## SEASONAL SUPPLIES OF ALL FRESH FRUITS <br> Unloads at 19 Markets, 1954 *

> (NEW YORK, LOS ANGELES, CNIGAGO, PNILAOELPNIA, BDSTON. OETROIT, PITTSBURGN, CLEVELAND, BALTIMORE, ST. LOUIS, ATLANTA, SAN FRANCISCO, DALLAS-FT. WORTN, DENYER, KANSAS CITY (MO.), OAKLANO (CALIF.) SEATTLE, WASNINGTON (O.C.). ANO NEW ORLEANS.
U. S. DEPARTMENT OF AGRICULTURE

Unloads of fresh fruits in 19 metropolitan markets in 1954 give a good indication of supplies throughout the year. Shipments ranged from more than 18,000 cars in January, February, and May to more than 24,000 cars in June and August. Total supplies were
seasonally the largest during summer and early fall, the harvest period for most deciduous crops. About 63 percent of the shipments were by rail, boat, and air and the remainder by truck.

## SEASONAL SUPPLIES OF FRESH CITRUS AND NONCITRUS FRUITS Unloads at 19 Markets, 1954*

* New york, los angeles, chicago, philadelphia, boston, detroit, pittsburgh, cleveland, BALTIMORE, ST. LOUIS, ATLANTA, SAN FRANCISCO, DALLAS-FT. WORTH, DENVER, KANSAS CITY (MO.), OAKLAND (CALIF.) SEATTLE, WASHINGTON (D.C.), AND NEW ORLEANS.

## SUMMARY

Supplies of most deciduous fruits harvested during late summer and early fall probably will be somewhat larger than a year earlier and homegrown and local supplies of fruit will be seasonally abundant. Continued strong demand for fruit during the next few months is in prospect. Under these conditions, the level of prices for fruit probably will dip seasonally as usual and then turn upward in late fall.

The 1955 deciduous crop is expected to be moderately larger than the 1954 crop although not quite up to the average for $1944-53$, according to the August 1 crop report. Production is indicated to be larger this year for all major deciduous fruits except peaches, apples, and California dried prunes. But prospective production of peaches and apples is larger this year in many States which harvest heavily from mid-summer on. The California clingstone peach crop, used mostly for canning, is about 4 percent larger. Apple production in many States that store heavily for marketing later in the season also is up.

Total production of almonds, filberts, pecans, and walnuts in 1955 is expected to be about 8 percent under 1954 and 16 percent below average. Prospective production of walnuts is a little larger than last year, but that of the other tree nuts is indicated to be smaller. The pecan crop is light for the second successive year, and supplies will be much smaller than usual.

Supplies of California Valencia oranges are expected to continue heavier, at generally lower pirices, this summer than last. Supplies of grapefruit, now mostly from California, will continue seasonally light until new-crop fruit from Florida is available in volume in October. About one-fifth of the California lemon crop remained to be marketed after August 1. The volume was a little larger than a year earlier. But stocks of frozen concentrate for lemonade were smaller. In early August, production prospects for the 1955-56 citrus crops were fairly favorable.

The 1954-55 packs of Florida frozen and canned citrus juices were 1 and 18 percent smaller, respectively, than those of the preceding season. Stocks of frozen orange juice, mostly concentrate, on August 1 were about 6 percent less than a year earlier. Stocks of Florida canned citrus juices were 30 percent smaller.

A small increase in the 1955 pack of frozen fruits seems likely. Some increase in the pack of dried fruits also seems probable. The total pack of canned fruits may not be greatly different from the 1954 pack which was the second largest of record.

## APPLES

1955 Apple Crop is Below
1954 Crop But Above Average
Production of apples in commercial areas of the United States was estimated as of August 1 at $107,389,000$ bushels, 2 percent smaller than in 1954 but about 1 percent above the 1944-53 average. Production was cut severely in a number of the central and mid-Atlantic States by spring Ireezes. Apples from these States usually provide much of the supplies during summer. In the Pacific Coast States and New England, production is considerably larger than in 1954. The Washington crop alone is up 35 percent. In New York and Michigan, the prospective crops are slightly larger than last year. These heavy-producing States store much of their crops for sale during fall, winter, and spring. This means that supplies during this period of 1955-56 may be somewhat larger than in the same period of 1954-55.

## Heavier Stocks of Canned Apples and Applesauce

Packers' stocks of canned apples on July 1, 1955 were 1,292,828 cases (basis 6-10's), more than 5 times the light stocks of a year earlier. On the same date, packers' stocks of canned applesauce vere 3,201,774 actual cases, more than 3 times the medium-sized stocks a year previously. The July 1 stocks of canned apples were equal to about 27 percent of the 1954-55 pack of 4,709,392 cases and those of canned applesauce to about 21 percent of the pack of $15,294,224$ cases. These percentages are somewhat higher than those of 2 of the 3 immediately preceding years, for which comparable figures are available. Stocks of canned applesauce held by wholesale distributors on July 1, 1955 were 1,332,000 actual
cases, up 18 percent. With the heavier stocks and lighter apple crops in the northern Appalachian area where much of the canning is done, smaller packs of canned apples and applesauce seem probable in 1955-56.

## Early-Season Prices Unsteady

With production smaller in the early producing States, marketings of apples were lighter during June and July than in these months of 1954. In Celifcrnia, where the Gravenstein crop is smaller this year, much of the crop is again going to processors. Prices at local markets in July have tended to be unsteady and to vary considerably among varieties.

## PEARS

Increased Production in Pacific Coast States
More Than Offsets Reductions in Other States
The 1955 crop of pears was estimated as of August 1 at 30.9 million bushels, slightly larger than the 1954 crop but nearly the same as the 1944-53 average. Production of Bartlett pears in the three Pacific Coast States amounts to about 20.9 million bushels, up 2 percent, and that of other varleties to 7.3 million, up 25 percent. Bartletts not only comprise a large part of fresh market sales in summer and fall but also are the principal variety canned. With the heavy increase in other varieties on the Pacific Coast, larger supplies will be available next fall and winter for fresh use and export. In States other than the Pacific Coast, estimated production of 2.7 million bushels is about 1.3 million bushels under that of 1954.

Prices in July Bigher
Than a Year Earlier
Harvest of California Bartlett pears started a few days later this year than last. With production smeller, carlot rail shipments of pears from California were considerably lighter by August 13 than a year earlier. Partly for this reason, prices for early-season sales on the New York and Chicago auctions averaged higher than in most comparable weeks of 1954. In California, prices received by growers for Bartletts for canning vere about the same in early August as a year previously. Prices for Hardys for canning were about the same as those for Bartletts. Prices received by growers for all varieties of pears for fresh use averaged moderately higher in July 1955 than in July 1954.

Increased Stocks of

## Canned Pears

Stocks of canned pears held by packers on June 1,1955 were about 1,587,000 cases ( $24-2 \frac{1}{2}$ 's), 80 percent larger than on June 1, 1954. These stocks were equal to approximately 20 percent of the record 1954 pack of 7,775,000 cases. Wholesale distributors' stocks of canned pears on July 1 , 1955, were about $1,146,000$ actual cases, 17 percent above a year earlier.

## 1955 Peach Crop is

Lightest Since 1943
Production of peache: in the United States in 1955 was eitimated as of August 1 at $47,830,00$ ) bushels. This is 22 percent small $r$ than in 1954, 30 percent under tae 1944-53 avera3e, and the smallest since 1943. Most of the reductic $n$ is in the Soutiern States and in other States marketing early in the siar on. In many of the important producing States which market heavily in Auf, ust and September, the crops are nearly as large as or larger than in 1954. This means that supplies of fresh peaches during these months probably will not be greatly different from those last year.

In the Pacific Coast States, which grow most; of the peaches that are canned commercially, total production is a lit';le larger than last year. The California clingstone crop, grow mostly for cenning, was estimated at $20,085,000$ bushels, up 4 percent. But the freestone crop of 10,793,000 bushels, part of which also is canned, is down 10 percent. This year this State is producing about 65 percent of the total crop in the United States.

Prices for Peaches in
June and July Much Higher
Than a Year Earlier
With supplies of fresh peaches in June and July much lighter than in these months of 1954, prices received by growers averaged considerably higher than last year. Most of these early peaches were from California. Rail shipments from this State by August 13 were about 14 percent larger than a year earlier, mainly because of the deficiency of fresh peaches from the Southern States and other early shipping areas.

In late July as sales from Northern States began and shipments from California increased, prices at shipping points in California declined considerably, but in early August still averaged somewhat higher than a year previously. During the rest of the season, demand for peaches is expected to continue strong and prices probably will average above a year earlier. In California, average prices received by growers for clingstone peaches for canning are considerably higher than a year ago.

## Smaller Carryover Stocks

## of Canned Peaches

Packers' stocks of canned peaches on June 1, 1955, were about 1,046,000 cases ( $24-2 \frac{1}{2}$ 's), 69 percent under a year earlier. Wholesale distributors' stocks on July 1 were about $2,557,000$ cases, much the same as a year previously. With stocks down and production up, especially of California clingstone, the total pack of canned peaches this year may be heavier that the 1954 pack. Cold-storage holdings of frozen peaches on

August 1 were 10.3 million pounds, 11 percent smaller than a year earlier. On June l, 1955, packers' stocks of fruit cocktail and salad, of which peaches are an important ingredient, were 7 percent under a:year earlier. But stocks held by wholesale distributors on July 1 were about 28 percent larger.

## CHERRIES

Production of Sweet Cherries
Up Sharply, Especially in
Pacific Coast States
The 1955 crop of sweet cherries was estimated as of August 1 at 118,980 tons, 21 percent larger than the 2954 crop and 26 percent above the 1944-53 average. In the 3 Pacific Coast States, the crop of 95,500 tons is 34 percent larger than in 1954. In mid-August barvest in the late-producing States was nearing the end.

Auction prices during late May and early June, when shipments were lighter than a year earlier, averaged higher than in this period of 1954. But with heavy shipments since mid-June, prices frequently have averaged lower than a year earlier.

The California pack of canned sweet cherries in 1955 is about 515,601 cases, basis $24-2 \frac{1}{2}$ cans, nearly douible the 1954 pack. There probably also is some increase in the pacir in Oregon and Washington this year. In 1954, these 3 States accounted for approximately 90 percent of the total United States pack of 953,000 cases. Stocks of canned sweet cherries held by packers on June 1, 1955 were 270,000 cases, 24 percent larger than a year earlier.

The 1955 California brined cherry pack is 9,863 tons, 22 percent larger than the 1954 pack. About 59 percent of the 1955 pack was made from Royal Annes and the rest from other sweet varieties.

Heavier Crop of Sour
Cherrios in 1955
Production of sour cherries in 1955, was estimated as of August 1 at 150,590 tons, 40 percent larger than in 1954 and 29 percent above average. The increase is the result of much larger tonnage in the Great Lakes States.

Although figures on the 1955 packs are not yet available, they probably are much larger than the 1954 packs of $2,254,000$ cases ( $24-2 \frac{1}{2}$ 's ) of canned sour cherries, and $86,695,315$ pounds of frozen sour cherries. Packers' stocks of canned RSP cherries on July 1, 1955 were 107,000 cases, 7 percent smaller than a year earlier. Wholesale distributors' stocks on July 1 were 335,000 actual cases, 14 percent smaller. Prices recelved by growers for sour cherries for processing averaged considerably lower than in 1954.

During July the U. S. Department of Agriculture purchased 257,300 cases ( $6 \mathrm{No}, 10^{\prime} \mathrm{s}$ ) of canned red sour pitted cherries for use in the National School Lunch Program. These cherries were obtained from processors in Michigan, New York, Ohio, Fennsylvania, and Wisconsin, and are to be delivered during the period August 15 through September 10 to schools participating in the National School Lunch Program.

PLUMS AND PRUNES
1955 Plum Crop Larger
in Caforajen Emainer
The 1955 crop of fresh plums in California and Michigan was estimated as of August 1 at 85,100 tons, 8 percent larger than the 1954 crop but 2 percent under the 1944-53 average. The increase is the result of heavier output in California which more than offsets reduced tonnage in Michigan. The California crop of 81,000 tons comprises over 95 percent of the total.

## Pacific Northwest Prune Crop Up Sharoly in 1955

The 1955 crop of prunes in Oregon, Washington, and Idaho totals 108,7.00 tons, 61 percent larger than the short 1954 crop and 2 percent above average. Production is up considerably in all areas of these States this year. The larger Pacific Northwest crop thic year probably will lead to increased shipments to fresh markets in September. It also may result in larger packs.

The 1954 pack of canned purple plums was $1,593,000$ cases ( $24-2 \frac{1}{2}$ 's ), 24 percent larger than the relatively smail 1953 pack. Production of frozen prunes was $4,497,957$ pounds, 46 percent under the large 1953 pack. Packers' stocks of Pacific Northwest canned purpie plums on June 1, 1955 were about 501,098 cases ( $24-2 \frac{1}{2}$ 's), 52 percent larger than a year earlier. Cold-storage stocks of frozen plums and prunes on August 1, 1955 were about 4.6 million pounds, 1 percent above a year previously.

## Fresh Plum Shipments Larger; <br> Prices Lower Than in 1954

Shipments of fresh plums from Calffornia through August 13 of the 1955 season were about 14 percent larger than those of the same part of 1954. As shipments reached heavy volume in July, prices for the principal varieties on the New York auction dropped below a year earlier.

Smialler Production of Dried
Frunes in Cali:ornia in 1955
The 1955 crop of dried prunes in California, which supplies most of the pack, is estimated at 146,000 tons, natural condition, dried. 'This is 18 percent under the 1954 crop and 16 percent below average.

## $\frac{\text { Heavy }}{\text { Grape Crease }}$ in 1955

Production of grapes in 1955 was estiwated as of August 1 o.t 3,185,500 tons, 24 percent larger than in 1954 and 9 percent above the 1944-53 averase. The California crop of $2,966,000$ tons is 27 percent larger than the 1954 crop. Production in other States for which estimates are made totals 219,500 tons, 9 percent under 1954. The prospective crop in Michigan is down sharply because of freeze damage earlier in the season. However, above-average crops are expected in other important Great Lekes States. In Arkansas, the crop is half of the short 1954 crop. With generally favorable weather so far this season, the Washington crop, mostly concords grow for juice, is expected to set a new record of 58,000 tons, 86 percent larger than in 1954.

## Large Increase in Tonnage <br> Processed Seems Likely

The large increase in the California grape crop this year consists mostly of table and raisin varieties. Harvest and shipment of these grapes to fresh markets has been delayed because the crop is slow in maturing. Mainly for this reason, about 18 percent fever carloads had been shipped by August 6. But shiyrents are expected to be heavy during late summer and fall, and for the entire season probably will exceed those of the 1954 season. Even so, most of the increased production probably will be processed. With stocks of wine on June 30, 1955, as reported by the Internal Revenue Service, about 9 percent smaller than a year earller, there may be some increase in tonnage crushed, mostly for wine. In previous years, a reduction of this size in vine stocks has sometimes led to increased demand for grapes for crushing into wine to replenish stocks. However, much of the increased tonnage probably will be dried into raisins.

Production of raisins in 1954 was 167,000 tons, natural condition, dried. This was 28 percent under production in 1953 and 32 percent below the 1944-53 average. Even with this reduction, supplies were larger than usual domestic consumption. To assist in the marketing of the 1954 output; the U. S. Department of Agriculture operated an export-payment program, similar to those of previous years. Under the 1954-55 program, about 15,659 tons had been declared for export by August 13, 1955.

## Prices Declining With <br> Increasing Shipments

Because of the light shipments of fresh grapes in June, New York auction market prices for Thompson seedless grapes averaged higher than a year earlier. But with increasing shipments in early July, prices declined to levels under a year previously. At shipping points in California in mid-August, prices for seedless grapes averaged lower than a year earlier, but those for Red Malaga and Ribier averaged higher.

As usual, California Valencia oranges will comprise most of the fresh oranges marketed during late summer. The California crop this year was estimated as of July lat 23,$500 ; 000$ boxes, 31 percent larger than the small 1953-54 crop but 20 percent under the 1943-52 average. On August 1, about 12 million boxes of these oranges remained to be marketed, compared with less then' 9 million a year earlier. Harvest of California Valencias usually is not completed until November or December. Most of the 1954-55 crop of Florida oranges had been harvested by August 1, and relatively small quantities continued to be marketed in August. Supplies from the 1955-56 Florida crop probably will become available in September, as usual, but not attain large volume until October.

Lower Frices for Larger
Production This Summer
With sales of California Valencias heavier in July 1955 than a year earlier, prices received by growers and at terminal auctions averaged somewhat under the high levels of July 1954. Auction prices declined in early August to a level considerably below the relatively high prices of a year earlier. Stocks of canned orange juice held by Florida packers on August 1 were about 19 percent smaller than on that date in 1954. Cold storage holdings of frozen orange juice, mostly concentrate, were about 6 percent below a year earlier. Combined stocks of these two items, single-strength basis, were about 7 percent smaller. This will tend to reduce competition with fresh oranges during late summer and early fall.

Increased Exports of
California Oracges
Exports of fresh oranges from California, chiefly Valencias, under the 1954-55 export-payment program totaled about 2.1 million boxes by August 13, 1955, 5 percent larger than by that date in 1954. Exports of California concentrated orange juice were 19 percent heavier. The current program continues for both fresh and processed oranges. On July 30, 1954, the program for the 1953-54 season was terminated for fresh oranges, partly because of the lighter remaining supplies, but was continued for processed oranges.

## GRAPEFRUIT

Most of the fresh market supplies of grapefruit during September will come from the California summer crop, supplemented by small imports from the West Indies. Supplies will continue seasonally light until grapefruit from the 1955-56 crop in Florida is marketed in heavy volume. Usually, harvest of the Florida crop gets under way in September and becomes heavy in October. In July 1955, prices received by growers for grapefruit averaged considerably higher than a year earlier. The light summer supplies usually bring the highest prices of the year.

Stocks of canned grapefruit sections and citrus salad held by Florida packers on August 6, 1955 were about 60 percent larger than a year earlier. But stocks of canned grapefruit juice were 42 percent smaller.

For use in the National School Lunch Procram, the U. S. Department of Agriculture has purchased 221,075 cases of Fiorida camned grapefruit sections. These purchases, made wiih Section 6 funds, are for delivery during August 16 through September 10, 1955.

Exports of fresh grepefruit from California under the current exportpayment prognam were gnproximately 189,000 boxes by August 13, 1955. This was about 1 percent less than a year eailier under a similar program.

## LEMONS AND LIMES

Supplies of 1954-55 crop California lemons remaining to be marketed after Augist 1 were somewhat larger than a year earlier. With demand stimulatミ? by hot weather, terminal auction prices advanced considerably during ixiv. Frices in mid-August averaged moderately above the relatively high prices of a year previously.

Since the start of the $1954-55$ season, retail prices for frozen concentrate for lemorade have averaged lozer each month than in the same month of 1953-54. At these lower p:ices ccnsumar purchases have been higher each month except June, witich ras relatively cocl.

Through August 1 of the 1054-55 season, slightly more lemons had been sold for fresh use, but much less had been processed, than in the same pert of 1953-54. By July 30, 1955, output of frozen concentrate for lemonade was about 7.2 million gallons, 26 percent under a year earlier. Froduction of most other lemon products also was down.

Froduction of limes in Florida in 1955-56 was estimated as of July 1 at 400,000 boxes, compared with 380,000 in $1954-55$ and 230,000 , the average for 1943-52. Fresh market shipments of these limes run seasonally high during June-October. Prices received by growers for limes in July 1955 averaged $\$ 2.70$ per box, basis the packing-house door, about 9 percent higher than a year earlier.

DRIED FRUITS
Heavier 1955 Pack
Seems Probable
Production of dried prunes in California was estimated as of August 1 at 146,000 tons (natural condition, dried), compared with 179,000 tons in 1954. In 1954, about 3,200 tons also were dried in Oregon, and a small tonnage probably will be dried again this year in this State. With the heavy increase in production of grapes in California, a considerable increase in output of raisins seems likely. Raisins and prunes
usually comprise over 80 percent of the production of dried fruits. Among other dried fruits, there may be an increase in apricots but a decrease in peaches. Total production of dried fruits in 1955 probably will be somewhat larger than the 1954 pack of a little over 400,000 tons (processed weight). This excluded substandard prunes and figs.

## Raisin Export and Date <br> Diversion Payment Programs

Under the Department's current export-payment program for raisins, about 15,659 tons had been declared for export by August 13, 1955. The rate of pajment is 1.5 cents a pound. Exports under the 1953-54 program totaled 53,3ll tons; and under a supplemental program for 1952 and 1953 surpluspool raisins, exports totaled about 6,909 tons. The rate for each of the latter two programs was 2 cents a pound.

Under the current diversion program to encourage increased utilization of dates produced in continental United States, 1,258,042 pounds had been approved for diversion by the Department of Agriculture by August 13, 1955. The rate of payment for diversion is 4 cents a pound.

## CANNED FRUITS AND FRUIT JUICES

Large Pack of Canned Fruits in Prospect for 1955-56

The 1955-56 commercial pack of canned fruits in continental United States probably will not be greatly different from the large 1954-55 pack. Large increases in the packs of canned apricots and sweet and sour cherries and a smaller increase for peaches seem probable. Decreases may occur in canned pears, apples and applesauce. The 1954-55 pack was about 3 billion pounds, the equivalent of 69 million cases of 24 No. $2 \frac{1}{2}$ cans, and the second largest on record.

Stocks of 10 items of canned fruits combined (applesauce, apricots, sour cherries, fruit cocktail and salad, peaches, pears, apples, berries, sweet cherries, and flums and prunes) held by packers on June 1, 1955 were about 6 percent larger than a year earlier. Stocks of canned apples, applesauce, and pears were puch larger, while those of apricots and peaches were much smaller. On July l, 1955, packers' stocks of canned apples were more than 5 times the light stocks a year earlier, those of applesauce were more than 3 times the medium-sized stocks of a year previously, but those of sour cherries were 7 percent smaller. Figures on packers' stocks on July 1 for other items are not available.

Stocks of the first 6 of the above 10 listed items plus pineapple held by wholesale distributors on July l, 1955 were about 7 percent larger than on that date in 1954.

In the 1954-55 season for processing Florida citrus fruits, the pack of canned grapefruit sections was over 5.2 million cases ( 24 No .21 s ), 21 percent larger than the 1953-54 pack. The pack of citrus salad was a little over 800,000 cases, down 7 percent. Stocks of these two items combined held by packers on August 6, 1955 were over 2.2 million cases, 60 percent larger than a year earlier.

Stocks of Florida Canned
Citrus Juices Much Smaller
Than a Year Ago
Stocks of canned single-strength citrus juices held by Florida packers on August 6, 1955 totaled nearly 5.5 million cases (24-2's), 35 percent under a year earlier. Stocks of grapefruit juice were 2.5 million cases, down 42 percent; and stocks of orange juice were 2.1 million cases, down 25 percent. Total movement of these juices into the distributive trade during the current season has been nearly as large as in 1953-54.

The 1954-55 Florida pack of canned single-strength citrus juices was about 32.7 million cases, 18 percent smaller than the 1953-54 pack. Output of eaoh kind of juice was down. Production of the completed packs and the percentages under 1953-54 are as follows: Orange, 16.5 million cases, 7 percent; grapefruit, 10.8 million cases, 27 percent; blend, 5.0 million cases, 22 percent; and tangerine, 0.4 million cases, 46 percent. In addition, 1,550,400 gilions of canned concentrated orange juice (hot pack) were made, 17 percent more than in 1953-54. Total production of canned citrus juices in 2954-55, including the Callfornia pack, probably will be 10 percent under 1953-54,

## FROZEN FRUITS AND FRUIT JUICES

Small Increase in Production

## in 1955 Seems Likely

Total production of frozen fruits and fruit juices in 1955 may be a little larger than the 1954 output. Among deciduous fruits, increases are expected for strawberries and cherries, the two principal items. Total production of frozen deciduous fruits probably will be slightly larger than the 1954 output of about 523 million pounds.

Some increase in production of frozen citrus juices also may occur. In Florida where the 1954-55 season has ended, the pack of frozen orange concentrate was 64.9 million gallons ( 642 million pounds), 1 percent under the 1953-54 pack. The packs of other frozen concentrates in Florida in 1954-55 were as follows: Grapefruit juice, 1.2 million gallons, down 26 percent; blended orange and grapefruit juice, 546,000 gallons, down 38 percent; and tangerine juice, 872,000 gallons, up 97 percent. In Florida, the season for making frozen lime concentrate got well under way in June with the output of 108,000 gallons. Production will continue seasonally large during summer.

In California, the season for making frozen orange concentrate will extend into fall. Output this year may exceed the 1954 pack of 1,447,000 gallons. Production of frozen concentrate for lemonade was over 7.2 million gallons by July 30 , about 26 percent smaller than a year earlier. Output of other frozen lemon products also was smaller.

Cold-Storage Stocks of Frozen Fruits
Larger, Those of Fruit Jujces Smaller, On August 1 , 1955 Than a Year Earlier

Cold storage holdings of frozen fruits and fruit juices on August l, 1955 were about 798 million pounds, slightly more than a year earlier. Stocls of deciduous fruits and berries in storage on Augnst 1 vere 382 million pounds, 13 percent larger. Strewberries at 153 million pounas and cherries at 85 million were the two largest items in storage August l. Stocks of strawberries were 6 percent larger than a year earlier, and cherries were 28 percent larger. During July stocks of these two items increased 47 million and 66 million pounds, respectively. Total stoclss of deciduous fruits increased l3i million pounds during July 1955, compared with an increase of 115 million pounds during July 1954.

Total stocks of frozen fruit juices in cold storage on August l, 1955 were about 416 million pounds, 9 percent smaller than a year earlier. Stocks of orange juice, mostly concentrate, were over 310 million pounds (3l. 3 million gallons), 6 percent smaller than a year previously. During July stocks of this juice decreased 6.1 million gallons, compared with about 4.1 million during July 1954. Each month since the start of the 1954-55 season for citrus, movement of frozen orange juice into consumption has been somewhat lareer than in the corresponding month of 1953-.54. For the 7-month period December 1954-June 1955, total movement has been about 15 percent larger. With movement continuing at this rate, stocks on December 1, the start of the new season for making frozen orange juice, will be under 10 million gallons, considerably smaller than a year earlier.

## TREE NUTS

Total production of almonds, filoerts, walnuts, and pecans in 1955 was estimated as of August 1 at 157,940 tons, about 8 percent smaller than in 1954 and 16 percent under the 1944-53 average. The walnut crop is the only one for which larger production is in prospect this year.

The walnut crop of California and Oregon is expected to total 78,700 tons, 4 percent larger than in 1954 and 9 percent above average. The California crop of 72,000 tons is up 5,000 tons, more than offsettin. a smell decrease in Oregon. The almond crop in California is expected to be 37,200 tons, 14 percent below the 1954 tonnage and 3 percent under average. Production of filberts in Oregon and Washington is estimated at 6,620 tons, 24 percent smaller than in 1954 and 24 percent below average. The crop of 6,000 tons in Oregon, the main producing State, is 2,000 tons smaller than the 1954 crop.

Total production of pecans in 1955 in 10 commercial States (North Carolina, South Carolina, Georgia, Florida, Alabama, Mississippi, Arkansas, Louisiana, Oklahome, and Texas) is expected to be 35,420 tons. The crop is 22 percent smaller then in 1954, 50 percent below average, and the smallest since 1936. The prospective production of improved varieties is 9,200 tons, less than half the comparatively small 1954 crop and less than one-third of average. The crop of wild or seedling varieties is expected to total 26,220 tons, 2 percent larger than the relatively light 1954 crop but 31 percent under average. Freezes in late March drastically cut production in most of the southeastern States, which usually grow most of the improved pecans. This is the second successive small crop of pecans. Supplies will be lighter than last year, and prices probably higher, especially for improved varieties.

FRESH FRUIT SUPPLIES IN 19 MARKETS, 1953 and 1954
A good indication of the nature, seasonality, and other characteristics of supplies of fresh fruits in the United States may be obtained from data on carlot unloads in principal markets. Such data for 19 metropolitan markets for 1953 and 1954 are available and have been summarized by kind of fruit, volume, source, type of transport, and month unloaded. Results of a similar study for 17 markets in 1952 were published in The Fruit Situation, June 1953.

In the current study, total unloads in the 19 markets were the equivalent of approximately 267,384 carloads in 1953 and 259,330 carloads in 1954. 1/ These unloads provided probably about 45 percent of total fresh fruit consumed in the United States each year.

Nev York led in unloads in both 1953 and 1954 with about 33 percent of total unloads in the 19 markets (tables 1 and 2). In both years, Los Angeles with about 11 percent was second, and Chicago with 9 percent was third. In 1953 about 66 percent of total unloads in the 19 markets were shipped by rail, boat, and air, and 34 percent by truck. 2/ In 1954, unloads from the two classes of shipments were 63 and 37 percent, respectively, of the total. The reduction in the percentage moved by rail, boat, and air in 1954 was partly the result of a strike that led to boats regularly discharging cargo at New York unloading at other ports for truck movement beyond to receivers. Of the total unloads in 17 markets in 1952, about 67 percent moved by rail, boat and air, and 33 percent by truck.

1/ These markets are New York, Los Angeles, Chicago, Philadelphia, Boston, Detroit, Pittsburgh, Cleveland, Baltimore, St. Louis, Atlanta, San Francisco, Dallas - Ft. Worth, Denver, Kansas City (Mo.), Oakland (Calif.), Seattle (Wash.), Washington (D. C.), and New Orleans. 2/ Type of shipment relates to the movement between local shipping point or seaport and metropolitan market within continental United States.

Fruit grown in the United States comprised about two-thirds of total unloads in both 1953 and 1954. Each year most of the imports were bananas. In 1954 about 44 percent of total unloads of bananas in the 19 markets were at New York. Mainly for this reason, this market also led in unloads of all imported fruit.

Unloads of fresh fruits in the 19 markets in 1953 and 1954 are summarized by kind of fruit and method of shipment in tables 3 and 4. Noncitrus fruits, including bananas, comprised about 68 percent of total unloads in 1953 and 70 percent in 1954. Each year total unloads of citrus fruit were only a little larger than those of bananas. For fruit grown in, the United States, noncitrus comprised 53 percent in 1953 and 55 percent in 1954. Each year about two-thirds of the citrus unloads but a little less than one-half of the noncitrus were moved by rail, boat, and air. Heavy rail shipments of citrus fruits from California to eastern markets contributed much to the larger citrus total by rail, boat, and air than by truck. Much the greater part of the unloads of grapes, pears, and plums and prunes were shipped by rail, incilcating shipment from western producing areas to eastern markets.

Total supplies of fresh citrus and noncitrus fruits in the 19 markets in 1953, as indicated by unloads, are shown by type of shipment and month in table 5. Unloads of individual kinds of fruits in these markets in 1954 are presented by type of shipment and month in table 6. The seasonal character of supplies in 1954 is depicted by the cover charts.

Supplies of all fresh fruits combined in the 19 metropolitan markets in 1954 were seasonally the largest during June-October, a period of heavy movement of freshly-harvested deciduous fruits. The peak in March probably is partly the result of delayed unloads from the preceding month due to a strike. With this exception, supplies were seasonally the lowest during late fall, winter, and early spring. During this period, reductions in supplies of noncitrus fruits were greater than seasonal increases in citrus. In each month of 1954, unlcads from shipments made by rail, boat, and air were considerably larger than those by truck. Peak shipments for the former type of transport were in June, and for the latter in August.

The monthly unload figures for individual kinds of fruits in table 6 portray seasonal patterns for most fresh noncitrus fruits that are in contrast to those for most citrus fruits. Supplies of most noncitrus fruits are heaviest during summer, when those of most citrus are the lightest. Among important individual fruits, bananas stand out not only as the leader in unloads but also in not varying greatly in unloads from month to month throughout the year. Moreover, unloads in each of the 19 markets did not change greatly from month to month.

Movement of Presh citrus fruit in 1954, as indicated by unloads in the 19 markets, was heaviest by rail, boat, and air each month of the year. (Inside cover chart). The same was true for noncitrus fruits except in March when some unloads especially of bananas, were shunted from boat to truck, as previously mentioned.

1 For some states in certain years, production includes some quantities unharvested on account of economic conditions. 2/ Dried basis. I ton of raisins equiva lent to about 4 tons of fresh grapes.

Table 17.- Grapes, California: Weighted average auction price per lug box, at New York and Chicago, June-August, 1954 and 1955

[^1]Table 18.- Pears: Production, by geographic divisions and on Pacific Coast, average 1944-53; anua 1954, and indicated 1955 I/

1/For some states in certain years, production includes some quantities unharvested on account of eccnomic conaitions.

2/ The 1955 crop will be almost a courlete failume because of spring freeze damage, although a few pears mey be produced, the prospective production is too small to warrant a quantitative forecast at this time.

Table 19.- Pears, Ca?ifornia Bartlett: Weighted average auction price per box, at New Iork and Chicago, July and August, 1954 and 1955

Compiled from the New York Daily Fruit Reporter and Chioago Fruit and Vegetable Reporter.

Table 20.- Plums and prunes: Production in important States, average 1944-53 annual 1953-54 and indicated 1955 1/

1/For some states in certain years, production includes some quantities unharvested on account of economic conditions. 2/ Includes excess cullage of harvested fruit (tons): 1953-Plums, California, 7,000; Prunes, Idaho, 800; Eastern Oregon, 300; 1954-Plums, California, 4,000. 3/In California, the drying ratio is approximately $2 \frac{1}{2}$ pounds of fresh fruit to $\frac{1}{1}$ pound dried.
