—Messrs. Sutton & Sons, of Reading, have published a small treatise on the formation of Lawns, Tennis, Croquet, and Cricket Grounds, Bowling and Putting Greens. The booklet is as elegant in appearance as it is useful in its practical directions. Of the need for such a work we have frequent opportunity of judging from the numerous enquiries we receive, so that we hail with pleasure the receipt of so trustworthy a book of reference and commend it to the notice of all concerned.

THE FORMATION OF TUBERS. — Some time since we called attention to the experiments of M. Noel Bernard, which seemed to show that the production of tubers in the Potato was in some way connected with the presence of "microbes" or of fungi. It has since been shown by M. Bernard himself that tubers can be formed without any such agency. M. Molliard in the last issued part of the Bulletin of the Botanical Society of France, while asserting that he had induced the swelling of the caulicle of the Radish by the agency of microbes, details some more extended experiments in the case of the Onion, bulbs of which were produced under aseptic conditions—conditions, that is, by which the presence of

microbes was prevented. It would seem then that for the present it is desirable to "keep an open mind" as to the agency of these minute organisms in the development of tubers and bulbs.

PUBLICATIONS RECEIVED. — The Culture of the Chrysanthemum, New Edition: W. Wells. — Journal of the Department of Agriculture of Western Australia, December, 1903. Contents: Among the French Vineyards, Parasites, Garden Notes, &c.—The Queensland Agricultural Journal, December, 1903. The contents include a botanical paper on Indigenous Queensland Grasses, and many notes on agriculture, forestry, &c.—The Agricultural Journal of the Cape of Good Hope. January, 1901. Contents: Rural Cape Colony, No. III, (illustrated), Meeting of Western Province Horticultural Board, Orange Culture without Irrigation, &c.

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his Correspondents.)

WHITE GROS COLMAR AND LADY HASTINGS GRAPES.—I shall be much obliged to any practical gardener who cultivates Grapes that can be appreciated at a nobleman's table if he will state whether or not he thinks the above Grapes are worth growing. I well remember the late Mr. Barron bringing White Gros Colmar from Chiswick to the Drill Hall in October, 1892, and before it was placed before the Fruit Committee he asked me what I thought of it. I told him "it was much inferior to Mrs. Pearson or Muscat of Alexandria." Nevertheless it was awarded a First-class Certificate; but from that day to the present time I have never seen or heard of that Grape. Like many other so-called late Grapes, the White Gros Colmar was shown in the month of October, instead of in March or April. "The good old sort, Lady Downes of our boyhood," of splendid flavour, can be kept until April and May. Among white Grapes Mrs. Pearson and Muscat of Alexandria, if the fruits are well grown and ripened, can, with great care, be had in April. I ask, therefore, whether White Gros Colmar and Lady Hastings, in table or keeping qualities, surpass Lady Downes, West St. Peters, Mrs. Pearson, and Muscat of Alex-andria? Upon their cultivation or value for market and for retailing to the general public, I require no particulars. W. C. Leach, Albury Park Gardens, Guildford.

CHRYSANTHEMUM NELLIE POCKETT.—I send you a photograph of a Chrysanthemum plant (Nellie Pockett) grown by me. This variety is better than any I have tried as a hush or specimen plant. The cutting was rooted in January, and was stopped twice, the last time in the middle of June. I took three shoots from the first stopping, and the last time I took three from each of the first three, making nine shoots. My idea was to get large blooms in preference to a quantity of moderate size. The photograph does not do justice to the beauty of the plant, which had foliage from the top of the pot up to the blooms. On the average the blooms would be about 8 inches in diameter and 6 inches deep, some, no doubt, a little more. The only chemical manure I used was a little of Thomson's Vine and Plant Manure at the final potting, and a small top-dressing of the same manure in August. Manure-water was given composed of sheepdung and soot at intervals. The plant developed nine splendid blooms, and it keeps its foliage better than any variety I have grown. H. Green, Nacton Hall, Lincoln. [An excellent specimen of a bush Chrysanthemum. Ed.]

BEGONIA GLOIRE DE LORRAINE. — Growers have from time to time described their methods of cultivating this plant, and the methods have varied from cold frame treatment during the summer months to confinement in a stove temperature. I have grown the plant this season in several ways to note results. The best and most useful plants were those struck from cuttings rooted between the months of February and June. Three cuttings were put into a 3-inch pot, and when well rooted they were potted into 5-inch and 6-inch pots without dividing them, using a compost of two-parts fibrous loam and one of leafmould, with plenty of sharp sand. They were grown in a temperature ranging from 65° to 80° with sunheat, being slightly shaded from the

direct rays of the sun. A moist atmosphere was maintained by syringing morning and afternoon. All the plants were dipped twice each month in a solution of XL-All to prevent attacks of mite. No plant was pinched or stopped. The flowers were picked off until a month before they were required to be in bloom. The flowers should expand in a temperature not exceeding 60°; they will then be found to last a much longer time than if kept in a greater degree of heat. Plants in 5-inch pots so treated are now flowering and are over 2 feet in height, and nearly the same distance through, the foliage almost hiding the pots from view. T. A., January.

STRAWBERRY BEDS (See "Hardy Fruit Garden," Calendar, on p. 54). — If Mr. Markham's advice were followed I think slugs would have a safe refuge in severe weather. The treatment I give my beds is just the reverse to that Mr. Markham advocated, and few of my Strawberries are slug-eaten. As soon as there are frosts sufficiently severe to allow manure to be barrowed between the rows of Strawberry plants (generally in December), I have the mulching done, in place of doing the work when the plants have finished fruiting. I try to get short, rotten stable-dung, and spread it from 1 to 2 inches thick from the harrows. It is allowed to lie on the surface until an opportunity occurs for digging it in. The manure is then forked-in 2 inches deep, which just allows of its being covered with soil. This is all the work necessary in the Strawberry quarters until the flower-trusses begin to appear, except hoeing once in fine weather. Then, and not until then, do I apply clean straw, or long strawy stable-dung, which I always use for a two-fold purpose, viz., for the fruits to lie on as they mature, and to prevent the plants suffering from drought. When all the fruits have been gathered, and a sufficient number of runners has been layered for a new bed, the remaining runners and bad leaves are cut off, and the soil between therows well hoed. This year it was forked to allow the rain to pass away quickly. Nothing is done further until manure is applied again in December. If possible, I shall dress the beds with soot previous to putting on long dung, with the view of checking the slugs this season, as I anticipate an extra quantity this year. A. Jefferies, Moor Hall Gardens, Essex.

Reply: My advice to dress Strawberry-beds with manure as soon as the fruits have been gathered, is the result of many years' experienceand close observation. Unless plants which have borne a heavy crop of fruit are afforded encouragement to build up strong crowns before the growing season has passed, very poor results will follow, especially if the soil contains much sand or gravel. To put on a thick layer of manure as soon as severe frosts occur, and then to bury it 2 inches deep in the soil, is, I submit, to provide excellent shelter for slugs. If slugs, &c., are numerous, a thorough dressing of fresh lime and soot should be applied before affording a mulch. When the winter has been mild, I have in spring frequently raked from the beds all the loose manure that was applied in September, dressed the beds with lime and soot, and then bedded down with fresh litter; but every details cannot be explained in a weekly calendar. H. Markham.

ORANGES.—Were the general body of fruit consumers in this country familiar with the excellence and high flavour found in home-grown Oranges, such as Messrs. Rivers & Son produce, a considerable demand for them might grow up. It would not be possible to-make Orange-culture under glass profitable here unless the fruits could command high prices. But the imported Oranges, up to the end of the year at least, are, as a rule, so acid, and to a large extent so lacking in softness of flesh and flavour, that one marvels they should find sale at all except as blood purifiers and preventers of scurvy. When the Fruit Committee were the other day privileged to taste fruits of the Egg and Achilles Oranges, the members found that they had in the first-named unwonted rich flavour, and in the other exceeding sweetness. Probably in a mercantile sense these qualities would not be regarded as meriting the payment.

for them of high prices; hence even with the most successful forms of culture the best of Oranges may not prove financially profitable. But there seems to be good reason for asking that some of the wealthy patrons of horticulture should encourage Orange culture here at home cylerecting and planting houses for that purpose.

NECTARINE "CARDINAL."—In the Gardeners' Chronicle for January 23 appeared a report of Mr. Bunyard's lecture on "New Fruits" to the "Beckenham Horticultural Society," in which he mentions the above variety of Nectarine, and says that it is grand, and certainly one of the best. [After reading 'favourable notes upon the

the fruits split at the stone during the stoning stage, and some of the least cracked which I left on the tree were, of course, scarred, and in most cases decay set in as soon as they commenced to ripeu. Many of those that were without a blemish up to that time would then split, in some cases nearly to the stone, and before they

FIG. 41.—ERICA LUSITANICA (CODONODES): NAT. SIZE.

A, Flower enlarged; B, Section of flower; C, Transverse section; D, Pollen-grain magn. 380 diam. (See p. 84.)

Mr. Somers Rivers in the interesting paper (see p. 78) described Orange culture in houses as conducted on much the same lines that Peaches are grown on wires or trellises near the glass. At present Orange culture generally is not culture at all. It is more often Orange stunting and starvation. Too often grown with other plants and not kept clean, they are far from being attractive objects, whether florally or pomologically. A. D.

variety when it was first introduced, seeing two or three nice dishes of fruits exhibited, and knowing that it was certificated by the Royal Hortzcultural Society, I planted a tree in a house to be started in the second week in January. I hoped its earliness would be a distinct gain, and helieved that it would, at least, be moderately good in other respects. The results were not as I anticipated. It grew into a very nice tree and fruited in 1902 and 1903, and each year a third or more of

could be gathered had commenced to decay. The tree was planted at the warmest end of the house, and there was always a little warmth in the pipes. The trees were not syringed after the fruits began to ripen. The flesh is very soft, and in many cases where the base of the fruit rested hard on the branch, decay had set in by the time they were ripe; thus, in neither year was there more than about a third of the crop of any use. I cannot account for the stone-splitting and the splitting of

the fruit when ripening in any way, except that it is a failing peculiar to the variety. It is moderately good in flavour, but not equal to Early Rivers. It does not set well, and requires to be fertilized with foreign pollen as it makes but little of its own. True, it ripens ten or twelve days earlier than Early Rivers, its earliness being the one and only merit it possesses, according to my experience; and except where earliness is the all-important object in view I should consider it would be far more profitable and satisfactory to plant Early Rivers and start the house a fortnight earlier. Apart from the disappointment one feels, after setting a moderate crop, to find the fruits finally dwindle down to about a third of the number one expected to have, anyone must know that it is a somewhat serious matter where glass is not extensive and a full crop is little enough. An experienced gardener once said that its only value was to get a "somewhat doubtful" early crop in places where glass is extensive, and that it was not one to plant where the loss of a crop would be seriously felt. I regret that I was not told this in time to prevent my planting it. If I ever grow it again it will be in a pot, and not as a permanent tree. Perhaps others have had similar experience. J. Gibbons.

DISEASE-RESISTING POTATOS.—I may add to what was stated on p. 74 by F. C. Edwards, that the variety Findley's Evergood was largely grown in this neighbourhood last season, and I have not seen or heard of its having shown disease, while other varieties can be as Positon. During the while other varieties, such as Puritan, Duke of Alhany, &c., were very badly diseased. I can also speak highly of Sutton's Discovery as a disease-resister. Although the season was a wet one and much against Potato-growing, Discovery is perfectly sound. The same is true of Northern Star. S. G. Randall, Skegness.

SQUIRRELS.—Having noticed a quantity of buds on the garden-paths underneath Sycamoretrees I looked out for the cause. I found it was squirrels. It is surprising how quickly they go about the work. To-day I stood for about three minutes watching one, and the mischievous rodent cut off close upon thirty buds in the time. No doubt it is the total above the time watching one, and they was of their ordinary. is the total absence this year of their ordinary food, nuts and seeds, that has driven them to this extremity, as from the movement of the jaws of the one I saw showed it was getting something. For many years squirrels have gnawed off a quantity of the young shoots on Horse-Chestnuts when about a foot in length, in each case scolloping out the pith in their centres. I have not seen them cut off Sycamore-buds before. H. J. Clayton, Grimston, Tadcaster, Jan. 28.

EARLY CROCUSES.—I note the interesting remarks on p. 75 in last week's Gardeners' Chronicle about the early white Crocus. Here we have had the yellow variety in bloom for the last ten days at least, and growing in an ordinary open border without the least protection. What more remarkable, I cut last week some beautiful heads of Rhododendrons to send to my employers in London. Further, our earliest Snowdrops opened here in the last week of November. They are growing in a sheltered corner. H.P. Rosebuds are at present plentiful on our borders, some of them even making an attempt to open. J. Jeffrey, St. Mary's Isle, Kirkcudbright, N.B.

FOREIGN CORRESPONDENCE.

NEW PINK CARNATION ENCHANTRESS.

THE great forward stride in Carnations is made more manifest in this variety than in any other since the advent of the Mrs. Thos. W. Lawson. It was raised by the same grower, and he pronounces Enchantress superior to it. flowers are 31/2 to 4 inches across when well grown the stems are strong, and from 2 to 3 feet long; the colour is a superb shade of rosy-blush-pink, richer and warmer towards the centre. It is an early and continuous bloomer, a strong, healthy grower, an ideal Carnation in every way. Ten thousand dollars were paid for the stock of it by a cut-flower grower—the best evidence of its value. J. Feser, Dayton, U.S.A.

[The photograph is quite unsuitable for reproduction. Ed.]

FLORISTS' FLOWERS.

SWEET PEAS AS POT PLANTS.

To what the Rev. David R. Williamson has said, on p. 47, in favour of the Sweet Pea as a garden [flower and for exhibition, something further may be added in regard to its value for pot culture. There are many forms of decoration for which the plants may be used with great effect. When well managed they flower freely, and combined with the soft green foliage they make effective plants (or rather pots of plants), and may be flowered well from 2 feet high upwards. The same plants may not last in flower for a very long time, but it is easy to keep up a succession of plants; or if wanted for any particular date, the early flowers may be taken cffany which begin to show colour—up to about a week before the plants are wanted to be at their best. Or if plants are very early they may be stopped back; and this is the best method when they are required to be kept dwarf. Almost any of the varieties may be used for pot culture, but I have found such sorts as Coccinea, Blanche Burpee, Gorgeous, Earliest of All (or Blanche Ferry), Stanley (or Black Knight), Lady Nina Balfour, Salopian, Oriental, and Triumph do well; and Miss Willmott, Hon. Mrs. Kenyon, Lady Grizel Hamilton, and Navy Blue, which grow rather taller, may be added.

Culture.-Sweet Peas may be sown any time from now until the end of March, and they will be ready for the Sweet Pea Society's show. Or if wanted later they may be sown in April. They may be sown in 5-inch pots, which should be filled firmly with a good rich loamy compost. Six to nine plants may be grown in each pot, but it is best to sow a few more seeds, and to thin out if all the seeds grow. If started under glass, care must be taken to afford them plenty of air as soon as they begin to germinate. The tops may be taken out once at least, and no further stopping will be required unless they have been allowed to become drawn, but I may add that by frequent stopping a single plant will form a good bush. I have grown them singly, and had quite bushy, well-flowered, dwarf plants of sorts which under natural conditions would run up tall. They may be potted-on into 8-inch pots as soon as well rooted, or they might be cultivated in smaller pots, but to finish them off well I have found the 8-inch none too large. After they are in the flowering pots their chief requirements are watering and tying; the latter is not a difficult matter, one good stick in the centre, and a few small ones round the pot to keep them up when young being all that is required. As they advance the tendrils will, with the aid of the one stick, keep the plants up with but little tying.

If water he afforded in excess it will prove ruinous, and they will suffer nearly as much if they get too dry. Liquid-manure of moderate strength may be used freely.

Beautiful as the cut blooms are, Sweet Peas can never be seen to such advantage as in a group of well-grown pot plants. I may also point out that Sweet Peas planted out from the pots, and round clumps supported by a few neat sticks are far more attractive than when grown in rows and where the ordinary Pea-sticks are used. A. Hemsley.

ENQUIRIES.

SEA BUCKTHORN.—Are sheep likely to eat Sea Buckthorn? J. C. & S. [Probably not. Ep.]

ACETYLENE GAS REFUSE .- Would the refuse of acetylene gas be safe to use for garden crops, and serve in the same manner as gas-lime? Has it any manurial value? Acetylene.

COVENT GARDEN FLOWER MARKET.

DUTCH bulbs are now over-plentiful, especially Tulips; these are selling for a very low price Large quantities were left on the stands at closing-time. Daffodils are coming in freely, and prices are much lower. There is a plentiful supply of these in pots, the prices varying from 6s. to 12s. per dozen. Very good Indian Azaleas are-more abundant, and there are some good mollis... Poinsettias still hold out. There were some very good dwarf plants with excellent heads of bracts. Callas in pots were very good, and cut blooms were more than plentiful, good flowers selling for 3s. per dozen. Lily of the Valley in pots may be had at about 12s. per dozen, and cut flowers from 6s. to 10s. per dozen bunches; good white Azaleaat about 4s. per dozen bunches. Cyclamon arelower in price. Erica hyemalis is plentiful, and there are some well-flowered plants of E. melanthera. Chrysanthemums, though few, may still be seen in some good flowers. The variety Mile. Louise Charvet, which gained an Award of Merit on Jan. 20, is one of the best; good flowers of this. were sold at 6s. per dozen. Framfield Pink is still good; scarlet Pelargoniums are more plentiful. Roses and hest Carnations continue to be scarce; Lilium longiflorum is quite equal to the demand; L. speciosum (lancifolium) and L. auratum arevery good. There is plenty of English-grown white lilac.

There is a good supply of Asparagus, Smilax, and other foliage plants; but best Maidenhair Fern is rather scarce, but of second quality there is plenty. Cycas leaves vary in price from 6d. to 1s. 3d. each, but there is little demand for these just now.

FRUIT MARKET.

Supplies seem plentiful, but there are not quite so many Grapes on sale, and retail prices were a little higher. A very good sample of Gros Colmar was priced at 4s. per lb., and Alicantes at 3s. 6d. Peaches, Apricots, and Plums from South Africa are now coming in; of Plums there are several sorts. Apples are very plentiful, and those from Nova Scotia very good. They have English names, such as Ribston, Golden Russet, Baldwin, &c. The Newtown Pippins from California are well-ripened, sound fruits; and a larger sample labelled Oregon Newtown Pippins are very fine Apples. There are some fine samples of stewing Pears. A. H., January 30.

THE ROSARY.

" LA DETROIT."

This is the name given to a new Rose to be sent out this spring by Messra. Breitmeyer, of Detroit, Michigan. It is said to have originated as a cross between Caroline Testout and Bridesmaid. The flowers are cup-shaped, fragrant, shell-pink in colour. In French, "detroit" is a masculine noun: why the feminine article is added we do not know. It would surely be better to drop the article, and call the Rose simply "Detroit."

MADAME MAURICE FENALLIE.

The Journal des Roses gives a coloured illustration of this new Rose, the result of a cross between a Bourbon and a Tea. It is very vigorous, and produces large flat flowers resembling those of Her Majesty in colour, and becoming ultimately nearly white. It was raised by M. Boutigny, Rue des Ursulines 4, Rouen.

The Rozenzeitung illustrates in colours two Tea Roses—Madame Jacques Charreton, creamcoloured, with deeper yellow centre; and Madame Bodin, pink, with paler centre.

SOCIETIES.

LINNEAN.

JANUARY 21.-Professor S. H. Vines, F.R.S., President, in the Chair.

Dr. Eric Drabble, F.L.S., exhibited a lantern-slide showing diagrams of blearpellary fruits of the French Bean. The specimens of Phaseolus vulgaris, Savi, were obtained from a garden on the Middle Coal measures of North Derbyshire. In the simplest case there is present on the posterior aspect of the normal carpel a second smaller carpel with reversed orientation and without seeds. In other cases the second carpel attains to at least one-half the size of the normal anterior one, and is fused with the latter proximally in such a manner as to give rise to a unilocular fruit with parietal placentation, the earpels being free from one another in their distal portion. In other cases the two carpels are of approximately the same size, and both bear seeds. They are completely fused below to form a unilocular ovary, while above they divaricate from one another.

from one another.

It was pointed out that although the Leguminosce are typically monocarpellary, certain members of the

Court with a view to the show being held there in 1901. The Chairman pointed out that almost without an exception the whole of the supporters of the Union were members of the National Dahlia Society, and their object in holding a show about the middle of September was to afford an opportunity for the new Cactus Dahlias, then at their best, to be seen to the greatest advantage. There was no thought of antagonism to the National Dahlia Scelety.

the new Cactus Dahlas, then at their best, to be seen to the greatest advantage. There was no thought of antagonism to the National Dahlia Scelety.

Mr. John Green was re-elected Chairman, and Mr. R. Dean, Secretary and Treasurer. It was resolved the show should take place during the third week in September. Several special prizes were announced.

THE ROYAL HORTICULTURAL SOCIETY OF IRELAND.

MR. T. SMITH, of Newry, so well known for the number of interesting plants he has introduced to our notice, thus writes in the Iriah Times:—

There are always reasons, and, no doubt, there are good reasons—or, perhaps, reasons which are not good—for the present condition of the above Speiety, but we need not go into them now. It occurs he me that no matter how successful the proposed floral fee.

ing state, and the Royal Caledovian Horticultural Society finds itself in a position strong enough to embark on an international exhibition, it is sad to find our frish Society in difficulties; and I trust that some of your Irish readers may be induced to come to its assistance. That the Royal Horticultural Society of Ireland has done good work in the past is known to all gardeners, and the Council finding that in recent years there has been a distinct increase in the interest taken in gardening in Ireland and in the work of the Society, are determined to make a special effort to wipe but the debt due by the Society, and to place it in a position to entitue its good work in the future. This end they hope to attain by means of a large floral lête and Daffodil show to be held in Dublin on April II and 15 next; and also by being enabled through the generosity of individuals to claim Mr. Smith's cheque."

GARDENERS' DEBATING SOCIETIES.

Fig. 42.—the "silver" or "plata" variety of orange, from a fruit cultivated by messrs. t. rivers and son, and shown at the drill hall on january 26.

Pulp juicy, flavour delicate. (see p. 76.)

order are bi- or even polycarpellary; but in these eases the polycarpellary fruit is of an apocarpous nature. It would appear, therefore, that the specimens described in some sense revert to ancestral conditions in so far as their bicarpellary nature is concerned, but that their syncarpous nature is anomalous. Comparison with related orders, e.g., the Connaraceæ, confirms this opinion.

THE LONDON DAHLIA UNION.

JANUARY 26.—The annual meeting of the supporters of the Union met in good numbers under the presidency of Mr. John Green, the Chairman of the Committee, at the Hotel Windsor on the above date. The Secretary read a large number of letters promising support to an exhibition in September next. A balance-sheet was submitted by the Secretary, Mr. R. Dean, showing the receipts from all sources to be £58.88.6d, and the expenditure £38.68.1d; but since the accounts were made up and audited, an additional sum in the way of unpaid subscriptions had been inceived, showing a balance in hand of £2 10s. The Chairman said that the Secretary and himself were in communication with the authorities at Earl's

may be, enough money could scarcely be made to both pay off the existing debts and provide a working balance for the future. The best way, I think, would be to pay off the present debts at once, and relieve the anxiety, if there be any; to make whatever sum is raised at the fete available as a working balance; and with this view I am prepared to subscribe £100 if two other persons will do the same, or £50 if five other persons will do the same, or the balance be raised in any other way, and so enable the Society to pay what they owe, and have done with it.

T. SMITH,

Daisy Hill Nursery, Newry.

In reference to this matter we have received the following letter from Mr. F. W. Moore, the highly-respected Director of the Royal Botanie Gardens, Glasnevin:—

"In the issue of the Gardeners' Chronicle for Jan. 23, p. 58, you were good enough to draw attention to a meeting summoned and presided over by Lady Ardilaun, with the object of devising means to strengthen the position of the Royal Horticultural Society of Ireland. The meeting was a success, and the resultshave been eccouraging. So far two promises of £50 each have been received in consequence of Mr. Smith's proposal At this juncture, when the Royal Horticultural Speicty of England is in such a flourish-

Royal Nurseries, Exeter, presided. The lecturer, referring to the Central Park, New York, pronounced it a splendid specimen of the skill of the engineer and landscape gardener. Green lawns, shady groves, fine drives and walks, expanses of water, &..., had taken the place of what was once a waste. Boton Market, 48 aeres in extent, was another fine open space. A characteristic feature of the residential parts of the city was the luxuriant Vines of Boston Ivy (Ampelopsis Veitchii).

LEE, BLACKHEATH AND LEWISHAM.—The monthly meeting was held at the Church Street Schools on January 29, when Mr. H. J. Jones, Ryecioft Nurseries, Lewisham gave a lecture on "The Cultivation, Growth, and Description of the various varieties of Sweet Peas." The subject was made highly interesting. Mr. Jones offered to provide a Silver Medal to be competed for at the next Winter Session.

DULWICH CHRYSANTHEMUM.—At a special meeting of the above Society Mr. Percy Waterer read a most interesting paper on "Sweet Peas," in which, after dealing with the history of the flower, he referred to the great variety of colour, and many other good qualities possessed by the improved forms introduced since Mr. Eckford first began to take interest in them

in 1879, and a few years later, Mr. Burpee. The lecturer dwelt on the necessity for a standard in form, for example, the bold upright standard of Black Knight and the hoeded standard and wings of Lady Grisel Hamilton. The double form was hardly desirable, but the Cupid and bush varieties would no doubt become popular. The importance of four flowers on a stem was over-estimated, as they were seldom evenly developed. Early planting was strongly advised, good root action being encouraged by cool weather, and deep trenching was important. It was doubtful if change of soil was so important as was generally considered, but a change of seed was consignally designed. sidered; but a change of seed was occasionally desirable. Natural manures were advised in preference to artificial, especially in a liquid state. After giving a list of desirable varieties the lecturer suggested a selection of eighteen, consisting of Dorothy Ecklord, Blanche Burpes, King Edward VII., Hon. Mrs. Kenyon, Blanche Burpes, King Edward vii., Hob. Mrs. Kenyon, Prima Donna or Lovely, Coccinea, Navy Blue. Lady Grisel Hamilton, Black Knight, Dorothy Tennant, Miss Willmott, Lord Rosebery, Prince of Wales, Triumph, Prince Edward of York, Lord Kenyon, Salopian, and America. The lecturer advised planting seeds in pots first week in February, growing on and planting out after first week in April. after first week in April.

HULL HORTICULTURAL. - On Tuesday, January 16, HOLL HORTICULTURAL.—On Tuesday, January 16, the subject of "Theory and Practice Irom a Cultivator's Standpoint" came up for discussion. Mr. Barker, of Hessle, introducing the subject. In an address, which naturally divided itself into two parts, Mr. Barker strongly favoured the opinion that practice was all-important for the gardener, and it was only when he was well grounded in this that he should turn towards theory. towards theory. The man relying absolutely on theory was not the man to earn his livelihood in the prolession. Many arguments were brought forward by the speaker in support of his contention. Several members joined in the interesting discussion, but each and all appeared to favour a happy combination of the two factors. If, R.

CHESTER PAXTON. - At the usual fortnightly meeting, held in the Grosvenor Museum on Jan. 30, an animated discussion took place upon "Suggestions for the Next Exhibition." Although past exhibitions held under the auspices of the Society have always been successsful, it was thought by several of the members present that the time had arrived when additions might be made to the prize schedule, as follows :-

- (1) To make the exhibits of Apples and Pears more educational by asking exhibitors to give particulars of the stock upon which the trees have been grafted as as the class of soil and situation in which they have been grown.
- (2) To make a special class for bottled fruits, in which those who do not grow fruit themselves may compete.
- (3) To offer prizes for collections of vegetables, as well as for winter-flowering Begonias, Cyclamens, &c.
 (4) To offer prizes for the impromptu naming of
- hardy fruits by young gardeners and others.
- (5) To encourage Chrysanthenium specialists to exhibit new varieties of merit.
- (6) To still further encourage table decorations by Tadies resident in the Society's district.

Mr. G. Lyon presided, and Mr. E. Stubbs, Bache Hall, introduced the discussion.

LIVERPOOL HORTICULTURAL. — On January 30 the annual meeting was held in Victoria Street, Liverpool. The report was presented, and adopted after some discussion. Several new members were elected on the Committee; and donations of three and two guineas voted to the Gardeners' Royal Benevolent Institution and Gardeners' Orphan Fund respectively. Various suggestions were made on "How to make our flower-shows more attractive for the masses," but dower-shows more attractive for the masses," but mothing definite was decided upon. Mr. Thos. Foster presided. J. S.

NATIONAL CHRYSANTHEMUM.

ANNUAL MEETING.

FEBRUARY 1.-The annual general meeting of the National Chrysanthemum Society was held in the newly-erected Carr's Restaurant, Strand, on Monday The lofty dining-room proved to be a very suitable place for such a meeting. The new President, Mr. Chas. E. Shea, presided, and there were about sixty members present, all of whom appeared enthusiastic. After the minutes of the last meeting had been adopted, &c., the Chairman proposed the adoption of the report and balance sheet, from which we make the following extracts:

EXTRACTS FROM REPORT OF THE EXECUTIVE COMMITTEE.

"The effect of the display made on that occasion [November exhibition] was distinctly lessened from the fact that the space placed at the disposal of the Committee was far too contracted, by reason of other exhibitions occupying a considerable portion of the building. A promise has been made that this defect

will he remedied in the future. The Executive of the Crystal Palace Company made the best arrangements they could under the circumstances, and your Committee are under an especial debt of obligation to Mr.

Geo. Caselton, the Superintendent, for his most valuable help in many ways.

"The Floral Committee held six meetings during the year—three at the Crystal Palace and three at the Essex Hall, the suitability of the last-named place being acknowledged by Committee and exhibitors alike. Nineteen First-class Certificates of Merit were awarded. Arrangements have been made for continuing the meetings of the Floral Committee at Essex Hall in the

present year.
"A Catalogue was issued during the past year, and will be supplemented by carefully-prepared lists which are to appear in the annual report.

"The annual outing of the Society took place in July

last, a party of 207 persons spending a delightful day at Park Place. Henley-on-Thames, by the kind permis-sion of Mrs. Noble.

"The annual dinner, at which the President occupied the chair, was held on November 25, a goodly number of members and friends being present.

"A deputation from the Committee attended the exhibition of the French National Chrysanthemum Society at Lille during November, and were most hespitably entertained. The report of the deputation will appear with the schedule of prizes.

The financial position of the Society continues satis-"The financial position of the Society continues sausfactory; there is a balance in hand of £69 98. Itd., with liabilities amounting to £5 98. The sum of £4 78. 8d. has been paid during 1903 on account of 1904. The Reserve Fund amounts to £115 158. 11d., £100 of this being on deposit. The Committee regret the loss by death of Mr. E. J. Bentley, who subscribed annually to the Fund. this Fund.

Special prizes were given by the President, who continues his Special First Prize of £5 58, in 1904; by Messre. Mackenzie & Moncur, Messrs. E. Wehb & Sons, Mr. G. H. Richards, Mr. W. J. Godfrey, Mr. H. J. Jones, and Mr. Robert Sydenham, all of which proved very helpful. Mr. P. Waterer's Silver Cups were won outright, and are now the property of the winners.

"Four officers acting as a deputation from the Committee have interviewed the General Manager of the Crystal Palace Company in respect of the arrangements for 1904. The Company are willing to allow space for three exhibitions, as in 1903, and there is reason to believe the sum given for the November show will be augmented in the present year. It is also hoped that some arrangement may be come to with the Crystal Palace Company, by which cheap railway and admission tickets may be provided for members and exhibitors. Should such an arrangement be made, a special circular will be dissued to members and exhibitors cetting forth these advantages, and giving as forces pressure the these advantages, and giving as far as possible the times of departure of trains from London. The matter of entrance fees will be considered, and on the re-commendation of the Finance Sub-Committee, the sum of £50 will be added to the November Schedule of Prizes; a considerable number of new Special Prizes will also be added It is the intention of the officers to seek the co-operation of the Secretary and Manager of the Crystal Palace, in endeavouring to secure better lacilities for the conveyance of exhibits to and from the Palace.

"The suggestion that an exhibition of market Chrysanthemums he held shortly before Christmas, is reto the Schedule Revision Sub-Committee for consideration and report.

"The present number of Societies in affiliation is 125; a few have ceased to exist owing to lack of local support. The present number of Members is 631, viz., 75 Fellows and 556 Ordinary Members, in addition to the Foreign Subscribers. An increase in the membership of the Society is urgently needed.

ELECTION OF OFFICERS, &C.

After a little pleasant discussion the report was adopted with unanimity and satisfaction; but it was agreed that a few lines should be added in respect to the visit of the deputation to the Ghent Quinquennial

Show in April last.

The President, Vice-President, and Officers were reelected, and Mr. Lake was elected to be an auditor in place of Mr. C. J. Ingram, who retires according

Several alterations were made in the constitution of the Committee, and Mr. J. W. Moorman, who retired last year, was re-elected a member of that body.

One-third of the Committee retires annually, and in addition two vacancies were caused by Mr. A. Newell (deceased) and Mr. George Little, who had failed to attend. Messre, W. Weeks and T. J. Berridge declined nomination. All the others were re-elected, and the new members included J. W. Moorman, Geo, Cuthbert, F. G. Oliver, Geo. Gover, and H. T. Wooderson. Six new Fellows were elected, and one Society was admitted to affiliation.

On the proposition of Mr. witty, and elected an honary Fellow of the Society.

A discussion took plece in regard to the proposal to hold an exhibition in December of Market Chrysanthemums, and the Chalrman elicited from the market growers present that they thought the exhibition

should be held in the Essex Hall, Essex Street, Strand. and that a suitable date would be Wednesday, Jan. 14.
Mr. H. J. Jones announced that he would be pleased,
should the Committee permit him, to provide one of the Society's Small Gold Medals to be awarded on that

In respect to the November exhibition, it transpired that the proposal to offer prizes of 5s. for the premier bloom of certain varietles has met with unexpected support. It is now thought that there will be upwards of one hundred such prizes. All of this money is offered in the form of special prizes by private individuals, who select any variety they prefer.

It was thought by some of those present—and we think with good reason—that the judging of these flowers will be a considerable task, as flowers may be shown exclusively for these prizes; but any flower shown in any class will also be judged with them, in the same way that the National Rose Society select their "medal" flowers.

Mr. Harman Payne explained that the promoters of the Turin Exhibition would be glad to have exhibits from members of the Society, and Italy was particularly in need of garden appliances.

The meeting concluded with a vote of thanks to the Chairman, which was passed before 9 o'clock P.M.

ROYAL HORTICULTURAL. Scientific Committee.

JANUARY 26. - Present: Dr. M. T. Masters, F.R.S. (in the chair); Messrs. Gordon, Odell, Shea, Worsdell, Saunders, Michael, Bowles, Massee, Holmes, and Fraser; Dr. M. C. Cooke; Revs. W. Wilks and G. Henslow (Hon. Sec.).

Codlin-moth in May .- Mr. SAUNDERS made the following contribution to this subject, discussed at the last meeting :- "I cannot find that more than one brood of the Codlin-moth has ever been noticed in England, though two hroods are common on the Continent and in America; and on the other side of the Atlantic three broods have been known. In this country the moth leaves the chrysalis in May, and lays her eggs very soon alterwards. The caterpillars are hatched in the course of a week or ten days, and remain in the Apple three weeks or a month; being fully fed, they leave the Iruit to Iall to the ground, and make their way to the nearest tree stem, and crawl up it until they find a suitable place to pupate in. If they cannot find a tree, a post or paling or even dead leaves will provide them with a shelter. The object in putting bandsround the trees is to provide the caterpillars with hiding places, where they may be found and destroyed. They are not sticky, but made of folded canvas or sacking, or even hay or straw bands, and should be put en as soon as any 'wind-falls' are found."

Maggots in Moss Litter .- Mrs. Horseley sent samples with enquiries. Mr. Saunders reports as follows: "The grubs found in the moss-litter manure were those of a fly belonging to the genus Bibio, but I cannot tell the name of the species, several of which are very common; perhaps the one hest known is the St. Mark's fly (Bibio Marci), so called from its generally appearing about St. Mark's day (April 25). These flies are quite black, and are rather more than half-aninch in length; their bodies are rather thin, and the wings are not very transparent; they measure about 14 inch from tip to tip. They fly in a very clumsy manner, and may be found crawling over plants, &c., in great numbers for a day or two, and then they disappear altogether. The flies may be easily caught in a butterfly-net. If Iowls are kept, I should spread the manure about and let them pick and scratch it over, for they will soon pick out the grubs. Mixing nitrate of soda with the manure might be tried, but I am not sure whether it would have much effect upon the grubs, as I have not heard of any experiments having been made on them. They are undoubtedly injurious to the roots of plants at times."

Coloured Photographs of Orchid .- Mr. ODELL exhibited a colour-photograph of Cypripedium insigne Sanderæ, executed by a new method. The yellow colour was very characteristic. It was received from Mr. A. S. Hickley, Kelso House, near Southampton.

Ixia diseased -Mr. SHEA showed leaves of I. crateroides, as being the only species with the foliage discoloured. There was no fungus present, the appearance being thought to be due to hereditary predisposition.

Eucaluptus with nodules .- Mr. SAUNDERS showed small plants with nodules on the stem close to the ground. Nothing could be found inside. Mr. Massee observed that ants can cause similar ones on Roses, the formic acid acting as an irritant; and knots can be produced artificially.

MARKETS.

COVENT GARDEN, February 3.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only irom day to day, but often several times in one day. Ep.]

(For continuation of Markets and Weather, see p. xiv.)

Angle for Lean-to Vinery: Ivy. For ordinary purposes an angle of 40° to 45° is best, but it will vary according to the situation, height of wall, &c. The angle of a roof is found by taking that formed by the rafters and the top front plate of the house, and measuring with an ordinary protractor.

Apprentice to Florist: H. P. In small business establishments it may be usual to send the girls out occasionally to deliver purchases, but if the girl be apprenticed to the business it is certainly not fair for the employer to keep her at such work during half her time. In your case, having paid a premium you describe as "heavy," we think you have a legitimate ground for complaint if you find that your daughter is not taught the details of the business as she should be. We are afraid employers frequently overlook the responsibilities that belong to them in respect of the education of their apprentices.

ASPARAGUS BEDS: A. H. In a fortnight's time afford the beds a little superphosphate, about 3 to 4 lbs. to the rod; and in May sow 3 lbs. of nitrate of soda to the rod, repeating the dressing of nitrate of soda in July. In November you may apply kainit at the rate of 6 lbs. to

BEGONIAS: T. H. W. The leaves are attacked by mites (Tarsonymus), invisible to the naked eye. Dip the leaves into tobacco-water, or dust them with tobacco-powder.

BIRDS AND FRUIT BUSHES: Amateur. A correspondent, "J. W.," has found the following method of protecting fruit blossoms from birds to be perfectly satisfactory. Take 8 ozs. of to be perfectly satisfactory. Take 8 ozs. of bird-lime and 8 ozs. of linseed oil. Melt them together by heating, and stir till cold. Paint this over Bamboo-canes, and place them in the fruit - bushes. If a bird once touches one of these canes, you will see very few birds in your garden afterwards for a long time. The adoption of this method will not injure the birds, but it will save your crop of fruits.

BOOKS: K. L. M. N. The botanical book most likely to suit your requirements is A Text-Book of Botany, by Dr. E. Strasburger, &c., published by Macmillan & Co. A new edition has just been issued.—A Young Gardener. The last edition of Hogg's Fruit Manual, Barron's and Vine Culture. The Book of Shrubs, George Gordon (John Lane); Trees and Shrubs for English Gardens. by E. T. Cook (Newnes); Schlich's Manual of Forestry, in five volumes.

BOUVARDIAS: G. Yes, we think it much better to allow the plants to commence growth before shaking them out of the soil, and re-potting them. If they have commenced growth before they are re-potted, the roots will quickly enter into the new soil, but otherwise there would be a delay, and in the meantime the soil would deteriorate in quality. See note under "Plants under Glass," on p. 86.

CARNATIONS: Old Subscriber. Your leaves are affected with the Carnation-rust, Helminthosporium echinulatum (we did not invent the terrible name). Burn the affected plants, and spray those still healthy with a solution of liver-of-sulphur, ½ oz. to the gallon, as a preventative.

CELOGYNE CRISTATA: S. W. Ewell. The number of flowers named as being on your plant of Ceelogyne cristata in a 6-inch pot is equal to any we have had brought under our notice, and is a proof of successful cultivation. Seven or eight flowers on a spike is more than the average, and your plants have developed an unusual number of flower-spikes.

CORRECTION.—Mr. W. Hinton writes that in respect to the Arbutus he described on p. 46, Gardeners' Chronicle for January 16, as growing at The Oaks, Hanworth, the word "circumference" is used instead of "diameter." This applies to both of the shrubs mentioned. Not-withstanding this the shrubs mentioned. withstanding this, the shrubs are good specimens of this species.

CRAMBE TATARICA: W. E. G. The plant is well known, but we have no personal experience of its qualities as a vegetable. You will find a reference to it in the Treasury of Botany under "Crambe."

CURRANT-BUD: W. W. The swollen buds indicate the presence of mites in the interior. answer to several correspondents, p. 48, Gardeners' Chronicle., January 16.

DENDROBIUM NOBILE, D. PHALENOFSIS SCHRODERÆ, &c.: C. H. D., Acton. See that all the plants are thoroughly clean, and the pots or pans in which they are growing should be clean also. which they are growing should be dean also.

The Dendrobiums should be afforded the warmest position, suspending them from a roof or placing them on a shelf near the roof-glass.

Afford water sparingly till the plants are in active growth, when a more liberal supply should be given. Cologyne cristata should be stored to all shediest position and kept in the coolest and shadiest position, and be kept moist during all the year. When growing actively too much rain-water can scarcely be given. The Oncidium requires a-situation in clear light.

DOUBLE CYCLAMEN: W. & Son. This condition is not very common, but we have seen it many times. It is not nearly so attractive as the ordinary type.

FOREMAN: C. S. We are afraid you demand only a week's notice, but in respect to the house you might consult a lawyer.

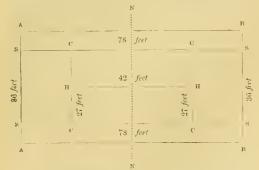

GARDENER IN LODGE: Tab. In the absence of an agreement to the contrary, you cannot be legally dismissed without a month's notice, unless for misdemeanor.

Head Gardener: E. H. S. Your employer is not obliged to give you three months' notice, but presumably he knew of the expiration of the lease, and in your interests he should have let you know.

IRIS UNGUICULARIS (STYLOSA): Constant Reader. This species may be replanted directly after the plants have flowered, which will be in this month or next. Plant them on a sheltered border under a south wall if possible, and the results will be better if you afford them the protection of a handlight when about to flower, as the weather is usually bad at the time.

IVY BASKET: J. R. W. Large basket-beds are sometimes constructed of stone, and Oakboughs are used for the same purpose. By raising the soil and shaping it to a suitable basket form, you could form an object most appropriate for the situation, and by turfing the sides make a very pretty structure. Use a dwarf wire trellised edging—preferably with the top inclined ontwards—for the rim of the basket, and bend over an iron rod for handle, or use a rustic design of Oakboughs, according to taste. The whole could be planted with Ivy, which, entwined in the rim and trained up the handle, would give an effect almost immediately.

LAWN TENNIS COURT: W. E. S. If you keep the accompanying diagram and explanatory details, where you may refer to them, you will not need to write us upon this subject at a future time. In regard to laying-out a front garden and carriage drive, we are not in a position to recommend particular firms, but any nurseryman who carries out landscape work at all would be able to do this. The persons you may approach for tenders would also submit plans for your approval. The dimensions for a single and double tennis court are as follows:

A B, B A, double court for three or four players; s s, s s, single court for two players. A A and B B are the base lines; A B, A B, and S S, S S, side lines; C c and C C, service lines; H H, half court line; N N, net. A court for the single game is 27 feet wide and 78 feet long; and for the double game, 78 feet long and 36 feet wide. The posts for supporting the net should be placed 3 feet beyond the sides. The service lines run parallel to the net, and arc 21 feet distant from the same.

MEALY-BUO ON GRAPE-VINES: J. S., Co. Down. The directions given on p. 366 of Gardeners' Chronicle for November 28, p. 16, may be carried out without causing injury to the canes. The mixture should be applied before the Vines commence to grow, and the buds need not be coated to the same extent you will paint the rods. Shield the top of the buds as much as practicable, and no injury will be likely to follow. Gas-tar and coal-tar are alike useful.

Names of Plants: Correspondents not answered in this issue are requested to be so good as to consult the following number.—J. McP. Are you playing us a trick, that you send such wretched specimens?—W. H. D. 1, Pinus pinaster; 2, Pinus densiflora; 3, Aspidium acrosticoides, often called Polystichum acrosticoides, a distinct North American Fern, and quite hardy. The peculiar manner in which the fertile, upper third portion is contracted is interesting, as it is a compromise between the separate fertile frond and the more common class, in which the sori are distributed more generally over the frond.—E. W., Durham. All good varieties of Dendrobium nobile, 1 and 5 especially. Every importation brings great variety, and already a large number representing every section have received varietal names.—Reader. Billbergia Burchellii.—E.W.R. 1, Celogyne cristata; 2, Oncidium flexuosum; 3, Passiflora racemosa.—G. S. H. Cattleya Percivaliana.—Tulip. We cannot undertake to name varieties of Tulips. The slight disfigurement of which you complain is caused by the plants having received a check when the flowers were expanding. It is not due to disease.

Nature's Greatest Curiosity: Correspondent.
The fruit or seed-vessel of Trapa natans, the Water Chestnut. Of course the statements made are more curious than true; but who could say what is Nature's greatest curiosity? Nobody but a vendor of quack medicines, and we are afraid we should not believe him.

NEGLECTED VINE: R. P. Assuming the vine to be growing out-of-doors, and that the rods are aged and the spurs several inches long, and consequently some distance from the wall, an endeavour should be made to replace this old wood with young canes as quickly as possible. Select young shoots that appear in the hest positions near the base of the rod, and train them to the wall, and these will ultimately serve instead of the worn-out rod, now 25 feet long.

Prune back the remaining shoots of last season's growth, leaving only two buds at the base of each. Wash the rods with a solution of soft soap and sulphur mixed well together in warm water. See that the surface of the wall is made good, if any pointing is needed, and then clean the walls thoroughly. Secure the rods to the wall, and should the young growths during the coming season be strong and of good length the old rods may be cut away at the end of September. The roots may need attention by affording them fresh soil, but it is not prudent to grow outside vines too strongly. Short-jointed shoots of medium strength are best, and should be kept as near to the wall as possible that the shoots may benefit from the sun-beat absorbed by the wall and afterwards radiated from it. If you require a cheap book upon the culture of vines in houses and out-of-doors, you might select The Book of the Grape, by H. W. Ward, published by John Lane, London, price 2s, 6d

Oncidium Papilio: Vallota. The temperature you mention, 65° to 70°, suits this plant. It may be grown either on a block, or in a basket or pot. The plants require to be kept moist at the roots all the year, as they are not deciduous, but, as with most other evergreen Orchids, the supply of water at the root should be reduced when the pseudo-bulbs are fully made up. It is not unusual for flower spikes sent up in winter to remain inactive for a long period, waiting for brighter weather, more favourable to development. Probably, if your plant were suspended near to the glass of the roof it might develop its inflorescence more quickly.

PEACH-TREE DROPPING ITS BUDS: W. G. The causes of this have been discussed again and again; but we think that it is most frequently due to improper ripening of the wood, or to the roots having suffered at some period from an insufficient supply of water. You will know hetter than we can which of these causes is most likely to apply in your own case.

Poinsettia "Bracts": R. H., Belgrave. The brilliantly-coloured leaves in the Poinsettia are called "bracts," because they are modified leaves interposed between the flowers and the normal leaves. In gardeus, the bracts upon one stem are sometimes collectively described as a "head." The correspondent meant that he had 200 "heads," and that some of these heads were composed of as many as forty-eight modified leaves (bracts). We do not share your disbelief in regard to the number of bracts in a head. It is seldom there are so many, but there is no reason to suppose our correspondent was guilty of exaggeration; doubtless those of all sizes were counted.

POTATO MAGNUM BONUM: J. E. J. This variety was introduced in 1876 by Messrs. Sutton & Sons, and was extremely popular for many years.

Removal of a Gardener's Effects: F. A. P. It is a matter for arrangement between the contracting parties; but very frequently the new employer defrays the cost of removal; and this appears to us a reasonable thing to do.

ROYAL GARDENER'S ORPHAN FUND: George MacKinlay. Thanks for 2s. 4d. received for this Fund.

SCARLET THORN SHOOTS WITH EXCRESCENCES: F. H. M. The knots are caused by a fungus called Gymnosporangium clavariæformo. One stage of this fungus grows on species of Juniper, bursting through the bark as gelatinous orange masses in the spring. It is the spores from the fungus on the Juniper that infects the Thorn, consequently no pains should be spared to find the diseased Juniper and cut away the diseased branches.

SEED-TESTING IN TWO HOURS: Correspondent.
We do not believe that the germinating power of all seeds can be tested in two hours by any chemical means; but a competent botanist would probably be able to tell you by careful examination whether a seed was alive or not in less than two hours.

TREE WASH: J. H. H. If your trees are growing over lawn grass, and you apply by means of a

syringe strong winter dressings that may render the grass unsightly for a time, it would be well the grass advantage of water over the grass by means of a garden engine directly each tree has been syringed. By thus diluting the insecticides and washing them into the ground, the illeffects will be hardly perceptible, if they are at all. A good winter dressing for trees affected with American blight is made as follows; take $\frac{1}{2}$ lb. of caustic soda, and $\frac{1}{2}$ lb. of crude commercial potash, dissolving them in 5 gallons of water. Spray this over the trees, taking care that every shoot is reached by the liquid. On the main stems you might use a solution of Calvert's carbolic soap, and rub this well into the bark by the use of a painter's brush. The best preventive of winter moths is by adopting the common practice of putting brown-paper bandages round the trunk of the tree in winter, and smearing them occasionally with tar, or any sticky substance (as cart-grease), which will prevent the female moths from ascending the trees, as the females are incapable of flight. When the buds commence to open in spring, syringe the trees with a solution of Parisgreen at the strength of 1 oz. to 20 gallons of This must be kept well mixed during its application, and use it with great caution, as it is violently poisonous.

Verbenas: D. D., Royston. Sow the seeds in March in a temperature of 60° or thereabouts, and when they have germinated place the pan in which they are growing as near to the glass as possible. When the seedlings are large enough. prick them out into shallow boxes, or pot them up singly into small pots. They should be grown as sturdily as possible, and they will be ready to put into the flower-beds at the end of May. Named varieties like Miss Willmott, &c., must be propagated by cuttings, which are generally taken in the month of August; but if you have stock plants you have kept through the winter, you may take cuttings from these early in March and root them in a temperature of 60°. Put them into pots of light, rich soil, and pot them on as may be required, stopping the shoots occasionally to induce a bushy habit.

Vines Bleeding: A Subscriber. We fear that the fact of your canes bleeding to the extent you describe, is due to their having failed to become properly matured during last autumn. The absence of sunshine in 1903 has resulted in many fruit trees indoors and out-of-doors being less "ripened" (as the gardener uses the term) than usual, though in large establishments, where every means are at hand, the skilful gardener has assisted the vines to a considerable extent by a freer use of fire-heat than usual and carefully-adjusted ventilation. You should cover the ends now bleeding with a coating of "styptic," or with the "knotting" recommended on p. 51 of the Gardeners' Chronicle for January 23.

VIOLETS: J. W. We are unable to state the cause of your Violets dying off. We find no fungus or insect.

YEW-TREES: E. R. Your trees are remarkable specimens, one 27 feet 6 inches in girth, and the other 18 feet 5 inches, both measured at 4 feet from the ground. In The Yew-trees of Great Britain and Ireland, by Dr. John Lowe, there is information of many of the big specimens in this country. But generally the measurements were taken at 3 feet from the ground. There is one described as being in your own village (Hambledon) 39 feet at 3 feet from the ground; another at South Hayling (Hants), 38 feet; one at Buxted (Sussex), 39 feet; another at Tisbury (Dorset), 37 feet. Many old specimen Yews have been illustrated in the back volumes of the Gardeners' Chronicle.

PRIMROSES AT READING.

THERE is a special interest attaching to the Chinese Primrose, the so-called Persian Cyclamen (C. latifolium), to the Sweet Pea, the China Aster, and some other garden flowers, which occupy the attention of the flower-lover and of the hybridist. Each of the plants we have named represent distinct species. Great as is the range of variation among them, it is the expression of the capacity to vary within the limits of the species itself, as there has been no crossing with other species. We naturally expect variation when two distinct species, as we so esteem them, are crossed, but we are not prepared for the vast amount of variation which occurs when no interspecific crossing has been effected.

In the Chinese Primrose, omitting for our present purpose all reference to the relative length of the stamens and style and their great significance, we have all shades of colour, from pure white to pink, rose, deep crimson, and in other cases to various shades of lavender and slaty-blue. In some there is a pale pink or lilac ground, thickly spotted with minute dots of a richly purple colour, and in one form the flower is pure white, without any yellow eye round the

mouth of the tube. This flower is a thrumeyed form, that is, the stamens are so placed that the anthers occupy the mouth of the tube. So brilliant are the colours that the traveller by the Great Western Railway, as he approaches Reading, wonders at the particoloured stripes which he can see in the large range of glasshouses of Messrs. Sutton. A nearer inspection increases the wonder and enhances the admiration. All these thousands of plants are grown for seed, and so well grown are they that each plant is the counterpart of its fellow. In some cases the variety is fixed, and comes so true from seed that it receives the honour of a name for distinction's sake, and the seed is sold in confidence that the whole or a very large percentage will come "true." The beautiful "Duchess" varieties, with their compact habit and pink flowers with a deep rosy-purple eye, come true from seed, and suggest the way in which new species may be evolved out of old. In other cases the plant does not prove so doeile, its seeds cannot be depended upon to reproduce the variation, and these remain unnamed, and their seed is sold in "mixtures." even degenerate so that incessant vigilance is required, not only to develop new variations, but to keep the older ones up to the desired standard. On a sunny day recently the operators were busy with their camel'shair pencils, taking measures in some cases to fertilise the flower with its own pollen where fixity is desired, or to make crosses where "improvement" and variation are required. For the houses not only afford a brilliant spectacle for the flower-lover, but they are the scene of physiological experiments carried out on a vast scale, and the details are recorded with the precision of those in a stud-book. From this point of view it is satisfactory that Mr. Bateson is watching and noting the results, so that we may look forward to some further expositions from his pen as to the problems of heredity, and as to the validity of the Mendelian hypothesis and its probable application to practical purposes. We may confidently look forward to the time when cross breeding and artificial fertilisation will be regulated by rule, rather than, as now, by accident or caprice. Mr. Bateson is to read a paper on the subject before the Linnean Society on Thursday evening next.

It is not only the flower that varies, but the foliage and the inflorescence. The leaves vary in colour from light yellowish-green to rich purple, at least on the under surface; they are palmate or oblong (Fernshaped), slightly indented at the edge, or deeply crimped and fringed at the margins. Then there is the Ivy-leaved or Holly-leaved variety, originally figured in these columns. It still preserves it characteristics without much variation, and its flowers are always malformed.

As to the inflorescence, the most remarkable "break" has occurred in the Star varieties, where the flowers, instead of being in compact trusses, are borne aloft in light loose panicles bearing tier upon tier of flowers. Among the Star Primroses variations in colour are showing themselves just as in the older forms. One is of a very pretty shade of rose-pink, and Ruby Star is of the brightest red; and double forms are making their appearance, and there are certain "giant" forms of this section which

are not only larger than the rest but later to flower. And all this variation in detail (and it is much greater than we can now specify) is manifested in the one uncrossed species.

The first Chinese Primroses brought over were from plants cultivated by the Chinese. The original wild plant has been discovered of late years in the mountains of Central China. We have so often given the history of its discovery, and so often described and figured the plant as found by Dr. Henry and by the Abbé Delavay, that it is not necessary to do more than give the reference to the pages where these details may be found (see Gardeners' Chronicle, April 26, 1902, p. 269). We may also refer to the detailed description of the varieties as seen at Messrs. Sutton's establishment in 1889, given in Gardeners' Chronicle, January 26, 1889, p. 115, details which it would be interesting to compare with those that could now be supplied, did time and space permit.

Nor can we say more now with reference to the Cyclamen than that it shares with the Chinese Primrose in the display at Reading of pure white or brilliantly-coloured flowers. Great as is the range of variation, it is somewhat less marked than in the case of the Primrose, though if one were confronted with the pure white of the giant forms and the very deep ruby-red of Vulcan, one might have to modify one's opinion.

FLORISTS' FLOWERS.

A NEW GOLD-LACED POLYANTHUS.

This variety, which bears the name of Mrs. Holden, is being offered for sale this year. It was raised by Mr. G. Thornley, Middleton, Manchester, from seed taken from a variety named Mrs. Brownhill; it has a black ground, and palegold centre and lacing, which is well defined and proportionate; the pip stout, and the truss-stem erect. It was raised a few years ago, and Mr. Thornley has been working up a stock. It must not be supposed the culture of the Gold-laced Polyanthus is a lost art in the North, for the Northern and Midland growers are eagerly buying up this new variety. It will probably be seen in good form in April next.

P 1 N K s.

Judging from the appearance of my own bed of Pinks, the position being a slightly raised one, facing the south-west, the persistent rains are acting injuriously upon them. They are being continually drenched, and the Pink is one of those plants which appear to be more adversely affected by wet than by frost. Some varieties of Pinks are more vigorous of constitution than others; some of the best, whether laced or border varieties, are among the most delicate, and they suffer in such a wet season. I hear from growers about the country that plants in the most carefully prepared beds show signs of weakness. In such a season as this the plants, if in a bed, may be assisted by drawing the soil up to them in the form of a ridge, but the soil is so saturated with moisture that it is of little avail. As soon as drier weather comes and the soil becomes workable, it will prove advantageous to remove some of the surface-soil of the bed, as far as it can be done with safety, what remains be gently stirred, and a good surface dressing of a suitable compost given. It may be said, "Why not winter the plants in pots and put them out in the open in early spring?" But it has been abundantly shown in the case of Pinks, as also of Carnations, that the best results follow autumn planting.

Some of the old Pink growers who grew plants in cold and exposed localities, subject to hard

frosts and killing winds, used to adopt the practice of covering their beds with sprays of Spruce Fir, the trimmings of young plantations. They were laid by for one year until they had lost their leaves; the sprays were then light in structure, and having a natural curve upwards, they were well adapted for protection and served a useful purpose. Some green sprays stuck in the bed about and around the plants make a serviceable protection also, especially when cold and sweeping

THE BEECH FERN

(POLYPODIUM PHEGOPTERIS).

Although this pretty little Fern is rarely seen in good form in cultivation, the accompanying photograph (fig. 43) shows that under congenial conditions it forms a really charming picture; and since it finds these conditions in damp, shady woods and rocky glens, it would clearly repay wider introduction. In the illustration we see it

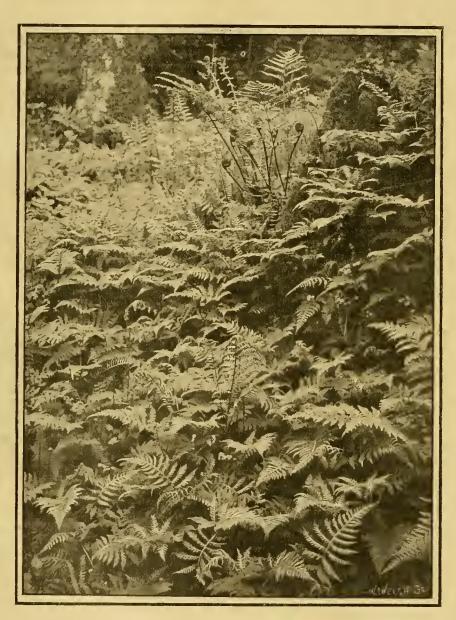

FIG. 43.—BEECH FERN IN CO. DONEGAL.

blasts abound. The beds of choice Pansies also can be protected in this way with advantage.
New varieties of border Pinks obcasionally appear, but rarely has there been seen of late a new variety of laced Pink. Time was when an interesting collection could be seen in the gardens of the Royal Horticultural Society at Chiswick growing and flowering freely; it is almost quite as good a town plant as the Carnation. I hope that in planning the new garden at Wisley space will be reserved for a representative collection of laced Pinks in common with other old favourites, which have lost something of their popularity, but which should not be allowed to become utterly lost. R. D.

associated with the Lady Fern and Shield Fern, and it is very often found in company with its near relative the Oak Fern (P. Dryopteris), both delighting in precisely the same conditions of an open, leafy, stony compost, in which their thin, black, spreading root-stocks find congenial harbourage.

Although belonging to the same genus as the common Polypody of the hedgerows, the Beech Fern differs very markedly by being quite decidnous, having thin, creeping root-stocks instead of thick, fleshy ones; and its spores, although borne in the naked dot-like heaps peculiar to the family, are much smaller, both in themselves and the size of their heaps, and are furthermore

dark-brown instead of golden-yellow. On the other hand, there is a greater similarity in the form of the frond than is seen in either the Oak Fern, or the remaining member of the family in these islands, the Limestone Polypody (P. calcareum), in both of which the frond is broad and triangular; while in the Beech, as we can see by the illustration, they are broadly lanceolate, with (and this is a very characteristic feature) the two bottom divisions turned downwards. Under culture it makes very pretty clumps, if grown in shallowish pans filled with an open compost, say, half loam and half leaf-mould, with a liberal admixture of coarse silversand. It has produced very few varieties, and obviously, like its cousin the Oak Fern, it is sufficiently self-satisfied to refrain from vagaries. Its long, fragile stalks are very brittle, and hence it cannot display itself to advantage in exposed positions, which dwarf it. On a sloping, rocky bank, however, protected by trees and facing the north, it speedily establishes itself and spreads, and in such positions may easily be enabled to rival the picture which has suggested our text. Chas. T. Druery, F.L.S., V.M.H.

NOTES FROM ISLEWORTH FOR 1903.

The subject which interested gardeners during the year under review, to the exclusion of most other subjects, was the weather. It was the wettest year, and incomparably the wettest summer, ever recorded in the London district. In the months of May, June, July, and August, I measured 20 91 inches of rain, thus exceeding the rainfall of the remarkably wet summer of 1879 by no fewer than 4·13 inches. It is possible that such continuous rainfall will never occur again round London, yet we must not calculate upon this, and gardeners will be well advised to take special notice of the few flowering plants which gave success during the past season.

AGAPANTHUS AND ARCTOTIS.

In this garden two plants stood out prominently as successes amid the general wreckage—one a very old favourite in suburban gardens, and the other an older plant still, but rarely seen outside botanic gardens. The first of these, Agapanthus umbellatus, is too well known to need any advertising, yet it is seldom given that very liberal treatment necessary to produce the finest blooms. During the growing season it is one of the greediest feeders and most moisture-loving plants in British gardens. The best forms of this type are superior to any other species or hybrids that I have seen. The other plant to which I refer is Arctotis aspera. The foliage of this plant is a silvery-grey with an olive subshade, and the astonishing brilliance of the orange-coloured flowers makes it a most effective "lawn" plant.

Even when it has rained for a week, the firstglint of warm sun will cause numerous flowers to expand, and the flowering season lasts until quite late in the autumn. This year the lawns wore an ideal carpet of the most lustrous green throughout the summer, and with a background of sombre Conifers or laughing Bamboos, such plants as these will prove a source of great delight to the eye. Arctotis aspera requires just the same culture as the garden Cineraria, except that it wants full exposure to the sun. Both plants are best grown in large pots or tubs (not under 14 inches diameter), and arranged on the lawn towards the end of May. Neither will stand frost without injury, and a temperature of 28° will kill the Arctotis outright.

Among specimen Pelargoniums for outside decorative purposes only two kinds faced the rains bravely. These were the well-known single scarlet Plutarch and the less-known Achievement. This latter bears large stiffly-erect umbels of pink flowers, and is said to have

been raised by a cross between the Ivv-leaved and zonal sections. It is certainly a plant of fine constitution.

FAILURE OF FLOWERING PLANTS.

Although flowering plants suffered terribly from the rains of 1903, quite the reverse was the case with hard-wooded trees, which luxuriated in the cleansing influence of the heavy falls and the meister atmosphere.

Many Conifers, which were undoubtedly dying or becoming unsightly objects, took a new lease of life in 1903, and gladdened the hearts of those who admire the varying effects of light and shade and the gradations of colour which can be produced in gardens without having recourse to flowering plants. The year 1903 has certainly been a lesson, and should be a warning, to those who rely mainly upon showy and brilliant flowering plants for their garden delights. This has been a year in which the beauties of foliage and of the serene expanse of lawn and grass-walk have triumphed over all competitors.

The polar blast of mid-April not only destroyed the fruit crops, but completely defoliated the Japanese Maples and spoiled them for the whole summer. The beautiful Platanus acerifolia variegata (of Russell) was also ruined. In fact the only Japanese Maple that held its foliage was the type, A. palmatum, a plant of no great beauty, except in its autumnal tints, but which is worth growing under the shade of other trees, where little else will grow. Even under glass foliage plants did better than flowering plants. My Colous quite out-blazoned anything the Cannas could do, these latter suffering from mould in the petals.

It astonishes me that this beautiful section of decorative greenhouse Coleus should be so entirely overlooked in British gardens, but I believe that the system of judging by "points" at flower-shows is partly to blame. By this means no Coleus is considered "good" unless it will grow to a particular shape and size in a certain sized To attain this end the plants must be constantly pinched and manure-fed. As a result, coarse green foliage, with a minimum of colour, and a deformed shape, are the gardener's ideals, and every plant with any sign of good blood must be cast to the rubbish-heap. Who can wonder that the public, seeing such hideous monstrosities put ferward as prize plants, decline to cultivate Coleus?

My own experience is that carefully selected Coleus are the best decorative (summer) conservatory plants that we possess. The only difficulty I find is that the extraordinary brilliance of their foliage "kills" every flowering plant put near them. I raised three new varieties in 1893. C. thyrsoideus is, in my opinion, not worth growing, except as a novelty; it will soon be cast aside.

Among exotic Amaryllids flowering in the open, the season was a complete failure, only Crinums Powelli and Moorei doing any good; and these were generally too late in coming into bloom. An odd Brunsvigia flowered well in August.

Under glass, Nerines had a good season, and Amaryllis a fair one. Lachenalias "lifted" better from their summer beds than perhaps ever before. A. Worsley, February, 1904. (To be continued.)

MARKET NOTES.

CHRYSANTHEMUMS.

CHRYSANTHEMUMS.

The following are good market varieties:
Soleil d'Octobre, pale yellow (October); Souvenir
de petite Amie, white (October); Source d'Or,
bronze coleur (November); Phœbus, yellow
(November); Queen of the Exe, pink (November);
Madame Philippe Rivoire, white (November);
Miveum, white (December); Lord Brooke, bronze
and yellow (December); Western King, white
(December); W. H. Lincoln, yellow (December);
Framfield Pink (January); L. Canning, white
(January). E. Molyneux.

CYMBIDIUM EBURNEUM.

Our illustration (fig. 44) gives a representation of a fine specimen of Cymbidium eburneum which flowered in the gardens of J. Miller Mundy, Esq., Shipley Hall, Derby (gr., Mr. J. C. Tallack). The plant, which has been grown at Shipley Hall for some years, bore thirty-one flowers, eight of which are on twin-flowered stems. It was photographed by Mr. E. A. Seaman, of Ilkeston, just as it was in the house, and without staking or otherwise arranging the flowers. The flowers are white, the labellum having a yellow disc and a few purple spets, and it is certainly one of the most beautiful of the genus. The species was discovered by Griffith at Myrung, on the Khasia Hills, India, alt. 5,000 to 6,000 feet, in 1837, and first flowered in England some ten years later. Since that time it has been frequently imported from various localities it can be used in situations where the latter will net thrive.

There is one tree that I have never seen mentioned as a probable timber-tree, and that is-

TSUGA MERTENSIANA (Anies Albertiana).

I do not altogether recommend this, as I know very little of the value of its wood in this country; but in America its timber is said to be equal or even superior to that of the Hemlock Spruce (Tsuga canadensis). A few small trees I have seen have shown a fairly hard, closegrained wood, but these were practically little more than stout poles. It is, however, one of the fastest-growing hardy Conifers we have in this country, and thrives quite as well on a poor hillside as in the deep, moist soil of a valley. I have known young trees make from 3 feet to 5 feet of growth in a season. Our largest specimen here is nearly 80 feet high, and is not an old tree by

FIG. 44.—CYMBIDIUM EBURNEUM, AS GROWN IN SHIPLEY HALL GARDENS.

in the Himalayas, and has always been a favourite in gardens, though rarely seen in such a fine specimen as that grown by Mr. Tallack. It thrives in a shady position in a cool intermediate house, and requires to be kept moist all the year, and watered very liberally while actively

FORESTRY.

In reference to the note on p. 59 respecting Larix leptelepis, I may mention that it grows well here on our sandy soil, one batch in particular having made a growth of from 3 feet to 4 feet in two years. They were planted in their present position in January, 1902, and are now about 8 feet high, and much thicker in the stems than common Larch of the same size. Their rate of growth is the more remarkable as they were not at all well reoted at the time of planting. Some Sycamores of the same size (when planted) that are close to them have been overtopped by a couple of feet by the Larch; and the Sycamore is not a slow-growing tree in a young state. L. leptolepis grows in a moist place better than its European relative, so that

any means. It is, however, the finest specimen Conifer I have ever seen, being perfect in every

A plantation of Tsnga Mertensiana, Pseudotsuga Douglasii, and Ahies concolor mixed would, I believe prove a paying investment in course of time. They should be at least 4 feet in height when planted, as smaller plants, though cheaper to buy at first, are usually the dearest in the long run. Many planters make a mistake in planting forest-trees too small, as small plants are more liable to be cut by spring frosts than larger ones. The werst part is that the leader gets cut, which means a loss of time before another leader is properly formed. The wood of

ARAUCARIA IMBRICATA

is valuable for some purposes when the tree has attained a fair size. A specimen about 21 feet in diameter was cut down here about seven years age, and the wood, after being seasoned, was used in the making of a fence. No tar or paint whatever has been used on the fence, which is in as good condition now as it was when first put up. Of course, the Araucaria is of no value as a foresttree, but its wood, where it can be obtained, is very hard and durable. J. C., Bagshot.

ORCHID NOTES AND GLEANINGS.

VARIATIONS OF A LÆLIA ANCEPS.

IT has been stated that truth is stranger than fiction. My note will seem incredible to many, but I am certain that it is correct. Soon after my taking charge of the Orchids at Gatton, in January 1900, a specimen plant labelled L. a. Sanderiana flowered, and the flowers had no colour on the front of lip. I was told that previously it had always showed the blotch of colour peculiar to the variety Sanderiana, yet I altered the label to L. a. Stella; in 1901, 1902, and 1903 it came the same as in 1900; it was shown and commented upon at the Royal Horticultural Society's meeting as true This year it has come again L. a. L. a. Stella. Sanderiana, having a well-defined blotch on the tip of the lip. By no chance can it be that there are two species in the pan, for each year it has produced four spikes annually previous to this year, and the flowers on all the spikes were the same; this year it had three spikes from the same lead that flowered last season and previously, and the flowers on each spike are true to L. a. Sanderiana. I shall be interested to know if anyone else has experienced a similar case. W. P. Bound, Gatton Park Gardens, Reigate.

DICTIONNAIRE ICONOGRAPHIQUE DES ORCHIDÉES.

In the issue just to hand, and which completes the numbers for 1903, M. Alfred Cogniaux, from drawings by M. A. Goossens, illustrates and describes thirteen species, among which are several old favourites:—

ANGRECUM FILICORNU.—A graceful species, long known by the figure in Thouars' Orch. des Iles Aust. d'Afrique, but of which little was known in gardens until it was exhibited from Sir Trever Lawrence's garden, in July, 1900. The plant, which is of slender habit, has narrow, channeled leaves, and produces flowers singly from their axils. Flowers about Juches across, white, and furnished with slender greenish spurs about 4 inches in length.

BRASSIA BRACHIATA.—The figure is lettered Brassia brachiata, but the description is of Brassia verrucosa; and no explanation is given for the contradictory naming. The two species form the showy members of the class "verrucose" of Eubrassia, and it has been suggested that they are members of the same species, the B. brachiata figured being much the showiar, and with petals much longer than in typical B. verrucosa. The species used in the early days of Orchid growing to form one of the leading exhibition plants. Sepals and petals narrow, pale green, the former 6 inches and the latter 4 inches in length, the sepals with a few and the petals with a cluster of chocolate-purple spots at the base. Lip white with wart-like green spots.

CALANTHE VERATRIFILIA.—An old garden plant of the evergreen section of Calanthe, with broad darkgreen leaves and erect spikes of numerous pure white flowers. It is an excellent stove house plant, and lasts in flower for many weeks.

CŒLOGYNE SPECIOSA ALBICANS.—The species was figured in the Botanical Register in 1847. The variety, like several of the other species figured, flowered in the collection of M. Louis Fournier, Marseittes. The large flowers have greenish sepals and petals and white labellum and column, both marked with reddishpurple.

COLOGYNE PANDURATA. — A hothouse Bornean species, almost a swamp plant. Flowers large, on stout stams. Sepais and petals green, lip whitish marked with blackish-purple.

CYPRIPEDIUM INSIGNE FORSTERMANI. — A showy variety of the C. nitens class. Upper sepal greenish at the base, white above, and bearing large chocolate blotches. Petals and lip striped and tinged with purple.

CYPRIPEDIUM × LEEANUM. — The familiar, useful hybrid originally raised in Sir Trevor Lawrence's gardene, and described in the *Gardeners' Chronicle* in 1884. Some of the better varieties are among the favourites still, and all are showy, easily-grown plants.

DENDROBIUM LOWII.—Arare yellow-flowered Bornean species of the nigro-hireute section, and still rare, although it was described in the Gardeners' Chronicle in 1861, and frequently imported since. The finest plant we have seen recently was quite a bush, growing in the Nepenthes-house in Sir H. Schroder's gardens, The Dell, Egham.

EPIDENDRUM POLYBULEON.—A pretty dwarf species producing numerous reddish flowers with white labellums, the variety luteo-album, which flowered at Burford, being yellow-and-white. The best form comes

from Jamaica, but the species is also found in Mexico and Guatemala.

LELIO-CATTLEYA × FREDERICK BOYLE VAR. KER-CHOVF.E (C. FRIAN.E ALEA × L. ANCEPS ALEA).—One of the gems in the fine collection of Mr. A. A. Peeters at the last Gheat Quinquennial Exhibition, and duly reported by us at the time. One of the finest of L. anceps crossas. Named in honour of M. le Comte de Kerchove de Deuterghem, the popular President of the Société Royale d'Agriculture et de Botanique de Gand. Flowers pure white, with yellow disc to the lip.

PHAIUS ALBUS.—The plant figured is more commonly called Thunia is gardens, that variely being known as Thunia Marshalliana. It is reed-like in growth, and readily propagated by cuttings of the stem. Flowers in short nodding racemes; white, with fringed orange-coloured ridges on the lip. The Thunia section of Phaius require a prolonged dry rest, like deciduous Dendrobes.

SELENIPEDIUM X NITIDISSIMUM (CAUDATUM X CONCHIFERUM).—While collectors eagarly sack for novelties in what are called Cypripediums, the Selenipediums are but coldly received. Nevertheless they are very ornamental plants, and will thrive in an ordinary heated conservatory. Their bright green leaves always render them ornamental, and the white, rose, and brownish flowers are continually produced. The variety figured has green flowers; the petals and lip striped and tinged with red-brown.

STANHOPEA LANGLASSEANA.—This was described by M. Cogniaux in the Gardeners' Chronicle, December 14, 1901, p. 426. Flowers white, spotted with crimson, the segmenta, epichile included, tipped with yellow, the epichile being orange colour. A note on the native habitat was given by M. Micheli and M. Ed. André in the Gardeners' Chronicle, January 18, 1902, p. 38, and by the late Mr. F. C. Lehmann, whose obituary notice we are sorry to have to give in the present issue, in a very interesting article, February 21, 1903.

COVENT GARDEN MARKET.

Good Poinsettias, Erica hiemalis, and a few pot Chrysanthemums, may yet be seen, and Solanums are still plentiful, but there is little sale for them. Erica melanthera is very good, and E. fastigiata, an old species which I have seen little of previously, is good, the bushy plants being well covered with tiny white flowers. Acacia Drummondi is well flowered, also Boronia megastigma. Cyclamens continue very plentiful, and there are some good Cinerarias to be seen; those of bright colours sell well. Azaleas are good, the pink "Oswald de Kerchove" is particularly fine. Callas, Daffodils, Tulips, and Hyacinths in pots are plentiful. All the Hyacinths now seen in the Market are grown three or more in a pot; white and pink flowered varieties are very fine, and they are more effective than when grown singly. There is certainly some signs of improvement in the trade for pot plants. There are still many empty stands, but a little bright weather would fill them again.

CUT FLOWERS.

Daffodils are most plentiful. Chrysanthemums still hold out, and there are some very good blooms to be seen. Tulips are abundant, and may be bought at very low prices. Roman Hyacinths are good and plentiful. Lily of the Valley is over plentiful and some very fine samples are to be seen. White Azalea is also over-abundant. Roses are still scarce, especially red flowers, and I learn from one of the largest growers that it will be fully a fortnight before many can be cut, excepting of the white Niphetos. Carnations are scarce, but a better supply is expected soon. Of Orchid blooms, Dendrobiums are more plentiful. Cypripediums are still coming in good. There are also some good Cattleyas, and Odontoglossum blooms are scarce. Double scarlet Pelargoniums (F. V. Raspail) are coming in better now. There are also some good pink flowers (Robert Hayes).

There is little to be said about the new French Market, except that there is a great lot of stuff coming in just now. After 9 o'clock, when the ordinary market is closed, this one becomes crowded, chiefly by hawkers, and a tremendous lot of produce is cleared off; Violets, Daffodils, Paper-white Narcissus, "Mimosa" (Acacia), and Snowdrops are the chief items. A. H., February 6.

BOOK NOTICE.

A GUIDE TO NATAL.*

THERE are guide-books and guide-books; this is one that should be spelt with a capital G! For few that we have seen can compare with this in the thoroughness with which the promise of the title-page is fulfilled, and those who wish to obtain a good general idea of this much-talked-of Colony cannot do better than peruse this book, which is full of information of general interest as well as of that particular kind which the traveller needs. The work is admirably planned, brightly written, and readable from cover to cover. It contains 300 pages, six maps, and is profusely illustrated with over three hundred beautiful photographic representations of the scenery, buildings, natives, places of interest, animal and vegetable productions, &c., which give an excellent idea of the many beauties nature has bestowed upon this goahead Colony of ours. For the convenience of those who use it, the work is divided into two books, which are again sub-divided into parts. In the first book the various towns and places of interest along the Natal Railway systems are dealt with. Here we are reminded that it is only sixty-eight years ago that the town of Durban was founded and named after Sir Benjamin D'Urban, then Governor of the Cape. At that time Durban "was mere sand and bush, the haunt of elephants and the abode of serpents; now there is not a fairer or more progressive town in all South Africa,' possessing fine broad streets, grand ornamental buildings, and some 22 miles of electric tramway around the town and extending to the suburbs. The population is over 60,000, and the town is growing so rapidly that although it has a fine and spacious Town Hall (in which the Museum and Picture Gallery are contained), it is insufficient for present needs, and the erection of another is contemplated. Like London, it has an Embankment, which is over a mile in length, and picturesquely bordered with Palms and trees; there is also a cricket "Oval," a racecourse, a "Lord's," and many other attractions. The Observatory and picturesque Botanic Gardens are situated in the suburbs; the latter are under the able management of Mr. J. Medley Wood, who has done much to bring them to their present state of perfection. Leaving Durban, the reader is conveyed to all

Leaving Durban, the reader is conveyed to all the principal towns and places of interest throughout the length and breadth of the Colony; and, if one may judge from the profusion of charming photographic pictures, there is no lack of beautiful and picturesque scenery. Pietermaritzburg, the capital of Natal, is a smaller town than Durban, but equally provided with attractions, commercial and other up-to-date conveniences, and fine buildings. The magnificent Town Hall is said to contain the fourth largest organ in the world. A picturesque view represents the "Cathedral Bells," which consist of four bells hung upon a tree—doubtless a relic of

more primitive times.

Among the many beautiful views of scenery are several charming waterfalls, one, near Howick, being 360 feet high; whilst the views of the mountains and valleys (or kloofs) make one long for a holiday to be among them. Especially grand are some parts of the Drakensberg Range, which at its highest point rises nearly $2\frac{1}{4}$ miles above sea-level. The views also convey a good idea of the general character of the vegetation of Natal, and several interesting pictures of the Kaffirs in their native costumes, their huts, and ceremonies, also embellish the book.

As giving some idea of the character of the wilder parts of Natal, the following may be

^{*} Natal: an illustrated Official Railway Guide and Handbook of General Information. Compiled and edited by C. W. Francis Harrison. Quarto. Published by Payne Jennings, Regent House, Regent Street, London. W.

quoted:—"Before leaving Verulam and its environments, it may be alike interesting and relieving to peep at the wild and romantic

FEBRUARY 13, 1904.]

into a veritable wonderland of beauty, where foaming rivers, black forests, cañons, and long, lonely plains are woven together into a mass

is by no means large, it makes up for it in foam, sparkle, and dash. It is environed by lonely forests, whose silence is seldom disturbed by

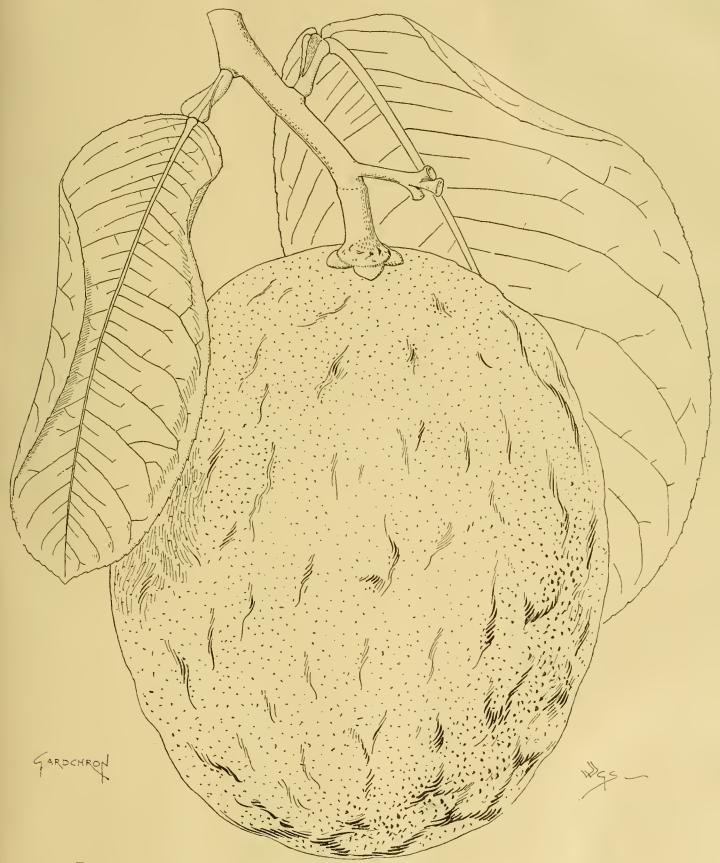

FIG. 45.—CITRON FRUIT (CITRUS MEDICA), CULTIVATED BY MESSRS. T. RIVERS AND SON, SAWBRIDGEWORTH, AND SHOWN AT A MEETING AT THE DRILL HALL ON JANUARY 26.

country round about the Inanda range of mountains, which adjoin the Mission Station. These bold and bluff-like buttresses of Nature jut out

which only a trained pedestrian will care to traverse. The Umzinyati River here plunges over a sheer cliff of over 200 feet. Though this river

aught save the barking cry of the baboon or the wail of the isinkwe (night-walking lemur). On the sandstone cliffs and in the recesses of the

thickly-wooded chasm—the haunt of the 'dassie' or rock-rabbit—many beautiful plants may be found. Within a few miles' circuit, about six native tribes are located. Here the tourist, having studied the Christianised native, can revel to his heart's content in barbarism as dense and unsophisticated as he could find in the depths of Matabeleland. Women toiling in the corn-fields, warriors in all the glory of plumes and spears, chieftains dwelling in semi-royal state, war-dances and barbarous festivals. If his temperance principles are not unalterable, he may partake of Kaffir beer out of a real calabash, and recognise in it the flavour of stale yeast."

Of course, the recent war is freely alluded to, and many pictures of what are now historic spots are given. Notably among them are two views of the renowned Spion Kop; another showing one of the famed Boer trenches at Colenso; one of the crossing of the Tugela by General Buller's forces on January 27, 1900, for the final attack and relief of Ladysmith; and there are several views of the tombs of soldiers who fell in the war, besides others giving the respective positions of the British and Boer forces; together with two excellent coloured maps, giving bird'seye views of the entire war district of Natal, with explanatory details. All these are really interesting and instructive, and give a far better idea than mere words can convey of the many difficulties our brave soldiers had to contend with. A brief account of the Transvaal is also included. Statistics, distances, and cost of railway journeys are given throughout in a concise, unobtrusive manner.

The second book deals with the physical geography, geology, forests, flora, vegetable products, fauna, game laws, climate, population, natives, government, industries, and many other details. Like the first book, it is well illustrated; among the pictures are some very useful photographic plates of a complete collection of the horns of Natal animals, all named, and two plates of Natal butterflies. Two views also represent the Laing's Nek tunnel before and after it was wrecked by the Boers.

Throughout the Colony farming seems to be extensively carried on; whilst fruit, Mealies, Sugar, Tea, Tobacco, and other products are largely grown.

If we put faith in this gnide-book then, it is clear that those who are under the impression that Natal partakes of the character of some parts of South Africa in being so much useless ground, will find themselves agreeably enistaken; while the numerous photographs show that it is not destitute of the grandeur of mountains and waterfalls, or of peaceful little spots "far from the madding crowd." It gives us evidence that not only is Natal full of natural and other attractions, but is a thriving and prosperous community, that intends to be thoroughly up-to-date, and is, therefore, a desirable land for the emigrant.

But Mr. Harrison points out in his preface "that while Natal realises the desirability of attracting to her shores farmers, traders, manufacturers, miners, mechanics, and other suitable emigrants," adds, "Although the Colony wants new blood, it must be accompanied by bodily muscle and mental grit. The battle of life may not be so fierce as it is at home, but it is equally arduous, and demands the utmost virility and moral stamina, ability, energy, and enterprise."

To all those who desire to know something more of this Colony, so often spoken of yet by the majority so little known, or to those who merely like to look upon some charming views of natural scenery, this guide-book can be thoroughly recommended, for, if the indices be omitted, there is not a dull page in it. N. E. Brown.

FRUIT REGISTER.

A PROLIFIC FIG-TREE.

WE have a Fig-tree planted out in one of the vineries here, covering about 40 square feet of trellis, which during last season ripened three crops, the total crop amounting to about The variety is Reculver, which, 400 fruits. according to Messrs. Bunyard & Co., is "one of historical fame, being cultivated by the Romans when located in the Isle of Thanet, B.c." They describe the fruits as being small, purple, and sweet. The tree under notice was planted originally as a standard in the open, but as such was not a success, so at the beginning of 1902 we removed it under glass, training it to the wires. We commenced to pick the first crop last year on May 12, and gathered on sixty-six days, thus averaging about six fruits each day. The fruit began to ripen on the upper part of the tree, and there was only a very short interval between the finish of one crop and the commencement of the next. The house in which it is planted is a new one, with a span-roof. Vines are planted on one side, to go up and halfway down the other side, the other half being devoted to Figs, an arrangement which seems likely to be successful. R. W. Dean, Wainsford Gardens, Lymington, Hants.

The Week's Work.

THE KITCHEN GARDEN.

By John Pentland, Gardener to C. H. B. Firth, Esq., Ashwicke Hall, Marshfield, Chippenham.

Rotation and Position of Crops.—Arrange where each crop of the season shall be sown or planted. Consider the situation of the garden, whether surrounded by walls or hedges, or shaded by trees on certain sides, and arrange the crops accord-ingly. Horseradish, Rhubarb, Jerusalem Arti-chokes, Spinach, Beet, Curled Greens, Celery, Brussels-Sprouts, Potatos, Turnips, and Seakale may all be grown satisfactorily on east, west, and north borders, putting the five first-mentioned crops where there is the most shade, not that they require this, but in gardens of limited dimensions it is necessary that every yard of ground should be occupied by the crop most suited to the situation. North borders are often utilised for late crops of Potatos, to be dug when young for sending to table at once, and during a hot and dry season they will be found suitable also for Turnips, Spinach, &c. The height of the wall or hedge and the breadth of the border will also affect the decision as to what crop should be planted. Utilise all the most sheltered and sunniest parts for early and late crops. In a well-managed garden such spaces are seldom vacant. The rotation of the various crops also requires forethought, but as each succeeding crop may require more or less space than the previous one occupied, no hard-and-fast line can be drawn, except that crops of Brassicas should be followed by roots and catch crops, and vice versa. Plant Celery after a crop of Brussels-Sprouts, Onions after Celery, autumu-sown Peas or Broad Beans after Onions, following with Cauliflower or Broccoli. Arrange the crops so that a similar crop will not be on the same ground oftener than every three years. If there is any vacant ground not yet turned up, let it be done at the first opportunity.

Seeds.—Owing to the wet condition of the soil, those anxious to sow seeds had better wait for a week or so, unless in very favourable districts. Our rainfall for the first four days of February has been 0.74. Place frames on a border having a south aspect, and, having prepared seed-beds in these, make a small sowing of Dalkeith, President Carnot, or Scrymgeon's Dwarf Brussels-Sprouts. Also make sowings of Radishes, Lettuce, and Cauliflower. When the seedlings are up, admit air to the frames on all favourable occasions, and when the weather will permit remove the frames elsewhere. Look to all seedlings, and thin them out where required. Keep Tomatos and Cucumbers well up to the light, and afford them

proper ventilation. Avoid high temperatures, by which many plants are ruined in the early stages of their growth.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, gr., Wrotham Park, Barnet.

Nuts.-In Kent and other localities where there are many acres of Filbert and Cobnuts cultivated for market, the pruning as a rule is commenced with the beginning of the year, and extends over a period of three months; but where there is only a moderate quantity of bushes grown, this operation need not be com-menced until February, when the tiny pink-coloured female blossoms are visible. In pruning the Nut-bush the object should be to keep the main branches clothed well with small, twiggy, fruitful growths. Remove all coarse wood and suckers springing up from about the stems, &c., but preserve sufficient male catkins to afford pollen for the fertilisation of the flowers. In some gardens Nuts grow with but little restriction, and in instances fruit very well; but the method practised by the Kent growers is undoubtedly the best, and induces fruitfulness and preserves neatness. Cut out all growths in the centres of young trees, which should always be kept well open; then select four to six of the best-placed shoots to form the main fruiting brauches of the future tree or bush. Shorten these back to an outside bud, and repeat the operation annually. Keep the stem clear, and bend the young shoots downwards to form the shape of a vase or basin, and when once these have been formed others may be left at each annual pruning until the proper dimensions have been reached, which should not be higher than 6 feet. The soil for Nuts should not be too rich. I have seen heavy crops produced by trees growing on poor, stony soil on banks unsuited to the growth of other kinds of fruit-trees. Trees or bushes that have fruited many years may be benefited by a heavy dressing of old woollen rags or fur-waste. Manure which is thoroughly decayed will also be helpful; but avoid strong farmyard dung in a green state.

General work.—The weather of late has been against outside work, and the land in some instances has been under water, rendering work impossible. Advantage must be taken of favourable opportunities to complete pruning operations. Any Apple and other fruit-trees it is intended to graft may now be headed back to within a reasonable distance from the main stems. Keep all the young shoots intended for scions embedded in the soil under a north wall till such times as they are wanted to be placed on the stocks. It is a good practice to re-graft healthy trees of useless varieties, or of such as will not succeed in the locality. There are few Apples that crop so well as that useful variety Lane's Prince Albert; another good but old Apple is Round Winter Nonsuch; Tom Put also crops well at Wrotham; Gooseberry Apple is one of the best keepers. The stems of young trees should be examined, and, if found to be infested with the mussel-scale, scrape the bark and thoroughly wash and dress it with a mixture of strong soapy water and paraffin, at the rate of a small 60 flower-potful of paraffin to 4 gallons of soapy water; after which paint the stems with limewash and soot, made to the thickness of ordinary paint.

THE FLOWER GARDEN.

By A. B. Wadds, Gardener to Sir W. D. PEARSON, Bart., Paddockhurst, Sussex.

Shrubs.—Top-dress beds containing "American" shrubs with rough peat or leaf-mould. Some will require to be thinned, and the growths of the shrubs regulated. Long straggling pieces should be cut away. Diplopappus chrysophyllus edged with Juniperus tamariscifolius make a neat bed of attractive foliage. These should be pegged down to about 15 inches, and the hedges to 12 inches. Ledum palustre with a groundwork of Erica alba; Kalmia latifolia, edged with Euonymus radicans variegatus, also are good combinations. Dwarf hybrid Rhododendrons are very pretty in spring edged with dwarf Golden Yews. Pernettyas are bright just now with berries; Yuccas in a large bed with a ground-

work of Skimmia japonica, Andromedas, Olearias, and all this class of shrubs are best in a garden by themselves, and should be planted this month. The hedges of these beds should be kept neatly and squarely cut.

Bedding Plants.—Those that were placed in heat last month will now have good short-jointed growths, a few of which should be taken off with a "heel" attached, every few days. Nepeta Glechoma variegata (ground Ivy), also Campanula isophylla, and its variety alba, are two very useful summer plants. The former may be used for covering rough places, or as a ground-work amidst Lobelia cardinalis pegged down neatly. The Campanulas are useful in the rock garden and are hardy. Cuttings of bedding Verbenas may be taken and seeds sown.

Tuberous-rooted Begonias required for bedding will now be starting into growth. Lay the tubers in boxes containing a little fibre and place them in a warm frame, syringing them daily. Seedlings from seeds sown last summer may be placed in a warmer temperature to encourage growth; seeds may also be sown now. The erect-flowering varieties are most suitable for bedding. Let the beds to be planted with these be afforded some fine peat, leaf-mould, and a little soot, forking them into the soil.

Fibrous-rooted Begonias.—As soon as the seedlings have germinated, place them in a good position near to the glass in the same temperature. Old plants may be divided up and cuttings taken.

Chimney Campanulas and Canterbury Bells that have been wintered in a cold frame may be removed out-of-doors previous to planting them in the borders.

General Work.—Specimen plants of Fuchsias, Heliotropes, and Ivy-leafed Pelargoniums required for the terrace and other parts of the flower-garden may be cut back and cleaned previous to putting them into fresh tubs or pots. Oak tubs are the best for out-door work. If plants of Hydrangea Hortensia are not to be re-potted, examine the drainage and make it perfect. H. paniculata should be cut back previous to repotting. Violas rooted last autumn may be planted in their summer quarters. Clean Myosotis, Wallflowers, and all spring-flowering plants, and use the hoe amongst them when the ground is dry. In the wild-garden or elsewhere the Clematis is commencing to grow; keep a look-out for slugs and mice. A 2-inch drain-tile, split in half and placed round the stem, will protect young plants until they become strong and of good length.

FRUITS UNDER GLASS.

By W. FYFE, Gardener to Lady WANTAGE, Lockinge Park, Wantage.

Figs in Borders. — We have just completed cleaning, tying, and top-dressing. The latter eperation implies the addition of whole turves where the roots upon the surface are most numerous, having well watered the border with diluted drainings from the stables. Syringe the trees daily, and afford a temperature of 50° at night and 55° by day, which may be increased to 65° with sun-heat.

Strawberries.—Introduce successional batches at intervals of about ten days in quantity according to the demand. Examine the drainagematerial in every pot, and remove the dead leaves from the plants. Afford a top-dressing to the plants if the pots will allow of this being done, and place the plants near to the glass and in a position where they will be under the influence of a freely circulating atmosphere. If the plants can be induced to produce stout flower-stalks and leaves, a crop of good fruits will follow. Syringe the plants morning and afternoon, and afford them sufficient water to keep the soil in the pots moist. The temperature at night should be from 45° to 50°. Plants about to flower will require a little extra heat, but even when they are in flower the atmosphere should not become severely dry. Distribute the pollen at noon by means of a brush, and on bright afternoons spray the trees slightly with the syringe as a prevention against red-spider. Examine plants on which fruits are set each morning and afternoon, and afford sufficient water to plants requiring some that it will run through the drainage. Liquid manure should be afforded

to increase the size of the fruits. Remove deformed or badly-set fruits, leaving six or eight fruits on each plant. Prevent cold draughts, and let the temperatures range from 60 to 65°, increasing this by day with moderate ventilation to 75°. Royal Sovereign is the principal variety grown here.

New Vine Borders.—In the making of new borders, the provision of drainage should be given first attention. Yet on some soils, such as given first attention. Yet on some soils, such as we have here, where the foundation is of chalk rock, little artificial drainage is required. But in order that a free circulation of air may pass under and through the border, which is neces to keep the soil and roots in a sweet condition, and to prevent the roots from resting on an unsuitable subsoil, or on concrete, which I consider little better, open out drainage to the depth of not less than 12 inches, putting about 3 inches of road-metal over the surface. This answers admirably here, with turves about 4 inches in thickness placed grass side downwards over the whole surface. The horder need not exceed 3 feet in width and 12 or 16 inches in depth, which will be about four turves deep, and in addition a layer of charcoal, half-inch bones, wood-ashes, limeor charcoal, half-inch bones, wood-asnes, lime-rubble, broken bricks, and cow-manure, between each layer of turves. The border should be made as firm as soil in good condition will permit, so that the Vines will produce short-jointed, well-ripened wood. Vines planted here in March, 1896, in a border as described, to which three additions in width have been made and a top-dressing added wearly is now made, and a top-dressing added yearly, is now 6 feet wide and 2 feet deep, with sufficient soil outside the arches to encourage the roots to work outwards, and to allow of a free circulation of air passing through the border. The border is covered inside or outside except when the frost exceeds 15°, when the outside border is covered with litter.

THE ORCHID HOUSES.

By W. H. White Orchid Grower to Sir Trevon Lawrence, Bart., Burford, Dorking.

Sophronitis grandiflora.—In the cool division, several well-flowered plants of this epecies produce a brilliant effect at this season. For many years we had a fine specimen (see Supplement to Gardeners' Chronicle, April 20, 1895), which produced from forty to sixty flowers annually. Probably through the plant's carrying so many flowers each year, it commenced to deteriorate; but about two years ago it was repetted into the new leaf-soil mixture—viz., equal parts of leaf-soil, peat, and sphagnum-moss—and is again quite up to its old form, having at the present time about sixty flowers open.

Miltonias.—The various Brazilian Miltonias, M. Jubbersiana, M. Peetersiana, M. Bluntii, M. festiva, M. flavescens, &c., should now be examined to see if any of the plants require more space, as this is the proper season to repot them. These dwarf-growing varieties should be grown in shallow pans, and as the young growths spread rapidly in every direction, they require a considerable amount of surface-room for their extension. Any old specimen plants that have become bare in the centre may be divided up, cutting away all diseased and useless pseudo-bulbs; the living pieces should then be made up again into neat, compact plants. Those pieces which have but few roots to hold them steady must be secured with pegs stuck into the compost, as they will not thrive if the least loose. The following species, M. Clowesii, M. cuneata, M. Russelliana, M. Regnelli, M. candida grandiflora, and the sup-posed natural hybrids M. Binotii, M. Joiceyana, M. Veitchiana, M. Lawrenceana, M. Crashleyana, M. Travassosiana, M. belula, and M. Lamarckiana, being stronger-growing plants, are best accommodated in the ordinary flower pots. These plants which may have their flower-spikes well advanced should not be disturbed at the root now, but may be attended to immediately the flowers fade or growth recommences. The pots or pans used should be at least half filled with fern rhizomes for drainage. Then use a compost consisting of good fibrous peat, ehopped sphag-num, and leaf-soil in equal parts, with a little coarse silver-sand, well mixing the whole together. Top-dress with living sphagnum-moss. These varieties that are in shallow pans should be lightly sprayed over whenever the surface-moss becomes in the least dry, while those in pots should be carefully watered with a fine rose watering-can, taking care not to afford too much water at one time, as the young growths are liable to decay from this cause. The whole of the Miltonias mentioned will thrive best in a rather cool, shady part of the intermediate-house. If grown in a very light position the foliage becomes thin and more yellow than is desirable. Cockroaches and woodlice are very fond of the small roots that are now pushing out. These insects must be exterminated with beetle poison, and pieces of Potato may be set for traps, which should be examined frequently.

PLANTS UNDER GLASS.

By C. R. Fielder, Gardener to Mrs. Burns, North Mymms Park, Hatfield, Hertfordshire.

Eucharis grandiflora (amazonica).—Plants that have flowered and need repotting may now be taken in hand. Let as much of the old soil aspossible be carefully removed from among the roots, and take away all small bulbs which, if required, may be placed in pots by themselves. The pots for Eucharis should be provided with perfect drainage, and the compost should be warmed to the temperature of the house in which the plants are growing before the operation of potting is commenced. Use good fibrous loam and a little rotten manure, together with sufficient coarse silver-sand and charceal to keep the soil porous. Press the soil firmly into the pots, and insert the bulbs so that they will be just covered with soil. Water sparingly until the roots have become active, which stage may be hastened if it is possible to plunge the plants in mild bettom-heat.

Gardenias.—Repet young plants raised from cuttings last autumn and now well established in 3-inch pots, into others 2 inches larger, using a compost of three parts loam, one part leaf-soil, a little rotten manure, and some coarse silver-sand. Pot firmly and place the plants as near to the light as possible in the stove or hothouse. It is well to raise young plants annually, and throw away an equal number of the oldest plants, it will thus be easier to keep the stock healthy and clean. Insert cuttings at the present time and they will make nice little plants by the autumn. To avoid disturbing the roots in potting, it is best to put the cuttings singly in small pots, using a light sandy soil. Place the pots containing cuttings under a handlight in a stove temperature, or in the propagating frame, where they will quickly make roots. Syringe the plants freely during favourable weather, and keep them in a stove temperature. The points of the shoets on young plants should be pinched out once or twice to make them bushy.

Libonia floribunda and L. pcnrhosiensis ×.—These useful winter-blooming plants will soon pass out of flower, and they should then be cut back and introduced into heat to produce new growths for making "cuttings." These will root easily, and should afterwards be potted into small pots and grown-on in heat for a time, taking the points of the shoots out occasionally.

Justicia carnea and Jacobinia chrysostephana.— Let cuttings be inserted as soon as procurable, placing them singly in small pots previously filled with a light sandy soil. The Jacobinia is a very showy and useful winter-flowering plant that will last a long time in flower, and the plants stand well when used in pots for house decoration. The flowers are rich orange-coloured, and are produced at the ends of the shoots similarly to those of J. carnea.

Coleus thyrsoideus.—A clear blue colour such as characterises the flowers of this plant is rare in winter, and for this reason it proves to be a useful addition to the plants available for conservatory decoration, from the middle of December to the middle of February. The flowers last well in the cut state, and are then useful for filling vases. As the plants go out of bloom they should be rested in an intermediate temperature until May or June, as, being a quickgrowing species, nothing is gained by commencing to propagate too early.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the Publisher. Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR,
41, Wellington Street, Covent Garden, London, Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.

Illustrations.—The Editor will be glad to receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

APPOINTMENTS FOR THE ENSUING WEEK.

FEB. 15 Birmingham Gardeners' Mu-tual Improvement Society meet. MONDAY.

THURSDAY, FEB. 18 Brighton Horticultural Society meet.

SATURDAY, FEB. 20-German Gardeners' Club.

SALES FOR THE WEEK.

MONDAY AND FRIDAY NEXT— Herbaceous Plants and Perconials, Azaleas, Roses. Begonias, &c., 67 & 68, Cheapside, E.C., by Protherce & Morris, at 12. WEDNESDAY NEXT—

WEDNESDAYNENT—
Greenbouse Plants, Palms, Azaleas, Roses, Fruit
Trees, Hardy Bulbs and Plants, &c., at 67 & 68,
Cheapside, E.C., by Protheroe & Morris, at 12—
Consignment of 1032 cases of Japacese Lilums,
Palm Seeds, Tuberoses, &c., at 67 and 68, Cheapside,
E.C., by Protheroe & Morris, at 3.—At Stevens', at
12.30, 300 cases Japanese Lities, 110 cases of Japanese
Iris, Fern Balls, &c.—At Stevens', at 1.20, Roses,
Lilles, Rhododendrons, Azaleas, Lilacs, &c,
FRIDAY NEXT—
Orchids in variety, at 67 and 68, Cheapside, E.C.,
by Protheroe & Morris, at 12.30.

(For further porticulars see our Advertisement columns.)

AVERAGE TEMPERATURE for the ensuing week, deduced from observations of Forty-three Years at Chiswick -39'2'.
ACTUAL TEMPERATURES:-

TOAL TEMPERATURES;—
LONDON, - Feb. 10 (8 p.m.); Max, 47°; Min, 44°,

Bar,, 29°1. Dull.
PROVINCES, - Feb. 10 (8 p.m.); Max, 50°, S.W. Counties;
Min, 36°, N.E. Scotland.

Society.

WE have already published the The Royal Morticultural more important portions of the Annual Report of the Society for the past year, and in another

column we give detailed particulars as to the Annual Meeting held on Tucsday last; our present comments may therefore be brief.

The chief interest at the meeting centred round the proposals for increasing the amount of the subscription. There were three courses open-the one to let things remain as they were, which would probably have been the best; but the Fellows present did not think so-at least, they did not say so. Secondly, came the proposal to raise the subscription to a minimum of two guineas, with exception in favour of gardeners and of Fellows living abroad. In the third place was the amendment proposed by Mr. HARRY VEITCH, to the effect that no alteration in the rate of subscription should be made, but that an entrance-fee of one guinea should be charged in future new Fellows electing to pay but one guinea yearly, and that gardeners and Fellows resident abroad be exempted from this payment. This amendment was carried by a large majority, and was afterwards confirmed when it became a substantive motion.

The suggestion made in our columns by Mr. George Paul, that the Journal should be paid for separately, found no exponent, though it is obvious that under existing circumstances there must be a great waste, for excellent as the Journal is, the number of Fellows who appreciate it is comparatively few.

Turning to financial matters, the Fellows have to thank Mr. Gurney-Fowler for his particularly lucid statement. Grave apprehensions had been felt in many quarters at the very inadequate response made by the Fellows to the appeal for help in building the Hall and offices which are so imperatively necessary. We earnestly trust Mr. FOWLER'S statement may awaken the Fellows to a sense of their responsibilities, and that a vigorous effort will be made to meet the deficiency, estimated now at £11,399. The amount required for fitting up the new building is not included in this sum.

Mr. Fowler pointed out the necessity for further subscriptions, and stated that the building might be completed by means of a mortgage or by a loan, and that some of the investments of the Society might be sold at a future time, so as to provide funds for paying off the mortgage or the loan. It will be remembered that the idea entertained when investments began to be made during the Treasurership of Sir Daniel Morris, was that they should be made use of for building the Hall.

In the course of the discussion it was stated that the Council are still hoping to obtain a sum of £5,000 for the surrender of the lease at Chiswick.

The proceedings were rather remarkable for their omissions. Little or nothing was said about the Centenary year. Chiswick, the historic glory of the Society, was barely mentioned. No details were made public as to the progress of the Hall, and very few as to the state of affairs at Wisley. Probably the conditions of the Drill Hall were so uncomfortable that the Fellows were even glad to exchange them for the amenities of the strects!

HICKLETON HALL .- Our Supplementary Illustration to the present issue affords a view of Hickleton Hall, the seat of Viscount Halifax Hickleton lies about 6 miles from the ancient town of Doncaster. The estate comprises 2,000 acres of park, garden, and farm land, and is noted for its fine forest trees. Standing at a good elevation, the site commands an excellent view of the Dearne Valley to Conisboro' Castle, and Wentworth, the Yorkshire seat of Earl Fitz-WILLIAM. Our illustration shows a view of the pleasure-grounds and flower-garden, comprising about 30 acres of ground. Two Yew-hedges, 150 yards in length, are very fine features. Roses succeed well on the strong soil of the gardens, and are planted extensively. The same may be said of Carnations. The hall is a substantial building of grey stone. A few minutes' walk from the Hall is the kitchen-garden, consisting of 3 acres, enclosed within a substantial brick wall. A range of fruit-houses 100 feet in length is built against the south wall, also a range of plant-houses. Peaches succeed well on outside walls heated by flues. The borders round the kitchen-garden are devoted to flowering plants, and are enclosed with neat Boxedging. Hickleton being in the centre of a colliery district, choice Conifers will not succeed there, and only the hardier sorts have been planted. Mr. H. WENMAN, the gardener, has been there for a quarter of a century, and for twenty-one years

past has been head gardener. He is treated by his employer as a friend rather than as a servant.

LINNEAN SOCIETY.—There will be an evening meeting on Thursday, February 18, at 8 P.M., when the following papers will be read:—
1. "Mendel's Laws as Illustrated by Wheat Hybrids," by Mr. R. H. BIFFEN; 2. "Heredity and Variation as seen in Primula sinensis," by Mr. W. BATESON, M.A., F.R.S.; 3. "Formation of Secondary Wood in Psilotum, by Mr. L. A. BOODLE, F.L.S.

"BOTANICAL MAGAZINE."-The February number contains coloured figures, together with descriptions of the following plants:-

Lysichitum camtschatcense, Schott, t. 7937 .- A half-hardy Aroid with bold oblong foliage and stalked yellow spathes enclosing a cylindrical spadix. It was figured in the Gardeners' Chronicle, April 7, 1900, p. 219. At Kew it is not successful in the open-air, but it does well in a wet, shady corner of the temperate-house.

Bulbophyllum auricomum, Lindley, t. 7938.—An elegant species, throwing slender flower spikes 4 to 10 inches long from the base of the pseudobulbs. The fragrant flowers are about 3 inch long with linear white or yellowish segments; lip small tongue-shaped.

Corydalis Wilsoni, N. E. Brown, t. 7939 .- A very handsome species from Central China, described in the Gardener's Chronicle, 1903, ii., p. 123.

Sauromatum brevipes, N. E. Brown, t. 7940 .- A curious Aroid producing from the tuber, spathes, and leaves. The spathes are tubular at the base, extended into a very long linear lanceolate blade and enclosing a long linear spadix; the leaves are pedately cut into linear divisions (see Gardener's Chronicle, 1903, ii., p. 93). Cambridge Botanic Garden.

Melaleuca uncinata, R. Brown, t. 7941 .- An Australian myrtaceous shrub with long linear leaves terminating in a curved hook; flowers minute pale yellow in dense globose heads about the size of a cherry, near the ends of the shoots.

MR. T. W. TURNER, who has been well-known for a number of years as an efficient general foreman in the Royal Horticultural Society's Gardens at Chiswick, has been appointed Superintendent of the grounds at the Royal Hospital,

WINTER-FLOWERING CARNATIONS AT SAND-RINGHAM .- Several weeks ago, when referring to the display of winter flowers made at Sandringham in December, we stated that some of the Carnation plants, raised from cuttings rooted in the previous January, had produced fifty or more flowers and buds. This statement has caused surprise to some of our readers who cultivate these same varieties of Carnations, and who invariably thin out the flowers, leaving one only upon each shoot. They have very rightly considered it to be impossible to raise plants in one year that would have as many as fifty shoots. It is necessary therefore to say that at Sandringham the operation of disbudding is not carried out with such severity on every plant. The disbudding varies a little upon different varieties, and according to the purpose for which individual plants are required. To obtain large flowers with long stems, only one bud is left at the apex of each shoot, the vigorous-growing varieties from America being especially suitable for furnishing such long-stemmed, large flowers. The variety Winter Cheer and several others, however, have a somewhat different habit, and in these varieties it is possible to obtain four moderately-good blooms upon each stem, if the plants are very vigorous and the growths well matured. We have several such specimens before us as we write, and though the flowers are

smaller than those in cases where more rigorous thinning has been practised, they are nevertheless of sufficient quality for many decorative purposes. The centre flower is always largest in size, but it is sometimes an advantage to be able to associate flowers of this class with opening buds, as they are in the bunches before us. It seems hardly necessary to explain that it was such plants that Mr. Cook described as producing fifty or more flowers and buds, and he had no intention of implying that there were fifty good shoots upon plants less than a year old. The oultivation of winter-flowering Carnations is increasing, and it will increase very much more now that such excellent varieties are obtainable for the purpose, therefore the practical hints given by Mr. Cook in his article on p. 18, January 9, may be studied with advantage by those who are not yet familiar with the details of cultivation.

FRUITS FROM BRITISH COLUMBIA.—We have received the following letter from the Office of the Agent-General for British Columbia, Salisbury House, Finsbury Circus, E.C.:—

"At the direction of Mr. J. H. Turner, Agent-General for British Columbia, I am sending you a few Apples grown in that Province It cannot be said that they are in the best of condition, as the small shipment received was greatly delayed in transit. However, I think it proves that a good quality of Apple can be grown in British Columbia and shipped to this country. The demand from the North-west Territories for this year's crop of British Columbian Apples could not be fulfilled.

"The Agent-General will be glad to supply all information possible on fruit-culture in British Columbia.

J. A. TURNER, Secretary."

The half-dozen Apples received with this communication were very well developed specimens, though becoming mealy. The climate of British Columbia is less cold in winter and less bright in summer than that of Nova Scotia, whence excellent Apples are sent to this country, being somewhat nearer to that of the British Isles.

PALM SEEDS. - Mr. A. HEMSLEY writes :-For the past two or three years the seeds of Cocos Weddelliana have been scarce, but there seems likely to be a plentiful supply this season. Already there have been some sold at Messrs. PROTHEROE & MORRIS'S auction rooms. The first consignments sold freely at 18s. per 1,000, but last week some were sold at about 15s. per 1,000. Good samples of Kentia Fosteriana have been selling at about 6s. per 1,000. K. Belmoreana has been making rather higher prices. We do not often see seeds of Geonoma gracilis at the auction rooms, but some were sold last week. They made 20s. per 1,000. Messrs. W. Bull & Sons have just received a large consignment of seeds of Phænix rupicola, the samples being very

ORCHIDS AT DÜSSELDORF. — We have already announced the great International Horticultural Exhibition, which is to be held this year at Düsseldorf from May 1 to October 23. Two special exhibitions of Orchids will, we learn, be arranged—viz., from May 1 to 3 inclusive, and from October 21 to 23. The Orchids will be exhibited in a special building. The committee undertakes to pay the carriage of exhibits from and to England, and to put every facility in the way of exhibitors. Prizes to the amount of £700 will be awarded. Cut flowers will be welcomed where it is not convenient to show plants. Phylloxera certificates must in all cases be sent. Schedules in English may be obtained from Mr. Jas. O'Brien, V.M.H., Harrow-on-the-Hill.

THE CHRYSANTHEMUM. — Mr. Wells, of Earlswood, Redhill, has published a third edition of his little book on The Culture of the Chrysanthemum for Exhibition, Decoration, Cul Flower, and Market. Mr. Wells writes from an experience of thirty-six years, and his "whole time is spent among Chrysanthemums, studying their

growth and noting their innumerable interesting peculiarities." He ought, therefore, to have something valuable to tell the novice; and everyone who notes his directions, from the cutting-pot to the exhibition-stage, will admit the clearness and value of his teaching.

STOCK-TAKING: JANUARY. - Very pleasant would it be to have to record an increase in both imports and exports for the first month of the year, but instead there is a small decrease. In Lancashire, all localities depending upon cotton for labour, wages, and profits, are affected most deeply by the trade-wrecking tactics of "bulls" and "bears" so-called on the United States markets, in which scenes are enacted by men who usually pass as sane, but whose mental condition may well be questioned. But to a few figures. According to the Trade and Navigation Returns the value of the imports for last month is put at £45,993,863, against £46,226,515 for January last year-a decrease of £232,652. Here may be takeu a few figures from the usual "summary" table as follows :-

IMPORTS.	1903	1904.	Difference.
Articles of food	£	£	£
and drink—duty free	9,136,016	9,037,657	-98,359
Articles of fond & drink—dutiable All other Imports	8,309,214 28,781,255	5,587,088 28,369,118	+277,844 -412,137

Here is the state of things in regard to fruit for the past month and the same period last year:

IMPORTS.	1903,	1904.	Difference.
Fruits, raw-	Cwt.	Cwt.	Cwt.
Apples	297,893	337,528	+39,635
Apricots and Peaches	8	224	+216
Bananas bunches	170,132	148,520	-21,612
Grapes	5,052	318	-4,734
Lemons	95,613	112.777	+17,164
Nuts-Almonds	7,711	7,854	+143
Others used as fruit	31,909	30,930	- 979
Oranges	850,716	819,402	-31,314
Pears	1,276	447	-829
Plums	19	154	+135
Unenumerated	6,586	3,562	-3,024
Vegetables, raw-			
Onlonsbush.	775.922	556,472	-219,450
Potatos cwt.	210,424	932,077	+721,653
Tomatos ,,	26,275	38,341	+12,066
Vegetables, raw, un- enumeratedvalue	£ 29,578	£37,256	+£ 7,673

It may be noted that since our last "stocktaking" there have been received from the Cape (per three Union Castle Company's steamers) 3,781 cases of Plums, 544 of Peaches, 223 of Apricots, 8 of Pears, 7 of Pineapples, and 26 of Nectarines. A correspondent states that the Agricultural Department at Pietermaritzburg is of opinion that fruit-growers in Natal might do better than they are now doing if they would but try. Perhaps care in selection of sites, in the varieties planted, and the preparation of shelters of various kinds would render the effects of hailstorms less pronounced, and Natal fruit be ultimately found on home market-stalls competing with those supplied by Cape growers. Perhaps our friends in the highlands of Natal may "tak' a thocht and mend."

EXPORTS

elaim final attention. In the month just closed, their value was entered at £24,083,365, against £24,903,636 for the same period last year—a minus difference of £820,271.

AZALEA INDICA "ROSE DE NOEL."—With us a Christmas Rose is white; but we have now to do with a rich rose-coloured Azalea, which, judg-

ing from the plate in the Revue de l'Horliculture Belge for February, has flowers of a good shape, fine colour, and an early-blooming tendency. It was raised by M. DE SMET-DUVIVIER as a sport, and flowers in December.

RAINFALL IN CO. DOWN.—Mr. A. F. GRUBB, gr. to Major FORDE, Seaforde Gardens, Co. Down, has sent us particulars of the rainfall in 1903, the total of which was 48.69 inches, as compared with 42.68 in 1902, 34.56 in 1901, and 44.07 in 1900.

BOARD OF AGRICULTURE.—The President of the Board of Agriculture and Fisheries has appointed Mr. Robert Burnard to be a member of the Departmental Committee on the working in Great Britain of the Fertilisers and Feeding-Stuffs Act, 1893, in the place of Mr. Thomas Elborough, who has resigned on account of ill-health.

AFRICAN MUSAS. - In an enumeration of certain useful or interesting plants belonging to the Congo flora, compiled by the indefatigable M. DE WILDEMAN, we find mention made of two species of Musa (one of which is cultivated in the Brussels Botanic Garden), each characterised by the presence of a tuber at the base of the stem, viz., Musa Gilletti, a species described by M. DE WILDEMAN himself, and M. religiosa, previously studied by M. Dybowski (see Revue Horlicole, 1901). The name "religiosa" was applied because the seeds are supposed by the natives to possess supernatural properties; and a like remark applies to the seeds of M. Gilletti. In M. religiosa roots spring from the whole surface of the tuber, while in M. Gilletti they proceed from the top of the tuber exclusively. Another Musa allied to M. Ensete, and also introduced to cultivation in Paris, is named and described as Musa Arnoldiana. It received a First-class Certificate from the National Horticultural Society of France when exhibited by Messrs. VILMORIN, ANDRIEUX ET CIE., October 10, 1901. M. DE WILDEMAN also in the course of his article on African Musas refers to the beautiful red-leaved form considered to be a form of M. paradisiaca. The plant, it appears, comes from the Congo. It does not ripen its seeds, although it bears fruit. It produces suckers freely, by means of which it may be propagated.

PLANT NOTES.

A FINE VERY LATE-BLOOMING NERINE.

Towards the end of last autumn I received from a leading nurseryman in the West of England a bulb of Nerine under the designation "N. new species." It had then only quite recently gone to rest, and at the commencement of December showed its flowerspike, which slowly developed and opened the first of the six flowers it carried about three weeks later, when it proved to be a very large flower of a pleasing shade of light-pink, with a darker line down the centre of each petal. On sending this flower for identification to the herbarium at Kew, I was informed that it was Nerine excellens, figured from Mr. Bull's garden in the October number of the Florisl and Pomologist for 1882, to which plate I was referred. Through the kindness of the Editor of the Gardeners' Chronicle, I have been enabled to compare this plate with my plant, and find that while the colour is exactly identical, the flowers of my plant are at least one-third larger than those represented on the plate; and as it comes into flower quite three months later than the ordinary type form of N. excellens, which blooms with me every year in September, I propose to name my plant N. excellens major Whether this name will be accepted by the nurseryman who holds the stock of this fine variety

or not I cannot say, but in any case it is, in my opinion, a very ernamental plant, and a most valuable addition to our stock of easily-flowered cool greenhouse bulbs. W. E. Gumbleton, Belgrove, Queenstown, Ireland.

Obituary.

F. C. LEHMANN.—The news of the unfortunate death of our esteemed correspondent, Mr. F. C. Lehmann, which we published some time since has been verified. He was drowned on Nov. 23 last, in the river Timbique, in Colombia, whilst crossing the river in a small beat to visit a gold mine in which he was interested. This well-known botanical traveller and explorer, who has done very much to increase scientific knowledge of the flora of Colombia and Ecuador, spent the greater part of his life in South America.

Mr. F. C. Lehmann was a betanist and explorer fer the leve of natural history and of seeing untravelled countries, and no man could be better adapted for such an adventurous career. He was a highly educated man, careful and far-seeing. A clever betanist and great lever of plants, and especially Orchids, to whose history he has added many useful and entertaining pages, and with his records and dried specimens enriched European herbariums. His drawings and descriptions of his new plants were most accurate and have appeared in the Gardeners' Chronicle repeatedly. He was associated with Miss Woolward in the production of the Marquis of Lothian's fine menegraph of Masdevallias, and in 1893 the British Museum purchased part of his herbarium and some of his drawings, chiefly Orchids. His most important work in connection with England began with his collecting for some years in South America for Messrs. Hugh Low & Co., to whom he sent many fine plants. About twenty-five years ago he settled at Pepayan, and has ever since, until his death, been German Consul there, a duty specially arduous in such a country where political disturbances are continual. Some light on that subject, and also an insight into the estimable character of the writer, and his leve for his work may be get by quoting a letter from Mr. Lehmann, from the Kaiscrliche Deutsches Konsulat in Popayan. general remarks about the failure of getting his papers in many cases, he says, under date March 24, 1903, "we have been several times without any communication for several months. Even te send letters by post was so uncertain that the last let of important papers I sent by express mule-rider all the way down to Buenaventura, to make sure that they would get on board a mail steamer. Orchid collecting and travelling have been altegether hampered during the time of the civil war. Officially it has been prenounced ended over and over again, but while reading the anneuncement, if were favourably situated, you would still hear the cracking of the rifles. I have been tied down by my consular duties, and also by having to rebuild the house on my country estate; but the latter seen will be finished new, and then I shall be able to ream over hill and valley again and look up some of the many pretty new things which I would like to get into European gardens, especially my discoveries in Masdevallias, most of which are as yet undescribed, for I am an enemy of making new species, and this eften carries me to the ether extreme. How careful and slow I am before I publish a new species you may derive from the fact that I have in my herbarium net fewer than about ferty-two species of Masdevallia, all with drawings and detailed descriptions, which I am sure are new, many quite extraordinary in construction, of which I have not published one. But I would like to get some of them into gardens, and though

my power of endurance is not quite what it was many years ago, for it is no trifle to travel twentyseven long years in these climates, I am still resolved to do something if it pleases the Lerd." The Masdevallias are specially difficult to import, and to Consul F. C. Lehmann's skill and untiring energy, gardens owe some of the prettiest, rarest, and most difficult to import, some of them his own discoveries, and others, known plants never before get over alive. Among his most interesting which we call to mind are Masdevallia ventricularia and its variety longicaudata; M. trinema (Lewii), M. angulata and its showier ally M. burfordiensis, M. deorsa, M. Lehmanni, M. Tubeana, and M. rosea. named plant Mr. Lehmann considered his hardest task, for in 1880, when travel was far more difficult than it is new, he, after great privations, reached its habitat at a very high elevation near Lexa, in Ecuader. The plant, which had been knewn from the time it was discovered by Hartweg in 1842, was successfully collected and packed; but all sorts of expedients had to be reserted to, to preserve a part of the specimens

THE LATE F. C. LEHMANN.

while passing through the hot valleys to the port. Once shipped the trouble did not end, for although daily tended by their collector the stock got smaller, and finally the Para, by which Mr. Lehmann was bringing them, got wrecked off St. Michael, Azores. But at the risk of his own life, Mr. Lehmann got some of the plants off alive, and landed them in England.

Other of his discoveries new represented in gardens are Cryptophoranthus Lehmanni, C. hypodiscus, Restrepia tricheglossa, Sievekingia suavis, S. Reichenbachiana, Stanhopea impressa. Maxillaria fractiflexa, M. scurrilis, and other singular Maxillarias; the rare new genus Tre-voria chloris, named by him in honour of Sir Trever Lawrence, Bart.; Pescaterea Lehmanni, Luddemannia Lehmanni, and L. trileba; Polycycnis Lehmanni, Oncidium xanthocentron, and many others, specimens of which will be found in the all-absorbing Reichenbachian Herbarium, for Reichenbach published some sets of "Orchideæ Lehmannianewa" in his Otia Botanica Hamburgensia, and often commented on Mr. Lehmann's excellent material and details of habitat, for in every case where not known he tested and recorded the altitudes and local peculiarities. He married a Colembian lady, and deveted a good deal of his energies of late years to the development of the estate, although necessarily

in such a country under difficulties. Gold, however, was found on it, and measures were taken to develop that interest, but with what result we know not. The last time he was in Europe he brought his son, who is about ten years of age, to be educated at Berlin.

Mr. Lehmann's rules of conduct and living he summed up in a few words once in a conversation about his adventurous life, and they are worth recording for the benefit of prespecting travellers. He said:—

"I attribute my good health, and even my life, mainly to two things. First, when in danger either from natives er, worse still, from lawlesswhite men, I never produce a revolver or other weapen. Scores have lost their lives for showing a revolver, for when guns are about it is always the aim to get the first shot in; so instead of terrifying, the production of a revolver may be your ewn death-warrant. Secondly, I never drink water without first beiling it. Often I have gone thirsty for hours befere I could get achance to beil water, but I preferred that to the risk. If I had coffee (and coffee has had to bebeiled over and over again semetimes), I would stir in a pinch or so, or more if I thought I could replenish the store soen. But in any case the water had to be beiled unless I was satisfied itwas beyond suspicion."

A very large number of his new plants of all descriptions collected in Guatemala, Costa Rica, Colombia, and Ecuador, have been published in Engler's Bot. Jahrbüch, under the title of Planto-Lehmannianeo. His Passifleras and Aristolechias were described by the Editor of this journal

The fellowing note is from Dr. Kranzlin, Berlin:—

"I know very little of Herr Lehmann's life. Atthe time of his death he was fifty-three years of age, and he had spent the greater part of his life in South America.

"His early bringing-up was of a most simple-kind, for, being of humble parentage, he received ne education beyond such as was afforded by the-village school. His accemplishments, his acquaintance with several languages, his botanical-knewledge and his skill as a draughtsman—alb these he acquired by his own indemitable energy and perseverance. Of his success as a collector-much more is known in England than in Germany. He travelled much for English herticultural firms, and was very seldem empleyed by German dealers. In Germany, so far as I know, only Herr Haupt in Brüg ever received Orchids-directly from Lehmann.

"He married Señera Maria Jesefa de Mosquera, a lady belenging to one of the old families ef Colombia. In consequence of this marriage hesettled altegether in Cauca, and especially in Pepayan. The landed preperty owned by the Mosquera family there is very important, and in order that he might have trustworthy people in responsible posts, Lehmann sent to Germany for one of his younger brothers and a sister, while he himself managed the gold-mines of Timbique. So far as I knew he sold these mines to a French company, but under conditions which necessitated his keeping the superintendence for a term of years. There, in fording the Timbique river, he met with his death, whether by an unhappy accident or by malice is not known.

"His successes as a betanical collector will-secure him a lasting memorial, and especially se as far as Orchids are concerned. If—only tomention one genus—all the Masdevallias he drew were to be published, they would eccupy more than double the well-knewn work of Lord Lothian. The best of the exquisite plants that he occasionally sent to Europe are in the possession of Sir Trevor Lawrence at Burford Lodge. His betanical collections are to be found in several European herbaria. The Herbarium

Boissier at Chambesy, near Geneva, owns a good collection; and another, nearly if not quite so complete, is in the Natural History Museum at South Kensington. Many of his plants have lately gone to Berlin, and the remainder, which are still in Pepayan, will also be sent to Berlin. His personal possessions naturally remain in Popayan with his family.

Details of his life are but few, and although I had friendly relations with him for eighteen years, I heard nothing of his earlier experiences. We had more than enough to discuss in botanical questions, and he told me nothing about himself. After his marriage he only came to Europe two or three times."

CHARLES VAN EECKHAUTE.-The death of this famous horticulturist, in his seventy-fourth year, is announced as having occurred on the 16th ult. He entered Louis Van Houtte's nursery at Ghent as long ago as 1844, and was well known to mest visitors to that famous establishment. He was fermerly a Professor in the Ghent School of Horticulture. Latterly he was connected with Mr. Sander's nursery at Bruges.

JOSIAH HOOPES .- From America we learn of the death of an old correspondent, Mr. Josiah Hoopes. He was a nurseryman in a large way of business, and published some years ago an excellent little manual of Conifers under the title of the Book of Evergreens. We were indebted to him for various interesting specimens. Mr. Hoopes was born at West Chester, Pennsylvania, in 1832, and died in the same city on the 16th

CATTLEYA MOSSIÆ.

WE are indebted to Norman C. Cookson, Esq, Oakwood, Wylam (gr., Mr. H. J. Chapman), for a photograph of a fine specimen of Cattleya labiata Mossiæ, fig. 47, which recently flowered in his gardens and which appears to be one of the most profusely flowered of any which have appeared. The species is an old favourite in gardens, and when well grown is one of the finest of its class, continuing the flowering of the largo-flowered Cattleyas throughout May and June. Many fine varieties have been distinguished by varietal names, the albino C. Mossiæ Wagneri being one of the finest of white Cattleyas. The variety illustrated is a large form of typical C. Mossia, with fine golden - yellow disc, and rich erimson markings on the labellum. The plant illustrated has been grown in a compost of leafmould, peat, and sphagnum moss, and it promises to be finer next season than it has been this.

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his Correspondents.)

DISEASE-RESISTING POTATOS .- Although in a trial of thirteen varieties, twelve were very badly diseased, yet Evergood was quite free from disease therefore Mr. Edwards asserts that we have a real disease-resisting variety at last (see p. 74). I grew Evergood last year in a trial with some twenty-five ether varieties. It gave a very fair average crep, but when a few good-looking tubers, selected for the cooking test, were peeled, disease spots were found in the flash in a marked degree. spots were found in the flesh in a marked degree. One experience no mere justifies the assertion that any Potato is disease-proof than does the statement that one swallow makes a summer. Tests, such as I trust the new Potate Society will be able to promote in different parts of the kingbe able to promote in different parts of the king-dom and on diverse soils, should not only be numerous each season, but should extend over five years at least. Any variety that is then found to be absolutely disease-resisting, may even be termed "disease-proof." The Petato world, evidently as rabid after sensations as are the financiers, politicians, or credulous treasure-hunters, has of late been dosed with paragraphs with respect to the astounding prices paid for tubers of Eldorade Potato. To me, it is astonishing that these prices have really been paid. I find in your own advertising columns offers from growers of the Eldorado of tubers at so "mederate" a price as 63s. per lb. How does that price compare with the reputed 150? A. D.

—— An acre of land was planted with Potatos here last season. The ground was prepared as follows:—In the autumn of 1902, 30 loads of farmyard manure were ploughed-in; in March following it was recedible bounded. following it was roughly harrowed, and pleughed-out ready for planting. In the first week in April 6 cwt. of Bentley's Potate Manure was sown broadcast, and the ground was then planted with the varieties Up-to-Date and British Queen. At the end of June the same quantity of soot was applied, and earthed up with the plough. The result was 9 tons of Potatos, and until now we have only found I bushel of bad tubers; the

reputedly good quality and in possession of natrepresent good quarty and in possession of natural vigour. Last year I grew thirty varieties of Potato, some new and some old, and my experience is exactly similar to that of Mr. Edwards. Some of the varieties were so badly diseased as to be hardly worth lifting, whilst in the case of others there was hardly a speck to be found on the tubers, and amongst the latter were the following, all comparatively modern varieties:—
Sir John Llewelyn, Evergood The Factor, King
Edward VII., Chiswick Favourite, British
Premier, and Cigarette. Experience of this wind has led growers to pay more attention to modern Petatos. How much of the disease of last year may be traced to heavy application of rank manure is an open question, but I am of the epinien that those people who grew their Potatos on land that was manured the previous season not only came out with less disease, but obtained produce of higher table quality. Though

Fig. 47.—CATTLEYA MOSSI.E, AS GROWN IN THE COLLECTION OF NORMAN C. COOKSON, ESQ.

remainder are sound. The ground slopes to the south, and is heavy, sticky loam. Our rainfall for 1903 was 46 16 ins. A. B. Wadds, Paddockhurst Gardens, Sussex.

- I was much interested in the note from Mr. F. C. Edwards which appeared in the Gardeners' Chronicle for January 30, in which he stated that out of thirteen varieties grown, twelve old and one new, the solitary instance in which he had ne disease was in the case of the modern variety, Evergood. This fact supports a contention that I have urged in various quarters that though we have not got a disease-proof Potato, and probably never shall have one, some varieties are much more liable to disease than others, and with a few exceptions those that suffer the worst are old Potatos that have had their constitutions weak-ened and worn down by the strain of years of cultivation; while the varieties that repel the disease in seasons like that of 1903 are of modern introduction, and possessed of youthful vigour in constitution. The deduction is that our hope in the fight against disease does not rest in search of the phantom Potato that is disease-proof, nor yet in the Bordeaux-mixture, which was practically useless when pitted against the continuous rain of last year, but rather in sinking sentiment by weeding out and discarding old and worn-out varieties and growing only those of modern introduction that are of

it has been grewn now for centuries in the country, we hardly knew our Potato. We guess at this and that, and advance theories that are quickly upset, but the Potato remains a plant of numerous peculiarities, and is continually affording opportunities for investigation and research. G. H. Hollingworth.

NECTARINE CARDINAL.—My experience of this variety is not quite that of your correspondent, J. Gibbon, p. 91. At the same time, I should hardly describe it as one of the best. It is useful where there is accommodation for several early Nectarines, and also if a few days in the time of ripening is a consideration, but I have not yet found it ten or twelve days earlier than Early Rivers. Growing in the same house as the lastnamed variety, it ripens with me about five days earlier. Our house is started on December 1. Even with this difference, it is worth growing when early fruits are required for a particular When it is immaterial whether such early date. fruits are Peaches or Nectarines, I should prefer it to Hale's Early Peach for private consumption; it is a better and surer cropper when forced. The fruits of Cardinal have not cracked with me. Cracking may be due to several causes, but the exact one could only be pointed out by semeone on the spot. Cardinal, when ripening its fruit, requires a drier atmosphere than do some Nectarines, and a freer circulation of air. In this

respect it resembles Précoce de Croncels. I shoul l not plent Cardinal where only one Nectarine was required, but rather Early Rivers, this, in my opinion, being far the finest and best of the early Nectarines. T. H. Slade, Poltimore Gardens, Exeter.

- Having grown and fruited this Necfor several years, I consider Mr. yard did not speak too strongly in favour of the variety, neither did Mr. Rivers when he described this variety in his catalogue in the following words: "The fruit is of good medium size, very brilliant colour and exquisite flavour, flower large. Cardinal forms a most compact, sturdy tree, and bears very freely ten days before Early Rivers." I can corroborate this. The tree is planted-out at the warmer end of the house; the hot-water-pipes pass directly over its roots. When ripe the fruits are perfect in colour. I bave never known a fruit to drop, and until last summer it has never produced a cracked or blemished fruit. The roots being so near the flow-pipe from the boiler, the man in charge was given instructions not to allow it to become too dry whilst the fruits were swelling; so, to be on the safe side, as he thought, he gave the tree some water every day. The result was that the fruits began to crack in the same manner as Mr. Gibbon's fruits did, just as they were getting over the stoning period. Water was then withheld, and the cracking stopped. The wounds healed up, and when the fruits were ripe the scars were hardly noticeable, there being only two that were not fit for the table. The fruits were ripe in May. If Mr. Gibbous has a well-drained border, and will keep the roots of the tree on the dry side whilst the fruits are swelling, the fruits will not be likely to crack. The variety sets freely without being fertilised with foreign pollen. It is, however, important that the temperature of the house be kept up to 60°, with little ventilation during daylight; but no fire-heat should be used at night unless there are 8° or 10° of frost. Peaches treated in this manner will set many more fruits than are required. Geo. Summers, Sandbeck Park, Yorks.

ACETYLENE GAS REFUSE. — In reply to the enquiry on p. 92 of the Gardeners' Chronicle for the 6th inst.: If the calcium carbide used is pure, the chemical formula is—

 CaC_2 (calcium carbide) $+H_2O=C_2H_2$ (acetylene gas) +CaO (lime). Commercial calcium carbide is not usually absolutely pure, but I think that for all practical agricultural purposes the waste may be considered as lime. Anyhow I use it as such. $C.\ J.$ Andrew, Southview, $St.\ Martins,\ Guernsey.$

THE NATIONAL CHRYSANTHEMUM SOCIETY .-In respect to our paragraph on p. 88 of last issue, Mr. R. Dean, Secretary, writes:—"The dates originally selected by the Committee and published were intended as suggestions to the Crystal Palace Company, who had of course to be consulted as to their appropriateness. Then some of the leading exhibitors made a representation that the November show should open on a Wednesday instead of Tuesday, in order to minimise Sunday labour. The opening day of the October show was changed from the 4th to the 5th, in order not to clash with the fruit show of the Royal Horticultural Society on the former date; and finally, as the October and November shows had thus been arranged to be opened on a Wednesday, it was finally resolved that the December show should, in the interest of uniformity, open on a Wednesday also. By doing so this year, and as I hope in the future, all danger of clashing with the fixtures of the Royal Horticultural Society will be avoided. It was only recently that I obtained the confirmation of the foregoing dates from the Crystal Palace Company (who have other important fixtures of exhibitions to arrange for), and I at once communicated them to the Gardening Press. I am obliged to you for giving them publicity," [We are not unnaturally, but still not justly, blamed when the dates given in our Almanac as correct are afterwards altered. Ep.]

THE NATIONAL CHRYSANTHEMUM SOCIETY'S NEW CATALOGUE.—I notice in your report on p. 94 of the annual meeting it is said that the recent catalogue issued by the National Chrysanthemum Society is to be supplemented by carefully prepared lists, which are to appear in the

annual report. I am sure all who are interested in Chrysanthemums will welcome this announcement, as I look upon the catalogue as an absolute failure in giving desirable information, although the price charged for it is not a small one. Let us hope the next issue will be better. E.[Molyneux.]

ERICA LUSITANICA.—I can endorse Mr. Bean's remarks on p. 84 of the Gardeners' Chronicle. It would be difficult to find a more charming effect than that of a large bed of this Heath, especially at this dull season. Our plants are about 4 feet high, and are in an exposed position. They were in flower on New Year's Day, and are now approaching their full beauty. Heaths do well in this district, the soil, being of a sandy nature, seems to suit them admirably. J. Murray, Sopley, Christchurch.

GRAPES WHITE GROS COLMAR AND LADY HASTINGS .- It is many years since I saw White Gros Colmar. I do not know one garden in which it is grown, neither have I ever heard a grower speak well of it. The variety is not mentioned in Mr. Barron's book on Vines. As to the variety Lady Hastings, I have seen it every year in its home at Melton Constable since it was raised, and have had good opportunities of testing its value. It is undoubtedly a very finely-flavoured black Grape. It originated as a sport from that highly-flavoured Grape Muscat Hamburgh. In appearance it is much like Madresfield Court in the shape and colour of its berries, as well as in the formation of bunch. The flavour of the parent is preserved in its progeny to a remarkable degree. The berries "set" quite evenly and easily, and the skin does not crack—a defect that Madresfield Court shows in some gardens, though it is generally admitted to be the fault of cultivation. The only fault I find in Lady Hastings is its somewhat tough skin. This defect, however, is not so noticeable in fully ripened specimens. As a Grape for use in September and October, Lady Hastings is worthy of cultivation where Grapes of high quality are required. E. Molyneux.

— My advice to Mr. Leach is not to grow Grapes such as White Gros Colmar or Lady Hastings for late supply, but to try Lady Hutt, one of the best white Grapes in cultivation. The fruits keep in splendid condition nearly as long as those of Lady Downes, and the quality is at its best here about Christmas. It is a much better Grape for late use than Mrs. Pearson, and is a good companion for Lady Downes, as it can be grown in the same house. It has a grand constitution. I have Lady Hutt grafted on Alicante, and also on White Colmar, which improves the lateness of the Grape, but does not improve quality or flavour. I have also White Coimar grafted on Trebbiano, but consider it the most worthless Grape in my possession. A. Kirk, Norwood Gardens, Atloa, N.B.

—— In reply to Mr. W. C. Leach's enquiry respecting the White Gros Colmar Grape (p. 90), I may say that I received a small bunch of this Grape from the raiser, the late Mr. Roberts, the first year he fruited it in the vineries at Charleville Forest, Tullamore; and so far as I can remember at this distant date, I was more favourably impressed with the flavour of the White Gros Colmar Grape than I was with its appearance, which was of a dull white colour. And I came to the conclusion that the Charleville seedling, being credited with good keeping qualities, might make a useful companion in the way of a large white-berried late Grape to its prototype, but nothing more. The White Gros Colmar is assuredly inferior to Mrs. Pearson in appearance, flavour, and keeping qualities, and it certainly falls far below the Muscat of Alexandria in every respect. Notwithstanding the great number of fruitshows that I have attended in various parts of the country during the interval of time that has elapsed since I received the small bunch of the White Gros Colmar, I have never since seen it. Speaking from my own experience, which I venture to say is also the experience of the majority of private Grape-growers, Black Hamburgh, Madresfield Court, Black Muscat, Muscat of Alexandria, Canon Hall Muscat, Mrs. Pearson, and Mrs. Pince's Black Muscat, are the

varieties of the Grape which are most highly appreciated by the owners of gardens in which the fruit is cultivated for their own tables. The flavour of the Frontignan Grape, black and white, is very good, but the berries, like the bunches, are very small and poor in appearance. H. W. Ward.

SOCIETIES.

ROYAL HORTICULTURAL.

FEBRUARY 9.—So far as the constitution of the Committees is concerned, and in other respects, the Royal Horticultural Society commenced another year (1904-1905) on Tuesday last, when a meeting was held in the Drill Hall, Buckingham Gate, Westminater. The Hall was nicely furnished with exhibits, but was not quiteso full as we have seen it on many similar occasions. The atlendance throughout the day was likewise less than usual on "Annual Meeting" day, but the heavy and continuous downpour of rain on the morning of that day was doubtless the reason of this.

The Orichid Committee recommended four Awards of Merit.

The FLORAL COMMITTEE recommended three Awards of Merit, and the FRUIT AND VEGETABLE COMMITTEE would have had a holiday but for Mr. George Woodward's having brought again some wonderfully fine examples of the Passe Crassane Pear.

The annual meeting was held "behind the curtain" in the Drill Hall, and a report of the proceedings is given below.

Floral Committee.

Present: W. Marshall (Chairman), and Messrs. H. E. May, George Nicholson, W. G. Baker, R. Dean, Jne. Green, E. Molyneux, G. Reuthe, John Jennings, C. R. Fielder, Charles Dixon, W. Bain, C. J. Salter, Chas. Jeffries, H. J. Cutbush, Jao. A. Nix, R. W. Wallace, R. C. Noicutt, Charles E. Shea, W. P. Thomson, R. Wilson Ker, and R. Hooper Pearson.

Mesers, J. Hill & Son, Barrowfield Nurseries, Lower Edmonton, London, exhibited a group of Ferns, including varieties of Davallia, Gleichenia, Gymnogramma, &c., all of them very clean and of healthy appearance, although the growths on Ferns at this season have been made some months ago (Silver-gilt Banksian Medal).

Messrs. Sutton & Sons, Reading, made a fine display of Chinese Primulas, of which we have written on p. 97. The Duchess was particularly attractive and distinct. This variety, with reddish pink ring around the greenish-yellow eye, was shown in a large batch, and the Double Duchess shows the characteristic transferred to semi-double flowers. Other good varieties were Brilliant King, Terra-cotta, Giant Blue, &c. (Silvergilt Flora Medal).

Messrs. Cannell & Sons again demonstrated their abililies as cultivators of the Primula by showing an entire table of well-grown plants of this genus. They were of a different type to their last meeting's exhibit, being of the etellala family and Chinese mixed. The introduction of the stellata blood has given them a less stiff panicle of bloom, and the splkes rise with greater freedom and height. The colours are pleasing, and many of first class quality. Miss Doris was a beautiful clean-cut white, the flowers large and numerous; Red Rover and Triumph were nice dark varieties, the latter rather lighter than Rover; Fashion, Fairest of the Fair (very proliferous), Queen Alexandra, and Lady E. Dyke were good varieties noticed. Firefly is a good dark red, but appears to deteriorate as the blooms become older. The group was given the Society's Silver Flora Medal.

The entrance end of the Hall was quite gay with flowering shrubs, grouped by Messrs. Russell, of Richmend. Lilacs, including the white variety; Azaleas mollis and indica, Daphne, and Hamamelis, were effectively grouped with tall Palms, Araucarias, &c. (Silver Flora Medal).

Messrs. Geo. Jackman & Sons' exhibit of Alpineplants from Woking, though not large, was not lacking in quality. A pan of coloured Primroses deserves aword of mention, they were of a rosy-mauve celour with pretty eye. Irises were also good; Clematis cirrhosa was again displayed by them.

Mesars. W. Cuthush & Son, Highgate, London, N., exhibited some forced shrubs, such as Prunus trilobafi. pl., Lilacs, &c., faced by a lot of hardy Irises In flewer, such as I. Tauri, I. histrio, I. reticulata Krelagei, I. Heldreichii, &c., and other bulbs. Messrs.

CUTDUSH also staged a tasteful group of cut Carnations, making a pretty effect, to which these plants so readily lend themselves (Silver Banksian Medal).

A collection of Cyplameos was staged by Messrs. Buch Low & Co., Bush Hill Park Nurseries, Enfield; there were some good colours, some varieties fimbriated others feathered.

The Fox HILL HARDY PLANT NUBSERY COMPANY (Mr. G. Reutte) had a small collection of alpines, included in which were some nice Irises and Colchicums.

Both Messrs Veitch and Messrs. Cannell again brought up Colcus thyrsoideus, the former grouping with Eupatorium vernale and Cheiranthus Kewensis, the latter with a white stellata primula "Lady Emily;" both were very pretty, Messrs. Veitch gaining the Silver Banksian Medal.

Messrs. Godfrey's stands of Chrysanthemum Winter Queen were beautiful, the flowers, for the season, being perfect, large, and well cultivated. They were much admired.

Roses, always pleasing, are specially so at this dult season. Mr. GEO. MOUNT had some very lovely specimens, and won the Silver Bankslan Medal. Liberty, a very rich dark colour, was good; as were also Mrs. W. J. Grant, Mrs. J. Laing, and Mme Gabrielle Luizet.

Mesers. WALLACE & Co., Kilnfield Gardens, Colchester, contributed to the alpine section with three trays of plants, their Primula megascefolla being a nice acquisition. The group included Irlses, Crocuses, Snowflakes, &c.

From the Royal Horticultural Society's new gardens at Wisley came sprays of berried shrubs and hardy spring flowers as, Primroses, &c. The large crimson berries of Oxycoccus macrocarpus were most effective, but well-berried sprays of varieties of Pernettya mucronala were very pretty.

Mr. H. T. DIXSON, Woodslde Nursery, Polegate, Sussex, showed a few large plants of a white-flowered Cyclamen the flowers of which were large and of bold appearance.

A variegated variety of Ivy named Queen Alexandra was shown by the Duke of NORFOLK, Arundel Castle, Norfolk (gr., Mr. Burbury). The leaves are small in slze, green, with broad white margin, and the variegation is constant throughout the year. A few plants of a semi-double white variety of Primula sinensis were shown from the same garden.

Mr. W. PALMER, Andover Nurseries, staged Primula Queen Alexandra. These bad tall spikes of faintly flushed flowers, semi-double. The plants were well-grown and robust, and were awarded the Bronze Flora Medal.

Messrs. CHEAL & SONS, Crawley, staged a group of alpines, the exhibit being relieved at the back with fancy shrubs and small plants of Pinus cembrs. There were blue Primroses, Acoultes, and Anemones, Anemone corrules blands being very pretty.

The Misses Hopkins, of Knutsford, also presented a group of these little plants, among which we noticed some good Primroses; one labelled "double mauve" was very uice.

A more comprehensive group was that exhibited by Messrs. BAHR & Sons. This display would delight any enthusiast of these flowers. The blossoms were abundant, the individuals clean-grown, well-formed, and the whole effectively staged. Hellebores of alt colours, Irises, Snowflakes, Primulas, including P. obconica, Crocuses, Saxifrages, were well represented; also Narcissus minimus, a tiny member of the family, yet standing out boldly with its brilliant yellow. The whole was interspersed with a mossy groundwork relieved at the back with Yuccas and Bamboos (Silver Flora Medal).

Still more alpines were in evidence, this time in the collection sent by Messrs. Ware, of Feltham. This was another good exhibit of these plants. They had Primroses, Saxifrages, Cyclamens, Anemones, &c. Anemone blanda atro-corulea was of a splendid colour; and a pan of Cyclamen Coum was nice. Other plants noted were Veltheimia viridifolia, Primula oheonica and P. obconica kermesina, Lachenalia Rector of Causton, and Adonis amurensis.

Awards.

Begonia Mrs. H. T. Disson.—This flowering Begonia was obtained from crossing B. Smithit alba with Goliath, a very strong-growing variety with pink-coloured flowers, sent out by M. Lemoine, of Nancy. The new variety is of more shrubby habit, being also shorter-jointed than Goliath, but the flowers are rich pink-colour, like those of Goliath. The variety appears very free-flowering. Shown by Mr. H. T. Dixson, Polegate (Award of Merit).

Tulipa Kauffmanniana aurea.—A very early-flowering species, with long pointed segments, red with yellow

margine on the outside, and wholly yellow or orangeyellow coloured inside. Shown by Messrs, W. Cutbush & Sons, Highgate (Award of Merit).

Eupatorium vernale. — A capital wioter-flowering plant with white flowers. A description was given on p. 74 of the Gardeners' Chronicle for January 30. From Messrs Jas. Veitch & Sons, Chelsea (Award of Merit).

Orchid Committee.

Present: Harry J. Veitch, Esq., In the Chair, and Messrs, Jas, O'Brien (Hon. Sec.), de B. Crawshay, J. Douglas, E. Hill, J. G. Fowler, F. Wellesley, J. Colmar, F. W. Ashton, H. T. Pitt, W. A. Bilney, F. A. Rehder, W. Cobb, R. G. Thwaites, H. J. Chapman, A. A. McBean, J. W. Potter, W. Bolton, J. Charlesworth, H. Ballantine, M. Gleeson, W. Boxall, H. A. Tracy, W. H. White, W. H. Young, F. Sander, and H. Little.

There was a very fine show of Orchids, the place of honour being taken by Messrs. SANDER & SONS St. Albans, who received the Society's Gold Medal for a very fine group extending the whole length of the Hall, and containing many fine hybrids. The most prominent novelties were Lælio - Cattleya x Lucasiana Hindeana (L. tenebrosa x C. lablata alba). a very fine hybrid with white sepals and petals, and rose-purple lip veined with dark crimson; Cyprlpcdium x Lamontianum (Calypso Oakwood variety × Rothschildianum), a distinct flower with ovate. acuminate, purplish-chocolate upper sepal, freckled on the upper half with green and margined white; and greenish-white extended petals and lip, whitish lined and tinged with purple; and C. x Brilliant (Buchanl anum × Calypso), a model flower with dark rose upper sepal, with a broad dark band, and pure white upper half, the glossy petals and lip yellow tinged with purple. There were also ten fine forms of C. x Lecanum. four good varieties of C. x sureum, the handsome C. x Transvasl, C. x Chas. Richman nigrum, C. x Sallieri aureum; an interesting lot of fine Odontoglossums, including a rose purple blotched O. crispum Pacho variety; two distinct varieties of their new strain of O. × loochristyense, the new O. × Harryano-crispum brugense, very finely marked; O. × Wilckeanum Illustré, O. nevadense, good O. × Wilckeanum, a number of good forms of Lælio-Cattleya x Bletchleyensis, an example of their new type of L. C. x Warnhamensis, in which the purple-lipped C. Trianæ Backhouslaua was used, and which has similar purple tips on the petals; the curious natural hybrid, Cymbidium × Ballianum; Miltonia × Bleuana, varietles of Zygo-Colaxx, Phalenopsis, Masdevallia polysticta with many splkes, and numerous other showy Orchids.

NORMAN C. COOKSON, Esq., Oakwood, Wylam (gr., Mr. H. J. Chapman), was awarded a Silver Flora Medal for a very pretty group of rare Odontoglossums and Cypripediums, among which were noted Odontoglossum crispum Grace Ruby, a handsome purple spotted variety. O. c. xanthotes Oakwood variety, in which the orange coloured spots are confined to the labellum: O. c. Lowize, O. c. Brilliant, a very showy white variety with large bright reddish-brown blotches; a grand plant of typical O. crispum with seventeen flowers on one spike-an excellent example of cultural skill; O. Pescatorei Prince of Orange, yellow finely marked with brown; O. × Adrianæ aureum, O. A. Oakwood variety, O. Pescatorei albescens, Cattleya chocoensis alba magna, Lælla anceps Schroderiana, Cyprlpedium x Juno, C. × Wm. Lloyd superbum, C. × Calypso Oak. wood variety, &c.

Messre. Charlesworth & Co., Heaton, Bradford, secured a Silver Flora Medal for a bright and effective group, in the centre of which were a number of the showy orange and red Lælio-Catileya x Charlesworthii, one of the best and freest-flowering plants of the At one end was an interesting selection of "botanical" Orchids, including the slender spiked reddish-yellow Mystacidium Hariotlanum, the shaggylipped Bulbophyllum Dayanum, the pretty Coelogyne sparsa, and several others. Several varieties of the showy Cattleya x Enid, the pretty Lælio-Cattleya x Lilian, a very handsome variety of L.C. × Gottofana, a clear yellow form of L.-C × Andromeda with reddish lip, L.-C. \times Myra, and other Lælio-Cattleyas also appeared. Among the Cypripediums the best were C. villosum auriferum, fine in shape and substance, and with almost wholly Indian-yellow-coloured flowers; C. x Cardosianum, C. x Hitchinsiæ, C. x Sallieri, and various Odontoglossums, among which were a peculiar form of O. grande, named "Fascinator," in which the markings were purplish instead of b. own.

G. F. MOORE, Esq., Chardwar, Bourton-on-the-Water (gr., Mr. Page), was awarded a Silver Banksian Medal for a group of specially fine Cypripediums, for the

three best of which see Awards. Among the others noted was C.×Miss Amy Moore, a very showily-marked flower; C. × Mons, de Curte, Swinburne's variety, with large dark blotches on the upper sepal; C. × Beekemanni, C.×Sallierl aureum, C.×Evenor, C.×Euryades, Chardwar variety; and the handsome C.×Mooreanum.

Mr. J. Cypher, Cheltenham, received a Silver Banksian Medal for a group of Dendrobinms, Cypripediums' &c., among which were noted a good form of Dendrobium × Schneiderianum; D. nobile giganteum, one of the best and roundest-flowered forms; D. × Dominia num; several good D. × Cybele; a white Dendrobinm of the D. × Ainsworthii class; several hybrid Cypripediums; Phalo-Calanthe × nívalis, Lælio-Cattleya × Hippolyta, &c.,

Messrs. Hugh Low & Co., Eush Hill Park, were awarded a Silver Banksian Medal for a group comprising Phalmenopsis Stuartlana, P. Aphrodite, P. Schilleriana, a grand specimen of a fine variety of Cattleya Trianæ, with sixteen flowers; Cypripedium × Thompsoni, and the varlety inversa; Epidendrum elegans, Cyperorchis elegans, Hæmaria discolor, Cattleya Trianæ alba, and good Dendrobium Wardianum and crassinode.

Messrs. Jas. Veitch & Sons, Chelsea, showed a group of Cypripediums, &c., in which were C. × Miss Louisa Fowler, a very pretty and distinct hybrid of C. Chamberlainianum and C. insigne Chantini; C. × Euryades excellens, finely spotted; C. × aureum virginale, similar to the Certificated plant; several Zygo-Colax, &c.

Sir H. SCHRODER, Bart. (gr., Mr. H. Ballantine), sent Odontoglossum × elegaos, Eastwood Park variety, and two Cypripedium × Lathamianum.

Mesers. B. S. Williams & Son, Hollowsy, showed a group of a large number of varieties of Cypripediums, for which they were awarded a Silver Banksian Medal. Eighteen varieties of Cypripedium were represented, C. × Pitcherianum, Williams' variety, being the host. Calanthe bella, Lycaste Skinneri alba, and L. lasiog'ossa were also noted.

M. C. BERANEK, Rue de Babylone, Paris, sent two hybrid Cypripediums, sald to be between Lawrence, anum and Godefroyæ leucochilum, and Spicerianum and Godefroyæ leucochilum.

J. TAYLOR, $E \colon q$, Margery Hall, Reigate, sent three fine spikes of Dendrobium speciosum.

J. T. RENNETT-PÜE, Esq. (gr., Mr. Downes), again showed Ipsea speciosa, finely flowered.

H. T. Pitt, Esq., Stamford Hill (gr., Mr. Thurgood) showed Cypripedium × Pittianum, a finely-spotted flower of the C. × Hera class.

H. LITTLE, Esq., Iwickenbam (gr , Mr. Howard), showed flowers of Lycaste costata.

Mr. H. A. TRACY, Twickenham, sent two hybrids of Cypripedium Charlesworthii and Cattleya Trianæ Bessle, a good flower.

DE B. CRAWSHAY, Esq , Sevenoaks (gr., Mr. Stables), showed Odontoglossum × Wilckeanum Argus, a large yellowish-white, heavily blotched flower.

M. CHAS. VUYLSTEKE, Loochristi, Ghent, sent two fine and distinct forms of Odontoglossum × Wilcke-anum, a very handsome O. × Vuylstekel, and a showy Lælio-Cattleya of the Bletchleyensis class.

Awards.

AWARD OF MERIT.

Cypripedium × Œdippe (parentage unrecorded), from Captain G. L. HOLFORD, Westonbirt, Tethury (gr., Mr. Alexander), and Messrs. Charlesworth—A grand hybrid with the shape and substaces of C × aureum, and the rose-tinted upper sepal of C. × Madame Jules Hye. Upper sepal clear dark-rose with a green blotch at the base. Petals and lip yellow marked with purplebrown.

Cypripedium × aureum virginale (Sallieri Hyeanum × Spicerianum), from G. F. MOORE, Esq., Chardwar, Bourton-on-the-Water (gr. Mr. Page)—Dorsal sepal large, white with green base; petals and lip greenish, the petals tipped with white.

Cypripedium \times Thompsoni (villosum aureum \times Calypso), from G. F. MOORE, Esq. (gr., Mr. Page).—A pretty flower, with the lower half of the dorsat sepat rose-purple, the upper half white; petals and lip yellowish tinged and veined with purp.e, and with a glossy surface.

Cypripedium × W. II. Page (niveum × Boxalli atratum), from G. F. Moore. Eiq —This is a form of C. × Gracece. Flowers white tinged and striped with dark-purple, the upper sepal being the darkest, and giving strong indication of C. Boxalli.

Fruit and Vegetable Committee.

Present: Geo. Bunyard, Esq., Chairman; and Messrs W. Balderson, Jos. Cheal, W. Bates, George Woodward, S. Mortimer, Alex. Dean, W. Pope, H. J. Wright, W. Fyfe, Jas. Gibson, Ed. Beckett, H. Parr, Geo. Reynolds, F. Q. Lane, Jno. Lyne, J. Jaques, Owen Thomas. Jas. H. Veitch, George Wythes, A. Herrington (US.A.), and A. H. Pearson.

ROGER LEIGH, Esq., Barham Court Estate, Maidstone (gr., Mr. Geo Woodward), exhibited excellent fruits of Passe Crassane Pear, and was awarded a Cultural Commendation.

ANNUAL MEETING.

The Annual General Meeting of the Fellows of this Society was held on Tuesday, February 9, at the Drill Hall, Buckingham Gate, Westminster. Sir Trevor Lawrence, Bt., the President of the Society, occupied the chair. There was a large attendance of the Fellows. The Secretary, Rev. W. Wilks, M.A., read the notice convening the meeting, the minutes of the last annual meeting, and the names of 75 new members; all of whom were duly elected.

COUNCIL VACANCIES.

"The following gentlemen were elected to fill the vacancies on the Council-Sir Trever Lawrence, Bart., Mr. J. Gurney Fowler, and Mr. James Hudson, V.M.H.

VICE-PRESIDENTS.

. The following were elected Vice - Presidents: - The Right Hon. Jescph Chamberlain, M.P., The Right Hon. the Earl of Ducie, The Right Hon. Lord Rothschild, Sir Frederick Wigan, Bart., Sir John T. D. Llewelyn, Bt.

OFFICERS.

The following Officers were elected:—Sir Trevor Lawrence, Bart., V.M.H., President; J. Gurney Fowler, Esq., Treasurer; Rev. W. Wilks, MA, Secretary Alfred C. Harper, Esq., Auditor.

PRESIDENTS ADDRESS.

The PRESIDENT, in moving the adoption of the Report and Accounts, said: Ladies and Gentlemen,-The Report is so full and so complete that there is, in my humble opinion, very little for me to add to it. The present is, as we all know, an epoch of very great interest to the Society, which was founded, as has been stated in the Report, in the year 1804, in the back premises of Messrs. Hatchard's hoek-shop in Piccadilly; and the fact that Messrs. Hatchard still carry on husiness at the same premises, and that this Soclety is now flourishing in a way in which, perhaps, it has never flourished before, bears testimony to the durability of English institutions. Now the present posttion of the Society is one which I think everybody in the British Empire who is interested either in it or in horticulture must view with great satisfaction. I know of no period in which the Society had so large a surplus income. As shown in the Accounte, that surplus is £3 641. That is a larger surplus, at all events, than has been secured during recent times; and when we look back to the position of the Society, and remember the comparatively few years that have passed since we left South Kensington, it is impossible not to see that a large number of people who are devoted to horticultural interests have come together determined, I might almost say, to create the Sectety de novo. As an indication of the change that has taken place I may mention one figure alone which has been supplied to me from the office, and that is, that last month, January of this year, we received in denations and subscriptions £5,757-more than double the income (several hundreds more) than we received during the whole of 1900-only four years That alone shows the growth of the Society; and although for some reasons, perhaps, it may be regretted that the Society has grown as very rapidly, for other reasons we must all be exceedingly glad, because it shows that we have a vast number of Fellows -our countrywomen and countrymen - who are interested in the pursuit in which we are engaged; and there is not the smallest doubt that at no period in the history of horticulture have gardening pursuits been so popular and so successfully prosecuted as at the present time, and I venture once to repeat, the prosperity of the Society is due to nothing but one fact, and that is that the Society has made up its mind to stick to the prosecution of horticulture. and that only, and as long as it pursues that course I believe its prosperity will never flag.

There is one matter I must refer to which is in the report, and that is the question as to whether the minimum subscription to the Society, which is now one guinea, should or should not be raised. That is a matter

which has been very carefully considered by the Council, and I should like to say that the Council thought it was a matter not for the Council in any way to decide, but for the Fellows to deal with as they think proper. Now if you will remember what has taken place, you will see that the position of the Society has altered very much from what it was when the guinea Fellowship was first started. In dealing with this matter it is likely some may say, "Why not leave well alone?" I freely admit that that is a very strong argument. But you must remember when the guinea subscription was started there was no Temple Show, no Holland House Show, no Crystal Palace Show, and practically no Journal [?]; so that the increased advantages which are now given to the Fellows of the Society represent a considerable pecuniary figure. This is set out in the report, although it ought to have been put in this way: For every guinea subscribed a Fellow can get, not necessarily does get; because it is obvious that if a gentleman does not live within easy reach he will not be able to enjoy the advantages which he might otherwise have in regard to the Society. When last year I expressed some surprise that a certain very prominent member of the House of Commons should be a member of this Society, he said this was the only Society where he got anything for his money. All I can say is, he not only gets something for his money, but very good value. With regard to raising the subscription, I may repeat that is a matter upon which we may have very different opinions, and it is one upon which the Council does not take any stand. The question of expediency is another matter. You could not have had a very much worse day than to-day, yet the 'hall has been so crowded that it has been difficult to see the plants, or to give the exhibits close inspection. It is thought by some that new Fellows should pay an entrance fee as well as the guinea subscription. I think an amendment is likely to be proposed to that effect, and that probably would meet the requirements of the case. The report enters fully into the state of the Society, its finances and position. In moving its adoption I shall be very pleased to answer to the best of my ability any question which may be put to me.

Mr. ALEXANDER DEAN seconded. The Society had, hessid, arrived at an important period of its history. Its progress had been very great, and their income had greatly increased; but they must not forget the enormous responsibilities which they had taken upon themselves in regard to their new Hall and the garden at Wisley-a garden which they should all be proud of, and which should become a credit to the Society and to British horticulture. Let them rejoice that the Society had, developed so, and that its prospects were so brilliant; but these were matters which must have the close attention of the Council. He could very well understand the Council's desire to see an addition made to the annual income from fellowships which would help them to meet their responsibilities, and he understood that the Council proposed that the one guinea should be doubled. That was a very important matter for consideration, and it had occurred to him that the Council had in view the possible danger of a large number of persons joining the Society, not for the splendid return they got for their money, but because they might belong to a fashionable body with its great social functions. If that were the case there would be a great danger of the Royal Horticultural Society's becoming a mere adjunct to society. He hoped such would not he the case, and that they would guard against the danger of their own Society's being flooded with people who were not horticulturists. He was told that gardeners were excluded from the Council's proposition-i.e., that gardeners would not be charged an additional fee; he hoped they would not be, but there would be considerable difficulty in determining who came under that designation. He thought they ought te say also "members of the horticultural trade." When they got these guineas from entrance fees, the money should be ear-marked to be spent on the Wisley Garden, or in liquidating the debt which must arise from the new Hall which was being erected.

Mr. Elwes said the value of the Journal to each Fellow was put down as 30s. It seemed to him that they might very well follow the plan adopted by other Societies, viz, that of making those gentlemen who wanted to receive the Journal pay extra for it. It must be obvious to those who received the Journal, that it had greatly increased in bulk and in scientific interest. Fellows should not get it for nothing, and he felt confident that a very large number of Fellows who had joined the Society in recent years would not really take the trouble to subscribe extra for it. As to the

question of the inadequacy of the subscriptions, seeing that £16 000 remained to be found to pay the estimated cost of the new Hall, would the Council consider the propriety of taking any part of the £17,500 balance which appeared to be their accumulated funds at that moment, so as to wive off that deficit? He did not know what was anticipated from any addition to the present subscription list; but it seemed to him that they should not start another debt of £16,000 when they had accumulated funds representing £17,500 lying idle or at any rate not required.

He knew there were some members—he hoped he would not be considered one of them—who thought that in the Wisley garden they had a White Elephant. That was not his opinion, but they must look forward for a considerable expeoditure, and it was because he did not wish the Council to become further burdened that he had ventured to ask his question.

The PRESIDENT said he was informed by their Secretary, Mr. Wilks, that the correspondence showed that a not inconsiderable number of Fellows joined the Society for the purpose of obtaining the Journal, and he believed that was the case. He quite agreed with all that Mr. Elwes had said about the Journal, but there might be some difficulty in getting the Fellows who did not wish to pay for it to forego taking it.

TREASURER'S STATEMENT IN RESPECT TO COST OF BUILDING THE HALL.

Mr. GURNEY FOWLER, the Treasurer, at the request of the President, made a ststement as to the Hall capital. The total amounts received up to the present time from donations was £22 561, or with added interest, sale of old materials and odds and ends (£451), £23,012. Then the subscriptions promised and which would come in when they wrote for them were £2,113, making £25,000 in all. Of that sum they had spent altogether £12,124, leaving a balance of £10,888 in hand. So that they must add £2,113 promised donations, making £13,001 to pay their liabilities as they exist at the present time. They had entered into a contract for building the Hall, £31 780; they had paid to the contractors £10 379, which left a balance of £21,400 still to pay, and £13,001 to pay it with. That left an absolute deficiency of £11,399, and that was without allowing anything for furnishing. This amount would have to be met either by further donations, by a mortgage, or by realising the investments of the Society. These amounted to £15 000. He would suggest (1) that so much of the investments as may be required should be lodged with the bank as security for a temporary loan until it could be seen what donations might ultimately be expected. On that point, although Mr. Elwes secmed to think the matter had hung fire, during the month of January they received over £1,500 which had not previously been promised. Therefore, he had great hopes that the Fellows would help to see the matter through. His second suggestion would he to obtain a mortgage after a time for so much of the deficit as was necessary from an insurance company, one of which had already offered favourable terms. His other suggestion was that at a favourable opportunity some of the investments of the Society be sold in order to pay off the mortgage or the loan as the case might With regard to the Hall it was a question of capital, and also a question of income, because, as they were all aware, when they were building a large hall of that description they would have certain increased expenses to meet annually. He had made a careful calculation from the facts before him, and he made out that the position would be something like this They had a surplus income of £3,641. They had had 250 new members this year in excess of last year, therefore they might assume that the surplus income was an income on which they might falrly depend, Out of that surplus they had additional annual expenditure to meet in connection with the new Hall (and interest on the £16,000 loan) of £2,389. Deducting from that rent of present offices and rent of Drill Hall £332, left £2,057. So that, without taking credit for any extra rentals which might be received from letting the Hall at times when it was not in use by the Society, their snrplus income would be reduced by over £2,000. The PRESIDENT then expressed the Council's

The PRESIDENT then expressed the Council's acknowledgment of the excellent work done by everyone for the good of the Society. The Committees of the Society were composed of men prominent in horticulture, who gave their services without any charge. Then it was perfectly impossible to exaggerate the obligations of the Society to their Secretary. There was nobody more loyal or more indefatigable, often a great sacrifice to himself, as Mr. Wilk's health was he no means what they all desired it should be. He was

glad to inform the meeting that the Council hoped to have in the future an assistant-secretary. That had been found absolutely necessary in order to carry out the work, which had grown to an enormous extent. Then he should not be doing justice to his own feelings if he did not say how admirably the staff worked, both in Victoria Street and at Chiswick, under Mr. Wright; and only that day the Council had given the staff an honorarium.

The Report and accounts were then adopted.

THE QUESTION OF GUINEA FELLOWSHIPS.

Mr. J. GURNEY FOWLER then rose to move the resoution relating to the fees to be paid in future by Fellows joining the Society, The full text of this resoution was given in the Report of the Council, and its effect was to abolish for the future the guinea Fellowhip, except in the case of professional gardeners and oreign members.

Mr. FOWLER said he understood that Mr. Veitch would move an amendment which would add an entrance fee of one guinea to the present guinea subscription. If the meeting preferred the amendment he would not press his resolution. Neither the esolution nor the amendment would affect the present 'ellowship, therefore they could all approach the natter with open minds. One of the Council's reasons or desiring to increase the income was, as had been tated, to meet the very large expenditure on the new fall. If the subscriptions remained as at present, and he members increased, more tickets would have to be ssued for their shows, and of course if all lovers of horiculture were members of the Society, the shows, intead of proving a remunerative investment, would prove eason was that the clerical work was so exceedingly eavy, and it was thought the time had arrived when ew Fellows eajoying the privileges built up by the old 'ellows should pay rather more than those who had orne the burden and heat of the day.

Mr. HARRY J. VEITCH moved the following amendment: "Provided that every Fellow, not being (I) a ond-fide working gardener, earning his own living by he pursuit, or (2) a Fellow permanently residing outide the British Isles, who in pursuance of the abovenentioned option, elects to pay an annual subscription f one guinea only, shall with his first subscription iso pay an entrance fee of one guinea." The question, e said, was not a Cabinet question, but one for the ellows. They were now all proud of their Society, nd it was only fair that any new Fellows should pay an dditional fee for the privilege of joining them.

Surgeon-Major INCE seconded the amendment. He referred it to the resolution because he feared if they oubled the guinea subscription there would be a great iminution in the number of new Fellows. That would e a terrible blow at a time when the Society had taken n itself such responsibilities. What with the new fall and its maintenance, and the garden at Wisley, he oubted whether they had not got a double white tephant.

Mr. ELWES asked whether the entrance fee would be ceated as capital or income? He thought it ought to e treated as capital.

Mr. ALEX. DEAN asked the Council to clearly define ie term "gardener."

The PRESIDENT, replying to Mr. Elwes, said the

uestion of capital or income had not yet hech

The amendment was then put, and carried by praccally the whole meeting.

On the motion of Sir John Llewelyn, Bart., a earty vote of thanks was accorded to the President, ad the meeting ended.

OYAL HORTICULTURAL SOCIETY OF SOUTHAMPTON:

FEBRUARY 4.—The annual general meeting was held the Mayor's Parlour on the above date, Mr. T. Miell, no., presiding. The forty-second annual report showed cash balance of over £80, as against £39 last year. avoured with good weather on the occasion of both avoured with good weather on the occasion of both the summer and autumn exhibitions, the attendance of the public was much better than has been the case or several years. The Gold Medal was won by Geo. all, Melchet Court Gardens. The Chairman, in loving the adoption of the report, referred to several ems in it. He congratulated the members that the ociety was once again out of debt, and asked for apport to enable it to continue so. The Chairman apport to enable it to continue so. The Chairman apport to enable it to continue so. The Chairman apport to enable it to continue so. The Chairman apport to enable it to continue so. The Chairman apport to enable it to continue so. The Chairman apport to the show grounds, referring especially to be efforts of Mr. Toogood in securing that concession.

Mr. Chandler seconded the motion, which was carried unanimously. Sir Samuel Moutagu, Bart, was again elected to the Presidency of the Society, the Vicc-Presidents being also re-elected Mr. H. J. Blakeway was voted Chairman, and Mr. T. Miell, jun., Vice-Chairman, for the ensuing year. The re-election of Mr. Fuidge to the Secretaryship was carried with applause.

DUMFRIESSHIRE AND GALLOWAY HORTICULTURAL.

FEBRUARY 8.-The annual meeting was held in the Town Hall, Dumfries, on the above date, Mr. R. Service (Chairman) presiding. The Secretary and Treasurer, Mr. Robert G. Mann, submitted the financial statement, which showed a total income of £384 1s. 3d., and an expenditure of £383 8s. $2\frac{1}{2}d$., leaving a balance due by Treasurer of 13s $0\frac{1}{2}d$. Considering

a balance due by Treasurer of 13s 03d. Considering the character of the past season, and that the Chrysanthemum Show in November was a new venture, the report was thought very satisfactory.

The Earl of Mansfield was appointed Hon. President of the Society, and Mr. W. J. H. Maxwell, of Munches, M.P., President. The following were appointed Acting Directors: Chairman, Mr. R. Service, of Messrs. Jas. Service & Sons, Maxwelltown, Dumfries; Vice-Chairman, Mr. J. McGregor, of Messrs. Fotheringham & King, seedsmee, Dumfries; Mr. S. Arnott, Carsethorn; Mr. J. Keonedy, nurseryman, Dumfries; Mr. J. Learmont, nurseryman, Dumfries; Mr. J. Hendersoo, Elmbank Gardens, and Mr. K. McKenzlc, Conheath Gardens. Mr. R. G. Mann, Courter and Herald Office, Dumfries, was re-appointed Secretary and Treasurer. It was remitted to the Directors to fix the date of the Autumn show, the understanding being that it would be held on August 26 and 27. be held on August 26 and 27.

NATIONAL CHRYSANTHEMUM.

FEBRUARY 8.—The Executive Committee sat for three hours on the above date at Carr's Restaurant, Strand, there being a large attendance. Mr. Thomas Bevan in the Chair.

Some correspondence followed the reading of the minutes, one of the chief items being a confirmation by the Crystal Palsec Company of the dates of the three exhibitions recently published, the Secretary pointing out that the exhibitions would commence on Wednesdays, and not on Tuesdays as has hitherto been the

case.

The Secretary reported the changes made in the Executive Committee. An interim financial statement was submitted, showing that the sum of £78 78 2d. had been received since January 1, including £25 from the Crystal Palace Company. The expenditure amounted to £22 138. 7d. With the balance in hand of £62 58 1d. at the end of the year, there was a balance at the bank of £117 188 8d. The Secretary's salary for the current year was fixed at the previous amount.

A very satisfactory agreement with the Crystal

year was fixed at the previous amount.

A very satisfactory agreement with the Crystal Palace Compacy was read, and the Secretary was instructed to sign the same on behalf of the Committee. In addition to the sum given in 1903 towards the Prize Fund, and also the same value in Medals, is added a special 1st prize of twelve guineas as a special Crystal Palace Company's 1st prize in the vase class.

The Treasurer made the gratifying statement that a much larger sum had been received as unpaid subscriptions than was at first anticipated while a considerable proportion of the assets [liabilities?] had been paid up.

siderable proportion of the assets [liabilities?] had been paid up.

The election of six members of the Floral Committee was then proceeded with. The scrutineers declared that the choice had fallen on Messrs. Howe, Crane, Ingamells, Simmons (outgoing members), and J. W. Moorman, in the place of Mr. Pulling who resigned. The Classification, Schedule Revision, Finance, and Arbitration Sub-Committees were also appointed.

The Schedule Revision Sub-Committee wade a report

Arbitration Sub-Committees were also appointed.

The Schedule Reviston Sub-Committee made a report showing that the sum of £50 had been added to the November schedule of prizes, and that in addition to the special 1st prizes given by the Crystal Palace Company, the Ichthemic Guano Co. (W. Colchester), Ipswich, offered a Challenge Trophy, value 8 guineas, to be won three times before it becomes the property of the winner; and in addition, for this year, a money-prize of £7 as the 1st prize in the class for six vases of incurved Chrysanthemums, six blooms in each. Mr. William Seward, Hanwell, also offers £5, in four prizes, for twelve blooms of Hanwell-raised incurved varieties, in not fewer than eix varieties. The various additions to the schedules were detailed, but considerable discussion took place over the 110 special prizes of 5s, each for the best blooms in the show, as the Schedule Revision Committee recommended the blooms be selected from the whole of the competitive classes, with liberty to stage individual blooms if duly entered. This was eventually agreed to. Some modified entraucewith liberty to stage individual blooms it duly entered. This was eventually agreed to. Some modified entrauce-fees were submitted, which provoked a good deal of debate, but were eventually agreed to with some modifications. The judges at the various shows were appointed, and also a special Committee to prepare a scheme for and carry out a market show, probably at the Essex Hall about the middle of December. the Essex Hall, about the middle of December.

THE HORTICULTURAL CLUB.

ANNUAL MEETING.

ANNUAL MEETING.

FEBRUARY 9.—The Annual Meeting of members of the Horticultural Club was held at the Hotel Wiodsor. Victoria Street, Westmioster, on Tuesday last, at 5 p m. The report of the committee, as read by the Chairman, showed the affairs of the Club to be in a very satisfactory condition. The Club has attained to a greater degree of popularity as a social centre for horticulturists, especially of Fellows of the Royal Horticultural Society, and among the papers that have been read at its meetings, some were contributed by eminent representatives of horticultural science.

As many as twenty-two new members were enrolled

representatives of horticul tural science.

As many as twenty-two new members were enrolled last year, and the membership is now 133. No member of the Club died during the year, but several had resigned owing to their having removed to districts where they were unable to partake of its privileges.

The income in 1903 was £128 78 4d., exclusive of £21 0s. 9d. brought forward from 1902. After meeting expenses the Committee had a balance in hand of £11 odd. A sum of twenty guineas was given to the new Hall scheme of the Royal Horticultural Society, and fifteen guineas for clerical assistance and expenses. The report and balance sheet were adopted, and the officers of the Club and members of Committee reelected. elected.

The dinner was attended by upwards of seventy members and friends, included amougst whom was a number of ladies

members and friends, included amougst whom was a number of ladies.

Sir J. T. D. Llewelyn, Bart., President, presided, and was supported on the right by Mr. Harry J. Veitch, and on the left by Mrs. Veitch. Amongst' others present were Messre. Bull, Nicholls, Gordon, Bevan, George Paul, Sydenham, O. Thomas, Ashton, Baker, Atkinson, Assbec, Monro, Rides, Pearson, Collingridge, Ker, Cove, Druery, Bunyard, Saunders, Wallace, Ingram, Barr, Hawes, S. T. Wright, Young, &c. Mr. George Gordon, who proposed the toast of "The Royal Horticultural Society," referred to some of the founders, of that Society and to former Secretaries, lie said we honoured the memories of the small band of horticulturists that laid the foundations of the structure of which we were so proud. But we ought to doubly appreciate the labours of the gentlemen charged with those duties to-day, for, great though the pioneers certainly were, they were not superior to these.

Mr. A. H. Pearson, in the absence of Mr Jeffries, responded, and said that in the darkest days of the Royal Horticultural Society it was in the walls of that Club that a few members discussed a plan for regenerating the Society.

Sir John Llewelyn proposed "The Horticultural Club," and expressed the placeure it grave him to recommended.

regenerating the Society.

Sir John Llewelyn proposed "The Horticultural Club," and expressed the pleasure it gave him to preside at one of the most representative and largest gatherings the Club had ever brought together. The Club was a great means of progress, and the papers read at its meetings were of the highest value, as at tested by the fact that the Royal Horticultural Society published many of them in its Journal At the next meeting Professor Henslow would read a paper on "The Object of Botanising Excursions." He was sorry that the Rev. D'Ombrain could not be with them.

"The Object of Botanising Excursions." He was sorry that the Rev. D'Ombraio could not be with them.

Mr. Geo. Monro responded in a humorous manner, and caused some amount of laughter in his reference to amateurs. The word was sometimes abused, he said. A man who hought twelve Apple-trees in as many varieties at a sale-room wrote to everyone about them, and showed at every exhibition he could get to, was not, in his opinion, a true amateur who practised horticulture for the love he had for it.

Mr. H. J. Veitch toasted the Chairman, and incidentally expressed the appreciation he had of the services

Mr. H. J. Veitch toasted the Chairman, and incidentally expressed the appreciation he had of the services of the Honorary Secretary, Mr. E. T. Cook. Subsequently Mr. Cook's health was proposed from the Chair. The proceedings were enlivened by quartettes and solos by the Georgian singers under the direction of Mr. Harry J. Stubbs, and by a humorous reading by Mr. C. T. Druery of his own verses, entitled "Modern Chivalry." Messrs. H. J. Veitch and Geo. Monro decorated the tables very heautifutly, and provided fruit for dessert. for dessert.

CARDIFF AND COUNTY HORTI-CULTURAL.

THE fiftcenth annual meeting was held at the Grand Hotel, Cardiff, Dr. De Vere Ituat presiding. The Society has, unfortunately, suffered from the had season, and sustained a monetary loss during the year of £85 88. 11d, which, after absorbing the balance from 1902 still leaves a deficiency on the year's working of £21 128. 3d; should, however, the outstanding subscriptions of £10 128. 6d. be recovered, the debt would be reduced to £11. reduced to £11.

A deputation from the Royal Horticultural Society A deputation from the Royal Horticultural Society which visited the summer show, and spoke highly of the exhibits staged, awarded twenty-four medals in all, besides nine special commendation cards. The total entries exceeded those of the previous year by 100. The date of the next show was fixed for July 27 and 28. Major General Lee was elected President; Mr. A. W. Morris, Chairman of Committee; and Mr. H. Gillett Secretary for the coming year. A Vote of Thapks was

Morris, Chairman of Committee; and Mr. H. Gillett Secretary for the coming year. A Vote of Thanks was passed to the Marquess of Bute for the use of the show

TRADE NOTICES.

H. E. MILNER & SON.—Mr. Edward White, of 25, Victoria Street, London, S.W., has become a partner in this well-known firm of landscape architects and surveyors.

ISAAC MATTHEWS & SON (NURSERYMEN), LIMITED—The above-named company has been registered, with a capital of £7,500 in £1 shares. Object, to adopt an agreement with I. Matthews, H. A. Matthews, and G. Hibbert, for the acquisition of the business of nurserymen, florists, and seed merchants, carried on by them at Milton, Staffordshire, as Isaac Matthews & Son, and to carry on the business of nurserymen, landscape and market gardeners, fruit, plant, and flower growers and salesmen, fruit and vegetable preservers, bulb growers, seedsmen, root and Potato merchants, &c. No initial public issue. The first directors (to number not more than seven nor fewer than four) are I. Matthews (chairman), H. A. Matthews, G. Hibbert, and E. J. Matthews. Qualification, £500; remuneration, £40 per annum, divisible. Registered office, Milton, Staffordshire.

Messes. J. Carter & Co.—For the convenience of City friends, Messes, James Carter & Co., seedsmen to H.M. the King, High Holborn, London, announce that they have opened a dépôt for the sale of seeds, bulbs, plants, and garden-sundries at 53A, Queen Victoria St., E.C., facing the Mansion House Station.

ENQUIRY.

GOOSEBERRY "IRONMONGER."—Was this variety of Gooseberry named after the surname of a gardener, or after a dealer in iron (ironmonger)?

L. M.

Baskets: R. L. B. You would be able to obtain large quantities of fancy baskets for flowers from any of the wholesale sundriesmen.

BLACK POPLAR: Paris. Yes; this is a fine tree for planting in towns wherever space permits. You will find a noble specimen in the Rue Richelieu, in the little square in the front of the Bibliothèque Nationale.

Books: P. F. B. Illustrations of the British Flora, by Messrs. Fitch and Smith, and published by Reeve & Co. The illustrations in this work are from wood-engravings. A more expensive work is British Wild Flowers, by Sowerby and Johnson, and published by John van Voorst, Paternoster Row, London. The latter work includes an infinite number of coloured drawings.

CATERPILLAR IN PEAR TREE: J. B. You omitted to enclose caterpillar in your box; none was found on opening it. Please forward a specimen for examination.

CHINESE PRIMULA: Holland. We have seen a better variety, having yellowish flowers, than that you have submitted to us. The monstrous character of some of your flowers, and the unusual development of the calyx, may be due to a free use of stimulants in the cultivation of the plants,

CURRANT BUD MITE: H. C. W. Yes; they are affected with the mite. Observe the same treatment advised in the cases you saw mentioned in these columns on p. 48, January 16.

CYCLAMEN BLOOMS: H. S. The blooms are very large, but we doubt if it is an advantage to have them so coarse, which is due to the prevalent method of gross feeding. The double flower is interesting, but not rare.

DAPHNE LEAVES: Zola. I can find no trace of fungi on the discoloured spots, nor any threads of mycelium in the substance. But I find that the same discoloured appearance can be caused by bruising or bending the leaves; hence external injury may have caused the discoloration. Possibly sudden changes of temperature

may have the same result. At any rate the leaves are otherwise healthy, with no trace of organic disease. M. C. C.

FREE GARDENERS: J. W. B. We know of no friendly society exclusively for gardeners and bearing the name of "The United Free Gardeners." Perhaps you mean the United Horticultural Benefit and Provident Association, whose Secretary is Mr. Collins, 9, Martindale Road, Balham. This Association is thoroughly recommendable.

GARDENER IN HOSPITAL: A. J. R. You might take the advice of a lawyer upon the question whether or not you would be likely to obtain a month's wages if County Court proceedings were instituted.

GARDENIAS: Amateur. See note under "Plants under Glass" on p. 103,

GRUBS IN FERN POTS: A. B. These are weevil grubs; they are very destructive, and undoubtedly the cause of the Ferns dying. You can trap them with slices of Carrot or Potato. If you observe any in your potting soil, bake it before use.

MUSHROOMS: T. G. We can find nothing the matter with the Baby Mushrooms; they are all right; the trouble, whatever it is, is with the cultivation. There is some mistake in the surroundings, probably in the condition of the atmosphere; they have not any disease. Our expert has eaten them, and he describes the flavour as normal.

Names of Plants: Correspondents not answered in this issue are requested to be so good as to consult the following number.—J. B. D. Probably Juniperus virginiana, so far as we can tell from such a scrap.—Wenlock. 1, Tsuga canadensis; 2, Cupressus Lawsoniana; 3, Cedrus, probably C. Deodara; 4, Thuya gigantea; 5, Cupressus Lawsoniana erecta viridis; 6, Retinospora filifera of gardens.—R. W. D. 1, Quercus ilex, not Suber.—J. S. T. Oncidium excavatum, often called Oncidium aurosum.—S. T. Lælia autumnalis, of the common type.—C. R. C. Leaves and pseudo-bulbs are not sufficient material on which to base accurate names; but No. 1 seems to be Cattleya Mossiæ; 2, Lælia tenebrosa; 3, Lycaste aromatica; 4, Dendrobium species.—Brunte. 1, Pinus Laricio; 2, Ligustcum ovalifolium variegatum; 3, Ficus radicans; 4, Senecio Ghiesbrechtii; 5, Pelargonium, probably Flower of Spring; 6, Polypodium glaucum.—J. Henderson. Anthurium Kelly's variety, for which Mossrs. Sander & Son obtained the Royal Horticultural Society's Certificate in 1896.—G. A. H. 1, Davallia platyphylla; 2, Adiantum decorum; 3, Selaginella Wildenovii; 4, Nephrodium molle cristatum; 5, Ceterach officinarum; 6, Polypodium vulgare.

Odontoolossum Cristum Unhealthy: Reader. The condition of the plants you describe seem to point to something wrong in the arrangement of the house, and the general management especially in regard to moisture and ventilation. We advise you to go over the plants, sponge them carefully, wash their pots, and thoroughly cleanse the interior of the house, staging, &c. Re-arrange the plants, and test by the use of a thermometer whether the temperature is kept pretty regularly at not more than 60° by day (unless by sunheat), and 50° at night. Do not admit air too freely so as to cause draughts, but regulate the ventilators according to the condition of the atmosphere outside. Generally the bottom ventilators will be sufficient to open. The roots of the plants must be kept moist by the use of rain-water if this can be obtained.

Oncidium Papilio: Vallota. The plant is not Oncidium Papilio; but, so far as we can judge by the dead example sent, it is one of the smaller Aërides. Send flowers when matured.

Pelargoniums: W. & J. Brown. The flowers of two varieties of Zonal Pelargonium are very interesting, and their reddish-pink colouring attractive. One of them especially is similar in type to the variety Fire Dragon, and being distinct in colour we feel it would be much valued by ladies and others for decorative uses, especially by those who have admired "Fire Dragon."

Potatos is what has been called Periola tomentosa, also Monosporium album. It is in reality a conidial condition of Nectria solani, which has a second conidial form of fruit known as Fusarium solani. Thoroughly dusting Potatos with powdered sulphur before storing prevents the spread of this and other diseases.

SITUATION IN CANADA: W. J. You might write to Mr. H. Slight, City Nurseries, 407, Yonge Street, Toronto; Messrs. J. Bruce & Co., 47-49, King Street, Hamilton; Messrs. Luke Brothers, Montreal, Quebec; and R. Campbell, Sillery Nurseries, Quebec. Some of these nurserymen might be able to help you, but we have no definite knowledge of their circumstances.

Souvenir de la Malmaison Carnations: Anxious. There would be no advantage gained by removing the flower-spikes now appearing, because these, besides supplying a good flower, help to encourage root-action. In any case they do not interfere with the growths now forming round the base of the plant. These growths should be thinned-out later, leaving from six to ten, according to the strength of the plant. Stimulants should only be applied when the pots are well charged with roots, or when the plants are in a weak condition. Assuming your plants to be from last season's layers, they are not yet in need of stimulants. Do not afford them any until the flower-buds are well formed. Weak soot-water added to a little liquid from the farmyard, alternated with a dash of Clay's Fertiliser, are the safest manures. Plants should be potted-on when the flowering season is past. Pots 8 inches in diameter will be found suitable.

Spring Frosts: A. E. S. In some of the vineyard districts on the Continent we believe
cultivatora do as you describe. It is generally done in the month of May, when
spring frosts may be very destructive. The
fires are lighted after midnight, and the
amoke is intended to shield the Vines from
the sun's raya until the atmosphere having
become less cold the frost leaves the canes. By
so doing the cultivators prevent rapid thawing,
and it is this rapid thawing, rather than the
frost itself, that is most to blame for the damage
sustained by the tissues of the plants. English
gardeners for the same reason sometimes
syringe frosted plants very early in the morning, and thus correct the frozen condition
before the sun's rays are upon the plants. We
do not know where you would find a descriptive
account of the practice of making smouldering
fires.

THERMOMETER: A. E. A. We believe it is possible to purchase electric thermometers that will awaken the gardener when the temperature falls to a certain point, which may be adjusted to circumstance. Write to Messrs. Negretti & Zambra, 38, Holborn Viaduct, E.C.

TREE WASHING: M. M. N. Read the note on p. 102 under heading "Hardy Fruit Garden," and you will learn how much parafin to use. If you do not use it in excess, and are careful to keep the liquid mixed well whilst applying it to the trees, the buds will not receive injury. It is best in such casea as yours to treat the thick stems by hand and use the spray over the remaining part of the tree. An ordinary scrubbing-brush will answer for the purpose of cleaning the stems. The solution of copper sulphate will be effective against lichens and moss.

IMPNEY HALL, DROITWICH.

[See fig. 48 and Supplementary Illustration.]

A BOUT a mile and a half from the town of Droitwich, in Worcestershire, so famous for its brine baths, is Impney Hall, the property of Dr. Corbett. The estate includes 7,000 acres of land, and is one of the most important in the district. A view of the Hall is reproduced on p. 114. It is an ornate structure of red bricks, with stone facings, having spires, turrets and balconies, and was built in 1875 by the late John Corbett, Esq., who died nearly three years

The principal flower-gardens are on the west front of the house, as shown in the illustration. From the upper terrace a very beautiful view is obtainable, the principal features in which are the Malvern Hills, the square tower of Dodder Hill Church, and between them and Impney, at the foot of the slope from the pleasure-grounds, some dense woodland. Advantage has been taken of the considerable slope in the ground from the house, to make three terraces, two of which are enclosed by stone balustrades. The formal character of the building and arrangement of terraces is further increased by the handsome bronze fountain in the centre, the

wide flights of thirty or more steps of bathstone, a number of busts representing Roman Emperors and other historical personages, at various positions on the balustrades; the asphalted broad paths, and the neat edging of Thyme that surrounds some of the flower-beds.

Below the third terrace there is beautiful greensward, and a further boundary of Ivycovered chains. In the immediate environs of the terraces the grounds are ornamented with beds of variegated Hollies, Rhododendrons, and many other choice shrubs, flowering species, as well as those with green and variegated leaves. There are large specimens also of some of the best shrubs.

The beds on the terrace are generally planted with the flowering species usually employed for such positions, but, instead of practising the "massing" method exclusively, many of the beds last season presented representations of the "mixed" system, though not in the degree that is becoming common in the London parks. The zonal Pelargoniums, Pyrethrums, and Lobelias were not quite so glaring and flat in appearance as they would have been but for the "dot" plants of various species that were intermixed with them.

It may be useful to some readers who have still use for the much-denounced but exceedingly bright Pelargoniums, to know that a variety named Universe, having much the same habit of growth as that of Henry Jacoby, but producing large bold trusses of scarlet flowers, was observed at Impney, and a note made that its effect was greater than that of the popular H. Jacoby. In perfect conformity with the general scene are the pretty little specimens of Japanese Conifers that grow in suitable positions between the flower-beds.

Before turning our attention towards the rosary, it may be remarked that the view from the west front of Impney, on a fine day in the month of August, affords an excellent picture of a formal garden lacking many of the objectionable features such gardens frequently possess. In the direction of the rosary lie two long and wide borders (15 feet wide), planted with choice herbaceous perennial flowering plants. These borders are good illustrations of the manner in which such plants should be cultivated. A broad path divides them, and neither border has a wall or hedge for background. The plants are consequently in full sunlight, with all the advantages that belong to an open position. The borders are of sufficient width to allow of the species being grouped and arranged to produce the best effect. Another collection of similar plants grow at the foot of a Pear wall.

The Rose-garden consists of beds cut out of the turf, and of borders under an Ivy-clad wall. One of the varieties that succeed extremely well is that of Auguste Guinoiseau, but most of the popular varieties are included in the collection.

In another portion of the pleasure-grounds have been provided all the delightful effects of an expanse of water, with rustic bridges, water-falls, &c. This water, which extends over several acres, was obtained by diverting a natural stream and damming it.

THE FERNERY.

Perhaps the most interesting of the glasshouses at Impney is the Fernery, a view of which is afforded by the Supplementary Illustration to this issue of the Gardeners' Chronicle. It is a sunken building, reached by descending steps, and was erected in a disused gravel-pit that had been made a "Dell." The structure is 160 feet long and 65 feet wide. The interior is made additionally attractive by a stream of water, which runs through the centre longitudinally. This afforded opportunities for rustic bridges, and the most has been made of them. There are upwards of twenty specimens of Dicksonia antarctica and other Tree Ferns, some of the specimens being of considerable height. Woodwardia radicans grows most vigorously and has an excellent effect, Meryta Sinclairii, Asparagus Sprengeri and A. deflexus were also noticeable features among the plants. A vast quantity of tufa stone has been used in the structure, and the interior is furnished with means of lighting by electricity.

OTHER GLASS HOUSES.

The remaining houses are used for the cultivation of fruits, flowers, and decorative plants. Impney is one of the few gardens in which the Pinc-apple is still cultivated, and excellent fruits of the Queen variety are obtained from them, some of which Mr. Jordan, the gardener, has exhibited successfully at Shrewsbury. A great amount of attention is given to the cultivation of Melons, and three new span-roofed sunken pits afford suitable means for this purpose. The favourite varieties are Hero of Lockinge, Eastnor Castle, and British Queen, the one last named especially so. Other varieties cultivated are Taunton Hero, Royalty (thought to be too large), Blenheim Orange, and Frogmore Scarlet. Mr. Jordan excels in the cultivation of late fruits, and has exhibited as many as eighteen good Melons at Birmingham Chrysanthemum Show on November 12. He employs a large amount of heat, and for this purpose selects the varieties Hero of Lockinge and British Queen. The plants are usually put in the bed at distances of 1 foot apart, and two fruits are allowed to ripen on each plant.

Home-grown Bananas are appreciated at Impney, and Mr. Jordan had a bunch of fruits last season which weighed 1 cwt., and contained 250 "fingers" or fruits. There are several good Peach-houses, and the trees are in a most fruitful condition. Some of the fruits of Violet Hative last season weighed 6½ oz. Spencer Nectarine is a favourite, and a good collection of Peaches is cultivated. Excellent crops of Grapes are grown in a number of vineries. The new variety Diamond Jubilee has been grafted on Black Hamburgh for two years past, and has done very well indeed. Last season the graft produced bunches about $2\frac{1}{2}$ lb. in weight, and the berries were of good colour and finish. The variety Chasselas Napoleon succeeds uncommonly well. The bunches of fruit were very large, and more characteristic in colour than is often the case. The variety Mrs. Pearson is a favourite here, and others cultivated include Muscat of Alexandria, Lady Downe's, Black Alicante, Gros Colmar, Barbarossa, Appley Towers, Duke of Buccleuch, &c.

Fruit-trees in pots include Plums, Peaches, Nectarines, Pears, Cherries, &c. In a Fighouse the varieties Brown Turkey and Bourjassotte Grisé (Grizzly Bourjassotte) produce good crops of fruit.

The indoor plants show good cultivation, and there have been batches of excellent Cinerarias, Primulas, Cyclamens, Pelargoniums, and 300 Chrysanthemums. The collection of 400 Cyclamens was most remarkable amongst all the plants. They were cultivated in a frame, where the pots were plunged in ashes. In August last, plants in 5-inch and 6-inch pots had as many as twenty leaves each, and many of them have subsequently presented a display of fifty fully developed flowers each. Mr. Jordan saves seeds from his own plants each year, selecting it from his best specimens, and partly with a view to increasing the

only tree of Allington Pippin gave very great satisfaction, and though Apples were generally so poor a crop, Worcester Pearmain, Lane's Prince Albert, King of the Pippins, and other varieties fruited heavily at Impney.

Dr. Corbett is one of the best-known and influential men in Droitwich, a town for which his family has done a very great deal. The little park which he has lent to the town, and which he maintains at his own expense, is a very popular rendezvous for thousands of visitors. P.

has appeared among Barkeria elegans sent direct from Mexico, and sold by Messrs. Protheroe & Morris in the spring of 1903.

In appearance the Epidendrum nonchinense, as it was named by Prof. Reichenhach, resembles the E. elegans, with which it is associated, so closely that the two can scarcely be separated when not in flower. Both have slender pseudobulbs, furnished with rather fleshy leaves and erect terminal flower-spikes. The flowers of E. nonchinense, however, are much smaller and more numerous, and white, with dark-purple markings on the labəllum. It is singular that two plants

FIG. 48.-IMPNEY HALL, DROITWICH, THE PROPERTY OF DR. CORBETT.

markings upon the foliage. Some of his plants, when these notes were taken, were so handsomely marked that they might have been profitably used as "foliage" plants. Of Primula sinensis there were three-hundred, and a similar number of plants of P. obeonica.

THE KITCHEN-GARDEN

includes 6 acres of land, two of which are enclosed within walls. Hardy fruit-trees have been planted wherever suitable positions could be found for them, and Mr. Jordan has himself worked a number of stocks with choice varieties of Apples. Last season the

ORCHID NOTES AND GLEANINGS.

EPIDENDRUM NONCHINENSE.

It is interesting to note that this pretty little plant has appeared again after many years, and in such a way that any doubt as to its origin is removed. Lindley, on erroneous information, described it originally as Læliopsis chinensis, but nothing was known of plants in gardens until it flowered in the late Mr. Day's collection, and a drawing of it appears in the collection of paintings of Orchids in that gentleman's collection now in the Kew Herbarium. The note accompanying the drawing states that the plant was purchased, with others imported from Mexico, at Stevens's sale, June 16, 1875. One plant at least

so much alike in growth and growing together should have flowers so dissimilar. The most marked botanical difference is in the peculiar short column of E. nonchinense, contrasted with the large winged column of E. (Barkeria) elegans, which displays itself so conspicuously on the labellum.

ONCIDIUM MONACHICUM.

Flowers of this interesting and singular species of Oncidium of the large-flowered O. macranthum section are sent by Mrs. E. Roy, Craigclowan, Perth, N.B., and with them flowers of O. serratum of the same section, and with which O. monachicum is often confused in gardens. Examination shows them to be very distinct from each other, and especially in the form of the labellum and crest. The broad reniform dorsal sepal of O.

nonachicum forms a hood over the column, the ncurved petals joining each other at the tips eneath it. The stalked ovate lateral sepals are liverging, and the ligulate front of the labellum ecurved. The flowers are brown, with a narrow colden margin and sulphur-yellow tips to the ringed petals and dorsal sepal. There are several allied species, the best known of which s O. lamelligerum, which is sometimes seen in gardens under the name of O. chrysodipterum, and which in its general aspect resembles O. serratum, but the petals are extended and do not mite at the tips as in O. serratum. All the pecies of the O. macranthum section thrive in a cool-house, and should be treated in much the same manner as Odontoglossums, being carefully shaded in summer, as the bright sunlight, beneicial to many Brazilian Oncidiums, proves injurious to these highland Colombian and Ecuadorean

A MALFORMED CYPRIPEDIUM.

A curious Cypripedium has been brought under our notice by Mr. Tucker, of Brighton. The ovary was one-celled, with marginal placentation. Above the ovary were three flower segments arranged spirally, and increasing in size from the lowermost to the uppermost; this latter greatly exceeded the others in size, vas pure white in colour, and resembled a lip except that there was no pouch, but a sheet olding over the column. The anther was solitary, and hy its side was a two-lohed stigma, with no crace of staminode. All this points to an arrest of growth. Monandrous Cypripediums are not incommon, but we have never seen one in which the segments of the flower have been thrown out of gear in this way. The plant was, we believe, a bybrid between C. niveum and another species.

OBSERVATIONS ON THE VEGETA-TION IN AN EQUATORIAL AFRICAN GARDEN.

GARDENS, public or private, are not common in Africa just under the Line. Indeed, the equatorial regions of that continent have until within recent years been lands unknown and wild. Nature, however, has been lavish of her favours in many instances, and there is abundance of situations for almost every type of garden, from the most essentially tropical to those almost alpine in character. This will not seem improbable when one recalls the fact that in parts of Eastern Central Africa there exists extensive, cool, fertile plateaux, at elevations from 5,000 ft. upwards, and rising from which, or perhaps situate on their confines, are such celebrated mountain masses as Kilimanjaro, Kenia, Ruwenzori, &c., having regions of perpetual snow above, and zones of tropical forest at their feet. These plateaux will, no doubt, in the near future contain thriving communities of settlers with large areas of cultivated land and many a pleasant garden.

In the meantime it is to be observed, regarding the tropical African possessions as a whole, that the British Government has for some considerable time taken an active interest in the establishment of public gardens, frequently called botanical stations. These have invariably proved of great value as a source of recreation for the Europeans in addition to being educational centres of good gardening for the native, and, as a result, of considerable benefit to the Colony's development. It is properly insisted on in these stations that the principal effort put forth by those in charge shall be in the direction of furthering and fostering to the fullest extent the development of whatever indigenous economic vegetation the country contains, and to the introduction of useful exotic plants. But it will always be found that none of these stations fails to possess, in more or less prominence and effectiveness, a portion devoted to a pleasure garden.

THE GARDEN AT ENTEBBE.

The botanic stations of many parts are, as regards efficiency, made or marred by the Administrators. Some of the more celebrated men have evinced keen enthusiasm in the matter, and have pursued a policy of facilitating and stimulating the work of those engaged in the botany or tropical agriculture of the possessions they administered. It is, therefore, in connection with some of the vegetative and other features of the latest of these stations, originated a few years ago by Sir Harry Johnston, that these notes deal.

thin layer of soil overlying a very hard, volcanic conglomerate; but it has been turned to advantage for various cultures. The soil in the forest belt is usually extremely rich, as the growth it supports testifies. The situation is roughly about four thousand feet above sea level, which, on first thoughts, would suggest a less tropical condition of affairs; but the peculiar position on the shores of a great lake, the influence of moisture-laden winds, frequent thunderstorms, &c, have to be considered. The forest belt is absolutely tropical, as its trees, shrubs, and humbler plants demon-

FIG. 49.—VIEW IN THE ENTEBBE BOTANIC GARDEN IN EQUATORIAL AFRICA.

The garden in question has been partially cut out of the jungle on the northern shores of Lake Victoria Nyanza, at the Government headquarters, Entebbe. Operations began in 1900. The site chosen takes in a portion of the finely forested land on the lake margin, which is from about half a mile to over a mile in width, and on the inland edge of which the land rises abruptly from less than one hundred to several hundred feet in height. It may be said to bear a fairly close resemblance to the well-known "Terrace Garden" at Richmond, Surrey. The higher portions, being often exposed grass-land, are consequently not so fertile as the forest land, and often consists of a

strate. A fairly good view can be obtained from the higher land already referred to, looking through and over the forest to one of the numerous bays in the lake beyond. It may be remarked in passing that the forest consists of a great variety of types, and it can hardly be said that any individual type of tree predominates.

This forest became one of the pleasantest portions of the garden after the rank undergrowth was removed. The numerous walks made through it, rendered possible that great desideratum in a tropical garden, cool shade. And for the walk surfaces the lake beach provided a quartzose, sandy

gravel, exactly suited for the purpose. By cutting out a dense jungle, composed of an interesting tree (referred to later on) which fringed the water-line, the fresh breezes from the lake were admitted and wider views obtained. The labour entailed was considerable, but was compensated for by the improvements effected. A large area was opened up for the cultivation of plants, useful and ornamental, while the features of the interesting native trees, shrubs, &c., were brought into prominence.

On the higher and drier portions of the garden, and on the exposed slopes, one used, often with much effect, many of the familiar flowering plants of our British summer gardens, with shrubs, trees, and a variety of plants from S. Africa, India, and Australia—indeed anything that liked sunshine and a well - drained soil. Although everything had to be done ab initio, it was possible to foresee that in a few years pleasing effects combined with an interesting collection of plants were quite possible in this equatorial

mate, as in the common Horse Chestnut, but not unequally as in the latter tree; the ten to fifteen leaflets radiating from the leafstalk (down to which they are cleft) almost form a circle. They are a pleasant, shining, soft-toned light green above, and somewhat greyish beneath. A leaflet may be 12 inches or so in length, about 3 inches across at the broadest part, and the petiole 10 to 12 inches long. The effect produced by this very distinct tree is long remembered, especially if viewed from an eminence. The writer recalls a combination formed of masses of it and a Phœnix, which instinctively brought the term "magnificent" to his lips. The genus Musanga was founded by R. Brown from Congo specimens. It is well figured in Dr. Stahlmann's interesting work, Mit Emin Pascha, on plate xv., and also

Myrianthus arboreus is a very striking fruit tree. It is common in parts of Central and West Africa, and belongs to the Urticaceæ. It is a small tree with very coarse palmate foliage, and is excellent for shade. The clusters of fruit are freely

FIG. 50.—GROUP OF RAPHIA PALMS IN AN EQUATORIAL AFRICAN GARDEN.

We will proceed now to glance at some of the items that attracted one's attention. The forest was always so full of interest, that much could be written about the trees which formed it, but on the present occasion it will suffice to glance at a few items which commanded attention. A Leguminous tree of great stateliness and beauty. which is often found in Central Africa, always excites one's admiration. It is a Piptadenia, and probably P. africana. Its lofty umbrageous head is borne on a massive trunk, the base of which is frequently buttressed in a wonderful manner. A Canarium is remarkable for its peculiarly Oak-like appearance. The proportions of its fine bole, huge branches, widespreading habit, and the sense of strength suggested, at once recall our familiar northern Oaks. The "wild Nutmeg" (Pycnanthus) is a high tree with a very straight clean trunk; usually the tops of older trees are broken off by wind, as the timber is extremely brittle.

From the point of view of handsome foliage, an Urticaceous tree, Musanga Smithii, easily takes front rank. It is lofty and much-branched when mature, with the branches tending to be more upright than pendulous. The leaves are pal-

produced and vary in size, being as large as a man's fist or bigger. Like the Bread-fruit they are composed of a great number of consolidated fleshy calyxes, flattened, and each containing a large seed covered with a thin, fibrous rind, which, when the fruits are ripe, has a sub-acid flavour. The tree looks quite effective in fruit, as it is of a pretty golden-yellow colour, contrasting well with the dark-green leaves. The leaflets are always used by the natives for shading transplanted seedlings. The short petiole is first placed in the ground and the tip arched over the seedling and stuck in on the opposite side.

Another genus found in West Africa is represented as a small tree. This was Barteria, a member of the Passifloreae. It is fairly common in the Nyanza forest, and grows to a height of from 20 to 30 feet; the slightly drooping branches are clothed with dark-green, wavy, leathery leaves, almost sessile, about 18 inches long, and 3 or 4 inches wide. In the axils of these are produced at certain seasons the most charming ivory-white flowers about 3 inches across, which are best described as resembling those of a Nymphæa. It is usual to see the branches wreathed with these beautiful flowers.

From the point of view of grace, beauty, and interest, no trees can be compared to the Palms, and it is only fair to compare them with each other. Raphia monbuttorum (fig. 50) is common around the Nyanza and forms not inconsiderable forests. It prefers to mass itself on the lake-side, where it receives abundance of sunshine and all the winds that blow. It creates in these positions effects to which only the brush of an artist can do adequate justice. Its proportions are quite imposing; the great arching leaves range from twenty to thirty feet in length; the constantly waving leaflets are a rich, deep green above, and silvery grey beneath; while the young unopened leaf pierces the air like a giant spear, and when unfolding, displays the most elusive tints between pale green and yellow. The embracing leafsheaths and lower portions of the midribs are a rich tawny colour with splashes of tints almost orange. Quite a garden of interesting plants find a suitable home amongst the moist débris that gathers in the sheaths. A rambling Fern (Pteris longifolia) drapes some in the most charming fashion; others are wreathed with a Lygodium, while Orchids (Listrostachys), seedling Ficus, Dissotis, Palisota, a handsome climbing Piper, and several grasses unite to form most interesting effects. M.

(To be continued.)

NOTES FROM ISLEWORTH FOR 1903.

(Continued from p. 99.)

NEW PLANTS OF THE YEAR RAISED IN THIS GARDEN.

Hymenocallis Ernstii (filamentosa x Moritziana).

Crinum amanteum (giganteum x amabile) .-Both these hybrids were described in the Gardeners' Chroniele. November 28th, 1903.

Hippeastrum hyb. (vittatum × sub-barbatum).-Not yet described.

Hippeastrum hyb. (aulicum × vittatum).-Not yet described.

Nerine pudica alba.—Snow-white.

Gloxinia (hort.) Renan .- A dwarf plant with large erect white flowers, wonderfully leopardspotted in dark-blue.

Plantago major variegata. - An interesting variegation of our common lawn Plantain, and of some beauty. If the markings prove permanent in character, it will make a good edging plant. I found this wild in Hants on the flint gravels.

Ipomæas (hort.).-Among a number of seedlings, I raised some of an intense ultra-marineblue, having flowers 3 inches span. Some of these were edged with azure-blue, and possessed great beauty. Unfortunately, little reliance can be placed upon seedlings coming true to their immediate parents, although every flower fertilises itself. This garden section is of recent growth, and there is at present no fixity of colour.

Senecio (hort.) President Castro.-The garden Cineraria will not stand much sun without damage. This new type has stiff, thick foliage, and will stand the sun much better. The foliage is indeed very distinct, and the flowers are of a type intermediate between the stellata and Covent Garden types, the flowers as large as the latter, but carried well above the foliage, as in the former. It is also a productive seed-

SOME GOOD PLANTS OF THE YEAR.

Nerine (hort.) "Lady Foster" is apparently a fine large garden form of N. pudica, and is practically white, but not such an intense white as N. pudica alba, or N. flexuosa alba. This latter plant I saw in flower at the Royal Gardens, Kew. Clivia miniata gigantea, shown at the Royal Horticultural Society, carries a huge truss of very widely-expanded flowers with broad segments. The whole inflorescence was very robust, and marked an advance on anything I have seen in this genus. Some seedling garden forms of C. miniata, shown by Mr. Wrigley at the Royal Horticultural Society, were also very remarkable for vigour, and some were splendid in colour also. It really seems as though hybridisers had at length produced a strain incontestably in advance of the species and of older garden forms.

Amaryllis Belladonna var. striata.—A form in which the flowers are striped with crimson almost to the base. Possibly this erraticism is inconstant.

Gladiolus (hort.) "Baron Von Hulot."—A rather small flower, but very distinct and pleasing. The colour is more blue than purple, and the markings are in white.

Pelargonium (hort.) Paul Campbell, single red, and P. (hort.) C. R. Fraser, single red-pink, struck me as new and good garden forms.

Some Plants Flowering at Isleworth in 1903.

Dyckia rarifora, a Brazilian plant of considerable hardiness, which can be well grown with garden cacti at winter minimum temperatures of about 45°. Its flowers, though patent, are of such an intense orange and last so many weeks in beauty that it is well worth growing for the decoration of the conservatory in summer. Quite a small plant will throw up a stem a yard high.

Narcissus (hort.) Beauty, an "incomparabilis" form of great merit for market purposes, as it is hardy enough. Its drooping habit, unfitting it for effect in borders or beds, is no disqualification as a cut flower, and enables it to stand the rain without losing colour. It is one of the few hybrid Narcissi that are not "washy" in color.

Bamboos: Phyllostachys henonis.—Three plants flowered this year, but up to the present show no seed. I think this is the most useful and beautiful Bamboo for decorative work, and it thrives at Isleworth.

Urginea micrantha.—A stove Scilla from Equatorial Africa, bearing a very tall, multi-flowered stem. The flowers are greenish-yellowish-white, small, and more interesting than beautiful. The bulb has woolly tunics, such as those of some Hæmanthi. A. Worsley, February, 1904.

(To be continued.)

FORESTRY.

ROYAL SCOTTISH ARBORICULTURAL SOCIETY.

The part of the Transactions of the Society (vol. xvii., part ii.) recently issued is full of interesting and suggestive matter, not always flattering to our national conceit, but all the more useful on that very account. Dr. Schwappach points out our deficiencies, Dr. Schlich shows how they may be remedied, Col. Bailey tells us the provisions made for the teaching of forestry in the University of Edinburgh, Mr. Booth calls attention to the work of the Duke of Atholl (1774-1830), and concludes his article by asserting that the only remedy for the Larch disease is to follow exactly the methods of the great "plantin' Duke"—select the situations only on high mountainous regions, and not stick the Larch any more like a fencing-post, regardless of its nature, into low-lying lands, nor into muggy situations."

The Douglas Fir naturally receives much attention, and Dr. Somerville's account of the Taymount plantations is of great value. Of all the exotic Conifers, says Dr. Somerville, this appears

to be by far the most important for British conditions. It grows best in Ireland and the west of Great Britain, where the air holds the maximum amount of humidity; but it also thrives well wherever it is sheltered from strong prevailing winds, provided the soil is sufficiently deep. It shows a marked aversion to chalk. Of the two chief varieties—the green from Oregon and the glaucous from Colorado-the green appears to be by far the more important for British conditions. It grows much faster, and yet yields better timber than the other, while although a little more delicate, it is sufficiently hardy for all practical purposes. The measurements of the Dropmore specimen, raised from seed sent home by Douglas in 1827, are given as follows:-Year 1891, age 61, height 120 feet, girth 10 feet 10 inches; year 1903, age 73, height 127 feet, girth 11 feet 6 inches. The general conclusion arrived at is that "in the Douglas Fir we have a tree of extraordinary value, and though

their way as the habits of the insects. The publication, which is a reprint from [the] Seventh Report [of the] Forest, Fish, and Game Commission [of the] State of New York, may be obtained from Messrs. Williams & Norgate, Henrietta Street, Covent Garden.

EUCHARIS GRANDIFLORA.

The accompanying photograph (fig. 51) of Eucharis was taken on January 1. The plants are never allowed to "dry off," as is the practice with some cultivators. They always stand over a hot-water tank, so that they have abundance of atmospheric moisture, to which I believe our success is in a great measure due. We are never for long periods without Eucharis flowers. One of the plants in the photograph had twenty-two flower-spikes, and some of the leaves are about 2 feet 6 inches long and 8 inches across. J. S., The Gardens, Fan Plaze, Turner's Hill, Sussex.

FIG. 51.—EUCHARIS GRANDIFLORA (AMAZONICA) IN FAN PLACE GARDENS, TURNER'S HILL, SUSSEX.

it is a little fastidious both as to soil and climate, there are doubtless large tracts where its cultivation will prove in the highest degree remunerative."

INSECTS AFFECTING FOREST TREES.

We desire to call the attention of arboriculturists to a recently-issued publication under the above title. It is the work of Dr. E. P. Felt, the State entomologist of the University of the State of New York, and consists of descriptions of the various insects injurious to certain forest trees. Their forms and their modes of life are described, and numerous illustrations, both coloured and uncoloured, are given. As the insects are in some cases the same as those by which we are troubled, and in any case, as the injuries inflicted are very similar, this publication amply deserves the attention of our foresters. Some odd methods of using the English language are noticeable, such as "considerable of the collecting was done," &c.; but these evolutionary changes in language are as interesting in

NURSERY NOTES.

PRIMULAS AT FOREST HILL.

The almost daily occurrence of rain, with its consequent dull and dreary weather, is especially trying to those who have to combat its effects in indoor cultivation. Add to this the usual winter atmospheric conditions prevalent in the immediate neighbourhood of London, in the shape of fogs, proximity to buildings, &c., and it will be admitted that the town grower is decidedly at a disadvantage compared with his more favoured country brethren.

Forest Hill, in which is situated the establishment of Messrs. J. Carter & Co., is not exempt from these untoward conditions, yet on a recent visit to these nurseries we were shown a very fine display of Chinese Primulas. These plants lend themselves for decorative purposes either in the plant-houses or in the home, and are hence deservedly popular and largely grown.

Messrs. Carter & Co. have not been lacking in their endeavour to maintain their reputation for

their strain of these flowers, and evidences were apparent of their success in this direction. Several well-filled houses contained plants possessing desirable qualities, presenting a very bright appearance. Great care and judgment have been displayed in order to obtain good results, which must have been very difficult of attainment in such a season as this. The hybridist needs bright, dry weather for successful pollination, and if this has to be supplanted by artificial heat, he is certain to be at a disadvantage. However, we noticed plenty of signs of seed-vessels already ematuring, testifying to the efficacy of a large stock of camel's-hair brushes in a 48-pot.

In such a varied collection it is difficult to discriminate, but we were struck with the qualities of that fine white variety "King Edward," whose robust plants were carrying good trusses of flowers of desirable form and substance. Princess May was also very pleasing, its large, well-shaped flowers being of a delicate pink blush colour. white sport from this variety promised well. It is also the parent of Hercules, another good type. Carter's Crimson, although not at its best, was a rich colour, and very brilliant. Holborn Queen, Fern-leaved, in colour faint pink, and Carmine, were also noticed. Lilac Queen, a semidouble, is very free in flowering, and would be useful for cutting purposes, as the truss is doosely panicled and the colour striking. The stellata varieties also lend themselves well for cutting purposes as they are not only tall and graceful in habit, but very free-flowering. Stellata pink, Stellata white, and Mont Blanc are good types of this section.

Other varieties noticed were Holborn Pink, Holborn Salmon, Rose, a fine Fern-leaved variety with large clean cut flowers; Magenta, very bold; Snowflake, a useful white variety for cutting, with abundant flowers, and Prince of Wales, a good

salmon double.

Other houses had well-grown plants of Cine-waria, promising another brilliant floral display later on; and still others were stocked with examples of the skill and patience of the Japanese craftsman, in the collections of dwarfed trees and shrubs in ornamental vases and pots, and animals and objects mimicked by those curious Ferns which are often met with in florists' shops.

FRUIT REGISTER.

APPLES NEWTON WONDER AND ANNIE ELIZABETH.

I would like to call attention to the excellent late-&eeping kitchen Apple, Newton Wonder, while there is yet time to plant a few trees. It crops regularly here as a pyramid or bush on the Paradise stock. and should be a remunerative Apple to plant for market, especially in a season like the past, when Apples were none too plentiful, and are now (mid-February) fetching 4d. per lb. The fruits are heavy, and partake of the characteristics of Dumelow's Seedling (Wellington), also of those of its other parent, Blenheim Orange-two excellent late Apples. We have several young standard trees on the Crab, but as yet they have not borne much fruit, though they promise well for the coming season. The fruits being large, are excellent for making dumplings, or for baking whole, and judging by their appearance would keep plump for another two or three months. Out of some six dozen bush-trees planted about seven years since, this variety has been pruned the least, having cropped so heavily that thinning has had to be done each year. I have noticed that the fruits have a tendency to cling to the tree much better than some varieties, in spite of their weight, which would make it a suitable variety to plant in exposed positions.

Annie Elizabeth is a sound-keeping variety of good size. The trees bear freely when once established, growing and fruiting well as an orchard standard on the Crab stock. It would certainly pay to grow these late-keeping varieties better than endeavouring to keep until this season those sorts that are at their best before Christmas. Other such varieties are Bramley's Seedling, Dumelow's Seedling [Wellington], Hambling's Seedling, &c. James Mayne, Bicton Gardens, Devonshire.

Mr. Mayne sent a few excellent fruits with this letter, the skins of which are still as smooth and plump as could be wished. One of Annie Elizabeth weighs $12\frac{1}{2}$ ozs. and one of Newton Wonder 94 ozs. Ep.]

The Week's Work.

THE ORCHID HOUSES.

By W. H. WHITE Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Dorking.;

Odontoglossum citrosmum. - In the restinghouse plants of O. citrosmum are starting into growth, but they should not be excited by heat or moisture to make rapid progress, or they will grow away and fail to produce flowers at the proper season. The young growths should be watched daily, and immediately a flower-spike is seen pushing up through the centre of the growth a piece of cotton-wool should be wrapped around it as a protection against slugs and woodlice. Should any of these creatures appear they must be trapped by the usual methods. As soon as a spike can be seen inside the growth, the plant should be given a thorough soaking and placed in a more genial atmosphere. Those plants that have not been properly rested, and do not produce flower-spikes during the next few weeks, should thereafter be put into their growing quarters; and any that require fresh rooting-material may at that time be given attention. O. citrosmum appears to be a plant that would thrive well in the new leaf-soil mixture; I would therefore advise Orchid-cultivators to give them a fair trial in this. With the new compost, shallow Orchid-pans without perforations in their sides are preferable to the ordinary teak-wood baskets.

The yellow Oncidium cheirophorum has grown exceedingly well in the Belgian leaf-soil, but until recently one could rarely find a plant in exuberant health, unless it was from freshlyimported bulbs. Now one sees plants which have not only healthy pseudo-bulbs and leaves, but with more numerous and stronger flower-spikes. This Oncidium should be placed near the roof in a shady corner of the intermediate-house. It does not care for much water at any time, and precaution must be taken not to pour water into the young growths or axils of the leaves. Established plants in health should be repotted soon after the flowers have faded, but weak and sickly plants may be potted into leaf-soil at once, keeping them rather on the dry side until they commence to grow.

Oncidiums in Cool-house .- The following distinctgrowing Oncidiums, O. macranthum, O. superbiens, O. zebrinum, O. serratum, O. chrysodipterum, O. lamelligerum, O. loxense, and O. monachicum, should be grown in the cool-house. Now that these plants are in full growth, place them in a position where the atmosphere is very moist, and whenever the weather is warm and bright a thorough damping between the pots two or three times a day will be of great benefit to them. aerial roots of O. zebrinum should be syringed lightly at least once a day. All plants of these species delight in fresh air. Last year several plants of the above species were potted in the new leaf-soil mixture, using three-parts leaf-soil, the remainder consisting of equal parts of peat and sphagnum-moss, and during the growing season the plants showed considerable improvement. A few days ago the plants were turned out of their pots, and large healthy roots were found encircling the whole of the compost. I need scarcely add that all of them have now been reported into similar compost. When reporting these strong growing Oncidiums it is advisable to use rather large pots, as the numerous young roots delight in plenty of space.

PLANTS UNDER GLASS.

By C. R. FIELDER, Gardener to Mrs. Burns, North Mymms Park, Hatfield, Hertfordshire.

Phyllocactus.—These plants should be watered sparingly during the winter season, and for the present it will be only necessary to afford sufficient water to keep the shoots in a plump condition. Shake the old soil away from plants in an unhealthy condition, and cut away all dead portions from the roots. The plants should then be repotted into pots as small as will accommodate them, in a compost consisting of three-parts loam, one-part leaf-soil, and a little old mortar-rubble and coarse silver-sand. Perfect drainage must be provided and maintained in each pot, otherwise loss of roots will occur. Keep the plants as near to the light as possible, and afford them a temperature of from 55° to 60°. Cuttings may be taken at the present time, using the tips of last season's growth cut to the length of about 6 inches. Insert these singly in 3-inch pots filled with loam and sand in equal proportions. pots containing cuttings may be placed on a shelf in the stove, and they will require very little water until they have made roots, as this would cause the cuttings to rot at the base.

Annuals.—Seed may now be sown of such useful annuals as German Asters, Stocks, Mignonette, Schizanthus retusus and S. wiseton-ensis, Celosias, &c. The Schizanthus is excellent, both in the cut state and for conservatory and houso decoration in pots. Lobelia tenuior is a rather tall-growing species, of upright habit, and having large blue-and-white flowers. It is a useful and easily-grown plant, and suitable for the conservatory. It comes true from seed, and seeds very freely. The white-flowered Stock Princess Alice is an excellent variety, both in the cut state and in pots. By making a sowing at the present time and in the two following months a long succession of flowers may be secured. The same remark applies to Schizanthus. The scarlet-flowered Alonsoa Warscewiczii is another very pretty and easily-grown annual, which succeeds in pots, and remains in flower for a long time. The Asters are too well known as pot plants to require more than a passing allusion. Celosia plumosa will also be found to be most effective for conservatory decoration. Although not an annual, Clerodendron fallax is best when raised from seeds annually. Sow seeds at once, and again later for succession. Grevillea robusta should also be sown. The seeds of the three last-named plants require to be sown in consider-able heat. The rest of the plants named above, with the exception of Mignonette, may be raised in a temperature of 50° to 55°. Mignonette should be placed in a cool frame or pit from which frost is excluded. In growing hardy and half-hardy annuals, care must be taken to prevent the seedlings from becoming drawn by removing the pots or pans to a slightly cooler atmosphere as soon as the seedlings are well up, while the operations of pricking them off into boxes or pans preparatory to potting should be promptly carried out.

THE FLOWER GARDEN.

By A. B. Wadds, Gardener to Sir W. D. Pearson, Bart., Paddockhurst, Sussex.

Herbaceous Borders.—These may be overhauled when the weather and ground will permit of the work being done properly. Achilleas, Saponarias, and Linarias require to be divided about every two years, but in order that the border may be furnished and look well, do not disturb more clumps than is necessary each season. Heuchera sanguinea, Zauschneria californica, Plumbago Larpentæ, and Statice, if they can be spared, will thrive better in the rock or alpine-garden. A few other good plants are Antholyza paniculata, Chelone barbata, and most of the varieties of Lychnis; they all have bright flowers that are capable of lasting a long time for house decoration. Ground that is to be planted with Pentstemons, summer-flowering Chrysanthemums, Phlox, and Gaillardias may be given a dressing of short manure, and if the soil be of a heavy nature, add lime-rubble also, turning it up roughly and leaving it so for a few weeks. If the border is too narrow to admit of Tritomas or Acanthus, these may be planted by the side of the stream in the wild garden; also any surplus roots of other species from the border can be planted here. All plants should be labelled neatly, and the surface of the ground be forked lightly over.

Iceland Poppies.—Owing to the wet weather a large percentage of these will have damped-off during the winter. If they are necessary for decoration and massing in large beds, sow seeds moderately thickly in boxes, and as soon as the seedlings are in rough leaf harden them off, then, in suitable weather transplant them from the boxes, putting them in small clumps. The beds should be given a liberal supply of leaf-mould and soot. Seedlings will give more satisfaction than old stools left in the beds.

Bedding Plants.—Pelargoniums may now be otted. Use clean pots, or the roots will hang to potted. the insides of them when required to be turned out, and the plants will receive a severe check. Fresh green damp moss will serve to cover the crocks. It new leaves be used for the purpose they keep the plants waterlogged unless they are broken up before they are put into the pots. A little of the old soil may be used with some fresh material; but as a rule too much is used, and the plants consequently take a long time to establish. Pelargoniums are net always given the attention they need, and at planting-time two have to take the place of one. The plants that will new be potted will probably be placed in a newly-started vinery, and the syringe will keep them from flagging for some after that time thoroughly water them through with a can. Do not syringe them in damp, dull weather; it is necessary that the foliage should get dry once in the day. Afford air to Calceolarias whenever it is practicable, and on fine days remove the lights altogether.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, gr., Wrotham Park, Barnet.

Peach and Nectarine-trees.-When the weather is favourable, these trees may be pruned, cleansed, and put into good order. Some of the young fruiting wood produced last summer will but it is to be hoped there will be sufficient strong, healthy flower-buds to supply a crop of fruits. Our trees were very lightly cropped last year, and therefore the wet season induced the younger trees to make too much wood. On the older trees the wood is shorter and of a much better appearance, being very promising. In pruning the Peach and Nectarine, the aim should be to keep the trees well furnished from bottom to top with healthy fruiting wood of medium strength, brown colour, and well studded with flower-buds. The pruning should be commenced and continued at intervals during the growing season, and at this time of year little should be required, except to remove all the very coarse wood, and prune back weak growths to within a couple of buds at the base, reserving shoots of medium length. Do not lay-in too much wood, hut allow plenty of room for growths that will be made during the coming season. Any shoots that have not matured may be shortened back to the more ripened wood, pruning, if possible, to triple buds. Wood which may have borne fruit, and can be spared, should be removed, and the places made good with young shoots. If the trees are infested with brown-scale, all the main branches should be scrubbed with soapsuds mixed well with paraffin, at the rate of a wineglassful of paraffin to 3 gallons of the suds. If the walls have been lime-washed hitherto, let them he given a fresh dressing previous to training the trees, and to prevent red-spider mix in with the lime a good quantity of flowers-of-sulphur. If the walls are of red-brick a thorough syringing with suds and sulphur will suffice; but if suds are net forthcoming substitute soft - soap. When securing the main branches to the proper positions, be careful not to injure the hark. Leave plenty of room in the shreds for the swelling of the shoots during the coming summer, and do not use too many nails. If the walls are wired avoid tying the shoots too tightly. It is good practice when training Peach-trees to cover all the main branches of the trees with fruitful shoots, they will protect the wood from strong sunshine; but in the absence of shoots some other protection should be employed. Trees that are trained

well, and are evenly balanced, need not be taken from the walls annually, but a thorough inspection of the branches should be made, removing any of the ties which are likely to pinch the bark, and supplying other ties that may be necessary. Any of the old shreds, if sufficiently strong for one more season's use, should be well soaked in hot - water previous to using them again, in order to destroy insects, &c. Be careful to keep each tree correctly labelled.

THE KITCHEN GARDEN.

By John Pentland, Gardener to C. H. B. Firth, Esq., Ashwicko Hall, Marshfield, Chippenham.

Trees and Hedges .- If the garden is surrounded by overgrown trees and hedges that shut out the light and injure the crops, let the trees be lopped, the hedges trimmed, and all gaps made good as seon as possible. Trees at a considerable distance from the boundary are rather beneficial than otherwise, as they break the force of the winds, but they should not be allowed close enough for their roots to penetrate the horders or their tops to throw a shadow over any part of the vegetable ground. This should be remembered in the making of new boundaries; the little trees you are planting may seem harmless enough, but ask yourself how they are likely to affect the vegetable-quarters in twenty-five or thirty years time. We frequently see the result of want of forethought in planting, or the results of planting to produce immediate effect, which is not practical gardening. Let the extent, position, and surroundings of the garden be extent, position, and surroundings of the garden be your guide in determining the height of the hedges. Where buildings or plantations are sufficiently near to the boundary to provide protection there is no need for a hedge higher than 5 feet, unless for securing privacy, which should be a secondary object in a kitchen-garden. If there is no other shelter te depend upon, the hedge should be kept high enough to protect Peas and Scarlet Runners from the wind. For an outside bound Runners from the wind. For an outside boundary hedge there is nothing to equal Holly or Holly and Thorn. Where interior hedges are required in gardens of large extent, use Helly or Yew in preference to Hornbeam or Arbor Vitæ.

Peas sown as advised in the Calendar for January 9 will now be up, and should receive no further protection unless they have been neglected, and have consequently become weak. In this case, gradually harden them off to be ready for planting as soon as the soil is in a fit condition.

Pricking out.—Prepare frames in which to prick out Cauliflowers. A hotbed will not be necessary. Put two or three barrowloads of short stable-manure in the bottom of the frame, and cover with sandy seil 4 inches deep; it will then be ready. Prick out seedling Tomatos into small pots; also pot on autumn-struck cuttings or seedlings. Wash down the pits and prepare beds for planting those most forward, and while the house is empty fumigate it with sulphur; afterwards spray the walls and woodwork with a weak solution of paraffin and water. See that the plants are thoroughly clean before planting them.

Collect Manure to be ready for making-up mild hot-beds for sowing French Beans, &c., for planting out. Look over Lettuces, Cauliflowers, and Cabbages frequently, and dust them with dry ashes and soot.

FRUITS UNDER GLASS.

By W. FYFE, Gardener to Lady WANTAGE, Lockinge Park, Wantage.

Cucumbers.—To maintain a supply of winter Cucumbers, high temperatures are necessary, and for late or very early supplies we find that plants in pots answer fairly well. But Cucumbers may be grown easily during the spring and summer months, provided they are not subjected to cold draughts and constantly fluctuating temperatures. They require a warm and moist atmosphere, and should not be too heavily cropped in the early stages of growth. Large quantities of soil are unnecessary. Light turfy loam, with a little fresh leaf-soil added, previously dusted with air-slaked lime, with occasional dressings of soot when the bed is formed, and light top-dressings of the same materials as the roots appear on the surface, will suit the plants

well. Do not allow the fruits to hang too long nor the growths to become crowded tegether, nor the vine to run beyond one or two joints beforebeing stopped. Train the plants not less than 18 inches from the glass, and when in bearing: afford them good supplies of water. Amongst a large number of varieties grown here last season, Carter's Ideal was the most fruitful and perfect variety, Challenger, Satisfaction, and Lord Roberts also being free fruiting handsome-varieties.

Tomato Plants raised from seeds sown in November are sufficiently advanced to be shifted into their fruiting-pots. Tomatos yield better results when they are not allowed too much root-We use no pots larger than 8 inches in diameter. Let the potting be done hefore the plants become root-bound. All materials used in potting should be scrupulously clean, and the warmed and moderately dry. The seil should conist of a rich fibrous loam, to which may be added lime rubble and wood ashes. When potting allow space for light top dressings. See that the plants are thoroughly moist at the roots before being shifted into larger pets; so that further water may not be required until the roots have taken held of the new soil. Provide a position with a wire trellis 8 or 10 inches from the glass, 12 inches separating each plant, trained with a single stem. Remove all lateral growths. When the plants are in flower they will require a drier atmosphere, which should be frequently circulated. Touch with the camel's-hair brush the individual flowers at about mid-day, and tapthe rods in the early morning when the atmos-phere is dry. When the fruits have set, let the phere is dry. plants be afforded liberal supplies of stimulants. and if exhibition fruits are required, the cluster's should be thinned, removing those fruits that appear less likely to make good specimens. Sow seeds for producing plants to fruit late underglass, and out-of-doors, Sow them thinly, and pot off the seedlings as soon as they can be handled. Keep them near to the glass.

** Under heading "New Vine Borders" in last week's Calendar, "cow" manure should have read "vine" manure.

THE APIARY.

By EXPERT.

The Heavy Rains.—The heavy rains have doubtless penetrated through the roofs of hives, and completely soaked the coverings. These should be changed at once, and the roofs covered with felt or zinc to prevent anything of the kind happening again. If the body bex should be completely saturated with wet or mildew, transfer the bees to a dry hive at the first opportunity. Have the new hive ready and placed near the old one, and on a fine warm day transfer the whole of the frames and bees as quickly and quietly as possible. If done in this manner the bees will scarcely realise the change. Remove the wet hive under cover to be repaired and dried for use in the coming season; but before using again have it properly cleaned out with the following preparation:—Two parts carbolic acid (Calvert's No. 5), six parts warm water, one part glycerine. Mix these together well, then scrub the hive thoroughly with boiling water containing plenty of soda, and after drying give the hive a good cleaning with the solution described above, and put it in the sun to dry.

Utensils.—The zealeus bee-keeper will be on the look-out for any novelties he may see advertised for the coming season, but I would advise anyone not thoroughly up - to - date in bee-keeping, to leave these severely alone until they have been proved and found to be useful to the bee-keeper, as the great point at stake should be to raise honey in the best and most profitable manner. In nearly every case the bee-keeper, if he commenced bee-keeping simply for a hobby, will soon turn his attention to the fact that there is money to be made from his hobby, and he then becomes a believer in having only the articles that are really useful and necessary in his apiary. The new season's catalogues are being issued, and care should be taken only to quality.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the Publisher.

Letters for Publication, as well as specimens and plants
for naming, should be addressed to the EDITOR,
41. Wellington Street, Covent Carden, London,
Communications should be WRITTEN ON ONE BIDE ONLY OF
THE PAPER, sent as early in the week as possible, and duly
signed by the writer. If desired, the signature will not be
printed, but kept as a guarantee of goad faith.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.

illustrations.—The Editor will be glad to receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, FEB. 23

Royal Horticultural Society's Committees meet. Meeting to consider formation of Gardeners' Association at Hotel Windsor.

FRIDAY, FEB. 26 | Royal Botanic Society's General Meeting.

SALES FOR THE WEEK.

MONDAY AND FRIDAY NEXT—
Border Plants, Perennials. Roses, Fruit Traes.
Azaleas, Lilles, &c., 67 & 68, Cheapside, E.C., by
Protheroe & Morris, at 12.
WEDNESDAY NEXT—

EDNESDAY NEXT—
Azaleas, Rhododendrons, Paims, Roses, Fruit
Trees, Perennials, Border Planta, Liliums, &c., at
67 & 68, Cheapside, E.C., by Protheroe & Morris,
at 12—At Stevens, at 12.30, Standard and Half
Standard Roses, Rhododendrons, Azaleas, Fruit
Trees, &c.

Trees, &c.

Trees, &c.

WEDNESDAY, THURSDAY AND FRIDAY NEXTSale of Nursery Stock and Greenhouse Flants, at
The Nurseries, Holgate, near York, by order of
Messra. J. Backhouse & Son. Ltd. by Protheroe &
Morris, at 12 first day and 11 two following days.

FRIDAY NEXT
Innovited and Fatablished Orbids, at 67 and 68

Imported and Established Orchids, at 67 and 68, Cheapside, E.C., by Protheroe & Morris, at 12 30. (For further particulars see our Advertisement columns.)

AVERAGE TEMPERATURE for the ensuing week, deduced from observations of Forty-three Years at Chiswick

ACTUAL TEMPERATURES :-

TOAL IEMPERATURES:—
LONDON. - Feb 17 (6 P.M.): Max. 40°; Min. 35°.
Feb. 18, Gardeners' Chronicle Office (10 A.M.):
Temp., 37°; Bar., 29°4, moderately bright.
PROVINCES.—Feb. 17 (6 P.M.): Max. 46°, S. W. Ireland;
Min. 33°, N.E. Scotland.

Long before County Councils Cottage came into existence, or Gardening. " whiskey - money " available, we had published our Cottager's Calendar, of which the circulation is still very large. Later on we urged the desirability of organising instruction in gardening among the labourers and small holders in the country districts. We were stimulated to do this from what we had seen and read in Belgium particularly. Nobody, as it seemed, paid any heed, and we thought our admonitions had been in vain. Suddenly a great change occurred, and now in most counties a widely extended and most beneficent system is in operation. From one end of the country to the other, from Yorkshire to Kent, from East Anglia to Worcester, from Northumberland to Durham, and even in Ireland, we hear of County Council lecturers and demonstrators. Many of them are personal friends and acquaintances, so that we have reason to know that the instruction is reasonable (we hesitate to use the word scientific, as that might be misunderstood), but reasonable and practical. We own we were among those who, knowing something of the Kentish peasantry, doubted the success of the enter-

prise in that county. Glad, indeed, are we to see that we were mistaken.

"The cottage-gardener of Kent," says Mr. W. P. Wright, "is now spoken of as a man of whom Kent may be proud. He is an intelligent thinker, and a plodding, patient worker. Once his confidence is obtained, he proves a willing pupil. He is keen in the acquisition of knowledge and enthusiastic in applying it. And he applies it with zest, uot only for his own benefit, but for the honour of his village."

Of course, a very great deal of this success, the greater part, is due to the selection of a competent instructor who knows his pupils, knows what they want, and knows how to supply that want. In Kent the lectures of the winter are linked to the work of the summer in the cottage gardens. Interest and emulation are excited. Information is given as to the best varieties to be cultivated and the best methods of turning the garden or the allotment to advantage.

In a local paper Mr. W. P. WRIGHT, the horticultural superintendent of the Kent County Council, speaking of his early experiences before the present system got into working order, said:—

"The most striking defect was the want of method in the arrangement of the crops, and the concentration of effort on a comparatively small result. It was noticeable that the men laid themselves out to grow a limited number of vegetables which were prominent in the schedules of the local shows. It was our object to encourage them to get as long a succession of produce as possible-both by means of rotation of crops and by successional sowings or plantings, thus keeping the ground occupied all the year. They did not, on their plan, get the full value of the garden. As an instance, I visited the garden of a man who carried off a number of show prizes year by year, and I saw that he was well prepared in his limited way for a forthcoming show. But, some time afterwards, when I visited it the second time, the garden was practically bare. The man came along, and I said, 'What's the meaning of this?' 'Didn't know you were coming again, sir,' he replied. 'Where are your vegetables gone?' I asked. 'If you go and look into my lodge I will show them to you,' he rejoined. And there they were, ready for another show. 'Then what do you do for vegetables in the winter?' I asked. 'Why, go without, was the reply. That was the sort of thing to fight against. A few of this stamp gave us up at once, but the vast majority saw that our system was the natural one, and that the other was the artificial one.

"I am proud to think," says Mr. WRIGHT, "that not only is the standard of gardening far higher in Kent than it was ten years ago, but that our humble workers have a clearer insight into the great forces which make for national progress. There is a strong, true spirit of advancement and of good sportsmanship amongst them. Our men no longer think solely of their pockets. They are no longer mere individualities. They are units in a band of workers proud of the great and growing fame of their county.

"Believe me, Kentish gardeners are not mercenaries, they are grand fellows, true as steel, when once they learn to trust you, and swiftly responsive to any appeal to the best side of their natures. If, in a still wider arena of garden battle, it ever falls to my lot to lead a chosen band into an inter-county contest (and that is one of my dreams for the future) I shall be proud of my followers, for I know that in victory they would be modest, in defeat cheerful, and hopeful for the issue of another fray.

"The crops which have shown the greatest results are: Potatos and Onions without a doubt.

The advance with both of these crops has been truly astonishing. The interest our cottagers take in Potatos amounts almost to a passion; the lectures also are well supported and by the right class of people.

"I don't believe," continues Mr. WRIGHT, "our rural schools will be encouraged to go on, turning out nothing but cheap clerks and shopgirls by the hundred thousand, as they have been doing. England has enough and to spare of cheap clerks and shop-girls, but of skilled artizans, fruit-growers, poultry-keepers, and cooks, all too few.

"It is evident that technical education in the direction of gardening has been a distinct gain to the county, and the hope may be entertained that, seeing the number of places which have not yet been created lecturing centres, the County Education Committee will not come to the conclusion that the work of the past decade has completed the education of the present generation of adult gardeners."

Our illustration has been taken mainly from Kent, but we know the good work is not confined to that county. The adjoining counties of Surrey, Middlesex, Essex, have also achieved a fine record, and we are continually called on to note what is doing in Worcestershire, in Cornwall, and very many other counties. The advantages are so great, the drawbacks so few, that everyone will heartily wish for the increased diffusion of sound practical teaching.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Committees will be held on Tuesday, February 23, in the Drill Hall, Buckingham Gate, Westminster. A lecture by Mr. R. Lewis Castle, of the Duke of Bedford's Experimental Gardens, on "Pomology," will be given at 3 o'clock. At a general meeting of the Society held on Tnesday, February 9, eighty-nine new Fellows were elected, making a total of 261 elected since the beginning of the present year.

—— The prize of £10 offered by the Council of the Royal Horticultural Society for the best essay on Cottage and Allotment Gardening has been won by the motto "Observe and Practise," Mr. C. Wakely, of Chelmsford.

—— POSTPONEMENT OF CENTENNIAL DINNER.
—Owing to unforeseen circumstances, the Centennial Dinner of the Society, proposed to be held on March 3, is unavoidably postponed.

HERR KARL DINTER.—We are glad to hear that this gentleman, who has been in the heart of the country disturbed by the rebel natives of German South-West Africa, has escaped unhurt, though he has lost everything. Mr. Dinter, it will be remembered, was for some time at La Mortola, and afterwards went in the German Colonial service to South-West Africa, from which little-known country he addressed us several interesting letters.

DAHLIAS.—The Dahlia enjoys the protection of no fewer than two special societies. Whether the mysteries of Dahlia culture or the intricacies of its floral conformation are such as to demand such an unusual amount of scaffolding for their safeguarding is a matter for the double Dahlia-specialists to determine, all we have to do with is to announce the publication of the Official Catalegue and Culture Guide of the National Dahlia Society. Exhibitions of Dahlias, or indeed of any other flower, stimulate the growers to the production of the newest and best forms; and they educate the public taste, and we may add that of the growers also, as may be witnessed in the increasing popularity of the Cactus Dahlias, and the gradual extinction of those hideous abominations, the show Dahlias proper. This is a matter of taste, it will be said, and so

it is, and the result is what we have described. Exhibitions, moreover, serve to elicit certain standards of comparison and means of classification, which become imperative as time goes on and novelties increase accordingly. The present publication contains some good practical articles on the cultivation of the Dahlia in the open-air or under glass. Mr. CHEAL tells us to cut the single Dahlia when the flowers are only half open, and thus avoid the early dropping of the florets of which people complain. Just now the single Dahlia seems to be going a little out of fashion, a circumstance greatly to be regretted. We trust Mr. CHEAL'S advice may do something to check this caprice. The lists comprise the names of the varieties now in commerce, together with brief indications as to the height of the stem and the colour of the flowers. Selections of the best twenty-four varieties (in each section) for exhibition, and of twelve varieties best suited for garden purposes are also supplied. These will be very useful to the beginner. We should like to see a little more attention paid to the foliage of the Dahlia, which is of itself an object of attraction, and should welcome some further details relating to the "habit" of the different varieties, and the way in which they throw up their flowers above the leaves-a point of much importance in out-of-door culture.

"THE MANGO."—By G. MARSHALL WOODROW. A pamphlet describing the history, distribution, climate, soil, and propagation of the Mango, with notes as to manuring, irrigating, grafting, budding, and transplanting this tree. A list of the best varieties of Mangos is appended, with a description of each. There are several pictures and a coloured frontispiece. Considering the value of the Mango and its many capabilities, this treatise should prove widely acceptable. It is published by ALEXANDER GARDNER, Paisley; by H. G. COVE, 41, Wellington Street, Covent Garden, W.C.; and also in Bombay, Calcutta, and Madras.

MONMOUTH.-Mr. W. J. GRANT reports on the horticultural work done during the past year under the auspices of the Technical Instruction Committee. "Reformatory, Little Mill .- The instruction given at this Farm School has been continued as before. H.M. Inspector of Reformatory and Industrial Schools reports as follows upon the instruction given at this School:-Valuable lectures on Agriculture and Horticulture continue to be given by Mr. Grant, County Council Lecturer. The purely theoretical lectures are often supplemented by Mr. GRANT's joining the boys when at work in the field or garden, and pointing out the practical application of principles. The County Council Agricultural Lectures are worthy of special remark. This work may be commended to the Council as not only being valuable at the present, but as likely to be of increasing importance as time goes Other lectures were given at numerous places within the county. The number of days upon which rain fell was 134, compared with 111 of the previous year, during a period of 273 days, with a total rainfall of 39.49 in., compared with 25.79 recorded in the previous year, and 24.07 recorded for the same period in 1901, showing the rainfall to be 13.70 above that of the total in 1902 for the same period.

GARDEN AND FARM PRODUCE BY RAIL.—We learn from the officials of the Great Eastern Railway Company that during the half-year ending December 31, 1902, the Company carried 71,600 boxes of garden and farm produce per passenger train, as compared with 71,500 during the same period of the preceding year. Considering the atmospheric conditions during the period in question, we think the Company is to congratulated on their success.

THE PROPOSED GARDENERS' ASSOCIATION. -Mr. A. DEAN writes: "Kindly permit me to remind all those who may feel a real interest in the formation of a National Gardeners' Association, that an adjourned meeting of all such persons will be held, so far as space will permit, in the room of the Horticultural Club, Hotel Windsor, Victoria Street, on Tuesday next, February 23, at 2 P.M. At the meeting held in December, a small committee was appointed to prepare a scheme and rules for the society. When later that committee met, and after long discussion, it was resolved that the Secretary draft a report embodying the views of that committee for submission to the adjourned meeting. That report has been prepared. Since then some new suggestions have been made from other directions, and these will be probably put forth at the ensuing meeting."

— We understand that at this meeting a resolution will be put to the effect that an association of professional gardeners should be formed, to look after such questions as wages, hours of employment, registration, &c. The organisation should have as its object the promotion of the well-being of the members in all matters pertaining to their daily life and labours. Everyone familiar with the conditions which now exist will sympathise with these objects. We shall watch with great interest the development of the Association, in the hope that it may secure the advantages of co-operation without the employment of methods which are open to objection.

DELENDA EST CARTHAGO.—An advertisement in our last issue comes as a funeral knell to the old garden at Chiswick. In proportion to its size and means, no garden in the world, not being a Government establishment, has ever accomplished so much for horticulture, none can point to a more brilliant staff of officials, or to such a record of work done. Much of this is not known, certainly not appreciated, by the present generation, but to the historian of gardening, Chiswick must always stand out in the forefront of gardening effort and garden accomplishment.

DISEASE - RESISTING POTATOS. — A very significant paper was read at a recent meeting of the Linnean Society, by Mr. E. S. Salmon, who, following up Marshall Ward's conclusions, shows that certain forms morphologically indistinguishable one from the other are nevertheless very different physiologically, especially in regard to their liability to or their freedom from attacks of parasitic fungi or otherwise. The plants experimented upon were species of grass, (Bromus), but there is no reason to doubt that if such differences exist in one set of plants, they may also be found in others, and that a disease-resisting Potato may be, to a much greater extent than at present, within the limits of possibility.

THE NATIONAL POTATO SOCIETY. - A meeting of the Executive Committee of this new Society was held at the Horticultural Club on Monday last. Mr. A. D. Hall, of Rothamsted, in the chair. The Secretary, Mr. W. P. WRIGHT, gave a statement as to the Society's finances, which was of a satisfactory kind. He then read many letters received since the previous meeting, all of them generally favouring the Society's objects. Tenders for the supply of ten varieties of Potatos selected for the trials were read, and it was agreed to accept those of a southern and of a northern firm, the quantities to be issued being equally divided. The number of trial plots, so far agreed to with a few others yet in view, will probably number twenty, and the seed-tubers will be sent to each of the trial places direct. Instructions as to time, distance, &c., in planting, were agreed to, and 1,000 copies of those in the form of a small pamphlet ordered to be printed. It is hoped to hold a conference and an exhibition in the autumn if support be given.

FORESTRY IN RHODESIA. — Mr. C. E. F. ALLEN, a young man who has just left the Royal Gardens, Kew, is going to South Africa to fill the position of Forester to the Rhodesia Railways, Ltd.

PUBLICATIONS RECEIVED. — Bulletin of the Botanical Department, Kingston, Jamaica. Appendix, 1902.— The Agricultural Gazette of New South Wales, Dec., 1903. Noteworthy features are the drought reports, collected from sixteen districts—Bulletin of the Department of Agriculture, Kingston, Jamaica. January, 1904. Contains a useful article, by H. H. Cousins, on Nitrification.

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his Correspondents.)

VARIATION IN LÆLIA ANCEPS.—In reference to Mr. Bound's note on p. 100, I may say that never before this season have I noticed such variation as there is amongst some of my flowers. Distinct white rays ran through the rose-lilac colour of each petal. All the flowers on one scape were the same, but other flowers on the same plant were true to the type. W. H. Clarke, Aston Rowant House Gardens, Oxon.

A PROLIFIC FIG-TREE.—In reference to the note on p. 102, by Mr. Dean, respecting a prolific Fig-tree, I may state we have a tree here which, when obtained from Messrs. Rivers & Son three years ago, was quite a small plant. It was planted on the opposite side to Vines in a span-roofed house, and is trained to wires. The tree now covers a space of 20 square feet. We had 300 fruits from the last crop of the season. Visitors from the South of England remarked upon the fine size and flavour of the fruits. L. B. Husbands, Belladrum Gardens, Beauly, N.B.

THE LATE F. C. LEHMANN.—As one who had the privilege of intimate friendship with this distinguished botanist and explorer, at almost the outset of his career, I wish to add my tribute to the many sterling qualities of the man; to his indomitable energy, courage, and resourcefulness under difficulties, and to his untiring zeal in the pursuit of knowledge, especially of those branches that were of utility to him in the career he had chosen, viz., botany, geography, and foreign languages. Although, unhappily, prematurely cut off from the scene of his labours, he has accomplished much, and enriched European gardens and botanical science to an extent exceeding his early aspirations. Freidrich Carl Lehmann was a man amongst men, and although his life's work is done, his memory will remain green in the hearts of those who knew him best. An English Admirer.

GRAPE LADY HUTT .- I can fully endorse all Mr. Kirk has said in favour of the variety Lady Hutt as a late white Grape. For several years I have grown here, and in other parts of the country, most varieties of Grapes that are generally grown in a private garden; but, with the exception of Muscat of Alexandria, there is no late white Grape with which I am acquainted to equal Lady Hutt in flavour and colour. In March, 1896, I planted in one late vinery here a rod of this variety, along with Lady Downe's, Alicante, &c.; but, unlike Mr. Kirk's, it is on its own roots. The plant has succeeded fairly well, annually showing a great many more bunches than are required for a the bunches in our case are, however, somewhat disappointing as regards size, being small in com-parison with the health and vigour of the Vine, the best not exceeding 2 lb. in weight. We had the fruit in good condition this year at Christmas, and it remained so until all was consumed early in the present month (February). It would be instructive to myself and doubtless to many other readers of the Gardeners' Chronicle if we could hear from the pen of such an expert Grape grower as Mr. Kirk the treatment he gives this variety as regards winter and summer pruning-whether he prunes very closely in winter [spur system], or leaves an extra eye or two; and does he adopt the usual summer practice of stopping the shoots at the second or third joint beyond the bunch, and all laterals closely stopped at first leaf, or whether he recommends the extension system, so far as space of trellis permits? G. Hall, Melchet Court Gardens, Romsey.

GRAPES WHITE GROS COLMAR AND LADY HASTINGS.—I can endorse all Mr. Kirk says concerning the Grape Lady Hutt. I have tried it in early houses, but the hest place for it is in the late vinery, where it would form a fitting companion to Lady Downe's. As regards the Grape Lady Hastings, I hope to fruit it, but at present there is something in its behavour I cannot quite understand. T. H. Slade, Poltimore Gardens, Exeter.

SULPHATE OF IRON.—In your review on p. 84 of A Treatise on Manures you mention that Dr. Griffiths is a strong advocate of sulphate of iron. I have no doubt that iron sulphate is a good fertiliser; but some soils may contain enough iron without the addition of the sulphate. I am penning this note as my experience of iron sulphate on many of the plants for which Dr. Griffiths recommends it does not prove it to be of much effect. Probably our soil contains sufficient iron, for, such plants. T. H. Stade, Poltimore Gardens, Exeter.

DISEASE-RESISTING POTATOS.—"A. D.," in his reference on p. 107 to Eldorado Potato, shows that he has not read the advertisement about Eldorado fully. The price 63s. per lb. is quoted for delivery in autumn. The present price is anything from £150 to £200 per pound. W. C.

THE GARDEN RUBBISH-HEAP .- Having read with interest Mr. Simpson's article on p. 81, I must congratulate him on the good soil he must have in his garden to stand such treatment as he describes; had he the garden under my charge to contend with, he would require a little more than refuse to produce a good crop. The top soil is only about a foot deep and is little better than the subsoil, which is a mixture of sand and clay (what I would call a very hungry soil), which, after such rain as we have had, might be compared to so much mortar, especially where we have been unable to get a trench filled in before rain comes on, which is very often the case. Another adverse circumstance is that the site is on the side of a hill, and its aspect is due north. Now if Brassica refuse had been dug in, such as Mr. Simpson suggests, taking into consideration the amount of water contained in such refuse, and the amount of rain that fell during 1903, I wonder in what condition the soil here would then be. He draws attention to the quantity of Pca and Potato-haulm, Brassica-tops and stumps. But in these days, with so many dwarf varieties of the last-named family, what waste is thereafter all? Take, for instance, two very good Cabbages, i.e., Sutton's Earliest and Sutton's All Heart; after taking away the edible part, what is left? The four outside leaves and about 1 inches of stump. There are much shorter Brussels-Sprouts on the market than formerly; Potatos also of the least haulm - producing kinds are generally planted. Peas produce a quantity of haulm; but I would prefer to see that rotting in a rubbishheap than turn it underground in the crude say were the weeds allowed to grow to such an extent that the garden could be manured with them? In few gardens is there so much labour allowed as to permit of the cleaning of ground being overdone; but many crops succeed better the oftener they are hoed through. Soil, as above described, is lightened a very great deal through the use of refuse from the rubbish-heap thoroughly rotted. For my own part, I think 1 should still prefer the manuring system, if not proceed in errors. practised in excess. I should like some gardeners of greater experience than myself to givo us, through the pages of the Gardeners' Chronicle, their own ideas and personal experience in such matters. J. Stocks, Fen Place Gardens, Turner's

SUTTON'S PERPETUAL EARLY - FLOWERING CARNATION.—This strain of the above popular flower appears to be a very useful one for winterflowering. From seeds sown in January last year, we have a batch of plants which have bloomed profusely during the autumn and winter months, and still bear many buds which promise to give a supply of flowers for some time to come. The flowers seem to have some of the characteristics of those of the Marguerite Carnation, but have more substance in them. R. W. Dean, Wainsford, Hants

THE ROYAL HORTICULTURAL SOCIETY MEET-ING.—You will perhaps permit a Scottish Fellow to express his gratification at the decision of the Fellows of the Royal Horticultural Society with regard to the change in the amount of the subscription. The course of allowing it to remain as it was might probably have been the beet, as you suggest on p. 104, but the one which was agreed to presents at least a via media, and will hardly have the effect of diminishing to any great extent the flow of new Fellows. There are comparatively few Fellows in Scotland, as may be observed from the list recently issued, but it should be the object of the Society to draw its members from as wide an area as possible, and one feels confident that the increase of the subscription to two guineas would have diminished the number of new Fellows from the more distant parts of the United Kingdom and other parts of the Empire. Even entrance fees, common as they are, are not popular; but the raising of the annual subscription would have been much worse. It should be the object of all friends of horticulture to see that the Society is put in as strong a position as possible. A Scotlish Fellow.

CHINESE PRIMULAS AT READING (see also p. 97).—What variety can excel in effect and beauty the "Duchess," of which there are six hundred plants, all as if from one mould? here is a study for any student in the faithfulness to colour and marking found in the whole The Duchess gives flowers of the finest form and size, profusely borne on stiff, erect steme, the ground white, and on it close round the eye a zone of rich rosy carmine. This is the most distinct and beautiful of all varieties. It is noticeable that selection last year from a plant or two which showed finer form has in the whole of the existing stock been reproduced. Then there is also being gradually bred a strain that will replace the red zone with bright blue; and it is possible there will be a strain having clearly defined Picotee edges to the petals. The blue tints are also developing. There is a deep blue, more dense in colour than anything yet seen; and there is a more developed strain of a very pretty pale blue, aptly named Cambridge Blue. Whites are numerous: Snowdrift, Pearl, Purity, Royal White, Superb White, Giant White are in great quantity; and how fine and floriferous they are! They are equally heautiful on palmate or Fern-leaf, or on dark or light-coloured foliage. Lovely soft pinks, richer carmines, pleasing magentas and purples, intense blood-red scarlets, and deep crimsons, all in masses, seen here in the sunlight and pure air, elicit expros-sions of delight and admiration. The giant singles are largely repetitions of the others, but have finer and more massive flowers. Of these there are a dozen varieties; and then again there are as many of the semi-doubles, also very beautiful, and to the gardener, as flowers for gathering and wiring, of the highest value. Even the lovely Duchess has been doubled, so rapidly does cross-fertilisation create novelties; and as we look on there are human agencies at work on these difficult-to-manipulate doubles, and that agency will succeed, as it has in the past, with every plant, and will with almost every flower. How excellent is the culture seen, how truly clean is everything! The journey was amply repaid; and, turning homeward, I felt that it was good for me to have been there, and to have revelled in this delightful flower-show. D.

STRAWBERRY-BEDS.—In the "Home Correspondence" column of the Gardeners' Chronicle for February 6, there were two notes on Strawberry culture. The one, a criticism of Mr. Markham's Calendar on p. 5-t, and the other, a reply by that gentleman. I prefer Mr. Markham's method. Here we use for planting in the summer the crowns that were forced in the spring, and generally plant them to follow the early Peas or the early Potato crop, the result being equal in either case. As soon as the Peahaulm can be cleared off, we plant the Strawberries from pots (in which they have been kept since forcing time), without digging or manuring the ground. The plants are put 1 foot apart in the row, and the rows are 3 fect asunder. Immediately the planting is finished, or as soon as

possible afterwards, a mulching of rotten stable-manure is afforded, which I think helps the crowns to mature. At the beginning of April all the loose manure is raked off and a dressing of soot applied. Later an application of blood manure or native guano is made and raked into the ground lightly. As soon as the flower-spikes have made good headway, the plants are bedded down with straw, which keeps the fruit from becoming dirty. We have very little trouble from slugs, and always have an excellent crop of Strawberries. The beds thus made are only allowed to stand two years, so that when one plantation is made another is cleared off. Digging between the rows I consider barbarous, as the roots that have been drawn to the surface by the previous year's mulching are bound to be wholly or partially destroyed. Instead of loosening the soil, I think the firmer it is the better it will be for the Strawberry plants. J. Stocks, Fen Place Gardens, Turner's Hill, Sussex.

FLOODS IN THE THAMES VALLEY.—Many of the gardeners in this district are passing through a very anxious and trying time owing to the floods. The gardens here, on the property of H. O. Hagan, Esq., are now at the bottom of a strong flowing river, which is washing away gravel-paths, taking out the soil from herbaceous borders, &c. Theranges of Peach-houses, Fig-house, Banana, and stove and Orchid-houses, &c., have water in them to the depth of from 1 to 2 feet. The consequence to Peaches, &c., just coming into bloom can be imagined. To make matters worse, the fires are all put out through the large quantity of water passing into the stoke-holes, although an attempt was made by men working night and day with pumps to cope with it, which however was useless. Until the water goes down one cannot tell the amount of damage done, but it must be very considerable. The gardener I succeeded here (Mr. Last) had a similar experience in 1894, when the Bananas were destroyed. Wm. Kirk, The Gardens, Riverhome, Hampton Court, February 15.

THE FLOODING OF MEADOWS.-We are having to-day (February 13) a repetition of floods in the meadows and other low-lying districts, accom-panied by a low and still falling barometer. Great grumblings by farmers, nursery gardeners, and others are being heard of the continuous wet, causing serious delay in the necessary preparation of the land for the sowing of seeds. repeated flooding of meadows not only weakens the best feeding grasses, but also starves and kills-the earth-worms, which are so useful in throwing up humus and are powerful agents in the improve-ment of the land. The flooding of the land also brings about a sure source of rot or fluke in sheep. The loss amongst flocks from this cause sheep. The loss amongst flocks from this cause alone is financially seriously hurtful to the farmers, who have from one cause or another, such as foreign competition, over-burdens of rent, and the property of the property and rates and taxes, been loaded up to the proverbial last straw. Their unremunerated labour, aggravated by an almost unparalleled wet season, reduces their position pretty nearly to that of a modern weary Sisyphus. It is not my belief that land should be so soon flooded after one night's fall of rain, which is, after all, a mere shower as compared to the torrential rains which fall within some regions of tropical and sub-tropical countries, where they measure as much or more in feet as we measure in inches. It is our continuous drizzle, clouded sky and want of sunshine, which give us so much cold and misery, and not so much any one year's maximum of rainfall. These, however, are the natural concomitants of the position of the British Isles, and are less or more marked in our eastern and western counties. With the exception of an occasional year or two of extra favoured weather, the hydrographical statistics or history of our country for hundreds of years teach us expect nothing different. But my object is to draw attention to the cause of so much land-flooding, and to fix some of the blame and responsibility for it. It has long been considered far too delicate a matter for anyone to remind our great landed proprietors who enjoy such vast estates in this small country, that the cause of much of its flooding, and its cure, rest entirely in their hands; and as the ownership of these estates carries with it

many responsibilities, duties, and obligations which they are expected to fulfil, they should be respectfully requested to see that those duties are carried out. The impediments in our rivers, brooks, and smaller watercourses, are brought down and allowed to accumulate from year to year and from decade to decade, and never cleared away; hence they become the cause of much of our dooded land, impoverished meadow pastures, and rotted sheep. If the landlords did their duty so far as lies in their power, they might then with good grace request their tenant-farmers to do theirs. We are not without a season of severe drought now and then, when we have a cry for rain just as loud as it is now for a cessation of it; then is the time when our water arteries should be seen to. Chambers of agriculture and county councils might do worse than put the flooding of meadows upon their respective agenda, and continue to press the matter in the proper quarter until it receivee attention. W. Miller, Berkswell.

HEAVY RAINFALL IN BRECONSHIRE. — The rainfall here during January was 7.88 inches, an inch and over falling on three days. The total amount for 1903 was 48.44 inches. In October alone it was 7.83 inches. A. J. Keen, Buckland Gardens, Bwlch, R.S.O., Breconshire.

With the enormous increase in the consumption of fruit, it is imperative that something he done to foster fruit cultivation in this country. The Departmental Committee of the Board of Agriculture might suggest in their report that free-holders anxious to increase their plantations and their output of fruit, but not having the where-withal to do so, could, under specially specified conditions to be drawn up by the Committee, receive a subsidiary grant from the Government or other public or local bodies, advanced upon a scale of repayment extending over a given period. W.H. Clarke, Aston Rowant Gardens, Oxon.

BEGONIA GLOIRE DE LORRAINE.—I noticed on p. 90 an interesting method by "T. A." of growing Begonia Gloire de Lorraine, also under "Plants under Glass" in issue for January 30, Mr. Fielder advised getting rid of the floweringstems as useless, but which I find very useful. When I started to grow this Begonia I had only one old plant, and I used every portion for the making of cuttings I possibly could, even the extreme points of the flowering shoots, and grow some splendid plants. I use some every year, and find they make the largest plants, but are a flittle longer forming roots than cuttings taken from the base after the plant is cut back. C. L. Branson, Coleshill Park Gardens, near Birmingham.

MANURES FOR TOMATOS.—In 1902 I carried out experiments with various manures with the object of determining as far as possible the enost profitable mixture for Potatos and Kidney Beans. The results obtained were communicated to the Press, and the large number of enquiries that I received in consequence from market gardenere in various parts of the country were ample evidence of the interest taken in such experiments. During the past year I could only find time for a very simple experiment on Tomatos. In my Potato experiment I had found a complete manure, containing nitrogen, potash, and phosphates, most profitable on my land, and that potasa was the most important constituent. The Tomato belonging to the same order as the Potato, I determined to test the value of potash in a complete manure for this crop. Accordingly two equal strips in a glasshouse received equal quantities of turfy loam, containing what I considered to be plenty of lime and nitrogen. To the soil on both strips I also applied superphosphate at the rate of 12 ounces per square yard, and to one of the strips only sulphate of potash at the rate of 6 ounces per square yard. The yield of Tomatos from the former strip was 21 lb. per square yard, and from the latter, which had received the potash dressing, it was 37 lb. per square yard; and the fruit was finer in both appearance and flavour, and worth quite a penny per pound more. The grariety of Tomato grown was Lister's Prolific. J. Y. Holmes, Salwarpe, Droitwich.

HYBRID WALLFLOWER.

THE flowers illustrated in fig. 52 are those of a hybrid Wallflower shown by Messrs. Jas. Veitch & Sons, Chelsea, at the meeting of the Royal Horticultural Society, on February 9. It is the result of a cross between a garden variety of

TREES AND SHRUBS.

FOTHERGILLA MAJOR.

The genus Fothergilla was founded in memory of John Fothergill, M.D., a celebrated physician

Fig. 52.—Hybrid Wallflower: Cheiranthus × Kewensis. (Colour Orange-yellow and Purplish-lilae.)

Cheiranthus Cheiri and the species C. mutabilis. The flowers when first opening are orange-yellow coloured, but soon become purplish. They are very fragrant, and Messrs. Veitch stated that the plants were in flower during the greater part of the year. The plants shown were in pots, and we presume it was of pot plants Messrs. Veitch were speaking.

in London during the middle of the eighteenth century, who formed an extensive collection of plants at Upton, in Essex, between 1762 and 1781, making a speciality of North American plants. The genus has long been represented in gardens by F. Gardeni (syn. F. alnifolia), a small shrub, native of the Sonth-eastern United States, and belonging to the same natural order as the Witch-

Hazels (Hamamelis). Until recently the genus has been considered monotypic, all the Fothergillas known being regarded as varieties or forms of the somewhat variable F. Gardeni. The plant whose name heads this note was figured in 1811 as F. alnifolia var. major in the Botanical Magazine, and subsequently as F. major in Loddiges' Cabinet, t. 1520. Introduced first to this country in 1780, it appears to have been lost to cultivation for very many years. Now, however, it has been re-discovered, and it is proposed to revive Loddiges' name and give it specific rank. As it has recently been added to the Kew collection from the Arnold Arboretum it will be of interest to record its re-introduction.

The Fothergillas are deciduous shrubs, bearing their flowers in terminal spikes. The flower has no petals, but owes its beauty to the stamens, of which there are about twenty-four, with long pinkish - white filaments and yellow anthers. F. major differs from the typical F. Gardeni in the following ways: chiefly, it is taller and stronger in habit, the ordinary F. Gardeni being a shrub of thin habit, with spreading, crooked branches, and usually not more than 2 feet or 3 feet high, whilst in F. major the branches are more erect and sturdier, and the shrub gets to be 5 feet or 6 feet high; the leaves are larger, oval or elliptic, usually broad or almost truncate at the apex with large crenate teeth there (the leaves of F. Gardeni are often narrow ovate); the flower-spikes are longer, distinctly cylindrical, measuring, in the Botanical Magazine plate, 2½ inches in length and 1½ inches in diameter, and more ornamental; lastly, it flowers in May and June, and thus a month later than F. Gardeni. The leaves of the Fothergillas often turn a very beautiful crimson in autumn. In a wild state the plants affect moist positions, and in cultivation they prefer a peaty soil.

SOPHORA VICIIFOLIA. In Szechuen, a province in Western China on the borders of Tibet, this shrub is described as covering large areas, in much the same way as Gorse or Heather does at home. It was collected by Mr. Watters as long ago as 1880 in the Province of Hupeh, and it was from his material that Dr. Hance made his description in the Journal of Botany the following year, and gave the species the name it now bears. Dr. Henry afterwards found it in the same province, and it is to him that we owe its introduction to cultivation. He sent seeds to Kew in 1898, from which the plant was raised which flowered in 1902, and was figured last March in the Betanical Magazine, t. 7883. It is a shrub of open habit, growing 3 to 4 feet in height, some of the twigs terminating in a spine. The leaf is pinnate, about 1½ inch long, and consists of six or seven pairs of leaflets, which are dark dull green and pubescent beneath; this pubescence extends to the leaf-stalks and young wood also. The flowers are borne, six to a dozen together, on short terminal racemes. The corolla, which is 3 inch in diameter, is white, whilst the calyx is pale violet. It is this pretty and unusual contrast in colour between calyx and corolla which makes the plant so distinct and interesting. But I learn from Dr. Henry that the flowers are not usually coloured in this way. The prevailing hue of the flower, as seen on plants covering large stretches of ground, is a dull white. It appears, therefore, that there are two (perhaps more) varieties of this plant. Indeed, the plants raised at Kew are not all alike; besides the form that has flowered, there is another that has not yet done so, but which is distinct in being less sturdy in habit and in having smaller leaves. In a wild state the species is found at high elevations—as much as 13,500 ft. -and on barren soils. It is quite hardy and easy to accommodate, and can easily be increased by means of cuttings. W. J. Bean.

SOCIETIES.

ROYAL HORTICULTURAL. Scientific Committee.

FEBRUARY 9-Present: Dr. M. T. Masters, F.R.S., in the chair; Messrs. Michael, Baker, Druery, Veitch, Worsley, Bowles, Saundera, Keeble, and Douglas; Dr. Ridley, Revs. W. Wilks and G. Henalow (Hon. Sec.). Viaitor, Mr. J. Hickley.

Beans Defective .- Mr. HORSLEY, of Winsford, Cheshire, sent aome mould in which Beans had been grown under glass, but failed. The Beans were old. It was thought that the seil was too light, with possibly deficient light, and the Beans being old might have been difficult to germinate. Mr. BAKER has undertaken to investigate the matter.

Coloured Photos of Orchids.—Mr. HICKLEY, natural colour photographer, of Kelso, Bassett, Southampton, exhibited some very beautiful transparent illustrations. of Orchids in their natural colours. They were effected by a special process of Mr. HICKLEY'S on platea sensitive to the primary coloura—red, green, and violet; but the special treatment by which the excellent results were secured is not yet patented. was enquired as to the cost of such for lantern-slides. These would be from 5s. 6d. to 10s. 6d. A vote of thanks was given to Mr. HICKLEY for his interesting exhibitions and description.

Tronxoleum tuberosum as edible.-Mr. BOWLES reported that the result of his trial was that while they were edible, he could not at all recommend them as palatable.

LINNEAN.

FEBRUARY 4.—Prof. S. H. VINES, F.R.S., President, in the Chair. The vacancles in the list of Foreign members caused by the deaths of Dr. Julius Victor members caused by the deaths of Dr. Julius victor Carus, Monsieur François Crépin, and Prof. Carl Gegenbaur having been previously announced from the Chair, the following were proposed for election in place of the deceased members: Prof. Eugène Louis Bouvier, Paria; Dr. Carl Chun, Leipzig; and Dr. Hugo de Vries,

Mr. CHARLES EDGAR SALMON, F.L.S., exhibited two apecimens of Epilobium collinum, from Scotland, with a series of E. montanum, and E. lanceolatum for

Prof. J. Bretland Farmer, V.P., having taken the Chair, the President gave an account of some reaearchea into the physiology of the Yeast-plant (Saccharomyces cerevisite). He began by drawing attention to the remarkable fact that though this plant consists of but a single minute cell, it is known to produce a variety of eozymes or ferments; such as diaetase, that converts starch into sugar; invertase, that aplits cane sugar into slucose and fructose: plucase, that coverts malione late. glucose and fructose; glucase, that coverts maltose into glucose; zymase, that decomposes glucose into alcohol and carbon-dioxide; as well as an undefined enzyme, protease, which digests proteid matter; it is this last that has been the subject of investigation.

The proteolytic activity of yeast has engaged the attention of many observers of whom Hahn and

attention of many observers, of whom Hahn and Geret are among the most recent (1900); and they express the opinion that the plant contains a protease which resembles in some respects the pepsin of the

which resembles in some respects the pepsin of the animal body, in other respects the trypain, thus constituting a new and distinct type of enzyme. In the course of the last session of the Society (Nov. 20, 1902), the President announced that he had discovered in many plants (see "Proceedings," 1902-3, p. 12) a protease resembling the recently discovered erepsin of the animal body. Since then he has endeavoured to determine whether or not the proteolytic phenomena of yeast may not be due in part to the presence of an enzyme of this character, with results which indicate that this is the case. that this is the case.

It was ascertained, in the first instance, that a filtered watery extract of yeast readily decomposes the simpler proteida, such as albumoses and peptones, into non-proteid bodies, such as leucin, tyrosin, &c., as indicated by the tryptophane-reaction. Such an extract was, however, in no case observed to exert any digestive action upon a higher proteid, such as fibrin. The conclusion to be drawn is that the protease extractable from yeast by water is neither a pepsio nor a

tractable from yeast by water is neither a pepsin nor a trypsin, but is an erepsin.

It is, however, quite true that yeast contains a protease that digests fibrin If yeast be extracted, instead of with diatilled water, with a 2 per cent. solution of common salt (NaCl), a liquid is obtained which digests fibrin with certainty.

What, now, is the nature of this protease that digests fibrin? Like the erepsin, it can act through a considerable range of alkalinity and acidity, and so resembles trypain rather than pepsin. Moreover, it must be borne in mindthat, up to the present, there is no evidence that pepsin exists in any other plant. Though the point can only be finally settled by separating and isolating the two proteases, the probability is that this peptonising enzyme is a vegetable trypsin. It may be incidentally mentioned that such an association of erepsin and trypsin has recently been demonstrated by Dr. Venon in the paperas. strated by Dr. Vernon in the pancreas.

The conclusion auggested by the observed facts is,

then, that yeast contains at any rate two proteases, the one an erepsin, the other probably a trypsin.

A point of subsidiary interest is that both these proteases are most active at a degree of acidity rather less than the natural acidity of the yeast extract; as, for instance, when any free organic acid in the extract has been neutralised by the addition of chalk. It appears been neutralised by the addition of chalk. It appears that this optimum acidity is due to the presence of acid phosphate of potash.

Mr. Ernest Stanley Salmon, F.L.S., then gave an account of his "Further Researches on the Specialisation of Parasitism in the Erysiphacee," in continua-

tion of his paper read February 19, 1902.

The comparative inoculation-experiments of 1 650. leaves of various species of Bromus, carried out by the author at the Cambridge University Botanical Laboratory, have shown that a very high degree of specialisa-tion has been reached in the adaptive parasitism of Erysiphe graminis, DC., to the different species of the genus Bromus. This specialisation has involved the evolution of a considerable number of "biologics

forms" of the fungus.

The complicated inter-relations of these "biologic forms" with their host-species were shown by means of diagrams. Evidence was given of the diatinctive infection-powers of the "biologic forms" on B. interruptus, B. "hordeaceus," B. commutatus, B. racemosus, B. velutinus, B. arvensis, B. tectorum, and B. arduennensis.

The facts obtained show not only the high degree of specialization which the fungus has undergone, but also that each species of Bromus possesses distinctive physiological (or constitutional) characters existing concomitantly with the specific morphological characters. These physiological characters are constant, and render the species susceptible or immune in a definite manner.

manner.

The author pointed out that it is possible, by using the index of the reaction to the attacks of these "biologic forms," to show the presence of specific physiological (or constitutional) characters in a plant. physiological (or constitutional) characters in a plant-As a rule, each species of Bromus shows physiological characters which hold good for all examples of the species obtained from different localities. But there are exceptions to this rule, and the author pointed out that "biologic forms" of host-plants exist. As an example, B. mollis and a plant called "B. hordeaceus" example, B. mollis and a plant called "D. nortuseeus were mentioned. These two plants are morphologically identical, but possess distinctive physiological characters which cause them to behave respectively as an immune and a susceptible race with regard tecertain fungl. It was pointed out that this fact of the existence within the range of a morphological species. of races possessing different constitutional powers as regards resistance to the attacks of certain fungi, is of importance in connection with the question of the possibility of the breeding of immune races of plants of economic value.

Details of experiments were given in which definite proof was obtained of the function of certain apecies of Bromus as "bridging apecies." In the instance given, conidia of the "biologic form" on B. racemosus, which in repeated experimenta had proved to be which in repeated experiments had proved to be-unable to infect B. commutatus, were sown on tweaty-two leaves of B. "hordeaceus," and produced full infection on twenty leaves. The conidia of the fungus-thus produced on B. hordeaceus were then sown on B. commutatus, and caused full infection. B. "hordea-ceus" is thus proved to be a "bridging species," affording a passage for the fungus on B. racemosus to the species B. commutatua, which it is unable to infect directly.

the species B. commutatua, which it is unable to infect directly.

In inoculation-experiments with Sphærotheca Humuli on Potentilla reptans, the results obtained showed that in the genus Sphærotheca—as in Erysiphe—specialisation of parasitism and the evolution of "biologic forms" have taken place. The experiments with Erysiphe Cichoraccarum on Plantago major proved that this "biologic form" cannot infect P. lanceclata, but that it is able sometimes to infect P. media. The increase it is able and in reduced perithecia on but that it is able sometimes to infect P. media. The fungus transferred to P. media produced perithecla on some of the inoculated leaves after the Oldium-stage.

From observations made in the field, the author has ascertained the constant association of a mycophagous

ascertained the constant association of a mycophagous larva with the Oidium-stage of many apecies of the Eryaiphaceæ. A number of these larvæ, feeding on the couldia of species of Erysiphe and Sphærotheca, were reared, and a Dipterous fly belonging to the Cectdomylidæ was obtained. This fly has been determined by Abbé Kieffer as belonging to the genus Mycodiplosis.

CARDIFF AND DISTRICT CHRYSANTHEMUM.

THE seventeenth annual meeting was held recently The seventeenth annual meeting was held recently at the Grand Hotel, Westgate Street, Cardiff. Mr. J. Julian occupied the chair, the attendance being much more numerous than usual. The annual report was submitted by the Chairman. It stated that the year 1902 ended in a loss of £18 1s. 3d., or a total deficit of £22 10s. 3d. at the beginning of the year 1903. The whole of that had been pald off, and the Society would start the next year clear. The next show had been fixed for November 2 and 3.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

FEBRUARY 5.- There was a fair display of plants on the above date.

S. GRATRIX, Esq., Whalley Range (gr., Mr. Cypher), exhibited a fine hybrid Cypripedium called C. × Alportense, the parents of which are stated to be C. insigne Harefield Hall var. x C. Boxallil. It is a much larger flower in every way than C. insigne Harefield

Harger flower io every way than C. Insigne Harefield Hall var., and was awarded a First-class Certificate.

W. THOMPSON, Esq., Walton Grange, Stone (gr., Mr. Stevens), exhibited a nice collection of Odontoglossums, including some good forms of O. × Wilckeanum, and a very distinct form of O. × crispo-Harryanum var. Regins, the latter receiving an Award of Mcrit. A Bronze Medal was awarded for the group.

A. WARDURTON, Esq., Haelingden (gr., Mr. Bailey), exhibited Cypripedium × Hindeanum Warburton's var. (Award of Mcrit).

M. CH. VUYLSTEKE, Loochristi. Ghent, sent half-adozen fine Odontoglossums. O. Wilckeanum. var Minos was awarded a First-class Certificate; O. Harryocrispum var. Talma and O. Vuylstekei var. gratiosa received Awards of Merit.

A. J. KEELINO & SONS, Bingley, received an Award of

received Awards of Merit.

A. J. KEELING & SONS, Bingley, received an Award of Merit for Cypripedium × Graceæ, a hybrid between C. Boxallif × C. niveum; also a Bronze Medal for group. H. Low & Co., Enfield, received Awards of Merit for Cypripedium × Watsonianum and C. villosum var. Lowii, the latter an albino form.

Mrs. ARDERN, Stockport (gr., Mr. Morris), was voted an Award of Merit for Odontoglossum × Andersonianum var. Liebe.

yar. Liebe.

J. E. Williamson, Esq.. The Grange, Stretford, staged a few nice plants, including a well-flowered plant of Cattleya Triange var, albida (Award of Merit).

Mr. JOHN ROBSON, Altrincham, and Messrs. JNO. COWAN & Co, Lid., staged collections of plants (Vote of Thanks). P. W.

THE NURSERY AND SEED TRADE ASSOCIATION.

FEBRUARY 10 .- The Secretary informs us that the Annual General Meeting of this Association was held on the above date, at its offices, 33, Wood Street, Cheapside, London, E.C., when the report of the Committee and the balance sheet for last year were presented, approved, and directed to be printed and distributed to members. The number of the latter gradually increases, and comprises 139 of the principal nurserymen and seed merchants in the United Kingdom, and 41 abroad.

dom, and 41 abroad.

The Association being a mutual one is confined to members of the trades it represents and those allied therewith, and they give to each other gratis, through the Secretary, private information respecting the stability and punctuality in payment of persons seeking credit. In addition to being able to obtain such valuable information direct from its members and its own registers, the Association is allied with 41 Trade Protection Societies, and has correspondents in most. Protection Societies, and has correspondents in most of the towns in the United Kingdom, for the purpose

of obtaining information.

During last year it expended £2017s. 2d. in making special enquiries for ite members. The funds of the Association are wholly expended for the benefit of the latter. Its usefulness and value to the members are proved by the increase in the amount of the debts foreign the increase in the amount of the debts collected and the enquiries made yearly relative to the financial position of persons seeking credit. During 1903 there were 1,155 enquiries made and answered, being an increase of 199 as against the year 1902.

NATIONAL CHRYSANTHEMUM.

THE Executive Committee have considerably augmented the prizes in the leading classes in the schedule for the November show at the Crystal Palace, which is fixed for November 2, 3, and 4; and the schedule of prizes will be found much more favourable to the prizes will be found much more favourable to the interests of exhibitors than that of 1903. The Crystal Palace Company are giving an additional sum of twelve guineas as a special 1st prize in the great Vase Class; the 2nd, 3rd, and 4th prizes are also materially augmented. The 1chthemic Guano Co. (W. Colchester), Ipswich, give a handsome Challenge Trophy, value eight guineas, in the class for six vases of incurved blooms, such trophy to be won three times hefore it becomes the absolute property of any exhibitor. In addition, the Company give for this year a 1st prize of £7. Mr. William Seward, the well known raiser of Banwell, gives the sum of £5 in four prizes for twelve blooms of incurved Chrysanthemums in not fewer than six varieties of Hanwell-raised seedlings, the names of six varieties of Hanwell-raised seedlings, the names of which are given in the schedule of prizes. Mr. Thomas Bevan and Mr. C. Harman Payne also offer prizes for special varieties; and in addition there are 109 special prizes of 5s. each for specially-named flowers selected from the whole show, and one of half-a guinea for the best novelty. Altogether, the November schedule of best novelty. Altogether the November schedule of prizes is increased to the amount of nearly £80.

ROYAL GARDENERS' ORPHAN FUND.

FEBRUARY 12.—The annual meeting of the subscribers to this praiseworthy Fund took place on the above date at Cannon Street Hotel, London, in disagreeable weather. It was scarcely surprising that the attendance was small.

In the regretted absence, through illness, of Mr. H B. May, Chairman of the Executive Committee, Mr. W. Poupart was invited to preside over the proceedings.

REPORT OF THE EXECUTIVE COMMITTEE.

REPORT OF THE EXECUTIVE COMMITTEE.

"The Executive Committee in presenting their sixteenth Annual Report congratulates the supporters of the Fund on its continued prosperity and usefulness, as although from causes too well understood by all, they are but able to show a trifling increase over the previous year's receipts from all sources, other than legacies; they have been enabled to increase their disbursements in the form of allowances and grants in aid from £1,092 15s. in 1902, to £1,255 10s. in 1903—a total increase of £162 15s.

"The Committee have to deplore the falling off in annual subscriptions, as shown in the accounts presented, and the more so as the deficiency mainly arises from the non-renewal of 5s. subscriptions, but they hope and helieve that when this fact becomes known and the present dearth of money passes away, these subscriptions will be renewed and increased in number.

"They cannot believe that those in whose interest the Fund was established are indifferent to its claims upon their support. Many there are, undoubtedly, who feel that they cannot subscribe 5s, annually, and these may be usefully reminded that all contributions are voluntary, and that the payment of a subscription one year does not imply that it must be continued in the next.

"The Committee gratefully acknowledged the receipt

may be usefully reminded that all contributions are voluntary, and that the payment of a subscription one year does not imply that it must be continued in the next.

"The Committee gratefully acknowledged the receipt of a legacy of £25 from the executors of the will of the late Mr. A. F. Oster, of Birmingham; and also the kind generosity of the Earl of Ilehester in throwing open his beautiful gardens at Holland House, on the occasion of the Royal Horticultural Society's exhibition being held there, by which means the Fund benefited to a substantial amount. The legacies left to the Fund by Mr. A. H. Sinee and Mrs. John Wills, amounting to £350, have been invested in the purchase of £380 122. 2d. two and a half per cent. Consols.

"The Committee keenly regrets to record the loss which the Fund has sustained by the death of two of its founders, Mr. A. F. Barron, of Chiswick; and Mr. James Smith, of Mentinore. Of Mr. Barrou's devotion to the Fund while its Secretary for eleven years it is not possible to feel other than the keenest appreciation or to speak other than in the highest terms; while of Mr. Smith it may be said that for several years after the establishment of the Fund he served on the Committee, and until his death was a zealous collector in ald of the charity whose interest he had so warmly at heart.

"The number of orphans who have been elected to receive the benefits of the Fund during the past fifteen years is 179, and the total amount expended in allowances during the same period is £12,192 178 feld. At the commencement of the year the number of children receiving the full allowance was 73, and 24 were added to the list by special resolution at the annual meeting. The number on the Fund now is 88, and 10 will be added by election this day. Most of the candidates have been in receipt of compassionale silowances since their nominations were accepted; and while the Committee would have been glad if they could have seen their way to put a larger number than ten on the Fund, prudence dictales the safer

years' limit.

"The Committee again gladly tender their warmest thanks to the local Secretaries for valued services rendered, and also gratefully acknowledge the zealously continued exertions on behalf of the Fund made by gardening friends in various centres, and could heartily wish that their number could be increased.

"The Annual Festival held on May 5 under the presidency of the Right Hon. The Earl Carrington, P.C., again proved an unqualified success from every point of view; and as a slight acknowledgement of the Committee's appreciation of the noble Chairman's kindness on that occasion, have the greatest pleasure in re-

of view; and as a slight acknowledgement of the Committee's appreciation of the noble Chairman's kindness on that occasion, have the greatest pleasure in recommending that Earl Carrington be this day elected a Vice-President.

"It has been arranged for the next Annual Festival to take place at the Hotel Cecil on Tuesday, May 17, and the Committee arc highly pleased to make the announcement that Sir J. J. Trevor Lawrence, Bart., K.C.V.O., President of the Royal Horticultural Society, has most kindly promised to preside on that occasion. As the Royal Horticultural society will this year estebrate its centenary, it is especially gralliying to the Committee that his President should have so kindly accepted their invitation, and trust that all friends of the charlty will raily round them in support of so distinguished a pairon of horticulture.

"The members of the Committee who retire by rotation are Mr. J. Assbee, Mr. W. H. Cutbush, Mr. G. Gordon, Mr. J. F. McLeod, Mr. T. A. Morris, Mr. G. H. Richards, and Mr. W. Roupell; and Messrs. Assbee, Cutbush, Gordon, McLeod, Morris, and Roupell being eligible, offer themselves for re election. Am. G. H. Richards does not offer himself for re-election, and Mr. P. E. Kay and Mr. G. Nicholson having resigned, Mr. William Bull, Mr. R. Hooper Pearson, and Mr. W. P. Thomson are nominated to fill the vacancies thus created.

"The Committee have much pleasure in recording

"The Committee have much pleasure in recording their appreciation of the admirable manner in which Mr. William Sherwood discharges' the duties of Treasurer on behalf of his father absent abroad, and

in anticipation of Mr. Sherwood's early return, as all hope, in renewed health and vigour, he is again nominated for re-election as Treasurer.

"The Committee have again pleasure in thanking Mr. M. Rowan and Mr. P. kudolph Barr for their most careful audit of the accounts of the Fund. Mr. Rowan is the retiring Auditor, and is nominated for re-election."

STATEMENT OF ACCOUNTS.

The principal sources of receipts in 1902 were as follows:—Annual dinner, £681 2s; subscriptions, £252 5s, 11s.; ditto from local secretaries, £47 2s 1d; donations, £237 14s, 7d.; ditto from local secretaries, £68s, 10d.; legacy from Mr. A. F. Osler, £25; Emma Sherwood Memorial, £13; dividends on Stock and Interest on deposit, £319 is, 11d.; which, with other receipts (including balance of £1,198 17s, 4d. from last account), made a total of £2.845 1s. made a total of £2.845 18.

On the other side the chief items of expenditure were On the other side the chief items of expenditure were as follows:—Allowances to orphans, £1,166 10s.; grants in aid, £76; Emma Sherwood Memorial, £13; making a total given to children of £1,255 10s. Other expenses included—Annual dinner, £174 4s. 4d.; secretary's salary, £100; printing and posting to subscribers, £35 9s. 7d.; purchase of £380 12s. 2d. Two-and-a-half per cert Consols, £350; making, with other minor expenses, a total of £2 012 13s. 3d. There are balances at hank, on deposit, and in hand, of £832 7s. 9d.; making a grand total of £2 845 1s. total of £2,845 1s.

PROCEEDINGS.

The Chairman proposed the adoption of the report and balance-sheet, and when it had been seconded by Mr. Harry J. Veitch it was adopted unanimously.

Mr. Harry J. Veitch it was adopted unanimously.
On the proposition of Mr. Geo. Gordon, seconded hy
Mr. Rochford, the Earl of Carrington was elected a
Vice-President. Mr. N. N. Sherwood was re-elected
Treasurer on the motion of Mr. Roupell, seconded by
Mr. J. F. McLeod. Mr. Assbee proposed that Mr.
Rowan be re-elected Auditor, and it was carried.
Mr. R. Hooper Pearson proposed, and Mr. Miles
(Southampton) seconded, that Messrs. J. Assbee, W. H.
Cutbush, Geo. Gordon, J. F. McLeod, T. A. Morris, and
W. Roupell, retiring members of Committee, be reelected. This was carried unanimously.
On the proposition of Mr. Assbee, Messrs. W. Bull,
R. Heoper Pearson, and W. P. Thompson were elected
members of the Executive Committee, in the places of

members of the Executive Committee, in the places of Messrs. Geo. Nicholson, Peter Kay, and G. II. Richards.

The re-election of the Secretary was the next business, and the Chairman proposed that Mr. Brian, Wynne he appointed at a salary of £125 a year, and showed good reasons for giving the extra £25, Mr. Wynne having worked very hard for the Fund. Mr. Roupell also here testimony to Mr. Wyone's remarkable enthusiasm and energy.

ELECTION OF CHILDREN TO THE FUND.

Messrs. Asshee. Lyne, Geo. Cuthbert, Geo. Reynolds and J. F. McLeod, were appointed scrutineers of the ballot, and the result was declared at 4 30 as follows.

1. GEORGE JAMES LAMMAS ... 367 votes.
2. HARRY GEORGE PANTLING ... 331 ,, 3, REGINALD JOSEPH PANTLING ... 331 4, MARGARET LAMMAS 328 5, LOUISE WIFELEY LOUISE WITCHER 6. MARY ELIZARETH PRETTY ... 229
7. ROBERT ARTHUR PRETTY ... 228 FRANK WILLIAM SONNTAG ...
HENRY GILLET 214 10. HILDA BLANCHE AYLING ... 186

There were nine unsuccessfut candidates.
On the suggestion of Mr. H. J. Veitch, a telegram was despatched to Mr. H. B. May, regretting his indisposition, and hoping for his speedy restoration to health.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.

Bristol and Bath Auxiliary.

FERRUARY 12.—A special meeting of the above Association was held at Chivers' Restaurant on the above date, to consider the advisability of holding a Rose, Begonia, and Orchid show in aid of the Institution, Mr. W. A. Garaway occupying the chair.

Mr. W. A. Garaway occupying the chair.

Mr. Vallance had carefully thought out the matter, and decided that a Rose show, to be held next year, would be the best means of increasing the income of so deserving a charity. He therefore proposed that a show be held for the purpose. On the vote being taken, it was unanimously decided to hold the show during the summer of 1905. The question of a guarantee fund was also brought forward, and responded to in a very cratifying way, many gentlemen adding their names gratifying way, many gentlemen adding their names to the list of guarantors.

Liverpool Auxiliary.

FEBRUARY 13.—The third Smoking Concert in aid of this Institution was held in the "Bear's Paw Restaurant," and was a great success. In addition to Mr. C. A. Young, the estimable chairman of management and Messrs. R. G. Waterman and A. G. Crippin, the hard-working Secretary and Treasurer, there were present Mr. J. Dickson (Messrs. Dicksons, Ltd.). Mr. B. Wilson Ker and Mr. Ranger (Messrs. R. P. Ker & Sons), Mr. H. Middlehurst, Mr. J. Finnigan, Mr. R. F. Barnes

(Eaton Hall Gardena), Mr. J. Gibbins (Croxteth Hall Gardens), Mr. B. Ashton (Lathom House Gardens), Mr. J. Guttridge (Wavertree Botanical Gardens), T. Foster, Gardens), Mr. B. Ashton (Lathoth House Gardens), Ar. J. Guttridge (Wavertree Botanical Gardens), T. Foster, W. Mercer, B. Cromweil, and Messrs. R. G. Waterman, and R. Pinnington. Later in the evening the chair was occupied by Councillor W. Watson Rutherford, M.P. ex-Lord Mayor of the City, who was accompanied by Mrs. Rutherford and Councillor Utley, the lady on eutering being presented with a charming bouquet by Mr. C. A. Young.

In urging the claims of the Institution, Mr. Rutherford made a powerful appeal to the Liverpool branch to organise and do all in its power to raise all the money possible. He thought there ought to be more relief granted, and it was not creditable that at the last election transfer recommended to more effected to the control of the co the last election twenty people were afforded temporary relief only. Gardeners should do what they could, and instil into the minds of their employers how beneficial the institution was. Me Dickson, and Middlehurst also spoke. Messrs. Waterman

Mr. Rutherford and Mr. R. W. Ker gave respectively three guineas and one guinea. New subscribers announced were Lady Tate, Mr. F. H. Gossage, Hull Chemical Co., and Councillor Utley. the latter stating that according to the interest of the branch, so would

the increase his aubscriptions.

The sum of £37 17s. had been forwarded to H. J., Veitch, Esq., leaving £2 19s. 8d. in the local Treasurer's hands. Orchid.

NATIONAL SWEET PEA.

THE third Annual Report of this Society has been The classification undertaken in 1902, and the published list of varieties most desirable to grow are recommended to the trade, to assist in determining the varieties most worthy of retention in catalogues. The Silver Medal of the Society for the finest novelty of the year was awarded to Scarlet Gem. The next annual exhibition will take place on Wednesday and Thursday, July 20 and 21, at the Crystal Palace, when prizes will be offered in thirty-six competitive classes. A schedule may be obtained from the Hon. Sec., Mr. H. J. Wright, 32, Dault Road, Wandsworth.

NATIONAL FRUIT GROWERS' FEDERATION.

COUNCIL MEETING.

THE usual monthly meeting of the Council was held at the Westminster Palace Hotel on Monday, the 15th at the Westminster Palace Hotel on Monday, the 15th inst. The following were present: Col. C. W. Long, M.P., Chairman; Messrs. J. Idlens, Evesham; C. D. Wisc, Gloucestershire; H.F. Gatting, Herefordshire; W. Idlens, Cambridgeshire; Hon. and Rev. A. Baillie-Hamilton, Guernsey; S. Boorman, Surrey; F. Smith, T. May, A. Meskin, A. S. White, W. Horne, and Percy Manwaring, from Kent; A. H. H. Matthews, Secretary to the Central Chamber of Agriculture; and A. T. Matthews, Secretary.

An important discussion took place on the question of the assessment of agricultural land being raised when planted with fruit. A typical case was brought forward from Kent, in which the rent is £120 and, because it has been planted with fruit-trees, the Income Tax Assessor raised the assessment to £353, which was maintained by the Commissionera, and from which decision the tenant was told there was no appeal. Mr. C. D. Wise said this was a mistake, and appeal. Mr. C. D. Wise said this was a mistake, and that such cases could be carried to the higher courts. He also gave two instances which had occurred in his neighbourhood, when similar attempts to raise the assessment had been successfully resisted. Another well-known case in Norfolk was cited, in which the tenant had gained his case on appeal. Mr. Thos. May said that such land should be treated as farm-land under Schedule B, and mentioned a case at Bromley when it was ao decided. The Council agreed that the when it was so decided. The Council agreed that the whole subject required careful investigation, and it was referred to the Departmental Inquiry for

The Rallway Advisory Committee then presented a report, stating that the Great Western Co. have agreed to place a few of their ventilated fruit vans, now only used on passenger trains, on the goods train service on trial, the Advisory Committee to report on their suitability. The van is an excellent one, and a very great improvement on the open trucks, which have to be sheeted. The railway authorities admit that they will sheeted. The railway authorities admit that they will also save much time by dispensing with the sheeting, and that they will thus be able to run the trains more punctually. This being the case, there is every hope that sheeted vans will soon become things of the past. The Midland Co. have been asked to add torpedo ventilators to the roofs of their passenger fruit trains, and as prevent much damage from the heating of soft fruits, which also leaves a smell in the van detrimental.

and so prevent much damage from the heating of soft fruits, which also leaves a smell in the van detrimental to the next load. Mr. Eaton, the Superintendent, has promised careful consideration to this suggestion.

The Committee has followed up the question of evening special passenger trains to pick up fruit from sending stations, and so enable late afternoop picking of soft fruit to be performed, and the fruit landed in Northern markets in the morning almost equal to morning-picked fruit. morning-picked fruit.

Revised passenger and goods service rates have been issued by nearly all the companies in pamphlet form, handy for the pocket, enabling the grower to see at a glance if it would answer his purpose to pay slightly more for carriage, and so catch an earlier market.

All these matters were brought before the Board of General Managers by the deputation from this Federa-

tion about fifteen months ago.

It was decided that in future all members should be welcome at the meetings of the Council, Monday, March 14, at 230 P.M., being the next fixture.

UNITED HORTICULTURAL BENE-FIT AND PROVIDENT.

AT a meeting of the Committee, on Monday, Feb. 8. fourteen new members were elected, making thirty-one in the two meetings this year. The annual general meeting will be held on Monday, March 14, at 8 P.M.

GARDENERS' DEBATING SOCIETIES.

DEVON AND EXETER GARDENERS' TION.—At a meeting held in the Guildhall on February 10, Mr. Sidney Baker, gr. to Sir Dudley Duckworth King. Wear House, read a paper on "Tomato Culture." The lecturer spoke of the various "Tomato Culture." The lecturer spoke of the various uses of this fruit as a salad, a dessert fruit, and a fruit-vegetable for the table. For early varieties, which should be sown in September or October, he recommended the Flying Dutchman and Early Ruby, and that the plants be grown in 8-inch pots or in shallow tubs it they can be plunged. In mixing the compost for use a little rough mortar rubble or charcoal should be added. Pollinate the flowers with a brush made from a rabbit's tail. For main crop he advised sawing in February, growing on and planting coal should be added. Formate the nowers with a brush made from a rabbit's tail. For main crop he advised sowing in February, growing on and planting in the border of a well-lighted house, in rows 3½ to 1ft. apart, the plants being not less than 16 inches from apart, the plants being not less than 16 inches from each other. The border should be shallow and the soil made firm. The plants should be ayringed early in the afternoon, but syringing must be discontinued when the fruits are colouring. A suitable compost when the fruits are colouring. A suitable compost was described, together with manuring and watering. The best kind of house for a main crop is a low span, 12 or 13 feet wide, permitting two rows of plants on each side. Good varieties for cultivation indoors are Perfection, Veitch's Glory, Flying Dutchman, Holme's Supreme, Dobbie's Champion, and Best-of-All. For dessert—Golden Nugget, Golden Queen, and Sunbeam.

- The first annual DORCHESTER GARDENERS'. meeting of this Society was held on February 3, Mr. C. F. Symes presiding. The report showed a steady increase in the membership. Captain Dymond was reappointed President, and Mr. Edward Nutting, Hon. The meetings in future will be held on the last Monday in each month.

ABINGER MUTUAL IMPROVEMENT .- On Monday, February 1, Prof. J. Percival, of Reading College, gave a lecture on the "Principles of Pruning common Fruit trees." The lecturer dealt with the various methods of pruning, and emphasised the importance of always pruning, and emphasised the importance of always cutting the trees with a definite object in view; sometimes in order to obtain new wood, at others to induce the formation of apurs, to start retarded buds, rejuvenating, admitting light, or checking excessive growth. Summer pruning was also dealt with, and root-pruning advocated when necessary.

CROYDON HORTICULTURAL MUTUAL IMPROVE-MENT.—The forthightly meeting was held on February 2. when Mr. W. P. BOUND, Gatton Park Gardens, Reigate, read a paper on "Present-Day Orchid Culture." Mr. BOUND spoke of the generat culture of Orchids. For the potting operations he mentioned the best materials to be used, and recommended the use of pots, but great care must be exercised in watering. The pots, but great care must be exercised in watering. The resting periods of the plants, the temperature of the house, and the ventilation to be maintained were all dealt with. Feeding with artificial manurea was not advisable, but occasional syringing with soot water was

WARGRAVE AND DISTRICT.—The Annual Report of thia Society for 1903 shows a prosperous condition at the end of its aixth year. The Chrysanthemum Show was again a success and enabled a sum of £15 13s. to be forwarded to the Royal Gardeners' Orphan Fund. A number of papers and lectures has been given during the year, Mr. W. H. Scott won the 1st prize for his essay on "Hybridisation," Mr. Fuller winning the prize open to assistant gardeners. The balance in hand is £19.98.4\frac{3}{4}d. out of a total income of £45.28.6\frac{3}{4}d. H. F. Nicholl, Esq., has been elected President for 1904/Mr. G. Stanton, Chairman, and Mr. H. Coleby, Hon. Secretary.

LIVERPOOL HORTICULTURAL, On Saturday. February 13, Mr. F. W. Shrivell, F.L.S., delivered a lecture on "Chemical and other Manures." Mr. Shrivell mentioned the value of nitrogen to the Pea and Beau, and contended that the fallacy that these plants require no uitrogen was gradually being exploded. Peas and Beane grown with nitrogen are sweeter in

flavour and produce larger crops. A series of diagrams demonstrated that the best results were obtained by using a small quantity of farm-yard manure in addition to chemicals, this being especially noticeable in the case of Broccoli, Potatos, &c. The mechanical effect of farm-yard manure was demonstrated, and several formulas given for Chrysanthemums, Vines, Melons, herbaceous borders, &c. J. S.

CHESTER PAXTON.—Mr. Robert Wakefield, Newton Hall Gardens, read a carefully-prepared paper on "Herbaceous Flowers for Home and Exhibition" in the Grosvenor Museum, Chester, on February 6. Mr. Wakefield, who is known in local horticultural circles as an expert in cultivating and exhibiting herbaceous flowers gave the following twelve varieties as heing a as an expert in cultivating and exhibiting herbaceous flowers, gave the following twelve varieties as being a typical collection for exhibition purposea during August and September: –Lilium auratum, Montbretia crocosmiæflora, Helenium pumlium magnificum, Achillea ptarmica fi pl. The Pearl, Chrysanthemum maximum, Scabiosa caucasica, Helianthus Soleil d'Or, Erigeron speciosus superbus, Gaillardia, Gladiolus Tne Bride, Coreopsis grandiflora, and Phlox Avalanche White.

BRISTOL GARDENERS' MUTUAL IMPROVEMENT. BRISTOL GARDENERS' MUTUAL IMPROVEMENT.—A successful meeting of this Association was held at St. John's rooms, on February 11, Mr. E. Poole presiding over a good attendance. The lecture for the evening was upon "Bouquet Making," by Mr. Powell, a representative from the Reading Gardeners' Association. Mr. Powell was practical in his demonstrations. Starting with the foundation of the bouquet, he proceeded to explain the wiring and arranging of the flowers to produce the most pleasing effect. His bouquet was handed to his audience for Inspection, and it proved that he understood his subject well. Sprays it proved that he understood his subject well. Sprays and button holes also received his attention, and the hints given were appreciated.

CROYDON HORTICULTURAL MUTUAL IMPROVE-MENT.—The fourth annual dioner was held at the Greyhound Hotel, Croydon, on Wednesday, loth inst., there being a good attendance. Mr. J. J. Reid, the President of the Society, was in the chair. Mr. C. H. Curtis gave the toast of "The Society." Mr. Boshier, Curtis gave the toast of "The Society." Mr. Boshier, in reply, said it was a pleasure to report that the association had had a most successful year, and was enabled to carry forward a substantial balance to the ensuing season. They had also held a very successful spring exhibition and an essay competition. For the coming session a complete syllabus of papers had been arranged, also two prize essay competitions. In addition to this, the Society had inatituted a gardeners registry, and by its means had been enabled to secure a situation for one of its members.

Obituary.

T. W. WEBLEY .- We have to record the death of Mr. T. W. Webley, of The Uplands, Selly Hill, Birmingham, on the 13th inst. The deceased took great interest in his garden, which is one of the most interesting and best-kept in the neighbourhood of Birmingham. He was attached to several local horticultural and other societies in the Midland metropolis, where he will be much missed. At the meeting of the Birmingham Gardeners' Mutual Improvement Society on the 15th inst., a vote of condolence with Mrs. Webley was passed. The interment took place at the parish church, Selly Oak, on the 17th inst.

WILLIAM COLE .- A once well-known metropolitan gardener, in the person of William Cole, of The Vineyard, Feltham, Middlesex, passed quietly away to rest on Tuesday morning last, at the age of sixty-nine years. Since the death of his wife a year and a half since Mr. Cole had much aged and was broken in health. Thirty years have elapsed since he left Ealing Park, once the home of Mrs. Lawrence, of plant fame, and in Mr. Cole's time occupied by Mr. Budgett, a wealthy merchant. The deceased gardener was not only there for many years, but he made a high reputation as a plantsman, Grape-grower, and general worker. He was a keen competitor at exhibitions in and around London, and his exhibits were always hard to beat. When he left Ealing for Feltham he commenced Grapegrowing, cultivating Muscat of Alexandria remarkably well; and that variety still remained his favourite one up to the last. He was greatly esteemed and respected by all who knew him. His services as a show judge were often in request.

MARKETS.

COVENT GARDEN, February 17.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who are responsible for the quota-tions. It must be remembered that these quotaday, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only trom day to day but offer several times. from day to day, but often several times in one

FLOWER MARKET.

Many of the early winter flowers are uow disappearing, and spring flowers are taking their places. Chrysanthemums are only seen on a few stands, but there are yet seme good bleoms coming in. Bright-coloured flowers are searce. Red Tulips make a higher price than Fullips of any ether colour; and though there are now some red Roses, they are very choice, and make high prices. Anyone who could send in a good supply of such Roses as Mr. G. Meunt exhibited at the Drill Hall, Westmiuster, on the 9th just would be supplying a great want, and would get a good return for his labours. All white flowers are very plentiful; it would seem that in looking after whites the brighter colours have been neglected, and though there will always be a greater demand for white flowers than for any ethers, we must have some cheerful Many of the early winter flowers are now disappearthere will always be a greater demand for white howers than for any ethers, we must have some cheerful colours. The Daffodils, which are now coming in in such quantities, afford plenty of yellow. The searlet Anemones (Anemone fulgens) are not yet plentiful, but they will presently be very useful. White Azslea is over plentiful, but we see very little coloured Azalea in cut blooms. Among

POT PLANTS

Azalea Madame Van der Cruyssen is plentiful, but this Azalea Madame Van der Cruyssen is plentiful, but this is not quite the shade of red that is appreciated, though it is a very useful Azalea. The pink Oswald de Kerchove is a fine pink, and I believe it would pay to grow for cut flowers. Good English Carnations continue to be scarce, but should we get a little sunny weather the supply will soon be considerably augmented. Double scarlet Pelargonium (Geranium) is not so plentiful as it was a few years ago, but a little bright weather may also see a considerable increase in the supply of this. Lilium laneifolium rubrum is very good: L. longiforum is not very plentiful but the supply good; L. longifiorum is not very plentiful, but the supply of Callas is well maintained, and the price for these is now at its lowest ebb. Cinerarias are good, and continue to sell well. Good Primulas are now rarely seen in the market; they are not so much in demand, perhaps, as they were a few years ago, but well-finished plants would sell in limited quantities. Erica Wil-mereana is new coming in, but it is not quite so well flowered as usual. Just now the market does not present a very busy appearance, many of the stands remaining empty, and there is much waste or stale stuff to be seen on some stands. $A.\ H.$

FRUITS AND VEGETABLES.

FRUITS AND VEGETABLES.
GLASOOV, February 17.—The following srethe averages of the prices during the past week:—Apples, Maine (U.S.), 15s. to 24s. per barrel; Californian Newtown Pippin, 8s. 6d. to 10s. per box; Canadian, 16s. to 28s. per barrel, and 8s. to 12s. per box; Oranges, Valencia, 420's, 7s. to 10s. per ease; large, 11s. to 15s.; 714's, 7s. 6d. to 10s. 6d.; Lemons, 5s. to 10s. per box, and 11s. to 18s. per case; Pears, 10s. to 12s. per box; Grapes, home, 1s. to 2s. per lb.; do., Almeria, 8s. to 20s. per barrel; Tomatos, 9d. per lb.; do., Teneriffe, 3s. to 8s. per box; Mushrooms, 1s. 3d. to 1s. 6d. per, 1b.; Onions, Valencia, 6s. 6d. to 8s. 6d. per ease.

Liverpoot, February 17.—Wholesale Vegetable Market

to 8s. 6d. per ease.

LIVERPOOL, February 17.—Wholesale Vegetable Market (North Hay).—The following are the average of the current prices during the past week—prices varying according to supply:—Potatos, per cwt., Main Crop, 4s. 6d. to 5s.; Up-to-Date, 4s. to 4s. 6d.; Bruce, 4s. 3d. to 4s. 9d.; British Queen 4s. to 4s. 6d.; Turnips, 6d. to 8d. per dozen hunches; Swedes, 1s. 3d. to 1s. 4d. per cwt.; Carrots, 3s. 6d. to 4s. do.; Parsley, 8d. to 10d. per dozen bunches; Onions, foreign, 4s. 6d. to 5s. per bag; Cauliflowers, 2s. to 3s. 6d. per dozen; Cabbages, 6d. to 10d. du.; Celery, 9d. to 1s. 6d. do.—St. Johns: Potatos, 10d. to 1s. per peek; Cucumbers, 4d. to 5d. each; Grapes, English, 1s. 6d. to 2s. 6d. per 1b.; do., foreign, 8d. to 10d. do.; Plnes, foreign, 4s. to 6s. each.—Birkenhead: Potatos, 1s 2d. to 1s. 4d. per peek; Cob-nuts, 8d. to 10d. per 1b.; Grapes, English, 2s. to 4s. do.; do., foreign, 6d. to 8d. do.; Tomatos, foreign, 6d. to 8d. do.; Mushrooms, French, 1s. to 1s. 4d. do.

SEEDS.

LONDON, February 16.—We have to report only a moderate enquiry for agricultural seeds. Prices of Red Clover continues firm, and owing to a good demand on the Continent stocks are becoming depleted. The few samples of English Clover being marketed show very poor quality. White Clover and Alsike unchanged in value. Rye-grasses steady. Hurst & Son, 153, Hounds-Jach.

CORN.

AVERAGE PRICES of British Cora (per imperial qr.), for the week ending February 13, 1904, and for the corresponding period of 1903, together with the difference in the quotations. These figures are based on the Official Weekly Return:—

THE WEATHER.

GENERAL OBSERVATIONS.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending Feb. 13, is furnished from the Meteorological Office :-

"The weather was again rough, wet, and unsettled over "The weather was again rough, wer, and missessed or the whole kipgdom, the rain being heaviest and most frequent in the south and southwest. A thunderstorm was experienced at Soilly on Monday and at several Irish and English stations towards the close of the week while in others lightning singly was observed.

while in others lightuing singly was observed.

"The temperature varied considerably in the different districts; in Scotland, England, N.W., and over Ireland it was below the mean, and in England, N.E., just equal to it, while in all other English districts it was above the normal. The highest of the maxima, and also the lowest of the minima, were with few exceptions recorded during the latter half of the period. The former varied from 52° in many western and southern localities to 46° in Scotland, N., and the latter from 11° n Scotland, E. (at Brsemar), 22° in Scotland, N., and 3° and 24° respectively in Scotland W., and Ireland, N., to 31° in England, S., and 34° in the Channel Isles.

"The rainfall exceeded the mean in all parts of the

"The rainfall exceeded the mean in all parts of the kingdom. In Scotland and the north-east of England. the excess was small, but over the major portion of Eogland the fall was three times the normal amount.

"The bright sunshine in England, N.E., where the per-centage of the possible was 23, the mean duration was just equalled; but in all other districts there was a deficiency. In Scotland, N., the percentage was only u, and in Ireland, N., no more than 8.

THE WEATHER IN WEST HERTS.

THE TRIED WEEK OF INCESSANT RAIN.-This was on the whole a warm week, and on no night did the thermometer exposed on the lawn show more than 8° of frost. The ground is at the present time at about a seasonable temperature, both at 1 and 2 feet deep. During the three weeks ending Feb. 14, more than 5 inches of rain fell, or \frac{1}{2} inch more than the average rainfall for January and February put together. This heavy fall is equivalent to 24 gallens of rain-water on each square yard of surface in this district. The percolation gauges, as may be imagined, have been very busy during this wet period, in fact, the whole of the; 24 gallens of rain-water has come through that on which there is no vegetation, and 22 gallons through the gauge on which short grass is growing. The sun shone on an average during the week for only threequarters of an hour a day, or for l_2^1 hour a day less than is usual in February. The winds were often very strong, and eame mostly from some southerly or westerly point—at no time, however, did the mean velocity for any hour exceed twenty miles. The mean amount of humidity in the air at 3 o'clock in the afternoon exceeded the average for the month at that hour by about 6 per cent. E. M., Berkhamsted, Feb. 16, 1904.

ENQUIRY.

CULTURE of Sunflower for seeds and of Chervil on a large scale for market purposes; information is required on these subjects. Can any reader oblige ? X.

*** EDITOR AND PUBLISHER.—Our Correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all communications relating to financial matters and to advertisements should be addressed to the Publisher; and that all communications intended for publication, or referring to the Literary department, and all plants to be named, should be directed to the Editor. The two departments, Publishing and Editorial, are quite distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Austrian Briar Roses: Dendrologist. The Austrian Briars, varieties of Rosea lutea, require very little pruning. Keep the branches thinned sufficiently for the air to circulate through the bushes, and do not stop the remaining shoots much, because the flowers are produced from the middle or upper end of these shoots. You may clear the stem for a foot from the ground if you choose, but there is no necessity to clear it for a greater length, provided you thin the branches.

Books: C. G. D. A pamphlet on the Gooseberry and Currant, by D. T. Fish, was published by L. Upcott Gill, Drury Lane, London, W.C., in 1882, price 1s., but we are unable to say if it is now obtainable. It contained a comprehensive list of varieties, also their history, cultivation, and descriptions of diseases that attack them.—G. S. L. We know of no book dealing specially with the subjects you mention.

CANADIAN GARDENING PAPER: Correspondent.
The Canadian Horticulturist, published monthly
by the Ontario Fruit Growers Association,
Toronto, Ontario. Price 10 cents monthly, or
1 dollar per annum. This subscription also
entitles the subscriber, if living in Canada, to
membership of the Fruit Growers Association
of Ontario, and all its privileges, including the
receipt of a copy of its Annual Report.

CHERVIL: S. A. M. Seeds of this can easily be procured from any seedsman. It is grown to flavour soups and for similar purposes, but we never heard of its being grown for medicinal use. All the Umbelliferæ have more or less medicinal properties, and some, like Hemlock, are very poisonous. So far as we know Chervil is harmless and agreeable.

CLEMATIS GRAFTS: Novice. The grafts were properly made, but the scions were probably taken from plants stricken with the fatal Clematis disease; at any rate, the grafts had all the superficial appearance of that disease.

COKE FOR HEATING GLASSHOUSES: Fuel. You ask what would be the quantity of gas-coke required to heat for ten daye 460 feet of 4-inch hot-water piping, attached to a saddle boiler, 320 feet of this piping being in two separate houses, in which a minimum temperature of 60° and 64° respectively is aimed at; and 140 feet of 4-inch piping, attached to the same boiler, in which hot-water is only turned on at night when it is likely to be cold—a circumstance which would only necessitate the burning of a few extra shovelfuls of coke at night; also a fourth house, with a separate boiler and 150 ft. of 4-in. piping attached thereto, to maintain a night temperature of 50°. You do not supply dimensions of the saddle boilers, we will therefore assume that the one to heat 460 feet of 4-inch piping is a plain saddle, 42 inches long, 16 inches wide, and 16 inches deep, with a 2-inch waterway, and having an actual heating power of 560 feet of 4-inch piping; and we conclude that the smaller boiler, to heat 150 feet of 4-inch piping, is 21 inches long, 12 inches wide, and 12 inches deep, with a 2-inch waterway, and an actual heating power of 210 feet of 4-inch piping. With boilers of the above dimensions, properly

stoked—that is, the flues being kept clean, and due regard paid to the matter of consuming as little coke as possible, consistent with raising and maintaining the desired temperature in each house, and never putting a shovelful of coke on the fire when a like quantity of ashes would answer the same purpose, especially in the morning, when weather conditions are likely to raise the temperature to the desired degree—we conclude that about 1\frac{3}{3} chaldron of coke would suffice to maintain the above-mentioned temperatures for ten days of such weather as we have experienced during the first ten days of this month. We may add that very much will depend upon the type of boiler you use, and upon the man who is charged with the important duty of stoking.

COVENT GARDEN SALESMAN: Doubtful. The name you mention is that of a very respectable and old-established salesman. We regret that we have not space to print a list of the salesmen. Consult our advertising columns.

CROP FOR LAND: W. O. J. You can hardly do better than make Potatos the first crop. Suitable chemical manures would be, per acre, 1 cwt. of sulphate of ammonia, 1 cwt. muriate of potash, and 5 cwt. superphosphate.

CROQUET GROUND: J. P. F. A croquet ground should not be less than 30 yards long by 20 yards wide. A full-sized ground is 40 yards long by 30 yards wide.

Gardener and Foreman: Reader. In the absence of an agreement, the gardener would have to give a month's notice, and the foreman a week's notice.

INSECTS AMONG ROOTS OF CURRANT-BUSHES:

G. R. The gruba you send are weevils. They have nothing to do with the Currant-bud mite. You cannot do better than burn the old stock you are now grubbing up, and plant healthy young bushes—if possible, on another site in the garden. Scrape together the old soil containing these pests and burn it.

INSECTS INFESTING ROOTS: G. A. H. We can find no trace of insects among the roots of the Chlorophytum plant, which appear to be in a very healthy condition. Collect some of the insects and forward them to us in a small box.

Names of Fruits: J. S. We do not recognise the variety of Apple, but from its appearance surmise that it was imported from Nova Scotia. The variety may not be one common in this country. Queer questions are addressed to us sometimes, but fortunately we are not often called upon to identify a variety of Apple, and to state at the same time in what country it was grown.

Names of Plants: Correspondents not answered in this issue are requested to be so good as to consult the following number. — A. H. Ornithogalum lacteum.—W. E. W. We cannot name the variety of Chrysanthemum from the flower sent.—Germania. 1, Centradenia rosea; 2, Coprosma Baueriana variegata; 3, Alonsoa incisa; 4, Peperomia Verschaffelti; 5, Lomaria gibba; 6, Pilea muscosa.—V. M. 1, Oncidium olivaceum; 2, O. sphacelatum; 3, O. flexuosum; 4, O. Wentworthianum.—M. L. Cymbidium Tracyanum of good quality.—Robinson. Dendrobium nobile nobilius, very well coloured.—Z. Q. 1, Cypripedium × nitens; 2, C. × Dibdin; 3, C. Haynaldianum; 4, Oncidium Cavendishianum.—W. N. Chimonanthus fragrans.—Surtus. 1, Cyperus alternifolius; 2, Myttus communis, small - leaved variety; 3, Ruellia Portellæ; 4, Clivia miniata; 5, Primula verticillata simensis; 6, Pinus sylvestris.—R. C. Iris fimbriata; Aspidium coriaceum, Zygopetalum Mackaii.—J. M. 1, Begonia hydrocotylifolia; 2, Sempervivum tortuosum variegatum; 3. Chlorophytum Sternbergianum; 4, Asplenium biforme; 5, Polystichum angulare proliferum; 6, Phillyroa angustifolia.—A Reader. 1, Dendrobium speciosum; 2, possibly Ornithogalum longi-bracteatum. Send in flower.—C. G. D. We cannot recognise the plant from the leaves sent. Send when in flower.—J. M., Notts. 1 and 2, Cœlogyne cristata; 3, Dendrobium aureum (syn. D. heterocarpuu.

Notice to Terminate Employment: A. T. M. You are entitled to a month's notice, but we think the notice might take effect from the day mentioned.

PELARGONIUMS: H. W. This is an example of reversion, the dwarf plant having sported to its original stronger-growing form. Such reversions frequently occur, and unless the one you send possesses features of special merit, it would not be worth the trouble and expense of propagation and distribution.

PLANTS FOR DISPOSAL: W. J. M. The plant is Billbergia nutans. There would be scarcely any demand for the species, and the return would hardly pay the expenses of advertising, &c.

"Shot hole Fungus." B. H. The best preventive against this fungus (Cercospora circumiscissa) is the ammoniacal solution of copper carbonate, it being unsafe to use the Bordeaux-mixture upon the Peach-leaves or young shoots. The foliage should be sprayed with the ammoniacal solution when the leaves are expanding, and it is necessary to repeat the operation several times at intervals. The method of preparing the solution is as follows: Mix 1 oz. of carbonate of copper and 5 ozs. of carbonate of ammonia together, and dissolve them in about a quart of hot water, and when thoroughly dissolved add 16 gallons of cold water. Remember you are bandling a powerful poison.

SUNFLOWER: Correspondent. Grown for the sake of its "seeds," which furnish oil, and are used for feeding purposes. Six pounds of seed are aaid to be required per acre, the average yield per acre being 50 bushels. The seed is sown in drills 18 inches apart, and the plants afterwards thinned out. It requires deep, rich soil, and if calcareous all the better. The small-seeded varieties are most esteemed for the quality of the oil. The land should be deeply ploughed in autumn and harrowed in spring. See R. C. Haldane, Sub-tropical Cultivations (Blackwood & Sons).

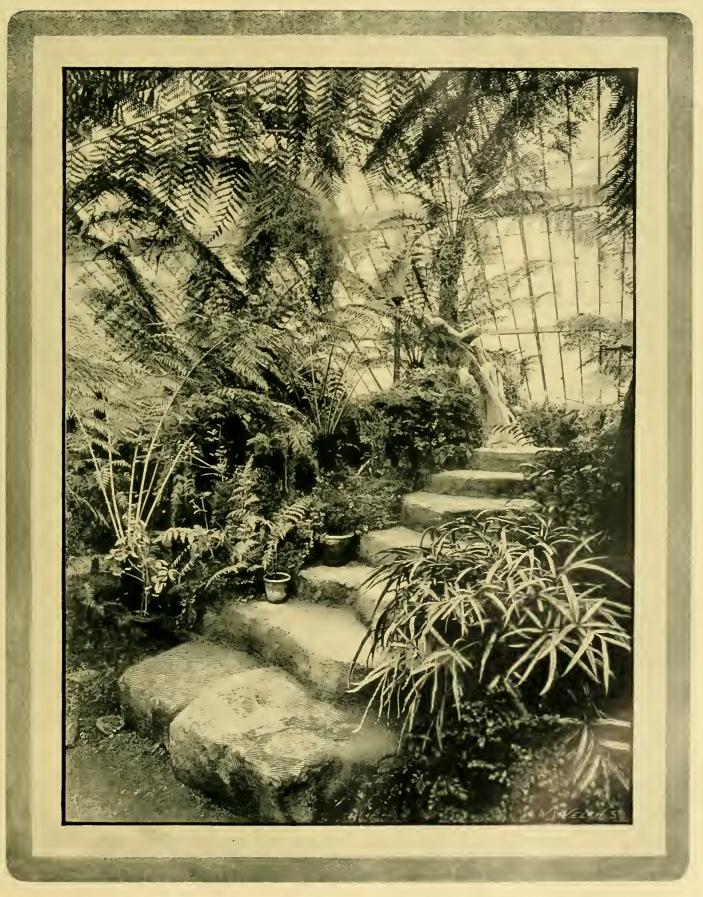

TOMATO STEMS: R. & Co. Some fungus is present in the root and lower portion of the stem, but in too immature a condition to identify with certainty. Water at intervals with a solution of nitrate of potash, and do not keep the atmosphere too humid.

Tomatos: S. P. Your seedling Tomatos appear to be affected with the "Damping-off" fungus (Pythium de Baryanum). The sample of soil sent is a good one, and should suit them. There must be a fault in the conditions under which you have been growing them. Do not keep the seedlings too damp at the roots or in too close an atmosphere, but afford them fresh air. Sow your seeds thinly. When the seedlings become large enough to move from the seed-pan, pot them singly into well-drained pots of small size in a light porous compost, or prick them off into pans or small boxes. Place them near to the glass in an atmosphere heated to about 65° to 70°. Repot them again when they require more rooting space.

Tubs for Containing Plants: G. S. We should not be disposed to tar the wood on the inside of these. Properly seasoned Oak or Teak will last a very long time, but if thought necessary, such tubs might be creosoted. If the tubs- be made with detachable sides, like those in use in the Temperate-house, Royal Gardens, Kew, it will be a convenience when the plants require to be moved into larger ones.

Tulifs: Case Bros. The bulbs are attacked by Botrytis, which are forming numerous sclerotia. Mix powdered sulphur into the soil, and water twice a week with a weak solution of Condy's Fluid. If the bulbs had been mixed with powdered sulphur before storing, the disease would not have appeared.

JAPANESE VEGETABLE PRODUCTS AND THE WAR.

NOW that hostilities are actually proceeding between Russia and Japan. our thoughts naturally turn to the consideration as to how far our commercial relations with both countries will be affected. Our imports from Russia are of such a nature that they could be largely compensated for by increased imports from our own celonies, without, perhaps, drawing from foreign countries at all. But commercial traffic does not stand in the same light with Japan; there are certain products of that country that are scarcely, if at all, obtainable from other sources, and many will suggest themselves to our readers as items of special interest to the gardening craft, as Liliums, Irises, Fern-balls, pigmy Conifers, and suchlike, which, however, are of small commercial importance when compared with such vegetable products as camphor, menthol, peppermint-oil, vegetable wax, ginger, &c.

Then, again, there are the numerous and very varied productions of Japanese art and mechanism that have been poured into this country in such large quantities of late years, and have, to use an expressive term, "taken on" with us, particularly the often

beautiful though modern lacquer ware, which again is derived from the vegetable kingdom. A certain amount of unrest has prevailed in the English markets dealing with Japanese products for some weeks past, notably with camphor and menthol, for both of which the world practically depends upon Japan. With regard to the first, although camphor is obtained from several plants belonging to widely distinct natural orders, such as Barus, Sumatra, or Borneo, camphor from Dryobalanops aromatica of the natural order Dipterocarpeæ, Blumea, or Ngai camphor of China, from Blumea balsamifera, natural order Composite, and others, yet the source of commercial camphor is Cinnamomum camphora, a tallgrowing tree of the order Lauraceae, native of China, Japan, and the Malay islands.

In the interior of the island of Formosa, as well as in Japan and throughout Central China, the tree is very plentiful. In Japan the manufacture of camphor is a Government monopoly, and the stringent regulations and methods adopted by the Government when taking over the industry have, no doubt, been the cause of the short supplies in the markets at the present time, as the making of it being so unremunerative to the people, small quantities only have been produced for some considerable time past. The natives of Formosa are also said to have given much trouble to the Government by their frequent attacks on the stills. The result of all this has been the holding back of supplies of crude camphor, so that European refiners for a long time have had little more than their old stocks to work upon; consequently prices have been advancing, and the quotations have already increased from about 2s. 6d. to 4s. per pound.

To obtain the substance it is necessary to cut the trees down and then further to cut up the wood into chips, which are boiled in vessels containing water; over these vessels are placed inverted earthenware pots, which are sometimes lined with straw. The steam arising from the water in the pots carries with it the camphor, which is deposited in crystals around the inside of the pots or on the straw, and is afterwards scraped off and placed in chests lined with lead or tinned iron. Formosa camphor is usually packed in this way, and is generally in a semiliquid state from having some water mixed with it for the purpose, it is said, of preventing evaporation. Japan camphor, which is dry, and of a much better quality, is placed in double tubs, also for the purpose of preventing evaporation.

Upon arrival in Europe this crude camphor finds its way into the hands of the refiners. The European process of refining, it is said, was long kept a secret, and towards the end of the seventeenth century the whole of the camphor brought to Europe was sent to Holland for sublimation. A similar monopoly also existed in Venice for some time. Camphor refining is still carried on in Holland, but it has spread into other countries and towns, as England, Hamburg, Paris, New York, and Philadelphia. The following is a brief description of the process of sublimation, which however varies slightly in different refineries.

The camphor, as imported, is broken up and mixed with from 3 to 5 per cent. of slaked lime, and 1 to 2 per cent. of iron filings. When sifted this mixture is passed through a funnel into a series of glass flasks, which are almost completely buried in a sand-bath. Instead of heating these by means of a fire, where flame might ignite the gas given off during the process of sublimation, dishes of fusible metal kept warm by a furnace

below the room are used. In these flasks the camphor is kept at a high temperature for twenty-four hours. When thoroughly melted the sand is removed from the upper half of the flasks, and into the neck of each some paper is pushed. A lower temperature is thus produced. and the vapour from the camphor condenses on the inside of the exposed half of the flask, forming a solid cake of pure camphor and leaving all impurities at the bottom. Care has to be taken not to admit the air too freely, as the camphor would be rendered opaque. The entire process occupies about forty-eight hours, and is completed by removing the flasks from the sand and sprinkling them with cold water; the glasses being thus broken, the refined camphor, in the form of a large bell-shaped cake, is removed. Each of these bells or cakes is about 3 inches thick and 10 to 12 inches across, and weighs from 9 to 12 lb.

The whole process of refining is one that requires much attention and care, more particularly with regard to its very inflammable nature. Every precaution is taken in the refining-house against fire. Over the furnaces upon which the sand-bath is spread, and into which the flasks are plunged, are arranged iron trays full of sand, which by touching a lever could be made to discharge their contents over the heated camphor below, should any of the flasks catch fire. Besides this there are plenty of means of exit in case of need.

It is said that the use of camphor as a disinfectant has much decreased of late years-a fact that can be fully accounted for from the numerous other disinfectants that are constantly being introduced, and that are, moreover, cheaper; but another market for camphor that is continually being extended is that for the many articles to which celluloid is now applied. It is estimated that ten times as much camphor is now used for this purpose than is consumed by the druggists The consumption of the article in the United States is said to amount to 200,000 lb. a month, a very large proportion of which is used in the celluloid and patent medicine trades; further than this, it is said that as the Japanese Government look upon camphor as a valuable war asset. they are keeping back its export, more particularly as if the war is prolonged they will require all their supplies for the manufacture of smokeless gunpowder. As a proof of the money value to Japan the export of this article represents it may be said that for the ten months of last year ending in October, the quantity sent out of Japan amounted to 3,710,874 kin, of the value of 3,254,000 yen, a kin equalling 1.3 lb. avoirdupois, and a yen equalling 2s. 01d.

The following note on the use of camphor for assisting the germination of seeds and the growth of cuttings may be of some interest. It is taken from the Dictionary of the Economic Products of India. "Mr. T. W. Lee, writing in the Journal of Agriculture, says that most seeds are greatly hastened in their germination by being soaked, previous to sowing, in soft water, to a pint of which a lump of camphor about the size of a large nut has been added. Mr. Lee tried this experiment on many vegetable seeds, such as Peas, Beans, &c., as well as Palms, Castor-oil seeds, and various other tropical seeds, which have very hard seed coats, many of which would require soaking in water for a long time before they would otherwise show signs of germination but which with the addition of camphor sprout easily and rapidly. This same fact may be take advantage of in stimulating cuttings of Roses or other plants sent from one country to another. Rose cuttings, for example, posted in England, carry safely to India, and the stimulation caused by dipping their freshly-cut ends in camphor water, helps greatly to enable them to take root when placed in the soil." Before leaving the subject of camphor, it may be well to mention the fact that about a year ago a process was devised in America by which camphor could be made synthetically from turpentine, and though no sample has set been seen in the London market it is now stated that the company are now preparing at their New York works, machinery for producing 2,000,000 lb. per annum.

MENTHOL.

Menthol, or peppermint camphor as it is sometimes called, has become so well known as an ant'-

known in the market as Kobayashi crystals. Up to the actual commencement of hostilities, this quality menthol had been selling in the market at 16,6 to 16/9 per lb. It has since risen to 17/6, and will probably command much higher prices. The oil, after the separation from it of the menthol, is also an article of export from Japan.

VEGETABLE-WAX.

Of vegetable wax it will suffice to say that this substance is produced from the small seed-like

FIG. 53.—AN EQUATORIAL AFRICAN GARDEN: NATURAL FERNERY IN A RAVINE WHICH IS A FAVOURITE HAUNT OF LEOPARDS.

septic, stimulant, and carminative, as well as for outward application in neuralgia and toothache, that any failure or shortness of supply will be a matter of considerable importance. The substance began to attract attention in this country in 1879, and since then it has become an increasing article of trade. It is a crystalline substance resembling ordinary campher, and is obtained by cooling the volatile oil from the fresh herb of Mentha arvensis var. piperascens and var. glabrata. The best quality menthol is that brought from Japan, and

fruits of Rhus succedance and R. vernicifera. The wax being deposited immediately under the thin skin which covers the fruits is easily separated by boiling them in water, the wax floating on the water in the process of cooling. It is used in candle-making. Japan Ginger, though not equal in quality or value to that from Cochin or Jamaica, may in course of time, should peace be quickly restored, become of importance. John R. Jackson, Claremont, Lympstone, Devon, February 18, 1904

OBSERVATIONS ON THE VEGETA-TION IN AN EQUATORIAL AFRICAN GARDEN.

(Continued from page 113.)

In open well-drained positions in the forest, and frequently on islands in the lake, an excellent flowering shrub, Cassia didymobotrya, is found. It forms a deuse mass of pleasant green foliage and freely produces its long, upright, terminal twin spikes of large yellow flowers. Fully developed specimens are about fifteen feet high, and small plants grouped quickly form effective masses. It was utilised successfully as a shade for young Cacao, for which its rapid growth fitted it.

Clothing the ground beneath the Palms one often finds a striking garden plant from the foliage point of view. I refer to Palisota Schweinfurthii. Palisota is a very distinct genus of Commelinaceæ, an order which furnishes many beautiful decorative plants for our gardens. Palisota Barteri, from W. Africa, was introduced to European het-houses long ago. P. Schweinfurthii has handsome shining deep-green leaves, somewhat wavy, about 2 feet in length and 10 inches wide; in habit the plant is vasiform. The dense cylindric spike of flowers is not showy, but when the fruiting stage arrives the crowded scarlet or orange coloured berry-like fruits are effective. Even in the densest shade the plant possesses a sturdy, healthy, evergreen habit. If it can be used in our sub-tropical gardening out-doors, as I am inclined to think it could in an average warm summer, it would be a distinct addition. Other useful garden plants, native in the ferest region, were Costus Afer, forming clumps, with stems nearly 10 feet high, clothed with dark-green leaves, spirally arranged in the peculiar way Costus affects, and terminated by a globose spike with closely folded bracts, from amongst which there seems to be always developing two or three beautiful, though fugitive, flowers with a narrow pink margin to the lip. Impatiens bicolor, about 4 feet high, with handsome foliage displaying a satiny sheen, and abundance of very dark-red flewers (having a pouch instead of the familiar broad lip of other species), was a quite common and useful garden plant. Where the shade was light and the soil somewhat sandy and well-drained, I found small groups or solitary plants of Hæmanthus (probably H. multiflorus). As may be imagined the umbels of bright scarlet flowers springing up amongst lowgrowing vegetation were more effective than one usually sees Hamanthi under glass. If a summerflowering species of hright colour could be obtained by the hybridists, it would be a charming out-door plant for our gardens.

A distinct and effective foliage plant is furnished by Scleria racemosa, a member of the natural order Cyperaceæ. It forms strong clumps, and is from 4 to 6 feet in height. The handsome arching leaves are arranged on the stem as though they were perfoliate, and the nodding plumes of fruit are extremely graceful. It abounds in damp sandy soil, and in some cases is an obnoxious weed.

Stemless Ferns, such as Davallias, Aspidiums, &c., luxuriate in moist places beneath the Palms, and form charming groups. It only requires to have other low-growing vegetation kept in check for a little and the Ferns menopelise the ground advantageously.

A large Dracæna is very common all over Central Africa up to 4,000 feet altitude. It is probably D. arborea. It has 'glossy, green, flexible, pointed leaves, and becomes with age a huge tree, with a gouty-looking, shapeless trunk, like the celebrated "dragon tree" of Teneriffe. Large tops, 3 feet or 4 feet long, put in as cuttings, where they were intended to remain, made useful garden plants. A species less graceful in its foliage than the above and

belonging to a different section in the genus is D. ugandensis, but it has drooping spikes of pretty, pale purple flowers. It is extensively used for fencing. It grows alongside Palisota. A Gloriosa (probably G. viresceus) is frequently scen, and invariably in moist shady places. Its graceful foliage and delicate tendrils are striking and distinct, but its showy red-and-yellow flowers render it additionally attractive. M.

(To be continued.)

ODONTOGLOSSUM PESCATOREI.

A REMARK passed by my employer recently, to the effect that he could not understand why Odontoglossum Pescatorei was not more extensively cultivated, has probably been made by many lovers of Orchids who appreciate the refinement possessed by the varieties of this beautiful species. When this species is grown in a satisfactory manner even the least handsome varieties are attractive, carrying as they sometimes do racemes of from fifty to a hundred blooms, and at a season of the year when cool-house Orchids are hut sparingly represented in flower.

It may seem strange that one having charge of perhaps the most remarkable collection of Odontoglossum crispum ever brought together should draw attention to such a despised subject as O. Pescatorei. If I were not convinced that Orchid cultivation is annually drawing into marrower limits, I would not attempt to divert attention from any of the more fashionably cultivated kinds.

I have seen many changes of fashion in Orchid culture in my all too short career among them. I can look back to a time when the Vandas, Aërides, and Saccolabiums of the East were as highly appreciated as the Cattleyas and Odontoglossum crispums of the present day. The Phalæ. mopsis of a few years later-what but the tide of fashion has discarded even representatives of these heautiful species of plants from the Orchid collections of to-day? As the glow of hrilliant "stars" from the East have faded from our houses, even so with the Masdevallias and other botanically interesting subjects of the Western world, which are discarded for the more gaudy subjects that satisfy the prevailing fashion. It is as difficult to find the hat that will cover the head of a fashionable Orchid-grower and of a true lover of Orchids who is actuated solely by the interest in his plants, as it is to combine the scientific botanist in the practical gardener.

O. Pescatorei has not of late years been imported in large quantities, for the reason that importers cannot get sufficient financial return for the plants, and they are at the present time by no means over plentiful. There is not the wide variation among them that is found to exist in O. crispum, but occasional varieties crop up which are as valuable as the hest of the lastnamed species. O. P. Veitchianum, which forms the centre flower in the accompanying illustration, was described by Professor Reichenbach in the Gardeners' Chronicle, vol. xvii., 1882, p. 588. The plant passed into the collection of Baron Sir H. Schröder. Nothing approaching the violet colour of the blotches represented in the central area of the flower has since appeared. It is deserving of all the appreciation its owner and the Orchid specialists afford it. O. P. Schröderianum in the lower left-hand corner, and O. P. Lindeni above it in the illustration; O. P. Charlesworthii, which received a First-class Certificate at the Temple Show of 1902—all have particular violet markings. One remarkable subject appeared some years ago, and was later certificated, from the collection of Sir. T. Lawrence, Bart., in O. P. "Prince of Orange," the golden-yellow ground and brown spotting making

it one of the most attractive among the section. Although not recognised at the time, this variety may prove to be of hybrid origin.

The other two flowers in the illustration include one that is pure white with the exception of the yellow disc on the centre of the labellum, and one of the typical varieties. Perhaps the largest and best variety of the type I have seen was that exhibited at one of the Drill Hall meetings a year or two past by Mr. Wilson Potter, of Croydon. But the quality of the flowers is affected by cultivation.

O. Pescatorei with us is one of the most easilygrown species of any in the cool Orchid-house, and the treatment afforded is in every respect similar to that afforded O. crispum. We never permit

FOREIGN CORRESPONDENCE.

TRICYRTIS HIRTA.

The notes on Tricyrtis hirta in the Gardeners' Chronicle for January 16, p. 45, were very interesting to me, as this beautiful plant does well here without very much trouble. All it asks of us is to give it a semi-shaded place to protect it from the hurning rays of our summer sun. If planted out in the open the fierce light first burns the ends of the leaves and ultimately the stem, till hy the end of August the whole plant is almost ruined. It will, however, even then send up shoots from the base, and attempt to flower; and should we have a prolonged 'fall,'

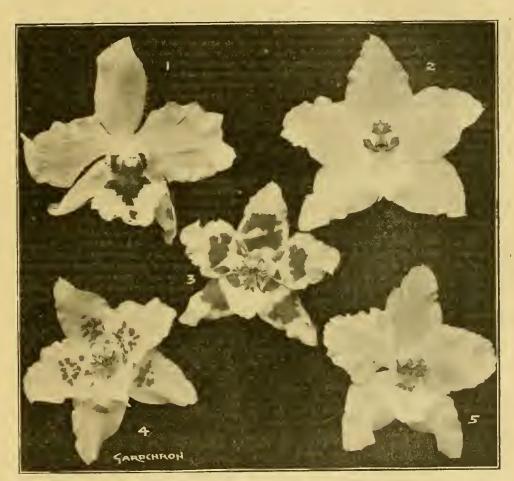

FIG. 54.—VARIETIES OF ODONTOGLOSSUM PESCATOREI.

1, O. P. Lindeni: 3, O. P. Veitchlanum; 4, O. P. Schröderlanum; 2 and 5 are unnamed varieties.

the temperature to fall below 50°, except in very severe weather. The mean is as near 55° as we can possibly keep it. Potting is done when new roots are being produced from the base of the newly-developing pseudo-hulb. The compost consists of fibrous peat, chopped living sphagnum-moss, and leaf-soil in equal proportions, with sufficient rough sand added to render the compost porous. The material is pressed firm, and the surface is made with a layer of chopped living sphagnummoss. We have found remarkable vigour in our plants since leaf-soil has been extensively included in the potting compost. Not only is the growth vigorous, but the flower-scapes have been all that could be wished, and the individual flowers finer in substance and in form.

If there is one Odontoglossum more than another deserving of the attention of amateurs, it is Odontoglossum Pescatorei. H. J. C.

it will do so bravely. But planted where the sun will not strike it till towards evening the result is very gratifying. If not disturbed for two or three years it then grows 4 to 5 feet high, and produces from thirty to forty of its quaint hut prettily spotted flowers on each stem from the summit and axils of the leaves, during the latter part of September and October, for four weeks, or even longer, if there is cool, clear weather; I have known them to last into November. It is not at all fastidious with us as to soil, growing equally well in sandy and moderately heavy but well-drained soils. I have never had occasion to use any peat, and the plant has been left unprotected during the winter months when our thermometer has shown a temperature of 3° below zero (Fahrenheit), but has received no injury. I have found it to give most satisfaction when closely divided

each year to single crowns or from autumnstruck cuttings, which give the same results. These I plant as early in the season as is possible about 6 inches apart each way in a solid bed; they then grow about a foot high, and for four weeks or more in the "fall" are a beautiful sight, being one complete mass of pretty spotted white-and-purple flowers. I have had as many as twenty-three fully-developed flowers on a single stem at one time from plants thus grown. Another advantage in keeping them dwarf in this way is that they can, if necessary, be easily protected from early frosts, and thus massed in a solid bed are much more effective than a few isolated plants would be. Cuttings of the growing tips taken in the "fall" root very readily if inserted in sand and placed in a cold frame in a box or pan. Propagated in this manner, I never care to risk them during the first winter without protection. The tops will die down at the approach of severe frosts to the newly-made callus, from which springs an eye for next summer's growth.

We have also a variegated variety imported as Tricyrtis macropoda variegata. The flowers are not very conspicuous; perhaps this is on account of its not being so happy as the one previously mentioned. This variety flowered in May, and produced large inflated pods, and afterwards purplish black fruits. Towards autumn the foliage is prettily striped with white, so I should judge, from the Dictionary of Gardening (Nichol-

son's), it is T. macropoda striata.

I hope these notes may be of interest to readers of the Gardeners' Chronicle, some of whom I claim as acquaintances through reading their numerous notes on hardy plants. Herbert Greensmith, Riverton, N.J., U.S.A.

ORCHID NOTES AND GLEANINGS.

HYBRID SPIRANTHES.

Ma. Oakes Ames describes in Rhodora for November, 1903, a natural hybrid between S. gracilis and S. præcox. The plant is described as completely intermediate in its characters between the two parents.

ONCIDIUM SPLENDIDUM AND O. MICROCHILUM.

The allusion to Epidendrum nonchinense as a humble attendant on the showier E. elegans in the Gardeners' Chronicle, February 20, p. 114, calls to mind the fact that similar instances are not uncommon. In the matter of the handsome O. splendidum, with its large yellow flowers, the sepals and petals barred with brown, and which is at present in flower in many gardens, O. microchilum with the same short pseudo-bulbs and thick upright fleshy leaves is generally imported with it, and even an expert is often puzzled to separate the species when not in flower. On the production of its flowers, however, it is seen that no two species could well be more dissimilar, O. microchilum having branched spikes of smallish flowers, in which the prevailing colour is brown. Then we have Odontoglossum Lindleyanum, despised of Orchidgrowers, which is the modest attendant on most of the showy Odontoglossums, such as O. crispum. the proportion of the undesirable O. Lindleyanum in some importations years ago being very annoying. The pretty wax-like O. pulchellum majus from some localities brings with it the insignificant-looking plant called O. Egertoni, similar in growth, but with very small imperfectly expanding flowers. O. Rossi majus may have with it the much smaller-flowered plant known as O. Dawsonianum, and O. Ehrenberghii, in some gardens. The showy Dendrobium McCarthiæ is often accompanied by the modest D. macrostachyum; O. Jonesianum brought with it a poor variety of O. Cebolleta, with thick terete leaves, similar to those of O. Jonesianum, but

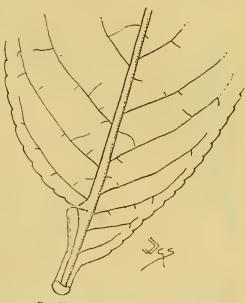

with totally different small yellow flowers. Numerous other instances of the kind may be found.

EPIDENDRUM EVECTUM.

This pretty Epidendrum is sent by Elijah Ashworth, Esq., Harefield Hall, Wilmslow (gr., Mr. Holbrook). Its bright rose-purple flowers are very attractive, and as it lasts in flower for many months it is a useful garden plant. Crossed with E. radicans, it produced E. x O'Brienianum, the first hybrid Epidendrum, which flowered with Messrs. Jas. Veitch & Sons in 1888, and which has proved one of the most free-growing and floriferous of hybrid Orchids. All the members of the genus Epidendrum with reed-like stems are very effective for arranging with the dwarfer and less graceful Orchids, and the most straggling growers are useful for training up pillars and covering back walls in plant-houses. They are readily propagated by cuttings of the stems, as with Dendrobiums of the D. nobile class, Thunias, and some other Orchids. J. O'B.

A CITRON LEAF.

ONE of the most characteristic features of the Aurantiaceæ, to which the Orange, Citron, Lemon, &c., belong, is the presence of com-

F10. 55. -MALFORMED LEAF OF CITRON.

pounded leaves. The blade of the leaf is jointed to the stalk by a distinct articulation, and the leaf-stalk is dilated on each side into a wing, so that except in size there is little or no difference between the blade proper and the stalk. In the specimen illustrated (see fig. 55), which was discovered by Mr. Worthington Smith when drawing the Citron fruited by Messrs. Rivers, a very curions condition existed. One half of the leafstalk is articulated in the usual manner, the other half is "simple," and the base of the leaf is prolonged in the usual fashion without a joint. It is possible that this furnishes an indication of the line of descent and modification in Oranges; but that is too speculative a matter for us to go into here.

THE PRIESTLEY CENTENARY .- The troubled life of Joseph Priestley and the animosity begotten by his theological opinions will be ignored, if not forgotten. What will be remembered is his discovery of oxygen gas, as well as many other gases. A statue was erected to him lately at Leeds. To him we owe the discovery that the green parts of plants exhale oxygen under the influence of light.

NOTES FROM ISLEWORTH FOR 1903.

(Continued from p. 117.)

ARCTOTIS AND GAZANIAS.—These South Africau Compositæ (often called Cape Daisies) are very interesting plants, and can be used, in part, to fill beds in place of the eternal Pelargonium.

A. brcviscapa is a very brilliant yellow or orange annual, the flowers being ringed with black at the base. It seeds freely in hot, dry weather, and if it is allowed to mature its seeds, will not carry any more full-sized flowers. This is an objection to any bedding-plant, as in wet seasons the plant fails, and in dry seasons the beds must be gone over carefully twice a week to pluck the old flower-heads off. It is useless for

A. Leichtlini is a light yellow, sub-shrubby perennial plant, useless for bedding, and altogether inferior to A. aspera. Does not seed with

A. aspera I have dealt with above. It is a sub-shrubby perennial, and useful for cutting.

A. arborescens is a white-flowered sub-shrubby perennial, the back of the flowers being ruddy. This plant is figured and described by Jacquin, and it is astonishing that later botanists should have confused this plant with A. aspera. In A. aspera each flowering stem (or lateral branch) bears three or four terminal flowers from what is practically the apex of the stem. In arborescens the flowers are single and axillary, being produced from the axil of practically every full-sized leaf. The habit of arborescens is prostrate at first, and then ascending; of aspera, sub-erect. The flowers are at the opposite poles of colour, and the only real resemblance is in the individual leaf. A. arborescens has a splendid constitution, and flowered well even in 1903 out-of-doors; but it cannot be compared in beauty to aspera, and is of no use for cutting.

A. aureola, of some gardens, is no more than a variety of A. aspera, even if it is distinguishable therefrom. Probably more than one plant is cultivated under this name in gardens, as the nomenclature of the whole genus is in a state of hopeless confusion.

A. grandis (stoechadifolia) is a charming annual for cutting, the silvery-white flowers being far more beautiful than Marguerites, and lasting quite as long. Several flowers terminate each stem or lateral (as in the case of A. aspera). This plant must be reared under favourable conditions to flower in the open the same year as sown. Plants sown in July can be easily wintered in the greenhouse, and will make splendid plants for the ensuing summer.

Gazania splendens is too well known to need describing. I consider it one of our best bedding plants in suitable soils.

G. hyb. gloriosa is a fine plant for rough bedding, but is too tall and irregular for neat work. Tho flowers are white, ringed at the base, and carried well up above the foliage. They are much larger than those of splendens, and the plant is more suitable for border work or for greenhouse decoration in spring.

For cut work, Arctotus aspera and grandis are

both good, but the others close when placed in a room. As to seed-producing capacities, no Gazanias seed with me; nor does Arctotis Leichtlini.

A. aspera and grandis both carry seed, but it is rarely fertile; and the seed of A. arborescens is always infertile with me.

A. breviscapa seeds freely, and the seeds germinate freely. As to cuttings, A. grandis apparently cannot be propagated in this way, and Leichtlini is difficult to strike. A. aspera and arborescens, and both Gazanias, are easily raised from cuttings. A. Worsley, February, 1904.

(To be continued.)

NOTICES OF BOOKS.

THE GARDENING YEAR-BOOK AND GARDEN ORACLE.

A forty-sixth annual issue of a book is of itself an evidence that it is in harmony with its environment; and so indeed we find it to be. It is full of useful reminders and serviceable information. The index to the advertisers is so convenient that it might be well to consider in future whether, with such an index, it might not be desirable to put the advertisements by themselves, and not suffer them to intrude themselves in the text.

THE FERTILISATION OF ORCHIDS.

One of the most fascinating of Darwin's books, and one that most readily carried conviction to the minds of his readers, was that on "the various contrivances by which Orchids are fertilised by insects." On this account we are glad to welcome a popular edition just published at the price of 2s. 6d. by Mr. Murray. The endless adaptations to purpose, and that purpose the welfare of the race, though now more familiar than they were when Darwin wrote, are still most astonishing, and lend an intense interest to the study of the flowers, which some only admire for their beauty, or only notice because of the oddity of their appearance.

FRUIT REGISTER.

A FEW GOOD APPLES OF RECENT INTRODUCTION.

DURING the past ten years there have been introduced several varieties of more than ordinary merit. I do not mean that they are better than such old standard kinds as Blenheim Orange, Dumelow's Seedling, Lane's Prince Albert, Bramley's Seedling, and others; but they are varieties that any grower of hardy fruits will do well to add to his collection.

CHELMSFORD WONDER.

Foremost amongst them I would place Chelmsford Wonder (fig. 56). In some fruit catalogues this variety is described as being like King of the Pippins, but I fail to see in well-grown fruits any resemblance to those of King of the Pippins. I do not know the parentage of this Apple, but think Dumelow's Seedling must have been one, the young wood being marked with minute grey spots, so distinctive of that of Dumelow's Seedling; the fruits also are similar in shape and colour, except that they have crimson spots and streaks. The tree is an excellent grower as an orchard standard and as a bush on the Paradise stock. The fruits will keep sound until April and May.

ROYAL JUBILEE.

This variety has been frequently mentioned in the Gardening Press as being very late-flowering, and therefore likely to escape the spring frosts. The tree is a good compact grower on both stocks, and the fruit above medium size, slightly ribbed towards the apex; colour clear lemon-yellow. It is likely to prove a valuable market Apple, and the fruits are in season during November and December.

Hormead's Pearmain

received an Award of Merit from the Fruit Committee of the Royal Horticultural Society in 1903, and well deserved the honour. The tree is a free grower and rarely fails to produce a crop of fruits which are medium in size and of conical shape; colour lemon-yellow. A very handsome Apple that will keep good till May.

NEWTON WONDER

is fairly well known; some very fine samples were exhibited at the Fruit Show at Chiswick in

October last. It is a very heavy solid Apple of the Dumelow's Seedling type and will keep in sound condition until June. [See note on p. 118, Gardeners' Chronicle, for February 20. Ep.]

BELLE PONTOISE

is a very handsome Apple of the type of Blenheim Orange. The fruits are heavy and solid; colour yellow streaked with dull red. This will make a splendid orchard variety as the tree is a strong grower. The fruit is in season from November until March.

BEAUTY OF STOKE

is a good Apple of the Pearmain type and an excellent keeper. It is a splendid variety for small gardens when worked on the Paradise stock, and rarely fails to produce a crop of fruits.

WAGNER.

This is an American variety, and like many others from the same source develops grand colour. It is a good keeper, and the trees prove to be good croppers; the variety will make an York in the minor group classes and at Weybridge in a Chrysanthemum group—they added considerably to the attractiveness of the exhibit. It is, perhaps, in a cut state that these flowers appeal most to the observer. A mass of trusses arranged not too thickly with their own foliage or some other suitable greenery in wide-mouthed vases is beautiful. The reason more are not cultivated is, I suppose, the ordinary gardener's antipathy to single flowers. It is a well-known fact that many gardeners abominate single blossoms!

Very good plants can be grown in 7-inch pots, and in 9-inch pots handsome specimens may be produced that will yield a wealth of flowers.

Stout cuttings may even yet be inserted, and they will quickly make stocky plants if the point is taken off when 6 inches high, and again when the same length of shoots has been made from the first pinching. Grow the plants in an atmosphere that is quite cool, and give them abundant space out-of-doors in May. Keep the shoots well staked-out as they grow, so that the

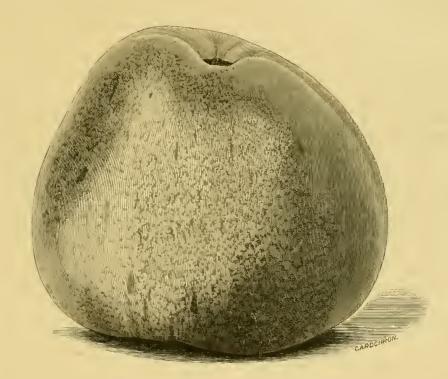

FIG. 56.—APPLE CHELMSFORD WONDER.

excellent market Apple. Young trees here made good clean growths last season.

The varieties Bow Hill Pippin, Byford Wonder, Royal Late Cooking, Mrs., Barron, and Norfolk Beauty have not fruited here, but all are good growers, and promise well this season. May 1904 prove a good year for hardy fruits! We sorely need one after the disastrous years of 1902-3. Chas. Page, Dropmore Gardens, Bucks.

FLORISTS' FLOWERS.

SINGLE-FLOWERED CHRYSANTHEMUMS.

When it is realised how beautiful the varieties representing this section are, and to what use they can be applied for decoration, the wonder is that more of them are not grown. For room decoration in a cut state, either in small vases or epergnes, and even for intermixing with other flowers, single Chrysanthemums harmonise well. For adding to groups of miscellaneous plants in a growing state, like I have seen them utilised last season several times—for instance, at

centre leaves will be maintained in a healthy condition.

Growing in small pots, and carrying many shoots and much foliage, the plants absorb a large quantity of moisture, especially in dry weather, and if they are at all neglected in this respect they quickly suffer.

As to variety there is an abundant choice. In making a selection, it is better to adhere to a few sorts of decisive colour. White, yellow, crimson, and pink are the salient colours. To make the selection more simple, I have classed them in that way:—

White.—Miss T. C. Warden, Purity, Earlswood Glory, Mr. H. Herbert, Thomas Suter, The Bride, Eucharis, and Miss King.

Fellow.—Kate Williams, Mrs. D. M. Parkin, Edith Sybil, Golden Star, Miss Annie Holden, Pretoria, Earlswood Beauty, and Golden Gem.

Crimson.—Elsie Neville, Robert Morgan, Scarlet Gem, Winifred Hull, Rov. W. E. Remfrey, Nora-Davies, Mrs. Cromwell, Felix, Annie Tweed Framfield Beauty, Mrs. W. Bird, G. W. Forbes, Annie Farina, and Miss Sydenham.

Pink.—Mary Anderson, Edith Pagram, Ewan Cameron, Miss A. Edwards, Mrs. Roberts, America, Emily Wells, Evelyn Foster, J. T. Angus, May Paul, Milly Agate, Miss Rose, Mrs. D. B. Crane, Mrs. J. Ferguson, Mrs. John Platt, Mrs. Langtry, Oceana, Rose Pink, Sarah Wells, and Salmon. E. Molyneux.

THE ROSARY.

ENGLISH ROSES.

It is refreshing to read of our supremacy in the Journal des Roses. A French visitor commenting on the Roses at the Temple Show which he saw in May last, about the same time as the corresponding exhibition in Paris, says everything is in favour of Paris as regards organisation and general effect, but the quality of the Roses is superior in London, where the refined taste which characterises the Paris exhibitions is wanting. The writer in the course of his article (rather out of date now!) says that he never saw such Roses, irreproachable as to cultivation, and with marvellous blooms. He indulges in so many superlatives that a cold-blooded English editor would make use of his blue pencil to delete them from any "copy" submitted to him for fear his readers would think the author guilty of exaggeration. The writer attributes these floral marvels to a "privileged climate"; but as the Roses in question were all grown under glass, we think the skill of the cultivator had an even larger share in the result than the climate!

Roses and their Cultivation.

The expression, "as plentiful as Blackberries," will have to be replaced by one connoting the abundance of books concerning Roses. As the population increases, so does the admiration for Roses, but for various reasons, in even greater proportion. There is, therefore, no fear that the market will be overstocked with good Rose books, and this, the work of Mr. T. W. Sanders, is, especially as regards the text, a good book, destined to survive, because so well adapted for amateurs and novices. Messrs. Collingridge, of Aldersgate, are the publishers.

COLONIAL NOTES.

THE CHAMPACA TREE.

On p. 48 of the Gardeners' Chronicle for January 16, we note that the Champaca tree (Michelia champaca) has been described as sacred to the Visbnu. This is however not quite correct. Preference is given to Champaca flowers in the worship of Siva, and in that light it may be regarded as sacred to the god. Champaca flowers are also used in the worship of many other Hindu deities, and the tree is often planted in the vicinity of temples. From the religious point of view much less sanctity is attached to the Champaca tree than to the Julasi plant (Ocimum sanctum), which latter is planted in the inner court-yard of every Hindu dwelling and is worshipped and watered every morning by the Hindu females before they partake of their breakfast. N. B. Dutt, Asst. Sec. of the Indian Gardening Association, Calcutta, February 4, 1904.

VIOLET SOUVENIR DE JULES JOSSE. -- This is a cross between Princess of Wales and Admiral Avellan, raised by M. Blanc, of Hyères. It is said to be of robust habit, and to flower from September to March. The flowers are reddish-mauve with a white centre. Moniteur de l'Horticulturc.

The Week's Work.

THE ORCHID HOUSES.

By W. H. WRITE Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Dorking.

Odontoglossums .- The month of February is an excellent time to afford more root-room to any of the cool-house Odontoglossums that are not flowering. Those plants that are just commencing to grow and require repetting may be turned out of their pots, and if the compost is in good condition it need not be disturbed, but good condition it need not be disturbed, but place the whole into a pot of convenient size, and fill up around the ball with compost, as one would do when repotting a Pelargonium. For drainage use Fern-rhizomes, just covering the bottom of the pot with them. The potting compost may consist of one-fourth fibrous-peat, one-fourth leatsoil, and one-half chopped sphagnum-moss, adding a moderate quantity of coarse silver-sand. Fill up to within $\frac{1}{2}$ inch of the rim of the pot with this compost, then surface with clean picked sphagnum-moss, taking care to press it firmly up to the base of the young growths. Such plants as have sufficient root-room to last until the autumn should not be disturbed at the root now, but if the surface moss requires to be replenished it may be done at once. All plants of O. crispum and others of that class that are in full growth or producing flower-spikes, should be afforded plenty of water until growth is completed, and the flower-spikes cut. At this season we look over our Odontoglossums twice each week, and those that are dry are afforded water liberally, but others that are neither wet nor dry wait until next watering day. The above remarks are applicable to any of the Masdevallias that require similar attention. The pretty Odontoglossum ramosissimum is now flowering in the areal heavy and it is adiabated to any the areal heavy and it is adiabated. cool-house, and it is advisable to cut the spikes immediately the leading pseudo-bulbs show signs of shrivelling; the plants invariably deteriorate if the spikes are allowed to remain too long. After the spikes are cut place the plant at the coolest end of the house, and afford but little water until growth has recommenced. The spikes of O. Hallii, and its varieties leucoglossum and xanthoglossum, should also be cut as soon as the flowers are fully expanded.

Aërides, Saccolabiums, and Rhyncostylis.-When in flower there are few Orchids more handsome than such plants as A. affine, A. Lawrencew, A. crassifolium, A. Lobbii, A. Larpentæ, A. maculosum Schroderæ, A. Fieldingii, A. suavissimum, Sc.; also Saccolabium giganteum, S. violaceum, S. Hendersonianum, and those Saccolabiums that are now known as Rhyncostylis retusa, R. præmorsa, R. guttata, and the lovely blue R. celestis. Unfortunately, these plants are rarely seen in private collections or at horticultural exhibitions, and are not often mentioned in the Gardening Press. Yet every one of them is worthy of a place in the most select Orchid collection. The majority of these epiphytal plants require the warm moist atmosphere of the East Indian-house; a few varieties, such as A. crispum, A. Warneri, and A. Lindley-anum, prefer the atmosphere of the intermediate-house. They appear to enjoy a high, sun-heated temperature, but fire-heat to any great extent quickly causes them to deteriorate. A. japonicum, A. Vandarum, and A. cylindricum should be grown cool the whole year Make a thorough examination of each of these plants and thoroughly clean them, espe-cially if there be any scale insects on them. Exceptional care is necessary in cleaning these tender-leaved plants, as the leaves are easily bent down and broken, and irreparable damage done. Some of the plants will naturally have lost a few of their earlier leaves, and part of the stem is bare; but if aerial roots are plentiful the stem may be cut off at its base and shortened, so that when the plant is placed in the new pot the lower leaves will be on a level with the rim. Ordinary flower-pots are preferable, and these should be drained with Fern-rhizomes, and a compost used of leaf-soil and sphagnum-moss in equal parts, pressing it in moderately firm about the roots. Surface to the base of the leaves with freshly gathered moss. After they have been repotted

the plants should be rather more heavily shaded than others in the house until the roots are again active. Plants that are well furnished with leaves to the bottom need not be disturbed by repotting, but if necessary the old material may be carefully picked out and replaced with fresh compost. Remove any flower-spikes which appear on the plants that have been repotted; others will come afterwards. The above cultural directions apply also to Angræcum sesquipedale, which should be grown in the warm-house.

The blinds and shadings used on the Orchidhouses should be fixed in their places at once, as the sun may soon be too powerful for the majority of the plants, especially in the middle hours of the day. After such dull weather, Orchid-growers cannot be too particular as regards shading, or irreparable damage may be done before they are aware of it.

PLANTS UNDER GLASS.

By C. R. FIELDER, Gardener to Mrs. Burns, North Mymms Park, Hatfield, Hertfordshire.

Begonia Gloire de Lorraine and B. Turnford Hall.—The stock plants are now commencing to throw up young shoots from the base, and when these are from 1½ to 2 inches in length they may be taken off, and inserted in pots to form a batch of plants for flowering early. Let cuttings for successional flowering be put in later as required, or the flowering of a portion of the early batch may be retarded by the removal of the flowers until about three weeks before the time when the plants are required to be in bloom. The removal of the flower-buds is also necessary when very large plants are required, for the culture of which details will be given in future Calendars. Cuttings of both the above varieties strike readily, and may be inserted to the number of ten or twelve in 5-inch pots which have been previously filled with a light sandy soil. Place the pots containing the cuttings in the propagating-frame, or under a handlight in the stove, and afford them a watering. If the stock plants have been infested with the mite, or so-called Begonia "rust," let the cuttings before insertion be dipped in weak tobacco-water, or some other insecticide, and make constant efforts to keep the pest under.

Tuberous-rooted Begonias.—A portion of the stock may now be started. Let the old soil be shaken from the tubers, then place them singly in pots just large enough to admit of a little soil being placed around each tuber. Afford a compost of two-parts sandy-loam and one-part leaf-soil, adding some coarse silver sand. At the first potting keep the tops of the tubers somewhat above the surface of the soil. Place them in a temperature of from 50° to 55°, and on fine days lightly sprinkle them with water from the syringe, which will be sufficient until growth commences, when more water may be gradually afforded. A safe method of starting the early batch, when the tubers are quite dormant, is to lay them bottom upwards on leaf-soil or cocoanut-fibre in boxes, placing a little of the same material around the tubers but not covering them, and spraying them over with the syringe once a day. The tubers should be examined frequently, and any that have commenced to grow must be placed with the crown upwards, potting them up as soon as a sufficient number have started. When treated in this way a very small percentage of losses will occur, as the water cannot rest in the hollows of the crowns.

Browallia speciosa is a very pretty and useful plant, that produces its bright blue flowers very freely, and remains in flower from early autumn till midwinter. Plants raised from seed sown at the present time will flower in the autumn. It may also be propagated from cuttings, and where these are available they may be inserted in pots filled with sandy soil and placed in the propagating-frame. Let the points of the shoots be pinched out several times during the growing season, and allow the plants sufficient room to develop fully their bushy habit. Grow them in an intermediate temperature until the summer, when they may be placed in a cool pit until the early autumn. Pots 6 inches in diameter will be sufficiently large for the final shift of strong plants.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, gr., Wrotham Park, Barnet.

Sweet Cherries.—To obtain heavy crops of large fruits annually, these trees should be grown on walls having a south-west aspect and trained in the fan-shape. At the same time, good crops of Cherries may be grown in other aspects in favourable localities, and as bushes or pyramids. Those wishing to plant trees this season should procure them at once, selecting the varieties that have been proved to be the best. Trees against walls should not be planted at distances of less than 17 feet, for considerable space is essential for the extension of the branches, which, if afforded proper attention, should eventually become roped with clusters of fruiting-buds. In the planting of young trees against walls, be careful to allow sufficient space between the wall and stem for the latter to thicken as the trees increase in size. The best soil for Cherries is that of a moderately rich, sandy loam resting on a well drained sub-Should the soil that has to be used be somewhat heavy, it may be much improved by freely mixing old brick mortar and wood-ashes with the staple previously to planting the young trees. The following varieties are among the best: Kentish Bigarreau, Napoleon Bigarreau, Governor Wood, Elton Heart, Early Rivers, and Black Tartarian. Bush or pyramid trees should be planted in rows, or in groups, so that they may be easily netted when coming into flower, and when the truits are ripening. Bush Cherry-trees, the heads of which need to be restricted, are apt to grow too strongly to be fruitful. In such cases the roots must be lifted and pruned at intervals to check them. Very little pruning of the branches will then be required, merely that of cutting back the shoots to within a few buds of the base each winter, and attention to "pinching" during the growing

Gooseberry Bushes, &c., which may bave been left unpruned in districts where birds are trouble-some should be attended to before the young buds become large, or much harm may be done when carrying out the work. Thin out the growths, and then syringe the bushes with a mixture of lime, soot, soap-suds, &c. After this has been done, scrape from beneath the bushes all the loose soil, and then afford a good dressing of lime and soot before applying a mulch of manure or a top-dressing of fresh soil. To protect the buds against sparrows, some threads of black and white cotton may be strung over the bushes. The more destructive bullfinch is not so easily frightened, and unless watched may destroy the buds in a whole plantation in a few days.

THE KITCHEN GARDEN.

By John Pentland, Gardener to C. H. B. Firth, Esq., Ashwicke Hall, Marshfield, Chippenham.

Slugs Eating Early Crops.—Owing to the rain of the present month, followed by frost and snow, a survey of the early crops in the kitchen garden is not encouraging. Many plants seem half-drowned; but the slugs are at work, although efforts have been taken to keep them down. Winter Lettuces, which have been dusted with soot, quicklime, and ashes, time after time, are eaten through the stem under the surface of the ground so much that they are toppling over when blown by the wind. Late autumn-planted Cabbages are also suffering from the same cause, and there is nothing for it but to keep on dusting the plants, as by doing so we may save sufficient to keep up the supply. When hoeing is possible let it be done, giving a good dusting with soot or lime an hour or so afterwards. Cropping in the open i3 for the present not to be advised, unless the soil is of a very sandy nature. If it is, sow Broad Beans, Peas, and round Spinach for succession. In gardens where the ground is heavy and the demand requires them, make another sowing of Peas in turf, and place them in a sheltered corner: they will be making progress, and be ready to plant-out when the soil is in better condition. Ground should be got ready if possible for sowing Onions, Parsnips, and Leeks at the end of the month. Endeavour to get in front of the work, as the time is coming when

you will be fully occupied with cropping, which must not be neglected when the proper season arrives and circumstances are favourable.

Seakale.-Where it is intended to make new plantations, get the ground in readiness by digging, and working-in plenty of manure with the soil as the work proceeds. Turn it up roughly, so that the frost and air will bring it into good condition for planting next month. If sufficient strong cuttings were made, as advised in a pre-Calendar, all will be in readiness when planting-time arrives; but should the stock be short, lose no time in making cuttings from the strong roots of forced plants that have been put on one side. Cut them into 4 or 5-inch lengths, and place them in a sheltered spot out-of-doors, covering them with a few inches of soil; they will soon form eyes. Maintain a supply for the table at present as previously advised, but as the season advances, a supply of crisp, well-flavoured heads can be had if the crowns in the open be now covered with small mounds about 9 high of Cocoanut-fibre or sifted ashes; which can carefully pulled to the one side when cutting. and if spread about afterwards will act as a useful top-dressing for the plant.

Celery. — Make a sowing in boxes indoors, covering the seeds but slightly; keep them moist, and afford shade until germination has commenced.

FRUITS UNDER GLASS.

By W. FYFE, Gardener to Lady WANTAGE, Lockinge Park, Wantage.

Vines in the early house, if consisting of Black Hamburgh, Madresfield Court, Buckland Sweetwater, and Foster's Seedling, will have flowered in the order named, about twelve days separating the first variety from that named last. The weather having been fairly mild much fireheat has been unnecessary, and with little sun, ventilation uncalled for. With the exception of the variety Buckland Sweetwater, which is benefited by having the hand passed gently over the bunch, an occasional shaking or tapping of the rods is all that we find necessary.

Thinning.—Commence to thin the fruits immediately the berries are large enough, or about the size of the seeds of Sweet Peas. Much judgment will be required, and the characteristics of the varieties should be remembered; for example, the stems of the Black Hamburgh being long and slender, only sufficient berries should be taken out to allow of those left attaining their full size without crushing each other, retaining sufficient to prevent the bunches falling out of shape when cut and when placed upon a dish for dessert. Avoid wetting the hotwater pipes, or, if these are very hot, a steam will arise which will cause a rust upon the berries and spoil their appearance when ripe.

Tying, &c.—The great majority of vineries are wired much too near the glass, which necessitates the tying down of the young and tender shoots before they are able to bear the strain, at the same time marring a free circulation of air between the foliage and the glass. To avoid this we drop the rods 2 feet from the glass; this allows sufficient space for the growths before touching the glass. The weight of the bunch is then allowed to gradually bring the shoots to their proper position, then a tie is made to prevent a further drop. The floor and paths should be sprinkled at shutting-up time with diluted drainings from the stables, and occasionally with soot-water, which will give a dark and healthy hue to the foliage. The artificial heat at night should be from 60° to 65°, and by day 75°. When above this a little air should be given, and when the weather is favourable the house may be closed at 80°, rising to 90°.

Peaches and Nectarines in Earliest House.—The weather has been so mild that it has been seldom necessary to keep the house closed, and the conditions being so favourable considerable progress has been made. Dis-budding having been carefully done in accordance with the growth of the trees, all shoots have been removed with the exception of the best break from the base of the fruit-bearing shoots, and a shoot from a point

above the fruit, which is left to attract the sap. This shoot may be pinched afterwards when not required for extension, but all the growths required for fruiting next year should be allowed to grow to their full length. We never tie these shoots to the trellis until the fruits have "stoned." This we consider to have two advantages, including natural protection to the fruit during the stoning period, and that of allowing the sun and air to act properly upon the shoots that furnish the next crop, the trellis being 2 feet 6 inches from the glass. Trees that have set a heavy crop with fruits in clusters of twos and threes should have the least promising and badly placed fruits removed. Syringe the trees sufficiently early to allow the foliage to become dry before night, and damp the borders and paths on cold dull days, as recommended for Vines. Maintain a temperature at night of 60°, and allow a rise of 10° or 15° by day.

THE FLOWER GARDEN.

By A. B. Wadds, Gardener to Sir W. D. Pearson, Bart., Paddockhurst, Sussex.

Pæonies. — The ground around herbaceous Pæonies may be forked lightly over now that the young growths can be seen. If the plants are crowded together they can be divided with the spade, without it being necessary to lift all the clumps. Those that are taken away should be planted in another place, in rich soil. Moutan Pæonies should be staked securely against the wind. Being generally planted in a warm corner, they are now showing buds, and will require protection in the event of severe frost.

The Wild Garden .- Where bulbs were planted in the grass, and the old soil thrown out to make room for new, this should be broken down and made level before the foliage appears, mowing will then be easier when the growth of the bulbs has died away. Top-dress old plants of Camellia and Chamærops (Palms) with peat and loam. Mice are very troublesome where Camellias are planted out-of-doors; they will strip a tree of its buds in one night for mischief. The break-back trap is a good remedy, or a little poison will be effective if it can be used. It is not too late to plant Primroses. Varieties of the Willow have a good effect when planted by a stream. If Willows are planted already, and it is necessary to increase the stock, cut them down and dibble them in round the parent plant to keep the varieties together. Creepers and shrubs that have been protected during the winter may be uncovered, and loose ends nailed or otherwise fastened up. Clean up leaves after rough winds, and use the leaves as a top-dressing for the plants. Golden Elders are best cut down every spring. Their appearance will be less straggling, and they will colour better. Prunus Pissardi has a good effect when grouped with Acer negundo variegatum, and growths of each will require to be regulated. Almond-trees planted amongst shrubs and in heavy soils should have their tops regulated. They also need root-pruning in autumn. The trees are very showy in the spring, and in a warm summer will ripen a quantity of fruits in southern gardens.

Dahlias.—The tubers may be placed in heat. If extra stock is required divide the tubers, but take care to have a portion of the centre stem on each divided piece to ensure a break. Two good varieties for bedding are Rising Sun (scarlet) and Yellow Pet. The plants grow 12 to 15 inches high; they are very bright when planted in beds by themselves, and require no staking.

Spira Watereri. — This beautiful flowering shrub may be cut over now it is starting into growth. It requires a moist situation, and if planted in beds has a bold effect. Top-dress old plants with peat or leaf-mould.

Subtropical Plants. — Seeds of some of the varieties sown last month will have germinated. Place them close up to the glass, and when the seedlings are large enough pot them off singly into thumb-pots, this method being more satisfactory than pricking them off into boxes.

Hotbeds.—Where the sides have become trodden down place some fresh litter round the frame to keep the heat uniform.

APPOINTMENTS.

MONDAY	FEB. 29 Birmingham Gardeners' Mutual Improvement Society meet.
MONDAY,	meet.
TUESDAY,	MAR. 1 Scottish Horticultural Associ-
THURSDAY,	MAR. 3—Linnean Society, meet.
SATURDAY,	MAR. 5 Socié é Française d'Horticul- ture de Londres, meet. German Gardeners' Club, meet.
TUESDAY,	MAR. 8 Royal Horticultural Society's Committees meet.
MONDAY,	MAR. 14 Birmineham Gardeners' Mutual Improvement Society, meet. Uoited Horticultural Benevolent and Provident Society's
WEDNESDAY	Annual Meeting. Royal Botanic Society's Exhibition at Regent's Park.
THURSDAY,	MAR. 17 Linnean Society, meet. Brighton Horticultural Society, meet.
SATURDAY,	MAR 19—German Gardeners' Club.
TUESDAY,	MAR. 22 (Royal Horticultural Society's Committees meet.
THURSDAY,	MAR. 24 Torquay District Gardeners' Association, show.
FRIDAY,	MAR. 25 General Meeting of the Royal Boianic Society.
MONDAY,	MAB. 28 Birmingham Gardeners' Mutual Improvement Society, meet.

SALES FOR THE WEEK.

MONDAY AND FRIDAY NEXT-Perennials, Azaleas, Roses, Fruit Trees &c., at 67 & 68, Cheapside, E.C., by Protheroe & Morris,

at 12.
WEDNESDAY NEXT—
Palms, Plants, Azaleas, Roses, Fruit Trees, Border
Plants, and Pereonials, at 67 & 68. Cheapside, E.C.,
by Protheroe & Morris, at 12; 975 Cases Litiums,
from Japan, Davalitas, Tuberoses, Palm Seeds, &c.,
by Protheroe & Morris, at 67 and 68, Cheapside,
E.C., at 3.—At Slevens' Rooms, at 12:30, Roses, Magnolias, Azaleas, Lilies, Davalitas, and Fruit Trees.

FRIDAY NEXT—
Orchids in variety at 67 and 68, Cheapside, E.C.,
by Protheroe & Morris, at 12 30.

(For further particulars see our Advertisement cotumns.)

AVERAGE TEMPERATURE for the ensuing week, deduced from observations of Forty-three Years at Chiewick

ACTUAL TEMPERATURES :-

TOAL TEMPERATURES:—
LONDON.—Feb 24 (8 P.M.); Max, 43°; Min, 36°.

Feb. 25, Gardeners' Chronicle Office (10 A.M.);

Temp., 36°; Bar., 30°2, snowing stightly.

Provinces.—Feb. 21 (8 P.M.); Max, 48°, S. coast of Iretand; Min, 37', S. of England.

THE desirability of organising A Gardeners' the craft of gardeners has been recognised from time which we may well call immemorial. The organisation of such an Association has heretofore always presented what appeared to be insuperable difficulties.

For our own part, we do not believe they are insuperable, and if the question is treated in the judicious and temperate manner which was evidenced at the meeting on Tnesday, we believe that such an organisation will grow, adapt itself gradually to circumstances, and prove beneficial alike to employer and employed. The evils to be met are the large numbers of unemployed gardeners, the inefficiency and carelessness of many who style themselves gardeners, the painful disparity between the amount of remuneration offered to an honest, competent gardener, the knowledge he must possess and the forethought he must exercise. When the wages offered to other domestic servants, or to skilled workmen in other trades, are compared with the remuneration offered to trained gardeners, the disproportion becomes obvious.

A system of co-operation and registration might do much to better this condition of things. When a young man has given proofs of his capabilities and conduct, all obstacles to his progress should, as far as possible, be removed, and every legitimate endeavour

made to help him in his career. A man who has not succeeded in giving some guarantee of his ability and willingness must not be surprised if he finds he is left behind in the race and that his claims, if he has any, are not recognized. All these are mere truisms. What we want now is to convert them into active operations. A way of doing this without any objectionable element such as would at once arouse antagonism, was pointed out at the adjourned meeting held at the Hotel Windsor on Tuesday last, to which we have referred, and concerning which we proceed to give some further details.

Mr. Owen Thomas presided, and in opening the proceedings announced with regret that Mr. A. DEAN, who had acted as Secretary, was unable to be present owing to illness. In his absence the minutes of the meeting held in January were read by Mr. GEO. KELF. minutes explained the circumstances of the previous meetings, expressed the belief that an Association was needed, but, owing to the fact that but few gardeners had shown any active interest in the matter or afforded suggestions or help, did not recommend any further proceedings to be taken.

Mr. W. H. DIVERS (Belvoir Castle Gardens) then said that he had been in communication with a dozen or so head-gardeners in regard to the matter, and most of them had expressed general sympathy with the movement, if the details could be made practicable. Mr. DIVERS concluded by proposing a resolution to the effect that an association of private gardeners be formed, and enumerated reasons why such a step was desirable, saying that it was a disgrace to them that the condition of those employed in gardening was what it was. Mr. JAQUES seconded the resolution.

The CHAIRMAN remarked that it was thought by some that the Committee responsible for the Gardeners' Dinner held in 1903 had inaugurated the movement for a Gardeners' Association. This was not the case. The Committee had offered their services as a means of promoting the formation of a society in the event of there being a general wish for it. He then proceeded to argue that such an association was necessary. Gardeners were in an inferior position to-day than they were twenty years ago, owing to agricultural depression, There were more gardens now of medium size, but fewer large ones. Other trades had, as a result of combination, been put upon a very much better footing during the same period. The Chairman gave some details of the kind of association that should be formed, and spoke of the need there would be for an examination of candidates, but expressed the opinion that the examination should be partly oral, so that skilful men who might not be able to express their ideas in writing so well as others might not suffer thereby. The results of examinations had not always been satisfactory. His proposals included one that gardeners having five men under them should be eligible as members, but that gardeners in smaller establishments and under gardeners should be admitted for one year only, and elected afterwards or not as the Society thought desirable. All candidates would have to be nominated by several members, and considerable care would have to be exercised to exclude a type of men that was not up to the proper standard. Examinations might be held once a year, and prizes and certificates offered for essays, &c., to encourage the members to attain to higher knowledge and greater efficiency. Such a Society would raise the status of gardening to a level approaching that of the learned professions. The steps that would be taken must be such as would have the sanction of employers.

Dr. MASTERS said that examinations did not and could not prove that a young man was a practical gardener, as experience must be obtained afterwards. Examinations merely proved that the young men had a love for their profession, and that they were industrious and anxious to get on. But what was there to take the place of an examination? What other test could there be? He (Dr. Masters) was entirely in sympathy with the objects of the meeting, heing convinced that gardeners generally were not receiving the remuneration and consideration to which their services, requiring as they did so much forethought and skill, entitled them.

Mr. JOHN WEATHERS regretted that the report of the Committee was of a negative character. He could not agree with Mr. DIVERS' resolution, believing that the Association should include all grades of the profession, and not merely private gardeners. It would not be successful if

commenced on such a basis.

Mr. GEO. GORDON expressed similar opinions. The scheme should include every section of gardeners, and at the commencement their objects should be material rather than sentimental. They might drop the question of examinations for the time being and endeavour to relieve the lot of gardeners, particularly the lot of under gardeners and those who had not succeeded in getting into good positions. The evils of the bothy system required to be remedied, and by a system of registration they should endeavour to convince employers that members of the Association would be worth liberal recompense. Mr. Gordon concluded by moving the following amendment: "That this meeting, having heard the report of the Committee, resolves to form a professional Gardeners' Association, and to elect a provisional committee to prepare a scheme to be submitted at a future meeting.

This was seconded by Mr. W. WATSON (Royal Gardens, Kew), who made an excellent speech in favour of banding together all professional gardeners of every type, to work together for the good of all. We may summarise Mr. WATSON'S remarks as follows: - Why should he, he asked, be excluded from the Association? Surely gardeners in public gardens, in commercial horticulture, in the horticultural trade, and in other grades were trained and skilled gardeners equally with the private gardener! Besides, how was Mr. DIVERS to distinguish between them? Gardeners were employed in private establishments at one time, in a public garden at another, and in a nursery or market garden at another. Were members to be put on and struck off the books as they were moving about in order to get wider experience and acquire greater skill? If Mr. Divers would consent to the scheme being one having the whole field of gardening for a basis, instead of one with such arbitrary limits, they might proceed at once. Experience had taught him (Mr. WATSON) that in order to make the proposal a success they must be prepared to work to secure tangible advantages for those who will become members. A programme that contained little in it but "dinners and talk" would not attract gardeners. He was sure that Mr. DIVERS and Mr. THOMAS would not recommend such a programme, yet until now that was the idea of the proposals those outside the Committee had formed. They must not expect to please everybody, but they should approach the work in the spirit of reformers. Mr. Watson explained the treatment of gardeners at Kew as democratic. If a man at Kew would work as well as the Curator he was esteemed equally with him. But gardening had become very largely a "dumping ground for duffers." This should not be permitted to continue. He would make a fence around the profession, and provide a door through which every member would have to pass, or choose some other vocation. Qualification for membership would require that the candidate should be a professional gardener who had been properly trained as such, in one sort of garden or another.

By professional gardener he meant one who earns his living in any recognised branch of norticulture, and one who has been through the usual course of training as improver or journeyman. At Kew, said Mr. Watson, five years' training was insisted on as the minimum, and this works satisfactorily. It is desirable that there should be a clear understanding on this point.

The term "gardener" belongs to the professional man by right, and they should resist any attempt to appropriate it by those who either play at gardening, or employ others to do it for them, whilst they take all the credit and even honours as if the work was their own. If a person pays an artist to paint a picture he would he an impostor if he exhibited it as his own, but there is a good deal of this kind of thing done under the cloak of amateur gardening.

Although gardening is one of the oldest and also one of the most important industries of this country, its votaries are absolutely without organisation. Mr. Divers asks, "Why should gardening be one of the most disorganised and the worst paid of all professions?" The answer is that no serious effort has ever been made to combine all gardeners in an association for the protection of their interests. We propose, continued Mr. Watson, to make a serious effort now. It is said that there are 10,000 gardeners in this country, but there are probably a great many more if we include commercial gardening; and if we succeed in uniting them they will constitute a force which, under proper guidance, should be able to lift the whole body of gardeners to a position to command that respect which is denied to them now. The advantages of co-operation are evident enough in other branches of industry. There need be ao apprehension of any mischievous intentions. A body constituted as ours will be would not attempt the promotion of schemes of a doubtful character. The right to combine for mutual protection and assistance is now recognised and even encouraged, and we believe that the objects of this proposed Association will commend themselves to all who have the welfare of horticulture at heart, and who would not deny to gardeners the same right of combination to promote the interests of their order as is enjoyed by the followers of other industries.

The objects of the Gardeners' Association are: -

- 1. Registration of gardeners.
- 2. Regulation of wages.
- 3. Regulation of working hours.

These are the most urgent points. When they have been satisfactorily dealt with, the Association might take up such questions as the proportion of apprentices or improvers to journeymen, especially in private gardens; foreign or alien labour; and provision for the aged and orphans.

The gardeners' charities are not altogether a credit to the members. Provision should be made for the aged and for the orphans, as other industrial hodies do, by having a Fund to be entirely subscribed by our own members, who should learn to rely upon themselves, and to support each other in case of need.

The poverty of the gardener is a serious obstacle in any attempt at organisation. Low wages make it impossible for him to do much more than provide for his immediate needs. At Kew for years the authorities have refused to supply a gardener at less than 30s, a week with a house, &c., and although some applicants decline to pay this, even when a highly-trained man is asked for, the rule is beginning to have an influence with employers. Mr. Watson said he had been told by one of our leading London nurserymen that 30s, as a minimum is too high, as he can get plenty of good men for 25s. Who is to blame

for this state of things? Employers will get labour as cheaply as they cau. Few have any desire to pay more than the market price for any commodity; but it is certain that many employers would willingly pay higher wages to competent gardeners if a higher price were set on their labour. In many cases the employer knows nothing of the circumstances; the agent, head gardener, or manager controls such matters, and he, like a good servant, gets men as cheaply as he can. The nurseryman in this case, is only an agent. We are therefore forced to the admission that gardeners are themselves to blame if they are, as Mr. Divers puts it, "the worst paid of all professions."

We are told by economists, continued Mr. WATEON, that low wages do not always mean cheap labour. Certainly he would rather employ one good man at 30s. than two duffers at 15s. each. He felt certain that it will be in the power of our organisation to improve the lot of the gardener in this respect without causing any ill-feeling among employers.

The minimum wage for an improver gardener at Kew is 21s., with extra pay for Sunday work; sub-foremen, who are practically permanent journeymen, get 27s. and extra for Sunday. In the County Council parks of London the minimum wage for a journeyman gardener is 27s.; firstclass foremen in the Royal London Parks are paid from £2 to £2 10s. per week. Compare these rates of pay with those in private gardens, in nurseries, and other establishments where gardeners are employed, and the difference will often be found to be from 25 to 50 per cent. Now if the ratepayers of London think 27s. little enough for a journeyman gardener, and the Government pays 21s. to improvers, either they are guilty of extravagance, or the men employed in other gardens for less are underpaid.

Registration of gardeners, and a rough classification according to ability and experience, will no doubt be of great assistance in steadying and regulating the labour market, and clearing it of impostors and incompetent persons. Every member will consider himself a kind of guardian of the Association. The inefficiency of many gardeners is unfortunately too true. Low wages, bad training, or none at all, are no doubt largely to blame for this. It is also to be feared that gardening is looked upon as a kind of dumping ground for dull and unpromising youths, who would stand no chance in other industries. Whether a remedy for this state of things can be found remains to be seen. Lack of education, even of an elementary kind, is also too often a conspicuous failing. Then, again, some gardens are so badly managed that young men who have been trained in them are deplorably wanting even in rudimentary knowledge and skill. It will be to the best interests of the Association to maintain as high a standard of skill as possible among its members.

The third question, that of hours of labour, will not present much difficulty, and Mr. Warson is of opinion that when a recognised working day or week has been decided upon, it will be generally adopted. A gardener cannot hope for an eighthours'-day any more than a doctor can, for, like the doctor, he has to deal with living and often very delicate subjects, which cannot be set aside like a book or a plank or a machine, to be taken up again at any time without detriment.

It is important that gardeners employed in commercial horticulture should take part in this movement. Commercialism has affected horticulture, as it has so many other arts in this country; and there has been an enormous increase in the number of nurseries and market gardens in the last twenty-five years. Commercial gardening may be said now to lead the profession, and the training to be obtained in some nurseries is of such a quality that it should be sought by young men who have the progressive spirit; for this country offers opportunities to the gardener where the farmer has failed, and there

are many capable young men "champing the bit" in private gardens who might be profitably employed, both for themselves and the community, in some department of commercial horticulture. The Gardeners' Association may be able to assist by endeavouring to obtain land on easy terms for horticultural industries. It may also do something towards removing other disabilities and obstacles, such as insecurity of tenure and the costly system of distribution.

Mr. C. H. CURTIS remarked that the terms of Mr. Divers' resolution would exclude he Chairman (Mr. Thomas) and Mr. Jaques from membership, neither of whom is now a private gardener. The Association should have a much wider scope.

Mr. Gregory and another gentleman having spoken in favour of the broader scheme, Mr. Drost, a market nurseryman of Richmond, supported the same plan from the point of view of the employer of labour.

The CHAIRMAN subsequently put the amendment, which was carried with four dissentients including the Chairman.

Mr. Watson then proposed that the following gentlemen be asked to constitute themselves a provisional Committee, with power to add to their number: Messrs. C. Jordan (Hyde Park), W. Watson, E. Beckett, W. H. Divers, E. Rochford, Peter Kay, George Gordon, R. Hooper Pearson, H. J. Cutbush, F. Sander, jun. (from F. Sander & Son), A. Dean, J. Weathers, and C. H. Curtis.

This Committee will prepare a scheme to be submitted before a public meeting of gardeners.

OUR SUPPLEMENTARY ILLUSTRATION affords a view of the Cattleva-house at Gunnersbury Park, one of the gardens of Mr. LEOPOLD DE ROTHSCHILD (gr., Mr. G. REYNOLDS). The photograph was taken when the varieties of Cattleya labiata were in bloom, and it serves to convey a good idea of the excellent manner in which the plants are cultivated by Mr. REYNOLDS. The specimen at the end of the house had about two dozen flowers, and some which flowered later were nearly as fine. Orchids are grown at Gunnersbury Park for their merit as showy and useful flowers, the selection being made with a view of having a good supply throughout the year. The Odontoglossum-houses now have a number of plants of O. crispum in flower, the supply of which will be continued for some time. Of Vanda teres, a large number of plants is grown, and they and the summer-flowering Cattleyas are in fine condition. The Crttieyas. have been grown in baskets or suspended pans to a great extent, and in the ordinary compost of peat and sphagnum - moss. The illustration proves that the result was satisfactory; but Mr. REYNOLDS, thinking that a change might be beneficial, is now using a mixture containing decayed leaves, and pots are replacing the baskets. The plants will also be placed on elevated staging instead of being suspended as formerly. A keen eye will be kept on the new departure, however, and if not beneficial a return to the old practice will be made.

DISCOUNTS FOR GARDENERS .- According to a correspondence in American Gardening, it appears that in America private gardeners have been "gradually educated" to expect a discount on their annual purchases of seeds. Of course the practice is strongly repudiated by our colleague, one of whose correspondents says such methods as "advertising certain discounts will not be countenanced by any conscientious gardener." We have already mentioned that last season a certain Dutch firm openly offered discounts of this nature, whilst others requested the name and address of the gardener. It is very difficult for a British trader who wishes to conduct his business in a legitimate manner if he has to meet competition of this character.

HORTICULTURAL INSTRUCTION IN RUSSIA.

—We take from the Moniteur d'Horticulture the following particulars of a mode of horticultural teaching which may become necessary here if the floods continue. An immense raft is constructed and placed in a stream. On the raft soil is placed, in which fruit-trees, &c., are planted. When all is ready the instructors go aboard, and the raft is allowed to proceed down the stream, stopping at the river-side villages to allow the professors to give their instruction to the peasants, who are summoned for the purpose by sound of bell. At the end of the journey the raft is broken up and the materials sold.

BOTANICAL DEPARTMENTS.—An appendix to the Kew Bulletin (entitled Appendix iv., 1903) has lately been issued. It contains a list of the members of the staffs of the Royal Botanic Gardens, Kew, and of the Botanical departments and establishments at home, in India and the Colonies in correspondence with Kew.

CHRYSANTHEMUM WINTER CHEER. — Mr. W. J. GODFREY has sent us blooms (February 19) of this new white Japanese variety, which show how valuable it will be for decoration in late winter.

EMIGRANTS TO SOUTH AFRICA. - In the interests of young gardeners in this country who are anxious to improve their position and prospects by emigration, we are asked to publish the following particulars of the conditions pre-vailing in South Africa. These particulars are supplied by an old Kewite, and we believe are trustworthy. The important matter for English gardeners to remember is the fact that £2 a week there is scarcely an equiva-lent to L1 at home. Our correspondent, who resides in Port Elizabeth, writes: "Lately I have known several cases of young gardeners coming out to this country under false impressions. Nurserymen and others have induced them to sign agreements for two or three years at wages of £2 per week, which is not enough to exist upon, much less to provide clothing, &c., all of which are expensive here. Even natives make as much as 30s. to 35s. per week, thus leaving a surplus of 5s. to an experienced white man who has worked perhaps ten or twelve years at the trade. I have seen several instances where gardeners have come out here, and when they have learned what things are like, have scraped together as much as would pay their rassage home, again, and returned. advise no gardeners to come to any situation under £3 to £3 10s. per week. For myself, I cipal parks, having been there for a number of years."

CHINESE SPECIES OF CLEMATIS, ETC .-MM. Finer and Gagnepain, taking up the work interrupted by the death of the lamented FRAN-CHET, have commenced the publication of a series of articles in the Bulletin of the Botanical Society of France (1903), p. 517, on the Flora of Eastern Asia. These articles will be complementary to those relating to China by Forbes and Hemsley in the Journal of the Linnean Society. In the Bulletin before us we find descriptions of seventythree species of Clematis, accompanied by figures of C. hastata, C. repens, C. otophora, and C. pogonandra. As many of these species are likely to be introduced into cultivation, connoisseurs may be interested in knowing of this publication. Fifty species of Thalictrum are treated in a similar manner by the same authors in the same issue of the Bulletin.

MARANTACEÆ.—M. GAGNEPAIN is occupied with the identification and description of the Marantaceæ of the Paris herbarium and garden. In the Bulletin of the Botanical Society of France, 1903, p. 586, he describes as having flowered in

the garden the following species: Costus micranthus from Martinique, Clinogyne similis, Calathea nigricans, and Calathea gigas, a very fine species provisionally called a Heliconia till the appearance of the flowers enabled its true position to be determined. The plant attains a height of 7 to 8 feet, with stalked, lanceolate leaves, spikes about 4 inches long bearing a single leaf and numerous overlapping straw-coloured bracts; sepals \(\frac{3}{4}\) inch long, purple with green and yellow spots; corolla 1 inch long, white or yellowish, staminode violet-coloured.

LINNEAN SOCIETY.—The next meeting of the Society will be held on Thursday, March 3, 1904, at 8 p.m. Papers: Mr. C. B. Clarke—List of the species of Carex known to occur in Malaya; Dr. J. G. de Man—On some species of the genus Palæmon, Fabr., from Tahiti, Shanghai, New Guinea, and West Africa. Exhibition—Mr. L. A. BOODLE: The formation of secondary wood in Psilotum (with lantern-slides).

Fertilisers and Feeding-Stuffs.—The Departmental Committee appointed to inquire into the working of the Fertilisers and Feeding-stuffs Act, 1893, met on the 23rd inst. The following members were present, viz.—The Right Hon. Lord Burghclere (Chairman), Dr. T. E. Thorpe, C.B., F.R.S.; Mr. J. W. Clark, K.C.; Mr. R. Burnard, Mr. A. M. Gordon, Mr. I. Pearson, and Mr. J. W. Spear, M.P. The following witnesses were examined:—Mr. T. Mansel Franklen, Clerk to the County Council of Glamorganshire; Mr. R. Gardner, Valley, Anglesey; Mr. G. F. Barron, Secretary of the Vale of Alford Analytical Association; and Mr. H. Rowe, Plympton, Devon.

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his Correspondents.)

THE NEW CARDEN AT WISLEY. — The fitting up and keeping up of Wisley as a first-class horticultural institution, with everything complete for research in the various departments of horticulture, cannot be done for a trifle. It will cost a great deal of money, and the Royal Horticultural Society would do well to be very careful that this admirable gift should not become a sort of "white elephant" on their hands. Therefore it would seem a wise course, as a first step, to make an accurate plan of the whole place, and then frame a complete programme of what is needed in this country for turning horticulture into a living science and art. An estimate of the probable cost of each piece of the whole work and its maintenance should be made, and then the whole work should be gradually built up as funds become available. In this way some kind, patriotic, and wealthy philanthropist may now and then be perhaps induced to give money for fitting up and maintaining some part of this great future National Institution. The present garden at Wisley, I presume, cannot be touched, as that, I imagine, is one of the reasons for which this handsome gift has been made, viz., to maintain the present unique garden in its original condition. That in itself will require a considerable expenditure. It does not seem desirable that this feature of the place should be interfered with more than can be avoided.

There are many problems connected with horticulture in this country which are awaiting solution. The following are a few in connection with glasshouse horticulture. Greenfly and other similar aphides can be efficiently dealt with by nicotine fumigation, but these preparations are expeusive, and search should be made for some cheap and equally satisfactory fumigator. Then, investigations should be made into the habits and work of that ever-present and ever-busy creature, the ant. There is a suspicion that ants act as distributors, not only of aphides, but of scale and other pests. If this should turn out to be true, an agent would be needed to destroy the ants. There

seems to be a symbiosis between ants and aphides, and perhaps also between ants and other pests, such as scale and American blight. An efficient destroyer of red-spider is badly wanted; it should be cheap and sure. When once this pest gets into a house it is very difficult to get it out again. A nurseryman here told me he had to throw away 200 pots of Ferns owing to this pest. Then there is that abomination called woolly aphis, or American blight. It is perhaps worse than the red-spider, and nicotine fumigations do not seem to destroy it. When it gets admission into a house it is one of the greatest nuisances. I always find ants associated somehow with this pest. Some cheap and easy mode of destroying this pest would be a great advantage.

A laboratory for all sorts of investigations and experiments connected with horticulture in these islands would, of course, be an essential part of the institution, and it would be advisable that some ranges of glasshouses should be set apart for experiments on plants. Fumigation would appear to be the easiest and most efficient mode of destroying insect pests; and perhaps the use of cyanide of potassium and sulphuric acid for the evolution of hydrocyanic acid would appear to offer the best promise as a general destroyer of insect pests. As this, however, is a very dangerous chemical to deal with, some means of readily opening ventilators from the outside to clear the atmosphere of the inside would be of the first importance; and also some easy means of pouring the sulphuric acid into the solution from the outside, such as an enamelled metal tube or some similar contrivance. It would be advisable to have the experimental ranges divided into separate compartments by means of glass, with a separate entrance to each compartment, so that a number of experiments may be conducted at the same time, without one experiment interfering with another. There is a number of things that can be done better by private firms in their nurseries; but there is perhaps a larger number of things that it would not pay private nurserymen, who work for profit, to handle. These especially are the problems to be served by the future great National Institution at Wisley. E. Bonavia, M.D.

THE LATE WILLIAM COLE.—In respect to the announcement in last week's issue of the Gardeners' Chronicle of the death of Mr. Cole, the following particulars may be interesting. Mr. Cole was born at Overton, Hants, on November 30, 1834, and in early life commenced to work on a farm at Overton. Here he managed to save a little money, and paid it as a premium to enter the gardens at Laverstock, Hants. From thence, by the payment of another sum, he went to Strathfieldsaye, Hants, under Mr. Johnson, then gardener to the Duke of Wellington, where he remained for a time; then to Cliveden, Maidenhead, under Mr. John Fleming, eventually returning to Strathfieldsaye as foreman under Mr. Johnson. On the death of the latter, the Duke wished to make Cole head gardener; Duchess gave the preference to a Scotchman, Mr. Bell received the appointment. But the Duke made Mr. Cole a handsome present as a solatium for his disappointment in not obtaining the post of head gardener. On leaving Strath-fieldsaye Mr. Cole went to the nurseries of Messrs. Veitch & Sons at Chelsea, and was sent by the firm as gardener to J. S. Budgett, Esq., then occupying Ealing Park. Here he remained some eleven years, and made an excellent reputation as a cultivator of specimen plants and Grapes. He was one of the principal exhibitors at the flower-shows held in Ealing and the neighbourhood. In 1875 he left Ealing Park, and established himself in business at Feltham as a cultivator of Strawberries and Grapes for market.

DISEASE-RESISTING POTATOS.—"A. D." has misread my article on this subject on p. 74. My object in writing was to try to prove that his assertion that "we were no forwarder" was incorrect; and I am of opinion that the correspondence in your paper since has proved that fact, but I did not say, nor did I think for a moment that Evergood or any other Potato was entirely disease-resisting in all parts and grown under all conditions. What I assert is that many of

the newer sorts are less liable to disease than the older ones, and if such is the case the article written by "A. D." was calculated to do a great injustice to those who have devoted years of study and hard work in trying to combat the dreaded disease, and who, in my opinion, have met with marked success. The Potato Society is to test the relative merits of various sorts now in commerce; but if after these trials are made it is found that there are no sorts quite diseaseresisting, our only way to attain the desired end would be to fall back on the raisers of new sorts, and encourage them to continue their labours with a view of securing some day a Potato that will resist disease; but I am afraid such articles as that of "A. D." will not further this end. If during such a summer as last one or two varieties stand ont prominently from others, as has been, I think, clearly proved by your correspondents, our great aim should be to encourage the raisers of those sorts to continue their efforts, and not say, "We are tired of hearing of diseaseresisting Potatos," simply because we have not yet attained perfection. I believe that in horticulture, like commerce, there is no such thing as being stationary, either we must go forwards or backwards. Which have we done since Patterson's Victoria, Dalmahoy, and Milky White were the leading Potatos? F. C. Edwards, Leeds.

BEGONIA GLOIRE DE LORRAINE.—My experience of the propagation of this plant differs from that of Mr. Branston's, described on p. 123, inasmuch as I have not found that plants grown from stem-cuttings, or joints with the leaf attached, "make the largest planta." I have grown plants that were raised from stem-cuttings side by side with others raised from basal shoots. If anything, the advantage rested with the latter, and I now use those cuttings only. If, however, I wished to raise a large stock from one or two plants, I should make a cutting of every joint with a leaf attached. But under ordinary circumstances the retention of the old flower-stems for propagation is unnecessary, and likely to harbour the mite, and therefore it is wise to take the first opportunity when the plants have become unserviceable to cut back, and consign the tops to the furnace. C. R. Fielder.

AMERICAN GRAPES .- In the Gardeners' Chronicle for February 6 there was an interesting article by Mr. W. Peters. Being desirons of promoting the cultivation of Grapes for flavour apart from mere size and appearance, I wish to point out that there are many Grapes vastly superior to the American varieties which can be brought to maturity in an unheated greenhouse as readily as they. Being an enthusiast in Grape culture, I obtained many years ago from the United States some of the best varieties of Vitis Labrusca raised there. They are very distinct from all the varieties of Vitis vinifera peculiar to the Old World. I have tried them in every way, with heat and without heat, in pots and in a good Vine-border with other Vines, and my experience of them is so unfavourable that I consider them not worth growing except as curiosities. Oddly enough, the variety best known here-the Strawberry Grape—was not familiar to my correspondents in the United States, and, according to the late Mr. Barron's Vines and Vine Culture, it was found in France growing semi-wild prior to the appearance of the Phylloxera and the introduction of American stocks. I believe it has long been known in the North of Italy. A former Duke of Devonshire liked it, and I have met with people who could eat it when given to them, but the majority thought the "foxy" taste objectionable. I still continue to grow it, and also a red variety which I have called the "Raspberry Grape," but its proper name is probably "Iona." These have a strong fruity aroma that can be noticed a long way off, but, the flavour, although resembling that of the Strawberry and Raspberry, is, in the opinion of many good judges, spoilt by the taint of the fox. Instead of being juicy the berries are gelatinous, and their contents slip down the throat before the stones can be separated by the tongue. "Niagara" is attractive in size of berry bunch, but its cloying sweetness is that of saccharin rather than that of Cane or Grapesugar. Any glasshouse in which American Grapes will ripen without fire-heat will bring to maturity that best of all Grapes, the Black Hamburgh, and the truly delicious Frontignan and Chasselas Grapes of France. Unfortunately, in London people taste with their eyes, and the demand is for large and showy Grapes, the flavour of which is less than a secondary consideration. The one exception is that queen of Grapes, the Museat of Alexandria, which has a fine flavour as well as an attractive appearance. For a reliable description of Grapes I confidently refer the readers of the Gardeners' Chronicle to that monumental work of the late Mr. Barron, to which I have alluded. W. Roupell.

MANURE FOR TOMATOS. — Few of your readers will be surprised to learn that Mr. Holmes's experiment of an application of 12 oz. of superphosphate per square yard to a Tomato border in a house was so little satisfactory. That represents a dressing at the rate of about 23 lb. per square rod area, a dressing at once very costly and exceedingly wasteful, as it is evident no crop could utilise such a free dressing. Had he but tested the 6 oz. per square yard of sulphate of potash, that being again at the rod area rate a very heavy quantity, apart from any superphosphate, he would probably have secured quite as good a result as was that mentioned. Still, it would be very interesting to learn how much would have been the crop produced on any similar area, the plants depending solely on what manure was found in the turfy-loam of which the border was composed. The cost of a manure dressing of 18 oz. per square yard must have been considerable. A. D.

THE GARDEN RUBBISH-HEAP. - I read Mr. Simpson's article upon this subject with the attention so important a matter deserves, and the conclusion that I have arrived at is that his system is not to be recommended for general adoption. The wet seasons from which we have suffered have brought the question to the front, as it has been very difficult to keep the weeds down. No donht some some annual weeds are beneficial to the soil when dug in, just as a green crop of tares would be, but Cabbage stumps, Potato and Pea haulm, and other tough refuse are positively injurious to the land if for no other reason than that they infest it with slime fungus, Potato-disease, mildew, and insect pests such as club magget or fly, wire-I have known manure from pig-sties worm, &c. to be highly injurious when used without been fermented because it swarmed with false wire-worms, creatures that feed on partially decomposed vegetable matter in their early stages afterwards attack Potato tubers, the rootstocks of Cabbages, &c. I have known them to pierce ripe Strawberries in all directions so as to completely spoil the fruit. Some weeds are injurious because they are the host plants of certain insects. The familiar garden weed "Fat Hen" nourishes the Black Aphis until the tops of broad Beans are fit for their use, and numberless other instances of injurious host plants might be named. When we want to catch wire-worms we bury a piece of carrot. If refuse cannot be thoroughly fermented in a heap it should be burnt and the valuable ashes spread upon the ground. W.

— Mr. Simpson, at p. 81, would make a clean sweep of the gardeners' old friend, the rubbish-heap. I think that such a receptacle is necessary to a garden, and at the same time can be kept decent and tidy. Pea and Bean haulm. Brassica stumps, trimmings of herbaceous borders, hedge clippings and prunings, should be kept separate, and burned when opportunity offers. In suburban gardens space is usually so limited that a corner can scarcely be found for a "heap, and I have been compelled to pay for such refuse to be carted away, which I should have been glad to have retained, and when decayed to have dug into heavy ground. In such gardens it is impos sible to burn garden refuse to get rid of it as the smoke annoys one's neighbours. It is an old maxim Smoke where no fly," and "Hoe where no weeds. but last season was so wet that hoeing was useless in getting rid of weeds, and keeping the garden clean. Digging in weeds and rubbish may answer in large country gardens, where such close cropping is not necessary, and the ground can remain fallow for a time to give such refuse time to decay, so that the roots may assimilate the manurial properties of such. Turning a wellmanaged rubbish-heap can be done at times when it is not favourable for ground work, and can eventually be run on to vacant ground on frosty mornings. George Potts, Streatham, S.W.

—— I too, like your respective correspondents, Mr. Simpson and Mr. Stocks, was for a long period of my life also in charge of a rubbish-heap, which was an accumulation of all weeds, superfluons vegetable matter, disused potting earth, prunings of trees, and everything else that had to be cleared away. All these were thrown on to one heap in the rubbish yard close by. Any material that would burn was set fire to, and that gave the heap a liberal mixture of wood or vegetable ash. When the heap became inconveniently large the whole mass was turned over, leaving ont such portions that had not sufficiently rotted down, and which was added to the new heap again forming. When the turned-over heap had lain for some time to further decompose and sweeten, it was then carted into the garden and used as circumstances required. With the exception perhaps of a Spinach-bed or an old quarter of Strawberry-plants being trenched-in, we never dug in vegetable matter in the crude state, preferring to have it all decomposed. Simpson's system, which appears to have been successful under his treatment, is the only instance I ever heard of. And we shall be interested to hear if Mr. Simpson's system of a weedy garden, which he appears to recommend, finds some converts amongst the students of the new schools of scientific gardening now forming throughout the country. True I may be considered a gardener of the old school, but I am not at all prejudiced against any new system, provided it has some backbone of commonsense to recommend it. W. Miller.

STRAWBERRY - SEDS .- The digging between the rows of plants is only done just deeply enough to cover the dressing of rotten manure, and does not destroy the surface-roots as Mr. Stocks Most outdoor crops are benefited suggests. having an inch of loose surface-soil, and the Strawberry is no exception to this. A loose surface not only helps to conserve the moisture in the soil and prevent the ground cracking in dry weather, but it is a great aid to equal distribution of water, whether from rain or by watering in times of drought. The forking over of the surface-soil in Strawberry plantations is very necessary on wet, clayey soils, especially after a wet season like that of 1903, as the water stood about on the ground in puddles where it had been trodden a little. It would be very injudicious to give the beds a dressing of rotten dung and immediately cover this with strawy-litter in January, as Mr. Markham advised. Three months later than this is ample time to apply strawy-litter to preserve the truits from dirt, grit, &c. The Strawberry, fortunately, is a hardy plant, and it is quite as unnatural as it is unnecessary to stifle the plants with strawylitter in January or February as advised. It also appears to me to be useless to trench the ground tt. deep and to break up the subsoil deeply with the viewof allowing the water to pass away freely if the water cannot reach there owing surface soil being hard, as it always does become through constant treading about the rows while gathering fruit, layering fresh stock, cutting off runners, and clearing off the strawy litter in autumn. Supposing a few roots (and there are but few) are damaged in lightly forking-in the rotten dung, I think the plants gain an advan-tage, as the dung is put in contact with the roots, and is thereby more available for the roots as growth commences. The application of to a hard and solid surface, as Mr. J. manure Stocks advises, and its removal in April, is erroneous practice, as half its value must be lost. I cannot think there are many gardeners in large private places where Strawberries are extensively grown who can afford time to wheel on to their Strawberry-beds rotten dung, and then rake it off again. Rotten dung should not be applied thickly enough to require any raking off. If Mr. J. Stocks ever does follow my method, he will find that planting Strawberries twelve months old at 1 foot apart in

the row will be of no use, as half the fruits will damp. Royal Sovereign, Monarch, &c., grow so strongly that the foliage almost meets at $2\frac{1}{2}$ feet apart each way in these gardens. A. Jefferies, Moor Hall Gardens, Essex.

- The calendarial directions that were given on p. 54 on the preparation of ground in readiness for transplanting properly hardened off forced Strawberry plants for yielding crops of ripe fruit during the months of August, September, and early part of October, as well as during the following summer and two succeeding years, were thoroughly practical, as also were the directions regarding the treatment of established plantations after the crops have been gathered. They are the reliable teachings of a practical and successful cultivator. It should not require the exercise of much reasoning on the part of any intelligent reader in order to be convinced of the good results, in the way of heavy crops of fine fruit, that is sure to follow the practice of annually laying on a good dressing of manure between the plants as soon as the crop of fruits has been gathered and the surplus runners removed from the plants. In addition to the substance of the manurial dressing heing worked down to the roots in due time, it will also preserve the soil about them in a uniformly moist state during an important stage of the plants' growth, and tend to the ultimate enlargement and consolidation of the "crowns," upon the size and mature condition of which, when the plants have completed their growth, the next year's crop mainly depends. There does not appear to be a great deal of difference in the method of procedure practised by Mr. Markham and Mr. Jefferies (see p. 90), except that the former correctly manures his plants while still in active growth, and capable of utilising to the fullest extent and in the heat dispersion. extent and to the best advantage the nitrogenous food thus applied. However, viewed from a cultural and commercial point, the difference is an important one, and altogether in favour of the writer of "The Hardy Fruit Garden" calendar. I think Mr. Jefferies has given rather too much prominence to the question of slugs, which he says would find "a safe refuge" in severe weather in Strawberry-beds manured as recommended by Mr. Markhem at p. 54. Unmindful of this asser-Mr. Markham at p. 54. Unmindful of this assertion, Mr. Jefferies says a few lines lower down in his note (p. 90), "as soon as there are frosts sufficiently severe to allow of manure being barrowed between the rows of Strawberry-plants, I have the mulching done," thereby affording the "safe refuge" for the slugs which he himself had just condemned. W. H. W.

KEW NOTES.

RARE FERNS.—It is an unfortunate fact that collections of Ferns are not popular at the present time. There are few enthusiastic growers of Ferns, and only a few nurserymen in the country possess a good collection. The demand for Ferns, other than the two cozen or so that are grown for market, is very l'mitel.

PLATYCERIUMS.

Perhaps the finest of the rare Ferns at Kew is Platycerium biforme; it is a grand specimen, and also a very remarkable-looking plant. The erect barren fronds are 2½ feet high and 2 feet broad; the fertile fronds are branched, pendulous, ribbonlike, and measure $3\frac{1}{2}$ feet long. Several plants of the rather better known P. angolense (fig. 57) are planted out on a stage; the fertile fronds of this species are undivided, differing very little in shape from the barren ones. P. madagascariense is also in cultivation at Kew; the plants have not yet reached their mature size, the fertile fronds being only 6 inches long. The plants are probably the only specimens of this species in cultivation.

, MARATTIAS.

Good specimens are to be seen of the rare Marattias, Burkei, laxa, and of Kaulfussii; the stipes of the first-named species being covered with a multitude of small protuberances. This genus, like the genus Angiopteris, is seldom seen outside botanical gardens.

OTHER SPECIES.

In House No. 1 there is a giant plant of Angiopteris evecta var. hypoleuca, having nine large fronds, each about 12 feet long and 5 to 6 feet in width.

Lindsaya guianensis and L. trapeziformis var. falcata are plants rarely seen in this country; they are very distinct, but very difficult to manage under cultivation.

Acrostichum spicatum is remarkable for having the sori developed within a cylinder-shaped structure at the apex of the frond, being so totally different from the typical Acrostichum, with its distinct barren and fertile fronds.

Helminthostachys zeylanica is a wonderful Fern, belonging to the "flowering" section; it has a fleshy stipe 1 foot high, from the top of which radiate about ten lanceolate segments; the fertile portion is developed from the centre, and is about 6 inches long.

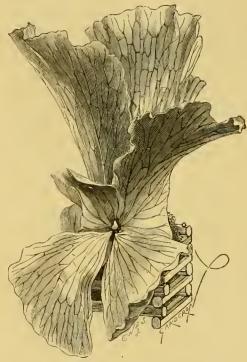

FIG. 17.-PLATYCERIUM ANGOLENSE.

Asplenium scandens is seldom seen; it has feathery fronds about 18 inches long, and is remarkable for its climbing habit; the specimen at Kew has grown up a Fern-stem some 3 feet high.

Polypodium americanum is one of the most rare and beautiful of this large and varied genus. It is covered with a felt-like film, which can be rolled off, leaving a dark-green glossy frond; it is rather leathery, 1 foot to 18 inches long, and 1½ inch broad. P. serrulatum is the gem of the genus. The graceful little fronds are some 3 inches long, and not more than one-eighth of an inch broad, with a margin very like that of a fretsaw. It would be difficult to believe this species could be a member of the same family as P. conjugatum with its giant proportions if it were not for the evidence on the reverse of the frond.

Scolopendrium nigripes is a tropical species with an almost orbicular frond about $2\frac{1}{2}$ inches across; it is a very distinct-looking plant from the typical Scolopendrium.

Aspidium anomalum. — This is probably the greatest curiosity amongst the rare Ferns. The frond is about 18 inches long and somewhat coriaceous, having the unique character of bearing the sori on the upper surface, none whatever being developed on the under surface; it is a hotanical curiosity.

One might continue to mention name aftername of choice Ferns in the Kew collection without exhausting the list. Indeed I have not referred to the Tree-Ferns or Filmy Ferns, of which there are plenty of rare kinds in the collection; but perhaps the enumeration of the few species mentioned may serve to give lovers of Ferns a slight idea of what the Kew collection contains. W. H.

SOWING ONIONS UNDER GLASS.

I po not know to what extent the practice of raising Onions under glass early in the year, to be afterwards transplanted into the garden, obtains, but it is apparent that those who have accorded it a fair trial are so enamoured by the results as to have adopted it instead of the old method of sowing in the open. I was greatly struck last autumn, when inspecting a number of cottage gardens, every one of which contained its bed of large Onions produced from seeds sown in dung-heated frames in spring, by the remark of one of the occupiers, who declared he planted 400, that they supplied his own family, leaving a surplus for sale. Another kept three families going. Moreover, their experience in another respect coincided exactly with my own, for previous to adopting this system the Onion crop, always a small one, was sometimes quite lost through maggot: but now maggot is never even

I tried all kinds of treatment in the endeavour to secure spring-sown Onions free from maggot, but in every instance the result was failure, till, trying the large-growing varieties from early-raised plants, the continued absence of maggot induced me to attempt the production of the whole crop in the same way, with the result that maggot is now, and has been for some years, a hearsay difficulty only. At first I expected that the extra labour required would be a serious drawback, but if there is more required in the production of a crop, it is certainly only slight, and to compensate it is not labour misspent, as one often felt it to be when the little plante from seeds sown in drills went down in lines. There are, too, other advantages in the system. The crop off a given space is perhaps three times larger than by the old method, and so less ground is required to produce the same quantity. The Onions besides are very much better flavouredalmost as mild, indeed, as Spanish produce; and I am not referring here to the large varieties selected for exhibition purposes, but to old and common kinds of the James' Keeping type, which individually bulk sufficiently large to meet the requirements of the most exacting cook-maid.

It must be explained that the culture of the plants in their earlier stages is considerably simpler than that usually accorded Onions raised in this way. The seeds may be sown as late as March 1, but those sown early in February produce a bulkier crop. It is essential that the soil be open and very fertile. To save time and space, once the seeds are sown, the boxes are piled one above another in a vinery till germination takes place, when they are stood out singly, and shortly afterwards tranferred to a late and therefore a cool Peach-house, whence towards the end of March they are placed out-of-doors. Early in April the little plants are set out in the portion of the garden chosen for the crop.

No better preparation of the ground than that afforded by a previous crop of Celery can be made, and therefore I mostly always succeed in letting Onions follow Celery. The lines run 15 inches apart, and the plants 4 inches apart in the row. Once dibbled into the ground, the plants receive no further attention beyond that of repeatedly hoeing the soil and weeding it. On more than one occasion a sharp frost has nipped the little seedlings shortly after transplantation, but they have always bravely overcome these

early misfortunes. I do not know that there is anything novel in producing Onions in this way, because it is apparent from old gardening records that something akin to the practice obtained long ago—with this difference, that the old-time gardener sowed his crop very thickly in the open garden the previous summer, and preserved the wee bulbs over winter, which, planted in spring, produced very large hulbs. So beneficial is the above practice that, at least in the North, it bids fair to become universal. B.

SOCIETIES.

ROYAL HORTICULTURAL.

FERRUARY 23.—On the occasion of the fortnightly meeting on Tuesday last, the Drill Hall, Buckingham Gate, Westminster, was filled with bright exhibite, and during the afternoon the pathways were so thronged with visitors that it was a matter of great difficulty to move about. Orchids were more than usually numerous, and the Orchid Committee awards included one First-class and one Botanical Certificate, and three Awards of Merit.

Before the FLORAL COMMITTEE were exhibited beautiful groups of forced Azaleas and other flowering study, and hardy flowers were more numerous than they have been. This Committee recommended three Awards of Merit.

The FRUIT AND VEGETABLE COMMITTEE had absolutely nothing to do.

In the afternoon a paper by Mr. R. Lewis Castle on "Pomology as a Study" was read by the Secretary.

Floral Committee:

Present: W. Marshall. Esq. (Cnairman); and Messrs. C. T. Druery, R. C. Notcutt, R. Dean, John Green, W. Howe, J. F. McLeod, R. Hooper Pearson, G. Reuthe, J. Jannings, C. R. Fielder, C. Dixon, C. J. Salter, J. A. Nix, Chas. Jeffcies, J. W. Barr, C. E. Pearson, R. W. Wallace, W. Cuthhertson, W. P. Thomson, E. H. Jenkins, W. J. James, Chas. E. Shea, and H. J. Cuthush.

The Rev. W. WILKS, M A., showed the members a fruit of Allamanda Williamsii, which was considered to be very rare in English plant-houses. A similar fruit was illustrated in the Gardeners' Chronicle, May 19, 1894, p. 633, which we reproduce in fig. 58.

Messrs. W. Cutuush & Son, Highgate, N., stsged a collection of early-flowering plants and decorative shrubs, prominent among the latter being Spirea Thunbergi. The group was backed with batches of Narcissus in variety, Golden Spur being very good. Iris sindjarensis and I. orchioides among others were included in the exhibit, while I. Bucharica, a tall species with white flower and yellow lip, was very noticeable, Hepaticas, Anemones, Saxifragas, Scillas, coloured Primroses, and the Grape Hyacinths were included. The centre of this collection was occupied by Clematis indivisa lobata, which made a fine show with its numerous flowers.

Messrs. Barr & Sons, King Street, Covent Garden, London, had a group of similar plants, Petasites fragrans, and sweet-smelling Hyzelnths, evidently catering for a different class of wivged visitors to their neighbour, the fætid Hellebore. Dwarf Veronicas, Ivies, and other similar rock-work plants were mingled with such tiny members as Natcissus minimus, N. cyclamiceus, Hepaticas, Scillas, &c. A showy basket of Byacinth "Leonidas 'was suspended above the stage, some of the plants making an effort to grow from the bottom of the basket.

Messrs. WILLS & SEOAR, South Kensington, staged a group of decorative Palms near the entrance. Some very good specimens were included in the collection, which was tastefully set up, nice plants of Kentia Canterburyana, Stevensonia grandiflora, Areca sapida, Carludovica palmata, Cocos Bornett, and C. plumosa, among others, heing present (Silver Flora Medal).

Messrs. J. Cheal & Sons, Crawley, contributed to the collection of Alpine plants in several trays planted in miniature ruck-garden style. Included were some good blue Primroses, dwarf ornamental shrubs, Contfers, and other plants suitable for the rockery. Primula denticulata and P. denticulata alba were well shown in this interesting group

Messrs. H. Henderson & Son, High Road, Tottenham, showed good specimens of Chrysanthemum Mdlle. Louise Charvet

Messrs. H. Cannell & Sons, of Swanley and Eynsford, staged Primulas of their well-known strain even better than on the two previous occasions this season. The plants were excellent specimens of these useful decorative plants, some of the individual flowers heing of extraordinary size and substance, with charming colours. Mrs. R. Cannell, a large well-shaped flower, white, with a pleasing yellow centre, had massive trusses of bloom; Fashion, a delicate mauve-pink, shading to a lighter centre, with stellata blood, was handsome; while Red Rover and Cardinal were good reds. Polar Star had loose panieles of white flowers. Another fine whife was White Duchess. Among the true Chinense type were two varieties with large flowers labelled White Pearl and White Queen respectively. Moonbeam was a pleasing acquisition, having large white blooms with a pronounced yellow eye,

appeared coospicuous, while a small pan contained quits a number of these tiny Alpines in full flower, and included Cyclamen Coum, Hepatleas, Anemones, Gentiana verna, a mere midget but most conspicuous on account of its lovely blue petals, the whole being crowned with a giant looking Anemone, A. fulgens, although the latter itself was but a few inches in height.

A very creditable stand of well grown plants of Cyclamen latifolium was set up by Mc. J. May, of Gordon Nursery, Twickenham. Some of the individual plants were literally crowned with spikes of bloom, and the whole stand was a blaze of colour of all hues, the rich marbling on some of the leaves giving an additional

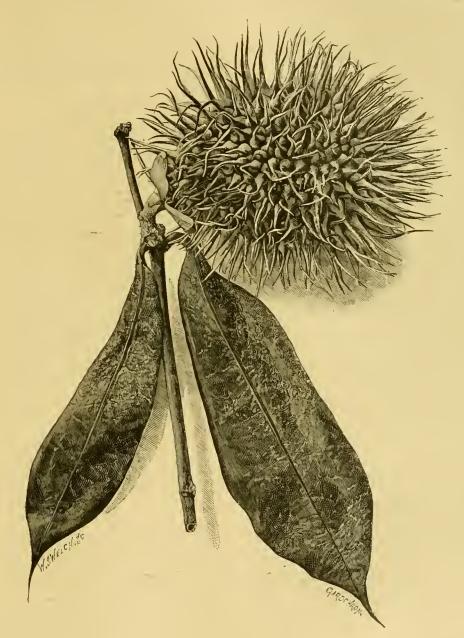

FIG. 58.—AN ALLAMANDA FRUIT-CAPSULE.

which did not detract from its heauty in the least. There were also included several trays of individual blooms arranged in rows, the whole exhibit being awarded the Silver Flora Medal. A rather showy Succulent, Echeverla gibhifora, from Messrs. Cannell, and dense heads of flowers with reddish sepals, the colour running into the upper leaves and giving the plants a very attractive appearance.

THE GUILDFORD HARDY PLANT Nursery set up a small collection of hardy early flowering plants which they make their especial province; showing good plants of Irlses, Primroscs, Saxifrages, giant Snowdrops, Cyclamen, with Ericas, Veronicas, Daphne, &c. Tellima rubrifolia, and Saxifraga Burseriana major

attractiveness to the group. Among other pleasing colours were several fine crimsons, a variety "Excelsior" having a rich shade of this colour, was an advance on the ordinary reds, although perhaps out quite so proliferous (Silver Flora Medal).

Messrs. Wallace & Co, Colchester, staged trays and pots containing a collection of Alpines, and included some very interesting species. Irises were interesting—I. Tauri, I. histrioides, I. Heldreichti, and a distinct yellow-variety, I Danfordiæ, were all good Hepaticas, Scillas. Eranthis, Crocuses, and Colchicums were included, and some good plants of Primula megascafolia. Pans of Colchicums, Crocuses, Snowdrops, and Irises were all plentifully flowered.

Messrs, J. VETTCH & Sons., of Chelsea, had a very pretty exhibit of flowering plants, interspersed with small pots of Maidenhair Ferns artistically plants of Primulas of pleasing arranged. Good and popular colours were bearing fine trusses of Stellata Blue Improved, Stellata white, salmon, and red, dotted with fine flower-heads cut from Chinensis varieties in flower-holders, and such varietles as Chelsea Rose, Salmon Red, and the beautiful Duchess, made a pleasing impression. Coleus thyrsoideus was again in evidence, giving proof of its lasting qualities as a winter-flowering plant, and formed a fitting background to a fine batch of Loropetalum chinense, a plant that deserves the attention of cultivators, its stems being literally crowded with white blossoms (Silver Banksian Medal).

Mr. H. B. MAY, Dyson Road Nurserles, Upper Edmonton, made a display of Ferns which were an object lesson in good cultivation. They were all of good colour, well-grown, clean, and most comprehensive in variety. Platyceriums in variety, Pteris Childsii, Nephrolepis Piersoni, Gymnogrammas in variety, G. schizophylla superba, and Davallia fijiensis robusta, all excellent specimens, deserve a word of mention. Davallia dissecta on its supports graced the background, while a batch of Adiantum farleyense rivalled in colour the gold on the Silver-gilt Flora Medal card whitch was displayed above indicating the Medal awarded to the group.

Messrs. Surron & Sons, Reading, staged a batch of white and blue Italian Hyacinths. The habit and perfume were good, so that they should prove desirable varieties for cutting purposes.

The Fox Hill Hardy Plant Nursery had numerous pots with flowering specimens of hardy plants. Iris histrioides major (fine blue colour), I. reticulata aurea, I. Tauri, were good; Sarracenia purpurea; Crocus Sieberi was doing finely in a pot. A rare Shortia, S. uniflora, was presented, and a new Iris, I. Hausknechti

The entrance of the hall to the right was a blaze of colour, given by a group of Azaleas staged by Messrs. R. & G. CUTHBERT, the Nurseries, Southgate. The flowers had quite smothered what foliage the plants possessed, and needed the relief given by such plants as Ferns, Palms, &c., backed with taller Palms. Standard Azaleas were worked in the group, and added to its attractiveness. The plants possessed fine colour; many were quite striking, the variety Anthony Koster being especially worthy of note; as was a fine variety of the Ghent Azılea, named Altaclarensis. Many named varieties of the mollis x sineusis group were of exceptional merit. The whole was awarded the Silver-gilt Flora Medal.

More Alpines were present, this time staged by Messrs. Ware, of Feltham, Middlesex. A great number of these little favourites were in flower. The collection formed a very fine contribution to the Alpine feature of the show. Many Primulas were presented P. obtonica of many forms, P. kermesina, P. megascæfolia, P. denticulata, and P. Cashmeriana alba were all in flower, the latter being very fine; Fritillaria crassifolia, and the dwarfer: F. citrina; the curious Scoliopus Bigelowi, and Cytanthus intermedius were all shown in bloom. Hepaticas, Scillas, Anemones, Leckenalias, Cyclamen Coum, and the tiny So denella a pina.

Messra. J. IAING & Sons, Forest Hill, staged a number of Begonia plants dotted with Maidenhair Ferns. A great many plants of Begonia g gantea carminata, with dark and red flowering spikes, had B. argentea guttata, a pretty foliage variety, as a companion. Some tipy Maidenhair Ferns along the front garea price firsh to the group.

gave a nice finish to the group.

Messrs Wm. CUTHUSH & SON, of Highgate, had interspersed in their group of forced trees and shrubs, a number of standard forced plants including Spircas, Wistarias, Laburnum, Cytisus, Riber, Prunus, Magnolias, &c. Staphylea colchica was finely flowered; Prunus triloha and Pyrus malus Scheideckeri, testifying to the usefulness of the members of the order Rosacaæ for forcing purposes. A ground work of Fatsia japonica gave a finish to the collection (Silvergilt Banksian Medal).

Near this latter group was an exhibit of Mr J. Russell, of Richmond, who saged a group of forced shrubs well arranged, tall flowering branches of Prunus triboha interspersing the whole. Andromeća speciosa was very much admired; Vibnruum opulus was good. Euryalatifolia variegata, Araucara, small Palms, &c, were used as an ecglog (filver Banksian Medal).

Mesers, B.S. Williams & Son, of Upper Holloway, staged a similar group to this last, the plants including standard Lileosyar d Azalcas.

AWARDS OF MERIT.

Eupatorium petiolare,—This is a very attractive Eupatorium with a loose branching habit, the growths requiring to be supported to a stake. The flower-heads are produced from axillary growths at every leaf axii, the upper ones, which are shorter, being also stiff enough to be self-supporting. The flowers are pink-and-white-owing to the centre ones having a little pink colour before expanding. Shown by Messrs. H. CANNELL & SONS.

Pleris Hillit.—This is a very distinct and handsome Pleris, said to have been introduced from Brazil. In general appearance it most resembles P. umbrosa, but the fronds and pinnæ are much thicker, more glossy, and the pinnæ, instead of heing flat, appear channelled, owing to the margins being nearly erect. Plants have already grown to 3 feet high. Shown by Messrs. HILL & SONS.

Cyrtomium Butterfieldii.—This is doubtless a variety of C. falcatum with crested or fimbriated margins. Being a hardy Fern it will be much appreciated. Shown by Mr. Percy J. Butterfield, The Ferns, Freezywater, Waltham Cross.

Orchid Committee.

Present: Harry J. Veitch, Esq., in the Chair, and Messrs. Jas. O'Brien (Hon. Sec.), de B. Crawshay, R. Brooman White, R. G. Thwaites, F. Wellesley, W. A. Bilney, J. Colman, W. Cobb, H. Little, H. T. Pitt, H. Ballantine, T. W. Bond, M. Gleeson, J. Duuglas, A. A. McBean, J. W. Potter, F. Rehder, F. J. Thorns, W. H. White, W. H. Young, J. W. Odell, W. Boxall, and E Hill.

The Orchids were again in the majority, a large number of groups being staged. The President, Sir TREVOR LAWRENCE, Bart. (gr, Mr. W. H. White), staged a remarkab'e group of fine specimens, which included Cypripedium × Lathamianum, with fourteen flowers × Ledouxiæ, and C. Sallieri, ten flowers; hirsuto-Sallieri, C. x Confetti, and others. Finely bloomed Dendrobium x Wiganiæ xanthochilum, with about fifty blooms; a large mass of the yellow Deudrobium x Melpomene, and D. signatum aureum, profusely bloomed; D. Kingianum album, D × Ainsworthi Hazlebourne var., fine masses of Sophronitis grandiflora, one with about sixty flowers; the graceful orangeand white Epidendrum porphyreum, Cattleya Trianæ, with eighteen flowers; and the fine C. T. Backhousiana. Ada aurantiaca, with fourteen spikes of orange-scarlet flowers: Spiranthes colorata picta, Miltonia fuscata, Odontoglossum × Humeanum, Mormodes buccioator Rolfei, the dark scarlet Epilælia × Psyche, Calanthe Sanderiana, and C. Steveusi; Odontoglossum coronarium miniatum, Masdevallias, &c. (Silver-gilt Flora

JEREMIAH COLMAN, Esq, Gatton Park (gr., Mr. W. P. Bound), staged an extensive group, in which were a ve y fine set of varieties of Dendrobium nobile, and hybrids of it raised at Gatton Park. Among those noted were threegood D. nobile album, D. X Wiganianum purpureum, D. X Aspasia, D. X Sibyl, D. Owenianum, D. X Rolfei, D. X rubens miroir, and D. R. elegans, the latter a fine improvement on D. nobile elegaus: D. X Artemis, D. X Othello, and D. X Firedy, fine hybrids raised at Gatton Park; a good set of varieties of Cattleya Triane, two of the most interesting being the old but still distinct C.T. Penelope, and the showy C.T. Mr. J. Colman; Vanda Cathearti, Zggocolax X Vei'ch', and various good Odontoglossums and Cypripediums were also remarked in the group, which secured a silver-gut Flora Meda!

Messrs Sander & Sons, St. Albans, were awarded a Si ver-gilt Flora Medal, for a very large group in which the raser species and hybrids were set up with magnificently flowered specimeus of Dendroblum Ward! anum, and with which was a specimen of the new D. Wardianum xantholeucum, a finely formed pure white flower with a large orange-yellow disc to the lip, on which there was no trace of the purple lines or spots usually seen in D. Wardianum album varieties. Set up with the Dendrobes were some good Odontoglossum crispum and notably a distinctorange spotled variety; O. nevadense. O. x loochristyense, O. x Wilckeanum, Cypripedium.x Persephone (Lathamianum x exul), an at ractive hybrid with a good dearof C. exul evident; C. x aureum Olympus, Selenipedium x "Pink Pearl" of the S. longifolium class, but with white-and-rose flowers; a set of varieties of I relio-Cattleya × Bletchleyensts, the rich orange Lælio - Cattleya x Doris Sander's variety, and other hybrids. .

R. G. THWAITES, Esq., Chessington, Streatham (gr., Mr. Black), was awarded a Silver Flora Medal for a fine group, principally of remarkably fine Dendro

biums; the D. nobile Murrhinianum and some others being very large and well bloomed specimens; and D. n. Thwaites variety, one of the largest and finest of coloured forms. Also noted were a large plant of a yellowish Dendrobium × Wiganiæ, some finely-coloured D. × Schneiderianum, D. Brymerianum, and other Dendrobes; the new yellow Lælia × Gwennie (Jongheana × Perrinii), Odontoglossum crispum, &c.

Mr. J. CYPHER, Cheltenham, secured a Silver Flora Medal for a pretty group, in the centre of which was an arrangement of the elegant white Dendrohium barbatulum, very profusely flowered. On each side were a selection of the best varieties of Dendrohium nobile, D. × Ainsworthii, &c.; Cypripedium villosum giganteum, C. × Lathamianum, t. e very handsome emeraldgreen-and-white C. × Maudiæ, C. × Gowerl, a fine white Miltonla × Bleuana, the scarlet Masdevallia × Heathii, and the yellow M. × Hincksiana, good forms of Cattleya Trianæ, &c.

Messrs. Jas. Veitch & Sons, Chelsea, staged an effective group principally of hybrids, one of which, and a very interesting Cymbidium from Yunnan, secured an Award of Merit. Other specially good things in the group were the clear white Lælio - Cattleya × Orpheus (C. Trianæ × L. glauca), L.-C. × Myra, both the clear yellow and the nearly white variety named "alba;" L.-C. × highburyensis, L.-C. × callistcglossa, L.-C. × Pallas, L.-C. × Warnhameusis, Phalænopsis × Hebe, Cypripedium × Miss Louisa Fowler, and other Cypripediums; several varieties of Dendrobium × Scylla (Cybele × japonicum), the hrilliant scarlet form of Epidendrum × O'Brienlanum, Masdevallia Imogen &c. (Silver Banksian Medal).

J. Bradshaw, Esq., Southgate (gr., Mr. Whitelegge), staged a select group, in the centre of which was the showy Ledia × D gbyano-purpurata "Mikado," with good sepals and petals, and showy rose-purple lip; and Cattlega Trianæ "Mavourneen," a good large white flower with a tinge of pink on the lip. (With them were some good Odontoglossums, including O. × Adrianæ and O. crispum, with strong branched spikes. Leaf soil had caused wonderful vigour in the plants, but the branching of the spikes has rendered the individual flowers of indifferent quality. "Also noted were Lycaste Skinneri alba and Enchantress, good O. × excellens, and other Odontoglossums (Silver Banksian Medal)

Messrs, Hugh Low & Co., Bush Hill Park, had an effective group, in which bushy, profusely-flowered specimens of Dendrobium crassinode were a feature. There were also some finely-coloured Cattleya Triane, the one named "grande" having a very large and finely-formed bloom, and another, pure white; good Dendrobium primulinum, Cypripedium x nitens magnificum, C. x J. Howes, C. x Calypso, Phalænopsis Stuartiana, and others, were also in the group (Silver Banksian Medal).

M. CHAS. VUYLSTEKE, Loochristi, Ghent, sent Odontoglossum \times Vuylstekei recens, and O. \times V. concinnum, two very fine dark forms; a good O. \times ardentissimum with purple markings on the segments; two forms of O. \times loochristyense and a finely-marked O. \times bellatulum nilens.

F. W. MOORE, ESQ, V.M.H., Royal Botanic Gardens. Glasnevin, Dublin, sent a magnificent spike of a very large and beautifully-marked form of Cymbidium graudifiorum.

JOHN C. F. RAMSDEN, ESQ. Guildford, sent a yellowish form of Cypripedium × Harrisianum.

G. W. LAW-BCHOFIELD, ESQ, Rawtenshall (gr. Mr. Shill), sent Cyprlpedium x aureum, Surprise, a beautiful yellowish-and-white flower.

R. BRIGGS-BURY, ESQ., Bank House, Accrington (gr. Mr. Wilkinson), again showed the beautiful Cypripedium × Minos, Young's variety, and the fine C. × Beckmanii (See Awards).

J. GURNEY FOWLER, Esq., South Woodford (gr. Mr. J. Davis), scut Cypripedium x J. Davis (? Dauthieri x Lecanum), a pretty light-coloured flower tinged and spot(e) with rose

F. WELLESLEY, Esq., Westfield, Woking (gr. Mr. Hopkins), seut Cypripedium villosum pulchellum, an attractive flower.

"MR. HENKEL, Darmstadt, sent a white Cattleya

Awards.

FIRST-CLASS CERTIFICATE.

Cypripedium × Beckmanii, from R. Briogs-Bury, Esq., Bank House, Accrington (gr. Mr. Wilkinson).—One of the nublest of Cypripediums, in which a flue form of Cy Sallieri has doubtless taken part. Flower of massive size, greenish - Jellow, the dorsal sepal heautiful,

spetted with blackish purple. Petals and lip tinged purple.

AWARDS OF MERIT.

Cymbidium × Ballianum (eburoeum × Mastersii), from Captain G. L. HOLFORD, Wes'onbirt, Telbury (gr., Mr. Alexander). - A very fine hybrid with pure white flowers, equal in size to those of C. eburneum, but with more pointed segments and more flowers on a spike, as in C. Mastersii, that on the plant shown having four fine flowers; crest of the lip yellow.

Cymbidium Wilsoni, from Mesers JAS. VEITCH & FONS, Chelses. - A remarkable species imported from Yuunan, China, and closely allied to C. g'ganteum, compared with which the plant is much dwarfer, the scape more slender, and the labellum less hairy. Sepals and petals green, with some indistinct dotted reddish lines extending halfway up. Lip cream coloured, with sepiabrown lines inside the side lobes, and reddish markings on the front.

Sophro-Cattleya × Saza (S. grandiflora × C. Trianæ), from Messrs. Jas. Veitch & Sons -A floriferous dwarf hybrid with rose coloured flowers, darkest on the lip.

BOTANICAL CERTIFICATE,

Dendrobium Williamsoni, from F. W. Moore, Esq, Royal Botanic Gardens, Glasnevin, Dublin.-A rare Himalayan species of the nigro-hirsute section, with white flowers baving orange-coloured discs to the lip.

CULTURAL COMMENDATION.

To Mr. G. A. King, gr. to Kennedy Jones, Esq., Knightons, East Finchley, for well-cultivated Cologyne cristata.

THE ROYAL CALEDONIAN HOR-TICULTURAL.

THE schedules of prizes to be offered at the spring and sutumn shows of the Royal Caledonian Horticultural Society have reached us. The shows will be held, as usual, in the Waverley Market, Edinburgh, on May 25 and 26, and September 14 and 15 respectively. Entries for the shows are open to all, whether membere of the Society or not.

The prizes are valuable and numerous, the classes comprehensive, and again include a competitive plan, open to under gardeners only, to be laid out suitably for a suburban residence garden, the 1st and 2nd prizes for which have been generously contributed by Sir John Glimour, Bart.

At the autumn show of the Society, always remarkable for exhibits of fruit, a special Trophy is offered for a collection of eight bunches of Grapes, containing not more than two bunches of any one variety. This has

more than two bunches of any one variety. This has been tendered to the Society by Mr. W. H. Massie, of the firm of Messrs. Dicksons, Edinburgh, and is a Silver Challenge Trophy worth 50 guineas. It will become the properly of any exhibitor who wins it three times. To this the Society has added valuable mone-

tary prizes and a gold badge.

The experiment of holding the Spring Show in the third week of May having been a success, the Council has decided to repeat it this year.

The membership of the Society has increased as we ave announced several times. The Council consider have abbounced several times. The Council consider that it is time another International Exhibition was held, and have begun preparations for a great International Exhibition to be held in Edinburgh in September, 1905. The Council hope to be in a position to offer about £1 500 in premiums. His Majesty the King has graciously accorded his patronage to this Exhibition and has given a Silver Cunto be availed.

Exhibition, and has given a Silver Cup to be awarded.

There has been a balance to the good on the year's working, which is largely due to the great increase in members during the last two years.

LINNEAN.

FEDBUARY 18 .- PROF. S. H. VINES, F.R.S., President, in the Chair.

Mr. R. H. BIFFEN read his paper on "Mendel's Laws and their application to Wheat Hydrids," illus!rating his remarks with lantern-slides.

An investigation of the various characters of the different races and varieties of Wheat showed that the following characters were dominant :- Beardless palese, keeled glumes, lax ears, velvet chaff grey coloration, red coloration in the chaff and red coloration in the grain; the corresponding recessive characters being tearded palem, rounded glumes, dense ears, glabrous chaff, white coloration in the chaff and grain.

In the second generation the plants showed the usual splitting into three showing the dominant character to one showing the recessive, with the exception of the rough chaff of Rivet Wheat, which in several cases was followed by impure splitting. In this generation a considerable variation occurred, particularly among the colour-characters, grey, for example, becoming almost black in some cases and very pale in others. Nevertheless, the splitting into grey and white and grey and red chaff appears to be pure.

An example of a hybrid intermediate in character between its parents was afforded by Polish Wheat Rivet. The progeny bore glumes and grain intermediate in size to that of the parents.

Evidence was also brought forward to show that certain anatomical characters, such as the presence of groups of bristles, the arrangement of sclerenchyma girders, the presence or absence of pith in the internodes, also followed Mendel's Laws. The same also appears to be true of certain "constitutional" characters, such as the time of ripening and the immunity to attacks of rust.

Prof W. F. R WELDON spoke at length on his views of the Mendelian hypothesis, referring in illustration to observations on hybrid albino mice and albino human beings.

Mr. W. BATESON, F.R.S., exhibited a series of specimens of Primula stuensis, about 240 in number, lent by Messrs. Sutton & Sons, illustrating the phenomena of heredity and variation, which he had been permitted to witness in their nurseries during five seasons. was well known, the species, since its introduction about 18.0, had given off numerous mutational forms, e.g., Fern-leaved, Ivy-leaved, the "stellata" type, and others. Many of these in their tuheritance follow simple Mendelian rules. Palm-leaf is dominant over Fernleaf and over svy-leaf, reddish stem over green stem and over deep red stem, single flowers over double, and each recessive form breeds true from self-fertilisation, from whatever pedigree it be derived. Imperfect segregation of Fern-leaf from Palm-leaf occurs as a rarity. The original introduced plant was thrum-eyed, but the pin-eyed is almost exclusively cultivated now. Thrum-eye is dominant over pin-eye. "Homostyled" forms have appeared, and their character is recessive to both pin and thrum. The stellats and sinensis types give a blend-form on crossing.

In the case of colour certain complications exist. Pure white with green stem is recessive to most and probably to all colours; but the evidence suggested that when a linged or flaked white with a reddish stem is crossed with colour, the colour is practically recessive, as in poultry. More experiments on this important point were needed. Pinks are recessive to mauves, and consequently mauves cannot be bred true without individual selection. Blue is often altogether disintegrated on crossing, not again reappearing. Some heterozygous types exist, e.g., cortain Livenders, and certain fancy reds. These each year give off two or more distinct colour types from the "self crossing of which they are formed. Of the two forms so given off, one at least breeds true at once, but the other may again break up in the succeeding generation. This case is exactly comparable with that of the Andalusian fowl.

Prof. W. F. R. Weldon criticised the paper, and was replied to by Mr. Bayeson; in summing up the President proposed a special vote of thanks to Messre, Sutton & Sons for their most interesting exhibition, which vote was carried by acclamation.

IRISH GARDENERS' ASSOCIATION AND BENEVOLENT.

Phis Society, founded in 1895, continues to show regress. It has assisted four members during the year to the full benefit allowed, and urges upon members year to the imbordance of placing before their friends the benefits and educational advantages which the Society affords. A balance of £34 15s, 11½0, stands to the credit of the Society. Mr. F. W. Moore, of Glasnevin, has been elected President for the year; with Mr. G. Watson, Treasurer, and Mr. W. S. Hall as Hon. Secretary. The syllabus for 1904 contains a comprehensive list of lectures and papers of general interest. Several competitions are members, for essays, packing, &c. open to the

EALING HORTICULTURAL.

THE Annual Meeting of this Society, which since 1861 has held an unbroken sequence of summer flowershows, took place on the 12th inst, Mr. R. WILLEY, one of the vice-presidents, in the chair.

The report of the Committeeset forth that the adverse The report of the committee set torth that the adverse balance left over from 1902 had been wiped out, and there was a small balance in hand. Mr. Leopold de Rothschild was re-elected President, Mr. A. G. Dixon, Treasurer, and Mr. George Cannon, Szcretary. The Committee recommended that the next show he held on June 29, so as to secure an exhibition of Roses. It was also reso ved that it be an instruction to the Committee to obtain consent to hold the show in Gunners bury Pack on the last-named date.

GARDENER'S' DEBATING SOCIETIES.

BECKENHAM HORTICULTURAL. On February 12 Mr. H. J. Jones gave a lecture on the "Sweet Pea." Mr. Weeks, Secretary to the Bromley Chrysanthemum Society, presided. The lecturer said it was possible to have Sweet Peas in bloom for three or four months. live Sweet Peas in bloom for three or four months. Take out deep trenches, put a good dressing of old hot bed manure at the bottom, and return the soil. Sow the seeds thioly, and when watering give a good soaking rather than a little often. To retard the flowers, should to be necessary, cut the plants down to within 15 inches of the ground, and in a month alterwards they would be again in bloom. The flowers should be actioned della search alleging rather features. wards they would be again in hoom. The flowers should be gathered daily, never allowing pods to form. Sweet Peas dislike strong manure. When watering with manure-water, care should be taken not to wet the stems or foliage. The process of hybridisation was fully explained, and a list of best varieties given. In the discussion that followed, Mr. Crosswell agreed with Mr. Begett's engineer that red lead whed to continue Mr. Beckett's opinion, that red-lead used to coat the seed before planting as a preventive against rats and mice was injurious to the seeds. Other speakers differed from this, and it would be interesting if readers of the Gardeners' Chronicle gave their experience : upon the matter.

READING GARDENERS' MUTUAL IMPROVEMENT. At the last fortnightly meeting of the above Association, Mr. Wiusor, foreman, Bearwood Gardens, gave a practical demonstration of wreath-making, and two wreaths were made during the evening. The first was to show the quicker method of making, the other to illustrate the procedure when more time is available. The principal flowers used were Arums, Carnations, Lily of the Valley, Roman Hyacinths, Orchids, and Chrysauthemuns. A useful discussion followed, in which many hints were given by Mr. Powell, of Park Place. Eight new members were cleeted.

CROYDON MUTUAL IMPROVEMENT - The lordnightly meeting was held on the 16th inst., when "Forced Vegetables" was the title of a paper read by Mr. W A. Cook, Shirley Park Gardens, who brought a good collection of these esculents to illustrate his paper. This being his first introduction to the mem hers of the Society, he was awarded a hearty reception. ; hers of the Society, he was awarded a hearty reception. He comphasised the increasing demand there is for forced vegetables. Toe varieties that came under notice were Asparagus, French Beans, Cauliflowers, Chicory. Dandellon, Cucumbers, Mustard and Cress. Peas, Scakale, Rhubarb, Potatos, Mushrooms, and Towards, New Legipton, invited the Inches here. reas, Seagale, Khudard, Potatos, Mushrobins, and formatos, the lecturer giving detailed instructions how each should be treated from the seed sowing until they are ready for the table. The different structures of house they should be grown in, soils and receptacles required, temperatures for each species, watering and ventilation, were each dealt with in detail.

CHESTER PAXTON. - 'Tillage versus Grass chards" was the subject of a paper by Mr. G. P. Miln on the 20th lnst. Some statistics were given from exon the 20th lust. Some statistics were given from experiments made as to which of the two methods was the better, the results being all in favour of Apple and Pear-trees being planted in tilled ground. On deep loamy soils, orchards of Apples and Pears might be safely grassed over after the trees had attained the age of from six to eight years; whilst on shallow tolk orchards should always be kept under tillage. An interesting and profitable discussion followed; and on the proposition of Mr. J. Wyone, Rowton (who presided), seconded by Mr. N. F. Barnes, the lecturer was accorded a hearty vote of thanks. was accorded a hearty vote of thanks.

LOUGHBOROUGH GARDENERS' .- The forinightly meeting of this Association was held in the Town Hall on February 16 Mr. J. Murray, B.Sc., Agricultural Lec-turer, gave a lecture upon "The Potato." Reference was made to placting, width of rows, distance between the sets, &c.; and good tillage was urged as being all important. Spraying for disease was fully explained, with details concerning artificial manures, the results of experiments on trial-grounds were given, and special reference made to Potato-culture in Lincoln shire. At the conclusion the lecturer was accorded thanks, and the Chairman received a similar compliment for presiding.

CHESTERFIELD & DISTRICT CHRYSANTHEMUM. CHESTERFIELD & DISTRICT CHRYSANTHEMUM.

The monthly meeting of this Society was held on February 16, when a very able paper was read by the Hon Treasurer, Mr. Burr, F.G.S., the subject being "George Stephenson at Tapion." Mr. Burr devoted some time to a description of Stephenson's pursuits after he had settled at Tapton House, Chesterfield, in 1540 Experiments and inventions carried on by him in his garden, both under glass and outside, were described. with Mr. Paxton, at Chatsworth, he was on the beston terms, and a friendly rivalry existed between them in the cultivation of fruits and flowers. The Stephenson Memorial Hall, in which the Chrysanthemum Society holds its autuum shows, was built to comemorate the life and work of one of Eogland's noblest sons.

HEADLEY AND DISTRICT. -The recently organised Gardeners' Mutual Improvement Society, at Read'ey, held its first meeting on February 13, at the Headley Institute, Mr. J. N. Mappin, presiding, Mr. J. Gregory, West Croydon, gave an interesting lecture of Some Gardens I have visited," i lustrated. The lecturer dealt briefly on various specimens of trees, shrubs, and plants taken from some of the principal gardens of England. This is the first of a series of lectures arranged for the first Tuesday in each month. Prizes are to be given to young men who give the hest essays on subjects of garden interest.

EGHAM AND DISTRICT.—A general meeting was held to inaugurate this new Association on Wednesday evening, February 21, when membera were enroited, officers elected, rules adopted, &c.

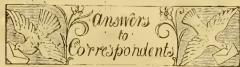

Obituary.

MRS. MUNDAY .- The death is recorded of Louisa Catherine Georgina Munday, widow of the late Major-General Godfrey Munday, on February 17, at 28, Montrell Road, Streatham, in her ninety-sixth year. The death of this lady is interesting to readers of the Gardeners Chronicle because she was a daughter of the late Hon. and Very Rev. William Herbert, Dean of Manchester. Dean Herbert published as early as 1806 a series of translations from the Norse, Italian, Spanish, and Portuguese. He originally studied law, and was also a Member of the House of Commons. To botanists he will always be remembered for his works on gardening matters, especially on hybridisation. His best-known work is The Amaryllidacea, which contains a mass of useful information on bulbous plants and their cross-fertilisation. A genus of bulbous plants was named Herbertia in honour of the Dean. He was born in 1778 and died in 1847. J. Dougtas.

FIBRE PLANTS IN CEYLON.—Britain's need is the world's opportunity-or perhaps, rather, the opportunity of that section capable of supplying the need. Ceylon would appear to be in this latter condition, with its railways, roads, its irrigation tanks and distributing appliances, &c. It has large tracts suited for Ramie, Rhea, and other fibrous plants, and it is maintained that cotton, equal to the best American, can be grown over vast tracts of land suited to the culture. And this is the staple just now lacking to render our spinners capable; they are willing to meet the world's enormous demand for the manufactured article. It may be that the necessary labour might not be forthcoming to the required amount. but the Deccan, the Cotton-growing quarters of India, might do much, and if there are over many coolies in the West Indies, an exchange of habitation could easily be effected. Capital is probably the thing most needed, and surely this ought soon to be had.

STOP-PRESS NOTE.

As this sheet is passing the press we regret to hear off the death at Sierra Leone of M. E. Laurent, of Gembloux, from fever. We shall allude to the subject again next week.

* * Editor. And Publisher.—Our Correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all communications relating to financial matters and to advertisements should be addressed to the Publisher; and that all communications intended for publication, or referring to the Literary department, and all plants to be named, should be directed to the Editor. The two departments, Publishing and Editorial, are quite distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Property of the second

AZALEA INDICA: Tewkesbury. The pale colour of the leaves of one of the shoots received is doubtless due to the roots being starved. Probably the plants have not been repotted for some time. If this be the case you should give them a shift directly the plants have flowered, and encourage them to make growth afterwards by affording them a position in a warm greenhouse, and maintaining a moist atmosphere by syringing the plants overhead morning and afternoon in bright weather. For the potting compost use peat, leaf-mould, and plenty of sand, adding a very little loam—if you can get some containing much fibre and that is free from chalk. Do not use animal manures, but a sprinkling of a good chemical fertiliser over the compost may do good if not used in excess. Make the soil very firm by the use of a potting-stick between the ball of roots and the surface of the pot, and do not use pots that afford more space than 1 inch around the roots. In the meantime the colour of the leaves may be improved by affording the plants a little clear soot-water occasionally, taking care that this is used in such a condition that it will not leave a coating of soot on the surface of the soil. The failure of some of the plants to open into flower when growth has commenced is due to the buds having been imperfectly matured last season. It is good practice to put Azaleas in a sunny position out-of-doors in July or August, when the flower-buds have formed and growth has ceased. This will help to harden or "ripen" both shoots and flower-buds. The plants should be removed indoors again before rains become frequent in autumn.

BIRD-LIME: C. H. The general method of making the viscid, adhesive substance known as bird-lime is by preparing it from the middle bark of the Holly. The bark is cut up and then boiled in water. This fluid is afterwards strained, and is concentrated by means of evaporation until it becomes of a substance like soft putty. When this is smeared on to the branches of trees, it is sufficiently adhesive to hold small birds that may alight upon it. A second method, but one not generally practised, is to obtain the "gluten" from Wheat by soaking and squeezing in water, and using it in much the same way. Bird-lime may be employed with disastrous effects in the garden, because all birds are not foes, and the lime will hold friends and foes alike. It should also be remembered that birds that appear enemies for a short period when the buds of fruit-trees are about to expand, or when there is ripe fruit in the garden, may be very serviceable at other scasons of the year, when their food consists more or less of insects. As a general rule it is a better plan to leave the birds alone, and protect your crops by the use of netting.

Books: J. & P. L. The best book of the kind is The Art and Practice of Landscape Gardening, by H. E. Milner, published by Messrs. Simpkin, Marshall, Hamilton, Kent & Co., Ltd., Stationers' Hall Court, London.—Correspondent. There is a book on the flora of Korea, but we have not seen it. It is entitled Conspectus Flora Korea, with plates. The author is Mr. J. Palibin. For the Riviera flora, in addition to Moggridge's and Bucknill's books, there is Penzig's Flore Coloriée de Poche du Littoral Méditerranéen de Gênes à Barcelone.

Carnations: Nemo. We consider your flowers to be very satisfactory. If seedling plants will produce flowers of such size, colour, and fragrance as those received, it appears hardly necessary for the amateur to cultivate named varieties from cuttings and layers. The pink-coloured flowers are extremely pretty, but they are less fragrant than those of deep crimson colour, which have preserved the characteristic of the old Clove Carnation to a gratifying degree. The gardener with plenty of means for cultivating his plants cannot be blamed for preferring named varieties, because in cultivating those, he can make certain of the colour and form the plants will produce, and he becomes familiar with the different habits possessed by the varieties. Though they are so like to each other in general characteristics, there are important differences, and when a

gardener has become familiar with these, he can cultivate his plants with greater certainty as to results than would be possible with plants raised from seeds.

CHRYSANTHEMUMS: Subscriber. Two good early-flowering varieties are Mytchett White and Queen of the Earlies (white). For yellow varieties choose Mytchett Beauty and Horace Martin. There is a Japanese variety known as Commandant Blusset (Calvat), colour rosyviolet, but it is not cultivated commonly now.

CREEPERS FOR LOW NORTH-WEST WALL: S. P. This is not an ideal position for flowering plants, and the degree of success you obtain will depend upon whether or not there is any shelter from north winds. In order to have such a display as you state is desirable in summer, you might try varieties of Clematis of the Jackmani type; but in this case the wall will have an unfurnished appearance in winter.

CURRANT-BUD MITE: W. S. The buds you forward are infested with the mite. You cannot do better than you suggest, viz., grub up and burn the one plant affected. At the same time sorape together the old soil from around the base of the bushes, and burn that also. Keep a sharp look out on your other bushes, removing and burning any shoots whose buds show this abnormal condition.

and burning any shoots whose buds show this abnormal condition.

Names of Fruits: C. S. Your Pear much resembles Beurré Diel, but the fruit being over-ripe it is not possible to determine the variety with certainty. Forward fruits at least a month earlier next season.—A. J. R. Send the Apple again next season before it is over ripe.

Names of Plants: Correspondents not answered in this issue are requested to be so good as to consult the following number.—R. H., N. Wales. 1, Davallia solida; 2, Dictyogramma japonica; 3, Lomatia silaifolia; 4, Araucaria Cunninghamii; 5, Pseudotsuga Douglasii, the Douglas Fir—Bicton. Cypripedium Boxallii, a very good variety. It is not rare for finely-grown Cypripediums to produce two flowers on a stem.—J. W. O. Epidendrum elongatum.—W. R. Send when in flower.—A. M., Manchester. 1, Lomaria gibba; 2, Selaginella Mertensii; 3, S. viticulosa; 4, Begonia incarnata; 5, Ophiopogon Jaburan variegatum; 6, Asplenium bulbiferum.—Constant Reader. 1, Buddleia globosa; 2, Streptosolon Jamesoni; 3, Acacia dealbata.—Young Gardener. Acacia dealbata.—D. L. C. 1, Oncidium Cebolleta; 2, Oncidium candidum, often called Palumbina candida.—E. W. D. Cœlogyne lactea, a near ally of Cœlogyne flaccida.—Vitex. 1, Restrepia maculata; 2, Masdevallia angulata; 3, Bulbophyllum Careyanum.

NARCISSUS: J. B., Altrincham. The variety is not a new one, the specimen being a forced flower of N. tortuosus.

Potato for Name: C. W. It is practically impossible to name a Potato at this time of year unless it has some very striking colour markings to render it distinct. We could easily name fifty varieties from which tubers could be selected closely resembling yours. Suppose you address a package of twenty such tubers to the Superintendent, Mr. S. T. Wright, Royal Horticultural Gardens, Wisley, Ripley, Surrey, asking that they might be tried at those gardens this year, when a Potato trial will take place. No doubt then the name will be ascertained.

Tulies: S. D. & Son. There appears to be nothing the matter with the bulbs, except that they have failed to make any roots. It would seem as if they had attempted to grow in conditions that encouraged top growth but not root action.

CENTENARY

HORTICULTURAL SOCIETY.

THE FOUNDERS.

JOHN WEDGWOOD.—The idea of a Central or Metropolitan Society for the promotion of horticulture certainly originated with John Wedgwood. This might alone have secured for him a place in the Dictionary of National Biography, alongside the many other distinguished members of his illustrious family; but it has not done so.

He was the eldest of the three sons of Josiah Wedgwood (see photograph on this page), the founder of the celebrated potteries, and was born at Etruria, in March 1766. After being at school at Hindley, he was sent in 1774 to one at Bolton-le-Moors, kept by a dissenting clergyman, Rev. Phillip Holland, and shortly after this we read of his fondness for gardening and for chemical experiments. father secured a chemist named Warltire to give lectures at Newcastle-under-Lyme, and in 1778, Erasmus Darwin, the intimate friend of Josiah Wedgwood, sent his son, Robert Waring Darwin, to stay at Etruria, and share this teaching. Robert Waring Darwin afterwards married Susannah Wedgwood, his fellow student's sister, and their second son was Charles Darwin. Josiah Wedgwood himself taught the boys geography and geology, and engaged a young French prisoner to teach them his native tongue. In 1782 John was sent to the University of Edinburgh with his younger brother Josiah, but in the same year was sent to Warrington Academy, the centre of liberal education at the time, and remained there until the Academy was closed in 1786. Among his fellow-students there was Malthus, whose

eldest sister had married his brother Josiah, whilst another sister married Sir James Mackintosh. They settled first at Tallaton, in Devon, and afterwards in Devonshire Place, Marylebone; but receiving £30,000 on his father's death in 1795, he, in 1797, bought Cote House, Durdham Downs, Bristol, where he had a large garden with a considerable amount of glass. Wedgwood was well read in Linnean botany, and joined the Linnean Society in 1794, whilst A. P. De Candolle was among his personal friends. Dr. J. E

work on population was, fifty years later, to suggest to Wedgwood's nephew Darwin the theory of Natural Selection.

After returning for a short time to the University of Edinburgh, Wedgwood, between 1787 and 1790, was in Geneva, Rome, and Paris, and then took part in his father's business. In 1792 he became a junior partner in the London and Middlesex Bank (Messrs. Davidson, Noel, Templer, Middleton, and Wedgwood) in Stratford Place, and in the following year he retired from the Staffordshire firm and married Louisa Jane Allen, of Cresselly, in Pembrokeshire, whose Smith was one of the first whose support he secured for the infant Horticultural Society.

In 1800, Wedgwood rejoined his brothers firm, and it is from Etruria, that on June 29 in the following year, he writes to William Forsyth the letter in which we have the first mention of the proposed Society. "I have been turning my attention," he writes, "to the formation of a Horticultural Society, and have drawn up such heads as have appeared to me necessary for the first formation of the Society. It would be proper to add a preamble just stating the ideas of the first founders of the Society."

The proposed rules are enclosed, and in a postscript Forsyth is requested to consult Sir Joseph Banks on the subject.

Sir Joseph Banks on the subject.

As we next hear of Wedgwood as a captain of volunteers drawn from the Etruria works in 1803, it was possible that patriotic duties postponed the preliminary meeting of the proposed Society until March 7, 1804. This meeting was held at Hatchard's, the bookseller in Piccadilly: Wedgwood pre-

greatest distinction until his own death in 1838, was an early recruit and was the author of the first paper published by the Society, that namely on "the objects which the Horticultural Society have in view," read on April 2, 1805, and forming the commencement of the first volume of the Transactions.

By that time Wedgwood had fallen on evil days. The ill success of the bank in

THOMAS ANDREW KNIGHT,

Fresident of the Horticultural Society from 1811 to 1838.

sided, and there were also present W. T. Aiton, Sir Joseph Banks, James Dickson, Wm. Forsyth (the elder), Hon. Charles Greville, and Richard Anthony Salisbury. The first regular meeting of the Society was held on the 30th of the same month, and the Earl of Dartmouth was then chosen as its first President, and Wedgwood as Secretary. Thomas Andrew Knight, the great experimental physiologist, who succeeded to the Presidency on the death of Lord Dartmouth in 1810, and occupied that Chair with the

which most of his fortune was embarked neces-itated his selling Cote House in 1805, and he moved to Maer Hall, and then to Etruria Hall, where he lived until 1810. In 1808 he communicated to the Society a paper on the culture of the Dahlia, but his later interest was mainly in his kitchen garden, as was evinced by short communications on American blight (1818), Onions (1819), Buda Kale (1821), and Celery (1824). Moving from Etruria to Heavitree, near Exeter, and in succession to Betley, Stafford-

shire, Kingscote, Gloucestershire, Abergavenny, and lastly to Seabridge, near Newcastle-under-Lyme, he became, in 1843, partially blind from paralysis of the optic nerve, and spent the last few months of his life at the home of his second son, Lieutenant-Colonel Wedgwood, at Tenby. Here he died of bronchitis, January 26, 1844, and was buried in the burial-ground of the parish church. The portrait of Josiah Wedgwood, the famous potter, given on p. 145, is copied by permission from the one in the Life of Josiah Wedgwood, by Dr. Smiles (Murray).

WILLIAM TOWNSEND AITON.

Born at Kew, February 2, 1766, when his father was in charge of the gardens of the Dowager Princess of Wales, Aiton personifies the later history of those gardens as private property. Educated at Chiswick, he, at sixteen, became assistant to his father, William Aiton, the editor of the first edition of the Hortus Kewensis, and on the death of the latter in 1793, succeeded him in the curatorship of the Royal Gardens, both at Kew and at Richmond. Between 1810 and 1813, with the assistance of Banks, Dryander, and Robert Brown, he published the second edition of his father's work, in five volumes, and in 1814 issued an epitome of it in a single volume. He received a silver medal from the Horticultural Society in 1817 for a paper on the cultivation of the Cucumber, and in 1820 was employed in the arrangement of the gardens of the Pavilion at Brighton and in the alterations made at Windsor on the accession of George IV: After 1830 he had charge of Kew only, and at the proposed re-organization of the Gardens, as the result of a committee of inquiry, in 1841, he resigned. Aiton died at Kensington, October 9, 1849.

SIR JOSEPH BANKS.

Banks is so well known a figure in the history of science, and the facts of his life are so generally accessible, that a brief outline will suffice here. The only son of William Banks, of Revesby Abbey, Lincolnshire, Banks was born in Argyle Street, London, on February 13, 1744. He was sent to Harrow when nine years old, and to Eton some four years later, and is reported to have been an idle boy until, when he was fourteen, his interest was excited in wild flowers, and he came across a copy of Gerard's Herball. On entering Christ Church College, Oxford, as a gentleman commoner. in 1760, he brought Israel Lyons there from Cambridge to teach botany; and, his father dying in 1761 and he having taken an honorary Master of Arts degree in 1763, he became a Fellow of the Royal Society in 1766; and in the same year started on a botanising expedition to Newfoundland, in company with his friend Lieutenant Phipps, afterwards Lord Mulgrave. They returned in the following year via Lisbon, and in working out his collection Banks then became intimate with Solander, then an assistant librarian in the British Museum. In 1768 he started on a voyage of eircumnavigation with Captain Cook in the Endeavour, taking with him Solander, two draughtsmen and two attendants, at an expense to himself of £10,000. They went viâ Madeira, Rio, and Cape Horn to Tahiti, where they observed the Transit of Venus; and thence to New Zealand, Australia (where they named Botany Bay and the

Endeavour River), New Guinea, Batavia (where Banks had a severe attack of fever), the Cape and St. Helena, reaching England once more in 1771. Banks' Journal kept during this voyage was published by Sir Joseph Hooker in 1896.

In 1772, again accompanied by Solander, Banks made a six weeks' excursion to Iceland; and in 1778 was chosen to succeed Sir John Pringle in the presidential chair of the Royal Society, a position which he occupied for the twenty-two remaining years of his life. The election of a naturalist greatly offended the mathematicians in the Society, and led to a small secession in 1784!

In 1779 Banks married Dorothea Weston-Hugessen, in 1781 he was created a baronet, and in 1795 a Knight of the Bath. As he had shown himself superior to petty jealousy by joining the Linnean Society on its formation by Dr. J. E. Smith in 1788, so now we see him attending this first meeting of the Horticultural Society. Wedgwood's letters exhibit a needless apprehension of possible opposition on the part of the older societies, more especially of the Linnean and the

Society of Arts.

The latter part of Banks's life was largely devoted to the extension of his scientific dibrary and his herbarium. These were placed freely at the disposal of students, and, whilst Dryander's careful catalogue of the former (in five volumes), completed between 1800 and 1805, is of the greatest bibliographical interest, the books themselves and the herbarium form most valuable portions of the British Museum collections. Banks was frequently instrumental in securing the return of natural history specimens captured during the war to France, good offices which were recognised by his election as a member of the Institute of France in 1802. It was at his suggestion that collectors were sent out on behalf of the Royal Gardens at Kew; and from his country house at Spring Grove, Isleworth, he was able to exercise some scientific supervision over them of an unofficial character. Not only did Banks during his lifetime employ Francis Bauer to execute his unequalled figures of plants, but he provided for him at his death; whilst he bequeathed his berbarium to Robert Brown, with a reversion to the British Museum, from which the Botanical Department of the Museum had its origin.

Banks was no mere patron of botany. Public duties and ill-health gave him little time for original work: he probably mistrusted his own powers as a systematic botanist; and throughout life he evinced a markedly utilitarian bent of mind. Whether he was studying with Thomas Wedgwood the improvement of the quality of English wool, or was collecting evidence as to the arrival of American blight, there was this practical point of view; so that, beyond a few short papers in the Transactions of the Morticultural Society, and his Short Account of the Causes of Blight, Mildew, and Rust, published in 1805, which reached a second edition in 1806, and a third in 1807, he issued little under his own name. He died at Spring Grove June 19, 1820, and was buried in the parish church of Isleworth.

JAMES DICKSON.

"The lynx-eyed Dickson," as Sir J. E. Smith calls him, was born of poor parents

at Traquhair, Peebles, in 1737 or 1738, and began his horticultural career in the gardens of Lord Traquhair, close to his birthplace. Thence he went to Jeffery's nursery garden at Brompton, and in 1772 set up in business for himself in Covent Garden. He had the good fortune early in his career to obtain the friendship of James Lee, of Hammersmith, and of Sir Joseph Banks. He became recognised as an authority on Cryptogamia, and published four quarto Fasciculi Plan'arum Cryptogamicarum Britannia in 1785, 1790, 1793, and 1801 respectively, which he followed up by nineteen folio fascicles of a Hortus Siecus Britannicus, containing twentyfive species each, issued between 1793 and 1802. For the purposes of his collections of Cryptogams, he made annual excursions in

of him in his eightieth year, painted and presented by H. P. Briggs, R.A., still looks down upon the Council of the Society from the walls of the Lindley Library.

WILLIAM FORSYTH.

Of the seven founders of the Horticultural Society two were Scottish-born gardeners, Dickson and Forsyth. William Forsyth was born at Old Meldrum, Aberdeenshire, in 1737, and in 1763 came as a pupil to the Chelsea Botanic Garden, then under the care of Philip Miller. After being for some time in the Duke of Northumberland's garden at Syon House, he returned to Chelsea, on Miller's death in 1771, as his successor. In 1784 he was appointed Superintendent of the Royal Gardens at Kensington and

DR. LINDLEY,

Who became Assistant Secretary to the Horticultural Society in 1822.

the Scottish Highlands between 1785 and 1791, that of 1789 being undertaken in company with Mungo Park, afterwards renowned for his African explorations. Park's sister became Dickson's second wife, and survived him. An original member of the Linnean Society in 1788, Dickson was elected one of the first Vice-l'residents of the Horticultural Society, and was continually re-elected until his death. This occurred at Broad Green, Croydon, August 14, 1822, and by his own desire he was buried in a remantic churchyard among the Surrey hills, where in his earlier days he had been accustomed to gather rare mosses. Sir James Edward Smith characterises him as a man of "powerful mind, spotless integrity, singular acuteness and accuracy"; L'Heritier dedicated to him the handsome genus of Trec-Ferns, Dicksonia; and a pleasing oil portrait St. James's, which post he retained until his death, which occurred July 25, 1804, four months after the inauguration of the Horticultural Society, at his official residence in Kensington Gardens.

Somewhere about 1768 Forsyth's attention was specially directed to fruit-trees and the diseases and injuries to which they are liable, and as a result he contrived a plaister of lime, cow-dung, and wood-ashes, which he asserted would produce a new growth over parts of the stem laid bare by injuries, with complete union between the old and the new wood. In 1789 the success of his experiments attracted the notice of the Commissioners of Land Revenue, and in consequence of their recommendation he received the thanks of both Houses of Parliament and a reward of £1,500, on making public the nature of his composition. In 1791 he

published Observations on the Diseases, Defects, and Injuries of Fruit and Forest Trees, and in 1802 a Treatise on the Culture and Management of Fruit Trees, of which a seventh edition appeared in 1824.

Thomas Andrew Knight asserted that a composition practically identical with Forsyth's had been in use long before, and naturally, considering his accurate and thorough knowledge of histology and physiology, altogether denied the statements as to any true union between cld wood once laid bare and that subsequently formed. Forsyth was dead at the time Knight's letters appeared in the Gentleman's Magazine, but the figure of a section of a stem published by the advocates of the plaister shows the truth of Knight's statement.

CHARLES GREVILLE.

We have not been able to gather many particulars as to one of the seven founders of the Society. The Hon. Charles Francis Greville, second son of Francis, first Earl of Warwick of the name, was born May 12, 1749. He was elected a Fellow of the Royal Society in 1772, and subsequently became a Vice-President; and he appears also to have been a Privy Councillor. In 1790 he had a garden at Paddington, and here he introduced Lilium concolor from China, and Clinogyne dichotoma from Penang in 1804; and Zingiber luridum from the Circars, and Curcuma æruginosa from Calcutta in 1807, as appears from papers by Salisbury in the first volume of the Transactions of the Horticultural Society. On the incorporation of the Society in 1809 Greville became Treasurer. He died April 23, 1809, unmarried, and his collection of plants was purchased by Thomas Jenkins, of the Portman Nursery. Though obviously written while he was alive, Robert Brown's dedication of the genus Grevillea did not appear until after Greville's death. It runs as follows :-

"This extensive genus I have dedicated to the Right Honourable Charles Francis Greville, one of the Vice-Presidents of the Royal Society; a gentleman eminently distinguished for his acquirements in natural history, and to whom the botanists of this country are indebted for the introduction and successful cultivation of many rare and interesting plants."

Greville House, on Paddington Green, which was presumably his residence, and thirty years ago was a working-man's club, is now a brewery store.

RICHARD ANTHONY SALISBURY.

One of the most remarkable figures, though not one of the most estimable characters, in the botanical history of the time was Richard Anthony Salisbury. He was born at Leeds in 1761, being the son of a cloth merchant named William Markham, whose wife was descended from a sister of Henry Lyte, the translator of Dodoens. At the University of Edinburgh he became the pupil of Professor John Hope, and the intimate friend of his fellow-student, James Edward Smith. In 1780, according to his own account, Markham became acquainted with Miss Anna Salisbury, an elderly connection of his mother's mother, whose name had been Salisbury; and she, in 1785, gave him £10,000 in Three-per-cents. to enable him to pursue his botanical studies, on condition of his taking her surname. He had then a fine garden at Chapel Allerton, near Leeds, which had been his father's; but in 1802 he purchased Ridgeway House, Mill Hill, which had formerly been the home of Peter Collinson, the correspondent of Sloane, Linneus, and Benjamin Franklin. In the first year of his occupancy of his new domain Smith visited him at Mill Hill, but, while Smith was then wedded to the Linnean System, Salisbury preferred the Natural System, and Smith seems to have resented his criticisms.

On the incorporation of the Horticultural Society in 1809 Salisbury became Honorary Secretary; but he seems in a very short time to have reduced the accounts to a state of chaos, and was succeeded by Joseph Sabine. It was in this year also that Salisbury seems to have been guilty of a piece of sharp practice, which naturally aroused much indignation. On January 17 Robert Brown read a paper before the Linnean Society "On the Proteaceæ of Jussieu," which was not published until 1810. Salisbury was present at the reading of the paper. During 1809 a volume On the Cultivation of the Proteax was published under the name of Joseph Knight, who had been gardener to George Hibbert, M.P., of Clapham, and who had then started in the nursery business in King's Road, Chelsea, afterwards known as Messrs. Knight & Perry's, and now as Messrs. James Veitch & Sons. From the preface and from internal evidence it is clear that all the botanical portion of this book was the work of Salisbury, and in it, while claiming absolute originality and making no reference to Brown's paper, he anticipates several of Brown's genera, either under new names, which thus obtain priority, or under names which he remembered Brown to have used. Bishop Goodenough writes to J. E. Smith on December 26, 1809: "How shocked was I to see Salisbury's surreptitious anticipation of Brown's paper on the New Holland plants, under the name and disguise of Mr. Hibbert's gardener! Oh, it is too bad! I think Salisbury is got just where Catiline was when Cicero attacked him, viz., to that point of shameful doing where no good man could be found to defend him." There was, accordingly, as Mr. Britten has shown, "a tacit understanding on the part of the botanical leaders of the period, including Brown, Banks, and Smith, that Salisbury's work and names should as far as possible be ignored," a system of boycotting that is, however, from a scientific point of view, quite indefensible.

About this time Salisbury moved from Mill Hill to 18, Queen Street, Edgware Road, close to Greville's, where he only had a garden barely 30 feet square, which, however, he filled with rare plants in pots. Continuing the botanical work of his life, he examined, dissected, described, drew and preserved every plant he could obtain, and made some progress with a Genera Plantarum, of which a fragment was published by Dr. J. E. Gray in 1866. As Mr. B. Daydon Jackson says, "Salisbury was never fairly represented by any productions worthy of his great ability." He published a folio Icones stirpium rariores, in 1791, a Prodromus stirpium in horto Chapel Allerton, in 1796, The Generie Characters in English Botany, collated with those of Linné, a strongly-worded attack upon Smith's work, in 1806, and two volumes of the quarto Paradisus Londinensis, with 117 plates, in 1806 and 1807. He also assisted W. T. Aiton in the second edition of the Hortus Kewensis, in which, by the way, Smithia sensitiva was described, and J. E. Gray, in his Natural Arrangement of British Plants, published under his father S. H. Gray's name in 1821.

In 1814 Salisbury introduced the Corsican Pine to Kew. He died of paralysis in 1829, bequeathing his herbarium and manuscripts to William John Burchell, afterwards well known as a traveller, the son of a Fulham florist, whom he made his heir after Alphonse de Candolle and J. E. Gray had both declined to take his name.

On Burchell's death in 1863 the herbarium went to Kew; but Miss Burchell gave the six volumes of drawings to Dr. J. E. Gray, by whom they were presented to the Botanical Department of the British Museum. A pencil portrait by Burchell, now at Kew, is the only one of Salisbury with which we are acquainted. Unfortunately, the beautiful Maidenhair-tree, to which his name was given by Smith, must bear the prior but uncouth name of Gingko, so that Salisbury is as yet uncommemorated. How bitter botanical feeling could be may be judged by the following quatrain written by Smith on Salisbury's Paradisus:—

"What malice lurks beneath this fair disguise! Satau once more steals into Paradise; But now how plausible so'er his tale is, We always take his words cum grano salis!"

G. S. Boulger.

To render our l'antheon more complete, we give the portrait of Thomas Andrew Knight, the famous physiologist, who was one of the Original Members, became President in 1811, and retained that office till 1838. His life and labours are the subject of a detailed notice in the Gardeners' Chronicle for February 10, 1877.

JOHN LINDLEY, whose career has also been on more than one occasion sketched in the Gardeners' Chronicle, was the son of a nurseryman near Norwich, and was for a time in the employ of Messrs. Wrench, a well-known firm still in high repute. His botanical proclivities brought him under the notice of Dr. (afterwards Sir) William Hooker and of Sir Joseph Banks, by whose influence he was appointed Assistant Secretary to the Society in 1822, Joseph Sabine being then Secretary. In 1830 Mr. Bentham became Secretary. Lindley served the Society under various titles till his death in 1865.

Our portrait is taken from a sketch made in 1848 by Dr. Lindley's eldest daughter, Lady Crease.

KEW NOTES.

Porphyrocoma lanceolata (Dianthera Pohliana).—There are several plants of this distinct Acanthad in flower in the Begonia-house. The species rarely attains to more than a foot in height, it forming a small, compact bush. The leaves are lanceolate-acuminate, about 6 inches long; the inflorescence is a dense, terminal, conclike spike, 3 to 4 inches long; the flowers are purple, about 1 inch long, with a large bright red bract at the base of each. The distinct colours of the flowers and bracts give to the inflorescence a novel and pretty effect. It is a native of Brazil, and should be given stove treatment. Cuttings rooted in May and grown in a stove temperature make bushy plants by the following February, when they should produce their flowers. The bracts last fully six weeks

after the flowers have fallen. The apecies was introduced to this country in 1880, and was figured in *Botanical Magazine*, tab. 4176.

FREESIA ARMSTRONGI.

This very rare and beautiful pink - flowered species may be seen freely flowering in house No. 7. It was sent to Kew about five years ago from South Africa, and although a charming plant, is comparatively unknown. The flowerspike is larger and much more branched than that of F. refracta, it is thrown well above the foliage and carries from ten to fifteen flowers. The individual flowers are about two-thirds the size of those of F. refracta, but they have not the fragrance that they possess. The deep rose colour of the segments is quite sufficient to recommend the species; the tube is white with orange colour at the base. To increase the stock it is a good plan to self-fertilise three or four flowers in each spike and to raise seedlings from these. They will produce flowering corms in two or three years.

CYNORCHIS COMPACTA.

This little gem is making a pretty display in the Orchid-house. It is usually monophyllous, the leaf being about 4 to 6 inches long, and about an inch broad. The flower-apike is produced when the leaf is half developed, and varies from 3 to 6 inches in height, carrying from fifteen to twenty-five flowers. The sepals and petals are rather small and pure white. The lip is about ½ inch in diameter, white, and marked with numerous small violet spots. Being a small species it is best to grow about a dozen plants in a pan. Being a native of Natal, it requires cool treatment. W. H.

CULTURAL MEMORANDA.

CAMELLIAS.

In an old span-roofed house having high front sashes, in a Devonshire garden, I noticed some time ago a fine example of Camellia-culture. The house in question runs north and south, and is about 32 feet long. The Camellias are planted in a bed in the centre of the house, and which, with the exception of the flag passage at the sides and ends, they completely fill to the height of 14 or 15 feet with healthy wood and large dark-green leaves, as close together as those in a well-kept Yewhedge. The branches having in the course of time reached the glass, they were headed down to the level of the sides and ends of the house the spring prior to my visit, after they had gone out of flower, with the best possible results. The bed in which the plants are growing at the same time had a few inches of the surface soil removed, this being replaced with a top-dressing of turfy-loam, followed by a soaking of tepid water, with subsequent waterings of weak liquid-manure. Copious syringings with clear water were given morning and afternoon at closing time, after the plants had flowered, to insure healthy growth being made preparatory to yielding a rich harvest of flowers the following winter and spring. When the plants have com-pleted their growth, abundance of fresh air is admitted to ripen the wood properly.

NIPHETOS ROSE.

A few months back I noticed a fine healthy plant of this charming Rose trained to a wire-trellis fixed beneath the roof of a lean-to house having a south aspect. This vigorously-growing tree, I was informed, had yielded a profusion of large blooms during the summer and autumn months, as there is a good supply of hot-waterpipes in the house with which to produce the necessary temperature during inclement weather. When the plant has ceased flowering and shed its leaves, all weakly growths are cut back to one joint from their bases, and any unduly long and

strong shoots are abortened back a little to promote a balance of growth. If a few dozen cuttings, more or less according to circumstances, are selected at pruning time with a "heel," that is a little of the old wood attached, and inserted round the edge of properly crocked 41-inch pots filled to the rim with a mixture of light loam and leaf-mould, and surfaced with sand, placed in a forcing-house and watered, root and leaf growth will be made in due time, when the young plants should be potted off singly into 3-inch pota, making the soil firm about the roots in potting. Return the plants to heat, and afford water to the roots, and support to the plants as necessary. H. W. W.

WINTER MELONS IN AMERICA.

The enclosed photograph (see fig. 62) ahowa the interior of a Melon-house in midwinter. I am one of the very few successful growers of The photograph will therefore give to readers of the Gardeners' Chronicle an idea of the different climatic conditions that exist in the States and England. Arthur Griffin, Gardener to Elbridge T. Gerry, Esq., Seaverge, Newport, R.I.

FRUIT REGISTER.

ECKLINVILLE SEEDLING APPLE.

According to the description of our best authorities on hardy fruits, and to the general experience of growers, this variety of early Apple tree has long held the reputation of being a very precocious and prolific bearer, but within the last few years two particular and singular cases have come within my notice quite at variance with all my former experience. In the one case, the owner originally had several young bush trees of Ecklinville planted and bearing profusely in his garden, and from their excellent behaviour

FIG. 62.—VIEW OF MELON HOUSE IN JANUARY AT "SEAVERGE," NEWPORT, RI.

winter Melons in the States, heing a private gardener, and ship the fruits, with forced vegetables, to my employers in New York city. We generally send from four to six hundred Melons to them between the month of December and the latter part of April, and the flavour is superb, in fact as good as we get them in midsummer, notwithstanding the thermometer in the winter months is sometimes as low as 8° below zero.

I have grown varieties of Melons from most parts of the world whence they could be obtained, and out of a very large number have only found three or four which were of first-class flavour. These I have crossed with each other, and have thus obtained the stock which I cultivate now.

The photograph is one of a large number my employer wished me to have taken for presentation to his guests at a dinner given by him at the Metropolitan Club, New York, when Melons from this house were served for dessert.

Being an Englishman myself, I know it to be impossible to produce in England good Melons in mid-winter, as you do not get the light atmosphere and the quantity of sun there is here. he decided to plant that variety in standard form in his orchards, some of which were on arable land, and others on turf. One orchard of arable land, about 8 acres, was entirely of Ecklinville; other orchards were of mixed varieties, with a large proportion of Worcester Pearmain, Dumelow's Seedling, King of Pippins, &c., but Ecklinville totalled about the one-half of the trees in the mixed orchards. All the trees grew away well, were well looked after, were moderately pruned, and grew in excellent health and vigour; but the Ecklinvilles will not fruit well. Year after year they are almost a complete failure, being the worst bearers among them all.

It is exasperating to wait year after year, to be again and again disappointed; yet it only requires something more than human nature to sacrifice such splendid and healthy trees. The patience of the owner is fast becoming exhausted, for he has already cut the heads off trees in the one orchard and grafted Peasgood's Nonsuch thereon. To my mind this is a doubtful proceeding, and I should have preferred Lane's Prince Albert; but at all events the Peasgoods have

been on for three or four years and are making Marge healthy trees. It would be well if any fruit-grower who has had similar experience, could throw any light on the cause of this extreme shyness in Ecklinville. The want of other or of foreign pollen will not apply, for here we have mixed varieties growing side by side, and the whole is situated in the midst of hundreds of acres of Apple trees in the very best part of the county of Worcester. I am rather inclined to attribute the cause to the absence of some mineral or other constituent in the soil-something which is required to build up the perfect bud and its thorough development, for I am told the flowers do not open kindly, and the petals do not reflex properly when opened. Possibly an analysis of the soil would discover a deficiency of something that is necessary for that variety. I should state that the Worcester Pearmain grews freely and crops heavily most years.

King of Pippins is being re-grafted with Worcesters, as with age the former has a tendency to canker. The tenants on this estate have always been anxious to plant Ecklinville largely, but we have thought it necessary to include proportions of other varieties, which we call land-dord's trees, for we innocently thought Ecklinville would be a short-lived tree, chiefly on account of its precedity and prolific bearing habits. William Crump, Madresfield Court Gardens, Malvern.

TREES AND SHRUBS.

LOROPETALUM CHINENSE.

This half-hardy plant should be more generally known, for it is one of the most distinct of the already large number of Chinese plants cultivated in our gardens. It was introduced somewhere about the year 1880, and is closely allied to the Hamamelis (or Witch-hazels), with which genus it has been united by some botanists. The species is distributed over a wide area in the large provinces of Hupeh, Fokien, Kiangsi, Chekiang, and the Chusan Archipelage, also in India, where it occurs on the Khasia Mountains. It is a remarkable fact concerning plants having a wide distribution that they readily adapt themselves to pot-culture, and the present plant is no exception to the rule. Under cultivation it forms a neat and compact evergreen shrub, 4 to 5 feet high, with somewhat oblique leaves, elliptic or elliptic-ovate in shape, 1 to 3 inches deng, and 1 to 2 inches wide, and of a light green colour. The flowers are pure white, in small heads of three to eight flowers, terminating the short lateral growths. petals are linear, and 1 to 11 inch long. flowers are produced naturally in early spring, each individual flower lasting some two to three weeks; but the plant produces a succession of bloom for upwards of two months. It is an exceldent plant for the cool greenhouse, either for pot or border culture; or it may be grown outside in mild districts in the south-west of England and Ireland. As a plant for the decoration of the greenhouse in mid-winter it is extremely useful, as with slight heat, such as that afforded by the warm greenhouse, plants may be easily obtained in flower at Christmas. And this may be done annually without causing loss of vigour to the plants, if they are well grown after the season of flower is ever, and the weed is thoroughly well ripened in late summer and autumn by exposure to all the sun and light possible.

Propagation may be readily effected by cuttings of half-ripened wood taken in autumn or spring, or by layers. Several fine plants have flewered recently in the temperate house and greenhouse at Kew. An excellent exhibit of plants of this species was made by Messrs. J. Veitch & Sons, of Chelsea, at the Drill Hall on February 23. Chas. P. Rafitl, Kew.

ALPINE GARDEN.

ONOSMA ALBO-ROSEUM.

INTRODUCED in 1890 from Asia Minor, and much desired and sought after at first, plant appears to be falling into neglect. This is due to its comparatively short life in gardens, and in this respect it compares badly with O. stellulatum tauricum, although there are some places where the latter does not stand well either. With me the last named gives no great trouble, even in a wet winter, while O. albo-roseum is only retained by frequent propagation. It seems to grow hard and woody, and to be unable to threw out fresh shoots to maintain its life. So far as regards its frost-resisting powers, I have no fault to find with it, but I consider it desirable to preserve it from excessive wet in winter by fixing a sheet of glass a few inches above it at that season. The plant requires a hot, dry corner, and I prefer that it should be well fixed between stones in such a way that it is not in contact with wet soil. It is not difficult to propagate by means of cuttings struck under glass, the pot in which they are placed being covered with half an inch or so of silver-sand. A thriving plant of this Onosma is very attractive, with its wax-like flowers, at first white, but changing gradually to pale rose and then to deep rose. The grey, hoary-looking leaves are not a contrast to but are in harmony with the beautiful flowers. Less effective than most of its congeners, it is no less beautiful, while it may well be accounted one of the best of rock-plants, despite its somewhat short life. S. Arnott, Carsethorn-by-Dumfries, N.B.

The Week's Work.

THE ORCHID HOUSES.

By W. H. White Orchid Grower to Sir Trevon LAWRENCE, Bart., Burford. Dorking.

Chysis. - The following deciduous epiphytal Orchids, Chysis aurea, C. lævis, C. bractescens, C. Limminghei, and the distinct hybrids, C. Chelsoni × and C. Sedeni ×, owing to the lack of sunshine during last autumn, were much longer than usual in maturing their pseudo-bulbs, and some of them are not properly matured even now, the bulbs and leaves being as green as they were during the growing season. Netwithstanding this, the plants are commencing to grow at their usual time, and should be treated accordingly. Until the flower-buds, which push up along with the young breaks, are visible, afford water sparingly, increasing the supply afterwards. Do not disturb the roots by repetting until the flowers have faded. The species of Chysis, being deep-rooting plants, should be grown in pots, to which copper wire suspenders may be attached. the roof. Provide perfect drainage by the use of Fern-rhizomes, and for potting use fibrous peat, leaf-soil, and sphagnum-moss in equal quantities. It is important that the surface of the compost, to the depth of about ½ inch, should consist of living sphagnum-moss. Place the plants at the warmer end of the Cattleyahouse, and when the pseudo-bulbs are partly made, suspend them in a sunny position in the East Indian-house; the extra light and warmth at that period will greatly assist their development.

Vanda Cathcarti.—This singular and handsome species is in flower, and it is one of those Orchids that is rather particular as to position and treatment. It will grow luxuriantly if trained up a teak-raft, and placed in a moist shady corner of the East Indian house. The aërial roots of this plant should be moistened at least once a day at this season, and twice or thrice each day during the summer months.

Ada aurantiaca also produces its bright cinnabar-red flowers at this season; the arching racemes are appreciated for table decoration, the colour being particularly bright by artificial light. The flower-spikes are easily gathered by giving

them a gentle pull, when the stem will readily part from the base of the young growths, and will be much longer than when cnt. Ada aurantiaca thrives exceedingly well in the leaf-soil mixture now generally recommended, and under identical conditions as the cool-house Odontoglossums.

Odontoglossum coronarium miniatum. — This much admired variety does not grow nearly so strong as the ordinary O. coronarium, and no difficulty is experienced at Burford in obtaining flower-spikes annually. The species is generally acknowledged to be a shy bleomer. Being of scandent habit, the plant should be cultivated in a long, narrow, well-drained teak-wood basket, and provided with peat and sphagnum-moss in equal parts, mixing plenty of crocks with this. The proper time to disturb the roots is when growth recommences. In re-basketing the plant, cut off several of the old back pseudo-bulbs, retaining about three or four behind the young growth; by so doing it will be pessible to put the plant into a smaller receptacle than would be the case otherwise. Cultivate the plant in the cool-house.

PLANTS UNDER GLASS.

By C. R. FIELDER, Gardener to Mrs. Burns, North Mymms Park. Hatfield, Hertfordshire.

Hippeastrums (Amaryllis).—Repot old bulbs just before they begin to make new growth. Shake the soil from the roots, and pet up the bulbs into pots measuring 5 to 7 inohes in diameter, according to the size of the bulbs. Let the pets be clean and well drained. A suitable compost will be one of three-parts loam, one-half a part of leaf-soil, and one-half a part of well rotted manure, together with plenty of coarse silver sand. In potting keep half the bulb above the surface of the soil. Those plants that are required to flower early should be placed in a temperature of 60°; but if it is desired to retard the flowering of others they may be allowed to start into growth in a temperature of about 50°. The roots will only occasionally need water until the new growth and flower-spikes are visible. The foliage bein; very subject to the attack of thrips funigation should be carried out at intervals, otherwise the plants will be crippled. Do not shake the soil from the roots of plants that have already started into growth, but shift them into larger pots; or, after putting the drainage in good order, remeve an inch or two of the surface soil and afford a top-dressing of the soil used for potting the other plants, adding a little bone-meal.

Caladiums and Alocasias.—These Aroids having rested during the winter may be restarted. Shake the old soil from the tubers and place them in small pots, affording them a compost consisting of equal parts fibrous loam, peat, and leaf-soil, and adding plenty of coarse silver sand. A little sphagnum-moss and broken charcoal, or brick rubble, may be added for Alocasias. After they are potted place the bulbs in a house where a minimum temperature of 60° is maintained, and water sparingly until growth has commenced. When the plants have made roots shift them into larger pots; those 6 inches in diameter are large enough for ordinary decorative plants, but if larger specimens be desired a subsequent shift into 8-inch or 9-inch pots may be afforded. Caladium argyrites and other dwarf-growing varieties should be grown in small pots. Propagation is effected by division of the tubers, a crown being retained to each division.

Gloxinias.—Remove the old seil from Gloxinia bulbs, and pot them into as small-sized pots as will contain the bulbs and allow of a little soil being placed around them. Afford the plants a temperature of about 60°, and water them carefully. When the bulbs have made a number of roots shift them into larger pets, using a potting compost of two parts loam, one part peat, and one part leaf-soil, adding plenty of silver-sand.

Tyderas, Negetias, and Achimenes.—A pertion of the stock of each of these may be started now. Let well-drained pans be filled to within 1½ inch of the rius with loam, leaf-soil, and peat in equal parts, adding a liberal allowance of silver-sand. Upon this lay the corms about an inch apart, and cover them with soil half an inch deep. Place the pans in the stove, and water them carefully. When the plants are 3 inches high pot them off, placing six or eight Achimenes in a 5-inch pot, or four Tydæas in pots of that size.

THE HARDY FRUIT GARDEN. By H. MARKHAM, gr., Wrotham Park, Barnet. The Orchard.—When the land is in a fit condi-

tion to be trampled upon, take the opportunity afforded to place stakes to young, newly-planted trees. When staking a young tree, it is very essential to use plenty of soft material between the stake and the bark in order to prevent injury to the latter. Use strong stakes, and drive them well into the ground at a distance of 6 inches from the stem of the tree. Tread the soil firmly about the roots, and when the tree has been finally secured to the supports slightly loosen the surface of the ground with a four-tined fork. Tarred twine, willows, or wire may be employed for fastening the trees to the stakes; wire is most durable, and quite suitable for use, provided a good soft pad is placed round the stem of the tree as mentioned above. Any worn - out rubber garden - hose, if cut into lengths, will be found an excellent material for this purpose.

found an excellent material for this purpose. If rabbits are troublesome protect the lower part of the trees with wire-netting, but allow plenty of room for the future sw-lling of the stems. Examine larger trees, and afford fresh stakes to any that need them, and make sure that ties upon other trees will not pinch the bark during next season. See that a label is affixed to each tree in order to identify each variety. If labels are fixed to the branches with wire, examine the wires and replace any that are likely to cut the bark. We use here labels made of lead for all fruit - trees, whether standards, bushes, or those trained on walls, and the names are stamped upon them. These can be fastened to the trees with wire, or attached to stout stakes 18 inches long, driven into the ground a few inches from the stem of the tree. If the latter method be adopted, no difficulty will be experienced in finding the names in summer when the trees are in full leaf. At the same time, keep a list of all the trees and their positions for reference in case any of the labels should get

lost or be misplaced. Pruning Young Standards .- Opinions vary as to whether or not these should be pruned the first year after planting. My experience is that they should in more or less degree according to the length and strength of the young shoots and the amount of roots. Select from three to five of the best placed shoots, and shorten them back to 15 inches from the base, always cutting to a bud pointing in the direction the following season's shoot is required to grow. Make the cuts as straight across the wood as possible. When the young shoots to form the main branches of the tree have been selected less pruning will be required. Spur back inner growths to keep the heads of the trees open, that the sunlight may reach the centres; but should the trees make strong, unfruitful wood each year, instead of pruning the branches, use the spade at the roots. If this be done with care and judgment, it will, as a rule, have the desired effect.

THE FLOWER GARDEN.

By A. B. Walles, Gardener to Sir W. D. Pearson, Bart., Paddockhurst, Sussex.

Roses.—The weather has been very unfavourable for planting operations, but it is time they were completed. Remove the protecting material that has protected Roses during the winter, and commence to prune the plants. A good sharp, strong knife is best for this purpose; but in places where there is a large quantity of plants to be pruned a pair of good sécateurs, that have thin blades and cut both edges, may be used. Care must be taken not to prune too closely with these, as the shoots are more liable to die back than if cut with a knife. If large blooms are required, and the plants are strong, prune moderately hard, and disbud later on, and to an outside bud. Keep the centre of the plant open. If the necessary time can be spared, disbudding is better than hard pruning, especially on strong - growing Teas. Weakgrowing varieties may be pruned rather more severely. The pruning of Tea varieties may be

deferred for a few weeks. Strong-growing Roses may be pegged down with very good results These do not require to be planted so closely, especially if the soil is suitable for Roses. We finished our planting here last week, and to fill up a few blank places in other beds we took off some of the outside pieces that were too thick, and found them well established on their own roots. I have found the variety Crimson Rambler trained on arches to suffer from the hard pruning. It is generally given in the early autumn after the flowering season. The plants show no signs of deterioration for two or three years after planting, but in five or six years the ill-effects of hard pruning are obvious. In such a case only enough should be cut away to enable the wood to become well ripened. If the plants are in a warm position, or in the full sun, they are liable to become badly attacked by red-spider. They may be syringed now with soft-soap and Quassia-water, and again before coming into bloom. Climbers on walls may be treated similarly, Cover the wall and bare places with last year's wood, cutting older pieces away as may be necessary. China or Monthly Roses will only require to have the shoots thinned. When pruning has been finished and the prunings cleared away, beds that have been manured for several years may be given a slight dressing with lime, and be mulched later on. Let all plants be labelled correctly with "Acme" labels, and they will then be more interesting than a collection without names.

Bulbs in Beds will now be showing through the soil, and should be dressed with lime and soot as a preventive of slugs. Loosen the surface soil with the Dutch-hoe.

Yuccas may easily be increased from old plants that flowered last season and have been left in the ground. They have thrown up some good suckers, which may be put into pots or planted in the ground. Yuccas have a good effect when planted in a bed containing Physalis Alkekengi, fresh beds of which may now be planted.

THE KITCHEN GARDEN.

By John Pentland, Gardener to C. H. B. Firth, Esq., Ashwicke Hall, Marshfield, Chippenham.

Potatos.—In many of the southern counties the planting of tubers in sheltered borders will soon become general, and if the soil is light and well drained, this may be done with the expectation of good results. The young plants will in all probability require some protection for a few weeks when they show through the soil, though in my own experience during more than twenty years I have only had my early Potatos cut off twice by frost, and on each occasion the tubers planted late were also frosted. On heavy, wet soil it will be better to postpone planting until the soil is in a less wet condition, or some of the tubers will decay, and the remaining ones grow irregularly. We had ample proof of this in the spring of 1903. Afford air to Potatos in frames whenever the weather is favourable. The heat afforded should not be sufficient to force the haulms up weakly, or the crop will be a failure. Make another planting on the open border, and place frames over them if necessary.

Cucumbers.—Where hotbeds and plants have been prepared as advised in a former Calendar, if not already done, cover the surface of the manure in the frame with about 4 inches of soil, raising a mound in the centre of each light about 1 foot high and 18 inches in diameter. When the soil has become warm and the heat of the hotbed has declined to about 75°, plant the plants on the mound, and keep the atmospheric temperature steady by covering the frame at night with mats. Admit air on bright days when required, and prevent extremes of heat or cold. Sow Gherkins.

Vegetable Marrows.—If Marrows are required early in the season, sow seeds in 3 inch pots furnished with damp soil, and place them on a shelf in an atmospheric temperature ranging from 55° to 60°, being careful not to give much water or the seeds will rot. As soon as the seedlings are through the soil, place them near to the light, and keep them sturdy. Plant the seedlings on a mild hot-bed when they have made a couple of rongh leaves, and cultivate them as hardy as possible, avoiding checks.

French Beans.—Maintain the supply indoors as previously advised, and sow seeds to produce plants for putting into cold frames and for planting out. Sow the seeds in rich moist soil indoors, or on a hot-bed, having a temperature not exceeding 60° unless by sunheat. Do not apply water until the seeds have germinated, unless it becomes absolutely necessary to do so. Afford them all the light and air possible when the weather will permit.

Seed Sawing.—Sow in the open, Onions, var. Ailsa Craig, Bedfordshire Champion, Rousham Park Hero, James Keeping, also Silver Skinned for pickling. Sow Parsley; also Elcomb's Improved, Hollow Crowned, and the Student Parsnips; purple and lily-white Seakale, large-Jersey Shallots, improved Mussellburgh and the Lyon Leeks.

Forcing-houses.—Give particular attention toventilating the forcing-houses and frames, or in a very few minutes sunshine may cause injury.

FRUITS UNDER GLASS.

By W. FYFE, Gardener to Lady WANTAGE, Lockinge Park, Wantage.

Pines.—The potting of succession or autumn suckers should be completed. Pots and crockshaving been made perfectly clean, transfer plants from 5-inch into 8-inch, and 6-inch into 10-inch pots. Should the plants have become root-bound, gently separate all matted roots with a pointed piece of wood; but it is not good practiceto allow the roots to get into such condition before repotting the plants. Let the soil be of the best fibrous yellow loam procurable, using only the fibrous parts from which the fineparticles have been removed. To every barrowful of loam fibre add a 6 or 8-inch potful of some approved chemical manure and an equal quantity of soot. Warm the soil to the same temperature as that of the house beforeusing it, and let it be fairly dry, so that the plants may be made moderately firm in the pots. Examine each plant carefully a few daysprevious to repotting, so that the soil may be moist about the roots when they are turned out of the pots. Withhold water for a timeafter potting, but maintain a moist, growthpromoting atmosphere by gently spraying the plants overhead with the syringe in the afternoon when closing the ventilators, damping all available surfaces at the same time. Let the temperature at night be 60° to 65°, and the bottom-heat 85° to 90°.

Peaches and Nectarines .- Trees in the second early-house were started here early in the year and forced moderately with a free circulation of top and front air during the greater part of the time. Under such favourable conditions, with the flowers well in advance of the wood-buds, no difficulty has been experienced in securing a good set. Disbudding was begunas soon as the buds had well started, removing at intervals all buds with the exception of one in front of the fruit, and depending upon anothershoot from the base for supplying wood for bearing next year. Should any shoots which havebeen allowed to remain appear likely to cause with a sharp knife. crowding, remove them Syringing must be done with discretion in dulb and cold weather. Too much moisture would belikely to cause the growths to be weakly, and the fruits would suffer. Should red-spider—a recog-nised enemy of the Peach—be troublesome, useflowers-of-sulphur on the affected parts rather than bring about an excess of moisture. temperature at night in severe weather should be 50°, and may rise 10° or 15° during the day with sun-heat.

Vines.—Attend to the disbudding of Vines in the second early house as soon as the best breaks can be distinguished, proceeding gradually, bearing in mind that the strongest breaks do not in every case produce the most compact and perfect bunches of fruit. Take every opportunity to-reduce long spurs by retaining the break nearest the main rod when possible. If any mealy-bugs are seen now, in spite of the winter cleansing, take a small brush dipped in methylated spirits, and with a slight touch kill the insects. When the flowers can be seen, the temperature under bright sunshine at closing time may rise to 85° and the temperature at night be 55° to 60°.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the Publisher. Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR. 41. Wellington Street, Covent Garden, London.

Communications should be WRITTEN ON ONE SIDE ONLY OF
THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.-The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself re-sponsible for any opinions expressed by his correspondents.

Illustrations .- The Editor will be glad to receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers. - Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, MAR. 8 Royal Horticultural Society's Commutees meet.

BALES FOR THE WEEK.

MONDAY NEXT— Perendials. Roses, Fruit Trees, Azaleas. &c., at 67 & 68, Cheapside, E.C., by Protheroe & Morris,

WEDNESDAY NEXT-

WEDNESDAY NEXT—
Azaleas, Rhodoceodroos, Palms, Plants. Roses,
Fruit Trees, Border Plants, &c., at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12 At Stevens'
Rooms, at 12:50, Roses, Azaleas, Palms, &c.; Fruit
Trees, Magnolias, Gladioti, &c.
THURSDAY NEXT—
Glearance Sale of Fruit Trees and Greenhouse
Plants, at the Royal Horticultural Society's Gardens Sution Court Road, Chiswick, by Protheroe &
Morris at 12:30.
FRIDAY NEXT—
Nursery Property, Greenhouses, Piping, &c., situate
at Oxford Road South, Gunnersbury, at the Mart.
Tokenhouse Yard, E.C., by Protheroe & Morris, at
2.—Burnese Dendrobes and other Orchids, at 67 &
68, Cheapside, E.C., by Protheroe & Morris, at 12:30.

of the Horticultural Society.

"IT was on March 7, 1804, The Centenary in a room in the house of Mr. HATCHARD, the eminent bookseller in Piccadilly, that the Society was first

organised. On that occasion there were present, Mr. CHARLES GREVILLE, Sir JOSEPH BANKS, Mr. RICHARD ANTHONY SALISBURY, a distinguished botanist of the day; Messrs. W. T. AITON and W. FORSYTH, two of the then royal gardeners; Mr. James Dickson, an experienced practical gardener; and Mr. John Wedgwood, at whose suggestion it appears that the meeting was called, and who afterwards became the first Treasurer. It was resolved that the objects of the new Society should be 'to collect every information respecting the culture and treatment of all plants and trees, as well culinary as ornamental;' 'to foster and encourage every branch of horticulture, and all the arts connected with it;' and 'that it shall be considered within the intention of the Society to give premiums for imprevements in herticulture, wherever it should be judged expedient to do so.' Each of the gentlemen present at this first meeting paid one guinea towards defraying preliminary expenses, and were called Founders, to whom was afterwards added Mr. J. HAWKINS, who had been accidentally

absent. It was further agreed that each Founder should name, at the next meeting, three other gentlemen for election as Original Members. A week afterwards this was carried into effect; and thus was founded the Horticultural Society of London, an association destined to accomplish most important improvements in the art as well as science of gardening, to embellish the country with a vegetation of exquisite beauty before unheard of, to clothe our plantations with trees whose ornamental appearance is only equalled by their sterling value, to create by its encouragement new races of flowers, fruits, and even esculents, and to substitute for the glasshouses of that day, in which plants could scarcely maintain a languid existence, structures calculated to

The rate of subscription has varied very considerably at different periods. The Founders contributed one guinea each, and all had the privilege of nominating three Original Members. Fellows elected after October 1, 1818, were required to pay five guineas entrance-fee and three guineas annual subscription, those elected before that date paying two guineas annually. Any person, however, exercising the trade or profession of a gardener, who should have received a medal from the Society, or have communicated a paper which was duly printed in the Transactions, might, with the consent of the Council, be elected to all the privileges upon payment of one guinea entrance fee and one guinea annual subscription. It is interesting to notice in passing that an entrance-

SIR TREVOR LAWRENCE, BART., K.C.V.O., ETC. From a portrait taken soon after his election as President of the Royal Horticultural Society in 1885.

ensure a richness of growth greater even than that of the exuberant vegetation of the tropics.

Thus does Mr. Andrew Murray narrate the inauguration of what is now called the Royal Horticultural Society. ANDREW MUR-RAY, whose genial wit is still held in remembrance, acted as Assistant-Secretary for some years after the retirement of Dr. Lindley. He had access to the records and other publications of the Society, from which he compiled a sumptuous volume, entitled, The Book of the Royal Horticultural Society, from which the passage just quoted has been, taken. Those interested in the history of the Society will there find traced its singularly chequered history. In 1804 there were but ninety-one Fellows. In the following year the meetings were held in the roems of the Linnean Society, at that time in Gerrard Street, Soho. In 1806 only seventeen Fellows were elected, and in 1808 only eight!

fee of one guinea, with an annual subscription of the same amount, was decided on at the annual meeting of the Fellows held on February 9 last,

The first Charter was granted in 1809. In 1810 the first volume of the fine series of Transactions was published. In 1811 THOMAS Andrew Knight, the eminent physiologist, became President, and remained so till his death in 1838.

Fruit and vegetables seem to have occupied the attention of the Society far more than flowers for several years. This is most marked in the far greater number of papers and plates on pomological points, published in the early Transactions, than appeared on floral subjects. For several years too the Council caused some two-dezen drawings of fruits to be annually executed. It must however be added that other collections of drawings of ornamental plants were already in process of formation by the time the Society removed to Regent Street, one of

J. GURNEY FOWLER, ESQ.,
Present Treasurer of the Royal Horticultural Society.

REV. W. WILKS, M.A., Sceretary of the Royal Horticultural Society since 1887.

which collections consisted of the most remarkable and beautiful plants of China. In 1811, the Council also notified that "it had been the intention of the Society from its first institution to present honorary premiums or medals to such persons as should raise and produce before them any new and valuable variety of Fruit or esculent Plant, or who should make any important discovery in Horticulture. But as the Society conceived every one of these subjects to be still capable of acquiring a greater degree of perfection, they submitted twelve improvements proposed by members, two of which affected Potatos, and the remaining ten were all pomological in its broader sense. The actual awards made about this time (eighty years ago) also bear out this statement. The fruit exhibited received constant awards, whereas flowers only appeared at that time on the annual award list two or three times.

In 1820 the Council reported that one of the objects which had particularly engaged the attention of the Society had been the formation of an experimental garden, that which they had already been able to maintain being regarded only as temporary; and they looked forward to that period when they might create an establishment which should at once become "a national school for the propagation of horticultural knowledge, and a standard of reference for the authenticity of every species of garden produce."

There were experimental gardens at Kensington and at Ealing prior to the establishment of the garden at Chiswick in 1822.

The original 33 acres of the Chiswick gardens comprised 17 acres in the "fruit and kitchen garden department," 2 acres of "lodges, roads, yards, &c.," and 14 acres in the "ornamental department"; 8 acres of the latter being devoted to the arboretum. These were subsequently reduced to 13 acres, which, now being considered unsuitable and inadequate, are being given up, as the Society now, thanks to Sir Thomas Hanbury, holds at Wisley the largest, best, and most beautiful garden it has ever had.

In spite of all its vicissifudes the record of a hundred years is decidedly inspiriting. Much more might have been effected, but so much has been done that we may safely say that no society of its kind has even approached it in what it has accomplished for horticulture. Its early days were, as we have said, watched over and guided by Thomas Andrew Knight, Sir Joseph Banks, and Joseph Sabine. At first progress was very slow. The great war did not end for eleven years after the foundation of the Society, and when at last it did end with Waterloo, the country was exhausted and impoverished by the long struggle.

Then, in 1822, came Lindley, with his vast knowledge, indomitable energy, and commanding personality. He was appointed Vice-Secretary in 1822. With his friends Royle and Bentham great things were then accomplished. Robert Thompson also has left an imperishable record as a gardener, a pomologist, and meteorologist. Solly as a chemist, and Daniell as a physicist, lent renown to the garden; and in our times George Gordon and later still Archibald Barron have upheld the glorious traditions

of Chiswick.

Amongst other things, the meteorological records for forty years, co-ordinated by the late Mr. GLAISHER, and almost unique of their kind, should be mentioned.

The chief and abiding fame of the Society. however, lies in the introduction of so many plants of interest and utility. We have not space to mention all the travellers sent out by the Society, still less to enumerate the results of their labours. Three collectors only need be here mentioned - Douglas, HARTWEG, and FORTUNE. Truly a noble trio!

If the Society had done nothing else but be the means of sending out these men and of distributing their importations, it would have far surpassed any other society of the same kind. The plants were grown, studied, described at Chiswick, and distributed from thence. No wonder that the name of Chiswick is held in respect and veneration wherever horticulture and botany are held in honour!

Reverting to the earliest history of the Society, we append a list of the Officebearers and Members of Council at its formation in 1804.5:

EARL OF DARTMOUTH, President.

Right Hon. Sir Jos. BANKS, Bart., KB.

JAMES DICKSON Right Hon. CHAS. GREVILLE RICHARD ANTHONY SALISDURY

Vice-Presidents.

James Sims, M.D. JOHN WEDGWOOD, Treasurer. Rev. ALEXANDER CLEEVE, Secretary.

WM. TOWNSEND AITON JOHN TREVELYAN Sir WM. BLIZZARD WM. FORSYTH THOMAS HOY

Rt. Hon. ISAAC CORRY Sir Christopher HAW-KINS, Bart. JOHN HAWKINS LORD MIDDLETON

WILLIAM MEYERS

CHARLES MILLER WILLIAM PRICE JAMES VERE

Of some of these gentlemen a short notice appears in another column.

Among the rank-and-file of the Society in its inauguration [year were [Sir J. E. SMITH, Dr. Lettsom, A. H. Haworth, George HIBBERT, A. B. LAMBERT, DAWSON TURNERall celebrated men in horticultural and botanical circles.

It may interest and amuse some of our readers to see what a meeting of the Society was like in George Cruikshank's time, and for the opportunity of doing this we are under obligations to the Council of the Society. Unfortunately we cannot assign the exact date to this amusing sketch (see Supplement), but we shall not be far out in assuming it to have been drawn about 1822, when the Society occupied a house in Regent Street, which was eventually sold in 1859.

The solemn state in which the meetings were then held contrasts with the less ceremonious proceedings of to-day. The President (probably T. A. KNIGHT) is in the chair, supported presumably by the Treasurer and Secretary (Joseph Sabine, to the left), and one of the Vice-Presidents. In all probability the caricatures are portraits, but we have not been able to identify them. The humorous comments on the fruits and flowers exhibited, and on the Fellows present, have not lost their point even now.

Thus the Society has been at one time prosperous, at another time depressed almost to bankruptcy, and this not once or twice, but repeatedly. Murray's book ends

with the brilliant period inaugurated under the presidency of the PRINCE CONSORT. His death in 1861 caused general consternation, and no society felt the shock more than the Royal Horticultural. We have no desire now to recall the miserable time that followed. Most of our readers are familiar with the efforts that were made to restore and rejuvenate the Society, and most of them are aware that among those to whom the credit of the present unexampled state of prosperity is chiefly due, are the President, Sir TREVOR LAWRENCE, who has stuck to the society through evil and through good report, and the Secretary, the Rev. W. WILKS, whose indefatigable energy and powers of organisation have been invaluable. As we have elsewhere given the portraits of the founders of the Society, so it is here appropriate to present the likenesses of some of the present officials (see pp. 152, 153). Sir Trevor LAWRENCE became President in 1885. His services and those of the Rev. W. WILKS are above alluded to, whilst those who had the opportunity of listening to the financial statement made by Mr. Gurney Fowler at the last annual meeting of the Society will experience no doubt that, as Treasurer, he is the right man in the right place. Like the President, Mr. Fowler is an enthusiastic cultivator of Orchids. It must be specially gratifying to these gentlemen to find that the centenary can be celebrated by the erection of a suitable home for the Society, which it has never before had. This has been accomplished largely through the munificence and zeal of Sir HENRY SCHRÖDER, Bart.; and the best way of showing our acknowledgments is by contributing at once to make up the sum still required to complete the building. Thanks also to the generosity of Sir Thomas Hanbury, we may confidently look forward to seeing the ancient reputation of Chiswick repeated at Wisley.

Whatever the future may have in store, the library, the gift of the Committee of the International Horticultural Exhibition and Botanical Congress of 1866, is saved from the fate of its predecessor by being placed in the hands of trustees, who are hampered in its maintenance only by their exiguous income—some forty pounds a year!—and the new garden also is held by trustees for the benefit of the Society.

The second centenary opens well and hopefully. The future of the Society, in so far as the advance of horticulture is concerned, will depend upon the practical recognition of the fact that no real progress is possible without the extension of scientific knowledge and its application to practice.

ROYAL HORTICULTURAL SOCIETY .- The next meeting of the Committees will be held on Tuesday, March 8, in the Drill Hall, Buckingham Gate, Westminster. A lecture on "Cottage and Allotment Gardens" will be given by Mr. A. DEAN at 3 o'clock. It is hoped that persons interested in this subject will attend the meeting and take part in the discussion.

- At a general meeting of the Society held on Tuesday, February 23, forty new Fellows were elected, making a total of 301 elected since the beginning of the present year.

HORTICULTURAL CLUB.—The next House Dinner of the Club will be held on Tnesday, March 8, at 6 P.M., at the Hotel Windsor. The Rev. Professor Henslow, M.A., F.L.S., V.M.H., has promised to read a paper, entitled "Tho Objects of Botanising Excursions."

SCIENCE AT CAMBRIDGE. - The followingpassages from the addresses made by the King or the occasion of the opening of the new buildingsin the University for the promotion of scientific research are noteworthy, and we trust will bear fruit abundantly:-" I am very glad to know of the educational work in connection with the great industry of agriculture which you have undertaken. In common with most branches of industry, agriculture has in modern times come to depend for its. success and extension upon the unremitting application to it of the results of scientific investigation. No greater service can be rendered to this ancient. industry than to furnish it with the means of research and instruction, which are essential in order that labour may be directed in profitablechannels. In the buildings which are to be opened to-day important provision will be made for instruction in some of the branches of knowledge upon which the scientific cultivation of the land is based, and you will, I hope, derive therefrom useful aid in the carrying out of yourundertaking. I pray that every success may attend you in the execution of the great work of general education which is now entrusted to you. . . . I earnestly desire the well-being of the University and the extension and development of all branches of study and research, which are essential to the. maintenance and the greatness and the welfare of my Empire. I have no doubt that Cambridgewill continue to occupy a foremost place in this work. To the older Universities must aucceed new endowments for education if my realm is tobe kept up to its proper standard of efficiency. L am glad to know many munificent donations havebeen received to that end, and that the museums which are now being opened for the study of subjects of especial importance at the presenttime will serve as an example of that generosity, at which friends and supporters of the University will rejoice.'

MR. T. W. TURNER.—Before Mr. TURNER left the Royal Horticultural Society's Gardens at Chiswick, a fortnight ago, to take up his new duties at the Royal Hospital, Chelsea, the Superintendent and Staff made him a presentation of a marble timepiece, as a mark of their esteem and an expression of their good wishes.

UNITED HORTICULTURAL BENEFIT AND-PROVIDENT SOCIETY.—We are informed that. the Annual Meeting of members will be held atthe Caledonian Hotel, Adelphi Terrace, Strand, on Monday evening, March 14, at 8 o'clock. Mr .. H. J. WRIGHT will preside.

"THE FRUIT-GROWERS' YEAR-BOOK" (Illustrated), 1904 (London: Hatton House, Great. Queen Street, W.C.). We cannot do better than quote from the title-page, which indicates that this. is a book "containing articles, notes, and interviews directly dealing with the latest developments. of the fruit-growing industry; essaya by authoritative writers, invaluable statistics and tables, and a directory of fruit-growers and market-garden farmers." We notice more than onearticle respecting the Northern Star Potato, and would further mention a useful monthly calendar. bearing special reference to fruit-culture.

FRUIT CULTIVATION IN BRITAIN. - The Departmental Committee on Fruit Culture appointed by Lord Onslow held sittings on Wednesday and Thursday, the 24th and 25th ult. The following members were present :- Mr. Boscawen,. M.P. (Chairman), Col. Long, M.P.; Mr. C. W. RADCLIFFE-COOKE, Mr. HODGE, Mr. MONRO, Dr. Somerville, Mr. P. Spencer Pickering, the Rev. W. Wilks, and Mr. Ernest Garnsey (Secretary). Evidence on behalf of the Board of Agriculture and Fisheries was given by Mr. REW, of the Statistical Department; Mr. BROOKE-HUNT, of the Educational Department; and Sir-W. T. THISELTON-DYER, K.C.M.G., Director off the Royal Gardens, Kew. Evidence on hortical *ural instructors for County Councils was given by Mr. Luckhurst, Derby; Mr. Goaring, Sussex; and Mr. Ettle, Somerset.

THE VEITCH MEMORIAL FUND. — At an adjourned meeting of the Trustees, held on the 23rd ult, it was decided to offer the large silver medal for distinguished service to Horticulture to Mr. John Wright, V.M.H., in recognition of his long and persistent efforts to diffuse amongst the industrial classes a practical knowledge of the cultural requirements of the vegetables and fruits most necessary for gardens and as an author who has written several valuable treatises on subjects relating to horticulture. Also a similar medal to Mr. Thomas Challis, of Wilton House Gardens, Salisbury, for his long and many services to gardening, especially in reference to his improved cultivation of hardy fruits.

THE FIRM OF PROTHEROE AND MORRIS, the horticultural auctioneers, of Cheapside, E.C., and Leytonstone, is well known to mest of our readers, who will be interested to hear of the redirement of Mr. George Field Morris from partnership. Mr. Morris, who is now retiring owing to advancing age, has been connected with the firm for a period of fifty-eight years, although for the past ten years he has left its management entirely to the remaining four partners, Messrs. H. G. MORRIS, J. B. SLADE, T. A. MORRIS and A. F. PROTHEROE, who will continue the business as keretofore. Our readers will be glad to know that Mr. G. F. MORRIS, who retires at the age of seventy-three years, is in good health, and they will join with us in wishing him many years to enjoy his well-earned leisure. The firm, which has been established upwards of seventy years, will still be known under the same name.

THE SURVEYORS' INSTITUTION.—At a meeting held on February 22, a paper was read by Mr. H. J. Elwes, F.R.S., entitled, "British Timber and its Uses." A discussion followed, and was adjourned to the meeting of Monday, March 21. The next ordinary general meeting will be held in the Lecture Hall of the Institution on Monday. March 7, when a paper will be read by Mr. Thomas Bennie (Fellow), entitled, "The Land Purchases for the New Naval Base at Rosyth, on the Firth of Forth." The Chair will be taken at 3 o'clock.

SPHAGNUM - MOSS IN ORCHID HOUSES. —
*Can any of our readers suggest what may be the reason for sphagnum-moss failing to succeed as *described in the following letter from a successful *Orchid cultivator, whose establishment is about three wiles from the sea on the south coast?

"We cannot get the sphagnum-moss to thrive in our Orckid-houses here. We use rain water, and no manures, but it persists in turning black and becomes rotten. This occurs if we use the new leaf-mould or the orthodox compost. The houses are airy and welt would and shaded with wooden roller blinds. The peat is the best peat we can buy. Is it possible that our propinguity to the sea (three mile:) has anything to do with it? It is aggravating, and I should be very glad if anybody would kindly assist us in the matter. I may add that we have been to various dealers fer our moss, but always with the same disappointing results. I cannot attribute it to the drainage, as we are most successful with our Odontoglossums, as well as with species in the warmer houses. There is no mycelium visible; the moss simply goes black."

PUBLICATIONS RECEIVED.—The Queensland Agricultural Journal, January. This, as usual, is full of useful information. Mr. F. M. Bai ey continues his contributions to the Flora of Queensland, which are this time illustrated by a photographic reproduction of Leucosmia Chermsideaua.—Agricultural Journal of the Cape of Good Hope, February. It is gratifying to learn that the prospects all round are very promising in spite of the lengthened drought. "Rural Cape Colony" is the title of an interesting series of articles; the notes this month on the fruit it dustry deserve special mention.—Indigenous Timbers of the Cape by D. E. Hutchins Conservator of Furests, is also noteworthy.—Need-List from the Imperial Botanic Garden, St. Petersburg, Some thirty-eight small pages printen in double 2012mn of names of seeds available for exchange.

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his Correspondents.)

PRUNING OF VINES AND TREATMENT OF SUB-LATERALS.—In reply to Mr. Hill, I may say that I have had about forty years' experience in cultivating the Vine; but I fear to state facts which I find in my practice are contrary to the system adopted by nine growers out of every ten. The summer pinching and winter pruning depend to a great extent on the different varieties of Grapes, their degree of vigour, and the crop of fruit which the Vine carries. Sometimes splendidly finished Grapes are seen on a Vine that does not require the sub-laterals pinched; and often very badly-coloured Grapes are seen on a Vine where strong sub-lateral growths are encouraged. The only way to stop this growth is by pruning, feeding, and watering at the proper season of growth. In winter I adopt the spur-pruning, but have leng spurs on shy fruiters, such as Duke of Buccleuch. Mr. Slade says that "there is sometime, in Lady Hastings he does not quite understand. Mr. Slade says that "there is semething This Grape was sent out as a sport, and received a First-class Certificate. Mr. Molyneux, who has seen this Grape growing at Melton Constable, might perhaps describe the difference between Black Muscat and Lady Hastings. The former was sent out in 1874 as a seedling, and the latter in 1890 as a sport of Muscat Hamburgh. A. Kirk, Norwood Gardens, Alloa.

DISEASE-RESISTING POTATOS .- I have no intention to withdraw my statement "that I am tired of hearing of disease-resisting Potatos." We have been hearing of them for the past thirty years, beginning with the old Redskin Flourball down to now, and I repeat that, so far as absolute permanent disease-resistance is concerned, we are no ferwarder. Is there in commerce to-day, in spite of the efforts put forth to beem one two comparatively new varieties, any one that is, in respect of disease-resistance, of crop, or of general quality, better than was that grand Petato of the last century, Magnum Bonum, for the first several years of its coming into com-What truly wonderful crops it gave free from disease—20 tons to the acre, a beautiful sample, and of capital table quality! That was sent out some 25 or more years ago, and it was soon the one Potato of the nation. The nearest approach to it since is doubtless Up-to-Date, also a great cropper and just now the Potato of the kingdom, but it seems to be even less disease-resisting. There is my point, and it is conclusive proof that so far we are no forwarder. I want a diseasepreof Potato. Can any of those who continue to raise new varieties find us such an one? As I mentioned at the first meeting of the Potato Society, we want a variety that is hairless, has thick, leathery, shiny smooth leaves, and stout, woody, smooth stems. Such a plant would be, I believe, impervious to the attacks of disease-spores, and these could be kept from contact with the newly-forming tubers were the rows of such ample width apart to allow of a good body of soil to be moulded up round the stems. Possibly many an esteemed disease-resisting variety loses its reputation because it is planted in seil reeking with resting spores, or because the seed-tubers have been weakened by bad storing. But enormous cropping even to-day is less a matter for admiration than is absolute immunity from disease. A. D.

STRAWBERRY BEDS.—Different opinions have been expressed in regard to the mulching of the plants, and particularly upon the date when this operation should be performed. Few will condemn the mulching of light and gravelly soils, but I am convinced that little or no benefit follows the mulching of soils of a heavier texture. I have witnessed the system of applying a heavy dressing of manure in the autumn, and raking the same off in the spring, also that of forking the manure in—not a happy process for the roots. My own experience has led man to discountenance the mulching of Strawberries under any conditions. Several years ago it was my good fortune to serve for a time under the late Mr. Strathdee, in Gadgirth Gardens, Ayrshire, not unknown to many as the "Garden of Eden" of Ayrshire. Gadgirth has long been famed for its successful fruit culture, and especially for that

of Strawberries. I will try to explain the practices which were so successful during my stay at Gadgirth. Mr. Strathdee had then been head gardener there for forty years. Strawberries were grown on a large scale, for commercial purposes as well as private consumption. Mr. Jefferies stated in the Gard. Chron. on p. 90: "When all the fruits have been gathered, and a sufficient number of runners have been layered for a new bed," thus showing a system of taking young stock from plants pre-ducing fruits, which was never practised at Gadgirth. Runners were taken from plants put out in the previous August, and these plants were not permitted to fruit until the season following. treatment of these non-fruiting plants consisted in keeping all flowers and superfluous runners rigorously pinched off, plying the Dutchhoes frequently—they were seldom idle—and in watering the young runners, some of which were layered in pots and the others in the bed. No mulching was given other than that of fine soil provided by the hoes. When the flower-scapes began to appear upon fruiting plants, thorough soakings of liquid manure from the farmyard were afforded at intervals until the most forward fruits showed the least tinge of colour. At the same time the littering-down with strawy material was accomplished. If the manure-water was given sooner, it would tend to produce a superabundance of foliage. As soon as fruiting was over, all runners and old leaves were cut away, and, together with the litter, wheeled on to the bed which had produced its third crop, and was therefore to be trenched in. The hoe com-pleted the rest of the work deemed neces-sary until fruiting time again arrived, when the previous year's formula was repeated. In trenching-in the old beds liberal dressings of farmyard manure were afforded, and such ground generally produced a crop of early Potates, which could be cleared off by the time it was again necessary to plant with Strawberries. Before the young plants were put out a very light dressing of well-decayed manure was spread. on the surface and slightly pricked in. encouraged the rapid formation of roots. The young plants were usually put at distances of 2 feet each way. Many varieties were grown, but I think for dessert purposes the most satisfactory was Royal Severeign, and for making jam Vicomtesse Héricart de Thury. In many cases failure is the result of insufficient care in selecting varieties adapted to the nature of the soil. President has always been a favourite, but unfortunately it fails to give satisfaction here on a cold retentive soil. Royal Sovereign leaves nothing to be desired, followed by Waterloo and Elton Pine. J. McCallum, The Gardens, Burkham House, Alton, Hants.

SOWING ONIONS UNDER GLASS.-The plea by "B." p. 140, for an extension of this practice comes very opportunely at a time when the condition of heavy soils is the despair of those who have to get in early crops. I have from time to time, for many years past, advocated the sowing of Onions under glass, not merely for the production of very big bulbs, which is, after all, a matter of minor importance, but as a successful means of combatting the difficulties which beset the grower of Onions in bulk for home consump-To grow Onions successfully from seed sown in the epen, seed sowing has to be per-formed quite early in the year, and more often than not the ground is at that time not in a fit condition to be meddled with, and the work has to be put off week after week, so that when the first hatch of Onion Fly takes place about the early half of May, later or earlier according to district, the young plants are in the stage when they are most susceptible to attacks, and the crop falls before the enemy in a heartrending sort of way, in spite of any remedial applications that may be used. "B" alludes to the labour side of the question and seems inclined to believe side of the question and seems inclined to denote that it is increased under the planting-out system; but after many years' practice and observation I am not at all inclined to agree that there is any increase of labour, and for the following the property of the initial elements. lewing reasons: First, the initial cleaning of the crop is absolutely avoided and the young plants get a thoroughly good start of the weeds, as when planting is carried out the ground will be clean. Again there is no thinning

to be done—not that thinning is a process absolutely necessary for the production of useful sized bulbs when sown where grown, but very few people have the courage to sow thinly enough. I think it may be taken as proved that weight of crop is greatly increased under the planting-out system, for the bulbs undoubtedly are larger and they are also far more uniform in size. The space required to raise many thousands of young Onions under glass is very little. My practice is to sow quite thickly, as the growth-thus becomes more upright and the plants easier to handle. Should the roots become slightly matted before planting out, this will have but very little influence on the general results of the crop, for, as pointed out by "B," the young plants soon recuperate and grow away from the check. The one thing needtul is to prevent drawing during the early stages. Treat the plants as ordinary bedding plants, and they will give no difficulty. One is tied to no time as to planting out, and can afford to wait until the weather and soil are favourable. J. C. Tallack.

CURIOUS PEST IN GARDEN.—Two years ago I purchased a residence with about 2 acres of ground, with kitchen and flower-garden combined, and have since found that about the months of July, August, and September all my family, as well as myself, have been pestered with what at first appeared to be "hives" or heat-spots all over the body, the portion attacked being that not exposed. I have been informed that the trouble is caused by insects which get under the skin, and are known as orange-tawnies or harvest bugs. I may mention that for a few years previous the garden appears to have been neglected. Acting on advice, I have had a great deal of pruning done, and undergrowth cut away; in addition to which I have had the kitchen-garden cultivated and lime dug in, this latter being, as I was told, the chief aid in eradicating the pest. I am at a loss, however, to know how todeal with the grass in the flower-garden and on the tennis-lawn. I have a strong opinion that the pest must be in the grass, as we find after playing that we invariably get renewed attacks. Dilute petroleum has been suggested to me as a remedy, but I am loth to use it lest it might destroy the grass. A. S. H., Dublin. [Find the culprit and we will endeavour to help you; at present it seems all guess-work. ED.

GRAPE LADY HASTINGS. — This variety, worked upon the Black Hamburgh, fruited here in 1902 and 1903, and we have formed a very favourable opinion of its merits. It has a robust constitution, with distinct and good foliage. The appearance of both bunch and berry bears resemblance to those of Madresfield Court. But what may be termed the framework of the bunch is of more substance than that variety. The berries set and swell well, attaining to a large size and good colour. The bunches have been allowed to hang as long as they would keep well, for the purpose of testing them in the different stages and comparing the Grapes with Muscat Hamburgh, the supposed parent, also worked upon Black Hamburgh. The three grow in the same house. The first of the three to commence to colour was Lady Hastings. Lady Hastings has been pronounced by some to be the best of the three. But it must not be overlooked that the berry of Lady Hastings, being much larger than that of Muscat Hamburgh, it had a little advantage. All three varieties are again showing well for bunches; and to further test the matter I propose giving the Fruit Committee of the Royal Hotticultural Society, with the representatives of the Horticultural Press (generally keen critics), the opportunity of testing the three varieties during the summer. With White Gros Colmar I have had no experience, and this, from what I have read, is not to be regretted. W. Fyfe.

ALLAMANDA SEEDLINGS. — I was very interested to see on p. 141 the account of Allamanda Williamsii fruit which the Rev. W. Wilks showed to the Floral Committee. I had a plant of A. Williamsi which fruited in the summer of 1900. This capsule ripened sixteen seeds. I sowed seven of them on July 12, 1901, five of which I was fortunate enough to raise, and one of them flowered in September, 1902. All of them flowered last summer, and the five plants are all different, either in growth or in the flowers. I think the A. Williamsi must

have been crossed with the bees, because I had another Allamanda in bloom in the same house. They seem to be all improvements on A. Williamsi. I have shown them to several of the best gardeners around here, and they advise me to send them to one of the leading nurserymen for his opinion. If you think it would be advisable, I would send some of the blooms to the Floral Committee some time during the coming summer. H. Barton. [By all means send some flowers to the Floral Committee, and if possible let all the varieties come at one time in separate packages, and with flowers of the typical A. Williamsi for comparison. ED

separate packages, and with flowers of the typical A. Williamsi for comparison. Ep]

THE PROPOSED GARDENERS' ASSOCIATION.—As one who has long nad under consideration the desirability of a Gardeners' Association, perhaps you will permit me to say now pleased I am that such an Association is now about to ecome an accomplished fact. It is nearly tweoty years since I first advocated the banding together of trained gardeners, in the columns of a contemporary over a non-de-plume. The lapse of time and a more extended knowledge of gardeners and their circumstances, their trials and loys, their suppressed aspirations and open patience and endurance, their devolion to their callung, has strengthened my opinion that gardeners snould be registered and thereby be protected—as far as is possible by such means—from injury by impostors and by those who have failed in other walks of life. Many gardeners may say truly that they do not require protection from such persons. Some may even think that the status of gardeners cannot be raised by registration. But such gentlemen are rather thinking of individuals than of the whole body of gardeners. We know that many gardeners do not require any protection, nor can their status very welf be raised by any registration. But what of the remaining 19,676 persons out of 20,000 engaged in gardening work who have received training of some kind in horticutture? We must not individualise, but study the weifare of gardeners collectively. If we do that, I think few will be disposed to say that the general position of gardeners does not require improving and cannot be improved. When the Association is formed I think the first and most important question to be considered should be that of registration. All persons who can prove that they have received a certain number of years to be fixed by the Committee or Council — I think they should not be fewer than seven years—shall be entitled to have their names insertbed on the register; but that they shall be liable to removal on proof of conviction fo THE PROPOSED GARDENERS ASSOCIATION.

long life, and accord it my ucqualified support J. Udal; Superintendent of Horticulture for Worcester County Connect.

— The proposition of Mr. George Gordon, which was seconded by Mr W. Watson, of Kew Gardens, ought to have the support of all engaged in horticulture I, for one, shall support such an Association to the utmost of my ability. If I remember rightly, some nine or ten years ago Mr. F. W Burbidge suggested something of the kind in an able article in the Gardeners' Chronicle, but no one took any practical notice of it. Gardeners as a rule, take a lot of rousing, but the time has come, "and now ir," when they must be roused to a sense of the nightly of their calling. It is perfectly true, as Mr. Watson said at the meeting, that in many instances gardening had become the "dumping-ground for duffers," which must stop. Not only so, but as members of an aucient craft we have been neverybody's hands but our own. Systems which have existed in connection with gardeners must end. Then again the title "Gardener" belongs to all at present—the merest tyre claims it. Before anyone can lay claim to the title of gardener, he or she should be compelled to serve a certain specified time in a good garden under a fully registered gardener, who of course wound be a scientific and practical gardener." In many instances at present employers look upon their gardeners as little further advanced than a common labourer. I would in conclusion suggest that the provisional Committee insert a paragraph in the Gardening Press, asku g all gardeners interested in the proposed Association to send in their names to the Secretary, or to any member of the Committee, then they could form some definite idea how it was being taken up. The only way of reaching them is through the Gardening Press; no other Press recognises us. J. Corbett, Mugrave Castle Gardens.

NOTES FROM PENZANCE.

THE first week of February is perhaps about the most inauspicious time that could be selected for the inspection of an open garden in this country, but even at this season of the year thereis much to be seen in the neighbourhood of Penzance that is possessed of interest to the flower-lover. In walking through the town and adjacent villages, I saw in little gardens Ribes sanguineum and its white variety in flower, as well as Arabis albida, Anemone fulgens, shrubby Veronicas, great bushes of the Paris Daisy (Chrysanthemum Halleri major), Cytisus racemosus, Lithospermum prostratum, Megaseas, Snowdrops, Crocuses, Primroses and Chionodoxas, while Arums were in fine leafage, an Oleander was the picture of health, and Ivy-leaved Pelargoniums were common on cottage walls, on one of which a zonal Pelargonium had reached the eaves, a height of about 18 feet. Facing the main road to Land's End. Clianthus puniceus was in bloom, and in other gardens. Olearia stellulata, Erica lusitanica (codonodes), Teucrium fruticans, Camellias, Hamamelis arbores, an enormous bush of Datura sanguinea, 10 feet in height; Chorozema Lowii, Saxifraga Boydii alba, S. Griesbachii, and many varieties of Narcissi were blossoming. Amongstthe last I noticed a spike of Soleil d'Or, over 3 feet in height, carrying fourteen flowers. Henry Irving is a Narcissus that is much appreciated in this locality, where it is already extensively grown, it being found rather earlier than N. obvallaris, while it is also of a good golden-yellow colour. At Trewidden, near Penzance, the residence of Mr. T. B. Bolitho, I was grieved to find that probably the finest epecimen of Daphniphyllum glaucescens in the British Isles had died. This example was 12 feet in height and 20 feet in diameter. When it was taken down the roots were found to be rotten. It will be a great loss, as the young plants will require many years to attain to the same proportions. Two bushes of Rhododendron grande, better known as R. argenteum, were in tull flower. These are precocious examples, as the species does not usually bloom until the end of March. In the largest, which is over 12 feet in height, the pistils are crimson-tipped, but in the other they are white. A young plant of Guevina avellana, a seedling from the well-known specimen, 20 feet in height, at Mr. Bolitho's Devonshire seat, Greenway, on the banks of the Dart, is making fine growth, its foliage being particularly handsome.

The Rectory garden at Ludgvan, about 3 miles from Penzance, though not of great extent, is one of the most interesting in the county, the Rev. Arthur Boscawen, who has on several occasions won the premier prize for Narcissi at the Truro Daffodil Show, being a most successful cultivator of rare plants. At the time of my visit Correacarnea, C. virens, C. ventricosa, and C. picta superba, were in flower in the open air; as were Grevillea alpina, Diosma ericoides, Iris tingitana, Manettia bicolor, and a large plant of Clematis indivisa lobata, whose earliest blossoms were almost expanded.

Amongst other rare plants to be seen in the best of health in this garden are the New Zealand Phyllocladus trichomanoides, Alectryon excelsum, the white Cytisus proliferus, 12 feet in height; Corynocarpus lævigatus, Fremontia californica, Pseudopanax crassifolium, the New Zealand Lancewood, 10 feet in height; Clethra arborca, Cassia corymbosa, a fine specimen of Myoporumlætum, whose lanceolate leaves are spotted with innumerable transparent dots, and which I have seen flowering abundantly in the early summer; Meryta Sinclairii, Tricuspidaria hexapetala, Psoralea pinnata, a strong young shrub of Metroderos robusta from the Isles of Scilly, where it affords such a gorgeous summer display (the

Callistemons are a'mo t invariably catalogued by nurserymen under the name Metrosideros, but the two are totally distinct), Podocarpus Totara, Mitraria coccinea, Philesia buxifolia, several large, specimens of Abutilon vitifolium, Echium callithyrsum, 6 feet across; Callistemon speciosum, many fice bushes of Romneya Coulteri, which in this garden does not resent transplantation, though in the majority of cases this is followed by its speedy decease; Olearia nitida, Senecio Greyi and S. Fosteri, Abelia floribunda, Berberidopsis corallina, the rare Eucryphia cordata, 5 feet in height; Rhapiolepis ovata, Ozothamnus rosmarinifolius, Leptospermums, Pittosporums in variety, Nandina domestica, and other shrubs; while of Rhododendrons, the variety Pink Pearl, 5 feet in height and as much through, is worthy of mention.

Amongst other noteworthy plants are a fine specimen of Furcræa longæva, a collection of twenty varieties of Sprenger's Yuccas, Dracena lentiginosa with narrow, brownish - red leaves; Mandevilla suaveolens, an enormous clump of Libertia formosa, 5 feet in height; Cyathea dealbata, Iris Robinsoniana, I. fimbriata (syn. japonica), Myosotidium nobile, Crinums of several species, Agapanthus, Nerines, Watsonias, and Antholyzas. In the rock-garden Ourisia coccinea, usually considered difficult to grow, is a weed, rambling everywhere and flowering profusely; Lithospermum prostratum has formed a cushion about 9 feet across; Kalosanthes grow and flower well, as do the rarer Erythroniums and Fritillarias; Primula Cashmeriana, from self-sown seed, was in flower, as were several blossoming colonies of Narcissus cyclamineus, also self-sown, and the fine Galanthus Whittalli was in bloom.

The large and representative collection of Narcissi, which includes most of the newer and rarer seedlings, gave evidence of being in the best of health, and I saw two N. cyclamineus seedlings that were flowering for the first time. One, a cross between N. cyclamineus and Henry Irving, had a clear yellow flower showing traces of both parents, and the other, from a cross with Soleil d'Or, had a many-flowered scape of clear yellow.

There are well-filled herbaccous borders and a large assortment of Saxifrages and other dwarf subjects among half-buried rocks in sunny borders. S. W. Fitzherbert, February 25.

Obituary.

JOHN MITCHELL.-Born near Southampton in the year 1814, Mr. Jno. Mitchell died at Escrick, near York, February 20, 1904. Like most men who have attained to a great age, he had outlived most, if not all, of his contemporaries in early and middle life. John Mitchell was in his day one of the best known and most successful practical gardeners in Yorkshire. He began his gardening career in the then famous nursery of Mr. Page, of Southampton. Besides being a successful nurseryman, Mr. Page had a large connection as a landscape gardener. The writer has often heard John Mitchell speak with much respect of his first employer, although he must have been a very small boy when he went to work there, seeing that his wages were for a short time "a penny a day." By diligent attention to his duties and using every opportunity to make up for his lack of day-school teaching, he gradually but surely kept on improving his position in life. His first place as head gardener was at Eden Park, Beckenham, Kent. From there he went to Apley Castle, in Shropshire, the residence of Sir Thomas Charlton Meyrick. After about seven years' service there, he came, in 1854, to be gardener and forester to the late Lord Wenlock, at Escrick. At that time this wellknown Yorkshire nobleman was making extensive improvements in the gardens and home woodlands attached to his residence. Amongst other im-

provements was the formation of a very fine Pinetum, in which, amongst other choice conifers, were planted some of the first-reared plants of Wellingtonia in the country. After a faithful aervice of some thirty-seven years the present Lord Wenlock kindly granted him a pension with a cottage in the village for the remainder of his life. As recently as the Wednesday before his death he was out in the village. His only daughter was married to one of his former pupils, Mr. B. Hope, gardener at Middleton Park, in Oxfordshire, the raiser of the well-known Middleton Park Beet. Some years ago both of them died, leaving two young children, who were brought up and educated by their grandfather. His remains were quietly interred in the village churchyard on Tuesday the 23rd ult. Mr. Mitchell has often told me about subscribing to the Gardeners' Chronicle when it was first issued in 1841, H. J. C.

A NEW CYMBIDIUM FROM CHINA.

This remarkable species of Cymbidium (C. Wilsoni) was imported by Messrs. James Veitch & Sons, of Chelsea, from Yunnan, China. It is

not fasciate l. The condition was remarkable, having been persistent for six years on the same plant.

Silver Fir diseased—Mr. Massee showed a branch attacked by Æcidium elatinum. The Uredo form known as Melamprosella Cerastii attacks members of the order Caryophyllacce. He observed that the disease of the Birch caused by Phytoptus is spreading greatly in the neighbourhood of Kew.

Cypripedium malformed.—Dr. MASTERS described an unusual form (from Sir Trevor Lawrence's collection) of a blossom, which had four sepals, two petals, one column, with two stamicodes, but a three-lobed stigma and three parietal placentas. It was thus a case of locreased numbers of parts, or an attempt at forming a multifold flower.

Cineraria, supposed disease—Dr. Cooke reported upon some leaves sent by Mr. Vose, of S. Norwood:—"I have received during the past week leaves of Checraria from a Fellow of the Society who suspected them to be attacked by some mould. I examined and reported on these to the effect that I could find no parasitic mould upon the leaves; and although I examined the tomentum of the under surface as completely as it seemed possible to examine such a substance, I could find no mycelium mixed with the filaments of the tomentum, and no fragments of fungus hyphe or fungus spores. Subsequent examination of other leaves, which had

FIG. 66.—CYMBIDIUM WILSONI, FROM YUNNAN. Flowers green with red marks; lip cream-coloured.

closely allied to C. giganteum, but differs in being much dwarfer, the scape more slender, and the labellum less hairy. The sepals and petals are green, with some indistinct, dotted, reddish lines extending half-way up. The lip is cream-coloured, with sepia-brown lines inside the side lobes, and reddish markings on the front. The species received an Award of Merit when shown at the meeting of the Royal Horticultural Society on February 23 last.

SOCIETIES.

ROYAL HORTICULTURAL. Scientific Committee.

FEBRUARY 23.—Present: Dr. M. T. Masters, F.R S. (in the chair); Messrs. Hennesey, Chittenden, Odell, Baker, Veitch, Michaol, Saunders, Bowles, Massee, Douglas, and Holmes; Dr. Cooke; Revs. W. Wilks and G. Henslow, Hon Sec.

Coloured photos.—Mr. Hickley exhibited some more miscellaneous transparent photos of vases, bouquets, &c., by his new process. A vote of thanks was accorded to him.

Cyclamen malformed - Mr. Odell showed specimens in which petioles and peduncles were fused together, but

brownish and dead spots near the margin, furnished from these spots a few delicate fungus hyphe with a lew spores or conidia, evidently belonging to some species of Cladosporium. But as Cladosporium is so commonly found as a saprophyte on all kinds of dead vegetable matter, and so very rarely as a parasite, and in this iostance occurred only upon dead spots, I came at once to the conclusion that it was not connected with any disease. However, I ventured to state that I should never be surprised to find some species of Orlium, with its chains of conidia, on leaves of Cineraria as well as on other composite plants."

The failure of Beans in Houses.—Mr. Baker reported as follows upon this matter brought before the last meeting.—"Mr. Horseley writes that the plants and the unsown seed have been destroyed, and the earth thrown away. I have therefore to form an opinion from the loog record. Assuming this to be correct, there is very hittle, if any, doubt that the failures were due to, first and chiefly, unbalanced sunlight and fire heat. The period of failure was the eod of October to January, an unusually dull, sunless time this season, even for these mooths, and it seems no allowance was made for this. This has been a fruitful source of trouble this season elsewhere, and should teach the importance of regulating the beat by the sunlight available. Secondly, the soil was chiefly of humus and too light, and almost certainly very deficient in available lime, phosphate, and potash.

GLOUCESTERSHIRE ROSE.

FEBRUARY 16.—The annual general meeting was held at the Guildhall, Gloucester, on the above date. The financial statement for the past year showed that the receipts amounted to £145 78. 6d. (Including subscriptions £99 18_{γ} 9d. and gate money £41 13s), and the expenses of the annual show £188 88. vd. (prizes £83 12s.), thus leaving a deficiency of £43 1s. The halance-sheet was adopted.

ANCIENT SOCIETY OF YORK FLORISTS.

THE report of this Society for 1903, together with the schedule of prizes for 1904, has just heen issued. The Treasurer leports an adverse balance on the year's working of £9 13s, 11d. The receipts for admission to the Chrysauthemum Show were £60 4s. 6d. short of those taken in 1902. A balance of over £200, however, remains to the credit of the Society.

remains to the credit of the Society.

Social gathering, floral services, and numerous meetings and shows have been held during the past season, a special feature being the institution of a Dablia Show, the latter being so enthusiastically supported that it was a most gratifying success. At the Chrysanthemum Show, the exhibits were equal to any at previous shows. The schedule of prizes for 1904 is again very extensive, and the Entertainments Committee purpose arranging a series of evening drives to take place during the summer months to places of interest.

GARDENERS' DEBATING SOCIETIES.

HULL AND DISTRICT.—On February 23 Mr. McIntosh read a paper before the members of this Association on "The Tilth of the Garden," prefacing his remarks by an explanation of the origin and formation of solls. Air, frost, rain, wind, and seismic eruptions had prepared the soil so that the lower forms of vegetable life were enabled to find sustenance therein, and left it richer on their decay. Deep cultivation was strongly urged, and the essayist was of the opinion that there was scarcely any land but which could not, by deep delving and breaking up, either by human force or physical agencies, be made fertile. W. R.

LEE, BLACKHEATH, LEWISHAM, AND WEST KENT.—The monthly meeting was held on the 26th ult., when a lecture on "Roots and their Functions" was given by Mr. G. D. Judge, of The Gardens, Beechwood, Eltham Road, Lee. The lecturer dealt thoroughly with his subject, and illustrated his remarks by showing specimeus of roots in various stages, and by diagrams.

BECKENHAM HORTICULTURAL.—Mr. J. Cheal gave a lecture, on February 28 at the Public Hall, on "Horticulture in the United States of America and Canada," illustrated with lantern-slides. The lecturer, who went to America to see for himself, found there is plenty for the British gardener to learn in those places. Mr. Cheal gave an account of his journey to the back-woods to find an old apprentice, part of which journey was by rail, sleamer, lumber wagon, and on foot through the forest. Mr Cheal, when asked if there was any prospect of British gardeners succeeding in America, replied: "Yes, if they were thoroughly qualified;" and he found that most of the leading parks and gardens were managed by English or Scotch gardeners. This was the last lecture of this winter's session.

BRISTOL AND DISTRICT GARDENERS.—A well-attended meeting was held on the 25th ult., when Mr. J. Coutts delivered a lecture on "Greenhouse Hardwooded Plants." Mr. E. Poole eccupied the chair. The lecture included minute details for the cultivation of Ericas, Rhododendrons, Azaleas, Boronias, &c., potting composts, training, and general treatment receiving attention. The next lecture will be held on March 17, when Mr. Myers will lecture on "Ancient and Modern Gardens," illustrated with lime-light views.

SPEKEFIELD COTTAGERS' AMATEUR GARDEN—
Six interesting lecture, by Mr. John Stoney, of Aigburth, have heen given to the members of this Society,
the lecturer illustrating his remarks by a series of
diagrams, lantern-slides, and specimens. The lectures
on each occasion were highly appreciated and well
attended. Many questions on technical points were
asked, and fully answered by the lecturer. The Chairman at the clusing lecture presented a handsome
walking-stick to Mr. Stoney on behalf of the members.

DEVON AND EXETER.—At the meeting held on the 24th ult., Mr. W. Mackay, of the Royal Nurseries, Exeter, read a paper on "Employers and Employés." Mr. Mackay advocated employers gaining the esteem and confidence of their men by a firm but easy attitude. It was a mistake on the part of an employer to think that condescension was likely to bring about undue familiarity or carelessness. An employé's duty was to study his master's interests and wishes. The lecturer advocated recreasing

tion and rest for the men. The paper contained much excellent advice to the members, of whom a large number was present.

CHISLEHURST GARDENERS'.—The Chislehurst Gardeners' Society heid a meeting on Tuesday. 25th ult., when Mr. Henry Cannell, V.M H., Swanley, gave a lecture entitled, "Fruit, and how to eat it." Being a practical gardener, he felt it his bounden duty to tell the community what he thought, in fact he was certain fruit was the best food to cat. For the past eight years and over he had tived entirely on fruit, vegetables, and farinaceous foods, and was a great deal better in health now than he was when he started this mode of living. Stewed Apples and wholemeal bread made without yeast were, in his opinion, the best of all foods. Bananas were said to be the most nutritious, and are recommended for weak stomachs. Bilberry, Whortleberry or Winnberry, and Loganberry, Blackherry, Cranberry, all received a passing remark Cherries, Currants, Gooseberries, Dates, Eldetberries, Figs, Grapes, Pears, Pineapple, Melons, Strawberries, &c., were all more or less useful. During the evening specimens of vegetarian diet were handed round by Mr. Cannell, assisted by his son, Mr. Robert Cannell. Several preserved fruits were tasted and commented upon.

READING AND DISTRICT GARDENERS.—There was a large attendance at the last fortnightly meeting of the above Association, when Mr. T. Neve, of Sindlesham House Gardens, Wokingham, introduced the subject of "The Potato in Connection with the year 1903." He noted the value of the Potato; the universal failure of the 1903 crop; the different varieties of Potatos; spraying to prevent disease, and made the following suggested remedies to prevent disease, viz.—an entire chauge of ground for growing the crop, the use of manures that are suitable for Potatos, change of seed, giving more thought to the early and second-early varieties, and planting varieties with as strong a constitution as can be obtained.

THE WEATHER.

GENERAL OBSERVATIONS.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending Feb. 27, is furulshed from the Meteorological Office:—
"The weather this week was dull in all districts, espe-

"The weather this week was dull in all districts, especially in the north and east of Great Britain. A considerable quantity of rain was experienced in Ireland and in many parts of Scotland, but over England the conditions generally were drier. Heavy snow and some sleet occurred, however, in the central and northern counties on Friday; and snow showers were very prevalent on the following day in the English districts, as well as in the east of Scotland.

"The temperature was high over the whole kingdom during the dirst two days, and conlinued fairly high in Ireland and the extreme north of Scotland, throughout.

"The temperature was high over the whole kingdom during the first two days, and continued fairly high in Ireland and the extreme north of Scotland, throughout the week; but elsewhere it fell suddenly and hecame very low. As a result of this change the averages were 1° or 2° below the mean over the kingdom generally, just equal to it in Scotland, W. and the Channel Islands, and a little above it in Ireland and the north of Scotland. The highest of the maxima, which occurred on Suoday, ranged from 60° in England, F. (at Cambridge), and 53° in the Midland Counties, to 50° in Scotland, N. and E, and to 40° in Scotland, W. The lowest of the minima, registered towards the end of the week, varied from 20° in Ireland, N., and 31° in the Channel Islands. The lowaverage temperature during the latter half of the period was due rather to the absence of heat in the daytime than to the severity of the nights.

"The rainful exceeded the mean in Ireland and the east and west of Scotland, and just equalled it in England, N.W., but in all other localities there was a deficit.

"The bright sunshine was greatly deficient in all districts. The percentage of the possible duration ranged from 27 in the Channel Islands, and Is in England, S., to 6 in the Midland Counties and Scotland, E., 5 in Scotland, W. and England, N.W., and to only 3 in England, N.E."

THE WEATHER IN WEST HERIS.

A WEEK OF WINTERLY WEATHER.—On the coldest day the temperature in the thermometer screen at no time rose more than 2° above the freezing-point, and on two nights the exposed thermometer registered 15° of frost. The ground is now about 2° colder at 2 feet deep, and about 4° colder at 1 foot deep, than is seasonable. There was no rain during the week, but on two days snow fell, and on one occasion the ground was just covered. Percolation has now almost entirely ceased through both gauges. The sun shone on an average for 2; hours a day, or for about three quarters of an hour a day less than the average duration for the time of year. Calms and light airs mostly prevailed, and for the last eight days the direction of the wind has

been in some point between north and east. The mean amount of moisture in the air at $3~\mathrm{P}$ M. was about 1 per cent. in excess of the average quantity for the end of February.

Taken as a whole, this was a month of about seasonable temperature, with continuous and heavy rains, and an unusual amount of cloud. There was no cold weather in the first half of the month, whereas during the remaining fortnight there occurred only three warm days or nights. On no night did the thermometer on the lawn show more than 15° of frost -which is a singularly high extreme minimum for the month. In fact, only twice before in February during the last eighteen years has the same thermometer falled to register a lower reading at some time during the month. Rain or snow fell on seventeen days, to the total depth of $3\frac{1}{2}$ inches—which is about $1\frac{1}{2}$ inch in excess of the February average. During the first three weeks there were only six days without rain; but after that time, with the exception of two moderate falls of snow, the weather remained dry. There was never enough snow to do more than just cover the ground. Fifteen gallons of rain-water, or nearly the whole of the rainfall, came through the gauge on which short grass is growing; and 17 gallons, or more than the rainfall, through the uncropped gauge. The sun shone on an average for 13 hour a day, which is about half-an-hour a day short of the average for the month. The winds were as a rule high, but in no hour did the mean velocity exceed 21 miles -direction west. The amount of moisture in the air at 3 o'clock in the afternoon was about 3 per cent. in excess of the February mean.

THE WINTER.

Seasonable in Temperature, but Wet and Sunless. This has been a winter of about average temperature. On no night were more than 16° of frost registered by the exposed thermometer, which is with two exceptions the highest extreme minimum recorded here during the last eighteen winters. In the middle of the season there occurred a remarkable period of wet weather. That is to say, during the twenty-six days ending February 19 rain fell to the total depth of 5% inches which is a greater quantity than the average amounts for any two of the winter months taken together During that remarkable period there occurred only four days without rain. The sun shone on an average for about half-an-hour a day less than is sea: onablemaking this the most gloomy winter yet recorded here -since the winter of 1886-7.

Our Underground Water Supply.—Since the winter half of the drainage year began in October last the total rainfall has exceeded the average for those five months by 5³, inches, which is equivalent to an excess on each acre in this district of 131,434 gallons. E. M., Berkhamsted, March 1, 1904.

TRADE NOTICE.

We understand that the architect of the Horticultural Hall, now in course of erection, has decided to employ the Lubrose paint, a material in which our correspondent, Mr. Druery, is interested.

THE LITERATURE OF CULTURES. - One of the great literary features of the day is the number of well-written, illustrated, and printed works-weeklies, monthlies, yearly reports, relating to almost everything which is of interest to any large section of the population. Horticulture, agriculture, the farm-all are extensively patronised by writer and reader, and very many are exceedingly worthy of patronage. Amongst others are the annual reports emanating from Government bureaus or departments; every one now issued is well worthy its important function. The latest to hand is the annual report of the Agricultural Department of Natal for 1902. Though late in appearing, the various reports of departments are full, and often well Industriate in appearance of departments are full, and often well illustrated from photographs and by means of elaborate tabular statements. The reading elaborate tabular statements. The reading matter is never involved, and the writers are men who endeavour to get to work without sacrificing space. It would be idle to discriminate where all is interesting, but readers who have the recently-published "guide" would find the annual report of value. Our South African friends may not be very energetic in their literary movements, but when they do move they appear to do it to some purpose.

MARKETS.

COVENT GARDEN, March 2.

(We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depreceding the date of our report. The prices de-pend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but often several times in one

REMARKS - English Apples are practically past. Some Albemarle New Town Pippins, 35s. per harrel, are very fine. The fruits from Nova Scotia and the States appear past their best. The chief supply of Onions is from France. Argentine Peaches fail in quality; they from France. Argentine Peaches fall in quality; they are 2s. to 4s. per case. Cape Peaches. per case. 2s. to 6s.; Nectarines, 4s to 6s.; Plums, 2s. 6d. to 5s.; Pears, 3s. to 6s. Brussels-tops, per bag 2s; Turnip-tops, per bag 2s. 6d. to 3s.; Sprouting Broccoil per bag 2s.; Cornish Broccoli, per crate 6s. to 7s. 6d; Cherbourg, per dozen 1s. 3d. to 1s. 9d.; Italian, per basket 3s. to 3s. 6d.; Salsify, per dozen 3s.; Ce'eriac, per dozen 2s. 6d. The bunches of Mint vary much in size.

POTATOS.

Home-grown, 100s. to 120s. per ton; foreign, 80s. to 110s. do.; Dunbars, 120s. to 140s. do Seed-tubers in variety. John Balh, 32 & 34, Wellington Street, Covent Gorden.

COVENT GARDEN FLOWER MARKET.

The supply of good flowering plants is now very abundant. On Saturday the 27th ult., much good material remained on the stands at closing-time, and this on cold nights must cause great loss to growers, fer many of them are entirely spoiled before the market is opened on the following Tucsday. Genistas were particularly abundant and well-flowered Azaleas in various colours; of these, the pitk and salmonshaded varieties sell best. Marguerites were plentiful and good. Cinerarias were very good, but the cold weather was against the sale of these Callas were very plentiful, and a good many were sold at low prices. weather was against the sale of these Callas were very plentiful, and a good many were sold at lew prices. Some well-flowered plants of the old double white Primula are coming in, but single Primulas are very poor indeed. Several growers have sent plants of Spiræa japonica, but they are not yet first-rate. Narcissus in pots are very good. Cyclamen continue to be plentiful. Several good varieties of Acacias are coming in, but the abundance of the Freuch "Mimosa" (Acacia dealbata) spoils the sale for these. Erica Willmoreana and E. fastiglata are in, but there is not much demand for them. Hyacinths in pots are over-plentiful, and at the close of the market large numbers remained unsold. Solanums are still to be seen, but remained unsold. Solanums are still to be seen, but there is little demand for them. A few good Lilacs in pets are now coming in; also Azalea mollis and Lily of the Valley. Of Palms and Ferns the supply is good, but there is very little improvement in the trade for them.

CUT FLOWERS.

CUT FLOWERS.

Roses are now more plentiful, and goed red-coleured flowers are to be seen. Those of General Jacqueminot make from 6s. to 8s. per dozen blooms. There are also a few flowers of Maréchal Niel to be seen. Liliums are good and plentiful. L auratums make from 4s. to 6s. per bunch; L longiflorums about the same prices, but some may be sold for less; and goed L. lancifoliums make from 2s. to 3s. The supply of Carnations continues to increase, but best blooms still make good prices. Some fairly good heads of Poiosettas are still to be seen. Gardenias have been sciling better, and it seems likely that these are to become more popular again. Freesiss are plentiful. Tulips are still abundant, and the quality varies much. Some very fine deuhle deep bronze-yellows and also double reds were seen; of the singles, reds are most wanted. A very regular supply of Lily of the Valley is now maintained, and just now it exceeds the demand. Daffodis are an important feature, and the best quality sell at very good prices. Callas continue plentiful, also white Azaleas. Coloured Camellias are abundaut, but these being without stems do not find much favour. I believe it would pay to cut these with wood. Anemones of various colours are plentiful.

much favour. I believe it would pay to cut these with wood. Anemones of various colours are plentiful. In the French market there is now a large supply. There are several varieties of Mimosa (or Acacia); some are remarkably pretty, the branches being deusely covered with the long racemes of bright yellow flowers; there are also some with round heads of bloom. A. H., February 27.

FRUITS AND VEGETABLES.

GLASOOW, March 2 .- The following are the averages of the prices during the past week:—Apples, Maine (U.S.), 15s. to 26s. per barrel; Californian Newtown Pippin, 8s. 6d. to 10s. per box; Canadian, 16s. to 28s. per barrel, and 8s. to 12s. per box; Oranges, Valencia, 420's, Teneriffe, 3s. 6d. to 5s. per box; Mushrooms, 1s. 3d. to 1s. 6d. per 1b.; Onions, Valencia, 6s. 6d. to 8s. 6d. per case; Cucumbers, 8s. per degen.

LIVERPOOL, March 2. — Wholesale Vegelable Market (North Hay).—The following are the average of the (North Hay).—The following are the average of the current prices during the past week—prices varying according to supply:—Potatos, per cwt., Main Crop, 4s. 6d. to 5s.; Up-to-Date, 4s. 2d. to 4s. 6d.; Eruce, 4s. 3d. to 4s. 9d.; British Queen 4s. 2d. to 4s. 6d.; Turnips. 6d. to 8d. per dezen bunches; Swedes, 1s. 3d. to 1s. 4d. per cwt.; Carrots, 3s. 6d. to 4s. do.; Parsley, 8d. to 10d. per dezen bunches; Onions, foreign. 4s. 6d. to 5s. per bag; Cauliflowers, 2s. 6d. to 3s. per dezen; Cabbages. 6d. to 10d. do.; Celery. 9d. to 1s. 4d. 0c.—St. Johns: Potatos, 1s. 2d. per peck; new do., 6d. to 8d. per lb.; Grapes, English, 1s. 6d. to 2s. 6d. per lb.; do., foreign, 6d. to 8d. do.; Apples 2d. to 6d. do; Tomatos, 6d. to 8d. do., Eirkenhead: Potatos, 1s. 2d. to 1s. 4d. per peck; Cucumbers, 6d. to 1s. each; Grapes, English, 2s. to 4s. per lb; do., foreign, 6d. to 8d. do.; Tomatos, foreign

CORN.

ENQUIRY.

PLANTS FOR BOMBAY.—I want for growing in the stove climate of Bombay some of the rarer flowering trees and shrubs, such as are not usually grown by nurserymen in this country. nsually grown by nurserymen in this country. I mean such shrubs as Astrapæa Wallichii, Dombeya Cayeuxii, &c. The authorities at Kew will only supply public institutions. I have tried without success the leading nurserymen in London, also some in Ghent and Bruges. Can any reader of the Gardeners' Chronicle help me?

ORCHID TUBERS FOR "SALEP."—Will any reader in the country say if the tuberous roots of British Orchids are still collected and used for making "Salep"? G. H.

ANSWERS TO CORRESPONDENTS.

Address: H. Ltd. Aug. Nonin, horticulteur, à Châtillon-sous-Bagneux (Seine), France.

Books; F. S., North Side. We have now in the press an enlarged and illustrated edition of the Calendar of Garden Operations, which seems to be just the book for which you enquire. It will' be ready in about three weeks, and may then be obtained on application to the Publisher of this journal.—W. H. Wood. Fertilisation of Orchids, by Darwin. Published by John Murray, Albemarle Street, London. Price 2s. 6d.—Orchid Review. This monthly periodical can be obtained from the Editor, Lawn Crescent, Kew.—Decorator. We do not know of any book obtainable on the subject of table decorations.—Nemo. A Dictionary of English Names of Plants, by William Miller, was published by Mr. John Murray, Albemarle Street, London.

CHRYSANTHEMUM HORACE MARTIN: J. S. This variety belongs to the early-flowering section, suitable for cultivation in horders out-of-doors. It is a sport from the variety Crimson Marie Masse, and the flowers are of deep rich yellow colour.

COLEUS THYRSOIDEUS: G. H. S. This new flowering species of Coleus may be raised from seeds, but after obtaining a stock, propagation by means of cuttings is easy enough, and this method gives excellent results. If you sow seeds, the present time is snitable for the purpose, and when sown let them be provided with a temperature at night of 60°, rising to 70° or so by day. In such an atmosphere the seeds will germinate freely. Old plants that have

passed out of flower should be rested in an ntermediate temperature until May or June, which will be soon enough to commence to propagate, as the plants grow very quickly.

W. L. Read above reply to G. H. S. You will have no difficulty in getting cuttings to make roots in May. A temperature of 50° at night is quite sufficient at present for the plants which have just flowered.

C PRIPEDIUM INSIGNE: F. W. T. The compost was charged with some manure or other substance containing much ammonia. We are not stance containing much ammonia. surprised that the plant is in ill-health. The best thing to do would be to remove it from the compost, wash the roots and repot in purer material.

- DESTRUCTION OF ELM STUMPS: Anxious Enquirer.
 It will serve no useful purpose to bore holes in
 the roots and pour paraffin into them, but if
 you use sulphuric acid in the holes, and repeat this occasionally, you will have no difficulty in breaking them up at the end of the year. stumps being already out of the ground, very great care would be necessary if you used dynamite, as portions of the roots would be likely to fly.
- DUBLE-SPATHED ARUM: W. D. We do not agree with you. We receive many such specimens. If another appears, try to fix it by sowing the seed, and ascertaining if the condition can be reproduced.
- E JCHARIS: H. S. The buds are attacked with the bulb mite. It has been found best in similar circumstances to burn the stock, and start with fresh bulbs. If you do this you cannot be too particular in throwing away all hot-bed material that may be in the house, and in cleaning every portion of the house as per-fectly as possible, so that the new stock may not be exposed to contagion.
- EXHIBITS OF ORCHIDS: E. T. Schedules are not always so explicit as they might be. It is not uncommon for them to contain a class similar to the one to which you draw attention—"Collection of Orchids arranged with any kind of Ferns or other foliage plants on a table 8 feet by 4 feet." We think that you should fill your table space with a collection of Orchids, and intersperse them with sufficient good Ferns to afford relief. It is impossible to say exactly how any particular judges would award the points in such a case, but it is safe to conclude that they would take into consideration the number of distinct varieties shown, the quality of the individual plants and flowers, and the general effect produced by arrangement. These are the points that should be kept in view by the exhibitora.
- Figura REPENS: J. S. This species will succeed best in very sandy loam with a little leaf-mould added. It is a greenhouse climbing plant, and may be used to cover a back wall or similar position.
- GARDENER'S EXPENSES OF REMOVAL: Journey-man. We do not think it is proper to take from your wages, the expenses that were allowed you four months ago, when coming to take up your situation. In the absence of an agreement the payment then made you was not upon the condition that you remained at the place for a certain time; but it would be, in the case of a domestic servant.
- GEOXINIAS: Anxious. Without knowing further particulars we are unable to assist you. The tubers are rotten and the roots dead. Have the tubers been kept in too low a temperature during the winter?
- GRUBS IN SOIL: H. A. M. The grubs you have ent are the larvæ of a small fly belonging to the Bibionidæ, several species of which live in the earth, feeding chiefly on decayed vegetable matter, and they often swarm in soil which has been heavily manured. It is highly im-probable that they had anything to do with the failure of the crop of Peas, but apply a dressing of lime and trench the ground.
- GRUBS FOUND IN CHRYSANTHEMUMS: J. W. The larvæ of the Ghost moth (Hepialis humuli), which are root-feeders. They have been introduced in the soil. The only remedy is to remove the soil and repot the plants in fresh

- HELIOTROPIUMS OR HELIOTROPES: R. H. "giant" Heliotropes we presume you giant" Heliotropes we presume you mean named varieties of this fragrant species. This being the case, you will not be able to propagate by seeds, as they would not all come true. To increase named varieties, it is usual to make cuttings from the young growing points in the spring or in August. If you have old plants and put them into a close, warm atmosphere, they will soon produce growths that may be used for this purpose. The cuttings will make roots easily in a pit having a temperature of 60° at night. When they have proted not them off singly into small have rooted pot them off singly into small pots, and repot them again when this is necessary. Let the rooting-compost be the same as recommended below for Ophiopogon.
- INSECTS ATTACKING CUCUMBER PLANTS: H. Y. Childs. The insects are two species of wire-worm belonging to the click-beetles or Ela-teridæ. They have undoubtedly been intro-duced in the compost. Beet-root, Carrot, or Rape-cake forms an attractive bait for these pests. The baits should be slightly buried. Your better course, however, is to clear out the old bed and make a fresh start; and if turf be used in the compost, see that it is not used from the outside of the stack. Fresh turn should on no account be used, unless it has been heated, as it harbours the insects.
- LEAVES OF CUCUMBER, SCHUHERTIA, AND BRUG-MANSIA: A. H. The leaf of Brugmansia has little the matter with it. The tiny spots lave been caused by Aphis. The immature Cucumber leaf arrived in a somewhat shrivelled condition, and it was only possible for us to see that it was much thinner in substance than it ought to be, and consequently would be an prey to disease. By proper ventilation and by washing the roof glass to allow more light into the house, endeavour to induce a stronger habit in the plants.
- MANURES: Chemicals. The manure described may be used for the plants in the stove, but be careful not to apply it in excess. Too little is very much better than too much. You do not make it clear what buds have failed to expand properly. Do you mean those of Ixomanda, Dipladenia, or Bougainvillea? Do you mean those of Ixora, Alla-
- MIGNONETTE: F. W. We are unable to discover any sign of disease, and believe your trouble to be due to some detail in the cultivation, such as excessive watering, &c.
- Mossy Lawn: C. C. If the lawn is in a very bad state it is probable that the grass is badly shaded by overhanging trees, or the ground is not provided with efficient means of drainage. he latter case the only permanent cure would be to provide such drainage, and make a fresh lawn by sowing seeds. But probably the moss is only troublesome in places, and the treatment may then consist in raking off the moss with a wooden rake, and affording a topdressing of fresh loamy, fine soil, with which you should mix a considerable quantity of wood-ashes and lime. Make this top-dressing moderately firm, and then sow seeds of lawngrasses. Later in the season the grasses should be encouraged to out-grow the moss by feeding them with nitrogenous manures.
- Names of Plants: Correspondents not answered in this issue are requested to be so good as to consult the following number.—B. R. J. Cymbidium Lowianum.—J. McC.: Sanseviera cymolatim Lowianim—3. McC.: Sanseviera zeylanica—T. R. B.: A very good form of Cattleya Trianæ.—G. J.: 1, Dendrobium × Ainsworthii; 2, Cypripedium (exul × bar-batum).—Zero. 1, Aloe saponaria; 2, Salvia; 3, Ficus repena; 4, Garrya elliptica; 5, Daphne Mezereum.
- Notice to Leave: Stenfold. If you are a journeyman gardener, one week's notice should. be sufficient, and we are unaware that it is necessary to tender your notice on a Saturday. Cannot you make arrangements agreeable to both parties?
- NEPENTHES LEAVES: J. R. The appearance of the Nepenthes leaves is not due to any fungus, but is an indication that they are suffering a check, probably due to the abnormal season and the absence of bright weather generally. Be careful in your treatment. Keep the tem-

perature steady and avoid draughts, and afford water carefully, always maintaining a suitable moisture in the atmosphere. Nepenthes similarly affected have with care quite regained their normal condition when the growing season has come round again. Nepenthes succeed best in a special house, where they can be given proper treatment without having to consider the requirements of other species of plants.

OPHIOPOGON: J. S. Pot the plant in a mixture of two-parts loam and one-part leaf-mould, and add half as much rough sand as leaf-mould. Cultivate the plants in the greenhouse. The roots may be divided in spring if you wish to increase the stock.

ORANGE: N. G. We are unable to name your specimen.

PANCRATIUM AND HIPPEASTRUM HYBRID: Hybridust. We do not see anything inherently improbable in such bigeneric hybrid as you suggest, but do not know of such a cross having been made. Mr. Worsley, of Isleworth, has attempted to cross Paneratium canariense, P. maritimum and P. zeylanicum with various species and garden forms of Hippeastrum, but without any result so far. Also vice versa, with no result whatever. We could probably tell whether hybridisation has taken place by looking at the alleged hybrid, even if not in flower at the time.

PANDANUS: Tudor. We find no disease. There has probably been some carelessness in watering. POTATO: Constant Reader. We cannot name the tubers at this late season.

SHOOT FROM APPLE-TREE: R. & R. This is a very bad instance of the effect of American blight or woolly-aphis. Wash the trees at once whilst still dormant with the caustic alkali solution prepared as follows :- Take a pound of caustic soda (commercial), and put it into a bucket half filled with water; taking care not to get a spot on your skin or clothes; then add delta the carbonate of potash to the liquid; stir this until dissolved, and dilute the solution to 10 gallons by adding water. Dissolve 10 oz of soft-soap in a little boiling water, and add this to the 10 gallons already prepared. Spray this over the trees on a dull day, when there is little or no wind, and take every care to prevent the spray blowing on to your skin or clothes. Such shoots as that you have sent should be cut off and burned before commencing to spray the trees.

VIOLETS: Enquirer. We cannot recommend individual firms, but you are not likely to meet with much difficulty if you apply for runners at a good nursery, choosing one where hardy-flowering plants are known to be cultivated. The variety Princess of Wales has very large violet-coloured flowers, but Princess Beatrice, California, and La France, are of nearly the same type. The fault of all of them, perhaps ia that they are too large, being like Pansies.

WHEAT PRICES: W. R. F. During the past ten years the highest price was in 1898, namely 34s. a quarter. In 1891 it was 37s. a quarter.

Worms in Lawns: C. C. (1) Dissolve $\frac{1}{2}$ an oz. of corrosive sublimate (Poison) in 15 gallons of water, and apply it over the lawn, and when the worms come to the surface sweep them up the worms come to the surface sweep them up If the fowls eat them they will be poisoned (2) If you mix a peck of freshly-made quick-lime in 40 gallons of water, allowing it to stand until clear, and then apply the liquid from a rose watering-pot, it will also serve to bring the worms to the surface. (3) You can obtain from Messrs. Cooper, Taber & Co. Ltd., 90 & 92, Southwark Street, London, S.E. a preparation known as "Chinese Worm Soap," which we have proved to be very valuable for the purpose, and easy of application. We have not used Residual Gas-water. not used Residual Gas-water.

III CHEST V ATHIST CATION (

NEW GARDEN WORMS.

IN some former articles published in these pages I have described certain of the earthworms which are found in our gardens and lawns. As these lowly creatures are of immense value and interest to the horticulturist, I feel it to be important that I should call attention to some new species which have recently been added to our lists. While on a visit to Oxford in the month of January, I had an opportunity of obtaining an introduction to the Curator of the famous Botanical Gardens. He at once placed himself at my disposal, and during the brief time I had at liberty we examined a few of the rubbish-heaps and the Lily-house for Annelids.

Among the species which were immediately forthcoming were half-a-dozen which I had already, some years before, recorded for Oxford-These included the sluggish green worm found under stones and near stagnant water; the little semi-aquatic worm known as Allurus, the red and purple worms, the long brown earthworm, and the striped Brandling. All these, with several others, are widely distributed in Great Britain, and are to be found in almost every garden of any dimensions throughout the country.

There were, however, among these familiar forms others, which, while they had all the character of English species, proved to be new to our catalogue. To these I call attention to-day.

The first is a worm which I think has most likely been observed in England before, but has not been distinguished as a distinct species. Like most other worms, it bears a considerable variety of names, but it is entered in Beddard's Monograph of the Oligochaeta, which is our standard work on Annelids, under the title Allolobophora cyanea (Savigny). He gives the following account of it. The length is 120 mm., the breadth 7 mm., and the number of segments 156. The girdle or clitellum extends from segment 29 to segment 34, and the tubercula pubertatis are on 30 to 33. The bristles or setæ are not strictly paired. The colour is dirty-grey, with a pale violet anterior. The other details which are supplied are technical, and do not help the reader to understand the appearance of the animal. I may, however, add that in the Oxford form the back of the girdle is smooth, each of the segments having entirely coalesced, though they remain distinct on the under surface. The length in alcohol is 31 inches. The male pores, which are found on the fifteenth segment, are seated on a swollen mass which affects the two adjoining segments. These appearances are

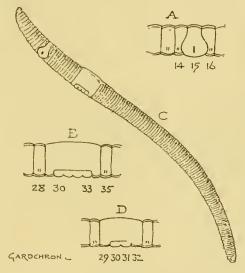

FIG. 67.-A NEW EARTHWORM.

A, B, c.—All represent Allolobophora cyanca (Savigny) **D.**—A. tepidaria, nov. sub-sp.

C.—A. cyanea (diagram of entire worm).
D.—A. tepidaria (girdle).

A, B, and D are somewhat enlarged.

best understood by reference to the drawings and diagrams.

Much information respecting A. cyanea may be found in Rosa's Revisione dei Lumbricidi (Torino, 1893), and Ribaucourt's Etude sur la Faune Lombricide de la Suisse (Genève, 1896). It is found generally distributed in Europe, and is undoubtedly a genuine British worm. Now that attention has once been called to its presence in this country, one may readily believe that it will soon be found elsewhere.

In some respects the species which remains to be described is more interesting than the foregoing, because it is not only new to Great Britain, but seems to be also a sub-species new to science. It is most closely related to the Irish worm (A. hibernica), which is at present placed under the species veneta (Beddard, 713; Rosa, op. cit., 33; Ribaucourt, 42). That which distinguishes it from the type and the other sub-species is the fact that the girdle is limited in every specimen which I have examined to four segments (29 to 32), the tubercula pubertatis being on 30 and 31. It is, moreover, longer and more slender than hibernica, and when alive it differs from its congeners in colour. It emits a yellow colouring matter which is soluble in alcohol.

Although this interesting worm was found outof-doors, it was most abundant in the Lily-house in stiff soil around the roots of plants. On this account I think it might be well to name the subspecies tepidaria. The further details of its structure and appearance are better reserved for such journals as deal in the technicalities of science.

I may be permitted to express the hope that, as our English list has received these two additions, a stimulus may be given to those who are interested in natural history to try to add yet further to our catalogue of indigenous Annelids. Hilderic Friend, High Wycombe.

ORCHID NOTES AND GLEANINGS.

HYBRID DENDROBJUMS AT WOODHATCH LODGE.

WOODHATCH, Reigate, the residence of Mrs. Haywood, has for many years been known to the horticultural world, its late owner, T. B. Haywood, Esq., having gathered together splendid collections of fruit-trees, Chrysanthemums and Roses, as well as a very choice collection of Orchids. Dendrobiums form at the present time a very prominent feature, and the plants are exceptionally well cultivated by Mr. C. J. Salter.

These Dendrobiums are particularly strong and vigorous-growing plants, and many of them are among the most beautiful hybrids in cultivation. Some of the specimens surpass any I have seen before, and it would be difficult to find a had plant among them. The black "spot," so often seen upon the foliage of Dendrobiums, is altogether absent. The house has a lean-to roof, and the back wall is well furnished with Ficus repens, and this forms a splendid background for the plants now in flower. It is astonishing to see the grand specimens that have been grown from small propagated pieces. Many of these small plants have produced in one year three new bulbs, a considerable number of them over 2 feet 6 inches in height, and the two and three years old plants are undoubtedly examples of excellent culture. Several plants of D. splendidissimum grandiflorum and others of that type have from four to seven strong flowering pseudo-bulbs, carrying from forty to sixty flowers on each bulb. One particularly noticeable plant is D. Hildebrandti × D. Wardianum, with a growth over 5 feet in length carrying seventy-seven flowers, the latter being like some varieties of D. Wardianum. Very conspicuous and attractive is D. melanodiscus var. gloriosa one of the brightest coloured forms of the D. melanodiscus hybrids. D. m. Salteri is a lovely hybrid with bright rose-tinted flowers with white bases to the segments, the centre of the lip orange-colour with claret-coloured base. D. splendissimum Mrs. Haywood is a strong grower, and bears exceptionally large flowers heavily marked with purple lilac colour, with a dark maroon-purple blotch on the lip. D. Edithæ var. superba produces fine large bright-coloured flowers. There are also splendid specimens in flower of D. Ainsworthii, (Woodhatch variety); D. A. var. picturata (very distinct); D. A. var. intertexta with very fine blooms; D. nobile nobilius, D. rubens purpurascens, D. Cybele var. nobilior, D. Ballianum, D. Rolfeæ, D. Schneiderianum, D. Juno, D. pallens, &c. It is noteworthy that the leaves are all green, and of fresh appearance, being in perfect condition, and that in some cases there are as many as five flowers produced from a single node. It is unfortunate that Mr. Salter is unable to send a group of these splendidly cultivated plants to one of the Royal Horticultural Society's meetings, they would make a fine display, and at the same time give to Orchid lovers an opportunity to

see the results of Mr. Salter's care and patience in hybridising and successfully bringing to perfection such showy and new forms.

THE CULTIVATION AFFORDED THE PLANTS.

A few hints as to their culture may prove useful. The plants are potted when the young growths commence to push new roots from their base. The pots are provided with perfect drainage, and the compost consists of sphagnum moss, with a moderate quantity of coarse silver sand mixed with it. After repotting, the plants are kept fairly dry, but as soon as the roots are seen pushing through the new compost, the supply of water is gradually increased. No manure or manure-water of any kind is used. During the growing season the temperature of the house ranges from 75° to 90°, with plenty of atmospherie moisture, and the plants are kept well shaded from the sun. Air is admitted only from the top ventilators. About the end of August the blinds are removed, and the plants are exposed to full sunshine, at the same time air is admitted freely. From the end of November until February the temperature of the house is kept as near 60° as possible, and no damping-down is done, the plants being watered occasionally to prevent the pseudobulbs from shrivelling. At the commencement of February a little damping-down is done to assist the flower-buds to develop kindly; but when the flowers open it is again discontinued.

The other Orchid-houses contain many fine and interesting plants. A batch of Masdevallia tovarensis has recently produced over a thousand white flowers, which during the winter months are invaluable for cutting purposes. Miltonia vexillaria is represented by fine healthy plants. The same remarks are also applicable to such Phalænopsis as P. Schilleriana, P. amabilis, and P. grandiflora. The Odontoglossums are in good condition-a noteworthy fact when it is remembered that the majority of the plants have been on the place for nearly a quarter of a century. Among plants in flower are Epiphronitis Veitehii, Cœlogyne flaccida, C. ocellata. Lycaste cruenta. Chysis bractescens, &c. W. H. White, Burford Gardens, Dorking.

SIR FREDERICK WIGAN'S COLLECTION.

Time has proved that not only is there a very rich collection of Orchids at Clare Lawn, East Sheen, but that Mr. W. H. Young, Sir Frederick Wigan's Orchid-grower, is a most successful cultivator of them. The records of the plants in the Phalænopsis-house, where at present the principal display is to be found, show that a large number of the plants were acquired in 1888, new and fine varieties being added as they presented themselves. They have been allowed to flower profusely every year, and although they have been in better condition at some times than at others, they have made steady progress, and are at present as strong and vigorous as could be desired. This is attributed in some degree to the fact that on the last occasion when new compost was given them a proportion of decayed leaves was added to the sphagnum-moss, and the whole surfaced with good sphagnum-moss. A proportion of leaves is now being mixed with the potting material for most Orehids at Clare Lawn, especially for those which have hitherto proved not quite satisfactory, and with good results; but a watchful eye will be kept on the new venture, lest the improvement may be only the result of the change, and that later a reaction may set in.

Suspended from the roof of the Phalænopsishouse is a very fine representative collection, the greatest show being made by P. Schilleriana, one of which has a four-branched spike about 5 feet in length; the unique plant of the pure white P. Schilleriana vestalis is also showing bloom; and others noted were P. × easta, P. × leucorrhoda, P. Stuartiana varicties, P. Sanderiana

Wigan's variety, P. Boxalli, P. fuscata, P. Mannii, &c.

At the end of the house are two large specimens of Eulophiella Elizabethæ showing flower, two of the few survivors of the original importation; a small lot of Bolleas and Pescatoreas; some rare Cypripediums, including the fine C. callosum Sanderæ Jules Hye's variety, which is said to have at last eclipsed the original; a vigorous lot of the showy-leafed Hæmaria diseolor, and a collection of Vandas of the V. tricolor class. On the staging are a number of the warmhouse Cypripediums in flower, a batch of Miltonia Roezlii, old residents at Clare Lawn, one stout specimen dating back from the "Peacock collection" of many years ago. Several varieties of the elegant little Oneidium tetrapetalum were in flower, also Cypripedium × Gowerianum magnificum, C. x Eira, a pretty Chamberlainianum eross; C. × Statterianum, Saccolabium bellinum, two fine specimens of Phaius tuberculosus, the one with four and the other with three spikes, and many Cypripediums.

In the adjoining house, arranged as a rockery, and clad principally with Ferns, Ficus stipularis, &c., the enormous masses of Cymbidium Lowianum, which occupy the prominent situations, have still a goodly number of spikes on them, and in the cool range a fine collection of varieties and hybrids of Cymbidium are in splendid condition; three plants of C. grandiflorum having flower-spikes, one specimen bearing five. C. × Wiganianum, C. Devonianum (with seven spikes), good C. eburneum, C. x eburneo-Lowianum, C. Lowianum eoneolor, and others were remarked. Suspended from the roof the specimens of Lælia Jongheana, L. pumila, and L. Dayana promised well for flower; and with them was a strong tuft of the little scarlet Jamaican L. monophylla, a reputedly difficult plant to grow, but which has flowered well here annually for some years.

The next division of the same range has a collection of Masdevallias; a large specimen of M. ignea, the pale-yellow M. Hincksiana, M. ephippium, and some others being in flower. Also Maxillaria Sanderiana with seven buds, a very handsome new form of Zygo-Colax, and many Odontoglossums in bud.

In the Odontoglossum-houses were a great number of forms in bud and some in flower. Among those already expanded were some of the best type of O. erispum, O. × elegans, O. triumphans, O. luteo-purpureum and its variety sceptrum, O. Wilckeanum, O. Hallii, a number of O. Cervantesii, and O. Rossii majus, O. Oerstedii, &c. One fine specimen of O. polyxanthum had a very strong spike, and O. x ardentissimum and some good spotted Odontoglossums not in flower were in excellent condition.

Among species said to have been much benefited by the admixture of leaves in the compost were some grand specimens of Cochlioda Noezliana and C. vulcanica; also a batch of Miltonia vexillaria and M. x Bleuana, with many good forms in bloom, and which are now generally known to have a partiality for what is called leaf-soil. Other pretty plants noted in the coolhouses was a fine mass of Dendrobium Kingianum with many spikes, a very brilliaut Sophronitis grandiflora coccinea, the clear rose-coloured S. g. rosea, and some good pans of Pleione Wallichiana and P. lagenaria.

In a warm-house range was a collection of Sobralias, a fine lot of Cypripedium bellatulum, imported in 1895 and now large masses with very fine fleshy leaves; with them were C. bellatulum album, C. Godefroyæ leucochilum, C. niveum, and some of the hybrids of this section, all equally vigorous; and a large specimen of Aërides Vandarum, and a number of Cypripedium villosum

In the Cattleya-houses some of the forms of Cattleya Trianæ, including one very fine pure white variety, are in flower; also C. Percivaliana, C. × The Hon. Mrs. Astor, with very fine yellow flowers, and a few other Cattlevas and Lælio-Cattleyas are in flower; suspended overhead and making a good display are varieties of Dendrobium nobile, D. x splendidissimum, D. primulinum, D. signatum, D. × Clarense (signatum × Findlayanum), a neat hybrid raised at Clare Lawn, and with a great resemblance to D. Aphrodite (nodatum); the rare D. senile, with singular hairy pseudo-bulbs and pretty yellow flowers; D. suleatum, and various other Dendrobes and Lælia anceps varieties.

Other plants of special interest or remarkably well bloomed were the fine Zygopetalum : Roeblingianum, and its worthy companion, Z. × Sanderianum, a batch of Spathoglottis × aureo-Veillardi, with pretty yellow-and-crimson flowers; Stauropsis gigantea with a very fine spike, good specimens of Platychnis glumacea, the pretty pale-yellow Cirrhopetalum Makoyanum, a very pure white Dendrobium nobile album, good specimens of Coologyne cristata, Cattleya intermedia alba and nivea in bud, a batch of all the showy hybrids of Lælia Digbyana, and a good selection of the other handsome hybrid Cattleyas and Lælio-Cattleyas.

In regard to the show of Cattleyas of the C. labiata class, the summer-flowering varieties here give the best results, as the fogs and dull weather which militate against the winter and early spring - flowering kinds have not to be reckoned with. The varieties of C. Mossia promise a greater show of flowers than usual, one specimen in an 8-inch pot having eleven flower-sheaths, and others being extremely well set with flower-sheaths. J. O'B.

TREES AND SHRUBS.

ILEX PERNYI, FRANCHET.

THE most interesting addition that has been made to the evergreen Hollies for a long time is this species from Central China. First diseovered by the Abbé Perny, after whom it is named, about fifty years ago in Kiuchu, it was afterwards found by Dr. A. Henry in Patung, and has finally been introduced to cultivation by Messrs. Veitch through their collector, Mr. E. H. Wilson. Whilst it bears a resemblance to some of the small-leaved varieties of llex Aquifolium, it is perfectly distinct from all the Hollies we have in cultivation. According to Dr. Henry, it grows to 20 or 30 feet in height, but it is densegrowing and compact in habit. The leaves are small compared with the typical ones of our native Holly, but are similar in texture and lustre; they are 3 to 12 inch long, very shortstalked, and ovate-lanceolate in outline; the lower half of the leaf is armed with from one to three pairs of rigid, spiny teeth on the margin, whilst the terminal half is in the form of a narrow triangle with a spine-tipped apex. In texture the foliage is stiff and coriaceous; in colour it is a deep shining green. The fruit is globose and red.

PICRASMA QUASSIOIDES.

The natural order to which this tree belongs Simarubeæ, has a very familiar representative in our gardens in Ailanthus glandulosa, the so-called "Tree of Heaven." The Picrasma, however, is very rare. Personally I know of but one specimen, and this has been in the Kew collection since 1890. During the long series of droughty summers it never got properly established, but during the last two or three years it has grown well, and is now 6 or 7 feet high. As it promises to be an ornamental tree it will be worth while to give it brief mention in these columns.

It enjoys a wide distribution in a wild state and besides Japan-where it reaches as fa north as Yezo-it also occurs in Corea, Chin

Hong Kong, several provinces of North India, and even in Java. In the Flora of British India it is described as a large, scrambling shrub; but Prof. Sargent, in the Forest Flora of Japan, alludes to it as a slender tree, 20 to 30 feet high, with a trunk about 1 foot in diameter. Last summer the young tree at Kew was most noticeable for its neautiful bark; this is rich-brown on the young wood, thickly mottled with pale dots. The bark is very bitter, a small piece leaving in the mouth for a long time an intense Quassia-like bitterness. The leaves, alternately farranged, are pinnate, bout 1 foot long, with $4\frac{\pi}{2}$ to $6\frac{\pi}{2}$ pairs of leaflets.

plants than the English climate, and as the Picrasma survived the winter of 1894-95 at Kew, it may reasonably be deemed hardy. But whether it will acquire in this country the autumn beauty described above is doubtful. Frequent disappointment has led us not to expect too much in this matter. W. J. Bean.

EUPATORIUM PETIOLARE.

OUR illustration at fig. 68 represents a very pretty species of Eupatorium shown at a meeting of the Royal Horticultural Society on Feb. 23,

MARKET GARDENING NOTES.

MIGNONETTE.

Good Mignonette is always appreciated, but in the early spring it is most in demand, both for pots and cut flowers. When grown successfully it is a most profitable crop. For producing flowers for cutting the seeds should be sown in small pots about the end of February. Placed on a shelf close to the glass in a house where there is a little warmth, it will soon germinate. When the seedlings are well up, they

FIG. 68.—EUPATORIUM PETIOLARE, FROM SPECIMENS SHOWN BY MESSRS. H. CANNELL AND SONS.

The leaflets are ovate, obtuse, 3 to 4 inches ong, smooth and serrate. Our tree is too small to bloom, but the flowers are described as green, and of but little beauty. Professor Sargent says to most important quality as an ornamental tree is the beauty of its autumn foliage. "The leaves urn early, first orange, and then gradually deep carlet, and few Japanese plants which I saw are to beautiful in the autumn as this small tree, which, judging from its northern home in Japan, and be expected to flourish in our climate." This refers to the climate of Massachusetts, J.S.A., which is not more favourable for tender

when it was recommended an Award of Merit by the Floral Committee. The habit of the plant is rather lax, branching very freely, and producing flower-heads upon growths from every leaf-axil. Most of these growths, especially those from the lower part of the plant, need to be supported to a stake, but the upper ones are shorter, and quite stiff enough to be erect. The form of the leaves is shown well in the illustration. The flowers are pinkish-lilac and white, owing to the centre ones having a little colour before they expand. The species comes from Mexico, and appears to be new to cultivation.

may require a little thinning out, about four plants being left in each pot. It will depend a little on the weather, but if the plants show no sign of becoming drawn, they may remain on the shelf in warmth until they have made a good start, when they should be removed to a cooler position. They should be always near to the light, and if placed in a frame the lights may be taken off in fine weather, for Mignonette will always make more satisfactory growth in the open if the temperature is above 45° Fahrenheit.

For the earliest crop the seedlings may be planted out in shallow frames, or if in the open

ground some temporary arrangement may be made for protection on cold nights or in bad weather. Inverted pots may be sufficient for plants put out a little later. The ground should be well manured before planting, and a good dressing of soot will be beneficial as a manure, besides keeping slugs away. Press the ground firmly round the roots. Much depends upon getting Mignonette early in the spring, and anything that can be done to advance its growth should be done. If the weather be dry and windy, the lights may be kept on, and a sprinkling of water will help the plants; but in showery, warm weather they must be exposed. In good ground Mignonette may not require any stimulant, but if it is not making strong growth afford liquid manure.

Varieties.—Machet is now the general favourite for pot culture, and some growers also use this for providing flowers for cutting; but I have found Vilmorin's Grandiflora more satisfactory for planting out, the spikes being close and compact and very sweet-scented. It is not always that the true varieties can be obtained Most growers select and save their own seed, but when buying it will pay better to get seed from the most reliable source, even if the price is much higher. A. H.

TREE CARNATIONS FOR BLOOMING IN FEBRUARY.

Messrs. Cutbush & Son, of Finchley, although they do not grow the flowers for market, think they might be grown for that purpose at a profit, the culture being simple, and the fuel bill small, the plants only requiring sufficient heat to keep out the frost. When recently at their nurseries, I was convinced of the value of the variety Wm. Cutbush for market purposes. This is of a pleasing colour, strong in stem, and very fragrant. The well-known white variety, Mrs. S. J. Brooks, raised at Finchley, is doing well there, though the first flowers are over, and plants have been trimmed up for the second flowering. The firm have a very large demand for this free-flowering variety. G. H. Crane, brilliant scarlet, is very prominent. Mrs. Theodore Roosevelt, a new dark pink variety, is very conspicuous, and is being eagerly sought after. C. H. Curtis, just now in bloom, though rather smaller, is very strong in the stem.

EARLY MALMAISON CARNATIONS.

The variety Princess of Wales is in bloom at Finchley during about eight months of the year, being grown in cold houses with just enough fireheat to keep out frost and damp. This variety is of good size, and has many other points of merit. Princess May, deep rose in colour and of handsome shape, is also to be recommended. This variety, being so free, must be rigorously disbudded to secure fine blooms. Robert Burns, of a bright salmon colour, makes a very useful variety for early winter-flowering. Stephen Castle.

Out-of-doors or Natural Seakale.

This vegetable when grown naturally is nicer than when forced, and many people consider it quite equal to Asparagus. It is ready for use during March and April. Many market gardeners think that the cultivation is difficult, but it is one of the easiest crops to grow. The following method is most generally adopted in this district:—Procure the sets any time from November to January, and lay them in trenches in light soil, and by planting-time they will have formed crowns and be ready to start into growth at once, before the weeds appear. If preferred, the sets can be bought prepared ready for planting at a slightly higher price.

Prepare the land in the spring, digging in a good dressing of manure; and there is nothing better for this than horses' toe-nails from the blacksmith's shop. About the beginning of April the sets will generally have formed crowns. Work the ground down fine, and draw out drills

about $1\frac{1}{2}$ inch deep and 3 feet apart. In these drills plant the sets with a dibber, 16 inches apart, deep enough to be covered with an inch of soil when the drills are filled up. Nothing will be required after then except to keep the ground clean by frequent hoeings through the summer. In the following January or February, when the land will work well, dig out trenches between the rows, covering the crowns with about a foot of soil. As soon as the Seakale is through the soil, cut with a sharp spade about an inch below the crown.

When all the crop has been cut the beds should be levelled; new crowns will soon form, and the second season's growth commence, which will only require a dressing of artificial manure and frequent hocings. In the first year a row of Cos Lettuce may be planted between the Seakale, or any small-growing crop which will not remain long on the ground, such as Radishes, Spinach, or dwarf Peas. C. M., Evesham.

VEGETABLES.

CHOU DE BURGHLEY.

My experience of this useful vegetable this year is singularly unfortunate, as I have only 2 per cent. of the plants true to name. The others are a nondescript collection of rubbish resembling some of the Kales, and have not hearted. The seeds were purchased from a first-class firm, and I fear if others have been deceived in this way my old friend R. Gilbert's useful introduction will be soon lost altogether. By sowing seeds during the last week of June I expected to have a nice lot of heads like young Cabbages, ready to cut the first week in February, which is the chief merit of this vegetable when true to name.

SEARALE, BEDDARD'S IMPROVED.

This variety is a great advance on both the old red kind and the Lily-white. It is very much stronger in growth, and produces better "heads" when grown under the same conditions. Four days longer are required to force it than the older kinds, but this is no disadvantage, for the extra time may be easily allowed for at starting. W. H. Divers, Belvoir Castle Gardens, Grantham.

CARTERS' DAISY PEA.

So many satisfactory accounts have been given in these pages of this variety of Pea that it may seem superfluous again to write its praises, but having grown it for several seasons I can confidently recommend it as one of the best second early dwarf varieties at the present time. It is of robust growth, reaching nearly 3 feet in height last year, but in ordinary summers the plants do not get much above 2 feet, and are literally crowded with fine pods nearly 6 inches long, each containing from eight to ten fine Peas of excellent flavour. I have been much impressed by the length of time the pods will hang without getting dry, having saved the crop for seed. The pods are usually borne in pairs, and the raisers are certainly to be congratulated upon giving us such a good Pea. I advise those who have not yet grown this Pea to procure a quart of seeds from the raisers and sow as soon as the state of the soil will allow, and I will vouch for it they will not be disappointed.

POTATO SUPREME

is a most prolific variety in the garden here, and there has been very little disease in the past two adverse seasons. The tubers are of good size, thick pebble-shaped, with shallow eyes, and the quality when cooked is of the best. It forms a good second early, though retaining its good qualities up to quite the end of the year. Whilst not despising newer varieties, we ought to think twice before discarding favourites that have stood us in good stead for many years past. J. Mayne, Bicton Gardens, Devonshire.

NOTES FROM ISLEWORTH

FOR 1903.

(Continued from p. 132.)

Expansion of Flowers during Frost. — After seven consecutive days and nights of unbroken ground frost, on the last of which we had 6° of air frost, I found Iris histrioides expand its flowers in an air temperature of 33°. I do not think any British bulbous plant would open its flowers under such conditions.

EFFECTS OF MID-APRIL FROSTS ON SOME PLANTS.

All stone-fruit crops were lost, except a sprinkling of Nectarines on walls. The Pear crop was lost, and Apples carried half a crop.

Besides the disastrous effects on fruit-trees and Acers, I noted Asparagus (culinary) and Veltheimias cut down. Crinum Moorei, Camassias, various Iris, and Pelargoniums were severely injured. During this spell of frost the temperature in air never fell below 28°, and I have never known so little absolute frost do such vast damage. I think the long continuance of cold and the bitter Polar winds that blew at the time did the mischief.

SEEDLING CACTI.

On some forms the fruits will hang on for several years without rotting, simply undergoing a partial withering process; and it is by no means easy to tell the precise moment when the seeds have attained maturity.

Probably this has occurred when a vinous odour exudes from the fruit, for it would seem as though this was an invitation to eat it addressed to all and sundry. Inasmuch as reproduction is the main function of life, Nature would hardly precipitate matters by such allurements unless the object to be gained would be thus secured. On any other supposition we should be the witnesses of an abnormal tendency to embryonicide. In practice I have not sufficiently tested the relative germination and vigour of early-gathered and late-gathered seeds of Cacti, but I have made the following notes:-On a flat-stemmed, redflowered garden Cactus the fruit ripened in nine months, and a year after germination I found that 223 seedlings were alive from this single fruit. On one flat - stemmed, white - flowered plant, a night-bloomer (the flowers of which last two nights and one day in beauty, and are excessively fragrant), I fertilised on one week four flowers. One of these fruits ripened in nineteen months, two others in twenty - one months, and the fourth hung on for two years and seven months. In the last case the fruit had shrunk somewhat, and the seeds had lost that transparent envelope by which they are surrounded in the earlier stages of ripeness; but none of them had germinated in the fruit. The first fruit to ripen had fewest seeds (about 220), the others had about 350 to 400 seeds in each case. The fruits of both these Cacti are very sweet, with a strong vinous aroma, and a flavour something like an over-ripe Gooseberry. They are certainly edible, and are probably very sustaining food.

N.B.—Both these plants are called Phyllocactus in British plant-nomenclature, but as this alleged genus is founded upon nescience, it should be deleted.

Notes on Some Seeds, &c.

Jatropha podagrica.—This is an old inhabitant of our stoves, but is rarely seen outside a few botanic gardens. It is worthy of more extended cultivation, for its brilliant orange-red flowers are freely produced during the greater part of the year. I find no record of seed having been produced in English gardens, but this year it carried a seed pod at Isleworth. This was trillobate and carried one seed in each lobe. As is the case with an allied Euphobiaceous plant

(Euphorbia splendens), the casings of the lobes become very hard and woody, and (presumably by the contractile force of desiccation) finally curl up and discharge the seeds suddenly to some distance.

This violent dehiscence makes it somewhat difficult to secure the ripe seeds. These are nearly inch long and resemble the common Phaseolus vulgaris (French Bean) in general aspect. They are rounded on the outer side and flat on the two inner sides, being thus roughly three-sided. The rounded side is greyish-white and prettily spotted or marbled; the inner sides are dark brown with a distinct whitish line marking the point of contact of the seed with the placenta.

I noted this plant growing wild and flowering freely about Caney, near St. Jago (Santiago) de Cuba, in March, 1894 (vide my Notes on Distribution of Amaryllidea, p. 18-Wesley). It was here that the only important land battle of the Spanish-American war took place. It has also been sent to Kew from Panama. On germination the radicle extends quickly both upwards and downwards, and the upper part (caulicle) swells out to a roughly spherical shape, forming the true rootstock of the plant, the bulbous-shaped, fleshy mass of which forms an interesting study. The cotyledons remain on the plant long after their primary functions have ceased, and act as true leaves for a considerable time.

Tulbaghia violacea .- This plant stands the rains bravely, and flowers for some months without a break. Owing to the small size of the mauvepurple flowers it is necessary to plant closely to secure effect outside. The best plan is to establish well in pots and plant out as close as possible in May. This plant is of the same hardiness as Nerine, and flowers from June to the end of October. Each pod contains one or two black seeds, not much unlike those of Agapanthus. They are rough and irregular, about a quarter of an inch long by one-sixteenth wide.

Scilla hamorrhoidalis .- I gathered this in Grand Canary, flowering in December. The fruits turn bright yellow when ripe. A. Worsley, Feb., 1904.

(To be continued.)

OBSERVATIONS ON THE VEGETA-TION IN AN EQUATORIAL AFRICAN GARDEN.

(Continued from p. 131.)

THE vegetation of the elevated, well-drained grass tracts is quite interesting, and contains many effective garden plants. There occur here occasional small patches of forest-evidently outliers from that at the lake-the chief glory of which is a Bignoniad, Dolichandrone platycalyx, a tall, upright-habited tree when well developed, with broadly pinnate foliage and abundant clusters of Teconia-like flowers nearly 2 inches wide and $1\frac{1}{2}$ inch deep individually, and of a rich canary colour. It is a very fine sight indeed in its periods of bloom. The timber it produces is of quite first-rate quality, and a large local demand exists for it. Another Bignoniad is also found here, but is not common. It is Spathodea nilotica, likewise a large shady tree. Its flowers are brilliant scarlet in colour, and on the tree suggest the presence of some tropical bird of splendid plumage. The campanulate corolla is 4 inches or more across and 3 inches in depth; the woody seed - vessels — shaped like a quaint, sharp-pointed shoe—have a method of pointing skywards, and, protruding from the top of the tree, create a peculiar effect. Everywhere in Central Africa, on welldrained, and frequently on very dry, soil in open land, one finds members of the genus Erythrina, usually ungainly trees, but producing when in flower wonderful colour effects by the vivid scarlet spikes of bloom springing from the naked

branches. In the region under review, one of the showiest, E. tomentosa, is quite common. The timber of these trees is not of much account, but the bark seems to afford some medicinal product, which is extensively used by Central African natives.

In this region, on the inland edge of the lake forest, the genus Landolphia, from a garden point of view, is seen at its best. Here L. florida loved to convert the upper portions of tall trees into patches of glistening white with its handsome, fragrant flowers. It is a noble climber, and its rich green foliage forms a fine setting for the wealth of bloom it so freely and so often produces. Another species, probably L owariensis, has equally fragrant flowers, abundantly produced in terminal paniculate masses; but they are small individually, and not showy in colour. This species bears clusters of fruits, similar in size and appearance to a Tangerine Orange, which look very tempting. The fibrous pulp surroundgrowth was enormous, and although its debilitating effects were clearly evident, one could not fail to admire the fine floral effect produced. When out of flower it was quite possible tomistake this plant for a Ficus seedling, as it had small, roundly oblong, dark green foliage, somewhat felted beneath.

With regard to the dwarfer and herbaceous vegetation perhaps the most showy is a Vernonia, which formed broad patches amongst the lower grasses. It is about 2 feet high, of sturdy habit, and has purplish flower-heads changing to a whitish colour. It made quite a fine garden plant. A strong-growing Coreopsis, with abundance of rich yellow (inclining to orange) coloured flowers, was alsofound in grass. Often associated with this was a graceful Leguminous plant (Desmodium), withterminal, nodding masses of inflorescence composed of many small flowers of a pale-rose colour. A larger-growing species, D. Scalpe, is occasion-

FIG. 69.—VIEW NEAR THE LAKE SIDE IN AN EQUATORIAL AFRICAN GARDEN.

ing the flattened seeds is not to be despised; but the two species of small monkeys inhabiting the forest lay prime claim to most of the ripe fruits.

It is odd to find a member of such a well-known shrubby genus as Hibiscus developing a tendency to climb, yet H. furcatus, a common species in the eastern tropics, does so. The writer has observed some of its slender, armed branches up in climberclad trees to a height of nearly 20 feet. It has conspicuous yellow flowers, with a deep purple blotch, as large as a single Hollyhock.

A Mikania (close to M. scandens) is an extremely graceful and effective shrub in rather dry sunny positions. A good specimen suggested that pretty and loose effect which Plumbago capensis gives when in flower. This Mikania had corymbs of deep lilac-coloured flowers.

It may be remarked here that Plumbago was represented by the widely distributed P. zeylanica, which is a small shrub with pure white flowers. A Loranthus, bearing clusters of orangeyellow flowers in great profusion, is parasitic, often in considerable quantities, on a certain common tree with small foliage and a spreading habit. In some cases the mass of parasitic

ally met with. This forms a very handsomeplant when cultivated, and might be more frequently seen in our greenhouses. The ubiquitous-Cassia mimosoides, with remarkably finely-cut pinnules and pale-yellow flowers, is a charming little garden plant in rather dry, sunny places. Acanthus arboreus (Gardeners' Chronicle, 1902, p. 222), always groups itself in most effective positions, where it displays to advantage its handsome though prickly leaves and terminal spikes of bright rosy-purple flowers. It was found at its best on the higher, well-drained open land. Here, too, flourished a very fine Plectranthus (Labiatæ), with elongated panicles of bright lavender-coloured flowers. The plant forms a somewhat globose mass of foliage 2 to-3 feet high, which has a more grey than green tone, and emits a pleasant perfume when onebrushes past it. The flowers are almost constantly produced, and are most effective. At certain seasons the grass is freely dotted with the showy puce-coloured flowerspikes of a very pretty dwarf Tephrosia. Lissochilus arenarius, one of the finest of the African terrestrial Orchids, is frequently met with.

Ets flower-spikes were often seen 4 or 5 feet high; when well furnished with its large, light purplish flowers it is a very striking plant. It must be admitted it was found a difficult subject to cultivate even in its local habitat, for when lifted and replanted in the garden it re-establishes itself very slowly. It has a wide range of distribution in Central Africa. The other terrestrial species noticed were a long way behind it as showy objects. The epiphytic Listrostachys fimbriata, Rolfe, n.sp., is a fine Orchid. The flowers are produced in great profusion in long, graceful, drooping spikes. They are of a pale yellow or straw colour. L. Whytei has large flowers, not many being horne on a spike. The petals are pure white, and the spur is of considerable length, and brownish in colour. This species is not common, and was only known before from the Mlanji mountain range in Nyasaland. A very charming Crinum of small proportions is found in damp places. It generally bears but two or three flowers in the umbel. Another species has large handsome, pure white flowers. This we took to be a distinct form of C. giganteum; it was common in places inland. It is said the natives associate this species with a defunct king who had quantities of it planted extensively around his residence, and that consequently no native was permitted to injure the wild plants. If the legend is true it furnishes us with a rare instance of the untutored African native applying an indigenous plant to a purely decorative gardening purpose. M.

(To be continued.)

HARDY FLOWERING PLANTS.

PLATYSTEMON CALIFORNICUS.

This pretty little Californian Poppywort proves to be quite hardy here. Plants from seed sown last April flowered in due time, and were admired by many, chiefly, I suppose, for their distinct appearance, as they are of too modest a nature for those who admire showy plants only. The seeds ripened, and a quantity having been self-sown there are now some nice strong plants ready for the return of the summer sun to bring them into flower. It will be interesting to note if these are of larger stature because they were sown in autumn, as the Shirley and some other Poppies are. Plants raised from seeds sown in April are among those choice annuals worthy of a place among alpine plants, being quite in character with such species. W. H. Divers, Belvoir Castle Gardens, Grantham.

KEW NOTES.

DENDROBIUMS are well represented in flower at the present time, and notwithstanding the sunless season last year, the plants are flowering fairly well. D. Wardianum is making a fine display, included in which are several good varieties. D. luteolum is a rarer Burmese species, having primrose-yellow - coloured blooms, produced towards the end of the pseudo-bulbs. D. superbiens is also flowering, with its arched spike of reddish-coloured flowers, developed at the apex of the growth. D. nobile and its numerous varieties add greatly to the bright show. Amongst the named varieties of this species are D. n. nobilius, D. n. Cooksonianum, and the very pretty D. n. Sanderianum; there are also some very good unnamed varieties in bloom. D. Wardiano × japonicum is an exceedingly free-flowering hybrid, the flowers being almost white. The Australian species D. speciosum, which many fail to flower satisfactorily, is just now the feature of the cool Orchid-house; one specimen growing on a block of wood is carrying fifteen fine spikes. The delicate little D. sarmentosum, with its miniature growths, is also in bloom. D. Fytchianum, D. Johnsoniæ, D. Madonnæ, D. longicornu, D. Boxallii, and D. infundibulum are flowering. D. crassinode, with its curiously swollen joints, is a mass of beautiful flowers. D. Rolfeæ × is a charming hybrid between D. nobile and primulinum, having the soft primrose-yellow colour characteristic of the latter species. Amongst other species are D. aureum, D. primulinum, and D. lituiflorum; the hybrid Dendrobiums include D. × Ainsworthii, D. × Andromeda, D. × Juno, D. × burfordense, D. × Leechianum, and D. × Thalia. W. H.

BULB GARDEN.

FOUR NEW SNOWDROPS.

Among a number of hybrid and seedling Snowdrops, which I owe to the kindness of Mr. James Allen, whose painstaking efforts to give us new forms of several favourite bulbous flowers deserve even more appreciation than they have received, are those following:—

Virgin has flowers which must be described as small compared with those of many of the newer and some of the older Snowdrops. It differs from most of these, however, in being almost pure white, from the absence or nearly so of the green markings on the petals. It has not the long petals of G. nivalis poculiformis, but is a better grower than that beautiful but delicate plant.

Robin Hood is a beautiful hybrid raised by Mr. Allen, and a vigorous-growing plant with large, bold flowers and fine foliage. It is one of the free-growers and long-livers, as one may judge from the increase it has made, and from its healthy appearance.

Perfection is a very handsome Galanthus, with large flowers of great substance and with the petals cupped. Like the preceding it has strong foliage, and promises to be a good grower in suitable soil.

Acme is of dwarfer habit of growth than a number of Snowdrops, although not really a "dwarf." It has charmingly-formed flowers of an "ear-drop" shape, and of good substance. I have had this variety since 1901, and in that time it has increased well and has been quite healthy, although of course one never knows when the dreaded Botrytis galanthina may attack it. No Snowdrop seems proof against that destructive Snowdrop mould.

It is difficult to tell in words the differences between these four Snowdrops, but when growing side by side the distinctions are apparent. S. Arnott.

The Week's Work.

THE KITCHEN GARDEN.

By John Pentland, Gardener to C. H. B. Firth, Esq., Ashwicke Hall, Marshfield, Chippenham.

The Sowing of Early Crops.-With a rainfall of 4:38 inches for February and 12° of frost on the morning of February 29, followed by 10° on the morning of March 1, it is difficult to know how best to proceed in regard to out-of-door crops. In most districts, however, it will be necessary to wait for better weather, especially if the soil be of a heavy nature, as this cannot under the circumstances be in fit condition for sowing seeds. But in order to obtain early crops seeds may be sown or plants put out into frames placed on a border. When the weather will allow, frames may again be moved to encourage other crops.

Rhubarb.—The ground for new plantations should be thoroughly well trenched and afforded a liberal supply of manure. After this has been done, take out holes 2 feet deep and 4 feet apart, putting in the bottom of each hole a quantity of manure. Make this moderately firm by treading, and then add a layer of soil, placing the roots on

this in such a manner that the crowns will be on a level with the surrounding ground. Work the soil and manure well in around the plant, making it moderately firm. It is better to place the manure conveniently near, so that the new roots will easily find it, than to put it actually in contact with broken or injured roots. When all is finished, afford a good mulching with manure. The stock may be increased if necessary by splitting up the crowns. In some instances these can be pulled apart easily, but where it is not possible, use the knife or spade, taking care not to make the wound larger than is needful. Much care should be exercised in respect to crowns which have been forced, as, being weaker, they are more liable to decay. Seeds of Rhubarb may be sown in September or October in drills, covering them an inch deep. Maintain a supply of Rhubarb for the kitchen by placing pots in an inverted position over the crowns out-of-doors, covering the pots with a few barrowfuls of stable-manure.

Globe Artichokes should be divided and planted towards the end of this month. Have the ground trenched and manured in readiness for them. Choose a well-drained part of the garden free from the drip of trees and well exposed to sunlight. To increase the stock, seeds may now be sown in boxes and placed in a house or frame having an intermediate temperature, until the seeds have germinated, and the plants have made rough leaves. They may then be hardened off gradually for planting out.

Peas.—Those raised in turves may now be planted out as soon as the ground is in a fit condition. Take out a trench wide and deep enough to admit the turves, which should be lifted off the slate carefully, and placed flat on the bottom of the trenches. Then work the soil well along the edges, and make it firm. Place short stakes along each row of plants, and on either side branches of evergreens to protect the young plants from winds. Autumn-sown Peas will also require protection. We have seen such Peas ruined by winds even when 2 feet high.

THE ORCHID HOUSES.

By W. H. WHITE Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Dorking.

Imported Odontoglossums .- Judging from the enormous quantities of Odontoglossum crispum that were imported into this country during the past year, there must be thousands of plants just recovering from the severe ordeal of importation, and the consequent rough usage they received before the plants reached the growers' hands. Several of the plants here that were imported early in the season are now showing their flower-spikes, but they are not sufficiently well estab-lished to bear much strain, and it is advisable to remove most of the buds, leaving just one or two flowers to determine the variety. When the flower has opened and the variety is known the spike should be cut off immediately. The principal object then should be to grow the plant stronger each year until it has so thoroughly reestablished itself that it can produce strong flower-spikes without loss of strength. Even in the case of strong well-rooted specimens, it is the case of strong, well-rooted specimens, it is far better to cut off the spikes when the flowers have been open a reasonable time, than to allow them to remain on the plant until the pseudobulbs shrivel. Slugs and small snails like the young succulent spikes of Odontoglossums. a good plan to isolate the more hopeful-looking varieties by placing the plants on inverted flowerpots stood in pans kept filled with water; even with this precaution constant watching is necessary, and these pests should be diligently sought for every night and early morning. Baits of young Lettuce leaves, pieces of Potato, and bran are useful in clearing them out.

Plciones.—Immediately the plants of Pleione humilis and P. Hookeriaua pass out of flower they should be planted in shallow Orchid-pans, using a compost of peat, loam, and chopped sphaguum moss in equal proportions, with a sprinkling of coarse silver sand. Suspend them near to the roof ventilator in the cool house. Water sparingly until the growths are well advanced, when the supply may be considerably increased. Other

species of Pleione, as P. lagenaria, P. præcox, P. maculata, and P. Wallichiana, require to be grown in the Cattleya or intermediate house; they should also be suspended close to the roof glass. These varieties are growing rapidly, and water should be afforded in almost unlimited quantities. When the new bulbs commence to form afford the plants an occasional application of weak liquid cow manure. When the weather is warm and bright, syringe the under sides of the foliage with tepid rain-water two or three times a day.

Zygopetalum Mackayii, Z. crinitum, Z. Sedeni, Z. Perrenondi, Z. Clayii, Z. Burkeii, Z. brachypetalum, and others of that section that require fresh compost should be attended to at once, repotting them in a mixture of fibrous loam, peat, leaf-soil and moss in equal parts, adding a moderate quantity of coarse sand. Place them in a warm shaded corner of the intermediate-house.

THE HARDY FRUIT GARDEN.

Ву Н. Маккиам, gr., Wrotham Park, Barnet.

Figs.-Fig-trees in the more favourable parts of the country, whether on walls or as bushes, bear heavy crops of fruits, the variety Brown Turkey in particular. The soil for Figs should not be too rich, a firm, sweet, gritty loam containing plenty of chalk or old mortar-rubble, resting on a thoroughly well-drained subsoil, induces fruitfulness. The aim should be to prevent strong, sappy growths. Trees when planted and trained fan shape on walls facing south, and having their roots in a rich border of unlimited size, make too much wood. In such cases it is necessary to root-prune rather severely; pruning the branches would have little effect. Trees in narrow borders close to gravel paths seldom grow too strongly, and if the heads are allowed to grow at will usually fruit well, the wood being short-jointed and thoroughly matured. I have never seen better and healthier crops of Figs than in the gardens of J. T. Friend, Esq., Northdown, in the neighbourhood of Thanet, except at Falmouth, where I saw, two years ago, a tree growing as a standard and abundantly loaded with fruits in various stages of development. Thin out the branches of trees on walls sufficiently to prevent crowding, remembering that the leaves are of large size. Lay-in all the young fruiting wood at full length, it being on the young wood that the fruits are produced. The present is a good time to plant young Fig-trees, or the work may be done much later if the plants are in pots. Let the borders be well drained, and use the soil in a moderately dry condition, that it may be made pretty firm previous to planting. When planting pot-trees, shake away all the soil, and slightly shorten the very long roots. Lay-out and cover the roots at various depths. The weather has been very unfavourable, but if care be exercised, the planting of fruit trees may be successfully carried out for a few weeks longer.

Raspberry Canes .- Cut down newly - planted canes to within a few inches of the ground level, for they should not be cropped in the first season. The young canes which will spring up from the base should fruit heavily next year. A few of the double-fruiting kinds on permanent beds may also be cut down, preserving the young growths as they spring up for the production of a crop in autumn. Varieties which have been tied to stakes or trained on wires at full length may now be shortened more or less according to their length and strength, and any which untied should be secured as early as possible, as they are now commencing to grow.

THE FLOWER GARDEN.

By A. B. WADDS, Gardener to Sir W. D. PEARSON, Bart., Paddockhurst, Sussex.

The Rockery .- If it is intended to overhaul the rockery next month, suitable soil should be made ready for the different plants. Any vacant places that are to be planted may be dug up and new soil added. Clear away all decayed matter from round the plants. Some of the hardy Cyclamens are showing their flowers. These plants do not require a very damp position; they grow here on the ledge of a rock, planted in loam and cow-manure. Hepaticas, Iris, and Scillas are coming into flower. To protect them from sparrows stretch threads of black cotton or thread over and about them. Place a hand-light over Primulas coming into flower to protect them from

Hot bed for Annuals, &c .- This should be prepared now of fresh leaves and stable litter in equal proportions for use in a few weeks' time. When the bed has settled, add the necessary soil, and take care that such soil is made free from slugs and grubs. The bed will then be ready when required for use.

Bedding Plants. - Lobelia, Heliotrope, single Chrysanthemums (the variety Morning Star is one of the best), Phlox Drummondi, and East Lothian Stock may be sown now in boxes, and placed in gentle heat. Pot off all seedlings and cuttings directly they have rooted sufficiently. Old stock plants of Lobelias will now produce plenty of good cuttings, which I prefer to seedling. seedlings. Borders or beds that will be sown with annuals next month should be given a dressing of dung, lime, and soot, digging the ground and leaving the surface rough until wanted.

Dahlias .- Take cuttings of these when they are long enough. Pot them singly into small 60-size pots and plunge them in a hot-bed. Pot seedlings of single-flowered Dahlias as soon as they have made rough leaves.

Lawns, Shrubberies, &c.-The past week has been unfavourable for getting lawns ready to be rolled and mowed. They must not be rolled too long before they are mowed, or the worm casts will appear again and clog the machine. In previous years we have commenced to mow bere February, but the weather this season has hindered the work, and has, unfortunately, delayed returfing and planting operations. Where evergreens are to be planted next month, such as Hollies, Yews, Box, &c., trench the ground or make good-sized holes, and prepare fresh soil and material for planting and mulching. Trees and shrubs that were planted twelve months ago and still require supports or wiring, should be given attention. Remove the ties or bands and put the fresh ones upon a different position on the stem. Cuba bast is a good tying material for trees and shrubs, being soft, yet strong when twisted. Keep the soil for 2 feet around the stems of the trees free from weeds, loosen the surface soil, and apply a mulch.

PLANTS UNDER GLASS.

By C. R. FIELDER, Gardener to Mrs. Burns, North Mymms Park, Hatfield, Hertfordshire.

Zonal Pelargoniums .- Where plants are quired to flower in winter, cuttings should be inserted now. Provide 5-inch pots with liberal drainage, and fill them with a sandy soil. Let about eight cuttings be inserted in each pot, and place them on a shelf or other position near to the glass in a temperature of 60°. much water until the cuttings have made roots. When they have become well rooted, place the cutting pots in a temperature of about 50°, to harden the plants, and at the same time pinch out the points of the shoots. After a few days the plants may be potted singly into small pots. As soon as these are filled with roots, transfer the plants to their flowering-pots, those 5 inches in diameter being sufficiently large for springstruck cuttings. A suitable compost for the final potting may be one of three-parts loam, half a part leaf-soil, and half a part rotten manure, together with a liberal quantity of coarse sand. Keep the plants in a light and airy house until the end of the spring, when they may be placed in a cold pit or frame. Towards the middle of the summer the plants should be stood on ashes in the open air thoroughly to mature the growth. Pinch the shoots once or twice, and continue to remove all flower-buds until a short time before the plants are required to flower.

Cordylines (Dracanas) and Codiaums (Crotons).-Plants which have become leggy may be utilised for propagation. Cut off the tops about 6 inches in length, and remove a few of the bottom leaves, cutting the base of each shoot back to apoint where it is not too hard and woody, otherwise roots will be made but slowly. Insert

the cuttings singly into small pots filled with loam and peat in equal parts, adding silver-sand. Press the soil firmly around the cuttings, and plunge them in the propagating-frame, or place them under a bell-glass in the stove. The plants may also be readily propagated by the process known as "ringing." To do this it is necessary toremove a few leaves about 5 or 6 inches below point of the shoot, and, using the knife, carefully peel off a ring of bark about 11 inch wide. A handful of sphagnum or other moss must then be placed around the stem where the bark was removed, and secured with matting. moss constantly damp, and after a few weeks the roots will appear, when the shoot should be cutoff the plant, potted carefully and placed under a handlight for a few days. Dracenas that need repotting should be afforded a compost of loam. peat, and leaf-soil in equal parts; while the compost for Codiæums may consist of three-parts loam, and one-part peat or leaf-soil, together with some silver sand.

Hot-house Blinds.—Have these put in order, so that they may be fixed without delay when the necessity arises.

FRUITS UNDER GLASS.

By W. FYFE, Gardener to Lady WANTAGE, Lockinge Park, Wantage.

Melons that were planted out early in February will now be showing fruit upon the first laterals. Should the plants be considered insufficiently strong, remove the fruit and stop the lateral back to the first leaf. Fruit will afterwards show on the sub-laterals, and this will afford an opportunity to secure an even crop of fruits over the area of the trellis. Supposing the trellis to be 6 feet high, stop the plants when they have made growth 5 feet long by pinching the point of the leading shoot. This will give strength to the plant and avoid waste of growth. There should be a bottom-heat of 80° to 85°, and when the plants are in flower the soil and atmosphere should be moderately dry, with a circulation of warm air passing through the house. Fertilise the flowers in the morning tunity to secure an even crop of fruits over the the house. Fertilise the flowers in the morning when the atmosphere is dry, and stop the shoots one joint beyond the fruit. If the plants are planted at distances of 2 feet, a crop of three fruits to each will be found sufficient. Fruits of the largest size have no special attraction. grown specimens of Hero of Lockinge and British Queen are good examples of what a Melon should be. In order to prevent canker or damping at the neck of the plants, I have for a number of years practised the system of planting recom-mended in a previous calendar. All water afforded the plants is applied directly upon the stem with satisfactory results.

Cherries .- When in flower these are so attractive that one is almost tempted to introduce them to the conservatory, where the conditions would be altogether unfavourable to the fertilization of the flowers. If fertilization has taken place the Cherries will be swelling at the base of the decayed flowers. Even if this be so, do not hurry the growth of the trees by the employment of high temperatures. Syringe the trees once only each day at present, doing this work in the forencen. Later on, when the weather out-of-doors is favourable, afford abundance of air and syringe twice daily. Pinch out the points of the shoots when they have made five or six leaves. Lightly fumigate the house at intervals. Keep a sharp look-out for grubs, which will be found rolled up in the leaves, and squeeze them between the thumb and finger. Maintain the temperature at night to 40°, or with ventilation to 50°. Fumigate trees placed under glass early in February and which are now unfolding their buds.

Early Figs in Pots.-It will be well not to over-crop these trees. Afford light top-dressings often, and if space is limited a layer of turves round the rims of the pots will prove of considerable assistance. When watering afford sufficient thoroughly to wet the roots, and afford occasional applications of liquid-manure and soot-water. Maintain a genial atmosphere by occasional and thorough syringing. Damp the paths and walls with liquid-manure. Admit air when the temperature of the house is 70°, which may rise to 80° at closing time.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the Publisher. Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be WEITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents .- The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself re-sponsible for any opinions expressed by his correspondents.

4llustrations.—The Editor will be glad to receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, do.; but he cannot be responsible for loss or injury.

Local News .- Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapera. - Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

Birmingham Gardeners' Mu-tual Improvement Society tual Improvement Society meeting. United Horticultural Benevo-lent and Provident Society's Annual Meeting. MONDAY. MAR. 14-WEDNESDAY, MAR.16 Royal Botanic Society's Exhibition at Regent's Park.

THURSDAY, MAR.17 Eighton Horticultural Society meeting. SATURDAY, MAR 19 German Gardeners' meeting. Club

SALES FOR THE WEEK.

MONDAY and FRIDAY NEXT— Herbaceous Plants, Azaleas, Roses, Liliums, &c., at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 19 WEDNESDAY NEXT-

Roses, Palms, Greenhouse Plants, Perennials, Fruit Trees, &c., at 12 o'clock. At 3 o'clock, about 500 cases of Japanese Liliums, &c., at 67 & 68, Chesp-side, E.C., by Protheroe & Morris, — At 12 30 at Stevens' Roses, Fruit Trees, Magoolla grandiflora, Azaleas, Rhododendrons, &c. FRIDAY NEXT—

Imported and Established Orchids at 67 and 68, Cheapside, E.C., by Protheroe & Morris, at 12 30.

(For further particulars see our Advertisement columns.)

THE forthcoming "World's St. Louis Exhibition. Exposition to be opened next May at St. Louis will, doubtless, prove to be the largest Exhibition that has yet been seen, eclipsing as it does in magnitude and beauty of the buildings and the extent of the grounds the wonderful Exhibition at Chicago in 1893, and those held at intervals in Paris.

The Exhibition is well advanced towards completion, and, judging from illustrated accounts, it will be all that the Americans say about it. Besides the great buildings set apart for collections of international exhibits, it is customary in American Exhibitions to erect isolated buildings as special "pavilions" from the various States; and each foreign country builds a "pavilion" characteristic of its native architecture, and surrounded by a garden also characteristic of the style peculiar to it.

There will be at St. Louis pavilions erected by Great Britain, France, Germany, Austria, Italy, and other European countries, China, Japan, and other Eastern countries, as well as from the South American Republics. Great Britain will be well represented in its section, and the Royal Commission appointed last year, with the PRINCE OF WALES as its head, to represent this country, comprises a representative body of our leading men.

The Royal Commission, in its selection of a characteristic existing building in England for its Royal Pavilion, made choice of an interesting type. It was felt that the Banqueting Hall or Orangery of the Royal Palace of Kensington would be representative of English domestic building at one of its happiest periods, and would be a tribute to the memory of a great architect, Sir Christopher Wren, to whom, after INIGO JONES, we owe the distinctly English development of the Renaissance of Italy, by which the Gothic and Tudor methods of building had been superseded.

From this master's hand there was the wide choice of St. Paul's, Greenwich Hospital, and the many fine City churches; but in the Orangery of Kensington was found a building that could be strictly reproduced to its real size. With dignity and fine proportion it unites a pleasant homeliness and simplicity peculiarly belonging to English work. They forthwith commissioned Messrs. eighteenth century. Previous to this period, the large English mansion gardens were mostly in the Tudor style, and continued so during the troublous times of the Stuarts; but many a fine garden as well as house suffered at the ruthless hands of the Commonwealth leaders.

WILLIAM, Prince of Orange, brought over Dutch ideas of gardening, and it was he who introduced what was then and has since been termed "Dutch gardening." He introduced this style of gardening about the Royal residences, and it was not long before the fashion became established and general throughout the country. The Dutch landscape gardeners whom William engaged to carry out his ideas were soon followed by numerous noteworthy English practitioners in the art, so that during Queen Anne's reign a great impetus was given to this Dutch style throughout the country, to be followed later by a school of landscape gardeners opposed to the Dutch ideas of design; and in consequence many of the finest examples of the Dutch type of gardens were destroyed, to give place to what was termed the "natural" style, in which formality and "natural" style, in which formality and straight lines were replaced by irregularity and absence of symmetry.

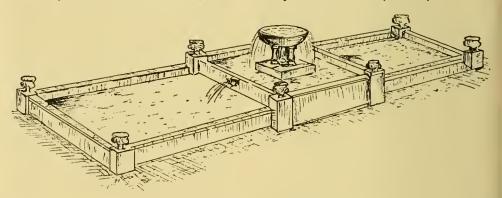

Fig. 70.—St. Louis exhibition. Sketch of Fountain, with Water Lily basin at either end. [See Supplementary Illustration.]

ERNEST GEORGE & YEATES as architects to reproduce a replica of this building, which is of red brick and white stone, and 170 feet in length. In the replica at St. Louis of WREN'S building, the only departure from the original is the introduction of an enriched plaster ceiling, such as would be found in a house of the period. On the south side of the building is a stone-paved terrace of corresponding size, and on this, no doubt, Royal groups have gathered above the quaint parterres, clipped Yews, fountains, lead statues, and other departed glories of Queen Anne's favourite garden. The work of building the Pavilion was carried out by Messrs. Trollope & Sons, of London.

Mr. W. Goldring, Kew, was appointed by the Royal Commission to design a garden to harmonise in character with the building, and he adopted in his plans a modified type of a formal garden of the period at which the banqueting-hall was built.

In the garden surrounding the Pavilion an attempt has been made to reproduce on a small scale the style of garden that was generally attached to the mansion residences in England during the reigns of WILLIAM III. and MARY, about the latter part of the seventeenth century, and at the time of Queen Anne, in the early part of the

The Queen Anne Gardens were a pleasing combination of the Tudor, Jacobean, and Dutch styles. Their characteristic features were stately terraces, shady avenues—or "pleached alleys," as they were called formal parterres enclosed by hedges clipped into shapes and embellished with topiary work, the forms of animals and birds cut out of Yews and Box.

This topiary work was distinctly a special introduction from Holland, and was at the time considered to be the highest form of art in the garden. The fashion became a craze, and was carried out to such an extent that it came under the scathing ridicule of Pope, and after that declined.

There are fortunately, still some of the most noteworthy examples of these Queen Anne gardens preserved in England, and the tendency at the present time is to continue the style, and a decided reaction has set in in favour of its re-adoption.

There is a charm about a genuine old formal garden that appeals to many people, and the idea of such a garden is shown in the British Royal Pavilion Garden, formed in six months, though the matured example would require six generations to perfect.

A water basin and fountain were always associated with an old garden, and generally the bowling-green and pleached alley were as inseparable from it as were stone and lead statues, urns and vases, which were generally admirable, though the making of these seems to be a lost art nowadays.

The long borders of old-fashioned flowers appeal to everyone in England, and the targe beds of simple outline are more in vogue than the embroidered parterres in the Italian style, that do not accord with the present prevalent practice of massing harmonising groups of colour.

The work of carrying out Mr. GOLDRING'S plans was entrusted to Mr. T. W. Brown, formerly of the Royal Gardens, Kew, and subsequently superintendent of the gardens of the Emperor of Morocco, at Fez; and he has carried out the work well under the disadvantages of restricted time and a severe winter climate.

EXPLANATION OF PLAN.
See Supplementary Illustration.

(Reduced one-half from the original plan of 16 feet to 1 inch.)

Description on line from C to D.

Bowling-green (sunk 1 foot 6 inches), shade trees behind.

Terrace (20 feet wide) with statues at end, surrounded by Yew hedges.

Pavilion, inner court with fountain and Palms. Terrace (24 feet wide by 100 yards long), with sundials at ends.

Fountain (90 feet long by 25 feet wide), centre basin 1 foot 6 inches above side basins.

Pleached alley of shade trees, raised 3 feet above general surface.

Flower-garden panels on each side of

Fountain (120 by 100 feet), sunk 1 foot 6 inches below general surface, and 3 feet below south terrace.

Design of panels outlined by clipped dwarf evergreen hedges.

Centre of panels of turf, paths around beds of paving stones.

Area of Garden (including Pavilion) about 3 acres.

The material for planting the garden beyond the trees and hedges has been contributed by the various firms in England, the chief exhibitors being the following:-Messrs. Cannell & Sons, Swanley, hardy herbaceous plants and seeds; Messrs. J. CARTER & Sons, High Holborn, bulbs and seeds; Messrs. J. CHEAL & SONS, Crawley, Dahlias; Messrs. Cutbush & Sons, Highgate, specimens of topiary work, clipt Yews, Box, &c.; Mr. J. FORBES, Hawick, Phloxes; Hobbies, Ltd., Dahlias; Messrs. Kelway & Sons, Langport, Gladioli, Delphiniums, and other plants and seeds; Mr. Amos Perry, Winchmore Hill, hardy herbaceous plants; Messrs. Sutton & Sons, Reading. Gladioli, Lilies, Narcissi, and other bulbs.

THE ROYAL HORTICULTURAL SOCIETY.—A congratulatory address from the Société Royale d'Agriculture et de Botanique de Gand has been received by us for presentation to the Society on a suitable occasion. The address is signed by Comte de Kerchove, and is very elegantly got up. The Ghent Society is only four years the junior of the Royal Horticultural Society, and, to say nothing of its ordinary exhibitions, its quinquennial celebrations have a wide-world reputation. A similar address from the Prussian Society has also been announced.

THE ROYAL BOTANIC SOCIETY OF LONDON has just completed arrangements for a grand Horticultural Exhibition to be held in the

gardens of the Society, Regent's Park, London, from June 6 to June 11 inclusive. Conferences and lectures on many subjects connected with gardening will be held during the exhibition. The prizes will comprise medals-gold, silver-gilt, silver, and bronze; cash prizes and diplomas. Bands will play during the afternoon and evening, and the gardens will be illuminated. The horticultural section will include exhibits of plants, flowers, fruits, vegetables, seeds, &c.; forestry, market gardening, horticultural buildings, implements, &c. An interesting section is promised under the head of "Colonial," comprising fruits, vegetables, &c., grown in the Colonies. There will be competitions in table decorations, and the decorative uses of flowers. The first of the monthly floral exhibitions will take place on Wednesday next.

LINNEAN SOCIETY.—The next meeting of the Society will be held on Thursday, March 17, 1904, at 8 p.m. Paper: Mr. A. W. WATERS, F.L.S., "Bryozoa from Franz Josef-Land." Exhibition: Mr. F. ENOCK, F.L.S., Natural-Colour Photography of living Insects and Flowers. A ballot will be taken in respect of Mr. John Lewis Bonhote as a Fellow.

BOTANICAL MAGAZINE.—The March number contains coloured illustrations and descriptions of the following plants:—

Oldenburgia arbuscula, de Candolle, tab. 7942.

—A South African Composite of striking appearance, figured in our columns at p. 9, fig. 4, of the present volume. Hort. Kew.

Tanakwa radicans, Franchet and Savatier, tab. 7943.—A Japanese plant allied to the Saxifrages, with long-stalked radical ovate, green leaves, with a reddish serrate margin, and an erect panicle bearing numerous small white unisexual flowers, in appearance like those of an Astilbe. By a misprint it was called Janakea in our columns, 1903, i., p. 209. Hort., Beamish, Cork.

Kirengeshoma palmata, Yatabe, tab. 7944.—A very remarkable and attractive Japanese plant allied to the Saxifrages, with palmately-lobed leaves, the lobes acutely toothed, and with loose cymose panicles of funnel-shaped yellow flowers, each about an inch in diameter. See Watson in the Gardeners' Chronicle, ii., 1903, p. 187; Garden, ii., 1903, p. 245. Hort. Kew.

Solanum glaucophyllum, Desfontaines, tab. 7945.—An erect shrub, native of S. Brazil and Uruguay, with glabrous, shortly-stalked, lanceolate leaves, and terminal cymes of numerous bell-shaped lilac flowers, each about 1 inch in diameter, succeeded by oval purplish berries. It is a very elegant species, long cultivated at Kew, but still little known outside botanic gardens.

Megaclinium platyrhachis, Rolfe, tab. 7946.—An Orchidaceous plant, native of British Central Africa. Like other species of the genus, it is remarkable for its flattened leaf-like flower-stalk, from the centre of which emerge in linear series the numerous small flowers characteristic of the genus. Hort. Kew.

"FLORA CAPENSIS."—We are glad to note the issue of Vol. IV., Sect. II., of the Flora Capensis, edited by Sir William T. Thiselton Dyer. The present section deals with Hydrophyllaceæ, Boraginaceæ, and Solanaceæ, by C. H. Wright; Convolvulaceæ, by J. G. Baker and C. H. Wright; and Scrophulariaceæ, by W. P. Hiern. It may be noted that under the Kalahari region are included the Orange River and Transvaal States.

AN ENGLISH GARDENER IN GERMANY.—Mr. J. S. Tonn, late gr. to Count Hahu, Basedow, Mecklenburg, Germany, and formerly in the gardens of the Duke of Sutherland, at Trentham, has been appointed gr. to His Serene Highness Prince Henry of Pless, Fürstenstein, Silesia, Germany.

PRESENTATION AT LEEOS.—On the occasion of the Annual Social Dance in connection with the Leeds Paxton Society, on March 2, when 150 members and friends were present, a presentation of a gold Albert chsin, with a gold medal attached suitably engraved, was made to the Chairman, Mr. William Moore, gr. to H. J. Bowring, Esq., Gledhow. This was subscribed for by the members of the Society in recognition of Mr. Moore's valuable services during the past nine years as their Chairman.

THE WINTER'S SUNSHINE.—The table below shows the total amount of sunshine that has been experienced at twelve representative stations in Great Britain during the three months December to February. The great difference between the number of hours of sunshine on the south and south-west coast and that in the great cities is very striking and particularly interesting to the gardener. The number of hours recorded during the past winter was in every case less than the average.

Falmouth ... 155 hours. Oxford ... 108 hours.
Scilly Islands 143 ., Aberdeen ... 69 ...
Jersey ... 146 ., London ... 66 ...
Southampton 140 ., Birmingham 63 ...
Bath 118 ., Manchester ... 37 ...
Cambridge ... 115 ... Glasgow ... 34 ...
Harrogate ... 110 ...

GERMAN HONOR CONFERRED ON AN ENGLISH GARDENER.—On the occasion of the German Emperor's birthday, His Majesty conferred on Mr. E. W. GILBERT the order of the House of Hohenzollern. Mr. GILBERT was formerly in the gardens at Trentham, and also in the gardens of Her late Majesty at Frogmore.

PROPOSED GARDENERS' ASSOCIATION.—At a meeting of the Provisional Committee held on March 9, it was decided to arrange for a public meeting of gardeners, to be held in London on the second day of the Temple Show (June 1), when a scheme for a National Association of Professional Gardeners will be submitted for approval. It was also decided to ask for donations to enable the Committee to print for circulation all over the country a pamphlet setting forth the main objects for which the Association is to be formed, and the advantages of co-operation and registration. Donations should be sent to the Secretary protem., W. Watson, Descanso House, Kew Road, Kew.

EXTENSION OF FRUIT CULTURE. — A correspondent writes: "An important meeting was held in Edinburgh on February 23, when Mr. Hodge, of Blairgowrie, met a representative gathering of horticulturists to confer with them on the extension of fruit culture, and the means of removing any hindrances to its progress. Hodge is a lawyer, and the Board of Agriculture representative of the Fruit Committee of the Board. In his remarks he proved himself to be intimately acquainted with the subject. His remarks on Raspberry culture in Blairgowrie, where that fruit is extensively grown, were most interesting, and suggested the thought that commercial ends might be best met by adapting the crop to the climate and the soil. Mr. GEORGE SINCLAIR, The Orchard, Preston Kirk, where he tenants a mixed market garden, and is also a lecturer in the Heriot-Watt College and the Royal Botanic Gardens, Edinburgh, was appointed by the meeting to represent the interests of the Edinburgh district before the Departmental Committee in London. A curious development in the flower trade has been effected in Edinburgh by the street merchants. Several months ago a number of lads combined and formed a kind of trading company to purchase flowers and distribute them to members. Purchases are made in the cheapest market-that is to say, if flowers are cheaper in Newcastle than in Edinburgh on a given morning,

their agent in Newcastle is advised to purchase and consign what is required, and an equal division of the goods is made as soon as they arrive in Edinburgh. It is a pretty sight to see at every few yards along Princes Street one of the lads with his portable flower-bench suspended from his neck, and every one of them exactly alike as to quantity, quality, and variety of flower."

STOCK-TAKING: FEBRUARY.—According to the Board of Trade Returns for the past month the figures for both imports and exports show an improvement. The total imports are placed at £44,110,519, against £40,560,585—a difference in favour of the past month of £3,549,934. Our summary figures read as follows:—

IMPORTS.	1903.	1904.	Difference.
Articles of food	£	£	£
and drink—duty free	7,922.377	8,617,536	+695,159
Articles of food & drink—dutiable	7,425,996	8,399,236	+973,240
All other Imports	25,212,212	27,093,747	+1,881,535

It will be remembered that people fighting, or about to do so, are ever in want of funds; that we are approaching Budget times, and that harvest prospects are being discounted—prices inclining upwards (as per "Corn Average" reports). There have been endeavours to make "corners" on Wheat, but they do not appear to have succeeded as yet. Fruit prospects are looking up, as noted below; but firstly we have other imports of fruit, roots, and vegetables:—

IMPORTS.	1903.	1904.	Difference.		
Fruits, raw-	Cwt.	Cwt.	Cwt.		
Apples	258,604	347,121	+88,517		
Apricots and Peaches	72	1 034	+ 962		
Bananas bunches	173,142	163,439	-9,703		
Grapes	1,196	477	-719		
Lemons	63,553	90,735	+27,182		
Nuts-Almonds	10,551	8,561	-1,990		
Others used as fruit	18,919	21,510	+2 591		
Oranges	863,344	737,661	-125,683		
Pears	1,920	1 263	-e57		
Plums	200	377	+177		
Unenumerated	6,360	6,310	-50		
Vegetables, raw-					
Oolonsbush.	670,591	750,095	+ 79,504		
Potatos ewt.	196,483	991,803	+795,320		
Tomatos ,,	41,376	37,122	-4,254		
Vegetables, raw, un- enumeratedvalue	£ 37,699	£39,553	+£1,854		

A somewhat rare phenomenon in London streets is the sale at kerb-stalls of several classes of Peaches. South America and South Africa are in competition, and we have Peaches selling at $1\frac{1}{4}d$. each and up to 3d. The business done seemed good. Since our last note here on the subject of Cape fruit supply, we have received notification of the arrival of four steamers from Cape Town with Plums, Peaches, Pines, Grapes, &c., apportioned as follows:—Plums, 8,034 cases; Peaches, 5,528; Pears, 2,066; Nectarines, 786; Apples, 32; Grapes, 11; Pines, 22; grand total, 16,489 cases. The Orient Company send us information respecting Tasmanian and Australian Apples now at sea, to the amount of 51,000 cases. The value of the imports for the past two months was £90,243,039; against £86,787,100 for the same period in 1903—a difference of £3,455,939.

EXPORTS,

The value of exports for last month was £23,894,813 against £22,775,436, a difference in favour of last month amounting to £1,119,377. This aspect of

things is somewhat clouded over by the twomonth comparison. Thus the two past months total up £47,978,178; the total for the same period in 1903 is £47.679,072—the difference (plus) falling to £299,106, but it is a difference on the right side.

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his Correspondents.)

CROCUS CHRYSANTHUS AND ITS VARIETIES. —In Crocus chrysanthus and its varieties we have a series of flowers of much diversity of colouring, and varying much also in size. None of the other species seems to vary so much in colour as this, and were it taken in hand, as C. vernus has been for many years, we might have an almost endless array of pretty and valuable early flowers. We all know how rich is the wealth of colour and marking which has come from C. vernus; but the gamut of colour has not such an extensive range in this species, while some of the forms of chrysanthus are of tiny size to begin with, and might be induced to give us a set of Lilliputian Crocuses as the antithesis of the manmoths among the forms of the Dutch Crocuses. All have a place, and these miniature flowers would stand the rude weather of spring better than the great flowers of the larger forms. This remark is not intended to disparage the larger Crocuses, but to be suggestive of future developments possible among these charming flowers of spring. What may be taken as the type form of C. chrysanthus comes from the type form of C. chrysanthus comes from the neighbourhood of Smyrna, is of a deep, rich orange colour, and of medium size, the segments of the perianth being about 1½ inch long. Sometimes the outer segments are feathered or suffused with bronze, a feature strongly marked in some of the varieties. The filament is orange, as are also the anthers, while the style divides at about the level of the while the style divides at about the level of the anthers into orange or yellow stigmata, variable in shade and size. The leaves reach to the level of the flowers, and are about 10 inches long at maturity, while the corm is rather like that of C. biflorus. Mr. Maw includes the species with his nudiflori and annulati. C. chrysanthus is an early bloomer, February being its usual time of early bloomer, February being its usual time of opening in average British gardens; but such varieties as C. c. fusco-tinctus and C. c. fusco-lineatus often open early in January with me. These two varieties are charming little plants, with small flowers of great beauty, bright orange-yellow in the interior, and marked with bronzy-brown on the exterior. Fusco-tinctus is suffused with this colour, while fusco-lineatus is more lined in its bronzy colouring. They vary somewhat, however, in these respects. In C. c. albidus we have a pretty white variety, but suffused towards the base of the flower with yellow. It is a pleasing have a pretty white variety, but suffused towards the base of the flower with yellow. It is a pleasing but somewhat scarce form. Mr. Maw also figures two varieties named var. corulescens, the one of a pleasing lulac-blue and yellow towards the base, and the other white with a bluish or lilac mark running from the base of the flower halfway up the segments, the greater portion of the base being yellow. Then there is another form of C. c. albidus with a blue base. Two newer varieties are Canary Bird, a pleasing Crocus with rich yellow flowers, and with the attraction of a rather pleasing sweet odour. One of the latest varieties to be offered is C. c. superbus, a very handsome form with rich or the latest varieties to be offered is C. c. superbus, a very handsome form with rich orange-yellow flowers, which are increased in beauty by the handsome scarlet stigmata. Not all of these varieties are readily procurable from the bulb trade, but the greater number are. Canary Bird, albidus, and superbus are the most expensive, but the type with the varieties. expensive; but the type, with the varieties fusco-tinctus and fusco-lineatus, are of a moderate price. S. Arnott, Carsethorn-by-Dum-fries, N.B.

PLANTS FOR BOMBAY.—If "H. K." will apply to M. J. Sallier, Horticulteur, 9, Rue Delaizement, Neuilly-sur-Seine, he will be able to procure Astrapæa Wallichii, Dombeya Cayeuxii, and other plants suitable for the climate of Bombay. L. B. Makowski, West Brayton.

CURIOUS PEST IN GARDEN.— If your correspondent "A. S. H," Dublin, p. 156, will strew sufficient fresh soot over the grass on his flewergarden and tennis-lawn while damp to discolour the whole surface, it will probably produce the desired effect by eradicating the pests complained of, and rendering the grass and ground distasteful to the lodgment therein of future colonies of the insects. I can fully sympathise with "A. S. H." some members of my family having had a similar experience last summer and early autumn. In addition to the surface-dressing of soot resulting in the probable eradication of the insects located in the short grass of flower-garden and tennislawn, it will greatly improve the condition and appearance of the grass itself by imparting renewed strength and vigour to the roots, and arich dark-green shade of colour to the young growth. So far as my experience goes soot is easily obtainable in the neighbourhood of any town of ordinary size at from 5d. to 6d. per bushel—money well spent by any householder in possession of garden and field-land, seeing that soot is apowerful fertiliser and purifier of the soil. The soot should be passed through a fine sieve and then distributed over the grass as evenly aspossible. H. W. Ward, Limehouse, Rayleigh.

— In this district of Cambridgeshire the same pest is very prevalent during the months stated by "A. S. H." They are to be found in the grass, trees, hedgerows, and even in the house, being apparently carried about by the wind. In appearance they resemble red spider, scarzely to be seen with the naked eye, but when examined under an ordinary lens, they are orangered in colour. We have tried various means as a preventive against the bites of this pest, but nothing seems to reach them or to prevent usfrom being bitten by them, as they work in under the skin (which can be proved by pinching the flesh immediately after being bitten, when the mites may be ejected). We have tried rubbing the body with Eucalyptus oil, ammonia, vinegar, &c.—these simply allay the irritation for a time. The mites do not trouble all persons alike, as I have known men when fruit-gathering not to betouched by them, while others have been covered with bites; and I have known persons to be badly bitten who have not been outside the house. I should feel greatly obliged for information respecting the life history, &c., of this minute insect. A. E. S., Meldreth, Cambs.

STRAWBERRY BEDS.—I cannot agree with your correspondent, Mr. Jefferies, p. 139, as to-digging between the rows in Strawberry beds. Supposing the manure was only buried two-inches under the surface, the plants would makenew roots in the manure and freshly upturned soil, but in the decomposing of the manure and settling of the soil, it would be found that the roots were little over an inch underground, so that when again digging the Strawberry beds, the roots must be destroyed. I have just examined the beds in these gardens to see how far they would bear out my statement, and find masses of roots at an inch from the surface; had I dug amongst these in the autumn, the crowns must necessarily have been weakened. I have never had any trouble with water standing in the rows, as the ground is in no way puddled, and in dry weather the strawy litter placed between the rows for the purpose of keeping the fruits clean, helps to distribute the water, when watering has to be done, also prevents cracking. If the soil in Strawberry beds requires to be loosened, what a great mistake we must all make by ramming the soil so firmly in potting Strawberry plants for forcing! Mr. Jefferies must have plenty of space for Strawberries at his disposal. J. Stocks, Fen Place Gardens, Turners Hill, Sussex.

— How does Mr. Jefferies conclude that the placing of a thin covering of short stable litter over a mulching of decayed manure from 1 to 2 inches thick, beaten down evenly with the back of a fork before and after applying the litter in January or February, when the weather permits of its being done, is injurious or stiffing to the plants? Has he ever experienced any injury to the plants from that cause, or is it merely an assumption? If it has a stiffing effect, why should it not be equally so when applied a few weeks after-

wards? Why should this thin layer of straw harm the plants more than soil, which he so strongly advocates? The litter is not intended to be beneficial to the plants, but to save further time and trouble, and in due time to protect the fruits from any objectionable matter. The digging or sorking of manure into the ground 2 inches deep in midwinter, disturbing, breaking, and damaging a portion of the roots when the land is cold and wet, to be followed perhaps by heavy falls of

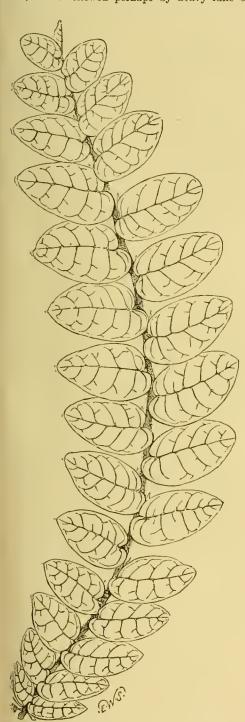

FIG. 71.—ORDINARY FOLIAGE OF CREEPING FIG, FICUS REPENS.

snow, during which time the broken roots lie practically dormant, is a practice I cannot advise. Water when applied through the water-can or garden-hose is not more evenly distributed if the tand has been previously mulched, than is the case when applying it direct to a dry loose surface. H. Markham.

SPHAGNUM-MOSS IN ORCHID-HDUSE. — Referring to your correspondent's enquiry respecting sphagnum-moss in Orchid-houses (p. 155),

I do not think that sea air has anything to do with this trouble. I have known one or two cases where soft water was scrupulously used for watering Orchids, but it was still found impossible to grow healthy sphagnum. The cause was eventually found to be in the too free use of lime-wash and whitening for shading, which in a rainy season found its way in sufficient quantities to the water-tanks to kill the sphagnum. Perhaps this hint may help your correspondent. Chas. E. Pearson.

FICUS REPENS was planted in the conservatory here about thirty years ago upon a north and east wall, and for over twenty years retained its original and well-known character. Some eight or nine years ago, however, one of the plants developed, at about 14 feet from the ground, a quite distinct and robust character, with ovate or egg-shaped leaves, beautifully ribbed and veined on the under-side. In this respect it resembled F. repens, but the leaves being nuch

Obituary.

EMILE LAURENT .-- As was announced in a recent issue, M. E. Laurent, the Professor at the Agricultural Institute of Belgium, at Gembloux, died suddenly, on February 20, between Accra and Sierra Leone, on board the Albertville. on his return to Europe. His career at the School of Horticulture at Vilvorde was marked by great distinction, and as soon as his studies were terminated he was nominated Professor in that establishment. Far from allowing himself to be dazzled by his success, he undertook further studies, and entered the University of Brussels. He frequented from its foundation in 1884 the botanical laboratory founded by Prof. Leo Errera, and passed with great distinction his examination for his Doctorate of Natural Science. Influenced by the example of Pasteur, whose immortal writings he had deeply studied, he betook himself to Paris

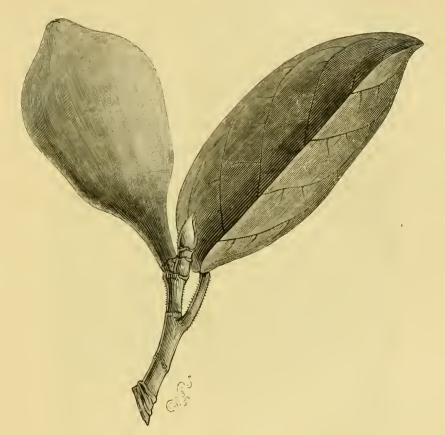

FIG. 72.—FRUIT AND LEAF OF ARBORESCENT FORM OF CREEPING FIG, FICUS REPENS.

larger with considerable more substance, these markings are much more distinct and beautiful. It has fruited this season for the second time. The fruit I now enclose, together with foliage of the two kinds. W. Fyje, Lockinge Gardens. [The larger leaves are those of the arborescent form of Ficus repens, which, being a climber like the Ivy, has dimorphic leaves. The arborescent forms in Ficus are equivalent to the larger leaves developed by "Tree" Ivies. Both forms have been illustrated in Gardeners' Chronicle, and we now reproduce them. The fruit sent is that of F. repens, and similar to that shown in fig. 72. F. repens and F. stipulata are names for the same plant. Ed.]

THE RAINFALL IN 1903 AT BELVOIR CASTLE AND BELVEDERE HOUSE. — Belvoir Castle, Leicestershire: 30.76 inches; rainy days, 200. Belvedere House, Co. West Meath, Ireland: 48.28 inches; rainy days, 231. Belvoir is 260 feet above sea-level, Belvedere 367 feet. Both have a similar geographical position and distance from the sea in centre of their respective islands. Brinsley Marlay.

to work in the laboratory of that savant. There also he came to the front. In 1891 he was charged with the re-organisation of the botanical studies in the Agricultural Institute at Gembloux, where he was enabled to devote himself entirely to the study of physiology as applied to agriculture. With scanty resources he got together collections of living plants worthy of a university. He gathered there at his own cost the richest collection that exists in Europe of the plants of the Congo.

Laurent interested himself keenly in the colonial movement promoted by the King of the Belgians. Twice, in 1893 and in 1895-6, Laurent travelled in the Congo region for scientific and agricultural purposes under the auspices of the Government. He acquitted himself of his task in a particularly brilliant manner. It is to him that we owe the most precise information and the most judicious advice as to the vegetable resources and the agricultural future of this immense territory. Amongst the numerous

documents which he collected in the course of his travels some were published by the Government of the Congo State in the Annales du Musée du Congo, others were sent to the botanic gardens at Brussels, where they were made the subject of memoirs by MM. Durand and De Wildeman. His friends were not a little surprised to learn during the course of 1903 that he had determined to undertake a new scientific expedition to the Congo. Six months sufficed for his observations; it was to be a pleasure trip, in which he was accompanied by his nephew. Remonstrances that were made to him were in vain; having survived two sojourns in Africa under less favourable conditions, he had reasons to think he could resist the fatal climate. It

viscous bread, and his discovery of the means of preventing the appearance of that diseased condition, and to his studies on the variability of fungi and microbes. Allusion may also here be made to his researches on the conditions governing the dispersion of Misleto, and to his recent memoir, in collaboration with M. Emile Marchal, on the problem of the formation of albumenoid matter in plants. Two facts of great scientific importance have been established by Laurent. Experiments carried on together with the French chemist, Th. Schloesing Fils, and which will remain models of precision, have afforded decisive proof that certain plants have the faculty of assimilating, of fixing as it is said, the gaseous nitrogen of the atmosphere. The importance of

THE LATE M. LAURENT.

was not, however, without apprehension that his friends bade him farewell at Antwerp, but they received with much pleasure the news of his progress. In his letters he spoke of the fine condition of the plantations which he had inaugurated in 1895-6. At last, when they knew that he was returning to Europe, they thought him safe, and were preparing to receive him in Antwerp in a few days, when the telegram announcing his death spread consternation among them.

The scientific reputation of Laurent was well established beyond the Belgian frontiers. He was elected last year a Correspondent of the Institute of France, and the King named him Chevalier of the Order of Leopold. We cannot here enumerate all his scientific publications, marked at once, as Professor Errera has stated, by their originality and critical acumen. But I may allude to his bacteriological experiments on

this matter may be estimated when the amount expended on nitrogenous manures is considered. The second point is the demonstration furnished by him of the conditions under which certain ordinarily inoffensive microbes become dangerous to plants and vice versa. The great interest of such researches in all questions of vegetable and animal pathology is manifest.

Laurent was about to be named Director of the National Agronomic Station on his return, but he has been taken from us at the age of forty-two, leaving his work unfinished. He had many friends in England, especially at Kew, which he adored—friends who estimated him for his loyal and amiable character. He was a true wan of science, a thorough patriot. He was characterised by a charming vein of humour, conscientious, faithful to principle, full of energy and individual enterprise. He was a protector of the weak and a helper of the workers. Louis Gentil.

SOCIETIES.

ROYAL HORTICULTURAL.

MARCH 8.—The usual fortuightly meeting of the Committees took place on Tuesday last in the Drill Hall, Buckingham Gate, Westminster.

Orchids were again shown extensively, and the Orchid Committee had a large number of novelties before them for certificate. Their awards included one-first class Certificate and three Awards of Merit.

Many very interesting groups of plants and flowers were exhibited before the Floral Committee, and a few novelties, but no Certificates or Awards of Merit were recommended.

An interesting species of Lebelia from Southern India was shown by Messrs. Paul & Son, The Old Nurseries, Cheshunt. The Committee were not satisfied on this occasion that it would make an effective flowering plant for the conservatory. In any case, it would appear to be capable of affording a new type for crossing with other species.

The FRUIT and VEGETABLE COMMITTEE met, but, as on the last occasion, this body found nothing of importance to inspect.

The NARCISSUS COMMITTEE sat for the first time this season, but no awards were called for. At the afternoon meeting there were forty-two new Fellows, four Associates, and three Societies elected to the privileges of the Society; and a paper by Mr. ALEX. DEAN, on "Cottage and Allotment Gardening," was read by the Assistant Secretary.

Floral Committee.

Present: W. Marshall, Esq. (Chairman); and Mcssrs. H. B. May, R. Dean, J. F. McLeod, R. Wilson Ker, C. T. Druery, J. Green, J. Hudson, J. Jennings, W. Howe, C. Dixon, W. Barr, J. A. Nix, C. J. Salter, C. E. Pearson, C. Jeffries, H. J. Cutbush, R. W. Wallace, W. Cuthbertson, C. E. Shea, W. P. Thomson, H. Turner, G. Paul, J. W. Barr, R. C. Notcutt, E. H. Jenkins, R. Froebel (?), Ch. Blick, Geo. Nicholson, R. Hooper Pearson, C. R. Fielder, and E. T. Cook.

Mr. J. Douolas, Edenside Nurseries, Great Bookham, showed two pots containing Saxifraga Burseriana major. They were in 5-inch and 6-inch pots, and the plants had not only completely covered the surface, but they themselves were literally hidden by the pretty white blessoms with yellow centres. A Cultural Commendation was awarded.

Messrs. H. Cannell & Sons, Swanley, made a very fine exhibit of Cyclamens, the plants being freely flowered, and the blooms were of good size and substance; also flowers representing their atrain of Chinese: Primulas. The same firm showed a considerable number of Cactaceous plants of various sizes, and all of them in excellent condition of health and growth (Silver Flora Medal).

Lobelia nicotlanifolia was shown by Messrs. PAUL &2 SON, The Old Nurseries, Cheshunt, The two plants were in pots, and were considerably mere than 6 feet. high. The leaves are lanceolate acuminate, 2 inchesacross the widest part, and more than a foot long. The seeds were sent home from Southern India, and the plant is probably a biennial. The terminal spike of flowers is more than 2 feet in length, and the whiteflowers are very numerous, but not large. The plants were grown out of doors during last summer, and have been cultivated in a cool-house since. Apparently the plants would need to be treated similarly to Humeas except that this Lobelia will flower in March. The plant was awarded a Botanical Certificate by the Scientific Committee. A number of plants of a strawcoloured Italian Hyacinth was also shown. These varieties have larger flowers and are rather later than the Roman varieties.

Mrs. Pilkington, Wellaton, Nottingham, exhibited two shallow pans filled with Primula Forbesii in flower, but although very freely flowered the plants had been grown rather weakly.

Pteris Wimsetti plumosa, exhibited by Mr. W. A. Cull, Bury House Nursery, Bury Street, Edmonton, is a plumose variety of this type.

Lachenalia hybrids were shown by Mr. F. W. MOORE, Glasnevin Botanic Gardens, Dublin. Like others that have heen shown from the same garden, these were very interesting, but if plants could be sent they would afford a better idea of them then.

Begonia Perle de Lorraine was shown by Messrs. T. CRIPPS & SON, Tunbridge Wells Nurseries, Kent. It is one of M. Lemoine's introductions, and makes avery pretty plant for flowering in March and ouwards. The flowers are palest pink, small in size, but produced in large, pendant racemes. The leaves are

bronzy green, and sparsely covered with rough hairs, which grow from the margins also.

Messrs. Jas. Veitch & Sons, Royal Exotic Nurseries, Chelsea, exhibited groups of flowering plants, each kind being grouped separately. The pretty hybrid Primula × kewensis (P. floribunda × P. verticillata), figured in Gardeners' Chronicle, March 31, 1900, p. 195, was shown in flower in 4-inch pots and & inch pots, the first blooms having just opened. Of greenhouse Rhododendrons, R. Veitchill (white), and R. Ne Plus Ultra (very fine reddish crimson), were well represented, Ne Plus Ultra being as effective as Veitchii is charming. About one cozen 11 ints represented hybrids of Clivia minlata, and there was a batch of Loropetalum chinense, and an excellent plant of Cheiranthus × kewensis (Silver Banksian Medal).

Mr. H. B. MAY, of Dyson's Lane Nurseries, Upper Edmonton, staged some good Ferns, and several ornamental plants — Oleander "rosea variegata," Boronia heterophylla (scarcely in flower). Some small plants of Gardenia florida showed planty of buds, the few flowers open being very fragrant; Adiantum Farleyense showed a splendid colour; A. grscillinum, A. digitatum, Nephrolepis Plersoni, and several species of Gymnogrammas were included (Silver Banksian Medal).

Messrs. J. HILL & Sons, Barrowfield Nurseries, Lower Edmonton, had the premier exhibit of Ferns, and displayed some rare varieties of these plants. The group was very nicely set up, the members being worked in to produce a pleasing effect: some Davailias on tall supports were at the back, and grand specimens of Platyceriums graced the centre and ends of the collection, whilst several tinted varieties of Ferns were arranged along the front. The plants were well grown, and included Platycerium athiopicum, P. Hillii, the rarer l'. Veitchii (a good plant), a fine plant of Adiantum asarlfolium, several tinted varieties of Adlantums, Lastræas, &c. Doodia aspera multifida and Lomaria attenuata were also noticed. Several Davallias were growing on Tree Fern stems, notably D. assamica and D. pentaphylla; Gymnogramme dobroydense and G. argyrophylla were both good (3llver Flora Medal awarded).

M. FRANTZ DE LXET, of Belgium, exhibited through Mr. R. Anker, of Addison Nursery, Napier Road, Kensington, W., some varieties of hardy Cacti and miniature succulents in tiny pots. Opuntia phæicantha major was conspicuous; Aloe Saliaris was shown in flower. Several small potfuls of a four-leaved Shamrock were also shown by this exhibitor. The leaves were small, but prettily spotted like those of a Medicago.

Mr. John Russell, Richmond Nurseries, Richmond, set up a group of forced flowering shrubs and plants, somewhat similar to their exhibit at the last meeting. The exhibit was very pleasing in effect and tastefully arranged, the plants were well flowered, and the colours harmonised. A background of Palms lent an additional feature to the group. Prunus triloba was interspersed through the exhibit. Staphylea colchica, Viburnum plicatum, Azaleas, and Prunus sinensis alba were the principal features (Silver-gilt Banksian Medal).

Messrs. R. & G. CUTHBERT, The Nurseries, Southgate, Middlesex, gave an interesting display with their group of forced Azaleas, relieved with Japanese Maples, Ferns, Palms, and similar plants. At one end of the group were some well-grown specimens of Stsphylea colchica. Several plants of standard Azaleas, all profusely flowered, were placed at intervals, and a fine bank of rich yellow-flowered Azaleas occupied the centre of the display. Azalea occidentalis var. magnifica was very fine, the effect of the white flowers with their upper petal tinged with yellow being enhanced by their light-green leaves. Azalea pontica, A. mollis, and A. mollis × sinensis were all represented by varieties (Silver Banksian Medal).

Messrs P. S. Williams & Son, of Upper Holloway, N., also showed Azaleas, but included many other specimens of forced shrubs in their group, and made the most of the corner allotted them. Shrubs in flower, on both standard and bush plants, edged with some tiny Palms, were very brilliant, and well covered with blossom. Ribes sanguineum and the variety alba were flowering freely, the latter having a very graceful appearance. Small plants of Lilacs, just suitable for the table, with others as standaads: Viburnum opulus, members of the Fruuus and Pyrus genera, together with some well-flowered Azaleas, were prominent in this pretty group (Silver Banksian Medal).

The exhibit of Messrs. WM. CUTBUSH & SONS, Highgate London, N., was a very tastefully-arranged and well-grown collection of plants. Two very beautiful members of the Leguminoseæ at once caught the eye io this collection—the Laburnum, with its chain of golden flowers, and the handsome Wistaria chinensle. Cytisus [Laburnum] Adami was interesting, its creamy-pink flowers being less glaring than its ye'low relative. The same firm displayed a stand of alpices. At the back of the group was a number of small shrubs and Conifers, all useful for rockwork culture. We may mention some fine Hepaticas, both blue and pink; a large hatch of Shortia galacifolla, and S. galacifolla rosea; Primula denticulata alba, Fritillaria Thunbergi, some fine Irises, Saxifrages, Tulips, Narcissus, &c. The same firm also displayed cut Carnations, and the pretty climbing Rose Dorothy Perkins (Silver-gilt Flora Medal).

Messrs. WM. BULL & SONS, Chelsea, London, set up a group of Azaleas, backed by some nice Cocos Palms. There was a variety of colours, and plenty of bloom. Mdlle. Estelle Cuveller, a fine white variety with large flowers, was noticed. A Vote of Thanks was awarded Messrs. Bull for their contribution.

Mr. JOHN R. BOX, West Wickham, staged some good plants of Begonia Gloire de Scaux, intermixed with some plants of Asparagus (Vote of Thanks).

A lesson in wail-gardening was afforded by an exhibit from Messrs. T. S. WAHE, LTD., Feltham, Middlesex. The improvised wall was covered on either side with cork, and the "pockets" were formed with the same One side was supposed to have a south aspect, and in the pockets were plants in flower, including Saxifraga Burseriana, Cyclamen Aucmone blanda, Daphne Blagayana, &c., and a number of species not in flower. On the north aspect were coloured Primroses, Shortia galacifolia, Primula denticulata, &c., also a number of hardy Ferns The exhibit may have done good by inspiring visitors to attempt "wall-gardening," but it would hardly be prudent to copy the model in detail, either in respect of the making of the peckets or the selection of plants (Vnte of Thanks).

Mr. A. R. Upron, Guildford Hardy Plant Nursery, Millmead, near Guildford, had hardy species of Veronica. The bushy little plants had been lifted from the open ground and put inio puts. The twenty-six species shown represented those that have proved most hardy. They are very interesting, even when not in flower, as the foliage varies very considerably in the different species, as, for instance, in V. cupressoides, V. salicifolia, V. pimeloldes, and V. Hectori (Silver Banksian Medal).

The Fox HILL NURSERY, Keston, Kent (Mr. G. Reuthe), had a few hardy and alpine plants, among which was Crocus Balansæ, the flowers of which were very distinct owing to the three outer segments being purple nearly to chocolate colour.

The approach of the Daffodil season was evinced by a fine display of these beautiful bulbous plants, brought by Messrs. Barr & Sons, of Covent Garden, and arranged among a fine collection of hardy spring flowering plants. The season having arrived when these latter plants are at their best, the individuals exhibited were even better than at previous shows this season. Pots, vases and boxes were all requisitioned to display these pretty subjects, and a miniature rock-garden was presented in a box, including, Primulas, Irises, Narcissi, Crocuses, Saxifragas, Scillas, Hepaticas, &c. A fine bowl of Freezlas, F. refracta alba, was displayed; some good forms of Primula obconica, Lachenalias and Fritillarias. Anemones, Irises, and Scillas. Petasites japonica glgantea was interesting, but lacked the fragrance of P. fragrans (Silver Banksian Medal).

Messrs. J. CHEAL & SONS, Crawley, staged some trays containing alpine plants, which included Soldanella alpina, and S. alpina rosea. There were also good trays of a fine blue Primrose. Conifers and dwarf shrubs formed a background to the whole.

The Misses HOPKINS, Mere, Knutford, Cheshire, staged a small collection of hardy plants, consisting principally of coloured Primroses and Polyanthus.

Messrs. R. Wallace & Co., Colchester, exhibited bulbous plants and alpines in boxes and pots. Crocuses were a feature—C. versicolor violacea, C. biflorus, were both good. Pans containing Saxliraga Burseriana major, Fritillaria citrina, F. armena, Anemone blanda, of fine colour; A. Pulsatilla, and Primula megasæfolia were all noticeable. Other good plants were Iris Heldreichi, I. reticulata, Hepatica triloba, Sternbergia Fischeriana, and the tiny Narcissus minimus (Silver Flora Medal).

A most interesting lot of sprays of Catkin-bearing trees was shown by Lord ALDENHAM (gr., Mr. E. Beckett), and demonstrated the numerous families of plants which depend on the agency of the wind to pollinate

them. Several species of Alnus, including A. cordifolia, Poplars, Willows, Corylus, and Garrya elliptica, were placed in vases; Hippophoe rhamnoides, the Sea Buckthorn, was included; Populus alba canescens pendula, had large catkins with bright red anthers.

Mr. G. P. EGGETT, of Angel Road, Thames Ditton, presented two structures of a portable nature for growing Ferns, &c., being composed of virgin cork, dressed with a greyish mixture of tufa, with pockets for the reception of Ferns, &c.

Orchid Committee.

Present: H. J. Veitch, Esq, in the Chair; and Messrs. Jas. O'Brien (Hon. Sec), De B. Crawshay, J. Gurney Fowler, J. Douglas, W. Cobb, H. Ballantine, J. W. Potter, F. Sander, Norman C. Cookson, H. Little, M. Glecson, J. Colman, J. W. Odell, H. T. Pitt, W. Boxall, J. Charlesworth, H. A. Tracz, W. A. Bilney, R. G. Thwattes, A. A. McBean, W. H. Ydung, W. H. White, F. W. Ashton, E. Hill, F. J. Thorne, T. W. Bond, and F. Wellesley.

There was a very fine show of Orchids, Dendrobiums, principally hybrids, predominating.

The highest award, a Silver-gilt Flora Medal, was given to Sir HENRY SCHRODER, Bart. (gr., Mr. Ballantine), for a very fine group of choice varieties. The best of each section of the season were represented. The forms of Odontoglossum crispum Included the beautiful O. c. Mrs. H. G. Moor, a perfectly-formed white variety, with an occasional dark reddish spot on one or two of the segments, and distinct markings of the same colour on the lip. The Calanthes included forms of C. Regnieri, and C. \times Baron Schroder pallida, a large flower with white sepals and petals, and rosy claret lip. Others noted were the handsome Odontoglossum × Adrianæ Memoria Victoriæ Reginæ, Epidendrum × Dellense, Cypripedium × Lathamianum, with cleven flowers; C. × Decdmani anum, well bloomed; C. × macrochilum, Lælia × vitellina, fine forms of Cattleya Trianæ, bright Masdevallias, Sophronitis, &c.

JEREMIAH COLMAN, Esq., Gatton Park (gr., Mr. W. P. Bound), was awarded a Silver Flora Medal for an excellent group of finely grown Orchids, comprising several good torms of Cattleya Trianæ, Vanda Catteartii, varieties of Phaius x Norman, Cymbidium x Lowideburneum, Dendrobium x Wiganianum, and other Dendrobes; the purple-flowered Masdevallla cuculata (which flowers at Gatton the greater part of the year). M. rosea. Odontoglossum Edwardl; forms of O. crispum, including one with very rich purple spotting on the segments; Brassavola nodosa, and the singular and pretty Acineta Colmani, with wax-like whitish flowers evenly spotted with purple, and which was voted an Award of Merit subject to its name being verified.

R. G. THWAITES, Esq , Christchurch Road, Streatham (gr., Mr. Black), secured a Silver Flora Medal for a fine group in which the Dendrobiums raised by him were the feature, and of which the fine strain of D. × Cybele elegans had round, brighly coloured flowers, varying considerably in tint, but all good. An interesting exhibit was a pure white Dendrobium nobile virginale, raised from seeds, and proving that 'albinos" may be perpetuated in that way. A novelty was Den drobium × Blackianum (Findlayanum × Wiganiæ), and its variety electrum, the former having flowers resembling D. × Wiganiæ, and with a dark eye; and the other of a peculiar white with vellow disc. Also noted were fine specimens of D. nobile Murrhinianum, several varieties of the new D. x Thwaitesire, D. x Wiganiæ, finely bloomed; Lælio-Cattleya x Warnhamensis, Odontoglossum crispum, &c.

Messrs. SANDER & Sons, St. Albans, had a select group for which a Silver Flora Medal was awarded. The most prominent things noted were the handsomelyblotched Odontogiossum crispum Mariæ, a flower of fine form; an equally remarkable dark variety of O. triumphans, the new Lælio-Cattleya x Edwardii (L. cinnabarica × C. Hardyana), a showy reddish-orange flower with ruby lip; a very large flowered Cymbidium grandiflorum, C. × Ballianum, C. × Lowio eburneum, Phaius tuberculosus Warpuri, and some showy hybrid Phaius; a good set of varieties of Cypripedium × aureum, a curious variety imported with C. Curtisii, and probably a natural hybrid; Chysis × Chelsoni, Trichopilia suavis, fine specimens of Dendrobium nobile nobilius, various hybrid Lælio-Cattleya, Ada aurantiaca maculata, Oncidium superbum and Houlletia Brocklehurstiana.

Messrs. Charlesworth & Co, Hea'or, Bradford, were awarded a Silver Flora Medal for an excellent group principally of fine hybrids, the most remarkable

of which were two very bandsome forms of Lælio-Cattleya × Haroldiana, one of which secured the only First-class Certificate of the day (see Awards). centre of the group was composed of a number of Lælio-Cattleya × Charlesworthii, whose glowing reddishorange, purple-lipped flowers make it one of the brightest of the scason. At one end were several forms of L.-C. × Myra, varying from primrose colour to orange, Etoile d'Or being all dark yellow and without the purple on the lip, as in the others. A good selection of Lycaste Skinneri varieties were included, Exquisite and Fascinator being very fine. Other remarkable things were several Lælia × Briseis, L. × Digbyano-purpurata, several Cattleya × Enid, the fine new Cypripedium × Cravenianum (Hera Lucienianum x Spicerianum magnificum), a noble and pleasingly coloured flower, Odontoglossum prænitens, and well-bloomed Oncidium concolor.

Messrs. Jas. Cypher & Sons, Cheltenham, secured a Silver Flora Medal for a fine group principally of Dendrobiums, which constitute one of their specialties. Among them were finely-flowered D. nobile nobllius. and D. n. Sanderianum, which in size and colour are still two of the best; D. n. giganteum Berkley's variety, a model flower and prettily coloured; D. n. Cypheri, very distinct and bright, and many other forms of D. nobile, D. xrubens, and D. xsplendidissimum varieties. and other hybrids, two of the largest and most deli-cately tinted being D. × Virgil and D. × Apollo album. Others noted were Cypripedium × Thompsoni, C. × Ashburtoniæ giganteum, a very remarkable form; C. villosum giganteum, C. x Chas. Richman; and the still rare emerald green and white C. × Mandiæ. Among the species shown were several nice plants of the graceful Dendrobium barbatulum.

W. THOMPSON, Esq., Walton Grange, Stone (gr. Mr. W. Stevens), staged a small group of his hybrid Odontoglossoms, which included several forms of O. × Waltonieuse, two dark-coloured O. × Vuylstekei; the handsome rose-purple tinted, finely blotched O. \times crispo-Harryanum purpureum; and the pretty O. x Adrianæ Babette (Silver Banksian Medal).

Messrs, Hugh Low & Co . Enfield, staged an interesting group, in the centre of which was a finely-flowered mass of the pretty and rare Dendrobium × Boxalli. With it were D. Brymerianum, D. × Roeblingianum, D. × Dulce Oakwood var., D. crassinode, forms of Cattleya Trianæ the prettiest of which was C. T. Enfieldiensis, a clear white flower with a blush-pink tip to the lip. Also noted were Oncidium barbatum, O. obryzatum, Cattleya amethystoglossa, Angræcum citratum, and the fine Cypripedium × Helen II.

NORMAN C. COOKSON, Esq , Oskwood, Wylam (gr., Mr. H. J. Chapman), showed the singular Dendrobium x Mac-jap (MacCarthiæ x japonicum), with white flowers tinged with pink; and D. x nobile-Wiganiæ (nobile Burfordiense × Wiganiae), with white flowers tipped with rose, and with a sulphur-yellow disc. The peculiar feature was the perpetuation of the dark purple lines on the lateral sepals, as in D. nobile Burfordiense.

H. T. PITT, Esq., Rosslyn, Stamford Hill (gr., Mr. Thurgood), again showed the finely-blotched Odontogloseum crispum Stanley J. Pitt, the still unique dark coloured O. x Adriana Cobbianum, a fine mass of Dendrobium aggregatum majus, and a purple-flowered Liparis near to tricallosa.

DE BARRI CRAWSHAY, Esq., Rosefield, Sevenoaks (gr., Mr. Stables), showed Odoutoglossum × Waltoniense rosefieldiense (crispum x polyxanthum), a very charming and interesting flower, as it shows the leatures of O. polyxanthum much more plainly than in the original, the fine canary-yellow flowers having the peculiar purple-brown central blotching on the segments as in O. polyxanthum, and the lip showing very strong indication of that species. Mr. CRAWSHAY also ehowed O. crispum De Barri, a perfectly shaped large flower, heavily tinged with purple on the reverse side, the colour showing through to the surface, each segment of which bears clusters of irregular reddishpurple blotches.

The Right Hon. Lord ROTHSCHILD, Tring Phrk (gr., Mr. E. Hill), sent a fine branched spike of Phalænopsis × intermedia Brymeriana

Messrs. Jas. Veitch & Sons, Chelsea, showed Cypripedium × Harri-Leeanum, a fine dark-coloured flower; and a good Lælio-Cattleya × Myra.

 $\mathbf{F},\,\mathbf{A},\,\mathbf{Rehder},\,\mathbf{E}\epsilon\eta$, Gipsy Hill (gr., Mr. Norris), sent Cypripedium villosum excelsum of the giganteum class. Captain G. L. HOLFORD, Westonbirt (gr., Mr. Alex ander), sent Ada aurantiaca Westonbirt variety, a large and bright form; Odontoglossum × Adriance Lady Crawford, with pale yellow ground, finely spotted; Dendrobium × Clio Eurford variety, and Cypripedium

× Scipio (Sallieri Hyoanum × Mrs. Tautz), a finelyshaped handsome flower.

F. WELLESLEY, E3q., Westfield (gr., Mr. Hopkins), again showed the handsome Cypripedium × Memoria Jerninghamiæ and a brightly coloured Lælia Jonglieana

Messrs. WM. Bull & Sons, Chelsea, showed two remarkably good and distinct forms of Lælio-Cattleya x Myra, the one with bright yellow and the other nearly white sepals and petals.

Awards.

FIRST-CLASS CERTIFICATE.

Lælio-Cattleya × Haroldiana magnifica (L. tenebrosa × C. Hardyana), from Messrs, Charlesworth & Co. resembling the beautiful L.-C. × H. John Bradshaw, which recently secured a similar award, but generally darker; sepals and petals with a bronzy-yellow ground, the greater part of the surface being tinged and veined with claret-purple; lip intense claref-purple, and of fine size and shape.

AWARDS OF MERIT.

Odontoglossum crispum Kinlesideanum, from NORMAN C. COORSON, Esq., Oakwood (gr., Mr. H. J. Chapman), -A peculiar and pretty form with white flowers, having the stalked petals decorated with closely-arranged cinnamon-brown markings in the middle. It is of the O. c. Lady Jane, and Oakfield Sunrise class, and is very attractive.

Odontoglossum crispum Rossendale, from J. Wilson POTTER, Esq., Elmwood, Croydon (gr., Mr. W. Young), flowers white, tinged with purple, and showily decorated with large red-brown blotches on the inner halves of the segments.

Dendrobium × melanodiscus gloriosum from Mrs. HAYWOOD, Woodhatch, Reigate (gr. Mr. C. J. Salter). A very bandsome large-flowered form equal in beauty to D. × Juno, flowers white, heavily tipped with carminerose, the lip having a dark purple eye surrounded by an orange band, the tip rose.

CULTURAL COMMENDATION.

To Mr. W. H. WHITE, gr. to Sir Trevor Lawrence, Bart., for a large and finely-flowered specimen of the pearly-white Dendrobium × Luna.

To Mr. J. Howes, gr to Walter Cobb, Esq, Tunbridge Wells, for a fine specimen of Tetramicra (Leptotes)

To Mr. THURGOOD, gr. to H. T. Pitt, Esq., for a finely-flowered mass of Dendrobium aggregatum majus.

The Lecture.

COTTAGE AND ALLOTMENT GARDENING.

A lecture by Mr. A. DEAN, on "Cottage and Allot-ment Gardening." was read by the Assistant Secretary, in the absence of Mr. Dean through illness.

The lecturer advocated the encouragement of this work among cottsgers and allotees, as it was not only a healthy form of recreation, but it resulted in an appreciable adjunct to the weekly wage. These men, although at the beginning making many mistakes, ulti-mately become good cultivators. The local societies, are the outcome of their enthusiasm, which the work of County Council lecturers, &c., has fostered. Allotments are of diverse forms and situations, but the best is one with a south aspect. The size is determined by the amount of time at the disposal of the holder, some having as much as 40 rods or even 4 acrethese of course are large holdings; but 6 rods are hardly sufficient. Of these plots a moderate portion is usually devoted to flowers and fruit, the major part being cropped with vegetables, especially potatos. Land for Allotments is provided by County Councils and landowners. That at Richmond, Surrey, is leased from the Crown. Of course the soil of allotments varies greatly in character; yet all soils respond to good cultivation and manuring. The holders are persons of all trades, one of 40 rods being worked by an ex-policeman, whilst another skilfully-worked plot is cultivated by a railway signalman. The interest evinced by the holders is apparent when it is mentioned that some are at work as early as 3 o'clock in the morning.

Vegetables occupy the major portion of the plots. Fruit is represented by Gooseberries, Currants, Strawberries, Apples, and Plums, as low standards, and Raspherries. The cottager is not a good fruit grower; one seldom sees a well-trained fruit-tree on a cottage wall, but Roses, Clematis, Honeysuckle, and such plants are grown to perfection. The flowers mostly grown are Dahllas, Carnations, Begonias, Petunias, Fuchsias, Pelargoniums, and annuals.

The cottager knows the value of deep cultivation, hence he trenches his ground. He knows this to be of use in case of drought, and that it enables the roots to penetrate in the deeper and moister soil. The planting is generally done in rows running the length of the garden; bush fruit is usually planted so as to enable the fruit to be protected from birds by netting.

The judging of allotments can be done very rapidly, especially by those who have to inspect many hundreds of gardens and allotments each year. The number of judges should never exceed two in number. The following is the schedule of marks adopted by the Surrey County Council :-

MAXIMUM MARKS.

20 for superior work, order, good regular cropping,

cleanliness, and evidence of high-class culture.

10 for Potatos, Peas, winter and summer Onions,
winter Greens, including Broccolis, BrusselsSprouts, Savoys, Kales, and Coleworts. To bardy iruits, and where there are no flower-garden classes, to flowers, also.

8 each for Runner, Dwarf Kidney and Broad Beans, also to Beet, Carrots, Cabbages, Caulif Parsnips, Turnips, and Vegetable-Marrows Cauliflowers,

6 for Asparagus, Celery, Lecks, Cucumbers, Lettuce, Rhubarb, Seakale, and Tomatos. 4 for Artichokes, Red Cabbage, Shallots, Spinach, Herbs, Small Salads, and anything else that may be found unenumerated.

These maximum numbers indicate the value to the grower which the compilers of the schedule attach to the various crops. It is as a rule found that cottagers and allotment-holders themselves also value the crops in similar ratio.

The total number of marks attainable is 236. But The folal number of marks attainable is 206. But no garden or allotment ever exhibits perfection in every crop, although the maximum for cleanliness, order, &c., is often attained. The highest pointed garden in Surrey so far, and a splendid garden it was, accured 184 marks; whilst the highest number yet given to an allotment was 179.

The following is the schedule of marks found best to adopt for flower gardens .-

MAXIMUM. 10 for order and neatness, and the same for brightness and general effect.

8 for hardy flowers and for tender flowers.

6 for Ferns, vases, or hanging plants, and to other unenumerated features including window decora-tion. There is also a total maximum of 38 marks, divided between cultivation and quality, tasteful arrangements, variety in plants, and any other special features.

Some cottage fronts are very beautifully decorated, exhibiting great taste, skill, industry, and not infre-

eximiting great tark, sain, industry, and the development of the less of the absence of Mr. Dean, and referred to the less on taught by good and bad cultivation side by side. The value of a good medium crop is estimated at the rate of £90 per acre. Surrey is training estimated at the rate of and per acre. Surrey is training some hundreds of youths in allotment work, and their crops would defy competition from many able gardeners. Lord Onslow has placed land at the disposal of the Surrey people to plant model allotments for examples as to the best manner of managing them,

LINNEAN.

MARCH 3.-Prof. S. H. Vines, F.R.S, President, in the chair.

Mr. L. A. Boodle, F.L S., exhibited photographic lantern slides demonstrating the formation of secondary wood in certain regions of the stem of Psilotum triquetrum. In parts of the rhizome immediately below the acrial stems, and at the base of the acrial stems them-selves, tracheides occur, often in considerable numbers, outside the primary wood. These external tracheldes are found to be still in course of development, as shown by the imperfect lignification of their walls, at a time when the primary wood has long been completed; in some cases the external elements of the wood further show a distinct radial arrangement. These stems thus exhibit distinct remains of the secondary vascular tissues characteristic of the Palæozoic Sphenophyllales

tissues characteristic of the Palæozoic Sphenophyllales, with which on various grounds there is reason to believe the Peilotaceæ to be allied.

Mr. C. B. CLARKE, F.R.S., F.L.S., then gave an account of his paper, entitled "List of the Carices of Malaya." After defining his meaning of the term Malaya, the author explained that be had been obliged to confine his remarks to the material existing at Kew, with certain additional specimens lent by Dr. Zahlbruckner, of Vienna, who had kindly sent over some of the types of Zollingei's collections. The British Museum Herbarium could not be utilised, owing to the impracticability of comparing the specimens belonging Museum Herbarium could not be utilised, owing to the impracticability of comparing the specimens belonging to the two institutions. In all, 54 species are here enumerated, of which 36, including the 11 here characterized as new belong to the subgenus Caricandra, a natural group essentially tropical, and difficult to diagnose as to *pecies; all possessing a triffd style, with a terminal spike male in the upper portion and female at the base. and female at the base.

The author, in a few concluding remarks, observed that species of Mapania from the north east of Brazil were not only closely allied to species on the west coast of Africa, but some of them were intermediate in character.

Dr. J. G. DE MAN'S paper "On some Species of the genus Palæmon, Fabr., from Tahiti, Shanghai, New Guinea, and West Africa." was communicated to the Society, and its scope explained by the Rev. T. R. R. Stenning, Sec. L.S.

s.d. s.d.

HORTICULTURAL CLUB.

The usual meeting of members of the Horticultural Club took place on Tuesday evening last in the Hotel Windsor Westminster. Mr. Harry J. Veitch presided, and there were twenty four members present. The subject for discussion was "The Uses and Abuses of Botanising Excursions," which was introduced in a very interesting discourse by Prof Geo. Henslow. He said we saw boys and girls gathering Buttercups and Daisies in quantities, but they frequently left them in the fields when they returned home. They found their enjoyment in gathering the flowers, and were therefore "gatherers." Of another type of botaniser were some ladies who not only gathered the flowers but fore "gatherers." Of another type of botaniser were some ladies who not only gathered the flowers but took them home and fixed them very neatly into books, and then got some botanist of their acquaintance "just to stick the names to them." They were "collectors." Prof. Heoslow proceeded to explain very neintedly how that convenience of facts. They were "collectors." Prof. Heoslow proceeded to explain very pointedly how that some collected for the very love of collecting, and others in order to obtain something that no one else possessed. In either case there followed very little, if any, improvement of the mind. Those who so eagerly sought that which no one else should have were frequently noscrupulous in the means they took to obtain this end. instances having occurred in which collectors have found rare plants, and either taken all of them, or destroyed them. These practices represented the abuses of botanising. But there was the other side, and Prof. Henslow, in proceeding to speak of the uses of this interesting occupation, reterred to the history of botanical science since the middle ages, when botanists were mere herbalists, and knew little of the true characters of the plants they handled, nutil Linneus provided a scienplants they handled, until Linneus provided a scientific classification to Botany.

Some extraordinary particulars were given in respect some extraordinary particulars were given in respect to Culpepper's Herbal, which a publisher is even now issuing to the public. In this work there is no botany whatever, and every plant is described as being under the especial influence of some planet. Prof. Henslow read a very amusing quotation, in which the author maintained that the Henbane was a Saturnite, though a previous writer had described it as being under the a previous writer had described it as being under the influence of Jupiter. Yet there have been issued 68,385 volumes of the small edition, and 9,864 of the

large edition.

large edition.

Prof. HENSLOW then said a few words about the "lumpers" and the "splitters" among botanists, Bentham, being a lumper and Babington a splitter. The former botanist made five Blackberries, five Roses, seven Hawkweeds, and fifteen Willows. Babington made forty-one Blackberries, eighteen Roses, thirty-three Hawkweeds, and thirty-two Willows. In his subsequent remarks the Professor explained how the differences that were supposed to have divided the differences that were supposed to have divided species have been broken down as a greater number of plants has been discovered, and that by evolution it has been shown that different plants have not a separate but a common origin, but he was not disposed to accept Darwin's theory of the origin of species. He proceeded to speak of plants of quite different families so far as the structure of the flowers is concerned, which develop much the same structure and habit when grown under the same conditions, especially if the conditions be of an extreme nature, and spoke of an experiment that had been made with a water-plant (Proserpinaca), that develops a different kind of leaves when growing in water than out of water. But by thickening the water with chemical salts, the plant is made to produce similar leaves to its ordinary ones. All this showed that variation was indefinite, and was in response to environment, and the study of these matters was the real value of a botanising excursion. has been shown that different plants have not a separate

environment, and the study of these matters was the real value of a hotanising excursion.

In the discussion which followed, Messrs. Veitch, Druery, Pearson, Geo. Paul, Sinders, and Waterer, took a part, and very strong denunciations were made of the practice of exterminating rare plants, whether it be done by the botanist, the mere "collecter," or by people who gather them for sale.

THE WEATHER.

GENERAL OBSERVATIONS.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending Mar. 5, is furnished from the Meteorological Office:

"The weather -During the greater part of the week the sky was densely clouded in all districts, except the north of Scotland. Cold rain, sleet, or snow showers occurred frequently in the south of Ireland and most parts of Great Britain, but the falls were generally very

The temperature was much below the mean, the "The temperature was much below the mean, the deficit ranging from 5° in Scotland, E., England, N.E., and Ireland, N., to as much as 8° in England, S. and S.W. In Scotland, N., however, the deficit was no more than 2°. The highest of the maxima, which were registered on Sunday in Ireland and at most Scotch stations, and on Saturday in England, varied from 52° in Ireland, S., to 4° in England, N.E. The lowest of the minima were recorded about the middle of the week, and ranged from 18° in Scotland, E., 19° in Scotland, N, and Ireland, N., and 20 in the Midland Counties and and Ireland, N., and 20 in the Midland Counties and

England, N.W., to 25° in Scotland, W., and to 31° in the Channel Islands.

"The rainfall was slightly in excess of the mean in England, S. and E. Ireland, S., and the Channel Islands, and just equal to it in England, N.E., but less in all other parts of the kingdom. In Scotland, N. and in England, N.W., the fall was scarcely appreciable. appreciable.

The bright sunshine was considerably less than the mean in all districts excepting Scotland. N., the deficit being especially large over England. The percentage of the possible duration ranged from 34 in Scotland, N. and 23 in Scotland, W., and 21 in the Channel Islands, to 10 in England, S. At many southern stations bright sunshine was entirely absent during the latter days of the week."

THE WEATHER IN WEST HERTS.

Another cold week.—On the coldest day the tempera-ture in the thermometer screen at no time rose more the in the thermometer screen at no time rose more than 3° above the freezing-point, and on the coldest uight the exposed thermometer registered 11° of frost. The ground has now become cold, the temperature, both at 1 and 2 feet deep, being about 3° colder than is both at 1 and 2 feet deep, being about 3 colder than is seasonable. Rain or snow fell on all but one day, but to the total depth of only about \(\frac{1}{2}\) inch. On the morning of the 4th, the ground was covered with snow to the average depth of an inch—which Is a greater depth than any recorded during the previous three winter months. Each day some rain-water has come through both of the percolation gauges, but the amounts have been small. On the first day of the week the sun shope for two hours, but during the rest of the week results of the percolation gauges. have been small. On the first day of the week the sun shone for two hours, but during the rest of the week no sunshine at all was recorded. The winds were light, and came almost entirely from some point between north and east. The mean amount of moisture in the air at 3 o'clock in the afternoon was unusually large, being as much as 21 per cent. in excess of the March enterprise for that hour. E. M., Berkhamsted, March 8, 1994.

COVENT GARDEN FLOWER MARKET.

A WEEK of bad weather again put things back, and there were not nearly so many flowering plants in the market on Saturday, March 5, as in the previous week. Yet the supplies were more than equal to the demand. Yet the supplies were more than equal to the demand. Cyclamens continue plentiful. Erica Wilmoreana was better flowered than previously; E. persoluta alba is in good condition; E. gracills vernalis is very poor. On one stand I saw some small plants of E. hyemalis, they were well flowered and of fresh appearance. Spirea japonic is very plentiful, also Spirea astiboides floribunda, but this does not force well, and the plants seen were poor examples. Good Azaleas were not abundant, but there were plenty of second quality. Begonia Gloire de Lorraine is again coming in, but the not abundant, but there were plenty of second quality. Begonia Gloire de Lorraine is again coming in, but the colour is not very good. Cinerarias are good and of bright colours. Some good Lilies of the Valley in pots are still coming in, and they make high prices. Daffodls are good and plentiful, chiefly the varieties Van Zion and Golden Spur. Hyacinths are still over plentitul. There were not so many good Genistas. There were hardy Conifers and other evergreens in large quantities, and they are offered at very low prices. Hardy flower roots for spring and summer flowering are now to be seen on many stands. Prim-

flowering are now to be seen on many stands. Primroses in flower are abundant.

CUT FLOWERS,

Daffodils are still the most prominent feature of this market. Fair prices are made for those of the best quality, but many have to be cleared at a low price or left over. Tulips continue over plentiful, and growers must find a very small margin of profit at the prices many of them make. Red Roses are more abundant and the prices are a little lower. Flowers of the variety General Jacqueminot have made 5a, per dozen blooms and of Liberty 128, per dozen blooms and of Liberty 128, per dozen blooms. variety General Jacqueminot have made 5s, per dozen blooms, and of Liberty 12s, per dozen blooms, but these were a little lower on Saturday. Catherine Mermet is very good now, also Niphetos; Sunrise is very pretty, but the blooms are small. The Bride is very pretty, but the blooms are small. The Bride is very fine, and has a great advantage over Niphetos, because when cut with long stems the flowers stand up well. A few Maréchal Niels are seen. The imported blooms of Perle des Jardins are good, but nots o deep in colour as those home-grown. Good Carnations continue to be more plentiful. Good scarlet Pelargoniums (Geraniums) are plentiful. White Azalea is abundant, and sells slowly. Gardenias have suffered in price; Pancratiums and Eucharis are moderate. The supplies in the French market were shorter;

The supplies in the French market were shorter;

one' salesman who had over 6,000 packages the previous Saturday had only 1,500 on March 5. White Narcissus and Mimosa (Acacia) made double the prices they did in the previous week. A. H., March 5.

JAPANESE PRODUCTS AT THE SALE-ROOMS.

On the 2nd inst., at Messrs. Protheroe and Morris's Auction Rooms, large quantities of Davallia bullata Mariesi were sold, and from the prices made it is evident that the various grotesque designs made up of the rhizomes of this pretty Davallia are still very population. the rhizomes of this pretty Davalla are still very popular. There was a considerable difference in the quality of the various lots offered, some of the ordinary "ballabape" being very inferior in make. There were, however, many of this shape well made, and in splendid condition, and sold in large quantities, would average nearly 12s. per doz. The fancy designs, such as monkeys on bicycles, junks, houses, balloons, men on horses, boys with drums, birds. &c., were well "made up," and the rhizomes appeared in good condition. A case of these, containing 14s large and small designs, made £14 10s. 6d. In these large consignments there are always some of indifferent quality, and some that do not start well, therefore high prices must be made by the retailer of the best, to get anything like a profitable return for the investment. return for the investment.

The balls do not give much frouble to start them into growth, but with the fancy designs, unless they can be given a moist atmosphere, the slender parts do not hold enough moisture to keep the rhizomes fresh. They do not require so much heat, but a close damp atmosphere.

atmosphere.

Nearly a thousand cases of Japanese Lilies, a large proportion of which were L. auratum, were sold. There was a good attendance of buyers, but the sale was not quite so brisk as it was earlier in the season. Most of the samples shown were in flue condition, and many of them of great size. The highest pricas made by L. auratum was 103, per dozen, but medium-sized bulbs sold very cheaply. Some very fine hulbs of L. cordfolium giganteum sold at the rate of about 208, per dozen; L. macranthum platyphyllum a little over 128, per dozen; L. rubrum cruentum about 98, per dozen; L. speciosum Melpomene about the same price; L. auratum platyphyllum, extra large bulbs, about 138, per dozen. The L. speciosum rubrum and album sold fairly well at moderate prices; a few extra-sized rubrum would average nearly 68, per dozen, and a few albums went nearly as high, and smaller and a few albums went nearly as high, and smaller bulbs went at much lower rates. L tigrinum eplendens about 63, per dozen. L'lium Harrisi (from Bermuda) sold at about 30s, per 100 bulbs.

Gladiolus brenchleyensis made from 338 to 403, per 1000, and hybrids of G. gandavensis the same price. Excelsior Pearl Tuberoses sold at about 20s. per 1000. Berlin crowns of Lily of the Valley made about 31s. per 1000, and good clumps made 24s per 100. The Gladstone variety of Spirea (Hotea) japonica made from 16s to 20s. per 100.

An importation of Iris Kæmpferi was also sold, and coloured plales were shown illustrating the varieties. The buyers did not seem to be much influenced by the pictures, for the prices made for good clumps would only average about 6s. per dozen. An interesting collection of Japanese Maples was sold, but these were not in very good condition.

PALM SEEDS.

The best samples of Cocos Weddelliana made about 15s, per 1 00), but there were some sold considerably below this price. The best samples of Kentia Belmoreana made about 9s, per 1 000; Kentia Fosteriana, 5s, per 1 000; the small lots of Latania borbonica made 64. per 1,000, and in large quantities, 58. per 1,000. Geonoma gracilis, 208. per 1,000; and Cocosinsignis, 5s. per 1 000.

FRUITS AND VEGETABLES.

FRUITS AND VEGETABLES.

LIVERPOOL, March 9. — Wholesale Vegetable Market (North Hay).—The following are the averages of the current prices during the past week—prices varying according to supply:—Potatos, per cwt., Main Crop, 4s. 9d. to 5s. 3d.; Up-to-Date, 4s. 3d. to 4s. 9d.; Bruce, 4s. 6d. to 5s.; British Queen 4s. 3d. to 4s. 9d.; Turnips, 6d. to 8d. per dozen bunches; Swedes, 1s. 3d. to 1s. 4d. per cwt.; Carrots, 3s. 6d. to 4s. do.; Parsley, 9d. to 1s. per dozen bunches; Onions, foreign, 4s. 6d. to 5s. per bag; Cauliflowers, 2s. 6d. to 3s. per dozen; Cabbages, 6d. to 1s. do.; Celery, 8d. to 1s. 4d. do.—St. Johns: Potatos, 1s. to 1s. 2d. per peck; Cucumbers, 6d. to 1s. each; Grapes, English, 2s. to 2s. 6d. per 1b.; do., foreign, 8d. to 10d. do.; Pines, foreign, 3s. 6d. to 6s. each; Mushrooms, 1s. 6d. per 1b.—Birkenhead: Potatos, 1s. to 1s. 4d. per peck; Cucumbers, 8d. to 1s. each; Cobnuts, 8d. to 10d. per 1b.; Grapes, English, 2s. 6d. to 3s. 6d. per 1b.; do., foreign, 6d. to 8d. do.; Tomatos, foreign, 6d.; Mushrooms, French, 1s. to 1s. 4d. do.

SEEDS.

LONDON, March 8.—We have to report that the unfavourable weather still affects the demand for agricultural seeds, but prices of all varieties continue remarkably firm. Hurst & Son, 15), Houndsditch.

CORN.

AVERAGE PRICES of British Corn (per imperial qr.), for the week ending March 5, 1904, and for the corresponding period of 1993, together with the difference in the quotations. These figures are based on the Official Weekly Return:

Description.	1903.	1904.	Difference.
Wheat Barley Oats	s. d. 25 3 23 1 17 1	s. d. 28 8 22 6 16 5	8. d. + 3 5 - 0 7 - 0 8

ANSWERS TO CORRESPONDENTS.

Addresses of Seed Merchants in Britain: W. R., U. S. of America. The Horticultural Directory and Year Book, price 1s., published at 12, Mitre Court Chambers, Fleet Street, London; or the Garden Annual, price 1s., published at 17, Furnival Street, Holborn, London, will furnish the addresses you require.

ALLAMANDA; Ixora. The cause of the flower buds of Allamanda falling before they expand, must be sought in the house itself. 'All we can say is that it is the result of a check; but whether this check be from cold draughts, too much or too little water at the roots, or unsuitable temperatures in the house, cannot be determined here.

AMERICAN GARDENING PAPERS: A. American Florist, price to Europe 2 dollars per annum; address, American Florist Co., Chicago. Gardening, 2 dollars per annum; address, The Gardening Company, Monon Building, Chicago. American Gardening, subscription 2 dollars per annum; address, 136, Liberty Street, New York. The Florist's Review, subscription 2 dollars per annum; address, 201, West 135th Street, New York. The last is supplied to the trade only.

ARTIFICIAL COLOURING OF FLOWERS: Ignorance. Ask your chemist for any aniline dye, and put the stems into water in which a little of the dye is mixed. They will absorb the colour by means of suction.

BIRCH: G. H. G. Your tree is affected, as many Birch-trees are, by a very minute insect (Phytoptus), which sets up irritation, swelling, and production of numerous adventitious shoots. As a rule they do little harm beyond disfiguring the tree. Cut out the "burrs" and burn them.

BOOKS: W. G. Sweet Violets and Pansies, by E. T. Cook. Published at Country Life Office, Tavistock Street, Covent Garden, London.

CONTINENTAL HORTICULTURAL PAPERS: F. PAPERS: F. L. Revue Horticole, address, Rue Jacob 26, Paris; Gartenfora, Gebrüder Borntraeger, Dessauerstrasse 29, Berlin; Revue de l'Horticulture Belge, Digue de Brabant 3, à Gand, Brussels; American Gardening, 136, Liberty Street, New York. We do not think any of these publications could be purchased in London, unless ordered. You might try Messrs. Williams & Norgate, Henrietta Street, Covent Garden, London, who would supply them to order.

GARDENERS' WAGES: Head Working Gardener, J. P. The facts as you state them appear to be as follows: Your employer gave you permission to go to see a gentleman to whom you had applied for a situation, but told you at the same time that he should not give you your wages as usual. You went, and he stopped one day's money from your week's wages, notwithstanding that you attended to the fires in the morning and evening of the day you were absent. Remembering also that you have always to attend to the fires at night and on Sundays, we think the action of your employer was ungenerous.

GARDENIA BUDS DROPPING: A. W. doubtedly the result of a check to growth, but we cannot say the cause without knowing all the conditions. Are you using manures or manure water of a very strong nature?

GOLDEN PRIVET: J. M. Privet is one of the very easiest plants to propagate by cuttings, and the golden-leaved variety, though a little less easy

than the type, offers no difficulty. Take off cuttings about a foot or more long, cut back to a point below the leaf nodes, and remove a few of the lower leaves. Then plant them in rows under a north wall or in some shady corner.

IXORA DISEASE: E. C. T. The spots are due to a fungus called Septoria cruciata. Remove and burn all diseased leaves, and spray all the plants twice a week with a rose-red solution of permanganate of potash. It would be well to separate the diseased plants from those that are healthy.

Loofah: T. W. W. Luffa ægyptiaca, a kind of gourd. We do not know where you can get seeds. Try Vilmorin et Cie., Quai de la Mégisserie, Paris.

Names of Plants: Correspondents not answered in this issue are requested to be so good as to consult the following number.—A. F. A seedling variety of Clivia miniata.—Constant Reader. 1, Picea excelsa var. Clanbrassiliana; 2, Cupressus sempervirens; 3, Juniperus sp.; 4, Thuya gigantea; 5, Cupressus Lawsoniana; 6, Cupressus Goveniana.—A. B. R. Retinospora squarrosa.—H. J. P. 1, Cymbidium Lowianum; 2, Dendrobium suavissimum; 3, Cattleya Loddigesii; 4, Codiæum (Croton) interruptum; 5, Codiæum Johannis; 6, Begonia subpeltata.— Codiæum Johannis; 6, Begonia subpeltata.— C. E. F. Bristol. The smaller is Cypripedium Hookeræ; the other Cypripedium tonsum.— A. J. B. Not Cattleya Mossiæ but a very fine form of Cattleya Percivaliana.—Corres-pondent. No name. Spray of white Orchid Odontoglossum pulchellum.—J. J. D. 1 Sela-ginella Mertensii; 2, Blechnum occidentale; 3, Nephrolepis davallioides furcans; 4, Davallia cauariensis: 5. Nephrolepis tuberosa: 6. Adiancanariensis; 5, Nephrolepis tuberosa; 6, Adiantum cuneatum variety; 7, Polypodium pustulatum.—C. G. Surrey. It is impossible to name garden Codiæums. The characters even on the same plants vary considerably. The on the same plants vary considerably. The better way is to match the leaves with those on plants in some specialist's collection.—Old Tim. Billbergia species, probably B. Moreli.

PALM-HOUSE: G. H. G. You do not specify what your Palms are. Some are all but hardy, and require greenhouse temperature only; others require the temperature of a stove all the year.

PLANTS FORCED BY FIRE: J. C. M. As a rule we look with suspicion on statements made in the lay press, but there is nothing improbable in the circumstance you mention. Similar instances where a check of any kind results in the unfolding of flower-buds by anticipation are not uncommon. The second flowering of Horse-Chestnuts after a long drought is a case in point.

Sanseviera zeylanica: J. McC. This plant belongs to a genus which affords fibre for the making of hemp. The genus is included in the Natural Order Hæmodoraceæ. The plants are herbaceous perennials in tropical and South Africa, and East India. S. zeylanica is by no means a new plant, having been introduced to this country in 1731.

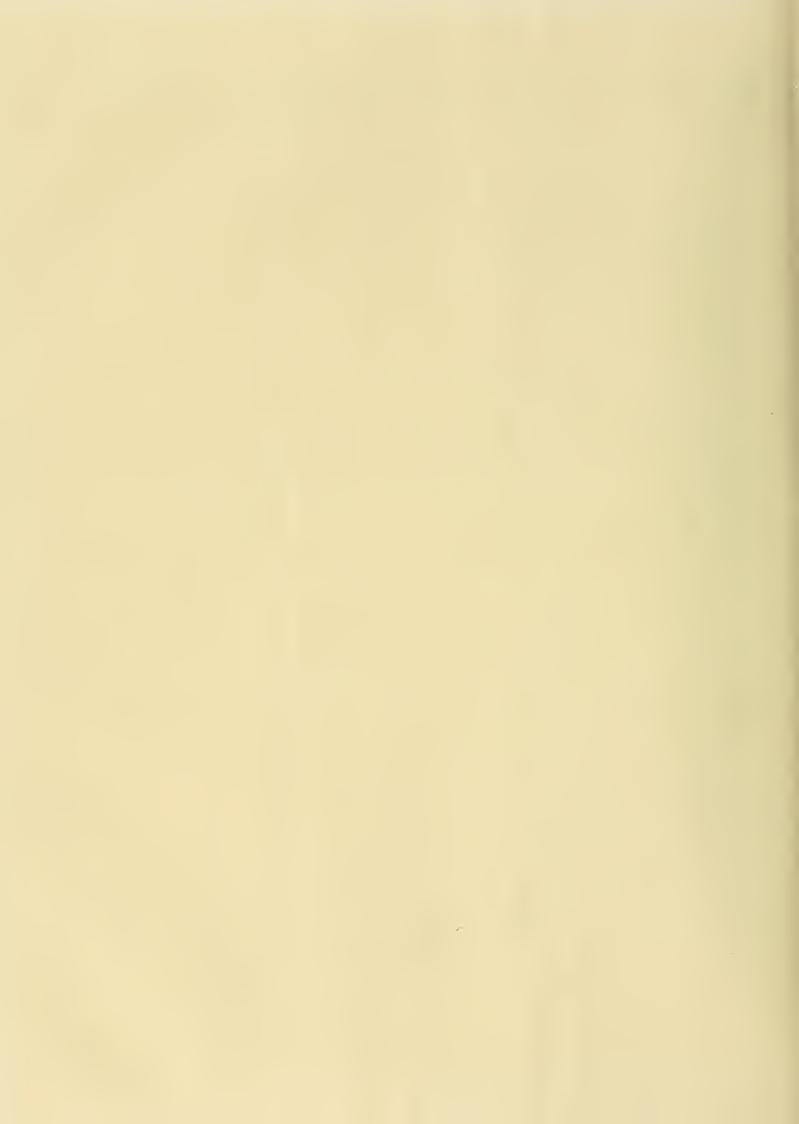

TEMPERATURES: Constant Reader. Several cases EMPERATURES: Constant Reader. Several cases of the thermometer falling to zero—32° of frost—occurred in 1879-80. You will find a very elaborate account by the Rev. G. Henslow in vol. viii. of the Journal of the Royal Horticultural Society. See also "The Report on the Meteorological Observations made at Chiswick between 1826-1869," by James Glaisher, Journal of the Royal Horticultural Society, ii., 1871. We think the record 40° below zero F. must be erroneous. When we do away with our silly erroneous. When we do away with our silly system and adopt the Centigrade plan such confusion will not arise.

VIOLETS: G. S. The plants are quite free from any fungus pest, and the unfavourable symptoms are undoubtedly due to some local conditions that can only be determined on the spot.

NEW ROSES.

Some of the finest Roses of recent origination have been raised at Newtownards and Waltham Cross. Though Mr. Wm. Paul is a veteran rosarian, his activities as a raiser still continue to be exercised, with splendid results. In this beneficent direction be is no doubt very materially assisted by his gifted and genial son. Mr. Arthur W. Paul, whose lecture on "Autumnal Roses," delivered in September, 1901, before the Royal Horticultural Society, was greatly admired.

Of Waltham Cross creations the latest and finest are Field Marshal, a distinct advance on the French crimson China Rose, Cramoisie Supérieure, being much deeper in colour and more perfect in formation; Corona, a greatly-improved White Lady (and this is saying much); Golden Queen, an exquisite climbing Noisette Rose, richer in colour than Rêve d'Or; Floribunda, Arethusa, and Elizabeth Kitto, of which the beautiful variety last mentioned somewhat resembles Madame Abel Chatenay.

Some valuable Roses have of late emanated from Mr. George Paul's famous nurseries at Cheshunt, where the production of single varieties has received much attention. Among the latest achievements of this eminent firm have been a new hybrid rugosa, entitled repens alba, and

Mrs. Allen Chandler, a pure white sport from Mrs. Paul, one of the grandest of Bourbon introductions.

Of the artistic merits of the varieties Mr. and Mrs. Ben Cant, given to the horticultural world by the great Colchester firm of Benjamin R. Cant & Sons, I need hardly say more than this: that they have won the Gold Medal of the National Rose Society. I am glad to have these Roses in my garden, for they perpetuate the memory of a great rosarian, from whom I received much kindness. I have given them, therefore, very conspicuous situations. Lady Roberts, a richer and more exquisitely beautiful Anna Olivier, was raised by Messrs. F. Cant & Co., another very eminent Colchester firm; while Mr. Cooling, of Bath, has given us Purity, Mr. A. Piper, Sunrise; and the Messrs. Veitch, of Chelsea, Queen Alexandra, essentially an effective pinkcoloured Crimson Rambler.

Among the most distinguished of recent introductions from Newtownards are the almost incomparable Mildred Grant, which its great raisers pardonably characterise as the finest variety that has ever been raised; and Alice Lindsell, both Gold Medallists, and without doubt magnificent creations, rivalling Frau Karl Druschki in splendour and renown, though they are not satinywhite, like that famous German Rose, but pale pink in complexion (Mildred Grant somewhat resembles Mr. Wm. Paul's Clio, but is of more splendid petal, and deeper hue); Ards Pillar, an extremely valuable crimson climber; Edith d'Ombrain, and Florence Pemberton. These far more than sustain the reputation of the raisers of Mrs. Sharman Crawford, Helen Keller, and Margaret Dickson.

England's Glory (Wood, 1902) is a Rose which I have not yet had an opportunity of seeing to great advantage, but I have it in my garden; and I can only hope that the anticipations of one of my friends, a son of the late Mr. Henry Bennet, regarding its capabilities and future achievements may be amply fulfilled.

What strikes me chiefly in reviewing those Roses of unquestionable merit which I have endeavoured, perhaps not very successfully, to characterise is the predominance of varieties of a delicate pink hue. These are no doubt, in most instances, highly effective; but there is a manifest danger of this special colour being far too much in evidence in our gardens and rosariums. A few more introductions of the types of Ards Pillar, Field Marshal, Ben Cant, and above all of that glorious variety Frau Karl Druschki (which I previously described as "a German Rose, of French extraction, with a Russian name"), would be of the greatest possible value for artistic effect. We require more crimsons of the velvety texture of Duke of Edinburgh, but stronger in petal and finer in formation; more yellows of the substance of Medea and Madame Hoste, but deeper in complexion; a hardier Maréchal Niel, less drooping and sensitive, suitable for open-air cultivation; a pure white Tea Rose, more obtrusive in its aspect and less pendulous in its habit than Souvenir de S. A. Prince; an improved William Allen Richardson, somewhat fuller in the centre than Madame Pierre Cochet, is also a possibility, and would be undoubtedly a great acquisition. David R. Williamson.

ORCHID NOTES AND GLEANINGS.

ORCHIDS AT GATTON PARK, REIGATE.

THE well-appointed blocks of Orchid-houses in the fine gardens of Jeremiah Colman, Esq. (gr. Mr. W. P. Bound) are devoted mainly to the raising and perfecting of good hybrid Orchids, and to the culture of exceptionally good forms of the showier species. So well has Mr. Bound succeeded that the outcome of his efforts compare favourably with these of any of the now large number of amateur establishments carried out on similar lines. "Increase and multiply" on the method so strongly set forth in the Gardeners' Chronicle some time ago, is a fixed principle at Gatton. First get a plant into good condition, and then remove the younger active leads from the inactive and unproductive old bulbs. This is the plan adopted with all fresh arrivals, and with the most remarkable success, for by this means even the species of the worst reputation as "bad doers" are overcome. One of the best examples of this kind at Gatton is the instance of a plant of Epidendrum (Diacrium) bicornutum, which no one has hitherto succeeded in growing well for any length of time, and which was bought some years ago in a very poor condition. It was brought round, and Mr. Bound removed the leading pseudo-bulbs and potted them up separately. They became vigorous, were again divided, and now there are ten fine specimens in splendid health and again about to flower. Another instance of what may be accomplished with freegrowing plants is given by the plant of Cypripedium insigne Sanderæ, bought by Mr. Colman in 1901, a small plant with seven leaves. It has been increased until now, when there are eleven plants having in the aggregate thirty-seven growths.

Increase by seeds seems to be still more prolific, for batches of Cattleyo-Lælia and Lælio-Cattleya crosses by the thousand now approaching flowering stage have been but a short time in hand, the best instance being given by a batch of L.-C. × Hippolyta, sown in March 1901, and among which some are already sending up flowers. A few of the points on which Mr. Bound bases his success worth noting. First, ordinary flower-pots instead of pans or baskets are used, the smaller pots having three holes under the rims for the suspending wires, and no other opening except the one at the bottom. Crocks in the pots are almost entirely dispensed with after the smallest pots (thumbs or small 60's) are passed, and from them a roomy shift is given. The compost used is ene-fifth leaves, and the other four-fifths of peat and sphagnum-moss, apportioned to suit the class of plants for which it is intended, the Cattleyas, &c., having the larger proportion of peat. For the rest a genial temperature with pure air but no cold currents, and cleanliness everywhere, even to the keeping good the paint, in which particular Mr. Bound thinks very highly of the new "Lubrose" paint, as its quality is always alike, and the injurious effect of the eld-fashioned

paints is not risked by using it. In addition to large quantities of showy hybrids in various stages of growth some very interesting crosses were noted. As the outcome of the fine culture of Epidendrum bicornutum before mentioned, are batches of several crosses with it-E. bicornutum × E. Ellisii, E. bicornutum × Brassavola grandiflora, and E. bicornutum × E. radicans were noted. Of the lastnamed cross were several sturdy plants of two distinct classes, the one having the growth and stem-rooting habit of E. radicans, and the other mere Cattleya-like in growth. Many crosses of interest have been made, such as Lælia x Lucasiana × Epidendrum ciliare, whose fimbriated labellum should give a distinct feature; Cattleya maxima crossed with Lælia anceps, Lælia Jongheana × L. anceps Dawsoni, L. Jongheana × L. flava, and a great number of others destined to give novelty rather than large flowers. Of this class a lot of Epidendrum × Boundii (radicans × Burtoni) has numerous heads of bright orange flowers, and as a winter flowerer it is decidedly acceptable.

Of the showy things all available good varieties for several years have been crossed and raised. Dendrobiums have been worked on considerably, and at present two or three of the houses have a fine show of them, and the process of weeding-out has been commenced.

Odontoglossums have given the most trouble, but they are now well in hand, for about 150 healthy little plants of good crosses are in evidence, and many more germinating. And still there are numerous new crosses of which the plants are yet but an inch high.

The process commences with the securing of good seed-capsules, a number of which are to be seen in the houses. The seeds are sown on an oval surface of gauze or "scrim" shading placed over moss, the cushion so formed being arranged about an inch below the level of the rims of the pots. The pots are placed in glass cases fitted inside the specially-constructed seedling-house, and the desired crop seems to follow with tolerable certainty, although the proportion of plants which reach the flowering stage is very small compared with the larger number which germinated.

In the specimen plant-houses the Odontoglossum-house is a pleasant sight with its fine, large-bulbed specimens, bearing in many cases very strong flower-spikes. Even the rare spotted forms grow with robust vigour, and Odontoglossum crispum Mary Colman, O. c. Colmani, O. c. Eleanor, O. c. Margery Tyrrel Giles, and other beauties which lately appeared at Gatton Park as small plants, now match the ordinary kinds in free-growing qualities. Oneidium macranthum and Odontoglossum Edwardii are very strong, and have stout spikes; O. superbiens, O. zebrinum, and other cool-house Oncidiums are equally good; and in flower suspended from the roof are many showy scarlet Sophronitis, wellbloomed Odontoglossum Rossii majus, Oncidium concolor, and other dwarf species. The section occupied by the Masdevallias has some in bloom, M. × Courtauldiana and the dark purple M. cucullata being very attractive.

In one of the Cattleya-houses C. Trianæ Courtauldiana was very beautiful, C. T. Russelliana, C. T. Mrs. Dorman, C. T. albida, and some others in bloom. In one corner were specimens of most of the white Cattleyas. In the larger Cattleya-house are the general collection of Lælias and Cattleyas with more of the Cattleya Trianæ in flower, those noted as specially vigorous or well-flowered being C. Trianæ Corningii, which this year is almost wholly white, while formerly it has had rose-colour on the lip; C. T. Mr. J. Colman, a fine dark form.

In the Nepenthes-house, where a very fine show of Pitcher-plants adorn the roof, Phaius × Norman, P. × Cooksoni, Vanda Cathcarti, and Acineta Humboldti, are in bloom. In another division are a good collection of Sobralias, some hybrids of which have been raised; a fine lot of Cymbidiums, the specimens of C. grandiflora and others being still in bloom.

In a span-house the collection of Lælia anceps are suspended from the roof, a batch of Miltonia vexillaria, Lælia flava, and other dwarf Lælias being in bloom on the stages. In another house one side was filled with examples of Cattleya labiata, which are said to have given six hundred fully expanded flowers at one time, and in other houses good Dendrobium Wardianum and D. crassinode album and many other pretty Dendrobes in flower were remarked, and throughout evidence of the best possible culture.

SOILS AND MANURES FOR SPECIAL CROPS.

THE growing of crops under glass has come to be a more or less highly specialised business. In fact, the work is more than a business-it has become an art as well. Messrs. A. F. Woods and R. E. B. McKenney, of the Bureau of Plant Industry, Washington, U.S., and others, are devoting their best energies to the production of plants reaching nearer and nearer to the highest standards. To get an idea of how successful these workers have been one needs only to bring to mind some of the wonderful creations among Roses, Carnations, and Chrysanthemums. But, after a plant has been produced with ideal possibilities, it will reach its best and hold its own only with the most intelligent care. A plant is much more than a delicately balanced machine; it is a sensitive living being, with its likes and dislikes and individual peculiarities. Thus, Messrs. Woods and McKenney say, the successful grower must learn to interpret the plant's silent language and to meet its varying wants, moulding it to his ideal, or perhaps to other people's ideals, according to the demands of the

The authors say that, among all the questions to be dealt with, there is no one more important than plant-feeding. What to feed, when to feed, and how to feed, are questions often asked; and we have to depend for answer upon the experience of expert growers and experimenters. While there is a very great deal yet to be learned by careful experiment in this field, a concise statement of the general practice in feeding or manuring certain crops may not be without interest and value. The questions of temperature, watering, and ventilation are extremely important in connection with plant feeding, but they cannot be discussed on this occasion.

It may be stated at the commencement that plants cannot be grown by rule; experience and individual experimenting by the gardener himself along conservative lines are necessary to success in the culture of any crop. In the present article attention will be directed especially to crops forced under glass, including Roses, Carnations, Chrysanthemums, Violets, Tomatos, and Lettuce.

THE ROSE.

The following table shows the amount of the most important chemical constituents in the various parts of the Rose-tree and also in the flowers. The nitrogen is given in the dry substance, that is in the portions of plant from which all the water has been driven off by artificial drying. The portions of plant having been fully dried are burnt to ash, so as to drive off all the organic constituents, which the plant obtains mostly from the air; there then remains the ashes, which, on analyses, show the amount of constituents which the plant obtains from the soil. These are given in parts per hundred.

CHEMICAL CONSTITUENTS OF THE ROSE.

Constituents.	In the Roots.	In the Stems.	In the Leaves	In the Flowers.	
	per cent.	per cent.	per cent	per cent.	
Potash	14.37	15.61	37.68	47 39	
Lime	41 26	51 60	11 29	10.25	
Phosphoricacid	28.16	11 21	12 13	29:43	
Iron oxide	2 13	2:31	4 29	0.86	
Nitrogen in dry substance	9 31	15 26	23.29	26 31	

We see from the above data that while potash is much the larger constituent in the construction of the leaves and flowers, which are the maturing organs of the plants, lime is greatly predominant in the roots and stems, the structural portions of the plant, because this element aids the convergence.

sion of available organic substance into "building material."

It is somewhat remarkable that the Rose flowers should contain such a large proportion of phosphoric acid in their ashes and of nitrogen in their dry substance, but there is reason to believe that the element phosphorus plays a very important part in the production of nitrogenous proteids.

Iron is in the largest percentage in the leaves, and it is known that this element is very necessary for the formation of the green colouring matter known as chlorophyll.

SOIL FOR ROSES.

A great variety of soils can be successfully used for forcing Roses, but a moderately heavy loam from rotted turf-sods is generally recommended. The lighter types of soil are most. favourable for such varieties as La France, Perle des Jardins, Duchess of Albany, and Niphetos; while a good stiff loamy soil is required for Brides, Mermets, Madame Hoste, Gontier, and Souvenir de Wootton. If the right type of soil cannot be found, light and heavy soils can be mixed to secure a soil of the desired texture. Assuming, however, that the proper sod-loam can be obtained, cut the sods in the autumn, and compost with cow or horse-manure, using one part of manure to three parts of soil. Turn and mix the heap two or three times during the winter, breaking up all lumps, and getting into good, even condition. At the last turning, which should be made several weeks before the compost is to be used, add 10 to 15 lb. of fine-ground bone, free from common salt, to each cubic yard of compost. This should be thoroughly mixed. Fine-ground steamed bone is best for greenhouse use, as it decays more quickly than raw bone, and its phosphoric acid thus becomes available earlier. If raw, coarse bone is used, only a small part of the phosphoric acid becomes available during the first season, but the nitrogen content of the bone-manure is a little higher.

It is also safe and desirable in the case of Roses to add to the bone manure some form of potash, especially in the lighter classes of soil We see from the foregoing analyses that potash bears a very important relation to the formation and to the storing up of the other chemical constituents in the plant.

About 1 lb. of sulphate of potash or 6 quarts of pure wood-ashes to the cubic yard, applied with the ground-bone, will be sufficient for the compost, which must not be too rich to start with, or the roots of the young plants will be injured. After the Rose-trees get a good start, and the soil is filled with fibrous roots, additional food will be required. The compost prepared as stated is adapted for plants from 3-inch or 4-incb pots.

The potting-soil used for the plants up to the time they are ready for the beds should be very thoroughly rotted sod-soil, as described above, mixed with one-sixth to one-eighth thoroughly rotted cow-manure or horse-manure, but with no bone or so-called chemical fertilisers.

SOIL STERILISATION.

It is considered best, if possible, to sterilise the potting-soil with steam from a high-pressure boiler. This will destroy the plant and animal parasites likely to injure the young plants, so that they will usually be able to take care of themselves when set from the pots to the beds.

Some of the most successful growers also sterilise their compost-soil for the beds. If this is properly done it destroys all nematodes (eel-worms), grubs, and all plant and animal parasites likely to attack the roots, as well as all weed seeds. In large establishments, at least, it will certainly pay to sterilise all soil used, especially where nematodes or other root parasites occur.

The usual method of sterilisation for greenhouse use is to build a large bin, about 4 fee wide by 10 or 15 feet long, and 3 feet deep, cunning pipes through the bottom of the bin (or through the bin a foot from the bottom) a foot apart lengthwise. In a 4 foot bin there would be three pipes, with one-sixteenth-inch holes drilled in them on the under side, about 1 foot apart. Fill the bin loosely with soil; turn in steam of about 80 pounds' pressure; put a few Potatos in the top of the soil, an inch or so under the surface, then cover the surface with tight boards or cloth, in order to prevent escape of the steam. Usually one or two hours under good pressure, if the soil is not too heavy, will cook the Potatos in the top of the soil; then one may be sure that the parasites and weed seeds have been destroyed. If high-pressure steam is used the soil will dry rapidly after the steam is turned off, and can be shovelled out of the bin without much difficulty, especially if one side of the bin is removable.

In sterilising soil without the use of a bin, the same process is used. The pipes are laid in the ground to be sterilised in a similar manner as in the bin. If it is desired to sterilise a foot of soil, the pipes should be placed under the soil about a foot, with the drill-holes on the under side; the surface should then be covered with boards, or something to prevent the escape of the steam, and the soil should, of course, first be loosened, so that the steam can circulate through it.

A few Potatos distributed over the area will tell when the sterilisation has become complete. After the sterilisation the pipes can be removed. It is a good plan before sterilising to mix in the farmyard or stable manure that is to be used, as this often contains numerous weed seeds. If artificial manures are used, of course it is not necessary to add them first.

Any small high-pressure boiler will serve to make the steam. Some use a small independent boiler for the purpose, others attach the apparatus to their high-pressure boiler. A low-pressure boiler is usually unsatisfactory, as it takes a longer time to circulate the steam, it leaves the soil wet and soggy, and does not do the work very well.

Soil sterilisation is rapidly coming into favour for all intensive work where the process is practicable. J. J. Willis, Harpenden.

(To be continued.)

THE PINES OF CUBA.

The Cuban Pines are confined to the two extremities of the island. They are found in the eastern province of Santiago, and in the western province of Pinar del Rio, and the neighbouring Isle of Pines. The two sections are separated by a pineless interval of about 350 miles. The specimens of Pinus in the Gray Herbarium, brought from Cuba by Charles Wright, represent actually three distinct species, although all are dabelled P. cubensis, Grisebach. Those collected by Wright before the year 1860, and some of them after that date, are native to the eastern end of the island. They are included under the Nos. 598, 3190, and a part of No. 1462. They all belong to a single species.

P. Wrightii.—This Pine has two (rarely three) slender leaves, about 6 inches long, and a subterminal young cone (beeoming reflexed at maturity) whose scales terminate in a distinct spine, so frail, however, that it usually does not persist on the ripe cone. The leaf section shows abundant marginal strengthening cells, detached from the epidermis, and similar cells with the two fibrovascular bundles. Usually there are two characteristic large resin ducts against the angles of the centre.

Specimens collected by Hamilton at Guama, on the south coast near the city of Santiago, and those collected by Underwood and Earle at Baracoa on the north-east coast, correspond in all particulars with Wright's specimens from the interior of the same province. No species of Pine other than this one has been found in eastern Cuba, nor has this Pine been collected at the western end of the island. This is the species these species, and No. 1462 (unfortunately used also for the eastern species) one of them.

P. terthrocarpa.—Of these western Pines one is P. terthrocarpa, Shaw, a Pine with two (rarely three) stout leaves 6 to 9 inches long, and a subterminal spineless cone. The leaf-section shows

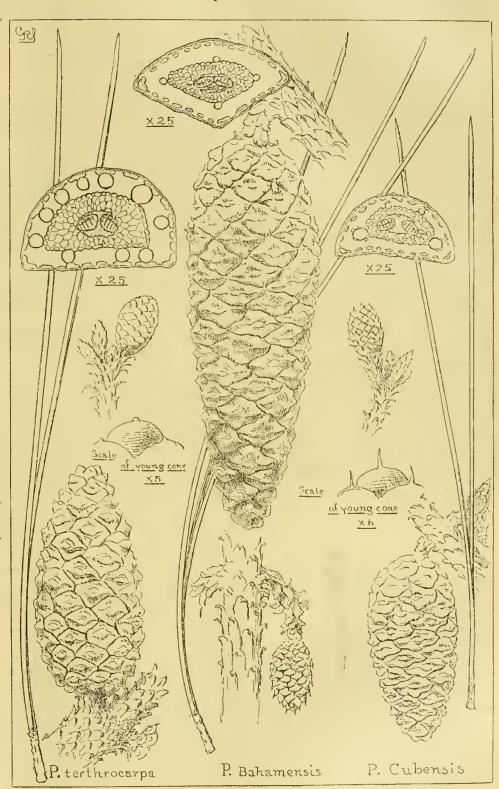

FIG. 74.- THE PINES OF CUBA

that Engelmann named P. Wrightii on Wright's Nos. 3190 and 1462 (in part). His mistake in supposing the cone to be lateral was due in all probability to imperfect material.

During the period from 1860 to 1864 Wright also visited Pinar del Rio, the extreme western province; and the result, in Pine specimens, was two other species. No. 3189 includes both of

strengthening cells close against the epidermis and with the two wood bundles. It is chiefly remarkable for the extraordinary size of the resin ducts. This Pine has been recently collected on the Isle of Pines and in Pinar del Rio, but has not been found in eastern Cuba.

P. bahamensis.—The other specimen of No. 3189, and the western specimen of No. 1462, belong to

the species variously known as P. heterophylla, Sdwth.; P. Elliotti, Engel.; P. bahamensis, Griseb., and often considered identical with P. cubensis, Griseb.

In Cuba this Pine usually has three leaves 8 to 10 inches long, and a leaf-sectio like that of P. palustris, Mill. Its most characteristic peculiarity lies in the long-stalked, reflexed, lateral young cone. It has never been found in castern Cuba, but is abundant on the Isle of Pines.

Grischach's original description of P. cubensis (1862) is founded on Wright's Nos. 598 and 1462. His later description (1866), where for the first time he mentions its position, specifies a latera cone, and cites Wright's Nos. 598 and 1462b., evidently confusing the two species. The name "cubensis" belongs properly to the eastern Pine with a subterminal cone, for it is very clear that Grisebach in his first description had the eastern species only in hand, and that description perfeetly describes the Santiago Pine.

The name of the western species, with the lateral cone, needs further consideration. Sudworth calls it heterophylla, basing his name on Elliott's P. taeda var. heterophylla in Sk., 11., 636 (1824). This description of Elliott specifies the staminate flowers as "yellow tinged more or less with violet," appearing in "early April." This is not our Cuban Pine, whose very striking rose-purple flowers open in late January or in early February. On the other hand, he describes the bark "as smooth as that of palustris," and the leaves "by twos and threes indiscriminately mingled," which are characters applicable to the Cuban Pine. The two species, P. taeda and this Cuban Pine, are found together in the locality of Elliott's variety, and inasmuch as the existence of the Cuban Pine was not at that time suspected, it is very probable that Elliott confused the two. In any event, his description, in important particulars, cannot be applied correctly to our species, and in that connection at least should be abandoned. The name cubensis being no longer available, P. bahamensis, Griseb. (1864), takes the precedence of P. Elliotti, Engel. (1880). The three Cuban Pines may therefore be arranged as follows :-

Cones subterminal, leaves in twos, rarely in threes.

Young cone armed, becoming reflexed, leaves slender.

- 1. Pinus cubensis, Grisebach, Mem. Amer. Acad., viii., 530 (1862). P. Wrightii, Engel., Trans. Sl. Louis
 - Acad., iv., 185 (1880).
- Young cone unarmed, remaining erect, leaves stout.
- 2. Pinus terthrocarpa, Shaw, in Sarg. Trees
 - and Shrubs, i., 149 (1903). P. cubensis var. terthrocarpa, Wright,
 - in Grisch, Cal. Pl. Cub., 217 (1866).
 - P. cubensis var. anomala, Rowlee, Bull. Torr. Club, xxx., 108 (1903), in part.

Cones lateral, reflexed, leaves in threes.

- 3. Pinus bahamensis, Grisebach, Fl. Br. W. Ind., 503 (1864).
 - P. occidentalis, Rich., Fl. Cub., iii., 233 (not Swarz), (1853); Griseb., Cat. Pl. Cub., 217 (1866).
 - P. cubensis, Griseb., Cat. Pl. Cub., 217, in part (1866). P. Ellietti, Engel., Trans. St. Louis
 - Acad , iv., 186 (1880).
 - P. heterophylla, Sudworth, Bull. Torr. Bot. Club, xx., 45 (1893); Sargent, N. A. Silva, xi., 157 (1897).
 - P. recurvata, Rowlee, Bull. Torr. Bot. Club, xxx., 107 (1903).
 - P. cubensis var. anomala, Rowlee, Bull. Torr. Bot. Club, xxx., 107, in part (1903).

The goographical position of these Pines now becomes consistent. P. cubensis lies in close touch with its nearest relative, P. occidentalis, south-west of Hayti, while P. bahamensis is in direct line with the trend of its namesakes of Florida, the Bahamas, and British Honduras. P. terthrocarpa seems to be a Pine of a very restricted area. George Russell Shaw, Arnold Arboretum, February 7, 1904.

BOOK NOTICE.

A MONOGRAPH OF THE COCCIDÆ OF THE BRITISH ISLES, Vol. II. (Robert Newstead), 8vo., pp. viii. +270, pl. 42 (1903). Price 25s. (Ray Society).

THE second volume of this work rivals the first in excellence. The descriptions of the whole of the known British Coccide are completed by its appearance. Mr. Newstead records eighty-eight species and four varieties; of these fifty-one species and two varieties are only found under glass. There is no doubt that these hothouse scale-insects have been introduced into this country, some more than fifty years ago, others during the last few years. There is every possibility of many more making their appearance.

These importations should be guarded against, as we can never foretell how an introduced scaleinsect may behave.

The groups of scale insects so ably dealt with in this volume are the Conchaspine, Lecaniine, Hemicocinæ, Dactylopiinæ, Coccinæ, Ortheziinæ, and Monophlebine.

A very careful and full account is given of all the British species found in the second group, which contains several very important plant posts. Several genera of Lecaniinæ occur in this country, but some of these infest only Grasses. Carex, Luzula, and other wild plants, and are thus of little economic importance. Now and again Lichtensia viburni occurs in great abundance on Ivy. The strange yet beautiful Ceroplastes eistudiformis (Townsend) is recorded on an Orchid, Chrysis bractescens, at Tring Park, and a strange star-like scale (Vinsonia stellifera) on Cypripediums. The Vine Scale (Pulvinaria vitis) occurs under glass on Vines and Peaches; whilst out-of-doors it attacks Alder, Birch, Hawthorn and Willow.

Mr. Newstead deals with the White Woolly Currant Scale, the Pulvinaria ribesiae of Signoret, as only a variety of P. vitis. This is a pity, as it has always been known as P. ribesiæ. I do not think we have any record of the Currant form attacking the Vine, or vice versa, and there is a great difference in size; one cannot help thinking that they are in some way specifically distinct. Except for this unfortunate alteration, the account given here of this pest is all that can be The other and more abundant Current Scale the Brown Current Scale (Lecanium ribis of Fitch) has also been abolished as a distinct species, and is described in the body of the work as L. persicæ var. coryli, Linn.; but in the appendix as var. sarothamni, Douglas. All these changes and synonyms make one feel very much inclined to speak of our "insect-pests" only by means of their popular names. The Brown Currant-Scale is the Brown Currant-Scale, but it has had no less than five scientific designations given to it, and even now no one seems agreed as to its right name. I doubt if it is wise to heed these changes of nomenclature when dealing with wellknown pests. The account of these Current Scales is followed by that of another Lecanium well known to Fern growers. The Fern Scale (Lecanium hemisphæricum) is a most prolific species; but, says Mr. Newstead, "it never gains headway on well-kept plants, as being a large

species it is easily seen on Ferns, and quickly removed with the fingers.'

The British Dactylopine are grouped in nine genera, the most injurious being the mealy-bugs (Dactylopius) and the Beech-louse or Felted Beech-coccus (Cryptococcus fagi). The females in this section are either active or sedentary, and may be naked, but most are either covered with a mealy coat, or with waxy, horny, or glassy covering; the female ovisacs are usually formed of loose, white flocculent matter. Mr. Newstead describes no fewer than five mealy-bugs. Two only occur under glass, the Dactylopius citri and D. longispinus; the three others are described for the first time, and occur on coarse grasses. An account of the destructive Felted Beechcoccus (C. fagi) runs to six pages, and is quite the best account yet written of this pest; but Mr. Newstead is surely wrong in saying spraying has not any effect on it. It may easily be cleared from a tree by caustic alkali wash in winter, and a few good sprayings of parassia emulsion in spring.

Another genus fully entered into is Orthezia (Bose), the adult females of which are more or less covered with plates or lamellæ of waxy secretion, those at the posterior end of the body forming an ovisac. The winged males have the abdomen furnished with a pencil of long filaments. The Orthezinæ are the prettiest of all scales, due to the wonderfully symmetrical arrangement of numerous glistening white, waxy plates, which partly or wholly cover the body; these females are always active, and carry their young or eggs in the ovisac. The genus Newsteadin is closely allied to Orthezia, but is of little economic importance, as the single species is a grass and moss feeder. The so-called Latana Bug of Ceylon, Orthezia insignis (Douglas) is a well-known insect in many greenhouses. strange scale insect is spreading in hothouses very rapidly, and is certainly very harmful. The adult female is dark bottle-green, short and oval, surrounded, except the head, by a marginal series of snow-white laterally connected lamelle, the posterior ones being directed backwards and downwards; behind projects the white ovisac. which reaches, when mature, four times the length of the body. The long legs project freely, and so do the antennæ, both reddish-brown in colour.

The body of the text closes with a short account of the Egyptian Cushion Scale, Icerya ægyptiacum (Douglas). Most people have heard of the enormous damage done in America by the Iceryapurchasi, an introduced Australian species. Orange and Lemon are equally destroyed by it in the Cape, and in Auckland whole orchards have been devastated. In Egypt an allied species occurs, which Mr. Newstead describes, and tells us that it has occurred in Britain on a freshly imported plant at New Gardens, which was promptly destroyed. As this pest has caused endless harm in Egypt, it behoves us to follow at once Kew's example, and burn any infested plant right away. This scale insect can at once be told by the great exudation of white waxy and cottony matter, with a fringe of large tapering white processes all round.

At the end of this work is a very valuable adjunct to such publications, "A Glossary of Terms," by means of which the technical descriptions of the various species become at once intelligible to non-entomological readers.

The work is illustrated by forty-one plates ef great beauty, the scales and the insects coloured, and many outline drawings of various characteristic structures, by which alone we can separate and identify certain allied species, are given.

The work will prove of great value to all interested in plant cultivation, and especially to those who have the care of hothouses, Fred. F. Theobald.

ALPINE GARDEN.

SHORTIA GALACIFOLIA VAR. ROSEA.

This plant was shown lately at the Drill IIall by Mesars. Cutbush & Sons. While some will think that the purity of the typical kind can hardly be excelled, this variety will be a charming companion to it. The colour will probably be deeper when seen in full exposure. The flowers, too, will increase in size when the plants are more established, even as the old kind has so vastly improved in the past few seasons. Fortunately the cultural requirements of the Shortia are well understood.

Anemone (Hepatica) angulosa alba.

This fine plant, shown recently by Mesars. Barr & Sons, while not absolutely white, is quite a near approach to it. The large florin-sized blossoms are a distinct gain in these plants, and the variety alba would appear to be of larger size than the well-known form. These Hepaticas, as they are still called, are popular with all, and the charming array of colour they represent, together with their simple cultural requirements, justify this appreciation. E. J.

SAXIFRAGA BURSERIANA MAJOR.

The fine examples of the above plant brought by Mr. Jas. Douglas to the Drill Hall recently were splendid specimens. The larger plant had probably 100 fine flowers. I did not count them, but having a plant of my own in flower with some seven dozen blossoms, I could readily see how much greater was the mass of bloom in Mr. Donglas's plants. The rosettes of this variety major are larger and bolder, the plant more pronouncedly silvered or encrusted, and the flowers larger than those of the type. A greater distinction, which is also a decided attraction, is the rich crimson foot-stalks, that render it distinct from the very first appearance of the buds, the latter being of the same fine colour. I allude to this marked characteristic specially, inasmuch as there exists another so-called major, which is obviously a slight enlargement of the typical kind—a much varied plant. The variety shown by Mr. Douglas I call "major" true, and it flowers several days earlier than all the others. I get the best results by growing the plant in rich loam, sand, and old mortar, with the fullest exposure at all times, and unplunged. The plants require an abundance of moisture in summer. E. Jenkins, Hampton Hill.

CACTI IN ARIZONA.

WE are indebted to the Curator of the Royal Gardens, Kew, for permission to use the accompanying illustrations (figs. 75, 76). One shows some plants of Echinocaetus Wielizeni as growing in the mountains of Arizona, a dry, hot, stony region near the borders of Mexico. The size of the plant can be estimated by the portrait of the collector, Dr. R. E. Kunze. In the background is a plant presumably of Cereus giganteus.

The other view, fig. 76, is taken in the garden of Dr. R. E. Kunze at Phenix, Arizona. In the foreground is a plant of the Barrel Cactus, Echinocactus Emoryi, estimated to weigh 300 lbs., and having a height of $3\frac{1}{2}$ feet. The spines are 5 inches long.

In connection with these illustrations we may call attention to a publication which has reached us from the Carnegie Institution at Washington, and which gives some account of the Desert Botanical Laboratory at Tucson, Arizona. This institution has been inaugurated by Dr. Common, of the New York Botanical Garden, under the auspices and direction of Messrs. Coville and MacDougal, who had previously visited the region on several occasions, and who made a special journey for the purpose of finding a suitable site for the laboratory.

FIG. 75.—ECHINOCACTUS WISLIZENI GROWING WILD IN ARIZONA.

The details of their journey are given in the publication above referred to, and are of a very interesting character. They are illustrated with a series of photographic reproductions, which give a vivid idea of the sand-danes, the rocks and other features of the scenery, as well as of the curious plants which by their structure and conformation are adapted to live under what would seem to be ungenial conditions. The laboratory has been established for the purpose of studying thoroughly the relation of plants to an arid climate and to substrata of unusual composition. Special studies have already been made at various stations of the

relations of plants to alkaline soils, and of the effects of irrigation. The immediate purpose of these investigations was to obtain information for the use of the horticulturist and agriculturist. At the laboratory now erected a wider outlook will be taken, and the investigation is expected to produce results concerning "the fundamental processes of protoplasm as important as any in the whole realm of Botany." The laboratory will be available for the use of students under suitable regulations. A journey of four or five days from Washington suffices to bring the visitor to the desert regions of Texas and Arizona.

FIG. 76.—ECHINOCACTUS EMORYI, 31 FEET IN HEIGHT, FROM A GARDEN IN ARIZONA.

OBSERVATIONS ON THE VEGETA-TION IN AN EQUATORIAL AFRICAN GARDEN.

(Concluded from p. 166.)

ALTHOUGH grasses are frequently both dangerous and unpleasant in Central Africa, even the most casual observer must be struck with the beauty of some species. A dwarf grass, forming little colonies, is quite common, which in the flowering period makes delightful patches of colour; the soft silky plumes seem of every tint from silverywhite to a deep rose-pink, and it maintains the display for several weeks. There are other sorts, tall and dwarf, with the inflorescence arranged in loose, graceful panicles of many pleasing tones. A charmingly decorative grass bears a dense silky plume of a peculiar brown tint. The flower-stem is from 5 to 6 feet high, and when cut for house decoration, the colour is retained for a considerable time. A perennial grass-like plant with a rigid, npright growth like an Irid, about 3 feet high, having broad, strong leaves, bears white downy plumes. It converts acres of ground into a mass of waving white. It is very common and is unexcelled for thatching purposes owing to the tough, durable nature of its leaves. It takes complete possession of land where it grows, and to exterminate it is almost hopeless. The matted mass of roots and tough root-stocks defy the native hoe.

The note of quaintness in the vegetation is furnished by the peculiar leguminous aquatic tree, Herminiera, and by the huge Ficuses enveloping other large trees. Herminiera Elaphroxylou is a monotypic genus found alongside some lakes and rivers in tropical Central Africa. It occupies a position in the order close to Æschynomene-a genus which is of some economic value in the eastern tropics, its pith being extensively used in manufacturing such things as helmets, &c. Herminiera seems to be a purely aquatic tree, as the writer has only observed it either in extremely swampy ground or just in the water, and most frequently in the latter position, where it forms dense groves. It will be remembered that outside the Mangrove family, trees of an aquatic habit are not numerous. In open positions the Herminiera forms a somewhat spreading tree about 20 to 25 feet high. The branches are copiously armed with short, sharp spines, and the foliage is sparse, like some Acacias. The flowers, usually produced singly, are of a fine orangeyellow colour, the standard being from 11 to 2 inches wide. The trunk has a swollen appearance, often attaining a considerable diameter below, tapering upwards, and is covered with a thin, dull-grey bark. The wood is extremely light and soft, so light indeed that a man can with little difficulty carry an almost entire large trunk. Some of the Nile-country natives use the wood as a float to assist them in crossing the river, and by others, according to Schweinfurth ("Heart of Africa") a peculiar light raft is made of bundles of the wattles, which they carry about like huge shields! But when allowed to remain in the water the bucyancy soon departs from the wood. The growth is extremely rapid, and it might well be called a weed amongst trees.

The remarkable manner in which members of the genus Ficus take possession of the trunks of other arboreal vegetation, enfolding them completely with growth, and in some instances gradually killing them out, is a feature frequently met with in the tropics of the eastern and western hemispheres. The Figs attain the proportions of gigantic trees in this way—if not in stem girth (and often in this), at least in branch spread. An instance occurred where the stem of a Phœnix Palm enveloped was probably 30 feet in height, and where the Fig commenced to give off its main branches

at a height of about 20 feet from the ground. In another example existing in the garden the Phoenix was in quite a flourishing condition, although at first sight it seemed to be growing from the centre of a huge, wide-spreading Ficus. The process of growth and trunk formation is very interesting. The seedling Ficus may begin life in a fork or other suitable part of the host-tree. The slight amount of debris that accumulates there, coupled with ahundant moisture, affords sufficient nourishment for the time during which the seedling is sending a number of delicate roots along the crevices of the bark towards the soil. Once that is reached, root-growth becomes extremely rapid, and the young plant appears to concentrate its energies on root-production, for soon almost the entire surface of the host-trunk becomes covered with delicate, pink-coloured roots about the size of small string. As growth develops these roots coalesce, forming a complete mass of tissue that looks in the early stage like a thick bark on the host.

It is odd what a prederence the Ficus shows for the Phænix Palm; but of course other trees carry their fig burden also. The genus is represented in great numbers and wide diversity of form in the lake-country vegetation. The prepared bark of several species clothes thousands of people with a garb like finely-tanned leather and of a rich brown colour. It is not the case that every Ficus begins life as an epiphyte, for many seedlings and saplings are found in the soil flourishing in the normal way. It will be recalled by those interested in the subject that in the case of the celebrated Assam Rubber-tree (Ficus elastica) advantage has been taken of this epiphytic propensity in establishing plantatations. M.

The Week's Work.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, gr., Wrotham Park, Barnet.

Peach and Nectarine Trees .- The flower buds on Peach and Nectarine-trees are now moving, and it is therefore very important to complete any pruning that remains to be done, otherwise many of the buds may be damaged when carrying out the work. Allow the young fruiting shoots ample room, so that the shoots that will be made in the coming season may also have sufficient space to grow properly. As soon as the pruning has been done, syringe the trees with an insecticide, but the more forward the buds are the weaker should be the solution used for syringing. Any of the trees likely to need increased nourishment may be afforded a good dressing of bone-meal, which should be pricked in over and about the roots after a little of the old surface-soil has been removed. If the land is of a heavy and alone returns some land is of a heavy and close nature, some burnt earth or old brick mortar may be advantageously employed. In some seasons, and where the soil is light and porous, a mulching of manure early in the season will be helpful; but as the land this year is at present so excessively wet, it will be better to defer top-dressing or mulching with manure for a time Young and newly planted trees may now be trained. If the young shoots are long and unripe, shorten them. Although some gardeners do not recommend the pruning of young trees, I generally use the knife with care until I have made sure of a good foundation of young shoots to form an evenly balanced tree. Before finally securing the young shoots to the walls or wires, tread the soil well over about the roots to prevent any further sinking. Allow plenty of room in the ties, and examine these at intervals, loosening them or replacing them when occasion requires.

Protection of the Blossoms.—In some seasons it may not be necessary to protect the flowers, but after last year's experience it is better to be on the safe side. Let everything be got in readiness for the moment when protection may be necessary. Apricots are usually the first to flower, and unprotected flowers are certain to be injured in the

event of severe weather. There are various methods by which protection may be employed. Trees on walls having glass coping need only have two or three thicknesses of fish-netting hung in front of them, reaching from the coping half-way to the ground, being kept at a reasonable distance from the trees by poles driven into the ground. A very satisfactory method of protecting the flowers is by the use of blinds. These were used at Longford Castle many years ago, and during the three years that I was foreman in those gardens very heavy crops each year were produced. Mr. H. W. Ward has frequently recommended the use of blinds in the Gardeners' Chronicle. Other means may be employed, such as Spruce-boughs, canvas, &c. The flowers need all the light and sun possible, therefore the protection should only be employed during frosty nights and cold biting winds, &c. The protection of the Peach-flowers by the use of blinds is fully described in a capital book on the Peach by Mr. Ward, in which he gives the details as to fixing, &c., and the cultivation of Peach-trees generally.

THE ORCHID HOUSES.

By W. H. WHITE Orchid Grower to Sir Trevon LAWRENCE, Bart., Burford, Dorking.

Cattleya Triana.—There are few Orchids at this season more useful than Cattleya Trianæ and its numerous varieties. As soon as the plants have passed out of flower, the young growths will start away, and from their base numerous new roots make their appearance. Before these young roots begin to grow, re-pot any of the plants that require more pot room or fresh material to root into. When re-potting strong, healthy specimens, do not disturb or injure any of the old roots more than is absolutely necessary. My method with well-rooted plants is to break the old pot with a hammer, and carefully take away the pieces of crock by degrees down to the base of the drainage. Select a pot of suitable size, and for drainage place a few well-dried pieces of Fern rhizome from the peat over the bottom, so that when the plant is placed in the pot, the surface of the old compost will be just below the rim. Then fill up around the roots with a compost consisting of fibrous peat, leaf-soil, and sphag-num-moss in equal parts. The peat and moss num-moss in equal parts. The peat and moss should be cut up roughly, adding a moderate quantity of coarse silver sand; mix the whole well together. Make this compost moderately firm about the roots, and fill up to within 3 of an inch of the rim, then surface up to the top of the rim with chopped sphagnum-moss. By this method of repotting few sticks will be necessary to keep the plant in its proper position. When the opera-tion is completed, give each plant a moderate supply of water, after which an occasional sprinkling of the surface moss with water from a fine rosed-can will suffice until the plants are growing freely. The strong-growing Lælia superbiens may be included with the above as regards its present requirements.

Thunias.—Such species as T. Marshallii, T. Bensonæ, T. alba, T. pulchra, T. candidissima, and the hybrids T. Veitchiana × and T. Brymeriana ×, must now be shaken out and be repotted. The general practice of growing several bulbs planted about 3 inches apart is a convenient one. The pots should be made half-full of drainage, over which let a thin turf of fibrous loam be placed, putting the grassy-side downwards. The roots will reach this loam, to the benefit of the plants, just before the flower-spikes appear. The rest of the compost should be composed equally of peat, loam, and moss, with small crocks and silver-sand. Every bulb will require a stake, and the base of the young growths should just rest upon the surface of the compost. The plants should be afforded the lightest position available in the stove or East Indian-house, for unless these obtain all the light possible they will not flower well. Do not afford much water until the growths lengthen and roots become plentiful. When in full growth an occasional dose of weak cow-manure water will be helpful.

Cymbidiums.—Any plants of C. giganteum, C. Hookerianum, C. H. grandiflorum, C. (Cyperorchis) Mastersii, and C. (Cyperorchis) affine, that require potting should be seen to at once. Pot them in the mixture advised for the Thunias, using

pots of a moderately large size. If the plants are watered with discretion and kept well shaded from strong sunlight, they will make strong growths and fine flower-spikes.

The deciduous Calanthes will soon require to be reported. Prepare the necessary quantity of good turfy-loam and lay it in a suitable place to get warm. Do not allow the loam to become dust-dry or it will be useless.

THE KITCHEN GARDEN.

By JOHN PENTLAND, Gardener to C. H. B. FIRTH, Esq., Ashwicke Hall, Marshfield, Chippenham.

Onions.—Autumn sowings will now require attention, and if the ground has been well prepared and is dry enough to be worked to a level surface without binding together, a start should be made to transplant the seedlings. This operation requires more care than is often given to it. When taking up the plants handle them carefully, so as not to injure the roots; and when planting place in rows 14 inches apart, with 5 inches between the plants in the rows. Make the holes with a dibble large enough to allow the roots to drop straight down without doubling up. Keep the bottom of the bulb slightly under the surface of the ground, and plant firmly, care being taken not to leave a vacant space below the in which the leading roots hang, without coming in contact with the soil. To obviate this drive the dibble well down a few times, a couple of inches or so from the plant, and press the soil towards it, filling up the hole completely. The roots will thus have solid ground to start in, and if there should come a sharp frost they will not be thrown out of the ground. When the planting has been done give a good dressing of lime between the lines, not allowing sufficient on the plants to injure them. A good dressing of the same mixture over the newly-sown seed-beds will be beneficial as a manure, and help to ward off the dreaded magget, whose acquaintance I have yet to make on a bed of our own sowing. Those who followed the advice to sow in frames, given in the Calendar for January 16, should take every precaution to harden the plants as much as possible by admitting plenty of light and air, and, as the outside temperature increases, exposing them on all favourable occasions until they are strong enough to be planted out, when they should be treated similar to those from autumn-sown seeds. Sow the main crop as soon as possible if not already done.

Asparagus Beds should have the surface soil slightly loosened with the fork, taking care not to go deep enough to injure the crowns. A slight mulching of short rotten manure will be beneficial, followed by a dressing of salt, which will wash in with the rain and act as a stimulant to the plants. Prepare the ground for making fresh beds.

Seed Sowing.—Sow on the open border Chervil, Corn Salad, Dandelion, Lettuce, Mercury, Kohl Rabi, Carrots, Broccoli, Brussels-Sprouts, Cabbage, Leeks, and if Parsnips are not already in, let them be amongst the first sown.

Sow in Heat seeds of Gourds, Ice-plant [Mesembryanthemum crystallinum], Tomatos, and Celery. Look well after growing crops, and as soon as the ground is in fit condition commence to hoe between early Cabbage and Lettuce.

THE FLOWER GARDEN.

By A. B. WADDS, Gardener to Sir W. D. PEARSON, Bart., Paddockburst, Sussex.

Mixed Beds and Borders.—Where borders or gardens of this description are appreciated, and time and labour can be afforded, they are unsurpassed for furnishing large supplies of cut flowers for use in decoration. To keep the borders neat and tidy and well stocked with plants, requires much attention, but it will repay the trouble. A south or south-west aspect is best, away from the shade of trees. No formal arrangement is necessary, but the border may have a background of shrubs, introducing in the beds a few ornamental or choice flowering shrubs, such as Cupressus Lawsoniana erecta viridis, C. L. nana and lutea, Daphne Cneorum, Kalmia latifolia, and Lilacs.

Herbaceous and Perennial Plants may be planted next to these in groups, and to furnish the beds or borders in the winter after the herbaceous plants have died down, a few hardy plants may be introduced, as Alyssum maritimum, Potentilla reptans, Thymus, dwarf Veronicas, Genista prostrata, &c. The soil for these should be in good working condition, and if at all stiff will require the addition of some leaf-mould, fine peat, lime rubble, or any suitable material to keep it open. The old-fashioned lines or one plant system can be dispensed with.

Biennials sown on a warm border about the end of May will be ready for transplanting in September, and should be planted to make large groups. Any plants that show flowers the same season should be pinched off; they will then make good plants for the next spring. The list of biennials is a large and useful one.

Planting.—Blend the colours so as not to clash with one another. Plant taller-growing varieties at the back, keeping smaller-growing sorts to the front.

Hardy and Half-Hardy Annuals, if grown on a stiff, cold soil, during wet summers will not be satisfactory unless much attention is given them. The seedlings must be protected from the ravages of slugs and other pests. The ground should be dug now, that the winds may help to sweeten and pulverise the soil previous to sowing seeds next month. Thin the seedlings out on a dull day, and place a little fine soil between them, carefully pressing them firm'y into the earth.

Bulls may also be planted in these mixed beds and borders; these should be labelled so as to prevent them from being disturbed in winter, and should be planted in the beds where they will finish blooming before the other plants grow sufficiently to hide them. In filling out the fronts of these beds and borders, bedding plants of flowering and foliage types may be used. Saxifrages, Sedums, Arabis, Funkias, and numberless others may be requisitioned. Neat, green-painted stakes should be used for staking purp ses, and the tying should be done loosely, especially in the case of annuals, otherwise they will fail to have a good effect. Mulching should be done as soon as planting is finished. Annuals will require to have a piece of netting or black cotton placed over the beds after the seeds are sown, or the birds will make the fine soil of the seed-bed a dusting place.

PLANTS UNDER GLASS.

By C. R. FIELDER, Gardener to Mrs. Burns, North Mymms Park, Haifield, Hertfordshire.

Anthuriums.-If not already done, re-pot such lants as require it without further delay. Turn the plants out of their pots, and with a pointed remove as much as possible of the old compost, taking care not to injure the roots more than is avoidable. The compost, which should be warmed before using, may consist of three parts good fibrous peat, one part loam, and a little fresh sphagnum-moss, together with some coarse silver sand and broken charcoal. Let the pots be thoroughly clean, and provide liberal drainage. Work the compost carefully among the roots, raising it an inch or two above the rims of the Place the plants in a house where a stove temperature with a moist atmosphere is maintained, and when the roots have become active afford them plentiful supplies of water.

Propagating—The majority of stove and greenhouse plants may be propagated during this month. As a general rule those cuttings strike the most readily which are taken from plants that have newly started into growth after a period of rest; therefore plants from which it is intended to propagate should be encouraged to make suitable growth. This may be readily done by affording such plants a slightly higher temperature and a moister atmosphere. The suitable length of shoot for a cutting varies in different plants, but shoots are generally long enough when they have from three to five joints. Many soft-wooded plants make roots readily from any part of the young shoots; hut as a general rule it is best to make a clean cut immediately below a joint.

Amasonia punicea. — This very! pretty stove plant is not grown so largely as its merits entitle it to be. Probably the reason for this is that the method of progagation is not generally understood. Propagation by cuttings made of the young shoots is possible but slow, and the readiest way of raising a batch from an old plant or two is to cut the stems up into eyes, similar to the plan adopted for Vines, every joint of the stem providing an eye. A suitable soil is peat and

loam in equal proportions, with some silver sand; and a dozen eyes may be inserted in a 5-inch pot. Place them on the surface of the soil, and press them in with the bud uppermost. Plunge the pots in the propagating-trame, and when the plants have rooted shift them into 3-inch pots, transferring them later to others 4½ inches in diameter. The plants may be allowed to flower in these pots, as they require but little root-room. Shake the soil from the roots of old plants, and prune the stems back. Repot into small pots and afford the plants a stove temperature, being careful not to over-water them. When well rooted repot into a larger size than that recommended for the young plants.

FRUITS UNDER GLASS.
By W. FYFE, Gardener to Lady WANTAGE, Lockinge
Park. Wantage.

Strawberries.-At this season the plants will becoming into flower almost daily. Should the weather be cold with cutting winds, avoid giving much ventilation during occasional outbursts of sun by keeping the fires well in check. A very moderate supply of air is all that is necessary tosecure a good setting of fruit. A little air left on constantly is best, for March winds are generally unfavourable to tender flowers, foliage, or fruit. When the flower-stalks are strong, throwing the blooms well above the foliage, a good setting of fruit is almost assured. As soon as this is apparent thinning the fruit should not bedelayed, bearing in mind that perfect fruits must possess size, colour, and flavour combined. plants must not be allowed to lack sufficient water at the roots. Rain-water at the same temperature as the atmosphere of the house is the most suitable to use, with diluted drainings from the stables, guane, or soot-water occasionally. When the fruit shows signs of colouring, clear water only must be given; and to produce high colour and flavour, a few days before the fruits are gathered, if possible give more and drier air, with a night temperature of 65°, increasing to a maximum of 80° in sunshine. Later plants can be induced to fruit better by encouraging them to root through the pots into some rich material which can be provided in many ways, and the plants will be found to be strengthened considerably if they can be left in one position until after the fruit is gathered. Strawberry foliage is very subject to the attacks of red-spider; this should be kept in check by syringing the plants on every favourable opportunity. Fumigation may be necessary in the early stages for the destruction of green-fly; do not fumigate when the plants are in bloom.

Vines .- Muscat of Alexandria .- In the earliest house here of this variety the buds are upon the point of bursting; and during the past sunless. weather high temperatures from artificial means have been avoided, keeping the growth in check, in hopes of a clearer sky. This house was planted over thirty years ago with single and pruned upon the close-spur system, with a rafter 20 feet in length. Eight years ago the taken from as near the ground-level as possible, and these are now 16 feet in length. In two more years they will complete the 20 feet. I state this. to show that with borders in good condition thisrenovating work can be accomplished without loss. of crop, and induce a considerable increase of energy in the Vines themselves distinctly visible from the time the young rods start to grow. This proves the advantage derived by the introduction of young wood, resulting in more vigorous and healthy root action. Where desirable, this process may be commenced now by leaving, when disbudding, a well-placed break near the base of the old rod, about the ground-level. These new canes should be allowed to extend 2 feet yearly, the spurs on the old vines should be removed at pruning time to the same distance. In late houses, of such varieties as Alicante and Lady Downe's, which have had a long season of rest, I notice thebuds are swelling. About April 1 these should receive attention by having the present amount of ventilation considerably reduced and applying a little fire-heat, the stoking to be guided by the external conditions.

Grape-room.—The fruit here will be exhausted by the end of March, being about six weeks earlier than the general time, the necessary conditions not having been quite so favourable as in former years.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the Publisher. Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London-Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPEA, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.

Illustrations.—The Editor will be glad to receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Local News .- Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Hewspapers. - Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY, MAR. 19 German Gardener's Club meet-

TUESDAY, MAR. 22 { Royal Horticultural Society's Committees meet.

THURSDAY, MAR. 24 Torquay District Gardeners' Assuciation, show.

MAR. 25 General Meeting of the Royal Botanic Society. Lady Day. FRIDAY.

SALES FOR THE WEEK.

MONDAY NEXT— 1,000 Roses of sorts, 250 Azaleas, Rhudodendrons, &c. Hardy Border Plants and Bulbs, Perennials, &c., at 67 & 68, Cheapside, E.C., by Protheroe & Morris,

WEDNESDAY NEXT-

WEDNESDAY NEXT—

800 Azaleas, Paims, &c., from Belgium: 2,f0) Roses,
Blandards, Dwarfs, and Climbers, Liliums, Herbaceous Plants, 6000 Begonias, &c., at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12 - At 12 30 at
Stevens', Roses, Japanese Fern Balls and Designs,
13 cases of Iris Kæmpleri, Azaleas, Khododendrons,
Fruit Trees, &c.

FRIDAY NEXT—
Imported and Established Orchids, at 67 and 68,
Cheapside, E.C., by Protheroe & Morris, at 12 30.

(For further particulars see our Advertisement columns.)

AVERAGE TEMPERATURE for the ensuing week, deduced from observations of Forty-three Years at Chiswick

ACTUAL TEMPERATURES :-

UAL TEMPERATURES:—
LONDON.- March 16 (6 P.M.): Max, 50°, Min, 36°,
March 17, Gardeners' Chronicte Office, 41, Wellington Street (10 A.M.): Temp., 41°; Bar., 29 9
Weather vary hright.
PBOVINCES.- March 16 (6 P.M.): Max, 50° North of
Ireland; Min, 41°, South coast of England.

THE following remarks, which we borrow from the Selection. Agricultural News (Bar-

bados), apply not only to Cotton, but with the necessary modifications of detail to all cultivated plants, on which account it will be of interest to our readers in general: -

"An article by Mr. HERBERT J. WEBBER, physiologist in charge of the plant-breeding laboratory in the Department of Agriculture, on "Improvement of Cotton by Seed-selection,' in the Year-book of the Department of Agriculture, contains suggestions which, if generally adopted, would lead to a large increase in the Cotton production of the United States. The extent to which this is possible by the adoption of scientific methods is shown by the fact that, while the average yield of Cotton in the United States is only about 190 lb. of lint per acre, yields varying from 500 lb. to 800 lb. per acre are frequently obtained on many large, carefully cultivated tracts. Mr. Webber does not believe that it is possible to greatly increase the acreage devoted to Cotton in the United States; but while a much larger acreage of Cotton could be grown in the old Cotton-producing States if necessity demanded it, there is a tendency in those States toward diversified farming rather than to-

wards further specialisation in Cotton-production. He concludes, therefore, that the most important problem now before Cotton-growers seems to be that of increasing the production on the same acreage, rather than of extending the acreage itself. He thinks that, while Cotton-growing in other countries is capable of being considerably extended, such extension will doubtless be slow, and will only slightly affect the industry in the United States, and that the American planter should strive, by the application of improved methods and machinery and by the use of improved varieties of Cotton, yielding more and better staple, to keep well in advance of competitors in foreign countries, where cheaper labour is available.

"Mr. WEBBER recognises that the character of the soil is the factor of greatest importance. He believes, however, that there is great opportunity of improving the industry on all lands, both good and poor; and he estimates that the Cotton crops could be doubled, on the same acreage now grown, by proper attention to two factors necessary to success-namely, the universal use of good seed, and by careful methods of tillage and fertilisation. While both of these factors contribute largely to success, Mr. WEBBER believes that the importance of good seed is probably more commonly overlooked than the matter of cultivation. The use of good seed, and its production by a regular system of selection, is just as important a factor in the production of crops as that of cultivation. No intelligent method of farm management disregards the production and use of good seed. The day when growers can afford to plant any sort of Cotton seed has passed. Only seed of a known variety, selected because of its desirable qualities and adaptability to local conditions, should be planted.

"The traditional belief that an occasional change of seed is necessary, if good crops are to be regularly secured, is attacked by Mr. WEBBER, who contends that, to secure the best results, plants must be bred and adapted to soil and climatic conditions, and that Cotton-planters, and growers of cereal crops as well, if they are to obtain the best results, must select their seed in the locality where it is regularly grown, in order to adapt it to the particular soil and climatic conditions.

"The paper outlines a system of selection based on the principle that, while plants reproduce their main characters unchanged, and the stability of the cultivated plants and natural species depends upon this law of heredity, still they are not absolutely fixed, but are very unstable and highly variable in minor characters. The system outlined, which is one that any planter can carry out on his own plantation, is based on the use of the seeds of only such plants as show the characteristics which it is desirable to reproduce, such as quantity of production, length of fibre, and earliness of maturity. It is recommended that after these have been carefully selected, the seed from the middle pickings of each plant be carefully gathered; that that from each one be ginned separately, in a gin that has been carefully cleaned, so as to prevent mixture of unselected seed; and that the seed of each plant be planted separately the following year, so as to test its quality for the reproduction of the qualities desired to be perpetuated. All that do not come up to the standard are to be discarded in the second year, and the seed of only the very best are to be used for planting the third year. By the beginning of the fourth year a sufficient supply of highly selected seed for seeding a large plantation will he secured. The system of selection can be indefinitely continued, however, from year to year on a tract of ground set apart for that purpose, and thus the quality of the Cotton can be kept to a high standard or constantly improved."

Laboratory at Cinchona (Jamaica).

THE Jamaican authorities The Botanical having decided to abandon their station at Cinchona, certain American botanists came to the conclusion that

it would be most desirable to establish a nursery for the raising of tropical plants prior to their removal to New York and other American towns for culture under glass, and to establish a laboratory there for experiment and research. The laboratory is to be managed by American botanists; but Mr. FAWCETT, the Director of the Public Gardens and Plantations, is offering every facility in his power, and will supervise the students who avail themselves of the privilege of studying there.

The illustrations given in the Journal of the New York Botanical Garden may in the future serve as suggestions for the erection of that research laboratory which it is so much to be desired should be erected at Wisley. Those who are alarmed at the prospective cost of the buildings will be reassured when they see the very modest erections which are considered sufficient for the purpose. At Wisley we have not so much in view a laboratory for the use of advanced students and general research as a small station where the direct applications of science to practical horticulture may be carried on. Of course we should always welcome a fully equipped laboratory for the purposes of pure science, being well aware that practical horticulture would profit in the end; but for the present our aspirations are limited to the immediate requirements of practical horticulture. Every year there erop up many questions of direct importance to practical gardeners-questions some of which at least could be settled in a few weeks, or even less, at a very small cost. We quite agree that the main consideration for the Council at present is to complete the accommodation for the offices, library, and exhibition hall as speedily and efficiently as possible. No more should be expended at Wisley than can be avoided till this is accomplished; but we should hope that this is now only a question of a few

WATER-LILIES (see Supplementary Illustration).- Few flowers excel these in beauty, but to the ordinary gardener they do not appeal so forcibly as do other flowers which can be used for decorative or exhibition purposes or as cut blooms. Nevertheless, as Mr. Hudson and Mr. Amos Perry have shown us at Holland House and at the Royal Horticultural Society's Drill Hall meetings, they can be used most effectively for exhibition purposes. We do not think any reader looking casually at our Supplementary Plate would do otherwise than think that the Water-Lilies there represented were growing in a lake in the open air. They were, in fact, shown at a floral exhibition at Amsterdam by Messrs. Zocher, of Haarlem, who kindly furnished us with the photograph. The lats Mr. JOHN WILLS was one of the first to make use of these levely plants for the decoration of apartments on grand occasions, but he had not the resources we now have. Visitors to the Oxford Botanic Garden in bygone times will also remember the series of troughs (of copper if we remember aright) partitioned into compartments and of varying depth, in which aquatic plants were grown from the time of SIBTHORP to that of DAUBENY. In truth the methods of growing these plants are so varied that they may be adapted to any garden, large or small, and among the

splendid hybrids raised by M. LATOUR-MARLIAG are several that can be as well grown without as with the aid of the hot-water pipe. A tub tarred on the inner side will suffice to grow many of them if no other means be available.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Committees will be held on Tuesday next, March 22, in the Drill Hall, Buckingham Gate, Westminster. A lecture on "Heredity of acquired Characters" will be given by the Rev. Prof. G. Henslow, V.M.H. At a general meeting of the Society held on Tuesday, March 8, fifty new Fellows were elected, making a total of 351 elected since the beginning of the present year.

THE SURVEYORS' INSTITUTION. - At the ordinary General Meeting, held at 12, Great George Street, Westminster, S.W., on Monday, March 7, 1904, the President (Mr. ALBERT BUCK) in the Chair. A paper was read by Mr. Thomas BINNIE (Fellow), entitled "The Land Purchases for the New Naval Base at Rosyth, on the Firth of Forth." The second Afternoon Meeting will be held at the Institution on Monday, March 21, 1904, instead of on Monday, April 18, as shown on the Kalendar. A discussion will take place on the paper recently read by Mr. H. J. ELWES, F.R.S., entitled "British Timber and its Uses." The Chair will be taken at 4 P.M. The Council have accepted an invitation from the members of the Northumberland and Durham, and the Cumberland and Westmoreland Provincial Committees, to hold their next Country Meeting at Newcastle-on-Tyne, on May 26 and 27. With a view to encourage the reading of Papers at the ordinary General Meetings, the Council have decided to award a Gold Medal for the best Paper, if of sufficient merit, read by a Member of the Institution during the session. Subject to a sufficient number of entries being received, the next Special-Certificate Examinations in Forestry, Land Surveying and Levelling, and Sanitary Science, will be held on Tuesday, Wednesday, and Thursday, June 7, 8, and 9. Particulars of these Examinations can be obtained from the Secretary. Applications must be sent in not later than April 20 next. Mr. F. T. GALSWORTHY, who recently retired from the Vice-Presidency, having placed the sum of £500, invested in Trustee Securities, at the disposal of the Council for the endowment of a Prize in connection with the Professional Examinations, it has been decided to devote each year's interest to a Prize in respect of that year, to be awarded to the Fellowship Candidate who, having passed the Associateship Examination while a Student, is found to have obtained the highest number of marks in his Associateship and Fellowship Examinations combined. By the Donor's special request the amount of the Prize is to be devoted. until exhausted, towards the payment of the winner's annual subscriptions, or, under special circumstances, partly towards that object and partly to the purchase of books or scientific instruments.

THE CHELSEA CEDAR.—The last of the old Cedars in the Physic Garden at Chelsea has been removed. It was one of the first planted in the country, in 1683. The trunk had been dead for years, but it still formed an imposing landmark, so that its removal, however necessary, will be a subject of regret. The history of the tree, with illustrations, has often been given in the Gardeners' Chronicle—see September 11, 1886, p. 336, fig. 70.

A SUGAR-PRODUCING PLANT (Caá-êhê or Azucá-caá).—In the early part of 1901 the authorities at Kew, as we learn from Mr. HILLIER, received from H.B.M. Consul at Asuncion, Paraguay, fragments of a Composite plant bearing the above mames, and credited with possessing a remarkable sweetening property, a few leaves being sufficient to sweeten a strong cup of tea or coffee, giving

also a pleasant aromatic flavour. The plant was discovered growing in the highlands of Amambai and near the source of the river Monday by Dr. BERTONI, and described by him in Revista de Agronomia, ii., pp. 35-37 (1899) under the name Eupatorium Rebaudianum. From the meagre material received at Kew, it was found that the smallest portion caused a persistent sweetness in the mouth, and further that the floral structure of the specimen agreed more nearly with the genus Stevia than with Eupatorium, its affinity being with S. collina, Gardner. The foregoing facts are gathered from the Kew Bulletin for 1901. p. 173; and we find upon enquiry that living plants or full herbarium specimens are still desired at Kew to facilitate the identification of this interesting plant.

CHISWICK.—Chiswick Gardens, which have so often been the scene of shows, conferences, committees, and such-like gatherings, were on Thursday, March 10, the meeting place of an assembly whose visit was prompted by motives of a more self-interested nature. The exhibitions were concerned with constructive horticulture; the recent meeting with destructive measures. In place of the Chairman stood the auctioneer; instead of the Committee were ordinary people; the Superintendent was at hand, not to guide the judges, but to indicate the features of a "lot," or to locate its position. Not many seemed anxious to assist in the breaking up of these historic gardens, and when the auctioneer commenced his duties there was plenty of room. Bidding was not very brisk, and it needed all the inducement at the auctioneer's command to obtain offers at all for some of the lots. Commencing with the stock in the lower garden, a plantation of young bush Apple-trees was disposed of. Here one could purchase for the sum of Gs. or 7s. ten or more Apple-trees true to name, whilst halfa-dozen really good pyramid Pear-trees only realised 6s. Nobody seemed to want fruit-trees, the cost of removal and transit no doubt accounting for the low prices obtained; still the season is now favourable for planting and removing fruit-trees, and to those who purchased them they were bargains. The auctioneer was disappointed, and then led the way to the plantations of Rhubarb, indulging in some witticisms as a preliminary to offering these plants. He spoke of having had champagne which had a suspicion of being prepared from Rhubarb. Some spirited bidding seemed to result from these statements, for hids were at once forthcoming, and prices reached as much as 16s. for one group of five stools, Linnæus being among the varieties. Prices soon dropped, and towards the finish "lots" of these plants failed to obtain bids at all, or were cleared out for a trifling sum; curiously enough, the standard variety Victoria was unsaleable. Standard Gooseberries went cheaply, but beds of Roses seemed in demand, although two dozen in a bed for Ss. was about the average price of these plants. A small bed of Carnations roused keen competition, and seemed to be amply valued at 19s. The shrubs and edgings of Box, Privet, &c., were in demand, probably for villa and suburban gardening, and for these plants prices were very fair. The Box seems to thrive especially well at Chiswick, and no doubt many persons have been struck with the beautiful hedges of Box which are to be seen there and are so nicely trimmedindeed, they were quite a feature of the place: of course, these were not included in the sale, but only smaller edging plants about 18 inches in height. When it came to two fine beds of Yucca recurvifolia near the Council Room excitement was keen among the would-be buyers, and after much competition they were knocked down for over £8, averaging about 8s. 6d. a plant; another row on the opposite side of the wall realised £4. Golden Privet and Box hedges near the Paxton

house sold well, but the shrubs and Conifers at the back of the vinery were almost given away. Prices were no doubt influenced by the size and the trouble in removing the plants. Some fairly good Camellias in the entrance-house, which were clean and of a nice colour, sold very well, but on adjourning to a plantation of Peach-trees near by prices reached zero, and after vainly trying to obtain more the auctioneer with a pang of regret knocked down about thirty nice trees for the insignificant sum of 8s.! In the large vinery were sold the Palms, Ferns, and bedding stuff, and we noticed among the buyers several persons of the "coster" type, who no doubt had expectations of retailing these plants at splendid profits to the unwary householder; but they should have devoted their attention to the fruit-trees, for now the plants were fetching very fair prices, especially the Palms and small Ferns-in fact the small Ferns fetched their full value. The auctioneer felt somewhat cheered at this, and as he led the way to the Fig-house reminded the people that now he had something worth offering, and hoped to obtain anything from £200 or thereabouts for this fine collection. Alas, he was disappointed! In vain he assured his hearers that they were not realising the situation; a choice Fig-tree in a large pot for 2s. was too absurd, but he could get no more. He then suggested offering several together, but the buyers would have none of it, so he continued knocking them down for a few shillings each, and sold the entire collection for a matter of less than £25. Another of the features of Chiswick was the collection of Ivies presented some years ago by the late SHIRLEY HIBBERD. These were offered as they grew on the walls, but the price fetched viz., 14s.—was indicative of the demand for them. No doubt they were bought for propagating purposes. The plants in Peach-house were offered, but no bid was made for them, and the sale was closed.

EXHIBITION SCHEDULES RECEIVED:

NATIONAL CARNATION AND PICOTEE SOCIETY (Southern Section).—Annual Exhibition at the New Hall of the Royal Horticultural Society, Vincent Square, Westminster, on Tuesday, July 26.

Beighton and Sussex Horticultual—Spring Show, April 12 and 13; Summer Show, August 23 and 24; Chrysanthemum Show, Nov. 1 and 2.

Kent County Chrysanthemum — Annual Exhibition on Wednesday and Thursday, November 2 and 3, at The Rink, Blackheath, S.E.

Hanley (County Borough), Staffs.—Annual Floral Fête in Hanley Park, Wednesday and Thursday, July 6 and 7.

IPSWICH AND EAST OF ENGLAND HORTICUL-TURAL SOCIETY'S DAFFODIL SHOW, to be held on Wednesday, April 13, 1904, in the Public Hall, Ipswich.

CROYDON HORTICULTURAL SOCIETY'S SUMMER SHOW, Wednesday, July 6, at Brickwood House Gardens.

THE LIVERPOOL HORTICULTURAL ASSOCIATION announce their Spring Flower Show to be held on Wednesday, April 13. The Secretary's Office is 7, Victoria Street, Liverpool.

THE FRUIT INDUSTRY.—The Departmental Committee appointed by Lord Onslow to enquire into and report upon the Fruit industry of Great Britain held sittings on the 9th, 10th and 11th inst. The following members were present: Mr. A. S. T. Griffith-Boscawen, M.P. (Chairman), Col. Long, M.P., Mr. C. W. Radcliffe-Cooke, Mr. Hodge, Mr. Monro, Mr. Vinson, Dr. Somerville, Mr. P. Spencer Pickering, the Rev. W. Wilks, and Mr. Ernest Garnsey (Secretary). On March 9, Mr. W. W. Berry, Mr. Edward Pink, Mr. John Wood, and Mr. George Smith, as four Kent

growers; en March 10, Mr. John Riley, Mr. John Watkins, and Mr. J. H. Wootton, as three Hereford growers; and en March 11, Mr. W. J. Lobjoit and Mr. W. Poupart, as two Middlesex growers, gave evidence. In addition, en March 11, Mr. J. Struthers, C.B., of the Scotch Education Department, and Mr. Buckmaster, of the Board of Education, furnished information.

BOARD OF AGRICULTURE.—We are informed that the departmental committee appointed by the Board of Agriculture and Fisheries to enquire into the working of the Fertilisers and Feeding Stuffs Act, 1893, held sittings on the 1st and 2nd inst. The Right Hon. Lord Burghtclere was in the chair, and the other members present were Dr. T. E. Thorpe, C.B., F.R.S., Mr. J. W. Clark, K.C., Mr. R. Burnard, Mr. A. M Gordon, Mr. I. Pearson, and Mr. J. W. Spear, M.P. The following witnesses gave evidence: Mr. John Hughes, F.I.C., F.C.S., representing the District Agricultural Analysts' Association, Dr. B. Dyer, D.Sc., Mr. J. Alan Murray, B.Sc., Mr. G. D. Macdougall, F.I.C., and Dr. J. Augustus Voelcker, Ph.D.

THE NEWEST ROSES.—We are much edified with a poster, forwarded to us by a correspondent, giving a list of Roses and other shrubs lately sold by auction in a certain Hertfordshire town. The public were offered an opportunity of buying such new Roses as Witte Ethos, Welrich Briuner, and Mahonia. Desirous of obtaining Jules Margottin, they had to seek for Yules Murgotten; Lausi van Haute proved to be Louis Van Houtte, and General Yucuminal to be Général Jacqueminet. No doubt Madame Charles Wood was not merely a harmless but a desirable acquisition, but Mad. guro Feshant sounded a little alarming. As to Chape de Napolian, Prins cum a Bohn, Mis John Ling, and Loun vun Rauffethese, with certain other treasures, suggested the oft-quoted lines-

"What's in a name? that which we call a Rose, By any other name would smell as sweet."

FORESTRY IN SCOTLAND.—At a meeting of the Edinburgh University Court it was resolved to approve of the following resolution, which had been passed unanimously at the jubilee meeting of the Royal Scottish Arboricultural Society, held in Edinburgh on February 16:-"That it is the opinion of the members of the Royal Scettish Arboricultural Society assembled in annual meeting that the Beard of Agriculture should now take steps to give effect to the recommendations of the Departmental Committee on Forestry as far as regards Scotland by providing an estate to serve as a State forest demonstration area, and also by providing example plots in connection with Edinburgh University; and, further, that forestry education in this country will not be adequately provided for until the foregoing are supplied and a thoroughly - equipped forest school is established in Scotland."

TURIN HORTICULTURAL AND FLORICUL-TURAL EXHIBITION.—Much support has been promised from foreign sources to the Turin Horticultural Exhibition, which is to be held in May. The exhibitors will include important representatives from France, Belgium, Germany, and Holland. Messrs. VEITCH, of Chelsea; Messis. William Bull & Sons, Messis. Sander & Co., of St. Albans, will be among the exhibitors from England. It is hoped that Messrs. PEETERS, of Brussels, will show some of their famous Orchids. The gardens of the Prince of Monaco (with greenhouse plants, collections of Crotons, Platycerium, &c.), and the gardens of the Casine of Monte Carlo will also probably be represented. From Trieste come specimens from Martin, Maron, Fonda, and Perotti. The Executive Committee of the Exhibition have received other effers of assistance and various

prizes for their competitors, besides numerous medals. The Royal Horticultural Society of Tuscany (under the patronage of the King of Italy) is organising a Committee of horticulturists, especially of Tuscan gardeners and amateurs, and is also offering medals for competition among them. The Horticultural Society of Palermo will award two diplomas and prizes. Already a fence is built round the Park Valentino, where the Exhibition is to be held, and many bulbs and Rose-trees have been planted there, under the superintendence of Messrs. Krelage, and Gemen & Bourg.

WINTER PRUNING COMPETITION .- This competition, as we learn from Mr. CRUMP, took place at Madresfield on March 3, in an orchard at Gnarlford, a place noted for good fruit-trees. The competition is open to all members of the Club, or to those nominated by members, and is divided into three classes, viz.: Class 1, for farm hands-that is, farmers or labourers; Class 2, open to other than farm hands, such as gardeners, amateurs, &c.; whilst Class 3 is the champion class, open only to 1st prize winners of the previous years, and who are perforce debarred from competing in a class that they have wen a 1st in for three yearstherefore the champion class becomes a battle of the giants. It should be mentioned that these competitions are the sequel to the season's technical instruction and demonstrations given on winter pruning, and as a matter of fact they have already been the direct means of turning out some very useful and skilled men, who are now in great demand. The Club itself has a scheme in working order for supplying two of these trained men all through the pruning season to its members and to the tenautry on the Madresfield estates at nominal charges. The trees were all set out and numbered some days previously by two stewards, and as each cempetitor had to prune three trees, care was taken that the trees selected should be of as varied a character as possible, but of equal difficulties as regards the ability and skill required, two and a half hours being allowed for the work. Thirteen competitors entered, and a ballet fer numbers having been taken, the signal was given and the workers commenced their allotted tasks. The judging was entrusted to Mr. James DAWES, of Ledbury Park Gardens, who has a very wide and practical experience in such matters. It may be here mentioned that Mr. Dawes judged the competition last year, and having secured the confidence of the competitors in his impartial awards, his decisions this year gave the same general satisfaction. The results arrived at were awarded by a scale of points, and as each competitor finished a tree, points were entered on one side for merit, and on the opposite side, for errors or faults, the whole being balanced and totalled at the finish. A lecture was also given by Mr. DAWES in the schoolroom at 7 o'clock the same evening, when the results were read out and enthusiastically received by a large audience. A large number of the spectators who were present in the afterneon and evening had correctly prejudged the competitions, a fact which goes very far to show the interest aroused in fruit-growing and the Club's good work.

RESULTS.

Class 1—Farm Hands... ... 1st, Joseph Powell. ,, 2—Open to All 1st, A. Bradshaw, jun. ,, 3—Champion 1st, C. F Crump.

Mr. Dawes pointed out some of the faults to the audience, and explained the value of good work, and a very instructive evening was realised. Next week a course upon vegetable cultivation will be given.

SOME ENGLISH GARDENS.—Miss Jekyll has in the press a book on this subject, with coloured illustrations by G. S. Elgood. It will be published by Messrs. Longmans & Co.

OLD WEST SURREY.—A book under this title, written by Miss Jeryll, will shortly be published by Messrs. Longmans & Co.

THE NATIONAL SWEET PEA SOCIETY: PRO-VINCIAL PRIZES .- The Committee of this Society, as we are informed by Mr. Horace WRIGHT, has arranged with the Wiltshire Horticultural Society, whose exhibition will be held on August 10. to include in the schedule a special class for Sweet Peas, for which the National Society will provide the prizes. The class is identical with the audit class on p. 19 of the National Sweet Pea-Society's schedule, and all members of this Society may exhibit free; others on paying the usual fees of the Wiltshire Society, of which Mr. LEONARD SLY, Salisbury, is the Secretary. The total prize-money offered by the National Sweet Pea Society is £3 2s. 6d., and a Silver Medal to the winner of the premier place. Mr. SLY will send full particulars. The Society has also been able to arrange with the Galashiels Horticultural Association for a class on behalf of Northern growers, the prizes being identical with those in the previous case. The class here is similar tothe classification class on p. 19 of the National Sweet Pea Society's schedule, and it will be contested on September 10. Members of the National Sweet Pea Society are entitled to exhibit free of special entry fee. The Secretary of the Galashiels Horticultural Association is Mr. JAMES-MALLEN, Galashiels, who will be pleased to send complete details of the class.

MISSOURI BOTANICAL GARDEN, ST. LOUIS .. -Toward the end of the year 1903 a fire, which originated from a defective flue in the boiler pitfrom which the newer range of plant-houses isheated, damaged the adjacent structures to the extent of about \$1,000 00. It chanced thatabout this point, in the hot and intermediatehouses, were clustered most of the Orchids and Platyceriums, and many other choice plants, andalthough the efficient service of the fire department reduced the loss on the buildings to aninconsiderable sum, the heat and smoke destroyed a large part of these collections, and so seriously injured the remainder that their recovery is likely to be at best a matter of several years" time. By the prompt action of the Beard, however, says Dr. Trelease in his annual report, these collections have been replaced by otherplants of the same or equally decorative species, and it is expected that the early spring will find the Orchid collection as large, varied, and interesting as before the fire. In connection with this loss Dr. TRELEASE records his appreciation of the courteous action of the New York: Botanical Garden, the Director of which, Dr. N. L. Britton, immediately offered such duplicates as could be spared from its collections; and a consignment of eighty plants, representing seventy-eight species of Orchids, was received from this source as soon as the buildings weresufficiently repaired for their reception.

NOVA SCOTIA FRUIT.-The Agent-General for Nova Scotia informs us that the Crystal Palace authorities have presented a special Commemorative Medal to the Nova Scotia Government for the exhibit of dessert, cooking, and cider Apples, which have been displayed by the Fruit Growers' Association in the Canadian Court during the last three months. Nova Scotian fruit. says the Agent-General, holds the first place among all the Apples imported into this country from abroad. By a process of systematic selection directed towards securing flavour combined with long-keeping qualities, and by limiting production to comparatively few varieties possessing these characteristics, Nova Scotian growers have won for their fruit this enviable position. Apple crop in Nova Scotia was unusually large last year, and over half a million barrels have already been shipped to this country.

THE ACTION OF ETHER ON PLANTS.

WE have already spoken of the use of ethervapour in accelerating the flowering of forced shrnbe, a process introduced by Dr. Johannsen, of Copenhagen, and now extensively practised in Germany and in France for commercial purposes. It is not long since we called attention to a pamphlet published by M. Maumené en the subject, and we have now the opportunity, thanks to the courtesy of that gentleman, of giving two illustrations from Le Jardin, which show better than words the effect of the process, and the great saving of time and fuel which results from its use. One cut shows a plant of Spirea Thunbergii (fig. 78) which had been exposed to the other treatment for forty-eight hours and then forced in the ordinary way. In fifteen days the plant was covered with flowers. A plant of the same species treated in the same way and in the same period, but not etherised, is shown for comparison.

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his Correspondents.)

sowing onions under Glass.—The labour attached to this process is in itself quite sufficient to prevent its being adopted generally, especially as there is no real need for such a departure being made in raising an ordinary kitchen-garden crop—a crop that has been secured from time immemorial from seed sown out-of-doors. I have raised young plants of Onions under glass for exhibition purposes, the seed being sown in January, and afterwards treated as so clearly described by "B.," the bulbs thus raised being staged at the August shows in the class provided for "spring onions." This circumstance implied no deception on the part of any individual exhibitor, as the fact was well known to one and all of the leading exhibitors in the vegetable classes, as well as to the show management. "B." says in the beginning of the second paragraph of his article on p. 140, "I have tried all kinds of treat-

rich, and from 2 to 3 feet in depth and resting on a gravelly subsoil, dried up quickly. I once had the Onion-bed in the firm grip of "Jack Frost" for three weeks after the seed was sown, without experiencing any bad effect therefrom. Onions raised thus were never molested by the maggot, for the very good reason that there were none. The perfect freedom of the ground treated in this manner from the maggot and other creatures that prey upon underground growth, must be attributed to the combined efficacy of deep and generous cultivation, early sowing of the seed, solidifying of the ground before and after the seed was sown, and in a great measure to the free use made of soot before sowing the seed. The same remarks will apply to other root crops, Parsley, Lettuces, &c., which in ordinary circumstances are attacked by the grub, &c. As soon as the young plants appeared aboveground, the Dutch-hoe was run pretty deeply between the rows, the operation being repeated once or twice in April and three following months, as much with a view to accelerate growth in the plants as to destroy seedling weeds. The young plants were thinned out as soon as large enough to handle to 2 or 3 inches in the rows, weeds being removed at the same time, showery weather being preferred for doing the work, as the weeds and plants can be removed more

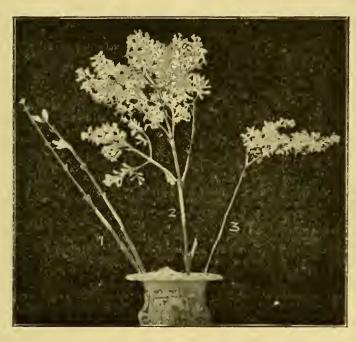

Fig. 77.—Showing the effect of ether in forcing lilac.

Fig. 77 represents three branches of Lilac. No. 1 is a branch not subjected to ether-vapour. No. 2 shows a branch which has been subjected to the ether and to a temperature of 16° to 17° C. (62° to 64° F.). No. 3 is a branch forced in the ordinary way, with a temperature of 30° C. (86° F.). No. 1, not etherised, was placed in the forcing-house at the same time as No. 2.

We must refer to our previous articles on the subject for full details, merely repeating that the operator must exercise the greatest caution not to bring a light of any kind near the apparatus, and that except for experiment sake it is hardly worth while to try the process commercially at this late period of the forcing-season.

This is one of many experiments that might have been carried out at Chiswick at a small cost without any costly laboratory. We may hope to see some trials of this new process made at Wisley, as the matter is clearly one of great practical importance.

PUBLICATIONS RECEIVED.—Prediction of the Weather for all parts of the World for March. By Hugh Clements. Mr. Clements claims to have discovered how to forecast the weather correctly. It is, he says, due to natural causes—the tidal action of the moon and sun. The prediction for March is not very cheerful, but indicates a continuation of unsettled weather.

ment in the endeavour to secure spring-sown Onions free from maggot, but in every instance the result was a failure till, trying the large-growing varieties from early-raised plants, the continued absence of maggot induced me to attempt the production of the whole crop in the same way, with the result that maggot is now, and has been for some years, a hearsay difficulty only." In view of "B's." statement, it may be as useful as the subject is opportune if I give for the benefit of young readers of the Gardeners' Chronicle particulars of the way in which I grew heavy crops of spring-sown Onions annually for over a quarter of a century without any loss from attacks of the maggot. My crop of Onions was always raised from seed sown in ground previously cropped with Celery. The ground was simply dug over, trodden down, the surface dressed with new soot in sufficient thickness to discolour the soil prior to raking the ground level, and drawing shallow drills about I inch deep at I foot apart, running north and south. The seed was sown thinly in these, the soil being afterwards closed in with the feet, trodden over, and raked over once more in the same direction as the drills. The operation was carried out as early in February as the condition of the ground would permit of its being done without the soil adhering to the boots of those engaged in the work—usually between February 8 and 20. The ground being light,

Fig. 78.—Spir.ex Thunbergii.

To the left, plant subjected to Ether previous to forcing: to the right, plant forced in the ordinary way, other conditions being identical.

expeditiously and effectively when the soil is moist. At the time of thinning out the rows, I extended the crop by transplanting some twenty or thirty rows of the thinnings in the same plot of ground from which the few remaining ridges of late Celery had just been removed and laid-in their full depth in the soil in a border under a north wall for future use. The roots of these little plants were shortened back nearly to the embryo bulbs, the plants being let into the ground, prepared as advised for the reception of the seed, the same depth as they were before, making the soil fairly firm about them with the setting-stick in planting. I never noticed any difference in the weight and quality of the produce obtained from transplanted plants and those which were left undisturbed in the rows, the crops in both cases being excellent. H. W. Ward, Lime House, Rayleigh.

CYANIDE OF POTASSIUM AS A FUMIGATOR.—I was very interested in reading in the Gardeners Chronicle for February 27, Dr. Bonavia's note on the new gardens at Wisley. I quite agree with him that nicotine as a fumigator is expensive. He mentioned the use of cyanide of potassium treated with sulphuric acid and water, by which hydrocyanic acid gas is evolved. I have used this for more than a year, and have saved myself a lot of time, trouble, and expense. It will kill mealy-bug, scale of all kinds, woodlice, ants, thrip, cockroaches—in fact, anything that has life, just as easily as nicotine will kill aphis. I have been most successful with it, so much so that some of my friends have advised me to give up gardening and become a professional. Of course it is a very dangerous poison, and should be

used only by a responsible person. Some time, if you will allow me space in the Gardeners' Chronicle, I will give some of my experience as to what plants I have fumigated, and the results. I enclose a spray of Camellia tree which had been infested with the mealy-scale—which we so often find on Camellias—for twenty-five years previous to my coming here. They have cost pounds for cleaning. Now they have no scale on them at all. I have cut in one week this year from one tree of the variety alba plena twelve dozen good flowers. There is not a spot of dirt on the leaves, though they used to be quite black at the time the flowers opened. W. G. Bushell, The Gardens, Rownhams House, Rownhams, Southampton. [The leaves are perfectly clean, and unusually bright in appearance. Ed.]

THE GARDEN RUBBISH-HEAP.—After reading the remarks of your various correspondents on this subject, I must confess to being one of the old school, and having a refuse heap, I treat it as a choice subject. Here we have a large kitchen-garden and orchard, and very little manure, the stud being small, consequently we are obliged to save every scrap of refuse for manure. Our soil, being on the clay, is heavy and wet, and it is only a few feet above sea level. My practice has been for many years to use all the rough refuse for trenching, placing this at the bottom of the trench and using the shorter refuse for single-digging. This adds to the subsoil after its decay, and at the next trenching one can go a little deeper. I do not object to the trench being nearly filled with this rough stuff; it keeps the ground open and allows water to drain away better. We do this every season for crops such as Onions, Parsnips, Carrots, Beet, &c., and have no reason to complain of the result. I use the ashes from the bonfire heap to put in the drills at sowing time, which helps the young seedling plants to grow, and adds potash to the soil. By the spring our rubbish corner is cleared out and made ready for the next season's refuse. I always advocate digging-in green refuse or crops, even the grsss mowings from pleasure-grounds, which Potatos and such crops, and keeps the ground open. I do not like digging in stumps of the Brassica tribe or old Turnips, as I fancy they tend to produce clubbing. All these I burn and make ashes of them. As your correspondent Mr. ashes of them. As your correspondent Mr. Miller says, "It is not wise to be prejudiced against any new system; circumstances alter cases." A. Lee, Beaulieu.

— I have read with interest the various letters criticising Mr. Simpson's article on "The Garden Rubbish Heap," lut none has given his method encouragement, as the results of his system would prove disastrous to the soil. The practice of digging - in all garden rubbish was at one time carried on extensively in this garden, for last year the weeds were entirely beyond the power of manual labour to get rid of. When I came here last April weeds were everywhere, in some places 2 feet high, which was in anything but accordance with the reputation of the place. Much trenching and deep digging have been done this winter, and it may not surprise the readers of Mi. Simpson's article to know that Cabbage stalks, hard prunings, and even Pea-stakes have been turned up in quantities, after having been buried for nearly six years. Surely, common-sense must have a wider distribution nowadays. A Young Gardener.

SPECIFIC AND VARIETAL FERN NAMES.—The awards made at a recent meeting of the Floral Committee of the Royal Horticultural Society to two new Ferns, named respectively Pteris Hilliand Cyrtomium Butterfieldii, lead me to point out the inadvisability of naming Ferns in this unscientific manner. A glance through the awards of recent years will show that this sort of thing is becoming the rule rather than the exception. This means a constantly increasing source of confusion, which should be checked by some rule prohibiting awards in such cases until duly authorised specific names can be attached. With regard to Pteris Hillii, "said to have been introduced from Brazil," there were certain charactera in it, especially the curious right-angled arrangement of the subdivisions of the basal pinnæ, that

may indeed constitute it a new species; but if so, it would be very desirable that the authority for the specific name should be stated or confirmed by the authorities at Kew. Otherwise it is quite possible that the species may already figure there under another name, and thus increase the already appalling synonymic fog. With the Cyrtomium, however, it is quite different, since it is undoubtedly no new species, as the name given implies, but merely a subthat it should be named Cyrtomium falcatum, so that it should be named Cyrtomium falcatum var. Butterfieldi. To my mind, the [correct names of] species of new plants should always be stated and insisted upon by the Committee. Except in the case of accidental hybrids this should always be ascertainable by reference to Kew, and by attaching it with the varietal name appended, we should have a proper record instead of a misleading one. Furthermore, if this is not insisted upon when the plant is put before the Committee, it is never likely to be done later, and in time its origin is very likely to become obscured. Why, too, should P. Hillii be merely "said" to have been introduced from Brazil? Surely the exhibitor should know its origin, especially as his name is attached to it, as it would have been had he discovered it! These points constitute precisely that sort of information which the Royal Horticultural Society should aim at securing, while as matters stand the great bulk of new plants is put forward with an utter absence of historical and guiding data. With British Fern varieties these data are always given, and I should never think of giving a new variety the name of the finder or raiser in a specific fashion, as is done with so many exotics. Polypodium Knightii, certificated some time back, is undoubtedly a plumose variety of a species; and I then pro-tested against an award being given under a specific name, richly as the plant merited one per se. This and the others above cited are types of scores. Chas. T. Druery, F.L.S., [A very old story. We entirely sympathise with our correspondent. He probably knows, as well as we, that repeated efforts have been made to induce the Society to do its duty in this matter. He probably knows also that in former years meetings have been held and committees appointed to deal with this very question, and that excel-lent rules for the guidance of the Committees have been laid down; but we fear they have been observed only on rare exceptions. Ep.]

DATES OF FLOWER SHOWS.—It is to be desired that in arranging for annual flower shows societies near to each other should avoid clashing. I note that the Ealing Society has fixed on June 29 for their summer show, which they hope may be held in Gunnersbury That is, as the crow flies, not more than two miles from the Old Deer Park, Richmond, where the usual great summer show will be held on the same day. The Richmond Society has had its schedules out for several weeks past. It is so obvious that two great local shows such as these are cannot be held with success so close together. The Ealing people fear, if held a week later, to clash with the National Rose Society's show at the Temple. Croydon show did so last year, but obtained a splendid display of Croydon show comes on July 6 this year, and the committee have no fear as to the result. Roses then are in abundance, and there would be plenty for Ealing. D.

THE WAY TO WISLEY.—In your number for January 23, there appeared an account of the Royal Horticultural Society's new gardens at Wisley. I must take exception to the directions given as to reaching the gardens by rail. The directions were evidently written by someone who was a stranger to the district. I have lived in Byfleet for a number of years, and of my own personal knowledge should like to state: (1) that the nearest station to the gardens is Byfleet, the distance being under four miles. (2) That the roads are not "exceedingly tortuous," and, except in extremely wet weather, are equal to the others in the neighbourhood. (3) That the road from the station to the gardens is exceedingly pretty and picturesque, and is frequently chosen by people for drives. (4) That there is a good service

of trains from London to Byfleet, which is on the L. & S.W. main line, and the next station to Weybridge. (5) The Railway Company already grants cheap tickets to other Societies visiting this neighbourhood, and would, if approached, no doubt afford the same facilities to the Royal Horticultural Society. (6) Conveyances meet every train, and special arrangements could be made for parties by writing to Mr. E. Finch, Byfleet Station. G. Carpenter, West Hall Gardens, Byfleet. [If our correspondent will refer to the note mentioned, he will see that the particulars were extracted from The Book of Arrangements issued by the Royal Horticultural Society. We are therefore not responsible for them. Ed.]

THE CLIMATE OF BRITISH COLUMBIA.—On p. 105, under the heading "Fruits from British Columbia," you speak of the climate of that country as being "less cold in winter and less bright in summer than that of Nova Scotia." The first part of this comment is quite correct, but the summers are as bright if not brighter than those of Nova Scotia, particularly in the interior, where probably the best Apples are grown. J. A. Turner, Secretary to the Agent-Genera? for British Columbia.

STRAWBERRY CULTURE.—I have read with much interest the discussion on Strawberry plantations, and I can fully endorse all that. has been said by Mr. McCallum on p. 155. My mode of cultivation is to plant onground that has carried a crop of early Potatos by the end of July, levelling, and dressing the soil with bone-meal, and lightly forking this in—Plant early in August with runners taken from Plant early in August with runners taken from a one-year-old plantation which has not been allowed to carry a crop of fruit, and only the required number of layers. In my experience I findthat runners from such plants take more kindly to the soil and start away more strongly than when taken from plants that have carried a full crop. The second autumn after planting they are mulched with spent hot-bed manure, which by the following spring is well decomposed, and requires no raking off. The hoe is brought intorequires no raking off. The hoe is brought into-use and well plied between the rows, and all runners are cut off. When the flower-scapes are well up they are bedded with long manure. Immediately the crop is gathered the plants are cleared of runners, weeds, and straw. The hoeis kept going until they are mulched again in the autumn. This system obtains for three-years, when the whole is trenched, and a goodcoating of manure applied, the ground being planted the following spring with early Potatos or early Cauliflowers, which is cleared off by August, when it is again planted with Strawberries. Our soil being very shallow, and overlying gravel, I think it well to apply a winter-I may state that under this treatment wenever fail to get a heavy crop; even last year we had an exceedingly good one; and after repeated trials of many varieties I find, with Mr. McCallum, that Royal Sovereign and Vicomtesse Héricart de Thury respond to my treatment best. R. Kidd, Hope Park, Bonnybridge, Slirlingshire.

Acts provide that no repayment can be made, save in certain quite exceptional cases, unless the claim is made within three years. April 5 next is, therefore, the last possible day on which a claim for the year ended April 5, 1901, can be lodged. Claims for repayment can be made or various grounds in respect of income from all sources, even when said to be paid "free of income tax," and we shall be happy to advise any of your readers, without charge, whether or not they can make a claim for repayment, on receiving full particulars of their incomes, and a stamped envelope for reply. The Income-Tax-Adjustment Agency, Limited (W. J. Andrews, Secretary), Poultry, London, E.C., March 2, 1904.

THE VITALITY OF SEEDS. — With reference to the recent correspondence which has been appearing in the Standard on "The Vitality of Seeds," I feel sure the following will be of interest to your readers. "During last year a collection of vegetable and flower-seeds, specially packed in a sealed tin box, came into my possession at Dawson, Yukon Territory. The box and its contents, which had been given to a missionary in

1895, had been left unopened by him on leaving the Klondike in 1900, and for years these seeds lay amongst a lot of rubbish subjected to a winter below zero, followed by as much as 90° Fahrenheit below zero, followed by as much as 90° Fahrenheit each summer. Planted by me in 1903, these seeds grew perfectly well, a circumstance which not only throws light on the vitality controversy, but testifies to the fact not generally, I believe, realised by people in this country that Dawson, situated as it is in a portion of Canada almost within the Arctic Circle, is yet not entirely a barren waste from a horticultural point of view. C. C. Chataway."

To this Mr. Martin Sutton appends a note as follows :-

"Some five-and-twenty years since I read a Report, written early in the nineteenth century, from an Indian Government official, calling attention to the fact that he had had seeds raised by his gardener in his English country home for his use in India; that while some of these seeds had proved excellent, others were absolutely worthless. On enquiry he found that in the one case the pods containing the seeds had been hung up in the chimney corner of the kitchen of the English mansion for some time and the seeds placed while warm in bottles and sealed. The seeds that failed, although dried in a similar way, had not been bottled for a considerable time afterwards. This hint was sufficient to start me on a long series of experiments, having for their object the safe elimination of the excess of moisture which all seeds contain as harvested in the English climate, however dry they appear when handled. This moisture has been a cause of very great trouble when English seeds, packed in hermetically sealed boxes, passed through the tropics, where the heat in the ship's hold caused the seeds to sweat and become mouldy. Naturally, I found there was a very great diversity in the amount of such moisture contained in the different varieties of seeds, and that, while some seeds could safely lose an amount of moisture equal to ten per cent. of their weight, others could not part with more than five per cent. without injury; consequently, the degree of dry heat to which seeds could be safely exposed, and the proper duration of such exposure before packing, varied very much, while some seeds required much more gradual desiccation than others. But before the experiments were completed, knowledge on these details was acquired, with the result that there seems hardly any limit to the period during which the germination of seeds may be conserved if they are properly prepared by drying in a suitable high temperature and hermetically sealed in that temperature. For many years past, seeds thus packed by my firm have been successfully used in all climates, and have been successfully used in all climates, and the box Mr. Chataway mentions was one of those which every agent of the Church Missionary Society, the London Missionary Society, and the Baptist Missionary Society receives annually, containing seeds for his personal use in Mission gardens from the Tropics to the Arctic Circle. Martin J. Sutton, Reading, February 23."

LAURELS AND TELEPHONE - WIRES. — Last February I planted a bank, previously covered with grass, with three-year-old transplanted Laurels that were well rooted. The bank contained five rows of plants. After a few weeks the foliage of the plants in the second and third rows commenced to fall in an alarming manner. from a hose-pipe was applied frequently during the few days of fine weather in early summer, but without effect so far as the loss of foliage was concerned. At the present time the plants are mere skeletons; the old wood is quite sound. The young wood I cut well back in the latter part of April. The first row and the fourth and fifth are all right, and have become well established; yet the foliage of these in places has the appearance of being burned, as if by some caustic substance. Directly over the two rows that have suffered so much are twenty or thirty telephone-wires (20 feet or so high). Is it possible these wires are responsible for the failure of the two rows? Most of the wires are new, having been put up since the bank was planted. Have any readers of the Gardeners' Chronicle experienced anything of the sort? Vanda, Yorkshire.

THE PROPOSED GARDENERS' ASSOCIATION.—One of the most lamentable incidents in the gardener's career is one that happens to a great many at one period or other, viz., the weary waiting for and the constant striving to obtain another place. If the Association can remedy this state of affairs, then it will be a boon to the gardening profession. Mr. Owen Thomas would exclude gardeners who haveless than five men under them. This would be unfair, as there are many gardeners in smaller places who are equally as intelligent and have as much love of their profession, whose knowledge and abilities are far beyond what is demanded in the place they happen to fill, having heen trained in the greater establishments. But what have they in common with us? The Commercial Gardeners' Association should be a separate branch for the interest and benefit of those in trade establishments. Mr. Watson's apsech is sanguine and enthusiastic, but his remark that gardeners are themselves to olame for the low state of wages is hardly norme out by facts. If an employer or his agent atpulates a certain yearly salary, the gardener who is an applicant must either accept those terms or lose the appointment. Mr. Watson truly says there is a great amount of inefficiency in the gardening fraternity; but there are also gardens which are under-manned, and which from constant changes of gardeners have become most disorderly. In such places many gardeners of ability submerge their lives in constant and unremitting toil, and obtain little or no encouragement. The bothy system is undoubtedly at the root of this congested state of our calling. Why have some gardeners a preference for young men? Labourers can do much of the work equally as well, if not better, and are more settled. F. Street, The Gardene, Ardwell, Wigtownshire.

— To prevent confusion (with other societies), and to include all branches, might not this be called the

of the work equally as well, if not better, and are more settled. F. Street, The Gardens, Ardwell, Wiglownshire.

— To prevent confusion (with other societies), and to include all hranches, might not this be called the National Horticultural League? Could it not be managed by twenty-one or more Councillors, who would meet once a quarter, and form committees to deal with the various subjects in detail. These to a great extent must be local men (London), and would meet as occasion required, work up reports, &c., to be brought before the quarterly meeting (of Council). Rules ought to be few at first, for they can always be improved upon and added to. Councillors and all officials should have been engaged in horticultural pursuits for at least ten years, other members not less than seven years. Subscriptions should be if possible as low as 22. 6d. per annum. All head gardeners, nurserymen nursery and market foremen who have held appointments for at least five years, and whose wages have been equivalent to a minimum of 30s. per week, should be able to join, for the first year at least, without nomination. All others eligible to become members to be proposed by two members and elected by the Council. The other questions, such as hours of working, wages, examinations, &c., ought not to be brought forward till an Association has been formed. These and other important questions should then be taken up by the Council, who might, perhaps, invite a lew outside members interested in particular subjects to give opinions, &c., at committee meetings. Perhaps the most important of them ought to be brought before the membere at annual or other meetings, so that all members may feel directly interested in making and huiding up the Seciety. If a Council of practical men can be selected, who are willing to devote considerable spare time to the cause, success must follow, and good truits be produced in due season. William E. Close.

SOCIETIES.

ROYAL HORTICULTURAL. Scientific Committee.

MARCH 8 .- Present: Dr. M. T. Masters, F.R.S., in the chair; Messrs Chitteoden, Nicholson, Michael, Veitch, Bowles; Drs. Rendle and Cooke; Revs. W. Wilks and G. Henslow, Hon. Sec.

Lobelia nicotianæfolia -A fine plant was exhibited by Messrs. PAUL & SON, Cheshunt—a native of Neilgherry Hills and Ceylon. The flowers were white, but the figure (Botanical Magazine, tab. 5587, 1886) shows them pale violet-coloured. A Botanical Certificate, proposed by Mr. Veitch and seconded by Mr. Chittenden, was unanimously awarded to Messrs. PAUL.

Jasmine with Tuberous Growths .- Specimens received from Mrs. STREET, Woodside, Caterham, were examined by Mr. SAUNDERS, who reports as follows :-" It is difficult to account for the growths, as there are no sigos of insect or fungus. Growths of a similar appearance occur on the roots of Roses, being caused by the irritation set up by ants."

Palms and Scale Insects -Mr. HALL, of Mowbray Park, Sunderland, sent some specimens, upon which Mr. SAUNDERS reports:—"The insects unfortunately arrived in a bad condition. (1) a parasitic fly (?), nearly allied to the Ichneumons; (2) undiscoverable; (3 and 4) two-winged flies (fam. Mycetophilidæ), or fungus gnats, as the grubs feed on fungi or decaying vegetable matter; they are of no importance; (5) scale insects, but so covered with germs as not to be identifiable.

' NATIONAL FRUIT GROWERS' FEDERATION.

MARCH 14 -The monthly meeting of the Council was held at the Westminster Palace Hotel on Monday last. Colonel Long, M.P., took the chair, but, being compelled to leave at an early stage of the proceedings, his place was filled by Mr. F. S. W. Cornwallis, the President-Elect.

A letter was read from Messrs, W. & H. Bracey, of Martham, near Great Yarmouth, respecting their claim against the Midland and Great Northern Railway Companies under owners' risk, which had recently been tried in the Yarmouth County Court, where a verdict was given in their favour, but against which the railway companies appealed. As the Board of General Managere have promised to further consider and define the Conditions of conveyance of fruit at owners' risk the conditions of conveyance of fruit at owners' risk, and as the matter is also being dealt with by the Departmental Inquiry, it was decided to defer the conalderation of Messrs. Bracey's case.
A discussion took place on the question of Preferen-

tial Rates, which was raised by an Instruction to the Committee in the House of Commons on the Lancashire and Yorkshire Railway (Steam Vessels) Bill, to be moved by Sir W. Tomlinson after the Second Reading.

The lostruction reads as follows:

"That it be an Instruction to the Committee that they insert provisions in the Bill requiring the Lancashire and Yorkshire Railway Company, in respect of any through rates for the carriage of merchandise between foreign countries and places in the United Kingdom which the Company make or charge, or to which they are party, to set out in their public rate-books at the ports of Goole and Hull, and any ports which may be hereafter established between those places, how much of each such rate is justly and reasonably appropriated by them, or is paid, payable. or agreed to be paid to or by them for (1) land carriage abroad; (2) dock, harbour, and shipping charges abroad; (3) conveyance by sea; (4) dock, harbour, and shipping charges at the British port; (5) and conveyance by railway, either by goods or passenger trains, ior luding any terminal and cartage charges in the United Kingdom." United Kingdom.

The Council passed a resolution fully approving of this Instruction, and calling on all Memoers of the House of Commons who are members of the Federation to support it.

The next meeting of the Council was fixed for Monday. April 18, and the annual general meeting for May 9.

THE UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

MARCH 14.-The annual meeting of this Society was held at the Caledonian Hotel, Adelphi, London, on the above date; Mr. HORACE J. WRIGHT in the chair.

Never in the history of this organisation has the Committee been able to place before the members a more gratifying report, as on every hand there are signs of substantial progress. The actual gain in membership during the year was fifty, giving a total of 1 016. As far as it goes this is satisfactory, but it does not go far to prove the anxiety of the your g gardeners of the day to make substantial provision for their old age. It is probable that hundreds of men know nothing of the "United" beyond the mere name, and those in rural districts, if they join a benefit seciety at all, which is by no means certain, are attached by one of the general associations, which cannot provide similar advantages to those which accrue to membership of the Society which was established by gardeners for gardeners, and for whose benefit it is still maintained. The organisation is a benefit society and a bank as well, and in this bank the depositor secures a higher rate of interest than is given by any (except one or two) of the reputable banks of the country.

The sum of £1,800 has been invested during the last

year, which goes to swell the total of the funds to £22,018 12s. 7d., which justified the chairman in describing the financial position as impregnable. A little upwards of £300 was disbursed in sick pay, this involving a levy of 7s. 2d, from members paying under involving a levy of 18, 2a, from hembers paying under the society's higher scale, and 48, 10d, from those under the lower scale. About £130 have been paid from the Benevolent Fund during the year, and the Convalescent Fund distributed £1108, between three applicants. This is given in sums of 10s, a week, and it appeared to be the one thing for which the Chairman had small respect,

he evidently considering that it could not be of material advantage as disbursed at present.

In moving the adoption of the Report the Chairman was emphatic in praise of the secrety and its management, and failed to understand why the young gardeners of the kingdom did not rush to join its ranks. As they did not do so he urged the acciety to advertise the substantial claims of the "United." but recognised the difficulty of finding adequate means of distributing reliable knowledge.

Mr. Chas. H. Curtis seconded the adoption of the

Report and Balance sheet, which was carried without dissent. It was resolved to print and distribute 3,000 copies of the Report.

ROYAL BOTANIC.

MARCH 16.—An exhibition of plants and flowers was held by the above Society in their gardens at Regent's Park on this date, many in eresting exhibits being brought forward. Held in the conservatory, and with more suitable surrouncings than are the exhibitions of the Royal Horticultural Society at the Drill Hall, the plants and flowers presented themselves to greater advantage, to which the increased light added not a little.

One of the finest stands at the show was that set up by Mesers WM. CUTBUSH & SON, nurserymen, Highgate, London, N. Their contribution extended the entire width of the great conservatory and consisted of forced shrubs and plants, with a variety of Alpine and spring bulbous flowers on an adjacent table. Standard, bush, and pyramid forms were arranged to the best effect, and the colours were blended. The Alpines included some fine blooms of Iris Haynii (Gold Medal).

Mesars. B. S. WILLIAMS & Son, of Upper Holloway, London, N, staged a similar group of forced plants, prominent amought which were some fine standard plants of Prunus triloba and Viburnum Opulus. Dwarfer plants, such as Azaleas, Lilacs, &c., with a suitable setting of foliage, completed a very fine group (Silver Meda)

Camellias comprised the main feature of the group arranged by Messrs. WM. PAUL & SON, Waltham Gross, and come fine plants of Clematis indivisa lobata were worked in with good effect. Amongs the Camellias, C. alba plena and fimoriata, fine whites; Mathotlana, fine dark red, with flowers of good form; Marchioness of Exercer, salmon-pink, and imbricata were noticable. Among the single section we noticed Kotope and Lady Ackinnon, the latter having petals splashed with white. Some new varieties were presented for Award, of which the varieties Mercury and Jupiter were awarded Certificates (Silver-gill Medal).

A really credia de exhibit of Cyclamen Laifolium.

A really creditable exhibit of Cyclamen latifolium was brought by Mr. Joun May, Gordon Nursery, St. Margarets, Twickenbam. The colours were of various shades, and the plants were well-grown specimens (Silver-gilt Medal).

Another group of Cyclamens was exhibited by Mr John Odell, Co.ham Green, Hillingdon, Uxbridge, but although they contained plants well flowered and of good colours, they suffe ed by comparison with the former show. The group was very extensive, and, together with some good Primu as, was awarded the Large silver Meual.

Messrs John Laine & Sons, The Nurseries, Forest Hill, London, exhibited Begonia gigantea, carminata interspersed with Ferns, and B. argentea guttata, having a batch of Asparagus sprengeri forming a pleasing shower along the front (Brunze Medal).

Messrs. Bakk & Sons, King Street, Covent Garden, displayed a group of Alpines, flacked at either end with varieties of Narcissus of home in vases. Some fine forms of Primula obconica were included, a variety Crimson King being of a striking colour; Fritillarias, Hepaticas, Scillas, Saxifrages, &c., were all shown well (Silver-gilt Medal).

Mesers J. HILL & Son, Barrowfield Nurseries, Lower Edmonton, had a very interesting group of Ferns, comprising some rare and interesting apecies, well grown, and of good colour (Silver-gitt Medal).

grown, and of good colour (silver-gill Medal).

H. T. Pitt, E.q. (gr., F. W. Thurgood), 57, Stamford Hill, Loodon, N., had a display of Orchids (Gold Medal). Many genera were represented, including some good Odout glossum crispum varieties, O. c. Persimmon, O. Adrianæ Cobbianum O. cordatum. Of Cypripediums, C. Curtisii, C. Chamberlainianum were eapecially good. Cymbidium granoiflorum was fine. Some good Cattleyas and Læ io-Cattleyas were included, also C. Enid maguifica, large petals with a fine rose coloured lip; C. Trianæ Our King; L. C. Digbyano Mossiæ, a pleasing light-pink colour with fimbriated llp, marked with a red line on a yellow ground; O. c. Stanley James Pitt received a Floral Ceruficate.

Mr. Thos. S. Ware. Feltham, Middlesex, showed cut blooms of Narcissus, including many of the best varieties.

warieties.

Messrs. W.M. Bull & Sons, King's Road. Chelsea, staged a group of Azaleas and Palms (silver Medal).

GARDENERS' DEBATING SOCIETIES.

CHESTER PAXTON.—The Curator of the Grosvenor Museum (Mr. Robt. Newstead, A.L.S., F.E.S., &c.), gave a lecture on "New and Noteworthy Pests and Parasites," on the 5 h is st. The introductory part of the lecture was devoted to a de-cription of the external characters of some typical insects. Life-histories of the noteworthy pests wore given special reference heing made to those occurring in the county of Cheshire. These iccluded the Crane-fly, the larva of which is ganerally known as the "Leather Jacket." Observations with regard to the last-named were made on the golf links near Chester, where many acres of grass were completely destroyed. The White Clover, however, proved immune, and not a particle of the

plants was found in any way injured. The comparatively new Potato-disease, which has proved so destructive to the tubers in certain localities in Cheshire, was dealt with; experiments proved that the disease readily perpetuated itself if infected tubers were planted. The lecture was illustrated by lantern-pictures, and a series of specimens of the various pests and examples of the injury caused by the latter.

REDHILL, REIGATE, AND DISTRICT.—On March 1, Mr. Magner gave a very interesting lecture on the "Ventilation of Greenhouses" The lecturer said it was not possible to grown healthy plants without ventilation and other sanitary conditions. In ventilation the principle advocated was, that air should be warmed before it reached the plants. A good discussion followed. A hearty vote of thanks was accorded Mr. Magner for his lecture. Mr. Blackwood showed an abnormal flower of Richardia æthiopica.

CROYDON AND DISTRICT.—This society held a meeting on Tuesday, March 1, when a paper was read by Mr. W. HARRIS on "Hardy Summer and Autumn Bulbs." In opening his subject the lecturer alluded to the apparent neglect of many of these beautiful flowers, which for heauty and fragrance are unsurpassed. Passing onto the Gladiolus, he discoursed on the treatment required by these showy plants, which rank high as herbaceous border flowers. The Raquiculus, Ixia, Sparaxis, Fritillarias, Alstromerias, Montbretias, Tigridias, Crocosmias, Colchicums or Meadow Saffron, Sternbergia, Zephyranthes or Zephyr Flower, and Cyclamens were amongst some others mentioned, and for each species cultural directions were given. A discussion followed. A hearty vote of thanks was given to Mr. Harris for his paper.

HULL HORTICULTURAL.—Mr. Clayton, of Grimston Gardens, Tadcaster, read a paper on "Gardens and their Management" hefore this Society on Tuesday, March 8; Mr. J. P. Leadbetter in the chair. The essayist referred to the antiquity of gardens. The making of gardens probably received its greatest stimulus during the Victorian era when there was great wealth in the country. Speaking of public gardens, he was of opinion that much money now directed to other channels could be utilised to more advantage in these places. Mr. Clayton gave some sound advice on the relations between employers and employes, and expressed an opinion that young men should commence at the bottom and work upwards, not neglecting a thorough grounding in the kitchen-garden and other outdoor work, for the more alluring department under glass. W. R.

DEVON AND EXETER GARDENERS'.—The meeting held on the 9th just, was an open one Por convenience the place of meeting was in the lecture-room of the Royal Albert Memorial College, and the lecture was illustrated by lime-light pictures thrown on a large screen. The lecturer was Mr. Ralph Morgan, a local hotanist and science student, the subject being "Insectivorous Plants," such as Droseras, Dioneus, Nepenthes, Sarracenias, and similar well-known subjects.

CHISLEHURST GARDENERS'.—On Tuesday, March 8, Mr. A. Hemsley gave a very interesting lecture upou "Rock and Alpine Planta," illustrated with lanternstilder. Many pictures of Alpine scenery, together with views of rockeries (both natural and artificial) in this country, were thrown on the screen. The whole lecture was full of valuable information regarding the formation and management of the rock garden, and a profitable evening was spent by those interested.

LIVERPOOL HORTICULTURAL. — On Saturday, March 12, Mr. Sherry, Botanic Gardens, delivered, the last lecture of the session in connection with the above Society before a good attendance of members. "Troublesome Pests under Glass" was the subject dealt with, and the life-history of beetles, thrips, redspider, and mealy-bug was fully explained. Remedies for trapping and killing these insects, which the lecturer had adopted successfully, were described. At the conclusion a brisk discussion took place in regard to eradicating mealy-bug and red-spider, several members advocating washing the rods when in a dormant state ten or twelve times with soft-soap. &c. A novel idea was brought forward by Mr. Hazelton, that of placing sulphur in frying-pans over ordinary portable oil-stoves to jet rid of thrips and spider.

READING AND DISTRICT.—The last fortnightly meeting of the above Association was held to the Abbey Hall, and there was a good attendance of members, Mr. W. Barnes presiding. Mr. J. Crook, of Forde Abbey, Chard, gave a most interesting lecture on "Spring Flowers," confining himself principally to the Snowdrop, Narcissus, Primrose, Iris, Myosotis, Anemone, and Chionodoxa. He strongly advocated that these should he planted in as natural a manner as possible, doing away with all formality in their arrangement, and growing them as far as circumstances would permit in the grass. The exhibits consisted chiefly of spring flowers.

Obituary.

WALTER HILL .- I regret to have to inform you of the death of one of your constant readers, Mr. Walter Hill, who died, at the age of eighty-three years, on the 4th inst. He was the first Colonial Botanist and Director of the Brisbane Botanic Gardens. Since his retirement in 1881, he has been living upon his property about eight miles from Brisbane, where he devoted his attention to the introduction of fruits, and in some instances met with remarkable success, especially with Japanese Plums, which he has freely distributed among growers. Mr. Hill was always more of a gardener than a botanist, although in the early days of the Colony he collected the indigenous plants and forwarded specimens of them to Kew, and to Baron von Mueller for determination. However, the economic interest was always uppermost in his mind, thus in his early days at the Gardens might be seen plots of a vast number of economic plants; and doubtless this was the means of starting in the minds of a number of colonists the idea of planting such plants, many of which he either imported himself or they were imported at his suggestion. This is enough to show that his life at the Botanic Gardens was a busy and useful one. His official duties often caused him to visit distant localities, and on his travels he made a point of collecting specimens of the indigenous flora. Several botanists have attached his name to plants, of which probably the most important are the following :-

important are the following:

Keraudrenia Hillii, F. v. M., a pretty Sterculiaceous under - shrub with blue flowers; Tecoma Hillii, F. v. M., a beautiful climber; Grevillea Hilliana, F. v. M., a handsome tree, producing a useful wood for the cabinet-maker; Musa Hillii, F. v. M., an indigenous erect - fruiting Banana (vide Botanical Magazine, 7401); Dendrobium Hillii, Hook. f. (now placed as a variety of D. speciosum), a superb Orchid; Myıtus Hillii, Benth., which forms a beautiful tree with a thin smooth bark, the wood being so extremely hard that few axes will cut it, hence its vernacular name "Scrub Ironwood;" Syncarpia Hillii, Bail., the Peebeen or Fraser Island Turpentine, a very large tree producing one of the most valuable of our hard woods; Platycerium Hillii, Polypodium Hillii, Baker, a somewhat rare Fern useful for clothing damp rockwork; Ectropothecium Hillianum, Hampe—this little moss being the most humble plant that bears the name of the deceased colonist.

Standing at the grave-side yesterday at his funeral, I noticed several old acquaintances and the sons of former friends of the deceased, as well as several nurserymen and gardeners. It was refreshing to find that all those present remembered and spoke only of the good which had been done by Mr. Hill. It was in fact a company of mourners—no pomp, no show, which was a great relief from that usually displayed at such gatherings. F. Manson Bailey, Brisbane, Queensland, February 7.

SAMUEL AINSWORTH. — On Saturday last, there passed away at Kilburn, in the person of Samuel Aiusworth, an interesting old link in the seed trade. Originally intended for a doctor, he studied for his degrees in London, but never practised, having become connected with the late James Carter, at that time at the height of his fame as a seedsman. Mr. Ainsworth's knowledge of foreign languages including Latin, brought his services into request in the compilation of the scientific section of the exhaustive catalogues for which Mr. Carter had a reputation. In those days he was also an active member of the Floral Committee of the Royal Horticultural Society, and frequently occupied the Chair. About 1870, Mr. Ainsworth took a trip round the world, and on returning, again found a position in his old firm, where he remained in harness until last year—his association with Messrs. James Carter & Co., of High Holborn, having extended over a period of more than fifty years. Those of the old school still left will remember "Sam" Ainsworth as a hearty and cheery individual, and one of those men who could never have made an enemy.

DAVID DRUMMOND.—The death is reported of Mr. David Drummond at Dublin, age 91; founder of the firm of Drummond & Co., Nurserymen.

MARKETS.

COVENT GARDEN, March 16.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the prin-Thursday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but often several times in one day, Ed.] day. COVENT GARDEN FLOWER MARKET.

WITH a brighter week trade has revived a little, and WITH a brighter week trade has revived a little, and growers have been tempted to set d in larger supplies. Messrs. T. Rochford & Sons have kept their stands clear of large Palms for some time, but last week they made a fresh start and had a fine lot of large specimens ou sale. There had been a little trade for them during the week, but on Saturday there were very few moved. Ferns now sell better, and with continued fine weather further improvement may be expected. No great improvement has yet been made in flowering plants. Cyclamens are very fine, but on saturday morning some remained unsold at closing time. Spireas are now remained unsold at closing time. Spliceas are now plentiful and are better flowered than earlier samples; plentiful and sre better flowered than earlier samples; Genistas continue good. Several growers have Cherarias in large quantities, and some are very good, those on Mr. Sweet's stands oring exceptionally bright. Some very fine pots of Lity of the Valley are now arriving. Indian Azaleas are plentiful. A lew double scarlet Pelargoniums are also coming in, but they are not of first quality, being rather tail. Hardy llowering plants include Lilaes, Pyrus, Prunus triloba, Prunus sinensis fi.-pl., and Deutzia Lemoinet. Azalea mollis is pleutiful and good; Genistas continue very good, but one or two growers who start early have now finished. Some of the finest flowered Erica Wilmoreana I have seen were in on Saturday, but the trade for these does not seem very brisk. E persoluta alba sells better; Hyacioths and Daffodils coutinue plentiful. plentiful.

CUT FLOWERS.

There is a considerable improvement in the cut-flower trade, and brightly coloured flowers are more abundant. Scarlet Pelargonium is lower in price. Car-nations are also cheaper, the supply of bright colours being considerably sugmented, the American varieties with long stems now being a leading feature. A few Malmaisons are to be seen, but they are not of high quality. I have notyet observed any good yellows. One salesman had some very fine English Violets, which salesman had some very fine English Violets, which were making 6s. per dozen bunches, with six blooms only in a bunch. Ordinary blue Violets continue plentiful, also Parma Violets.

plentiful, also Parma Violets.
Of Orchids, Odonteglossums, Dendrobiums, Ceelosynes, and a few Cypripediums are still to be seen. Some good Cattleyas are also arriving, but they are not yet very plentiful. Eucharis, Gardenias, White Azalea, Liliums, Callas, and Lily of the Valley, vary but little. Daffodils continue to come in from all sources in fine quality. Roses are now getting very plentiful, Caroline Testout on long stems with good foliage is very fine; also Catherine Mermet, Bridesmaid, and the Bride, the strong stems giving this a great advantage over Niphetos; but this good white Rose will take somethic g very good entirely to supersede it for many purposes, and very fine blooms are sede it for many purposes, and very fine blooms are now coming in. Anemones are now a great feature, the St. Brigid varieties are very fine, A. stellata double and single, and the scarlet fulgens. Large quantities of scarlet Coronaris are also seen; Ranunculus flowers lo several colours are very good.

FRUITS AND VEGETABLES.

SEEDS.

LONDON, March 15 - Owing to finer weather, we have to report an increased demand for agricultural seeds. Red Clover, White Glover, and Alaske remain unchanged in value. Lower grades of the new crop English Trefoil are being sold at easier rates. Perennial and Irish Italian Rye grasses are also essier, owing to forced sales by dealers. Hurst & Son, 152, Houndsditch.

CORN.

THE WEATHER.

GENERAL OBSERVATIONS.

THE FOLLOWING SUMMARY RECORD of the weather

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending Mar. 12, is furnished from the Melcorological Office:—
"The weather during this period underwent many changes, especially in the south. It was, on the whole, fairer than of late, and at about the middle of the week brilliantly fine in nearly all districts. Thunder was experienced on Wednerday at Clitton, Portland

Bill, and in London.

The temperature was below the mean generally, but "The temperature was below the mean generally, but owing to some biga readings on Tue-day and Wednesday, it just equated the normal in England, 3, and E. and the Channel Islands. The highest of the maxima, registered as a rule on the 8th or 9.h. ranged from 60° in England, 8, and the Midiand Counties (London, Southampton, and Oxford), to 51° in Scotland, W. and Ireland, N., and to 48° in Scotland, N. The lowest of the minima occurred towards the end of the week, except at some Scotch stations. In Scotland, N., the thermometer feil to 21°, and in England, E., the Midland Counties, and Ireland, N. to 23°, elsewhere the readings ranged from between 24° and 26°, except in the Channel Islands, where the thermometer fell no lower than 38°.

"The rainfall was less than the mean generally, but equal to it in England, N.E, the Midland Counties, aud England, S.E

aud England, S.E. "The bright sunshine was more abundant than for many weeks past, and exceeded the mean in almost all districts. The percentage of the possible duration ranged from 47 in the Channel Islands, 42 in Iroland, N., and 40 in England, S.W., to 27 in England, N.E., and 22 in Scotland, N. At Bournemouth and Jersey the percentage was as high as 54, and at Aberdovey as 55.

THE WEATHER IN WEST HERTS.

Six consecutive rainless days .- The first day of the past week proved very warm for the time of year, the temperature in the thermometer screen rising in the middle of the day to 59°. Owing to the previous cold spell, which had lasted exactly a fortnight, it was difficult on that oceasion to believe that the thermometer had not
