AUTHOR'S PREFACE

Second Edition of The Oil Well Driller History of the Oil Industry of the World.

This title is selected owing to the fact that the driller is the man in charge of the well when it is drilled into the sand or lime strata, which is the true source of petroleum—crude oil, and the first man to receive the true history and record of all wells drilled in the world.

While it may seem to the uninitiated a task involving but little difficulty to prepare for publication the true history of the oil, natural gas, carbon black and the by-products of the world, it is not out of place here to assure all such readers that this work is one demanding a vast amount of labor and research, watchful care, untiring patience and great discrimination. This need not be said to any person who has had experience in similar work in attempting the production of a true history of petroleum. I did not underestimate the difficulties of the task, and came to it fully imbued with a clear idea of its magnitude, and a determination to execute it in such a manner that it should receive the commendation of all into whose hands it should fall.

I was born and resided in the oil regions, and for twenty-five years was employed in the several departments connected with the oil industry. The past five years have been consumed in visiting every oil and gas field, pipe lines and stations, oil refineries and carbon black factories in person in the United States, Canada and Mexico, which required twenty-five thousand miles of travel, ten thousand people were interviewed, two thousand letters were exchanged in correspondence, and a cost of twenty thousand dollars was required to publish the first and second editions. While a perfect historical work, unprejudiced and unbiased,

of the world's greatest enterprise, the oil and gas industry, has never before been published, this one can be relied upon to be true in every sense of the word, and is the recognized authority on all matters pertaining to the history of oil, natural gas, carbon black and its by-products.

Those who have aided this work with statistical reports, information and interviews are the—

Standard Oil and affiliated companies.

Pure Oil Company.

John W. Steel (Coal Oil Johnny).

Lewis Emery, Jr., Manufacturing Co.

National Transit Company.

Tidewater Pipe Line Company.

United States Pipe Line Company.

Producers and Refiners Pipe Line Co.

Whiting, Vacuum.

Camden Consolidated, Bayonne.

Chas. Pratt & Co., Acme.

Thompson & Bedford, Atlantic.

Eclipse and Galena-Signal.

Standard Oil refineries.

Tidewater refinery, Bayonne, New Jersey.

Pure Oil refinery, Marcus Hook, Pa.

Lewis Emery, jr., producer and refiner, Bradford, Pa.

Cornplanter, Seneca and United refineries, Warren.

Pa.

Oil Well Supply Company, Pittsburg, Pa.

J. M. Guffey Petroleum Co., of Texas.

Pacific Coast Oil Co., of California.

Philadelphia Natural Gas Co.

Burt Oil Company.

AUTHOR'S PREFACE—Continued.

American Cordage Co.
Columbia Cordage Co.
A. Knabb & Co., manufacturers of oil barrels, Warren, Pa.
Carnegie Natural Gas Co.
Hope Reserve and Connecting Gas Co.
Union Gas Corporation.
Oil City Fuel Supply Co.
Pennsylvania Gas Co.
United Natural Gas Co.
Manufacturers Light and Heat Co.
Ohio Fuel Supply Co.
Northwestern Ohio Gas Co.
Tripple State Natural Co.
Colonel James M. Guffey, Pittsburg, Pa.
Thomas W. Phillips, New Castle, Pa.
United States Senators S. B. Elkins and N. B. Scott, West Virginia.
B. B. Dovener, Congressman, Wheeling, W. Va.
Honorable Leslie M. Shaw, Secretary of the Treasury of the United States.
Honorable Charles D. Walcott, Director of the Department of the Interior of the United States Geological Survey.
Honorable William R. Merriam, Director of the Census of the United States.
Honorable S. P. Langley, Secretary of the Smithsonian Institute of the United States.
West Virginia Historical Society.
Astor Public Library, New York.
Cooper Union Library, New York.
Pennsylvania State Library, Harrisburg, Pa.

Warren Weekly Mail, Warren, Pa.
Oil City Derrick, Oil City, Pa.
Bion H. Butler, editor on the staff of the Pittsburg Times, Pittsburg, Pa.
Walter B. Brooks, executor of the estate of Dr. J. P. Hale, Charleston, W. Va.
C. H. Shattuck, Parkersburg, W. Va.
Foreign oil and gas statistics were received through the kindness of—
Sir Michael H. Herbert, late British Ambassador.
Comte Cassini, Russian Ambassador.
Herr Von Holleben, German Ambassador.
M. Jusserand, French Ambassador.
Signor Edmondo Mayor des Planches, Italian Ambassador.
Don Manuel de Azpiroz, Mexican Ambassador.
Baron W. A. F. Gevers, Minister of Netherlands.
Senor Don Emilio de Ojedo, Spanish Minister.
Senor J. F. de Assis Brasil, Minister of Brazil.
Mr. Manuel Alvorez Calderon, Minister of Peru.
Mr. Koyoro Takahira, Japanese Minister.
Senor Don Gouzalo de Quesada, Minister of Cuba.
Colonel J. C. Rathbone, Parkersburg, W. Va.
Honorable Willis B. Benedict, Titusville, Pa.
British-American Petroleum Co., Yenangyat, Upper Burma, India.
Royal Dutch Petroleum Co., Singapore, Sumatra.
Nobel Brothers, Baku, Russia.

And thousands of others, and to all those the author extends his grateful thanks.

Yours very truly,
CHARLES AUSTIN WHITESHOT.

TO THE PUBLIC IN GENERAL AND THE READER IN PARTICULAR.

In bygone years several persons unfamiliar with the oil industry, not having been directly interested or employed therein, and a great number of them who had not seen an oil or natural gas well in operation prided themselves upon being authorities and authentic writers of oil history. It was those exaggerated and misrepresented stories that led the writer to take up the task of writing an oil and natural gas history of the world's greatest industry, being a practical oil man and having had a number of years of actual experience in the oil business. In the year 1900 I laid aside the editorial pen on *The Oil Region News* and at once began the labor of gathering pictures covering the entire period of the oil industry from its beginning, and the compiling of a true and full history of the oil industry, over five years being consumed in my travels, visiting every oil and natural gas field of note, the oil refineries, pipe line systems, shipping points and offices in the United States, Canada and Mexico. While the writer of this history is not associated with any company or individual in this work, and is free to use his own judgment regarding what is true and what is not true in oil history, he does not take issue with any company or individual interested in the oil and natural gas industry, but he does take exception to a great number of newspaper articles which greatly misrepresent the true state of the oil industry. One in particular, which claims to be a history of the Standard Oil Company, the main part of the so-called history was taken from the Congressional Record from the evidence given before the Industrial Commission appointed by Congress to investigate the

methods of the Standard Oil trust. The writer for the magazine very cleverly avoided giving all the evidence on both sides of the question at trial, and intentionally avoided giving a true and full report of the proceedings of the committee, and only permitted that part that was against the Standard Oil Company, which led the readers of the article to form an opinion of the case without giving the evidence in full on both sides of the trial. The reader will find every word of evidence given before this commission in the rise and history of the Standard Oil Company in this history. The writer has interviewed all of the leading shareholders and officials of the Standard Oil Company and affiliated companies from the general officials to the officials in the fields, beginning with John D. Rockefeller and the Standard's army of assistants; and to these men the writer is under deep obligations for courteous treatment received in securing information and statistics, from the officials in the general office at 26 Broadway, New York; the district officials, the refiners, pipe line officials, and the men in the fields. This is truly an American company of American men, who are advancing millions of dollars each year in establishing markets in all parts of the world for American oil, and it can truthfully be said the sun never sets on the supply and demand of American oil. The writer feels under deep obligations to Senator Lewis Emery, jr., and a great army of independent oil producers for favors and kind treatment in the way of information and records, and to all those he extends his grateful thanks.

CHARLES A. WHITESHOT.

History of the Oil Industry of the World

CRUDE OIL.

Petroleum (from Petra, a rock) and Oleum (oil or rock—oil), a natural product of the earth oozing from below the surface and flowing with the gas. Petroleum is not of constant composition, but is a variable mixture of animal, marine, mineral and vegetable liquid hydro (carbons), and varies in color from light lemon to dark green and black.

EARLY HISTORY OF PETROLEUM—PETROLEUM SPRINGS.

While the history of petroleum in America prior to developments brought about by artesian drilling will probably be accounted of little practical value, it is apprehended that a work of this sort overlooking it would be incomplete.

In Europe and Asia it has been an object of some commercial value for centuries, and there is good reason to believe that it has been known and used since the earliest ages of the world.

It is impossible to go back to the time when petroleum was first discovered. From its frequent occurrence in the form of springs in many parts of the world, it is evident that it has always been known—certainly more than four thousand years.

Layard and Botta, in their discoveries at Ninevah, adduce positive evidence that the inhabitants of this ancient city had knowledge of the existence and use of petroleum. In building the city, an asphaltic mortar ("slime," according to the Old Testament), was employed, the asphalt for which was a partially evaporated petroleum. That used at Babylon was obtained from the Springs of Is, on the Euphrates, which, at a later date, attracted the attention of Alexander, of Trajan, and of Julian; they, even to this day, supply the neighboring villages with oil.

Herodotus, 500 years before Christ, spoke of the oil wells of Zante; and Pliny and Dioscorides described the oil of Agrigentum, which was used in lamps under the name of "Sicilian Oil."

The wells of Amiano, on the banks of the Taro, were formerly used for lighting the City of Genoa.

The earliest history of the discovery of petroleum (Crude oil) in America was made by the "Seneca Indians," one of the clans of the five nations called by the French "Hiro Couis," the men of the five nations (afterwards the six nations) and later called Iroquois by the English. The Indians of the six nations called themselves "Hedonosaunee," which means literally they form a cabin or wigwam. To this day the name Iroquois is the name applied to the six nations or tribes of Indians known as Mohawks, Oneidas, Senecas,

Onondagas, Cayugas and Tuscaroras. Those tribes or clans of Indians when first discovered by white men, inhabited what is now known as Central and Western New York and Northwestern Pennsylvania.

When the five nations were first visited by Europeans the Senecas chiefly dwelt among the hills south of the Cayuga and Seneca Lakes in New York and along the Genesee river, though at the same time they had villages on the upper waters of "Alegina," meaning clear water and known as the Allegheny river, and the west branch of the Susquehanna rivers in Pennsylvania. Thus they guarded a line extending from Lake Ontario to the navigable waters of the Allegheny. They called themselves Nuduawgah, or the men of the hills, and had many traditions in regard to the discovery of the fire water springs, meaning the oil springs, the location of which they guarded as a secret for a great number of years.

The nation of Indians on the south of the Senecas were the Mingos, and on the north and northwest were two strong tribes or nations known as the Errieronons Erie or Cat Nation, and the Andestiquerons or Kahquah Nations, class of the Hurons. Like other Indian tribes, the Kahquahs guarded against surprise by placing their villages a short distance back from any navigable water. In this case from the Niagara river and Lake Erie one of those villages was named Onquiaahro, after the mighty torrent which they designated by that name—a name which has since been shortened and transformed into Niagara. In dress, food and customs the Kahquahs do not appear to have differed much from the other savages around them, wearing the same scanty covering of skins, living chiefly on meat killed in the chase, but raising patches of Indian corn, beans and gourds.

Such were the inhabitants of a region which was then crossed by no imaginary lines of latitude or longitude, state, county, township, or district, and such were their surroundings when first visited by the French in 1604. At this early date and perhaps centuries before wild game was very plentiful and buffaloes roamed in the forests and on the shores of a large body of fresh water which is now known to every American as Lake Erie. Through the jealousies of conquest the Eries became the deadly enemies of the Iroquois, while the Kahquahs remained neutral and neighbored a great deal with the Senecas, the largest tribe of the Iroquois inviting them to visit their hunting grounds and kill all the buffaloes they wished. At this date the Senecas held an annual feast on or about full moon in August of each year. In later years the white men named the Indian feast week the Indian Corn Dance, which is celebrated each year to this date.

It was at one of those early feast gatherings or dances that the Senecas first introduced the fire dance

to the Kahquahs. This was done by gathering a great number of cat tails, or cat-o'-nine tails, the popular name of a tall reed, *Typha Latifolia*, aquatic or swamp plant found growing in all large swamps in Western New York, Pennsylvania, Ohio, West Virginia, Kentucky and other states, having insignificant flowers in a long dense cylindrical spike at the end of the stem. Its long flat leaves are much used for the bottoms of chairs and for coopering barrels. The cat tails were very plentiful in the swamps in Southwestern New York. The Senecas would gather the cat tails and take them to the oil springs and dip them in the oil. This was kept a great secret by the Senecas. After the cat tails were well saturated with oil the Indians would carry them to the place where the feast or dance was held and at night each Indian would take a cat tail and light it, then began to dance the Indian stag dance with an occasional Indian war whoop. This amused the Kahquahs, and as they were friendly Indians and on the friendliest terms with the Senecas they soon found where the oil springs were located. And as early as July 18, 1627, a French missionary, Joseph de la Roque Dallon, of the Order of Recollects, described oil springs in a letter published in 1632, in Segards "L'Histoire du Canada," and this description is confirmed by the Journal of Charlevoix, 1721.

Fathers Dollier and Galinee, missionaries of the Order of St. Sulpice, made an early map of this section of the country which they sent to Jean Talon, Intendant of Canada, November 10th, 1670, on which was marked at about the point where the town of Cuba, New York, is now, located oil springs called "Fountain de Bitume." At this early date the two tribes or nations of Indians on the shores of Lake Erie in the Indian tongue were known as the Errieronons and Andestiquorous, but the white men called them the Erie and Kahquah nations. These names they were generally known by and the names we have adopted in speaking of them.

In the early history of New York we find the Governor was aware that oil springs had been discovered in the southwestern part of the State. Richard Earl, of Bellamont, Governor of New York, in the tenth year of his majesty's reign, William III., on the 3d of November, 1700, at the headquarters of the Governor at New York, instructed his chief engineer and surveyor, Wolfgang W. Romer, during his visit to the country of the six nations, "to go and view a well or spring which is eight miles beyond the 'Seneks' (Senecas) farthest castle which they have told me blazes up in a flame when a lighted coal (coal) or firebrand is put into it. You will do well to taste the said water, and give me your opinion thereof, and you will bring with you some of it."

Thomas Chabert de Joncaire, who died in September, 1740, is also mentioned in the Journal of Charlevoix of 1721, as authority for the existence of oil at the place mentioned and at points further south, probably on Oil Creek, Pennsylvania.

The following account of an event occurring during the occupancy of the French in the northwest of Pennsylvania is given as an example of the religious uses made of the oil by the Indians, as these fire dances are understood to have been annually celebrated. While

descending the Allegheny river, fifteen leagues below the mouth of the Conewango creek at the site of where Warren, Pa., is now located and three leagues above Fort Venango, at the mouth of French Creek, where the city of Franklin, Pa., is now located, we were invited by the chief of the Senecas to attend a religious ceremony of his tribe. We landed and drew up our canoes on a point where a small stream entered the Allegheny River. This was at the mouth of Oil Creek, where Oil City, Pa., is now located. The tribe appeared unusually solemn. We marched up the stream one league, where the Indians, a large band it appeared, had arrived some days before us. Gigantic hills begirt us on every side. The scene was really sublime. The great chief then recited the conquests and heroism of their ancestors. The surface of the stream was covered with a thick scum which burst into a complete conflagration. The oil had been gathered and lighted with a torch. At sight of the flames the Indians gave forth a triumphant shout and made the hills and valleys re-echo again. This was on the site where Rouseville, Pa., is now located.

In nearly all geographies and notes of travel published during the early period of settlement, this oil is referred to, and on several old maps, French as well as English, the word "Petroleum" appears opposite the mouth of Oil Creek, Pennsylvania.

It was also known many years ago that a similar product existed in "Virginia," now West Virginia, since General George Washington, in his will, in speaking of his lands on the Great Kanawha river, of which he had several thousand acres, says: "The tract, of which the 125 acres is a moiety, was taken by General Andrew Lewis and myself for and on account of a bituminous spring which it contains, of so inflammable a nature as to burn as freely as spirits, and is nearly as difficult to extinguish."

Thomas Jefferson, in his "Notes on Virginia," also describes a burning spring on the Great Kanawha river.

From a history written on salt by Doctor J. P. Hale, of Charleston, W. Va., in 1876, the following is a true copy:

The Kanawha salt works are situated in Kanawha county, West Virginia, on the Kanawha river, commencing about three miles above Charleston and extending up the river for several miles, on both sides.

These "Licks," as they are called, have not only been known and extensively worked, from the first settlement of the valley by the whites, but have been known and used, from time immemorial, by the Indian tribes, and frequented by swarms of buffalo, elk, deer, and other wild animals, before the advent of the white man.

In 1873, when all this region was an unknown wilderness, which had never been penetrated by the most adventuresome white man, a party of Shawnees who dwelt upon the Scioto, in what is now Ohio, made a raid upon the frontier settlements of Virginia, in what is now Montgomery county. Having taken the settlers unawares, and after killing, burning and capturing prisoners, as was their custom, they retreated, with their captives, down New River, Kanawha and Ohio, to their homes. One of these captives, Mrs. Mary Ingles, the great grandmother of Dr. J. P. Hale, who afterwards made her escape and was returned to

CAT TAILS, TALL REED, TYPHA LATIFOLIA, AQUATIC OR SWAMP PLANT

her friends, related that the party stopped several days at a salt spring on the Kanawha river, rested from their weary march, killed plenty of game and feasted themselves on the fat of the land; in the meantime, boiling salt water and making a supply of salt, which was carefully packed and taken with them to their western homes. This is not only the first account we have of salt making on Kanawha, but anywhere else west of the Alleghanies. In fact, if there is any earlier record of salt-making from brine springs, anywhere in the United States, I am not aware of it.

The earliest settlement made by whites, in the Kanawha Valley, was by Walter Kelley and family, at the mouth of the creek which bears his name, in the spring of 1774, several months before the battle of Point Pleasant, where the combined Indian tribes, under the celebrated Sachem, Cornstalk, were defeated and driven back by the Virginians, under General Lewis.

Kelley and his family paid the forfeit of their lives for their temerity; they were all killed by the Indians; but after the battle of the Point, when there was greater security for life, the valley was rapidly settled, mostly by Virginians, and in a great part by the hardy soldiers who had followed Lewis to Point Pleasant.

The early pioneer settlers, in a wilderness, without communication with other settlements, except by foot or bridle paths, depended upon the Kanawha Licks for their scanty supply of salt. In those days of simple economy and provident thrift, when everything useful was made the most of, the women's wash-kettles were put under requisition for a fourfold duty; they boiled the daily hog and hominy, and other wholesome, frugal fare; once a week they boiled the clothes, on wash day; semi-occasionally they boiled the salt water for a little of the precious salt, and every spring they went to the sugar camp, to boil the annual supply of maple sugar and molasses.

It is related that at one time, when there was an apprehended attack from the Indians, the few early settlers were posted at the mouth of Coal river, for protection. Being out of salt and suffering for the want of it, they sent some of their hardy and daring young men in canoes up to the salt spring, where they dipped the canoes full of salt water; and, getting safely back, the water was boiled, and the precious salt made under cover of the fort.

Among the earliest land locations made in the valley, was one of 502 acres, made in 1785, by John Dickinson, from the Valley of Virginia, to include the mouth of Campbell's creek, the bottom above and the salt spring. Dickinson did not improve or work the property himself, but meeting with Joseph Ruffner, an enterprising farmer from the Shenandoah Valley, Virginia, in 1794, and describing his salt spring to him, Ruffner became so impressed with its value that he then and there purchased the 502 acres upon Dickinson's own report, without himself seeing it, agreeing to pay for it 500 pounds sterling without condition, and other sums conditioned upon the quantity of salt to be made, which might increase the price to 10,000 pounds sterling. Having gone thus far, he sold out his Shenandoah estates, and in 1795 removed himself and family to Kanawha to look after his salt property. Upon arriving there, however, his penchant for

rich farming lands overcame him, and he purchased, from George and William Clendenen, the large river bottom of 900 acres extending from the mouth of Elk river up Kanawha; and, upon 40 acres of which the village of Charleston had been laid out and started the previous year. This last purchase, and the subsequent attention to clearing and improving the farm, diverted Ruffner's attention for a time, from the salt project; the delay was fatal so far as he was concerned; he did not live to execute his pet scheme or realize his cherished hopes. Dying in 1803, he willed the property to his sons, David and Joseph, enjoining it upon them to carry out, as speedily as practicable, his plans of building up extensive salt manufactories to supply not only the increasing local demand, but a larger and still more rapidly growing demand which was now coming from the many thrifty settlements throughout the Ohio Valley. During the elder Ruffner's life, however, he had leased to one Elisha Brooks the use of salt water and the right to manufacture salt; and in 1797 this Elisha Brooks erected the first salt furnace in Kanawha or in the western country. It consisted of two dozen small kettles set in a double row, with a flue beneath, a chimney at one end, and a fire bed at the other.

To obtain a supply of salt water he sank two or three "gums," some 8 or 10 feet each in length, into the mire and quicksand of the salt lick, and dipped the brine with a bucket and swape, as it oozed and seeped in through the sands below.

In this crude, rough-and-ready way, Brooks managed to make about 150 pounds of salt per day, which he sold at the kettles, at 8 and 10 cents per pound. No means were used to settle or purify the brines or salt, as the salt water came from the gum, so it was boiled down to salt in the kettles, with whatever impurities or coloring matter it contained. As it issues from the earth it holds some carbonate of iron in solution; when it is boiled, this iron becomes oxidized, and gives a reddish tinge to the brine and salt.

This Kanawha salt soon acquired a reputation for its strong, pungent taste, and its superior qualities for curing meat, butter, etc. A great many who used it and recognized these qualities in connection with its striking reddish color came to associate the two in their minds in the relation of cause and effect, and orders used to come from far and near for some of "that strong red salt from the Kanawha Licks."

Almost the only mode of transporting salt beyond the neighborhood, in those early days, was by pack-horses, on the primitive, backwoods pack-saddle. So much of this was done, and so familiar did the public mind become with the term, as used in that sense, that even to this day, among a large class of people, the verb "to pack" is always used instead of other synonymous or similar terms, such as carry, transport, fetch, bring, take, etc., and the "tote" of Old Virginia.

It was not until 1806 that the brothers, David and Joseph Ruffner, set to work to ascertain the source of salt water, to procure, if possible, a larger supply and of better quality, and to prepare to manufacture salt on a scale commensurate with the growing wants of the country.

The Salt Lick, or "The Great Buffalo Lick," as it was called, was just at the river's edge, 12 or 14 rods in extent, on the north side, a few hundred yards

above the mouth of Campbell's creek, and just in front of what is now known as the "Thoroughfare Gap," through which, from the north, as well as up and down the river, the buffalo, elk, and other ruminating animals made their way in vast numbers to the lick. I may mention *en passant* that so great was the fame of this lick, and the herds of game that frequented it, that the great hunter, explorer, and conqueror of the "bloody ground" of Kentucky, Daniel Boone, was tempted here, made a log cabin settlement, and lived just on the opposite side of the river, on what is now known as the Donnally farm or splint coal bottom. I have had, from old Mr. Paddy Huddleston, who died a few years ago, at nearly one hundred years of age, many interesting anecdotes of their joint adventures in hunting and trapping. Boone still lived there in 1789-90, when Kanawha county was formed, and in 1791 served as one of the delegates for the county in the Legislature at Richmond.

But to return to the Lick, and the operations of the Ruffner brothers. In order to reach, if possible, the bottom of the mire and oozy quicksand through which the salt water flowed, they provided a straight, well-formed, hollow sycamore tree, with four feet internal diameter, sawed off square at each end. This is technically called a "gum." This gum was set upright on the spot selected for sinking, the large end down, and held in its perpendicular position by props or braces, on the four sides. A platform, upon which two men could stand, was fixed about the top; then a swape erected, having its fulcrum in a forked post set in the ground close by. A large bucket, made from half of a whisky barrel, was attached to the end of the swape, by a rope, and a rope attached to the end of the pole to pull down on, to raise the bucket. With one man inside the gum, armed with pick, shovel and crowbar, two men on the platform on top to empty and return the bucket, and three or four to work the swape, the crew and outfit were complete.

After many unexpected difficulties and delays, the gum, at last, reached what seemed to be rock bottom at 13 feet; upon cutting it with picks and crowbars, however, it proved to be but a shale or crust, about six inches thick, of conglomerated sand, gravel and iron. Upon breaking through this crust the water flowed up into the gum more freely than ever, but less salt.

Discouraged at this result, the Ruffner brothers determined to abandon this gum, and sink a well out in the bottom, about 100 yards from the river. This was done, encountering, as before, many difficulties and delays; when they had gotten through 45 feet of alluvial deposit, they came to the same bed of sand and gravel upon which they had started, at the river.

To penetrate this, they made a 3½-inch tube of a 20-foot oak log, by boring through it with a long shanked augur. This tube, sharpened, and shod with iron at the bottom, was driven down, pile-driver fashion, through the sand to the solid rock. Through this tube they then let down a glass vial with a string to catch the salt water for testing.

They were again doomed to disappointment; the water, though slightly brackish, was less salt than that at the river. They now decided to return to the gum at the river, and, if possible, put it down to the bed

rock. This they finally succeeded in doing, finding the rock at 16 to 17 feet from the surface.

As the bottom of the gum was square, and the surface of the rock uneven, the rush of outside water into the gum was very troublesome. By dint of cutting and trimming from one side and the other, however, they were, at last, gotten nearly to a joint, after which they resorted to thin wedges, which were driven here and there as they would "do the most good."

By this means the gum was gotten sufficiently tight to be so bailed out as to determine whether the salt water came up through the rock. This turned out to be the case. The quantity welling up through the rock was extremely small, but the strength was greater than any yet gotten, and this was encouraging. They were anxious to follow it down, but how? They could not blast a hole down there, under water; but this idea occurred to them; they knew that rock blasters drilled their powder holes two or three feet deep, and they concluded they could, with a longer and larger drill, bore a correspondingly deeper and larger hole.

They fixed a long iron drill, with a 2½-inch chisel bit of steel, and attached the upper end to a spring pole, with a rope. In this way the boring went on slowly and tediously till on the 1st of November, 1807, at 17 feet in the rock, a cavity or fissure was struck, which gave an increased flow of stronger brine. This gave new encouragement to bore still further; and so, by welding increasing strength of shaft to the drill, from time to time, the hole was carried down to 28 feet, where a still larger and stronger supply of salt water was gotten.

Having now sufficient salt water to justify it, they decided, and commenced, to build a salt furnace; but while building, continued the boring, and on the 15th day of January, 1808, at 40 feet in the rock, and 58 feet from the top of the gum, were rewarded by an ample flow of strong brine for their furnace and ceased boring.

Now was presented another difficulty: how to get the stronger brine from the bottom of the well, undiluted by the weaker brines and fresh water from above; there was no precedent here; they had to invent, contrive, and construct anew. A metal tube would naturally suggest itself to them; but there were neither metal tubes, nor sheet metal, nor metal workers—save a home-made blacksmith—in all this region, and to bore a wooden tube 40 feet long, and small enough in external diameter to go in the 2½-inch hole, was impracticable; what they did do, was to whittle out of two long strips of wood, two long half tubes of the proper size, and, fitting the edges carefully together, wrapped the whole from end to end, to fit, as nearly as practicable, water tight, in the 2½-inch hole, and was cautiously pressed down to its place, and found to answer the purpose perfectly; the brine flowed up freely through the tube into the gum, which was now provided with a water tight floor or bottom, to hold it; and from which it was raised by the simple swape and bucket.

Thus was bored and tubed, rigged and worked, the first rock-salt well west of the Alleghanies, if not in the United States. The wonder is not that it required eighteen months or more to prepare, bore and com-

plete this well for use, but, rather, that it was accomplished at all under the circumstances. In these times, when such a work can be accomplished in as many days as it then required months, it is difficult to appreciate the difficulties, doubts, delays, and general troubles that beset them then. Without preliminary study, previous experience or training, without precedents in what they undertook, in a newly settled country, without steam power, machine shops, skilled mechanics, suitable tools or materials, failure, rather than success, might reasonably have been predicted.

The new furnace, which for some time had been under construction, was now complete. It was simply a reproduction of the Elisha Brooks' kettle furnace, on a larger scale. There were more kettles, of larger size, and better arranged.

On the 8th of February, 1808, the Ruffner Bros. made their first lifting of salt from this furnace, and simultaneously reduced the price to the then unprecedentedly low figure of 4 cents per pound.

From this time forward, salt-making, as one of the leading industries of Kanawha, was an established fact, and Kanawha salt one of the leading commercial articles of the west; and wherever it has gone, from the Alleghanies to the Rocky mountains, from the Lake to the Gulf, its superior qualities have been recognized and appreciated.

The neighboring property owners, who had watched the progress and result of the Ruffner well with such deep interest, now instituted borings on their own lands, above and below, and on both sides of the river. Among these earlier, enterprising experimenters were William Whitaker, Tobias Ruffner, Andrew Donally, and others. All were more or less successful in getting a supply of brine, at depths varying from 50 to 100 feet, and by 1817 there were some 30 furnaces and 15 or 20 wells in operation, making in the aggregate 600,000 to 700,000 bushels of salt.

In this year an important revolution in the manufacture of salt was effected by the discovery of coal. Although, in one of the finest coal fields of the world, coal had not, hitherto, been found here in workable seams, nor been used at all, except for blacksmith purposes. Wood had been the only fuel used in salt-making, and for other purposes, and all the bottoms and convenient hill slopes for several miles up and down the river had been stripped of their timber to supply this demand.

David Ruffner, true to the spirit of enterprise and pluck which bored the first well, was the first here to use coal as a fuel. This would appear to be a very simple matter now; but was not so then. It was only after many months of discouraging efforts, and failing experiments, that he finally succeeded in getting it to work to his satisfaction. Its value established, however, its use was, at once, adopted by the other furnaces, and wood ceased to be a fuel for salt-making in Kanawha.

Other important improvements were gradually going on in the manner of boring, tubing and pumping wells, etc. The first progress made in tubing, after Ruffner's compound wood-and-wrapping-twine tube, was made by a tinner, who had located in Charleston to make tin cups and coffee pots for the multitude. He made tin

tubes in convenient lengths, and soldered them together as they were put down the well. The refinement of screw joints had not yet come, but followed shortly after, in connection with copper pipes, which soon took the place of tin, and these are recently giving place to iron.

In the manner of bagging the wells, that is, forming a water-tight joint around the tube to shut off the weaker waters above from the stronger below, a simple arrangement called a "seed-bag," was fallen upon, which proved very effective, which has survived to this day, and has been adopted wherever deep boring is done, as one of the standard appliances for the purpose for which it is used. This seed-bag is made of buckskin, or soft calfskin sewed up like the sleeve of a coat or leg of a stocking; made 12 to 15 inches long, about the size of the well hole and open at both ends; this is slipped over the tube and one end securely wrapped over knots placed on the tube to prevent slipping. Some six or eight inches of the bag is then filled with flaxseed, either alone or mixed with powdered gum tragacanth; the other end of the bag is then wrapped, like the first, and the tube is ready for the well. When to their places—and they are put down any depth, to hundreds of feet—the seed and gum soon swell from the water they absorb, till a close fit and water-tight joint are made.

The hydraulic contrivance for raising salt water from the gums, consisting of a bucket, a swape and a man, was simple, slow and sure; but the spirit of progress was abroad and it soon gave place to a more complicated arrangement, consisting of a pump, lever, crank, shaft, and blind horse or mule, that revolved in its orbit around the shaft. This was considered a wonderful achievement in mechanical contrivance, especially by the men who had worked the swapes.

For several years this "horse-mill," as it was called, was the only mode of pumping salt water on Kanawha, but in the fullness of time it also went to the rear in 1828, and the steam engine came to the front, not only for pumping, but also for boring wells and various other uses.

In 1831 William Morris, or "Billy" Morris, as he was familiarly called, a very ingenious and successful practical well borer, invented a simple tool, which has done more to render deep boring practicable, simple and cheap, than anything else since the introduction of steam.

This tool has always been called here "Slips," but in the oil regions they have given it the name of "Jars." It is a long double-link, with jaws that fit closely, but slide loosely up and down. They are made of the best steel, are about 30 inches long, and fitted, top and bottom, with pin and socket joint, respectively. For use they are interposed between the heavy iron sinker, with its cutting chisel-bit below, and the line of augur poles above. Its object is to let the heavy sinker and bit have a clear, quick, cutting fall, unobstructed and unencumbered by the slower motion of the long line of augur poles above. In the case of fast augur or other tools in the well, they are also used to give heavy jars upward or downward, or both, to loosen them. From this use the oil well people have given them the name of "Jars."

Billy Morris never patented his invention, and never asked for nor made a dollar out of it, but as a public benefactor, he deserves to rank with the inventors of the sewing machine, reaping machine, planting machine, printing cylinders, cotton gin, etc.

This tool has been adopted to general use wherever deep boring is done, but, outside of Kanawha, few have heard of Billy Morris, or know where the slips or jars came from.

The invention of this tool, the adoption of the heavy sinker and some other minor improvements in well boring, gave a great impetus to deep boring in Kanawha. Wells were put down 500, 1,000, 1,500, and 1,800 feet, and one, the deepest in Kanawha, by Charles Reynolds, to about 2,000 feet. These borings would doubtless have been carried to a much greater depth, but that the fact soon got to be understood, that the salt-bearing strata had been passed, and that no brines were obtained at a greater depth than 800 to 1,000 feet. The limit of the salt-bearing rocks is readily told by the character of the borings. Within this limit are sandstones, shale, coal, etc., of the Coal Measures lying nearly horizontal, though dipping slightly to the northwest; below is the Carboniferous Limestone, which underlies the Coal Measures, and crops out 100 miles to the eastward. This limestone, when penetrated, is known to the well-borers as the "long-running rock," from the fact that a boring-bit will run a long time in it without being dulled.

No regular suites of samples of borings from the Kanawha wells have ever been kept. This is not important, however, as the strata are well known, and can be examined along the New river canon as they crop out to the eastward.

The Kanawha borings have educated and sent forth a set of skilful well-borers, all over the country, who have bored for water for irrigation on the western plains, for artesian wells for city, factory, or private use, for salt water at various places, for oil all over the country, for geological or mineralogical explorations, &c., &c.

Nearly all the Kanawha salt wells have contained more or less petroleum oil, and some of the deepest wells a considerable flow. Many persons now think, trusting to their recollections, that some of the wells afforded as much as 25 to 50 barrels per day. This was allowed to flow over from the top of the salt cisterns, on to the river, where, from its specific gravity, it spread over a large surface, and by its beautiful iridescent hues, and not very savory odor, could be traced for many miles down the stream. It was from this that the river received the familiar nickname of "Old Greasy," by which it was for a long time familiarly known by Kanawha boatmen and others.

At that time this oil not only had no value, but was considered a great nuisance, and every effort was made to tube it out and get rid of it. It is now the opinion of some competent geologists, as well as of practical oil men, that very deep borings, say 2,500 feet, would penetrate rich oil-bearing strata, and possibly inexhaustible supplies of gas.

In 1775, General Washington visited the Kanawha valley in person, and located some very valuable lands for his military services. About three miles above the Salt Lick he set apart and deeded to the public, for-

ever, a square acre of land near the river, on which was a great natural wonder, then little understood, called a "burning spring." For many, many years after, it was visited by every one who came to or passed through Kanawha, as one of the great curiosities of the region. It was simply a hole in the ground, which filled with water when it rained, and up through which issued a jet of gas, giving the water the appearance of boiling, and when lighted burned with a bright flame till blown out by high wind.

In 1841, William Tompkins, in boring a salt well a short distance above the burning spring, struck a large flow of gas, which he turned to account by "boiling his furnace" and making salt with it, effecting a great saving in fuel and economy in the cost of salt.

In 1843, Messrs. Dickinson & Shrewsberry, boring a few rods below, tapped at about 1,000 feet in depth, nature's great gas reservoir of this region. So great was the pressure of this gas, and the force with which it was vented through this bore-hole, that the augur, consisting of a heavy iron sinker, weighing some 500 pounds, and several hundred feet more of augur poles, weighing in all, perhaps 1,000 pounds, was shot up out of the well like an arrow out of a cross-bow. With it came a volume of salt water, which stood probably 150 feet high. The roaring of this gas and water, as they issued, could be heard under favorable conditions for several miles.

It would have been difficult to estimate with any approach to accuracy, the quantity of gas vented by this well, and no attempt was made to measure it. I heard it roughly estimated as being enough to light London and Paris, with, perhaps, enough left to supply a few such villages as New York and Philadelphia. But as this is a salt well, as well as gas well, I suggest that the gas estimates be taken, "*cum grano salis*."

The salt water and gas from this well were partially collected, and conveyed through wooden pipes, to the nearest furnace, where they were used in making salt.

For many years this natural flow of gas lifted the salt water 1,000 feet from the bottom of the well, forced it a mile or more through pipes, to a salt furnace, raised it into a reservoir, boiled it in the furnace, and lighted the premises all around at night. About the only objection to the arrangement was that it did not lift the salt and pack it in barrels.

The success of this well induced other salt-makers to bore deep wells for gas, and several were successful. Messrs. Worth & English, Tompkins & Co., Wm. D. Shrewsberry, J. H. Fry, and J. S. O. Brooks got gas wells and used the gas either alone, or in connection with coal, for fuel in salt-making. Gas was also struck in a few other wells, but did not last long, and was not utilized.

The first flow of gas ever struck in Kanawha was as far back as 1815, in a well bored by Capt. James Wilson, within the present city limits of Charleston, near the residence of C. C. Lewis, Esq.

The Captain had not gotten as good salt water as he expected; but instead of being discouraged, he declared in language emphatic, that he would have better brine or bore the well into the lower regions, with higher temperature.

Shortly after this the augur struck a cavity which gave vent to an immense flow of gas and salt water.

The gas caught fire from the grate near at hand, and blazed up with great force and brilliancy, much to the consternation of the well borers and others. Captain Wilson thought it would be a reckless tempting of Providence to go any deeper, and ordered the boring stopped.

This well is now owned by the Charleston Gas Light Company, who at some future time contemplate reopening it to test the gas for lighting the city.

Of the many wells in the neighborhood that have furnished gas, some have stopped suddenly, and some by a slow and gradual process. Whether these stoppages have been from exhaustion of the gas, or sudden, or gradual stoppage of the vent-ways, has not been definitely determined. It is known, however, that in the Dickinson & Shrewsbury well, which blew longer than any other, that the copper pipes in the well, and the wooden pipes leading to the furnace, were lined with a mineral deposit, in some places nearly closing them. This deposit has not been analyzed, but may possibly be silicate of lime. A system of torpedoing might break up these incrustations from the walls of the well and rock cavities, and start the gas again.

From the results of such wells in Pennsylvania and New York we have large encouragement to hope for similar results here.

A few wells intelligently manipulated might give gas enough to boil all the salt manufactured here, and run all the machinery in the neighborhood.

After the introduction of steam power, and the use of coal for fuel, no striking change was effected in the process of salt manufacture for a number of years. What improvements were made were simple in degree. Wells were bored deeper, the holes were bored larger, the tubing was better, the pumps and rigging simpler. The furnaces were larger, better constructed, and more effectively operated, the quality of the salt improved and the quantity increased, but still they were kettle furnaces of the original type.

The mammoth of the kettle era was that of Joseph Friend & Son, at the mouth of Campbell's creek, on which they made 100,000 bushels of salt per annum. The usual capacity of other furnaces was 25,000 to 50,000 bushels per annum.

This was about the condition of the salt manufacture here in 1835, when there were, all told, about 40 furnaces, producing annually about 2,000,000 bushels of salt.

During this year George H. Patrick, Esq., of Onondaga, New York, came here, to introduce a patent steam furnace.

The furnace proper, after it was developed and improved, consisted of cast iron pans, or bottoms, 8 to 10 feet by 3 feet. Eight or ten of these pieces were bolted together by iron screws, forming one section 24 to 30 feet long, by 8 or 10 feet wide. There were two, three or four of these sections, according to the size of the furnace. Over each of the sections was constructed a wooden steam chest, bolted to the flanges on the sides of the pans and otherwise held together by wooden clamps and keys, and iron bolts and rods, all made steam and water tight by calking. These several sections are set longitudinally on the furnace walls to form one continuous furnace.

After the furnace comes a series of wooden vats or cisterns, a usual size for which is about 10 feet wide and 100 feet long. The number of these cisterns varies according to the size of the furnace. They are constructed of poplar plank, 4 to 5 inches thick, dressed to joints, and fitted in a frame of oak by sills and clamps. They are tightened by driving wooden keys, and then calked to make them water tight. This system of clamping and keying cisterns was introduced here from a model brought by Col. B. H. Smith, from the navy yard at Norfolk. It was very simple and effective, and has been retained to this day, without improvement or change.

There are two sets of these cisterns, the first in which the brines after boiling in the furnace proper, are settled, and at the same time strengthened up to saturation. The latter in which the salt is graduated from the clear saturated brines. These settling and grain-ing cisterns are very much alike, except that the grainers are but 15 to 18 inches deep, while the settlers may be double that or more. Through each and all of these cisterns from end to end are three rows of copper pipes, usually 5 inches in diameter.

After the salt water is boiled in the furnace proper, it runs into these settling cisterns, and after being thoroughly settled and saturated, is drawn into the grainers, where the salt is deposited, and once in 24 hours is lifted out by long-handled shovels, on to a salt board, suspended above the grainer, and from which, after proper draining, it is wheeled in wheel barrows to a salt house, where it is packed in barrels ready for shipment.

The steam generated by the boiling in the furnace proper is carried from the steam chest, by wooden pipes, to the copper pipes and through the settlers and grainers. This steam giving up its heat in passing through these cisterns, keeps up the temperature of the brines, and causes rapid evaporation. The temperature of these cisterns varies from 120 degrees to 190 degrees; an average would probably be 165 degrees.

This, in short, is a description of the steam furnace, after it was improved, and the first mistakes and crudities eliminated. In the first experiments only very slight heat was imparted by the steam to the brines, and only very coarse or alum salt made. It was very simple, accomplished all that was expected, and so soon as it was fairly tested, improved up to its working condition, and its advantages demonstrated, the days of the kettle furnaces were numbered.

Andrew Donnally and Isaac Noyes were the first to try and adopt the plan. Then followed John D. Lewis, Lewis Ruffner, Frederick Brooks, and others, till all had made the change; and when the Ohio river furnaces were built, the system was fully adopted there.

Thus, this oil not only seems to have been known, but to have been systematically gathered in very early times. Upon the bottom lands of Titusville, Pa., were many acres of cradle-holes dug out and lined with split logs, evidently constructed for the purpose of gathering oil. The fact that the earliest English-speaking inhabitants could never discover any stumps from which these logs were cut, and the further fact that trees of great size were found growing in the midst of these cradles, are evidences that they must have been

operated long ago, but by whom is a question as yet unsolved. Some have suggested that it was the work of the mound builders, but the writer indulges in no such belief. It is more reasonable to suppose that the French, who knew of its location, utilized this greasy product to a *considerable* extent for medicinal and other purposes, and arranged these holes, or pits, as a means of gathering it. They were in possession of this region for more than a hundred years before it was personally known to the English-speaking whites, and during that great period there was ample time for the stumps of trees taken to line these pits to crumble to dust, as well as for small trees to attain great proportions. Two miles north of Burning Springs, Wirt County, West Virginia, on the north branch of Burning Spring run, the writer in May 1903 found a sycamore tree growing on an old brick furnace that was used in the sixties. The tree is thirty feet high and eight inches in diameter. What proportions will this tree attain in one hundred years. General Irvine, during his exploring expeditions along the Allegheny river and its tributaries in the summer of 1785, visited Oil creek, Pennsylvania, and in his report says: "Oil creek has taken its name from an oil or bituminous matter found floating on the surface. Many cures are attributed to this oil by the natives (meaning the Indians) and lately by some whites."

For many years the usual means of gathering this product of nature, which finally became known as "Seneca Oil," by virtue of having been first discovered by the Seneca Indians, was by throwing a woolen cloth or blanket upon the water, which the oil floated on, and then wringing the cloth over a wooden or stone vessel. The clean wool absorbed the oil and rejected the water, and in this way a considerable quantity was obtained. The oil was then bottled in small vials and sold by peddlers in many parts of the country as a sure cure for rheumatism, sore throat and various aches and pains. At this early date it was noticed by the white men that the Seneca Indians had long, black, shining hair and that their beautiful hair was envied by the other Indian nations. The Senecas used this oil on their heads as the Americans do the hair oils that are made from the same kind of oil to-day. Between 1825 and 1830 we find the white settlers on Oil Creek, Pennsylvania, dipping oil from holes dug near where the oil seeps out of the ground. Logs and timbers were formed in a hollow square, with openings on the up stream end, and anchored in the water on Oil Creek. The oil floating on the top of the water was caught in the log pens, which were commonly called oil coops. Each morning and evening the oil was skimmed off the water in the coops. These pens were known as oil coops in the early days of Oil Creek. From 1830 to 1839 nothing new had taken place on Oil Creek or at the oil springs at Cuba, New York. However, in the year 1839 Samuel M. Kier and his father, Thomas Kier, of Pittsburg, Pa., had a well drilled on the bank of the Allegheny river about one mile above Tarentum, Pa. The well was drilled for salt water brine by a Kanawha, W. Va., salt well (borer) driller, Joseph Doty, Sr., by name. The spring pole system of drilling was used. This is the first drilled well we have any record of in Pennsylvania.

After the well was drilled deep enough to find salt water the water rose to the surface and ran over at the mouth of the well. After some months oil made its appearance and mixed in considerable quantities with the salt water. About the same time Lewis Peterson, Sr., discovered oil in a well he had drilled on his farm adjoining the Messrs. Kier's. The accumulation on Mr. Peterson's premises was so considerable that it became troublesome and had to be removed by means of surface drains. But after letting the oil run into the river for some time the idea came to Mr. Peterson that the oil might be used to oil machinery, and in the year 1845 he presented Mr. Morrison Foster, of the Hope Cotton Factory, located at Pittsburg, Pa., with a bottle of oil gathered from the salt water from his well at Tarentum. Mr. Foster, in conjunction with the manager of the spinning department of the mill, Mr. David Anderson, experimented with the oil, and soon found that by a certain process it could be combined with sperm oil in such a way as to form a better and cheaper lubricator for the finest cotton spindles than the best sperm oil. Mr. Peterson supplied two barrels of oil each week for ten years before it was made known. This was the first practical use of petroleum (crude oil) in America.

And next we find Mr. Samuel M. Kier, with that practical sagacity with which he was distinguished, could not believe that this (then mysterious production of nature) had been made in vain. He was convinced that there must be a want somewhere which it was intended to supply. As an experiment the oil was bottled and introduced as a medicine. Chemistry had frequently shown that petroleum possessed several valuable medical properties, but in Mr. Kier's early essays the science of advertising was not understood, or at least but little resorted to, and his "patent medicine" speculation failed. In 1842 Samuel M. Kier became fully impressed with the conviction that the oil from his salt water well had its important uses. At this early date he submitted samples of petroleum (crude oil) to Professor J. C. Booth, of Philadelphia, Pa., who, after a careful analysis of it, recommended him to offer it to a New York gutta-percha company, who were seeking a proper solvent for this gum. The gutta-percha company's experiments with it were not satisfactory. After mature reflection by Professor Booth he became convinced that by distillation an excellent burning oil could be obtained from the crude oil. He then furnished Mr. Kier with drawings for a suitable still. Mr. Kier returned to Pittsburg, Pa., constructed a still and put it in active operation. The product he named "carbon oil," by which designation it was for a long time generally known. At this time lamps adapted to the proper use of "carbon oil" had not been invented, and other uses for crude and refined oils had not yet arisen, and again Mr. Kier's project met with indifferent success. Three years later Mr. Kier started his sixty-gallon still "refinery" again near his salt well at Tarentum. In the meantime his salt water well was tubed and started to pump, and in a short time the head of salt water became exhausted and petroleum (crude oil) appeared and was pumped freely. Thus in the year 1845 was established the first "oil pumping well" known to the oil world. But years were yet to elapse before human knowledge

should attain to a full comprehension of this singular discovery, destined to effect the greatest trade revolution known to modern commerce. After pumping the well a short time the stock of petroleum (crude oil) became in excess of the market, and at this time very little illuminant or refined oil was used. However, in a short time the coal oil excitement commenced, and mineral oil as an illuminant came into general use, as lamps adapted to refined oil were now invented, with the cheapness, brilliancy and safety combined to recommend them. For some unknown cause Mr. Kier could not sell his oil and after considerable negotiations with a Mr. Ferris, of New York City, contracted for the greater portion of the well's production in crude. In the year 1850 Brewer, Watson & Co. came into possession of all the timber in and around the then village of Titusville, Pa., and thousands of acres of land on Pine and Oil creeks, in Crawford and Venango counties, Pa. This was the land the oil springs near Titusville, Pa., were located on. At this date the oil drippings from these springs and coops were neglected, as the oil for curative purposes was getting to be very common and would not sell as fast as the springs would supply it.

In a paper communicated to the "American Journal of Science," for July, 1833, on "*The Saliferous Rock Formation in the Valley of the Ohio*," by Dr. S. P. Hildreth, of Marietta, touching incidentally on the subject of Carburetted-Hydrogen Gas and Petroleum, says: "All salt wells afford more or less of this interesting gas, an agent intimately concerned in the free rise of the water, and universally present where salt water is found. Indeed, so strong is the evidence afforded by the rising of this gas to the surface of the existence of the salt rock below, that many wells are sunk on this evidence alone. It is without doubt a product of the saliferous formation, as it rises in many wells without any appearance of petroleum, which latter product is probably generated by bituminous coal, and in all wells, from a depth far below where coal has been discovered in sufficient quantity to furnish such an immense and constant supply as is continually rushing from the earth in these saliferous regions. In many wells, salt water and inflammable gas rise in company with a steady uniform flow. In others, the gas rises at intervals of ten or twelve hours, or perhaps as many days, in vast quantities, and with overwhelming force, throwing the water from the well to the height of fifty or one hundred feet in the air, and again retiring within the bowels of the earth to acquire fresh power for a new effort. This phenomenon is called "blowing," and is very troublesome and vexatious to the manufacturer. The explosion is sometimes so powerful as to cause the copper tube which lines the upper part of the well to collapse, and to entirely misplace and derange the fixtures about it. By constant use this difficulty is sometimes overcome by the exhaustion of the gas, and in others the wells have been abandoned as hopeless of amendment.

A well on the Muskingum, ten miles above McConnellsville, at six hundred feet in depth, afforded such an immense quantity of gas, and in such a constant stream, that while they were boring, it several times took fire from the friction of the iron on the poles against the

sides of the wall, or from the scintillations from the augur, driving the workmen away, and communicating the flame to the shed which covered the works. It spread itself along the surface of the earth, and ignited several combustible bodies at the distance of several rods. It became so troublesome and difficult to extinguish, whenever ignited, being in this respect a little like the Greek fire so celebrated by Gibbon, that from this cause only the well has been abandoned. In the days of superstition and ignorance this would doubtless have been attributed to the anger of the genius who presided over the spot, and thus protected it from the unhallowed approaches of man.

At A. P. Stone's well, on the opposite side of the river, a little below McConnellsville, the gas rises in small regular puffs or discharges, averaging one for every minute or two, causing the water to flow in jets from the spout as it falls into a large cistern below. The water rises in the head through a bored log to the height of twenty-five feet above the surface of the earth. Through a hole in the top of a small receiver cup, the gas rises in a constant stream, and when a candle or torch is applied, kindles into a beautiful flame, burning steadily until extinguished by closing the hole—affording in the stillness and darkness of midnight a striking and interesting phenomenon. It is supposed that this well alone furnishes sufficient gas, if properly applied, to light the town very handsomely. No petroleum rises with it, and very little in any of the other wells of this locality. The quantity of gas in different wells varies very considerably; all, however, afford sufficient to keep the water in constant agitation over the mouth of the well. The supply of water depends very much on the quantity of gas discharged. A few miles above Charleston, on the Big Kanawha, great quantities of the carburetted hydrogen are slowly emitted through the earth. A tract of several rods in extent, near the river bank, is so charged with it that on making shallow cavities in the sand, and applying a fire-brand, it immediately becomes ignited, and burns with a steady flame for an indefinite period, or until extinguished by covering it with sand. The boatmen, a rude but jolly race, often amuse themselves by tracing a circle in the sand around some one of the company unacquainted with the mystery, and, applying fire, a flame immediately springs up as if by magic around the astonished wight, which, being entirely confined to the circle traced, adds much to his terror, and increases the delight of his boisterous companions. In a short time the sand beneath the burning gas becomes red hot. The neighboring women sometimes make use of it to boil their water when washing clothes on the bank of the river, and boatmen occasionally cook their food in the same easy and cheap manner. This spot would afford a fine site for the temple of the fire-worshippers of ancient Persia. In low stages of the water, gas and oil are seen oozing from the bed of the river at various points. On the Little Muskingum river, a few miles from Marietta, this gas is discharged in many places—often through a pool or sink-hole filled with water—in which case it is called a burning spring. Petroleum is often found rising from the earth near the spring. Throughout the whole saliferous region, so far as I have any

knowledge, on penetrating the salt rock a greater or less quantity of carburetted hydrogen gas is discharged through the opening; in some places accompanied by petroleum, and in others without this co-existent production."

Continuing, he says of

Petroleum or Fossil Oils

Since the first settlement of the country west of the Apallachin range, the hunters and early pioneers have been acquainted with this oil. Rising in a hidden and mysterious manner from the bowels of the earth, it soon arrested their attention, and acquired great value in the eyes of these simple sons of the forest. It was thought to be a sovereign remedy for nearly all the diseases common to those primeval days; and from its success in rheumatism, burns, coughs, sprains, &c., was justly entitled to all its celebrity. It acquired the name of Seneca Oil—that by which it is generally known—from having first been found in the vicinity of Seneca Lake, New York. From its being found in limited quantities, and its great and extensive demand, a small vial of it would sell for forty or fifty cents. It is at this time in general use among the inhabitants of the country for saddle bruises and that complaint called the scratches in horses. It seems to be peculiarly adapted to the flesh of horses, and cures many of their ailments with wonderful certainty and celerity. Flies and other insects have a natural antipathy to its effluvia, and it is used with much effect in preventing the deposit of eggs by the "blowing fly" in the wounds of domestic animals during the summer months. In neighborhoods where it is abundant it is burned in lamps in place of spermaceti oil, affording a brilliant light, but filling the room with its own peculiar odor. By filtering it through charcoal much of this empyreumatic smell is destroyed, and the oil greatly improved in quality and appearance. It is also well adapted to prevent friction in machinery; for, being free of gluten, so common to animal and vegetable oils, it preserves the parts to which it is applied for a long time in free motion. Where a heavy vertical shaft runs in a socket it is preferable to all or any other articles. This oil rises in greater or less abundance in most of the salt wells on the Kanawha, and collecting as it rises in the head on top of the water, is removed from time to time with a ladle, and put by for sale or use.

The greater abundance of stone coal in this locality, than in that of the Muskingum, gives it a decided advantage in the elaboration of petroleum. On the latter river the wells afford but little oil, and that only during the time the process of boring is going on. It ceases soon after the wells are completed, and yet all of them abound more or less in gas.

A well on Duck Creek, about thirty miles north of Marietta, owned by Mr. McKee, furnishes the greatest quantity of any in this region. It was dug in the year 1814, and is four hundred and seventy-five feet in depth. Salt water was reached at one hundred and eighty-five feet, but not in sufficient quantity. However, no more water was found below this depth. The rocks passed were similar to those on the Muskingum River, above the flint stratum, or like those between the flint and salt deposits at McConnelsville. A bed of

coal two yards in thickness was found at the depth of one hundred feet, and gas at one hundred and forty-four feet above the salt rock. The hills are sandstone, based on lime, one hundred and fifty or two hundred feet in height, with abundant beds of stone coal near their feet. The oil from this well is discharged periodically, at intervals of from two to four days, and from three to six hours' duration at each period. Great quantities of gas accompany the discharges of oil, which for the first few years amounted to from thirty to sixty gallons at each eruption. The discharges at this time are less frequent and diminished in amount, affording only about a barrel a week, which is worth at the well from fifty to seventy-five cents a gallon. A few years ago, when oil was most abundant, a large quantity had been collected in a cistern holding thirty or forty barrels. At night some one engaged about the works approached the well-head with a lighted candle. The gas instantly became ignited, and communicated the flames to the contents of the cistern, which, giving way, suffered the oil to be discharged down a short declivity into the creek, where the water passes with a rapid current close to the well. The oil still continued to burn most furiously, and, spreading itself along the surface of the stream for half a mile in extent, shot its flames to the tops of the highest trees, exhibiting the novel and perhaps never-before witnessed spectacle of a river actually on fire.

Here we find Petroleum obtained more than thirty years before its final development, yet attended with all the accidents, and presenting all the phenomena that characterize its production in Pennsylvania. These are not accounts open to the suspicion of exaggeration. They were written and published more than a generation before the *philosophy* of Petroleum broke upon the understanding of man. Here we find it repeatedly forced upon his attention in the very way it was finally developed, and still the idea of artesian drilling was never designedly applied to the production of Petroleum till at last suggested, as is often the case with great ideas, by a most trivial occurrence.

Here was a well drilled for salt to the depth of six or eight hundred feet—to the average depth of Petroleum wells in Pennsylvania in 1865—producing scarcely anything but Petroleum, every well in the region throwing up more or less of the oil, and yet it seems never to have occurred to any one that if drilled for expressly, it could be found in paying quantities.

What a comment on the narrowness of a mind pre-occupied! How have we overlooked all the great truths of philosophy, until at last they secured a sprouting place in some mind unprejudiced by practice and unbiassed by theory? And then we call it inspiration, when the germ that has fallen in good ground, and sprouted, and blossomed, and borne fruit, has proved to be such a very wonderful little seed, and one that all saw, and none comprehended, when it was lying exposed in the stony places. And then we wonder we had not comprehended it before, especially as it was easier to comprehend it—the simple, little idea—than to shut it out from our understanding as the thing quite incomprehensible.

Its value as a lubricator was indisputably established; its medicinal properties were appreciated; very

little stood in the way of its adaptation to purposes of illuminating, and so much of even that objection was removed by the simple process of filtering through charcoal—on which process a patent had been obtained—that in the light of present events, it is impossible to understand how its importance could have been overlooked, could have failed to suggest, if not the philosophy of its existence in the earth, the manner in which it is held among the rocks, at least the hope of making a fortune by developing it after the manner of raising brine.

Nathaniel Cary, of Cornplanter Township, Venango County, Pa., was the first white man to sell Seneca Oil as a specific for rheumatism and other ailments of humanity from 1806 to 1815.

Even thirty-eight years later we find Mr. Kier, of Pittsburg, profitably engaged in bottling and selling it as a great natural panacea; consuming in this way regularly about three barrels a day, obtained from his father's salt well at Tarentum, a few miles above Pittsburg, on the Allegheny River, labelling his bottles to the effect that this most wonderful remedy was obtained four hundred feet below the surface of the earth—distilling it, even, so that nearly every objection to it as an illuminator in the crude state was removed, and yet pocketing the returns without giving a thought to its origin or extent.

With Mr. Kier naturally enough the consideration was to utilize what he had, to make the most of it, rather than by research and development to bring forth that which would have been in every sense a drug in the market. He grasped one idea—its utility, and suggested the next—its development.

Thus, link by link, was forged slowly, the chain of events which united thought and action, effecting what is known as the "discovery" of Petroleum.

THE DISCOVERY OF THE VALUE OF PETROLEUM.

The reader will hardly need to be informed that the circumstances related here were not what led to the discovery of the economic value of Petroleum. There can hardly be said to be any merit in witnessing and describing circumstances purely accidental in their occurrence, when to do so effects no impression useful to the cause of human progress. However accidental, the events referred to must be allowed to have been very suggestive; but, inasmuch as they did *not* suggest anything of practical importance to the very intelligent gentlemen who beheld them, it would seem to increase our obligations to the person who finally did grasp the simple idea of the philosophy of Petroleum, and that without any knowledge of the circumstances mentioned. But it must be conceded that, in their cases, a most important incentive was wanting—the article had no certain market, no determinate value. The fact that it sold for fifty and twenty-five cents a gallon proves nothing. It sold for that in 1859, but the first day's production of the first well "broke the market." There was no demand for it, because its uses were unknown—or, at least, not definitely understood. If any one thinks that a larger and more constant supply would have earlier brought about a knowledge of its importance (had that supply been accidentally obtained,

and had its continuance been altogether conjectured), let him reflect how comparatively slow was its introduction to general use even when the supply was so large that its cost was merely nominal, and its continuance an established fact. No! The world was not yet ready for it. And, though the long course of scientific research in other directions, which prepared for its final reception, has escaped public attention, it is easy to show that the way was not prepared in a moment; but it is difficult, looking back from the light of the present, to excuse a stupidity which cannot now be understood, because it has been outgrown.

No science has been more active, progressive, and useful in the last sixty years than Chemistry. But its strides have been as silent as they have been rapid; and though as a science it has almost grown up within the age of living men, and while it has done more, perhaps, than all other sciences to enable us to understand physical relations, there are still plenty of intelligent people who know no more of it than the name. It is mainly to this science that we owe those elaborate experimental researches which demonstrated the practical utility of Petroleum to the domestic comforts of refined civilization.

About the year 1830 a German chemist named Herr Reichenbach, while experimenting with the bitumen found in wood, discovered a white, tasteless, inodorous, waxy substance which he called Paraffine, because of its antipathy to unite with other substances. Like Louis Selligne, of France, Reichenbach had devoted much attention to the production of illuminating oils from coals and bituminous shales in his own country, as well as various other portions of the Continent of Europe, and like him experimented for years without producing anything of value.

The small quantity of paraffine obtained was hoarded as a curiosity of the laboratory, and for many years, it is said, was the only bit of that substance in existence. It does not appear that Reichenbach himself at the time clearly understood the chemical change by which it was produced, but his researches were continued, and together with Selligne's and several others, his name now appears as the inventor or discoverer of kerosene, or coal oil. It seems likely that either of them is entitled to all he claims, for they appear to have worked separately; and aside from the meagre details of their process given to the scientific journals of the day, to have known little of each other's experiments.

It is true, no vast credit can attach to the invention or discovery on account of originality, for the way was very clearly pointed out by facts already known. But its importance can hardly be overestimated. The refining influence—we might say the civilizing influence—of a good cheap illuminator, could easily be shown if this were the place for an extended essay on the subject.

The introduction of gas in the cities of Asia and Europe furnish statistics on the subject most interesting from the political, as well as the humanitarian point of view. But the want of an illuminator for the habitations of the poor, and for such places as could not be economically lighted with gas was manifest, and in obedience to a common want we find it invented *almost* simultaneously in three countries—England,

France and Germany—occupying the same plane in civilization. Such coincidences frequently occur; but it is a *remarkable* fact that they never occur unless the invention has become a manifest necessity to the comfort of the society, and the progress of the civilization which the inventors have enjoyed.

Reichenbach's ounce or two of Paraffine was preserved for many years as a great curiosity to his scientific friends. A small quantity of it was also discovered by Selligne, a few years later; but it was reserved for Mr. James Young, of Scotland, to complete the value of the discovery by showing how to produce it at will, and in quantity, and by utilizing it to the comforts of mankind. In 1850 he procured a patent in England for the manufacture of "paraffine oil, or oil containing paraffine, and paraffine from bituminous coals." Some years later a similar patent was issued to him by the government of the United States.

Before this oil had been manufactured from bituminous shales and coals on a small scale in France—by Selligne—in Germany, and in the Austrian Empire. Even on the American Continent, Dr. Abraham Gesner manufactured oil from coal as early as 1846, and exhibited the same in the course of his lectures in the British Provinces. Uniting himself with capitalists, Mr. Young promptly began the manufacture of paraffine oil on a large scale. No lamp had yet been invented in which it would burn without a most offensive smoke, and while the heaviest of this manufacture was used for lubricating machinery, the lightest was reduced to paraffine wax, manufactured into candles, and sold as spermaceti, to which it bears a striking resemblance. It is a product obtained by destructive distillation of the oil—that is, one substance is destroyed before the other is produced. The change which takes place is purely chemical, and not mechanical, as it would be if the paraffine was separated from the oil by which it was merely held in solution. Mr. Young's process consisted in breaking the coals into pieces about the size of a hen's egg, which were then distilled in the common gas retort, with worm pipes and the ordinary refrigerators of stills, the water in them being kept at a temperature of about 55 degrees Fahr., by a stream of cold water entering the worm cistern. The retort was kept at a low red heat, and heated up gradually. The product was an oil containing the paraffine.

The crude oil was put into a cistern, and steam heat applied up to about 156 degrees. This separated some of the impurities, and the oil was run off into another vessel, leaving the impurities behind. The oil was then distilled in an iron still, with a worm pipe and refrigerator, the water in the latter being kept at 55 degrees Fahr. The oil thus distilled was then agitated with 10 per cent. of sulphuric acid for an hour. It was then allowed to settle twelve hours, when it was drawn off and distilled with half its bulk of water, which was run into the still from time to time to supply the quantity distilled off. The light oil came over with the steam, and was employed for illumination. The oil left in the still was carefully separated from all water and put into a leaden vessel, and then agitated with two per cent. of sulphuric acid. It was then allowed to settle twenty-four hours. This oil was then run into another vessel, and for every one hundred gallons

there was added twenty-eight pounds of chalk ground up with water into a paste. The oil and chalk were agitated together until the oil was freed of acid. After it had remained a week at rest, it was used for lubricating machinery, and was mixed with animal and vegetable oils for that purpose.

To obtain the Paraffine the oil containing it was brought down to a temperature of 30 degrees Fahr., when paraffine will crystallize and separate itself from the oil; or it may be filtered and finally submitted to pressure. Again it was agitated with its bulk of sulphuric acid, and the operation repeated until the acid ceased to be colored by the paraffine, which was kept melted during the operation.

Mr. Gerker's method differed from this not very materially, but had for its object not the production of paraffine, and therefore the similarity of the treatment ceased just where the production of paraffine began.

His purpose was merely to procure an illuminating oil, which he called "Kerosene," a name almost identical in its meaning with "Paraffine Oil." The patents granted him by our government, known as the "Kerosene Patents," were sold to the North American Kerosene Gas Light Company, of New York, which in 1854 began the manufacture of Kerosene Oil at their works on Newtown Creek, Long Island, New York. Its introduction was discouragingly slow. The refining process was not thoroughly understood, and nothing had then been found to overcome the odor, which was most offensive. Men interested in the manufacture of camphene, and burning fluids of all sorts spread the belief that it was very explosive. But the beauty of its light commended it in spite of the odor and the fear of explosion, though in fact when first manufactured it was no more explosive than ordinary sperm oil. One great apparent need was a lamp which would burn it without a smoke, and admit of its being moved around, which could not be done when it was burned in the camphene lamp. This difficulty was afterwards remedied by the introduction of the Vienna burner by Mr. J. Austin.

Mr. Young's patents specified a paraffine oil from "coals." The great profit of the business induced many to embark in the manufacture of the oil, and he soon found that his patent-right was being invaded both in this country and England. Proceedings were instituted at once to compel the payment of a royalty of three cents per gallon, and also for damages by infringement of the patent-right. In most cases these were strenuously resisted; the defendants in many cases claimed that their oils were not from coals, but from bituminous shales and asphaltum. These gave the proprietors of the lands with whom for the most part sharp bargains had been driven, a pretext for checking the despoliation of their property, under contracts for the removal of coal, and Mr. Young, in common with many of the other English manufacturers, found himself involved in litigation that threatened to prove interminable, and was only settled at last by compromise. One of the best effects of these costly suits was a most exhaustive scrutiny into all the varieties of coals and bitumens, and, though in a few instances carboniferous deposits, which were clearly shown to be asphalts or of that nature, by their solution in benzine and naphtha,

were pronounced "coals" by ignorant jurors, and did not affect the value of those researches to the industries of the world, nor change the opinions of educated men. Mr. Young's patent, after having been the source of a princely fortune, expired in England in 1864, and four years later in the United States, but it had brought him no revenue from this country since the discovery of Petroleum in Pennsylvania.

Before that event took place, however, a market was being prepared for it on the continent of Europe, by the manufacture on an extensive scale of oils from coals, schists and bituminous shales.

In Germany, on the Rhine, and in various parts of France and Switzerland, large manufactories were erected, and it soon became not a luxury of life, but a necessity. And in the Empire of Austria, in some of the Northern provinces of which it was extensively manufactured, a lamp had been invented in which the oil burned with a beautiful clear flame, and without smoke. The light could also be carried about indifferently without extinguishing. Here was the great desideratum at last, the greatest obstacle overcome. This lamp was promptly introduced into the United States. Our government has issued innumerable patents for improvements in this lamp. The quality of our light has been greatly improved, but it is less the result of any improvement in the lamp than a more perfect method of refining the oil.

When Mr. Young began the manufacture of mineral oil, the success of his efforts sent consternation into some branches of industry on this side of the Atlantic.

The great manufacturers of animal oils along our eastern seaboard were first to take the alarm. For years they had almost monopolized the whale fisheries, and large amounts of capital were invested in the production of the smaller fish oils and lard oil. They saw in his success the breaking down of their monopoly, the destruction of their trade; and, determined to preserve their importance, they commenced manufacturing mineral oils themselves. Casting about for the means of self-preservation, they very soon discovered that our own country afforded even greater facilities for the production of these commodities than either Great Britain or any other part of Europe.

Our bituminous coal measures were found to be the most extensive and accessible in the world. Upon examination, valuable oil-producing shales were discovered. Mines could be obtained on the most reasonable terms; could often be purchased in fee for a few dollars per acre. Everything was favorable, and it seemed as if our prestige in oil was not only to be maintained, but vastly increased.

The great difficulty was the cost of labor, which was four times as great as in England, and nearly six times greater than in Germany, where much of the work was done by women. This, to be sure, was in some measure compensated by the difference in the cost of lands; but it was a compensation which must soon have been overcome.

Eastern capitalists invested largely in the coal lands of Virginia, Kentucky and Missouri, and to obviate the expense of transporting the coal by rail, began the erection of oil works at the mines.

Near Boston, Mass., Samuel Downer had erected works on a most extensive scale, which cost about half a million dollars, while at Portland he had other works put up at an expense of \$250,000 for the manufacture of oil from imported coal; and they continued to increase, till at the time oil was struck there were not less than fifty or sixty of these establishments in the United States, one of which was in Portland, one in New Bedford, four in Boston, one in Hartford, five in the environs of New York, eight or ten in Western Pennsylvania, twenty-five in Ohio, eight in Virginia, six in Kentucky, and one in St. Louis. Many, if not most of these were of small capacity, however, and the greater part of them were not more than fairly started when the discovery of petroleum prostrated the whole business, and threatened its projectors with overwhelming loss, from which they were happily rescued by converting their oil factories into refineries, which was done with very little trouble.

Joshua Merrill, manufacturing chemist of the Downer Kerosene Oil Company of Boston, Mass., was the real discoverer of Kerosene Refined Oil and its by-products.

While the object of this history has been to show the gradual steps by which the economic value of petroleum was discovered, or rather demonstrated, and while the reader will, I presume, believe with me, that had its value not been thus conclusively determined, and had not the way for its reception at home and abroad been opened by the previous extensive introduction of coal oil both as a lubricator and an illuminator, its development must have been indefinitely delayed; for it was a belief in its identity—for practical purposes—with coal oil that prompted the series of investigations which resulted in its most wonderful development.

The event which finally determined its economic value, which proved its identities with and differences from, coal oil, which showed that, while for many purposes it was about the same—for most purposes it was superior, was the exhaustive analysis procured and paid for by George H. Bissell and others, the report of which is appended to this history rather than place it in the chronological order to be observed throughout this work.

MESSRS. EVELETH, BISSELL & REED,

Gentlemen:—

I herewith offer you the results of my somewhat extended researches upon the Rock Oil, or Petroleum, from Venango County, Pennsylvania, which you have requested me to examine with reference to its value for economical purposes.

Numerous localities, well known in different parts of the world, furnish an oily fluid exuding from the surface of the earth, sometimes alone in "tar springs," as they are called in the western United States; frequently it is found floating upon the surface of water in a thin film, with rainbow colors, or in dark globules, that may, by mechanical means, be separated from the fluid on which it swims.

In some places wells are sunk for the purpose of accumulating the product in a situation convenient for collection by pumping the water out. The oil exudes

on the shores of lakes and lagoons, or rises from springs beneath the beds of rivers. Such are the springs of Baku, in Persia, and the wells of Amiano, in the duchy of Parma, in Italy. The usual geological position of the rocks furnishing this natural product is in the coal measures—but it is by no means confined to this group of rocks, since it has been found in deposits much more recent, and also in those that are older—but in whatever deposits it may occur, it is uniformly regarded as a product of animal, mineral, marine and vegetable composition. Whether this decomposition has been effected by fermentation only, or by the aid of elevated temperature, and distilled by heated vapor, is perhaps hardly settled.

It is interesting, however, in this connection to remember that the distillation, at an elevated temperature, of certain black bituminous shales in England and France, has furnished large quantities of an oil having many points of resemblance with Naphtha, the name given to this colorless oil, which is the usual product of distilling Petroleum. The very high boiling point of most of the products of the distillation of the Rock Oil from Venango County, Pa., would seem to indicate that it was a pyrogenic (fire-produced) product.

Bitumen, Asphaltum, Mineral Pitch, Chapapote, &c., &c., are names variously given to the more or less hard, black resinous substance which is produced usually from the exposure of Petroleum to the air, and is found either with or without the fluid Naphtha or Petroleum. The most remarkable examples of the occurrence of these substances, so intimately connected with the history of Rock Oil, are the Lake Asphaltites of the Dead Sea, so memorable in history, the well-known Bitumen Lake of Trinidad, and the deposits of mineral pitch or Chapapote in Cuba. In one of the provinces of India, vast quantities of Petroleum are annually produced, the chief consumption being local, for fuel and lights, but a portion is also exported to Europe for the production of Naphtha. In the United States, many points on the Ohio and its tributaries are noted as producing this oil; nearly all of them within the coal measures. A detailed history of these various localities can be found recorded in books of science, and their repetition here would be out of place.

General Character of the Crude Product.

The crude oil, as it is gathered on your lands, has a dark brown color, which, by reflected light, is greenish or bluish. It is thick even in warm weather—about as thick as thin molasses. In very cold weather it is somewhat more stiff, but can always be poured from a bottle even at 15 degrees below zero. Its odor is strong and peculiar, and recalls to those who are familiar with it the smell of Bitumen and Naphtha. Exposed for a long time to the air, it does not thicken or form a skin on its surface, and, in no sense, can it be called a drying oil. The density of the crude oil is .882, water being 1.000. It boils only at a very high temperature, and yet it begins to give off a vapor at a

temperature not greatly above that of boiling water. It takes fire with some difficulty, and burns with an abundant smoky flame. It stains paper with the appearance of ordinary fat oils, and feels smooth and greasy between the fingers. It is frequently used in its crude state to lubricate coarse machinery. In chemical characters, it is entirely unlike the fat oils. Most of these characters are common to Petroleum from various places. In one important respect, however, the product of your lands differs from that obtained in other situations, that is, it does not, by continued exposure to the air, become hard and resinous like mineral pitch or bitumen. I have been informed by those who have visited the locality, that on the surface of the earth above the springs which furnish your oil, there is no crust or deposit of this sort such as I have seen in other situations where Petroleum or mineral tar is flowing. This difference will be seen to be of considerable importance, as it is understood and represented that this product exists in great abundance upon your property, that it can be gathered wherever a well is sunk in the soil, over a great number of acres, and that it is unailing in its yield from year to year. The question naturally arises, of what value is it in the arts, and for what uses can it be employed? These researches answer these inquiries.

Examination of the Oil.

To determine what products might be obtained in the oil, a portion of it was submitted to fractional distillation. (Fractional distillation is a process intended to separate various products in mixture, and having unlike boiling points, by keeping the mixture contained in an alembic at regulated successive stages of temperature as long as there is any distillate at a given point, and then raising the heat to another degree, &c.) The temperature of the fluid was constantly regulated by a thermometer, the heat being applied first by a water bath, and then by a bath of linseed oil. This experiment was founded upon the belief that the crude product contained several distinct oils, having different boiling points. The quantity of material used in this experiment was 304 grammes. The thermometer indicated the degrees of the Centigrade scale, but, for convenience, the corresponding degrees of Fahrenheit's scale are added. The water bath failed to distil any portion of the oil at 100 degrees C. (—212 degrees Fah.) only a small quantity of acid water came over. An oil bath, linseed oil, was then substituted, and the temperature was regularly raised by slow degrees until distillation commenced. From that point the heat was successively raised by stages of ten degrees, allowing full time at each stage for complete distillation of all that would rise at that temperature before advancing to the next stage. The results of this tedious process are given in the annexed table—304 Grammes of crude oil, submitted to fractional distillation gave:

	TEMPERATURE	QUANTITY
1st Prod.	at 100° C. =213° Fah. (acid water)	5 Gms.
2d "	at 140° C. to 150° C. =284° to 302° Fah.	26 "
3d "	at 150° C. to 160° C. =302° to 320° Fah.	29 "
4th "	at 160° C. to 170° C. =320° to 338° Fah.	38 "
5th "	at 170° C. to 180° C. =338° to 367° Fah.	17 "
6th "	at 180° C. to 200° C. =356° to 392° Fah.	16 "
7th "	at 200° C. to 220° C. =392° to 428° Fah.	17 "
8th "	at 220° C. to 270° C. =428° to 518° Fah.	12 "
Whole quantity distilled by this method.....		160
Leaving residue in the retort.....		144
Original quantity.....		304

Product No. 1, as above remarked, was almost entirely water, with a few drops of colorless oil, having an odor similar to the original fluid, but less intense.

Product No. 2 was an oil perfectly colorless, very thin and limpid, and having an exceedingly persistent odor, similar to the crude oil, but less intense.

Product No. 3 was tinged slightly yellow, perfectly transparent, and apparently as limpid as the second product, with the same odor.

Product No. 4 was more delicately yellowish than the last, but was in no other respect distinguishable from it.

Product No. 5 was more highly colored, thicker in consistence, and had a decided empyreumatic odor.

Product No. 6. This and the two subsequent products were each more highly colored and denser than the preceding. The last product had the color and consistency of honey, and the odor was less penetrating than that of the preceding oils. The mass of crude product remaining in the retort (equal 47.4 per cent.), was a dark, thick, resinous-looking varnish, which was so stiff when cold, that it could be inverted without spilling. This showed no disposition to harden or skin over by exposure to the air. The distillation was arrested at this point in glass, by our having reached the limit of temperature for a bath of linseed oil. The density of the several products of this distillation shows a progressive increase, thus:

No. 2.....	density....	733
No. 3.....	"	752
No. 4.....	"	766
No. 5.....	"	776
No. 6.....	"	800
No. 7.....	"	848
No. 8.....	"	854

To form an idea of the comparative density of these several products, it may be well to state that Sulphuric Ether, which is one of the lightest fluids known, has a density of .736, and Alcohol, when absolutely pure, .800.

The boiling points of these several fluids present some anomalies, but are usually progressive, thus, No. 2 gave signs of boiling at 115 degrees C. (equals 239 degrees Fah.) and boiled vigorously and remained constant at 225 degrees C. to 228 degrees C. (equals 437 degrees to 442 degrees Fah.) No. 3 began to boil at 120 degrees C. (equals 428 degrees Fah.), rose to 270 degrees (equals 518 degrees Fah.), where it remained constant. No. 4 began to vaporize at 140

degrees (equals 284 degrees Fah.), rose to 290 degrees (equals 554 degrees Fah.), where it remained constant. On a second heating the temperature continued to rise, and passed 305 degrees (equals 581 Fah.) No. 5 gave appearance of boiling at 160 degrees (equals 320 Fah.), boiling more vigorously as the heat was raised, and was still rising at 308 degrees (equals 581 Fah.) No. 6 commenced boiling at 135 degrees (equals 275 degrees Fah.), boiled violently at 160 degrees (equals 320 Fah.), and continued rising above the range of the mercurial thermometer. No. 7 commenced ebullition at the same temperature as No. 6, and rose to 305 degrees (equals 581 Fah.), where the ebullition was not very active. Much time was consumed in obtaining these results. We infer from them that the Rock Oil is a mixture of numerous compounds, all having essentially the same chemical constitution, but differing in density and boiling points, and capable of separation from each other, by a well-regulated heat.

The uncertainty of the boiling points indicates that the products obtained at the temperatures named above, were still mixtures of others, and the question forces itself upon us, whether these several oils are to be regarded as *educts* (*i. e.*, bodies previously existing, and simply separated in the process of distillation), or whether they are not rather produced by the heat and chemical change in the process of distillation. The continued application of an elevated temperature alone is sufficient to effect changes in the constitution of many organic products, evolving new bodies not before existing in the original substance.

Properties of the Distilled Oils.

Exposed to the severest cold of the past winter, all the oils obtained in this distillation remained fluid. Only the last two or three appeared at all stiffened by a cold of 15 degrees below zero, while the first three or four products of distillation retained a perfect degree of fluidity. Exposed to air, as I have said, they suffer no change. The chemical examination of these oils showed that they were all composed of Carbon and Hydrogen, and probably have these elements in the same numerical relation. When first distilled, they all had an acid reaction, due to the presence of a small quantity of free sulphuric acid, derived from the crude oil. This was entirely removed by a weak alkaline water, and even by boiling on pure water. Clean copper remained untarnished in the oil which had thus been prepared, showing its fitness for lubrication, so far as absence of corrosive quality is concerned. The oils contain no oxygen, as is clearly shown by the fact that clean potassium remains bright in them. Strong Sulphuric Acid decomposes and destroys the oil entirely. Nitric Acid changes it to a yellow, oily fluid, similar to the changes produced by Nitric Acid on other oils. Hydrochloric, Chromic and Acetic Acids do not affect it. Letharge and other metallic oxyds do not change it, or convert it in any degree to a drying oil. Potassium remains in it unaffected, even at a high temperature. Hydrates of Potash, Soda and Lime are also without action upon it. Chloride of Calcium and many other salts manifest an equal indifference to it.

Distilled with *Bleaching Powders* (chloride of lime) and water, in the manner of producing chloroform, the oil is changed into a product having an odor and taste resembling chloroform. Exposed for many days in an open vessel, at a regulated heat below 212 degrees, the oil gradually rises in vapor, as may be seen by its staining the paper used to cover the vessel from dust, and also by its sensible diminution. Six or eight fluid ounces, exposed in this manner in a metallic vessel for six weeks or more, the heat never exceeding 200 degrees, gradually and slowly diminished, grew yellow, and finally left a small residue of dark brown lustrous-looking resin, or pitchy substance, which in the cold was hard and brittle. The samples of oil employed were very nearly colorless. This is remarkable when we remember that the temperature of the distillation was above 500 degrees Fah. The oil is nearly insoluble in pure alcohol, not more than 4 or 5 per centum being dissolved by this agent. In ether the oil dissolves completely, and on gentle heating is left unchanged by the evaporation of the ether. India Rubber is dissolved by the distilled oil to a pasty mass, forming a thick black fluid which, after a short time, deposits the india rubber. It dissolved a little amber, but *only* sufficient to color the oil red. It also dissolves a small portion of copal in its natural state, but after roasting, the copal dissolves in it as it does in other oils.

Use for Gas Making.

The Crude Oil was tried as a means of illumination. For this purpose, a weighed quantity was decomposed, by passing it through a wrought iron retort filled with carbon, and ignited to full redness. The products of this decomposition were received in a suitable apparatus. It produced nearly pure carburetted hydrogen gas, the most highly illuminating of all the carbon gases. In fact, the oil may be regarded as chemically identical with illuminating gas in a liquid form. The gas produced equalled ten cubic feet to the pound of oil. It burned with an intense flame, smoking in the ordinary gas jet, but furnishing the most perfect flame with the Argand burner.

These experiments were not prosecuted further, because it was assumed that other products, now known and in use, for gas-making, might be employed at less expense for this purpose, than your oil. Nevertheless, this branch of inquiry may be worthy of further attention.

Distillation at a Higher Temperature.

The results of the distillation at a regulated temperature in glass led us to believe that in a metallic vessel, capable of enduring a high degree of heat, we might obtain a much larger proportion of valuable products. A copper still, holding five or six gallons, was therefore provided, and furnished with an opening, through which a thermometer could be introduced into the interior of the vessel. Fourteen imperial quarts (or, by weight, 560 ounces) of the crude product were placed in this vessel, and the heat raised rapidly to about 280 degrees C. (equals 536 degrees Fah.), somewhat

higher than the last temperature reached in the first distillation. At this high temperature, the distillation was somewhat rapid, and the product was easily condensed without a worm. The product of the first stage was 130 ounces (or over 28 per cent.), of a very light-colored thin oil, having a density of .792. This product was also acid, and, as before, the acid was easily removed by boiling with fresh water. The temperature was now raised to somewhat above 300 degrees C. (equals 572 degrees Fah.), and 123 ounces more distilled, of a more viscid and yellowish oil, having a density of .865. This accounts for over 43 per cent. of the whole quantity taken. The temperature being raised now above the boiling point of mercury, was continued at that until 170 ounces, or over 31 per cent., of a dark brown oil had been distilled, having a strong empyreumatic odor. Upon standing still for some time, a dark blackish sediment was seen to settle from this portion, and on boiling it with water, the unpleasant odor was in a great degree removed, and the fluid became more light-colored and perfectly bright. (It was on a sample of this that the photometric experiments were made.) The next portion, distilled at about 700 degrees Fah., gave but about 17 ounces, and this product was both lighter in color and more fluid than the last. It now became necessary to employ dry hickory wood as a fuel, to obtain flame and sufficient heat to drive over any further portions of the residue remaining in the alembic.

It will be seen that we have already accounted for over 75 per cent. of the whole quantity taken. There was a loss on the whole process of about 10 per cent., made up, in part, of a coaly residue that remained in the alembic, and partly of the unavoidable loss resulting from the necessity of removing the oil twice from the alembic, during the process of distillation, in order to change the arrangements of the thermometer, and provide means of measuring a heat higher than that originally contemplated.

About 15 per cent. of a very thick, dark oil completed this experiment. This last product, which came off slowly at about 750 degrees Fah., is thicker and darker than the original oil, and when cold is filled with a dense mass of pearly crystals. These are Paraffine, a peculiar product of the destructive distillation of many bodies in the organic kingdom. This substance may be separated, and obtained as a white body, resembling fine spermaceti, and from it beautiful candles have been made. The oil in which the crystals float is of a very dark color, and by reflected light is blackish green, like the original crude product. Although it distills at so high a temperature, it boils at a point not very different from the denser products of the first distillation. The Paraffine, with which this portion of the oil abounds, does not exist ready-formed in the original crude product; but it is a result of the high temperature employed in the process of distillation, by which the elements are newly arranged.

I am not prepared to say, without further investigation, that it would be desirable for the company to manufacture this product in a pure state, fit for producing candles (a somewhat elaborate chemical process); but I may add that, should it be desirable to do so, the quantity of this substance produced may prob-

ably be very largely increased by means which it is now unnecessary to mention.

Paraffine derives its name from the unalterable nature of the substance, under the most powerful chemical agents. It is white, in brilliant scales of a greasy lustre; it melts at about 116 degrees, and boils at over 700 degrees Fah.; it dissolves in boiling alcohol and ether, and burns in the air with a brilliant flame. Associated with Paraffine are portions of a very volatile oil, *Eupione*, which boils at a lower temperature, and by its presence renders the boiling point of the mixture difficult to determine. I consider this point worthy of further examination than I have been able at present to give it, *i. e.* whether the last third, and possibly the last half, of the Petroleum, may not be advantageously so treated as to produce from it the largest amount of Paraffine which it is able to produce.

The result of this graduated distillation, at a high temperature, is that we have obtained over 90 per cent. of the whole crude product in a series of oils, having valuable properties, although not all equally fitted for illumination and lubrication.

A second distillation of a portion of the product which came over in the latter stages of the process (a portion distilled at about 650 degrees Fah., and having a high color), gave us a thin oil of density about .750, of light yellow color and faint odor.

It is safe to add that, by the original distillation, about 50 per cent. of the crude oil is obtained in a state fit for use as an illuminator without further preparation than simple clarification by boiling a short time with water.

Distillation by High Steam.

Bearing in mind that by aid of high steam, at an elevated temperature, many distillations in the arts are effected which cannot be so well accomplished by dry heat, I thought to apply this method in case of the present research. Instances of this mode of distillation are in the new process for Stearine candles, and in the preparation of Rosin Oil. I accordingly arranged my retort in such a manner that I could admit a jet of high steam into the boiler, and almost at the bottom it contained Petroleum. I was, however, unable to command a jet of steam above 275 degrees to 290 degrees Fah., and, although this produced abundant distillation, it did not effect a separation of the several products, and the fluid distilled had much the same appearance as the Petroleum itself, thick and turbid. As this trial was made late in the investigation, I have been unable to give it a satisfactory issue, chiefly for want of steam of a proper temperature. But I suggest, for the consideration of the company, the propriety of availing themselves of the experience already existing on this subject, and particularly among those who are concerned in the distillation of Rosin Oil—a product having many analogies with Petroleum in respect to its manufacture.

Use for the Naphtha for Illumination.

Many fruitless experiments have been made in the course of this investigation which it is needless to recount. I will, therefore, only state those results which are of value.

1. I have found that the only lamp in which this oil can be successfully burned is the Camphene lamp, or one having a button to form the flame, and an external cone to direct the current of air, as is now usual in all lamps designed to burn either Camphene, Rosin Oil, Sylvic Oil, or any other similar product.

2. As the distilled products of Petroleum are nearly or quite insoluble in alcohol, burning fluid (*i. e.*, a solution of the oil in alcohol) cannot be manufactured from it.

3. As a consequence, the oil cannot be burned in a hand lamp, since, with an unprotected wick, it smokes badly. Neither can it be burned in a Carcel's mechanical lamp, because a portion of the oil being more volatile than the rest, rises in vapor on the elevated wick required in that lamp, and so causes it to smoke.

I have found all the products of distillation from the copper still capable of burning well in the Camphene lamp, except the last third or fourth part (*i. e.*, that portion which came off at 700 degrees Fah. and rising, and which was thick with the crystals of Paraffine). Freed from acidity by boiling on water, the oils of this distillation burned for twelve hours without injuriously coating the wick, and without smoke. The wick may be elevated considerably above the level required for Camphene, without any danger of smoking, and the oil shows no signs of crusting the wick tubes with a coating of Rosin, such as happens in the case of Camphene, and occasions so much inconvenience. The light from the rectified Naphtha is pure and white without odor. The rate of consumption is less than half that of Camphene or Rosin Oil. The Imperial pint, of 20 fluid ounces, was the one employed—a gallon contains 160 such ounces. A Camphene lamp, with a wick one inch thick, consumed of rectified Naphtha in one hour $1\frac{3}{4}$ ounces of fluid. A Carcel's mechanical lamp of $\frac{7}{8}$ -inch wick, consumed of best Sperm Oil, per hour 2 ounces. A "Diamond Light" lamp, with "Sylvic Oil," and a wick $1\frac{1}{2}$ inches in diameter, consumed, per hour, 4 ounces.

I have submitted the lamp burning Petroleum to the inspection of the most experienced lampists who were accessible to me, and their testimony was that the lamp burning this fluid gave as much light as any which they had seen, that the oil spent more economically, and the uniformity of the light was greater than in Camphene, burning for twelve hours without a sensible diminution, and without smoke. I was, however, anxious to test the amount of light given, more accurately than could be done by a comparison of opinions. With your approbation I proceeded therefore to have constructed a *photometer*, or apparatus for the measurement of light, upon an improved plan. Messrs. Grunow, scientific artists of this city, undertook to construct this apparatus, and have done so to my entire satisfaction. This apparatus I shall describe elsewhere—its results only are interesting here. By its means I have brought the Petroleum light into rigid comparison with the most important means of artificial illumination. Let us briefly recapitulate the results of these

Photometric Experiments.

The *unit* adopted for comparison of intensities of illumination is Judd's Patent Sixes Sperm Candle.

The Sperm Oil used was from Edward Mott Robinson, of New Bedford—the best winter Sperm remaining fluid at 32 degrees Fah. The Colza Oil and Carcel's lamps were furnished by Dardonville, lampist, Broadway, New York. The Gas used was that of the New Haven Gas Light Company., made from best Newcastle coal, and of fair average quality.

The distance between the standard candle, and the illuminator sought to be determined was constantly 150 inches—the Photometer traversed the graduated bar in such a manner as to read, at any point where the equality of illumination was produced, the ratio between the two lights. I quote only single examples of the average results, and with as little detail as possible, but I should state that the operation of the Photometer was so satisfactory that we obtained constantly the same figures when operating in the same way, evening after evening, and the sensitiveness of the instrument was such that a difference of one-half inch in its position was immediately detected in the comparative illumination of the two equal discs of light in the dark chamber. This is, I believe, a degree of accuracy not before obtained by a Photometer.

Table of illuminating power of various artificial lights compared with Judd's patent candles as a unit:

Source of Light.	Ratio to Candle.—1.
Gas burning in Scotch fish-tail tips, 4 feet to the hour	1:5.4
Gas burning in Scotch fish-tail tips, 6 feet to the hour	1:7.55
Gas burning in Cornelius fish-tail tips, 6 feet to the hour	1:6.3
Gas burning in English Argand burner, 10 feet to the hour	1:16.
Rock Oil, burning in 1-inch wick Camphene Lamp, consuming 1¾ ounces of fluid to the hour	1:8.1
Carcel's Mechanical Lamp, burning best Sperm Oil, 2 ounces of fluid to the hour, wick ¾ of an inch	1:7.5
Carcel's Mechanical Lamp, burning best Sperm Oil, 2 ounces of Colza Oil	1:7.5
Camphene Lamp (same size as Rock Oil above), burning best Camphene, 4 fluid ounces per hour	1:11.
"Diamond Light" by "Sylvic Oil," in 1½-inch wick, 4 ounces per hour	1:8.1

From this table it will be seen that the Rock Oil Lamp was somewhat superior in illuminating power to Carcel's Lamp of the same size, burning the most costly of all oils. It was also equal to the "Diamond Light" from a lamp of one-half greater power, and consequently is superior to it in the same ratio in lamps of equal power. The camphene lamp appears to be about one-fifth superior to it, but, on the other hand, the Rock Oil surpasses the Camphene by more than one-half in economy of consumption (*i. e.*, it does not consume one-half so much fluid by measure), and it burns more constantly. Compared with the Sylvic Oil and the Sperm, the Rock Oil gave on the ground glass diaphragm the whitest discs of illumination, while in turn the Camphene was whiter than the Rock Oil light. By the use of screens of different colored glass

all inequalities of *color* were compensated in the use of the Photometer, so that the intensity of light could be more accurately compared. Compared with Gas, the Rock Oil gave more light than any burner used except the costly Argand consuming ten feet of gas per hour. To compare the *cost* of these several fluids with each other, we know the price of the several articles, and this varies very much in different places. Thus, gas in New Haven costs \$4 per 1,000 feet, and in New York \$3.50 per 1,000, in Philadelphia \$2.00 per 1,000 and in Boston about the same amount.

Such Sperm Oil as we used costs \$2.50 per gallon, the Colza about \$2.00, the Sylvic Oil 50 cents, and the Camphene 68 cents—no price has been fixed upon for the rectified Rock Oil.

I cannot refrain from expressing my satisfaction at the results of these photometric experiments, since they have given the Oil of your Company a much higher value as an illuminator than I had dared to hope.

Use of the Rock Oil as a Lubricator for Machinery.

A portion of the rectified oil was sent to Boston to be tested upon a trial apparatus there, but I regret to say that the results have not been communicated to me yet. As this oil does not gum or become acid or rancid by exposure, it possesses in that, as well as in its wonderful resistance to extreme cold, important qualities for a lubricator.

Conclusion.

In conclusion, gentlemen, it appears to me that there is much ground for encouragement in the belief that your company have in their possession a raw material from which, by simple and not expensive process, they may manufacture very valuable products.

It is worthy of note that my experiments prove that nearly the *whole* of the raw product may be manufactured without waste, and this solely by a well directed process which is in practice one of the most simple of all chemical processes.

There are suggestions of a practical nature, as to the economy of your manufacture, when you are ready to begin operations, which I shall be happy to make, should the company require it—meanwhile, I remain, gentlemen,

Your obedient servant,

B. SILLIMAN, JR.,

Professor of Chemistry in Yale College.

NEW HAVEN, APRIL 16, 1855.

Benjamin Silliman, Jr., an American chemist, born in New Haven, Conn., December 4, 1816, graduated at Yale College in 1837 and became assistant to his father, Benjamin Silliman, Sr., the first Professor of Chemistry at Yale College, 1802-1853. Young Silliman succeeded his father and held the position of chemistry at Yale College until he died. The day of his death was June 14, 1885.

EARLY AND INTERESTING FACTS.

We now approach that interesting period in the history of Petroleum in America which witnessed the first

movement toward a practical development of its astounding resources.

The reader who has carefully scanned the report to Mr. Bissell and others will have observed that, however it may have been with himself, the existence of Petroleum was not a novelty to scientific minds.

While he will perceive with admiration the completeness and comprehensiveness with which every phase of the subject was examined, and reflect with astonishment upon the manner in which every mode of treatment was foreshadowed, it cannot fail to strike the reader as remarkable that, notwithstanding the value of this product to our country has been about \$3,200,000,000; notwithstanding forty-five years have elapsed since the first well was drilled, and the total number of wells since drilled to obtain it must reach 211,573. We shall now follow up the history of that development, which has since proved to be of so great importance to the prosperity of the country, and the comfort and convenience of mankind.

Bearing in mind the frequent appearance of Petroleum in the salt wells of the Kanawha valley in West Virginia, and along the valley of the Ohio near the mouth of the Muskingum, the reader will not be surprised to hear of its appearance in the salt wells of Tarentum, on the Allegheny river, twenty miles above

Pittsburg, Pa. But its appearance at this place was singular, in so far that instead of appearing where the wells were first sunk, many of them were successfully pumped for brine for a long time before the manifestations of oil disturbed operations. Mr. S. M. Kier, who together with his father was a large owner in these salt works, stated that one well on the left bank of the river, after having been pumped constantly for twenty years without a show of Petroleum, passed to new owners, who rigged it up with a new engine of greater power, and in a few days it began to yield four or five barrels of oil per day.

The wells on the other side of the river owned by S. M. Kier and his father had for years previous yielded a small quantity of Petroleum, which, being suffered to waste for a long time, spread itself over the surface of the old canal, and became accidentally ignited, when it came so near causing the destruction of a large amount of property, as well as endangering human life, that it was afterwards poured upon the ground.

About the year 1849, Mr. S. M. Kier, Jr., conceived the thought of putting it up in bottles and selling it as a specific remedy for all the ills of life. He opened an establishment in Pittsburg, where it was put up in half-pint bottles, which were wrapped in the following descriptive sheet, and sold for a half-dollar apiece:

KIER'S

PETROLEUM, OR ROCK OIL, CELEBRATED FOR ITS WONDERFUL CURATIVE POWERS. A NATURAL REMEDY! PROCURED FROM A WELL IN ALLEGHENY COUNTY, PA., FOUR HUNDRED FEET BELOW THE EARTH'S SURFACE. PUT UP AND SOLD BY SAMUEL M. KIER, 363 LIBERTY STREET, PITTSBURG, PENN'A.

The beautiful balm, from Nature's secret spring,
The bloom of health and life, to man will bring;
As from her depths the magic liquid flows,
To calm our sufferings, and assuage our woes.

The Petroleum has been fully tested! It was placed before the public as a Remedy of Wonderful Efficacy. Every one not acquainted with its virtues, doubted its healing properties. The cry of humbug was raised against it. It had some friends—those that were cured through its wonderful agency. These spoke out in its favor. The lame, through its instrumentality, were made to walk—the blind, to see. Those who had suffered for years under the torturing pains of Rheumatism, Gout and Neuralgia, were restored to health and usefulness. Several who were blind have been made to see, the evidence of which will be placed before you. If you still have doubts, go and ask those who have been cured! Some of them live in our midst, and can answer for themselves. In writing about a medicine, we are aware that we should write Truth—that we should make no statements that cannot be proved. We have the witnesses; crowds of them, who will testify in terms stronger than we can write them, to the efficacy of this remedy; who will testify that the Petroleum has done for them what no medicine ever could before; cases that were pronounced hopeless, and beyond the reach of remedial means; cases abandoned by Physicians of unquestionable celebrity, have been made to exclaim, "This is the Most Wonderful Remedy Yet Discovered!" We will lay before you the certificates of some of the most remarkable cases: to give them all, would require more space than would be allowed by this circular. Since the introduction of the Petroleum, many Physicians have been convinced of its efficacy, and now recommend it in their practice; and we have no doubt that it will stand at the head of the list of valuable Remedies. If the Physicians do not recommend it the people will have it of themselves; for its transcendent power to heal will and must become known and appreciated; when the voices of the cured speak out; when the cures themselves stand out in bold relief, and when he who for years has suffered with the tortures and pangs of an immedicable legion, that has been shortening his days and hastening him "to the narrow house appointed for all the living," when he speaks out in its praise, who will doubt it? The Petroleum is a Natural Remedy; it is put up as it flows from the bosom of the earth, without anything being added to or taken from it.

It gets its ingredients from the beds of substances which it passes over in its secret channel. They are blended together in such a form as to defy all human competition. The Petroleum, in this respect, is like Mineral Water, whose virtues in most chronic diseases, are acknowledged, not only by Physicians, but by the com-

munity at large. These singular fluids flowing out of the earth, impregnated with medicinal substances of different properties, and holding them in such complete solution as to require the aid of Chemistry in order to detect them, bear ample proof to the fact that they are compounded by the master hand of Nature, for the alleviation of human suffering and disease. If Petroleum is medicine at all, it is a good one, for Nature never half does her work; and that it is a medicine of unequalled power we have the most abundant testimony. It will be used when many of the new remedies now in vogue will have been forgotten forever. It will continue to be used and applied as a Remedy as long as man continues to be afflicted with disease. That it will cure every disease to which we are liable, we do not pretend; but that it will cure a great many diseases hitherto incurable, is a fact which is proved by the evidence in its favor. Its discovery is a new era in medicine, and will insure to the health and happiness of man.

All of which was followed by about a hundred testimonials of wonderful cures of hopelessly incurable diseases.

In fact, after the manner of patent medicines in our own day, it was declared perfectly capable of doing or undoing whatsoever anybody could wish done or undone. It was trundled around the country by agents who traveled in vehicles decorated in gilt, with pictures of the good Samaritan ministering to a sufferer writhing in inhuman contortions under a palm tree.

Although the oil cost him next to nothing, as it was obtained from his own wells, which were pumped for salt, and for a long time he could not dispose of even the whole of the two or three barrels a day produced, yet the expense of introducing it as a medicine in this way consumed the profits. As the stuff, however, possessed considerable medicinal virtue, the demand continued to increase until quite a valuable trade was established, when he withdrew his agents and furnished it exclusively through the drug stores.

This at first left a quantity on hand, for his sales sensibly fell off for a while, after the agents were withdrawn in 1852, and having previously burned the crude oils at the wells, it occurred to him that he might utilize this surplus if he could only devise some way of rendering it less offensive, in the way of smoke and odor.

The most obvious suggestion was to distill it. This he accomplished by fitting a caldron kettle with a cover and a worm. The first result was a dark distillate, little better than the crude itself; but after he learned to manage his fires so as not to send it over too rapidly, he produced by twice distilling an article about the color of clear cider, which, like all distillates, had an odor infinitely more offensive than the crude Petroleum, and as he knew nothing of treating it with acids, as is done at the present time—as, indeed, was extensively done very shortly after that with coal oil—he seemed to be progressing very slowly toward the production of an illuminator.

After some improvement on the camphene lamp, however, he perceived with joy that his distillate would burn without smoking, provided the flame was kept low enough and the lamp left perfectly quiet. From this rude beginning, he went on improving both the

quality of his fluid and the adaptability of his lamp, thus manufacturing and selling for a dollar and a half a gallon all the Petroleum he could not dispose of as a medicine, for burning, till at last by the introduction of the "Virna burner" and the treatment of his distillate with acids he had brought the matter nearly to its present state of perfection, when the first Petroleum well in Venango County broke his monopoly and put an end to the manufacture of coal oil in the United States.

Up to the time when his first attempts to utilize Petroleum for a burning fluid, a very little of which had been collected on Oil Creek by absorption in blankets, from which it was wrung, amounting in all perhaps to a couple of barrels per month, the principal part of which was gathered from a spring which bubbled up in the middle of the creek on the Hamilton McClintock farm, three miles above Oil City.

Many writers have given very exaggerated accounts of the quantity of oil exuding from these springs, and convey to the reader the impression that the surface of the creek was an unbroken sheet of Petroleum, while the truth is, only in high water, when the freshets brought down that which had collected in the bays, was it at all noticeable.

The spring next in importance was near the northern line of the county on the lands of Brewer, Watson & Co. It was beside this spring the first artesian well was drilled for Petroleum.

The first written document looking to a mechanical development is the following between J. D. Angier, a resident of Titusville, Pa., and the firm of Brewer, Watson & Co., consisting of Ebenezer Brewer and James Ryan, of Pittsburg, and Jonathan Watson, Rexford Pierce and Elijah Newberry, of Titusville, associated in an extensive lumbering business on Oil Creek:

The Agreement.

"Agreed this fourth day of July, A. D. 1853, with J. D. Angier, of Cherrytree Township, in the county of Venango, Pa., that he shall repair up and keep in order the oil spring on land in said Cherrytree Township, or dig and make new springs, and the expenses to be deducted out of the proceeds of the oil, and the balance, if any, to be equally divided, the one-half to J. D. Angier and the other half to Brewer, Watson & Co., for the full term of five years from this date. If profitable."

BREWER, WATSON & Co.
J. D. ANGIER.

Following out the spirit of this agreement, Mr. Angier proceeded at once to erect some slight works for collecting the oil. A few rude trenches were dug, centering in a common basin from which the water was raised by a pump, connected with the saw mill of Brewer, Watson & Co., into a series of broad, shallow troughs, shelving off to the ground. Where the water passed from each trough into the next was rigged an ingenious little skimmer adjusted just under the surface of the water, so as to collect the oil.

The water passing under was again agitated by the fall which favored a further separation of the oil, which

was collected as before by the skimmer at the end of the trough. In this manner three or four gallons a day were collected, and even as high as six gallons, where the ground had been recently agitated by digging, but the expense consumed the profit, and after a few months, the experiment was suffered to drop.

Mr. Angier describes a remarkable phenomenon observed in this method of obtaining the Petroleum. While digging in the gravelly clay, three or four feet beneath the surface, the workmen frequently struck "pockets" of oil often containing a quart.

In the summer of the year 1854, Dr. F. B. Brewer, whose father was at the head of the firm of Brewer, Watson & Co., visited relatives at Hanover, New Hampshire, and carried a bottle of Petroleum to Professor Crosby, of Dartmouth College, where he had graduated some ten years before.

A few weeks later George H. Bissell, a native of the town and a graduate of the same college, but then practicing law in New York City, while on a visit to his mother, called to spend an evening with his old tutor, Professor Crosby, and was shown the Petroleum, upon the wonderful properties of which the Professor expatiated with great enthusiasm.

Coal oil was then just being introduced in the eastern states for illuminating and lubricating, and the similarity of the products naturally suggested the question why Petroleum might not be used for the same purpose. Of Mr. Kier's attempts in that direction nothing was of course known. They were upon too limited a scale to attract attention. The only doubt was as to the supply; and that was of course a serious doubt.

Coal oil was selling for a dollar a gallon, and from the glowing description which had been given of the spring by Dr. Brewer it seemed reasonable to hope that many thousand gallons might be collected annually.

Professor Crosby had a son, who was ready for any enterprise that promised a chance of making money. He seems to have been persuaded from the first that the oil spring was a humbug, but he had the penetration to see that it was a humbug of the "taking" sort; and, dilating on the representations of Dr. Brewer, he induced Mr. Bissell, on certain conditions to pay the expenses of a trip to Titusville, for the purpose of inspecting the spring. The most obvious method of handling such a piece of property for the purpose of making money was to throw it into a joint stock company.

If he brought back a favorable report of the spring, Mr. Bissell pledged himself to organize the company and launch the enterprise on the New York stock market.

Mr. Bissell authorized him to propose to the firm of Brewer, Watson & Co. the formation of a joint stock company, with a capital stock of \$250,000, divided into ten thousand shares of twenty-five dollars each—Brewer, Watson & Co. to receive one-fifth of the whole stock; and five thousand dollars for the tract containing the oil spring, to be paid out of the first money realized from the sale of treasury stock, which was also to be one-fifth of the whole. Mr. Crosby was to take one-fifth, and assume one-fifth of the expense of

getting up the company, while the other two-fifths were to remunerate Mr. Bissell, and his associate in law, Mr. Jonathan G. Eveleth, for the trouble of organization.

To this Dr. Brewer, as the agent of Brewer, Watson & Co., replied in the following letter, a copy of which has been preserved and is furnished by Dr. Brewer, Jr.;

GENTLEMEN:—We have received through Mr. A. H. Crosby, your proposals to put in market in a joint stock company, certain springs yielding a peculiar oil surpassing in value any other oil now in use for burning, for lubricating machinery, and as a medicinal agent.

The springs yielding this oil are situated on Oil Creek in Venango county, near the corner of Warren and Crawford counties, and cover a large surface of territory.

The yield is abundant, and is believed to be inexhaustible. We have some simple machinery constructed at an expense of, say two hundred dollars, that yields on an average to each spring worked three gallons per day, requiring perhaps one day in a week the attention of one man, which, when estimated with regard to the percentage, will show as follows:

Capital invested, \$200, int., at 10 per cent. . . .	\$20
Two months of run \$20 per month.	40
	—
Total	\$60

The cost of raising 1.095 gallons of oil, worth here seventy-five cents per gallon, making \$821.25. Deducting expenses \$60 leaves \$761.25.

Now, this is only one spring, and worked very imperfectly, but actually paying an interest on \$10,000.

I make these figures as they are, and have been whenever the spring has been worked, and this is no fancy thing for a stock, but an exceedingly large paying stock, and one that with proper machinery would afford a much larger percentage.

Now, your proposition, as far as it goes, is satisfactory; but it does not go far enough to guarantee to us a certain *quid pro quo* for what we have paying us now. And in asking us who will represent only one-fifth of the company to furnish the actual capital gratuitously, to the other four-fifths, for what we expect to realize on one-fifth, is not perhaps asking too much, but it would in our opinion be granting too much.

There are other parties in Pittsburg who were very solicitous to put the thing in market a year ago by purchasing our interest, but we prefer the plan you suggest if you will warrant us a certain amount for our premises; and we will propose as follows: Pay to Brewer, Watson & Co. \$5,000, to be reimbursed to the stock company from the first sale of stock, or as you may deem proper in any way, and we will assign or deed to the company the right to go on and erect such machinery as the company may think proper, to procure oil on a certain one hundred acres of land known here as the Willard Farm, and embracing most of the oil territory as yet discovered, and further, all springs on our other lands adjoining, not interfering with our lumbering and farming interests.

This will give us an equivalent, or partially so, for what we furnish the company; and we wish the company to pay from the sale of stock its current expenses, whatever they may be, and by sale of stock to provide for a dividend, if thought best—such stock to have preference over all other except for the reimbursement of the purchase money. The other stock should be sold as you propose. These, gentlemen, are our views, hastily thrown together. If the general outlines meet your favor the minutia can be arranged with you in New York.

* * * * *

After spending a few weeks with Dr. Brewer, Mr. Crosby hurried back to Hanover to report, but finding that Mr. Bissell had returned to New York he forwarded the letter, of which the above is a copy, to Mr. Eveleth, who was in Maine, and apparently not comprehending its terms he hastened after Mr. Bissell, and reported his proposition accepted. Mr. Bissell announced himself satisfied, and at once began the preliminary arrangements for organizing the company. In a gush of innocent satisfaction with the success of his negotiations Mr. Crosby telegraphed to Dr. Brewer that *his* proposition was accepted. He returned again to New Hampshire, and a few days later he wrote the following:

HANOVER, N. H., September 11, 1854.

MY DEAR DOCTOR:—

I intended to have written you again before leaving the city, but as I was very busy, and as the main question was settled by my telegram of the Monday previous, I concluded to wait until my return home.

I cannot now tell you exactly when we shall be ready to meet you in New York, but will write next Monday again, and shall then be able to tell you when you had better start.

The oil, I suppose, you can take with you to Erie, and ship it so that it will be in New York nearly as soon as you are, and that will be in sufficient season to offer it for exhibition, as we shall then have circulars, stock books and everything else ready to issue to a gullible public."

But this gulling of the public is not an enterprise of unmitigated interest with men who have everything to gain, and Eveleth & Bissell, having considerable to lose, objected to this scheme in so far that ten days later this embryo broker, curbing his wild ambition to surge into the stock exchange, and get up a panic with his "fancy," writes Dr. Brewer to the effect that after a "long talk" with Eveleth and Bissell it was decided to "put the thing through by daylight."

Thus vanished his bright dream of oil spring "fancy" at a premium of five hundred per cent., and his enthusiasm thenceforward continued to wane.

Shortly afterward, Dr. Brewer, empowered as the attorney of the lumbering firm, visited New York City to ratify the terms of sale and contract, but the letter which Crosby had forwarded to Mr. Eveleth having been lost in the mails, the result was a general misunderstanding.

Eveleth & Bissell suspecting that Crosby had intentionally deceived them—which was surely not the case—now refused to credit his statements as to the value of the springs, dismissed Dr. Brewer, and peremptorily

dropped the whole matter. But they had already incurred obligations to the extent of several hundred dollars for seals, certificates of stock, stock books, etc. On the eve of his departure for Titusville, they sent a line to his hotel, saying they would reconsider the matter, and inviting him to call. He did so, and an arrangement was effected on substantially the same basis as before proposed; but Crosby, who was unable to meet his portion of the expenses, was left entirely out of the bargain. The agreement to sell ratified, for their better information, it was decided that one of them should visit the locality at once, and examine the spring, and bring away a draft from which a map could be made.

The oil which had been sent on to Mr. Bissell was distributed for examination among several prominent chemists, and a week or two later he wrote the following letter, which may convey some idea of what it cost, both in time and money, to bring about the organization of the company and to procure the analysis of the Petroleum, which must be regarded as the most important step in all these negotiations, if we accept only the birth of the great fact which made development possible. Messrs. Eveleth & Bissell were young men, and, though possessed of considerable means, did not rank among the "heavy" of New York, and the whole expense of the organization and the analysis was advanced by them in one of the most stringent seasons that has ever marked the financial history of our country. It was done, too, at a sacrifice of personal convenience, which could only have been prompted by an earnest faith in the ultimate success of their enterprise—but the letter:

NEW YORK, November 6, 1854.

F. B. BREWER, ESQ.:—

Dear Sir: We have had to encounter many obstacles in the way of organizing our joint stock company, and shall be unable to get out our papers at the time originally proposed.

Mr. Eveleth will go on at the earliest possible period, and will then be prepared to arrange everything to our mutual satisfaction. I do not think, however, that it will be possible for Mr. Eveleth to arrive in Titusville before the 18th or 20th inst.

We have obtained our stock books, certificates of stock, signs, &c., &c., and have done everything to insure success when we fairly get under way. We have forwarded several gallons of the oil to Mr. Atwood, of Boston, an eminent chemist, and his report of the qualities of the oil and the uses to which it may be applied are very favorable. Professor Silliman, of Yale College, is giving it a thorough analysis, and he informs us that so far as he has yet tested it, he is of opinion that it contains a large proportion of benzole and naphtha, and that it will be found more valuable for purposes of application to the arts than as a medicinal, burning or lubricating fluid.

Our expense of a thorough analysis will be very heavy; but we think the money will be well spent. We send you a proof-sheet of our certificate of stock. The book will be printed of course on bank-note paper.

Let us hear from you at your earliest convenience, and believe us,

Very truly yours,

EVELETH & BISSELL.

The whole cost of the analysis, including the photometrical comparison, for which a new and improved instrument was especially provided, was between eleven and twelve hundred dollars, every cent of which was advanced by these young men.

The above letter is the first that bears the seal of The Pennsylvania Rock Oil Company; but as the company came not into legal existence till nearly two months later, it was probably applied in obedience to a whim, or perhaps to give their correspondent an idea of its impression.

REAL ESTATE TRANSACTIONS ON OIL CREEK.

The first deed from Brewer, Watson & Co. bears date of November 10, 1854, and conveyed in fee simple to George H. Bissell and Jonathan G. Eveleth, of New York City, one hundred and five acres of land in Cherrytree Township, Venango County, Pennsylvania, embracing the island at the junction of Pine Creek and Oil Creek, on which a part of the works of the lumbering firm were situated. It was on this island that Mr. Angier's trenches were dug, and the first artesian well drilled for Petroleum five years afterwards. The consideration for the property mentioned in the deed was twenty-five thousand dollars, though the real consideration was but five thousand. It was thought that if the consideration should appear to be such an insignificant fraction of the capital stock it would be more difficult to dispose of the shares, and therefore, as is usually done in the formation of joint stock companies, the land was put in at a figure far above its cost. The deed, though dated on the 10th of November, was not formally executed till the first of January following, for the reason that Messrs. Eveleth and Bissell had opened negotiations with a party of gentlemen in New Haven, under whose notice the matter had been brought by Professor Silliman, who evinced an inclination to subscribe for a large portion of the stock, and in case they did, it was proposed to place one or more of their number on the board of directors, and have the property conveyed directly from Brewer, Watson & Co. to The Pennsylvania Rock Oil Company. But this failing, Eveleth and Bissell gave their joint and several notes for the purchase money, save five hundred dollars paid in cash, and on the first day of January, 1855, the deed was executed by the members of the firm living in Titusville, and four days afterwards by the remaining members in Pittsburg. It was asserted in a paper on this subject which appeared in the *Atlantic Monthly*, for 1869, that Dr. Brewer never received pay for the land, which is quite untrue; for, though Dr. Brewer never had anything to do with the land except in the capacity of agent for his father and the other members of the firm, the notes he received were certainly paid for; they were all found cancelled, and with payment indorsed, among papers submitted by Mr. Bissell. This may seem a matter of trifling interest in the history of the vast industry born of these transactions, but as well as being a piece of personal injustice, it is a palpable absurdity, for Mr. Bissell afterwards acquired, and retained, an immense amount of property in the country, that would have been liable for those debts.

On the 30th of December, 1854, the following certificate of incorporation was filed, as by law required, with the Recorder of the city of New York, and also at Albany with the Secretary of State:

"Certificate of Incorporation of the Pennsylvania Rock Oil Company.

STATE OF NEW YORK,
CITY AND COUNTY OF NEW YORK, SS.

Be it known that we, the undersigned, do hereby associate ourselves as a body politic and corporate, pursuant to the N. Y. Revised Statutes, 4th edition, Vol. 1st, Chap. 18th, Art. 2d, and also Laws of New York, 1853, Chap. 333, in relation to the formation and management, powers and responsibilities of corporations.

And the following are the articles of our agreement and association:

Art. 1. The name of the corporation shall be the Pennsylvania Rock Oil Company.

Art. 2. The objects for which said Company is formed, are to raise, procure, manufacture and sell Rock Oil.

Art. 3. The capital stock of the said Company shall be two hundred and fifty thousand dollars, and shall be divided into ten thousand shares of twenty-five dollars each.

Art. 4. The business of said Company shall commence on the 1st day of January, 1855, and continue fifty years.

Art. 5. The business of said Company shall be under the management of seven trustees, and the board of trustees for the first year shall consist of the following persons, viz:

George H. Bissell, of New York; J. G. Eveleth, of New York; Franklin Reed, of New York; Francis B. Brewer, of Titusville, Pennsylvania; Anson Sheldon, of New Haven, Connecticut; James H. Salisbury, of New York; and Dexter A. Hawkins, of New York.

Art. 6. The principal place of business shall be in the city and county and State of New York.

In witness whereof we have hereunto set our hands and affixed our seals, this thirtieth day of December, Anno Domini, one thousand eight hundred and fifty-four."

Here follow the signatures of the above-mentioned seven trustees, of whom, all but Dr. Brewer, who represented the stock of Brewer, Watson & Co., were mere lay-figures, occupying positions it was necessary for appearance's sake, that some one should fill. Not more than one of them at most represented stock held in his own right, stock for which he had paid.

On the 16th of January, 1855, Eveleth and Bissell conveyed to the Trustees of The Pennsylvania Rock Oil Company all their right and title to the lands, but the deed fortunately was not recorded, and the estate continued ostensibly in them till the following autumn, when it was conveyed to other parties for the benefit of the *new* Pennsylvania Rock Oil Company.

After the organization of the company in January, an effort was made to get the stock taken at some price, but the great stringency in the money market, not less than the unusual character of the enterprise,

placed the stock in the ever-dangerous category of "fancies," and prevented its being taken to any great extent in the city of New York.

Yet every effort was made; and even Crosby, then engaged as a reporter on one of the newspapers of the city, became again an agent in the enterprise. He received a few shares in acknowledgment of former services, and a few more to engage some influence he was supposed to possess by having at all times the ear of the public; but no sooner had he got his couple of hundred shares transferred to his own name on the books of the company, than, figuratively speaking, he dropped the ear of the public—which had never been a profitable ear to him—and gave his exclusive attention to the disposal of his stock.

Selling stock may be pleasant enough when one has stocks that sell, but unfortunately for his hopes, Mr. Crosby's were not of that sort.

With him, as with others, the times were hard—in fact, as is usually the case with such jovial characters, the times were especially hard in his case. He was desperate, but his desperation, instead of quickening his wits, seemed rather to cloud them; and Dr. Brewer, who frequently passed back and forth from Titusville to New York, and who was cognizant of most of their transactions and difficulties, relates how one day—it happened to be a day when the desperation of Mr. Crosby's prospects had sunk his mercurial temperament to the very lowest notch—he chanced to learn that Messrs. Eveleth and Bissell were about concluding a sale of several hundred shares of stock to a Connecticut gentleman at two dollars and a half per share; and, regarding the knowledge in the light of a special providence—a plank that would save him from being engulfed in a sea of troubles—he reached out and grasped it; in other words, he sought an interview with their client, and offered him the remnant of his own stock at fifty cents per share. The result was what any one might have foreseen—what Mr. Crosby himself could not have failed to foresee, only that he was blinded by desperation—the man knowing neither of the parties and suspecting a swindle, refused to take the stock from either, and peremptorily dropped the transaction.

The consternation of Messrs. Eveleth and Bissell, who had now expended seven or eight thousand dollars, without receiving a cent, and had calculated on this sale to help them out with their own obligations, when they learned of the transaction, and the aggravating circumstances by which that failure was brought about, may possibly be imagined, but cannot be described.

But as it was useless to offer stock for sale while Mr. Crosby had any to sell, they found it expedient to buy for themselves the little remnant of stock he found it impossible to sell to any one else, and he readily parted with it for such a meagre sum as enabled him to reach the paternal roof at Hanover! And thus forever subsided that luminary to whom it pleased the writer of the paper in the Atlantic to gushingly ascribe the development of Petroleum!

The enterprise continued to hang fire. True it is, that neither of the partners was able to give his exclusive attention to its management. Their legal busi-

ness claimed their attention, and so far there was nothing in prospect for the stock company, to encourage the thought of giving up a thrifty legal business, to assume the more active management thereof. But they engaged the services of John Sheldon, a superannuated minister from Connecticut, and kept him to fan the little flame of interest manifested by a circle of gentlemen in New Haven, who eagerly watched the progress of Professor Silliman's analysis. To say that he was not earnest in his work would be doing him injustice. He was enthusiastic. He bought several hundred shares himself, for which he gave a note that he had about as reasonable a hope of paying as the immortal Micawber, when he negotiated his paper at the Canterbury Inn, and then, poor man, he became not only an enthusiast but a fanatic.

Some two thousand shares were transferred to him to sell, and the lowest price fixed. Dreaming the same fond dreams of sudden riches that have ever been the fatality of oil stocks, he fell frantically to work. The following letter from him will throw some light on the way they were obliged to dicker in the disposal of the stock:

My Dear Sir:—

Professor Silliman has not yet completed his photometrical examination of the Rock Oil, in comparison with other burning fluids; but will probably wind up his analysis in all this week.

The experiments last evening were favorable, and are to be renewed again this evening, and continued until the work is done.

The oil will not burn well in the Carrol Mechanical Lamp, but burns finely in the camphene lamps, and will be tested in those now in general use. The value of the oil depends mostly on its properties as a burning fluid.

In this respect the analysis, in its results, has been highly satisfactory. Several gentlemen here have signified a desire to take some of the oil stocks, and pay for the same in town lots, but I have not as yet been able to satisfy my own mind as to their value and hence have not closed any negotiations. * * * * *

This difficulty in disposing of stock was not occasioned more by the complete prostration of the money market than by the laws of the State of New York, which bore heavily on such enterprises by rendering the shareholder in a joint stock company liable for its debts to the extent of the par value of the stock he owned.

During the preceding year such enormous frauds had been perpetrated by taking advantage of this law that it was even difficult to give away stocks of just as good character as theirs. It was not considered the safest investment in the world for a man having no means of knowing the financial condition of a company, except by tedious investigations, which it was not possible for every one to make, to take shares at two dollars whose par value was twenty-five, when, for aught they knew, they might be called upon any day by decree of court to pay the whole twenty-five to the company's creditors.

With the opening of spring, however, the partners took the matter more actively in hand. About the mid-

dle of April Professor Silliman's report was handed in, and after being printed was distributed wherever it was desired to obtain notice for the enterprise. On the 11th of May, writing from New Haven, their agent says:

"Silliman's report is now generally in the hands of the monied men of this place, and the impression it has created is decidedly favorable to the P. R. O. Company. But with the present state of feeling existing here in reference to joint stock companies formed under the laws of the State of New York, and doing their business in the City of New York, I do not think that any great amount of stock will be taken by capitalists in this city.

The history of the New York & New Haven Railroad, and also the Western Empire Company, is still remembered with sorrow. Many had been ruined by the frauds committed by these companies, so that by them many others had sustained losses."

Under the circumstances, it is not at all strange that monied men should be cautious. * * *

Some of the most prominent business men here have signified a desire to take stock in the Company, provided it be reorganized under the laws of Connecticut, and New Haven made the place of its business operations. In this state the property of the stockholder is not liable for the debts of the Company." * * *

From the above we may obtain a view of the situation and the difficulties that trammelled them. To begin with, they were not rich; and the cost of the land, and the expense of the analysis—including the photometrical comparison about twelve hundred dollars—together with all the innumerable smaller expenses of organization, had absorbed the greater part of their available means. The previous fall they had employed Mr. Angier to take charge of the spring, and run the rude machinery for pumping which he had himself invented and erected, and now when the spring opened, he was engaged to resume operations, while they hastened to do that which they saw must plainly be done before they could succeed—to organize a new company under the laws of Connecticut. This accomplished, a number of men promised to subscribe liberally for the stock.

Therefore a new company was formed in New Haven with a nominal capital of three hundred thousand dollars, and preparations made to take the property of the old company at twenty-four thousand dollars, and raise by immediate assessment a sufficient sum to undertake the development of the property by trenching on a large scale.

The deed to the first company had never been recorded, and it was thought the simplest course to call in all the stock—on every matter, since they owned the most of it themselves, and the rest was held principally by their agent, who, poor man, rejoiced at the thought of cancelling his obligations by returning it—and thus after extinguishing the former corporation, make the deed directly to the new company.

When everything was ready for the transfer, Mr. Bissell had occasion to visit Titusville, where he was detained over Sunday.

A drizzling rain prevented his walking out. While lounging in the parlor of the little inn of the hamlet,

he chanced to pick up a copy of the Pennsylvania Statutes, used by the Justice of the Peace, who held court in the room, and therein, to his amazement, he saw re-enacted the old English statutes of mortmain, devised and enacted three hundred years before, to check the absorption of the landed property of the realms by the several denominations of churches.

The statutes there framed for a wise and beneficent purpose were here perverted so as to render forfeit to the state of Pennsylvania the lands of any corporation organizing beyond its borders!

He hastened at once to apprise the new company of this fortunate discovery, and on the 20th of September, 1855, executed a deed to Asahel Pierpont and William A. Ives, of New Haven, who gave a bond for the value of the property and promptly leased it for ninety-nine years, to the new company legally formed two days before, by the publication of the following articles of association:

ARTICLES OF ASSOCIATION

OF THE PENNSYLVANIA ROCK OIL COMPANY.

Be it known that we the subscribers, do hereby associate ourselves as a body politic and corporate, pursuant to the provisions of Title 3d, Chapter 14th, of the Statute laws of the State of Connecticut, entitled "Of Joint-stock Corporations," and the act in addition thereto, and in alteration thereof, and the following are the articles of our agreement and association:

Art. 1. The name of the corporation shall be the Pennsylvania Rock Oil Company.

Art. 2. The capital stock of said corporation shall be three hundred thousand dollars, and the said capital stock shall be divided into twelve thousand shares of twenty-five dollars each.

Art. 3. The purposes for which the said corporation is established are the following, viz: to raise, procure, manufacture and sell *Rock Oil*, coal, paints, salt or any mineral or natural productions which may be found in any springs or mines, or on any lands that may come into the possession of said company by deed or lease, and generally to perform all acts and transact any business incidental to or that may be necessary in the prosecution of said business.

Art. 4. The statute aforesaid entitled "Of joint-stock companies," is hereby particularly referred to, and made part of these articles: and the corporation hereby established and organized under and pursuant to the said statute shall have the powers, and shall proceed according to the regulations described and specified in said statute.

Art. 6. The said corporation is established and located in the city of New Haven, county of New Haven and state of Connecticut.

By order of the Board of Directors.

New Haven, Sept. 18, 1855.

It will thus be seen that Eveleth and Bissell retained a controlling interest in the affairs of the new company. There were, indeed, in the published articles of association, a number of other names on the list, among them John Sheldon's; but they never took their stock, and it was retained by the partners. The consideration for the land was \$24,000, and, though retaining so much of the stock themselves, they had now about received the amount of their expenditure, and felt inclined to hold it and wait the result of further development of the property.

A small fund was raised for the treasury, and Mr. Pierpont, an eminent mechanic, was sent out to examine the spring with a view to the improvement of Mr. Angier's machinery. It was, however, though rude, perfectly adapted to that mode of development, and no other had been yet thought of.

Mr. Pierpont would have resumed more extensive operations, but the inharmony that forever afterwards characterized the management of this company had already begun to manifest itself, and it was found impossible to raise more money for the treasury.

While Mr. Bissell and his partner held a majority of the shares they were crippled by the by-laws to which they had subscribed, and which provided that a majority of the board of directors should be chosen from the New Haven stockholders. The one thousand shares that Mr. Ives had taken were paid for in local securities that were afterwards proven to be worthless at the time, and out of the vituperative charges that followed this discovery sprang the spirit of dissension that always thereafter divided their counsels and circumscribed their usefulness.

In a letter to Mr. Bissell in October, Dr. Brewer, speaking of a new trench, says: "Mr. Angier took six gallons from it, though it had been gathered the day before," and in a postscript to the same letter he adds: "As I have no interest in the matter only the wish to see it go on to perfection, of course I can have no object in magnifying its resources, but from fifty to one hundred gallons per day may be had by the judicious expenditure of five hundred dollars." But the five hundred dollars were not forthcoming. Even Mr. Angier's services were dispensed with.

COMMENCEMENT OF DEVELOPMENTS ON OIL CREEK.

Preoccupied by a course of specious reasoning, it is wonderful how completely the human mind may ignore the inductive logic of facts. It is a lamentable, and, apparently, an incurable frailty which more than all other human infirmities retards the progress of knowledge. It is the fault of an ancient system of specula-

tive philosophy which accepted the plausible as conclusive—which, taking anything for granted, rejected that as exceptional to the law which could not be warped to the support of its theory—a philosophy which, while it encouraged reflection, forbade experiment, and thus left much uncertain that might have been rendered positive by the simple turning over of a chip—a philosophy which received its death blow from Bacon, the experimentalist, and Franklin, his follower. But enough of its dreamy essence still lingers to tone the wild, progressive spirit of the age.

Without bringing into question here the plausibility or correctness of that theory which referred the origin of Petroleum to coal, can we help but express our wonder at the perversity of those minds, which, pre-occupied with such a conclusion, steadfastly overlooked the fact that in every important case to which they could refer, it had been found very far *beneath* the coal measures?

While clinging to and reiterating a theory that was perfectly indisputable, namely: that the oil was forced to the surface by the expansibility of the gas with which it is invariably accompanied.

But a new day was dawning—a day which witnessed the birth of a new idea that gave a new direction to human thought, and developed an industry which will forever mark an era in the progress of the world.

It was the idea of obtaining Petroleum by means of artesian wells. It was a simple thought, but significant—a thought which, as Professor Silliman remarked, was the one of all others most naturally suggested by the various phenomena that had attended the discoveries of Petroleum in the salines of the Muskingum and Kanawha valleys, described in this work—the first idea that *should* have been suggested to a mind cognizant of all these circumstances; and yet, though himself editor-in-chief of the periodical in which the circumstances were described, he very candidly confessed that throughout the five months he was prosecuting the analysis, the thought of artesian drilling never once occurred to him. And yet of all in any way connected with these first transactions, he was the only one of whom we had a perfectly reasonable right to expect such an idea; but Professor Silliman's interest in the matter terminated with the conclusion of the elaborate analysis, for though he perfectly comprehended its value, he never expected to see it obtained in any great quantity, and the two hundred shares of stock he held were given him in order to make him president of the company, and thus secure the prestige of a name renowned in science.

The idea came from another quarter, and was suggested by an incident as trifling as that which disclosed the law of gravitation. While seeking shelter beneath the awning of a Broadway drug store, one scorching day in the summer of 1856, Mr. Bissell's eye fell upon a remarkable show-bill lying beside a bottle of Kier's Petroleum in the window.

His attention was arrested by the singularity of displaying a four-hundred-dollar bank note in such a place; but a closer look disclosed to him the fact that it was only an advertisement of a substance in which he was deeply interested. He stepped in and requested permission to examine it. The druggist took it from

the window, and, having plenty of them, told him to keep it. For a moment he scanned it, scrutinizing the derricks and remarking the depth from which the oil was drawn, till instantly, like an inspiration, it flashed upon him that this was the way their lands must be developed—by artesian wells. It seems a very simple thought, but how astounding have been its results. It has added more than three thousand million of dollars to the material wealth of our country, and it makes our most valuable commodity of export, and throughout the world must furnish the means of subsistence to more than a million people. Its influences upon civilization are incalculable. Yet all this by the birth of a new idea. Thus, step by step the world improves, moving on toward knowledge.

The idea was simple—at first it may almost seem to have been self-evident, but reflect that the mind which grasped it must also have taken in a better conception of the philosophy of the *existence* of Petroleum than had any other mind before.

It is not unlikely that the mind of this man may have been prepared for the reception of such an idea, by long reflection. It is quite likely that Newton had seen many an apple fall before the one that gave him an idea, and it is just as unlikely that he would have ever drawn the conclusion from the incident if the necessity of the law of gravitation had not previously occurred to his mind.

When Mr. Bissell disclosed his theory to his partner that gentleman embraced it with enthusiasm, and they promptly canvassed the practicability of putting it to the test.

Their first notion was to attempt to experiment themselves, but even if they could induce the company to help them in their scheme they reflected that such a step would necessitate the loss of their legal business, and even if it should prove successful, which was all an uncertainty, they never dreamed of flowing wells that would make them millionaires in a day.

In this dilemma they imparted their convictions to Mr. Havens, of the firm of Lynn & Havens—real estate brokers on Wall street, New York—a man who had been largely identified with the construction of the first railroads in Western Pennsylvania, and he was so favorably impressed with the theory that he signified a desire to take part in the enterprise himself, and after a few days' reflection offered them five hundred dollars to secure him a lease of the property from The Pennsylvania Rock Oil Company. But that was a company very much inclined to thwart any plan proposed by the New York stockholders, and, though several of the New Haven parties, prominent among whom was Mr. Pierpont, readily accepted the new idea, they having faith—if the expression may be pardoned—and though after much delay the lease was finally granted, it was not till Mr. Havens had been overwhelmed in financial embarrassments which prevented his going on with the contract.

By the terms of the contract he was to pay the company twelve cents per gallon for all oil raised for fifteen years, and a year was given him to begin operations.

When Eveleth and Bissell conveyed their title to The Pennsylvania Rock Oil Company they reserved to the

lumbering firm the use of the mill race and the right of way over the property, in consideration for which the Oil Company received a lease to take "oil, salt, or paint" from all other lands of the firm in Venango county for a term of ninety-nine years.

But the wives of the members of the firm had not joined in the power of attorney by which the agent conveyed the lease, and would be entitled to dower in the event of the death of their husbands.

The idea of artesian drilling was too fascinating to be forgotten. It grew reasonable, upon reflection. It was sustained by all the phenomena of Petroleum. It was encouraged by every written account. It grew into such favor with the New Haven stockholders that they formed a scheme to monopolize its value.

Before the year allowed for Havens to begin operations had nearly expired, Mr. Townsend, then president of the company, in lieu of Professor Silliman, resigned, employed Mr. E. L. Drake, whom, in the darker days of its prospects, he had cajoled into purchasing two hundred dollars' worth of his own stock for the ostensible purpose of going to Titusville, to rectify the oversight mentioned in the lease, though the real object was not less to have him inspect the locality with a view to what followed, while it might be done at the expense of the company.

That this *was* their plan of operation, will be perfectly plain to any one who follows the progress of the cunning development of their scheme.

First and foremost, the legal hitch might just as easily have been fixed up by sending the documents by mail; for it was merely an oversight, and the women had no objections to signing. Then Mr. Drake, though an intelligent gentleman, was the last one to choose for the performance of legal business, as no occupation of his life had prepared him for such duty; besides, in order to give a pompous turn to the transaction in the eyes of the backwoodsmen, the legal documents, together with several letters, were mailed to "Colonel E. L. Drake, care of Brewer, Watson & Co.," before ever the man left New Haven.

The title was the pure invention of Mr. Townsend, who generously acknowledged his *pious fraudum*, and in the oil region and elsewhere, he has ever since been known as *Colonel Drake*. On his way to Titusville, he stopped to examine the salt borings at Syracuse, New York, and about the middle of December, 1857, was trundled into the little village of lumbermen, on the wagon that brought the mail from Erie, Pennsylvania. Prepared as they had been for his coming, he was received with ostentatious hospitality.

Finishing that part of the legal business which could be accomplished in Titusville, he spent a few days examining the various indications of oil on the lands, and then proceeded to Pittsburg, to add the signatures of Mrs. Brewer and Mrs. Rynd to the instrument of conveyance, and after visiting the wells at Tarentum, the picture of which on Mr. Kier's advertisement had suggested the idea of drilling for oil, he hurried back to New Haven, enthusiastic to conclude the scheme. On the 30th of December, the three New Haven directors, constituting a majority, executed a lease to Edwin E. Bowditch and E. L. Drake, by the terms of

which they were to pay the Pennsylvania Rock Oil Company only *five and a half cents a gallon royalty* for the oil raised for fifteen years. At the annual meeting of the directors, eight days later, this lease was brought up, and, notwithstanding the protest of the two other directors, George H. Bissell and Jonathan Watson, representing a trifle over two-thirds of the whole stock, it was ostentatiously ratified. The thing, however, was so palpably unjust that Mr. Bissell and Mr. Watson withdrew, protesting, from the council. Perceiving that they had overdone the matter and might possibly lose all if they persisted, they at once changed the consideration to one-eighth, in kind, of all the "oil, salt or paint" produced, and determined to defy every protest against this. The deed was at once sent to Franklin and recorded. But, refusing to concur in terms more favorable than those granted in Havens' lease, Mr. Bissell threatened to restrain despoliation of the property by injunction, if they attempted operations. Their position was quite untenable. They knew it, and rather than undergo the scrutiny of a legal investigation, and being determined not to let the prize slip from their fingers, they yielded. A supplemental lease was recorded, making the terms the same as in Havens' lease, but extending the time to forty-five years. To this Bissell and Watson cheerfully agreed.

On the 23d of March they formed themselves into an association under the title of "The Seneca Oil Company." They had the grace to shun publicity, and the publication of the articles of association, required by law, was effected in an obscure little weekly, published in one of the villages of New Haven County, Connecticut.

The basis of their association was the lease. Mr. Drake appeared as the principal stockholder; but no stock was ever issued.

It was in effect only a partnership, the members of which sought protection against each other under the laws for joint-stock companies. From the little influence he possessed in the management of their affairs, it is evident that Drake would have furnished but little of the capital. He was not in a situation to do so. For eight or ten years previous he had been a conductor on the New York & New Haven Railroad, at a salary of seventy-five dollars per month, and the little he had been able to save from such a pittance had been swept away by an unlucky investment the year before.

He was engaged at a thousand dollars a year, and about May 1, 1858, arrived in Titusville with his family.

He had been provided by the company with a fund of a thousand dollars on which to begin operations.

His first step after getting settled was to start up the old works abandoned by The Pennsylvania Rock Oil Company, and then he cast about for a practical artesian driller to drill a well.

On the 2d of July, 1858, he writes:

"Here I am digging along yet in search of oil and other valuables. The month of May was a hard one, and the first eleven days of June, but since then we have had dry weather, so that I have got the start of

the water, and am now gathering about ten gallons of oil per day—at the same time sinking a well for the purpose of taking what oil there is on the island.

I have found some difficulty in getting a borer. All were engaged on jobs that will last until fall. Yesterday Mr. Brewer wrote me that he could get one for me at Allegheny, who will bore and tube for three dollars a foot, which is the best offer I have had. I wrote the Doctor to send him along at once. Yesterday I set some men to opening a new spring, so that things begin to look greasy."

In justice to his partners, it is due to say that Mr. Drake was well supplied with money. In the oil region there has been a general belief to the contrary, but this is entirely without foundation. In his private affairs possibly, he was embarrassed, but in his last quarterly statement to the company before striking the oil, he reported a fund of two hundred and eighty dollars on hand.

On the 16th of August, '58, he writes as follows:

"I received on Saturday at Erie, Aug. 14th, a package containing \$472.67, from the Treasurer of the Seneca Oil Company, and gave the Express Company my receipt.

"I shipped two barrels of oil to Mr. Pierpont at New Haven, as he said he could make a market for it.

"In sinking our well last week we struck a large vein of oil, but the same thrust of the spade opened a vein of water that drove men out of the well, and I shall not try to dig by hand any more, as I am satisfied that boring is the cheapest. I should have had my borer here, but I wrote him on the 1st, I was not ready, as I did not know that you could raise the money, but money we must have if we make anything. I have abandoned the idea of boring and pumping by water, as I could not have the exclusive right to the power, but must be subject to the sawyer, the turner and the blacksmith, so that after consulting the best salt and oil men at Tarentum, I have contracted for an engine to be ready for boring by the first of September.

"I have got out the timber for my pump-house, and am having it framed to-day. We shall get it up this week. I shall send in a statement of my stewardship on the first of September, but if in the meantime the Company should feel too poor to furnish a thousand dollars more by the 10th of September, please let me know at once. Money is very scarce here. The lumbermen could not sell their lumber for cash this summer, and the people all depend upon the lumber trade."

The company did not send him the thousand dollars as soon as the 10th of September; his engine was not ready; and when he finally was prepared to start, the driller had taken another job and operations were suspended for the winter. In February, 1859, Drake went to Tarentum and engaged a driller to come up in April. But April came and no driller appeared, the man having been able to get a better job nearer home.

When Drake went down to look after him, Mr. Kier recommended him to engage William Smith and his two sons, who had done a great deal of work on his salt wells. About the middle of June, provided with a complete set of tools from Mr. Kier's shop, "Uncle Billy Smith" and his two sons arrived in Titusville.

Aggravating delays followed. In artesian drilling in the early days it was necessary to begin on the rock to drill. This was previously done by digging a common conductor hole, and cribbing it up with timber. When the rock is within a few feet of the surface it was the cheapest and easiest method, but in some localities to do so would be practically impossible. They started to dig a hole, but it so persistently caved in and filled with water when they got a few feet below the surface, that Drake determined to give it up and try an experiment that had suggested itself to his mind. This was the driving of an iron tube through the quick-sands and clay to the rock. If this is exclusively his own invention, which is probable, it is a pity he did not procure a patent on it. The royalty would have afforded him at least a competency, though the driving pipe is not so much in use now as formerly.

The operators in the oil region have had the benefit of his invention without any return, unless, indeed, we except the good feeling which prompted them to send him a present of \$4,200 when they heard he was sick and in need.

The pipe was successfully driven to the rock—thirty-six feet—and about the middle of August the drill was started. The drillers averaged about three feet a day, making slight indications all the way down.

Saturday afternoon, August 27th, 1859, as Mr. Smith and his boys were about to quit for the day, the drill struck the top of the first sand, making the total depth of the whole well 69½ feet. They withdrew the tools, and all went home till Monday morning. On Sunday afternoon, however, "Uncle Billy" went down to the well to reconnoiter, and, peering in, could see a fluid within eight or ten feet of the surface. He plugged one end of a bit of a tin rain-water spout, and let it down with a string. He drew it up *filled with Petroleum*.

That night the news reached the village, and Drake, when he came down the next morning bright and early, found the old man and his boys proudly guarding the spot, with several barrels of Petroleum standing about.

The pump was at once adjusted, and the well commenced producing at the rate of about twenty barrels a day. The news spread like lightning. The village was wild with excitement; the country people round about came pouring down to see the wonderful well.

Mr. Watson jumped on a horse and hurried straightway to secure a lease of the spring on the Hamilton McClintock farm, near the mouth of the creek. Mr. Bissell, who had made arrangements to be informed of the result by telegraph, bought up all the Pennsylvania Rock Oil stock it was possible to get hold of, even securing much of that owned in New Haven, and four days afterward was at the well. His views of the matter had ever been the broadest, as his transactions had been the boldest.

While others were seeking for surface indications before leasing, he rushed forward, and secured farm after farm down the creek and along the Allegheny, where there were no surface indications whatever. The result has proven the wisdom of his conclusions. Drake unfortunately took a narrower view of the matter. He pumped his well in the complacent conviction that he had tapped the mine! He was probably led

into this supposition by what seemed to him the remarkable incident of having struck a crevice in the sand. No money was paid on most of the leases at first taken; a royalty of an eighth or a quarter only being reserved by the easy old farmers who owned the land, and without a cent he might have secured any quantity of territory. He was repeatedly advised to do so by shrewd men who were themselves laying the foundation of fabulous fortunes; but it was his fatal misfortune to disregard that advice. When several other wells had been struck and his eyes were opened to his mistake, it was too late—the golden opportunity had fled.

The well fell off slowly till toward the end of the year, it produced only about fifteen barrels per day. It was never pumped at all on Sundays, and averaging the production twenty barrels per day—an average probably much too high—and granting a hundred and five working days, shows the production for the year 1859 to have been twenty-one hundred barrels. But there were many days in succession when it was not pumped. At one time Mr. Smith approached one of the tanks with a light, when the gas caught fire, and the derrick, pump-house, oil vats and all were completely consumed, and it was nearly a week before operations could be resumed.

Probably two thousand barrels even would be 25 per cent. above the actual production of the four months of that year.

The second well was promptly started by Barnsdall, Meade and Rouse, and at the depth of eighty feet, in November, it was pumped for two or three days, but yielded in all less than five barrels of oil, till it was sunk to about one hundred and sixty feet, when in February, 1860, it was again started, and produced from forty to fifty barrels per day. The third well was sunk by Mr. Angier for Brewer, Watson & Co., in the spring of 1860, on the McClintock farm, and the oil was struck about the middle of December following, but both of these last wells had been put down without the aid of an engine—"stamped down with a spring pole," they called it—and after pumping by hand one day at the third well, producing twelve barrels of oil, so much water came up that operations were suspended till an engine could be got down from Erie and set up, which was not till the middle of January. Considering everything, the difficulty of disposing of the oil was much less than might have been expected. Kier contracted to take part of it at fifty-six cents per gallon, and the rest was disposed of through Scheiffn Brothers, of New York. And here ends the history of Petroleum developments on Oil Creek prior to the year 1860.

THE BISSELL-DRAKE WELL—SENECA OIL COMPANY.

THE FIRST WELL DRILLED EXCLUSIVELY FOR OIL IN AMERICA.

George H. Bissell, President; Col. Edwin L. Drake, Superintendent; William Smith, Driller; Charles and Frank Smith, sons of William Smith.

Tool-dressers and blacksmiths commenced drilling May 20, 1859; struck oil Saturday, August 27, 1859; depth of well, 69½ feet; well produced, 20 barrels of oil when first struck; well completed Saturday, August 27, 1859.

The Bissell-Drake well was the first well drilled exclusively for oil; the fact is clear and indisputable that George H. Bissell and Colonel Edwin L. Drake were the pioneers and founders of the oil business in America, and to the sagacity, ingenuity, perseverance and skill of those men the whole world is largely indebted for the knowledge and introduction of one of the most important discoveries, conveniences and social blessings of modern times.

GEORGE H. BISSELL,

OF NEW YORK CITY.

Among the earliest of the early pioneers of the Western Pennsylvania oil region, George H. Bissell, of New York City, must take a leading and prominent place. We show clearly in succeeding sketches and by historical data, that Petroleum was gathered upon the Watson Flats, near Titusville, and at McClintockville, just above Oil City, as early as 1840, and so on down to 1856-7-8 and '59. It however, remained to Mr. Bissell to give force and effect and final triumph in developing this world-renowned benefaction.

The facts, as we give them below, are obtained from reliable data, and are given without fear of contradiction. But first of Mr. Bissell's early history:

George H. Bissell was born at Hanover, New Hampshire, November 8, 1821. He is descended from a family of Norman-French origin, which came from Somersetshire, England. His mother came of Belgic and Holland descent. One of his ancestors was the first settler at Windsor, Connecticut, in 1628. The late Governor Clark Bissell, of Connecticut, and Governor William H. Bissell, of Illinois, were relatives.

About the age of twelve years his father died, and George was thrown upon his own resources for support. He gained education and fortune, but never by the aid of a dollar from anyone. While at school and college he supported himself by teaching and writing for magazines and papers. In the business struggle, it was his own energy and talents which won the victory.

Some two years were spent at the Military School at Norwich, Vermont; another period at Kimball Union Academy, at Meriden, New Hampshire, and he was graduated at Dartmouth College in 1845. For about two months he held the professorship of the Greek and Latin languages at the University at Norwich, but resigned on account of the inadequate salary.

Going to Washington, D. C., he was employed during the winter of 1845-6 as correspondent of the Richmond Whig. In the spring of 1846 he went to Cuba, and thence to New Orleans, where he became connected with the editorial department of the New Orleans Delta. For several years thereafter he contributed largely to the columns of the different papers of that city.

In 1846, on the organization of the High School, Mr. Bissell was elected its first principal, over many

competitors. Subsequently he was chosen Superintendent of the Public Schools in New Orleans. His remarkable administrative ability and high qualifications as a scholar were of great service in his onerous position. The schools reached a discipline and prosperity before unknown. Amid the pressure of official and editorial duties, he still found opportunity to study law and several of the modern languages. In the summer of 1853 impaired health compelled him to come to the North.

It was during this year that Mr. Bissell's attention was first called to Petroleum. He saw, at the office of Professor Crosby, of Dartmouth College, a bottle of Petroleum, given Professor Crosby by Dr. Brewer, of Titusville, Pa., found upon his (Dr. Brewer's) land on Oil Creek. He became greatly interested in the product, and, about six months after, sent to Titusville Mr. J. G. Eveleth, who was then and had been previously, his partner in other business. They bought together what were then thought to be the principal oil lands of Pennsylvania. The lands were in extent one hundred acres in fee simple and one hundred and twelve acres on lease for ninety-nine years, on Oil Creek, about two and a half miles below Titusville, for which they paid five thousand dollars. In 1854 they organized "The Pennsylvania Rock Oil Company," which was the first Petroleum company in the United States.

This Company was organized under the laws of New York, with a nominal capital of \$500,000, most of the stock being owned and retained by Messrs. Eveleth and Bissell, who were its officers.

The Company proceeded to develop the lands by trenching them and raising the surface oil and water into vats. The supply was very limited, amounting to perhaps a few barrels in the course of a season, which was sold at one dollar and fifty cents per gallon, to parties who retailed it for medicinal purposes. In the spring of 1855, Professor Silliman, of Yale College, was employed to analyze the oil, and Messrs. Eveleth and Bissell furnished him with all useful apparatus for his experiments, and paid the entire cost of the analysis. Professor Silliman's report, published in the fall of 1855, attracted attention in New Haven, and led to the reorganization of the Pennsylvania Rock Oil Company, with that gentleman as President.

The work of trenching the lands was continued until 1858, when the question of boring an artesian well was discussed and advocated strongly by Mr. Bissell, it having been suggested by the fact that Mr. Kier, of Pittsburg, had obtained a small quantity of oil from one of his salt wells near Pittsburg, at a depth of about 400 feet.

The New York and New Haven stockholders were not harmonious, and finally, after much discussion and difficulty, a contract was concluded between the Pennsylvania Rock Oil Company and some of its members by which the latter agreed to lease the lands for a term of years, and pay the parent Company a royalty of 12 cents a gallon on all oil raised. They then organized in New Haven a new company, based on the lease aforesaid, and employed one of their number, Mr. E. L. Drake, as Superintendent, and furnished him with the necessary capital. He proceeded to Titusville, and,

after many delays and obstacles, on the 27th day of August, 1859, the first oil was struck, and the first Petroleum obtained from an artesian well drilled on Oil Creek, Venango county, Pa., and this was accomplished under the auspices of "The Seneca Oil Company," lessees of "The Pennsylvania Rock Oil Company," the organization of which, and the first purchase and development of oil lands under it, were mainly due to George H. Bissell.

Soon after the completion of the "Drake well," Mr. Bissell and Mr. Eveleth began the purchase of large tracts of oil lands along "The Creek," investing between two and three hundred thousand dollars in the enterprise. Thenceforward they engaged in the production of the oil by drilling wells at various points on "The Creek," at Franklin, Petroleum Centre, &c., doubling and quadrupling their investments in magnificent pecuniary returns. We have not the details of all the operations of these pioneer operators, and it is, perhaps, needless that we give them. It is enough to know that George H. Bissell's name is identified prominently, and we may add, honorably so, with all the early struggles and later triumphs in connection with this great national blessing, and that his name and fame is "a household word" among oil men from end to end of the continent.

From 1859 to 1863, Mr. Bissell was a resident of the oil region, his home being at Franklin, Venango county. He erected a large barrel factory at Franklin, and continued this industry for some years. In 1866 he established a banking house at Petroleum Centre, which withstood the vicissitudes and disasters of the oil region from year to year, and was regarded as one of the soundest and most substantial banking institutions in the oil country.

In 1863 Mr. Bissell removed to the City of New York. In 1864 he represented the oil dealers of Pennsylvania and the Petroleum Board of New York at Washington. He made a powerful and effectual argument before the Committee on Ways and Means in opposition to the tax on the crude material, which would have proved ruinous.

In addition to conducting an immense Petroleum business, he was at one time carrying on three banking institutions, building a railroad in the oil country, and was president and director of various companies in New York. He was prominent in the organization of the New York Loan and Indemnity Company. He was also President of the Peruvian Petroleum Company and of the Peruvian Refining Company. These companies supplied most of the Petroleum used on the Pacific coast of South America, and made large shipments to Australia, England and other countries.

Mr. Bissell was admitted to the bar of New York in 1855—to practice in the United States Courts in 1857, and to the bar of Pennsylvania in 1861. He was married in 1855 to Miss Ophie Louise Griffen, of New York City, who died suddenly in the spring of 1867. He was a liberal donor to various institutions. Dartmouth College is indebted to him for a gymnasium which cost twenty-four thousand dollars.

Mr. Bissell was an erect, well-proportioned figure and had an active step and an intellectual head and face. His head was long, towering to a round, high

brow, while the other features were not less significant of mental force and the purest character.

In Trow's Directory of New York City, 1856, is found the firm of Eveleth, Bissell & Reed, oil, 346 Broadway, N. Y.

Trow's Directory of New York, 1860, George H. Bissell, lawyer, 14 Wall street; house 112 East Fourteenth street, New York.

Jonitan G. Eveleth, 1860, oil, 346 Broadway; house 4 West Twenty-second street, New York.

George H. Eveleth, 1870, President, 55 Beekman street; house 416 Fifth avenue, New York.

George H. Bissell, 1880; house 16 West Fortieth street, New York.

George H. Bissell, 1883, President, 5 Beekman street; house 16 West Fortieth street, New York.

George H. Bissell died at his home, 16 West Fortieth street, New York, November 19, 1884. Two children survive him, one son and one daughter. Mrs. Louise Pratt, the daughter, resides in the Bissell home, 16 West Fortieth street, New York, and the son, Rev. Pelham, St. George Bissell, resides on Long Island, New York.

COLONEL EDWIN L. DRAKE,

BETHLEHEM, PA.

The subject of this memoir, whose useful life will leave the mark of its individuality upon the events of the Petroleum industry, was born on the 29th of March, 1819, at Greenville, Green county, New York. His parents were poor, but respectable and intelligent people, and earned their living by farming. Edwin L. was the eldest of two sons—their only children. The brother died in the far West about the time Mr. Drake's name was heralded to the world in connection with the first oil well. When the oldest of their sons was about eight years of age, the parents removed to the vicinity of Castleton, Vermont, where they gave their children the benefit of the old-time New England common school education.

Passing an uneventful childhood, there was, perhaps, but a single incident so indicative of his future useful career as to leave any impression on his own mind, or to be worthy of remark in a sketch of his life—and that incident was a dream. It is, of course, only singular in so far that with the superstitious, it is capable of prophetic interpretation; but one can hardly be said to have had any childhood who has not had strange dreams. It was a day-dream—not a waking dream, however. He sat upon the wide old porch that shaded the entrance to their plain abode. The autumn sun shone down upon his head; and the autumn breezes, heavy with the fragrance of the fields, lulled him to sleep, and sleeping he dreamt. With his brother—in fancy—he raked the dry stubbles of the wheat field. Together they tugged and toiled, and after infinite labor they had raked a great stack of straw into a corner, nearly half a mile from the house. Then for a bon-fire! While his smaller brother watched with gleeful anticipation, Edwin touched a match to the pile. They watched it a moment in ecstasies—but their mirth was turned to horror when,

their stack consumed, the ground continued to blaze and burn! They exerted all their strength to quench it, but in vain. The devouring flames rose higher and higher. The fire burned deeper and wider. It followed their receding footsteps; and now, completely terrified, they turned and fled to their mother. When they reached the house, Edwin, breathless and guilty, buried his face in her lap and confessed the deed. She led him gently to the door, and after watching the flames a moment, she said calmly, and without reproach: "My son, you have set the world on fire!"

Nearly thirty years later these words of his mother were recalled by the burning of his oil tanks a few weeks after the first well began to produce. When the tanks burst, and the creeping flames spread over the surface of the creek, he may possibly have entertained a momentary suspicion that his mother's words were about to be fulfilled. The incident recalled the dream.

At the age of nineteen he left home to seek his fortune—which meant to go West. Like the majority of emigrants in that latitude, his ultimate destination was Michigan, where he had an uncle living. At Buffalo, however, he obtained a situation as night clerk on the steamer Wisconsin, plying between that port and Detroit, where he remained until the season closed, when he went to his uncle's, near Ann Arbor, and worked on a farm for about a year.

He then procured a situation as a clerk in a hotel at Tecumseh. This was a type of the Western hotel of the day, and around the hospitable log fire upon the broad hearth it is not unlikely that Drake caught that droll and happy faculty of story-telling which was always among the genial characteristics of his manner. In this situation he remained two years, acquiring something of that Western "push" which was not developed until brought out by the difficulties which beset his labors years later on Oil Creek.

After leaving Tecumseh he returned to visit his parents in Vermont, and was persuaded to remain in the East.

He next went to New Haven, Connecticut, where he served three years as clerk in a dry goods store. They were three uneventful years, and in the hope of bettering his prospects he gave up his situation and obtained a position in one of the retail dry goods stores on Broadway, New York. While here he married a young woman whose home was in Springfield, Mass., and soon afterwards, falling into a lingering illness, it became advisable to seek country air, and they went to Springfield. While there Mr. Drake was offered the position of Express Agent on the Boston & Albany Railroad, at a salary of fifty dollars a month, which he accepted, and held the position till 1849, when he resigned it to accept the office of Conductor on the New York & New Haven Railroad, then just opened, which he held nearly ten years, with entire satisfaction to the superior officers of that corporation, and only resigned it to take charge of the developments on Oil Creek in Pennsylvania, as described in the opening chapters of this work.

The position he held on the railroad gave him the opportunity of forming an extensive acquaintance, which his inclination prompted him to improve. In

1854 his wife died, leaving him one child, two others having already died; and he broke up the comfortable little home he had provided in New Haven, and went to boarding.

It was about this time that he made the acquaintance of James M. Townsend, a banker in New Haven, into whose society he was thrown at the Tontine Hotel, where, at the time, both made their home. A few years afterward, when the prospects of the Pennsylvania Rock Oil Company were under a shadow, Mr. Townsend, who, amidst the allurements of social intercourse, kept an eye upon business, induced his friend Drake to invest a little balance of two hundred dollars which he had in bank, in stock of that corporation, and sold him a part of five hundred shares which he himself held. This was the beginning of his connection with the business which has rendered his name famous. About the first of the year 1857 he married Laura Dow, of New Haven, a young woman of most excellent character, who had ever been to him a friend and guide in prosperity, and a staff and a light in the gloomy days of adversity and want. During the summer of 1857 Mr. Drake was compelled by debilitating illness to give up work on the railroad for a couple of months; but at the same time he was not prostrated, and, having at least an "inquiring" interest in the Pennsylvania Rock Oil Company, he began to investigate its prospects, and the subject of Petroleum generally. He had leisure time for conversation with the directors, of whom his friend Townsend was one, and also President of the board.

The new idea of developing the property by artesian wells had been suggested some time before, and found in Mr. Asahel Pierpont, an intelligent and persistent advocate. Business complications forbade the thought of his going to attend a matter so far away from home, and perhaps the growing dissensions of the company discouraged the hope of efficient action in a legitimate way. The Board of Directors consisted of five members, three of whom were residents of New Haven, as required by the by-laws adopted, and, though representing but a third of the whole stock of the company, they controlled the management of its affairs. From what followed—all of which has been minutely described in this book—it is indisputably clear that the New Haven stockholders were determined to secure to themselves the advantages of this new idea.

In December of the year 1857, Mr. Townsend, then President of the Board of Directors, engaged Mr. Drake to proceed to Venango county, as has been previously stated. He finished his business, and returned, enthusiastic to embark in the enterprise which they had projected.

On the last of the month, the New Haven members of the board—a majority and a quorum—met and executed a lease of the lands to Mr. Bowditch—one of the largest New Haven stockholders—and Mr. Drake, the terms of which were remarkably advantageous to the lessees, but which it was found necessary to change before the other members would permit them to go on.

When all was satisfactorily arranged with the old company a new corporation was formed called "The Seneca Oil Company," of which Mr. Drake was the

nominal President, and in which he appeared as the principal stockholder.

In the published article of association the stock was subscribed as follows:

	Shares.
W. A. Ivis	2,680
E. L. Drake	8,926
J. F. Marshall.....	394

But of the 8,926 shares which were in his name, Drake, according to a previous understanding, transferred all but 656 to the other members of "The Pennsylvania Rock Oil Company," and it then stood as follows:

Asahel Pierpont	3,334
James M. Townsend.....	2,785
William A. Ivis	2,680
Edwin E. Bowditch.....	1,630
E. L. Drake.....	656
Henry L. Pierpont.....	521
J. F. Marshall.....	394

Total 12,000

This comprised all the New Haven members of The Pennsylvania Rock Oil Company, of which the largest stockholders in the new company—Pierpont, Townsend and Ivis—were directors.

In the following spring Mr. Drake set out for Titusville with his little family, and until a house was prepared boarded at the American Hotel. Himself, wife and two children and a horse were boarded for six dollars and a half per week, where a few years later they would only have been entertained for about twice that amount per day.

Shortly after arriving he bought a tract of twenty-five acres of land in Titusville, of Jonathan Watson, through the center of which Drake street now runs.

He unfortunately sold this in 1863, realizing about ten thousand dollars by the bargain. It was shortly afterwards sold for ninety thousand dollars.

Nothing perhaps better indicates the condition of the little village than the fact that a few weeks after his arrival, being in want of a couple of picks and spades, he found there were none to be had short of Meadville, or Erie. Though his life at the well was crowded with incidents, they were incidents now too common to be any longer interesting.

After oil was struck there was some difficulty in obtaining a market for it—a difficulty which, indeed, continued to increase, until in a couple of years' time, it was for a season nearly impossible to sell at any price. There was no room for delay, and relying upon his integrity to shield him from the imputation of improper motives, naturally counting something on his service to the company and his own interest in that company's welfare, he hastened at once to Pittsburg and contracted to furnish about a third of the oil to S. M. Kier, and arranged hastily with Mr. George M. Mowbray for the disposal of the rest on commission.

In 1860, Mr. Bissell proposed a division of the lands in lieu of the twelve cents per gallon royalty, and the Seneca Company thus obtained in fee simply one-third

of the land which Drake afterwards sold for them, for enough to clear them of all indebtedness, though it is doubtful if they made a dime by the whole transaction. Indeed, they declared they did not.

In 1860, Drake was elected Justice of the Peace for Titusville, an office worth about three thousand a year at that time, when every man was rushing to sell or buy leases, the documents for which he mostly drew and acknowledged. At the same time he bought oil for Shiefflin Bros., of New York, and thus increased his income to about five thousand a year.

In 1863, he sold his property, and left the oil region forever, taking with him between fifteen and twenty thousand dollars, and united himself with some Wall Street broker, in oil stocks. It was a very unfortunate, not to say short-sighted move, for a man with his total ignorance of the manipulations of stocks, and with so limited a capital.

His little fortune was soon engulfed. His health, already impaired by his labors on the Creek, gave way and his noble wife now cast about to secure the future. She removed the family to a cheap and quiet abode in Vermont, and hoarded to the last the little she had been able to save from the wreck.

But his illness lingered and his strength failed, and his physician advised him, if possible, to seek the sea air. A friend kindly offered the use of a cottage on the Highlands-of-Never-Sink, near Long Branch, New Jersey, and thither they removed. But their funds were now exhausted, and their misery began indeed.

His disease was most agonizing; neuralgic affection of the spine, which constantly threatened paralysis of the lower limbs. He needed constant care, and his wife, surrounded by a family of four helpless children, attempted to keep them in bread by her needle. Sewing she could obtain in plenty, when she could tear herself from other absolute duties, to go after it, tramping through wet meadows and chill and choking sea fogs that roll in on that dreary point. But with all her noble and uncomplaining effort to keep them in bread without begging, she found it impossible. Medicines were out of the question, and with the greatest difficulty she got together the price of his fare to New York and back—eighty cents—and he struggled up to the city to get a situation for his eldest son among some of his old acquaintances. Before returning in the afternoon he was met and recognized in the street by Mr. Z. Martin, of Titusville, who noticed his wretched appearance, and drew from him the story of their misery.

Mr. Martin, after providing him with a warm dinner, of which he stood sorely in need (for above the money to pay his fare he had not enough to pay for a cup of coffee, and he was weak from hunger), gave him twenty dollars, and cheered him with the hope of raising a fund for him in the oil region. No sooner was his distress made known than with a generosity for which they have ever been famed, the citizens of Titusville, with some aid from individuals throughout the region, raised four thousand two hundred dollars for his relief, which wisely enough was committed to the management of Mrs. Drake, who frugally hoarded

it, and yet continued to meet a part of the family expenses with the wages of her needle.

In 1870, on the advice of his physician, she removed her invalid husband and three smallest children to Bethlehem, near Allentown, Pennsylvania, where they lived a number of years, beloved and respected by a large circle of friends who had gathered about them.

In conclusion we have the pleasure to record the fact that the Legislature of Pennsylvania, at its session in 1873, deemed it proper to pass a law which granted to Colonel Drake a pension of fifteen hundred dollars a year during life, or that of his wife. This was not charity, but simple justice.

Colonel Edwin L. Drake died at Bethlehem, Pa., November 8, 1881, and his body now lies at rest in Woodlawn Cemetery, at Titusville, Pa., where a fine crescent-shaped granite monument was erected in his memory. In the center of the monument is a figure in bronze of an ancient stone driller. On the arch above the figure is the name Drake and on each side of the figure are three panels, and on these panels is inscribed the following:

No. 1.

Col. E. L. Drake: Born at Greenville, N. Y., March 29, MDCCCXIX; died at Bethlehem, Pa., November 8, MDCCCLXXX. Founder of the Petroleum industry. The friend of man.

No. 2.

Called by circumstances to the solution of a great mining problem. He triumphantly vindicated American skill and near the spot laid the foundation of an industry.

No. 3.

That has enriched the state, benefited mankind, stimulated mechanic arts, enlarged the pharmacopoeia and has attained world-wide proportions.

No. 4.

He sought for himself not wealth, not social distinction; content to let others follow where he led. At the threshold of his fame he retired, to end his days in quieter pursuits.

No. 5.

His highest ambition was the successful accomplishment of his task. His notable victory the conquest of the rock. Bequeathing to posterity the fruits of his labor and of his industry.

No. 6.

His last days, oppressed by ills, to want no stranger. He died in comparative obscurity. This monument is erected by—(Name to be added here after the death of the giver)—in grateful recognition and remembrance, at Woodlawn Cemetery, Titusville, Pa. Dedicated October 4, 1901, and finished September 4, 1902.

DEVELOPMENTS ALONG OIL CREEK.

After oil was struck on the island in Oil Creek, at the junction of Pine, the development spread rapidly thence to its mouth, where now is situated the thriving

DRAKE MONUMENT.
WOODLAWN CEMETERY.
DEDICATED OCTOBER 4TH 1901. FINISHED SEPTEMBER 4TH 1902.
TITUSVILLE, PA.

city of Oil City, containing about fifteen thousand inhabitants, and fast growing into a solid business center.

With one stride, indeed, the whole territory was virtually thrown open to employment, for the very day that Drake's well began to pump, Brewer, Watson & Co. leased the Hamilton, McClintock Farm, below Rouseville, where the "surface indications" were even better than on their own tract, which had passed entirely from their control to The Pennsylvania Rock Oil Company. Here they immediately began to drill a well—the third one ever drilled for oil—and all the intermediate territory for sixteen miles along the narrow valley of Oil Creek was soon taken up.

At first, it is true, speculators looked for "surface indications"—"pebble rock," "oil springs," &c.—and leased only where they were found; but when a few older or better informed minds took the initiative others followed, and a few months' experience proved that there was no reliance to be placed in "surface indications," and that good wells were as likely to be obtained half a mile away, as beneath the most productive natural spring.

The second well, on the Watson flats, below Titusville, was begun within a few days after the completion of the first, by Messrs. Barnsdall, Meade, Abbott and Rouse. It was situated a little above, and almost within stone-throw of the first, and, though it was tested in November, 1859, it had to be drilled deeper and was not finally completed until February of the following year. Like the third, drilled by Mr. Angier, for Brewer, Watson & Co., on the McClintock Farm, this was also put down by means of a spring pole; and, indeed, the same is true of several hundred of the first wells drilled along the Creek; nor was the system entirely abandoned before 1865; and to strong men, whose means were limited; it afforded a ready mode of development that answered a good purpose in opening up "shallow" territory; but it was a means totally inadequate when they began to drill wells below four or five hundred feet.

THE FIRST LARGE FLOWING WELL IN AMERICA.

The first flowing well or "gusher" in America was named "The Fountain," which was drilled in May, 1861, on the David McElhenny Farm, near Petroleum Center, on Oil Creek, in Pennsylvania, by Captain A. B. Funk. The well was drilled to the third sand and flowed at the rate of three hundred barrels a day. Everybody went wild over the new industry; people flocked to the oil region as if it had been a gold field, and the hillsides along Oil Creek were thickly dotted with derricks; new fields were discovered and drilled, and the richly productive oil sands were found to cover an area extending northeastward into New York and southwestward through Pennsylvania, West Virginia, Southeastern Ohio, Kentucky and Tennessee. This is known as the White Sand Oil Belt, and produces the light yellow and amber colored oils which are the highest grade of crude oils produced in the world.

The oil is produced from the following named sands: First, Second and Third, Oil Creek, Glade, Clarendon, Warren, Cherry Grove, Kane, Elk, Brad-

ford, Hundred-foot, Speechley, Cow Run, Dunkard, Maxon, Salt Sand, Keener, Big Injun, Berea Grit, Gantz, Fifty-foot, Stray, Gordon, Fourth and Fifth. This is the strata of the Devonian age. Later came the discovery of crude oil in the much older rock or sands, known as the "Trenton Rock."

The history of oil production has been very much the same in all the different fields, whether the region has been covered with the primeval forest, or occupied by thriving farms and villages. The derrick has been no respecter of anything; the forest has melted away before the demand for timber to make derricks, engine-houses, boiler-houses, tanks, tank-houses and steam-boxes.

After the farm has been leased a location is made, usually on low land near a stream of water; the water is needed for the boiler and to mix the drilling. After the location is made a derrick or rig is built; this is called a "wild cat well." If it comes in a duster or dry hole, nothing will be said about it, but if it comes in a good well it will cause great excitement; new locations will be made, temporary roads are then cut in every direction to the locations, the rigs are then built, and in a short time the thud of the drill is heard night and day.

Long before the Fountain Well had given out the wonder in regard to it was overshadowed by a new sensation. On the Tarr Farm, the "Phillips Well" burst forth with a stream of three thousand barrels of oil daily! Not to be outdone by the territory down the Creek, the Empire Well in the immediate vicinity of the Fountain Well, suddenly burst forth with its three thousand barrels daily, figures which subsequent flowing wells vainly endeavored to equal.

Kier & Co., of Pittsburg, began to develop the J. W. McClintock Farm, on which the village of Petroleum Center was located. Hibbard & Co. began on the John McClintock Farm; Henry R. Rouse, S. Q. Brown, John Mitchell and others, on the Buchanan Farms; Crossley & Fletcher on the Stoeppel Farm—all before the first of February, 1860. "The Crossley" was the third well completed; and upon the flats below Titusville and up the valley of Pine Creek as far as Enterprise, there were not less than twenty companies and individuals preparing to put down wells as soon as the spring opened.

The number of farms between the island on which oil was first struck and the mouth of Oil Creek, a distance of between sixteen and eighteen miles, was forty-three, and, though most of the statistics of the early operations are now hopelessly lost, from the few preserved we are able to glean the following:

The Island tract, embracing one hundred and five acres, originally owned by Brewer, Watson & Co., was transferred to George H. Bissell and Jonathan G. Eveleth, of New York, in 1854, and by them put into a joint stock company, called The Pennsylvania Rock Oil Company. In 1858 the property was leased to The Seneca Oil Company, which put down the first well.

The lease ran for forty-five years, and as the decline in the price of oil made it ruinous to pay the royalty of twelve and a half cents per gallon, The Pennsylvania Rock Oil Company came to an agreement by which The Seneca Oil Company took a small portion of the

THE GREAT NOBLE AND DELAMATER WELL
FARREL FARM, OIL CREEK, PA., 1863.

land in fee, and gave up the lease in the summer of 1860.

After this was accomplished George H. Bissell purchased the interest of The Pennsylvania Rock Oil Company, of which he was himself principal shareholder, for fifty thousand dollars, and that portion of the tract was thereafter known as the Bissell Farm.

Mr. Bissell at once began actively to develop the farm, putting down ten or twelve wells, six of which were productive, and yielded for some time eighty barrels per day, which was much better than any other territory in the immediate vicinity. The farm a few years later was sold to the Original Petroleum Company.

Next below this is the Griffin Farm, located on both sides of Oil Creek, and containing the ruins of several derricks. The property was pretty well developed after passing into the hands of the New York and Pennsylvania Petroleum Company, and below this is the Crossley Farm, on the east side of the creek, which, though well developed, was never very productive territory; and this is again followed by the second Bissell Farm, owned by George H. Bissell & Co., which, like all the rest of the territory which came under the management of this energetic man, was thoroughly and successfully developed.

Below the second Bissell Farm are the two Stackpole Farms, partly covered by one of the large dams used in the production of pond-freshets.

The upper Stackpole Farm passed into the possession of the Northern Light Oil Company and Brewer, Watson & Co.; the lower one contained ten wells and two abandoned refineries. Then follows the Pott Farm, on which there have been no producing wells, and next below is the Shreve Farm, owned by the Great Western Consolidated Oil Company, but, like the farm above, it has not been productive territory.

The Shreve Farm is followed by the J. Stackpole Farm, which came into the hands of Brewer, Watson & Co., and was well developed by sub-leases, but without remarkable success.

The Flemming Farm, next below, owned by Mrs. Flemming, was found to be, if not entirely unproductive, at least remunerative territory, and without any evidences of development.

The same may be said of the Henderson Farm, which is just below it.

The Jones Farm, which is next in order, though thoroughly tested by drilling nearly twenty wells, it never proved productive territory, yet from surface indications it was as promising as any farm along the Creek.

The second Flemming Farm, a little more than four miles below Titusville, is next after the Jones Farm, and the beginning of better territory. The flats on this farm were thoroughly tested, and several good wells obtained; one, a flowing well, was successfully operated for some time, when the owner, hoping the more completely to shut off the surface water and increase the flow of oil, drew up the tubing to change the locality of the seed-bag; but after rearranging it, from some unaccountable cause, the well not only ceased to flow, but never again produced oil.

The Miller Farm, then a station on the Oil Creek Railroad, and formerly the scene of great enterprise on the part of the Pit Hole and Miller Farm Transportation Company, is the first below the second Flemming Farm on the Creek.

Though formerly excellent territory, having a great number of good flowing and pumping wells, it now produces little or no oil, and owing to the improvements in the manner of transporting oil by pipe line, and the fact that many of the refineries once operated there are now abandoned, the enterprise that once marked the place has almost entirely subsided.

From the Miller Farm to the mouth of the Creek at Oil City, the territory has been incomparably the best ever discovered, producing up to 1868 probably two-thirds of all the oil brought to the surface to that date.

The Shaffer Farm, which is next, though containing but little more than fifty acres, was formerly one of the moderate producing farms on the Creek. This farm, though, in the year 1864, containing less than a half dozen buildings, was for a time the terminus of the Oil Creek Railroad, and immediately became a shipping station of great importance, for the oil was then shipped in barrels, and not less than fifteen hundred teams were employed in hauling it to the cars from the wells, and, together with their drivers, and other auxiliaries, these supported the innumerable stables, hotels and eating-houses that sprang up in a night like mushrooms. Though at one time the village on Shaffer Farm numbered over two thousand inhabitants, there is hardly a house now remaining to mark the scene of former activity.

When the road was extended, the buildings were taken down and removed to the next station.

The Sanney Farm, which is the first after the Shaffer, though not unproductive, has not been remunerative territory; and, though once the seat of a number of small refineries, is now completely abandoned; and the same may be said of the Gregg Farm, which follows:

The Beatty Farm, just below, lying at the mouth of Hemlock Run, has done better, and once contained a number of good wells, several of which were up the run.

The Farrell Farm, though containing but thirty-six acres, has been probably the most remunerative bit of country property of its size in the whole oil regions. Its original owner was James Farrell, but a part of his interest was sold to the Commonwealth Oil Company. It is situated on Bull Run on the east side of Oil Creek. The renowned Noble and Delamater well, which flowed three thousand barrels of oil a day when first struck, commenced in 1863, and continued to flow till 1865, and is estimated to have produced upwards of three million dollars' worth of oil; and another well, the Craft, on the same farm, produced over one hundred thousand barrels.

Besides these there were several other good wells on the tract, but all of them are now abandoned. Opposite this, on the other side of the Creek, is the Foster Farm, rendered scarcely less famous by the great Sherman well, which began flowing in 1862, at the

JAMES S. McCRAY FARM

McCRAY HILL

PETROLEUM CENTER OIL CREEK, PA.

1870-1874

X TRIED TO SINK SHAFT TO OIL SAND.

rate of two thousand barrels per day, and for nearly two years is said to have averaged nine hundred barrels per day. It commenced to flow in May, 1862, and ceased in February, 1864; but for a long time afterward it was successfully pumped. On the other side of the Creek again, bounded by both the Foster and Farrell Farms, lies the Caldwell farm.

The famous well of the same name, struck on this farm in the spring of 1863, being found to have a subterranean connection with the Noble and Delamater well, the owners of the latter offered to buy it, and it was sold with an acre and a half of land for the sum of \$145,000.

The upper McElhenny Farm, which is next below these, was one of the first to be thoroughly developed, and was always one of the best producers. A great number of wells were drilled on this farm in the years 1860, 1861 and 1862, and, though none of them were large enough to be remarkable, nearly all were remunerative.

The Espy Farm adjoining was remarkable for the old Buckeye well, and proved valuable territory. The flats on this farm were developed among the earliest, but the uplands tested several years later were very productive.

The Benninghoff Farm, which lies between the two McElhenny Farms on the Creek, at the mouth of Pioneer Run, was at one time remarkable for the great number of its flowing wells.

Most of the wells on this tract flowed when first struck, and though none of them were large, all were lasting, and the territory very sure.

A number of joint stock companies were chartered to work leases on this farm, for it was brought into market at the period of the great excitement.

John Benninghoff was robbed at his home on Benninghoff Hill, Oil Creek, Venango county, Pa., Thursday evening, January 16, 1868, by James Saeger, George Miller, John McDonald, George Elliott, Jacob Shuppert, Henry Geiger and Lewis Warlde. Mr. Benninghoff did not believe in depositing his money in banks. He bought an old iron key-lock safe and kept his money and valuable papers in it. The night of the robbery the safe contained \$280,000 in money and \$100,000 in government bonds. Two hundred and sixty-five thousand dollars was stolen; \$10,000 in bills and \$5,000 in gold was overlooked by the robbers. The robbers held Mr. Benninghoff and family at bay with guns and revolvers. The money was divided up between the robbers at Lewis Warlde's hotel at Meadville, Pa. James Saeger, the organizer of the gang, took \$100,000 of the money as his share and went to Colorado and bought a ranch and stocked it with cattle. James Saeger is living in Colorado at the present time.

Jacob Shuppert, Lewis Warlde and George Miller served one year in the Western Pennsylvania Penitentiary for the robbery. The others were never captured.

The lower McElhenny Farm, situated on both sides of Oil Creek, below the Benninghoff Farm, was one of

the earliest developed, and for many years continued to be one of the most productive.

It was purchased, like the upper McElhenny Farm, of the original owner, by Hasson and McBride, and L. Haldeman & Co.

The most remarkable wells on this farm were the Empire and Crocker, the former of which started off at two thousand five hundred barrels a day, and after yielding an average of two thousand barrels a day for nearly four months, finally dropped off to three hundred, and then ceased altogether. Among the other best wells on the farm were the Burtis and the Davis.

The Boyd Farm, next below this, singularly enough proved very poor territory, though it was surrounded by that which was exceptionally good. It was at one time the seat of several small refineries, all of which have been abandoned.

The Stevenson Farm, in this vicinity, but not reaching to the Creek, was developed in 1865, and proved to be valuable territory, though possessing no valuable features.

On the James S. McCray Farm, at Petroleum Center, the first wells were drilled on the flats along Oil Creek, which nearly surrounded half of the farm, and some of the largest wells that were struck on Oil Creek in 1863, 1864 and 1865 were drilled at the base of that hill on which the farm is situated. In 1865, when the production on the flats was at its height, Mr. McCray refused half a million dollars in cash for the farm. Early in the spring of 1870 Keffer and Watson, operating on the Dalzell tract, on top of the hill, struck a well which began to flow four hundred barrels of oil a day. This well was near the McCray line, and when it was struck immediately leases were in anxious demand on the McCray farm on top of the hill, and operators were crowding to obtain them on any terms at all. He, however, fixed a uniform price of one thousand dollars per acre bonus and one-half the oil. Even at these unusual figures there were plenty of experienced operators ready to take leases. He also began to operate himself on a large scale, and so remunerative was the territory that in the whole oil region of Pennsylvania there is not today another piece of land equal in size on which so many paying wells were drilled. Six months after oil was struck on the hill and eight years after the first well was drilled on the same flats, this farm produced over twenty-seven hundred barrels of oil a day, yielding to its owner, James S. McCray, the enormous income of more than six thousand dollars a day, and yet but little more than half the production was his. The farm produced eight hundred and fifty-one thousand barrels of oil.

The J. W. McClintock Farm, on which the once flourishing city of Petroleum Center was situated. The farm contains two hundred and seven acres, and was leased in November, 1863, by George H. Bissell & Co., and in the following February put into a joint stock company called the Central Petroleum Company of New York.

It embraces, besides the land on which the town is situated, the circular ravine to the left, called Wild-Cat Hollow, nearly every square rod of which was perforated with a well. Not less than a hundred and

THE PHILLIPS AND WOODFORD WELLS

TARR FARM, OIL CREEK, VENANGO COUNTY, PA., DECEMBER, 1861

fifty wells were drilled on this territory, and nearly eighty per cent. of the whole number were remunerative; and this was undoubtedly—until the opening up of the Parker's Landing field, which was for the most part very sure territory—the best showing made by any farm in the region.

The remarkable results shown by this farm were undoubtedly due quite as much to the excellency of its management as to the superiority of the territory, and stands a bright example of the result of the judicious and economical management of an oil farm. Instead of giving out leases at random, to parties willing to pay a large bonus for the sake of getting leases on which to found speculative joint stock companies, and then in all probability—having enriched themselves by the sale of stock, neglect the development of the land—instead of pursuing this course, so common in the oil region, they only gave leases to actual operators, and at a uniform royalty of one-half the oil.

In 1865 a bonus of one hundred thousand dollars and "one-half the oil" was offered for ten leases on the farm, but promptly refused, and the result proved the wisdom of the decision, for, while the owners may not have realized more than this, they retained the unrestricted control of the property.

Three million dollars' worth of oil, or more, must have been taken from this territory, and the revenue from ground rent, for building, at one time was very great. The village retains of its former population only about ten persons, and, as the farm is now exhausted beyond the hope of another excitement, must continue to decay.

Scarcely less decided was the success that attended the development of the Hyde and Egbert Farm, on the other side of the Creek along the foot of the McCray hill. It was purchased in 1859, of the original owner, Davidson, and soon after tested with fair results, but it was not until 1863 that the flowing wells, which rendered this territory the subject of such wild speculation, were struck.

The Maple Shade and the renowned and singular Coquette well are the most remarkable in the history of this farm.

The first operations here were the least successful, and thus it came to be looked upon as doubtful territory for some time.

The Hayes Farm, below the Hyde and Egbert, is situated on both sides of the Creek, and, though pretty well developed, it was never so well managed as many of the farms by which it is surrounded.

On this farm was attempted the experiment of digging a shaft five feet by seventeen, to the oil-bearing rock known as the "third sand." The enterprise was undertaken by the Petroleum Shaft and Mining Company, and the shaft was commenced in the rear of the Maple Shade, near the line of the Hyde and Egbert Farm. Though unfortunately for the cause of science, the gas would have rendered the enterprise impracticable, it was abandoned for want of means, when down less than a third of the distance.

The H. Story Farm, better known as the Columbia

Farm lies directly below the Hayes. It was bought in 1859 by Pittsburg parties, for eleven thousand dollars, and some other contingent benefit, and shortly afterward put into the Columbia Oil Company. The Columbia Oil Company was chartered by Act of the Legislature of Pennsylvania, May 1, 1861. D. B. Stewart, President; G. S. Bancroft, General Superintendent; D. H. Boulton, Assistant Superintendent. Directors: Thomas Scott, J. Edgar Thompson, Andrew Carnegie, D. B. Stewart, William Melville, David McCargo, Robert Pitcairn.

The Columbia Oil Company in 1862 purchased the H. Story Farm from a syndicate, which bought the farm from H. Story and wife in 1860, paying them eleven thousand dollars for the farm, and sold it to the Columbia Oil Company in 1862 for \$128,000.

The Columbia Oil Company was organized with a capital of \$200,000, divided into 10,000 shares of a par value of twenty dollars each. During the year 1862 the stock varied in price from two dollars to ten dollars per share. At that time the chief difficulty with the company was the receipt of twelve hundred barrels of oil a day, and no market for it, but a foreign demand soon sprung up. About that time Col. Thomas Scott and other high officials of the Pennsylvania Railroad Company got control of the Columbia Oil Company and began shipping the oil to Philadelphia and other seaboard cities at less than the cost of any other shipper, and the company at once began to make money. Between 1862 and 1864 the company paid as dividends \$300,000. In April, 1864, \$70,000 as dividends was paid the stockholders, in May \$100,000, and in June \$100,000. The dividends between July and December, 1864, were \$625,000, making a total of dividends since the formation of the company, \$1,195,000. In June, 1864, the old shares were called in and new ones issued of fifty dollars each. The holder of an original twenty-dollar share received five new ones of fifty dollars each. The person who paid one year and a half before, in 1862, the par value of twenty dollars each for one hundred shares and held his stock to June, 1864, received \$12,000 in dividends to December, and from the profits on the increase of capital made in June, 1864, obtained an accession to his stock of four hundred shares, which were worth with the original one hundred at the then market price \$42,000, making a clear profit of \$52,000 in eighteen months. If he bought the original shares at their lowest price of two dollars each, that profit was made on a capital of two hundred dollars for one hundred shares at two dollars per share.

Next below, and on the opposite side of the Creek, is the Tarr Farm, one of the very best on the Creek, and renowned for the Phillips and the Woodford wells, the first of which, when struck, is said to have produced 3,000 barrels per day, and the latter 1,000 barrels per day, though in both cases it is probable the figures are too high.

They were situated within two rods of each other, and the subterranean connection between their sources of supply was so manifest that when the "Woodford" pumped the only remedy left the "Phillips" was to

draw the tubing, and let the surface water down to shut off the oil from both.

Enormous sums were offered by both owners, but as either had it completely in his power to render the property of the other worthless, neither was willing to settle until both wells were nearly ruined by the surface water, and the consequence was that many smaller wells than either yielded as much oil as both. These famous wells were located on the bank of the creek to the left (going down of the railroad bridge).

The Blood Farm was one of the earliest to be developed, and therein may be said to have been its misfortunes, for in 1861 and 1862, when oil was almost valueless, often selling in bulk as low as ten cents per barrel, and not infrequently suffered to run to waste as utterly worthless, this farm produced more than all of the oil region together, and before the time of speculation and high prices was exhausted, or nearly so, there were a great number of good wells, many of them flowing, and one that flowed 2,500 barrels per day. Below this, at the mouth of Cherry Tree Run, is the Rynd Farm, which, though now producing comparatively little, was once good territory. Not less than a dozen different companies had interests in this farm, and the whole flat has been perforated with holes, though it was rather uncertain territory. The Widow McClintock or Steele Farm, next below, was also good territory. The farm was the property of the widow, Mrs. McClintock, who was herself burned to death in 1864, while lighting the fire with oil, and left the farm together with all the accumulated money of two years' production, to her adopted son, John Steele. It has since passed from his possession, and is now in the hands of John W. Waitz. Its production at present is very small.

The John McClintock farm, below this, at the mouth of Cherry Run, commenced producing in 1860, and, like those immediately above it, produced at a time when oil was worth least.

The number of wells sunk on this tract cannot now be ascertained, but must have been very great. Though but few of them were large enough to be singular, nearly all were remunerative.

There were also several refineries on the farm at one time, which are now abandoned.

The Buchanan Farms, situated on either side of Cherry Run, being mostly upland, neither of them were thoroughly developed until the speculative fever of 1864 and '65 brought them into the market as the basis of the formation of joint stock companies, but the narrow flats along Oil Creek had previously been tested with considerable success.

The village of Ronseville, still a flourishing town, with a population of nearly three thousand, is situated partly on both of these farms.

Though both farms have been quite productive, and have had several large wells, the percentage of dry holes has been very great.

There were several smaller refineries on both those farms, and the number of stock companies was beyond all belief.

The Hamilton McClintock Farm, containing three hundred and fifty acres, is situated at McClintock's

Station, on the Oil Creek Railroad, and lies on both sides of the stream. It is one of the first farms that came into the market as oil territory—being, in fact, the second—for here were found the surface indications which for the first year or two were thought by most operators necessary to warrant the drilling of a well.

Some years before the idea of adopting artesian drilling in the development of Petroleum had dawned upon the world, the owner, Hamilton McClintock, had collected oil from a spring that bubbled up in the middle of the Creek, and around which he built a crib in order to prevent the oil from being borne away on the current of the water. By occasionally skimming the pool inside this crib, and sometimes agitating the ground with a pick or crowbar to the depth of a few inches, he collected several barrels in the course of a year without giving himself much trouble, and it was all disposed of with some profit to the surrounding farmers, and was sent to Pittsburg by the lumbermen in the spring of the year. But, though fifty barrels *might* have been collected, it is doubtful—reports to the contrary notwithstanding—if ever more than five actually *were*. The third well to produce oil on the Creek was drilled in this crib for Brewer, Watson & Co., by J. D. Angier. The town, which took its name from the farm, and which was once a brisk, little place, has been nearly obliterated.

The Clapp Farm, purchased of the original owner in 1859, by George H. Bissell and Arnold Plummer, was thereafter at once thoroughly developed, and, though there was a large percentage of dry holes, the number of paying wells was also very great, and the fact that Mr. Bissell was at the same time conducting the largest barrel factory in the oil region, enabled him often to ship his oil to market when others either sold it to speculators for ten cents a barrel, or let it run to waste because they could not afford to pay two and two and a half dollars apiece for barrels to ship it in.

The total daily product of all the wells in June, 1860, was estimated at two hundred barrels. By September, 1861, the daily production had reached seven hundred barrels, and then commenced the flowing well period, with an addition to the production of six or seven thousand barrels a day. The thing was monstrous, and could not be endured! The price fell to twenty cents a barrel, then to fifteen, and then to ten! Coopers would sell barrels for cash only, and refused to take their pay in oil, or in drafts on oil shipments. Soon it was impossible to obtain barrels on any terms, for all the coopers in the surrounding country could not make them as fast as the Empire well could fill them. Small producing wells were forced to cease operations, and scores became disheartened and abandoned their wells. The production during the early part of 1863 was scarcely half that of the beginning of 1862, and that of 1864 was still less. In May, 1865, the production had declined to less than four thousand barrels per day.

Names of oil companies and officials operating on the Allegheny River and Oil and French Creeks, in Pennsylvania, in 1863, 1864 and 1865:

WEIKEL RUN AND M'ELIENNY OIL COMPANY; capital, \$230,000; 2,300 shares, \$100 each. A. B. Stone, President; D. P. Eels, Vice President; E. J. Farmer, Treasurer; F. C. Prentiss, Secretary; G. E. Herrick, Counsel. Directors: J. D. Rockefeller, W. C. Scofield, A. B. Stone, C. C. Cobb, E. J. Farmer, J. V. Painter, D. P. Eels, H. Chisholm, R. L. Chamberlain.

MILTON FARM OIL COMPANY; capital, \$200,000. Lubricating oil producers, Franklin, Pa. President, H. Garretson, Cleveland, Ohio; Vice President, Amos Townsend, Cleveland; Secretary and Treasurer, Alfred Ely, Jr.; Company Attorney, Roland D. Noble. Directors: Lemuel Crawford, George W. Howe, George B. Hicks, J. G. Graham, N. P. Payne, John Tennis, P. I. Price.

CLEVELAND AND BUFFALO PETROLEUM COMPANY; capital stock, \$180,000. Officers: R. K. Winslow, President; George H. Burt, Vice President; John J. Myers, Secretary and Treasurer.

PITTSBURG AND ALLEGHENY VALLEY OIL COMPANY; capital, \$200,000, divided into 100,000 shares of \$2 each; \$180,000 invested in real estate; \$20,000 appropriated for working capital. This company was organized under the General Mining and Manufacturing Law of Pennsylvania. Officers: Curtis G. Hussey, President, Pittsburg, Pa.; Thomas H. Howe, Secretary and Treasurer, Pittsburg; Henry Holdship, Director, Pittsburg; James W. Clark, Director, Boston, Mass.; George Sinclair, Director, Cleveland.

CLEVELAND AND CHERRY VALLEY OIL COMPANY; capital, \$50,000; 50,000 shares, par value \$10. Officers: B. F. Peixotto, President; Edward Budwig, Secretary; C. Koch, Treasurer.

ARMY OIL COMPANY; capital, \$150,000. Officers S. N. Payne, President; W. D. Mann, Vice President; D. Stratton, Secretary; T. S. Beckwith, Treasurer; L. Sternberg, Superintendent; T. J. Carran, Attorney. Leases on McClintock and Buchanan Farms, Oil Creek, Pennsylvania.

INDIAN ROCK OIL COMPANY OF NEW YORK, operating on Oil Creek, Pa. Officers: G. A. Hoyt, President; Victor L. Conrad, Secretary and Treasurer; J. T. Briggs, General Superintendent. Operating the Miller Farm, containing 375 acres in fee simple, and the Foster Farm, 25 acres.

CENTRAL PETROLEUM COMPANY, organized 1863; Officers: James Bishop, President; William H. Breeden, Vice President; Christopher Meyer, Treasurer; Austin Stevens, Secretary. Directors: James Bishop, William H. Breeden, Christopher Meyer, George H. Bissell, Johnson Letson, A. T. Stout, Frederick Prentice, Josiah Oakes, Wed W. Clark. The property of the company consisted of two hundred and eighty acres in fee simple on Oil Creek, Venango county, Pa., generally known as the "George Wash-

ington McClintock Farm," on a portion of which the flourishing village of Petroleum Center is situated.

Oil on hand in tanks December 15, 1865, 6,976 barrels. The government tax of one dollar per barrel on all oil sold took effect on the first day of April, 1865. Oil sold at the wells in April, 1865, at \$5.50 per barrel. One dollar for internal revenue on each barrel left the oil at the wells worth \$4.50 per barrel.

Report by Edward Fox and M. C. Martin, General Superintendents.

GERMANIA PETROLEUM COMPANY, incorporated under the laws of the State of New York, September 7, 1864; capital, \$3,000,000; 600,000 shares, par value \$5 each. Officers: J. F. Schepeler, President; H. Holt-hausen, Treasurer; Charles Throckmorton, Secretary. Main office, New York City. Leases and wells in President and Complanter Townships, Venango county, Pa.

In 1864 and 1865 the United States well," at Pit Hole, was struck, and flowed, as estimated, January 7, 1865, 650 barrels per day. By this well came the famous Pit Hole excitement, which must ever stand prominent in the history of the oil region of Pennsylvania. Pit Hole City was commenced May 24, 1865, and soon the town contained a population estimated at 8,000.

At one time Pit Hole City had fifty hotels; several of them were palatial in size, and truly gorgeous in their equipment. The cost of the Chase House was over \$80,000; the cost of the Morey and Bonta Houses, equally as large. It had miles of streets, lined with buildings, including banking offices, school-houses, churches, an opera-house and other appendages of a first-class modern city.

Soon the production of oil at this point decreased to a mere nominal figure; fire swept away whole streets of the town; the signs of decay were evident. A general collapse took place, and piece by piece Pit Hole City was carted away.

Commencing at Titusville in 1859, the tide of development swept over the valley of Oil Creek, and along the Allegheny River, above and below Oil City, for a considerable distance, then Cherry Run in 1864; then came Pit Hole Creek, Benninghoff and Pioneer Run—the Woods and Stevenson farms on Oil Creek, in like succession, in 1865 and 1866. Tidioute and Triumph Hill, in 1867, and in the latter part of the same year came Shamburgh. In 1868 the Pleasantville oil field furnished the chief center of excitement.

A lull took place, to be followed by the developments on the McCray Hill, at Petroleum Center, and on the Shaw Farm, near Rouseville, Foster Farm and East Hickory Center, and then the great "down the river," or lower oil field, loomed up to become the principal center of production.

HISTORY AND RECORD OF THE FIRST WELL DRILLED IN THE WORLD.

Early record can be found of it at the Salt Lick, or the "Great Buffalo Lick," as it was then called.

Between Dana and Campbell's Creek, near Buffalo and Deer Gap, now known as the "Thoroughfare Gap," five miles southeast of Charleston, West Virginia, on the bank of the Great Kanawha River, was drilled the first well to be recorded in the world. David and Joseph Ruffner began to drill a well for salt brine in 1806 and from this well we have the first record of any well in the world that a spring pole was used to drill with, and the first place in the world that any kind of drive pipe was used to case off the surface sand

and gravel; and the first place to use tubing and a packer in a well.

In 1798 Joseph Ruffner, Sr., built the first brick store ever built west of the Allegheny Mountains, one-half mile southeast of the "Great Buffalo Lick," on the north bank of the Great Kanawha River, and a small village was built up and named Terra Salus, and later named Kanawha Salines, Latin names for salt. About 1820, the colored people ("negroes") began to call the village of Kanawha Salines Malden, from the fact that a whipping post had been established there to whip the refractory negro slaves. The negroes, when speaking of a whipping, called it getting mauled. After being whipped they called it Malden, meaning the whipping was done, hence the name of Malden, the oldest town west of the Allegheny Mountains in West Virginia.

The first safe used west of the Allegheny Mountains was brought over by Joseph Ruffner from East Virginia, also the first vault was brought over from East Virginia through the kindness of Mr. Chester Oaks, the present owner of the Ruffner store at Malden, W. Va. The writer in May, 1903, was permitted to examine the vault and safe and the contents. The vault is built of iron, brick and stone in the northwest corner of the store on the first floor, and the safe is on the second floor of the store. The safe is two feet wide, two feet deep and three feet long, made of very hard wood, bound with iron and locked with a very large old-fashioned padlock. In the safe the writer found a number of old books and papers, of which Mr. Oaks, the owner of the store, made the writer a present. The books and papers date from 1787 to 1856. The oldest paper is a due bill dated Terra Salus, West Augusta, Virginia, August 11, 1787, signed Joseph Ruffner. One bill is dated Terra Salus, Kan. Cont. Va., July, 1810: David and Joseph Ruffner, brothers, owe William Morris, ironsmith, for two bore edges or cutting rock chisels, ten pounds of steel each one, and ten pounds of iron each one; two bore or augur bars, one hundred pounds each, and two bore bar unions, eight pounds each, and two bore bar pins, two pounds each; for making them, twenty dollars.

WILLIAM MORRIS.

One bill dated Kanawha, Salines, Va., June, 1832, David and Joseph Ruffner to William Morris, for making one pair of bore bar slips two dollars.

August 1, 1832, received from Ruffner Brothers, two dollars for making one pair of bore bar slips.

WILLIAM MORRIS.

This is the first true record we have of the making and use of jars.

One-half mile east of Malden the writer was invited to visit the salt works of J. D. Dickinson & Co., sole makers of Kanawha salt. The capacity of the works is 165 barrels of 280 pounds each day. The founder of these, the only remaining salt works on the Great Kanawha River at this writing, was John Dickinson, of East Virginia, who located on the tract of land six miles southeast of Charleston, W. Va., in 1785. Mr. Dickinson sold all but 252 acres of this large tract of land and in 1832 drilled five wells for

salt brine and built a new salt works, which has remained the property of the descendants, J. L. Dickinson having charge since 1872, with his son, C. C. Dickinson, present manager. The wells are made to flow the water out by compressed air.

The writer next visited the site of Burning Springs, eight miles southeast of Charleston, W. Va., on the north bank of the Great Kanawha River, on a tract of 698 acres of land, the property of John G. W. Tomkins, son of William Tomkins, the original owner, who bought it from George Washington. Here is located the famous Burning Spring of which George Washington speaks in his will. George Washington visited the Kanawha Valley and Burning Springs in person in the summer of 1775. Through the kindness of Captain William B. Stevens, the gentleman that lives on the Tomkins Farm, that Burning Springs are located on, the writer was very kindly shown over the historic farm. The "Gum wood" conductors in the river and salt water springs were pointed out and their history given. The gas was lit in one of the "gums," as they are called there, while the writer made a picture of it and returned to Charleston, where he met Mr. John Tomkins, owner of the farm, and through him was introduced to Mr. Walter B. Brooks, executor for the estate of the late Dr. J. P. Hale, a very able writer and authority on the early history of salt-making on the Great Kanawha River, and through the kindness of Mr. Brooks the writer was loaned a paper on salt written by Dr. J. P. Hale in 1876. In the early days a drilling well was spoken of as a boring well.

HISTORY AND RECORD OF THE FIRST LARGE GAS WELL STRUCK IN THE WORLD.

In 1815 Captain James Wilson, who then owned and occupied the Clendenen Block House on the bank of the Great Kanawha River in the town of Charleston, county seat of Kanawha county, Virginia, drilled a well near the block house for salt water. At 400 feet deep a small salt brine well was struck and the well was drilled deeper in the hopes of getting more salt. At 500 feet deep the gas sand was struck and the tools were blown from the hole, the gas taking fire. After the gas weakened, Captain Wilson had the hole filled up and the well abandoned as being worthless. This is the history and record of the first drilled gas well in America. The old well is now located near the residence of C. C. Lewis, Esq., on Kanawha street, in the limits of the city of Charleston, county seat of Kanawha county, and capital of the State of West Virginia.

HISTORY OF THE SAND DIGGINGS OF VIR- GINIA—NOW WEST VIRGINIA.

On the left bank of the Hughes River, named after the first white settler who lived near its mouth, by the name of Jesse Hughes. In 1810, Bushrod W. Creel, who owned and lived on a farm of 100 acres on the left bank of the Hughes River, Wirt county, W. Va.,

six miles from where it empties into the Little Kanawha River, at that date was rated the best hunter and trapper on the Hughes River. While hunting on the river he discovered oil coming out of the bank. The thought came to him that the oil must be good for something. A day or two after he gathered two small bottles of it and took it to Marietta, Ohio, and sold it to Bosworth, Wells & Co. as bank oil, by whom it was claimed to cure all pains and aches that man was heir to. In a short time the oil had a greater sale than the supply. This induced Bushrod Creel to dig in the bank for oil. At ten feet deep a gravel bed was struck and in this gravel a black or dark green 27-degree gravity oil was found. This oil was bottled and taken to Marietta, Ohio, and sold by Bosworth, Wells & Co. Every spring for forty-five years Bushrod Creel would dig a new hole down in the gravel and dip and wash the oil out with water. In this way the place took the name of Sand Diggings. The first house that was built near by was built in 1849, one-half mile west of the Sand Diggings, on the Stanton and Parkersburg Turnpike. In that year (1849) gold was discovered in California, and as all the talk at the house was in regard to gold being discovered in California the house was christened California House, and the place to this day goes by that name. A few years ago the house burned down. In 1855 George S. Lemmon drilled the first well on the right bank of Hughes River, opposite Bushrod Creel's Sand Diggings. The well was drilled for salt brine by water power. At the depth of fifty feet oil, gas and fresh water were struck, and nothing more was done with the well for three years. In the meantime Bushrod Creel had dug over the gravel bed on the flats of his farm, which was found to be one hundred feet wide and two hundred feet long and thirty feet deep. This was the extent of the Sand Diggings on the Hughes River.

In 1858 C. H. Shattuck, a salt-maker and bottler of "Spruce Oil," of Tarentum, Pa., learned through a tramp the first known history of the Sand Diggings. However, the tramp didn't know or remember on what river the diggings were located, but he remembered they were near Parkersburg, W. Va. In 1859 C. H. Shattuck arrived in Parkersburg and inquired for the oil diggings, but no one seemed to know where they were located. One morning C. H. Shattuck started up the Little Kanawha River. After going about ten miles he learned from a settler that the oil diggings were about twelve miles from there on the Stanton and Parkersburg Turnpike, on the Hughes River. Mr. Shattuck arrived at the California House for dinner. That afternoon he went to the Sand Diggings and bought ten acres of land from Bushrod Creel adjoining his Sand Diggings on the Hughes River, and in a short time began to drill the first well ever drilled in Virginia, now West Virginia, exclusively for oil. The well was drilled by the lever process, three hundred feet deep, just fifty-nine days after the Drake well at Titusville, Pa., and proved to be a dry hole. At this date the Lemmon well was pumping twenty gallons of oil a day. After the death of Bushrod Creel the Sand Diggings and farm were left to John Creel, his son. In a few years John Creel

sold the Sand Diggings and farm to A. C. Dravo, of Beaver Falls, Pa., who drilled a number of wells on the farm before he died. The farm is now owned by John F. Dravo.

Sand Diggings to California House, one-half mile.

Sand Diggings to Parkersburg, W. Va., by the river, thirty-one miles.

Sand Diggings to Parkersburg by the Stanton and Parkersburg Turnpike, twenty-two miles.

Sand Diggings to Burning Springs, Wirt county, sixteen miles on the line of the upheaval.

Sand Diggings to Petroleum, on line of the upheaval, seven miles.

HISTORY OF BURNING SPRINGS, WIRT COUNTY, VIRGINIA, NOW WEST VIRGINIA.

The White Sulphur Springs induced William P. Rathbone to purchase the land which the Burning and White Sulphur Springs were located on, in 1841, from John F. Petty. The tract of land contained one hundred acres on the present site of Burning Springs, Wirt county, W. Va., on Little Kanawha River, thirty-five miles east of Parkersburg.

The first well drilled at Burning Springs, Wirt county, W. Va., was drilled by Charles Reynolds, of Charleston, W. Va., in 1842, for salt brine, on a five-acre lease from William P. Rathbone, and his two sons, Colonel J. C. Rathbone and John V. Rathbone. The well was drilled with the spring pole method, and ten months were consumed in drilling it. At 303 feet deep salt water was found in paying quantities, but owing to the large quantity of oil, commonly called Rock Oil, the well was abandoned as useless, as the oil spoiled the brine for salt. In the fall of 1859 General Samuel D. Karns, of Pittsburg, Pa., leased one acre of ground with the salt water well on it from William P. Rathbone and his two sons. In the spring of 1860 General Karns and his brother Frank tubed the old greasy water hole, as it was called. This was the well that Charles Reynolds, of Charleston, W. Va., drilled in 1842 for salt brine. After a few days' pumping the well began to pump pure oil at the rate of seven barrels a day. The oil sold at fifty cents a gallon. In 1861 was the great excitement at Burning Springs. The first wells were drilled with spring poles. During the close of 1861 the oil operators and people at Burning Springs were greatly annoyed by the Confederate army, which stole their horses and committed other acts of violence. In January, 1862 the Federal Government placed a revenue of one dollar on each barrel of oil sold, and in the same month authorized J. Cassius Rathbone to organize a regiment of men to defend the property at and about the Burning Springs. The regiment was organized and mustered into the Union army as the Eleventh West Virginia Infantry, with J. C. Rathbone as its Colonel, in February, 1862. In April, 1862, several raids were made in the neighborhood of Cairo, Petroleum, California House and Burning Springs. The houses and other buildings and a number of oil derricks were burned and the horses and cattle taken

away by members of the Confederate army. In the first part of May, General Jones, of the Confederate army, made a raid on No. 18 tunnel at Cairo and fired the wooden arch in the tunnel. This was done to stop the traffic on the B. & O. Railroad, but the Union army on guard nearby drove the Confederate army back and put out the fire in the tunnel. Shortly after firing the tunnel General Jones and two thousand of his men made a raid on the people on the Hughes River, then crossed the country to the Little Kanawha River and made a raid on the town of Burning Springs. At that time Colonel J. C. Rathbone and five hundred of his men were stationed on the hill back of and overlooking Burning Springs. Before any damage was done General Jones demanded a surrender from Colonel Rathbone, with the promise that no lives would be lost. After the surrender by Colonel Rathbone to General Jones the trouble began. Houses and stores were robbed and set on fire, all the oil wells and tanks were set on fire and all the cooper shops, barrels of oil, loaded and empty barges were set on fire, and in a short time the whole river was a solid blaze of fire and burned the timber on both sides of the river for a distance of eight miles down the river. Over twenty thousand barrels of oil were burned. General Jones made the raid to keep the Government out of the revenue on the oil. The raid is known to this day as the great Burning Springs Fire of May, 1862.

NAMES OF FIRST OIL COMPANIES OPERATING IN WEST VIRGINIA.

C. H. Shattuck began operating at Sand Diggings on Hughes River in 1859.

General S. D. Karns, Sr., began operating at Burning Springs, Wirt county, on Little Kanawha River, in 1860.

J. T. Johnston & Co. began to drill for oil on the Hughes River in 1860.

Messrs. Hazlet & Co., of Wheeling, began drilling near Petroleum, Wirt county, in 1860.

J. B. Blair & Co. began operating on Bull Creek and at the depth of 160 feet, on the 16th of March, 1863, struck a thousand-barrel well.

The next large well struck was the Gilfillen well on Rawson's Run, near Horse Neck. The third large well was the Tack well of the American Oil Company, on Rawson's Run.

Sharp & McKinney, Campbell & Co. and Tack & Brasher were operating near Horse Neck in 1863, 1864 and 1865.

OIL LEASE USED AT BURNING SPRINGS, WIRT COUNTY, WEST VIRGINIA, 1855 TO 1875.

COPY OF THE WILLIAM P. RATHBONE LEASE.

One thousand dollars bonus at time of lease on one acre of land, one thousand dollars when the soil is broken. No more than one acre of ground leased to any party or company. Drilling to be commenced within sixty days after lease is drawn up. One-fourth

of all oil produced from the wells on the William P. Rathbone property to be delivered by the owner or company in iron-bound barrels, within twenty-four hours after produced, to William P. Rathbone and his sons, Colonel C. J. and John Rathbone.

HISTORY OF THE VOLCANO-PETROLEUM OIL FIELD IN RITCHIE AND WOOD COUNTIES, WEST VIRGINIA.

This field came into existence in 1860, by the discovery of a spring that produced a heavy dark green, 29-degree gravity natural lubricating oil, on the headwaters of a small run one mile south of the town of Volcano. A small town was built during the early oil excitement near this spring. The town was given the name of Oil Spring, and the run was named Oil Spring Run. One mile south of the oil spring on the same run is located the natural gas spring that burned for a number of years. Two miles south of this spring is the town of Petroleum.

Petroleum is the only railroad point on the uplift, or upheaval, between Burning Springs, near Charleston, on the Great Kanawha River, and Belmont and Eureka, on the Ohio River. Petroleum is located on the east side of the uplift, on Goose Creek, Ritchie county, W. Va., twenty-two miles east of Parkersburg, on the Baltimore & Ohio Southwestern Railroad. Two miles west of Petroleum, on the west side of the uplift on the Baltimore & Ohio Southwestern Railroad, is located Volcano Junction, of the Laurel Fork and Sand Hill Railroad. This railroad was built to Volcano, on White Oak Run, a distance of four miles north, in the early oil excitement of 1866. The road was built by the Volcanic Oil and Coal Company. W. C. Stiles, Jr., was General Manager.

The population of Volcano in 1872 was 2,500, present population 100. The railroad was abandoned in 1897.

HISTORY OF THE FIRST FLOWING WELL IN THE WORLD.

A well was struck on the Archie Buchanan Farm, at Rouseville, Pa., July 10, 1860, by Rouse, Mitchell & Brown. The well was called "The Curtis Well." It was drilled 180 feet deep with a spring pole, and flowed five to ten barrels of oil a day for fifteen or eighteen months. No tubing was used and the well was soon flooded out with surface water.

HISTORY OF THE FIRST LARGE FLOWING WELL IN THE WORLD.

This well was struck on the David McElhenny Farm, near Petroleum Center, on Oil Creek, Pa., May 12, 1861, by Captain A. B. Funk. This was the first well ever drilled to the third sand, which was struck at four hundred feet deep. After drilling into the sand sixty feet the well began to flow at the rate of three hundred barrels a day. The well was named the "Fountain Well." Total depth of well, 460 feet.

OIL MEN'S ASSOCIATION.

The first Oil Men's Association was formed and organized at Titusville, Pa., Monday evening, November 26, 1860. Colonel Edwin L. Drake was elected President; Cornelius Chase, Vice President; C. M. Allen, Secretary.

HISTORY AND RECORD OF THE OLDEST PRODUCING WELL IN THE WORLD.

George Rice Farm, Well No. 1, on Goose Run, in the town of Macksburg, Washington county, Ohio. George Rice, owner. Well drilled in 1862 to the Macksburg sand and later named the 500-foot sand. The well is five hundred feet deep and is producing three barrels of oil at the present day.

HISTORY AND ROUTE OF THE UPHEAVAL OR UPLIFT OF VOLCANIC ORIGIN IN THE STATES OF OHIO, WEST VIRGINIA, KENTUCKY AND TENNESSEE

Scientists agree that at some period in the world's history there was an upheaval of some kind, which raised or uplifted the formations of the earth from two hundred to one thousand feet, and from one and one-half to fifty-six miles wide, which completely changed the character of the earth's surface. Beginning at Caldwell, the county seat of Noble county, Ohio, the first Cow Run sand is within one hundred feet of the surface. This is the extreme northwestern end of the uplift. The next town is Dudley, on Duck Creek, in Noble county, Ohio. The uplift here is one mile wide. Oil was found in the first Cow Run sand 150 feet deep. The next town is Macksburg, Washington county, Ohio, on Duck Creek. Oil was found in the first Cow Run sand at 150 feet and in the Macksburg, or 500-foot sand, and later oil was found in the Big Injun sand. The uplift is eight miles wide at Macksburg. The next town is Elba, on Duck Creek, in Washington county, Ohio. Oil was found at Elba in the 500-foot and the Big Injun sands. The uplift at Elba is ten miles wide. The next town is Warner, in Washington county, Ohio. Oil is found in the 500-foot or Macksburg sand. The uplift is fifteen miles wide at Warner. The next town in the center of the uplift is Cow Run Postoffice, on Cow Run Creek, Washington county, Ohio, the center of the Cow Run sand oil field. The oil is found in the second Cow Run sand. The uplift at Cow Run is twenty miles wide. The next town in the center of the uplift is Salama, in Pleasants county, W. Va., on the Ohio River. Oil is found in the Cow Run, Big Injun and Berea Grit sands. The uplift at Salama is sixteen miles wide. The next town on the uplift is "Horse Neck," in Pleasants county, W. Va. The oil is found in the Salt sand and Big Injun sand. The uplift at "Horse Neck" is six miles wide. The next town on the uplift is Borland, on Bull Creek, in Wood county, W. Va. The oil is found in the Salt sand. The uplift at Borland is three miles wide. The next town on the uplift is Volcano, on White Oak Run, in Wood county, W. Va. Oil is found in the Salt sand, 250 feet deep and the Big Injun, 400 feet deep, on the west side of the uplift. The uplift at Volcano is two miles wide. The next town on the uplift is Oil Spring, on the east side of the uplift, on Oil Spring Run, on the edge of Ritchie county, W. Va. The oil is found in the Salt sand at two hundred feet deep on the flats. The Cow Run sand crops out on top of the hill near the mouth of the coal mine, between Volcano and Oil Spring. The upheaval at Volcano is very plain. Volcano is on the west side of the upheaval, where the

rock and earth formations dip ninety degrees to the west one-fourth of a mile, then there is a basin one mile wide between Volcano on the west side and Oil Spring Run on the east side of the uplift. The east side uplift is one-fourth of a mile wide; the rock and earth formations dip ninety degrees to the east. The next town is Petroleum, on the east side of the uplift, on Goose Creek, in Ritchie county, W. Va. One and one-half miles west of Petroleum, on the west side of the uplift is Volcano Junction. The next place is California House, on the east side of the uplift, in Wirt county, W. Va. The next place is the Sand Diggings, on the Hughes River. The oil is found in the Salt sand. The upheaval is one and one-half miles wide at the Sand Diggings. The next place is Parrish Forks, on the west side of the uplift, in Wirt county, W. Va. The oil is found in the Salt sand and Big Injun sand. The next place is Oil Spring, on Standing Stone Run, Wirt county, W. Va. The oil is found in the Salt sand, on the west side of the uplift. The next place is Standing Stone. The oil is found in the Salt sand, on the west side of the uplift. The uplift is one and one-half miles wide at Standing Stone, Wirt county, W. Va. The next place is North Branch of Burning Springs Run, on the east side of the uplift. The oil is found in the Salt sand and Big Injun sand. The next town is Burning Springs, on the east side of the uplift, on the Little Kanawha River, in Wirt county, W. Va. The oil is found in the Salt sand and Big Injun sand. The uplift is one and one-half miles wide at Burning Springs, Wirt county, W. Va. The basin is one mile wide in the center of the upheaval and it extends from Burning Springs, in Wirt county, W. Va., to a point on the uplift near Horse Neck, in Wood county, W. Va., a distance of thirty-six miles. The next town on the uplift is Evelyn, Wirt county, W. Va. The uplift at Evelyn is eight miles wide. The next town is Spencer, the county seat of Roane county, W. Va. The oil is found in the Big Injun sand. The next town on the uplift is Walton, Roane county, W. Va. Gas is found in the Big Injun sand. The next town on the uplift is Jarrett, Kanawha county, W. Va. The next towns on the uplift are Dana, Malden and Burning Springs, on the Great Kanawha River, Kanawha county, W. Va. The gas was from the Gas sand, the oil and salt water from the Salt sand. Salt is made from the brine of the salt water from the Salt sand and the Big Injun sand. The uplift at Malden is twelve miles wide. The next town on the uplift is Racine, Boone county, W. Va. Gas is found in the Big Injun sand. The uplift is sixteen miles wide at

Racine. The next town on the uplift is Logan, county seat of Logan county, W. Va. The uplift at Logan is twenty miles wide. The next town on the uplift is Burning Springs, Mingo county, W. Va. Gas, oil and salt water are found in the top of the Salt sand. The uplift at Burning Springs, Mingo county, W. Va., is twenty-five miles wide. The next place on the uplift is Martin county, Kentucky. The uplift at Prestensburg, Floyd county, Ky., is forty miles wide and takes in the oil wells near Paintsville, in Johnson county, Ky., and all the wells in Floyd county. The next two counties on the uplift in Kentucky are Knott and Perry. The next town on the uplift is Burning Springs, Clay county, Ky. The uplift at Burning Springs, Clay county, Ky., is fifty miles wide. The next town on the uplift is Barboursville, county seat of Knox county, Ky. Oil is found in the Shallow and Deep Lime formations. The next counties in Kentucky on the uplift are Whitley, Pulaski and Wayne. The next town is Sunnybrook, in Wayne county, Ky. The wells are shallow. The uplift at Sunnybrook, Wayne county, Ky., is fifty-three miles wide. The next counties on the uplift are Scott, Pickett, Fentress and Overton counties, Tennessee. The first oil field in Tennessee on the uplift is the Pall Mall, in Fentress county. The next fields in the uplift are the Bob's Bar and Lacy oil fields, in Fentress and Pickett counties, Tennessee. The next is the Overton field. This is the last place oil is found on the southeastern end of the uplift in Overton county, Tennessee. The distance from Caldwell, Noble county, Ohio, over the uplift through West Virginia and Kentucky to the oil wells in Overton county, Tennessee, is 413 miles. The oil formations on the uplift are from two hundred to one thousand feet nearer the surface. That accounts for the wells being so much shallower on the uplift than at other localities.

HISTORY OF OIL AND GAS SPRINGS.

On the farm of H. D. Foutty, two miles northeast from the mouth of Goose Creek, in Wirt and Ritchie counties, West Virginia, on the line of the upraise or upheaval, one and one-half to two miles north of the Sand Diggings, is an oil spring, located on the bank of Second Big Run, four hundred feet from its mouth, and another one at Sheep Cave, one and one-half miles north of the Sand Diggings. The oil has been seeping out from those springs since the coming of the white men to that section of the country, and the springs are seeping oil to this day.

HISTORY OF THE GREAT WILDCAT MYSTERY ON LOT 646, CHERRY GROVE, WARREN COUNTY, PENN'A.

Christ. Larsen, owner of lot, leased to Fred Morck and William Falkner, and subleased to George H. Dimick and Captain Peter Grace. Dimick and Grace started to drill well No. 1 on Lot 646 in January, 1882, and on the 11th day of March, 1882, the well was shut down and plugged on top of the sand later named

the Cherry Grove sand, and held as a mystery, but, owing to the well not being properly plugged, the plugs leaked, which allowed the well to make several small flows. During this time the well was surrounded and watched by a heavy guard. This guard would not allow any person to go near the well. The plugs were drilled out on the 29th of March, when the well began flowing stronger than before, and it was again plugged and guarded as a "mystery" until May 17, 1882. In the meantime it became known that oil had been found in the well on Lot 646 and a number of wells were at once started drilling adjoining Lot 646. When the well on Lot 646 was drilled in it began flowing one thousand barrels of oil a day. This was the beginning of the great "boom of 646." A town was at once built upon the hill above the well, which was given the name of Cherry Grove. The next nearest town was given the name of Garfield, in honor of the President, and the next town that sprang up was named Farnsworth, after the owner of the saw mill, and at that time was the most exciting of all the oil regions, when every well struck was a gusher, when the Sheffield and Clarendon plank roads were covered with a continuous procession of wagons loaded with oil well machinery, household goods, provisions and merchandise. Garfield was then a busy, thriving town; Farnsworth was a raging sea of unconfined deviltry, and all were full of life and beer. The two towns had a combined population of 15,000. But it is all changed now. Garfield and Farnsworth have not over fifty souls and in history are next to Pithole, Pa. In the spring before 646 was struck the greater part of Cherry Grove township was a wilderness. The tract of cleared land on the crown of the hill was occupied by Swedish farmers who were getting a living with considerable difficulty. Two thousand feet above the sea level, nine miles from a railroad, with almost impenetrable forest stretching the entire distance, the region was as isolated and uninviting as any inhabited part of this rough country.

It was by accident that Captain Peter Grace put up a rig late in the winter on Lot 646 and began drilling a wildcat well. He intended to make his venture still farther over the hill, but could not get a lease. If he had got the lease he wanted his well would have proved a dry hole, and the solitude of Cherry Grove would doubtless have remained undisturbed to this day and beyond. Sitting at a reading room table one evening and building leaning towers with a set of dominoes, Captain Grace rapidly sketched the history of the venture which, according to accepted report, yielded him in the neighborhood of half a million dollars.

"We struck sand in 646," he said, "on March 11. She showed up strong. The well was then plugged and left under guard till March 29. On that day the plug was drilled out, and she began flowing stronger than before. There was no tankage to accommodate such a flow, and the well was being watched from the outside; so we had to plug her again. The woods were full of scouts. Our guard was in charge of Tom King, who had eight men under him, armed with guns. All sorts of rumors were afloat as to what the well was doing. One night two men approached one of the guards and offered him \$2,000 for a chance to gauge the flow. The impression was becoming gen-

eral that the well was a gusher, and something had to be done to counteract it.

"At that time it was impossible for me to move without being watched. I was shadowed by scouts wherever I went.

SHOOTING THE FIRST WILDCAT WELL 646 IN CHERRY GROVE DISTRICT.

"So one night I went to Warren, Pa., and told one of the Roberts Torpedo Company's men that I wanted to see him later in a certain room at a hotel. He agreed to meet me there. When I went away I was shadowed to the hotel, and the men who were following me went into the room next to the one I had designated. The torpedo men came at the hour named, and I told them I was going to shoot 646. I especially charged them to make their arrangements for doing the work with the utmost secrecy. It was arranged that they should come down on the following night. All this conversation was overheard by the spies in the next room.

The next night, when the men started for Cherry Grove with the torpedoes, it seemed as though every body in the region knew that the well was going to be shot. Hundreds in wagons and on horseback followed the wagon down to the woods. The empty shell and the glycerin cans were taken into the derrick. Our lanterns showed these movements to the hundreds who were watching at a distance. The contents of the cans was poured into the shells—but the cans had contained nothing but water. Then, with the torpedo reel, the shells charged with water were carefully lowered down into the plugged well. While we stood around the hole an iron was rattled in the casing head to imitate the sound of the falling slug, and then one of the men in the derrick struck the anvil a powerful blow that faintly jarred the ground. It happened that just then the well made a little flow.

"The news spread in the crowd that 646 had been shot and had failed to respond except with a very feeble flow. The motions of shooting the well had been gone through with so faithfully that one of the men who had been on guard outside declared when he came into the derrick that the smell of glycerin made him sick, but there hadn't been an ounce of glycerin in the woods. Before morning the news was all over the oil region that the Cherry Grove wildcat had been shot and had proved to be little better than a dry hole."

OPENING THE WELL.

The well was not opened till May 17. Meanwhile it had become known that a pool had been struck which was likely to produce a tremendous sensation in the oil region, and operators eager to secure the lease of lands had begun flocking to Cherry Grove. Much of the land in that township was held by large tannery companies, which were getting out bark and lumber. The owner of the land on which 646 was drilled was a Swede named Chris Larsen. It was leased by Morck & Falkner, from whom George Dimmick, Captain Grace's partner, secured the lease before the well was begun. In February, when the well was drilled to

the depth of some eight hundred feet, Larsen gave them notice to quit, the lease having expired. A compromise was effected, by which Grace & Dimmick obtained the oil right. It was said that they gave him \$55 an acre; but he finally secured other advantages which netted him some \$20,000 before the first of June. A few other farmers made small fortunes out of their oil lands. One made enough money to enable him to buy a good farm in New York State; but the history of the Cherry Grove excitement furnishes no stories of poor land-owners waking up to find themselves millionaires. Things are done differently now than they were in the early days of oildom.

The growth of Cherry Grove as an oil field was rapid. Before the close of May eight wells were drilling, and sixteen other rigs were building. June had not ended before six wells were flowing, sixty-three were drilling, and work was doing on nearly a hundred rigs. In the middle of that month the four wells then completed were pouring out some 10,000 barrels of oil every twenty-four hours. The close of July saw fifty-six producing wells, 163 drilling wells and 114 others up. At the end of another month the number of flowing wells was 161, of drilling wells 116 and of rigs 46; and the production for the month averaged about 28,000 barrels a day. Within a little more than three months from the time of opening the first well, Cherry Grove had become the greatest oil-producing tract in the world. But August proved to be the great month in the history of Cherry Grove. In September the daily flow dropped from nearly 28,000 barrels a day to only a little more than 3,000. The story of the decline of the Cherry Grove wells is told by the monthly record of dry wells drilled and the decrease of the average production per well. In July two dry holes had been opened, and in August the number reached seventeen. The total number of wells finished in September was comparatively small, and only two of them proved to be dry. But there were eleven more dusters in October and three in November. The average daily production per well had greatly fallen off before the producers began to find dry wells. In June it was over 1,200 barrels, in July a little over 300, in August about 150, in September 30, in October 13 and in November 10.

THE OPENING OF THE CHERRY GROVE POOL.

The area of oil-bearing sand was small and there was only so much oil to be got out of it. In the early days of oil producing, before men learned how to put down wells quickly and make the most of an opportunity, the life of Cherry Grove would have run into years, instead of being numbered by weeks. Producers soon suspected what was the nature of the field. Wells were put down with the greatest haste, for it was known that the producers who got down to the sand first would get the most oil, and that those who were late would get left. When the wells already down began to decline their owners went into reckless torpedoing, and the end of Cherry Grove as a profitable oil field was thus hastened. The field is wholly outlined by dry holes.

The oil market was seventy-three cents a barrel when 646 was struck, and dropped to sixty-five cents. Bradford, Oil City and Titusville Oil Exchanges sold the most.

HISTORY OF THE WOODEN OIL TANKS.

The first tanks used in holding oil were not the truncated cone-shaped ones, bound by iron hoops, which in later years came into general use, but rectangular boxes, held together and made liquid-tight by clamps fastened by keys.

The object of the foregoing minute descriptions is to put on record an accurate account of the methods employed in the early days of Petroleum production. The first tanks used were 10, 20, 25, 30, 50, 60, 75, 100, 200 and 250-barrel tanks. In the early days of the oil development the tanks were nearly buried in the ground, not over one or two feet being above ground, and the decks on the tanks were covered with sods and ground. This was done to protect the tanks from the weather, but owing to the great trouble with the tanks leaking the underground method was given up and the new method of making a grade on the surface was adopted and came into general use. At a number of the refineries and at central points in the oil fields in the early days dump stations were built, where the oil was run from the barrels to the tanks, but in a short time the pipe lines came into general use in carrying the oil and the dump stations quit business. The tanks at the present day are built on a level surface grade, and after the well connections are made and the pipe line is connected to the tank a square wooden house is built over the tank to protect it from the weather. The tanks mostly used at the present day are 100, 250, 600, 800, 1,000 and 1,200-barrel wooden tanks.

EARLY HISTORY OF THE POLECAT RUN WELL AND THE DISCOVERY OF OIL IN THE WORLD-FAMOUS SISTERSVILLE, W. VA., BIG INJUN SAND OIL FIELD.

William Wheeter and L. M. Ludwig, of Ottawa, Ohio, met by appointment Joshua Russell, McCormick and Morrison, George Stocking, John Dare, Joseph Shook, Thomas Lowery and Eveline B. Russell, at the McCoach Hotel, now the Mercer Hotel, in Sistersville, W. Va., in the fall of 1889 and leased their farms, which contained about two thousand acres of land, for oil and gas, the property-owners to have one-eighth of all oil produced. In January, 1890, a location for a well was made on the farm of Joshua Russell, on Polecat Run, one and one-half miles north of Sistersville, W. Va. The name of the company was Wheeter, Ludwig & Ihrig. This company gave Robert E. Mooney, a rig-builder from the Lima, O., oil field, a one-eighth interest in the leases for furnishing and building the rig for the well. In February, 1890, Mr. Mooney began to build the rig. The day they began to build the rig William Wheeter, a driller, and senior member of the company, was wound up in the slack

of the cable around the bull wheel shaft at a well he was drilling near Ottawa, Ohio, and was killed. The rig was finished the last of February and in March, 1890, drilling began. The first week in July, 1890, oil was found in the top of the Big Injun sand and the well began to fill up. After running the second screw it was discovered that the well was filling up with salt water. After the soft sand was drilled, which was about twenty feet, the well was shut down until a string of rods and two-inch tubing could be slipped from the Lima, Ohio, oil field. The rods and tubing arrived at Sistersville in the latter part of August, 1890, and in September the well was tubed and roded. After pumping the well three weeks it was discovered that they could not exhaust the water. Then the well was shut down until spring, with the full intention of casing the water off in the Big Injun and drilling the well down to the Gordon sand. At that date the hundred-foot sand oil field in Butler county, Pennsylvania, was at its height, producing 1,000 barrels of salt water to 100 barrels of oil.

L. M. Ludwig heard of the large tubing being used to pump the wells in the hundred-foot oil field in Butler county, Pennsylvania, and paid a visit to the field. He returned to Pittsburg and ordered a four-inch string of tubing and rods for the Polecat well. The well was tubed and pumped a three-inch stream of salt water for six months before a show of oil could be seen. At the end of eight months the well was making ten barrels of oil a day, and after two years' pumping the well was flowing thousands of barrels of salt water and four hundred barrels of oil. The drillers on the well were Harry Ihrig and Ed Wheeter.

In 1891 Captain J. T. Jones and a number of other producers began to drill across the Ohio River on the Ohio side opposite Sistersville.

The first oil turned into the pipe line and sold in the Sistersville oil field was from the F. and C. Russell Farm, well No. 1, Captain J. T. Jones owner, August 28, 1891.

Early in 1892 the town lot excitement struck Sistersville, which was the beginning of the great Sistersville oil boom, and in less than two years wells were drilled that proved the Sistersville oil field was more than twenty miles long and ten miles wide. In the meantime the Wheeter heirs had an executor appointed to look after their interests, for some unknown reason. L. M. Ludwig and Robert E. Mooney would not pay any attention to the interests held by the Wheeter heirs and Harry Ihrig, but went on operating the property under the name of Ludwig & Mooney. This soon brought on one of the largest suits at law ever held in West Virginia. Judge Jackson, of the United States Court for the district of West Virginia, was appealed to for an injunction restraining Ludwig & Mooney from further operating the leases. Judge Jackson granted the injunction and appointed C. H. Shattuck, of Parkersburg, receiver, pending the trial. About six months after Mr. Shattuck was appointed receiver he got Ludwig & Mooney, Harry Ihrig and the Wheeter heirs to compromise their suit. Ludwig & Mooney paid Harry Ihrig and the Wheeter heirs' \$120,000 for their interest and \$30,000 for the receiver's and the lawyers' fees. One year later Ludwig & Mooney sold

this lease to the Carter Oil Company for \$450,000. In less than two years the Carter Oil Company sold \$500,000 worth of oil from the lease. The Polecat well No. 1 is producing twenty barrels of oil at the present day.

HISTORY OF THE USE OF THE FIRST BULL OR TUG ROPE ON WELLS.

The use of the single bull rope was invented and first used by Charles Reynolds, a Kanawha salt driller, in 1828, at Burning Springs, Kanawha county, W. Va.

The invention of the second or use of two bull ropes was by John Rumbaugh, Superintendent of the Washington Oil Company, at Taylorstown, Pa., in April, 1891. The two bull ropes were first used on the E. Ely Farm well No. 2, Washington Oil Company, Taylorstown, Pa., to drill to the fifth sand. The Union Drilling Company were the contractors. The drillers were William Cummings and S. W. Munn; the tool-dressers were Samuel Cruthers and the writer of the Oil Well Driller Oil and Gas History.

Mr. John Rumbaugh is now Superintendent for the South Penn Oil Company at Salem, W. Va.

The three bull ropes were first used at the deep well of the Forest Oil Company at Elizabeth, Pa., in 1897.

HISTORY OF THE FIRST ELECTRIC POWER STATION.

The first electric power station built to pump oil wells in the world was erected on the Andrew Ernest Farm, Finney Station, Washington county, Pa., four miles west of Washington, Pa. Echo Oil Company and Joe Akin, owners; built in 1895; one-story wooden building, 20x30, used for the power-house; 25-horsepower gas engine and electric generator of 900 revolutions and 500 volts. Twenty-two wells are connected with the plant and six wells are pumped at one time. A 20-horsepower motor is placed in the engine-house of each well. It can pull rods and tubing by electricity. Two men in charge of power—F. P. Criswell, electrician; Charles McWreath, pumper. Present owners, South Penn Oil Company.

HISTORY OF THE HOODOO WELL.

L. G. Robinson well No. 1, Folsom, Wetzel county, W. Va.; J. E. Carnahan & Co., owners. Drilling began January 12, 1901. Plugged the first hole March, 1901, and moved the rig and began drilling on the second hole April, 1901. Plugged the second hole and moved the rig the second time July, 1901. Began drilling on the third hole August, 1901. In November, 1901, oil was struck in the Gantz sand, 3,005 feet deep. The well was estimated to produce five barrels of oil a day. From the Gantz sand the well was drilled deeper, and in January, 1902, at the depth of 3,233 feet and only twenty-seven feet from the Gordon sand, the slate cave near the Gantz sand caved in on the tools and was the cause of a fishing job that lasted over one year. Seventy-five different drillers and tool-dressers worked on the well. The tools were fished out of the last hole fifty times; rig moved twice; wore

out twelve Manila cables, three wire cables, one new engine, three new belts, five sets of bull wheels, two band wheel shafts, two band wheels and three sand reels; used 405 pails of tallow and five barrels of engine oil; profane words used on the well, 1,000,000; quotations from the Bible used on the well, none, Gordon sand, 3,260 feet; total depth of well, 3,270 feet; finished well February 10, 1903; well produced first twenty-four hours, 15 barrels of oil. J. E. Carnahan & Son, contractors. Cost of well, \$40,000.

Carnahan, Robinson & Smith sold their leases, including the Hoodoo well, in the Folsom district, in 1902, to the South Penn Oil Company, a branch of the Standard Oil Company, for \$1,000,000.

That the reader may more fully understand the workings of an oil well, the writer deems it proper to go back and review the early history and explain the several methods of drilling wells from the earliest history of the salt works on the Great Kanawha River, in West Virginia, to the present day.

Beginning with the spring pole, or kicking-down appliance, which consisted of a spring pole large enough in size and strong enough to lift the tools and an attachment at the small end of the pole, which held the tools suspended vertically. The large end of the pole was fastened firmly to the ground by stakes driven in a figure "X" over the end, while blocks and forks of trees, eight to ten inches in diameter were used as a fulcrum upon which the pole midway rested. The tools were hung to the small end of the pole by a chain or rope, so as to have in the suspension free play, in order to get a strictly vertical line for the tools in their descent. Attached to the upper end of the rope or chain was a flat piece of solid hard wood, which passed upward through a corresponding flat mortise in the pole. This piece of wood was bored with holes perhaps an inch apart or more, a strong movable pin passing through one of these holes supporting on the top of the pole the entire string of tools. As the tools descended into the hole they were gradually lowered by drawing out the pin and slipping it into another hole higher upon the stick. When the last hole in the perforated slat had been used a short joint of rods was inserted between the swivel eye and the lower rods. The lower end of the chain or rope was attached to the swivel eye, while the upper end passed over the top of the perforated slat and was fastened to the pin used in the holes of the slat attached to the spring pole. When the last hole of the slat was reached the second time a longer joint of rods was substituted for the shorter ones used. Then, as was the practice at first, a string of rods, piece by piece, was screwed together from the top of the tools to the swivel eye attached to the chain or rope that was attached to the spring pole. This was repeated until the well was finished. The rods used to drill with were round, four squared and six hexagonal one inch to two inches in diameter, ten to twenty feet long, with three-fourths to one and one-half-inch six-thread straight pin joints. The subs or short rods used were two to ten feet in length, but experiment led to the use of a strong rope instead of a string of rods to drill with. The tools were let down to the bottom of the hole, the rope was placed over the top of the small end of the spring pole and

the pole was bent down about two feet, the rope was made fast to the spring pole. When the spring pole was in its natural position the tools would be suspended about two feet from the bottom of the hole, and near the small end of the spring pole a chain or rope was attached, and to this saddle stirrups for the feet of the workmen, two or three in number. The men each placed a foot in the stirrup, with one or both hands hold of the spring pole, and by a sudden, simultaneous kick downward the spring pole was bent, letting the tools with the bit or drill drop into the hole and cut the rock, the elasticity of the pole lifting the tools back into their place. The driller stood or sat on a bench near the mouth of the hole and turned the tools forward and backward, and in this way round holes three, four, five and six inches in diameter were drilled vertically into the earth to a depth of fifty to one hundred and fifty feet. Instead of a stirrup a platform fastened on one side to a timber by a hinge was also used. To the opposite side was attached a chain or rope, connecting with the small end of the spring pole. The workmen standing upon the platform near the hinge, suddenly stepping together and throwing their combined weight upon the opposite side, bent the pole and let the tools drop, and, stepping back, the pole would raise the tools off the bottom in the hole. The men stepping backward and forward caused the pole to bend and spring back into place. This would raise and drop the tools in the hole, and in this way the first wells were drilled.

The oil operations began in Pennsylvania by the blanket process, then the skimming process and the use of oil coops to catch the oil floating on the water. Holes were dug at or near the oil springs or seeps and the oil was dipped out. A pit or hole was dug to the rock and cribbed with timbers. As all the pits or holes dug in the early days were on the flats or near some stream of water the diggers had more or less trouble in reaching solid rock, owing to the trouble with sand, gravel and water running into the hole. This led to the general use of iron drive-pipe and the three-pole derrick, with two center guide poles, pile-driver fashion. Horses were employed in raising the battering ram or maul. Horses were also used for motive power in drilling, walking in a circle or upon a treadmill, as in the old style of threshing machines. A three-inch hole was drilled with a long bevel bit, called a cheese knife. Then the hole was reamed four or five inches in diameter with a bit, according to the size of hole required. Then a round reamer was run to the bottom of the hole. In the early days no person believed that a round hole could be drilled with a flat bit. When deeper drilling was needed to reach the sand the tools and rods were made heavier. Later the slat and pin were discarded and a chain was used, leaving the tools down a link at a time. As the drilling began to scatter and the foolish notion that oil could only be found along the bottoms or banks of some running streams had been proved false and the digging of pit or conductor holes became general, a windlass with pole arms run through the shaft was used to hoist the bucket filled with earth out of the hole. After the hole was dug to solid rock, which was from ten to eighty feet deep and six feet

in diameter, a plank box, eight inches square, was lowered to the rock. The conductor box, as it was called, was braced in the hole, the lower end resting on the rock in the bottom of the hole, and the top extended two to six feet above the surface. About this time the four-pole skeleton derrick came into general use. The first four-leg derrick used was the Drake well style, which was boarded from bottom to top, but owing to the derricks being so easily blown down by the numerous windstorms the Drake derrick style was very little used. The Drake derrick was thirty-two feet high and the first oil well ever drilled with steam power. The four-pole derricks were fifty feet high. At or about this time the steam engine and boilers came into general use. The engines and boilers first used in drilling oil wells were stationary, with the engines on the top of the boilers, but owing to so many fires, caused by the gas from the wells igniting from the boiler, the engines were made separate from the boilers.

After the conductor hole was dug and the conductor box put in, the derrick was then built over the conductor hole and the conductor box was sawed off even with the derrick floor. This was the beginning of spudding over the shaft "drilling." This was done by running a short old cable about two hundred feet long over the derrick. One end was spliced in the eye of the eye-box, which was screwed to the sinker. The sinker was screwed to the jars, and they were screwed to the stem. The bit or drill was screwed to the stem. It was the custom in those days to bore a double row of one-inch augur holes in a circle about three feet from the center of the conductor hole in the derrick floor. This was done to set up and to unscrew the joints on the drilling tools, which was done by placing the handle of the lower wrench against an iron pin that was put into a two-inch augur hole bored through the derrick floor and into the derrick sill, which held the wrench, the other end of the wrench was placed on the square of the tools, while the wrenching was done with the upper wrench, by placing the point of the wrench bar in one of the augur holes in the floor, with the bar against the wrench handle, about six inches above the floor. The wrench bar was made of two-inch pipe, about six feet long, with a solid tapered pin welded to the lower end. The top end was used as a lever by the driller and tooldresser. One would pull and the other push, and in this way they tightened and loosened the joints of the drilling tools. In the early days, while the other end of the cable was wrapped three times around the bull wheel shaft, in those days only one wheel was used, and that was the tug or bull-rims. The outside one had a groove for the bull rope to run in, while the inside one was used as a brace to the arms and a place for the hand pins. The space between the arms in the center of the wheel was left open for the dog or brake to drop in. The dog or brake was made of a piece of plank two by six and about fifteen inches long, one end fastened to a piece of leather or belt, which was nailed to the girt above the bull wheel. When the wheel was running ahead the arms would push the lower end of the dog out of the space, but when the wheel started backward the lower end of the dog would drop into the space between

DRILLING WELL
IN THE EARLY DAYS OF THE AMERICAN OIL INDUSTRY

THIS PICTURE WAS TAKEN BY GAS LIGHT AT NIGHT

the arms in the wheel and brace against the arm and hold the wheel from running backward. It was the custom then to keep the bull wheel running ahead. One end of the cable was wrapped around the bull wheel shaft three times. Two men would take hold of the cable near the shaft and by drawing the cable tight on the shaft the bull wheel would lift the tools in the hole. After the tools were lifted up two or three feet from the bottom the men would throw slack in the rope. This would let the tools drop to the bottom of the hole, and drawing tight on the cable would raise the tools. When they wished to pull the tools out of the hole they just put the end of the cable between the shaft and cable, and the wheel in turning would wind the cable on the shaft and pull the tools out of the hole. After the drillings were bailed out of the hole the tools were backed down on the bottom. The two men would take hold of the cable, and the bull wheel would be started ahead and the men would pull and slack the cable. This was called spudding over the shaft. The wells were drilled fifty to two hundred feet in this style of drilling. In a short time the grasshopper walking beam came into use, and the left-hand, three-foot long, one-inch temper screw came into general use, and about this time the brake wheel and brake was invented. This was the beginning of the use of bull wheels with a brake and bull rope throw-off. After ten years' use of the four-pole derrick and grasshopper walking beam, the 72-foot standard four-legged, two by eight-inch hemlock plank legged derricks, with seven stories of girts and braces, and the walking beam attached in the middle to the Samson post, with band wheel, tug pulley, crank and shaft, and sand reel, came into general use. At the beginning of this style of rig the right-hand thread sash temper screw was invented. The screw was one inch in diameter and four feet long. On the lower part of the screw was attached a double handle bar and under the handle bar was the yoke, under the yoke were three washers for the yoke to turn on, and under the washers was made a ball end on the temper screw. Two holes were drilled in the yoke, one at each end, and in these holes two links were welded, and to these links were attached two clamps, one to the C, with handle bar to tighten the clamps to the wrapper on the cable, while the upper end of the screw sash was made with an eye welded to it. At this time a two-inch iron hook was used which was made with threads and nut and was bolted through the end of the walking beam. To this hook the eye of the temper screw was attached. After a short time the two-inch solid iron tee hook was invented and used by cutting a slot in the end of the walking beam, with the tee part resting on the top of the beam and the hook part beneath, to which the eye of the temper screw was attached.

At that date the two-inch straight pin and box on the drilling tools was used. The first conductor spudded in without digging a conductor hole was in the Bradford oil field in 1878. This was the beginning of the use of the hexagonal and octagonal conductor, which took the place of the square conductor. In 1879 the round iron circle was invented for wrenching and unwrenching the tools. After one or two years' use

of the round iron circle the half-circle came in use and was generally used about ten years.

In 1880 Jonah Smith, a contractor, first used the taper pin and box to drill with in the upper Glade oil field, in Warren county, Pennsylvania. The taper joint is now universally used in all parts of the world.

The Barrett and Forgie jack and circle was first used in the Washington, Pa., oil field, in 1887. This is the universally used wrenching jack and circle on drilling wells at the present day.

The tee temper screw came into general use in 1880.

HOW A MODERN OIL WELL IS DRILLED.

The modern methods require a wooden derrick eighty-two feet in height and a walking beam, bull wheels, band wheel, crank and shaft, sand reel, boiler and engine, engine bull wheel, forge and belt-houses, and a set of drilling tools. Drilling tools proper consist of a rope socket, jars, stem and bit. The rope socket makes the union between the tools and rope; the jars are two long links united and are used to give the tools a jerk when they are fast; the stem or augur bar is the long weight that drives the bit or drill into the rock; the bit or drill is the lower section of the drilling tools, and is made of very fine steel; the bit is dressed with a bevel and tempered to drill hard rock. The whole string of tools is about sixty-five feet long; the weight of the big-hole tools at the beginning of the well is three thousand five hundred pounds. As the hole is reduced in size the weight of the tools is also reduced.

At the completion of a well twenty-eight hundred feet deep the tools weigh two thousand pounds, and the cable or rope four thousand five hundred pounds, and is two and one-fourth inches in diameter. Attached to the rope socket of the drilling tools is a cable or rope, called the drilling line; the cable passes over the "crown pulley" on top of the derrick, so as to allow the tools to swing in it clear of the floor near the ground; the other end of the cable passes over the "crown pulley" down the back of the derrick to the "bull wheel shaft." The cable is wound around the shaft to raise the tools out of the hole by a movable rope, called the bull rope, that passes on the outside of the left-side bull wheel, which is called the tug wheel. The bull rope passes around the bull wheel in the back of the derrick and around the tug pulley on the band wheel, which is in the belt-house; the bull rope is crossed in the middle to give the bull wheels a forward motion; the band wheel is operated by a belt from a twenty-horsepower steam engine in the engine-house; the steam is furnished by a twenty-five-horsepower boiler located near the engine-house.

The first work on a drilling well after the rig has been built (the rig is the derrick and all the woodwork about it, and is built by rig-builders or carpenters), the rigging up or getting ready to drill is done by four men—two drillers and two tooldressers. After the well is rigged up and ready to start, the first drilling is called spudding, and is started from the surface of the earth, or, in other words, from the top of the ground. To begin spudding, one end of a rope jerk-

line is attached to the wrist pin in the crank on the shaft of the band wheel, while the other end is attached to the cable near the bull wheel shaft. The cable runs from the shaft which the cable is wound upon up to and over the "crown pulley" on the top of the derrick and down to where it is attached to the rope socket on the stem; the stem is attached to the bit or drill, the crank revolving in a circle, giving the tools an up-and-down motion. The motion is regulated by the engine, while the hole is made by letting down the tools with a brake on the bull wheels.

In most places the well is spudded to the solid rock, and wooden conductor is put in to keep the surface ground from falling in the hole. In some places drive pipe is used to case off the quicksand. A short old cable is used to spud the well one hundred and fifty feet deep; the old cable and jerk-line is taken off and a longer and better cable is put on; then the walking beam is put to use. The walking beam used in drilling deep wells is a solid oak timber sixteen by twenty-nine inches and twenty-seven feet long. The walking beam is attached in the middle to an adjustable saddle; the saddle is fastened to the upright timber called the "Samson post," which is sixteen by sixteen inches, and fourteen feet long. The other end of the Samson post is dovetailed and is locked into the main sill by a large wooden key. The main sill is twenty by twenty inches and thirty-one feet long, which is fastened to the derrick and mud sills, which are the ground foundation of the rig. On one end of the walking beam is the temper screw and clamps which attach to the cable or rope; at the other end of the beam is a pitman, which is connected to the wrist pin in the crank on the shaft of the band wheel. The crank, revolving in a circle, gives the pitman and walking beam an up-and-down motion, which raises and drops the drilling tools in the well. When they first begin to use the walking beam this is called "hitching on" in oil country parlance.

To begin drilling, nearly one barrel of water is run in the hole, then the tools are started into the hole, and are governed by a brake on the right-side bull wheel, called brake wheel. The tools are run to the bottom of the well and stopped by the brake. The lever of the brake is handled by the driller; the engine is stopped with the crank on the upper center; the walking beam is raised up high enough so that the pitman can be coupled to the wrist pin in the crank, while on the other end of the beam the temper screw is raised up into the sash by an elevator rope over small pulleys under the walking beam by weights, and the clamps are fastened to a wrapper on the cable; the brake is thrown back and slack cable is run off the bull wheel. The slack is pulled down near the temper screw and tied back to the side of the derrick. The engine is started; this gives the walking beam a rocking motion, which raises and drops the tools in the bottom of the well. This is kept up until all the screw is let out, which is five to six feet long. The water is used to mix up the rock which the bit or drill cuts up; this sediment is called drillings. After the screw has been run out and five or six feet of hole has been drilled, The bull rope is put on the bull wheel and the slack cable is pulled up and the temper screw and clamps

are unhitched from the cable; the pitman and walking beam are unhitched from the wrist pin and lowered to a pitch of forty-five degrees; this clears the other end of the beam and temper screw from the hole. The engine is started and the tools are pulled out of the hole, and the bull rope is thrown off; the bailer or sand pump is run into the well. The bailer is a tube about twenty-five feet long made of soft iron, with a dart valve on the bottom and a bail on the top; to this bail is attached a wire or rope sand line, which runs over a sand shive at the top of the derrick, then down to the sand reel back of the band wheel. One-half of the sand reel is outside of the belt-house; on this end is coiled the sand line, which is kept in place by arms on the reel and supported by a tail post; while on the other end of the reel is the friction and back brake pulleys. The reel is held in place by a swing lever; one end is fastened to a pin in the knuckle post, which is fastened to the main sill; the other end of the swing lever is attached to a reach, which goes into the derrick, and is attached to a hand lever and clevis on the floor, and is operated by the driller.

Pulling the lever forward pulls the friction pulley against the band wheel and pulls the bailer out of the hole; holding the lever a little past center lets the bailer down in the well; pushing the lever back throws the pulley on the back brake and stops the reel. The bailers vary in size according to the size of the hole; the bailer or sand pump lifts the drillings out of the hole and is emptied or dumped through a hole in the derrick floor called a dump hole. The drillings accumulate under the derrick and some are carried away by water. After the hole is bailed out water is again put in and the tools are run in and hitched on as before; this is repeated until the well is completed. At the beginning of one of these wells a sixteen-inch hole is started, the wooden conductor is put in this hole, which is about twenty feet deep. The hole is reduced to thirteen inches, and from two hundred to fifteen hundred feet of ten-inch casing is put in to shut off water and caves; the hole is reduced to ten inches, and from eight hundred to two thousand feet of eight and one-fourth-inch casing is put in to shut off the lower caves. The hole is reduced to eight and one-fourth inches. From fifteen hundred to twenty-two hundred feet of six and one-fourth-inch casing is put in to shut off the salt water.

This size hole is usually drilled through the oil sands. Near the center of the hole on the derrick floor is placed a circle and jack and two wrenches, to set up and unscrew the tools. Two bits or drills of the different sizes of hole are used; while one bit is on the stem at the bottom of the well the other is in the fire in the forge heating, or is dressed and setting in the slack tub where the bits or drills are tempered. The bits are heated in a forge on the right side of a derrick with coal or coke. The blast used to blow the fire is from the bellows at the side of the forge. At some of the drilling wells natural gas is used to heat the bits, which are very heavy and are handled by a crane and endless chain; they are dressed by placing one end on the floor against a stoving post, while the hot or beveled end rests on a large anvil and is

SPUDDING WELL McDONALD PA. OIL FIELD

dressed with heavy sledge hammers by the driller and tooldresser. The bits are dressed to a uniform gauge, according to the size of hole being drilled.

A drilling well is run steadily night and day; two men are on tour together. One is the driller and the other is the tooldresser. The driller is the engineer and does the drilling, and the tooldresser is the fireman and blacksmith and does the tool-dressing. The morning tour men begin their work at midnight and are relieved at noon; the afternoon men begin their work at noon and are relieved at midnight. The number of bits or drills dressed on tour vary greatly, according to the kind of drilling. In slate, one bit; in lime, one or two bits, and in sand, five or six bits. From ten to sixty feet are drilled on tour. Before the oil sand is reached the outside casing, the eight and one-fourth inch and the ten-inch casing is pulled out to be used on other wells. When the top of the oil sand is reached, drilling is stopped. The well is measured, the oil saver and casing head are put on and connections are made to the tank, which holds about two hundred and fifty barrels. After this is done drilling is again resumed. If the well is a good one it will fill up with oil or flow into the tank; if it is a small well it is shot with nitro-glycerin, and if it is a dry hole it is a total loss to the owners; the casing is pulled out and the hole is abandoned, and the rig is taken down and moved away.

REPORT TO THE COMMISSIONER OF AGRICULTURE, DEPARTMENT OF AGRICULTURE, WASHINGTON, D. C., FOR THE YEAR 1863.

BY C. H. SHATTUCK, PARKERSBURG, W. VA.

Animal oils, rushes, resinous knots even nutshells, and other substances, have been used at different times as light-producers. It is not necessary, however, in this article to dwell on obsolete illuminations except as they incidentally exhibit to better advantage the important position which petroleum, as a light-producer, occupies before the world. The large quantities of this substance now consumed invest every place in which it is found with an importance corresponding to the amount produced. Even a cursory examination of this subject will excite no little wonder at the great productiveness of some of the oil regions of this country; and it will also strike the observer with surprise when he remembers the tardiness with which the wealth of these regions was developed. It would have been hard to have convinced, six years ago, even the least skeptical on such subjects, that today we would have wells right in our midst yielding thousands upon thousands of gallons of oil daily.

The history of petroleum in America commences in Indian times. The early settlers in this country found the Indians using it for medicines, for paint, and in

their religious ceremonies. But whatever may have been the knowledge and uses of petroleum in this country up to the present time it is now clear that henceforth it must hold a prominent place among the articles of commerce. It must not be supposed that the history of petroleum commences in America. As a fuel it is no stranger to the French, to the dwellers on the Caspian, nor to the Norwegians. As an illuminating agent it is fast supplanting the animal and vegetable oils. The lamps of India are fed by it; the streets of Genoa are illuminated by means of it; and there is, perhaps, no considerable city, either in the old or new world, where the new forms of lamps adapted to the use of kerosene are not found in use. Many scientific men have affirmed that the slime with which the artisans at the tower of Babel cemented their structure was composed in part of this same coal oil. The walls of Babylon were smeared with it, and the Dead Sea, which we are told burned Sodom and Gomorrah, is a basis in which rock oil is profusely accumulated. The Spaniards who discovered Trinidad, we are informed, gazed with amazement upon a lake of pure petroleum. Rock oil is found in Sicily and has illuminated its cities. Italy, France and England all have had their reservoirs of petroleum. Whether we consider either the abundance of the supply or the great comfort and benefit derived from the use of petroleum, its recent discovery in this country must be ranked with the greatest events of the age. The pumping, barrelling and refining of it will require the labor and reward the diligence of multitudes of men, and as an article for light, as well as for various manufacturing purposes, it will ever be in demand. It is well known that Seneca or rock oil has long been famous for its medical properties; little, however, did those who used it in small quantities for this purpose dream of the abundant reservoirs which slumbered so quietly in their subterranean beds. We find that no practical movement was made in search of the native article until as late as the year 1854, when a company, Messrs. Eveleth & Bissell, of New York, organized and made preparations for boring on Oil Creek, Venango county, Pennsylvania; still, it was not until 1859 that the borings proved a success. This delay was not owing to the scarcity of oil, as events afterward proved, but rather to a want of energy in pushing the work to completion, probably a lack of confidence in final success. The first well, at the depth of seventy-one feet, developed the oil; the yield at first was but four hundred gallons, but soon rose to one thousand gallons daily. Enthusiasm now began in earnest, and Titusville, a small town near the well on Oil Creek, rose from a long obscurity to great distinction. Meanwhile attention was turned in other directions, and from this epoch we date the history of the

Oil Interest in West Virginia.

With the oil excitement at its height in Pennsylvania, of course it was not long before the oil business of West Virginia began to teem with busy operations, and enterprising capitalists diligently engaged in collecting the rich stores of petroleum which were discovered in her territory. The first operators in West

OUTLINE OF COMPLETE DRILLING WELL

Virginia were J. T. Johnson & Co., from near Pittsburgh. These parties commenced their operations on Hughes River, Wirt county, in November, 1859. They bored a number of wells with varying success. Soon afterward Messrs. Hazlet & Co., of Wheeling, began to operate in the vicinity of Petroleum (a small town and station named from the product of the region), on the line of the Northwestern Virginia Railroad. These gentlemen were more successful than the parties last named; and this same vicinity has remained one of the most prolific portions of the oil regions of this State. We are at this time unable to give accurately the yearly yield of this region, yet we know that it has been and is still very great. In the spring of 1860 Mr. S. D. Karns leases from Mr. John D. Rathbone an oil well which, in former years, had been bored for salt purposes. This well was situated on the Little Kanawha River, in Wirt county, eight miles above the town of Elizabeth, the county seat. In the hands of Mr. Karns it proved very productive, yielding from fifteen hundred to two thousand gallons daily. The oil now commanded a good price in market, and it became manifest that this region (known as Burning Spring, from a gas spring in the neighborhood) was certain to reward the labors of operators. The attention of many was immediately turned to this district, and when, in December, 1860, Mr. J. C. Rathbone bored a well and pumped from it daily from eight to ten thousand gallons of oil, the excitement became great. There were now three districts producing abundant supplies of petroleum in West Virginia. Men of all classes—mechanics, lawyers, laborers of all kinds—turned their feet in this direction, and soon became actively engaged in the business of procuring and shipping oil. All the land in the immediate vicinity of the working or producing wells, and much at a distance from them, was leased or purchased by capitalists eager to embark in the business. Buildings in the neighborhood, which had rejoiced in the name of hotel or inn, were speedily crowded to overflowing; quiet farm-houses, hitherto only humble and unpretending dwellings, were forced from a quiet obscurity to a bustling notoriety. The farms of J. C. and J. V. Rathbone soon became a city of huts. Nothing could be seen but great piles of barrels, derricks, scaffolds and cisterns; nothing heard but the puff of the steam engine, and the click, click of the drill.

The process of boring or drilling is simple. The drill generally used is about eighteen inches in length, shaped at the point quite like the hand drills commonly used by quarrymen, and corresponding in size to the well wished to be bored. This is secured to the augur stem, a two-inch round iron bar from fifteen to twenty feet long, weighing probably from three to four hundred pounds. This is raised from the rock or bottom of the well twelve to twenty inches, as the case may be, either by the application of steam or lever power, and the fall of the iron from these heights does the drilling. By the steam power the drill will strike from twenty-five to forty times per minute. Poles are attached as the well deepens. To those unacquainted the process would seem tedious; yet drilling or boring in such material as is usually found in West Virginia, from the surface to a depth of four hundred feet, will

average, probably, twelve feet per every twenty-four hours. The usual diameter of wells is four inches. West Virginia now began to rejoice over her newly developed sources of wealth, and to look forward to a bright future. The "peculiar institution" of Virginia had hitherto excluded many men from her limits. Indeed, so well understood had this fact been, that many of her best men, although not generally opposed to it, regretted the domination of this power here. Yet all now indulged the hope that the day was dawning which should see, before its noon, the wooded hills and neglected valleys of West Virginia doffing their rugged garb, and putting on the robes of a thorough and expanded cultivation; and, as preliminary to this, they hailed with a welcome the coming of those who, reared and trained in the practice of active and honorable industry, should give their labor and substance to the development of the resources of their State. But these hopes were of short duration. The active efforts of those who had moved to the new field of labor were only begun when the hostile shots were fired upon Fort Sumter. There were heroes sweating and delving in the oil regions as well as elsewhere. The promises of wealth which the oil regions had made, and which now seemed about to be realized, were forgotten. Princely fortunes lost their charms when an imperiled country called her sons to her defense, and now those who but recently came to these localities to pursue the avocation of peace departed to practice the arts of war.

Operations on any extensive scale were now impracticable; and even if splendid results had not been impossible on account of a scarcity of laborers, the murderous raids of guerillas would have completed what the other began. A few who remained and endeavored to perpetuate what had been so well commenced labored on, notwithstanding the new difficulties. Yet the predatory incursions of guerilla bands made any large shipments of oil almost impossible. Nevertheless, despite all the obstacles thus interposed, and which were understood only by those who have been compelled to contend against them, there was produced at the one point of Burning Spring alone, in the year 1861, four million gallons of oil. In the year 1862 three million two hundred thousand gallons were sent to market from this same point. The product of 1863 does not, probably, exceed two millions of gallons. When it is remembered that this large amount of oil was produced in one section alone of not over one mile square, and under circumstances the most unfavorable to production, the reader may form some idea of what might be done under circumstances that would deserve to be called auspicious. It must not be supposed that in estimating the oil interest of West Virginia the small tract or point embraces the entire oil-producing district of the State. Explorations made for the discovery of oil in West Virginia, it must be remembered, had only begun three years since. The force of circumstances concentrated the efforts of explorers in the territory around this district. Oil was first discovered here in abundant quantities. People naturally flocked to this point, and before curiosity and investigation had been able to exhaust the objects of attraction here, and turn to search for new fields,

HONORABLE HENRY R. ROUSE.
FOUNDER OF ROUSEVILLE, PA.

1823. IN MEMORIAM 1861.

OF

HONORABLE HENRY R. ROUSE.

Hon. Henry R. Rouse was born in Westfield, Chautauqua county, New York, October 9, 1823. Died April 17, 1861, aged 37 years, from injuries received at the burning of an oil well on the Buchanan farm, now Rouseville, in Venango county, Pa., being one of the nineteen persons who lost their lives at this the first oil well fire that occurred in the oil regions. He lived but a few hours." (Copied from memorial displayed in the county commissioners' office in the court house at Warren, Pa., beneath a life-size oil painting of the Hon. Henry R. Rouse.)

The will of Henry R. Rouse, deceased, which this article is copied from, can be found in Register Docket No. 3, Page 455, of Warren county, Pa. Will recorded May 1, A. D. 1861. R. K. Russell, Register; by D. H. Waite, Deputy.

All that is left to mark the location of the Merrick well on the Buchanan farm, in the southern limits of the borough of Rouseville, Pa., where Mr. Rouse was burned, is the upper end of the drive pipe, about two feet above ground, with a wooden plug driven into the top of the drive pipe.

the so-called secession of Virginia, with all its baneful evils, fell like a blight upon the land. While the supply from this district was diminished to some extent, other regions, unexplored, some of which are now proving as productive, remained untouched.

These territories, from which enterprise was banished by the war, remained with all their mineral and oleaginous wealth, unrevealed, quietly awaiting the time when, without the din and perils of war, the men of toil could enter the subterraneous chambers and bring forth their treasures to the world. This period has at last arrived. Steadily the rebellious forces have been pushed and driven back until this portion of West Virginia, at least, can be said to be entirely free from them. Men begin to feel again that they are safe and sound under the old government, and with this feeling comes the revival of business. But few days have elapsed since the development of an entirely new oil district. A few months since Messrs. J. B. Blair & Co. began operating on Bull Creek, and at the depth of 250 feet, on the 16th of this month (March), they struck a vein of oil which has continued flowing at the rate of a thousand barrels of oil per day since. A curious fact connected with the oil beds here is the following: Commencing at Burning Spring, on the Kanawha River, we trace a belt of upheaving rock, causing a vein of rock some twenty feet in width to stand perpendicular on its edge, and running north one degree east, crossing Hughes River at the oil wells already spoken of; also crossing the railroad near the oil wells of Hazlet & Co., and crossing Bull Creek at the wells first spoken of, Messrs. J. B. Blair & Co.'s; thence on and crossing the Ohio River, the oil district appearing to follow, this upheaving appearing to designate where oil exists. All along this line may be found gas or burning springs. As these gas springs are an excellent indication of oil, it may be safely said that oil will be discovered the entire length of this belt, thus giving West Virginia almost treble the amount of territory to that of Pennsylvania. Already borings have commenced on and all along this line; probably there will not be less than one hundred wells sunk this season at different points yet undeveloped between Burning Spring and the Ohio River. That many will be successful cannot be doubted. Professor Rogers, in an able article on the history of petroleum, brought out last July, believes the great basin to be near the Ohio River, this State. Indeed, the large yield of the wells on Bull Creek, five miles from the Ohio River, recently discovered, would seem to be proof of this assertion. It is not intended here to discuss the theory of the origin of petroleum, nor yet its composition or gravity of the several oils obtained in West Virginia. In regard suffice to say they differ little from the Pennsylvania oils, a very able report of which we have from Prof. J. B. Lesley, just published. Indeed, these great oil-bearing districts differ but little in any respect, both being hilly, clayey soil, well watered, and with an abundance of timber.

It will be observed that the yield of petroleum here during the year 1863 is less than former years. This, however, cannot be taken as an index of the real productiveness of the region; it may be said this is all that was brought to market. In May last the Rathbone district was, together with all the apparatus, burned and entirely destroyed by the rebel forces under General Jones. Twenty thousand barrels of oil were burned with it. The losses were heavy, and, of course, were severely felt, both in material destroyed and time spent in rebuilding; had these disasters been averted the yield would have been equal to former years. We rejoice to believe that the day is now come when, in peace and without hindrance, West Virginia will be permitted to demonstrate the true extent and richness of her oil districts. The wise and energetic administration of the affairs of our State is beginning even now to tell in our behalf. The infant State is a giant even in its infancy; and when once it is able to give an undivided attention and care to its great internal interests, it will be manifest to the world that the promise of its babyhood was only a truthful augury of the prowess and splendor of riper years. The treason which once lurked stealthily or shook its gory locks defiantly among us is now skulking to its grave. Men are daily feeling more and more that traitors are infamous, and that loyalty and honest industry are the surest elements of power and progress; and we venture to affirm that when, under the effects of a general education and a wise and energetic government, the State of West Virginia fairly begins her course, she will take rank high up and far forward among her noble sisters, and will have no cause to blush when she looks at the emblems which betoken the sources of her power. When her mineral wealth begins to be developed, when her reservoirs of oil, her vast beds of coal, lead and iron ore have become known in their true character, when her facilities for refining these articles are known, and all her resources for producing have been unfolded in their full proportion, we think her sister States will not be reluctant to award honor and admiration and warm welcome to the star that last began to shine in our national constellation. Oil is brought to Parkersburg, the general oil market of the State, from Burning Spring, during the spring and fall, by flatboats on the Little Kanawha River, at a cost of seventy-five cents per barrel; other seasons, when the river is not navigable, it is wagoned at a cost of two dollars per barrel. It is well to mention here that a bill has recently passed in the West Virginia Legislature for the improvement of this river. A company has already been formed, sufficient stock subscribed, and we may expect that soon the Little Kanawha will be navigable all the year. From Hughes River and Petroleum districts the oil is hauled to points on the Northwestern Virginia Railroad at a cost of twenty-five to fifty cents per barrel, and from Bull Creek it is hauled to the Ohio River at a cost of fifty cents per barrel.

HISTORY OF HON. HENRY R. ROUSE,
FOUNDER OF ROUSEVILLE, PA., AND
SON OF SAMUEL D. AND SARAH
ROUSE.

H. R. Rouse was born in the town of Westfield, Chautauqua county, New York, October 9, 1823; was educated in the public schools, then emigrated to Warren, Warren county, Pa., where he taught school. When oil was discovered on Oil Creek, he went to Venango county, Pa., and in conjunction with John L. Mitchell, of Enterprise, and Samuel Q. Brown, of Pleasantville, Warren county, Pa., secured a lease of the Archie and John Buchanan farms on Oil Creek, agreeing to give as a royalty one-fourth of the total product. Rouse, Mitchell & Brown started to drill a well on the Archie Buchanan farm in October, 1859, and struck a small well in the first sand. In 1860, Rouse, Mitchell & Brown sub-leased a number of acres of the Archie and John Buchanan farms to other parties, who drilled a number of small wells in the first sand. On the 17th day of April, 1861, while a number of men were gathered at the hotel waiting for their supper and discussing the fall of Fort Sumter, a man came into the hotel and reported the famous Merrick well flowing oil from the second sand. He inquired for Mr. Rouse and was told he was at Captain Dave Taylor's round top shanty near Cherry Run. After arriving at the shanty, which was about three minutes' walk from the well and opposite Franklin S. Tarbell, the tank builder's house, he found Mr. Rouse talking to Captain John B. McNair, and reported the strike to them. The men started to the well. When they reached the well it was flowing a full six-inch pipe of oil, and, though it was never fully gauged, it was estimated to flow 2,500 barrels of oil a day. The excitement was very great, parties coming from every direction to see the big well. At about half past seven in the evening of the day the well was struck Mr. Rouse and Mr. W. B. Benedict were standing on a plank near the well, watching it flow, when the gas came in contact with the fire in the boiler of the Wadsworth well about eight rods away, and a violent explosion occurred. It is estimated that three hundred persons were present when the explosion took place, which set the Merrick well on fire. When Mr. Rouse was found he was about two hundred feet from the well in a brush pile, his clothing still on fire and his eyes entirely destroyed.

Forty-two men were burned, nineteen of whom died. Twenty-three were maimed for life; nine were burned upon the spot. Two men with their valises were seen to come from the direction of Oil City just before the explosion. After the fire was extinguished the only remains of the two men were two small piles of ashes and the iron binding of their valises. At this date Oil Creek was high. A man by the name of Metz charged twenty-five cents for each person to cross the creek. All of the houses on the east side were turned into hospitals. Mr. Rouse was taken to the hotel and placed on a bed; his first inquiry was for Allen Wright, a friend and acquaintance of many years. Upon Mr. Wright reaching him, Mr. Rouse requested that a

justice of the peace should be brought in, as he wished to make his will. Mr. Wright said to him: "Henry I don't know where a justice can be found." An oil operator who was standing near volunteered his services, saying he was familiar with the writing of wills. His services were accepted and Mr. Rouse, lying on his back, proceeded to dispose of his property as follows:

In the name of God, amen; I, Henry R. Rouse, being as I believe near my last moments, but sound in mind, do make this my last will and testament:

First—My executors to be George H. Dimick, Samuel D. Rouse and Samuel Q. Brown.

Second—I bequeath to my father, Samuel D. Rouse, five hundred dollars per year during his lifetime.

Third—Rouse & Mitchell hold the notes of S. A. Skinner and Allen Wright for twenty-five hundred dollars; my half I bequeath to them. They are having hard enough times without having to pay the notes.

Fourth—All the leases of Rouse & Mitchell and Rouse, Mitchell & Brown, I want to have them lease at one-half the oil; and I bequeath to them all of my share of said rent over the one-half the product of the wells, as now stipulated to be paid in their respective leases.

Fifth—I bequeath to George H. Dimick two thousand dollars for the use of himself and his mother, to be paid out of the residue when my estate is settled up.

Sixth—To John Mitchell I bequeath my black mare.

Seventh—I have the sheriff's deed of the store and dwelling house occupied by Thomas Morean. I bequeath said property to his two youngest children, Eva and Maggie; their father to have the use of it until they come of age.

Eighth—I bequeath the residue of my estate, after making some other bequests, to the Commissioners of Warren county, the interest of it to be expended on the roads of said county, after I make some other bequests.

Ninth—I have a little namesake, Henry Rouse, in East Granby, Connecticut. I bequeath to him five hundred dollars. I cannot think of his name. His mother is the daughter of Joel C. Rouse; his name is Henry Rouse Vict.

Tenth—David H. Taylor, I bequeath to him five hundred dollars.

Eleventh clause is blank.

Twelfth—I bequeath to my aunt, Clara C. Hart, five hundred dollars.

Thirteenth—I bequeath to Miron Waters five hundred dollars, to be paid when my estate is settled up.

Fourteenth—I also bequeath five hundred dollars to my hired boy, Miron Dunham, to be paid when my estate is settled up.

Fifteenth—I wish to change the object of the clause contained in No. 8 so as to give the benefit of one-half of it to the poor of Warren county. It is given in trust to the county commissioners for that purpose.

Sixteenth—To Almedia Arnold I bequeath two hundred dollars.

Seventeenth—To Joel C. Rouse, of Saratoga, N. Y., I bequeath three hundred dollars.

THE FAMOUS WILD CAT MYSTERY

(Lot 646) DRILLED IN OIL SAND MAY 18, 1882, CHERRY GROVE, WARREN CO., PA.

HOODOO WELL (FOLSOM-ROBINSON OIL FIELD)
FOLSOM-ROBINSON, WETZEL Co., W. VA.

Eighteenth—I bequeath to Mrs. Morean, wife of Thomas Morean, three hundred dollars.

Nineteenth—Two gentlemen carried me out of the fire. I bequeath them each one hundred dollars.

Twentieth—Let my funeral be without display. No funeral sermon to be preached. Bury me by the side of my mother, at Westfield, N. Y.

Twenty-first—I have a beautiful picture, an engraving, in Hempfield's store at Pittsburg; I bequeath it to William Hirst, of Meadville, Pa.

Twenty-second—I bequeath my library to my father.

Twenty-third—I bequeath my wardrobe to Mrs. Thomas Morean.

I have nothing more to add at present. I authorize all who are here present to witness the foregoing as my last will and testament.

In testimony that the foregoing is the last will and testament of Henry R. Rouse, and at his request, we, the undersigned, hereby sign the same in his presence, in Cornplanter township, Venango county, Pennsylvania, this seventeenth day of April, A. D. one thousand eight hundred and sixty-one.

HENRY R. ROUSE. (Physician in attendance.)
His X mark.

N. H. JONES,
ALLEN WRIGHT,
S. R. CHRISTY,
Z. MARTIN,
W. B. WILLIAMS,
W. H. KINTER.

After having acknowledged the will, Mr. Rouse lay for some moments in silence; he then said: "I wish to see the doctor." Dr. Christy, who was nearby attending to the other sufferers, responded at once. Mr. Rouse said to him: "I wish to know exactly my condition." The doctor told him: "Henry, you will have to die, and that very soon." His only remark to this was: "The grave; oh, how cold the grave." Then to Mr. Wright he said: "Allen, I wish you to promise me that I shall be laid by the side of my mother." Mr. Wright promised, and now the body of Henry R. Rouse reposes by the side of his mother in the beautiful cemetery at Westfield, New York.

Hon. Henry R. Rouse was burned in a horrible manner and lived only seven hours, during which time he suffered indescribable agony. In his bed of suffering he dictated a will which for conciseness and clearness of dictation is not often equalled. At the end of every sentence and oftener water had to be placed to his lips with a spoon. His lips had been burned away and half of his body was in a crisp. The will contains twenty-three clauses. When he had finished the dictation he had little strength left, and in view of his hands being so badly burned he could not sign his name, but simply made his mark. Uriah Smith was one of the men who assisted in helping Mr. Rouse out of the brush heap; the other man is not known.

List of persons burned at the Merrick well:

Burned to death—Hon. Henry R. Rouse, Enterprise, Warren county, Pa., of the firm of Rouse, Mitchell & Brown, oil producers; W. S. Skinner, Wattsburg, Erie county, Pa.; James Walker, Butler county, Pa.;

George Hayes, Chautauqua county, N. Y.; Albert Gardner, Pontiac, Mich.; Judson Mason, New York State; G. W. Bentley, Harlansburg, Lawrence county, Pa.; Philander Stevens, Chautauqua county, N. Y.; one unknown man.

Badly Burned—Hon. Willis B. Benedict, Enterprise, Warren county, Pa., now resides in Titusville, Pa.; Levi Walker, Butler county, Pa.; S. Houston Walker, Pittsburg, Pa.; John Restling, Chautauqua county, N. Y.; A. D. Easton (fatally), Whiteston, Oneida county, N. Y.; Constant Burnell, Erie county, Pa.; James Perry (fatally), Utica, N. Y.; Smith Cushing, Sherman, N. Y.; Thomas Page, Mercer county, Pa.; James Smith, Venango county, Pa.; James Johnson, Mercer county, Pa.; Archibald Montgomery, Venango county, Pa.; Charles Lockwood, Michigan; Augustus Cummings (fatally), orphan boy; Joseph Buel, Utica, N. Y.; Joseph Bloyd (fatally), Utica, N. Y.; J. A. Kent, Chautauqua county, N. Y.; John Glass, Butler county, Pa. George Glass, Henry Chase, Mr. Burley and a number of others were slightly burned.

Wells Burned.

Merrick, Little & Hauley; Rouse, Mitchell & Brown; Wadsworth, Dobbs, Mason, Maxwell and Rice wells.

The Merrick well, oil burned, 1,000 barrels; Wadsworth, 500 barrels; Dobbs, 700 barrels; Mason, 40 barrels; Maxwell & Rice, 600 barrels.

John Buchanan's barn burned, with 106 barrels of oil stored in it and 60 bushels of wheat.

In the fall of 1858 Henry R. Rouse was elected by a large majority to represent Warren and Crawford counties in the Legislature of the State, and the next year he was re-elected. He spent much time, money and labor in opening and improving roads and constructing bridges in Warren county. The county commissioners serving at the time of Mr. Rouse's death were E. Barnes, Alden Marsh and M. Miles. They at once took steps to make the fund of the "Rouse Estate" practically beneficial. The amount realized, after the completion of arrangements necessary to make it available, was about \$186,000. They purchased a farm of 400 acres near Youngsville at a cost of \$13,500 and erected a plain two-story brick building with stone basement, the main part being 100 by 37 feet and the wing 36 by 20 feet; also necessary farm buildings, all of which constitute the property known as the Rouse hospital. Henry R. Rouse was a single man and had but few relatives, hence he made Warren county his principal legatee. As a legislator he was intelligent and trustworthy; as a citizen he was public spirited, sagacious and useful; as a friend he was faithful, agreeable and true. A costly monument was erected to his memory at Westfield, N. Y., where he is buried, which is the home of his birth, and another at the Warren County (Pa.) Home for the Poor; but his most enduring monument will be in the hearts of a grateful people who have learned to appreciate his beneficence and worth.

The Oil Fields of America

WEST VIRGINIA AND OHIO.

BY J. T. HENRY, PROF. J. P. LESLEY AND PROF. W. F. ROBERTS, 1873.

It is almost impossible to describe or rather define the limits of what is called the oil region of West Virginia. Streams which empty into the Ohio River, as far as fifty miles above Marietta, afford the usual surface indications of oil. One hundred and fifty miles below Marietta, the Ohio river touches the north-east corner of Kentucky, and, on the streams which empty into the Ohio at this point, oil is said to abound, and to have been discovered in paying quantities. From Fishing Creek, which empties into the Ohio, fifty miles above Marietta, there is a country running back from ten to thirty miles from both banks of the Ohio, that affords surface indications. Of course, the existence of oil throughout all this vast region is doubtful.

On the Ohio side of the river are the counties of Washington, Athens, Morgan and Noble, in which oil has been drilled for and found. On the Virginia side, there are eight counties—Tyler, Calhoun, Roane, Jackson, Kanawha, Wood, Wirt, Ritchie and Pleasants—in which oil has been found. These twelve counties embrace a territory which extends away from Marietta in every direction, and whose extent is from thirty-five to sixty miles. Great excitement prevailed on the discovery of oil in this region in 1860, and was followed by speculations in land and the formation of oil companies. As a specimen of the producing character of this oil territory in the early days of the business we may instance the Dutton well, on Duck Creek, Ohio, which was struck in 1860, at a depth of fifty feet, and averaged, it is said, from seventy to one hundred barrels per day for a considerable time. Another, called the Steel well, on Duck Creek, produced some five hundred barrels per day for some weeks, and in 1865 was producing five barrels per day. This well was drilled to a depth of one hundred feet. In the summer of 1864 a well called the Dixon was sunk eight hundred feet, when it commenced flowing at the rate of thirty barrels per day. The Bull Creek region, on the Virginia side, had in 1865 some forty or fifty wells. The largest of which yielded sixty barrels per day.

In 1860, when the excitement was at its height, a crisis occurred. The price of petroleum suddenly went down, until the barrels, as they came from the hands of the cooper, were of more value than the oil

that filled them. Two causes led to this—the world had not learned the use of Petroleum, and the early surface wells threw forth so many barrels of oil that the supply was larger than the demand, and the market became overstocked. This disheartened capitalists, and lands fell. Then came the war. Virginia seceded and the line of the Ohio became contested ground. McClellan crossed, but his forces were too busy with the Baltimore & Ohio Railroad to think of protecting the oil-hunters, then swarming along the Kanawha. Although there was no organized army of Confederates in West Virginia, there was nevertheless a body of guerillas who were constantly harassing the country. The result was a panic. In a week the whole party left. The derrick stood in the field over the half-drilled well, the oil gushed up and overspread the ground, the houses were town down for camp-fires, and the whole enterprise perished. As soon as the turmoil of war ceased the drill was again set in motion, and operations have continued with singularly uniform success up to the present time. The present center of the oil-producing region of West Virginia is Volcano, formerly called White Oak, which consists of two narrow belts of land, only a few rods wide, running parallel with each other at a distance of about a stone's throw apart. Their direction the longest way is north, ten degrees east and south, ten degrees west. Here, within a distance of six miles in length by one in width, is embraced the whole of the West Virginia heavy oil-producing territory. Within this narrow limit is produced all the heavy lubricating oils known as the Globe, Peninsular, Grant, Hillsdale, Mount Farm, White Oak, Gales Fork, Volcanic, &c., which have become so well known in this country and in Europe. In one respect the geological formation here is remarkable. Upon either edge of these oil belts the rock, upon the surface, stands at an angle of about eighty to ninety degrees, and is precisely similar in character to the rock found in the surrounding territory at a distance of six hundred feet below the surface. While the lower stratum of rock entirely surrounds the oil belt, it is missing under it, or, rather, instead of lying six hundred feet below the surface, it here appears at the surface. The conclusion is irresistible that this belt rock once formed part and parcel of the lower stratum, and that at some period by some convulsion of nature it has been forced to the surface. We suppose it is to this circumstance that Volcano is indebted for its name. It is somewhat limited in numbers and territory, yet its productions aid not a little in making up the aggregate of the material wealth of the nation. There are at present quite a number of new wells be-

ing put down, both for heavy and light oils. The heavy oil is found at a depth of about six hundred feet, while for the lighter oils it is necessary to go down to a sand rock twelve hundred feet below the surface. The wells yield, on an average, about three barrels per day.

The territory known as the Glantz tract, and owned by the Oil Run Petroleum Company at Volcano, is considered one of the best producing tracts in West Virginia. From twenty-three wells during 1872 this company had an average production of 3,750 barrels per month, of all gravities ranging from twenty-nine degrees to thirty-five degrees. The oldest well on the tract, the Moore well No. 1, produced alone 7,735 barrels of thirty-five-degree gravity. The second well struck, the Shafer and Stein well, has produced 2,748 barrels of oil, twenty-nine degrees gravity.

A recent writer at the Ohio oil field, and particularly of the Cow Run region, says: For the encouragement of oil producers, and men interested in the production of oil in Ohio, and more especially to show that Pennsylvania is not the only oil-producing territory, I present you the following figures and data of a two-acre lease, situated at Cow Run, Washington county, Ohio. Grecian Bend Company's well No. 1, struck oil in April, 1869, at a depth of three hundred feet, and produced 966 barrels until January 1, 1870. Well No. 2 struck oil December 25, 1869, at a depth of seven hundred feet, and produced 21,985 barrels until January 1, 1870. Well No. 3 struck oil June, 1870, at a depth of four hundred feet, and produced 1,134 barrels until January 1, 1871. Besides this, the company has paid the Transportation Company over five hundred barrels charged for evaporation. This is the production of only one company. The School House Company has produced and sold, the past year, over \$60,000 worth of oil. And Perkins, Harvey & Co.'s wells have produced and sold, to August 1, 1870, \$212,566.33 worth of oil. This is the production of only three companies, out of a host of good companies located at Cow Run.

The West Virginia and Ohio oil fields are justly celebrated for the production of lubricating oil, which is held in great estimation in England and on the continent of Europe.

The combined production of Ohio and West Virginia for 1872, was estimated at 320,000 barrels.

In connection with our sketch of the oil region of West Virginia and Ohio, we would offer some facts in relation to the discovery of what has been termed *Crystallized Petroleum*. In noticing it we simply give the reports of two eminent scientific men—Professor Lesley and Professor W. F. Roberts.

Professor Lesley's Report.

The following report is taken from the printed proceedings of the American Philosophical Society:

Professor J. P. Lesley communicated a notice of a remarkable coal mine or asphalt vein, cutting the horizontal coal measures of Ritchie county, West Virginia.

Mr. Lesley said that, through the kindness of R. H. Gratz, Esq., of Philadelphia, a descriptive letter and

a map had been submitted to him, which exhibited geological facts of more than ordinary interest to those who are studying the origin of the rock oil deposits of the West.

The curious points of the case require careful investigation, but there seems to be no good reason to doubt the essential correctness of the statement.

The coal-beds of West Virginia pass horizontally through the pronglike ridges from valley to valley. Some of these ridges run as narrow on the top and as regular as railroad embankments, for three or four miles, and in nearly straight lines, between equally straight vales terminating bowl-shaped against some cross ridge.

It is across such vales and dividing ridges that the asphaltum vein of Ritchie county makes a straight course, "2,323 feet long, as at first measured, but since then traced in both directions still further, so that now it is known to extend more than two-thirds of a mile." Explorations beyond this line have failed to find it. Its outcrop, four feet ten inches thick, was discovered crossing a ravine fifty feet wide at the bottom, and rising on each side with slopes of nearly forty-five degrees. On one of these hillsides at a height of ninety feet the outcrop showed the same thickness, but at a height of 185 feet it was found to be but two feet six inches thick. It is not certain that this diminution is in a vertical direction; it may be lateral; for the slope between the ninety and the hundred and eighty-five feet levels is more gradual, especially upon the western side.

In the bottom of the ravine a vertical shaft was sunk to a depth of thirty-four feet upon the vein, which continued uniformly four feet ten inches thick, the asphaltum being filled in pure and clear, without the least admixture of earthy or foreign ingredients, between the smooth and almost perfectly vertical walls of yellowish-greenish sandstone, lying in horizontal layers, through which this gash or fault was once no doubt an open fissure, communicating with some reservoir of coal oil which still, it may be, lies beneath it undisturbed. The most interesting part of the phenomenon for structural geologists is this gash.

The substance which fills this gash-fault in the coal measures of Northwestern Virginia resembles the glossiest, fattest caking coals, and has a decidedly prismatic structure; breaks up into pencils, with flat, lustrous faces and sharp edges, but the faces are not set at any fixed angles to each other, so that the effect upon the eye is rather that of a fibrous than of a prismatic structure. At the same time there is not the slightest appearance of layers, but the aspect of complete uniformity or homogeneity. Pieces are taken out, it seems, a foot in diameter; and that portion of one of these pieces which I have shows a plain face on one side, as if it had encountered one of the walls, and is covered with a delicate film of a dead black substance like charcoal dust, which is probably the dust of the vein substance itself.

Pieces lying at the surface of the ground are said to yield as much oil as specimens taken out six or eight feet down. By the ordinary dry distillation the substance is reported to yield as much oil as the Albert coal. By a different process, the first and only trial,

at which six hundred pounds in one charge were used, forty-four and a half gallons of superior oil were obtained. Retorts are now upon the ground.

Geographical and Mineralogical Report of Prof. W. F. Roberts.

McFarland's Run is a noted locality in the great oil formation of West Virginia. A vertical crevice filled with crystallized or solidified petroleum in a direct line is found crossing the deep-cut gorges of small streams and rising to the summits of the ridges bounding them.

In the month of June last I made a special visit to this part of the country for the express purpose of making a full and particular examination of this phenomenon, if I may so term it, in geology. I traveled from Cairo Station, on the Parkersburg branch of the Baltimore & Ohio Railroad, over a road then in progress of grading by the Ritchie Coal Oil Company for a branch railroad to connect their property containing this solidified petroleum deposit with the main road, and during this journey, I could not detect anything remarkable or different in the general geological structure of the country to that shown in some of the other oil-producing sections in the West Virginia "oil belts," with the exception of an opening made on the line of the road on the Ritchie Coal Oil Company's lands near McFarland's Run, where there is a vein of a peculiar substance, resembling somewhat some of the most glossy kinds of bituminous coal. Having secured specimens, I continued round the point of the hill, and entered a deep-cut gorge formed by a small run, a branch of McFarland's, and at about half the distance from the head of the run I reached a shaft sunk upon the line of a fissure, or crevice in the strata, in this peculiar kind of substance, of the same quality and characteristics of the specimen taken from the place above referred to. This crevice is a vertical one, four feet four inches wide, and the strata adjoining it on both sides is horizontal, a common micaceous sandstone, in their plys of a yellowish-green color, of the carboniferous formation.

The shaft, I was informed, was sunk thirty-four feet downward. It was perfectly filled with solidified petroleum. The course of the dyke or opening in the horizontal coal strata run in a course S. 75½ W. and to N. 75½ E., which I traced in both directions. I traced the opening which had been made in the line of this crevice up the steep-sided ridges and over their summits, and I found from the specimens visible at the several shafts that the solidified or crystallized petroleum rose to the surface, or nearly so, in all places. The west hill bounding the ravine where the dyke crossed over, I judged to be about three hundred feet above the level of the ravine where the deep pit was sunk. The east hillside is about two hundred feet above the ravine. Developments of shafting have been made proving the continuation of this Petroleum-filled crevice in solidified form more than one mile in a direct line, and bounded by a flat or horizontal formation of shales and sandstones of the middle carboniferous series, similar in all respects to other ridges in oil-pro-

ducing sections in West Virginia. The walls of the crevice are perfectly smooth and regular, and exceedingly well defined.

The crystallized petroleum has a fibrous structure. It is very glossy in appearance, of the color of the purest specimens of richest and fattest bituminous gas coal. It melts under heat readily and runs like pitch. This peculiar mineral has been wrongly called "asphaltum." Its fracture, luctre and general appearance are altogether foreign to the Albert coal, or to any other mineral of that class. By experiments made upon this crystallized petroleum, it has yielded from one hundred and forty to one hundred and sixty-nine gallons of oil to the ton.

Developments will prove the continuation of the crevice filled with the same material—the crystallized petroleum—into and through the properties I am reporting upon, and in consequence of its embracing within their boundary lines two deep-cut valleys and high ridges intervening, an immense quantity can be mined above water level, and one cannot put an estimate too high upon this property, containing as it does, this valuable mineral substance.

How deep this solidified material may continue down beneath the level of the valleys is not determined. The crevice may get much wider, and still be filled with this solid Petroleum. One thing is, however, certain, that it has its source from some immense subterranean lake or large opening in the strata of the lower measures of liquid Petroleum. The numerous gas and oil springs closely contiguous and ranging with this dyke show that there are beneath the surface large cavities filled with oil.

At the junction of the streams which meet in the southern part of this tract is excellent boring territory, room enough for a large number of oil wells. The geological structure of the strata shows great disturbance underneath the surface, and here may be seen the pure oil oozing out from the joints of the rocks, and gas springs bubbling up on the surface of the water, throwing off oil in rainbow-colored tints. The nature of the formation, the geological structure of the strata and the contour of the surface, as well as other indications, show that this tract of land is located in an exceedingly rich Petroleum section of the country, where proper development should be prosecuted without delay. One thing more may with propriety be mentioned, that this solidified Petroleum in all places is free from any deleterious foreign substance. Where it has been shafted upon it is as pure as oil generally is found in the best oil-producing localities of West Virginia.

A few years ago thirty-two barrels of this mineral were sent North, and all of it was retorted, a large portion being put through on a commercial scale in the city of Brooklyn, and resulted as follows:

YIELD OF ONE TON.

Illuminating gas, 7,000 feet . . . @	\$2.00	\$14.00
140 gallons oil @	.60	84.00
17 bushels coke @	.12	2.0
		100.04

The analysis of Prof. R. Ogden Doremus gives the following result:

100 PARTS MINERAL DRIED AT 212° FAH.

Ash	2.15
Hydrogen	8.45
Carbon	75.96
Oxygen	12.75
Nitrogen69

RESOURCES OF WEST VIRGINIA.

PETROLEUM.

BY HON. WILLIAM E. STEPHENSON, OF PARKERSBURG,
WEST VIRGINIA, 1876.

PREPARED UNDER THE DIRECTION OF THE STATE BOARD
OF CENTENNIAL MANAGERS OF THE STATE OF
WEST VIRGINIA, 1876.

Prof. M. F. Maury:—

DEAR SIR:—In accordance with your request, I give you some account of the oil interests of West Virginia, and am sorry that sickness and a press of business prevented my writing a fuller statement of this very important item in our natural resources. A source of considerable wealth to the State since 1864 is found in the production of Petroleum. This production at present is confined principally to what is known as the "Oil Break," a geological upheaval of the earth's surface, giving it a roof shape or bulge, especially in the rocky portion. This break, passing from Ohio into this State, crosses the Horse Neck Fork of Bull Creek, Cow Creek and French Creek, all of which flow into the Ohio River a few miles above Marietta; then passes in a direction to the southeast, across Goose Creek, Hughes River and the valley of the Little Kanawha, in the direction of Charleston.

Petroleum in small quantities was found within, and even outside the territory of this break, at a very early day. As far back as 1771, Thomas Jefferson gave an interesting description of a burning spring, and the oil connected with it, found in the Great Kanawha valley. But it was not until modern discovery and invention had transmuted the oily treasures into a source of money-making that its abundance and multifarious uses became rapidly known. The main developments of the oil interests of West Virginia commenced soon after the close of the war of 1865. There had been partial developments in different sections of the State prior to that period, but it was in a very primitive way. At Burning Springs, in Wirt county, and at different points along "The Break," wells had been drilled and oil obtained in paying quantities, but the difficulties found in getting it to market deterred operators from making "developments" in any satisfactory manner.

Petroleum has been obtained near Morgantown, in Monongalia county, and at points on a line from Morgantown to Charleston, Kanawha county. This fact gives rise to the theory that the "great Pennsylvania oil belt" extends into West Virginia, and crosses the State from north to south. Acting upon this theory, parties are now actively "prospecting" for new oil territory. A beginning will be made during this summer, on territory at the headwaters of the Little Kanawha River. It is thought by practical oil men that this line is to be the future oil field of the State. Everything in this direction, however, is in the future. A few months will, it is believed, confirm or disappoint the now pronounced belief of some of the most successful operators of Pennsylvania, in the success of the attempt. Many of them propose to make large investments in this direction. But, looking to the past, we must consider what has already been done in the way of actual accomplished facts: Up to 1865, the oil business in West Virginia had been almost entirely speculative. Large amounts of money had been expended, and but little return had been made on the investments. In 1865-6, however, the business assumed a legitimate form. Oil men came to an appreciation of the fact that this, like any other legitimate calling, had to be followed with an eye to economy, and to a proper regard for order and system in the management of oil and oil wells. As a consequence of this oil development assumed a more scientific and businesslike shape. Operations commenced almost simultaneously at Burning Springs, Oil Rock, California House, Volcano, Sand Hill and Horseneck. Large quantities were produced at all of these points. Light oil was obtained from each of these places except at Volcano and Sand Hill. At these points were produced the "heavy oils," which have obtained a world-wide reputation as "lubricators."

The amount of heavy oil produced in the West Virginia oil regions is about three hundred barrels per day. Its gravity runs from 26° to 32° Beaume. It is used, in its crude state, almost exclusively for the purpose of lubrication. It will stand a lower degree of cold test than any other oil lubricator. This, added to its extreme cheapness, gives it the preference to all other lubricators, for general purposes. By different processes of reducing and admixture with oils of a lighter gravity, it makes most excellent lubricators, at still lower rates than the crude article is produced. These, as well as the crude heavy oil, are used in all parts of the country, and even form a large item in our export trade. The wells producing heavy oil are durable in their character, yielding not a large but steady flow of their oily treasure. It is the opinion of most experienced operators that there is still undeveloped heavy oil territory of large extent within the State. Whilst the light oil regions ran a rapid course, giving a large yield during their productive career, the heavy oil district continues to remunerate the producer. Some idea may be gained of the extent of the oil development in the districts just named by the inspection of a few figures. As far as can be estimated, there have been produced not less than 3,000,000 barrels of oil. The specific gravities of these range from

27° to 45° Beaume, the greater portion varying from 27° to 33°.

The estimated value of this product is about \$20,000,000. The number of producing wells at present is 292, averaging about three barrels per day each. If the price and the times justify it, this number would probably be doubled in twelve months. One noticeable feature in the development of oil in West Virginia is the cheapness of putting down wells. In Pennsylvania it costs from \$5,000 to \$10,000 to drill a well, while in the oil district of West Virginia it costs not exceeding \$1,200. Men of small means can operate in the State, but in Pennsylvania the operator must have a fortune to make success certain.

Notwithstanding the fact that oil had been developed in Pennsylvania long prior to 1865, and that large sums had been expended in the production of the crude product, in Venango county, in that State, to West Virginia belongs the honor of first furnishing the means of transporting it to market in the modes now recognized to be cheap, safe and expeditious. By means of tubing lines and iron tank cars oil is shipped to the seaboard and to all parts of the country in bulk, thus cheapening transportation, and bringing the article to the door of the consumer.

By means of steam pumps, adapted to the purpose, oil is propelled for miles through iron tubing to such terminals as are accessible. It is cheaply pumped to the Ohio River, or to the Baltimore & Ohio Railroad and to the Laurel Fork & Sand Hill Railroad, and from thence transported in tank cars to its destination, the product being handled with safety and great expedition. By these means the producer is enabled to send his oil to market from the most inaccessible points. Parkersburg is the great oil center of the State. Here is the market for the crude article, both for West Virginia and Ohio. Here are large refineries, which not only consume our own production, but import largely from Pennsylvania. The refinery capacity of Parkersburg is about 2,000 barrels per day. In connection with most of the refineries are "reducing" and "treating" houses, for putting the heavy crude oil into shape for lubrication. Being at the junction of the Little Kanawha and the Ohio Rivers, and the center of railroad connections which gave it the advantage of river and rail transportation, it has become a recognized point in the sale and delivery of crude oil and its products. The trade gives employment to several hundred operatives, besides furnishing facilities by which great prosperity has been brought to this active and well-to-do city.

A few words about the uses of Petroleum may be of interest to the general reader. The "heavy oils" are extensively employed for lubricating purposes, taking the place almost wholly of the various articles heretofore in use for this purpose. For illuminating purposes, the light oils, when refined, are extensively—almost universally—used. This is not to be wondered at, when it is known that the intensity of the light of the refined Petroleum is eighteen times as great as that of burning fluid; six times as great as that of sperm oil, and more than twice that of camphene, while the oil itself is furnished more cheaply than any of the above-named articles. Printing inks of all col-

ors are made from Petroleum, the black especially being an excellent article. Many varieties of soap are made from it and are held in high repute. The medical qualities of Petroleum, especially the crude article, have long been known; its use as a liniment, more especially for cutaneous diseases, is quite extensive. As a specific for consumption, by the inhalation of its vapors, it has acknowledged virtues. Recently, it has been applied with very satisfactory results as a motive power in running the machinery of steamboats, iron mills, etc. It is also used successfully in smelting iron ores, and as a coating for iron and wood to preserve them from decay; indeed, for almost numberless other purposes which cannot be even named in a brief article like this.

Yours very truly,

WILLIAM E. STEPHENSON.

Parkersburg, W. Va., April, 1876.

KENTUCKY AND TENNESSEE OIL FIELDS IN 1873.

Along Boyd's Creek, Barren county, Ky., three miles from Glasgow, are the best oil wells of this State. Glasgow is a town of three thousand inhabitants, situated on a branch of the Louisville and Nashville Railroad, and one hundred miles from Louisville, and eighty from Nashville, Tennessee. At the present time there are fifteen wells in operation, producing oil. The Armell wells in this district are drilled to a depth of 130 feet, three of which are flowing about three barrels per day. Two of these wells have flowed for six years, and at one time produced 400 barrels per day. Chess, Corley & Co., oil refiners at Louisville, who own a large scope of territory in this section, have met with good success as oil operators, having thus realized a large fortune.

Their well No. 1 is producing 35 barrels per day. At first it produced 70, and has now been pumping three years. A Pittsburgh Company own some land here, on which they have put down a number of wells, producing on the average 3½ barrels per day.

The pioneer oil men of this region are Messrs. Chess, Corley & Co. and Messrs. Graham & Thomas. Both these firms commenced operations early in 1865.

During 1865 and 1866 considerable interest was manifest on Boyd's Creek, and many wells were put down, all of which pumped or flowed more or less oil. With the increased production, the price fell from \$1.50 to 25 cents per barrel, at the wells. The oil was 40° gravity and tainted with sulphur. With the limited knowledge of refining at the time it was difficult to deodorize it. Operators became discouraged, and the territory fell at once. Some wells, within a few days of completion, were abandoned, and the oil adventurers went back to their various homes, many discouraged, others hopeful that when oil would become scarce, and science

overcome the deodorizing difficulty, all would again be prosperous. In 1869 active operations again commenced, and with the improvements in the refining process, the prices rose from 25 cents to \$2.00 per barrel.

There was quite an excitement in 1867 near Burksville, Cumberland county, Kentucky, which was occasioned by the striking of the Crocus well at a depth of 300 feet, which flowed 300 barrels of heavy oil per day, after discharging salt water for three months, but this promising field was abandoned by reason of the extreme cost and difficulty of shipment and consequent low price of oil. There is one well in this section, which is only 80 feet in depth, and has flowed six-dollar lubricating oil for the past six years. The oil from this well is teamed 40 miles to the river, and shipped down the Cumberland to Nashville, Tennessee. Navigation on the River is only open five months in the year. In Cumberland county, on one of the tributaries of the Cumberland River, a well exists which was put down to a depth of 400 feet, and has flowed about 60 barrels per day into the stream, for upwards of four years. The oil from this well is quite black, very heavy, and of a rank smell. Along Scrub, Indian and Greasy Creeks, on the Cumberland River, there are many oil springs, which produce from one to five barrels per day of surface oil. These wells or pits are dug down to the blue clay to the bed rock. Cumberland county is the foot of the mountain range, and is hilly and rocky. Burksville, the county seat, is connected with a railroad and by a forty-mile stage route.

Near Bowling Green, Ky., a well was sunk to the depth of 80 feet, which produced oil in considerable quantities, for over twelve months. The owner built a small refinery for the manufacture of his own production. This was the only well drilled in that section. Within a few miles of the Mammoth Cave, near Green River, there are several oil springs. The surface rock here is so impregnated with oil and gas, that a match will ignite them. At Boston station there is a gas well, some 90 feet in depth, which produces a considerable quantity of gas.

There is little doubt but the north-western part of Kentucky is rich in coal and oil. We know that one well was drilled in Henderson county, near the Ohio River, which passed through a four-foot vein of coal, at twelve feet from the surface; and another six foot vein, at 50 feet from the surface, and at 450 feet a small well of the best lubricating oil ever produced was discovered.

It is the opinion of practical oil men who have visited Kentucky, that the best oil lands have not yet been touched, and that all that is required to make this rich mineral State prosperous, is capital and energy.

Little is known of the producing capabilities of Tennessee, but it bears the evidence of being an important field of enterprise for the production of oil. At White Bluff, Dixon county, thirty miles west of Nashville, there is a small green oil well of the same character and quality as that of But-

ler county, Pennsylvania. This well is 500 feet in depth.

Mr. Eugene Scott, of Karns City, Butler county, Penna., informs us that he visited the wells on Boyd's creek, late in the fall of 1872. He says: "I was astonished to learn that in this enlightened age of petroleum mining, the people here knew little about the business. The derricks were only 30 to 45 feet in height; some with one bull wheel, and some with two. The whole rig is of white wood. . . * * * * * They dressed their bits in the shape of a wedge, and reamers, why, they are beyond description. Drilling is only done in the day time, and it is usual to take six weeks to get down 150 feet. The seed-bag is put on the tubing, which is frequently drawn in testing. The oil-bearing rock is a kind of a shell and sand-rock mixed, and of a white color. The stream (Boyd's Creek) had been tested three miles north and south, and finding the best wells in the center of the line of tests, and that the hills had not been operated on, I concluded that the belt crossed the creek, and ran parallel with the Pennsylvania belt, therefore I took a large lease southwest of the best producing well on the Creek, and at the depth of 250 feet struck 28 feet of loose sand, full of oil and salt water. Two miles north-east of this, and on a line with the best wells on the Creek, my partner drilled a well with a Pennsylvania oil rig, and in six days reached the sand-rock, but there was little oil; the well produced only one barrel per day."

"It is usual when a well is dug in this country, to pump it for a few days, and then tube with three-quarter inch pipe, and let it flow—then remove the machinery, and drill another well. The bed rock of the Barren county oil field is white limestone, which in the valley is about eight feet from the surface. The surface rocks are usually flat, and so porous that water will run through them readily.

We are furnished by this gentleman above named with the following well records:

- 30 feet, white limestone;
- 40 " shale;
- 60 " limestone;
- 20 " oil bearing rock, a kind of shell and sand-rock, mixed, and of a white color.

OIL REGION OF INDIANA IN 1873.

In the western part of Crawford county, Ind., there is an oil region that has never been properly tested by that only sure test—"the drill." The surface indications of oil extend five miles in width by over ten miles in length, and consist of a tar spring, oil springs, and oil rock, of several varieties and in great abundance. The tar spring has been known ever since the county was settled, and is nine miles from Leavenworth; it is about half way up a large hill which is probably one hundred and fifty feet high; it flows after each heavy rain, and in the course of a year throws out tons of tar or asphaltum. It is between the Otter

fork and the West fork of Little Blue; the nearest well to it is the Dexter well, which is two miles distant. The oil springs are found on Otter fork, and West fork, and in hollows tributary to them, there are quite a number of them from which small quantities of oil can be collected. The oil rock is found in great abundance. At one place on Otter fork, the bed rock of the creek is a soft, black sandstone, and contains over thirty per cent. of oil. If a piece of it is put into a fire it blazes like a candle, and will continue to burn till it loses one-third of its weight. In the vicinity of the Dexter well on the West fork, the oil rock is in great abundance, and in almost every hollow—and their name is legion—in all that locality, rock more or less impregnated with oil may be found.

The Wells.—In 1861 a well was sunk to the depth of ninety-seven feet, by a man named Custerman. He obtained no show of oil, and never pumped the well. The war caused him to stop work, and he has never been heard of in that locality since. In 1863—4 several wells were sunk—three on the west fork. The Dexter well is 580 feet deep, and has a fine show of oil; it rises constantly in the conductor; a quart can be taken off every morning. It is lubricating oil of good quality. It now belongs to the Dexter Oil and Salt Company, and they intend to sink it deeper this year. The Clark well, located three miles below, is 640 feet deep; found no oil; a little gas and saltish water. The well has been left open and is filled with sediment. The Eaton Sulphur Well three miles further down the creek, is only 275 feet deep; flows white sulphur water. It is becoming a great resort for invalids.

These are all the wells that have ever been sunk on the West fork. On the Otter fork, there have been five wells sunk. A small show of oil was found in two of them. The Golden Salt well is one of them, and is over 1,000 feet deep. All of these wells are below the indications. No well has ever been sunk on either creek above the indications except the one mentioned.

The Geological Position.—The locality is in the sandstone which underlies the Great Indiana coal field; the first strata below is the carboniferous limestone, which is about 800 feet thick; the next strata is known as the knob sandstone, and is about 400 feet thick, and is the last strata through which they passed at Terre Haute, in sinking their well, which is the only successful oil well yet sunk in the State. It is 1,625 feet deep.

“The Crawford County Petroleum and Mining Company” are now sinking a well at Leavenworth. It is to be sunk through the black slate penetrated at Terre Haute, which will be a depth of about 1,300 feet.

The marked difference in the geological formation in the Indiana region and those of Pennsylvania and West Virginia is in the limestone, and consequently wells will have to be deeper here to reach the main source of the oil, which lies below it. While the thick strata of limestone will make it expensive to sink wells, it is a good evi-

dence that the oil exists in abundant quantities, or it would not rise so far through it and make so great and extensive surface show.

The Louisville, New Albany and St. Louis Railway passes through the center of Crawford county.

CALIFORNIA OIL FIELDS IN 1860

The discovery of petroleum in California adds another to the already widely varied products of that State. It has been known for a long time that deposits of petroleum existed near the coast, but as yet the production of this oil has been unimportant. The Leaming Petroleum Company, recently organized in San Francisco, has fairly abundant success. The crude oil is found in the mountains of the San Fernando District, thirty-five miles north-west of Los Angeles, from which point there is railroad communication of thirty-one miles with the Port of San Pedro. The cost of transportation from the mines is 2½ cents the gallon, and the cost of refining 2 cents per gallon for small quantities, and 1½ cents for large lots. Up to the present time several shipments of crude oil have been received at San Francisco, aggregating some hundreds of barrels, which have found immediate purchasers at remunerative rates. The Gas Companies are prepared to take and use not less than 1,000 barrels per day, and the district owned by the company is sufficiently extensive and prolific to warrant the delivery of that or even a greater amount, so soon as the requisites can be obtained to furnish suitable works. These shipments have, so far, been the products of natural springs from which the oil was dipped with buckets; one spring is now producing two barrels per day; but when a system of scientific operations shall have been introduced, the yield will be greatly augmented. It is the opinion of capable men who have carefully examined the mines, that they are of sufficient capacity to furnish nearly all of the oil required for consumption on the Pacific coast.

GEOLOGICAL HISTORY OF THE OIL FIELDS OF AMERICA.

The geology of the oil country is a subject upon which many theories have been wrecked. In dealing with it I propose to present a few quotations from the best authorities I can find upon the subject, and I would here acknowledge my indebtedness to that excellent little work of Henry E. Wrigley, Esq., C. E.

It is well known that the Alleghany mountains divide the United States geologically as well as geographically; that east of them lie the transition, the primitive and the alluvial formations, and west of them the great secondary formation, or formation by deposition from water. This secondary formation extends across the continent, from the Alleghanies to points far west of the Mississippi.

Whether the great valley drained by the Mississippi was once swept over by an ocean, of which the Great

Lakes are but the remaining puddles, is not an object of immediate interest. That the Alleghanies formed the shore or beach of some such body of water, and that along its edge were strewn animal and vegetable remains, it is undoubtedly safe to assume.

The presence of carbon, as the base of oil, shows that these deposits were either animal or vegetable, it being the base of the animal and vegetable world, as silica is likewise of the mineral world.

Of course, the drill does not reach these deposits. They lie perhaps almost uniformly under the edge of this formation, at a depth of from 30 to 40,000 feet. The heat at this depth, although only a matter of estimate, is doubtless very great, as we know that between 150 and 2,000 feet in depth there is an increase of 30°. It would seem, then, that these deposits of animal or vegetable matter are volatilized and thrown off into the upper rocks, and condensed there, by the lower temperature, into liquid oil. Into what rock the gas will enter will depend upon the character of the rock. A close slate or sandstone will resist it; but wherever it finds a crevice or an open porous rock, it will force its way into it, and will condense there.

Consequently the rock itself is the guide of the driller in searching for oil, and the location of the oil-producing spots resolves itself into the existence of this porous sand rock.

All the oil-producing spots that have been found in this section of the United States are included in a belt of fifty miles in width, stretching from Western New York to Tennessee, in a line parallel with the Alleghanies, and lying about fifty miles to the west of them. The producing spots themselves are in area but the smallest specks upon this belt, and are scattered over it in such an indiscriminate manner that it is impossible to trace any connection between them, or, rather, to deduce the position of one producing spot from others, with any degree of satisfaction. It is equally impossible to trace any connection between these spots and the water-shed or river-drainage of the country.

A matter which will somewhat affect the question of production at the south end of the belt is the dip of the sand rock deeper into the earth as it goes south. Although this is, in a great measure, counteracted by the general slope of the water-shed of the country in that direction, it will still average, as near as can be ascertained by leveling and drilling, about thirty inches to the mile. Professor Silliman says that "Petroleum is uniformly regarded as a product of vegetable decomposition."

Professor Dana says: "Petroleum is a bituminous liquid resulting from the decomposition of marine or land plants (mainly the latter), and perhaps also of some non-nitrogenous animal tissues."

Professor Denton says: "It is a coral oil, not formed from the bodies of the coral polyps, as some have supposed, but secreted by them from the impure waters, principally, though not exclusively, of the Devonian times."

Professor Winchell says: "Crude Petroleum is not a product of definite composition. It seems to be a varying mixture of several hydro-carbons, some of which, as naphtha, volatilize with rapidity when ex-

posed to the atmosphere; others, as kerosene, slowly; while others, as bitumen, are nearly fixed. It contains also varying quantities of aluminous matter and other impurities.

Petroleum occurs in stratified rocks of all ages, from the Laurentian to the recent. It has even been observed in some rocks of a granitic structure. The mere presence of Petroleum in a formation is far from being evidence that it exists in large quantities. Observation has shown that it does not exist in large quantities in any formation except under certain intelligible conditions. Its presence in small quantities is to be expected.

It is an opinion almost universal among geologists that Petroleum has been produced from organic remains. Hence, long before the discovery of eozoon in Laurentian rocks, it had been inferred that organic life existed upon our planet during the accumulation of these rocks, because, among other reasons, they afford conspicuous quantities of Petroleum. Geologists are somewhat divided in opinion as to whether animal or vegetable organisms have afforded most of the native oil. Little dissent exists, however, from the doctrine that most of the oil occupying the pores and pockets of fossiliferous limestone has been derived from animal bodies, while that saturating shales, and arising from shales, has had a vegetable origin. As the oil of commerce is probably derived from the latter course, it appears that we are to regard our commercial oil as a marine, animal, mineral and vegetable product."

Professor Winchell closes his article on the geological phenomena of Petroleum by presenting a synopsis of oil regions, and the formation tributary to their supplies.

I. The black shales of the Cincinnati group afford oil which accumulates in the fissured shaly limestones of the same group, and supplies the Burkesville region of Southern Kentucky, and Manitoulin Island, in Lake Huron.

II. The Marcellus shale affords most of the Petroleum which accumulates in the fissured shaly limestones of the Hamilton group, and thus supplies the Ontario oil region, locally divided into the Bothwell district, the Oil Springs district and the Petrola district. The Marcellus shale affords also a large portion of the oil which accumulates in the drift gravel of the Ontario region.

III. The Genesee shale, with perhaps some contributions from the Marcellus shale, affords oil which accumulates in cavities and fissures within itself in some of the Glasgow region of Southern Kentucky. It affords also the oil which accumulates in the sandstones of the Portage and Chemung group, in Northwestern Pennsylvania and contiguous parts of Ohio. It affords also the oil which accumulates in the sandstones of the Waverly (Marshall) group, in Central Ohio. It affords also that which accumulates in the mountain limestone of the Glasgow region of Kentucky and contiguous parts of Tennessee, as also some of that which is found in the drift gravel of the Ontario region.

IV. The shaly coals of the false coal measures, aided, perhaps, by the Genesee and Marcellus shales,

seem to afford the oil which assembles in the coal conglomerate, as worked in Southwestern Pennsylvania, West Virginia, Southern Ohio, and the contiguous but comparatively barren regions of Paint Creek, in Kentucky.

V. The coal measures may perhaps be regarded as affording a questionable amount of oil, which may have been found within the limits of the coal measures in the West Virginia and neighboring regions:

From this exhibit, it appears that the principal supplies of Petroleum, east of the Rocky Mountains, have been generated in four different formations, accumulated in nine different formations, and worked in nine different districts. The sandstone beds in which the Pennsylvania oil is found belong to the Chemung group of the Devonian formation. It is so called from the Chemung River, in the State of New York, where it is well exhibited.

HISTORICAL GEOLOGY.

The history of geology has been divided into four eras. The first era is known as the Archæan era. The word Archæan is the Greek for beginning. The second era, the Paleozoic era. Paleozoic means ancient life and is used here because it includes the earliest forms of life. The third era is the Mesozoic. Mesozoic means middle life. The fourth, the Cenozoic era, the period of recent life.

Archæan time is the period when the oldest known rocks were formed by the action of the water and heat on the cooling crust of the earth. In the early part of the next era (the Paleozoic) appear traces in the rocks of the first forms of life. This is called the Silurian age; and the rocks of this period were all made under water from sediment and the remains of animals and vegetables deposited during very long periods of time. The rocks of this era are mostly sandstone, limestone and shales. The next or upper part of this era is known as the Devonian or age of fishes. From the rocks made in this age, we find that the sea was peopled with fishes. Some of them of immense size. The land had swarms of insects and was covered with dense jungles and heavy forests.

The third division of this era is known as the Carboniferous age, or age of coal plants. The word Carboniferous is from the Latin word carbon. The fourth division, known as the Cenozoic era, the period of recent life, was followed by what is called the Glacial period, when the whole eastern part of the continent, reaching southward to the fortieth parallel, was covered with immense fields of ice, resulting in the peculiar formation called drift. This was in turn followed by a period of warmth, melting and flood, called the Champlain period; and again tropical vegetation took place and the animals began to roam in the forests and the fishes inhabited the waters as at the present day.

The geological history of the earth, its age and the number of years the several groups of oil and natural gas producing strata were in the process of formation.

The first Petroleum age of the earth is known as the Laurentian period and it embraces the Cambrian and Trenton rock of the lower Silurian age. The two ages of the Laurentian period have covered an era of one hundred million years.

The Lima, Ohio, and Indiana oil is produced from the Trenton Rock limestone of the lower Silurian age of the Laurentian period, which covered an era of one hundred million of years in forming. After that period came the Devonian, embracing the Carbon and Permian ages. In this period all the groups of oil and natural gas producing strata in Pennsylvania, New York, West Virginia, Southeastern Ohio, Kansas, Indian Territory, Tennessee and Kentucky were formed. This period covered an era of forty-six million four hundred thousand years. Following this come the Triassic, the Jurassic and Chalk periods, covering an era of fourteen million three hundred thousand years. The Texas and Louisiana oil strata were formed in the Cretaceous age of the Chalk period. Following this period is the Eocene, Miocene, Neocene and Pliocene periods. The oil strata of Colorado, Utah and Wyoming are of the Cenozoic age of the Eocene period; and the oil strata of California is of the San Pablo age of the middle Neocene period. The periods covered an era of two million eight hundred thousand years. This brings us up to the Glacial age, which was five hundred thousand years ago.

GEOLOGY OF ROCKS.

Rocks are found in layers or beds one above another and are called stratified rocks from the Latin word stratum, meaning bed. These layers were made one after another, beginning with the lowest, which is therefore the oldest and is embedded with seaweed, which is the first appearance of vegetable life; and in the succeeding layer is found the first appearance of animal life. Rocks have been divided into three classes, namely, igneous, sedimentary and organic. Igneous rocks are those which have been melted in the earth or have resulted from some volcanic action. Sedimentary rocks are those made from sediment deposited from the waters of oceans, lakes or rivers. Rock thus made from sand is called sandstone; that from mud is called shale, and that from gravel, conglomerate or pudding stone. Organic rocks are those which have been formed entirely from animal, marine and vegetable life, the true sources of petroleum oil and gas.

THE ORIGIN OF PETROLEUM AND THE POWER THAT CAUSES OIL AND WATER WELLS TO FLOW.

Beginning with the Laurentian period, the oldest and deepest strata that the world has any record of as a Petroleum crude oil producer were in the process of formation one hundred and sixty-four millions of years ago. The Laurentian period is underlaid by the Paleozoic period, which had the first rocks and shale that had traces of life. After this period a

APPROXIMATE DEPTH BELOW PITTSBURG COAL.

APPROXIMATE DEPTH BELOW PITTSBURG COAL.

climatic change on the face of the earth took place. This was the period that a vegetable grew which formed the beds of clay. At the close of this period another climatic change on the face of the earth took place, which is known as the Heat period, and during which period the clay beds were baked into shales—slate. This was the under clay of the first or lower Silurian period, when the earth was covered with water which contained marine life. The water in cooling off the earth or baked clay beds caused cracks or fissures in the shale or slate, which allowed the water to fill the porous parts of the earth. While the water was receding vegetable and animal life took place. At the end of this period another climatic change occurred, which completely changed the character of the earth's surface. As a legacy to the world death left Petroleum. Animal, vegetable and marine life were ruthlessly destroyed in this period.

Countless millions of fishes were carried on the crest of the flood. Then the waters subsided and the fish were left floundering in the mud; they could not release themselves; they sank deeper and deeper in the thick deposit, which closed over them and hardened rapidly. The fate of animal and vegetable life on the land was the same. The clay gradually hardened into rock, which enclosed these animal and vegetable forms and held them firmly embedded. In some places this hardening process was so rapid that air was completely excluded from the buried forms before decomposition set in. The animals, fishes and plants remained in their rocky depositories in a state of perfect preservation for centuries. But changes in the earth's composition are constantly taking place. Improvements made by a natural shifting of the strata gradually caused conditions which admitted air to the imprisoned fossils. Disintegration ensued. The result was Petroleum crude oil. It is probable that this decaying matter which has been encased in the rocks for millions of years does not always result in the formation of Petroleum. The presence of other chemical elements is necessary to this, but what they are is one of the mysteries of science. All that chemists know is that Petroleum is a mixture of carbon and hydrogen. But they do not know the proportion in which these elements are combined to make it. Attempts to analyze it have always failed, and no means of manufacturing it artificially has ever been devised.

At the end of this period another climatic change took place. It is an indisputable fact that every layer, seam or change in the earth's formation represents a climatic period in the earth's age. During the several climatic changes the earth has become thicker and heavier. The method in which stratification, by the agency of water, has been effected in bygone times may be understood by a study of the manner in which successive layers of gravel, sand, mud and other formations are deposited in a river or running stream; the same process has been at work through all the periods of time. Sand formations are comminuted fragments of igneous, metamorphic or volcanic rocks, or of chert, flint and other hard formations. They are detached from the parent rock, and as boulders and pebbles are ground against each other by water or in any similar way. The colors of sand correspond to

those of the minerals in the rocks from which they were detached. It may be red, white, gray or black, but when quartzose, as it often is, it is normally reddish-yellow, from oxide of iron. The greater part of the earth's crust, in nearly every land, is found to be thus stratified. Strata may be conformable or unconformable. In the former case there generally is a considerable approach to parallelism among them. It is, however, inferior in exactness to that of cleavage planes. Strata laid down by water, as a rule, retain fossil remains of the animals, fish, mineral and vegetable plants imbedded in them when they were soft and plastic. Metamorphism generally destroys those organic remains, but leaves the stratification undisturbed. Thus, there are two kinds of strata, sedimentary and metamorphic, nearly synonymous with fossiliferous and non-fossiliferous stratified rocks. Most strata have a dip and a strike. The fossils will in most cases show whether strata are lacustrine, fluvial or marine. They prove that deposit was very slow. One stratum may overlap another, or a stratum may thin out, or an outcrop of it may exist. As a rule the lowest are the oldest, but some great convulsion may have tilted over strata in limited areas, so that the oldest have been thrown uppermost. A study of the same beds over a wide expanse of country prevents error in estimating the relative age of strata thus reversed. The thickness of the stratified rocks is believed to be about twenty miles, or one hundred thousand feet thick; thus it is proved that between every sand and fossil formation there is a raw or baked clay, shale or slate formation. As the earth has been constantly growing and at the end of each climatic change it has added another layer on top of the several layers that form the earth; and since it is a fact that below and above each sand layer or porous lime formation impenetrable layers of slate are found which are impenetrable to gas, oil or water, it is made plain for the reader to understand since the earth is round and the oil, water and gas are unable to pass through the shale or slate underlying the porous sand or lime formations, the weight above bearing down upon the sponge-like sand rock forces the gas, oil and water into the pores or cavities of the sand rock. As the water is heavier than the oil or gas, it is found in the bottom of the porous part of the sand or lime formations, the oil next and the gas on top. This explains the fact that at every oil well drilled, where gas or oil is found, the gas comes first, the oil next and the salt water last. It is a known fact the deeper the sand or lime formation that contains oil and gas, the greater is the rock pressure. For example, the highest rock pressure found in the Kansas gas field is four hundred pounds. The wells are from seven to nine hundred feet deep. The highest rock pressure found in the Findlay (Ohio) and Indiana gas fields was seven hundred pounds. The wells are one thousand to three hundred feet deep, while the greatest rock pressure is found in the gas wells in Wetzel county, West Virginia. These wells are thirty-two to thirty-five hundred feet deep, and at a number of them the rock pressure has run up to fifteen hundred pounds. For a further and more simple explanation take a rubber ball, fill it with water and plug the hole with a stick.

Lay the ball on a table or anything that is solid, then place a brick on the ball, pull the stick out and see the result. Fill the ball again with water and plug it with the stick and place two or three bricks on it. Pull the stick out; you will notice that there is a greater pressure on the ball and it squirts the water further. This is the same case with the gas and oil bearing formations. The sides or edges run out thin and closed or round like a ball. The gas, oil and water cannot pass off through the slate in the bottom or through the slate on top, hence it is kept in prison until the drill releases it as the stick releases the water in the ball. All oil wells have more or less gas, but the volume may be small. If the gas is confined in the well for a short time it may raise a rock pressure of from two to fifteen hundred pounds. This is the power that makes the wells flow and is thus explained as the oil or salt water fills up the hole above the gas. It shuts the gas in and as the gas increases in pressure it raises the oil in the well until it has gathered pressure enough to shove the oil out at the top of the hole. This is called a flowing well. A shallow well does not require as much pressure of gas to make it flow as does a deep well. After the head of oil flows out the gas makes a wild, roaring noise, as though it wanted to tear down the derrick or tanks. This noise is made from the pressure of gas that was required to flow the oil out and free the hole. The gas then escapes without any pressure and goes steadily until the well begins to gather another head of oil. After the gas weakens in pressure and volume the well is tubed with two-inch tubing and packed with a rubber packer above the producing sand.

Near the bottom of the hole, in some of the shallow fields, the wells are tubed with one and one-fourth-inch tubing with a rubber wall packer above the producing sand, near the bottom of the well. After the gas gets weak and the well ceases to flow, the tubing and packer are pulled out, and the well is then tubed with two-inch tubing and rodded and put to pumping.

HISTORY OF THE ORIGIN OF LUBRICATING OR HEAVY OIL.

All natural heavy or lubricating oils at one time in the early periods of the earth contained the same specific gravity as all other light or high-grade oils. During the periods of eruptions of the earth, caused by volcanic upheavals or uplifts, which rent the earth, causing crevices and avenues through the several layers of strata which form the earth, an avenue of escape was given to the gas, oil and salt water that was imprisoned in the lower and older rocks. Gas, as it is now known, is the light, gaseous body arising from the animal, marine and vegetable bodies in decomposition, and the salt water from the marsh flooded by the tide. As the gas was held in solution with the oil and salt water in the sand or lime strata it was in a semi-liquid body, but as it was the lightest, and as it rose to the middle layers or strata, it freed itself from the salt water. As it gradually rose to the upper strata

it freed itself from the oil, and at a great number of places it comes to the surface through fissures in the rock and is called gas springs. In many places where oil springs or oil seeps occur this is caused by the gas under-pressure raising the oil near the surface before it is able to free itself. This gas and oil have taken hundreds of thousands of years to get to the surface of the earth. In these countless years the oil was seeping through the several strata of the earth. In its ascension it lost its volatile constituents through long exposure in passing through the several layers of strata, and in this way the gravity was changed from 43° to 28° and 29° gravity. It is known that as soon as a high-grade oil comes to the surface of the earth a large amount of gas leaves the oil, and at once the oil begins to evaporate. This evaporation constantly takes place and the so-called old oil that is stored in large iron tanks at the several places in the oil regions is always mixed with fresh or newly produced oil before refining. The loss in evaporation as well as in the gravity of the oil has always been very great. When it has been stored in tanks and held from ten to fifteen years on the expectation of a great increase in its marketable value, these drawbacks were noticeable, to say nothing of the cost of storage eating up the profit.

The natural lubricating oil, used to oil all kinds of machinery, is produced in the Franklin lubricating oil district at Franklin, Pa. The Petroleum and Volcano lubricating oil is produced at Volcano, W. Va. The Mecca-Belden lubricating oil is produced at Mecca, Ohio. The lubricating oil market in the lubricating oil districts is from three to four dollars a barrel of 42 gallons of oil.

SUBTERRANEAN TEMPERATURES OF DEEP WELLS AT WHEELING, W. VA., AND PITTSBURG, PA.

BY W. HALLOCK.

The question as to the conditions which exist in the interior of the earth has always attracted much attention. The most important factor in the solution of this riddle is the determination or estimation of the temperatures there existing. The British Association has for years seized every opportunity to obtain data as to the rate at which the temperature increases as the earth's crust is penetrated. Some of the most recent and reliable contributions on this subject are by Mr. E. Dunker, of Halle, Germany, and were obtained from a 4,170-foot well at Sperenberg, not far from Berlin, and a 5,740-foot well at Schladabach, near Leipzig.

Early in 1891 a number of the most enterprising citizens of Wheeling, under the name of The Wheeling Development Company, finished a well near Wheeling, on Bogg's Run, on the farm of Squire Keltz. This well was 4,500 feet deep, 4 $\frac{7}{8}$ inches diameter and *dry*; cased only to 1,570 feet. The strata there are nearly *in situ*, undistorted and dipping only fifty feet to the

mile. More satisfactory geological conditions can scarcely be imagined.

The well being dry, ordinary United States Signal Service maximum thermometers were used, and special tests showed that no precautions needed to be taken to prevent circulation of the air. The thermometers were lowered and raised, and depths measured by a steel wire:

Results:

TABLE I.

DEPTH FEET.	TEMP. FAHR.	DEPTH FEET.	TEMP. FAHR.
1350	68°.75	3125	88°.40
1591	70.15	3232	89.75
1592	70.25	3375	92.10

2875	85.45	4462	110.15
2990	86.60
		100	51°.30

These observations when plotted show a slow increase for the upper half of the uncased portion, about 1° F. for 80 to 90 feet, whereas the lower part shows a more rapid increase, about 1° F. for 60 feet; the whole series giving a well-defined and regular curve, with a slight deflection at 2,900 to 3,000 feet, where oil sand occurs. Practically all the rest of the uncased well is in shale. The increase in the rate at which the temperature rises as the bottom is approached can only be temporary, or we should have an inconceivable or improbable state of temperature at comparatively slight depths.

The two distinct series of observations combined in Table I. nowhere disagree more than 0°.3 F. and hence may be looked upon as very reliable and accurate.

Table II. gives a comparison of the results at the four great wells.

TABLE II.

NAME OF WELL AND LOCATION	FEET FOR 10 FAHR.	TOTAL DEPTH	TEMPERATURE AT TOP	TEMPERATURE AT BOTTOM
Sperenberg, near Berlin	59.2 ft.	4170 ft.	47°.8 Fahr.	118°.6 Fahr
Schladabach, near Leipzig.....	65.0	5740	51.9	135.5
Wheeling Development Co.				
Top and greatest depths.....	74.3	4500	51.3	110.3
Mean of lower 3,000 ft.....	75.4			
Pittsburg, Peter's Creek.....	71.5 } to 5000 ft.	5386	51.0	{ at 5000 ft. 120°.9

A series of observations in a coal mine near the well gave us a very probable value of the temperature of the top invariable stratum 51°.3 Fahr. From the mean and annual temperature of Marietta and Stubenville as reduced by Schott it might be taken at 51°.5 Fahr.

Samples of air were taken at the bottom of the well, but their subsequent analysis revealed nothing of especial interest.

This well was drilled by T. S. Kinsey and his two sons, of Wellsburg, W. Va.

When the observations of 1891 were finished, an oak plug was driven into the top of the casing and thus the hole protected. In July, 1893, the hole was opened, and it was found full of fresh water to within forty feet of the top, having leaked full in something less than two years. Those who should know have no doubt that this water entered at the lower end of the inner casing, i. e., at 1,570 feet below the surface.

It was very desirable to obtain a series of temperatures with the water in the well, to discover the extent to which its circulation would or does effect the distribution of temperature in the hole.

The ordinary signal service mercurial maximum thermometers were used, inverted, as in 1891. They are enclosed in a heavy, sealed glass tube to protect them from the pressure of the water, and were used in pairs and all corrections applied. The two always agreed within 0°.2 F., except once at 2,669 feet, when one evidently failed to record correctly. The two thermometers were in an iron bucket, three feet long and three inches in diameter at the end of the wire, and two were in an open frame, two hundred and sixty feet from the end of the wire. The temperatures at depths of one, two and three hundred feet were determined with other thermometers separately lowered from the top of the well.

The results are given in Table III. The first column contains the depths in feet; the second, the corresponding temperatures in degrees Fahrenheit, as they were found July, 1893. In column three are the temperatures interpolated from Table I., as found in July, 1891. The last column gives the differences, or rise in temperature, in the well in two years

At 3,200 feet an obstruction occurs, which I was not able to remove with the available tools and which temporarily prevented an investigation of the lower 1,300 feet of the well. A glance at the fourth column in Table III., shows that the temperatures in water in 1893 are practically identical with those in air in 1891.

TABLE III.

Depth in feet	Temperatures in Fahrenheit.		1893. mims. 1891
	1893	Interpolated from 1891.	
103	52°.53
206	53.53
311	55.03
1586	70.12	70°.15	-°.03
1921	75.95	73.82	+°.13
2055	75.28	75.42	-.14
2276	78.13	77.93	+°.20
2396	79.54	79.45	0.09
2539	81.21	81.15	0.06
2669	83.39	82.75	0.64
2793	84.56	84.41	0.15
2937	86.12	86.07	0.05
3057	87.42	87.50	-.08
3196	89.27	89.30	-.03

Only once does the difference amount to $0^{\circ}.2$ Fahrenheit, and these differences show no evidence of a warming in the top and cooling in the bottom, as we would naturally expect. It seems to me we are thus compelled to believe that there is not an appreciable circulation even of water in a hole of five inches in diameter.

The Forest Oil Company, of Pittsburg, Pa., are at present at work upon a well which is already the deepest on this continent and the third in the world, and will be raised to the second place if care and enterprise can do it. It is already the deepest ever drilled with a cable, its rivals in East Prussia having been put down with rotating diamond core drills. The well, in February, 1897, is 5,386 feet deep, about $6\frac{1}{8}$ inches in diameter of casing, which is only a little over 900 feet in depth. The well is dry and has an inlet of gas at a depth of 2,285 feet.

The geological conditions of this well are almost identical with those at Wheeling. The well is on Peter's Creek, on the farm of Wm. Bedell, about $2\frac{1}{2}$ miles west of West Elizabeth and about 12 miles south-east of Pittsburg.

Mr. Young, the vice-president and manager of the Forest Oil Company, has very kindly consented to the use of the well for the investigation of the underground temperatures at that place, and hence we have here a rare chance for obtaining more data as to the interesting question of earth temperatures.

Mr. E. E. Crocker, the superintendent of that section, went with me to the well and was of the greatest assistance, both with advice and hands. The drillers also contributed in a large degree to the ease and success of the expedition. It is indeed gratifying to find "practical men" so interested in scientific questions and so willing to put up with what to them must appear useless trifles. The actual work at the well is in the hands of S. W. Colman, H. A. Stroup, Clif. Young and Eugen O'Brian; Mr. Joseph Kegan having direct supervision of the wells in that particular district. It would be difficult to find a lot of men better qualified to "break the record," and carry this well to its utmost depth.

The thermometers were lowered upon a steel tape marked at every 50 feet, which was wound up upon a spool attached to the shaft of the engine.

A pair of readings was made at 2,250 and 2,350 feet, i. e., just above and just below the inlet of gas. The reading at 2,250 feet was about 78° Fahrenheit, which agrees well with the same depth at Wheeling, but the thermometers could not be let down long enough to give a thoroughly satisfactory reading. The thermometers at 2,250 feet indicated a cooling due to the expansion of the gas amounting to about 14° .

Four thermometers were lowered to a depth of 5,000 feet at 5 p. m. on the 5th of February and taken out at 9 a. m. on the 6th; they gave a record at that depth of 120.9° . This means a temperature of about 127° at the bottom, 5,386 feet below the surface of the earth.

A careful comparison of this record with the Wheeling temperature will show that the two are almost identical for the same depths; for example, extrapolating from the Wheeling well to 5,000 feet we get 119.6° as against 120.9° at Pittsburg.

Science is indebted to Professor I. C. White for the diversion of the Wheeling and Pittsburg wells into scientific channels, and the U. S. Geological survey has generously contributed toward the payment of the expenses incident to these investigations.

In the late spring or early summer it is hoped that a fuller record of the temperatures in the well can be obtained.

The well which stands without a peer on earth is at Paruschowitz, near Reibnik, in Eastern Silesia. More than two years ago it was over 6,500 feet deep, and it was the intention to go to about 8,800 feet (2,700 meters). No recent report has been had from it, and temperature observations were not to be commenced until the well was finished. We may, however, rely upon the Germans to give us a thorough and trustworthy record, when the time comes.

[FROM THE PROCEEDINGS OF THE AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE, VOL. XLII, 1893.]

NOTE ON FURTHER OBSERVATIONS OF TEMPERATURE IN THE DEEP WELL AT WHEELING, W. VA. BY WILLIAM HALLOCK, COLUMBIA COLLEGE, NEW YORK, N. Y., JULY, 1903.

[ABSTRACT.]

When the observations of 1891 were finished, an oak plug was driven into the top of the casing and thus the hole protected. In July of this year the hole was opened and it was found full of fresh water to within forty feet of the top, having leaked full in something less than two years. Those who should know have no doubt that this water has entered at the lower end of the inner casing, i. e., at 1,570 feet below the surface. This water can be easily bailed out, and will be when drilling is commenced.

I was very desirous to obtain a series of temperatures with the water in the well, to discover the extent to which its circulation would or does effect the distribution of temperature in the hole.

The ordinary signal service mercurial maximum thermometers were used, inverted, as in 1891. They were enclosed in a heavy, sealed glass tube to protect them from the pressure of the water, and were used in pairs and all corrections applied. The two always agreed to within $0^{\circ}.2$ F., except once at 2,669 feet, when one evidently failed to record correctly. Two thermometers were in an iron bucket, three feet long and three inches diameter at the end of the wire, and two were in an open wire frame, two hundred and sixty feet from the end of the wire. The temperatures at depths of one, two and three hundred feet were determined with other thermometers separately lowered from the top of the well.

The results are given in Table I. The first column contains the depths in feet; the second, the corresponding temperatures in degrees Fahrenheit, as they were found in this July, 1893. In column three are the temperatures interpolated from Table II, as found in July 1891. The last column gives the differences, or rise in temperature, in the well in two years.

At 3,200 feet an obstruction occurs, which I was not able to remove with the available tools, and which temporarily prevented an investigation of the lower 1,300 feet of the well. It is not serious—a heavy tool will easily open the well completely. A glance at the fourth column in Table I shows that the temperatures in water today are practically identical with those in air two years ago.

TABLE I

Depth in Feet	Temperatures in Fahrenheit		1893. Mims. 1891.
	1893	Interpolated from 1892	
103	52°.53
206	53.53
311	55.03
1586	70.12	70°.15	—°.03
1921	73.95	73.82	+°.13
2055	75.28	75.42	—°.14
2276	78.13	77.93	+°.20
2396	79.54	79.45	0.09
2539	81.21	81.15	0.06
2669	83.39	82.75	0.64
2793	84.56	84.41	0.15
2937	86.12	86.07	0.05
3057	87.42	87.50	—°.08
3196	89.27	89.30	—°.03

TABLE II.

Depth in Feet	Temperature, Fahr.	Depth in Feet	Temperature, Fahr.
100	51°.30	2990	86°.60
1350	68.75	3125	88.40
1591	70.15	3232	89.75
1592	70.25	3375	92.10
1745	71.70	3482	93.60
1835	72.80	3625	96.10
1992	74.50	3730	97.55
2125	76.25	3875	100.05
2236	77.40	3980	101.75
2375	79.20	4125	104.10
2486	80.50	4200	105.55
2625	82.20	4375	108.40
2740	83.65	4462	110.15
2875	85.45

Only once does the difference amount to 0°.2 Fahrenheit, and these differences show no evidence of a warming in the top and cooling in the bottom, as we would naturally expect. It seems to me we are thus compelled to believe that there is not an appreciable circulation even of water in a hole of five inches in diameter.

All the results, down to 3,200 feet, give a gradient of 1° Fahrenheit for every 81.5 feet, whereas the last few hundred feet show about 1° Fahrenheit increase for every 60.0 feet. The expense of these supplementary tests were born by the United States Geological Survey and it is with the Director's permission that this note is published.

Development of Illumination and the First Use of Oil for Light and Heat.

The Invention of the Kerosene---Refining Process of Crude Oil and the Invention of Lamps with Air Burners and Glass Globe Chimneys.

Before the period of artificial illumination there were many manifestations of light in nature coming to the aid of the denizens of the earth during the hours of darkness. Of these were the so called luci-form appearances, including the aurora borealis and australis, which enliven the long nights at the polar zone; the magellan clouds of the Southern Hemisphere; the zodiacal light, whose cause was long a subject of speculation, and the diffused light of the milky way, known to the Chinese as the "river of the sky."

The light from the stars and planets is not inconsiderable. Under the clear night of the Arizona deserts the atmosphere seems charged with star mist; eminences miles away may be outlined, the dial of a watch may be read, and a trail followed with little difficulty. These are the conditions under which night journeys are made to avoid the burning sun. The planet Venus, at inferior conjunction especially, sheds light sufficient for the traveler over open country.

There are at times nights of remarkable luminescence. Clouds become phosphorescent, and often under certain states of electric stress, during high winds, glimmer with a faint light not amounting to a discharge of the electric fluid. Frequently successive flashes of "heat lightning" aid the traveler in finding his way. It is possible, also, that the soil over certain regions may become phosphorescent under the light of the sun and retain the property during the night, as certain gems are phosphorescent after being submitted to sunlight. Snow has this property. Gaseous emanations of a phosphorescent character are occasionally abundant enough to produce temporary illumination.

Next to the sun in value to man as a light producer is the moon. Though intermittent in the power and duration of its light, the moon has proven a valuable auxiliary on the night side of man's life, and its period has given a measurement of aggregates of time.

In torrid climates, and at hot seasons of the year, work is often carried on by moonlight in order to escape the heat of the day. While moonlight is 450,000 times less bright than daylight, under cer-

tain favorable conditions the light seems intense and ample for many purposes.

The well-known phosphorescence of lichens has been found to give considerable light during warm moist nights in the summer. Certain flowers are phosphorescent, or emit flashes of light, as the tuberose and moonflower. In the vegetable world there are numerous sources of light whose faintness cause them to escape ordinary observation. As an aid to man, however, the light from the vegetable kingdom is far less useful than that yielded by the animal kingdom.

When the animal kingdom is reached, numerous examples of light phenomena connected with vital processes are found. The familiar firefly of northern latitudes frequently renders summer nights luminous, while the tropical noctilucidae yield an actual and valuable illumination which has been utilized as light in several interesting ways by the inhabitants of regions in which the insects are found.

The distinguished traveler Kaempfer described the fireflies of Siam as "settling upon the trees like a fiery cloud," and in Brazil Gardener compares them in brilliancy with "stars that have fallen from the firmament and are floating about without a resting place." Kidder says: "In the mountains of Tijuca, I have read the finest print of the American newspapers by the light of one of these natural lamps placed under a common glass tumbler, and with distinctness I could tell the hour of the night and discern the very small figures which marked the seconds of a little Swiss watch. The Indians formerly used them instead of flambeaux in their hunting and fishing excursions, and when traveling in the night they are accustomed to fasten them to their feet and hands. And they are used by senoritas for adorning their tresses. Prescott narrates the terror they inspired in the Spaniards in 1520. "The air was filled with "cocuyos," a species of large beetle which emits an intense phosphoric light from its body strong enough to enable one to read by it. These wandering fires seen in the darkness of the night were converted by the besieged into an army of matchlocks," so says Bernal Diaz."

ANCIENT TORCHES AND CANDLES

ECLIPSE OIL REFINERY
FRANKLIN, PA.

The bearing of the light of the firefly on the light of the future is very important, and the investigations carried on at the Smithsonian Institution a few years ago may introduce a new epoch in illumination. Some interesting experiments on the nature and origin of the light emitted by the firefly have lately been made by Prof. S. P. Langley. From the stereoscope he finds the light to be of exceedingly narrow range of refrangibility. The heat given out is scarcely appreciable, being less than one-half of 1 per cent of that produced by an equal amount of light from a candle or other common illuminant. That the light is a chemical product would seem to be established by the fact that it decreases by products which check combustion (e. g., nitrogen), and increase by products which aid combustion (oxygen), and that the product of the process is apparently carbonic dioxide. The subject of the origin of 'phosphorescent' light is one that may developed very interesting features, for as graphically stated by Prof. Oliver L. Lodge, if the secret of the firefly were known, a boy turn-a crank might be able to furnish the energy necessary to light an entire electric circuit. From this standpoint Professor Lodge regards as enormous the waste of energy in the machinery of electric light making now in use."

Most of the 150 species of animals which are light producing inhabit the sea, where their light is of small importance to man. The wonderful phosphorescence on the tropical seas, which has drawn forth many descriptions of its beauty, is caused by the collective lights of myriads of infusoriae on the surface of the water.

The day opens up a vast field of activities requiring light for their prosecution. Solar light is normal for the carrying on of these activities, and the night is normal for rest and recuperative processes. The important phenomena of the day are sunrise and sunset; and the day's labor regulates itself to twilight, morning and evening hours, and the hours of broad day divided by the meridian of the sun. Sunrise is attended with certain phenomena, which observant people have noticed.

The Hopi tribe of Arizona, for instance, employs the following terms for sunrise: *talavaiya*; place of sunrise, *tarva yum tyaki*; faintest dawn, *kuyaniptu*; first light, *talti*; light of sunrise, *talaove*; yellow light of sunrise, *sikyanupti*; before emergence of sun, *tawa kuyiva*, "sun appears;" sunup, *tarva yama*. Few tribes indeed have not been impressed with dawn and sunset, and few in oblique latitudes have failed to mark the seasonal progress of the sun along the horizon.

There is a wide difference in the amount of sunlight enjoyed by the dwellers on the earth's surface, depending on the height and configuration of the land, its absorptive and reflective qualities, the presence of forests and vegetation, the amount of moisture and dust in the air, cloud formation, and other elements which suggest themselves to the reader, producing local and periodical variation. To these must be added the seasons and the

position in latitude determining the length of the day and duration of twilight.

The superabundance of sunlight has brought many devices for warding off and tempering the rays and ameliorating their heat. For protecting his eyes from the excessive light man has devised eyeshades, hats, and parasols; and for shade and protection from the heat, shelters of brush, skin, or cloth. In some environments the chief function of the house seems to be for shelter against a burning sun, and this points out a probable origin of the house in tropical countries.

Nowhere is this regulation of daylight more thoroughly carried out than in our modern houses of the temperate regions, whose development has been along praiseworthy lines of more light and air. What the ancients directly accomplished by small light openings requires now hangings, lace curtains, inside shutters, blinds, perhaps sash curtains, outside shutters, and an awning. These may be further reinforced by shade trees. With all these adjuncts one might be led to believe that the dim light of the early houses is still preferred by the moderns.

As a corollary of protection from the sun follows the observation that tribes living in the shade become lighter in color than their fellows living in the open country. It is also true that there is a characteristic facial modification, such as wrinkling and contorting about the eyes produced in those who are exposed to the glaring light of the deserts or the sea.

Without doubt man is a diurnal animal; his eyes have not the condensing power of those of the *Felidæ* and other nocturnal beasts. The man apes are also day animals, and those tribes of mankind retaining a degree of primitiveness regulate their rest to the setting and rising of the sun.

With the use of fire begins the history of artificial illumination. The nocturnal light of nature became then of little moment in comparison with fire lights and the burning brand in the hand of man; the conquest of light over darkness was signalized and the night side of man's life and his progress toward culture became a theme of surpassing interest.

There perhaps cannot be a satisfactory reconstruction of the period before the knowledge of fire, and the difficulty persists in the subsequent stages of the acquisition and use of fire, and the generation of fire at will—stages grasped by the philosophic mind of Paul Broca.

One fact stands out clearly—that man unacquainted with fire is unknown. With the light of the camp fire comes the torch and from this starting point, by the help of observations on less civilized peoples, it may be possible to reconstruct the history of artificial illumination and to check it in some degree by the aid of archaeology.

The following table, briefly epitomizing the development of the candle, is presented as the result of extended research in this direction:

DEVELOPMENT OF THE CANDLE.

Protoillumination in lieu of torch:

Fireflies used as torches. Fat bodies of birds and fish burned for light.

Prototorch (adventitious and temporary):

1. Firebrand, branches, resinous wood, bark, leaves, etc.

Torch (for customary use):

2. Slivers or other elements tied together in a bundle.
3. Roll of resin wrapped in leaves.

Protocandle:

4. Rope soaked in resin.
5. Fiber soaked in fat or wax.
6. Rush soaked in grease.
7. Stick or splint with grease for lighting.

Candle:

8. Mass of fat formed upon a stick around which is wound a wick of fiber.
9. Candles of wax or fat.
10. Dipped candles.
11. Molded candles; improved and art candles of twentieth century.

While the line of development has proceeded from the rude torch to the candle, the steps marked in the series are suggestive, embracing devices used by different peoples and at divers times. There is not space here to present the result of investigations among different peoples and in special areas. It will be seen that the purpose for which light is to be used, the place in which it is to be used, the period, and the resources of the environment, are among the modifying influences on materials and apparatus. Hence the complete steps of the development may not be exemplified in a given area, though a number of superposed phases of light utilization may exist side by side. It is true, also, that the growing need of light has brought a closer association of the means of illumination with the life of man. The smoking torch, for example, is utilized for open air illumination, while the candle enters the house and companionship of the family.

Following the torch in the line of development comes the lamp, which separated from the stem of the torch at a period when oils and fat came to be used. This may have occurred (1) as a concomitant of migration or after the domestication of animals whose fat was available; (2) at the time of the discovery of mineral oil, (3) or of the utilization of vegetal oils, such as that of the olive and the coconut.

The lamp appears to have arisen at a period after migrations into the temperate zones had brought man into new conditions. The principal of these was the longer night, and joined to this was the settlement in comparatively permanent habitations. In this view the fire stick and torch were the essential accompaniments of early migration and without doubt determined the spread of man over the earth's surface.

Since the torch, from its perishable character, is

rarely found on ancient sites, there is little to be said as to its archaeology. The lamp, on the contrary, being a higher idea, involves work in stone, pottery, bronze, or iron, producing objects which survive burial in the soil. Discoveries by French archaeologists have shown that the lamp was in use at the close of the lacustrine bronze age, and up to the present time these are the most ancient objects which have been found that are unmistakably lamps.

It would seem that the lamp with a wick had its origin at a culture plane represented by that of the bronze age, though such employment of fire might have been prefigured by usage in the age of polished stone. Again, the latitude and consequent difference in temperature of stations have exerted controlling influence on the character of the early lamps which it might be possible to employ. Thus climatic conditions render the fuel supply of the lamp or fluid and broadly determine the form of the reservoir.

It is almost safe to say that the higher types of illuminating apparatus would not have been developed except in the temperate zone or the region of long nights. The tallow candle is a device of cold regions; the same may be affirmed of the open fat lamp. The form of the latter seems to depend upon the character of its fuel supply, and this cause no doubt constantly gives rise to forms of extreme primitiveness in the midst of a high civilization, aside from those descending from the primitive type and retained in use through the working of the large body of survivals of custom in every society.

DEVELOPMENT OF THE LAMP.

The series might have grouped at the beginning devices for producing a temporary light and those undifferentiated lamps of skulls and bones. The bodies of birds and fish burned by means of a wick also may be classed with the lamps.

1. Oil bag from which oil is thrown on a fire to produce a temporary light. Kwakiutl Indians, British Columbia. Lighting apparatus of skulls or bones suggestive of primitive lamps.

2. Lamp. Unworked beach stone with a cavity supplied with oil and having the wick laid along one edge. Aleut shell heaps.

3. Lamp. Hollow beach stone with moss wick arranged along one edge. Worked stone lamps. Eskimo.

4. Lamp of pecten shell with oil wick of rush pith. Anios, Japan. Fusus shell hanging lamp. Orkney islands.

5. Lamp. Terracotta saucer, China. India, etc.

6. Terracotta saucer with edge pinched up into gutter or gutters for wick. Syria and India.

7. Lamp. Terracotta. Reservoir almost closed over; spout for wick. Lamps of pottery with reservoir almost closed over; spout for wick. Lamps of pottery with reservoir closed over. Lamps of bronze with one or more wick spouts. Roman.

8. Lamps of iron of simple shape with plain open or closed reservoir and with spout, and often hav-

MODERN LAMPS AND LANTERNS, FOR BURNING REFINED OIL,

ing dip catchers and a device for tipping to allow the oil to reach the wick. There is considerable variety of such lamps, which were used in Europe before the epoch-making invention of Argand. Being products of the blacksmith's hammer, they present a certain crudity, as of antiquity. However, there is no reason to doubt that they are the survivals of the forms of the iron age.

It may be interesting to briefly pursue the line of the lamp into the inventive age.

LAMPS OF THE INVENTIVE AREA.

9. Lamp of brass with reservoir mounted on rod and stand; several curving spouts. Italian. Development from the Roman lamp.

10. Lamp of brass designed to furnish heavy oil to the wick under hydrostatic pressure. Flemish.

11. Lamp with chimney; draft to flame and heavy oil under gravity pressure. Argand's invention and French inventors.

12. Lamp with chimney and Argand burner; heavy oil under forced pressure of a spring. Devices for heating heavy oil. France.

13. Lamp of glass having one or two tubes; for burning whale oil.

14. Lamp burning "camphene" by means of wick and tubes and without chimney. United States.

15. Lamp with chimney; ventilated burner; woven wick raising refined petroleum by capillarity. United States, 1870. Developed burner to end of century.

At present the destiny of illumination is in the hands of the investigator and inventor. Who knows to what heights their efforts will lead? But before the inventive era, before Argand; if you please, the world satisfied its needs for light with the immemorial simple lamp and smoky torch, increasing the illumination at times by multiplying the number of lights, and casting over scenes of splendor the flare of torches little removed in simplicity from those of prehistoric man.

It may be a wholesome correction of our pride in the advance of a century to reflect that most of the human race is still in the uninventive period, depending for light on torches and simple saucer lamps.

The epoch-making invention of the chimney and the discovery of boundless hydrocarbons in the earth have not yet reached the majority of mankind, while the electric light casts its bright rays in a very small area of immense obscurity. Still there is progress, and gradually tribes from their beginnings unacquainted with more than the most simple illuminating methods are seeking more light.

It is interesting to note in this connection the education of the Hopi Indians of Arizona in the use of artificial illumination. The environments of these Indians is semi-arid, and there is such scarcity of fuel in their isolated country that it must be used sparingly for cooking and only as a luxury for illumination. Hence, up to a few years ago, all avocations ceased at dark. Four years ago the writer, while encamped at Walpi, noticed only a solitary light at night in the pueblo. There was at that time a demand for candles. Two years later a number of lights shone from the windows of the village. Lately kerosene oil has become known; a great many families possess the lux-

ury of a kerosene oil lamp, and this has worked a great change in the habits of people. This seems in epitome the history of illumination.

A SCIENTIFIC PROBLEM FOR THE CAUSE OF THE FLAME OF A TORCH, CANDLE, OIL LAMP OR LANTERN SOLVED.

A burning torch, candle, oil lamp or lantern is a small gas factory. No matter in what state any material is, whether it is a solid like wax and tallow, or a liquid like alcohol, crude or refined oil, it must first be converted into a gas before we can have a flame. The only difference between a torch, candle, oil lamp and lantern and the sources of natural gas or gas factories is that the gases of the torch, candle, lamp and lantern are not made at a distance and conveyed by means of pipes to distant burners, but they are manufactured on the spot and consumed as fast as they are made. Our ordinary candle is made of oil, wax and tallow, a solid which consists mainly of two substances, one of which is called carbon, the other hydrogen. The burning of the wick melts the wax or tallow near it. This molten wax or tallow is absorbed by the wick and carried to the flame. It is the same the liquid is changed into gases. The decomposition of the molten wax or tallow is absorbed by the wick and carried to the flame. It is the same with the torch and lamp and lantern. The oil is absorbed by the wick from the reservoir and carried to the burner where it is changed into gases. The decomposition of the molten wax and tallow and the heating of the oils yield acetylene gas, marsh gas and olifient gas, and these burn with a flame. By burning we mean that the carbon and hydrogen of these gases unite with the oxygen of the air with sufficient heat to make a flame. Flames may be luminous, as the ordinary yellow gas flame, or non-luminous as the bluish flame you get in your gas stove. The ordinary gas flame is a luminous particle of carbon which, set free by the burning, is made to glow. You can prove this statement by holding a cold plate or any cold object so that the open flame of the torch, candle or lamp will strike it. After holding the object over the flame a short time, remove the object, and you will see a deposit of carbon black commonly called soot. This soot is the carbon which has come from the acetylene gas. The great heat of the flame makes the finely divided carbon particles glow in the flame. The light of the Welsbach incandescent is due to the glowing of the incombustible materials of which the mantles are made. The same can be said of the glass and other materials used in making torches, lamps and lanterns.

HISTORICAL DATA.

Before proceeding to an account of the oil trade which relates to the world, it is proper to describe the chemical character of Petroleum. As expressed by the etymology of the word, it means rock oil.

From the Encyclopedia Britannica the following quotation is made: "The proximate principles of Petro-

leum have been determined and examined chiefly by Schorlemmer in England, Pelouze and Cahon in France and C. M. Warren and S. P. Saddle in the United States. Many other chemists have contributed valuable assistance to the work. These researches have established the fact that Pennsylvania Petroleum consists chiefly of two homologous series of isomeric compounds, having the general formula C_nH_{2n+2} , at one extremity of which marsh gas is found, and solid paraffine at the other." In other words, Petroleum is a compound of a series of animal, mineral, marine and vegetable hydro-carbons, beginning with a union which contains the smallest possible quantity with the largest possible quantity of hydrogen which could unite with such an infinitesimal particle of carbon, and descending in the series with each union in the course containing less hydrogen and more carbon than the one above it, until the union last formed is all carbon, except the faintest conceivable trace of hydrogen. This last in the series is solid paraffine, while the beginning, next to pure hydrogen, is the lightest of gases. Petroleum, therefore, includes not only oil of various gravities in a liquid state, but also the substance spoken of in the oil country as "natural gas," and also paraffine, whether in a semi-liquid or a solid condition. Heavy oils contain more carbon and less hydrogen than oil of lighter gravity. Ohio oil and Baku (Russia) oil are noted for the large amount of carbon in their composition, while most of the oil produced in Western Pennsylvania, excepting the Bradford oil, has less carbon. The yield of illuminating oil is, of course, greater from Pennsylvania oil than from that produced in Ohio, Texas or Oklahoma. This is because of the excess of carbon in the latter. It is well to note the fact that the great bulk of oil produced in the United States is found on the western slope of the Alleghany Mountains, or upon the plane of their base, though in part, as in Ohio and Indiana, some distance westward from the foot of the slope. Oil is found in Colorado, Kansas, Texas, Wyoming and California in paying quantities.

As early as 1833 the older Silliman, of Yale College, contributed to the *American Journal of Science* an interesting account concerning a Petroleum spring near Cuba, in Alleghany county, New York, after he had in person visited the spring and examined the oil upon its surface. Nearly fifty years later there was opened in the vicinity of this spring a large territory of oil production. In 1855 the younger Silliman made a thorough chemical analysis and test of oil brought from Venango county, Pennsylvania, the results of which he embodied in a report to Eveleth & Bissell, of New York.

MANUFACTURE OF PETROLEUM PRODUCTS

COMMUNICATED TO THE SOCIETY OF ARTS, MASSACHUSETTS INSTITUTE OF THEOLOGY, MARCH 14, 1872, BY S. DANA HAYS, STATE ASSAYER AND CHEMIST FOR MASSACHUSETTS, ETC., ETC.

By referring to any authentic shipping-list, the number of thousand gallons of crude and refined Petroleum sent away from the United States every day and week may be ascertained; and very little search in this di-

rection develops statistics that are surprising to persons previously unfamiliar with them. As, for example, the total value of the crude and refined Petroleum exported last year (1871), estimated at a low average value of twenty-five cents per gallon, amounts to nearly *thirty-five millions of dollars*, in one year. And it is especially notable that a considerable proportion of this material is classed as "refined," and consists of products manufactured from the crude Petroleum of the wells before shipment. There is certainly no other article of commerce exhibiting similar statistics of production and manufacture among the industries of this country.

The object of this memoir is to briefly sketch the history and present condition of the manufacture of Petroleum—a manufacture which is of great importance, and which, after the diligent study given to it, and under skillful management, yields products superior to those obtained in Europe and elsewhere, from the same crude material.

Having had uncommon opportunities for making myself familiar with the manufacture of Petroleum products, after careful investigation, and in the correspondence of others, I find it generally acknowledged that to Mr. Joshua Merrill, manufacturing chemist of the Downer Kerosene Oil Company, of Boston, more than to any one else, belongs the honor of bringing this manufacture to its present advanced state; and, as an account of his labors and discoveries in this connection would provide a nearly complete history of the art, I take pleasure in recording some of them in this form.

COUP OIL.—The first coal oil made for sale in this country was produced at the works of the United States Chemical Manufacturing Company, in Waltham, Mass., by Messrs. Philbrick and Atwood, early in 1852. It was made, in connection with the picric acid, benzole and other products, from coal tar; and was named by Luther Atwood, the inventor, "Coup Oil," after the *coup d'etat* of Louis Napoleon, which had taken place a few months before.

This was a lubricating oil for machinery, of which a hundred and seventy-five thousand gallons were made. It was used by many of the largest factories and railroads, and at that time was so highly esteemed that Messrs. Atwood and Merrill were employed to make and sell it in Glasgow, Scotland, for Messrs. George Miller & Co., in 1855 and 1856. But if compared with a neutral hydro-carbon lubricating oil of the present day, it would be considered entirely unmerchantable, on account of its very offensive odor and other comparatively poor qualities.

EARLY EXPERIMENTS.—In 1856 Mr. Samuel Downer, who had previously been a successful sperm and whale-oil merchant, erected buildings in South Boston, and employed Mr. Merrill to manufacture hydro-carbon oils for lubricating purposes especially; and a great many experiments were tried there, on a manufacturing scale, with different forms of apparatus; and to determine the most suitable crude material from which to make these oils.

About four hundred tons of Trinidad bitumen, and one hundred tons of Cuban "chapotote" were con-

sumed, and converted into lubricating and burning oils, during these early experiments. The experience gained in this way, and the many difficulties then overcome, proved of great service in the latter operations at these works.

THE FIRST ILLUMINATING OIL.—Light coal oil products appear to have been used by individuals in this country, for illuminating purposes previous to this time; but upon the introduction of the Knapp and Dietz lamps, which were originally designed for burning resin and other oils, it was found that some of the light hydro-carbons obtained from these West Indian bitumens burned freely in them, yielding a bright and beautiful light as compared with that from the animal oil lamps and candles previously in common use. This was an important advance, and inaugurated the general burning of these hydro-carbons in lamps in this part of the country; the first illuminating oil having been made by Mr. Merrill, from Trinidad bitumen, in 1856.

ALBERTITE PRODUCTS.—In the spring of 1857, the first attempts to use the Albert coal, from Hillsboro, New Brunswick, as a source of lubricating and illuminating hydro-carbon oils, were made at South Boston. But the condensing apparatus, which had been used when distilling other coals and bitumens, was found to be unsuitable for this new material, as a black asphaltum-like substance passed bodily over out of the retorts, and often closed the cool pipes of these condensers. This difficulty was only overcome after six months spent in experimenting by Mr. Merrill, who then invented an atmospheric condenser, which, being constructed of large hollow disks, allowed this tarry distillate to pass through, with the more liquid hydro-carbons, from which it was separated afterward. With this improved apparatus, the Albertite proved such a valuable material that, in the fall of 1857, six retorts, each having a capacity for twelve hundred pounds of coal, were erected in the open air, with the new condensers attached, and together yielded about three hundred and sixty gallons of crude coal oil in twenty-four hours. Twelve more retorts were soon added to these six, out of doors. After Mr. Downer had made contracts with the Albert Mining Company for a regular supply of their mineral, thirty retorts were erected in a substantial brick building; and these were followed by twenty more, the first eighteen having been worn out and removed. These fifty retorts were used for more than four years, and produced at the rate of nine hundred thousand gallons of crude, or six hundred and fifty thousand gallons of refined oils each year—quantities very much larger than were anticipated when the first experiments were made, in 1856.

A very large part of the products from this Albertite mineral were hydro-carbons used for lubricating purposes; and their acknowledged excellence was entirely due to the untiring labor and skill of the manufacturing chemist. It is almost impossible for persons unfamiliar with the distillations of this mineral to realize at the present time, when similar processes are in common operation, how many obstacles there were to success in these early days. Many of the best forms of steam-distilling, and other apparatus now in use, were employed and perfected then.

"CRACKING."—One observation made by Mr. Merrill during the manufacture of Albertite products became of such practical and scientific importance in after years that it is worthy of special description here.

The light or "thin" products, afterwards used as illuminators, were for a long time unmerchantable, and the production of them was undesirable; but it was observed that every time the crude coal oils, or the heavy lubricating oils made from them, were distilled, these thin, light-colored hydro-carbons were invariably produced at first by the distillation, although the oils in the apparatus had been previously fractioned with great care.

This caused so much loss of material that every endeavor was made to prevent it; such as surrounding the upper part of the stills with heated flues, and covering their tops with sand, or other poor conductors of heat. But these efforts to prevent the decomposition only served to demonstrate that any distillation of these hydro-carbons is necessarily *destructive*, and that the light distillates were produced by condensation of vapors in the upper part of the distilling apparatus, which, falling back into the body of the heated fluid, to be again raised in vapor, were thus decomposed, with the deposition of carbon, into lighter and thinner hydro-carbons. Further experiments showed that these hydro-carbons could be so easily decomposed that the *continuous* production of light distillates, having a specific gravity of about .818 (42° Beume), was effected from hydro-carbon oils having a specific gravity of .880 (30° Beume) in an apparatus holding a thousand gallons, by properly regulating the heat applied; the other products being only uncondensed gases, and deposited carbon left in the apparatus at the end of the distillation. These light distillates became valuable for use in lamps some time afterward, and the manufacturer's difficulty was thus removed; but the unstable nature of these hydro-carbons, and the ease with which they may be "cracked," was practically demonstrated when endeavoring to overcome an annoyance.

KEROSELENE.—Any account of the Albertite products would be incomplete without mention of the lightest naphtha obtained from it, which was known as "keroselene." This was made by Mr. Merrill in 1857, just after the first successful distillation of the New Brunswick mineral; and it was used in considerable quantities for supplying carburetted air or automatic gas machines, which would have been useless at that time without this material. It was obtained in a crude condition by carefully refrigerating the waste gases as they passed from the outlets of condensers attached to the stills and retorts; this crude material, after agitation with sulphuric acid, was redistilled by steam heat; and the exceedingly volatile keroselene, having a specific gravity of only .634, and which boiled at 85° Fahrenheit, was manufactured in this way.

Mr. Merrill first noticed the anesthetic effects of keroselene upon a laborer engaged in cleaning a tank or cistern which had contained it, at the works; and afterwards experimented further with it upon rats and mice. This discovery of its anesthetic properties was recorded in the medical and surgical journals of that

time, and many interesting results were obtained with it by different members of the medical profession.

PETROLEUM.—I have been unable to find any record of the distillation of American Petroleum, taken from the wells, in a large way; although it was investigated, and the distillates obtained in Pennsylvania Petroleum was not, probably, made into illuminating oil, for sale, before the fall of 1858; although there were fifteen establishments using Petroleum exclusively, in the United States, by the fall of 1860.

During the years 1858 and 1859, several hundred barrels of Petroleum were brought to Mr. Merrill from surface wells; and, on one occasion, a considerable quantity was sent to him for distillation from the famous Tarentum well in Pennsylvania. And afterward the heavy paraffine oils and residuary products from Western establishments, which were considered valueless there, were manufactured into lubricating and illuminating hydro-carbon oils at the works in South Boston. As the supply from flowing wells increased, the use of Albertite as a source of fluid hydro-carbons gradually diminished, although it was not abandoned until 1865.

After the trying experiences of former years, no difficulty was encountered in converting crude Petroleum into naphtha, burning oil (called kerosene or "wax-oil"—a patent trade-mark name), lubricating oil and paraffine, similar to those made from coals and bitumens. Petroleum breaks up into thin hydro-carbons by distillation even more readily than the Albertite products; and when large demands are made for burning oil the distilling apparatus is operated slowly, or modified in form, so that the condensed vapors of the Petroleum, or heavy oils obtained from it, are repeatedly heated by being returned into the body of the still; and in this way the yield of the lighter hydro-carbons may be increased at will, the whole contents of the still being converted into burning oil when desirable. This principle is applied to the immensely large wrought-iron stills, holding two thousand barrels, or eighty thousand gallons each, that are now frequently used; they are placed over a number of small fire-places, with the top and upper part of the stills exposed to the outside atmosphere, for the purpose of condensing and returning heavy vapors in the stills.

Petroleum yields, by distillation, nine distinct commercial products.

Name.	Specific Gravity	Beaume Scale	Boiling Point
Righolene	025...	65° F
Gasolene	665...	85	120° "
C. Naphtha	706...	70	190° "
B. Naphtha	724...	67	228° "
A. Naphtha	742...	65	300° "
Kerosene Oil	804...	45	350° "
Mineral Sperm Oil	847...	36	425° "
Neut. Lubricating Oil	883...	29	575° "
Paraffine	848...

Four of these products are especially interesting and valuable; the first is Righolene. It nearly corresponds to the keroselene of the Albertite products, and is an extremely volatile hydro-carbon, used for producing

local anæsthesia, by its rapid evaporation, during short surgical operations. In 1866, Mr. Merrill was requested to make the most volatile fluid he could produce from Petroleum, by Dr. Henry J. Bigelow, the eminent surgeon of Boston. This was done by re-distilling gasolene, which was the very lightest Petroleum naphtha, by steam heat, and condensing the first distillate by the aid of ice and salt. In this way, ten per cent. of the gasolene was converted into the lightest of all known fluids, which was named righolene by Dr. Bigelow. Its specific gravity is only .625, and it boils at 65 degrees Fahrenheit. The evaporation of this fluid is so rapid at common temperatures, that it will depress the mercury in a Fahrenheit thermometer to nineteen degrees below zero, in twenty seconds. Several hundred gallons of righolene have been consumed for surgical purposes. We pass next to the neutral heavy lubricating oil. At the works in South Boston, the production of lubricating oils has always been a specialty, but with petroleum there came a scarcity of heavy dense crude materials from which to make these oils; fortunately, however, other manufacturers of petroleum, finding the illuminating oil and light products more profitable, have been glad to dispose of their heavy residuum at these works; and the deficiency of material has been supplied from this source.

The lubricating or paraffine oils were always characterized by offensive odors and tastes, so that a person brought in contact with them become at once aware of their origin; the desideratum with manufacturing chemists, from the earliest days of this industry, has been the production of dense neutral oils, or oils free from these offensive objections. Much time and study have been devoted to experiments having this object in view; and shallow stills, stills with double heads, repeated distillations, different processes of purification by chemical agents, and many other means, have been tried without success. But partly as the result of an accident, Mr. Joshua Merrill succeeded in making neutral oils in November, 1867.

Distillation had fairly commenced, from a still heated in the usual manner, by a direct fire underneath, and charged with nine hundred gallons of mixed heavy and light oils that had been previously distilled, and which were too heavy for illuminating and too light for lubricating purposes, when it was found that the condenser had partially closed from some accidental cause; and this by the consequent pressure, soon caused leakage at joints about the bottom of the still, over the fire. Continued distillation increased the leakage, so that it was necessary to withdraw the fire gradually from under the still; although the distillation was continued for some time in an attempt to empty the apparatus by operating very slowly. When the fire was removed, and after distillation ceased, two hundred and fifty gallons of light hydro-carbons, had passed over through the condenser. The next day, the oil left in the still, having cooled sufficiently, was removed; and Mr. Merrill was surprised to find it different from anything that had ever been seen

before. It had a bright yellow color; was clear, very nearly odorless, neutral and dense. Further experiments showed this result to have been obtained by the removal of all light odorous hydro-carbons without decomposing either the distillate or the oils remaining in the still, and that this had been accomplished by the moderate fire employed, and its gradual withdrawal.

This mode of operating was immediately applied to other distillations; and, after two months spent in determining the best mode of procedure, Mr. Merrill obtained letters patent for his valuable discovery, from which extracts will be made in a description of the present improved processes of manufacturing petroleum products, at the end of this memoir. This discovery consisted, first, in determining that the odor and taste of the heavy distilled oils arise from the presence in them of light and odorous hydro-carbons, formed during the previous and necessarily destructive distillations; and that when they are removed by distilling in a suitable apparatus, with the application of only sufficient heat to remove them, without decomposing or cracking the oils in the still, the latter are left nearly odorless. And, secondly, in perfecting the means for effecting this removal of the odorous bodies. The introduction of steam from an open pipe to the body of the apparatus during this distillation, aids greatly in effecting the separation as it lifts the light vapors out mechanically into the condenser; and it also serves to regulate the heat employed for distillation.

Thus, by extraordinary means, true fractional distillation of the heavy mixed oils is effected; and Mr. Merrill says: "I believe it is impossible to prevent the cracking or decomposition of these hydro-carbon oils, except by keeping them in the still, at temperatures below their boiling point.

Many hundred thousand gallons of this neutral heavy hydro-carbon oil, which has frequently perplexed the most expert judges and dealers in oils, have been made by Mr. Merrill. It is almost odorless and tasteless, and cannot be easily distinguished when mixed with one-fifth part of its volume of the best bleached animal, sperm or other fat oil, as an examination of this specimen will assure you. No better estimate of its valuable qualities can be given than the statement that, in the year 1871, fifty thousand gallons of this oil were sent to England alone, where it was used for lubricating spindles, oiling wood and other purposes. Another important substance obtained from petroleum is

Paraffine.—This was one of the very first products made at the works in South Boston, in the early days; and it is interesting to know, that while Cuban chapapote bitumen yielded paraffine by distillation, and Albertite gave large quantities of it, the Trinidad bitumen never afforded any of this crystalline mineral wax. Mr. Merrill began to make paraffine from Pennsylvania petroleum in 1859, and since then has, at times, made the enormous quantity of fifty thousand pounds (or twenty-five tons), in one month. It is a product of de-

structive distillation of this petroleum, and does not exist already formed in the crude oil.

This substance is used principally in candles, also for rendering textile fabrics waterproof, and for many other purposes; as one maker of friction matches in New York has used one hundred thousand pounds, and a manufacturer of chewing gum in Maine seventy thousand pounds, of paraffine in one year.

Mineral Sperm-oil.—The fourth product to which I wish to draw your attention is mineral sperm oil. This is a burning heavy oil made from petroleum; and its valuable properties as a safe illuminating agent are such as to render this product one of very great importance. The following statement of its discovery and characters is given in Mr. Joshua Merrill's own words:

"In the summer of 1869, in connection with Mr. Rufus S. Merrill, I made an important discovery relating to burning the heavy or paraffine oils in lamps for illuminating purposes. Mr. R. S. Merrill is a skillful mechanic, who has devoted himself for several years to perfecting the construction of lamps and burners for hydro-carbon oils. While experimenting upon an apparatus for burning paraffine wax, with a view to increase the light from this beautiful substance over that obtained from common candles—the only form in which paraffine is burned—he one day put some lubricating oil into the lamp, instead of the paraffine wax, and we were both much surprised at the good qualities of the light yielded by it. But, after examining some days, we found this heavy oil to be impracticable as an illuminating material in its present form, and that some modification would be necessary. It occurred to me that if this heavy paraffine oil was passed through a partially destructive distillation, cracking it enough to lessen its viscosity, but not enough to render it volatile, its increased mobility would cause it to ascend the wicks freely, and yet preserve its character as a fixed oil.

"After many trials, I obtained the product now called 'mineral sperm-oil,' which is sufficiently thin to fill the wicks perfectly; but it is so far from being a volatile oil that it is comparatively inodorous, and will not take fire at any temperature below 300 degrees Fahrenheit, or nearly a hundred degrees hotter than boiling water. Flames of considerable size, such as a large ball of wicking-yarn, saturated with oil, and ignited, when plunged beneath the surface of this oil, previously heated to the temperature of boiling water, are extinguished at once. It burns freely in the German student lamps, and with great brilliancy from the 'Dual' burner."

The manufacture of this oil is patented in this country and in Great Britain; and Mr. Merrill estimates the quantity that may be made at least one-quarter of the whole production of petroleum, or about one hundred and sixty thousand gallons of mineral sperm-oil every day—a quantity more than twice that of the whale and sperm oils obtained in the best days of the whale fishery in this country.

The present time, when government authorities and scientific men are so generally cautious against

the "dangers of kerosene," and just as French savans have discovered that certain heavy petroleum oils may be burned in lamps, seem peculiarly opportune for the introduction of this product of American skill and invention—namely, a hydro-carbon, or mixture of hydro-carbons, which seems to fulfill all the requirements of an oil to be burned in lamps, yielding a steady, brilliant and safe light. And practical indications of its appreciation may be found in the manufacturer's announcement, that the demands for this mineral sperm-oil is steadily increasing. It is used on ocean steamers plying between the United States and Europe, and also on several railroads.

Manufacture of Petroleum Products.—It only remains for me to give you a brief outline of the manufacture of petroleum products, as conducted at a well-managed establishment in this vicinity.

The crude petroleum is received here from the West in round wooden tanks, one or two of which occupy a railway carriage, as you have undoubtedly observed them on the neighboring railroad; and these are sometimes emptied into bulk-boats, when the works are more easily approached by water. The petroleum is pumped out underground into the iron reservoir tanks that closely resemble gasometers, where any sand and salt that may be present are deposited and removed. The crude oil, drawn from these reservoirs is first pumped into large wrought-iron stills or upright cylinders, incased in wood to prevent loss of heat, which hold about twelve thousand gallons each. These are the naphtha stills, in which the petroleum is heated by steam alone; the distillates being collected by condensers, consisting of iron pipes surrounded with cold water. Only the naphthas, or about fifteen per cent. of the crude oil, are distilled from the large stills; but the four kinds (gasolene, A, B and C naphtha) are collected in different receptacles. Righolene, as stated before, is made by a second distillation of gasolene.

The steamed crude oil remaining in the naphtha stills is pumped from them into smaller stills heated by direct fires underneath, and holding about a thousand gallons each; the whole contents of these are distilled over and condensed, excepting that which passes into the air as uncondensable gas, and the separated carbon. This is the first complete distillation, and it is eminently destructive; the products being separated, by densities, into three grades—No. 1, crude burning oil; No. 2, intermediate oils; and No. 3, crude lubricating oil. Each of these is redistilled by itself in apparatus of the same size and construction as that used for the first distillation, and they all break up again into lighter, intermediate and heavy oils. No. 1 is thoroughly agitated with sulphuric acid and

caustic soda successively; by revolving stirrers in large tanks, before its second distillation; and it then yields from the still, eighty per cent. of its volume of finished kerosene and mineral sperm, and nearly twenty per cent. of denser oil. No. 2 is redistilled before treatment with acid and alkali; it yields crude lubricating oil principally. No. 3, the crude lubricating oil, requires more careful manipulation than either of the others. It is first agitated with sulphuric acid, and then distilled with caustic soda present in the still, the product being mostly dense paraffine oil. This is placed in wooden barrels, in ice-houses, where it remains for from seven to ten days; and during this time the paraffine wax crystallizes, so that the masses retain the form of the barrels when they are removed. It is now put into bags made of strong cloth, which are arranged one above another, with sheets of iron between them; and, when submitted to heavy pressure, it yields crude scale-paraffine wax remaining in the bags, and the heavy oil is pressed out. The crude paraffine is refined by repeated solution in naphtha, recrystallizing and pressing until it is perfectly white and pure, ready for sale. The heavy oil is treated by the patent deodorizing process. It is placed in stills heated by fires underneath; and the temperature is slowly and gradually raised, until from twenty to thirty per cent. of the contents of the apparatus is distilled over; it is then allowed to cool in the stills, and when removed, is ready for sale. The hydro-carbons that pass over the condensers during this process have very offensive odors; but the oil remaining in the stills, if the operation has been properly conducted, is free from the characteristic odor of paraffine oil, and has only a slight odor, similar to that of fat oil. Live steam is generally used in the body of the oil during this operation, and the distillation is effected at as low a temperature as possible.

The very last distillates that are obtained from all the destructive distillation made at the works are highly colored, and known technically as "cokings;" they are accumulated and distilled by themselves, yielding crude lubricating oil principally. After every distillation of petroleum, or the products obtained from it, considerable masses of separated carbon are obtained as residuum; and, as caustic soda is frequently used in the apparatus, it remains in this coke; this is saved, however, by burning the carbon in a properly constructed fireplace; and the ashes lixiviated yield the soda as carbonate. The sulphuric acid that has been agitated with the oils, known technically as "sludge," is carefully saved, and generally sold to makers of biphosphate of lime fertilizers, although some of it has been successfully converted into commercial oil of vitriol by an ingenious process that I need not detain you to describe.

OLD IMPERIAL OIL, REFINERY
OIL CITY, PA.

ANCIENT OIL LAMPS

CRUDE OIL REFINERIES.

REFINING CAPACITY OF NEW YORK.

The first oil refinery erected in the oil regions was built by William A. Abbott, James Parker and William Barnsdall, at Titusville, Pa. Work on the refinery was begun on the 6th of November, 1860, and on the 22nd day of January, 1861, the fires were lit and the refining of oil was commenced. The success of this refinery was the beginning of several oil refineries on Oil Creek and in different parts of the United States. As an illustration of the enterprise of oil refining in the United States in a little over ten years, when once a refinery had begun to refine crude oil, a list of the refineries in 1872 is given.

Statement showing the daily refining capacity of the city of New York and vicinity in 1872.

BOSTON, MASS.

The Crude Refining Capacity of Boston, Mass., and vicinity in 1872 was estimated at 3,500 barrels per day.

BUFFALO, N. Y.

The Crude Oil Refining Capacity in 1872.

The Star Oil Works, owned and operated by Thayer & Riddell, No. 385 Hamburg St., Buffalo, has a Still Capacity of nearly two hundred barrels per day.

Dudley & Co., Buffalo, have a refining Still Capacity of 251 barrels per day.

CRUDE OIL CAPACITY OF PORTLAND, ME., IN 1872—
PORTLAND OIL WORKS.

Portland had one refinery, originally built and used for the manufacture of coal oil, with a capacity for working ten thousand tons of coal annually. It was one of the best and most perfect coal oil works in the United States, and was among the most extensive. It was the last to give up the manufacture of coal oil. The still capacity of these works was 350 barrels of crude oil daily.

WM. ATWOOD, Supt...

JAMESTOWN, N. Y., IN 1872—MARVIN & CO. OIL WORKS.

This was a small refining locality, the works being owned by Messrs. Marvin & Co. Their still capacity was about fifty barrels per day.

THE OIL REFINERIES OF THE PRESENT DAY.

They are much larger and have a much larger refining capacity than those used in the early days. The Bayonne refinery at Bayonne, New Jersey, owned by the Standard Oil Company, is the largest in the world. It covers over five hundred acres of ground, has a deep-water harbor, with crude and export oil docks, with deep-water outlet to New York bay, which enables the large tank steamers and other vessels to land at its docks and load or unload their cargoes of crude or refined oil for all ports in the world. This refinery is the seaboard terminal for the Standard Oil Company's seaboard pipe lines. This refinery is divided into two yards, as follows: Old yard, 60 stills, 25 feet long and 14 feet high; 18 sweeping stills 40 feet long, 19 tar stills, 10 steam stills; 1 borax and acid house. New yard, 40 sweeping stills, 40 feet long; 24 new tar stills, 8 large new tar stills, 10 large steam stills, 8 large reducing stills, 1 cooper shop, with a capacity of 20,000 barrels a day; 1 tin shop for making tin oil cans, 1 pump station for loading and unloading tank steamers, and other vessels; and one office building.

In the back part of both yards are 200 iron tanks, 90 feet in diameter and 35 feet high, with a capacity of 35,000 barrels each. The yards are surrounded by a brick wall six feet high. This refinery has the finest fire equipment in the world. All the tanks, stills and buildings are connected with water, steam and acid fire extinguishers. The capacity of the refinery is over 20,000 barrels of oil a day. The main general office of this refinery is in the Standard Oil building, 26 Broadway, New York. The refinery can be seen across New York bay from the upper floors of the Standard building in New York. The officers of the refinery are as follows:

James Smith, L. D. Morrison and J. P. Krebs, Committee; J. E. Eggleston, Superintendent of Refinery; Edward Johnson, Master Mechanic; Asa Hunter, Chief Engineer.

The Standard Oil refineries at the present time are: Thompson & Bedford, Constable Hook, N. J.; Pratt Refinery, Green Point, Long Island; Sone & Fleming Refinery, South Brooklyn, N. Y.; Atlantic Refinery, Philadelphia and Pittsburg, Pa.; Acme Refinery, Olean, N. Y.; Galena-Signal Oil Works, Franklin, Pa.; Eclipse Refinery, Franklin, Pa.; Vacuum Oil Company, Rochester, N. Y.; Kings County Oil Refinery, Constable Hook, N. J.; Eagle Oil Works, Constable Hook, N. J.; Star Refinery, Buffalo, N. Y.; Standard Oil Refinery, Point Breeze, Philadelphia, Pa.; Queens County Oil Works, Long Island City, N. Y.; Camden Consolidated Refinery, Baltimore, Md.; Peerless Manufacturing Company, Louisville, Ky.; Chess, Carley & Co., Louisville, Ky.; Standard Oil Company of Ohio, Refineries Nos. 1 and 2, Cleveland, O.; Solar Refinery, Lima, O.; Maumee Refinery, Toledo, O.; Whiting Refinery, Whiting, Ind.; Prairie Oil Refinery, Neodesha, Kan.; Kansas Refinery, Kansas City, Kan.; Consolidated Refinery, Florence, Col.; Waters-Pierce Oil Company, St. Louis, Mo.; Camden-Standard Refinery, Parkersburg, W. Va.; Security Refinery, Port Arthur, Tex.; Lone Star Refinery, Corsicana, Tex.; Pacific Coast Refinery, Point Richmond, Cal.

The Acme Refinery, of which John D. Archbold is president, is the general head refinery, with all the Standard Oil Company's branch refineries combined, and each refinery has a territory to cover, and no two refineries of the Standard Oil Company will sell or ship oil into one and the same territory. This territory is supplied by the Atlantic Refinery of Pittsburg, Pa.

Following are the leading independent oil refineries at the present day:

Pure Oil Refinery, Marcus Hook, Philadelphia, Pa.; Emery Manufacturing Company Oil Refinery, Bradford, Pa.; Wilberine Oil Works, Warren, Pa.; Coru planter Refining Company, Warren, Pa.; Crew, Levick & Co. Oil Refinery, Warren, Pa.; Seneca Oil Works, Warren, Pa.; United Refining Company, Warren, Pa.; Conewango Refining Company, Warren, Pa.; Superior Oil Works, Warren, Pa.; Warren Refining Company, Warren, Pa.; Levi Smith Refining Company, Clarendon, Pa.; Union Petroleum Company, Clarendon, Pa.; Empire Oil Works, Oil City, Pa.; Penn Refining Company, Ltd., Oil City, Pa.; Crystal Oil Works, Oil City, Pa.; Germania Refining Company, Oil City, Pa.; Independent Refining Company, Ltd., Oil City, Pa.; Pennsylvania Paraffine Oil Works, Titusville, Pa.; Titusville Oil Works, Titusville, Pa.; American Oil Works, Ltd., Titusville, Pa.; Emlenton Refining Company, Emlenton, Pa.; Sun Oil Company Refinery, Toledo, O.; The Paragon Refining Company, Toledo, O.; Imperial Oil Works, Marietta, O.; The Merchants' Refining Company, Buffalo, N. Y.; Beaver Refinery, Washington, Pa.; Freedom Oil Works, Freedom, Pa.; Pittsburg Refining Company, Coraopolis, Pa.; Union Petroleum Company, Philadelphia, Pa.; Miller's Oil Refining Works, Allegheny,

Pa.; The Island Petroleum Company, Pittsburg, Pa.; Waverly Oil Works, Pittsburg, Pa.; Great Southern Refinery, Port Arthur, Tex.; Burt Refinery, Port Arthur, Tex.; Gulf Refining Company, Port Arthur, Tex.; Higgins Refining Company, Port Arthur, Tex.; New Franklin Refinery, Los Angeles, Cal.; The Union Refinery, Bakersfield, Cal.; Sunset Refinery, Sunset, Cal.

The competition the producers and refiners of American oil have to contend with is the foreign crude and refined oils and a duty or tariff levied on all American oils in foreign countries, as also on all kinds of coal, wood and coke, electric light and manufactured gas, cotton-seed oil, lard oil and tallow, peanut and fish oils.

Both the Standard Oil and independent oil refiners have a regular line of tank steamers to deliver the refined export oil to all ports of the foreign countries. A great deal of the oil is delivered in barrels and tin cans of five American gallons, or four imperial gallons, to the can. The American oil is the safest, cheapest and makes the best light of any oil in the world. The money received from the export oil from the foreign countries amounts to about \$75,000,000 a year. This money goes to the American oil producer and refiner and American laborers. The Standard Oil Company, when they first began to refine oil, had only one grade of refined oil. Their trade-mark was Standard Oil. That grade was 120 flash test. All of their barrels at the beginning were painted blue, with white heads. The same style and color is used at the present day.

Names of refined oils refined by the Standard Oil Company, Ohio State test: Prime White, Water White, Red Star, Eocene, Crystal Light, Hyperion, Diamond White, 150°; Pratt's Astral, 150°; Silver Light, 120°; Eastern, Elain, Pearl.

NUMBERS OF ILLUMINATING AND LUBRICATING OILS
REFINED BY THE CORNPLANTER REFINING CO.

[INDEPENDENT REFINERY, WARREN, PA.]

The Cornplanter Refinery uses numbers instead of names for their oils.

Gasoline, naphtha and illuminating oils:

Cornplanter Gasoline—No. 2015, 74 stove gasoline. Uses: For stoves, automobiles and gas engines.

Cornplanter Deodorized Naphtha—No. 2013, 62-63 degrees. Uses: Paints, varnishes, mechanical purposes.

Cornplanter X Water White Oil—No. 2001, 47-48 gravity; 150 fire test. Uses: Highest grade burning oil, water white in color.

Cornplanter 120 Water White Oil—No. 2004, 48 gravity; 120 fire test. Uses: Water white in color, sold only in States not requiring 150 test.

Cornplanter Export Oil—No. 2008, 45 gravity; 116 fire test. Uses: Sold only for export.

Cornplanter 300 Oil—No. 2002, 38 gravity; 265 flash; 300 fire test. Uses: Railroad coach lamps, torches; also match for mineral seal.

Spindle oils and neutrals:

Cornplanter Neutral—No. 2026—34 gravity, 330 flash, 390 fire test, 25 cold test, 70-80 viscosity; a bloomless oil. Uses: For mixing with animal and mineral oils and in the manufacture of wool oils; is a match for S. O. Co.'s No. 2 wool stock.

No. 2096—34 gravity, 330 flash, 390 fire, 25 cold, 70-80 viscosity; not a bloomless oil. Uses: For fast running spindles, sewing machines, separators and other light running machinery, cordage or rope oil.

No. 2111—34½ gravity, 330 flash, 390 fire, 25 cold, 80 viscosity. Match for S. O. Co.'s White Rose.

No. 2341—35 gravity, 320 flash, 390 fire, 25 cold, 75 viscosity. Uses: Spindles, looms, sewing machines.

No. 2011—32 gravity, 400 flash, 450 fire, 25 cold, 155-160 viscosity; white, high-grade, viscous. Uses: Spindle and loom oil.

No. 2023—31.8 gravity, 400 flash, 450 fire, 25 cold, 155-160 viscosity. Same as 2011 excepting the color, which is darker.

No. 2½—31.6 gravity, 400 flash, 450 fire, 25 cold, 160 viscosity. A match for Manchester Spindle.

No. 2030—31.6 gravity, 400 flash, 450 fire, 25 cold, 155-160 viscosity. Pale spindle, darker in color than 2023. A match for S. O. Co.'s Atlantic No. 1 filtered.

No. 2034—31.5 gravity, 400 flash, 450 fire, 25 cold, 160 viscosity. Uses: Spindle, machine, gas engine, dynamo, separator. A match for S. O. Co.'s No. 2 Eagle.

No. 2037—Same as 2034, excepting that it is darker in color. Uses: Same as 2034, and also used for leather oil and transformer oil.

Wool stock:

Cornplanter Wool—No. 2212—32.5 gravity, 375 flash, 425 fire, 25 cold, 140 viscosity. A debloomed red wool stock. Also used for leather oil.

No. 2396—32.4 gravity, 390 flash, 440 fire, 25 cold, 140 viscosity. Lighter in color than 2212. A match for Eclipse Wool Stock.

Dynamo and engine oils:

Cornplanter Dynamo—No. 2204—30.5 gravity, 415 flash, 470 fire, 25 cold, 190 viscosity. Highest grade dynamo oil, sun debloomed. Uses: Suitable for the heaviest work on dynamos and marine engines. A match for Arctic Engine.

Cornplanter Engine—No. 2202—31 gravity, 410 flash, 465 fire, 30 cold, 200 viscosity. Matches No. 2 or 26 Red and Atlantic Red.

No. 2345—29 gravity, 420 flash, 480 fire, 30 cold, 350 viscosity. Uses: Adapted for work on the heaviest dynamos and engines. Matches Eagle Red and Solar Red.

No. 2193—30.5 gravity, 410 flash, 465 fire, 25 cold, 180 viscosity. Pale Engine same as Renown Engine.

Cylinder oils:

Filtered—No. 2018—29 gravity, 450 flash, 500 fire, 80 cold, 90 at 212 viscosity. Amber color.

No. 2025—29 gravity, 450 flash, 500 fire, 80 cold, 90 viscosity. Extra light in color.

No. 2075—28 gravity, 500 flash, 550 fire, 75 cold, 120 viscosity. Light in color; match for Cosmos.

No. 2027 or 2078—Same specifications, excepting amber color.

No. 2080—Same specifications, excepting dark in color; match for Continental.

No. 2036—27 gravity, 540 flash, 600 fire, 75 cold, 140 viscosity. Extra light in color.

No. 2094—Same specifications; amber color.

No. 2033—Same specifications; dark color; match for Economic.

No. 2106—26¼ gravity, 555 flash, 625 fire, 55 cold, 165 viscosity. Dark color; matches Dark XXX Valve.

No. 2146—26¼ gravity, 555 flash, 625 fire, 55 cold, 165 viscosity. Amber color.

No. 2340—27 gravity, 550 flash, 610 fire, 40 cold, 150 viscosity. Match for F. F. F. and Valvoline.

No. 2343—Same; amber in color.

Unfiltered stocks:

No. 2017—26 gravity, 540 flash, 600 fire, 30 cold, 140 viscosity. Match for S. O. Co.'s "A" and Capitol.

No. 2102—25½ gravity, 585 flash, 650 fire, 30 cold, 200 viscosity. Same as 600 W.

2159—25 gravity, 600 flash, 660 fire, 30 cold, 230 viscosity. Matches Locomotive Cylinder.

No. 2466—23.8 gravity, 630 flash, 700 fire, 40 cold, 270 viscosity.

No. 2421 matches Galena Engine.

No. 2421½ matches Galena Car.

No. 2503 matches Galena Coach.

No. 2502 matches Galena Perfection Valve.

Castor machine oil:

2041—No. 1 Castor Machine. Uses: Axle oil, harvest oil and slow running machinery. A match for XXXX Castor.

No. 2051—No. 2 Castor Machine. Uses: Harvester oil, journal oil, fast running machinery. Lighter in body than 2041; match for Eldorado Castor.

No. 2054—No. 3 Castor Machine. Uses: Harvesters and engine, still lighter in body than 2051; a match for Eldorado Engine.

Cup greases:

Nos. 1, 2, 3, 4, 5—Gear greases; axle greases—

Nos. 1, 2, 3, 4, 5—Gear greases. Axle greases. Motor compound; an extra fine grease, used on U. S. battleships.

NAMES OF ARTICLES MADE FROM OIL.

Rubbing oil for furniture, Ozone Paraffine, Diamond Paraffine, Golden Machinery, White Castile Soap, Marblé Castile Soap, Green Castile Soap, Transparent Glycerin Soap, White Toilet Soap, Pink Toilet Soap, Honey Soap, Mothers' Soap, Sibley Soap, Pine Tar Soap, Laundry Chip Soap, Oak Bone Common Soap, Benzene Soap, Paper Mill Felt Soap, Sibley's Screw Cutting and Drilling Compound, Nos. 1 and 2.

MIXING OIL.

The most striking example of chemical preparations of Petroleum is perhaps found in the justly celebrated Galena-Signal oils produced and chemically treated at Franklin, Pa. These oils consist of a lead soap dissolved in the natural Franklin heavy oil. A lead soap is prepared after the ordinary manner, by boiling oxide of lead with a saponifiable oil, and the whole is dissolved in the Franklin Mecca-Belden and West Vir-

ginia lubricating oils. The oils thus prepared have great tenacity and endurance as lubricators, particularly for car axles, for which purpose they are principally used. Mixtures of refined lubricating oils with tallow, sperm, whale and lard oil are used for lubricating. Light lubricating oil, neat's foot oil and castor oil mixed make a fine dressing for leather. Lubricating oil mixed with cotton-seed and lard oil is used for oiling wool. Rape and heavy oil mixed make a fine lubricating oil. Ground graphite mixed with heavy oil makes a fine lubricating oil. Heavy reduced oils are mixed with powdered pyrophyllite. This mineral resembles *talc*, and when powdered is especially soft and greasy to the touch.

Three barrels of cotton-seed oil mixed with two barrels of miners' stock make five barrels of miners' oil. Raw linseed oil, mixed in equal parts with linseed refining stock, makes raw linseed oil. Raw linseed oil and Japan dryer heated up to 125° and agitated makes boiled linseed oil. Five gallons of A naphtha and 20 gallons of turpentine mixed make a No. 1 turpentine.

A, B and C naphthas are fluids of different volatilities taken off between gasoline and illuminating oil. They are used in mixing paint, printing ink, dissolving rosin for oilcloth, and as fuel. Natural oil and residuum reduced make lubricating oil to launch boats. Saponifiable oil is used for locomotive driving-wheel boxes.

METHOD OF REFINING CRUDE OIL IN 1894.

REFINED OIL—CRUDE OIL STILL—CONDENSERS—DISTILLATION OF CRUDE—STEAM STILL—TREATMENT WITH CHEMICALS AND WASHING—NAPHTHA AND NAPHTHA PRODUCTS—PRODUCTS FROM RESIDUUM—PARAFFINE WAX—REDUCED LUBRICATING OILS.

Refined Oil.—It is no exaggeration to say that two hundred different products are now made from crude petroleum. The limits of such a report as this will not, of course, permit even mention of each further than to outline some general classification. The broadest that can be made is to divide the products into those that result from the distillation, and those that result from the reduction of the crude article. Every product, we think it safe to say, that has been obtained from crude oil, is secured by one or the other, or in some cases, by a combination of both of these processes. By distillation we mean the converting of the crude by heat into vapors and the condensation of those vapors back to a liquid, from which the manufactured article is produced. By reduction we mean the driving out of the crude by heat its lighter portions, leaving the remaining product behind still in liquid form. Products of both classes can be, and usually are, made by the same process; that is, while heat is converting one part of the crude oil into products by distillation, that is, turning them into vapor for condensation, it is at the same time converting the other part into a product of reduction by driving off the very vapors that make the distillate products. Again: both processes are often resorted to in successive stages of manufacture, to produce

certain articles. A distillate product is afterwards reduced, and a reduced product is afterwards distilled; in some instances the processes being repeated several times before the finished goods are secured. This is particularly true of the lighter and the heavier parts resulting from the method of manufacture, aiming to convert the major part of the oil under manipulation into some desired product. These lighter and heavier parts are therefore known to petroleum manufacturers as by-products. As petroleum in its crude state is composed of an almost indefinite number of differently compounded hydro-carbons, that is, combinations of the chemist's elementary substances carbon and hydrogen, varying in volatility; and as the manufactured products are almost countless in number, it will be readily understood that the methods of manufacture must be many, complicated and delicate. In the early days of the industry, but one product was sought for, and today the staple article of manufacture is that same product secured, however, in many grades. We refer to refined oil. But the possibility of making other valuable products was soon apparent, and each year experience and study in the art have developed almost unlimited extension of the use of petroleum.

The main product of petroleum, refined oil for illuminating purposes, is always the result of distillation. At many large works to-day the crude oil, which is the base of all petroleum products, is received into storage tanks of 30,000 to 35,000 barrels capacity direct from the main pipe-lines. Formerly crude came to the works in barrels, from which it was emptied into troughs and flowed through a sieve, to catch solid impurities, into tanks. Some of the less important refineries do not have this direct connection with the pipe-lines, and crude is brought to them in tank cars. These have an outlet valve at the bottom to which hose is connected carrying the oil into a large pipe which conveys it to the tank from which the stills are filled. When the stills are ready to be charged, powerful pumps force the crude oil through large lines into them, as it is important that time should not be wasted in this preliminary work. A careful refiner makes sure that no water is pumped into his stills; for if it is; it must also be evaporated, as well as the oil.

The production of refined oil is the result of four distinct steps.

(1) Fractional distillation (that is the vaporizing and condensing of the oil) in a still heated by fire. (2) Fractional distillation in a still heated by steam. This is really a reducing process so far as the refined oil is concerned. (3) Treating the distillates with chemicals and washing them with water. (4) Settling to make the oil clear and bright for delivery.

Crude Oil Stills.—Many different sizes of stills have been tried, from the primitive cast-iron one of a few barrels capacity of the early days to the huge cheese-box vessels holding 3,000 and 3,500 barrels erected at several works, and many different varieties have been tested—upright cylinders, horizontal cylinders, cheese-boxes of various construction, not to mention the unsuccessful devices for effecting continuous distilla-

tion. Experience has narrowed the style of stills down to two, their competing merits being a source of much controversy among practical men. These are known as the cylinder and cheesebox still. The former is a simple horizontal steel or wrought iron cylinder twelve and one-half feet or a little more in diameter and thirty feet or a little more in length. A cylinder of this size holds about 1,000 barrels of crude, and is the size generally found at the seaboard refineries. A circular dome about five feet in diameter and four or five feet high is set on the top of the still in the center, as an outlet for the rising vapors; a wrought-iron gooseneck fifteen inches in diameter, conducting them over to the condenser pipe, to be described later. The still rests on brick work which surrounds the lower half, the upper half being left exposed to facilitate the "cracking" or destructive distillation of the oil already explained. A double fire-box is built under the front quarter of the still, but, by having the flue for the exit of the gases of combustion in the rear, the heat is applied to the whole length of the bottom and well up on the sides of the cylinder. Some of the stills have flues running along their sides, with dampers to cut off the heat at certain stages of the run. The advocates of this style of still claim for it cheapness of construction, because of its simplicity, economy in repairs, and the largest amount of work accomplished with a given quantity of fuel.

Cheesebox stills are somewhat more complicated in construction. They consist of a vertical cylinder ten feet or a little more in height and thirty feet or a little more in diameter, of five-sixteenth inch wrought-iron, with a dome shaped top of the same material, and a five sixteenth steel bottom made in a double curve to provide for expansion. The center is supported on a circular pier of brickwork, which serves also for an exit for the gases of combustion through an underground flue to the chimney. From the central pier a number of brick arches are sprung to the circumference. These arches support the still and form the sides for fireboxes, of which there are varying numbers according to the design of the builder. These fireboxes are placed at equal distances from each other on the circumference of the still. A still the size mentioned above holds about 1,200 barrels of crude. The vapors from the distilled oil pass through three pipes into a vapor chest above the top of the still, from which they are conveyed through a large number of three inch pipes over into the condenser. The advocates of this style of construction claim for it the production of a larger yield of refined oil distillates, of lighter gravity and a superior color.

Both the cylinder and the cheesebox stills are provided with man-holes, covered when the still is charged by circular plates held in place by screws and bolts. One manhole is on the top of the still and one near the bottom, on the end in the case of cylinder and side in the case of cheesebox stills. They are opened to cool the still after it has been run off, the upper one admitting men to clean and inspect it, the lower one being convenient for the men to throw out the coke or dirty sediment that has dried on the bottom and sides during the run. The stills are provided with steam pipes of

various plans, charging and drawing off pipes, gauges, vacuum and pressure valves, and many other devices.

Condensers.—Originally these were copper coils, which were soon supplanted by coils of iron pipes in a tank of water. Coils of pipe are still sometimes used, but the general plan for condensers is to have straight pipe of convenient lengths laid one above another, and connected together by return bends or manifolds in a rectangular box of iron or wood. Sometimes the distillate is carried through the condenser by a number of separate pipes. In other cases all the vapor passes through one continuous pipe. The aim of the different designs is to secure the most perfect condensation of the oil vapors. Any vapor reaching the end of the condenser pipe in the form of gas is taken away to be burned for fuel. The condensed vapor is received at what is known as the running room, where it is watched and tested by the refiner and turned into such one of the several tanks set apart for the different products as, from time to time during the progress of the run, seems best.

Distillation of Crude.—As soon as the stills are filled a gentle fire is started under them, and the more volatile constituents of the crude are driven off into the condensers where they are cooled sufficiently to be liquefied, flowing as liquid from the end of the worm. Some of the very lightest of the naphtha distillates can be condensed only at low temperatures, and then held in liquid form only under pressure. Usually this is not attempted, but the vapor is allowed to escape in gaseous form to be burned for fuel either under the stills or boilers. It is not possible to describe the distillation or "run" in other than very general details, the points of separation of products varying with different grades of crude, with the proportion of the different times using the same crude, and in accordance with the ideas of the most economical method for securing the best results held by different refiners. As the fire under the still is increased in intensity the condensed vapors that appear at the mouth of the worm in what is known as the "running room" grow heavier as the run progresses, and separations or "cuts" are made by the refiner turned the steam into this or that receiving tank as his judgment directs. The points of demarkation between what is known as naphtha and oil distillate or distillate and residuum are, as can be readily understood, purely arbitrary ones. In fact, even after the most careful separation, it is found that the heavy naphtha contains considerable of the oil distillate, and the oil distillate quite a quantity of the heavy naphtha product. Generally the distillation is fractionated into four parts—a light and heavy naphtha and two separations in the oil distillate, leaving a residuum or tar in the still. In the running of these products the gravity or density of the condensed distillates continues to grow heavier until a point is reached where, in the judgment of the refiner, the color has become so dark that the distillate cannot be treated up to a satisfactory shade in the finished oil. The fires are slackened in order to allow the "cracking," already described, to occur. By this the vapors are decomposed or split up into heavier and lighter ones, the former dropping back into the boiling oil, the latter pass-

ing over the condenser pipe to be reduced to liquid form. During this process of "cracking" considerable quantities of uncondensable or permanent gas are produced and utilized for fuel.

From the different Pennsylvania crudes the range of product is somewhat as follows:

Naphtha . . .	from 8 to 20 per cent.
Refined oils .	from 78 to 70 per cent.
Residuum . .	from 9 to 5 per cent.
Loss, about	5 per cent.

The gravities of naphtha range from 90° to 62°, the gravities of refined oil distillate from 50° to 44°, the gravities of residuum from 25° to 16°.

The yields and gravities vary according to the crude run and the products to be secured. There is left on the bottom and sides of the still, after drawing out the liquid residuum, from one to one and a half per cent. of the original charge, in the form of coke or solid deposit. This is thrown out and used for making carbon sticks. The time required to run off a still of the size we have described is from three to four days.

Steam Stills.—The naphtha and oil distillates that have come from the crude stills are next put into a still worked entirely by steam. These stills are either horizontal cylinders or upright cheeseboxes holding about 1,000 barrels each. The distillation in them is effected by means of steam coils run along their bottom and top. Of the refining of crude naphtha in these stills we will speak more specifically later. Distillates for illuminating oils are subject to a reducing, not a distilling process at this stage of manufacture. The aim is simply to drive off the inflammable gases carried over with the heavier product in fractionating the crude, in order that the distillate may be rendered safer for consumption in lamps. The heat of the steam vaporizes the more volatile gases and carries them into a condenser to be liquified the same as distillate from a crude still. The elimination of the lighter parts from the distillate is continued until the body of the distillate in the still will stand the fire test required. By fire test is meant the temperature at which the oil will give off sufficient gas to ignite and burn.

Treatment with Chemicals and Washing.—The refined oil distillate as it comes from the crude stills is impregnated with tarry matter and inflammable gases, imparting a greenish color and an offensive odor. The gases are driven off in the steam still just described. The color and odor of the distillate after it has been steam-stilled are improved by the purifying action of chemicals and a thorough washing with water. The outline given of the method of treatment employed in early times at the Humboldt refinery, in our section describing those works, would serve almost as well for a description of the process employed to-day; except that then the distillate was moved from one tank to another for the several stages of the work, while it now remains in the same vessel throughout the treatment. This is called an agitator—a large vertical cylinder holding from one to two thousand barrels, generally lined with lead. It is built with a conical bottom to facilitate the removal of the objectionable impurities and water, as the treatment progresses. The agi-

tator having been filled with distillate, sulphuric acid is mixed with it, and the distillate and acid are thoroughly agitated by means of an air blast introduced at the base of the conical bottom. When the air blast is shut off, the acid, completely charged with the resinous matter which it has picked up in its contact with the distillate, gradually sinks by its gravity to the bottom, from which it is readily drawn off as sludge without disturbing the purified distillate above. The distillate is then treated in the same way with soda or some other alkali, to neutralize any trace of the acid that may be left in it. The soda is drawn off in the same way as the acid. After these agitations, the distillate is thoroughly washed with water sprayed on the top and allowed to percolate through to the bottom; the number of washings and the manner of applying the water differing somewhat at different works; this remark is true also of the manner of applying the acid and alkali. The sludge is turned over to the acid-restoring factories or to fertilizer works; the former producing fresh acid, and the latter making ammoniated phosphates from it. The treated distillate is now allowed to run down, or is pumped away, into broad shallow tanks called settling pans where it is allowed to stand for any water or other impurities that may still remain in it to slowly settle out, a steam coil at some refineries being used to furnish the necessary heat in cold weather to raise the temperature to the proper point to facilitate this separation. The oil is now bright, clear and clean, ready for delivery.

Naphtha and Naphtha Products.—We cannot help but recognize that the number and variety of petroleum products are almost limitless, when we begin to examine into the naphtha specialties. Refined oils are of many grades, from the ordinary low test oil of export to the 300° fire test oil used by certain railroads, to or from the standard white or yellow oil color to the beautiful water-white as clear and brilliant as spring water. But the varied grades are quite similar in constitution and are put to practically the same uses. With naphthas it is different. The products are unlike and the purposes served by them widely dissimilar. Naphtha as it comes from the crude stills is charged in a still quite like the steam just described for driving out of oil distillates the more gaseous elements. In this the naphtha is distilled by steam heat, the same as refined oil distillate, except that in the case of naphtha a much larger proportion of the contents of the still is driven out in the form of vapor. The most volatile portions are seldom condensed. We refer to ringoline, so named by Dr. Bigelow, and chymogene, which are gases at ordinary temperatures, are liquified only at low temperatures, and are held as liquids only under pressure. They have a specific gravity of 0.625 and boil at 65° Fahr. They have been used as anæsthetics for surgical operations, really freezing the parts to which they are applied. They also serve as substitutes for ammonia in engines for artificial refrigeration, their evaporation being so rapid that a temperature of 19 degrees below zero Fahrenheit has been obtained.

The next heavier product is known as gasoline, used generally in machines for carburetting air to make illuminating gas for dwellings and factories.

This product is also employed in lamps for street lighting.

Then follows stove naphtha, used for heating and cooking in a great variety of stoves especially constructed for this purpose, a trade already of large magnitude and deservedly increasing with remarkable rapidity, winning its own way as an economical and comfortable means of cooking during the extreme heat of our western and southern summers.

A large proportion of the yield next secured is known as gas naphtha, and is delivered to gas works of cities, being now the staple article from which illuminating gas is made.

These grades, and others especially made for the purpose, are used in paints and varnishes, because of the readiness with which they evaporate, and in the manufacture of floor cloths, patent leather, etc.

Many of the naphtha products have to be treated with chemicals to deodorize them. This is done in an agitator similar to that employed for treating refined oil distillate, but care has to be exercised to avoid large losses by the evaporation of the more volatile constituents when the liquid is agitated. It was, therefore, for some time the practice to effect this agitation by some mechanical contrivance in the way of a vertical revolving shaft fitted with arms, but now an air blast is used as in the case of refined oil. Additional distillation and other manipulations are also needed to finish some of the products designed for particularly delicate uses.

Products from Residuum.—Naphtha is the by-product lighter than refined oil produced in its manufacture. Residuum is the corresponding heavier product. It is the residue of the crude left in the still after the vapors making naphtha and refined oil distillates have been driven out. A by-product at the refinery, it becomes a crude product, or base of manufacture, when transferred to the paraffine works. The residuum is put into stills much like those used for crude petroleum, except that they are smaller and as the fire used is much hotter and the contained liquid heavier, they are built stronger. The charge is distilled to dryness, leaving a thick layer of coke or porous carbon in the bottom, of considerable value for the manufacture of carbon points for electric light lamps, for fuel and for many other purposes.

The distillation of residuum for the manufacture of oils and waxes is an industry by itself, requiring perhaps more skill and the use of much more complicated apparatus than the production of refined oil from crude. Tar stills are often provided with a preliminary condenser in the form of cast or wrought iron eight or ten inch pipe suspended above the still or condenser box in the air, the temperature of the atmosphere being sufficient to liquefy a considerable portion of the vapors. These air condensers are provided with proper outlets to draw off the condensed oil, which, of course, is the heavier part of the vapors, the rest of the vapor passing into a condenser, similar to a refined oil condenser, immersed in water. The first part of the distillate run from tar is generally found to be sufficiently light in gravity to be sold for gas-making purposes, or to go back to the refinery to be

re-run for the production of refined oil the same as crude. After this is run off, paraffine oil distillate steadily pours forth from the end of the condenser worm, increasing in gravity and deepening in color until the still is empty. This distillate passes through a treating process much like that employed for refined oil and naphtha, except that it is more severe as the product is so much heavier, requiring longer time, more chemicals and greater care. From this point the manipulation is in the hands of the producer of wax, as the production of the multiform paraffine lubricating oils is the result of methods used to secure the wax. The work is so distinctive and the products so unique that it seems best to consider this subject in a section by itself.

Paraffine Wax.—Fossil paraffine or Ozokerite or "earth wax" has been found for many centuries in enormous quantities in different parts of Europe, but particularly Galatia. It was mined the same as other mineral deposits, purified and made into candles. Peckham tells us that in 1875, there were 22,000 tons taken from the foot hills of the northern slopes of the Carpathian mountains in Galatia and certain mines of Moldavia. Its name was given it by the chemist Carl Reichenbach, who discovered in 1830, that it was the result of the distillation of several organic bodies at high temperatures. He named it paraffine because of its remarkable resistance to chemical action, the literal meaning of the word being "little, or too little affinity." As found in the natural state in these European fields, it appears to be a mass of brown, greenish or yellow scales, which when softened can be molded like beeswax. As made from petroleum, it is in the form of a translucent crystal, of a light yellow to bluish white color, according to the grade of distillate from which it is made and the chemical treatment to which it has been subjected.

It is of interest to find that paraffine was a product of commercial importance long before petroleum oils were manufactured. Crew quotes at length from Prof. F. H. Storer's reference to patents secured by the French chemist Selligie, in 1839 and 1845. We will simply enumerate the products he described as made from bituminous shale, to show how long before the beginning of the petroleum industry, methods almost identical with those that are now so generally employed were known and tried. He used both sulphuric acid and soda for treatment and employed superheated steam in manufacture. The products of his distillation were:

1. A white, almost odorless, very limpid mineral oil that could be used for illuminating purposes in suitable lamps.
2. A light lemon-colored oil, perfectly limpid, almost odorless, that could be burned in ordinary lamps having an elevated reservoir, and, when mixed with animal or vegetable oil, did not easily congeal when subjected to cold.
3. A fat mineral oil containing a little paraffine and peculiarly adapted to lubricating machinery.
4. Red coloring matter extracted from the three oils just mentioned.

5. White crystalline paraffine, which needed but little treatment to be fit for making candles.
6. Grease for lubricating machinery.
7. Black pitch for preserving metals, woods, etc.
8. An alkaline soap.
9. Sulphate of ammonia.
10. Manure from the coke.
11. Sulphate of alumina from the coke.

It is also interesting to remember that the valuable paraffine products extracted from petroleum were not found as the result of a search for them, but in an effort to remove from paraffine lubricating oils an element that made them gum up the machinery on which they were used. Samuel Downer, in his experiments in this direction, chilled the oil until it solidified and then pressed it, the solid that was eliminated being wax.

The practice today is to slowly chill the heavy oil coming from the distillation of tar by means of a solution of sodic, or magnesian, chloride, brought to the required temperature by use of an ammonia refrigerating apparatus. The semi-solid mass is then subjected to hydraulic pressure at a temperature of from 30° to 40°. The cakes remaining after pressing out the oil from the wax are then melted and the wax allowed to again crystalize, to be subjected to a much greater pressure at a higher temperature, the aim being to expel as much of the oil as possible. The absence of the wax from the expressed oil gives it what is called a good "cold test," that is, the quality of withstanding a considerable degree of cold without developing paraffine crystals to clog the machinery upon which it may be used as a lubricant. The absence of the oil from the wax makes it dry instead of greasy when put to its various uses. The temperature to which the distillate is chilled before it is pressed determines what is known as the "melting point" of the wax, that is, the temperature at which it liquefies.

For many purposes, particularly for the manufacture of the finer grades of candles, wax that has undergone even the several purifying processes already described has to be still further freed from oil. This is done by washing it with naphtha or heating it almost to the point of melting, to drain the oil out of it, and then chilling it once more after a slight chemical treatment. In this way a most beautiful, hard, colorless article is secured, which is practically pure crystalline paraffine. It is put to a large number of uses, but its greatest consumption is in the manufacture of candles, where it is gradually displacing all other materials.

Reduced Lubricating Oils.—The paraffine oils just described are the result of the distillation of the residuum or reduced product left behind in the still when distilling crude petroleum. Other lubricating oils, having different characteristics from those of paraffine oils, and therefore better adapted to certain uses, are made more directly from the crude by a reducing process. The lighter elements in the crude are driven off, generally with great rapidity, their quality being ignored in the effort to obtain a proper residue in the still. At some works vacuum stills are employed

for this purpose, that is, stills built sufficiently strong to admit of their standing a partial vacuum put upon them by the aid of a pump during the run to accelerate the withdrawal of the vapors liberated from the crude by the heat. A refinery making the reduced products is generally known as a lubricating oil works. The student of the methods at such factories finds himself in a labyrinth of processes and surrounded by multi-form products. The extremes of refined oils and of waxes are touched, while between lies a wilderness of products of all kinds designed to meet the varied tastes, whims or needs of consumers. Some of the oils are mixed with the pressed distillate obtained in animal or vegetable oils, and some are purified or decolorized by filtration through animal charcoal. Each process is a separate art. And each process has devoted to it intricate and expensive machinery, quite beyond our limits, in such a report as this, to describe.

The advent of petroleum as a lubricant was almost as important as its advent as an illuminant. Its cheapness is reflected in the reduced costs of many lines of manufacture, where the friction of whirling machinery has to be overcome; not to mention its almost exclusive use for the lubrication of the rolling stock of railroads. Improvements in manufacture and more accurate methods of testing have removed the objections offered to the first products put on the market, namely, disagreeable odor and danger from fire, either because the oils threw off inflammable vapors or themselves ignited in spontaneous combustion when heated by friction.

HOW CRUDE OIL IS REFINED AT THE PRESENT DAY.

Not fewer than three hundred different useful products are obtained from petroleum-crude oil, chiefly by distillation. Most of the lubricating oils are prepared from the heavier natural oil, some of which, indeed, comes from the earth in condition for immediate use. The lighter crude oils are those which furnish most of the illuminating media. The distilling apparatus consists of an iron cylinder, or a "cheesebox" tank, into which at the largest refineries the crude oil is delivered direct from the pipe-line. Heat is communicated by coils of steel pipe within the still; the vapors pass out of the cylinder through a coil of wrought-iron pipe immersed in cold water, and are thus condensed. The lightest oils—the naphthas—pass over at a low temperature and are allowed to run into a receiver until a certain degree of specific gravity has been reached, which depends upon the kind of kerosene to be obtained; then the heat is increased and the product, which is illuminating or lamp oil, is directed into a second receiver, while the black, pasty substance left behind is the coke pitch or axle grease residuum. The uncondensable gas is led back to the furnaces and used as fuel. The naphtha contains gasoline, three grades of benzine, and much low-grade kerosene, which are separated from one another by redistillation. The illuminating oils pass from the stills to tanks called "agitators," where they are thor-

oughly treated with sulphuric acid, or oil of vitriol. Under the influence of a strong blast of air, which stirs the oil violently and gives the name to the apparatus, the acid attacks certain substances present in the oil and is itself partly decomposed, giving off sulphurous acid, a strong bleaching agent, and borax is much used for bleaching the oil.

After forty-five minutes or more of agitation with the acid and borax the contents of the tanks are allowed to become quiet. A wonderful change has taken place; the straw-colored, ill-odored oil is now a brilliant, water-white, slightly fluorescent liquid, with very little odor, underneath which is found the black sludge acid, containing the impurities of the oil. The sludge acid is drawn off again into the tanks provided for it, the kerosene is again agitated with sulphuric acid, and then thoroughly washed with water, first by percolation and then by agitation with air, after this water has been withdrawn. The agitation is repeated with caustic soda, and finally water is again used to remove the soda. The kerosene is then removed to storage tanks, or to tank cars or barrels, for immediate distribution; or it is sealed in tin cans for export.

On an average, seventy barrels of illuminating oil are produced from a hundred barrels of high-grade Pennsylvania, Ohio or West Virginia crude oil. At least a hundred varieties of lamp oil are produced by the Standard Oil Company, mainly to provide high-price and low-price oils to conform to the laws of the different states. All of these would be called indiscriminately "kerosene" by the general public, but they are very different in appearance and quality, and as to safety in use. Only the best grades of kerosene are popular in the United States, and practically all the cheaper yellowish oils are sent to Europe, where the element of first cost to the consumer is of more importance. The coke pitch, petroleum tar, or residuum, as it is variously styled, forms a very important part of Pennsylvania, Ohio and West Virginia crude oil petroleum, worth almost in dollars and cents as much as all the other products put together, though it forms but ten per cent of the whole. It is redistilled, yielding a light oil which is used as fuel, and the heavy oil, which requires further treatment.

This "heavy distillate" is known as paraffine oil. When it is subjected to cold and pressure crystalline paraffine wax separates from it, leaving an oil from which many of the best lubricants are made, such as sewing machine oil, bicycle oil, jewelers' oil, and oils made to grease any and all kinds of fine machinery. Paraffine wax is one of the most valuable of all the products of petroleum, and is used for more purposes than any other product. It is sold as "crude," "semi-refined" or "refined." Probably most of this is consumed in the manufacture of chewing gum, wax for the ball room floor, and wax for sealing fruit cans; candles, parlor matches, toilet soap and wax tapers occupying second place. The final residue left in the still is "tar still-coke," the purest form of artificially prepared carbon, used in the manufacture of electric light pencils, salves and ointments, hair oil, pomade, vaseline, cosmoline, petrolatum, or petroleum jelly. All these names denote practically one and the same thing—amorphous par-

affine wax widely used by pharmacists and in the arts. The methods of preparing it are kept more or less secret, but they depend upon the fact that when the residuum obtained by evaporating petroleum in a vacuum is filtered through bone-black, the result is a brownish-yellow substance which is not affected by acids, is almost free from odor and is semi-solid at ordinary temperatures. Naphtha and gasoline are used as a fuel for naphtha launches and gasoline stoves, circus shows and street lights. Naphtha, gasoline and benzene are used to remove grease and other stains, and for the manufacture of laundry soap.

THE FORTUNES THAT ARE INVESTED IN THE PRODUCING AND REFINING OF PETROLEUM-CRUDE OIL, AND ITS BY-PRODUCTS.

In this history the reader has been given the history of how petroleum crude-oil was discovered, the method of drilling for it, shipping it to the market, and how it is refined. The next question is, how much does it cost to drill, and how many wells have been drilled in the United States; how much money has been invested in drilling for oil since the Fall of 1859, to and including the year 1902.

From the most authentic resources we find that 128,995 wells were drilled in the Appalachian fields, which includes all of the States of Pennsylvania, New York, West Virginia and Southeastern Ohio, from 1859 up to and including 1902; 50,615 wells have been drilled in the Lima field in Northwestern Ohio, from 1884 up to and including 1902; 19,000 wells have been drilled in the State of Indiana from 1860 to and including 1902; 6,000 wells have been drilled in the State of California from 1875 up to and including 1902; 2,000 wells have been drilled in the State of Kentucky from 1860 up to and including 1902; 2,000 wells have been drilled in the State of Texas from 1870 up to and including 1902; 1,500 wells have been drilled in the State of Kansas from 1894 up to and including 1902; 600 wells have been drilled in the Mecca-Belden, Ohio, lubricating oil field, from 1860 up to and including 1902; 400 wells have been drilled in the State of Colorado from 1870 up to and including 1902; 250 wells have been drilled in the State of Wyoming from 1875 up to and including 1902; 125 wells have been drilled in the State of Tennessee from 1862 up to and including 1902; 52 wells have been drilled in Oklahoma from 1875 up to and including 1902; 46 wells have been drilled in the Indian Territory from 1875 up to and including 1902. This makes 211,573 wells drilled in the United States. This does not include water wells or test wells drilled in other States not mentioned.

Eight hundred million dollars have been invested in production, that is, in taking the crude oil out of the ground; this includes the leases, rentals, bonuses, options and rigs. An oil rig consists of the derrick, engine and belt-house, and all woodwork about a well, casing, tubing, rods, boilers and engines, tanks, pipes and connections. As a rule the drilling is let by contract; the

man who takes the contract to drill a well is called a "contractor." He hires the drillers, tool-dressers, and furnishes the drilling, fishing, and casing tools, cables or ropes, and all tools needed in drilling a well. The contractor receives 30 cents to \$2.00 per foot for drilling the well. After the oil is brought to the surface it must be stored, transported, and refined. The money invested in pipe-lines, refineries, tanks and tank cars and their necessary adjuncts is given as \$900,000,000; in round numbers, \$1,700,000,000 has been invested in the oil industry in forty-four years.

TALK ABOUT MONEY.

From the drilling of the first well in 1859, to the close of the year 1903, the price of petroleum-crude oil has fluctuated between \$20.00 a barrel in 1860 to ten cents a barrel in 1862. The market at this writing is \$1.56 per barrel. The Lima, Ohio, Indiana, Kansas, Texas and California oil fields averages \$1.00 per barrel. The average would be about \$3.00 a barrel during the forty-four years. Of the 211,573 wells drilled in the United States, one-third were dry holes; while the others produced from 1859 to and including 1902 over 1,080,800,000 barrels of oil. The production of crude oil in 1902 was 80,894,590 barrels. Figured at this average price the total production would represent a value of nearly \$3,200,000,000. John D. Rockefeller, the richest man in the world, is at the head of the oil operations, the richest industry in the world. At the present rate of interest Mr. Rockefeller will be a billionaire in less than ten years. The number of men employed in the actual production of oil is nearly three hundred thousand. These are drillers, tool-dressers, rig-builders, pumpers, roustabouts, and teamsters. Those who are dependent upon the production of oil for a livelihood number in the hundreds of thousands. The Standard Oil Company alone employs 40,200 men; this company has an agent, or delivery tank-wagon, or a number of them, in every town or city in the United States, Canada, Mexico, South America and Europe.

THE EARLY DEMAND FOR AND SALE OF CRUDE OIL AND THE ORIGIN OF THE FIRST OIL MARKET.

Nathaniel Cary, of Venango county, Pa., gathered oil on Oil Creek and took it to Pittsburg, Pa., and sold it as a medicine from 1800 to 1808. Robert McKee struck oil in his salt well at Dudley, near Caldwell, Noble county, Ohio, in May, 1816. The natives used it and called it "devil's grease." From 1840 to 1850 Bushrod Creel gathered from the sand diggings on his farm on the Hughes River, in Wirt county, W. Va., oil that he sold Bosworth, Wells & Co., of Marietta, Ohio, and other people, as a remedy. Bosworth, Wells & Co., Marietta, Ohio, bought and sold crude oil from 1840 to 1846.

In 1846 Samuel Kier, a Pittsburg druggist, bottled crude oil taken from his salt well at Tarentum, Pa., and sold it as a remedy to cure everything to which

human flesh is heir to, from colic to consumption and Bright's disease.

From 1840 up until the Drake well was struck in 1859, the natives along Oil Creek gathered the oil with blankets or log coops that floated on the water from the oil springs or seeps. This oil they sold as Seneca oil. James Dutton struck oil near Macksburg, Ohio, in July, 1852. His well over-supplied the demand for medicine oil, and is the first record in history where the oil market was broke by a greater supply than a demand for crude oil. One afternoon in the summer of 1853 while out hunting, William Taylor discovered a dark, greasy substance on the water of a spring at Mecca, near Warren, Ohio. He gathered the oil from the top of the water by means of a flannel cloth, and bottled and disposed of it as "British Oil," then a remedy largely sold on the market for curative purposes.

From 1856 to 1858 John D. Angier skimmed oil off the water of the oil springs at the junction of Oil and Pine Creeks, and sold the most of it as medicine. On the 27th of August, 1859, the Drake well was drilled in, and began to produce twenty barrels of oil a day, which fully supplied the demand of the shale oil refiners. In a short time other wells were drilled on Oil Creek, which more than supplied the demand for oil. The over-production at some of the wells allowed the oil to run into Oil Creek. A number of children and men began to dip oil and store it in barrels, or anything that would hold it. After a short time oil buyers began to buy oil from the dippers as well as the oil producers to make up their cargo to float down Oil Creek, and the Allegheny River to the refineries at Pittsburg. Soon the oil dippers began to own tanks that held 10, 50, 100 or 250 barrels of oil, and into those tanks the dippers dumped the oil they dipped and stored it for the highest price they could get from the refiners on the Creek or the shippers to Pittsburg and other refining points. After the producers got to take better care of their oil very little ran away. This was the means of doing away with the oil dippers. However, the oil dippers were not to be outdone. They began to go around to the producers and buy the non-merchantable oil that came from the bottom of the well-owners' tanks, known as B. S. (below standard). They would barrel the B. S., and haul it to their tanks and dump it. Then they would steam the B. S., and after it settled they would draw the water off and sell the oil to the refiners, and in this way they became known as the dump men. The dump man developed into a refiner later on, and was known as the B. S. refiner; that is, he bought B. S. oil and redeemed the better parts of it and placed it on the market.

The dump man visited the small producer in all localities, bought his oil at so much, by contract, and if there were one or two feet in the tank bottom he bought it in a lump sum, or at so much per barrel. He also bought the good oil from small producers who could not hold their oil long enough to get a full tank. The wells had declined to such a point that the owners could not hold their oil for a month at a time, and were obliged to sell from day to day or week to week. The dump man was their market. When the refiners from

Pittsburg, Cleveland, New York, Erie and Philadelphia sent their representatives in the oil region to purchase crude oil, and they used to travel up and down Oil Creek like platoons of cavalry, pricing oil at various wells, the usual method of approaching the producer was to say, "Have you any oil to sell?" The answer would be, "Yes, I have so many feet of oil in the tanks, or so many barrels." The producer would say, "What price are you giving to-day?" If it was thought the producer was not posted on existing prices the trader would probably reply, "What is the dump man paying?" Receiving a reply he might name a figure just enough above it to get the oil. The dump man was the first merchant to make prices in the oil field. His price was steady all the time. You could always market with the dump man.

At this date all of the refiners in the Oil Creek valley let their benzine go to waste. They burned it as refuse oil or gave it to the owners of the wells. The producers would take or haul this benzine from the refineries to their wells and "benzine, or flood the well," as it was then called. Connections were made to the benzine in barrels on the derrick floor to the casing head of the well. The benzine would run down the well and remove the paraffine, or rod wax, from the wall and sand formations of the well. This was called flooding, or cleaning, the sand in the well, and at the time was reported to make the wells produce more oil. The benzine would mix with the paraffine and the fresh oil as it passed from the sand, and in that state would be pumped from the well into the tank, and the producer would sell it to the dump man as pure oil, and he in turn would sell it to the refiner.

Sometimes as much as twenty barrels of benzine would be given away free by one of the oil refiners to a producer to flood his well. The producer would sell the mixture to one of the dump men with one or two hundred barrels of oil, not mentioning the fact that he had flooded one of the wells with benzine. The dump man, in turn would sell this oil to the refiners, and perhaps the refiners who gave the benzine to the producer as a present for hauling it away would, unknowingly, buy the same benzine back through the producers' agent, the dump man paying as high as \$3.00 and \$5.00 a barrel for it. In a short time the refiners were making more benzine than all the ingredients put together from the oil. This led the refiners to suspect that something was wrong, and upon investigation found the producers and dump men were selling them benzine mixed in the crude oil. This led the refiners to quit buying from the dump men. They employed agents to buy their oil.

This led up to the use of the instrument called a "thief," to test the oil to see if it contained benzine or water. In the course of time the dump man was succeeded by the refiners' agents. Oil sold through refiners' agents during the first ten years of the business. These agents were migratory, that is, they moved about through the oil region, making individual contracts with producers and others. Their meetings would occur

at night. They would meet in the evening, after supper, and discuss the trade. That was the origin of the first oil exchange. Later on, as the business became systematized in a few hands, they began to adopt regular hours for business, and one of their first resolutions was to do no trading after a certain hour (6 o'clock in the day). Later on they adopted a resolution to do no trading after 4 o'clock. Banking hours were adopted for their trading, but that was when the oil exchange became a permanent factor in the trade. All the trading from 1875 to 1895 was done in the oil exchange.

Trading done outside of the exchange was known as curb-stone trading, and was not considered respectable, and was classed with "bucket-shop" operations. The rapid fluctuations in oil in 1876 did a great deal to foster the exchange element and to show people that it was possible to make money rapidly by these wide fluctuations. The sudden advance of three dollars a barrel for oil in 1876 brought the public into speculation with the oil producers. This was the beginning of the speculators on the exchange to manipulate prices in ways not justified by new production or market conditions. Producers themselves sometimes sold oil to themselves at higher prices in order to fix the price for the Standard Oil Company, which held millions of barrels of oil in storage.

Speculators also resorted, especially during the early eighties, to the practice of circulating false rumors concerning the production and discovery of new wells for the purpose of illegitimately influencing prices in oil. Out of this evil grew the practice of the large producers and speculators of employing "oil scouts" to watch the new wells drilled in the different oil fields, and especially the new wells drilled in new territory, known to the oil men as "wildcat wells," to secure information as to the production of the new wells. The large stocks of oil which were on hand during that period enabled the "bear" speculators to sell short in large quantities without ever covering their sales; and the effect was to depress prices to producers. This was the condition of affairs when "the great wildcat mystery of 646" was drilled in, which at once broke the market. The price for crude oil in the year 1882 was as follows:

Prices of certificates of crude oil closed January 3, 1882, at 81¼c, against 88¾c on January 3, 1883, an advance of 7½c on the year. Transactions in certificates were not heavy during the first four months of 1882. The average price for January was 83¼c, the highest 86¾c, lowest 79¼c. In February the lowest was 80¾c, the highest 88¾c, and the monthly average 85c. The tendency of prices was down. The highest price in March was 84¼c, the lowest 78½c, and the average 81c. In April prices continued the lower course, the highest being 80½c, the lowest 75½c, and the monthly average 81c. In May the top figure reached was 76½c (the 4th). From that date the drop continued through the month, closing at 55½c, the average for the four weeks be-

ing 71½c. June witnessed lower prices and some fluctuation, 64c being reached on the 2d. Later however, 51½c was touched, and on the 30th 53c; the monthly average was 54¾c. On July 6 the lowest figure was reached, 49¾c, the highest for the month being 63½c (on the 31st), and the monthly average 57¾c. August was dull, and prices remained heavy, production in Cherry Grove being at its flood; 61½c was the highest, 54½c the lowest, and 58¾c the average price. More animation was noted in September, as it had become known that the Cherry Grove region was rapidly declining. The lowest price was 53¾c, the highest 95c, and the average 72½c. October saw prices touch 99c and drop again to 88c, the average being 93¾c.

November's fluctuations were marked and violent. The highest price was \$1.36 (on the 6th), the lowest 87c, and the average \$1.14½. The month's sales of certificates was enormous. December was a quieter month, but furnished the final spasm of the year in the shape of a panic, resulting in heavy losses—to those best able to stand them. The highest price was \$1.16¾, the lowest 74¾c, and the average price 92¼c.

The oil market from its beginning up to 1895 was governed by the "bulls" and "bears," and not by the supply and demand. This led the Standard Oil Company to adopt a new system, and on January 23, 1895, the Seep Purchasing Agency, of Oil City, on behalf of the Standard Oil Company, posted a notice that thereafter the prices paid by it for crude oil to oil producers would be "as high as the markets of the world will justify, but will not necessarily be the price bid on the oil exchange for certificate oil." This change was rendered necessary from the fact that very little oil was actually being sold on the exchanges, and the Standard Oil Company, through its several pipe line systems, to accommodate its customers, opened a Seep Purchasing Agency in all of its pipe line offices, where the holders of oil in the pipe line could sell their oil.

THE OIL MARKET MONDAY, JANUARY 11,
1903.

The Seep Purchasing Agency posted the following price it would pay for credit balance oil:

Pennsylvania crude oil.....	\$1.85	per barrel
Tiona, Pa.....	2.00	" "
Corning, Ohio.....	1.65	" "
New Castle.....	1.72	" "
North Lima.....	1.36	" "
South Lima.....	1.31	" "
Indiana Trenton Rock oil.....	1.31	" "
Whitehouse, Tenn.....	1.30	" "
South Neodesha, Kan.....	1.36	" "
North Neodesha, Kan.....	1.16	" "
Neodesha, heavy oil.....	.60	" "
Bartlesville, Indian Territory.....	1.14	" "
Somerset, Kentucky.....	1.30	" "
Ragland66	" "
Corsicana, Texas, (light).....	1.27	" "
Corsicana, Texas, (heavy).....	.55	" "
Petrolia, Ontario.....	2.32	" "

The Producers and Refiners Oil Company also quoted \$1.85 for Pennsylvania crude oil.

Credit balances is the number of barrels of oil in the pipe line credited to the owner, for which a receipt in the shape of a negotiable oil certificate is given. The oil is stored in the pipe line company's large iron tanks, free of storage for the first fifteen days; after that a small storage is charged. In case of fire or loss of the oil by accident, the owners lose a percentage of their oil, the pipe line company runs no risk, as they act as the owner's agent, in case of accident. This is called "general average." Ninety per cent of the oil is bought by the Standard Oil Company, through checks issued on the Seaboard National Bank of New York, indorsed by Joseph Seep, the purchasing agent.

The Oil Market from 1860 to 1904

Monthly and yearly average prices of pipe-line certificates of Pennsylvania crude petroleum at wells in daily market, 1860-1904.

[Per barrel of 42 gallons.]

The producers of Pennsylvania high-grade oil should receive five cents a gallon for their crude oil, the pipe lines to receive one-half cent a gallon for transporting the oil from the wells in the oil fields to the interior oil refiners, and one and one-half cents a gallon to the seaboard refiners; the refiners

to receive five cents a gallon on all grades of oil and supply barrels when required on all oil refined and shipped; the wholesaler to receive from one to two cents a gallon; the retailer to receive one to two cents a gallon; the railroads to receive not over one cent a gallon for freight on oil shipped over fifty

miles from the refiners or pipe lines, and the consumer not to pay over sixteen cents a gallon for the best grade of refined oil.

OIL AND GAS LEASE AS IT IS WRITTEN AT
THE PRESENT DAY.

This lease, made this fourth day of January, A. D. 1905, by and between William B. Snow, of the County of Tyler, and State of West Virginia, of the first part, and Charles A. White, of Warren, Pennsylvania, of the second part,

Witnesseth, That the said party of the first part, in consideration of the stipulations, rents and covenants hereinafter contained, on the part of the said party of the second part, his executors, administrators and assigns, to be paid, kept and performed has granted, devised and let unto the said party of the second part, his executors, administrators and assigns, for the sole and only purpose of drilling and operating for petroleum oil and gas, for the term of five years, or as long thereafter as oil or gas is found in paying quantities, all that certain tract of land situated in Lincoln district, Tyler county, and State of West Virginia, bounded and described as follows, to-wit: On the east by lands of James Monroe; on the north by lands of Peter Smith; on the west by lands of Robert Bright; on the south by lands of Samuel Lytle; containing two hundred acres, more or less. The said second party hereby agrees, in consideration of the said lease of the above premises, to give said first party one-eighth ($\frac{1}{8}$) of all the oil or mineral produced and saved from said premises; and further agrees to give \$250.00 per annum for the gas from each and every well drilled on the above described premises, in case the gas is conducted and used off the above described premises. The said second party not to unnecessarily disturb the growing crops thereon, or the fences.

Said second party has the right, which is hereby granted to him, to enter upon the above described premises at any time for the purpose of mining or excavating, and the right of way to and from the place of mining or excavating, and the exclusive right to lay pipe lines for the purpose of conveying or conducting water, steam, gas or oil over and across said premises; and also the right to remove at any time any or all machinery, oil well supplies, or appurtenances of any kind belonging to said second party.

The party of the second part agrees to complete one well within six months from the date hereof, and in case of failure to complete one well within such time, the party of the second part hereby agrees to pay thereafter to the party of the first part for any future delay the sum of two hundred dollars per annum, within three months after the time for completing such well as above specified, payable quarterly to William B. Snow, at his home. And the party of the first part hereby agrees to accept such sum as full consideration and payment for such yearly delay until one well shall be completed, and a failure to complete one well or to make

any such payments within such time and such place as above mentioned, renders this lease null and void, and to remain without effect between the two parties.

It is understood by and between the parties to this agreement that all conditions between the parties hereto shall extend to their heirs, executors and assigns.

In Witness Whereof, We, the said parties of the first and second parts, have hereto set our hands and seals the day and year first above written.

WILLIAM B. SNOW, (L. S.)
CHARLES A. WHITE, (L. S.)

Witnesses:

George E. Black,
Henry Hughes.

THE HISTORY OF THE OIL EXCHANGES,
WHERE SEVERAL FORTUNES WERE
WON AND LOST IN ONE DAY.

An interesting feature to the visitor in the oil country during the early days was the brokerage business. It was as interesting as it was surprising. A visitor to the section and trade, calling at the different exchanges in existence, seeing the number of brokers and dealers engaged, and these augmented on the arrival of every train, the constant coming and going of telegraph messages, and listening to the terms used, found himself in a new world, where thousands on thousands of dollars' worth of property changed hands with an indifference and ease which astonished and bewildered him.

In 1868 brokerage was started by a few individuals, and for some time was chiefly confined to buying for refineries in Pittsburg, Philadelphia and New York. In most cases the brokers were paid by the buyers a commission of ten cents per barrel, and this was sometimes increased by an additional five cents per barrel by the seller. At the outset the business was a matter of experiment, but soon the attention of other parties was attracted thereto. New men entered the ranks, and the whole thing was placed on a legitimate basis by the formation of brokers' boards in the cities where the heaviest trade was carried on, and the establishment of regular rates of brokerage.

In 1869 Erie "cornered" the market, and by the large transactions in crude oil at the wells, influenced the refined markets in New York and Cleveland, thus bringing them in as extensive buyers and opening these important points to the brokers. At that time the broker assumed a more important position in the commercial world, and all over the oil country, wherever the fluid was produced or shipped, either crude or refined, the greater part of the transaction was executed by the broker. His business consisted of buying and selling "spot," "regular," or "future." As these expressions or terms as used will convey to the uninitiated no idea of the particular trade named, a few words may be appropriately given in explanation. "Spot" was the

term used when the oil was to be removed and paid for immediately; "regular" was where the buyer was allowed ten days in which to put in the cars and take out the oil. These were parole contracts and without writings, the broker acting under orders from his principal, whom he named to the other party, and he being often the witness to the trade; but in case of the "future" this was not the custom, as the fulfillment of these took place at the expiration of the agreed time. A written contract was drawn up by the broker and was signed by him as such. This was accepted by both parties and was equally binding, the one agreeing to sell and the other to take a certain quantity of oil within a certain period of time, at a price named in the contract, which also specified that the party in whose favor the contract was drawn should give the other ten days' notice within which to remove the oil.

Regular future contracts were buyers' and sellers' options. In the first the buyer had the right to demand the oil at any time and by the last the seller could put it in whenever he choose, all within the time named in the contract. By these contracts the buyer was also bound to take the oil or pay, or take a difference in money, according as the trade had proved in his favor or against him, and this difference was that between the contract price and the regular market rate on the last of the ten days' notice.

METHODS THAT PREVAILED.

The "regular" contracts are spoken of because there was a species of contract by which the amount of difference was named and limited at the start. These were called "puts" and "calls." A "put" was where one party agreed to give a certain sum of money to be paid at once for the privilege of delivering a named quantity of oil at a price also named, within an agreed time.

A "call" was when the money was paid or the right to call on the other to deliver the oil. In these cases the prices of the "put" or "called" oil was generally higher than the rate of regular contracts for the same time. This was because it was a one-sided affair, since under no circumstances could the acceptor of the offer get more than the amount bid, whilst if the market went against him he was obliged to settle the difference at what may have proved a heavy loss.

In all regular contracts the seller paid the brokerage, but in these irregular trades there was no established custom as to which of the parties it was due. In New York and Oil City the commissions differed, and this was an obstacle in this business to which brokerage in other commodities was not liable. I refer to the fact that in all "futures" the broker had to wait for fulfillment of the contracts ere he could collect his commission, and if either party failed he lost his pay. By this he was actually made to insure the solvency of both parties to the amount of his brokerage, which was a manifest injustice. His business ought to end with the issue and acceptance of the contract, and though it was

customary for brokers to attend to the taking or delivery of oil for their principals, they got no additional pay for their extra service.

In a business like this the market in years gone by fluctuated greatly. A combination was frequently formed to lower or raise the price of oil, and this was especially the case as the time approached when a number of contracts matured. The "bulls" and "bears" were then rampant, and the talk was all the "long" and "short" order. When the oil market was lively the close of the first and last half of the year was generally marked by some such struggle, and the brokers bought and sold thousands of barrels of "paper" oil so as to effect settlements of six months' contracts that were coming due.

WERE CLOSELY ALLIED.

Brokers were, by the nature of their business, very closely connected. Each generally had correspondents in different cities where there was an oil exchange, with whom to share the brokerage arising from the purchase of the sales made through their joint exertions; and it sometimes happened that each broker was obliged to call in the oil till the commission was so divided and subdivided that it would hardly pay the telegraph bills of the different parties. In fact, brokerage was a hard-worked and poorly-paid profession, and yet there was an excitement about it that formed a great attraction. The men were a jolly, jovial set, free and generous with their money and kind offices, and as there was a business where much was of necessity left to their honor, each man took a pride in keeping his word on an equal footing with his bond.

During 1878, by the exertions of prominent men identified with the trade, regular exchanges were established in Titusville and Oil City, and later on in Pittsburg, New York, Warren, Bradford and Parker. The one at Oil City was opened Tuesday, April 23, 1878. It was a gala day for that place, it being at that time the most important commercial event in the history of that city, and to the speculative oil business, more than anything else, is Oil City indebted for the appellation "Hub of Oildom." The pipe line certificates afforded an excellent medium for speculation, and the commodity they represented was then subject to fluctuations of 5 to 50 per cent. In a single year the clearances exceeded 11,000,000,000 barrels. Business was booming and the brokers had business from nearly all quarters of the country.

The forerunner of these institutions was the "Curbstone" exchange at Oil City in 1870. Business was done on the street, and producers, operators and spectators would congregate on the sidewalk, discuss the situation, tell stories and buy and sell oil. Trades were made in offices, at wells, and everywhere. The business was at fever heat, and everybody who had a few dollars was "in it." Business rapidly increased, and rooms were rented which were used until the formal opening of the exchange, as stated above, took place.

The application of the clearing-house system in 1882 simplified the routine and facilitated deliveries. The volume of business was immense, the clearances often amounting to 10,000,000 or 15,000,000 barrels a day. Only the New York and San Francisco stock exchanges surpassed it. During rapid fluctuations the galleries would be completely packed with men and women who had taken a "flyer" and watched the antics of the bulls and bears intently. To a stranger the place seemed like a mad-house with all its inmates turned loose. Pandemonium reigned supreme; at times it was almost impossible to understand what a person was saying, although yelling at the top of his voice not a distance of a foot away from you.

BRADFORD'S OIL EXCHANGE—SOME REMINISCENCES OF THE PANIC OF BLACK THURSDAY, DECEMBER 9, 1882.

The Bradford Oil Exchange was one of the largest in the oil country. It had a handsome brick building on Main street. At the sides of the large hall were reading rooms, a parlor and coat rooms. The bull ring across which the brokers waved their arms and yelled at one another was a stout nickel-plated railing in the center of the hall, enclosing an oblong space some twenty feet long and eight feet wide. Over the entrance was a gallery, which used to be open to visitors, but the seats in it later were rented to speculators who desired to watch the market for opportunities for quick turns. Though only one commodity was dealt in, the shouts that were hurled across the bull ring were joyous to a stranger. "Sell five for a quarter!" yelled repeatedly, with the waving of hands, means that the noisy broker wanted to sell five thousand barrels of crude petroleum, represented by a certificate of one of the pipe lines, for \$1.13 $\frac{1}{4}$ —or whatever the figures ending with $\frac{1}{4}$ may be—per barrel, deliverable on the following day. "Sell five, cash, for a quarter," means the same, except that the delivery is to be made in time to be reported at the clearing-house on the day of the transaction. "Thirteen and a half for five, seller next week," signified that the crier wanted to sell five thousand barrels of oil for \$1.13 $\frac{1}{2}$ a barrel delivered at any time the seller may select in the following week. By substituting "buyer" for "seller" the option was given to the purchaser. Transactions made before 11 o'clock a. m., and specified as "cash" were reported to the clearing-house before 12 30 p. m. of the succeeding day. The expenses of the clearing-house, in which the accounts of the brokers with one another are balanced, are assessed upon members of the exchange in proportion to the magnitude of their transactions. The hours for business in the exchanges are from 10 a. m. till 12:30 p. m., and from 1:30 till 4 p. m. In

the evening the brokers gather in the exchanges to deal in puts and calls.

It is doubtful whether Black Friday in New York produced a wilder panic than that which reigned in the Bradford Oil Exchange when on November 23 the market dropped in two hours from \$1.14 $\frac{1}{2}$ to 97 cents. Certainly nothing approaching it had ever been seen in the oil region. The market opened at \$1.12 and very sensitive. The downward tendency was stoutly resisted by the bulls throughout the forenoon, and when the gong struck the game did not stand greatly in favor of the bears. The crowd had hardly gathered around the bull ring in the afternoon before the market began to fall to pieces. Point after point was lost; and, gradually at first, but with mad haste later on, those who had been bulling the market developed into bears. In the corridor of the exchange was a dense throng, in which there were a number of women, whose possessions were growing less at every drop of the market. The crowd extended to the sidewalk and spread out, up and down the street. News of the break had spread throughout the town, and merchants, mechanics, clerks, bookkeepers, day laborers and men of almost every avocation left their duties and hastened to the scene of the excitement. Some had to stay only long enough to hear the first news that came from within the closed doors. It told them that they had lost all they had to lose, and with blanched faces they turned away. Brokers howled themselves hoarse in their efforts to find their customers and call for a renewal of margins. Telegrams of bearish character were flowing into the exchange from the other oil centers, and these contributed to the excitement that was every minute growing wilder about the bull ring. The scene when an excited broker leaned over the ring and shouted his offer to sell fifty thousand barrels at one dollar became indescribable. Another broker had to drop sixty-four thousand barrels because his customers could not or would not make good their margins. Panic reigned in the gallery, where the excited speculators rose to their feet, waved their hands and shrieked in fruitless endeavor to attract the attention of their brokers, who were packed around the ring, struggling for foremost places, gesticulating wildly, and shouting at the top of their voices their offers to sell.

On one of the benches at the west side of the hall sat a woman, the wife of a railroad mechanic, whose pale and twitching face betrayed the suffering she was enduring. She had been buying oil on a rising market, investing her husband's wages and all the money she could spare in margins. The market had continued to advance till the time came when she could have sold out at a profit, according to common report, of forty thousand dollars. She saw this fortune melting away and was powerless to check the ruin. How she came out of the wreck is known to few, if any, besides herself and her broker.

NAMES OF OFFICERS AND MEMBERS OF
THE SEVERAL OIL EXCHANGES

FROM 1882 TO 1886.

THE TITUSVILLE OIL EXCHANGE.

The following is a list of the Titusville Oil Exchange in 1882, of which Mr. A. P. Bennett was President; Mr. M. W. Quick, Vice President, and Mr. C. M. Coburn Secretary: Members: A. L. Ackerman, I. E. Ackerly, M. N. Allen, Samuel Ames, F. W. Ames, Dr. M. Bailey, C. S. Barrett, F. Q. Barstow, N. B. Barnsdall, Fred Bates, L. Beaumont, W. D. Beebe, B. D. Benson, W. B. Benedict, A. P. Bennett, George L. Benton, M. B. Bettis, H. C. Bloss, Marcus Brownson, W. J. Booth, R. H. Boughton, Jr., S. P. Boyer, S. Q. Brown, J. W. Butters, W. A. Byers, Julius Byles, J. A. Cadwallader, H. P. Chamberlain, J. H. Caldwell, J. J. Carter, Charles Castle, T. P. Chambers, G. A. Chase, Lanman Chase, C. M. Coburn, J. H. Cogswell, J. H. Cogswell, Jr., Manley Crosby, James H. Davis, J. H. Dingman, J. A. Dower, J. R. Drum, J. A. Dunn, G. B. Esterly, B. F. Edwards, David Emery, E. O. Emerson, E. H. Eddy, S. P. Franchot, Nelson Farel, John Fertig, S. S. Fertig, R. D. Fletcher, E. B. Frew, C. B. Friedman, D. W. Field, D. H. Fisher, C. N. Fuller, W. S. Gwaltney, H. C. Grenner, D. R. Greene, F. H. Gibbs, George Gilimor, M. B. Groesbeck, M. C. Goss, J. M. Guffey, H. M. Haskell, R. W. Hall, Edgar Hale, G. R. Harley, A. C. Harton, J. M. Henderson, William M. Henderson, H. L. Hershberg, F. A. Hill, E. C. Hoag, Joseph Hoenig, F. M. Hooper, J. M. Hooper, R. E. Hopkins, E. A. Houard, A. B. Howland, G. C. Hyde, J. W. Jackson, B. F. Kraffert, O. Keese, R. L. Kernochan, A. T. Knowlson, John Lammers, E. P. Landas, R. H. Lee, Frank Loomis, W. P. Love, William Loverock, T. S. McFarland, T. A. McLaughlin, M. B. McManus, J. W. McClellan, W. T. McKee, David McKelvy, J. C. McKinney, J. L. McKinney, John McCort, Joseph McDonnell, C. Merrill, F. L. Mitchell, R. J. Moorhead, B. E. Moreland, J. A. Morley, J. A. Neill, C. H. Newkirk, W. H. Nicholson, Frank P. Nuse, Daniel O'Day, James Parshall, S. W. Parshall, C. N. Payne, F. M. Pratt, A. N. Perrin, John Pitcairn, Jr., H. Y. Pickering, J. A. Pincott, H. B. Porter, James Purtill, W. A. Pullman, M. W. Quick, A. S. Ralston, W. B. Roberts, E. T. Roberts, M. R. Rouse, J. C. Russell, John Satterfield, I. L. Shank, L. L. Shattuck, N. Shaffner, G. Shamburg, Loomis L. Shattuck, Charles St. John, W. T. Scheide, Joseph Seep, Roger Sherman, W. B. Sterrett, J. D. Sterrett, R. H. Sterrett, D. B. Stewart, Lyman Stewart, Milton Stewart, A. H. Steele, H. C. Stevens, W. B. Stewart, H. F. Sweetser, T. J. Smiley, Jesse Smith, George F. Southard, O. F. Schonblom, C. E. Stewart, Frank Tack, Theodore E. Tack, H. L. Taylor, Taylor Tift, S. E. Tift, T. P. Thompson, W. W. Thompson, B. W. Vandergrift, Jonathan Watson, J. A. Waugh, W. H. Wallace, R. A. Watson, E. W. Watson, U. C. Welton, E. Westheimer, I. Westheimer, C. W. White, Isaac

Williard, D. O. Wickham, P. T. Witherop, W. J. Woods.

THE BRADFORD OIL EXCHANGE.

Following is a complete list of members of the Bradford Oil Exchange in 1883: C. L. Wheeler, President; J. M. Fuller, Secretary. Members: C. D. Angell, C. C. Adams, D. W. Allen, James Amm, R. R. Armor, F. W. Andrews, C. H. Ames, F. M. Aiken, J. M. Armstrong, F. E. Boden, H. L. Blackmarr, James Broden, A. H. Blomer, H. C. Brooks, H. C. Bosley, W. E. Bullock, A. F. A. Brown, L. A. Brenneman, E. H. Barnum, Thomas Bradley, John Brown, H. E. Brown, W. H. Bradley, A. P. Bennett, Asher Brown, George A. Berry, S. P. Boyer, E. A. Boyne, J. E. Butts, Jr., C. K. Book, E. J. Boyleston, J. E. Blair, W. W. Bell, O. D. Bleakley, J. N. Bolard, W. E. Boyleston, G. S. Bumstead, C. A. Ball, J. C. Brenneman, G. F. Blackwell, J. S. Book, W. P. Book, W. W. Brown, S. G. Bayne, E. C. Bradley, G. H. Brooks, D. D. Babcock, J. C. Chambers, George Chambers, C. S. Clarke, S. E. Critchlow, E. E. Chambers, W. L. Curtis, J. A. Clarke, G. W. Cottebaugh, E. S. Crooker, S. G. Coffin, O. H. Colton, C. H. Cramer, Richard Church, J. H. Cosford, N. R. Collins, W. H. D. Chapin, John Cochran, R. B. Corey, F. J. Conant, Fred Conlin, J. E. Cochran, William Chambers, Nathan Bushnell, Wesley Chambers, J. M. Clapp, Joseph Duke, William Duke, Warren Dow, E. H. Dyer, E. R. Dresser, Rollin Dow, C. M. Dodge, F. A. Dailey, George S. Daniels, Harley Dewolf, H. R. Decker, John Denman, S. H. Durston, A. K. Darrow, F. W. Davis, H. S. Davis, W. G. Evans, F. F. Elliott, Lewis Emery, Jr., M. C. Egbert, W. R. Ewing, J. A. Ege, John Eaton, J. M. Fuller, L. E. Fuller, F. H. Frisbee, H. W. Ford, J. B. Farrell, C. H. Filkins, J. C. Frisbee, H. B. Goe, Frank Gifford, R. H. Gray, Victor Gretter, Bateman Goe, W. G. Gray, J. A. Gartland, Otto Germer, E. N. Hallock, C. R. Huntley, A. Hochstetter, R. T. Hazzard, J. W. Humphrey, Jr., Francis Händel, E. T. Howes, Peter Hannon, H. B. Huff, F. P. Hayes, George C. Howe, S. B. Hughes, W. P. Halderman, B. N. Hurd, L. E. Hampsher, C. E. Hequembourg, J. E. Haskell, I. L. Halderman, A. R. Hacker, W. A. Innes, F. S. Johnson, E. T. Johnson, E. H. Jennings, I. G. Jackson, J. A. Johnson, J. T. Jones, J. B. Jayne, Heman Janes, W. Harry Johnson, A. F. Kent, P. T. Kennedy, John B. Kane, D. W. Longwell, F. P. Leonard, W. P. Logan, Robert Long, Theodore Ladd, Emanuel Levi, R. T. Lain, H. A. Marlin, M. H. Mercer, H. P. Malone, S. W. Mason, A. K. Murray, M. Mattison, W. C. McNish, Robert Moore, C. C. Melvin, William Munnhall, F. W. Mitchell, M. Murphy, L. E. Mallory, T. A. McLaughlin, T. J. Melvin, R. P. Miller, M. N. Miles, J. M. McElroy, T. E. McCray, J. M. McCray, W. D. McBride, A. W. Newell, H. H. North, Charles Newell, W. H. Odell, Daniel O'Day, R. H. Owens, C. E. Parsons, W. A. Pullman, C. N. Payne, C. W. Pratt, John Potts, N. D. Preston, R. Painter, T. J. Powers, W. H. Powers, H. J. Pemberton, H. E. Pickett, E. W. Marshall, P. W. Roth, O. M. Roberts,

G. L. Roberts, H. O. Robbins, S. M. Reed, D. A. Ralston, S. C. Rhodes, A. Richards, S. G. Slike, C. P. Stevenson, A. J. Stephenson, M. Shaw, Kenton Saulnier, N. T. Saunders, Joseph Schlesinger, D. M. Saunders, L. C. Stanford, James H. Snow, B. F. Smith, W. H. Spain, G. C. Smith, Clark Stewart, H. C. Shearman, R. C. Shearman, S. Solomon, P. M. Shannon, A. B. Smith, Joseph Stettheimer, J. H. Simonds, H. B. Steck, Joseph Seep, O. F. Schonblom, L. H. Smith, Charles Samuels, Louis Suhr, J. B. Steele, Winfield Scott, L. R. Shaw, W. P. Thompson, H. S. Tucker, R. E. Townsend, B. F. Thornton, J. L. Tracy, M. B. Taylor, H. W. Tews, R. H. Thayer, A. J. Thompson, B. I. Taylor, D. P. Thomas, S. W. Vandersaal, T. J. Vandergrift, George H. Van Vleck, W. F. Van Schaik, C. L. Wheeler, E. P. Whitcomb, W. O. Wing, S. A. Wheeler, C. S. Whitney, A. Willoughby, W. R. Weaver, P. L. Webster, C. B. Whitehead, M. Wall, J. F. Wilson, E. D. Warner, A. Warner, A. B. Walker, E. F. Willets, H. M. Walters, H. F. Whiting, A. J. Wellman, Henry White, R. M. Waugh, J. A. Waugh, W. W. White, W. G. Young, A. B. Young, D. G. Young, John P. Zane, W. B. Zielie.

THE NATIONAL PETROLEUM EXCHANGE, 57 BROADWAY,
NEW YORK—THE MEMBERS OF THE NATIONAL
PETROLEUM EXCHANGE, NEW YORK.

Following are the officers of the National Petroleum Exchange: President, Charles George Wilson; Vice Presidents, H. L. Horton, J. E. Little; Treasurer, E. K. Willard; Secretary, William C. Brose; Directors, Emil Schalk, R. H. Foote, S. M. Lehman, E. H. Bunker, W. J. Osborn, H. H. Marks, C. M. Taylor, H. H. Truman, C. F. Schrammer, P. C. Royce, Solomon Dreyfus, Alfred de Cordova, John A. McPherson, J. F. Sadler, F. H. O'Connor, N. L. Hunting.

Following are the names of the members of the National Petroleum Exchange, as obtained from the official records:

Henry Allen, Frank J. Abbor, T. S. Atwater, William Adams, Otto Arens, H. Alton, E. Corning Abell, Eugene Alison, R. L. Anderton, J. S. Baird, J. L. Blood, E. H. Bunker, Charles L. Bartlett, James A. Breen, George W. Bailey, Thomas E. Bailey, S. E. Brainard, W. C. Brose, Henry Bushman, E. L. Brodt, George Brenecke, W. R. Beers, F. F. Beals, J. A. Baker, C. C. Beggs, R. B. Borland, John P. Beal, Caleb C. Bedell, H. H. Barnes, D. Barnes, Asher Brown, F. S. Belton, P. D. Barker, Horace Bird, E. G. Burgis, D. M. Bogert, Jr., Maynard Bixby, George A. Betts, Henry T. Barton, Ed J. Brown, James D. Cummings, Clarence Creighton, Henry S. Church, A. T. Comar, William L. Carbin, L. D. Cordes, W. H. D. Chapin, Lewis Contencin, John Connor, N. F. Clark, B. E. Chitton, T. M. Coekind, E. W. Corlies, J. M. Coleman, Adrian Crucy, John Cattus, A. H. Coheux, O. R. Canchois, Henry Clews, E. J. Donnell, Peter Diestil, H. D. Dumant, Nathan Dole, John W. Davis, Theodore Dorsey, W. H. Dufur, Aaron de Cordova, Alfred de Cordova, C. F. Doane, Clark Dunham, R. L.

Dunbacher, W. H. Daly, Solomon Dreyfus, William Diestil, J. Frank Emmons, John H. Evans, John M. Ewen, J. M. Emanuel, Frank Elwood, Thomas Eagen, W. G. Evans, C. F. Eberlin, John M. Forbes, Jr., C. M. Foster, Randall H. Foote, J. Ferro, M. B. Fielding, Charles J. Fraser, A. Fraser, G. E. Foster, C. Foley, Fred Fisher, Isaac Friedenheit, Charles Garlich, H. B. Gomers, Howard Gallups, P. R. Gray, Albert E. Goodheart, William R. Gilbert, Nicholas Groyume, Theodore Goerck, C. Gimbernat, Jonas G. Goldsmith, Jacques Gutman, Wright Gillies, F. A. Gans, Siegf. Gruner, George P. Gray, M. A. Geryoune, James Graham, Felix Gottschalk, J. J. Gould, Henry Geering, James F. Hughes, Harry T. Horton, R. E. Hopkins, John H. Hebert, Augustus G. Hildreth, N. F. Hilton, Fred L. Hebert, John Hartshorne, Henry D. Harris, A. R. Hacker, J. W. Humphrey, Jr., J. L. Hathaway, J. H. Holt, George P. Hart, Oscar Hackmann, A. G. Hetsy, H. B. Hebert, N. E. Haskill, Maurice Hochstetler, R. M. Henning, Rufus Hatch, Jacob T. Hiffelsheimer, N. Helmers, T. E. Harrison, N. L. Hunting, George H. Hopper, J. C. Inches, J. A. Jamerson, P. H. Judd, J. T. Jones, T. K. Jordan, J. B. Jayne, Franz Krohn, John H. Kump, Leon Klopman, Charles Knowd, A. Klein, M. Keating, Jr.; J. Otto Koch, F. A. Klemm, Isadore Kahn, C. E. Kimbark, Herman L. Kingsbury, W. F. Kidder, William L. Lay, S. M. Lehman, Phil Lehman, James E. Little, George I. Landon, William Lummis, Henry Lewis, George Lewis, T. A. McLaughlin, Joseph Levi, W. H. Longwell, John L. Lorghii, J. B. Mercereau, J. B. McCue, H. R. Moore, Gouverneur Morris, Lewis Morris, J. McKim Minton, G. A. Morrison F. H. Morrison, F. A. Marsley, R. Muller, Alex. J. Meyer, James O. M. McHenry, Allen W. Masteron, L. A. Morrison, H. B. McKinney, Mont Isaacs, F. M. Maas, J. H. Mayer, H. B. Marks, M. McCarthy, R. J. Morehead, E. Marthens, Harry H. Marks, C. F. Mackenzie, Alex. Marshall, S. G. NEW YORK PETROLEUM EXCHANGE, 18 BROADWAY, NEW YORK.

(ORGANIZED APRIL 12, 1877.)

Proceedings of the annual meeting May 6, 1884; also rules of the exchange, by-laws and lists of its officers and members. Seventh annual report, May 6, 1884.

The eighth annual meeting of the New York Petroleum Exchange was held in the exchange, 18 Broadway, New York, May 6, 1884, in conformity with Article IV., Section I., of the by-laws. President L. H. Smith called the meeting to order at 12 30 p. m.

Officers: L. H. Smith, President; James A. Waugh, First Vice President; S. F. Strong, Second Vice President; H. M. Curtis, Treasurer; W. H. Lewis, Secretary. Directors: P. V. Miller, Livingston Roe, H. O. Beebe, H. E. Hosford, Minot Mitchell, Samuel Ames, Nic Mehlen, M. A. Winkle, Frank Tack, Marshall Ayres, Jr., H. S. Corwin, P. B. Crosby, H. A. Patterson, J. W. Copmann, C. E. Orvis, F. D. Stead, W. G. Young, G. H. Lincoln, Marcus Heim, James P. Moore.

Standing Committees, 1884—Finance: C. E. Orvis, Chairman; George H. Lincoln, H. S. Corwin. Floor: Nic Mehlen, Chairman; M. N. Day, M. Heim, S. F. Strong, G. M. Loederer, F. H. Skelding. Conference: Nic Mehlen, Chairman; Frank Tack, P. B. Crosby. Clearing-house: S. F. Strong, Chairman; H. A. Patterson, Frank Tack. Law: S. F. Strong, Chairman; S. C. T. Dodd, N. P. Stanton. Complaint: P. V. C. Miller, Chairman; Livingston Roe, H. E. Hasford.

LIST OF MEMBERS.

A.

No.	Name.	Address.	Company or Firm.
88	C. F. Ackermann,	27 and 28 Beaver St.,	Meissner, Ackermann & Co.
111	Fred T. Ackermann,	27 and 28 Beaver St.,	Meissnes, Ackermann & Co.
227	Judah L. Adler,	526 Broadway.	
472	J. W. Alexander,	311 West 55th St.	
220	Harry Allen,	62 Broadway,	Allen & Stead.
299	Henry Allen,	70 Broadway,	Henry Allen & Co.
334	Samuel Ames,	18 Broadway,	Hilton & Waugh.
67	James Ames,	Buffalo, N. Y.	
364	Wm. H. Anderson,	18 Broadway.	
147	Frank W. Angel,	56 Wall St.	
85	John D. Archbold,	44 Broadway,	Acme Oil Co.
455	T. H. Armstrong,	Weehawken, N. J.,	Weehawken Oil Docks.
12	Eli W. Arnold,	18 Broadway.	
76	M. Arnold,	18 Broadway.	
583	Simon W. Arnold,	24 State St.	
586	B. Arnson,	14 Cedar St.,	Arnson & Co.
421	W. S. Arter,	18 Broadway,	C. C. Beggs & Co.

- 475 Thomas J. Aspell, 42 New St.
 9 J. M. Atwater, 37 Pearl St.
 123 Marshall Ayres, Jr., 34 Broadway.

B.

- 259 F. G. Babcock, Hornellsville, N. Y., Bank of Hornellsville.
 109 Paul Babcock, Jr., 44 Broadway, Sone & Fleming Manufacturing Co.
 24 W. Babcock, 54 Broad St., Room 4, Babcock & Cox.
 402 Roger S. Bacon, 30 Pine St., Orvis Bros. & Co.
 94 C. W. Baker, 18 Broadway, J. C. Fisher & Co.
 340 Geo. Bancroft, 55 Stone St., Small & Bancroft.
 671 J. B. Barbour, Jr., 18 Broadway, James S. McKelvey.
 99 E. H. Barnum, Bradford, Pa.
 663 John R. Barrett, 125 Pearl St.
 480 John M. Battle, 2 Stone St., Room 50.
 14 Frederick F. Beals, 55 Broadway, Room 6.
 36 O. H. Beebe, 32 Broad St., Van Schaick & Co.
 385 Chas. W. Beebe, 18 Broadway.
 433 LeGrand E. Beers, corner Washington and Flushing avenues.
 330 G. A. Beling, Jr., 81 New St.
 688 Geo. A. Bergmann, 30 Platt St., Geo. A. Bergmann & Co.
 10 Irv. S. Bernheimer, 52 Broadway, Bernheimer & Spyr.
 386 J. A. Berrian, Jr., 23 Beaver St., Geo. H. Lincoln.
 640 M. K. Bettis, Oil City, Pa.
 614 David Bettman, 121 East Sixtieth St.
 476 J. M. Bettman, 18 Broadway, Room 813.
 521 M. A. Bettman, 75 and 77 Leonard St.
 51 James M. Bingham, Twelfth and Pike Sts., Pittsburg, Pa.
 465 Emmett Birdsall, C. 2 Exchange Ct., and 52 Broadway.
 47 J. M. Bishop, 867 Case ave., Cleveland, O.

RULES ADOPTED BY THE CONFERENCE
 OF OIL EXCHANGES FOR THE PURPOSE
 OF SECURING UNIFORMITY
 IN BUSINESS BETWEEN THE
 OIL EXCHANGES.

PIPE LINE ACCEPTANCES.

1. In the Oil Exchanges deliveries of the oil of a pipe line shall be made in the acceptance or certificates of that pipe line, unless otherwise stipulated at the time a transaction is made. Such acceptances or certificates shall be storage paid.
2. Acceptances or certificates are pipage unpaid, unless otherwise aged upon.

REGULAR OIL.

3. Regular oil means oil that is to be delivered on the first business day after the transaction.

4. All transactions, if not otherwise specified, shall be considered regular oil.

SPOT OR CASH OIL.

5. Spot or cash oil means oil that is to be delivered on the day of the transaction.

SELLER'S OPTION.

6. A seller's option means a transaction wherein the seller has the privilege to deliver the oil at any time within the time specified by giving the customary notice.

BUYER'S OPTION.

7. A buyer's option means a transaction wherein the buyer has the privilege to demand the delivery of the oil at any time within the time specified by giving the customary notice.

NOTICE ON B. & O. AND S. O.

8. If the oil on a buyer's or seller's option is desired to be delivered on a certain day, notice must be given on the previous business day, before 2:30 P. M. If the contract is not thus terminated or otherwise cancelled, the oil must be delivered on the last day.

"PUT."

9. A "Put" entitles the buyer of the "Put" to the privilege of putting oil to the other party at any time within the time specified at the price named by giving the customary notice.

"CALL."

10. A "Call" entitles the buyer to the privilege of calling on the seller for the oil at any time within the time specified at the price named by giving the customary notice.

11. Notices on "Puts" and "Calls" must be given during business hours. The notice makes it an absolute transaction, and the oil is delivered at the delivery that comes next in regular order.

WRITTEN CONTRACTS.

12. Written contracts shall be governed by these rules in so far as they are not provided for by their own written terms.

DEPOSITS TO SECURE TRANSACTIONS.

13. Either party to a transaction may, at any time during business hours, require the other party to deposit sufficient money or oil, as the party called

on may select, to secure the transaction to a point ten cents per barrel, distant from the then market price if the market is below one dollar per barrel; and if the market is above one dollar, then this distance to be ten per cent. of the market price when the call is made. The party in whose favor the market may fluctuate shall have the power to call in like manner for additional deposits of not less than five cents per barrel to maintain but not exceed the margin. The deposit shall be made within half an hour from call. A failure or refusal to make the deposit within the specified time shall be considered a failure to fulfill the contract.

TIME OF PUTTING UP SECURITY ON TIME CONTRACT.

14. Upon the consummation of a time contract on which security is to be put up, it shall be the duty of the seller and buyer to sign or accept a contract therefor, and put up the specified amount of security within twenty-four hours after confirmation until such time as the required security is placed. The contract shall be subject to the preceding rule on deposits of security. A failure of either party to a contract to conform to this rule shall be considered a breach of contract, and the party guilty may be so proceeded against.

WHERE COLLATERAL SHALL BE PUT UP.

15. Unless otherwise agreed upon, collateral security must be put up in some bank in good standing where the party putting up said security is not owner or part owner.

PUBLIC OFFERS.

16. A declaration to buy or sell in open 'change can be accepted by any member. In case of misunderstanding in accepting offers to buy or sell it must be decided immediately by a vote of the members present.

FICTITIOUS SALES.

17. Fictitious transactions are positively forbidden, and render the parties concerned liable to fine, suspension or expulsion from the exchange.

TELEGRAPH ORDERS BETWEEN CORRESPONDENTS.

18. If not otherwise arranged, telegraphic orders between members of the various exchanges shall be good for at least twenty minutes from the time the telegram arrives at its destination, unless in the meantime said order shall be withdrawn; and said order shall not be considered withdrawn by party giving said order until such time as the withdrawal telegram shall have arrived at its destination and shall have been delivered to party addressed; or when said party cannot be found immediately, a reasonable time (say three minutes) elapses to permit said withdrawal telegram to have been delivered.

19. When contracts mature on Sunday or any

legal holiday, delivery shall be made on the succeeding business day. But where two holidays occur on consecutive days—as where Sunday immediately precedes or follows a legal holiday—contracts falling due upon the first of such holidays shall be settled upon the business day immediately preceding, and those maturing on the second of such holidays shall be settled upon the business day following the same.

CLOSING OF CONTRACTS.

20. If any member fails or refuses to comply with the requirements of a transaction, the other party shall have the privilege to close the transaction and establish the difference in the following manner: He shall notify the delinquent personally, or in writing, of his intention to close the contract under this rule. He shall then give the presiding officer a written order to buy or sell, as the case may be, the kind of oil and delivery the transaction calls for, which order shall be executed free of charge publicly for account of delinquent, and the transactions shall be recorded in the Arbitration Committee's book of awards. The delinquent may then forthwith be dealt with for default of contract. A failure to close out a transaction under this rule shall not relieve either party from the responsibilities of the contract. The Presiding Officer shall also have power in the same manner to close out and convert collateral security put up by a delinquent. The provisions of this rule shall apply to transactions between members of different conference exchanges, subject to the following conditions:—

The party desiring to close a transaction under this rule shall present a written statement of the contract, together with specific instructions to the presiding officer of the exchange to which he belongs, and said officer, after satisfying himself of the justice of the claim, shall forward the instructions to the presiding officer of the exchange of which the delinquent is a member. It is understood that in this, and all similar cases, the presiding officer acts as the agent of the parties, and neither he nor the exchange be held responsible for acts performed in accordance with the rules.

PUBLIC NOTICE TO ABSENTEES.

21. If a party to a transaction, or his agent, cannot be found at the exchange or his office, it shall be considered a good notice tender or demand, if the presiding officer shall publicly announce the business that is desired to be transacted with the absent party, and the absent party shall be held liable thereby. If the secretary of the exchange has no record of the office of a member it shall be held that the exchange room is his office or place of doing business.

BROKERAGE.

22. If not otherwise arranged, the brokerage on either a sale or a purchase shall be \$2.50 per thousand barrels.

FRACTIONAL PRICES.

23. The price on public offers to buy or sell shall not be divided into smaller fractions than one-eighth of a cent per barrel.

BUSINESS HOURS.

24. (As amended). The exchanges shall be open for business from 10 o'clock A. M., 75th meridian time, to 3 o'clock P. M. On Sundays and legal holidays the exchanges shall be closed.

25. The exchange shall not allow its members to engage in trading outside of business hours, either in spot or regular oil. Buyers or sellers options, "permanent loans," puts or calls; and in case of violation of this rule, or any other misconduct, the offender shall be brought up by his own exchange, or its members, or by members of other exchanges, and shall be fined, suspended, or expelled. The arbitration of the offense shall be subject to the rules of the exchange to which the offender belongs.

26. Any member in good standing of any exchange in the conference shall have the privilege of joining any or all other exchanges in the conference under the rules of the exchange to which such application is made.

SUSPENDED OR EXPELLED MEMBERS.

27. Any member of the several exchanges who may be suspended or expelled from either of the exchanges to which he belongs, shall likewise stand expelled from all the exchanges to which he belongs. A suspended or expelled member shall be ineligible to membership in any of the exchanges until such time as said member shall be reinstated. Notice of such suspension, expulsion or reinstatement must be sent to the several exchanges, and be placed upon bulletin board or otherwise duly advertised by the secretary of the exchange receiving such notice. Any member of any of the exchanges who makes trades on the floor of the exchange with or for a member who stands suspended or expelled from any of the exchanges, shall be liable to fine, suspension or expulsion from the exchange to which he belongs.

REJECTED APPLICANTS.

28. If any of the oil exchanges, adopting the Conference Rules, reject or refuse membership to a person, the secretary of said exchange shall communicate to the secretaries of the several oil exchanges the fact of such rejection, giving the result of the ballot cast for said applicant.

WHEN CONFERENCE RULES GO INTO EFFECT.

29. Each exchange in the conference shall have the same number of votes in adopting a rule, as it has representatives in the Conference of Exchanges, and when three-fourths of the representative vote of the exchanges connected with the conference shall report to the president their approval of any rule or law recom-

mended by the conference the president shall declare the rule or law adopted, and name the day and hour that it shall go into effect, not later than the information of the fact can reach all the exchanges.

ARBITRATION BETWEEN MEMBERS OF THE SEVERAL EXCHANGES.

30. A member who shall be accused of a breach of contract, violation of the conference rules, or any other misconduct by any member of any of the exchanges in this conference, shall be summoned before the Arbitration Committee of the Exchange to which said accused member belongs, the application for such arbitration shall be subject to the rules of the exchange where complaint is entered, and the decision is rendered in accordance with these rules.

31. The carrying charges on oil shall be due and payable when the oil is returned, provided that if the oil is carried more than one week the accrued carrying shall be due and payable Monday of each week.

32. When the kind of oil is not stated, it shall mean "National Transit Company through its United Pipe Lines Division."

CLEARING HOUSE RULES.

1. The Seaboard National Bank shall be the Clearing House agent of the exchange, and the clearance manager and assistant shall be sworn to secrecy in accordance with the agreement with said bank.

2. Each member or firm having transactions shall make a statement in ink, or blanks adopted by the exchange, of all such transactions, accompanied by a certified check, if there is a cash difference against him, or by National Transit Company certificates, or an accepted order therefor, if there is a difference against him in oil.

3. A failure to hand into the Clearing House a statement by 11:30 A. M. will subject the delinquents to a fine of \$10 for the first offense, \$20 for the second offense, and the third offense shall be reported to the Clearing House Committee, who shall report to the board of directors, recommending such penalty as they deem proper.

4. Any member handing a statement to the Clearing House containing an error, resulting from non-comparison, or any clerical error, shall pay a fine of \$2.50.

5. No member may make or accept a public offer to buy or sell on the floor of the exchange, unless he participates in the Clearing House.

6. All transactions not otherwise specified shall be in "Regular Oil."

6. All transactions in "Regular Oil" of one day shall be cleared on the following business day.

8. Transactions in "Cash Oil" may be made before 11 A. M., and such transactions shall be cleared on the same day. Transactions in "Cash Oil" made after 11 A. M. shall be made Ex-Clearing House, and shall be so declared at the time of the transaction, and delivery shall be made before 2:15 P. M. and paid for by certified checks, whenever so demanded.

9. On all time contracts, where notice is given, such notice shall be given one hour before the closing of the

Exchange, and the oil shall be cleared on the following business day. On all time contracts running to maturity the oil shall be cleared on the day when such contracts expire.

10. Notices on loaned or borrowed oil shall be given not later than 2:30 o'clock P. M.

When a member or firm fails to place his or their sheet in the Clearing House before 11:45 A. M. it shall be considered a default of contract, and the manager shall make up his or their sheet and present it to the presiding officer of the exchange, who shall notify each member or firm on the floor having such delinquent, and shall then buy or sell cash oil for account of such delinquent.

9. Supplementary sheet shall be placed with the Clearing House immediately by the buyers or sellers of such oil. The oil covered by such transactions must be placed in the Clearing House by 1:30 P. M., and the loss shall be borne *pro rata* by each interested party as the loss which he or they sustain bears to the gross amount of the failure. Checks for such loss shall be placed in the Clearing House as soon as the manager makes the amounts known.

12. All accrued charges on loaned oil shall be added to the amount due for the oil on the Clearing House sheet at the time of the return of the oil.

AGREEMENT WITH THE SEABOARD NATIONAL BANK.

The Seaboard National Bank agrees with the New York Petroleum Exchange that it will act as a Clearing House for the members of said exchange under its rules and regulations. The bank agrees to become responsible to the exchange for all oil or moneys entrusted to the Clearing House Department. The bank agrees that the managers of the Clearing House and his assistants shall be sworn to the strictest secrecy in every department, and to a faithful performance of their duties, and that they shall be *positively* prohibited from speculating, directly or indirectly, in oil. The Clearing House manager shall keep an account with each person or firm, charging the account with the total daily clearance as shown by his or their sheets, also charging such accounts with all fines which may be incurred by such members or firms under the rules of the Clearing House. The amounts collected for such fines shall be turned over to the treasurer of the exchange. The bank shall charge one cent for each thousand barrels cleared; one-half cent for each thousand barrels received, and one-half cent for each thousand barrels delivered, whenever the average clearances for any one month shall be 70,000,000 barrels, or more, as shown by the delivery sheet. Charges for clearing and fines shall be payable to the managers on demand. Each member having transactions shall make out a statement on blanks adopted by the exchange, of all oil coming in and going out, accompanied by a certified check if the difference is against the sheet, or with the oil if the sheet shows more going out than coming in.

All statements must be placed in the Clearing House by 11:30 A. M., and the Clearing House shall settle all accounts by 2 P. M. on the same day by giving checks and delivering the oil. The managers shall give

each day to the superintendent of the exchange a statement showing the total of the clearances of that day. This agreement may be terminated or any of its terms altered by either party on giving thirty days' notice.

In witness whereof, the president and cashier of the Seaboard National Bank have hereunto affixed their signatures for the bank, this 1st day of May, A. D., 1883, under the seal of said bank.

(Signed) W. A. PULLMAN,
President.
S. G. NELSON,
Cashier.

In witness whereof, The New York Petroleum Exchange have caused their president, secretary and treasurer to sign this agreement with their respective hands, and seal with the official seal of said exchange, this 1st day of February, A. D. 1883.

(Signed) L. H. SMITH,
President.
W. FISHER,
Secretary.
H. M. CURTIS,
Treasurer.

Two thousand three hundred and seventy-two gentlemen were visitors on the floor of our exchange for the fiscal year. The highest number (261) were registered during August, 1883, and the lowest (146) during January, 1884.

The official Weekly Circular has been published regularly. The subscriptions have paid the expenses of printing, and for the year October 1st, 1882, to October 1st, 1883, a balance of \$9.61 was delivered into the treasury of the exchange.

All members are respectfully requested to notify the superintendent of any change of their office addresses.

RUD. HUBEN,
Superintendent.

Any members of oil exchanges entitled to the reduction of commissions as here authorized shall be held to maintain the full rates specified for the public in all business in petroleum done through them, and any such members of said oil exchanges who shall be proved as dealing for others for less rates than established by this board for the public, or who shall fail to answer charges of so doing before the tribunals of the oil exchange, shall be thereafter debarred from any reduction of commissions from the full rates.

HENRY B. GOMBERS.

SHIPPERS OF CRUDE PETROLEUM.

PHILADELPHIA, April 9th, 1885.

The Petroleum market opened strong this morning on the Anglo-Russian war news, and advanced in sympathy with a general rise in the stock, grain, and provision markets. After touching 79, some realizing sales broke the price of ½ ct., but orders from New York parties, who were buying at the opening, advanced the price to the highest point of the day, when the market became dull. The decline in the last hour to 78¼ was on light transactions and due to the anxiety felt concerning Ackerly No. 2, which, as well as Producers' No. 13, will be shot this afternoon.

Producers' No. 15 continues to make a good showing, the latest gauge being 71 bbls, per hour. The next wells to be brought in, are Murphy No. 3, which is 50 feet in the sand, No. 5, 30 feet in the sand, and Producers' No. 19, 20 feet in the sand. Murphy No. 5

is east of Producers' No. 15 and should make a good well, while the productiveness of No. 3 is doubtful. Ackerly No. 1 is flowing 47 bbls. per hour; Phillips, 19 bbls; Producers' No. 18, 20 bbls. and Fisher No. 14, 40 bbls. This morning's gauge of Thorn Creek shows a decline of 1,038 bbls., being 9,578 bbls.

Carrying rates, Philadelphia, 25 cents; Oil City, 30 cents.

WILDCAT MYSTERY WELLS WATCHED AND REPORTED BY SCOUTS.

A report was spread in the oil exchanges one day in the fall of 1882 that a wildcat well in Forest county, Pa., had been drilled in the sand and was making a good showing.

At that time nearly all the scouts in the field were scattered around in the oil villages not far from the Cooper tract, in Forest county, Pa., where they had been giving their attention to a new well which had just been drilled by the Anchor Oil Company. The wildcat was some fifty miles or more away. "The operators will know all about the wildcat before the exchanges open tomorrow morning," said an old scout who sat by the fire that evening in the Jamestown House at Garfield, Pa. "Twenty-five or thirty scouts started for the well this afternoon."

The life of a scout is different from that of any other man in the oil region. Much of his work must be done in the night. He is compelled to make long journeys on foot and to sleep many nights on the ground. He must know all there is to be known about an oil well, and, above all, thoroughly trustworthy. His pay is about \$150 a month, and he usually gets a percentage of all profits resulting from transactions made on information furnished by him. His expenses are paid by the operator in whose interest he is working, and he may use his discretion as to how large a bribe it is necessary to offer a guard at a well for a sample of the sand or an opportunity to pass the lines and gauge the flow. Many of the scouts have had experience in drilling wells and guarding them, and all are men who have an intimate knowledge of the oil fields, above and below ground.

STRATEGY OF THE OIL FIELDS.

When a producer sets out to make a well a mystery he knows that he has a task before him. The high board fence which he puts around his well, a hundred feet or more from the derrick, prevents the scouts from getting samples of the sand unless they do so by arrangement with a guard. If the scouts succeed in obtaining a thimbleful of sand they can make a good guess as to what the well will amount to. Some of the scouts have as many as four or five hundred phials of sand, each of which is labelled with the name or number of the well from which it was taken. In some tracts the sand is of the color of pulverized fire-brick, in others it is chocolate-colored, and in others it is white, gray and variegated. The experienced scout can see something significant either in the composition or color of every sample of sand that he examines.

"This," said a scout, holding up a phial in which was as much gray sand as could be taken upon the blade of a penknife, "was very precious at the time it was obtained. It came from the great mystery of 646 in Cherry Grove, Warren county, Pa."

After an owner of a mystery has made provision for preventing the scouts from getting any of the

sand, he must make arrangements for keeping them so far from the well that they cannot hear the flow of oil into the receiving tank. So he cuts underbrush and surrounds his well with an almost impenetrable brush fence, on the outside of which he stations guards with rifles or pole axes as weapons. As many as a hundred guards are sometimes employed at a single well. If the scouts are unable to make their way through this line and get within hearing distance of the tank, they must trust to sight for indications as to what is doing at the well. The wag of the walking beam will tell them within fifty feet how deep the well is, though a stranger can only see that the beam oscillates with a slower motion as the well grows deeper. If drilling has ceased the scouts watch the ventilator of the receiving tank with the aid of a field glass, noting the number of hours out of twenty-four that the inflow of oil causes gas to escape from the ventilator in a thin cloud. Knowing the number of gallons that will flow through the pipe in an hour, they can compute the result of the flows that have taken place in the twenty-four hours. Another way of telling how deep a well has been drilled is by watching the cable through a field glass when the tools are pulled up. As the rope is wound upon the bull wheel the coil runs to one end of the axle and back again, and so on, like thread wound evenly on a spool; and, by watching the weaving of the rope back and forth where it comes in sight above the roof of the derrick, the scouts can tell how many layers there are of the rope that is wound up, and can make a close guess as to the number of feet of rope drawn from the well.

SI HUGHES'S EXPLOIT.

An old scout told the following story of an exploit which made Scout Si Hughes famous throughout the oil region:

"Ten days before the Cherry Grove wildcat 646 was opened excitement as to what the well was doing was at fever heat. It was believed that she was flowing strongly, but nothing was known for certain. No scout had succeeded in getting past the guards, and no sand had been secured. Si Hughes was then working for J. A. Cadwallader. Cadwallader offered him a tenth interest in all the land secured on any information which he would bring from the well. Hughes suddenly disappeared. None of the men in the field knew what had become of him. Three days later he suddenly reappeared, looking as though he had been drawn through a knot-hole. Cadwallader began buying land near 646. He took in partners, a stock company was formed, more land was bought, and wells were drilled. Hughes had been lying for forty-eight hours under the derrick floor of 646—lying there in the cold mud with nothing to eat, and he had piped off the mystery so that he knew exactly what she was doing. How he got in there nobody but himself knows. The stockholders in the company that began operations on his information kicked about keeping the bargain to give him a tenth interest,

and offered him \$4,500 for his work. Hughes refused it. He said he would have what he bargained for or nothing.

Another scout, speaking of Hughes' exploit, said that, although the matter was unsettled, Hughes was sure of at least \$50,000 for his two days' and two nights' work under the derrick floor of 646.

By such expedients as have been described, and by many others, the scouts obtain information as to the closely-guarded mysteries. Then they hasten to the nearest telegraph station and send cipher dispatches to the operators for whom they are scouting, telling the results of their work. The codes used for this purpose are extensive enough to convey any necessary information concerning doings in the oil field. Going into the exchange with this knowledge as to the well that is attracting the greatest attention as being the most likely to have an effect on the market, the operator possesses a great advantage over all who do not have as trustworthy information. In spite of the strife between them, some of the scouts are on the best of terms with the producers to whose wells they have given the closest and most unwelcome attention. When the mystery is opened the game is ended, and scouts and producers laugh over the strategy with which it was played.

A CAPTIVE SCOUT.

Now and then the men guarding a well capture a scout in the act of attempting to get through the lines to a place where he can hear the flow of the oil into the tank. Late in November the mystery that was attracting the most attention was the new Anchor well in the Cooper tract. The derrick stands on the side of a wooded hill. It was guarded by a large force of Swedes armed with pole-axes. The woods fairly swarmed with scouts. The campfires of the Swedes and of the scouts across the ravine suggested, after nightfall, the encampment of opposing armies. One night the guards heard a rustle of leaves and crackling of dry twigs close to the lines. A posse of them made a rush toward the spot whence the noise came. Two scouts were found stealthily making their way toward the well, crawling on all fours through the thicket and along the trunks of fallen trees. At the approach of the guards the scouts sprang to their feet and made off into the woods, closely followed by a dozen Swedes. One of the loghuggers was captured. There was no need of asking questions; captors and captives understood each other perfectly. The scout was securely bound with ropes. Then the guards offered to take him to a shanty where he would have protection from the chilling night wind; but he declined to accept any favor from them, and two men were detailed to stand guard over him till morning. There was not much about him except his plight to suggest the captive who stood "chained in the market-place," but he was as stolid as any captive could be. The next morning he was released with the assurance that he would not escape rough usage if caught again. A scout said afterward that the man

who was captured had caused the arrest of the guards who detained him, and that a test case was to be made of it.

"The scout was guilty of nothing but trespass," said he, "the penalty of which is only a few cents. Operators can well afford to have their scouts plead guilty of this offense as often as they are caught, in view of the value of the information they obtain for them."

MAKING IT A MYSTERY.

One of the most noteworthy mysteries of the oil region was the Shannon well, the wildcat venture of the Cooper tract in Forest county, Pa. Some time in June, 1883, Mr. P. M. Shannon, a producer of long experience, followed the 45-degree line from Sheffield nine miles into the wilderness. There, at a point six miles southeast of the famous Cherry Grove field, and nearly five miles from the nearest cabin, he put up a rig and began drilling. Before the tools reached the sand he took two partners into the venture, Mr. T. F. Melvin and Mr. A. B. Walker. On July 26 the three partners stopped at the well on their way back from a fishing excursion. They learned from the drillers that, according to their reckoning of the altitude at which drilling was begun, sand should already have been struck if there was any there. The partners were not very hopeful as to their venture, and Messrs. Melvin and Walker decided that they had seen enough of the wildcat for the present, and went on up to Cherry Grove, leaving Mr. Shannon behind. He remembered that a spring barometer had been used for determining the altitude of the locality, and that the measurement might have been so far out of the way that there was still hope of striking oil sand. Just before noon on that day the driller said to Mr. Shannon:

"I guess we've struck something."

"The tools were pulled out," said Mr. Shannon, telling the story of his venture, "and a fresh bit was put on. Drilling was resumed, and within ten minutes an odor of gas came from the well. Our fuel had given out and we were burning hemlock bark.

"Getting a little gas," said the driller; "better look out for the fire."

"I put my head down to the hole and heard a rushing sound far down in the well. The tools were pulled out as quickly as possible, and the bailer was run down. The oil had risen five hundred feet in the well, though the bit had gone only about ten inches into the sand. The rushing sound continued, and it was plain that there was going to be a strong flow unless the well was plugged. We had a few plugs on hand. Two or three of these were put in and driven down. I would rather have given five thousand dollars than have her flow; but in about an hour and a half she began to spout. The oil saturated the ground and ran down the hillside into the brook. I am not accustomed to manual labor, but I pulled off my coat and went to work damming the brook, so that the oil would not float down on the water and tell the story.

AN UNEXPECTED DANGER.

"I sent a note to my partners, which I believe one of them has had framed. I don't remember just what it was, but it was something about her being 'a teaser.' Another messenger was sent to Sheffield for more plugs. While he was away the well flowed again, and we put down the last plugs we had on hand and then shoveled sand into the hole and drove it down, but still she flowed. The messenger got back from Sheffield the next morning, bringing plugs in a bundle of hay across the saddle. This precaution was necessary, for news concerning a new well spreads like wildfire, and it takes only a little while for the scouts to be on hand. My partners arrived at the well at about 10 o'clock that morning. They thought my message was a joke, but had procured some plugs and come on. More plugs were then driven down, and the flow was stopped. The last plug, however, had stopped about 500 feet from the bottom, and could not be driven further. The tools rested on it.

"You had better pull out the tools," said I to the driller; "I guess she will stay plugged now."

"The driller started to haul up the tools, but I noticed that the rope was coming out of the well slack, and called the driller's attention.

"She's flowing the tools out of the well."

"I began to say something about that being too old a gag, when he yelled:

"They're coming—run, for God's sake!"

"Before the words were out of his mouth there was a noise as of a tremendous explosion, and the tools, weighing about three or four thousand pounds, were shot up through the top of the derrick at least sixty feet and came crashing down through the roof, splintering the floor and sticking into the ground some eight or ten feet. That's the first and last time I ever saw a set of drilling tools thrown out of the well by the flow. We put down eight more plugs, but she continued to leak at the rate of at least fifty barrels a day.

GUARDED BY RIFLEMEN.

"The question then was how to keep the well a mystery. The two drillers, two tool-dressers and seven hunters were armed with Springfield rifles. A path marking a hexagon around the well was cleared in the underbrush, and a man was stationed at each of the six corners with orders to let no one cross the path. The path was lighted up with lanterns at night, so that no scout could creep across in the darkness. Provisions were sent to the men, who had their regular hours on guard, under command of Captain Haight—as the men called him—who was the contractor for drilling the well. The well was thus kept under guard till September 15, when she was opened to anybody who wanted to see it. The well produced 600 barrels of oil a day when first drilled in."

The oil scouts at the Great Mystery of 646, Cherry Grove, Warren county, Pa., and the Shannon Mystery, of Forest county, Pa., were: S. B. Hughes,

J. C. Tennent, P. C. Boyle, W. C. Edwards, J. C. McMullen, Frank H. Taylor, Joseph Craig, Joseph Cappeau, James Emery and J. H. Rathburn.

The oil scouts at the Phillips School-house well, Thorn Creek, Butler county, Pa., in 1884, were: Mike Murphy, William Barnsdall, Charles Goodwin and Hon. M. N. Lockwood.

In the days of the oil exchange the market was governed by the "wildcat wells" or new production. When a wildcat well was due to strike the sand the scouts would watch the well come in. If it was a large well the market would drop and the producers would lose money, but if it was a dry hole the market would remain steady or go up. This taught the oil operators to employ scouts to report the wildcat wells to them. If the wells were large the operator would sell all of his oil before the market would drop, and if it was a dry hole they would hold their oil for a higher market.

The oil scouts had a great number of hardships. Their work was mostly done at night and through the day they would sleep under the derrick or brush pile. When the oil exchanges closed the oil scouts' work was done.

The oil exchanges closed in 1896-1897, after many fortunes had been gained, and many a "lamb" was shorn and many a "duck" lamed. It was a raging fever, a delirium of excitement, compressing many years of ordinary anxiety and haste into one week, and one disastrous break in the market after another began to allay the fever for speculating on the oil exchanges. As the years passed there was less demand for opportunities to gamble by putting up margins.

One of the worst features was the manipulation of the oil market in the oil exchanges by the large oil producers or by the brokers holding large amounts of oil under orders "to sell when it raises or falls to a certain figure," and whenever the market reached one of the two points the large producers and brokers unloaded their oil on the market in the oil exchanges and up or down would go the market with a crash, and then a panic would ensue among the smaller holders of oil, as they were termed the "lambs," and again they were shorn of their fleece and called on by their brokers to make good by putting up more margins. After the public and people in general became more acquainted with the oil exchange and brokers' methods the exchanges and brokers began to lose their business, and on January 23, 1895, when the Seep Purchasing Agency, a branch of the Standard Oil Company, announced that they would quote their own prices for crude oil and not be influenced any longer by the oil exchange market quotations, came the death knell to the oil exchanges. But little is said in the oil country at the present day of the oil exchange. Day after day passes without a single sale having been made, and frequently the clearances for the entire month do not amount to 8,000 barrels. Several years ago, after the oil excitement subsided, for the purpose of keeping the exchange in existence, the brokers satisfied their speculators' thirst by trading in grain on quotations obtained from the

Chicago Board of Trade. This was continued for a number of years and up until the Board of Trade shut off furnishing outsiders with the quotations. The transactions in grain were large, and at the present time a small amount of business is done on the New York grain quotations. Parker had a lively exchange during the early oil excitement, and the greatest bull movement in the history of oil originated at that place. But as the time wore on trade slackened, the exchange was closed, and the "boys" shifted to Bradford, Oil City, Titusville, Warren, Pittsburg and New York.

The Bradford exchange was started on January 1, 1881, with fifty members and a \$40,000 building. Five hundred others organized the Producers' Petroleum Exchange and erected a handsome brick block, occupying it on January 2, 1882. Both exchanges did an immense business for years, but now both have subsided and the buildings are stores and offices. The Titusville exchange, which was constructed during the early oil days, has gone the same road. Captain Vandergrift built the old Pittsburg Oil Exchange, which was the finest one of them all, and the exchanges in New York and Oil City are the only ones now doing business. The exchange at Oil City, Pa., is known as the Oil City Oil, Grain and Stock Exchange. The officers are: E. V. D. Selden, President; John M. Reed, Vice President; G. W. McClintock, Secretary, Treasurer and Clearance-House Manager. Directors: N. F. Hilton, O. H. Strong, J. M. McCarty, Leo Milton, J. Goettel, S. H. Simpson, William Perry, E. McCracken, S. Y. Ramage, George H. Torrey and F. N. Chambers.

The New York Oil Exchange is known as the Consolidated Stock and Petroleum Exchange, Broadway and Exchange Place, New York.

The oil exchange in New York was erected in 1887, on Broadway and Exchange Place. At one time it had 2,400 members, and its membership was the largest in the country save the Produce Exchange. Its seats sold as high as \$3,000, and its business at times exceeded the transactions of the Stock Exchange. Now oil is hardly mentioned once a week. The exchange at Philadelphia was of a lesser degree, and a score of oil towns sharpened their appetite for speculation by establishing branch concerns and bucket shops. The latter now flourish in the oil country, and the almost entire disappearance of the speculative oil trade is not the least remarkable, as the producers generally sell their oil in the shape of credit balances. Credit balances is the number of barrels of oil in the pipe line credited to the owner, for which a receipt in the shape of a negotiable oil certificate is given. The oil is stored in the pipe line company's large iron tanks, free of storage for the first fifteen days; after that a small storage is charged. In case of fire or loss of the oil by accident, the owners lose a percentage of their oil, the pipe line company runs no risk, as they act as the owner's agent, in case of accident. This is called "general average." Ninety per cent. of the oil is bought by the Standard Oil Company, through checks issued on the Seaboard National Bank of

New York, indorsed by Joseph Seep, the purchasing agent.

THE BEGINNING OF OIL PIPE LINES—THE EARLY AND LATER MODES OF OIL TRANSPORTATION.

The early oil operator had many difficulties to contend with in the transportation of his oil to market, as the only mode of land-carriage consisted in hauling the oil from the wells to Titusville and Oil City, Pa., or other shipping points. The roads were bad, and when much used and in wet weather, they then became almost impassable. The author of "Petrolia," writing on this subject, says:

"Oil Creek mud attained a fame in the earlier and subsequent years that will be fresh in the memory of those who saw and were compelled to wade through it. Teamsters and horsemen swore both loud and deep at it. Newspaper correspondents exhausted all their adjectives, epithets and expletives in essaying to give a faint description of its demerits. Weary pedestrian pilgrims, like Bunyan's Christian, were inclined to part with their knapsacks after a brief experience; ministers of the Gospel and devoted laymen earnestly desired sustaining grace while urging their weary beasts over and through it. Mud, deep, and indescribably disgusting, covered all the main and by-roads in wet weather, while the streets of the towns composing the chief shipping points had the appearance of liquid lakes or lanes of mud."

The difficulties of moving the thousands of barrels of oil which it was necessary to transport can be better imagined than described. It was indeed a huge task, and many were the mishaps attendant upon the rough and swearing teamsters, as was evidenced to anyone passing along the line of roads leading to a large shipping point, as the way was literally strewn with broken wagons, dead horses, oil barrels, filled and empty. Some one conceived the idea of conveying the oil down Oil Creek to the Allegheny in flat boats, to hold the oil in barrels or bulk, and the employment of pond-freshets to float the boats, when laden with oil. Flat-bottom boats were procured from the upper Allegheny, and from all opints where they were built. Arrangements were made with the mill owners at the headwaters of Oil Creek for the use of their surplus water at stated intervals. The boats were towed up the creek by horses—not by a tow-path, but through the stream—to the various points of loading, and when laden they were floated off upon a pond-freshet. The amount of oil brought down upon one of these pond-freshets averaged from 15,000 to 20,000 barrels—the largest quantity ever brought out of "the creek" upon a single freshet would not exceed 40,000 barrels. The oil was transferred at the oil wharves at Oil City to a larger and better class of boats, and floated down the Allegheny to Pittsburgh.

At one time over 1,000 boats were employed on

the creek and river, and in addition to these there were some thirty steamers, passenger and towboats engaged in the same traffic. This oil float furnished employment to about 4,000 men.

Collisions and "jams" were of common occurrence; a boat would by some mismanagement get aground, and thus swing round, by the force of the stream, when it filled with water and sunk. Against this obstacle the advancing boats dashed with great force, the weaker ones becoming splintered from the concussion, the stronger ones being wedged fast, in the order in which they came, and thus formed what is familiarly known on Oil Creek as "a jam." During the freshet of May, 1864, a "jam" occurred at Oil City, which resulted in the loss of from 20,000 to 30,000 barrels of oil.

The magnitude of the oil business soon attracted the attention of railroads running near the oil region. The Atlantic & Great Western Railway first built a branch road from their main line at Meadville to Franklin, thus opening an avenue of traffic to New York, Philadelphia and Cleveland. About this time, 1861-2, the Oil Creek road was projected and built from Corry to Titusville, thus connecting with the Philadelphia & Erie Railroad. The Oil Creek road was gradually extended down the valley of Oil Creek to Shaffer farm. In the winter of 1865 and 1866 the Atlantic & Great Western extended their branch road from Franklin to Oil City. I need not here occupy the reader's attention with a particular account of railroad developments in the oil region. It is sufficient to say that the country has ample accommodations in this respect at the present moment.

With the advent of railroads the mode of doing business was revolutionized. Car tanks were brought into use, each car being mounted with two wooden tanks, having a capacity of about forty barrels each, and by the aid of pipe lines were filled upon the railroad track with great ease, and at much less expense, compared with the old system. The wooden car tanks later gave way to the iron cylinder-shaped single tank, which held about the same amount of oil as the two wooden tanks. These were used for transporting both crude and refined oils. A great many railroad companies owned iron car tanks for the transit of oil. There were, on all the railroads that handled petroleum, about 2,500 iron bulk cars, of an average capacity of eighty-five barrels to a car, giving a tankage capacity on wheels of 212,500 barrels. Cars that carried oil in barrels were not included in this aggregate.

The expense of hauling by team was an important and expensive item, and helped to reduce the gross price of oil. During the spring and summer of 1862 the price paid for hauling or teaming oil from the flowing wells on the lower McElhenny farm to Oil City and Titusville was from half a dollar to a dollar and a half per barrel. Later in the fall of that year three dollars to three dollars and fifty, and even four dollars per barrel was paid.

The magnitude of the petroleum industry made it necessary to find some mode of transportation even cheaper than a railroad. By force of circumstances

barges and tank cars for oil in bulk displaced the truck carrying oil in barrels. The pipe line, in turn, displaced the car and boat. The introduction of this mode of transporting oil marks an era in the petroleum industry. The freight by rail amounted to five or six dollars per car from the oil region to New York. It was most economical, therefore, to refine the crude near the wells; so that freight need be paid only on the products desired, and the quantity to be moved reduced to a minimum. The country around Pittsburg and Oil City was filled with little works taking out of the crude the refined oil needed for export. When the idea of allowing the oil to flow from place to place through iron pipes was put into practical form the cost of transportation was so much reduced that a few enormous refineries were built at the seaboard near New York, Philadelphia and Baltimore; and on the shores of Lake Erie, near Buffalo and Cleveland, to do the work which the almost countless small refineries in the oil region had heretofore done. This meant a revolution in methods of manufacture and in costs. Careful search has been made in the existing literature on petroleum to find the first reference to the use of a pipe line for the transportation of oil. The account given by C. L. Wheeler, quoted by Peckham from the Bradford Era, probably deserves this distinction:

"He said, in substance, that the first suggestion of a pipe line for transporting oil, so far as he knew, was made to him by General S. D. Karns, at Parkersburg, W. Va., in November, 1860. Mr. Karns said that as soon as he could raise the money he would lay a six-inch gas pipe from Burning Springs to Parkersburg and let the oil gravitate to the Ohio River, a distance of thirty-six miles. For some reason, this line was never laid. Some years after—Mr. Wheeler was unable to recall the exact date—a Mr. J. L. Hutchinson, inventor of the rotary pump which bears his name, conceived the idea of forcing oil through pipes, and explained his plan to John Dalzell and the narrator in the latter's office in Titusville. Subsequently Hutchinson's plans became a reality, the first pipe line being laid from the Sherman well to the terminus of the railroad at Miller farm, a distance of about three miles. The inventor's idea of the hydraulic pressure of a column of that length was certainly very exalted, and he took elaborate pains to prevent the breaking of pipes. At intervals of fifty or one hundred feet were air chambers like those on the old-style field pumps, ten inches in diameter, for the purpose of equalizing the pressure. These queer protuberances gave the line the appearance of a fence with ornamental posts, and excited great curiosity. The weak point, however, was the jointing, which, as the pipes were made of cast-iron and imperfectly finished at their ends, was very defective, and the leakage from this cause was so great that little, if any, oil ever reached the end of the line. It was a success theoretically, but a mechanical failure. Thus the expectations for easy and cheap transportation for crude oil raised by the building of the first pipe line were ruthlessly

dashed to the ground and the inventor discontinued his experiments in despair."

In 1862 a bill was introduced in the Pennsylvania Legislature to authorize the construction of a pipe line from Oil Creek to Kittanning; but, owing to the vigorous opposition of those interested in teaming oil, it was not passed. Later a plan to lay a line down the Allegheny River to Pittsburg for the same reason came to nothing.

Samuel Van Syckle, of Titusville, Pa., was the first to put down a working line. It was only four miles long, extending from Pithole to Miller's farm, and carried but eight barrels per day. It demonstrated, however, the thorough practicability of moving oil in this way. The difficulty up to this time had been in making the joints of the pipe tight. Van Syckle overcame this; and, although his line faced an ascent of nearly five hundred feet, the oil was delivered at the further end practically without loss. Its construction required a large amount of money, involving Mr. Van Syckle in debt and embarrassments. The First National Bank of Titusville, then in the height of its power and prosperity, came to the relief of the enterprising gentleman identified with the construction of this new mode of transporting oil to the railways, advancing to him as his needs required, more than \$30,000. The line, after a few months of trial and disappointment, was given up as a losing venture. The enterprise, with its property, machinery, &c., subsequently fell into the hands of the First National Bank, its largest creditor. This was in the fall of 1866.

And here we digress, in order to bring up the history of Mr. Henry Harley's pipe line, constructed and completed about this date, from Benninghoff's Run to Shaffer farm.

In the fall of 1865 Mr. Harley began the construction of a pipe line from Benninghoff Run to Shaffer farm, at that date the termini of the Oil Creek & Allegheny River Railroad. In this undertaking his skill and experience as a civil engineer were of great value to him. The line was constructed amid all sorts of threatening demonstrations from a combination of oil teamsters and lawless men, bent upon destroying whatever seemed inimical to their interests, or that ceased to minister to their wants. The threatenings of these men found open utterance at all points, and these were either privately or publicly endorsed and approved by those who assumed to have, or really cultivated an interest in the well-being of the men whose cause they espoused. Mr. Harley, however, with the same vigor and determination which has characterized him through life, "pushed things," and in the spring of 1866 his enterprise was an acknowledged success, and his efforts universally commended.

While this pipe line was in process of construction the teamsters of Shaffer farm and vicinity, then forming a large fraction of the population of "the creek" between the lower McElhenny farm and Titusville, came to regard Mr. Harley's pipe line, and, indeed, all pipe lines, as legalized robbery, and as infringements upon their rights as common car-

riers—as a fatal blow at their means of livelihood—or, as many of these exasperated, ignorant men expressed it—“an effort to take the bread from the mouths of their children.” Of course these lawless combinations had plenty of sympathizers, aiders and abettors, who saw, in the destruction of the business which had drawn so many thither, to engage in “hauling oil,” a loss of their own sources of revenue, and hence it is, or was, that Mr. Harley had few friends who dared to avow themselves such, and so he may be said to have been compelled to “go it alone.” Threats of vengeance, torrents of abuse and a wild clamor for what these men termed their “rights” greeted him upon every hand. His movements were watched with daily increasing frenzy on the part of the large body of teamsters all about him. There were street brawls and bar-room rows growing out of these pipe line affairs, which finally culminated in an attempt to impede their construction by acts of violence, and a resort to mob law. These infuriated but misguided men set fire to the wooden tanks belonging to Mr. Harley, many of which were filled with oil. They sought to destroy the pipe line by breaking the joints, and by every conceivable device determined to thwart the designs of the enterprising and plucky projector. They sent him letters threatening his certain assassination if he did not abandon his scheme for impoverishing them by ruining their business! Several assaults were made upon the men employed in constructing the line, in which pistols, clubs and stones were freely used, but I believe no lives were sacrificed.

While these lawless demonstrations were transpiring Mr. Harley was not idle. He secured several detectives from New York and elsewhere, made teamsters of them, and they in turn made confidants of their fellows. In less than a week after the adoption of this scheme for the capture of the leaders Mr. Harley had more than twenty of their number under arrest and conveyed to the county jail at Franklin! This strategic movement demoralized the remainder of the gang, and in ten days afterward more than three hundred teams and teamsters had shaken “the dust from their sandals,” and gone hence to return no more. The twenty or more leaders arrested and committed to the county prison at Franklin were kept there for two or three months, when, no one appearing against them, they were discharged, wiser, and I doubt not, better men!

Mr. Harley completed his line from Benninghoff to Shaffer farm, and it was a positive success. It had cost him months of toil and a large amount of money, but all this was of little account when compared to the fearful trials and almost insurmountable embarrassments and determined opposition he had encountered from the people I have mentioned. Going to and from his works with his life in his hands, a price put upon his head, assassination threatened, overt acts committed and the general voice openly or secretly against his enterprise, one can, in a measure at least, comprehend his unenviable surroundings. He, however, found himself ample for the emergency. Turning neither to the

right nor to the left to appease the wrath of those who sought his life or threatened the destruction of his property, he completed his enterprise and met his reward in its unqualified success.

In December of 1866 Johathan Watson, a director and creditor of the First National Bank of Titusville, Pa., came into possession of the Van Syckle pipe line, and subsequently disposed of a portion of his interest to William H. Abbott. At that time J. T. Briggs and George S. Stewart, of Titusville, Pa., were running the Van Syckle pipe line in the interest of the First National Bank of Titusville, Pa. In June, 1866, William H. Abbott formed a co-partnership in pipe line interests and for the general transaction of the oil trade, with Henry Harley, who had just completed his pipe line from Benninghoff Run to the Shaffer farm on Oil Creek. Messrs. Abbott and Harley at that date owned one-half of the Pit Hole and Miller farm pipe line, and Mr. Harley owned all of the Benninghoff Run pipe line. They believed the Van Syckle pipe line could be made to pay, in connection with the Benninghoff Run pipe line, already in successful operation, and resolved to purchase Mr. Watson's interest and consolidate the two lines, which was done, and thenceforward for sixty or ninety days the business was conducted under the firm name of Abbott & Harley Pipe Lines.

The Western Transportation Company held the only charter granted by the Legislature of the State of Pennsylvania at that period, for piping or transporting oil from the wells to railway stations. This was the charter used for constructing the 5½-inch pipe line from the Noble well to Shaffer farm, before referred to. As opportunity presented itself Messrs. Abbott & Harley purchased the stock of this company, and in the course of the summer and fall of 1867 found themselves in possession of sufficient of its script to control it all, and their lines were subsequently organized under the old Western Transportation Company's charter, and took the name of the Allegheny Transportation Company. The following gentlemen were elected as the first board of directors, held January 25, 1869:

Henry Harley, W. H. Abbott, Joshua Douglass, J. P. Harley and Jay Gould. At a subsequent meeting of the board Mr. Harley was elected President; Mr. Abbott, Secretary; T. W. Larsen, Treasurer, and William Warmcastle, General Superintendent. Mr. Warmcastle was associated with Messrs. Harley & Abbott in one capacity and another ever since these gentlemen commenced their pipe line enterprises, and laid, or superintended the construction of the first two miles of the Benninghoff Run line. Upon the consolidation of Mr. Abbott's and Mr. Harley's interests, and the organization of the Allegheny Transportation Company, in 1867, Mr. Warmcastle was appointed general superintendent, and he continued to hold the position with that uninterrupted relationship of confidence and rare ability always characterizing a faithful discharge of responsible duties.

In 1868 the Allegheny Transportation Company,

having grown into almost colossal importance, and hence understood for "a power" in the oil regions, the attention of the various railway lines to the seaboard were attracted to it, and the president of the Erie Railway Company, Jay Gould, succeeded, in advance of all negotiation, in obtaining control, by purchase, of the valuable interest. With this purchase, which comprised a little more than one-half of the stock, Mr. Harley was appointed to the superintendency of the oil traffic of the Atlantic & Great Western and Erie Railways, with the title of "general oil agent." This responsible position he continued to fill, systematizing its cumbersome and unwieldy proportions, and reducing them to practical business comprehension, as susceptible of control as the simplest problem in mathematics—through the administration of Jay Gould, and he was re-appointed to the same position upon the accession of the new management, of which General John A. Dix, ex-Governor of New York, was made president. In May, 1872, he tendered his resignation, his private affairs requiring his attention and presence in Europe. Soon after the acceptance of his resignation, Mr. Harley visited Europe, spending some months abroad, business affairs in the main engrossing his time and attention.

Early in the spring of 1871 the Oil Creek & Allegheny River Railway, impressed with the belief doubtless, that the Allegheny Transportation Company had organized itself so fully and completely in the interests of the Erie Railway Company as to compel it to stand in a position of armed neutrality, if not open hostility to the interests of the former road, threatening seriously their freighting facilities, resolved upon a new pipe line to meet the emergency. A company was organized, under the title of the Commonwealth Oil and Pipe Company, in the interest of the Oil Creek Railroad, and its construction promptly entered upon.

In August of the same year Mr. Harley opened negotiations with the Oil Creek road for the purpose of effecting a combination of interests, and shortly afterward terms were agreed upon, resulting in the organization of the Pennsylvania Transportation Company, with a capital of \$1,700,000, owning and operating nearly 500 miles of pipe line, running hither and thither upon the surface of the earth "over mountain and gorge, over rock and plain," here, there and everywhere, in the almost double triangle, made up of Tidioute, Triumph, Irvineton, Oil City, Shamburg, Pleasantville and Titusville, with the apex at Miller farm.

The new organization at its first meeting elected the following Board of Directors: Henry Harley, W. H. Abbott, Jay Gould, A. R. Williams, J. Douglass, C. B. Wright, U. S. Lane, George K. Anderson and W. H. Kemble. Subsequently Mr. Harley was elected President; Mr. Abbott, Treasurer; T. W. Larsen, Secretary, and Mr. Warmcastle, General Superintendent.

THE FISHER BROTHERS—JOHN J. FISHER, HENRY FISHER AND FRED- ERICK FISHER.

The Fisher brothers began shipping oil by the river to Pittsburg in 1863, succeeding John Burgess & Co. The three brothers divided their forces, to give each department personal supervision, John J. Fisher managing the buying and shipping at Oil City, and Henry and Frederick receiving and disposing of the cargoes at Pittsburg. Competent men bought crude oil at the wells and handled it in the yards and on the boats. The firm owned a fleet of bulkboats and towboats and acres of barrels. Each barrel was branded with a large letter "F" on both heads. The big "F" was the trade-mark of Fisher Brothers. When railroads were built Fisher Brothers discarded boats and used more barrels than before. When flat cars with two wooden tanks placed on each car were introduced, they adopted them and disposed of the barrels, and later formed a partnership in pipe lines with J. L. and E. B. Grandin and Adnah Neyhart in the Tidioute pipe line. They were also interested in the Tidioute & Dennis Run pipe line, the Pierce & Neyhart, Fisher Brothers and C. W. Ellis pipe line in 1866, and Pierce, Neyhart & Grandin pipe line in 1868. The Tidioute pipe line was the first three-inch pipe line laid by J. L. Grandin, Pierce & Neyhart, Fisher Brothers, C. W. Ellis, M. G. Cushing and James Parshall at Tidioute and Dennis Run, Pa., in 1867. In 1868 J. L. and E. B. Grandin, Fisher Brothers and Adnah Neyhart purchased the remaining interest in the Tidioute pipe line, these gentlemen being from the first its largest stockholders, and in 1869, with David Beatty and John Hunter added to their number, began and completed a pipe line from Fagundas to Trunkeyville, Pa. These pipe lines were successfully operated through the years 1869, 1870 and 1871. At that date the Pennsylvania Transportation Company, the most extensive pipe line incorporated in the oil regions, became interested in them. In November, 1865, the Oil City & Pithole Railroad Company began a railroad from Reno to Rouseville and Pithole, Pa. The work was pushed with such energy that the first train from Reno to Pithole was run on March 10, 1866. Captain J. J. Vandergrift and George V. Forman equipped the Star Tank Line to carry oil in tank cars and laid the Star pipe line from West Pithole to Pithole City, Pa., to connect with the railroad. In 1862 a bill was introduced into the Legislature of Pennsylvania for a pipe line from Oil Creek to Kittanning, Pa., but this and a subsequent scheme for laying a pipe line down the Allegheny River to Pittsburg was strongly opposed and not accomplished for a number of years.

The Venango Transportation Company oil pipe lines, operating on Oil Creek and Franklin, Pa., was organized in 1863-1864, C. V. Culver, President.

The Rochester & Oleopolis Transportation Company of Oil City, Pa., laid a six-inch oil pipe line from Olcopolis to Oil City, Pa., in 1865.

Payne & Martin pipe lines were in operation at Petroleum Center, Pa., in 1866.

The Cherrytree pipe line, from Kane City to Rynd Farm, Pa., was in operation in 1866, and was owned by John Wallace & Co., of Rouseville, Pa.

The Empire Transportation Company was organized in 1867 and laid a number of short pipe lines from the wells to the railroad on Oil Creek.

Vandergrift & Forman were operating the following pipe lines in Pennsylvania in 1867-1868: Pithole & Paxton, Fagundas & Trunkeyville, Shaw Farm & Oil City, Sandy & Oil City, Miller Farm & Oil City, and the Franklin & Oil Creek pipe lines.

The first free oil pipe line bill was introduced in the Legislature of Pennsylvania in 1868, and the Legislature, by consent of Thomas A. Scott, at that date vice president of the Pennsylvania Railroad, permitted the bill to pass, giving the right of free pipe lines in eight counties of Pennsylvania, as follows: Allegheny, Armstrong, Butler, Clarion, Crawford, Forest, Venango and Warren, with a proviso that no pipe line should enter Pittsburg or Allegheny, Pa. This proviso was put in to keep the pipe line owners from shipping oil over the Baltimore & Ohio Railroad. This is a sample of the justice the people of Pennsylvania received while Thomas A. Scott was their political dictator and lobbyist.

Stephen D. Karns laid the first pipe line from Parker's Landing, Pa., to the railroad on the opposite side of the Allegheny River in 1868. In the spring of 1869 Fullerton Parker joined Stephen D. Karns in building pipe lines under the name of the Karns & Parker Pipe Line. During the summer of 1869 Parker, Thompson & Co. laid a pipe line as a competitor to the Karns & Parker Pipe Lines, and after a year or more of rivalry and competition the two pipe lines were united under the name of the Union Pipe Line.

The Grant Pipe Line Company was organized at Parker's Landing, Pa., in 1870, Colonel R. B. Allen, President.

The Emlenton Pipe Line was laid from Upper Turkey Run to Emlenton, Pa., in 1871.

The Antwerp Pipe Line, from Upper Turkey, Pa., was laid in 1871.

The Octave Pipe Line was organized at Titusville, Pa., in July, 1871; M. Stewart, President; J. E. Blake, Vice President; D. O. Wickham, Secretary; O. G. Emery, Treasurer; D. Emery and L. Emery, Jr., Directors.

The Fairview Pipe Line, from Fairview to Karns City, Pa., in 1872.

Relief Pipe Line, from Petrolia, Karns City and Parker's Landing, Pa., in 1872.

The Butler Pipe Line, from Butler county oil fields to the loading rack on Allegheny Valley Railroad at Parker's Landing in 1872.

The Cleveland Pipe Line Company, S. D. Karns, owner, from Karns City and Petrolia to Parker's Landing, Pa., was laid in 1873.

The Mutual Pipe Line Company, operating in Venango, Armstrong, Clarion and Butler counties, Pa., in 1871.

The free pipe line bill passed both houses of the Legislature of Pennsylvania March 13, 1872. The Legislature on the 18th of March, 1872, passed a bill repealing the Scott proviso, which allowed free pipe lines in only eight counties of Pennsylvania.

In 1872 the American Transfer Company began to build and acquire by purchase pipe lines on Oil Creek and in the lower oil fields. This was the first Standard Oil Company pipe line.

J. H. Dilks organized the Olean Petroleum Company in 1873, with headquarters at Olean, N. Y. A pipe line from the Bradford oil field was laid and the first oil was pumped from Bradford to Olean on Thanksgiving Day, 1873.

In 1873 the Union Pipe Line Company acquired a number of pipe lines and operated its system in connection with the Empire Pipe Line.

The Legislature of Pennsylvania in May, 1874, passed the pipe line bill, regulating the pipe line companies and ordering them to make monthly statements of runs, stocks, receipts, etc.

In 1874, the Vandergrift and Foreman and the Mutual pipe lines consolidated, under the name of the United Pipe Lines.

The growth of the pipe lines up to and including the spring of 1874 was wonderful. Short pipe lines multiplied, and one after another was built from the producing wells to the oil refineries and railroad shipping points, and crossed and paralleled one another in every direction. Competing companies waged war upon one another, cutting rates to the point of doing business at an actual loss. When the producer had run his oil into the storage tanks of some of these concerns he was not certain whether the certificates received (for they all issued certificates instead of paying cash for oil) had any value; yet the producer had either to run his oil through the pipe line that was connected to his tank or quit producing the oil. These badly managed competitive pipe line companies were the direct cause of the Vandergrift and Foreman and the Mutual Pipe Lines consolidating in one united pipe line system.

The Columbia Conduit Pipe Line was built in 1875, and was the first four-inch trunk pipe line extending from Millertown to Pittsburg, Pa., a distance of sixty miles. The line was owned by Dr. Hostetter, of Pittsburg, Pa.

The Union Pipe Line Company pumped its first oil from the Bradford, Pa., oil field to Olean, N. Y., November 23rd, 1875.

The Olean Pipe Line Company was succeeded by The Empire Transportation Company, owned by the Pennsylvania Railroad Company, in 1876.

The Warren Pipe Line was constructed in 1876 from the David Beatty farm, in East Warren, to a loading rack on the Dunkirk, Allegheny Valley & Pittsburg Railroad, at West End, Warren, Pa. David Beatty was owner.

The first pipe lines in the Bradford, McKean county, Pa., oil field, were the McKean County Pipe Line, the Olean Petroleum Pipe Line, the Empire Pipe Line and the American Transfer Pipe Line.

The United Pipe Lines, into which numerous smaller pipe lines were merged into one grand division or association, was the first step taken in the direction of settling the question of oil transportation by pipe lines for all time. The advantages of the consolidation quickly commended the new order of things to the public. The United Pipe Lines erected hundreds of 35,000 barrel oil tanks to store the over-supply of oil, made pipe line connections to all of the tanks at the wells and built pump stations where they were needed to handle the oil. The best pumps and appliances were adopted in improving the service and diminishing its cost. Uniform rates were established, and every detail was systematized. The United Pipe Lines Association moved forward steadily, avoiding the faults that had wrecked other pipe lines. It bought or combined the Oil City pipe line, the Antwerp pipe line, the Union pipe line, the Cleveland (Karns) pipe line, the Grant pipe line and the Columbia Conduit pipe line, the Relief pipe line, the Pennsylvania Transportation Co., Clarion division of the American Transfer Co., the Prentice pipe line and the Warren pipe line.

The American Transfer Company published the following notice:—

BRADFORD, PA., October 31, 1872.

“Notice is hereby given to patrons of the American Transfer Company that all losses sustained on oil on account of lightning, fire or other unavoidable causes, will be charged to parties holding oil in the custody of the company, whether said oil is to their credit on the books of the company or in certificate *pro rata* upon the principles of general average.

DAN. O'DAY,
Superintendent American Transfer Co.

A bill to repeal the Free Pipe Line laws was introduced in the Legislature of Pennsylvania by Representative Marshall in 1878, and was defeated. The Free Pipe Line Bill passed the House in the Legislature of Pennsylvania April 23, 1878.

The Tide Water Pipe Co., Ltd., was organized and began business in the Bradford, McKean county, Pa., oil field in 1878. The officers were: Samuel Q. Brown, president; W. S. Benson, secretary; A. A. Sumner, treasurer; James Alden, purchasing agent. General office, Bowling Green Building, 11 Broadway, New York. In the fall of 1878 the Tide Water Pipe Co., Ltd., began laying a six-inch pipe line from their main field supply pump station at Rixford, Pa., to Muncy Station, Pa., oil loading rack on the Philadelphia & Reading railroad. This section was completed in May, 1879. The second section was laid to Tamanend, Pa., in August, 1882, and was completed to the seaboard at Bayonne, N. J., in June, 1887.

In 1879 the United Pipe Lines bought the stock and interests of the Empire Transportation Company owned by the Pennsylvania Railroad Company in the upper and middle oil fields and began the erection of 35,000-barrel iron storage tanks. At one time there were in the vicinity of Olean, N. Y., 300 iron oil tanks, having a capacity of 9,000,000 barrels of oil in storage.

The pipe lines in 1879 were: The Smith's Ferry Transportation Company, the West Virginia Transportation Company, George Rice Pipe Line, American Transfer Company, United Pipe Lines, Tidewater Pipe Company, Ltd., Tidioute & Titusville Pipe Line, Franklin Pipe Line, Octave Oil Company Pipe Line, Fox Farm Pipe Line, Shaffer & Charley Run Pipe Line, T. C. Joy Pipe Line, Pennsylvania Transportation Company, Church Run Pipe Line, Cherrytree Pipe Line, Emlenton Pipe Line, Keystone Pipe Line and Associated Pipe Lines.

UNITED PIPE LINES,
Oil City, Pa., May 1, 1879.

Notice:

On and after Thursday, May 1, 1879, transportation charges will be collected in advance on all acceptances furnished by the United Pipe Lines; also upon all transfer orders deposited for credit, making all oil leaving first hands on and after the above date pipeage paid instead of unpaid, as heretofore, in order to accommodate the trade. Exceptions will be made to this rule in cases of contracts for future delivery of pipeage, unpaid oil, provided such contracts have been made prior to the date of this notice, all *pro rata* assessments made to cover losses of oil occurring after April 30, 1879, will be payable in oil, pipeage paid.

Per order of the Executive Committee,
E. HOPKINS,
General Manager.

PETROLEUM PRODUCERS' UNION.

To the General Council of the Petroleum Producers' Union the following report is submitted in compliance with the resolution of the council, passed July 20th, 1880, in these words:

Resolved, That the Committee on Legal Remedies be and hereby is directed to report the proceedings of their work since the commencement of legal proceedings on behalf of the council against transportation companies of Pennsylvania. On February 18th, 1880, President Benj. B. Campell, of the Petroleum Producers' Union, in a suit against the United Pipe Lines, while a review of the evidence was being held in the United States Court, held in Pittsburg, Pa., February 18th, 1880, the Standard Oil Company, owners of the United Pipe Lines, offered the president of the Petroleum Producers' Union a sum of money to drop all the suits pending against the transportation companies and the Standard Oil Company in general in the State of Pennsylvania. The money to be applied as follows: In payment of court cases, refunding to all subscribers their contributions to the fund raised for the expense of the legal proceedings, payment of the attorneys, and the remainder, if any, to be returned to the Standard Oil

Company. From the facts in the case, it is true that the president of the Petroleum Producers' Union did on the 18th day of February, 1880, accept from the Standard Oil Company a large sum of money, as per agreement, to withdraw all suits at law against said company. All costs and other bills were paid as agreed upon, with a large balance left, which was not returned to the Standard Oil Company, as per agreement.

This report was made to the general council of the Petroleum Producers' Union held at Bradford, Pa., August 10th, 1880.

Attested:

E. BREWER,
Secretary Pro Tem.

The business of the American Transfer Company in McKean county, Pa., was transferred to the United Pipe Lines, November 20th, 1880; Dan O'Day, Superintendent, E. Hopkins, General Manager.

The management of the United Pipe Lines in 1880 was as follows: Capt. J. J. Vandergrift, President; J. R. Campbell, Treasurer; Edward Hopkins, Manager; Dan O'Day, Superintendent.

The pipe lines in 1883 were the United, Ohio Transit, West Virginia Transportation Company, Tide Water, Emery, Equitable, Monongahela, McKinney Bros., Union Oil Company, and McCalmont Oil Company. In 1883 the McKinney Bros. and the McCalmont Oil Company's pipe lines were acquired through purchase by the United Pipe Lines.

From 1870 up to 1884 the production of crude oil was each year greatly in excess of its consumption for all purposes. Consequently oil accumulated and was stored in iron tanks at Colegrove, Tiona, Warren, Oil City, Parkers Landing, Pennsylvania, and Olean, N. Y. In August, 1884, this accumulated crude oil reached the enormous maximum amount of 39,083,464 barrels of oil above ground. The oil in over production was valued, in 1884, at \$40,000,000.

The United Pipe Lines operated under three divisions, the Upper or McKean Co. division; the Middle division from Warren to Franklin, Pa., and the Lower division—Clarion, Armstrong, Butler and Allegheny county, Pa. On May 12, 1884, the United pipe lines were transferred to the National Transit Company and the three divisions were merged into one grand division of the United Pipe Lines division of the National Transit Company. The National Transit Company operates under the original charter granted Andrew Howard, J. S. Swartz and others employed as "lobbies" by the Pennsylvania Railroad Company. This is one of the fifteen charters granted a gang of Pennsylvania railroad lobbyists by the legislature of Pennsylvania April 7, 1870. This charter is known as the Pennsylvania Company, or No. 5, and is identically the same as the South Improvement Company, known

as No. 2. By the terms of those charters, if carried out, the Pennsylvania Railroad Company would have been lord and master over all things, with the United States Government under its control. Such was the ambition of Thomas A. Scott, the political anaconda of the Pennsylvania Railroad Company.

The following is a correct and true copy of the South Improvement and Pennsylvania Company charter:

CHARTER OF THE SOUTH IMPROVEMENT COMPANY.

AN ACT TO INCORPORATE THE SOUTH IMPROVEMENT COMPANY.

Section 1. Be it enacted by the senate and house of representatives of the Commonwealth of Pennsylvania in general assembly met, and it is hereby enacted by the authority of the same, That S. S. Moon, R. D. Barclay, John A. Fowler, or a majority of them, their associates, successors, and assigns, be, and they are hereby authorized and empowered to form and be a body corporate, to be known as the South Improvement Company, which shall be, and is hereby, vested with all the powers, privileges, duties, and obligations conferred upon the act to incorporate the Pennsylvania Company, by the act of the legislature of Pennsylvania, approved the 7th day of April, A. D. 1870, and the supplement thereto.

Section 2. That the stockholders of said company, by and with the consent of the holders of not less than two-thirds of the shares of stock, be, and they are hereby, authorized to change the name and title of the said company and designate the location of its general office, which changes shall be valid after the filing of a certain certificate in the office of the secretary of the Commonwealth, signed by the president and attested by the seal of the said company.

JAMES H. WEBB,
Speaker of the House of Representatives.

WILLIAM A. WALLACE,
Speaker of the Senate.

Approved the 6th day of May, A. D., 1871.

JOHN W. GEARY,
Secretary.

CHARTER OF THE PENNSYLVANIA COMPANY.

AN ACT TO INCORPORATE THE PENNSYLVANIA COMPANY.

Section 1. Be it enacted by the senate and house of representatives of the Commonwealth of Pennsylvania in general assembly met, and it is hereby enacted by authority of the same, That Andrew Howard, Jr., S. Swartz, G. B. Edward, J. D. Wellsto, and J. T. Malin, their associates, successors, and

assigns, or a majority of them be, and they are hereby, authorized to form and be a body corporate, to be known as the Pennsylvania Company, and by that name, style, and title shall have perpetual succession and all the privileges, franchises, and immunities incident to a corporation; may sue and be sued, implead and be impleaded, complain and defend in all courts of law and equity, of record and otherwise; may purchase, receive, hold, and enjoy, to them, their successors, and assigns, all such lands, tenements, and leaseholds, estates and hereditaments, goods and chattels, securities and estates, real, personal, and mixed, of what kind and quality soever, as may be necessary to erect depots, engine houses, tracks, shops, and other purposes of said corporation, as hereafter defined by the second section of this act; and the same from time to time may sell, convey, mortgage, encumber, charge, pledge, grant, lease, sublease, alien and dispose of, and also make and have a common seal, and the same to alter and renew at pleasure, and ordain, establish and put in execution such by-laws or ordinances, rules and regulations as may be necessary or convenient for the government of the said corporation, not being contrary to the constitution and laws of this Commonwealth, and generally may do all and singular the matters and things which to them shall appertain to do for the well-being of the said corporation and the management and ordering of the affairs and business of the same; Provided, That nothing herein contained shall be so construed as to give to the said corporation any banking privileges or franchises or the privilege of issuing their obligations as money.

Section 2. That the corporation hereby created shall have power to contract with any person or persons, firms, corporations, or any other party, howsoever formed, existing, or that may hereafter exist, in any way that said parties, or any of them may have authority to do, to build, construct, maintain, or manage any work or works, public or private which may tend or be designed to include, increase, facilitate, or develop trade, travel, or the transportation or conveyance of freight, live stock, passengers, or any trade traffic, by land or water, from or to any part of the United States or the Territories thereof; and the said company shall also have power and authority to supply or furnish all needful materials, labor, implements, instruments and fixtures of any kind whatsoever, on such terms and conditions as may be agreed upon between the parties, respectively, and also to purchase, erect, construct, maintain, or conduct, in its own name and for its own benefit, or otherwise, any such work, public or private, as they may by law be authorized to do (including also hiring lines for telegraphic communication), and to aid, co-operate, and unite with any company, person or firm in so doing.

Section 4. The company hereby created, shall also have power to enter upon and occupy the lands of individuals or of companies on making payment therefor or giving security according to law for the purpose of erecting, constructing, maintaining, or managing any public work, such as is provided for

or mentioned in the second section of this act, and to construct and erect such works thereon, and also such buildings, improvements, structures, roads, or fixtures as may be necessary or convenient for the purposes of said company, under the powers herein granted; and to purchase, make, use, and maintain any works or improvements connecting or intended to be connected with the works of the said company; and to merge or consolidate or unite with the said franchises of any other company or companies on such terms and conditions as the said company may agree upon; and to fix and regulate the tolls or charges to be charged or demanded for any freight, property, or passengers traveling or passing over any improvement erected, managed, or owned by the said company, or on any merchandise or property transported over any road whatever by the said company, and to make, from time to time, dividends from the profits made by the said company; the several railroads managed by said company shall continue taxable, as heretofore, in proportion to their length within this State, respectively; and the said Pennsylvania Company shall be taxable only on the proportion of dividends on its capital stock and upon net earnings or income, only in proportion to the amount actually carried by it within the State of Pennsylvania, and on its earnings or income derived from its business beyond the limits of this Commonwealth shall not be liable for taxation.

HOW THE NATIONAL TRANSIT COMPANY (STANDARD OIL COMPANY) GOT THE CORPORATE POWERS WHICH THE SOUTH IMPROVEMENT COM- PANY WERE GRANTED.

"An Act to Incorporate the Overland Contract Company was approved March 22, 1871."

That is the act for transporting oil by pipe line throughout the State of Pennsylvania; and the provisions of the Southern Railway Security act, or the Overland Contract Company act, are the same as the Pennsylvania Company, or the South Improvement Company act, identically. It is simply the same act with another head.

The National Transit Company bought the Pennsylvania Company charter, under which the National Transit Company is organized, March 8, 1881, for \$16,250.

The present Free Pipe Line Bill was introduced in the Senate of Pennsylvania by Senator Lewis Emery, Jr., from Bradford, Pa., in 1883, and was passed in the same year.

The first pipe line in Lima, Ohio, was the Edwards Pipe Line, which began buying Lima oil in April, 1886, at 40 cents a barrel. On May 1, 1886, the Buckeye Pipe Line (branch of the Standard Oil Company) began the building of a 35,000 barrel iron oil storage tank on the Ben. C. Fautrot lands,

Southwest, Lima, O., and on May 11, 1886, commenced buying Lima oil in the field at 40 cents a barrel, and on the 1st of June, 1886, began to build the Solar refinery near the C. & A. railroad at South Lima, Ohio.

The Billingsly Pipe Line Bill was introduced into the legislature of Pennsylvania in 1887 by Representative Billingsly of Washington county, Pa.

THE WESTERN AND ATLANTIC PIPE LINE.

W. & A. P. L.

Joseph H. Craig, President and General Manager. The line was known as the W. & A. and the Craig-Elkins & Kimble Company. This company began building pipe lines in the Washington and Taylorstown oil fields in 1887. Storage tanks were first built near the Baltimore & Ohio railroad at Washington and Taylorstown, Pa. In the spring of 1888 they began laying pipe lines in Armstrong, Allegheny, Beaver and Butler counties, Pa., and built storage tanks and oil loading racks on the Pittsburg and Western (Baltimore and Ohio) railroad near Mars, Pa. The Western and Atlantic Pipe Line sold their pipe lines, storage tanks and loading racks to the National Transit Company (Standard Oil Company) in December, 1889.

The Eureka Pipe Line Company, principal office Oil City, Pa.; chartered under the laws of West Virginia, December 22, 1890; authorized capital, \$2,000,000; par value shares, \$100; amount paid in, \$100,000. Incorporators: Daniel O'Day, Buffalo, N. Y.; C. N. Payne, Titusville, Pa.; C. W. Archbold, Parkersburg, W. Va.; H. W. Sweeny, Oil City, Pa.; J. R. Campbell, Oil City, Pa.

The W. L. Mellon Pipe Line, known as the Craig-Mellon Line, was organized in 1892, and began laying a pipe line from their pump station and storage tanks at Hay's Station (near Greggs), Allegheny county, Pa., to the McCurdy, Oakdale and McDonald, Pa., oil field. In the spring of 1893 the Mellon line began building storage tanks and a pump station on the Wells flats at Sistersville, W. Va., and a five-inch line was laid from Sistersville, W. Va., to Hay's Station, Pa., and in 1893 they built the Crescent Pipe Line, a five-inch trunk line, from Hay's Station to Philadelphia, Pa. In 1895 the Mellon Pipe Line sold their entire interests in pipe lines to the National Transit Co. (Standard Oil Co.)

The pipe lines in 1893 were:—

The National Transit Co. United Pipe Lines Division, six and eight-inch trunk lines from Bear Creek, Pa., to Olean, N. Y.

Bear Creek, Armstrong county, Pa., to Crown, Clarion county, Pa., 28 miles.

Crown, Clarion county, Pa., to Kane, McKean county, Pa., 35 miles.

Kane, McKean county, Pa., to Colegrove, McKean county, Pa., 22 miles.

Colegrove, McKean county, Pa., to Olean, Cattaraugus county, N. Y., 30 miles.

Kane, McKean county, Pa., direct line to Olean, Cattaraugus county, N. Y., 35 miles.

The Buffalo line is about 56 miles long, having its initial point at Olean, N. Y. It is four-inch pipe. The New York line consists of two six-inch pipes starting at Olean, N. Y., and running parallel to each other through the southern counties of New York State to Saddle River, N. J., where the lines separate; one going down to the refineries at Bayonne, N. J., and the other going under the North and East rivers to the refineries at Hunter's Point, on Long Island. In addition to the two parallel six-inch lines, the New York line is looped at many of the stations; that is, extra lines are put in to relieve the pressure on the other lines and so increase somewhat their capacity; thus making the total length of pipe used 762 miles, the distance traversed by the line being 313 miles.

The Tide Water line of six-inch pipe, extends from Rixford in McKean county, to the refinery of the Tide Water Oil Company, Limited, at Bayonne, N. J., a distance of 284 miles.

The Southern Trunk line starts from Morgantown, W. Va., and extends to Philadelphia, a distance of 274 miles. This line is composed of six-inch and eight-inch pipe, the total length of pipe being about 364 miles.

We give below a table showing the actual length of each trunk line. In addition to this there are many other large lines connecting the various systems and different oil fields.

For example: Between Kane and Bear Creek, a distance of 63 miles, there are five six-inch lines; from Kane to Colgrove, there are 22 miles of eight-inch pipe; from Colegrove to Olean, 30 miles of eight-inch pipe. The total pipe, including these large connecting lines and the double lines and loops, amounts to 3,000 miles.

Pittsburg Pipe Line, four-inch pipe:—	Miles.
Bear Creek to Pittsburg	55
Buffalo Line, four-inch pipe:—	
Olean to Buffalo	56.25
Cleveland Pipe Line, five-inch pipe:—	Miles.
Bear Creek to Simpson	29.81
Simpson to Warren	30.23
Warren to Mantua	22.16
Mantua to Cleveland	28.59—110.79
Philadelphia Pipe Line, six-inch pipe:	Miles.
Colegrove to Hunt's Run	23.41
Hunt's Run to North Point	25.90
North Point to Pine	25.73
Pine to Latshaw	45.40
Latshaw to Millway	51.94
Millway to Philadelphia	62.50—234.88
Baltimore Pipe Line, five-inch pipe:—	
Millway to Baltimore	65.80

New York Pipe Line, six-inch pipe:— Miles.	
Olean to Wellsville	28.54
Wellsville to Cameron Mills	27.91
Cameron Mills to West Junction....	29.74
West Junction to Catatonk	27.37
Catatonk to Osborne Hollow	27.99
Osborne Hollow to Hancock	29.86
Hancock to Cocheton	26.22
Cochecton to Swartwont	28.94
Swartwont to Newfoundland	29.00
Newfoundland to Saddle River.....	28.77
Saddle River to Bayonne, N. J.....	16.29
Saddle River to Hunter's Point, N. Y.	12.26
Total (with loopings)	762.01
Tide Water Pipe Line, six-inch pipe:— Miles.	
Rixford to Olmstead	28.7
Olmstead to County Line	36.0
County Line to Muncy	53.5
Muncy to Shuman	33.9
Shuman to Hudsonale	27.65
Hudsonale to Changewater.....	52.5
Changewater to Bayonne, N. J.....	51.5 —283.75
Southern Pipe Line, eight-inch and six-inch pipe:— Miles.	
Morgantown to Watson	33.88
Watson to State Line	35.82
State Line to Knepper	66.67
Knepper to Millway.....	75.42
Millway to Philadelphia.....	62.50
Total (with loopings)	364.29
Crescent Pipe Line (Mellon Line) five-inch pipe:— Miles.	
Greggs to Milbank	about 48
Milbank to Ingleside	24
Ingleside to Saxton	30
Saxton to Mount Holly	55
Mount Holly to Florinal	40
Florinal to Linwood.....	60 —267
United States Pipe Line (Emery Line), double line, four-inch and five-inch pipe:— Miles.	
Titusville to Tarport	about 65
Tarport to Westfield	60
Westfield to Athens	55
Total (two lines)	360

The trunk lines carrying Pennsylvania crude are nearly 3,000 miles in length; but this does not include the network of two-inch pipes that fairly cover the producing country, and serve as feeders for the trunk lines. A representative of the Standard Oil Company appearing before a committee of the State Legislature, in February, 1891, testified that the total length of lines transporting Pennsylvania crude was undoubtedly 25,000 miles; or, as one of the senators put it, "a girdle for the earth."

The lines are usually laid under ground with bends, at intervals, to allow for expansion and contraction.

The pipe for these trunk lines is made especially for them. It is wrought iron, lap welded, and comes in lengths of 18 feet. On each end coarse and sharp taper threads are cut, nine to the inch, and the lengths are connected with long sleeve couplings, also screwed taper. The pipe is tested to stand a pressure of 2,000 pounds to the square inch, made necessary by the tremendous pressure carried on some of the pumps. This is sometimes as high as 1,500 pounds. It can be appreciated by remembering that, in addition to overcoming the friction of the oil on the line, which increases enormously as the rapidity of the flow is increased, the large body of liquid is made to move with great speed. It was found that the friction on the 108 miles of six-inch pipe between Rixford and Williamsport, Pa., was equal to a column of oil 700 feet high—that is, had this line had a gradual descent amounting to 700 feet, the adhesion between the oil and pipe would have prevented any flow, with the pipe full of oil for the 108 miles.

At each station there are two or more storage tanks from 30,000 to 35,000 barrels capacity, the oil being received from the station next before into one of the tanks, while the pump is emptying another. In this way the movement of oil through the trunk lines is made incessant. Most of the stations are also provided with duplicate pumping machinery so that there need be no interruption of the flow of oil even when one pump has to be stopped for repairs. The distance between stations averages 28 to 30 miles, but loops are sometimes laid around a station so that one pump has moved oil as far as 110 miles.

Where the New York trunk line passes under the Hudson river it is double—that is, one pipe is placed inside of another with tight fitting sleeve joints. The jacket pipe has its ends separated by a space of 12 inches to permit the enclosed pipe to be screwed home. The sleeve is then pushed over the 12-inch gap, and the whole space between the pipes is filled with lead poured in melted. The line is held in place on the bottom of the river by two sets of heavy chains parallel with the pipe and about twenty-five feet from it, one on each side. Every 300 feet a guide chain connects the pipe with these lateral chains, and beyond each one of these connections an anchor, weighing over a ton, keeps the whole in place. The line crossing the salt marshes approaching the river is laid in a rectangular wooden box, filled with hydraulic cement to withstand corrosion.

Pipe Line Pumps.—The pumps employed for this severe service are magnificent machines. The National Transit Company have been building their own pumps, constructing for trunk line service enormous triple expansion crank and fly wheel engines, which are superseding other makes of pumps on their lines. At each station there is generally one of these high-duty engines and a low-duty one for relief or emergency service. Most of the pumping is done by the machine just described, the other being employed when the main pump is being repaired or adjusted.

A station equipped with a high-service pump has also seven or eight horizontal tubular boilers, 80 to 100 horse power each. Six of the boilers are fired at once. They are placed in a boiler-house 40 feet square, built

of brick and coverd with a corrugated iron roof. The pumps are in a separate brick building, being separated for greater safety from fire. The stations are lighted by electricity, as the pump never stops moving the oil forward every day and night in the year. The stations are connected with one another and with the main offices of the pipe lines by independent telegraph wires. When a producer's tank is measured and accepted by a gauger and the oil passed into the pipe line, a report is telegraphed to the central station of that section of the field. A complete record of the capacity of each tank in the field is here kept by which the feet and inches of the oil indicated by the despatch are at once converted into barrels and placed to the credit of the producer on the books of the pipe line. By this means, at the end of each day, an accurate return can be made of the oil received; which, checked by an equally accurate report of the oil delivered, enables the pipe line to know their stocks at all times.

At each station there are two or more receiving or storage tanks built of light boiler iron; the usual size being about 90 feet in diameter, and 30 feet high. These tanks have conical roofs of wood covered with No. 20 iron. Each tank holds about 30,000 barrels of oil. A general idea of the plan of construction of storage tanks can be learned from the following specifications under which the tanks of many of the pipe lines are built:—

that it can follow the bends in the pipe. This spindle is fitted with steel blades set radially. It is kept in position in the pipe by three arms both in front and rear, with a guide wheel on the end of each arm. Oblique vanes put in motion by the moving oil rotate the spindle and the steel blades scrape the pipe. [At the rear end of the "go-devil" a piston that approximately fits the pipe, gives the instrument a forward motion, being impelled by the oil pumped through the line. Until within a few years, it was customary for men to follow the scraper in its trip, knowing where it was by the whirring noise it made; any obstacle being located by the stopping of the "go-devil." This is no longer thought necessary. A catch-box is placed at the other end of the line, and the time of the trip is so well known that the arrival of the little traveler can be closely timed. But the lines are regularly patrolled to promptly detect any leaks, although the system of checking from tank to tank makes it impossible for any serious break to occur without detection.

Oil Loading Racks—Closely associated with the pipe lines in such a description as this should be the loading racks for filling cars on railroad sidings. There are very many of these, both in the oil region and at different points along the main trunk lines, and at their termini. From one car to an entire train of thirty to forty cars can be loaded at once at many of these racks.

Cleaning Pipe Lines.—All crude petroleum contains more or less amorphous or uncrystallized paraffine or wax. Water mixed with crude oil forms an emulsion or soapy deposit. The paraffine is known in the oil region as "sucker-rod wax," because it collects on the rods used for pumping wells. The emulsion is locally known as "B. S." These two sediments, together with the impurities naturally incident to the producing of petroleum and its transfer from point to point, gradually choke the pipe lines, particularly in colder weather. To clean them, a curious instrument called a "go-devil" is sent through the pipe. These scrapers or brushes have at different times been of various designs, the one now used being the improved instrument that experience has shown is best suited to the work. It is a spindle with a ball and socket joint near its center so

The construction is of the simplest character; and, in general, the same at all points. Perpendicular branches are carried up at intervals, equal to the length of a tank car, from the main oil line, which is run along the side of the track. These branches are each provided with a stopcock and a movable pipe of proper length to reach over the dome of the tank car standing on the track; when moved into that position by a man passing from one of these upright branches to another, on a platform that has been erected at a convenient height. When the train of cars has been pushed into place on the track, these movable pipes are put over the platform down into the domes of the cars and the oil turned on. As many cars as the side track will hold can thus be loaded at the same time.

Pipe Line Companies.—The trunk lines are con-

trolled by the National Transit Company; the Tide-Water Pipe Company, Limited; the Octave Pipe Line; the Southwestern Pennsylvania Pipe Lines; the Eureka Pipe Line Company; the Buckeye Pipe Line Company; the Southern Pipe Line Company; the Charles Miller Pipe Line; the Western and Atlantic Pipe Line; the Elk Pipe Line; the Crescent Pipe Line (Mellon Line); the Producers' Pipe Line; the Producers' and Refiners' Oil Company, Limited; the United States Pipe Line (Emery Line), and the New York Transit Company. The first two mentioned are the most important. These companies moved the oil from the region to the terminus of their lines. The National Transit Company does a very large proportion of the entire business. It holds the original charter granted to Andrew Howard and J. S. Swartz and others under the name of the Pennsylvania Company, by the Act of April 7, 1870. The Pennsylvania Company charter is the same as the South Improvement charter. In 1880, it absorbed the business and plant of the American Transfer Company; and, on April 1, 1884, the business and plant of the United Pipe Lines—that branch of the organization being since known as the United Pipe Lines Division of the National Transit Company.

Pipe Line Certificates.—The National Transit Company and the Tide-Water Pipe Company, Limited, United States Pipe Line, Producers' and Refiners' Pipe Line, Guffey Petroleum Company, Higgins Pipe Line and other lines issue certificates for crude petroleum received. These are printed acceptances for crude, and are negotiable the same as a certified check. We give here a copy of a certificate of the National Transit Company.

Acceptance.

No..... OIL CITY, PA.,.....18..

NATIONAL TRANSIT COMPANY, (1,000)

Through its UNITED PIPE LINES division,

Deliver toor order,

ONE THOUSAND BARRELS of crude petroleum (of 42 gallons each) on the following terms, which are agreed to by the holder hereof:

1. It is agreed that the petroleum mentioned in this order is held by the National Transit Company, subject to a transportation charge of twenty cents per barrel, and a storage charge which will be at the rate of twenty-five cents per day per thousand barrels, as long as the market price of certificate oil is below one dollar per barrel; thirty-five cents per day when the market price is from one dollar to one dollar and fifty cents per barrel, and forty cents per day when the market price is above one dollar and fifty cents per barrel; no charge, however, to be made in rate of storage on account of prices going above or below the prices named, unless the market price remains above or below the specified point for thirty consecutive days, and that the point of delivery of such oil shall be within the United Pipe Lines division.

Not good until accepted
by Agent at.....

2. It is further agreed that this order shall be returned to the National Transit Company for exchange within six months from date of issue, or be subject to a storage charge of one-twentieth (1-20) of one cent per barrel daily thereafter until returned.

3. It is further agreed that the National Transit Company shall not, in any event, be liable for any loss of crude petroleum, resulting from lightning, fire, storms or any other unavoidable causes, it being distinctly understood and agreed that any such loss or losses shall be charged *pro rata* upon all petroleum in its custody at the time of such loss or destruction, and that the quantity of petroleum called for by this order shall be reduced by its proportion of such loss or destruction.

4. It is further agreed that transportation and all accrued storage charges shall be paid on the amount so deducted.

Order Accepted.

No..... Agent.....Registrar

The system of issuing these certificates is, briefly, as follows:—

When a producer wishes to deliver oil from his tank, he notifies a gauger of the pipe line, who measures oil and gives a voucher for it, running it into the line. The oil thus received is treated the same as a deposit in a bank. Against it certificates are issued in lots of one thousand barrels each, at the request of the owner. It was in these that the oil exchanges dealt.

The fluctuations in the price of petroleum from 1875 to 1885 rendered a speculative investment in the article an object of exciting interest. June 1, 1879, was Sunday. The market opened on the 2nd at 74 $\frac{5}{8}$ cents per barrel. It continued to fall, with little disposition to rally, until on the 17th it closed at 64 $\frac{5}{8}$; and after fluctuating between 65 and 68 for four days, it reached 75, and dropped to 69 $\frac{5}{8}$ on the 25th. It hovered about 70 until the 9th of August, when it began to fall, reaching 64 $\frac{5}{8}$ on the 27th. A slight rally held it at about 66 until the 7th of September, when an upward movement began, reaching 96 $\frac{1}{4}$ on October 9th. It remained near 91 until the 10th of November, when it again moved upward, reaching \$1.27 $\frac{1}{2}$ on the 21st, closing that day at \$1.22 $\frac{1}{2}$. On the following day it ranged between \$1.22 $\frac{1}{2}$ and \$1.10 $\frac{7}{8}$, closing at \$1.18 $\frac{1}{8}$, from which it rallied, reaching on the 2nd of December \$1.28 $\frac{1}{8}$. Between the 10th and 18th it ranged between \$1.27 $\frac{1}{2}$ and \$1.10, and fluctuated greatly between \$1.18 and \$1.09 from this time to January 15, 1880, when it went down in three days to \$1.05, and steadily declined with scarce a rally, till, on March 9, it touched 85 $\frac{7}{8}$. It hovered between 85 and 90 till April 6th, when it again commenced to decline, reaching 71 $\frac{1}{4}$ on the 21st. On the 5th of May it closed at 72 $\frac{1}{2}$, and by the 26th had again reached the latitude of 93 $\frac{3}{4}$, closing on the 31st at 98 $\frac{3}{4}$. It will thus be seen that the certificates of oil in tank were worth that year from 64 $\frac{5}{8}$ cents to \$1.28 $\frac{1}{8}$ per barrel, and this variation of almost 100 per cent. occurred between

August 27th and December 2d, an interval of only sixty-eight days.

All stock oil tanks are gauged to ascertain true dimensions, and the iron hoops are striped with white paint to guard against fraud. In days gone by a number of producers would tighten the hoops on the tank, (called driving the hoops) decreasing the capacity of the tank. This was done without reporting it to the pipe line company, and the next time the pipe line company would run the oil a shortage would be found. This led to an investigation of the pipe line authorities, and the cause of the shortage in oil was found to be due to the driving of tank hoops by a number of producers. This led to the striping with white paint across the hoops on the tank near the pipe line connections to the tank. Each tank has a register number stenciled on it in white letters. Each time the gauger received orders to run oil from the stock tanks in the oil fields he first inspected the white stripes to see if the hoops had been tightened or driven. The oil is first tested with an instrument called a "thief" to see if the oil contains any water; if it does the water is drawn off at a plug in the bottom of the tank, and the temperature is taken. The oil should be 80 degrees Fahrenheit. The measure of the oil in the tank is taken. The usual size of the tank is 250 barrels. The bottom of the tank is 16 feet and the top is 13 feet in diameter, and is 7 feet and 6 inches in height. The oil is then turned into the pipe line through a two-inch connection at the bottom of the tank by a man known in the oil country as a pipe line gauger. The oil is taken off down to the pipe line connections, which is about one foot from the bottom of the tank. The heavy matter in the bottom of the tank is "B. S.," below standard, and is left in the bottom of the tank. After the oil is run down to the connection the gauger closes the stop at the bottom of the tank and gauges the amount left in the tank; he then gives the owner a stub or run ticket for the amount of feet and inches of oil run, the pipe line company buys this oil at once, or issues a certificate for every 1,000 barrels of oil to the owner or to the persons named on the division order of the pipe line for the amount of barrels of oil in the pipe line or storage tanks to their credit, with the usual $\frac{1}{8}$ royalty reserved for the property owner. This oil at the present time is pumped to Brooklyn, N. Y., Bayonne, N. J., Philadelphia, Pa., Baltimore, Md., Buffalo, N. Y., Cleveland, Ohio, and Whiting, Ind. (Chicago station).

The first pump stations are usually arranged to receive by gravity the oil from a number of wells. Then large force pumps are used; they raise it into great storage tanks. Regular cities of thirty-five thousand barrel iron tanks are located at Olean, New York; Meadow Lands, Tiona, Colegrove, Parker's Landing and Gregg's Station, Pennsylvania; Morgantown, Eureka, Downs Station and Sistersville, W. Va.; Lima and Cygnet, Ohio, Whiting, Ind., and other convenient points. Often as much as thirty-five million barrels of oil are stored in such tanks at one time. The trunk lines of six and eight inch wrought iron pipes takes the oil from these points, conveys it over mountains, through forests, across or under rivers, and delivers it as needed at the large cities already mentioned. On account of adverse gravity and the great friction in the

pipe, many powerful pumps are needed to keep the oil moving; these are placed at central points in the valleys, and they send the oil along at a very high pressure, as high as fifteen hundred pounds to the square inch. At the terminal stations elaborate gate-houses are provided for the purpose of reducing the pressure to a point at which it is safe to deliver the oil to refineries, to discharge it into tank cars, or to pour it into the holds of tank steamers for transportation across the seas. The cargo of such a vessel may be twelve million gallons of oil in bulk, but the capacity of the pipe line is such that she can be loaded or discharged in seven hours.

The crystallizing of paraffine from the oil seriously interferes with the operation of the pipe lines. This thick and waxen coating has been known to form so rapidly that within twenty-four hours the daily flow of a six-inch pipe line has dropped off a thousand barrels. A contrivance with rotating blades called a "go-devil," driven by the force of the flow, is sent through the pipe lines to clean them.

Telegraph and telephone systems follow the route of the pipe lines, and all of the pump stations, refineries, storage points and the offices are connected by wire in case of an accident to the line that would cause a large leak, or if the line parts or breaks the pressure will drop to a low point, which will cause the pumps to run very fast, which is a warning to the engineer in charge of the pump station to stop the pumps until the line is repaired.

Following are the forms of certificates, division orders, transfer orders, purchase order, run tickets, telegraph report, working interest and royalty forms used by the several pipe lines:—

PIPE LINE CERTIFICATES.

Copy of a certificate of the National Transit Co.:—
Acceptance.

No. 10,100. OIL CITY, PA., February 10, 1896.

NATIONAL TRANSIT COMPANY, (1,000)

Through its UNITED PIPE LINES division,

Deliver to John M. Collins, McDonald, Pa.

ONE THOUSAND BARRELS of crude petroleum (of 42 gallons each) on the following terms, which are agreed to by the holder hereof:—

1. It is agreed that the petroleum mentioned in this order is held by the National Transit Company, subject to a transportation charge of twenty cents per barrel, and a storage charge which will be at the rate of twenty-five cents per day per thousand barrels, as long as the market price of certificate oil is below one dollar per barrel; thirty-five cents per day when the market price is from one dollar to one dollar and fifty cents per barrel, and forty cents per day when the market price is above one dollar and fifty cents per barrel. No change, however, to be made in rate of storage on account of prices going above or below the price named unless the market price remains above or below the specified point for thirty consecutive days, and that the account of prices going above or below the price named unless the market price remains above or below the

point of delivery of such oil shall be within the United Pipe Lines division.

Not good until accepted
By John M. Collins,
Agent at McDonald, Pa.

2. It is further agreed that this order shall be returned to the National Transit Company for exchange within six months from date of issue, or be subject to a storage charge of one-twentieth (1-20) of one cent per barrel daily thereafter until returned.

3. It is further agreed that the National Transit Company shall not, in any event, be liable for any loss of crude petroleum resulting from lightning, fire, storms or any other un-

avoidable causes, it being distinctly understood and agreed that any such loss or losses shall be charged *pro rata* upon all petroleum in its custody at the time of such loss or destruction, and that the quantity of petroleum called for by this order shall be reduced by its proportion of such loss or destruction.

4. It is further agreed that transportation and all accrued storage charges shall be paid on the amount so deducted.

Order No. 10,100. Accepted, February 10, 1904.

JOHN M. COLLINS, Agent. A. G. DEANE, Registrar.

McDONALD, PA., Feb. 2, 1905.

To SOUTH WEST PENNSYLVANIA PIPE LINES.

The undersigned certify and guarantee that they are the legal owners of 'The Knockers' and Boosters' Oil Co., Wells Nos. 1 and 2, on Riley Lewis Farm, Cecil Township, Washington County, State of Pennsylvania, including the royalty interest, and until further notice you will credit all oil as per directions below.

Credit To:—	Division of Interest.	Postoffice Address.
Jerry Berry	1/8	Soho, Pa.
Samuel Hubley	1/8	Carnegie, Pa.
John Wiles	1/8	McDonald, Pa.
Thomas Miller	1/8	McDonald, Pa.
Chas. Cameron	1/8	McDonald, Pa.
Abner Conkle	1/8	McDonald, Pa.
Frank Collins	1/8	McDonald, Pa.
Riley Lewis	owner 1/8 royalty.....	McDonald, Pa.

Pipe Line Tank Nos. 2,304, 2,601.

The South West Pennsylvania Pipe Lines is hereby authorized, until further notice, to receive oil from said wells for transportation for said parties severally in the proportions named, subject to the following conditions:

FIRST—Payment of a transportation charge of 20 cents per barrel; all oil received from said wells shall be delivered at the option of the South West Pennsylvania Pipe Lines at any delivery station on its lines.

SECOND—The South West Pennsylvania Pipe Lines shall charge storage at the close of each month on so much of the oil so received which shall have remained undelivered from the preceding month, at the rate of 25 cents per day per thousand barrels so long as the market price of certificate oil is below \$1 per barrel; 30 cents per day when the market price is from \$1 to \$1.50 per barrel; and 40 cents per day when the market price is above \$1.50 per barrel. No charge, however, to be made in the rate of storage on account of the price going above or below the price named, unless the market price remains above or below the specified point for thirty consecutive days.

THIRD—The South West Pennsylvania Pipe Lines shall deduct two per cent. from all oil received from wells into its custody on account of dirt and sediment, and in addition shall deduct one-twentieth of one per cent. for each degree of artificial heat above normal temperature to which said oil shall have been subjected, and oil shall be steamed as heretofore.

We agree in case of any adverse claim of title to furnish the SOUTH WEST PENNSYLVANIA PIPE LINES satisfactory evidence of title, or, failing to do so, to furnish satisfactory indemnity, upon reasonable demand, against such adverse claim or claims; and that the said the SOUTH WEST PENNSYLVANIA PIPE LINES may retain the oil until we do so, or until the dispute as to ownership is settled.

TRANSFER ORDER.

Mannington, W. Va., Feb. 1, 1905.

To THE EUREKA PIPE LINE COMPANY:

We have this day sold our interest in wells Nos. 1, 2 and 3 on Flagg Meadow Farm, Rising Sun Oil Co., Burt Town District, Marion County, State of West Virginia, as below:

Interest.	Names.	P. O. Address.
1/4.....	James Gorman.....	Olean, N. Y.
1/4.....	O. B. Tulley.....	Painted Post, N. Y.
1/4.....	John Tanker.....	Waverly, W. Va.
1/8.....	Peter Galaher.....	Claysville, Pa.
1/8.....	George Bailer.....	Sand Hill, Idaho.

You will therefore transfer the same to the credit on your books to

Pipe Line Tank Nos. 28,000, 28,100, 28,104.

L. B. Gordon,
F. Harris,
G. Henderson,
N. Hartnett,
M. Homan.

The assignee above named hereby certify and agree that they are the legal owners of the well interest above transferred and authorize the EUREKA PIPE LINE COMPANY, until further notice, to receive oil for transportation and storage pursuant to above transfer.

The Eureka Pipe Line Company is hereby authorized, until further notice, to receive oil from said wells for transportation for said parties severally in the proportions named, subject to the following conditions:

FIRST—Payment of a transportation charge of 20 cents per barrel; all oil received from said wells shall be delivered at delivery station on its lines.

SECOND—The Eureka Pipe Line Company shall charge storage against all oil run and received into its custody from wells after the expiration of the month following that in which it is received at the rate of one-fortieth of one per cent. per barrel for each day thereafter said oil shall continue to remain in its custody.

THIRD—The Eureka Pipe Line Company shall deduct two per cent. from all oil received from wells into its custody on account of dirt and sediment, and in addition shall deduct one-twentieth of one per cent. for each degree of artificial heat above normal temperature to which said oil shall have been subjected, and oil shall be steamed as heretofore.

FOURTH—The Eureka Pipe Line Company shall not in any event be liable for loss of petroleum resulting from lightning, fire, storms or other unavoidable causes, and such loss shall be charged pro rata upon all petroleum in its custody at the time of such loss, and transportation and all accrued storage charges shall be paid on the amount so deducted.

We agree in case of any adverse claim of title to furnish THE EUREKA PIPE LINE COMPANY satisfactory evidence of title, or, failing to do so, to furnish satisfactory indemnity upon reasonable demand, against such adverse claim or claims, and that the said THE EUREKA PIPE LINE COMPANY may retain the oil until the dispute as to ownership is settled.

Witness:

IRON AND WOODEN OIL TANKS

RULE FOR DETERMINING THE CONTENTS OF WOODEN TANKS

SUCH AS ARE USED AT OIL WELLS.

At the point where the tank is measured, square the circumference, then multiply by .07958 which equals area at point in tank where measured; multiply by 144, which equals the number of square inches. Divide by 231 (number of cubic inches in a gallon) then divide by 42 (number of gallons in a barrel). Result is the number of barrels per inch

It is customary to measure the outer circumference of a tank, taking such measurements each 2 feet between top and bottom, commencing at a point representing the actual inside bottom (as staves on outside project below bottom) The intermediate measurements are calculated by proportion thus: If the first measurement is 42 feet, and the next 2 feet is 40 feet, the measurement midway between, or 1 foot above the bottom, will be 41 feet.

EXAMPLE.

32 feet = circumference of a 100-bbl. tank on the bottom line
 32 feet squared = 1024
 Multiply by .07958 = 81.48992
 Multiply by 144 = 11734.54848 square inches
 Divide by 231 = 50.79891 gallons
 Divide by 42 = 1.209 + no. bbls. per inch in bottom of tank

Formula for computing tanks—bbls. per inch—

$$\text{Circum}^2 \times 0.07958 \times 144$$

$$231 \times 42$$

NOTE:

Measurements must be taken in feet and decimal parts. *Deductions* from outside measurements must be made to allow for thickness of staves See table showing *percentage* to be deducted from circumference before computing contents.

Deductions must be made for roof supports or other deadwood in tanks. Calculate the areas of such deadwood in inches, divide by 9702, which will equal the barrels per inch to be deducted

This oil is received into the general stock of Producers and Refiners Oil Company, Limited, subject to a transportation charge of twenty cents per barrel, and a storage charge at the rate of twenty-five cents per day per thousand barrels. But is not chargeable with any assessment for losses of oil in the general stock, resulting from lightning, fire, storms, or other unavoidable causes.

Three run tickets are issued for each tank of oil run. The gauger retains one, one is given to the owner of the oil and the third is sent to the district pipe line office.

WORKING AND ROYALTY INTERESTS.

Working interest is usually seven-eighths, and royalty one-eighth. The royalty is deducted from all oil run into the pipe lines and is held in reserve for the royalty or property owner. The remaining seven-eighths is divided equally between the share or working interest holders, known as the operators or owners of the well.

STEAMING OIL IN THE TANKS.

During the winter months the oil in the stock tanks becomes chilled and too thick to run in the pipe lines. Steam was used to heat the oil at the beginning of the oil industry on Oil Creek. Steam connections were made direct from the boiler to the tank, the steam escaping with the oil near the bottom of the tank, and the force required to send the steam down through the oil would mix the B. S., non-merchantable oil on the bottom of the tank, with the good oil. The steam would condense into water, and the oil, B. S. and water would mix together, which would require two or three days to settle the water, B. S. and oil. The water being the

heaviest would settle to the bottom of the tank, near the bottom of which a hole was bored, in which a plug was driven, and when it was desired to draw the water from the tank the plug would be pulled and the water allowed to run out until the oil began to appear in it. The plug was then driven into the tank and the pipe line gauger was notified that the oil was steamed, settled and the water drawn off. The gauger would call and test the oil. If it was warm enough and free from water and clear he would gauge it and run it into the pipe line. If the oil was not settled or warm enough he would not accept it but would return in a day or two and again test it. This was a great annoyance to both the producer and pipe line company, and led to the invention of two-inch steam coils for tanks. The coils are placed within four inches of the bottom of the tank; the steam connections are made from the top of the tank and pass down through the oil and connect with the coil. An outlet of the coil is made by extending one end out through the tank on the end of this outlet a stopcock is screwed, which is used to regulate the steam in the coil and not allow only the condensed water to escape. The steam passing through the coil heats the oil. (See illustrated plan of 2-inch steam coils for oil tanks.)

Summary of Statements Made January 9th, 1904, Relating to Business of Various Pipe Lines for Month Ending December 31st, 1903—In Barrels of Forty-two Gallons Each.

WELLS CONNECTED WITH THE PIPE LINES.

Eighty-seven thousand producing oil wells are connected with the Standard Oil Company's pipe lines and 5,000 with the Independent pipe lines.

The trunk pipe lines from the oil fields to the seaboard at the present time are:

The Cumberland (Kentucky) pipe line, from Olympus, Tennessee, to Braden Station, Tyler county, West Virginia. The route and size of line and location of pump stations are as follows: First

pump station at Olympus, Pickett county, Tenn.; sixty miles of 2, 4, and 5-inch pipe line to Somerset station, Pulaski county, Ky.; forty miles of 5-inch pipe line from Somerset to Winchester intersecting station, with 3-inch branch line, 17 miles in length, from Barbourville, Knox county, Ky., to Winchester station, Perry county, Ky.; Winchester station to Licking Run, Magoffin county, Ky.; 68 miles 5-inch line intersects with 4-inch branch line, 41 miles in length, from Ragland, Bath county, to Licking Run, Magoffin county, Ky.; Beaver Creek, Floyd county, Ky., station 3-inch line 40 miles in length to Licking Run intersecting station; Licking Run station to White House Rack, Johnson county, Ky.; 30 miles 6-inch line White House Rack, Johnson county, Ky., to Hamlin, Lincoln county, West Virginia, intersecting station 40 miles of 6-inch line, Milton, Cabell county W. Va.; 2-inch branch line, 20 miles in length, from Milton, Cabell county, W. Va., to Hamlin intersection station; Hamlin, Lincoln county, W. Va., to Elm Run station, Ritchie county, W. Va.; 83 miles of 6-inch line Elm Run to Braden intersection station, Tyler county, W. Va.; 31 miles 6-inch line, Buckeye-Macksburg pipe line, Vinton Creek station, Vinton county, O., to Wolf Creek station, Athens county, O., 43 miles of 3-inch line Wolf Creek, Athens county, to Lowell station, Washington county, O.; 13 miles 4-inch line, Lowell, O., to Eureka intersection station, Eureka, Pleasants county, W. Va.; 18 miles of 6-inch line, Corning station, Perry county, O., to Elba Junction; 32 miles of 4-inch line branch to Elba, Washington county, O.; 4-inch line, 2½ miles in length, Elba Junction, O., to Eureka intersection station, Pleasants county, W. Va.; 20 miles 4-inch line, Payne station, Washington county, O., to Eureka station, 9 miles 4-inch line, Eureka pipe line, Eureka intersection station, Eureka, Pleasants county, W. Va., to Braden intersection station, Tyler county, W. Va.; 31 miles of 6-inch line, Sistersville (Thistle station), Tyler county, W. Va., to Braden intersection station, 12 miles of 6-inch line; Braden intersection station, Tyler county, W. Va., to Downs intersection station, Marion county, W. Va., 25 miles 6-inch line; Sand Fork Station, Lewis county, W. Va., to Ten-Mile station 32 miles of 6-inch line; Ten-Mile station to Downs intersection station 19 miles of 6-inch line; Downs intersection station, Marion county, W. Va., to Ewing intersection station, Washington county, Pa., 50 miles of 6-inch line; Downs intersection station to Dolls Run Junction, Monongahela county, W. Va., 16 miles of 6-inch line; Ewing station, Washington county, Pa., to Dolls Run Junction, Monongahela county, W. Va., 41 miles of 6-inch line; Dolls Run Junction to Morgantown intersection station, Monongahela county, W. Va., 9 miles of 6-inch line; Downs intersection station, Marion county, W. Va., to Morgantown intersection station, Monongahela county, W. Va., 21 miles of 6-inch line

SOUTHERN PIPE LINE.

Morgantown station, Monongahela county, W. Va., 6 and 8-inch trunk line to Watson station, Fayette county, Pa.; Watson station to State Line station, Bedford county, Pa.; State Line station to Knepper station, Franklin county, Pa.; Knepper station to Millway station, Lancaster county, Pa.; Millway station to Philadelphia terminus oil refinery, Point Breeze, Chester county, Pa.; Millway station, Lancaster county, Pa., to Baltimore terminus oil refinery, Baltimore, Md.; Millway station, Lancaster county, Pa., to Bayonne seaboard terminus oil refinery, Bayonne, Hudson county, N. J.

THE PRAIRIE OIL AND GAS COMPANY
PIPE LINE.

W. J. Young, President, Pittsburg, Pa.; D. J. O'Day, General Manager, Lima, O.; W. F. Gates, Superintendent, Independence, Kan.

From Red Fork, Creek Nation, Indian Territory, to Kansas City, Kan. The stations on the line are as follows: Red Fork, Indian Territory, station to Territory line station 6-inch line, Chelsea; Cherokee Nation station to Territory line station via Bartlesville, Cherokee Nation, to Lawton station; Cherokee Nation 6-inch line, Lawton to Cleveland, Oklahoma Junction 6-inch line Cleveland, Oklahoma, Osage Nation, to Cleveland Junction, Cherokee Nation, 4-inch line; Cleveland Junction via Caney, Montgomery county, Kan., to Peru Junction, Kan., 6-inch line; Peru, Chautauqua county, to Peru Junction, 3-inch line; Peru Junction, Kan., to Independence, Montgomery county, Kan., 6-inch line; Coffeyville, Montgomery county, Kan., to Independence, Kan., 3-inch line; Independence to Neodesha, Wilson county, Kan., 6-inch line; Cherry Vale, Montgomery county, Kan., to Neodesha, Kan., 3-inch line; Neodesha, Kan., 6-inch line; Neodesha via Chaunte, Neosha county, to Humboldt, Allegheny county, Kan., 6-inch line; Humboldt via Iola to Garnett, Anderson county, Kan., 6-inch line; Garnett to Paola, Miami, Kan., 6-inch line; Paola to Kansas City, Wyandotte county, Kan., 6-inch

KANSAS AND INDIANA PIPE LINE.

Kansas City, Kan., to Whiting, Ind., 6-inch line.

INDIANA PIPE LINE.

Whiting, Lake county, Ind., terminal; Whiting to Wilders station, Kankakee, Stark county, Ind., 8-inch line; Wilders station to Laketon station, Wabash county, Ind., 8-inch line; Laketon station to Preble station, Adams county, Ind., 8-inch line; Preble station to Montpeller station, Wells county, Ind., 6-inch line; Montpeller station to Broad Ripple station, Marion, Marion county, Ind.; Preble sta-

tion, Adams county, Ind., to Adgate station, Lima, O., 8-inch line. The Indiana trunk pipe line follows the route of the Chicago and Alton (Erie) railroad right of way from Lima, O., to Whiting, Ind.

THE BUCKEYE PIPE LINE.

St. Mary's station, Auglaize county, O., to Adgate station, Lima, O., 6-inch line; Adgate station to Cygnet station, Wood county, O., via Findlay and North Baltimore, O., 8-inch line; Tontogany station, Wood county, O., via Bowling Green, O., to Cygnet station, O., 6-inch line; Cygnet station to Rollersville station, Sandusky county, O., 6 and 8-inch lines; Rollersville station to Toledo terminal 6-inch line; Rollersville station to Green Springs Junction station, Seneca county, O., 8-inch line; Cygnet station, Wood county, O., to Green Springs Junction station, Seneca county, O., 8-inch line; Green Springs Junction station to Wakeman station, Huron county, O., 8-inch line; Wakeman station to Berea station, Loraine county, O., 8-inch line; Berea station to Mantua station, Portage county, O., 8-inch line Mantua station to Cleveland, O., Lake Erie terminal, 6-inch line; Mantua station to Warren station, Trumbull county, O., 8-inch line; Warren, O., station to Simpson station, Lawrence county, Pa., 8-inch line; Simpson station to Bear Creek station, Armstrong county, Pa., 8-inch line; Bear Creek pump station is known as the mixing station. This station supplies all the trunk lines with Pennsylvania and Lima, O., and Indiana mixed crude oil.

THE NATIONAL TRANSIT COMPANY'S PIPE LINES.

The general head division of all the Standard Oil Company's pipe lines united into one grand division, operating under the charter granted the Pennsylvania Company by act of the legislature of Pennsylvania, April 7, 1870. The charter of the Pennsylvania Company was purchased by the National Transit Company March 8, 1881, for \$16,250. On May 12, 1884, the United and numerous other pipe lines were transferred to the National Transit Company. The officers of the National Transit Company are as follows: Henry H. Rogers, President; Daniel O'Day, Vice President; John Bushnell, Controller; George Cheseboro, Assistant Controller; George W. Colton, Treasurer; W. A. Harris, Assistant Treasurer; F. M. Towl, General Superintendent; D. S. Bushnell, Assistant General Superintendent; Forrest M. Toll, Constructing Engineer. General office, Standard Oil Building, 26 Broadway, New York.

National Transit Company United Pipe Lines, Upper Division, John O'Brien, Superintendent, Bradford, Pa.

National Transit Company United Consolidated, Eureka, Southern, Cumberland (Kentucky) Mellon-Crescent, South West Pennsylvania, Buckeye-

Macksburg, Lower Division, Henry G. Scrafford, Superintendent, Pittsburg, Pa.

THE NATIONAL TRANSIT.

Names and route of the several trunk pipe lines in the United and Consolidated Grand Division of the National Transit Company:

Mellon Pipe Line (five-inch line)—Sistersville, W. Va., to Littleton, W. Va.; Littleton, W. Va., to Anderson, Pa.; Anderson, Pa., to Ewing, Pa.

South West Pennsylvania Pipe Line (two, three, four, five and six-inch line)—Taylorstown, Pa., to Cundall, Pa.; Cundall, Pa., to Ewing, Pa.; Washington, Pa., to Ewing, Pa.; McDonald and Oakdale, Pa., to Greggs Station, Pa.; Greggs Station to Ewing, Pa.; Ewing, Pa., to Nedsky, Pa.; Greggs Station, Pa., to Nedsky, Pa.

Crescent Pipe Line (five-inch line)—Greggs Station, Pa., to Millbank, Pa.; Millbank to Ingleside, Pa.; Ingleside to Saxton, Pa.; Saxton to Hays Grove, Pa.; Hays Grove to Florinel, Pa.; Florinel to Marcus Hook, Pa. Seaboard Terminal Refinery, Philadelphia, Pa.

National Transit Company—United Pipe Lines Division (four, five, six and eight-inch lines)—Scio, O., to Turkey Foot, W. Va.; Turkey Foot to Ewing and Shannapin, Pa.; Ewing Station, Pa., to Shannapin Station, Pa.; Shannapin to Nedsky Station, Pa.; Ewing Station, Pa., to Nedsky Station, Pa.; branch line from Nedsky Station to Allegheny, Pa.; Nedsky Station, Pa., to Bear Creek Station, Pa.; Bear Creek Station to Crown Station, Pa.; Crown Station to Kane Station, Pa.; Kane Station to Colegrove Station, Pa.; Colegrove Station to Hunt's Run Station, Pa.; Hunt's Run to North Point Station, Pa.; North Point Station to Pine Station, Pa.; Pine Station to Latshaw Station, Pa.; Latshaw Station to Millway; intersection station to Point Breeze; Seaboard Terminal Refinery, Philadelphia, Pa.; Millway Station to Baltimore, Md., Seaboard Terminal Refinery; Millway Station, Pa., to Bayonne, N. Y.; Saddle River Junction Station to the Seaboard Terminal Refinery, Bayonne, N. J.

Pacific Coast Oil Company Pipe Line, California (Standard Oil Company)—Length of line, 280 miles; size of line, eight inches. Route of line: Waite Station, Kern county, Cal., to Pond Station, Kern county; Pond Station to Corcoran Station, Tulare county, Cal.; Corcoran Station to Lethent Station, Fresno county, Cal.; Lethent Station to Mendota intersecting station, Fresno county, Cal.; Colinga branch line station, Fresno county, Cal., to Mendota intersecting station; Mendota intersecting station to Los Palos Station, Fresno county, Cal.; Los Palos Station to Newman Station, Merced county, Cal.; Newman Station to Vernalis Station, San Joaquin county, Cal.; Vernalis Station to McCabe Station, Contra Costa county, Cal.; McCabe Station to Maltby Station, Contra Costa county, Cal.; Maltby Station to Port Richmond Terminal Refinery, San Francisco Bay, Cal.

Security Oil Company Pipe Line, Texas (Standard Oil Company)—Size of line, eight inches. Route of line: Batson to Sour Lake, Sour Lake to Beaumont, Beaumont to Sabine Pass, Seaboard Terminal Refinery.

Tidewater Pipe Line Company, Limited (operated under agreement with the Standard Oil Company)—Size of line, six inches. Route of line: Tarpot, East Bradford, Pa., to Station No. 1, Rixford, Pa.; Station No. 1 to Station No. 2, Olmsted, Pa.; Station No. 2 to Station No. 3, County Line, Pa.; Station No. 3 to Station No. 4, Muncy Station, Pa.; Station No. 4 to Station No. 5, Shumans, Pa.; Station No. 5 to Station No. 6, Hudsonale, Pa.; Station No. 6 to Station No. 7, Changewater, N. J.; Station No. 7 to Seaboard Terminal Refinery, Bayonne, N. J.

United States Pipe Line Company (Independent and Standard)—Incorporated September 6, 1892. Capital stock, \$2,000,000. Michael Murphy, President; J. W. Lee, Vice President; I. G. Jackson, Secretary; W. W. Tarbell, Treasurer; H. J. Wing, Superintendent. Directors: Michael Murphy, New York; R. M. Jennings, Pittsburg, Pa.; Louis Walz, Oil City, Pa.; Delevan Emery, Bradford, Pa.; Hugh King, New York; Peter Theobald, Titusville, Pa.; J. W. Lee, Pittsburg, Pa.; Thomas W. Phillips, New Castle, Pa.; Joseph Seep, C. N. Payne, Titusville, Pa.; J. C. McDowell, Pittsburg, Pa.

Crude and refined lines; size of lines, four and five inches. Route of lines: Titusville, Pa., to Warren, Pa., 31 miles; crude line five inches, refined line four inches; Warren, Pa., to Bradford, Pa., 30½ miles; crude line five inches, refined line four inches; Bradford, Pa., to Westfield Station, Pa., 57½ miles; crude line four inches, refined line five inches Westfield Station, Pa., to Athens Station, Pa., 53 4-5 miles; crude line four inches, refined line five inches; Athens to Parkson Station, 63 3-5 miles; crude line four inches, refined line five inches; Parkson to Freemansburg, Pa., loading rack, 59 miles; Freemansburg to Marcus Hook Terminal Refinery, Phil-

adelphia, Pa., 64.1 miles; crude line four inches, refined line five inches.

Producers and Refiners Pipe Line Company, Limited (Independent)—Size of line, two, four and six inches. Route of line: Trail Run (O.) Station to Sistersville Station, W. Va.; Sistersville Station to Pine Grove Station, W. Va.; Pine Grove Station, W. Va., to Taylorstown Station, Pa.; Taylorstown Station to Washington Junction, Pa.; Washington, Pa., field station to Washington Junction; Washington Junction to Primrose Station, Pa.; Primrose Station to Coraopolis Station, Pa.; Primrose Station, via McDonald, Noblestown and Oakdale, Pa., to Coraopolis Station; Coraopolis to Adams Station, Pa.; Adams to Butler, Pa.; Butler to Karns City, Pa.; Karns City to Dotters Station, Pa.; Dotters Station to Oil City, Pa.; Oil City to Titusville, Pa., then intersecting with the United States Pipe Lines.

Emery Pipe Line (Independent)—Lewis Emery, Jr., owner. Route and size of line: Sugar Run, Pa., to Sarksville, Pa., 40 miles, three and four-inch line; Riterville to Bradford, Pa., 18 miles, three and four-inch line.

TEXAS PIPE LINES.

Higgins Pipe Line, from Batson to Sour Lake; six-inch line.

United Oil and Refining Company, Sour Lake to Beaumont; six-inch line.

National Oil and Pipe Line Company, Beaumont to Port Arthur; six-inch line.

Franklin Pipe Company, Limited, Franklin, Pa. J. W. Grant, President; D. Grimm, Secretary; E. Black, Superintendent. Size of pipe line, two, three and four inches. Route of line: Franklin oil field to refinery and loading rack, Franklin, Pa.

Cornplanter Pipe Line Company, Warren, Pa. Size of pipe line, two inches. Route of line: Tiona, Clarendon, Stoneham, Glade Run and Glade to refinery, East Warren, Pa.

GENERAL CORPORATION.

CODE OF WEST VIRGINIA LAWS.

OF REGULATIONS CONCERNING TRANSPORTATION OF PETROLEUM BY PIPE LINES, OR STORAGE BY TANKS.

CHAPTER XV.

From Chap. 44 Acts 1891, which amended Chap. 27 Acts 1879, entitled "An act prescribing regulations for the transportation of petroleum or other oils or liquids by railroad companies or transportation companies or through pipes of iron or other material constructed for that purpose."

The sections in this chapter bear the same numbers as in the Acts of 1891.

As to appropriation of land, see Section 41 of Chap. 21 of this book.

Certain pipe line companies are common carriers, Section 41 of Chap. 21 of this book.

WHAT PERSONS AND CORPORATIONS ARE SUBJECT TO THIS ACT.

1. Every person, corporation or company now engaged, or who shall hereafter engage or continue in the business of transporting or storing petroleum, by means of pipe line or lines or storage by tanks, shall be subject to the provisions of this act, and shall conduct such business in conformity herewith; and the word company whenever used in this act shall be construed to include persons and corporations.

MUST ACCEPT ALL PETROLEUM OFFERED.

2. Any company heretofore or hereafter organized for the purpose of transporting petroleum or other oils or liquids, by means of pipe line or lines, shall be required to accept all petroleum offered to it in merchantable order in quantities of not less than two thousand gallons at the wells where the same is produced, making at its own expense all necessary connections with the tanks or receptacles containing such petroleum, and to transport and deliver the same at any delivery station, within or without the state, on the route of its line of pipes which may be designated by the owners of the petroleum so offered.

PETROLEUM TO BE INSPECTED, MEASURED AND RECEIPTED FOR.

3. All petroleum of a gravity of thirty-five degrees Baume or under at a temperature of sixty degrees Fahrenheit, offered for transportation by means of pipe line or lines, shall, before the same is transported, as provided by section two of this act, be inspected, graded and measured, at the expense of the pipe line company, and the company accepting the same for transportation shall give to the owner thereof a receipt stating therein the number of barrels or gallons so received and the grade, gravity and measurement thereof, and within a reasonable time thereafter, upon demand of said owner or his assigns, shall deliver to him at the point of delivery a like quantity and grade or gravity of petroleum in merchantable condition as specified in said receipt; except that the company may deduct for waste one per centum of the amount of petroleum specified in such receipt.

CHARGE FOR TRANSPORTING OIL.

4. The charge for receiving, transporting and delivering petroleum of the gravity of thirty-five degrees Baume or under at a temperature of sixty degrees Fahrenheit by means of pipe line or lines, shall not exceed one cent per barrel of forty-two gallons, per mile: provided, that if said rate should amount for the whole distance transported to less than ten cents per

barrel, then the sum of ten cents per barrel may be charged; provided, that if the distance be over twenty miles and not more than thirty miles, one-half cent per barrel may be charged for every mile over twenty miles; and provided, further, that if the distance be over thirty miles, the maximum charge shall not exceed twenty-five cents.

CHARGE FOR STORAGE AND ALLOWANCE FOR WASTE.

5. Any company engaged in storing petroleum of a gravity of thirty-five degrees Baume or under, at a temperature of sixty degrees Fahrenheit, by means of tanks, shall be permitted to charge for storage one cent per barrel per month or part of a month, unless the same is removed within fifteen days from the date when said oil is received into the custody of such company, and shall be allowed for evaporation and waste one-half of one per centum of the oil per month, unless removed within thirty days from the date of the receipt of such petroleum; but no company engaged in the business of storing petroleum of the gravity of thirty-five degrees Baume or under, at a temperature of sixty degrees Fahrenheit, shall charge for storage any amount in excess of that authorized by this section.

OIL EXCEEDING 35 DEGREES TO BE INSPECTED, ETC.

6. All petroleum of a gravity exceeding thirty-five degrees Baume at a temperature of sixty degrees Fahrenheit, offered for transportation by means of pipe line or lines, shall be inspected and measured at the expense of the company transporting the same, before the same is transported; and the company accepting the same for transportation, shall give to the owner thereof, or to the person in charge of the well or wells, from which such petroleum has been produced and run, a ticket signed by its gauger, stating the number of the feet and inches of petroleum which were in the tank or receptacle containing the same before the company began to run the contents from said tank, and the number of feet and inches of petroleum which remained in the tank after said run was completed; and all deductions made for water, sediment or the like, shall be made at the time such petroleum is measured; and within reasonable time thereafter said company shall, upon demand, deliver, from the petroleum in its custody to the owner thereof, or to his assignee, at such delivery station on the route of its line of pipes as he may elect a quantity of merchantable petroleum, equal to the quantity of petroleum run from said tank, or receptacle, which shall be ascertained by computation; except that the said company transporting said petroleum may deduct for evaporation and waste two per centum of the amount of petroleum so run, as shown by said ticket; and except that in case of loss of any petroleum or other like unavoidable cause, such loss shall be borne pro rata by all the owners of such petroleum at the time thereof. But said company shall be liable for all petroleum that is lost while in its custody by the bursting of pipes or tanks, or leakage from pipes or tanks; and it shall also be liable for all petroleum lost from tanks at the

wells where produced before the same has been received for transportation if such loss be due to faulty connections made to said tanks; and said company shall be liable for all petroleum lost by overflow of any tanks with which pipe line connections have been made, if such overflow be due to the negligence of such company; and for all the petroleum lost by the overflow of any tanks with which pipe line connections should have been made under the provisions of this act, but were not so made by reason of negligence or delay on the part of said company.

CHARGE FOR TRANSPORTING OIL EXCEEDING 35 DEGREES.

7. Any company engaged in transporting petroleum of a gravity exceeding 35 degrees Baume at a temperature of 60 degrees Fahrenheit, by means of pipe line or lines, may charge for receiving, transporting and delivering such petroleum not to exceed twenty cents per barrel for each barrel of forty-two gallons; provided, however, if where the point of delivery is without this State, more than twenty cents per barrel be charged, then there shall be charged no greater sum than ten cents per barrel for receiving such oil and transporting the same that part of the distance which is within this State.

CHARGE FOR STORAGE.

8. Any company engaged in transporting or storing petroleum of a gravity exceeding 35 degrees Baume, at a temperature of 60 degrees Fahrenheit, by means of pipe lines and tanks, shall make no charge for storing said petroleum until after the expiration of the month following that in which the oil was run and received into custody. But it may charge for storing said petroleum of a gravity exceeding 35 degrees Baume at a temperature of 60 degrees Fahrenheit, for every day after the expiration of the month following that in which said oil shall have been run and received into custody, not to exceed one-fortieth of one per cent. per barrel of forty-two gallons for each day thereafter said oil shall continue to remain in its custody. And such company shall make no charge for water, sediment, waste and the like in transporting or storing any petroleum after the same has been gauged or measured, before the run of the same is made, except the two per centum for waste and evaporation hereinbefore mentioned.

CHARGES TO BE UNIFORM.

9. No company engaged in transporting or storing petroleum by means of pipe line or lines and tanks shall charge, demand or receive from any corporation, company, association, person or persons a greater or less rate for the transportation or storage of petroleum than it charges, receives or demands from any other corporation, company, association, person or persons for the transportation or storage of petroleum of like gravity; and any shift, device, or subterfuge made or attempted for the pur-

pose of avoiding the provisions of this section shall be void.

VIOLATIONS—HOW PUNISHED.

10. Any company, its officers or agents, wilfully violating any of the provisions of Sections 2, 3, 4, 5, 6, 7, 8 or 9 of this act, or charging for any of the services provided for in any of said sections, an amount in excess of that authorized by said sections, shall be guilty of a misdemeanor, and on conviction thereof shall be fined not less than one hundred dollars, nor more than one thousand dollars, and shall moreover be liable to the party aggrieved for all damages sustained by him by reason of such excessive charges.

LIEN FOR CHARGES.

11. Any company engaged in transporting or storing petroleum shall have a lien upon said petroleum until all charges for transporting and storing said petroleum are paid.

ACCEPTED ORDERS AND CERTIFICATES NEGOTIABLE.

12. Accepted orders and certificates for petroleum issued by any company engaged in the business of transporting and storing petroleum in this State, by means of pipe line or lines and tanks, shall be negotiable, and may be transferred by endorsement, either in blank or to the order of another, and any person to whom the said accepted orders and certificates shall be so transferred shall be deemed and taken to be the owner of the petroleum therein specified.

PROVISIONS GENERALLY RESPECTING RECEIPTS, CERTIFICATES, ORDERS, ETC.

13. No receipt, certificate, accepted order or other voucher shall be issued or put in circulation, nor shall any order be accepted or liability incurred for the delivery of any petroleum, crude or refined, unless the amount of such petroleum represented in or by such receipt, certificate, accepted order or other voucher or liability, shall have been actually received by and shall then be in the tanks and lines, custody and control of the company issuing or putting in circulation such receipt, certificate, accepted order or voucher, or written evidence of liability. No duplicate receipt, certificate, accepted order or other voucher shall be issued or put in circulation, or any liability incurred for any petroleum, crude or refined, while any former liability remains in force, or any former receipt, certificate, accepted order or other voucher shall be outstanding and uncanceled, except such original paper shall have been lost, in which case a duplicate plainly marked "duplicate" upon the face, and dated and numbered as the lost original was dated and numbered, may be issued. No receipt, voucher, accepted order, certificate or written evidence of liability of such company on which petroleum, crude or refined, has been delivered, shall be re-issued, used or put in circula-

tion. No petroleum, crude or refined, for which a receipt, voucher, accepted order, certificate or liability incurred shall have been issued or put in circulation, shall be delivered, except upon the surrender of the receipt, voucher, order or liability representing such petroleum, except upon affidavit of loss of such instrument made by the former holder thereof. No duplicate receipt, certificate, voucher, accepted order or other evidence of liability shall be made, issued or put in circulation until after notice of the loss of the original, and of the intention to apply for a duplicate thereof, shall have been given by advertisement over the signature of the owner thereof in at least four successive issues of a daily or weekly newspaper published in the county where such duplicate is to be issued. Every receipt, voucher, accepted order, certificate or evidence of liability, when surrendered, or the petroleum represented thereby delivered, shall be immediately cancelled by stamping and punching the same across the face in large and legible letters with the word "cancelled," and giving the date of such cancellation; and it shall then be filed and preserved in the principal office of such company for the period of six years.

14. No company, its officers or agents, or any person or persons engaged in the transportation or storage of petroleum, crude or refined, shall sell or encumber, ship, transfer, or in any manner remove or procure, or permit to be sold, encumbered, shipped, transferred, or in any manner removed from the tanks or pipes of said company engaged in the business aforesaid, any petroleum, crude or refined, without the written order of the owner or owners thereof.

COMPANY TO MAKE AND POST SHIPMENT OF BUSINESS.

15. Every company now or hereafter engaged in the business of transporting by pipe lines, or storing crude or refined petroleum in this State, shall, on or before the tenth day of each month, make or cause to be made and posted in its principal business office in this State, in an accessible and convenient place for the examination thereof by any person desiring such examination, and shall keep so posted continuously until the next succeeding statement is so posted, a statement plainly written or printed, signed by the officer, agent, person or persons having charge of the pipes and tanks of said company, and also by the officer or officers, person or persons, having charge of the books and accounts thereof, which statement shall show in legible and intelligent form the following details of the business:

First—How much petroleum, crude or refined, was in the actual and immediate custody of such company at the beginning and close of the previous month, and where the same was located or held; describing in detail the location and designation of each tank or place of deposit, and the name of its owner.

Second—How much petroleum, crude or refined, was received by such company during the previous month.

Third—How much petroleum, crude or refined, was delivered by such company during the previous month.

Fourth—How much petroleum, crude or refined, such company was liable for the delivery or custody of, to other corporations, companies or persons at the close of the month.

Fifth—How much of such liability was represented by outstanding receipts or certificates, accepted orders or other vouchers, and how much was represented by credit balances.

Sixth—That all the provisions of this act have been faithfully observed and obeyed during the said previous month.

The statement so required to be made shall also be sworn to by said officers, agent, person or persons before some officer authorized by law to administer oaths, which oath shall be in writing, and shall assert the familiarity and acquaintance of the deponent with the business and conditions of such company, and with the facts sworn to, and that the statements made in the said report are true.

16. All amounts in the statements required by this act, when the petroleum is handled in bulk, shall be given in barrels and hundredths of barrels, reckoning forty-two gallons to each barrel, and when such petroleum is handled in barrels or packages, the number of such barrels or packages shall be given, and such statements shall distinguish between crude and refined petroleum, and give the amount of each. Every company engaged in the business aforesaid shall at all times have in their pipes and tanks an amount of merchantable oil equal to the aggregate of outstanding receipts, certificates, accepted orders, vouchers, acknowledgements, evidences of liability and credit balances on the books thereof.

PENALTY FOR CERTAIN VIOLATIONS.

17. Any company, its officers or agents, who shall make or cause to be made, sign or cause to be signed, issue or cause to be issued, put in circulation or cause to be put in circulation, any receipt, accepted order, certificate, voucher or evidence of liability, or shall sell, transfer or alter the same, or cause such sale, transfer or alteration, contrary to the provisions of this act, or shall do or cause to be done, any of the acts prohibited by the thirteenth section of this act, or omit to do any of the acts by said section directed, shall be guilty of a misdemeanor, and on conviction thereof shall be sentenced to pay a fine of not exceeding one thousand dollars, and undergo imprisonment not less than ten days nor exceeding one year.

PENALTY FOR SELLING WITHOUT OWNER'S CONSENT.

18. Any company engaged in the business of transporting by pipe transfer or remove, or cause or procure to be sold, transferred or removed from the tanks or pipes of such company, any petroleum, crude or refined, without the written consent of the owner or owners thereof, shall be guilty of a

misdemeanor, and on conviction thereof shall be sentenced to pay a fine of one thousand dollars and undergo an imprisonment of not less than ninety days and not exceeding one year.

PENALTY FOR FAILURE TO MAKE STATEMENT REQUIRED.

19. Any company engaged in the business of transporting by pipe lines or storing petroleum, crude or refined, and each and every officer or agent of such company who shall neglect or refuse to make the report and statement required by the fifteenth section of this act, within the time and in the manner directed by said section, shall forfeit and pay the sum of one thousand dollars, and in addition thereto the sum of five hundred dollars for each day after the tenth day of the month that the report and statement required by said section fifteen shall remain unposted as therein directed.

APPOINTMENT OF EXAMINERS—THEIR DUTIES, ETC.

20. The holders of any receipts, certificates, accepted orders, or other vouchers or evidences of liability, or the owners of oil in the custody of any such company described and referred to in this act, to an amount not less in the aggregate than ten thousand barrels of petroleum, crude or refined, may at any time present their petition to the circuit court of any county wherein such company may be engaged in business or have its principal office, or to any judge of said court in vacation, setting forth under oath their ownership as aforesaid and desire for the appointment of examiners for the purposes of this section; and upon such petitioners giving bonds to be approved by the court, or by the judge granting the order, that they will pay all expenses and costs that may accrue in the proceedings, the court, or any judge thereof in vacation, shall forthwith appoint such number of impartial, disinterested and expert persons as may be asked for in said petition, as examiners, and shall fix the amount of their compensation; and the court or judge by order shall direct and empower such examiners to immediately inspect and measure all the petroleum, crude or refined, in the custody of any such company named in the said petition, on the day of such inspection, and to examine the books of said company relating to the issue and cancellation of receipts, certificates, accepted orders, vouchers, or evidences of liability, and to its open accounts with persons, companies or corporations with whom it deals in the receipt and delivery of crude or refined petroleum. Such examiners, when so appointed, shall each immediately be sworn before any authorized officer to perform his duties with fidelity and according to law, which oath shall be reduced to writing, signed and filed with the clerk, and they shall then make immediate inspection, examination and measurement, as required by said petition and order and by this act. And it shall be the duty of each and every such company, its officers, agents and employes, to give immediately upon request of any such authorized

examiners, all the information demanded in said petition and required by this act to be reported, and also full access to the offices, tanks, pipes, books and accounts of such company. Upon the completion of such inspection, measurement and examination, it shall be the duty of the examiner or examiners, or in the event of the death, resignation, declination or inability to act of any of them, then to others, or any of them, within ten days after their appointment to make to the court appointing them a written, signed and sworn report of such examination, inspection and measurement, and file the same of record with the clerk thereof, which report shall show:

First—How much merchantable and also how much unmerchantable petroleum, crude or refined, they found in the tanks and lines of such company, and where the same was located or held by description of tanks.

Second—For the custody or delivery of how much crude or refined petroleum they found such company to be liable at the same date.

Third—How much of such liability was represented by outstanding receipts, accepted orders, certificates, vouchers or evidences of liability, and how much by credit balances.

PENALTIES TO WHICH EXAMINERS ARE LIABLE.

21. Any examiner so appointed as aforesaid who shall make any false examination, inspection, measurement or report, or shall make known directly or indirectly to any person any information he may become possessed of in the course of his examination, inspection or measurement, except by means of his report made and filed in accordance with this act, or who shall receive directly or indirectly any fee, reward or benefit, or the promise of any fee, reward or benefit, other than that provided by this act, for the performance or non-performance of any duty or thing contemplated by this act, or connected with his said employment, shall be guilty of a misdemeanor, and upon conviction thereof shall be sentenced to pay a fine of one thousand dollars, and may at the discretion of the court be confined in jail not to exceed one year.

PENALTY FOR REFUSING ACCESS TO BOOKS, ETC.

22. Any officer, agent, manager, superintendent, or employe of any company engaged in the transportation by pipe lines of petroleum, crude or refined, or the storage thereof, who shall refuse or neglect after demand made to give to any authorized examiner full and free access to any and all offices, pipes, tanks, accounts, books and vouchers required by him in the pursuance of his appointment and this act, shall be guilty of a misdemeanor, and upon conviction thereof shall be sentenced to pay a fine of not exceeding one thousand dollars, and may at the discretion of the court be confined in jail not to exceed one year.

CONFLICTING LAWS REPEALED.

23. All acts and parts of acts inconsistent with the provisions of this act are hereby repealed.

HOW PIPE LINE COMPANIES MAY ENTER UPON AND APPROPRIATE LANDS.

A company organized for the purpose of transporting natural gas, petroleum or water, necessary for use in carrying out the provisions of this act in piping and transporting natural gas and petroleum, or for drilling for the same, through tubing and pipes, may enter upon any land for the purpose of examining and surveying a line for its tubing and pipes, and may appropriate so much thereof as may be deemed necessary for the laying down of such tubing and piping, and for the erection of tanks and the location of stations along such line, and the erection of such buildings as may be necessary for the purpose aforesaid; such appropriations shall be made and conducted in accordance with the law providing for compensation to the owners of private property taken for public use; provided, that no dwelling house, yard or garden shall be taken for such purpose, nor shall any oil tank, gas or oil pipe line be erected or laid within one hundred feet of any occupied dwelling house without the consent of the owner thereof. And so far as the rights of the public therein are concerned, the county commissioners as to public roads, and the council of any municipal corporation as to streets and alleys, in their respective jurisdictions, may, subject to such regulations and restrictions as they may prescribe, grant to such company the right to lay such tubing and piping therein: provided, however, the right to appropriate for any of the purposes herein above specified shall not include or extend to the erection of any tank, station, or building, or lands thereof, or to more than one continuous line of pipe or tubing, or land therefor, in or through a municipal corporation without the council first consents thereto; and all excavations shall be well filled by such company, and so kept by it, in all cases. Such company shall, for the purpose of transporting natural gas, oils and water, be considered and held to be a common carrier, and subject to all the duties and liabilities of such carriers under the laws of this State. —[Code 52:24.]

EXPORT AND DOMESTIC TRADE IN PETROLEUM PRODUCTS.

Export Trade—Barrels—Cans and Cases—Shipments in Bulk—Tank Steamers and Sailing Vessels—Tank Cars—Tank Wagons—New York Produce Exchange Rules Regulating Exports—State Laws Regulating the Sale of Petroleum Products.

Export Trade — Petroleum has undoubtedly reached a wider market than any other product of American industry. Every quarter of the globe has

been blessed by its beneficent light. Wherever commerce has made its way, petroleum has been taken as an article that finds ready sale. As has been said: "It is carried wherever a wheel can roll or a camel's foot be planted. The caravans on the Desert of Sahara go laden with Astral oil and elephants in India carry cases of Standard White. Ships are constantly loading at our wharves for Japan, India and the most distant isles of the sea." Everything connected with this magnificent business is of interest. We have seen that a silent revolution in the industry took place when pipe lines for the transportation of crude were found practicable. Another revolution has been experienced during the last fifteen years in the mode of carrying much of the finished oil exported. Until within this period all petroleum was delivered to foreign countries in either barrels or cases. Today the transportation of oil in bulk is becoming very general, displacing to some extent, though not altogether, shipments in barrels, and to a lesser extent, shipments in cans. The making of these packages should be briefly described.

Barrels.—When it is remembered that this outline describes the making of but one of several distinctly different kinds of packages for conveying petroleum to distant markets, that it is of course entirely separate from the manufacture of oil, but a necessary adjunct to the success of the industry, the ramifications of the manufacture of petroleum can be comprehended.

The oak staves are purchased ready jointed and seasoned in West Virginia, Tennessee and Michigan, and the barrel heads are brought to the works ready glued up. The first operation in barrel-making consists in fitting the necessary number of staves together in a thick wrought-iron ring encircling their lower ends. This is an operation requiring some experience and judgment. The embryo barrel is then placed in an iron cylinder and steamed, whereby the wood is softened. The staves are next encircled by a wire rope connected with an engine, and are thus bent into shape and drawn together, a second strong iron hoop being slipped on their upper ends to hold them in position. The barrel is then "fired" by burning some readily combustible material in the interior, and the curvature of the staves thus rendered permanent. A number of extra temporary iron hoops of great thickness are next slipped on, and drawn toward the bulge of the barrel by means of an ingenious arrangement of iron hooks or claws actuated by steam power. The final operation performed upon the staves consists in placing the barrel in a lathe, paring off the rough ends and cutting the grooves for the heads.

The barrel is then ready to receive the heads and to be hooped. The hoops weigh collectively about twelve pounds, and the total length of iron required for a set is 433½ inches, so that putting the out-turn of finished barrels from one factory at 10,000 per day, we have a length of about seventy miles of hoop iron (weighing about 55½ tons) used daily.

In order to render the barrels capable of holding their fluid contents without leakage, they are coated

internally with glue, about one pound of glue to three barrels being required. The glue solution is poured into the barrels hot, the barrels bunged up and rotated so that the solution coats the entire surface, the surplus being afterwards drained out. There is some pressure of steam in the barrel during the operation, and a leak is thus at once shown. The barrels finally receive a coating of the well-known blue paint on the staves, and white paint on the heads. Oil barrels returned to be refilled are often cleaned externally by an arrangement of rapidly revolving wire brushes, are steamed out, re-glued and repainted.

Before the barrels are filled, the hoops require "driving" to take up the shrinkage of the wood. This was formerly done exclusively by hand, but Mr. E. J. Hopper has invented a successful machine for doing this by steam power. In this apparatus the barrel stands on a platform arranged like an inverted steam hammer, and on turning on the steam it is brought, with a succession of blows, against a number of hinged stops, which closely encircle the barrel and on which the hoops strike. With one such machine the hoops of 2,000 barrels can be driven in ten hours by one man and two boys—an amount of work which formerly entailed the hand labor of ten men.

The barrels are filled from a rack provided with a series of pipes connected with a barrelling tank. Each pipe has at its exit end a float connected with a valve, which shuts off the oil when the barrel has been filled to within one gallon of its contents. The shives with which the barrels are closed are of wood and are put in with glue. A package which remains perfectly tight and free from leakage as long as it is handled carefully, and the continuous skin of glue remains intact, is thus produced.

As already stated, shipments heretofore made in barrels to many ports are now being made in bulk by both sailing vessels and steamers. These shipments and the vessels carrying them will be referred to later.

Cans and Cases.—Shipments of oil to warm climates are made exclusively in cans, as barrels, though cheaper per gallon, are liable to develop leaks when exposed to decided changes in temperature. Deliveries to the more distant ports of China, Japan, India, Australia, the East Indies and South America are still, and probably will for many years continue to be, made in these packages, as bulk vessels cannot afford to engage in that trade because no return cargoes can be secured, so that the whole expense of the round trip would have to be borne by the load of oil carried out, the steamer returning empty. Cases can be packed close together, making a solid mass, with no loss of space in a ship's hold. In this respect they have a decided advantage over barrels.

The cans are of rectangular form, holding five American (or four English imperial) gallons, and are put by twos into wooden rectangular boxes. The outside dimensions of a case are about 20¾ inches long by 15 inches high and 10½ inches wide. This makes a very convenient package for handling,

the weight of the case with the cans full of oil being about 80 pounds. The manufacture of the can and of the case are distinct industries, the former requiring delicate and expensive machinery and a large force of skilled mechanics. Most of the raw material used in making the cans, including the tin plate, is imported from England, the major part of the heavy duty imposed being returned as drawback by the government when the package of oil is exported. This is also true of the case, much of the lumber used coming from Canada, a duty being paid when it is brought into this country, and returned on such portion of the lumber as is made up into the case and shipped abroad. Each can is fitted with a handle of wire or tin and a screw top from which the oil may be poured when the consumer wishes to use it. An oil case with its two cans is a package that reflects great credit on the skill of American inventors.

Shipments in Bulk.—A considerable portion of our domestic trade in refined oil and some portion of the trade in lubricating oils has, for many years, been done in bulk. By this we mean that no package is used for the product as it passes from the refinery to the consumer. Its course is somewhat as follows: When finished at the refinery it is pumped into large storage tanks. From these it is delivered in bulk to barges or tank cars. These carry it to the stations where it is pumped again in bulk to the dealers' tanks, to be by them delivered to the customer, or, in some cases, direct from the tank wagon to the consumer.

But this mode of transportation for export trade is of recent growth. When it was suggested that there were economies to be secured by carrying oil abroad in bulk, that all of the weight transported would be oil, and freighting the package would be saved, not to mention the expense of bringing back the empty barrel to be used again, which was largely practiced, as the barrels had become a burden to the foreign buyer, the contents being consumed and the packages left on his hands, numerous objections were presented. Some of them were, the great cost of providing vessels for the purpose, the small earnings on the investment because the return voyage must be made without cargo, the danger attending the enterprise from fire, and from loss of both vessel and cargo by foundering, and the damage to the oil by changing its test or color through the extra handling.

The change in the mode of transportation when it had once begun was carried forward with startling rapidity. The "Vaderland" was not a success as a tank steamer. In 1886 two others were fitted up, the "Crusader" and the "Andromeda." The former was filled with a large number (45 in all) of cylinder tanks of different sizes, averaging in capacity 125 barrels, making the total capacity of the ship about 275,000 gallons. The "Andromeda" was provided with rectangular tanks, 72 in number, making the total capacity about 685,000 gallons. Neither of the steamers made many voyages.

But when the thought was once fairly presented, it soon became apparent that mechanical construc-

tion only stood in the way of making the change. Sailing vessels carried from 5,000 to 8,000 barrels each, and made about two and one-half to three trips per year; bulk steamers could be built to carry 20,000 to 30,000 barrels, or three times as much as a sailing vessel, and make seven to nine trips per year, or three times as many as a sailing vessel. The result has been that last year as many as fifty-nine different tank steamers carried oil from the United States abroad, and fully 76 per cent. of the total exports of crude and refined oil, other than those in cases, were made in bulk.

Some of these steamers are "converted," that is, turned into bulk boats, although built for other uses. They can generally be distinguished by having their boilers and engines amidships, instead of, as in the case of the vessels built for this trade, aft, for greater safety. But many of the tank steamers are constructed especially for this service. They are models of marine architecture. They are built entirely of iron, including the decks. When loaded the whole body of the vessel is filled with oil, the ship's structure forming the necessary receptacle, the liquid occupying all the space to the "skin" or iron of the sides and bottom. This is a great improvement over such form of construction as that of the "Crusader" and the "Andromeda," already referred to, decreasing the cost of transportation by increasing the carrying capacity of the vessel, there being no unoccupied space between the tanks, and decreasing the risk of fires and explosions, as these empty spaces gave room for the accumulation of gas. Both these objections held true against the style of construction adopted later of a double bottom, the bottom of the oil tanks being elevated a short distance above the actual bottom of the ship. The tank ships as now built have a longitudinal and numerous transverse bulkheads, which, with the stringers and beams put in to prevent the slightest straining, make them, from a structural point of view, undoubtedly the safest and strongest vessels in the mercantile marine. Here is given a clear and comprehensive description of one of the more recently built steamers, the "Charlois":

This vessel is 310 feet long, 39 feet beam and 25 feet 3 inches deep, and is capable of carrying upwards of 3,500 tons of petroleum, besides bunker coal, on a moderate draft.

The requisite subdivision into eight tanks of moderate size is obtained by the introduction of nine thwartship bulkheads, which are very heavily stiffened and made extra thick to withstand the pressure due to any one tank being full while the others are empty. In addition to these there is a longitudinal bulkhead running the entire length of the oil compartments in the center of the ship, which further subdivides each tank into two. Wells, or water spaces, are formed at each end of the oil compartments, which are filled with water when the vessel is loaded with oil, and thereby isolate the oil from the rest of the ship and boiler room, to prevent risk of fire. Each tank is provided with a smaller tank above, running up through the 'tween-decks to the upper deck, which is fitted to allow

for the expansion and contraction of the oil, due to difference in temperature, without permitting the oil to ever fall below the level of the top of the tank proper, which is essential to the vessel's stability at sea. It is usual to carry these expansion tanks about half full of oil. The expansion tanks also serve the purpose of giving access to the tanks, proper man-holes and Jacob's ladders being provided. A special feature in this vessel, which the designers had particularly in view, is the fact that she could, with very slight alterations, be used for ordinary cargoes; the expansion tanks being arranged conveniently, and of extra size, for this purpose; this is, we think, an important point. The machinery and boilers are placed close aft, and clear of the oil compartments, and the saloon and officers' and engineers' cabins and gallery are abaft this, and therefore well clear of the tanks. The crew are berthed in the fore-castle, and there is a long bridge amidships, with a shade or awning deck, connecting it to the poop. The shade deck was specially introduced by the designers to make the vessel more seaworthy, as she is employed in the Atlantic trade, and this considerably reduces the amount of exposed deck. The internal fittings of this vessel are most complete, and, as a further precaution against fire, she is lighted throughout by electric light on the incandescent principle, the engines and dynamos being placed in the engine room directly under the control of the engineers. There are also steam heaters for all the cabins and the crew. Two powerful pumps are fitted in the 'tween-decks with very complete piping arrangements, each pump being capable of discharging the entire cargo of oil in thirty hours. As pointed out, there is no double bottom for water ballast, but tanks are provided at both ends for trimming purposes. For ballasting the ship when light, two or more of the oil tanks are run up with water, special means being provided for this purpose, and when so laden the vessel is much steadier at sea than if carrying ballast in the ordinary double bottom; and, as these vessels have to make one out of every two trips across the Atlantic, light ship, this is very important.

Experience has suggested some minor improvements since the "Charlois" was built. The vessels constructed later have somewhat greater carrying capacity. The expansion tanks are not so large, but extend the whole length of the oil tanks they are designed to relieve. The strength of the hull has been still further increased by the addition of another deck or horizontal partition running through the oil tanks, dividing each into an upper and lower tank. This iron partition, with its braces, adds materially to the stability of the ship both when empty and full.

The change from barrel to bulk transportation means large economies in many ways. Before it was made, oil was filled into barrels, each package weighed by itself, then rolled to the dock front and hoisted up over the side of the ship, lowered into the hold and stowed away. Each operation required considerable manual labor. The sailing vessel, for a month or six weeks, was then exposed to the de-

CAR LOAD OF NEW OIL BARRELS
(READY TO SHIP FROM THE A. KNAPP & CO., BARREL FACTORY), WARREN, PA.

100

lays and vicissitudes of an ocean voyage, arriving at length at its destined port. Here she was unloaded, a barrel at a time, and the oil stored away in packages to be held until used, subject to loss from leakage and serious damage in appearance. By the new method of transportation, a steamer comes to the wharf and the oil is pumped from the refinery storage into her tanks with great rapidity; the largest of the ships being loaded in from ten to twelve hours even though they hold four or five times as much as the sailing vessels of a few years ago. A voyage of two weeks and perhaps a few days, the time being subject to very close calculation, brings the cargo to the foreign port. Here it is unloaded with the same dispatch that was used in loading; the oil being pumped into large storage tanks on shore, in which it is held without loss or damage until needed; the steamer starting immediately on her return trip. Not a moment of time is lost and no item of extra expense incurred.

LAUNCHING OF THE PENNOIL TANK STEAMER, OWNED
BY PURE OIL CO., AT GREENOCK, SCOTLAND,
NOVEMBER 18, 1902.

The Pennoil is a sister tank steamer to the ill-fated Pureoil. Built for the carriage of petroleum in bulk, the Pennoil is 385 feet long, 50 feet in beam, 30 feet deep (moulded) and at her summer Plimsoll mark carries close to 7,000 tons. She has been built to take the highest class in both British and German Lloyd's registers, and embodies all the latest experience of oil carrying vessels. A special feature in the design is that, unlike the majority of tank vessels, her machinery is placed amidships, which, it is expected, will obviate the undue straining to which tank vessels of large size with machinery in the after end are subjected in a seaway. The range of oil holds is divided into two spaces—one forward and one aft of the machinery space, and further subdivided and fenced off by means of cofferdams and divisional bulkheads. The total number of tanks is 22, each completely and hermetically isolated, and tested by a pressure of over 40 feet of water, necessitating a structure of very great strength and rigidity, combined with excellence of workmanship in detail. The range of tanks aft of the machinery is traversed by the tunnel, a huge circular tube admitting of access for examination of the shafting, and which is built on a system patented by the builders. A pump room is fitted at each end of the vessel, with one of the largest size of Snow pumps installed in each room, in connection with a system of pipes and valves by means of which the control of the entire operation of taking in or discharging a cargo of oil (or water ballast) can be performed, acting separately, or by the two pumps in conjunction. In the pump rooms are also placed the powerful steam fans, which are for the purpose of exhausting from the tanks the heavy and dangerous vapors which remain there after discharging their contents.

"The vessel has a fore-castle, bridge, and poop, connected the one with the other by a fore and aft

bridge, for use in heavy weather, and in these are provided on a most comfortable scale quarters respectively for crew, petty officers, captain, officers, and engineers. There are also provided wash rooms, workshop, and refrigerating chambers. A complete installation of electrical light is fitted by Messrs. McEwan, Clark & Co., of Edinburg and Glasgow, and with the object of preventing risk of fire, the ship is heated throughout the living quarters by steam. A system of overhead trolley railways has been provided for conveying of coal with minimum of labor to the stokehole from any part of the extensive range of bunkers, which aggregate a total capacity of 1,500 tons. Besides the compartments, which can be used for water ballast, a double bottom is provided under the machinery and large trimming ballast tanks at the extreme end of the vessel. Powerful steam windlass, winches, and steering gear are fitted. The propelling machinery, designed for a speed of 11 knots, and consisting of a set of triple expansion engines having cylinders 26 inches and 74 inches by 48 inch stroke, and three large single-stroke boilers, for a working pressure of 180 pounds, has been supplied by Messrs David Rowan & Co., Glasgow, Scotland.

BULK BARGES.

There are several bulk steamers, smaller, of course, than the ocean steamers, engaged in our coastwise domestic trade. But before either the ocean or coastwise steamers were put into service, many bulk barges were employed moving refined oil and naphtha about the seaboard harbors. This mode of transportation has grown in favor, and to-day, there is a large fleet of such barges, with their attendant steam tugs to furnish motive power, employed not only in harbors, but in the carrying trade for considerable distances along the coast and up the larger rivers. The barges are of wood or iron, some large enough to hold 500,000 gallons, the whole space of the hull being divided into tanks for the oil. Simpler in construction than bulk ocean steamers, they make it possible to move large quantities of oil with dispatch and economy.

Tank Cars.—The value of this mode of transportation became apparent in the early days of the petroleum industry; but in their construction, as in other branches of the business, there has been an evolution. The first cars consisted of two wooden tubs or vats of 2,000 gallons capacity each, set on an ordinary platform car. In 1872, horizontal cylinder tanks of iron were tried. Each held about 4,000 gallons. The size has gradually been increased by lengthening the cylinder and increasing its diameter until now many of the cars carry 8,000 gallons each. Cars holding this quantity are about thirty-two feet in length and six feet in diameter. The tank is made of quarter-inch steel and has on the top a dome, similar to a still dome, to care for the expansion of the oil. In the bottom of the car is an outlet valve with proper contrivances to admit of connecting lines through which to empty the tank. The total number of tank cars employed in the United States is between nine and ten thousand.

Tank Wagons.—The delivery of oil by tank wagons is extending the idea of bulk transportation to its farthest limits. The wisdom of carrying in this way the huge quantities, which a steamer or a train of tank cars convey for considerable distances, may be apparent; when the advantages of moving the smaller quantity which a tank wagon will hold, for the short trip it can make, may not be clear. That there must be economy or other advantages in this method of transportation is indicated by the strong foothold it has gained, as it is quite generally adopted in our larger cities and towns.

A tank wagon consists of a horizontal cylinder of steel of about three and one-half feet in diameter, and eight feet in length, mounted on four wheels similar to those used on heavy trucks. The capacity varies from 250 to 1,000 gallons; the large sizes being used in cities having paved, level streets; the smaller sizes, in the hilly outlying districts, or in sections where the trade is limited. A few of the larger wagons are rigged for three horses. Each tank has some sort of a man-hole on top, for the admission of the oil, and some one of the various designs of outlet cocks and measuring devices, for drawing out the oil. These, with the receptacle in the cans for carrying the oil into stores, the driver's seat, and, in fact, all of the minor features of the plan of the wagons, differ in different cities. In some places the wagons leave the oil at customers' houses, but usually are employed to supply the stores in which oil is sold.

RULES GOVERNING EXPORTS OF CRUDE PETROLEUM.

The rules governing transactions in this branch of the business are those of the New York Produce Exchange, contracts for shipments from Philadelphia as well as New York being made subject to them. We give below the rules that apply to crude petroleum —

"Crude petroleum shall be understood to be pure natural oil, neither steamed nor treated, free from water, sediment, or any adulteration, of the gravity of 43 degrees to 48 degrees Beaume.

"When crude petroleum is sold in bulk, the quantity shall be ascertained by tank measurement, at the time of delivery.

"Crude petroleum in barrels shall be sold by weight, at the rate of six and one-half pounds net to the gallon.

"In the absence of any stipulation, crude petroleum, when sold in barrels, shall be understood to mean, so far as regards packages, such packages as were originally refined petroleum barrels, whose last contents was crude petroleum, refined petroleum or naphtha.

"When contracts for crude petroleum call for second-hand refined petroleum barrels (i. e., barrels whose last contents has been refined petroleum or naphtha) the sellers shall have the privilege of substituting new barrels, but they shall be glued.

"The weighing and verification of crude petroleum shall be governed by the rules applicable thereto under the head of refined petroleum."

Rules Regulating Exports of Petroleum.—Con-

tracts for the sale of petroleum for export are made subject to the rules of the New York Produce Exchange. This is true of deliveries to be made from Philadelphia and Baltimore as well as from the port of New York. We append these rules as now in force.

"Refined petroleum shall be Standard White or better, with a burning test of 110° Fahrenheit or upward, and of a specific gravity not below 44° Beaume, United States Dispensatory Standard.

"The burning test of refined petroleum shall be determined by the use of the Saybolt Electric Instrument, and shall be operated in arriving at a result as follows: In 110° and upwards, the flashing points, after the first flash (which will generally occur between 90° and 95°), shall be taken at 95°, 100°, 104°, 108°, 110°, 112° and 115°.

"In 120° and upwards, after first flash, at 110°, 105°, 110°, 115°, 118°, 120°, 122° and 125°.

"In 130° and upwards, every five degrees until burning point is reached.

"When refined petroleum is sold in bulk, the quantity shall be ascertained by measurement on the decks of tank boats.

"Refined petroleum shall be delivered in blue, well-painted barrels, with white heads. Barrels shall be well glued and filled within one or two inches of the bung.

"Refined petroleum in barrels shall be sold by weight, at the rate of six and one-half pounds net to the gallon.

"The tares of refined petroleum in barrels shall be weighed by half pounds and gross weight by pounds.

"The gross weight of packages for refined petroleum shall be not less than 360 lbs., nor more than 415 lbs., and the actual gross weight shall be plainly marked thereon.

"Barrels shall be made of well-seasoned white oak timber, and shall be hooped not lighter than as follows: Either with six iron hoops, the headhoop 1¾ inches wide, No. 16 gauge English standard, the quarter hoop 1½ inches wide, No. 17 gauge, and the bilge hoop 1¾ inches wide, No. 16 gauge; or, with eight iron hoops, the head hoop 1¾ inches wide, No. 17 gauge, the collar hoop 1¼ inches wide, No. 17 gauge, the quarter hoop 1½ inches wide, No. 18 gauge, and the bilge hoop 1½ inches wide, No. 18 gauge. But all old barrels of which the gross weight is less than 395 lbs. may be hooped with six iron hoops 1½ inches wide, excepting the chime hoop, which shall be 1¾ inches wide.

"Buyers may test, at their own expense, the correctness of the gross weight, or gauge of the whole, or part of any lot delivered, and the average shortage found on a portion of not less than ten per cent. shall be taken as the average amount to be deducted from the lot.

"The tare shall be plainly marked upon each barrel before it is filled. Buyers may test the accuracy of the tare so marked to the extent of five per cent. of the lot, and the average difference between the tare thus ascertained, and the marked tare on the barrels tested shall be accepted as the average

difference on the entire lot. Any excess of tare so discovered shall be allowed buyer.

"Naphtha.—Naphtha shall be water white and sweet and of gravity of from 68° to 73° Baume.

"When naphtha is sold in bulk the quantity shall be ascertained by measurement on the decks of the tank boats.

"Naphtha in barrels shall be sold by weight, at the rate of five and three-quarter pounds net to the gallon.

"Barrels containing naphtha shall be painted blue with white heads, and be well glued.

"Naphtha shall be weighed, and may be tested by the buyer, as provided in the foregoing rules relating to refined petroleum.

"Residuum.—Residuum shall be understood to be the refuse from the distillation of crude petroleum, free from coke and water, and from any foreign impurities, and of gravity from 16° to 20° Baume.

"Residuum, when sold in barrels, shall be sold by weight at the rate of seven and one-half pounds net per gallon.

"Residuum shall be weighed, and may be tested by the buyer, as provided in the foregoing rules relating to refined petroleum.

"Empty Barrels.—Unless otherwise stipulated, empty barrels shall be understood to have last contained either refined petroleum or naphtha.

"Barrels shall be classified according to the use for which they are fitted, as follows:

"First-class shall include all barrels, which, if properly coopered, would be fit to carry refined petroleum or naphtha.

"Second-class shall include barrels which are unfit for refined petroleum or naphtha, but which would, if properly coopered, be fit for crude petroleum.

"Third-class shall include such barrels as are unfit for either crude, refined petroleum, or naphtha, but which can be used for residuum, if properly coopered.

"When barrels, which would otherwise be first-class, have been injured by sand, mould or water, they shall be placed in the second class.

"When barrels are sold as they run, the term 'as they run' shall be understood to refer to the condition as to the cooperage only.

"When barrels have been filled with crude petroleum, and steamed out after shipment to Europe, and used for refined oil, such packages shall be placed in the second class.

"All empty barrels must have six hoops, and be delivered in form, shooks or staves not being a good delivery.

"On re-inspection of rejected barrels, the buyer must receive the pay for such rejections as of the class designated by the inspector, and pay inspection on such as he decides were improperly rejected.

"Contracts and Deliveries.—All deliveries and contracts for delivery of petroleum and its products, under these rules, shall be of the production of the United States, unless otherwise specified, but refined petroleum made from crude oil of the district known as 'Lima' or oil made from crude oil of a similar quality or character, shall be excluded.

"All settlements of contracts for refined petroleum and naphtha shall be on the following basis: In barrels on 50 gallons; in bulk on 45 gallons. All settlements of contracts for crude petroleum shall be on the following basis: In barrels on 48 gallons; in bulk on 42 gallons.

"All cooperage shall be in prime shipping order. Tar and pitch barrels shall be excluded, except for residuum.

"Deliveries of petroleum and its products, sold in bulk, shall be made in yard, at refinery, or warehouse, free of expense to lighter, quality to be approved in the tank at the time of delivery.

"Deliveries of petroleum and its products, in barrels, shall be made in yard, at refinery, or warehouse, where sea-going vessels can load, or, if not, sellers to pay lighterage to vessel.

"The words, 'yard where sea-going vessels can load,' shall be understood to mean a yard at which vessels of at least 4,500 barrels capacity can complete loading.

"The presentation of an invoice, weigher's or gauger's return, a certificate of inspection of the oil, together with an accepted order on the warehouse, yard or refinery, shall constitute a delivery.

"No weigher's or gauger's return or certificate of inspection dated more than four secular days previous to the time of delivery shall be valid, and the said returns shall be verified on oath or affirmation when required.

"Petroleum and its products shall be held for three days from noon of the date of delivery order, free of storage and insurance. The party issuing the delivery order shall keep the goods covered by insurance during the three days; it being understood, however, that the responsibility of the said party shall only extend to due care in providing insurance, and not to any failure on the part of the underwriters to pay losses which may be sustained.

"Cargo contracts shall specify dates between which the vessels shall be ready for cargo, and also number of lay days vessels will have to load, and the term 'suitable to vessel' is hereby declared to have no reference to the time when vessels shall be ready, but to imply that when ready sellers shall deliver and buyers receive in such quantities that the vessel may be loaded in the specified lay days.

"If a vessel is not ready to receive her cargo on or within specified dates, a written notice to the buyers from the sellers on or before the latest named date that they are prepared to deliver as per contract, shall be considered a delivery, so far as maintaining to the sellers all their rights in the contract, and the sellers may commence delivering any time thereafter on one day's notice, and may deliver until completed such approximate quantity per day as would serve to fill the vessel in the stipulated lay days.

"When goods are delivered to vessel by buyer's orders the acceptance of them by buyer's inspector shall be an acknowledgment that the goods are in accordance with the contract.

"When petroleum or its products are delivered to vessel by buyer's directions, the seller's risk shall

end upon delivering goods to the ship's tackle, and the seller may require evidence from the buyer that the goods are actually covered by insurance until paid for.

"When the capacity of the vessel exceeds or falls short of the amount specified in the contract, including the margin, then the specified amount shall be delivered. In determining the capacity of the vessel, barrels of fifty net gallons capacity in case of refined petroleum and naphtha, barrels of 48 net gallons capacity in case of crude petroleum, and barrels of 45 net gallons capacity in case of residuum, shall be the basis for settlement.

"On option contracts, when not otherwise stipulated, it shall be understood that ten days' notice shall be given, five of which shall be within the delivery time specified. When the 'flat' is used, it shall be understood to mean without notice.

"All deliveries shall be made before 5 o'clock P. M. Parties making original deliveries from warehouse or refinery, shall do so before 4 o'clock P. M.

"Each party to whom delivery is made on an option contract, and who intends to deliver the same out again on an option contract, shall note on the delivery order for memorandum attached thereto the time when received, and shall deliver the same out again within fifteen minutes. Parties having oil to receive, and which they intend to deliver out again on an option contract, but who are prevented from so doing by lack of time, shall make delivery by 10 A. M. of the next business day, and each party receiving on the extended delivery day shall note the time and deliver out as above specified. No delivery shall be allowed beyond 12 M. on the delivery day so extended. Parties holding delivery orders of memorandums over fifteen minutes, except for cause acceptable to the Committee on Petroleum, shall be liable to the party injured by such unjust detention to the extent of the damage.

"Payments for all deliveries made before 3 o'clock P. M., shall be in legal tenders or certified checks. Parties making deliveries after 3 P. M. cannot demand legal tenders or certified checks; such deliveries, however, will be good if made in conformity with rule, but without delivery order. Payments which are extended by reason of delivery after 3 P. M. shall be made as provided above before 12 M. of the next business day.

"When calls are made on option contracts, the original call shall be made by 10 o'clock in the morning, and parties on whom the call is made shall note on the call the time it was received; and if they recall on account of it, they shall do so within thirty minutes.

"When contracts mature on a Sunday or legal holiday, deliveries shall be made on the preceding business day.

"Contracts for the delivery of petroleum or its products may be assigned, and the assignee shall succeed to all the rights of the assignor.

"All assignees of such contracts shall be bound by the obligations of the original contracts.

"In case any party holding a contract for petroleum or its products shall become insolvent, then all

such contracts held by such party shall become due immediately, and shall be settled by the parties in interest at the market price of the day when such insolvency occurs, for the deliveries stipulated in the contracts, less the customary brokerage. All assignments of contracts made in contemplation of, or after, insolvency, shall be void.

"Nothing contained in these rules shall be constrained to prevent either of the original contracting parties from making delivery to or claiming delivery from the other party to the contract, but such delivery shall in no way otherwise invalidate the rights of any assignee of such contract. In case, however, a contract has been assigned, and either of the original contracting parties shall become insolvent, the other party to the contract may, at any time before the maturity of the contract, demand a sufficient margin from the assignee to make the contract good at the market price of the day for the delivery stipulated in the contract, and the party calling the margin shall put up an equal amount. Both margins shall be deposited in such trust company as shall be agreed upon, and such margins shall be kept good. If the demand for margin under this rule be not complied with within twenty-four hours after said demand, it shall then or thereafter be at the option of the aforesaid party to the contract to cancel the same, and settlement shall be made at the market price of the day next following such demand, for the delivery stipulated in the contract, less the customary brokerage.

"INSPECTION."

"Buyers shall have the right of naming their inspector, but shall do so at least five days before the maturity of the contract, failing in which the sellers may employ, at buyer's expense, any regular petroleum inspector approved by the Committee on Petroleum, and his certificate that the oil is in conformity with the contract shall be accepted. On a contract for prompt delivery, or where no notice is required, buyers shall name their inspector when contract is executed, otherwise sellers may appoint the inspector at buyer's expense.

"It shall be the duty of the inspector to promptly inspect all goods entered, and in case of rejection, to notify the seller immediately, to the end that he may be able to fill the contract by replacing the rejected goods.

"In case of dispute between buyer's inspector and the seller, in consequence of the rejection of goods, the seller shall have the right to name an inspector, and if the two cannot agree they shall name a third inspector as umpire, and a majority of the three shall decide the case, and render it incumbent upon the umpire to give a certificate in the regular form, without reference to the dispute. Inspectors to whom such dispute is referred shall have held uninterrupted license from the New York Produce Exchange for at least two years.

"Inspectors shall have the right to require barrels to be filled with refined petroleum at least twelve hours before the goods are tendered for inspection.

GENERAL RULES.

The forms of contracts hereto annexed are hereby made part of these rules, and when not otherwise stipulated, it will be understood that negotiations are based upon them.

"Washed or fictitious, sales are positively forbidden.

"Any disputes arising on contracts for petroleum and its products to be delivered in Philadelphia or Baltimore shall be adjusted by these rules.

"All transactions in petroleum and its products among members of the New York Exchange shall be governed by the above rules, but nothing therein contained shall be construed as interfering in any way with the rights of members to make such special contracts or conditions as they may desire."

We give below the form of contract for sales of refined oil in bulk and in barrels, as showing the general form of all these contracts:

CONTRACT FOR REFINED OIL IN BULK.

NEW YORK, Feb. 1, 1905.

Sold for account of Mr. Samuel Barr,

To Mr. George Carr, 50,000 gallons of refined petroleum in bulk, color, to be standard white, or better, burning test 110 degrees Fahrenheit, or upward, at 5½ cents per gallon, cash on delivery. To be delivered in yard at Erie, Pa., option as to time of delivery during the next ten days.

Subject to the rules of the New York Produce Exchange.

Brokerage ½ of one per cent. by seller.

JOHN DOUGH,
Broker.

OPTION CONTRACT FOR REFINED OIL IN BARRELS.

NEW YORK, Jan. 26, 1905.

Sold for account of Mr. Hugh McIntire,

To Mr. Charles Jones, 1,000 barrels, 100 per cent., more or less, refined petroleum. Color to be standard white, or better. Burning test 110 degrees Fahrenheit, or upward, at 6 cents per gallon, cash on delivery, in yard suitable to vessel. Vessel to be ready not earlier than the first Wednesday of February, 1905, nor later than the first Saturday of February, 1905, with two days to load.

Subject to the rules of the New York Produce Exchange.

Brokerage ½ of one per cent. by seller.

PETER MONEYMAKER,
Broker.

It may be well to add that the 44° gravity, Baume, United States Dispensatory standard, mentioned in these rules, corresponds to .8045 real specific gravity. Reference is made to Standard White color. There are three grades of color recognized in export shipments—Standard White (straw color), Water White (colorless), and a shade of color intermediate be-

tween the two, called Prime White. One of the rules speaks of 110° fire test. This means an oil which does not ignite when raised to this temperature in a testing apparatus which we will describe later, and a spark of fire, by means either of a burning splinter of wood, a burning piece of string, a little lamp or gas jet, or electricity, is applied to it. When no other test is designated in a contract 110° test is implied. But many countries have their own laws to regulate the test of the oil that can be legally used, and these laws generally prescribe the means for ascertaining the test. For example, England has fixed a minimum limit in the flash at 73° Fahrenheit, on an instrument devised by the eminent chemist, Sir Frederick Abel, with the aid of Dr. W. Kellner, assistant chemist of the English War Department. The test is to be found in the manner carefully outlined by the law, to be explained more fully in our section on modes of testing. Germany has a different test, with a minimum of flash at 21° on the Celsius scale or centigrade division of the thermometer, corresponding practically to 70° Fahrenheit, their own instrument to be used. In preparing oil for shipment to any country an effort is always made to have it comply with the legal requirements in regard to test, the oil being examined according to the mode of testing prescribed by that country.

State Laws Regulating the Sale of Petroleum Products.—The Legislatures of nearly all the States of the Union have enacted some restrictions on the manufacture and sale of oils. These show a wide divergence as regards the mode of examination and the test prescribed. It is not our intention to review this confused condition of legislation. The law in our State is that of May 15, 1874 (P. L. 189). It is, perhaps, as simple and satisfactory as any. It fixes a fire test limit of not less than 110° Fahrenheit for any illuminating product, such fire test to be ascertained on the Tagliabue cup, or the instrument that may be used by the inspectors of export oil. We append a copy of the law:

PENNSYLVANIA STATE LAWS FOR PETROLEUM.

(P. L. 189, May 15, 1874).

1. No refined petroleum, kerosene, naphtha, benzole, gasoline, or any fluid, be they designated by whatsoever name, the fire-test of which shall be less than 110 degrees Fahrenheit, shall be sold or offered for sale as an illuminator for consumption, within the limits of the Commonwealth of Pennsylvania.

2. Said fire-test shall be determined by an inspector appointed under the provisions of this act, who shall use Tagliabue's or such other well-defined instrument as may be used by the inspectors of export oil, according to the following formula: Heat with alcohol small flame; when thermometer indicates ninety degrees remove lamp; at ninety-five try for a flash, with small bead of fire on end of string, held within a quarter of an inch of surface of oil; replace lamp and work oil up gradually from this point until the burning point is reached, removing lamp every four degrees, and allowing oil to run up three degrees

before replacing lamp, flashing oil each time, just before lamp is replaced, until result is attained.

3. The said inspector shall be appointed by the Courts of Common Pleas, one in each county in the commonwealth, wherein said burning oil or fluids as before mentioned, are manufactured: *Provided*, That in any county where there shall be more than one Court of Common Pleas, the said appointments shall be made by Court No. 1, in said counties, and in any county wherein is situated a city of more than three hundred thousand inhabitants, in such case in lieu of Court No. 1, the appointment of inspector shall be made by the Mayor of said city.

4. The said inspectors shall hold their office for the term of three years, unless sooner removed by the appointing power, for incompetency, or found guilty under the provisions of this act; vacancies in said office to be filled by the authority in which the appointing power is vested by this section. The said inspectors shall be authorized to appoint such clerks or deputies as they may find requisite for the carrying out of the duties specified under this act; the said clerks and deputies shall be paid out of the fees of the office, by the inspector of the county wherein the service is performed; all clerks and deputies are held answerable by this act, and subject to the same penalties for violating any of its provisions as are provided in this act for the punishment of the appointed inspectors. Each inspector, deputy or clerk, after receiving his appointment, and prior to entering upon the duties of the office for which he is appointed, shall file in the office of the prothonotary of the Court of Common Pleas, an oath or affirmation that he will well and truly perform the duties of his office and carry out the provisions of this act, and said inspectors shall also file a bond, with one or more approved securities, in style similar to that of the sheriff of the county, in the penal sum of ten thousand dollars, for the faithful performance of the duties of said inspector's office, as provided in this act. The said inspector is hereby empowered to receive and collect from the manufacturer or owner the sum of 20 cents per package for each package inspected in any lot under ten; ten cents per package for each package inspected, in any lot not more than fifty; seven cents per package for each package inspected, in any lot or all lots over fifty; and one dollar for each car of bulk refined oil; and in any case any person shall call upon said inspector to inspect one package of refined oil, he shall charge said person for each inspection fifty cents. The said inspector shall provide at his own cost, stencils for the purpose of branding packages, to read thus: "State of Pennsylvania, fire-test one hundred and ten degrees," with name of inspector: *Provided*, When oil so inspected shall stand higher test, the inspector shall designate such actual test by his brand.

5. The said inspector, or his clerks or deputies, shall and are hereby empowered to enter any place or building where oil or fluids, as before designated in this act, are manufactured, kept in store for sale or consumption, in this commonwealth, and in such counties where oil is sold and not manufactured, for which no inspector has been appointed, or in any other place within the limits of this State, wherein he has

reason for believing that oil is being kept or sold contrary to the provisions of this act, for the purpose of carrying out the true intent and meaning of this act, any inspector shall have the privilege to re-inspect, and is hereby empowered to inspect any oil, as hereinbefore designated in Section First, which he may, by any reason believe to be under fire test, and if so found by him to be under fire test and falsely branded, he shall prosecute or cause to be prosecuted the offender, as herein authorized in Section Four of this act; no charge shall be made for re-inspection.

6. Any person violating any of the provisions of this act shall, upon conviction thereof, be deemed guilty of a misdemeanor, and shall be subject to a fine of not less than two hundred and fifty (\$250) dollars, nor more than five hundred (\$500) dollars, or imprisonment not less than one year, or both, at the discretion of the Court, one-half of said fine to go to the prosecutor and one-half to the school fund in the district where such misdemeanor may have been committed. Also, if any person shall sustain damage to his property or injury to his person, by reason of a violation of any of the provisions of this act by another person, the person guilty of said violation shall be held liable to the person injured for all damages sustained thereby.

7. All the oils or fluids subject to inspection under this act that may be found in the hands of those who sell in less quantities than one barrel, with a fraudulent brand or mark of inspection, or found to have been adulterated or not coming up to the fire test, as the mark of inspection would indicate, shall be subject to seizure by the said inspector, and the same shall, after ten days' public notice, be sold solely for re-distillation, the proceeds of such sale, after deducting the necessary expenses of sale and seizure, shall one-half be given to the public school fund wherever the seizure was made, and one-half to the informer.

8. Any inspector or deputy appointed under this act, who shall violate any of its provisions, by neglecting to inspect upon request, or shall falsely brand any oil or fluid, shall be deemed guilty of a misdemeanor, and upon conviction thereof, shall be fined not less than two hundred and fifty (\$250) dollars, nor more than one thousand (\$1,000) dollars, and be subject to imprisonment for not less than three months or more than one year, or both, subject to the discretion of the Court, one-half of the fine to go to the informer, and one-half to the school fund of the district wherein the offense was committed.

9. The packages containing oil manufactured for export shall be branded with a stencil by the manufacturer with the words "for export," all benzine, naphtha or any hydro-carbons, created in the manufacture of refined oil from crude petroleum, or otherwise manufactured, shall be inspected and branded "Benzine," and shall not be kept for sale or used in any way for giving light to be burned in lamps, and this act shall not be construed to prohibit their use in making gas to be conveyed through pipes to burners similar to gas in city gas works, to be used for the same purpose, and further the penalties for violating this section shall be the same as applied to the use of refined oil below legal test.

10. Nothing contained in this act shall be construed or held to apply in any manner, to any kind of oil or fluid manufactured for export from this State, or in transit from one State to another through the limits of this commonwealth.

11. Any person or persons who shall sell or cause to be sold any barrel or package, or who shall refill the same without first removing the brand of the inspector, shall be liable to a fine of three hundred dollars for every barrel or package sold or delivered or refilled, said fines shall be recoverable as other fines of like character are recoverable by law, and one-half shall go to the informer, and one-half to the school fund of the district in which the offense was committed.

MODES OF TESTING PETROLEUM PRODUCTS.

REFINED OIL—LUBRICATING OILS—PARAFFINE WAX.

Refined Oils.—In addition to an inspection for color, which is a simple examination by the eye, refined oils are subjected to two tests, one to ascertain their specific gravity and the other to determine their fire test. The lines of demarkation between oil and naphtha, the product from crude lighter than oil, on the one hand, and between oil and residuum, the product heavier than oil, on the other, is, as has been seen, a purely arbitrary one. It has also been seen that it is not practicable to make oil absolutely free from the volatile elements of the crude called naphtha, or the heavier elements that should be left in the still as residuum. The presence of too large a proportion of the former renders the oil unsafe for illuminating purposes, as these lighter hydro-carbons vaporize at temperatures so low that the lamp may become filled with gas and an explosion follows. The presence of too large a proportion of the heavier elements injures the illuminating properties of the oil by preventing it from burning freely. The specific gravity test aims to show the density of the oil, and so to indicate, in a general way, the quality of the heavier hydro-carbons it contains.

Gravity.—To make a test for gravity, a tall glass jar is filled with the oil and a combined hydrometer and thermometer is immersed in it. The hydrometer, which is graded according to the Baume scale, registers the gravity, and the thermometer indicates the temperature of the oil. Standards for gravity require the oil to be at 60° temperature when tested, but carefully prepared tables have been made for correcting the hydrometer reading to a 60° temperature basis, so that the gravity can be ascertained quickly with the oil at temperatures both above and below 60°. We give, among our statistics on petroleum products, a table showing the corresponding real specific gravity and the weight of one gallon of oil for each degree of the Baume hydrometer. In the absence of a table, however, Baume can be easily converted into real specific gravity, by dividing 140 by 130, plus the degree indicated on the Baume scale.

Flash and Fire Tests.—The test for gravity is of but little moment in comparison with that to ascertain

the fire test of oil. Upon it the public have to depend for a guarantee that the product can be used for illuminating purposes with safety. Proper methods and sufficient care should be employed in manufacture to insure, in the finished product, the absence of the more volatile hydro-carbons, which are vaporized at low temperatures, and may form an inflammable atmosphere in the oil reservoir of lamps. According to the axiom of Dr. F. H. Chandler, of the Columbia College School of Mines, "No lamp is safe with dangerous oil and every lamp is safe with safe oil." This does not necessarily mean the establishment of a high test requirement that will be burdensome, both to the manufacturers by restricting their yield to too narrow limits, and, at the same time, to the consumers, it being a well known fact that, as the test is raised, oil proves less satisfactory as an illuminant, specially constructed lamps being required to make very high products burn at all. There is needed, simply, a test that will detect the presence of the easily volatilized elements, which unscrupulous refiners sometimes leave in their burning oil to cover up defects in manufacture. As low a fire test requirement as comes within the limit of safety, rigorously enforced, is all that is needed to accomplish this end.

While considering this topic of safety we cannot forbear to quote a paragraph from an article by Mr. Boverton Redwood, the secretary of the London Petroleum Association, and their inspector, who was the associate of Sir Frederick Abel in the most thorough investigation of the subject made in England before the adoption of the admirable law now in force. That the same conclusion has been reached by every scientific study of the question, is reassuring to the people of Pennsylvania, to whom the petroleum industry is so important:

"There are probably no grounds for supposing that petroleum oil constitutes a dangerous article in the ordinary stock of an oilman. On the contrary, there is a good deal of evidence in support of the opposite view. Thus, to take one instance only, in the case of one of the most recent fires at an oilman's shop almost the only portion of the contents of the shop which had escaped destruction were three barrels of petroleum oil, constituting, according to the evidence given, the whole stock of this material on the premises at the time of the fire. These barrels were a good deal charred, but still held a considerable quantity of oil. Petroleum is, in fact, a far less dangerous liquid than is commonly supposed, as was pointed out some years ago, and again last year, by Sir Frederick Abel in lectures at the Royal Institution. Statistics show that the destruction of petroleum-laden ships by fire is very rare, and at least one case is on record where a vessel carrying petroleum having been set on fire by lightning, the fire was extinguished and the cargo brought safely into port. Many barrels discharged from the vessel in question bore evidences of the heat to which they had been subjected, being in some cases so much charred that a penknife blade could be driven through the staves, and yet these barrels still held the oil intact."

When oil is heated, vapors are thrown off, and, being heavier than air, they do not rise far from the surface of the oil under test. On passing a light over this

surface, as the temperature of the oil is raised, there will first appear what the English Petroleum Act of 1862 describes as a "pale blue flicker or flash," caused by the vapor igniting and burning off from the surface of the oil. The temperature of the oil when this first occurs, is called its "flash test" or "flashing point." As the temperature rises still further, a point is reached at which the oil itself takes fire on the application of a lighted taper. This is called its "burning point" or "fire test." Ignition is always preceded by a flash, but the difference in temperature between the points of flash and burning varies according to the grade of oil and its mode of manufacture. It will be clear from this description that at neither of these temperatures would the oil ignite in spontaneous combustion, as a light is required to secure even the flash referred to. Spontaneous combustion will not take place until the oil has been heated to at least 300 degrees higher than the technical "burning point" prescribed by our State law. Testers soon found that the flash and burning points were affected by the manner in which the oil was heated, by the size of the light applied to the surface, and by many other features of the test, if the details were left to the discretion of the operator. It was necessary either to outline with great minuteness every step in the test, or invent an instrument that would do the work mechanically, and, therefore, always uniformly. Modern testing cups aim to do this. The instruments have been improved, and modes of testing made more uniform. The old method of passing a burning splinter of wood or a bead of fire on the end of a string across the surface of the oil, has been supplanted by mechanical devices which carry the flame of a little lamp near to the oil, or by the use of an electric spark.

The apparatus adopted by the New York Produce Exchange is that known as the Saybolt Electric Tester, which has been in use since 1879. It is much like the Tagliabue cup; but uses an electric spark instead of a burning splinter of wood to communicate the fire to the vapor. A copper water bath, heated by a spirit lamp or gas jet, has set in its top a glass petroleum holder. A thermometer is held in place in the water bath, and another in the oil, while a clever device throws an electric spark across the surface of the oil whenever desired. The water bath is filled and heated to 100° Fahrenheit, and the lamp removed. The oil cup is filled to within one-eighth of an inch of its top, and placed in the bath. When the temperature of the oil reaches 90° an electric spark is sent across it. The lamp is then replaced under the water bath and the spark applied when the temperature of the oil is 95°, and again when it is 100°, 104°, 108°, 112°, and 115°, or until the oil flashes. The cup prescribed by our State law is the Tagliabue open cup, which is about the same as the Saybolt cup, except that a lighted taper, instead of an electric spark, is used—the objective point being that at which the oil itself ignites.

Undoubtedly the test most widely employed the world over is that of Sir Frederick Abel adopted by the English Parliament, August 11, 1879. The specifications of the apparatus as described minutely in the law are briefly as follows:

A cylindrical cup of gun metal or brass, tinned inside, 2 inches in diameter and 2.2 inches high, provided with a close-fitting, overlapping brass cover which carries the thermometer and test lamp, is suspended in a bath or heating vessel consisting of two flat-bottom copper cylinders—the inner one 3 inches in diameter and 2½ inches high, the outer one 5½ inches in diameter and 5¾ inches high—the smaller set inside of the larger, and the space between them filled with water. The oil cup, therefore, is surrounded by an air space of one-half inch, heated by a water bath; which, in turn, surrounds it. A copper cylinder or jacket, 6½ inches in diameter, surrounds the water bath. A thermometer is provided for the water bath and another for the oil. The light for testing is furnished by a little lamp, supported on the cover of the oil cup in such a way that, as a slide is removed—uncovering a square hole in the cover of the cup—it is tilted so as to bring the flame just below the cover, returning to its original position as the slide is moved back. Near the lamp is a little bead, the dimensions of which represent the size of the test flame to be used. Where gas is to be obtained the oil lamp is to be replaced by a gas flame; but the size of the flame, is still to be regulated by the standard bead. The temperature of the water bath is brought to 130°, and the lamp used for heating is withdrawn. The oil cup is then filled to within one-half inch of the top with oil at 60° temperature, and placed in position. When the oil reaches 66° the operation of testing is commenced; the test flame being applied once for every rise of one degree. This is done by slowly drawing open the slide—and closing during a fourth oscillation; the movement of the slide swinging the light of the testing lamp below the cover of the oil cup, as described above.

Lubricating Oils.—In addition to tests for gravity, flash and burning points—which are made in ways somewhat similar to the tests applied to the refined oil—lubricating oils are subjected to two other tests; to determine their "viscosity" and their "cold test." By the former it is claimed that the lubricating properties of the oil can be, to a large extent, determined. It shows its viscosity or glutinous quality. The test is made by noting the length of time occupied by a given quantity of the oil in flowing through a small orifice of prescribed dimensions and form, at a given temperature; the longer the time required the greater the viscosity.

By cold test is meant the temperature at which the oil thickens or becomes cloudy or ceases to flow because of the crystallization of the paraffine it contains. The test is usually made by slowly cooling the oil in a small tube, or long bottle about 5½ inches in length and 1½ inches in diameter, in which a thermometer is inserted to note the temperature at which the oil no longer flows when the bottle or tube is inclined, or the temperature at which deposition of paraffine commences.

Paraffine Wax.—This is subjected to two tests, one to ascertain the amount of oil left in it, and the other to determine its melting point. The former test is applied by noting the loss in weight of a given quantity of wax when subjected to a specified pressure for a

certain length of time. By melting point is meant the temperature at which the wax after being melted begins to solidify on cooling. A thermometer is inserted in the melted wax and used to gently agitate it until a film of the crystallizing point appears. The temperature is noted as the so-called melting point of the wax.

HISTORY OF THE INVENTION AND MANUFACTURE OF IRON PIPE.

William Smith, an iron moulder of Pittsburg, Pa., invented the first iron pipe ever made in the world, in 1843. Mr. Smith named his foundry the National Pipe Works.

The American Wrought Iron Oil and Natural Gas Line pipe, Tubing, Casing and Drive Pipe for oil and

gas wells and transporting oil and natural gas are specially made of lap-welded wrought iron of selected material, tested to 2,000 pounds before leaving the mills, and are known in the trade as oil line pipes. The lengths are from 18 to 24 feet long, and are made in sizes as follows: 2, 2½, 3, 3½, 4, 4¼, 4⅞, 5, 5 3-16, 5¼, 5½, 5⅝, 6, 6 3-16, 6¼, 6½, 6⅞, 7, 7½, 7⅞, 8, 8¼, 8½, 9, 10, 11, 12, 13, 14, 15, 16, 18, 20, 30 and 32 inches in diameter, and are fitted at one end with a coarse and sharp-cut taper thread, from 8 to 11 to the inch, while the other end is supplied with a collar called a socket, thimble or coupling.

Mr. William Childs, Jr., secured a United States patent in 1854 for the invention of making wrought iron pipe with welded seams.

The Boston Tube Works, of Boston, Mass., made the first butt and lap weld tubing, casing, drive pipe and line pipe for oil and gas wells.

The Beginning and Rise of the Standard Oil Co.

In the year of 1858 two young men, Morris B. Clark and John D. Rockefeller, of Cleveland, Ohio, started a small commission store on Merwin street, foot of Superior street, and the Cuyahoga river dock at Cleveland, Ohio. Their business was carried on in a very modest way and on a small scale until the year 1863, when a gentleman from Oil Creek, Pa., Samuel Andrews by name, and an oil refiner by profession, called at the commission house and induced Messrs. Clark and Rockefeller to organize a joint company to refine crude oil at Cleveland. Messrs. Clark and Rockefeller, as commission merchants, were handling refined oil, and this induced them to form a partnership in a small crude oil refinery, with Samuel Andrews. Their first refinery was built at the mouth of Kingsbury Run, Cuyahoga river, one mile from where it empties into Lake Erie, at Cleveland, Ohio, and was known as the Clark, Rockefeller & Andrews Crude Oil Refinery. The capacity of the first refinery when completed was found to be ten barrels of refined oil each day, and only one grade of oil was refined under the Andrews process from crude oil. Because of the fact that they only had one grade the firm gave it the name of Standard Oil 120° fire test. From time to time new tanks and stills were added to the little refinery, until the firm had over \$100,000 invested in the refinery, and at the same time a number of other refineries were built or were building in and around Cleveland, and in 1865 Cleveland was the largest refining center in the world, with twenty refineries, with a capacity of 9,000 barrels of refined oil a day. This was the year the several refiners began cutting prices in refined oil to get a market for their product. At that date lamps were not universally used, and more oil was refined than was consumed. Clark and Rockefeller, as commission merchants, had a number of regular customers who bought a regular amount of refined oil each day, but as the other refiners were cutting on the price of refined oil, Clark and Rockefeller had to reduce the price on their oil to keep their customers. This discouraged Mr. Clark but Mr. Rockefeller had a different view of the matter, and he used to argue that if new markets could be opened up it would create a greater demand for the refined oil, and as an evidence of this belief he sold his interest in the commission business to Mr. Clark, and in return bought Mr. Clark's interest in the refinery. The firm's name was then changed in the refinery to Rockefeller & Andrews. In the new firm Mr. Andrews attended to the refining, while Mr. Rockefeller attended to the buying and selling of the oil. From the beginning his effect on the business was tremendous. His motto was save and not waste. He owned his own teams and he himself went to the wells

on Oil Creek and bought the oil and had his teams to haul the oil to the nearest railroad point, and then shipped it by rail to the refinery at Cleveland, Ohio. By this method he did away with the middle man and speculator. He made his own oil barrels, and painted them blue with white heads and black lettering. He found a regular market for their refined and heavy, or lubricating oil, and he found a use and sale for the residuum, or still tar that the other refiners burned up or let go to waste in the run. He watched the new improvements made in the refineries and the developments made on Oil Creek. John D. Rockefeller was a very shrewd buyer of crude oil, a great financier, an expert in selling their oils and ever ready to adopt new and better methods of handling the oil, and Mr. Andrews was recognized as the best refiner.

These qualities were the success of the firm, which grew rich, and started a second and larger refinery. They added a new member to the firm, Dr. William Rockefeller, a brother of John D. Rockefeller. The second refinery went under the firm name of William Rockefeller & Co. The firm, with two refineries, then took in a new partner in the person of Henry M. Flagler, who was assigned to the purchasing branch, which was known on Oil Creek in 1868 as Rockefeller, Andrews & Flagler Company, and in 1869 Henry M. Flagler was placed at the head of the company's house, which they were about to open in New York for the sale of their oils.

From 1868 to 1870 the competition and cutting in the price of refined oil was so great that there was little profit in oil after the freight was paid. At the same time the Pennsylvania Railroad Company, who believed they had a patent right over all the territory of the State of Pennsylvania for the passenger and freight carrying traffic, gave John D. Rockefeller and his associates a rebate on all the oil they shipped on their road. This was done to drive the Atlantic & Great Western (Erie) road and the Lake Shore & Michigan Southern railroad out of the oil regions of Pennsylvania, and in a short time the Pennsylvania and the Atlantic & Great Western (Erie) railroads gave John D. Rockefeller and his associates a large rebate for all their oil, crude and refined, to Cleveland, Ohio, Philadelphia, Pa., New York and other points, shipped by rail or water, by them. The Lake Shore & Michigan Southern Railroad was cut off from carrying oil for the Rockefeller interests, owing to the fact that they would not give as good a rebate as the Pennsylvania and Erie railroads.

Mr. Rockefeller and his partners had as much right to ask for rebates from the railroads carrying their oil as people have to ask for and expect excursion rates for

ten or more persons traveling to a certain point or place, or as much right as people marketing or shopping have the right to price goods and if not satisfied with the prices at one place to go elsewhere. This was the case with Mr. Rockefeller and his partners. If they could not secure the rebate from one railroad they would go to another, and agree to give the railroad a number of barrels of oil to haul to certain points each and every day at a fixed rate, with a return rebate. It was all right and proper for Mr. Rockefeller and his partners to ask for a rebate, but it was unlawful for the railroads to grant it. The railroads were granted charters as common carriers, and were not to discriminate between shippers in railroad carrying rates. Rockefeller, Andrews & Flagler got to be very large shippers of oil to the seaboard. The Lake Shore & Michigan Southern railroad officials asked for part of their traffic, but before this was done a meeting was held between John D. Rockefeller, representing Rockefeller, Andrews & Flagler, and William H. Vanderbilt, representing the Lake Shore & Michigan Southern (New York Central & Hudson River railroad). A shipping rate was agreed on at that time.

John D. Rockefeller was the president and adviser of all the concerns he was interested in, and on January 1, 1870, he combined all his companies into one, the Standard Oil Company, which was incorporated under the laws of the State of Ohio. January 10, 1870, with an authorized capital stock of \$1,000,000. On February 10, 1872, the Standard's capital was increased to \$2,500,000. The incorporators were John D. Rockefeller, Henry M. Flagler and Samuel Andrews, Stevenson V. Harkness and William Rockefeller. Through the agreement with the New York Central railroad and the Standard interests, the Pennsylvania and Atlantic & Great Western (Eric) railroads lost the Standard Oil Company's carrying traffic. This led Thomas A. Scott, vice president of the Pennsylvania Railroad Company, to suggest to John D. Rockefeller to purchase the South Improvement Company charter, and have the three leading railroads in the Oil Creek oil regions agree to a division of the traffic and raise the carrying rates to other shippers.

Following is a true and correct copy of the charter of the South Improvement Company:

CHARTER OF THE SOUTH IMPROVEMENT COMPANY.

An Act to incorporate the South Improvement Co.

Section 1. Be it enacted by the Senate and House of Representatives of the Commonwealth of Pennsylvania, in General Assembly met, and it is hereby enacted by the authority of the same, That S. S. Moon, R. D. Barclay, John A. Fowler, or a majority of them, their associates, successors, and assigns, be, and they are hereby authorized and empowered to form and be a body corporate, to be known as the South Improvement Company, which shall be, and is hereby, vested with all the powers, privileges, duties, and obligations conferred upon the act to incorporate the South Improvement Company, by the act of the Legislature of Pennsylvania, approved the 7th day of April A. D., 1870, and the supplement thereto, and by that name, style and title shall have perpetual succession and all the

privileges, franchises and immunities incident to a corporation; may sue, and be sued, implead and be impleaded, complain and defend in all courts of law and equity, of record and otherwise; may purchase, receive, hold, and enjoy, to them, their successors, and assigns, all such lands, tenements, and leaseholds, estates and hereditaments, goods and chattels, securities and estates, real, personal and mixed, of what kind and quality soever, as may be necessary to erect depots, engine houses, tracks, shops, and other purposes of said corporation, as hereafter defined by the second section of this act, and the same from time to time may sell, convey, mortgage, encumber, charge, pledge, grant, lease, sublease, alien and dispose of, and also make and have a common seal, and the same to alter and renew at pleasure, and ordain, establish and put in execution such by-laws or ordinances, rules and regulations as may be necessary or convenient for the government of the said corporation, not being contrary to the constitution and laws of this commonwealth, and generally may do all and singular the matters and things which to them shall appertain to do for the well being of the said corporation and the management and ordering of the affairs and business of the same;

Provided, That nothing herein contained shall be so construed as to give to the said corporation any banking privileges or franchises or the privilege of issuing their obligations as money.

Section 2. That the corporation hereby created shall have power to contract with any person or persons, firms, corporations, or any other party, howsoever formed, existing, or that may hereafter exist, in any way that said parties, or any of them may have authority to do, to build, construct, maintain, or manage any work or works, public or private, which may tend or be designed to include, increase, facilitate, or develop trade, travel, or the transportation or conveyance of freight, live stock, passengers, or any trade traffic, by land or water, from or to any part of the United States or the Territories thereof; and the said company shall also have power and authority to supply or furnish all needful materials, labor, implements, instruments and fixtures of any and every kind whatsoever, on such terms and conditions as may be agreed upon between the parties, respectively, and also to purchase, erect, construct, maintain, or conduct, in its own name and for its own benefit, or otherwise, any such work, public or private, as they may by law be authorized to do (including also herein lines for telegraphic communication), and to aid, co-operate and unite with any company, person or firm in so doing.

Section 3. The company hereby created shall also have the power to make purchases and sales of or investments in the bonds and securities of other companies, and to make advances of money and of credit to other companies, and to aid in like manner contractors and manufacturers, and to receive and hold, on deposit or as collateral or otherwise, any estate or property, real or personal, including the notes, obligations and accounts of individuals and companies, and the same to purchase, collect, adjust, and settle, and also to pledge, sell, and dispose thereof on such terms as may be agreed on between them and the parties contracting with them; and also to indorse and guar-

antee the payment of the bonds and the performance of the obligations of other corporations, firms and individuals, and to assume, become responsible for, execute and carry out any contracts, leases, or sub-leases made by any company or companies, individuals or firms whatsoever.

Section 4. The company hereby created shall also have power to enter upon and occupy the lands of individuals or of companies on making payment therefor, or giving security according to law, for the purpose of erecting, constructing, maintaining, or managing any public work, such as is provided for or mentioned in the second section of this act, and to construct and erect such works thereon, and also such buildings, improvements, structures, roads, or fixtures as may be necessary or convenient for the purposes of said Company, under the powers herein granted; and to purchase, make, use, and maintain any works of improvements connecting or intended to be connected with the works of the said company; and to merge or consolidate or unite with the said company the improvements, property and franchises of any other company or companies on such terms and conditions as the said company may agree upon; and to fix and regulate the tolls or charges to be charged or demanded for any freight, property or passengers traveling or passing over any merchandise or property transported over any road whatever by the said company, and to make, from time to time, dividends from the profits made by the said company; the several railroads managed by said company shall continue taxable, as heretofore, in proportion to their length within this State, respectively, and the said South Improvement Company shall be taxable only on the proportion of dividends on its capital stock and upon net earnings or income, only in proportion to the amount actually carried by it within the State of Pennsylvania, and on its earnings or income derived from its business beyond the limits of this commonwealth shall not be liable for taxation.

JAMES H. WEBB,
Speaker of the House of Representatives.
WILLIAM A. WALLACE,
Speaker of the Senate.

Approved the 6th day of May A. D., 1871.

JOHN W. GEARY,
Secretary.

This charter was secured and turned over to the South Improvement Company by Thomas A. Scott, vice president of the Pennsylvania Railroad Company.

The stockholders and signers to the agreement of the South Improvement Company, which was organized January 2, 1872, were: W. G. Warden, 475 shares; O. F. Waring, 475 shares; John D. Rockefeller, 180 shares; William Rockefeller, 180 shares; Henry M. Flagler, 180 shares; O. H. Payne, 180 shares; J. A. Bostwick, 180 shares; P. H. Watson, 100 shares; Richard S. Waring, 10 shares; Charles Lockhart, 10

shares; John P. Logan, 10 shares; W. P. Logan, 10 shares; William Frew, 10 shares. P. H. Watson was elected president and W. G. Warden, secretary.

The signers to the railroad carrying rates and rebates were William H. Vanderbilt, vice president of the Lake Shore & Michigan Southern Railroad, and the New York Central and Hudson River Railroad; Jay Gould, president of the Atlantic and Great Western and Erie Railroads; Thomas A. Scott, vice president of the Pennsylvania Railroad System; Robert A. Garrett, president of the Baltimore & Ohio Railroad System.

The agreement was as follows:

The South Improvement Company, party of the first part, agrees to ship 45 per cent. of all oil transported by it over the Pennsylvania Railroad; 30 per cent. of all oil transported by it over the Atlantic & Great Western (Erie) Railroad, and 25 per cent. of all oil transported by it over the Lake Shore & Michigan Southern (New York Central and Hudson River Railroad), and further agrees to ship all oil transported by it in the Baltimore & Ohio territory over the Baltimore & Ohio Railroad. The South Improvement Company also agrees to furnish suitable tankage facilities for shipping petroleum and receiving it at its destination, and to keep records of the amount of petroleum and its products shipped over the railroads concerned, both by itself and other parties, and the Lake Short & Michigan Southern and New York Central and Hudson River and all branches operated under the said New York Central System.

The Atlantic & Great Western and Erie, and all connecting railroads operated by the Erie Railroad System; the Pennsylvania and all connecting railroads operated by the Pennsylvania Railroad System; the Baltimore & Ohio and all connecting railroads operated by the Baltimore & Ohio Railroad System, parties of the second part, agree to allow parties of the first part rebates on all petroleum and its products carried by them, and to charge all other parties not less than the full rates specified in this contract and agreement. The railroads also agree to furnish to the South Improvement Company manifesto and way bills of all petroleum or its products transported over their lines by all parties whatever; also all the railroads and water navigation companies, parties of the second part of this agreement, shall at all times co-operate, as far as they legally may, with the party hereto of the first part, to maintain the business of the party hereto of the first part against loss or injury by competition, and to that end shall lower or raise the gross rates of transportation over its railroads and water navigation connections as far as it legally may, for such times and such extent as may be necessary to overcome such competition.

The following is a list of some of the gross rates and rebates provided for in the contract:

RATES AND REBATES ACCORDING TO CONTRACT.

ON CRUDE PETROLEUM.

From any common point to:—	Gross Rate.	Rebate.
Cleveland, Ohio	\$.80	\$.40
Pittsburg, Pa.80	.40
New York, N. Y.	2.56	1.06
Philadelphia, Pa.	2.41	1.06
Baltimore, Md.	2.41	1.06
Boston, Mass.	2.71	1.06

ON REFINED PRODUCTS AND BY-PRODUCTS.

From Pittsburg, Pa., to:—	Gross Rate.	Rebate.
New York, N. Y.	\$2.00	\$.50
Philadelphia, Pa.	1.85	.50
Baltimore, Md.	1.85	.50

From Cleveland, Ohio, to:—

Boston, Mass.	2.15	.50
New York, N. Y.	2.00	.50
Philadelphia, Pa.	1.85	.50
Baltimore, Md.	1.85	.50

For each barrel of 45 gallons.

The contract of agreement was formally signed, sealed and delivered to the South Improvement Company, January 18, 1872, and the increase of freight went into effect February 26th, 1872 and February 27th, 1872.

A mass meeting of the oil producers was called, and on Monday, March 15th, 1872, by the influence of the producers, a resolution was introduced into the House of Representatives by Representative Glenn I. Schofield, of Warren, Pa., ordering an investigation of the South Improvement Company. Immediately the frightened participants cancelled the contract of agreement. By the 26th of March the representatives of the people had secured a pledge in writing from the five great railroads concerned of perfect equality and no rebates, drawbacks or other arrangements in favor of any one thereafter.

March 30th, 1872, Congress began the investigation, which brought to light the fact that the incorporators of the South Improvement Company were employes of the Pennsylvania Railroad Company, at Philadelphia, Pa., when not "lobbying" at Harrisburg, Pa., for the Pennsylvania Railroad Company. The committee also brought to light the evidence of the contracts, and meanwhile the Committee on Legislation and Pipe Lines was securing from the Legislature of Pennsylvania the repeal of the South Improvement Company's charter, and the passage of a so-called Free Pipe Line Law. The railroads in the South Improvement Company agreement feared the destruction of the railroads' property. Gen. George McClellan, of the Atlantic & Great Western, telegraphed the members of the Legislature of Pennsylvania and the oil producers that the contract with the South Improvement Company was "cancelled." President Clark, of the Lake Shore & Michigan Southern Railroad, telegraphed the Legislature and wrote an open letter to

the oil producers that the agreement with the South Improvement Company was formally abrogated and cancelled.

Chairman Homer Ramsdell, of the Erie Railroad, in an open letter, declared the contract with the South Improvement Company was abrogated.

Vice President Thomas A. Scott, of the Pennsylvania Railroad, announced that the contract with the South Improvement Company was terminated officially.

William H. Vanderbilt, vice president of the New York Central and Hudson River Railroad, in an open letter, stated the contract with the South Improvement Company was cancelled with all the railroads March 20th, 1872. This was six days before the repeal of the South Improvement Company's charter.

After the repeal of the South Improvement Company's charter the oil trade was transferred to the Standard Oil Company, and at this stage a few of the ablest business men the world has ever seen realized the importance of the oil industry, and invested largely in the purchase of property connected with it. The success of the oil business was phenomenal, and so was the success of the Standard Oil people. The profits they made, and as much capital as they could borrow, and new stock they issued, were fearlessly re-invested, and they soon became the largest owners of oil refineries and pipe lines in the oil business and in later years entered the oil territory as producers of oil, and soon became the principal owners of the territory which contains the great source of wealth. The Standard Oil Company would long ago have gone to pieces had it not been managed upon the whole in harmony with the law of supply and demand, and have employed the most skilled labor and have always given their employes the highest salaries and wages, and accorded them the most civil treatment. The Standard Oil Company has never had a labor dispute or strike with its employes in the oil regions.

It is generally admitted that the price of oils, both refined and lubricating, to the consumers are as low to-day as the supply and demand of the world will permit. The greatest competition the American oil has to-day is that which is produced in Russia, Japan, East India and Sumatra, and to meet this competition the American refiners have oil refineries and oil stations at or near all the important foreign seaports.

All of the successful oil and natural gas operators and oil refiners, Standard or independent, are self-made men. Not one could be said to have been rich at the start.

After the South Improvement Company's charter was repealed, the Congressional Committee decided its labors were done, and the investigation ceased.

The Standard Oil Company, from time to time, acquired by purchase or consolidation pipe lines and refineries. In 1874 the Parkersburg, W. Va., Refinery, under the management of J. N. Camden, became part of the Standard Oil Company, and through Mr. Camden's influence with Robert A. Garrett, president of the Baltimore & Ohio Railroad, they received special rates on all oil and material shipped and received by them over the Baltimore & Ohio Railroad.

The Pennsylvania Railroad Company continued to give the rebate to the Standard Oil Company after the

repeal of the South Improvement Company charter, and on March 13th, 1875, the capital of the Standard Oil Company was increased to \$3,500,000.

In May, 1877, the directors of the Pennsylvania Railroad Company instructed its president, Thomas A. Scott, to no longer discriminate between their customers, but to treat all alike. In due time the Standard Oil Company received notice from the Pennsylvania Railroad Company that their shipping rates would be equal to all other shippers. This was the cause of the Standard Oil Company turning all of its shipping over to the other three trunk lines, the Baltimore & Ohio, New York Central and Erie Railroads. At the same time the Pennsylvania Railroad Company was operating the Empire Pipe Line. This was the cause of the railroad war between the Pennsylvania Railroad and the Standard Oil Company, backed up by the Baltimore & Ohio, New York Central and the Erie Railroads. The three roads cut the rates to the Standard Oil Company to 10 cents a barrel on oil to the seaboard. The three roads fought the fight of the Standard Oil Company against the Pennsylvania Railroad. They bore all the expense of the fight. While the Standard Oil Company was waiting and reaping the benefits the railroads were cutting the rates for the benefit of the Standard Oil Company. At this time the Pennsylvania Railroad became pressed for money for operating expenses, and were forced to sell the Empire Pipe Line to the Standard Oil Company. This rate cutting led up to the great railroad strike which began July 16th, 1877, on the Baltimore & Ohio Railroad, at Martinsburg, W. Va., and in two weeks tied up the Pennsylvania, Erie, New York Central, Lake Shore and Michigan Southern and all Western Railroads.

The feelings of the railroad employes all over the country was expressed by the address of those of the Pennsylvania Railroad to its stockholders: "The stockholders were reminded that many of the railroad men did not average 75 cents a day; that the influence of the road had been used to destroy the business of its best customers, the oil producers, for the purpose of building up individual interests. The Columbia Oil Company, owned and controlled by J. Edgar Thompson, ex-president, and Thomas A. Scott, president of the Pennsylvania Railroad, and Andrew Carnegie, superintendent of the Allegheny Valley branch of the Pennsylvania Railroad, have been "dead-heading" all the oil the Columbia Oil Company's wells produce. The Carnegie Iron Works and the J. Edgar Thompson Steel Works, at and near Pittsburg, Pa., are and have been "dead-heading" the raw and manufactured iron ore, coal and coke and iron and steel over the road in the personal interest of J. Edgar Thompson, Thomas A. Scott and Andy Carnegie. What is the result. In place of the Pennsylvania Railroad Company receiving \$7,000,000 in revenue this year, although shipments are in excess of last year, your road will receive scarcely \$3,500,000. This alone would have enabled your company to pay us enough for a living." ("Dead-heading" means hauling freight or carrying passengers free).

Through Thomas A. Scott, the Standard Oil Com-

pany were given such low rates on transportation the Standard Oil Company grew rich, while the Pennsylvania Railroad became so poor it could not pay its employes living wages, which was the direct cause of the great railroad strike of 1877.

Thomas A. Scott, to prove his un-American principles, as soon as the strike was declared on the Pennsylvania Railroad, demanded State troops from the Governor, and the next day demanded United States troops from the President. On sight of the United States soldiers and the State Guards the strikers became enraged, and resisted their authority in giving the new men their places. This led up to the riot in which the taxpayers of the City of Pittsburg, Pa., and Allegheny county, Pa., compromised with the Pennsylvania Railroad Company for the burning of the Union depot and a few cars, \$1,810,000. The Railroad filed claims for damages to the amount of \$2,938,460, which was over \$1,000,000 more than the cost of everything that was destroyed when it was new. Philadelphia, Harrisburg and other points on the road had the sad experience of entertaining United States soldiers at the cost of the taxpayers of the United States government. Also the taxpayers of Pennsylvania were called on to pay the State Guards to defend the railroad's property, and the whole trouble was caused by the dishonest methods of the high officials of the Pennsylvania Railroad, J. Edgar Thompson, Thomas A. Scott and Andrew Carnegie. Those three officials conspired against the stockholders of the road. The majority of the stock of the Columbia Oil Company, one of the largest oil producing properties on Oil Creek, Pa., was held by J. Edgar Thompson, at that time president of the Pennsylvania Railroad; Thomas A. Scott, vice president, and Andrew Carnegie, superintendent of the Allegheny Valley railroad branch of the Pennsylvania Railroad. From the Oil Creek oil regions to Pittsburg, Pa., and Buffalo, N. Y., the oil was "dead-headed" over the Pennsylvania System as the property of the Pennsylvania Railroad, when in fact it was the property of only three of the road's high officials. The same thing is true of the beginning of stockholders of the Carnegie Steel Company were J. Edgar Thompson, for whom the J. Edgar Thompson Steel Works, at Braddock, Pa., was named; Thomas A. Scott, for whom the Homestead, Pa., mills were to be named, and Andrew Carnegie, for whom the entire works were united in one and named Carnegie Steel Works. This company used the Pennsylvania System to carry its raw and manufactured iron ore, coal and coke, iron and steel, and by virtue of those three men being the highest officials of the Pennsylvania Railroad they gave themselves as the Carnegie Steel Company such low rates over the Pennsylvania Railroad that it did not pay for the equipment of the road, not to mention that there was nothing left in the way of revenue to pay the employes living wages, and nothing to pay the stockholders a dividend. Had the high officials of the Pennsylvania Railroad managed the road within the limits of the law, and the charter granted them as common carriers, and granted no favors to any person or company, but to charge the same rate to every shipper, no matter whether he was an official of the road or an individual shipper; had this law been

put in force and carried out, there would have been no strike; no lives would have been lost, and the taxpayers would not have had the burden of paying all of the loss caused by the strike, as the stockholders would have realized enough in revenue from the earning power of the road to pay its employes good wages and themselves a dividend on their stock. Had justice been meted out as it should have been J. Edgar Thompson, Thomas A. Scott and Andrew Carnegie should have been forever banished from America. This would have prevented Andrew Carnegie from placing a burden upon the people of the United States with his ill-gotten money by agreeing to build Carnegie libraries, conditional upon the people subscribing about one-half of the cost of building the library, and forever placing a burden upon themselves to maintain the library in a grand manner, while Carnegie or his estate holds a perpetual mortgage upon the library in the name of Carnegie Library. In the name of America, and the sense of pride and decency, will the people never learn to reject any and all Carnegie libraries, and each city and town issue bonds and build its own free library? Great honor is due the City of Wheeling, W. Va., for refusing to accept a Carnegie mortgaged library.

This great railroad strike was the cause of the second Congressional investigation into the rebate method of the Standard Oil Company and the railroads, and was the direct cause of the enactment of the Inter-State Commerce Law, which immediately went into effect. About this time the Erie Railroad was pressed for operating funds, and appealed to the Standard Oil Company for assistance. The Standard Oil Company agreed to give the Erie assistance providing the Erie would sell them the Erie docks and terminus at New York, Jersey City, N. J., Cleveland, Ohio and Chicago, and grant the Standard Oil Company a perpetual lease upon all the right of way of the Erie Railroad System for oil pipe lines. This agreement is now and has been in effect for a number of years.

Samuel Andrews, who sold his interest in the Standard Oil Company in August, 1879, to John D. Rockefeller, Henry M. Flagler and Oliver H. Payne, for \$1,000,000, owing to disagreement with the management of the company's affairs, stated that the regular rate from Cleveland, Ohio, to New York, was \$1.40 a barrel on oil, while the Standard Oil Company only paid 80 cents a barrel on all the oil they shipped, and the dividends of the Standard Oil Company for the years 1876, 1877 and 1878 were 50 per cent, above the investment.

NAMES AND TITLES OF THE CORPORATIONS OF THE STANDARD OIL COMPANY.

Pacific Coast Oil Company, incorporated under the laws of California, February 19, 1879. General office, San Francisco. Capital stock, \$1,000,000. Number of shares, 100,000. Value per share, \$10. Capital stock increased from \$1,000,000 to \$2,000,000 and \$2,000,000 to \$6,000,000. Directors: Charles N. Felton, San Francisco; L. D. Fisk, San Francisco; George Loomis, San Francisco; George M. Hedges, San Francisco; E. H. Forester, Alameda, Cal.

Standard Oil Company of New Jersey.—Was incorporated under the laws of the State of New Jersey, August 5th, 1882. The authorized capital stock at the time of its incorporation was \$3,000,000, which was subsequently increased on March 19th, 1892, to \$10,000,000. Another certificate increasing the capital stock to \$110,000,000 was filed June 16th, 1898. The incorporators were Henry M. Flagler, New York; Thomas C. Bushnell, Morristown, N. J., and James McGee, Plainfield, N. J.

Standard Oil Company of New York—Incorporated under the laws of New York, August 18th, 1882. Capital stock authorized, \$5,000,000. This amount was increased April 9th, 1892, to \$7,000,000. The incorporators were William Rockefeller, J. A. Bostwick, Benjamin Brewster, O. B. Jennings and Charles Pratt.

Standard Oil Company of Iowa.—Incorporated under the laws of the State of Iowa, June 15th, 1885. The incorporators are John D. Archbold, W. H. Tilford and Samuel C. T. Dodd. Capital stock, \$1,000,000. General office, Council Bluffs, Iowa.

Ohio Oil Company.—Incorporated under the laws of the State of Ohio, August 1st, 1887. Authorized capital, \$2,000,000. Main office, Lima, Ohio. Incorporators, W. H. Mandeville, C. G. Cass, James McCormick, Samuel M. Jones and J. C. Sinclair.

South Penn Oil Company.—Incorporated under the laws of Pennsylvania, May 27th, 1889. Authorized capital stock, \$2,000,000. Incorporators: Daniel O'Day, Buffalo, N. Y.; N. F. Clark, F. Loomis, J. R. Campbell, Wade Hampton, Jr., and Millard Scheide, all of Oil City, Pa.

South Penn Oil Company.—Admitted under the laws of the State of West Virginia, October 29th, 1889. A. B. Fleming, Attorney, Fairmont, W. Va.

REGULATIONS OF THE RELIEF ASSOCIATION OF EMPLOYEES OF THE SOUTH PENN OIL COMPANY.

We, whose names are subscribed hereto, do hereby form an Association for the purpose of establishing and maintaining a fund from which to pay benefits to those members of the Association who, under the regulations hereinafter set forth, may be entitled to receive payment of such benefits.

Said Association shall be known as the Relief Association of Employees of the South Penn Oil Company, and hereinafter called the Association, and may be incorporated under the laws of any State, if desired by the members.

Said fund shall be known as the Relief Fund, and shall be established and maintained by monthly contributions of the amounts hereinafter specified, from the members of the Association, and by the contributions of the South Penn Oil Company, hereinafter called

the Company, and by the income arising from investments of such parts of the fund itself as may not be needed for the payment of benefits and the operating expenses of the Association.

The business of the Association shall be conducted in accordance with the following regulations:—

First.—No person shall be permitted to become a member of the Association unless at the date of his applying for membership herein he shall possess the following qualifications: (a) He shall be a regular employee of the Company, and if over fifty years of age shall have been an employee of such Company continuously for a period of at least two years immediately preceding his application for membership; (b) He shall be free from every infirmity, injury, disease and intemperate habit tending to shorten his life or increase his liability to personal injury.

Second.—Every application for membership shall be signed by the applicant in the presence of a subscribing witness, and shall be in the following form, viz.:—

APPLICATION FOR MEMBERSHIP IN THE RELIEF ASSOCIATION OF EMPLOYEES OF SOUTH PENN OIL CO.

To the President of Said Association:—

I,....., of, in the County of, and State of....., employed in the service of the South Penn Oil Company as in the District, do hereby apply for membership in the Relief Association of Employees of the South Penn Oil Company, and hereby certify the following facts to be true:

- 1. My full name is
 - 2. I was years of age on my last birthday, which was
 - 3. I have been engaged in my present employment for immediately prior to the date of this application, and my experience in connection with the business of producing and transporting oil and natural gas has been as follows:
.....
.....
My father is (Living or dead)?
..... My mother is
(Living or dead)?
- The names of my wife and children, and the ages of my children, are as follows:
- Name of wife,
 - Name of oldest child is ; age, years.
 - Name of second child is ; age, years.
 - Name of third child ; age, years.
 - Name of fourth child is ; age, years.
- (Others in order.)

4. I am correct and temperate in my habits and have no mental or bodily infirmity, injury or disease which tends to shorten my life or increase my

liability to personal injury, and am now able to earn a livelihood.

5. I agree to be bound by the regulations of said Association now in force and which may hereafter be adopted.

6. I agree that the acceptance of a benefit from the Relief Fund of said Association for sickness, bodily injury or death happening to me, shall operate as a release of all claims for damages against the South Penn Oil Company by reason of such injury or death which could be made by me or through me, and that I or my legal representatives will, upon request, execute such written instrument as may be necessary to evidence such release.

7. I agree to contribute to said Relief Fund the sum of upon the acceptance of this application, and the sum of each calendar month following that in which this application is made, while I remain a member of the Association, and that said monthly contributions may be deducted and paid to said Relief Fund from any wages or salary due me from my employer, or from benefits payable under the regulations.

In Witness Whereof, I have signed this application, this day of, A. D. 190....

Witness:
.....

Third—That every application for membership shall, when approved by the Chairman of the Auxiliary Board of the district in which the applicant may at the time be employed, be submitted to the Board of Control. If, upon investigation, said Board of Control shall find that the applicant is entitled to membership in the Association, said Board shall cause his name to be placed upon a roll of membership thereof; but if it shall be found that the applicant is not entitled to such membership, his application, together with the sum he may have remitted therewith as a contribution to the Relief Fund, shall be returned to him, said Board of Control and said Auxiliary Boards being the same provided for by Regulation Fourth hereof.

Fourth.—The Association shall begin business and its fiscal year shall begin on the first day of May, A. D. 1904. Its business shall be managed by a Board of Control and three Auxiliary Boards.

The Board of Control shall consist of seven members, six of whom shall be appointed by the Company and one shall be elected as hereinafter provided.

The representative above provided for to be chosen at large as member of the Board of Control shall be elected annually by the Auxiliary Boards in joint session, at time and place to be determined by said Boards from the list of nominations which must be submitted to said Boards at least ten days before the said joint session. Any candidate receiving the nomination of twenty-five members of the Association shall be eligible for election, and the one receiving the greatest number of votes at the joint session of the Auxiliary Boards shall be declared elected as representative to the Board of Control.

Fifth.—There shall be three Auxiliary Boards, known as the Auxiliary Board of District No. 1, the Auxiliary Board of District No. 2, and the Auxiliary Board of District No. 3.

The Chairman of each of these Boards will be the District Superintendent of the Company in the respective districts, unless some other selection of Chairman should be made by the Company; but the other members thereof will be elected annually by the members of the Association employed in the respective districts.

Sixth.—Each Auxiliary Board shall consist of five members, and shall have, in addition to a Chairman, a Secretary and such other officers as the members thereof may deem necessary for the transaction of the business committed to them. The member in each district receiving the highest number of votes at the annual election therein shall be Secretary of the Board; and in case of his inability, death, or resignation, the member receiving a number of votes next to the highest shall be the Secretary, and the vacancy caused by his advancement when the same may occur more than sixty days before an annual election, shall be filled by the election of a new member for the unexpired term at a special election to be held after ten days' notice, in the same manner as regular annual elections are to be held.

Seventh.—Elections for members of the respective Auxiliary Boards shall be held on the second Tuesday of December and on the same date in each year thereafter, between the hours of 10 o'clock A. M. and 2 o'clock P. M. Every such election shall be held by ballot, and every ballot shall have printed upon it the names of all the candidates to be voted for in the district in which such ballot is to be cast; but no person shall be voted for, nor shall his name be printed upon the ballots, unless at least ten members of the Association shall, at least twenty days before the election file with the Secretary of the Board of Control, a written request that his name be printed upon the ballots as a candidate. No member shall be permitted to vote for a number of candidates greater than the number to be elected, but any member may vote for a less number if he so desires. Every member casting a ballot shall indicate the persons for whom he intends to vote by striking out the names of all others printed upon the ballot. All ballots shall be securely sealed when cast, so as to conceal the names of the persons voted for. Every member casting a ballot must write or cause his name to be written on the back thereof, in the presence of a subscribing witness.

Eighth.—When five or more members shall assemble at the time and place fixed for holding an election they shall select a competent person to act as Receiver of Ballots, who may or may not be a member of the Association. All ballots shall be deposited with said Receiver of Ballots, who shall make duplicate lists of the names of the persons depositing the same and shall transmit one of said lists, together with all ballots received by him, to the Secretary of the Board of Control. The other said lists shall be retained by said Receiver

of Ballots for at least three months after the election. The ballots shall be opened and the votes for each candidate counted by the Secretary of the Board of Control, in the presence and with the assistance of two members of the Association, not then candidates for any office therein. Neither said Secretary nor the members present when the votes are counted shall at any time disclose the name of any candidate for whom a member may vote without the consent of such member. Immediately after completing the count of votes the Secretary, and those assisting him, shall prepare and sign duplicate certificates, showing the number of votes cast for each of the candidates in the respective districts. One of said duplicate certificates, showing the number of votes cast for the several candidates in each district, shall be transmitted to the Receiver of Ballots in the respective districts.

All elections and appointments herein provided for shall for the first year, be held and made as soon as practicable after the formation of the Association, the incumbents thus selected to hold office until the regular election time or time of appointment first occurring thereafter.

Ninth.—It shall be the duty of the Chairman of the Auxiliary Boards to investigate the circumstances surrounding each application for membership in the Association, made by persons within their respective districts, and to recommend to the Board of Control that the same be granted or refused, as in their judgment may be proper. If objection be made by any member of the Association to the granting of an application for membership, such objection shall be considered by the proper Auxiliary Board, and such recommendation made to the Board of Control as may be favored by a majority of the Auxiliary Board.

The Board of Control shall, in the admission of members, follow the recommendation of the proper Auxiliary Board, unless said Board of Control shall be of opinion that an error has been made by the Auxiliary Board in that regard, in which case both Boards shall together reconsider the application and determine whether the same shall be granted or refused.

Tenth.—It shall also be the duty of all members of the Auxiliary Board to inquire concerning every case of sickness, injury and death among the members of the Association in their respective districts, and report the same to the Secretary of the Board of Control.

Eleventh.—The respective Auxiliary Boards shall meet within five days after the beginning of each fiscal year, and at such other times as may be necessary for the interests of the Association.

Twelfth.—Within their respective districts, the Auxiliary Boards shall, with the concurrence of the Boards of Control, have power to expel any member of the Association for any of the following causes: (a) Non-payment of two or more regular monthly contributions to the Relief Fund; (b) False representation or fraudulent concealment made or practiced for the purpose of securing membership in the Asso-

ciation; (c) Habitual drunkenness; (d) Disobedience of the order of those having control over him in his employment, when such disobedience shall directly or indirectly endanger life, limb or property; (e) Feigning disability from sickness or accident for the purpose of obtaining payment of a benefit when not entitled thereto under these regulations, or for the purpose of obtaining a greater benefit than such member may be entitled to.

Thirteenth.—The Board of Control shall meet on the first business day of each fiscal year, and at such other times as the business of the Association may require. In case of a failure to meet on said day, those members thereof previously in office shall hold over until the incoming Board shall meet and assume the duties of office.

Fourteenth.—The Board of Control shall have power to prescribe the manner of keeping the books of account and other records of the Association; to adopt such written and printed forms as they may deem proper for the orderly and prompt transactions of its business; to approve or refuse applications for membership previously acted upon by an Auxiliary Board as provided in Regulation Ninth hereof; to inquire concerning every claim for payment of a benefit, and approve or reject the same after a report shall have been made thereon by the proper Auxiliary Board; to designate the depository of the Relief Fund and fix the amount of the bond or bonds to be given for the security of the same; to invest from time to time such parts of the Relief Fund as may not be needed to pay benefits and to meet the operating expenses of the Association; to fix the compensation of the Treasurer and Secretary of the Board of Control and of such assistants as they or either of them may require; to employ counsel; to designate the places at which annual and special elections of members of the Auxiliary Boards shall be held; to expel any member of the Association for any of the causes specified in the regulations; and to exercise all other powers and authority necessary for the proper management of the business of the Association and not by these regulations delegated to the Auxiliary Boards.

Fifteenth.—The members of the Association shall, as regards the amount of their monthly contributions to the Relief Fund, be divided into three classes, to be designated as Class 1, Class 2 and Class 3, respectively. Those receiving wages in amounts not exceeding \$75.00 per month when admitted to membership shall belong to Class 1, and shall contribute each month the sum of one dollar. Those receiving wages in amounts over \$75.00 and not exceeding \$100.00 per month when admitted to membership shall belong to Class 2, and shall contribute each month the sum of one dollar and fifty cents. Those receiving wages in amounts over \$100.00 per month when admitted to membership shall belong to Class 3, and shall contribute each month the sum of two dollars.

When any member is receiving a Sick Benefit, as provided in Regulation Eighteenth, and his contribu-

tion, when due, is not otherwise paid, the Company shall have the right to deduct the amount of such contribution from the Benefit, and give credit to said member therefor. Contributions shall be due and payable on the first business day of every month.

Sixteenth.—The benefits to be paid to members of the Association, who by these rules may become entitled to payment of benefits, shall be designated as Sick Benefits and Death Benefits. By Sick Benefits shall be understood the sums payable to members of the Association on account of disabilities due to sickness or accident not resulting in death; by Death Benefits, the sums payable on account of the death of members resulting from disease or accident.

Seventeenth.—Benefits will be paid on account of the disablement or death of members whose contributions to the Relief Fund shall have been paid in full and who shall have complied with these regulations of the amounts and under the circumstances mentioned and described in Regulation Number Eighteen, viz.:

Eighteenth.—Those members in Class 1, disabled by sickness or accident to such an extent as to disqualify them for their employment, shall be paid a *Sick Benefit* of one dollar for each day the disability may continue, during a period not exceeding twenty-six weeks, and fifty cents for each day during the period of twenty-six weeks following thereafter; but when a member returns to duty after a disability from sickness for which he is entitled to payment of a benefit, and within two weeks after such return is again disabled by sickness or by accident of such character as would entitle him to payment of a Sick Benefit, such second disability shall be counted with the first in computing the time for which benefits are to be paid him.

Those of Class 2, disabled by sickness or accident to such an extent as to disqualify them for their employment, shall be paid a Sick Benefit of one dollar and twenty-five cents for each day the disability may continue, during a period not exceeding twenty-six weeks, and sixty-three cents for each day during the period of twenty-six weeks following thereafter; but when a member returns to duty after a disability from sickness for which he is entitled to payment of a benefit, and within two weeks after such return is again disabled by sickness or by accident of such character and under such circumstances as would entitle him to payment of a Sick Benefit, such second disability shall be counted with the first in computing the time for which benefits are to be paid.

Those members of Class 3, disabled by sickness or accident to such an extent as to disqualify them for their employment, shall be paid a Sick Benefit of one dollar and fifty cents for each day the disability may continue during a period not exceeding twenty-six weeks, and seventy-five cents for each day during the period of twenty-six weeks following thereafter; but when a member returns to duty after a disability from sickness for which he is entitled to payment of a benefit and within two weeks after such return is again disabled by sickness or by accident of such character and

under such circumstances as would entitle him to payment of a Sick Benefit, such second disability shall be counted with the first in computing the time for which benefits are to be paid.

Sick Benefits, payable for disabilities occurring or existing in any month, shall be paid at the end of that month.

In all cases of disability a certificate of a physician in regular practice must be presented to the Board of Control when required by said Board.

Nineteenth.—Members will not be entitled to Sick Benefits for time during which wages are paid to them by their employers, and such time will be deducted in computing the amount to be paid by the Association.

Twentieth.—When the death of a member results from disease or accident contracted or occurring after his admission to membership, the person or persons who by these rules may be entitled to payment of a benefit on account of such death, shall be paid a Death Benefit of one thousand dollars if the decedent was a member in Class 1; fifteen hundred dollars if a member of Class 2; and two thousand dollars if a member of Class 3; less such amount as may have been paid for Sick Benefits to or for the use of such decedent member during the sickness immediately preceding and terminating in his death.

Twenty-first.—Claims for Death Benefits will be paid within ten days after satisfactory evidence of their validity shall have been furnished to the Board of Control. All other claims will be paid monthly.

Twenty-second.—Neither Sick Benefits nor Death Benefits for disability or death, resulting from accidents, will be paid in any case unless the accident causing the disability or death shall happen while the member is actually engaged in the duties of his employment, or being on the way to or from the place of his work or at home, or in attempting to save the property of his employer from injury or destruction or to save the persons or property of others from being injured or destroyed by the operation of or in consequence of an accident happening to the property, machinery or appliance of his employer.

Twenty-third.—Sick Benefits will in all cases be paid to the members on account of whose disability they may become payable.

Twenty-fourth.—Death Benefits shall be paid to those who by law would be entitled to take the deceased member's personal estate in case of his intestacy, except when the deceased member shall have appointed, in the manner prescribed by these regulations, some other person or persons beneficiary to receive payment thereof, in which case payment shall be made to such beneficiary or beneficiaries.

Twenty-fifth.—Death Benefits for death resulting from accident shall be paid to the widow, children or parents of the member on account of whose death the same may become payable. If such deceased member

shall leave a widow, but no children, such widow shall be entitled to receive payment of the whole amount of such Death Benefits; if he shall leave a widow and children, said Death Benefit shall be paid to them in the same proportions as they would take his personal estate in case of intestacy; if he shall leave children, but no widow, said Death Benefit shall be paid to such children in the same proportions as they would take his personal estate in case of intestacy; if he shall leave neither widow nor children, but leave a father and mother jointly, if both be living, or to the survivor if one of them be dead. Any member who at the time of applying for membership in the Association shall have neither wife, child, father or mother, may, if he so elects, appoint such person or persons as beneficiary or beneficiaries of the Death Benefit secured to him by membership in the Association, as he may see fit, if but one person be so designated, he or she shall receive payment of the whole of said Death Benefit, or if more than one be so designated, they shall be paid said Death Benefit in equal shares, or in such other proportions as such member may request in his application. The marriage of a member subsequent to his appointment of a beneficiary of the Death Benefit secured by his membership, shall be a revocation of such appointment.

Twenty-sixth.—Any member may withdraw from the Association after having given one month's notice of his intention so to do, and paying all contributions (if any) for which he may be in arrears prior to and including the date of said notice. Such withdrawal shall operate as a release by the withdrawing member of all claim or claims for any benefit accruing subsequent to the expiration of said notice, and a release of all claim to reimbursement for any part of the sums contributed by him to said fund while a member of the Association.

Twenty-seventh.—Members of the Association who may be discharged for cause from the service of the Company shall forfeit all claim for benefits on account of any disability accruing after the date of such discharge takes effect, and all claims to reimbursement for any part of the moneys contributed by him to the Relief Fund.

The words "discharged for cause," as used in these regulations, will be taken as including dismissal because of incompetency, inattention to duty, disobedience of orders, drunkenness and immoral habits tending to diminish the efficiency of the person addicted thereto in the performance of his duties.

Twenty-eighth.—Members who may be dismissed without fault on their part from the service of the Company, so long as they continue to pay regularly to said Fund the contribution specified in Regulation Eighteen, remain members of the Association and shall be entitled to receive Sick Benefits and Death Benefits under such circumstances as would entitle them to Sick Benefits or Death Benefits if they had continued in the service of the Company but if any member so dismissed shall at any time fail to pay any such contribution, such failure shall *ipso facto* terminate his membership and cause a forfeiture of all rights to receive payment of

any benefit or part thereof for disability occurring after the date of such failure, and shall cause a forfeiture of all right to reimbursement or any part of the contribution paid by him to said Fund.

Twenty-ninth.—Members who may obtain leave of absence or be temporarily dismissed from the service of the Company may preserve their membership in the Association, and their right to receive Sick Benefits and Death Benefits by paying regularly to the Relief Fund the contribution required by Regulation Number Eighteen.

Thirtieth.—Whenever the amount contributed by any member shall be one hundred dollars in excess of all benefits paid to him, and the Fund exceeds two hundred thousand dollars he shall be relieved from the payment of further contributions until the amount in said Fund shall be reduced to two hundred thousand dollars by the payment of benefits and operating expenses, except that those who may become members while such suspension of contributions exists and whose contributions have not severally reached the amount of one hundred dollars, shall be required to pay their contributions regularly as if the suspension had not occurred.

When the amount contributed by any member, whose contributions have been suspended, shall fall below one hundred dollars in excess of all benefits paid to him, his contributions shall be resumed in all respects the same as before such suspension.

Thirty-first.—If at any time the membership of the Association shall be reduced to below five hundred, such reduction shall operate to dissolve the Association at midnight of the last day of the month in which it shall occur.

The Association may also be dissolved, notwithstanding the membership may exceed five hundred, by the vote of its members. For the purpose of taking such vote fifteen per centum or more of the members may sign and file with the President of the Board of Control a written proposal to dissolve, and said President shall forthwith give notice thereof by mail to all members, and shall in said notice give notice of a time and place at which the votes of the members will be taken for and against a dissolution. If it should be found that a majority of the members favor a dissolution, the Association shall be deemed dissolved at midnight of the day on which the vote shall be taken, notwithstanding the votes may not be counted until the next of a subsequent day. If it should be found that a majority are against a dissolution, the Association shall continue as before.

No member shall be entitled to payment of a benefit for any disability or death consequent upon any accident which may happen after midnight of the day on which a vote to be taken showing a majority of the members in favor of dissolving the association, but those who at that time may be disabled by sickness previously contracted or by accidental injuries previously sustained, shall receive the same benefits as they would have received if there had been no dissolution.

In the event of a dissolution, all liabilities of the

Association shall be paid out of the Relief Fund, if sufficient for that purpose; but if said Relief Fund shall not be sufficient to meet said liabilities, the same shall be paid pro rata, and no member of the Association nor the Company shall be liable for the payment of any part of said liabilities beyond the amount of the said unpaid monthly contributions due from such member or company at the date of such dissolution.

If after payment of such liabilities a balance shall remain in the Relief Fund, the same shall be distributed among the then members and the Company in proportion to the whole amount they may have contributed to the said Fund.

Thirty-second.—The Company agrees to contribute to the Relief Fund, for the first five years, each month a sum equal to twenty-five per centum of the amount contributed thereto by its employes during the same month, and from and after the expiration of said period of five years it agrees to contribute the sum of ten per centum of the amount contributed by its employes during the same month.

At the end of the first five years the Company will consider the propriety of continuing to pay twenty-five per centum of the amount contributed by its employes each month, and if it continues to pay twenty-five per centum of the amount contributed by its employes, it will be considered a voluntary payment, and it may be discontinued at the option of the Company.

Thirty-third.—The acceptance of a benefit by a member of the Association or by those entitled to receive the same in case of his death, shall operate as a release by such member, or, in case of his death by those receiving payment of the benefit of all claims for damages which could be made by such member or by those claiming by, through or under him against the Company.

Thirty-fourth.—The contributions which members are required to pay by the foregoing Regulations are estimated to be sufficient to pay all benefits and operating expenses of the Association. Should said contributions be found insufficient for said expenses, they may be increased, or if found greater than necessary they may be reduced; but such increase or reduction shall only be made by joint action of the Board of Control and all Auxiliary Boards.

Thirty-fifth.—This Association shall not be considered formed until at least five hundred and one employes of the Company possessing the qualifications specified in Regulation First hereof shall have signified their willingness to become members thereof and to be bound by these Regulations by affixing their signatures hereto or to printed copies hereof, and shall each have signed an application for membership in the form set forth in said Regulation First.

S. Farley, Oakland; L. F. Gilmore, San Francisco; John M. Wright, San Francisco; W. E. Dargil, Oakland.

Standard Oil Company of New York—Admitted under the laws of West Virginia February 12, 1901; C. W. Archbold, Attorney, Parkersburg, W. Va.

TRUST AGREEMENTS AND SUBSEQUENT CONSOLIDATED CORPORATIONS.

The managers of the Standard Oil Company of Ohio and of other companies associated with it, found that pools and ordinary forms of agreement regarding prices and output did not give sufficient power over the various members, either to control the market or to secure the most efficient methods of production. In consequence this company first devised and put into effect the so-called trust agreement, by which numerous individuals, firms, and corporations, formerly competitors, were brought together in 1882 into one Standard Oil Trust. The trust was organized substantially as follows: A board of nine trustees received in trust from the different parties to the agreement, either an assignment of stock with full voting power, or in some other way the absolute control of the management of the separate properties. The trustees issued in return for these assignments, or other controlling power, trust certificates representing the respective valuations of the plants. All the properties were then managed by these nine trustees in complete harmony. The profits were distributed among the holders of the trust certificates as if they were dividends on stock, independent of the question whether the original property, for which one had received his trust certificate, was making profits or was idle.

STANDARD OIL TRUST.

The word "Trust" originated with the Standard Oil Company in 1882, when the stock of the twenty

allied companies was placed in the safe keeping and management of nine trustees, who were duly elected to manage the affairs of the Standard Oil Trust on the dividend profit sharing plan.

THE STANDARD OIL TRUST AGREEMENT, CHARTERS AND BY-LAWS.

This agreement, made and entered upon this second day of January, A. D. 1882, by and between all the persons who shall now or may hereafter execute the same as parties thereto witnesseth:

I. It is intended that the parties to this agreement shall embrace three classes, to wit:

(1) All the stockholders and members of the following corporations and limited partnerships, to wit:

Acme Oil Company (New York), Acme Oil Company (Pennsylvania), Atlantic Refining Company of Philadelphia, Bush & Company Limited, Camden Consolidated Oil Company, Elizabethport Acid Works, Imperial Refining Company Limited, Chas. Pratt & Company, Paine, Ablett & Company Limited, Standard Oil Company (Ohio), Standard Oil Company (Pittsburg), Smith's Ferry Oil Transportation Company, Solar Oil Company Limited, Sone & Fleming Manufacturing Company Limited.

Also all the stockholders and members of such other corporations and limited partnerships as may hereafter join in this agreement at the request of the trustees herein provided for.

(2) The following individuals, to wit:

W. C. Andrews, John D. Archbold, Lide K. Arter, J. A. Bostwick, Benj. Brewster, D. Bushnell, Thomas C. Bushnell, J. N. Camden, Henry G. Davis, H. M. Flagler, Mrs. H. M. Flagler, H. M. Hanna, and George W. Chapin, D. M. Harkness, D. M. Harkness, trustee; S. V. Harkness, John Huntington, H. A. Hutchins, Chas. F. G. Heye, O. B. Jennings, Chas. Lockhart, A. M. McGregor, Wm. H. Macy, Wm. H. Macy, jr., estate of Josiah Macy, jr., Wm. H. Macy, jr., executor; O. H. Payne, O. H. Payne, trustee; Chas. Pratt, Horace A. Pratt, C. M. Pratt, A. J. Pouch, John D. Rockefeller, Wm. Rockefeller, Henry H. Rogers, W. P. Thompson, J. J. Vandergrift, Wm. T. Wardwell, W. G. Warden, Joseph L. Warden; Warden, Frew & Co., Louise C. Wheaton, Julia H. York, George H. Vilas, M. R. Keith, Geo. F. Chester, trustees.

Also all such individuals as may hereafter join in this agreement at the request of the trustees herein provided for.

(3) A portion of the stockholders and members of the following corporations and limited partnerships, to wit:

American Lubricating Oil Company, Baltimore United Oil Company, Beacon Oil Company, Bush & Denslow Manufacturing Company, Central Refining Company of Pittsburg, Chesebrough Manufacturing Company, Chess-Carley Company, Consolidated Tank Line Company, Inland Oil Company, Keystone Refining Company, Maverick Oil Company, National Transit Company, Portland Kerosene Oil Company, Producer's Con'd Land

and Petroleum Company, Signal Oil Works, Limited; Thompson & Bedford Company, Limited; Devoe Manufacturing Company, Eclipse Lubricating Oil Company, Limited; Empire Refining Company, Limited; Franklin Pipe Company, Limited; Galena Oil Works, Limited; Galena Farm Oil Company, Limited; Germania Mining Company, Vacuum Oil Company, H. C. Van Tine & Co., Limited; Waters-Pierce Oil Company.

Also stockholders and members (not being all thereof) of other corporations and limited partnerships who may hereafter join in this agreement at the request of the trustees herein provided for.

II. The parties hereto do covenant and agree to and with each other, each in consideration of the mutual covenants and agreements of the other, as follows:

(1) As soon as practicable a corporation shall be formed in each of the following States, under the laws thereof, to wit: Ohio, New York, Pennsylvania and New Jersey; provided, however, that instead of organizing a new corporation, any existing charter and organization may be used for the purpose when it can advantageously be done.

(2) The purpose and powers of said corporations shall be to mine for, produce, manufacture, refine, and deal in petroleum and all its products, and all the materials used in such business, and transact other business collateral thereto. But other purposes and powers shall be embraced in the several charters such as shall seem expedient to the parties procuring the charter, or, if necessary to comply with the law, the powers aforesaid may be restricted and reduced.

(3) At any time hereafter, when it may seem advisable to the trustees herein provided for, similar corporations may be formed in other States and Territories.

(4) Each of said corporations shall be known as the Standard Oil Co. of (and here shall follow the name of the State or Territory by virtue of the laws of which said corporation is organized).

(5) The capital stock of each of said corporations shall be fixed at such an amount as may seem necessary and advisable to the parties organizing the same, in view of the purpose to be accomplished.

(6) The shares of stock of each of said corporations shall be issued only for money, property, or assets equal at a fair valuation to the par value of the stock delivered therefor.

(7) All of the property, real and personal, assets, and business of each and all of the corporations and limited partnerships mentioned or embraced in class (1) shall be transferred to and vested in the said several Standard Oil companies. All of the property, assets and business in or of each particular State shall be transferred to and vested in the Standard Oil Co. of that particular State, and in order to accomplish such purpose the directors and managers of each and all of the several corporations and limited partnerships mentioned in class first are hereby authorized and directed by the stockholders and members thereof (all of them being parties to this agreement) to sell, assign,

transfer, convey, and make over, for the consideration hereinafter mentioned, to the Standard Oil Co. or companies of the proper State or States, as soon as said corporations are organized and ready to receive the same, all the property, real and personal, assets and business of said corporations and limited partnerships. Correct schedules of such property, assets and business shall accompany each transfer.

(8) The individuals embraced in class second of this agreement do each for himself agree, for the consideration hereinafter mentioned, to sell, assign, transfer, convey, and set over all the property, real and personal, assets, and business mentioned and embraced in schedules accompanying such sale and transfer to the Standard Oil Company or Companies of the proper State or States, as soon as the said corporations are organized and ready to receive the same.

(9) The parties embraced in class third of this agreement do covenant and agree to assign and transfer all of the stock held by them in the corporations or limited partnerships herein named, to the trustees herein provided for, for the consideration and upon the terms hereinafter set forth. It is understood and agreed that the said trustees and their successors may hereafter take the assignment of stocks in the same or similar companies upon the terms herein provided, and that whenever and as often as all the stocks of any corporation and limited partnership are vested in said trustees the proper steps may then be taken to have all the money, property, real and personal, of said corporation or partnership assigned and conveyed to the Standard Oil Company of the proper State on the terms and in the mode herein set forth, in which event the trustees shall receive stocks of the Standard Oil Company equal to the value of the money, property and business assigned, to be held in place of the stocks of the company or companies assigning such property.

(10) The consideration for the transfer and conveyance of the money, property, and business aforesaid to each or any of the Standard Oil Companies shall be stock of the respective Standard Oil Company to which said transfer or conveyance is made, equal at par value to the appraised value of the money, property and business so transferred. Said stock shall be delivered to the trustees hereinafter provided for, and their successors, and no stock of any of said companies shall ever be issued except for money, property, or business equal at least to the par value of the stock so issued, nor shall any stock be issued by any of said companies for any purpose except to the trustees herein provided for, to be held subject to the trusts hereinafter specified. It is understood, however, that this provision is not intended to restrict the purchase, sale, and exchange of property of said Standard Oil Companies as fully as they may be authorized to do by their respective charters, provided only that no stock be issued therefor except to said trustees.

(11) The consideration for any stock delivered to said trustees as above provided for, as well as for stocks delivered to said trustees by persons mentioned or included in class third of this agreement, shall be the delivery of said stocks, to the persons entitled thereto, of trust certificates hereinafter provided for, equal at par value to the par value of the stocks of the

said Standard Oil Companies so received by said trustees, and equal to the appraised value of the stocks of other companies or partnerships delivered to said trustees. (The said appraised value shall be determined in a manner agreed upon by the parties in interest and said trustees). It is understood and agreed, however, that the said trustees may, with any trust funds in their hands, in addition to the mode above provided, purchase the bonds and stocks of other companies engaged in business similar or collateral to the business of said Standard Oil companies on such terms and in such mode as they may deem advisable, and shall hold the same for the benefit of the owners of said trust certificates, and may sell, assign, transfer, and pledge such bonds and stocks whenever they may deem it advantageous to said trust so to do.

III. The trusts upon which said stocks shall be held, and the numbers, powers, and duties of said trustees, shall be as follows:—

(1) The number of trustees shall be nine.

(2) J. D. Rockefeller, O. H. Payne and Wm. Rockefeller are hereby appointed trustees, to hold their office until the first Wednesday of April, A. D. 1885.

(3) J. A. Bostwick, H. M. Flagler and W. G. Warden are hereby appointed trustees, to hold their office until the first Wednesday of April, A. D. 1884.

(4) Chas. Pratt, Benj. Brewster and John D. Archbold are hereby appointed trustees, to hold their office until the first Wednesday of April, A. D. 1883.

(5) Elections for trustees to succeed those herein appointed shall be held annually, at which election a sufficient number of trustees shall be elected to fill all vacancies, occurring either from expiration of the term of office of trustee or from any other cause. All trustees shall be elected to hold their office for three years, except those elected to fill a vacancy arising from any cause except expiration of term, who shall be elected for the balance of the term of the trustee whose place they are elected to fill. Every trustee shall hold his office until his successor is elected.

(6) Trustees shall be elected by ballot by the owners of trust certificates or their proxies. At all meetings the owners of trust certificates who may be registered as such on the books of the trustees may vote in person or by proxy, and shall have one vote for each and every share of trust certificates standing in their names; but no such owner shall be entitled to vote upon any share which has not stood in his name thirty days prior to the day appointed for the election. The transfer books may be closed for thirty days immediately preceding the annual election. A majority of the shares represented at such election shall elect.

(7) The annual meeting of the owners of said trust certificates for the election of trustees and for other business shall be held at the office of the trustees in the city of New York on the first Wednesday of April of each year, unless the place of meeting be changed by the trustees, and said meeting may be adjourned from day to day until its business is completed. Special meetings of the owners of said trust certificates may be called by the majority of the trustees at such times and places as they may appoint. It shall also be the duty of the trustees to call a special meeting to holders of trust certificates whenever requested to do so by a peti-

tion signed by the holders of 10 per cent in value of such certificates. The business of such special meetings shall be confined to the object specified in the notice given therefor. Notice of the time and place of all meetings of the owners of trust certificates shall be given by personal notice as far as possible and by public notice in one of the principal newspapers in each State in which a Standard Oil Co. exists at least ten days before such meeting. At any meeting a majority in the value of the holders of trust certificates represented consenting thereto, by-laws may be made, amended, or repealed, relative to the mode of election of trustees and other business of the holders of trust certificates; provided, however, that said by-laws shall be in conformity with this agreement. By-laws may also be made, amended, and repealed at any meeting, by and with the consent of a majority in value of the holders of trust certificates, which alter this agreement relative to the number, powers and duties of the trustees and to other matters tending to the more efficient accomplishment of the objects for which the trust is created, provided only that the essential intents and purposes of this agreement be not thereby changed.

(8) Whenever a vacancy occurs in the Board of Trustees more than sixty days prior to the annual meeting for the election of trustees, it shall be the duty of the remaining trustees to call a meeting of the owners of the Standard Oil Trust certificates for the purpose of electing a trustee or trustees to fill a vacancy or vacancies. If any vacancy occurs in the Board of Trustees, from any cause, within sixty days of the date of the annual meeting for the election of trustees, the vacancy may be filled by a majority of the remaining trustees, or, at their option, may remain vacant until the annual election.

(9) If, for any reason, at any time, a trustee or trustees shall be appointed by any court to fill any vacancy or vacancies in said Board of Trustees, the trustee or trustees so appointed shall hold his or the respective office or offices only until a successor or successors shall be elected in the manner above provided for.

(10) Whenever any change shall occur in the Board of Trustees, the legal title to the stock and other property held in trust shall pass to and vest in the successors of said trustees without any formal transfer thereof; but if at any time such formal transfer shall be deemed necessary or advisable it shall be the duty of the Board of Trustees to obtain the same, and it shall be the duty of any retiring trustee, or the administrator or executor of any deceased trustee, to make said transfer.

(11) The trustees shall prepare certificates, which shall show the interest of each beneficiary in said trust, and deliver them to the persons properly entitled thereto. They shall be divided into shares of the par value of \$100 each, and shall be known as "Standard Oil Trust certificates," and shall be issued subject to all the terms and conditions of this agreement. The trustees shall have power to agree upon and direct the form and contents of said certificates, and the mode in which they shall be signed, attested and transferred. The certificates shall contain an express stipulation that the holders thereof shall be bound by the terms of

this agreement, and by the by-laws herein provided for.

(12) No certificates shall be issued except for stocks and bonds held in trust, as herein provided for, and the par value of certificates issued by said trustees shall be equal to the par value of the stocks of said Standard Oil Companies, and the appraised value of other bonds and stocks held in trust. The various bonds, stocks and moneys held under said trust shall be held for all parties in interest jointly, and the trust certificates so issued shall be the evidence of the interest held by the several parties in this trust. No duplicate certificates shall be issued by the trustees except upon surrender of the original certificate or certificates for cancellation, or upon satisfactory proof of the loss thereof, and in the latter case they shall require a sufficient bond of indemnity.

(13) The stock of the various Standard Oil Companies held in trust by said trustees shall not be sold, assigned, or transferred by said trustees, or by the beneficiaries, or by both combined, so long as the trust endures. The stocks and bonds of other corporations held by said trustees may be by them exchanged or sold and the proceeds thereof distributed *pro rata* to the holders of trust certificates, or said proceeds may be held and reinvested by said trustees for the purposes and uses of the trust; provided, however, that said trustees may from time to time assign such shares of stock of said Standard Oil Companies as may be necessary to qualify any person or persons chosen or to be chosen as directors and officers of any of said Standard Oil Companies.

(14) It shall be the duty of said trustees to receive and safely to keep all interest and dividends declared and paid upon any of the said bonds, stocks and moneys held by them in trust, and to distribute all moneys received from such sources or from sales of trust property or otherwise by declaring and paying dividends upon the Standard Trust certificates as funds accumulate, which in their judgment are not needed for the uses and expenses of said trust. The trustees shall, however, keep separate accounts and receipts from interest and dividends, and of receipts from sales or transfers of trust property, and in making any distribution of trust funds, in which moneys derived from sales or transfers shall be included, shall render the holders of trust certificates a statement showing what amount of the fund distributed has been derived from sales or transfers. The said trustees may be also authorized and empowered by a vote of a majority in value of holders of trust certificates, whenever stocks or bonds have accumulated in their hands from money purchases thereof, or the stock or bonds held by them have increased in value, or stock dividends shall have been declared by any of the companies whose stocks are held by said trustees, or whenever from any such cause it is deemed advisable so to do, to increase the amount of trust certificates to the extent of such increase or accumulation of values and to divide the same among the persons then owning trust certificates *pro rata*.

(15) It shall be the duty of said trustees to exercise general supervision over the affairs of several Standard Oil Companies, and as far as practicable over the other companies or partnerships, any portion of whose stock

is held in said trust. It shall be their duty as stockholders of said companies to elect as directors and officers thereof faithful and competent men. They may elect themselves to such positions when they see fit so to do, and shall endeavor to have the affairs of said companies managed and directed in the manner they may deem most conducive to the best interests of the holders of said trust certificates.

(16) All the powers of the trustees may be exercised by a majority of their number. They may appoint from their own number an executive and other committees. A majority of each committee shall exercise all the powers which the trustees may confer upon such committee.

(17) The trustees may employ and pay all such agents and attorneys as they may deem necessary in the management of said trust.

(18) Each trustee shall be entitled to a salary for his services not exceeding twenty-five thousand dollars per annum, except the president of the board, who may be voted a salary not exceeding thirty thousand dollars per annum, which salaries shall be fixed by said Board of Trustees. All salaries and expenses connected with or growing out of the trust shall be paid by the trustees from the trust fund.

(19) The Board of Trustees shall have its principal office in the city of New York, unless changed by vote of the trustees, at which office, or in some place of safe deposit in said city, the bonds and stocks shall be kept. The trustees shall have power to adopt rules and regulations pertaining to the meetings of the board, the election of officers, and the management of the trust.

(20) The trustees shall render at each annual meeting a statement of the affairs of the trust. If a termination of the trust be agreed upon, as hereinafter provided, or within a reasonable time prior to its termination by lapse of time, the trustees shall furnish to the holders of the trust certificates a true and perfect inventory and appraisal of all stocks and other property held in trust, and a statement of the financial affairs of the various companies whose stocks are held in trust.

(21) The trust shall continue during the lives of the survivors and survivor of the trustees in this agreement named, and for twenty-one years thereafter; provided, however, that if at any time after the expiration of ten years two-thirds of all the holders in value, or if after the expiration of one year 90 per cent of all the holders in value of trust certificates shall, at a meeting of holders of trust certificates called for that purpose, vote to terminate this trust at some time to be by them then and there fixed the said trust shall terminate at the date so fixed. If the holders of trust certificates shall vote to terminate the trust as aforesaid, they may, at the same meeting, or at a subsequent meeting called for that purpose, decide by vote of two-thirds in value of their number the mode in which the affairs of the trust shall be wound up, and whether the trust property shall be distributed or whether part, and if so, what part shall be divided and what part sold, and whether such sales shall be public or private. The trustees, who shall continue to hold their offices for that purpose, shall make the distribution in the mode directed, or, if no mode be agreed upon, by two-thirds in value as

aforesaid, the trustees shall make distribution of the trust property according to law. But said distribution, however made, and whether it be of property, or values, or of both, shall be just and equitable, and such as to insure to each owner of a trust certificate his due proportion of the trust property or the value thereof.

(22) If the trust shall be terminated by the expiration of the time for which it is created, the distribution of the trust property shall be directed and made in the mode above provided.

(23) This agreement, together with the registry of certificates, books of accounts, and other books and papers connected with the business of said trust, shall be safely kept at the principal office of said trustees.

(Signatures.)

SUPPLEMENTAL AGREEMENT.

Whereas in and by an agreement dated January 2, 1882, and known as the Standard Trust agreement, the parties thereto did mutually covenant and agree, *inter alia*, as follows, to wit: That corporations to be known as Standard Oil Companies of various States should be formed, and that all of the property, real and personal, assets, and business of each and all of the corporations and limited partnership mentioned or embraced in class first of said agreement should be transferred and vested in the said several Standard Oil Companies; that all of the property, assets, and business in or of each particular State should be transferred to and vested in the Standard Oil Company of that particular State, and the directors and managers of each and all of the several corporations and associations mentioned in class first were authorized and directed to sell, assign, transfer, and convey, and make over to the Standard Oil Company or Companies of the proper State or States, as soon as said corporations were organized and ready to receive the same, all the property, real and personal, assets and business of said corporations or associations; and whereas it is not deemed expedient that all of the companies and associations mentioned should transfer their property to the Standard Oil Companies at the present time, and in case of some companies and associations it may never be deemed expedient that the said transfer should be made, and said companies and associations go out of existence; and whereas it is deemed advisable that a discretionary power should be vested in the trustees as to when such transfer or transfers should take place, if at all.; Now, it is hereby mutually agreed between the parties to the said trust agreement, and as supplementary thereto, that the trustees named in the said agreement and their successors shall have the power and authority to decide what companies shall convey their property as in said agreement contemplated, and when the said sales and transfers shall take place, if at all, and until said trustees shall so decide, each of said companies shall remain in existence, and retain its property and business, and the trustees shall hold the stocks thereof in trust, as in said agreement provided. In the exercise of said discretion the trustees shall act by a majority of their number as provided in said trust agreement. All portions of said trust agreement relating to this subject

shall be considered so changed as to be in harmony with this supplemental agreement.

In witness whereof, the said parties have subscribed this agreement this 4th day of January, 1882.

(Duly signed by the same parties.)

BY-LAWS OF THE TRUSTEES OF THE STANDARD OIL TRUST.

ARTICLE I—ELECTION OF TRUSTEES.

Trustees shall be elected by ballot by the owners of trust certificates or their proxies.

Elections of trustees to succeed those already appointed shall be held annually, at which election a sufficient number of trustees shall be elected to fill all vacancies occurring either from expiration of the term of office of any trustee or from any other cause.

All trustees shall be elected to hold their office for three years, except those elected to fill a vacancy arising from any cause except expiration of term, who shall be elected for the balance of the term of the trustee whose place they are elected to fill. Every trustee shall hold his office until his successor is elected.

The annual meeting of the holders of trust certificates and the election of trustees shall be held at the office of the trustees in the city of New York, on the first Wednesday in April of each year, unless otherwise ordered by the trustees, and the said meeting may be adjourned from day to day until its business is completed.

Special meetings of the holders of trust certificates may be called by a majority of all the trustees at such time and place as they may appoint.

Special meetings shall also be called by a majority of the trustees whenever requested so to do, by a request signed by the holders of 10 per cent in value of trust certificates.

The business of such special meetings shall be confined to the objects specified in the notice given therefor.

Notice of the time and place of all meetings of owners of trust certificates shall be given by a personal notice, as far as possible, and shall also be advertised in one of the principal newspapers published in each State in which a Standard Oil Company exists, at least ten days previous to the time of meeting.

At all meetings the owners of trust certificates, who may be registered as such on the books of the trustees, may vote in person or by proxy, and shall have one vote for each and every share of trust certificates standing in their names, but no such owner shall be entitled to vote upon any share which has not stood in his name thirty days prior to the day appointed for the election.

The transfer books may be closed for thirty days immediately preceding the annual election.

A majority of the shares represented at such election shall elect.

At all elections of trustees the Board of Trustees shall be the judges of the qualification of voters; shall prescribe rules and regulations for voting, appoint tellers to direct and count the votes, and cause the result of the election to be entered in full on their minutes.

The trustees may commit their powers in this matter to a committee of their own members.

The election shall be held on a day designated for that purpose, unless prevented by accident, in which case the trustees shall designate another day for the election.

ARTICLE II—BOARD OF TRUSTEES.

The Board of Trustees at their first meeting after their annual election shall elect by ballot from their own number a president, vice-president, treasurer and secretary, and such officers shall hold their offices during the pleasure of the board. Whenever a vacancy occurs in the Board of Trustees more than sixty days prior to the annual meeting for the election of trustees, it shall be the duty of the remaining trustees to call a meeting of the holders of the trust certificates for the purpose of electing a trustee or trustees to fill the vacancy for vacancies.

If any vacancy occurs in the Board of Trustees from any cause within sixty days of the date of the annual meeting for the election of trustees, the vacancy may be filled by a majority of the remaining trustees, or at their option may remain vacant until the annual election.

The board may also appoint an assistant treasurer, assistant secretary, auditor, and such additional officers, agents, executive and other committees as it may deem advisable, and remove the same at its pleasure.

In the absence of the president and vice-president the board may appoint a chairman *pro tempore*; during a prolonged absence or inability of the president or any other officer, the board may appoint substitutes *pro tempore*, and on the death or resignation of the president or other officers, it shall fill the vacancy.

A majority of the trustees shall be required to constitute a quorum for the transaction of business, but less than a quorum may adjourn from time to time and from place to place.

Regular meetings of the Board of Trustees shall be held on the first Wednesday of January, April, July, and October of each year, unless the same shall be a legal holiday, in which event the meeting shall be held on the day following.

ARTICLE III—THE PRESIDENT.

The president shall preside at all meetings of the owners of trust certificates or trustees if present; appoint or remove all officers and agents other than those elected by the owners of trust certificates or the Board of Trustees; call meetings of the Board of Trustees, when requested by a majority of the trustees in writing; sign all certificates of shares, and have a general care, supervision and direction of the affairs of the trust. He shall have power to call meetings of the board from time to time when he shall think proper; to sign certificates of shares in blank and leave them with the treasurer in sufficient numbers to provide for the prompt transfer of shares.

In the event of the death, absence, or inability of the president to perform the duties imposed upon him by

these by-laws and the orders of the Board of Trustees, the vice-president may exercise his powers and perform his duties, subject to the control of the Board of Trustees or executive committee.

ARTICLE IV.—THE SECRETARY.

It shall be the duty of the secretary to notify the members thereof of all meetings of the Board of Trustees, when required by the president or by a majority of the trustees in writing; to attend such meetings when practicable, keep true records of the proceedings; attest such records after meeting by his signature; safely keep all documents and papers which shall come into his possession, and truly keep the books and accounts of the trust appertaining to his office, so as at all times to show the real condition of the trust affairs, and shall present statements thereof when required by the board. He shall keep books in which transfers of shares may be made by any owner of trust certificates or his attorney duly constituted in writing; also a share ledger and certificate book; prepare new certificates upon all the transfer of shares and surrender of the old certificates and keep a register of all the certificates issued.

On the day of the annual election the secretary shall furnish for the use of the inspectors an alphabetical list of all the owners of trust certificates who shall have been registered as such for thirty days prior to said election. The assistant secretary shall perform such of the duties of the secretary as may be required of him by the Board of Trustees.

ARTICLE V.—TREASURER.

It shall be the duty of the treasurer to keep and account for all moneys, funds, and property of the trust which shall come into his hands, and he shall render such accounts and present such statements to the trustees and executive committee as may be required of him.

Disbursements shall only be made by him under resolutions of the Board of Trustees, or by the executive committee, or upon vouchers approved by the proper officers.

He shall sign certificates of shares when presented to him after they shall have been signed by the president.

The assistant treasurer shall perform such of the duties of treasurer as may be required of him by the Board of Trustees.

ARTICLE VI.—EXECUTIVE COMMITTEE.

The executive committee shall possess and exercise by a majority of all its members all the powers and duties of the Board of Trustees, but only when the board shall not be in session. They shall keep a record of all their proceedings, which shall be certified by the secretary under his hand, which record shall be read at the next ensuing meeting of the Board of Trustees. The secretary shall call meetings of this committee on the requisition of the president of the board or of any of its members.

ARTICLE VII.

The fiscal year of this trust shall be the calendar year.

ARTICLE VIII.

These by-laws may be altered, amended, or repealed at any meeting of the owners of trust certificates by a vote of a majority in value of all the owners represented, provided, however, that all by-laws relative to formal meetings and formal duties of the trustees and officers may be altered by the Board of Trustees.

REVISED CHARTER OF THE STANDARD OIL
COMPANY OF NEW JERSEY.

Resolved, That it is advisable to alter the charter of this company to read as below stated, and that a meeting of the stockholders be called to meet at the principal office of the company in Bayonne, New Jersey, on the 14th day of June, 1899, at 11 a. m., to take action thereon, notice of such meeting to be signed by the president and secretary, and given to each stockholder in person, or mailed to his proper postoffice address, at least ten days previous to the time of meeting, as provided by the by-law.

First, The name of the corporation is Standard Oil Company.

Second, The location of the principal office in the State of New Jersey is at the company's refinery in the city of Bayonne and county of Hudson. The name of the agent therein and in charge thereof, and upon whom process against this company may be served, is J. H. Alexander.

Third, The objects for which this company is formed are: To do all kinds of mining, manufacturing, and trading business; transporting goods and merchandise by land or water in any manner; to buy, sell, lease, and improve lands; build houses, structures, vessels, cars, wharves, docks and piers; to lay and operate pipe lines; to erect and operate telegraph and telephone lines and lines for conducting electricity; to enter into and carry out contracts of every kind pertaining to its business; to acquire, use, sell, and grant licenses under patent rights; to purchase or otherwise acquire, hold, sell, assign, and transfer shares of capital stock and bonds or other evidences of indebtedness of corporations, and to exercise all the privileges of ownership, including voting upon the stocks so held; to carry on its business and have officers and agencies therefor in all parts of the world, and to hold, purchase, mortgage and convey real estate and personal property outside the State of New Jersey.

Fourth, The total authorized stock of the corporation is one hundred and ten million dollars, divided into one million and one hundred thousand shares of the par value of one hundred dollars each. Of said stock the one hundred thousand shares now issued and existing shall be preferred stock, and the increase of one million shares shall be common stock. Said preferred stock

shall entitle the holder thereof to receive out of the net earnings a dividend of and not exceeding one and one-half per centum quarterly before any dividend shall be paid on the common stock. Common stock may, at the discretion of the company, be issued in exchange for preferred stock, and all preferred stock so received by the company shall be canceled. Common stock may also be issued in payment for such property as the company has authority to purchase. Holders of preferred and of common stocks shall have like voting power.

Fifth, The names and postoffice addresses of the incorporators and the number of shares subscribed for by each shall remain as set forth in the original certificate of incorporation.

Sixth, The duration of the corporation shall be unlimited.

Seventh, The corporation may use and apply its surplus earnings, or accumulative profits authorized by law to be reserved, to the purchase or acquisition of property, and to the purchase or acquisition of its own capital stock from time to time, to such an extent and in such manner and upon such terms as its Board of Directors shall determine; and neither the property nor the capital stock so purchased or acquired, nor any of its capital stock taken in payments or satisfaction of any debt due to the corporation, shall be regarded as profits for the purpose of declaration or payment of dividends, unless otherwise determined by a majority of the Board of Directors or a majority of the stockholders.

The corporation, in its by-laws, may prescribe the number necessary to constitute a quorum of the Board of Directors, which may be less than a majority of the whole number.

The number of directors at any time may be increased or diminished by vote of the Board of Directors, and in case of any such increase the Board of Directors will have power to elect such additional directors, to hold office until the next meeting of stockholders, or until their successors shall be elected.

The Board of Directors shall have power to make, alter, amend, and rescind the by-laws of the corporation, to fix the amount to be reserved as working capital, to authorize and to cause to be executed mortgages and liens upon the real and personal property of the corporation, and from time to time to sell, assign, transfer, or otherwise dispose of any or all of the property of the corporation; but no such sale of all of the property shall be made except pursuant to the votes of at least two-thirds of the Board of Directors.

The Board of Directors, by resolution passed by a majority of the whole board, may designate three or more directors to constitute an executive committee, which committee, to the extent provided in said resolution or in the by-laws of the corporation, shall have, and may exercise, the power of the Board of Directors in the management of the business and affairs of the corporation, and shall have power to authorize the seal of the corporation to be affixed to all papers which may require it.

The Board of Directors from time to time shall determine whether and to what extent, and at what times

and places, and under what conditions and regulations, the accounts and books of the corporation, or any of them, shall be open to the inspection of the stockholders; and no stockholder shall have any right of inspecting any account or book or document of the corporation except as conferred by statute or authorized by the Board of Directors or by a resolution of the stockholders.

The Board of Directors shall have power to hold its meetings, to have one or more offices, and to keep the books of the corporation (except the stock and transfer books) outside of the State, at such places as may be from time to time designated by them.

I certify that the above resolution was adopted by the Board of Directors of the Standard Oil Company at a meeting held on the 26th day of May, A. D. 1899, a majority of directors being present and voting in favor thereof. Witness the seal of said corporation.

(Corporate Seal.)

L. D. CLARKE,
Secretary.

BY-LAWS OF THE STANDARD OIL COMPANY OF NEW JERSEY.

ARTICLE I.—MEETING OF STOCKHOLDERS.

The annual meeting of stockholders and the election of directors shall be held at the office of the company in Bayonne, New Jersey, on the second Tuesday in January in each year, and said meeting may be adjourned from day to day until its business is completed.

Special meetings of the stockholders may be called by a majority of all the directors at such times and places as they may appoint.

The directors shall also call a meeting of stockholders within ten days after a written request so to do signed by a majority of the stockholders.

The business of such special meetings shall be confined to the subject specified in the notice therefor.

Notice of the time and place of all meetings of stockholders shall be signed by the secretary, and be given to each stockholder in person or be mailed to his proper postoffice address at least ten days previous to the time of meeting.

At all meetings stockholders who may be registered as such on the books of the company may vote in person, by agent, or by proxy, and shall have one vote for each and every share of stock standing in their names, but no shareholder shall be entitled to vote upon any stock which has not stood in his name ten days prior to the day appointed for the election.

The transfer books may be closed for ten days previous to the annual election.

At all elections the directors shall be the judges of the qualifications of voters, shall prescribe rules and regulations for voting, appoint inspectors to collect and count the votes, and cause the result of the election to be entered in full on their minutes.

The board may commit its powers in this matter to a committee of its own members.

The election shall be held on the day designated for that purpose unless prevented by accident, in which

case the board shall designate another day for the election.

A majority of the stockholders present at any meeting shall constitute a quorum.

ARTICLE II.—BOARD OF DIRECTORS.

The Board of Directors shall consist of thirteen persons, who shall hold their office one year and until their successors are elected.

The Board of Directors at their first meeting after every annual election shall elect a president, four vice presidents, a treasurer, and secretary, and such officers shall hold their offices during the pleasure of the board. One person may be both secretary and treasurer.

In case of any vacancy in the Board of Directors by death, resignation, or otherwise, the board shall have the power to fill for the unexpired term such vacancy by ballot.

The board may also appoint one assistant treasurer, one assistant secretary, and such additional officers and agents as they may deem advisable, and remove the same at their pleasure.

In the absence of the president and vice-president, they may appoint a chairman *pro tempore*.

During a prolonged absence or inability of the president or any other officer, they may appoint substitutes *pro tempore*, and on the death or resignation of the president, or other officer, they shall fill the vacancy.

Five of the directors shall be required to constitute a quorum for the transaction of business; but less than a quorum may adjourn from time to time and from place to place.

The Board of Directors may at their option hold their meeting at any place outside of the State.

Dividends upon the capital stock of the company, when earned, shall be declared by the Board of Directors on the first Tuesday of February, May, August and November in each year, the same to be payable on the 15th of the succeeding month. The board shall have power to fix the amount to be reserved as working capital.

ARTICLE III.—PRESIDENT.

The president shall preside at all meetings of the stockholders or directors, if present; sign all certificates of stock and have a general care, supervision and direction of the affairs of the company. He shall have power to call meetings of the board from time to time when he shall think proper, or when requested by a majority of the board.

In the event of the death, absence, or inability of the president to perform any duties imposed upon him by these by-laws and the order of the Board of Directors, the vice-president may exercise his powers and perform his duties, subject to the control of the Board of Directors.

ARTICLE IV.—SECRETARY.

It shall be the duty of the secretary to notify the members thereof of all meetings of the Board of Directors when required by the president, or when requested by a majority of the directors in writing; to attend such

meetings when practicable; keep true records of the votes at elections and all other proceedings; attest such records after every meeting by his signature; safely keep all documents and papers which shall come into his possession, and truly keep the books and accounts of the company appertaining to his office; and shall present statements thereof when required by the board. He shall keep books upon which transfer of stock may be made by any stockholder, or his attorney duly constituted in writing. He shall prepare new certificates upon the transfer of shares and surrender of the old certificates and keep a register of all certificates issued. The assistant secretary shall perform such of these duties as the directors may require.

ARTICLE V.—TREASURER.

It shall be the duty of the treasurer to keep and account for all monies, funds and property of the company which shall come into his hands, and he shall render such accounts and present such statements to the directors as may be required of him. He shall deposit all funds of the company which may come into his hands in such bank or banks as the directors may designate; he shall keep his bank account in the name of the company, and shall exhibit his books and accounts to any director upon application at the office during ordinary business hours; he shall indorse for collection the bills, notes, checks and other negotiable instruments received by the company he shall sign all bills, notes, checks and other negotiable instruments of the company and shall pay out money on the business as the corporation may require, taking proper vouchers therefor, provided, however, that the directors shall have power by resolution to delegate any of the duties of the treasurer to other officers, and to provide by what officers all bills, notes, checks, vouchers, orders, or other instruments shall be signed. The assistant secretary shall perform such of these duties as the directors may require.

ARTICLE VI.—CORPORATE SEAL.

A corporate seal shall be prepared and shall be kept by the secretary in the office of the company.

The impression of the seal may be made and attested by either the secretary or an assistant secretary for the authentication of contracts and other papers requiring the seal and bearing the signature of the president or one of the vice-presidents.

ARTICLE VII.—FISCAL YEAR.

The fiscal year of this corporation shall be the calendar year.

ARTICLE VIII.—AMENDMENTS.

These by-laws may be altered or amended by a vote of the directors at any meeting.

The first general office of the Standard Oil Company was located on the corner of Euclid avenue and Broadway, Cleveland, Ohio. Their second office was located at 18 Broadway, New York City. The present

general headquarters of the Standard Oil and affiliated companies are in the Standard Oil Building, 26 Broadway, New York.

The Standard Oil Company, of New York, of which William Rockefeller is president, owns the granite building at 26 Broadway, facing Bowling Green. The building is fifteen stories high, 209 feet from Broadway, through to New street, contains four acres of floor space, and cost one and one-half millions of dollars. Its architecture is severe but imposing, the interior rich without ornament, and all the rooms large and perfectly lighted and ventilated.

This building is the headquarters of the American petroleum industry, being occupied only by the company to which it belongs and by companies engaged in different branches of the same industry. Here may be found the offices of several producing companies which are engaged in drilling wells and pumping crude petroleum from the bowels of the earth in various parts of the States of New York, Pennsylvania, West Virginia, Ohio, Indiana, Kentucky, Kansas, Colorado, California, Texas and Indian Territory. Here also are the offices of the different pipe line companies, which receive the crude products from the wells, and convey it in under ground pipes to the great refineries in various interior cities and at the seaboard. The company which builds, owns and operates the peculiar boiler-shaped cars which are used to convey refined oil to all parts of the United States has its home in this building; and likewise the companies which carry oil in bulk across the ocean and deposit it in great tanks at various sea ports, to be distributed by tank cars on British and Continental railways. The trans-Atlantic steamships carry from 800,000 to 1,000,000 gallons, which is loaded or discharged in from seven to fifteen hours. They make seven or eight round trips a year. Side by side, with these are found the offices of companies engaged in manufacturing the scores of useful products derived from petroleum, as well as the materials used in such manufacture, and the barrels, tin cans and cases, in which a portion of these products is marketed.

These companies are all separate, but their interests are identified by reason of identity of stockholders.

The business carried on through these agencies is the largest and most successful in this age of large industries, and is due to the energy and far-sightedness of a comparatively few men. The united investments to-day aggregate over \$100,000,000. Every device which ingenuity could invent, experience suggest and capital obtain, has been utilized for enlarging the quantity and improving the quality of the products manufactured, and for cheapening the cost of their manufacture and transportation, with the result that the public are supplied, not only with light, but with many new, necessary and useful articles derived from petroleum at a cost which is almost nominal. In its cooperage department the company uses yearly 100,000,000 feet of oak timber, from twenty states; and at Oswego, N. Y., it has the largest lumber mill in the world, cutting yearly over 100,000,000 feet of white pine into material for oil sent out in cans.

This industry stands distinct and separate from many large industries, in some respects copied after it, in the fact that it has refrained from stock-jobbing,

and, instead of restricting production and increasing prices, it has pursued exactly the opposite policy, and striven by cheapening its products to increase the demand and widen the market for them. A less cost and a larger market is the theory upon which this business has always been conducted, and its great success proves this to be a much wiser business policy than the theory of restricted production and increased prices, which has ruined so many promising industries.

The Standard Oil Trust was dissolved in 1892. The property held by the trust was distributed among twenty different corporations in various States and localities. In each of these corporations the former nine trustees, as individuals acting together, held control, so that the same unity of management of the twenty separate companies was maintained as had existed under the one trust, which did not go into effect until June, 1898.

THE STANDARD OIL COMPANY OF NEW JERSEY IS THE
HEAD OF THE STANDARD OIL COMPANY
OF NEW YORK.

This Company and its allied branches produce and manufactures 90 per cent, of the total output of refined oil in the United States; owns wells in Pennsylvania, New York, Ohio, Indiana, West Virginia, California, Kansas, Kentucky, Colorado, Texas, Wyoming, Utah and Indian Territory, and owns refineries in all the leading cities in the North and in the South. It also has its own pipe lines connected with all the oil fields in the United States, buys 90 per cent. of all the oil produced in the United States, and stores it in large iron tanks for future use or delivers it by pipe line direct to its refineries; then by trunk line it carries the oil direct to tidewater. The business is very extensive, both at home and abroad. The Standard Oil Trust was capitalized at \$10,000,000, the holders of which had only a beneficiary interest in other companies controlled by the Standard Oil Trust, but in June, 1899, holders of these certificates were given in exchange for their securities share for share, new common stock of the Standard Oil Company of New Jersey, capitalized at \$110,000,000, which succeeded to the properties formerly held by liquidating trustees. The new stock represents a direct ownership in the properties of the Standard Oil Company. This change was due to a *desire* of the Standard Oil people to give up the "Trust" feature of their business, in accordance with the anti-trust laws.

The Standard Oil Company of New Jersey is the financial head of all the Standard Oil and affiliated companies. The stock certificates are issued by the Standard Oil Company of New Jersey, which governs the *evener* system, adopted by this company to share equally the profits and losses from the several allied companies whereby the holders of stock in the refineries, pipe lines and the producing companies were given share for share in the Standard Oil Company of New Jersey, and share equally in the value of all the stock and receive dividends per ratio on the number of shares held. There is probably no concern in the

world which is the subject of so much suspicion, and psychological, as well as industrial, antagonism, as the Standard Oil Company. People who know nothing whatever of the oil business, of the industry, history, methods or results of the company, feel perfectly competent to pass judgment, always, of course, against the Standard. It has been regarded as the evil genius which is the cause of all the bad and none of the good in the oil industry. The lawsuits, legislative investigations, and practically all anti-trust schemes and literature have been directed against the Standard Oil Company as the "Monopoly" of the refining, transporting and producing of petroleum oil. Following is a true and full list of all the investigations, suits-at-law and the evidence in full as sworn to, and the names of the witnesses and a full history of the proceedings as brought out at the Hepburn Investigation in the State of New York, in 1889:

HISTORY OF STANDARD OIL

COMBINATIONS.

ORGANIZATION AND PURPOSES.

Mr. Lewis Emery quotes part of the testimony of Mr. Henry M. Flagler before the Committee on Manufactures of the House of Representatives in 1888. This shows that in 1870 the firm of Rockefeller, Andrews & Flagler was formed to succeed the separate firms of Rockefeller & Co. and Rockefeller & Andrews. The capacity of the new firm was about 600 barrels of crude oil per day. This firm in the same year was reorganized under the name of the Standard Oil Company of Ohio, with a capital of \$1,000,000.

John D. Rockefeller made affidavit concerning the growth of the Standard Oil Company as follows:

"1. Q. What was the first combination in which you were interested of different establishments in the oil industry. A. The first combination of different establishments in the oil industry in which I was interested was the union of William Rockefeller & Co., Rockefeller & Andrews, Rockefeller & Co., S. V. Harkness and H. M. Flagler, about the year 1867.

"2. Q. What were the causes leading to its formation? A. The cause leading to its formation was the

desire to unite our skill and capital in order to carry on a business of some magnitude and importance in place of the small business that each separately had theretofore carried on. As time elapsed and the possibilities of the business became apparent we found further capital to be necessary, obtained the required persons and capital, and organized the Standard Oil Company with a capital of \$1,000,000. Later we found more capital could be utilized and found persons with capital to interest themselves with us, and increased our capital to \$3,500,000. As the business grew, and markets were obtained at home and abroad, more persons and capital were added to the business and new corporate agencies were obtained or organized, the object being always the same, to extend our business by furnishing the best and cheapest products."

It appears that the Standard Oil Company was re-organized in 1872 with a capital of \$2,500,000, which was again increased to \$3,500,000 in 1875, which remains the amount of capital of this particular company to the present time.

GROWTH OF MONOPOLY DURING THE SEVENTIES.

Beginning early in the seventies the men interested in this company began to associate themselves with other refiners and to extend their business with greater rapidity. They also secured control of the pipe lines of Pennsylvania, a process which is more fully described under a separate heading. Numerous refineries were either driven out of business altogether, or were in some way led to affiliate with the Standard Oil Company. Certain witnesses attribute this growth of control over the refining business partly to the ownership of the pipe lines, but the chief reason assigned by many opponents of the combination is railroad favoritism, a detailed history of which is given later on.

Mr. Emery specially refers to previously existing testimony to show the manner in which the Standard Oil Company, through the influence of railway discriminations, grew from a small concern in 1870 to a practical monopoly of the entire oil refining business in 1879. In 1870 there were approximately 250 refineries, most of them located in the oil regions. The Standard Oil Company then owned about 4 per cent of the refining capacity of the country. In 1879 Mr. H. H. Rogers and Mr. Jabez A. Bostwick, members of the Standard Oil Company, testified before the Hepburn committee that that company, or the combination which it represented, owned or controlled 90 or 95 per cent of the refining industry in America. There was a time, Mr. Emery declares, when he did not know of a single independent refiner.

The witness himself was interested in the Octave Oil Company at Titusville, having a capacity of about 800 barrels daily. This company was invited to join the Standard Oil Company, but refused to do so. In the latter part of 1873 it was forced to sell out to that company, having been unable to maintain its business. The refinery cost \$85,000, and sold for \$45,000. It was run for two or three years by the Standard Oil Company, but was finally dismantled.

In 1880 the witness built a new refinery in Philadelphia at the suggestion of the Pennsylvania Railroad,

but was again driven out of business by discriminations, especially by the inability to obtain cars to ship oil from his wells to his refinery.

Mr. S. C. T. Dodd, in reply to a schedule of questions, made the following statement as to the process of growth of the Standard Oil combination:

"About the year 1872 the condition of the refined oil business was disastrous, and failures were of constant occurrence. Leading refiners began to combine for the purpose of making the business successful. The combination was by means of purchase of stocks and interests of various companies, and, until 1882, the combination was solely by stock ownership in the hands of a limited number of individuals, who controlled the corporations as agencies in a common sense business. In 1882 these owners entered into the trust agreement. The companies whose stock they owned, in whole or in part, appear in the same agreement. They were not then competing companies. The individuals named as trustees controlled them by virtue of absolute ownership of a majority of their stocks. When the trust was dissolved, in 1892, the same fact existed. The individuals then trustees continued to control the companies by virtue of absolute ownership of a majority of their stocks."

Mr. John D. Rockefeller, in answer to interrogatories submitted by the commission, made affidavit as to the growth of the Standard combination. He attributed the extension of its business, not to crushing of competitors, but to the need of additional capital in order to employ the most effective methods of manufacture and transportation. From time to time it was discovered that existing methods were unsatisfactory, and larger investments had to be made for improved methods. Thus to perfect the pipe line system required some \$50,000,000 of capital. This could not be obtained without industrial combination.

ORGANIZATION OF TRUST, 1882.

Up to 1882 there was no formal consolidation of the numerous refining and pipe line companies which were controlled by the officers of the Standard Oil Company or which were worked in harmony with it. At this time the Standard Oil Trust was formed, being the first organization to take on that form. The various separate organizations placed the control of their stock of property in the hands of trustees, who were thus able to control completely the operation of all the concerns.

Frank S. Monnett, Attorney-General of Ohio, testifies that there were altogether 39 companies which entered the Standard Oil Trust, 14 of which transferred all their stock and the remainder a controlling interest to the trustees. Besides this a large number of individual owners and firms entered the trust. There were nine trustees, holding office for three years, with one-third retiring annually.

The trust certificates were issued in amounts equal to the appraised value of each plant transferred. According to Mr. Monnett, there was no attempt to inflate the valuation. Each company agreed that no stock should thereafter be issued excepting to the trustees.

Mr. Emery, on the other hand, testifies, but without submitting detailed evidence, that refineries and other establishments were taken into the trust at rates greatly in excess of their actual value, the chief consideration being the power of monopoly which was thereby acquired.

Mr. Monnett testifies that the trustees themselves had 466,280 of the original 972,500 trust certificates. They also hold more than half of the shares of the present constituent corporations, while Mr. Rockefeller holds more than half of the number held by the trustees.

EXISTING ORGANIZATION.

1. Reorganization into separate companies, 1892.—The Standard Oil Trust, having been held illegal in various States, was dissolved in 1892, the separate establishments and plants being reorganized into twenty constituent companies having a capitalization of \$102,233,700. Thus certificates when surrendered were replaced by a proportion of the shares of each company properly divided.

The following form of transfer was used to give holders of trust certificates proportionate shares in the capital stock of each of the constituent companies established at the time when the trust form of organization was abandoned:

Know all men by these presents:

That we, John D. Rockefeller, Henry M. Flagler, William Rockefeller, John D. Archbold, Benjamin Brewster, Henry H. Rogers, Wesley H. Tilford and O. B. Jennings, trustees for winding up the Standard Oil Trust, by W. H. Tilford, our attorney in fact, and John D. Rockefeller, of New York, do hereby constitute and appoint John Bensinger, of New York City, our true and lawful attorney for the purposes following, to wit:

Whereas, John D. Rockefeller has placed in the hands of said attorney assignment No. A 365 for $\frac{256854}{972500}$ of the amount of corporate shares held by said trustees on the first day of July, 1892, in each of the companies whose stocks were so held.

Now the said attorney is hereby authorized to secure from each of said companies transfer upon their corporate books of said stock and stock certificates for whole shares, and scrip for fractional shares thereof, and when the said certificates and scrip are received from all the companies referred to the said attorney shall deliver the same to John D. Rockefeller, and the said assignment of No. A 365 shall at the same time be delivered to the said trustees.

And the said attorney hereby agrees to obtain the said certificates and scrip and to deliver the same and the said assignments as above specified.

(Signed in print.) JOHN D. ROCKEFELLER.
HENRY M. FLAGLER,
WILLIAM ROCKEFELLER.
JOHN D. ARCHBOLD.
BENJAMIN BREWSTER.

O. B. JENNINGS.

(Signed in ink.) WESLEY H. TILFORD.
W. H. TILFORD, *Attorney in Fact.*
JOHN D. ROCKEFELLER, per GEO. D. ROGERS.
JOHN BENSINGER.

Thus, Mr. Monnett testifies, the Standard Oil Company has several constituent corporations in Ohio. The Ohio Oil Company leases oil lands and purchases crude oil. The Buckeye Pipe Line Company' in conjunction with other pipe line companies owned by the Standard, makes a complete system which transports crude oil to the various refineries in Ohio and adjoining States. The Solar Refining Company engages in refining. The refined product is transported by the Union Tank Line Company, which has great advantages in the use of tank car and terminal facilities. It is by this control of the means of transportation that the Standard secures its monopoly.

Mr. Monnett further states that the Standard Oil Company, of Ohio, on August 5, 1891, sold its tank cars to the Union Tank Line Company for \$3,500,000, most of which sum it transferred in 1892 to the Standard Oil Trust for distribution among the holders of trust certificates. This was in defiance of the order of the Court, of 1892, prohibiting it from further relations with the Standard Oil Trust. Since then this company has paid no dividends, although it still pays salaries. Its accumulated funds have been apparently charged off for depreciation and profit and loss. Its officers refused to submit its books to the Courts, and are believed to have burned a large number of them.

2. Capitalization.—Mr. Dodd, in reply to a schedule of questions, stated that the property of the various companies entering the Standard Oil Trust, was valued at \$75,000,000 in 1882. In 1892 the value was estimated at \$121,631,312. Perhaps 50 per cent of this additional value had come from profits invested, the remainder from additional capital subscribed. Up to 1896 about the same proportion of profits continued to be applied to improvements, but since that time the profits have been divided, as is seen from the higher rate of dividends. An average of 5.77 per cent has been allowed for annual depreciation.

The inventory referred to by Mr. Dodd is as follows:

COMPANIES	Appraised Value	Capitalization
Anglo-American Oil Co., Ltd....	\$ 6,913,639 49	\$ 5,000,000
Atlantic Refining Co.....	8,631,376 67	5,000,000

Capitalization 20 corporations..	102,233,700 00
Excess.....	19,397,612 63

3. Existing relations of constituent companies and trust.—Mr. John D. Archbold testified that, although the Standard Oil Trust was dissolved in 1892, the men who were the former trustees have held a majority of the stock in all the different companies which made up the trust, so that they work together as harmoniously as before. The latest movement on the part of the combination, in order to secure more complete unity and to provide for the claims of small holders of trust certificates, is the organization of a New Jersey corporation entitled the Standard Oil Company. This corporation has a capital of \$100,000,000 of common stock and \$10,000,000 of preferred stock, and is authorized to own the stock of any of the different corporations connected with the Standard Oil Company and to buy from all parties who own such stock whenever they desire to sell.

Mr. Monnett testifies that a man could not have his trust certificates reconverted into stock of the several constituent companies, and get out of the trust, unless he held \$66,000 worth. This enables the trustees and a few others holding large amounts to exchange their certificates for stock and thus to practically control all the constituent companies, while smaller holders retain their certificates and are still receiving dividends upon them. Altogether only 54 per cent of the trust certificates were converted into stock. Holders of fractional shares in the separate companies receive no dividends.

Replying to this testimony Mr. Archbold states that the replacement of trust certificates by proportionate shares of stock in the separate companies has been going on steadily, and that only a small number of trust certificates are still outstanding. He admits that the dividends when declared are at a certain percentage upon these outstanding certificates and a properly adjusted rate upon the capital stock of the different companies. The rate of dividend may be considered as if it were entirely upon the trust certificates at their former full amount,

The prices at which Standard stock is quoted on the market are still based on the old trust certificates, since practically the equitable interest in each of the separate companies corresponding to a share in the trust certificates is of the same value. If the purchaser should buy trust certificates on the market and take them to the company it would give him either a proportion of the shares of each of the separate corporations or an equal amount of the stock of the newly formed corporation, the Standard Oil Company of New Jersey.

The Standard Oil Company has always kept its stocks and certificates off from the Stock Exchange, and there has been very little speculation in them. The officers and directors have bought and sold stocks only to a very limited extent, and usually for the purpose of increasing their holdings. Mr. Archbold himself has bought and sold only 100 shares during ten years.

Mr. H. H. Rogers states that when the Standard Oil Trust was dissolved those holders of trust certificates whose holdings were small received only fractional shares in the various separate companies, and on these shares they receive no dividends. The denominator of these fractional shares is about 975,000 and the numerator is often very small, so that the interest is so trifling

that it would be impossible to pay a dividend. Nevertheless the Standard Oil Company is prepared to do whatever is fair regarding such fractional shares.

DIVIDENDS AND PROFITS OF COMBINATION.

According to Mr. George Rice, the Standard Oil Trust from 1882 to 1892 paid dividends equal to more than double its entire capitalization in 1888. Since 1892, when the trust was nominally dissolved, thirty quarterly dividends of 3 per cent have been paid, and 77 per cent in special dividends since 1895, making a total of 167 per cent on its capitalization, or in all \$170,730,279. Aside from these dividends the company has invested millions of dollars of its net earnings in producing oil property.

Mr. Monnett's testimony confirms the above generally. He speaks specifically of extra dividends of 5 per cent in 1895, 19 per cent in 1896, 12 per cent in 1897, and 4 per cent in 1898. He adds that, judging from the recent rates of dividends, a prominent judge has said that the present value of trust certificates, whose face is \$97,250,000, would be \$486,250,000.

Other witnesses also refer to the high value of Standard stocks as showing enormous profits. Mr. Archbold states that on this point that the price prevailing at the time of his testimony, \$465 per share, was the highest ever known.

Mr. Dodd submitted the following statement, showing all the dividends declared by the combination since 1882. In addition to these a stock dividend of 20 per cent was declared in 1887. He stated that no distinction had been made in the distribution of profits between the former owners of closed and dismantled plants and others.

	Per cent.		Per cent.

Mr. P. C. Boyle believes that the profits of the Standard Oil Company have not been reduced by the depression in the price of crude oil. The capital stock of the company before its reorganization several years ago was \$100,000,000, and the witness has heard that it was worth \$500 per share. The stock of the Tidewater Pipe Line Company, which has a capital of \$10,000,000, was quoted at \$2,000 per share. There may be agreements between this company and the Standard, but it is not absolutely under the Standard's control.

OHIO SUITS AGAINST STANDARD OIL COMPANY.

I. General description.—Mr. Monnett, the Attorney-General of Ohio, testifies that suit was brought against the Standard Oil Company of Ohio in 1891, and a decree was secured in 1892 directing it to withdraw from the Standard Oil Trust. In November, 1897, the Attorney-General summoned the same company before

the Court on the ground that it had not withdrawn it in good faith, but simply modified the form of organization. On the basis of answers to interrogatories submitted to Mr. John D. Rockefeller, information was secured which led to filing suits against all the constituent companies of the original trust which were then doing business in Ohio—the Buckeye Pipe Line Company, Ohio Oil Company, Solar Refining Company and Standard Oil Company of Ohio. There were four causes of action: (1) As against public policy; (2) for confederating and attempting to evade the decree of 1892; (3) for violation of the Ohio anti-trust act of 1898; (4) against the Buckeye Pipe Line Company for transacting telegraph business as a common carrier, which was ultra vires. This company was found to be exchanging business with the Western Union Telegraph Company.

The present status of these suits (at the time of Mr. Monnett's testimony) is as follows: The officers of the Standard Oil Company of Ohio are before the Court on the charge of contempt for refusing to produce their books. They are also held for violation of the original decree of the Court, and it may inflict any fine it sees fit. An independent suit has been brought for taking away the charter of this company, and another suit for the same purpose is pending against the Buckeye Pipe Line Company, in which the witnesses are also before the Court for contempt in refusing to answer questions. If the existing suits are won, the monopoly of the Standard Oil Company in the Ohio field, which depends on its control of the pipe lines, will be destroyed.

Mr. Archbold, in replying to the testimony of Mr. Monnett generally, points out that the attacks upon the Standard Oil Company in the Courts of Ohio were injurious to the interests of the State, since that company, through the various corporations in which it is interested in Ohio, pays about \$250,000 taxes yearly and distributes \$3,250,000 as wages to 4,700 employees.

2. Production of books.—Mr. Monnett testifies, in further detail, that in these suits the Supreme Court of Ohio has ordered the Standard Oil Company of Ohio to produce its books and records, and it has refused to do so, relying on its constitutional rights. The question as to the power to compel it to produce its books is still pending. According to Mr. Monnett, testimony before that Court shows that a large number of books and papers were burned two or three days after the order requiring the production of books was made. The evidence of John McNirney on this subject is quoted in full. He was an employee in the car shops of the Standard Oil Company at Cleveland, and assisted in lowering certain boxes which he believes to have contained books from the office of the Standard Oil Company. That same day and the following Monday he assisted in burning a large number of books, taken from such boxes in the car shop furnaces. The books were large books, apparently ledgers, and many loose papers and letter-press books were also burned. Altogether nine chests and six sacks of materials were burned.

Mr. Archbold denies absolutely the fact of such burning of books by the Standard Oil Company. He

states that at the time of the original inquiry on the subject the company offered to produce every employee who could have any knowledge on the subject, each of whom could have denied the statement. The Attorney-General refused to have them sworn at the time, although he knew that the secretary of the Standard Oil Company of Ohio had made an affidavit that the books were in his possession.

3. Alleged attempts at bribery.—Mr. Monnett refers to the alleged attempt of the Standard Oil Company to bribe himself, as Attorney-General of Ohio, and offers to submit papers in the case, but presents no further evidence.

Mr. Archbold testifies that affidavits have been filed with the Supreme Court of the State of Ohio denying specifically all of Mr. Monnett's charges of attempted bribery, and asking the Court to appoint a commissioner to investigate the charges. The Court has not acted upon the subject, but the company is anxious that it should do so.

I. PIPE LINES—CONTROL BY COMBINATION

EARLY HISTORY.

Mr. Boyle gives a somewhat detailed history of the development of pipe line transportation in the oil business.

The first successful pipe lines were established in 1864 from Pithole to the Miller farm. Others were soon constructed in the same district. These were usually short, scarcely over five miles in length, and at first did not even connect directly with the wells themselves, although this practice was soon established. Numerous lines soon grew up in different parts of the oil region, but the first more extended systems date from 1869, when the Mutual Pipe Line was laid more or less throughout Clarion county. Vandergrift & Forman later established a system through Butler county, which became the nucleus of what is now known as the United Pipe Line System.

The original pipe lines were only transporters of oil, but the nature of their work soon led them to purchase oil, although at first it was not in the name of the company itself. At times there were rumors casting doubt on the integrity and solvency of some of the pipe lines. The prices which purchasers of oil were willing to pay to the pipe lines varied accordingly, since they were sometimes in doubt as to whether the oil would be forthcoming. It was quite common in those days for shortages to be discovered in the amount of the oil held by the pipe lines as compared with the amount which they owed to certificate holders. The lines would use oil or sell it and expect to make up the shortage by purchase later on. Mr. Boyle quotes from a published statement of the Atlantic Pipe Line in 1876, acknowledging a shortage of 6,000,000 barrels, but stating that 15,000,000 barrels had been purchased to cover it.

Mr. Emery also makes a brief statement of the early history of pipe lines. He states that the first attempt to combine separate pipe lines into a more complex system was made by William H. Abbott and Henry Harley, beginning about 1866. By 1869 they had a

capital of nearly \$2,000,000, and 500 miles of pipe centering in the Miller farm. The concern was then known as the Pennsylvania Transportation Company.

ABSORPTION OF COMPETING LINES BY STANDARD.

1. History.—Several witnesses describe the process by which the Standard Oil Company gradually secured control of the various pipe lines throughout the oil region. The opponents of the trust attribute the success of the Standard Oil Company in this movement to the railway discriminations upon oil received from pipe lines controlled by that company. It appears that for a considerable period a rebate of 22 cents per barrel was allowed on oil from the pipe lines maintaining the agreed rates of pipage. These discriminations are more fully described under the head of Railway Discriminations. Other opponents of the combination ascribe its success in driving out competing pipe lines largely to the practice of paying premiums upon oil in the territory of such competing lines.

Mr. Boyle gives the fullest statement of the growth of the pipe line consolidation during the seventies, and attributes it to the natural advantages arising from large capital and from skill in organizing. He testifies that during the early part of the decade very numerous pipe lines had been established. These were at first constructed on a small scale by separate oil producers, but having entered the business many producers were inclined to extend their lines and form a system. There thus arose an excessive number of competing lines, and the solvency and integrity of some of them became a matter of doubt. This excessive competition was the cause of driving the pipe lines into a more complete organization. As early as 1873 or 1874 a pooling arrangement was made by some of the pipe lines, and rebates were paid by railways on oil received from such lines. The United Pipe Line Company was established in 1877, with a capital at first of \$3,000,000, and acquired by purchase a large number of lines. The new company included many producers and stockholders of the smaller companies, but it is estimated that the persons controlling the Standard Oil Company had somewhat more than a one-half interest in the United Pipe Lines. The National Transit Company is the present owner of the United Pipe Lines System, and the Standard Oil Company controls the National Transit Company.

Mr. Archbold states that the small lines which existed during the early period were inadequately capitalized and inefficient in many cases; that consolidation was welcomed by all producers, and resulted in a lowering of charges for pipage from 40 to 20 cents per barrel.

Mr. Rockefeller also speaks of the necessity of very large capital to conduct the pipe line business advantageously.

2. Premiums on oil reached by competing pipe lines.—Mr. Lockwood declares that, by means of the high rebates which the pipe lines controlled by the Standard secured from the railways, they were able to offer higher prices for oil to the producers and to sell at lower prices to refiners than independent pipe lines were. In this way twenty-six pipe lines, built during

the early seventies, were driven into bankruptcy, and were absorbed by the United Pipe Line and the American Transfer Company. These pipe lines were practically shut out of the market.

A similar policy has been pursued in attacking independent pipe lines built later. Thus, in 1887, Craig, Elkins & Kimble built the Western and Atlantic Pipe Line. The price of oil at that time was 69 cents, but by the time the new pipe line was fairly in operation, in 1888, the price was raised to 88 cents per barrel, while the white-sand oil in the counties reached especially by the new pipe line was placed at a premium by the Standard Oil Company, which paid from \$1.08 to \$1.13 for oil at the wells. In November, 1889, the price of this oil had reached \$1.30, and the witness, as a producer in that district, was drilling many wells in the hope of very large profits. About this time the new pipe line was bought by the Standard Oil Company at the price demanded by its owners, and the very next day the premium on oil from this district was taken off, while the price of crude generally fell gradually to 53 cents. The witness and other producers suffered great losses from this reduction, while the Standard Oil Company made sufficient profits by it to recompense itself for the purchase of the pipe line. The price of refined oil was not reduced. This great decrease in price could not be attributed simply to the increase in production.

Mr. Phillips also testifies to the practice of the pipe lines controlled by the Standard Oil Company of paying premiums on oil for the purpose of attacking competitors. He also believes that the Standard recoups itself for the cost of pipe lines purchased by lowering prices to producers and raising them to consumers.

Mr. Boyle considers the paying of premiums upon oil in fields reached by independent pipe lines a necessary method of competition. The new pipe lines make it a practice to cut charges for pipage in order to secure business, and the Standard Oil Company practically merely meets such cuts by paying premiums upon oil from the district, while keeping its nominal pipage charge the same. The witness referred especially to the Peerless or Keystone pipe line, which fixed a pipage rate 5 cents below that of the National Transit Company, so that the latter was forced to bid a premium of that amount in order to get oil. The same condition of affairs existed regarding the Craig-Elkins line referred to by Mr. Lee. On being questioned further concerning the amount and purpose of such premiums, Mr. Boyle stated that he had knowledge of premiums being placed on oil regardless of any superiority in quality, and of premiums being taken off, but that he had no knowledge of the purpose of such premiums.

Mr. Archbold states that the premiums paid by the pipe lines controlled by the Standard Oil Company for oil from particular districts are usually due to superior quality of the oil, this being the case at present with the Franklin, North Lima and Scio oil. But "where we have found, after providing these special facilities, which have no value for any other purpose, that our business was attacked by a newcomer, we have, of course, endeavored to protect it." Mr. Archbold admitted, specifically, that when the American pipe line was built through to Philadelphia, a premium was put on the oil from the large fields in Butler county and

Washington county, and that this premium was taken off as soon as the pipe line had been purchased. "We would do the same thing again." The premium in these cases was due to the competition, unquestionably.

Mr. Rogers confirms Mr. Archbold's testimony in every particular. He states that at present the only premiums which are paid are on account of superior quality. In most cases the Standard Oil Company has been forced to pay premiums by competitors reducing pipage or paying higher prices. A premium is not to be considered as of the nature of a rebate, since it goes to the producer, while pipe line charges are paid by the refiner or exporter, and rebates would go to them.

3. Existing independent pipe lines.—Aside from the competition of the Producers' and Refiners' Pipe Line, hereafter referred to, the Standard Oil Company meets competition in the Ohio field from the Manhattan Oil Company, and in the Indiana field from the Cudahy pipe line. There is trifling competition in the Scio field.

OPPOSITION OF STANDARD TO FREE PIPE LINE LAW.

Opponents of the Standard Oil Company declare that a further means by which the combination prevented the establishment of competing pipe lines and secured its monopoly was the preventing for a long time of the passage of a law in Pennsylvania permitting the exercise of the right of eminent domain throughout the State for the laying of pipe lines.

Mr. Emery testifies that the first pipe line companies were chartered by special acts of the Legislature, and that privileges were given only to a favored few. The indignation over the exposure of the South Improvement Company scheme in 1872 forced the Legislature to pass a law granting any person the right to lay pipe lines, with the privilege of eminent domain, within eight of the leading oil counties. The witness at that time sought to persuade Mr. Scott, president of the Pennsylvania lines, to reach competing lines of railway and water transportation. This Mr. Scott refused to do, and the act did not apply to Allegheny county, so that pipe lines could not reach the city of Pittsburg.

Numerous pipe lines were established under this act, but it was practically repealed by the Wallace Corporation Act in 1874, and within a few years the Standard Oil Company, by a corrupt bargain with the railroads for discriminating rates, forced all but one of these lines into bankruptcy, and bought them up. Since 1876 the entire oil district has been under the complete dictation of the trust, until the organization of the new independent pipe lines, beginning about 1890.

Mr. Emery, who was a member of the Pennsylvania Legislature, and actively engaged in pushing the passage of the free pipe line bill from 1874 to 1883, further declares that the Standard Oil Company did directly oppose that bill. In 1883, when he and Mr. Lee were making speeches in behalf of the bill in various parts of the State, the Standard Oil Company attempted to influence the farmers by arguing that pipe lines would injure their property. The witness refers specifically to a meeting which was held in favor of the bill at Lancaster, Pa., at which dodgers were scattered headed:

"Look out for false prophets." The dodgers declared that "these people are endeavoring to pass a law that will destroy the springs of your farms; it will blow up your houses; it will create havoc in your fields when the pipe bursts, killing the grass. Most dangerous of all laws." Mr. Archbold, so Mr. Emery declares, is mistaken in his testimony on this point.

Mr. Lee's testimony states practically the same facts as Mr. Emery's on this point, in less detail. He adds that in 1883 the Standard Oil Company probably controlled 90 per cent of the crude oil transported, and it has sought to secure control of all new lines since that time, so that it still has practically the same proportion.

Mr. Archbold denies that the Standard Oil Company opposed the passage of the free pipe line law in Pennsylvania. The company was entering the business largely and understood the importance of the measure to the entire petroleum trade. He denied the issuing of any circular opposing the measure, but modifies this statement by saying that he does not know of any being issued.

Mr. Boyle knows of no direct opposition of the Standard Oil Company to the passage of the free pipe line law in Pennsylvania, or to the laying of independent pipe lines, although he knows of a single instance where the Standard Oil Company secured a right of way in order to prevent another pipe line from being built.

OPPOSITION TO LAYING OF INDEPENDENT PIPE LINES.

I. Charged against Standard.—Another method which has been employed by the Standard Oil Company to prevent the laying of competing pipe lines appears to be the purchase of land intended to be crossed by such pipe lines and the influencing of railways to oppose the crossing of their tracks by such lines.

Mr. Lee testifies that this practice was employed during the earlier history of the pipe lines. The most active opposition to the laying of such pipe lines, however, was manifested when the independent oil interests in Pennsylvania attempted to establish the United States Pipe Line to the seaboard. Mr. Lee's testimony on this point is substantially the same in general import as that of Mr. Emery given below, but is less detailed.

Mr. Emery gives a detailed history of the attempt to lay the United States Pipe Line, of which he was a prime mover and the first president. He states that in 1890 he determined personally to build a line to the coast, if possible, to avoid the excessive transportation charges. He first went to the president of the Reading Railroad with a view to securing a contract for transporting oil by that railroad from Williamsport, Pa., pending the further extension of the line. After some delay he received the reply: "If we give you this contract, we shall disturb our relations with the Standard Oil Trust, and we can not do it." He then determined to lay the line along the boundary of New York and Pennsylvania to Hancock, N. Y., and to secure a contract with the New York, Ontario and Western for transporting oil to the Hudson, with a right to construct a pipe line later along its tracks. This contract having been secured he approached the Erie Railroad,

and was told by Mr. Thomas, its president, that he would be permitted to cross the road at Bradford and to pass under its bridge over the Delaware at Hancock or through the bank of the road.

Meantime Mr. Emery had been employing experts to secure right of way for the pipe line. As soon as the movement became known a number of men, who the witness knows were connected with the Standard Oil Company, began to seek a right of way over this same territory. They bought mortgages against pieces of land along the route to induce the owners to give them another right of way. They bought a number of strips of land in New York, just beyond the Pennsylvania State line, crossing the pipe line. In New York the former free pipe line law had been so amended as to be practically ineffective. All these difficulties were, however, finally overcome, after great delay and expense.

When the attempt was made, however, to lay the pipe line under the Erie Railroad, at Bradford, the witness was surprised to find it opposed by force. His employees drove away the railroad men, but the laying of the pipe was afterwards prevented by injunction of the Courts, although it had been intended to cross at the same place where the two Standard pipe lines had been permitted freely to cross. At Hancock, also, without warning about such opposition, the men building the new pipe line were met at the bridge of the Erie Railroad with forcible opposition. They remained there three months, but were finally compelled to give up the attempt. At the same time the New York, Ontario and Western violated its contract, and the pipe line was finally forced to go back seventy miles to the Susquehanna river, and to build from Athens to Wilkesbarre. It was necessary to make legal contests for the crossing of every railroad, and the witness comments on the fact that almost identically the same briefs were presented by lawyers of different railroads at different places in their opposition. The various expenses of litigation, loss of time and business, entailed a loss of \$150,000 in reaching this point.

For some time the pipe line transported oil from Wilkesbarre by rail over the New Jersey Central. It then sought to extend its line farther toward the coast. It succeeded in crossing the Pennsylvania Railroad by obtaining ownership of an acre of land. When it reached the Delaware, Lackawanna and Western a farm was bought over which the railroad passed, and it was believed that the line could be legally laid under a culvert where the owner of the land has an undisputed right of passage. Nevertheless the line was built by night, and was strongly secured in place and guarded. The employees of the pipe line company forcibly prevented a large number of railroad employees from taking up the pipe line. It was arranged that men on each side should be arrested in order to make a peaceable legal fight, but while these proceedings were going on a couple of locomotives were brought up by the railroad, and hot coals, hot water, stones, etc., were thrown at the men below. The railway employees were finally driven away; the pipe line employees secured arms and held possession of the field for seven months. The lower Courts decided in favor of the pipe line, but after four

years of litigation the Supreme Court of New Jersey has decided that the pipe line must be removed. The line does absolutely no harm. The line will ultimately have to build to Philadelphia.

The pipe line company now transports oil from this point fifty miles over the New Jersey Central to the coast. The amount paid for freight is not, as stated by Mr. Archbold, \$6 or \$7 per car, but about \$10 per car, a high rate for that distance. The actual rate is 7.8 cents per barrel on refined and 6½ cents on crude.

Mr. Emery believes that New Jersey and other States should pass laws allowing pipe lines to be laid wherever desired, by taking land by eminent domain, and paying the damages, just as is practiced in laying railways. He has attempted to secure the passage of such an act in New Jersey, but implies that corrupt influences prevented it.

Mr. Phillips testifies that it was the belief of the independent interests that the opposition to the laying of the United States Pipe Line through New Jersey was instigated by the Standard Oil Company. Mr. William Rockefeller is a director, he has been informed, of the Delaware, Lackawanna and Western Railroad.

2. Denial.—Mr. Archbold testifies that the opposition of railways, especially the Delaware and Lackawanna, to the crossing of their tracks by the United States Pipe Line Company was not caused by the influence of the Standard Oil Company in any way whatever. In this particular case the pipe line company had carried its line across the railway surreptitiously, on a Sunday, and had then placed an armed force to protect it. The Supreme Court of New Jersey finally decided that the pipe line company must remove its line.

The freight rates now received by the United States Pipe Line Company from the terminus of its line to the seaboard, over the Central Railroad of New Jersey, are lower than the Standard Oil Company has ever received for an equal distance.

The crude oil is carried 52½ miles at the rate of \$7.93 per tank car containing twenty tons, and the railroad returns the empty cars free. This contract is for one hundred years, and may be abrogated by the pipe line company upon five years' notice, the railway company having no right to abrogate it.

Mr. Boyle is inclined to believe that the methods used by the Standard Oil Company in opposing the laying of pipe lines by the independent oil men are entirely justifiable. It is just as fair to purchase land in front of a pipe line to prevent its passage as to purchase land desired by a competitor for any other purpose, by offering a higher price than the competitor can afford to pay. The duplication of pipe lines generally is wasteful and inexpedient.

Mr. Boyle also cites an instance where the Standard Oil Company itself encountered opposition to the laying of its pipe lines by other refiners. In 1874 the National Transit Company undertook to lay a pipe line from Parkersburg to Macksburg, and were stopped at several points by the leasing of land to Mr. Ogle at the instance of Mr. George Rice. Contracts were made with farmers to secure the exclusive right to cross their lands at exorbitant prices. Mr. Rice

actually built a pipe line, but not in accordance with these contracts, his sole purpose being to prevent the laying of the Standard's line.

NATIONAL TRANSIT COMPANY.

1. Charter.—The present charter of the National Transit Company is identical in its terms with the charter held by the South Improvement Company. Mr. Emery submitted the full text of both charters and described the manner in which the National Transit Company secured its charter, proving his statement by official records. On March 22, 1871, a charter was granted to the Overland Contract Company, the incorporators being the same persons who received the charter of the South Improvement Company on May 6, 1871. Both companies were given the powers contained in the charter of the Pennsylvania Company, passed April 7, 1870. The name of the Overland Contract Company was changed, on May 16, 1871, to the Southern Railway Security Company. This company failed to pay taxes on its capital stock to the State of Pennsylvania, and in 1873, the amount then due the State being \$18,345, its charter was seized by the State and was held until 1881. At that time it was sold by the State for \$16,251 to individuals who later transferred it to the National Transit Company.

The witness dwelt especially upon the fact that the existing National Transit Company has the same excessively wide powers as were given to the South Improvement Company, and implies that it is abusing these powers in essentially the same manner as that company did.

2. Efficiency of Pipe Lines.—Mr. Boyle submitted an extract from the Pittsburg Commercial Gazette of May 5, 1892, showing the manner in which the National Transit Company had met the immense demand for new facilities for storing and transporting oil during the rapid development of the McDonald field in 1891. In July of that year the output of the McDonald field was only about 3,000 barrels daily. By the middle of August it had reached 15,000 barrels, but by the 1st of September the National Transit Company was able to handle 26,000 barrels per day. By the 1st of October it could handle 40,000 barrels per day, and when in November the production of oil reached nearly 80,000 barrels per day the capacity of the pipe lines had been raised above that figure. Iron tankage of the capacity of 3,000,000 barrels was erected during these few months and 53 miles of pipe of different sizes were laid within a territory of 12 square miles. Many powerful pumps were installed to force the oil through the pipes. In round numbers 10,000 tons of iron and other building materials were shipped into the McDonald field for erecting tankage alone.

The witness refers to this experience as showing the necessity of large consolidated capital to meet the exigencies of the oil business. It would not have been possible, even if numerous large pipe lines had existed, growing up under a free pipe line law, for them to cope with such a sudden demand

unless by constant and thorough co-operation. The new independent pipe lines have not shown themselves at all competent to meet the needs of the producers.

3. Amount of Business, Etc.—Mr Rogers states that the amount of residuum in the bottom of the tanks of the National Transit Company is published monthly. The company owns about 35,000 miles of pipe, ranging from 2 to 8 inches in diameter. The estimated amount of oil in pipes 5 inches in diameter and over on October 1, 1899, is 535,528 barrels. The witness submitted the following statement of credit balances outstanding against the National Transit Company from 1889 to 1899.

CREDIT BALANCES IN NATIONAL TRANSIT CO.

[IN BARRELS OF CRUDE OIL OF 42 GALLONS EACH.]

Time.	Barrels.
June 30, 1889.....	3,217,749.16

December 31, 1898.....	3,822,997.28
June 30, 1899.....	4,910,451.22
September 30, 1899.....	5,349,392.54

According to Mr. Davis, the pipe line companies (in the Ohio field) have their own experts for gauging tanks, although the producer may have a representative present when the tanks are gauged. The pipe line company deducts 2½ per cent of the amount of oil received from the producer on account of the waste and evaporation. There is considerable sediment and surplus in the tanks belonging to the Standard Oil Company, but it is supposed that this is partly sold to refiners and partly charged up against producers. When losses by fire occur the producers in the locality are assessed by a reduction of their credit balances, although the witness believes there is no contract authorizing this.

EFFECT OF PIPE LINE MONOPOLY.

1. Control of Competition.—It was pointed out by several witnesses that the almost complete control of the pipe line system by the Standard Oil Company gives it great power in fixing the prices of crude oil, since producers can dispose of their product only through the pipe lines, especially in

view of the fact, which is alleged, that railway rates on crude oil are by agreement kept at least as high as, if not higher than, the pipe line charges. The pipe line system also gives the combination great advantage over other refiners, who must pay the rates of pipage fixed by the Standard, which are claimed to be excessively high, or the high rates of freight. The evidence in detail as to the arrangements between the railways and the pipe lines is given under the heading "Railway Discrimination." The evidence as to pipe line charges follows.

2. Purchase of Crude Oil by Pipe Lines.—The practice of the pipe line companies controlled by the Standard Oil Company is to receive all oil produced by the wells with which their pipes are connected, gauging the amount and recording the quantity received from each producer. The producer can then at any time, by the custom of the business, although not by contract, receive from the company the value of his oil in store at the price for that day. He can instead receive "pipe line certificates" for 1,000 barrels each, which are negotiable in open market. The independent pipe lines apparently follow the same practice and often pay from 1 to 9 cents per barrel more than the Standard Oil Company.

3. Pipe Line Charges.—Mr. Lee, Mr. Phillips, Mr. Emery, Mr. Davis and Mr. Rice maintained that the pipe line charges of the standard Oil Company are excessive. The rate for local pipage is 20 cents per barrel, and for the transportation of oil to the seaboard 45 cents per barrel. These rates have not been reduced for fully 20 years. The rate charged by the independent pipe line organizations for local pipage is 15 cents per barrel.

Mr. Phillips testifies that he has been informed that the cost of transporting oil through the United States Pipe Line, when carrying half of its capacity, is about 5 cents per barrel as far as the terminal in New Jersey. The cost of gathering oil in the producing field is estimated at from 3 to 5 cents per barrel.

Mr. Lee points out that the cost of 2-inch pipe has fallen from 35 cents to 6 cents per foot. He believes the cost of local pipage is from 7 to 8 cents a barrel.

Mr. Rice believes that the cost of local pipage does not exceed 5 cents and that the cost of pipage to the seaboard is about the same. In proof of this Mr. Rice refers to a paragraph in a contract between the National Transit Company and the Tidewater Pipe Company, referring simply to their local lines. In this contract a division of traffic is arranged for, and it is provided that if either party shall gather by its local lines more than its percentage it shall pay to the other three-fourths of the local charge, i. e., 15 cents on each barrel of such surplus. In accordance with the customary method of pooling, there is a certain implication, although not conclusive, that the actual cost of piping is 5 cents, the profits from the surplus charge above actual cost being paid over to equalize the traffic.

Mr. Rogers, president of the National Transit Company, believes that the pipe line charges of the

company, 20 cents per barrel, are reasonable, although they have not been lowered for twenty years. The company undertakes to lay pipe lines without extra charge to new wells, even though 15 or 20 miles distant, if there is a reasonable prospect of considerable petroleum. Such laying of pipes involves considerable risk, since the production may prove slight or may decline. Although the company takes up the pipe lines, which are no longer needed and uses the material elsewhere, this involves considerable expense. The witness does not believe that the independent pipe lines, which make a lower pipage charge, are prepared to furnish facilities wherever demanded; their systems are confined to narrow fields.

The practice of charging the same price to all producers is, on the whole, fair, in view of the constant change of conditions regarding each well.

The witness does not know the actual cost of gathering oil or the profits of the National Transit Company. The charge for carrying oil to the seaboard is 45 cents per barrel, and the witness does not think that anybody knows what the actual cost is.

The cost of pipage in any case does not affect the producers, but comes from the purchaser of the oil. The receipts given by the pipe lines apply to oil received at the wells, and are immediately merchantable.

On being questioned as to the reason why no further reduction in pipage charge had been made, Mr. Archbold testified that the cost of laying pipes had been sometimes more and sometimes less than before, and that the long distance for which pipes have frequently been laid to reach new fields have involved heavy outlay.

REBATES AND DISCRIMINATIONS BY PIPE LINES.

Mr. Boyle submitted a series of letters between R. P. Crawford and Mr. H. McSweeney, and also a letter from Mr. S. C. T. Dodd, solicitor of the Standard Oil Company, all these letters bearing dates during 1884, referring to the matter of rebates granted by the pipe lines during the seventies. In his letter Mr. Dodd states that about 1879 Mr. Crawford and others brought suit against the United Pipe Lines, a Standard organization, asking for forfeiture of its charter on the ground that it had made discriminations in pipage charges between different individuals. Criminal suits on the same ground were brought at the same time. Mr. Dodd found that, so far as any discrimination had existed, it was due to contracts for special rates which had been inherited from pipe lines absorbed into the United Pipe Line Company, among which was one between Mr. Crawford, for the Bear Creek Oil Company, and the Mutual Pipe Line Company. Such discriminations were believed by Mr. Dodd to be against public policy and he ordered them discontinued. The letters from Mr. Crawford to Mr. McSweeney demand the payment of 5 cents per barrel upon all oil received from certain wells between

1879 and 1884 on the ground of this previous contract with the Mutual Pipe Line Company for a 15-cent rate of pipage. The demand was finally refused by Mr. McSweeney in view of the information furnished by Mr. Dodd in his letter.

IMMEDIATE SHIPMENT.

Mr. Boyle states that there has been considerable confusion in the public mind in regard to the meaning of the phrase "immediate shipment" in connection with oil. This practice was first resorted to in 1872, but was most prominent during the excessive production in the Bradford field. At this time it was impossible for the pipe line companies to furnish tankage with sufficient rapidity, and it became the custom to take oil for immediate shipment, so that the purchasers might come into the market owning tankage and having cars to ship oil and purchase oil at a lower price than prevailed on the regular markets.

INDEPENDENT PIPE LINES AND OTHER ORGANIZATIONS.

HISTORY OF ORGANIZATIONS.

Much testimony was given concerning the various organizations recently formed by the independent oil producers and refiners, their relations to one another and to the Standard Oil Company.

According to Mr. Boyle, these movements grew out of the earlier Producers' Protective Association, which during 1887 and 1888 had formed an agreement among producers and between them and the Standard Oil Company for restricting production. He states that this organization first attempted to build an independent refinery, but impracticable men were put in charge and it failed.

The first pipe line company to be organized was the Producers' Oil Company, Limited, which built a pipe line from the refineries in Titusville and Oil City to the new McDonald oil field. The next company to be formed was the Producers and Refiners Oil Company, which brought in the independent refiners to assist in the movement. According to Mr. Boyle this new company, capitalized at \$250,000, practically took over the property of the Producers' Oil Company, capitalized at \$600,000. It appears from other witnesses also that these two companies are substantially identical, although maintaining separate organizations.

The United States Pipe Line Company was the next to be organized, the purpose being the transportation of both refined and crude oil to the seaboard. The last company formed was the Pure Oil Company, organized in June, 1895. Mr. Boyle declares that previous to the formation of this company an attempt had been made to combine the other independent organizations, which was checked by suit of some of their stockholders. One of the chief purposes of the new company was to secure

control of the other two companies. It was organized as a New Jersey corporation in 1897, with an authorized capital of \$1,000,000, of which about \$377,000 has been paid in.

The testimony of Mr. Boyle concerning the organization of the Pure Oil Company and its purpose of securing control of the stock of the other independent companies is confirmed in most particulars by Mr. Lee, and especially by Mr. Phillips, who said that the four independent organizations are practically controlled by the same individuals. The persons who took stock in the first company were also stockholders in the others. The purpose of the organization of the Pure Oil Company is largely to prevent the Standard Oil Company from securing control of any of the other independent organizations, as it has repeatedly attempted to do. It is expected that ultimately a majority of the stock of each of the other companies will be held by the Pure Oil Company. It has been proposed to increase the capital of the company to \$10,000,000. The Pure Oil Company is also engaged in marketing refined oil, and has been specially successful in Germany.

CHARACTER OF INDEPENDENT ORGANIZATIONS—VOTING TRUST.

There was considerable controversy between the witnesses defending the Standard Oil Company and those opposing it as to the precise character of the Pure Oil Company. Mr. Boyle and Mr. Archbold declared that it was a trust of the closest possible kind, basing this statement both upon the fact that it was seeking to combine other corporations, and especially upon the fact that its stock has been put in control of a voting trust.

I. Text of Agreement of Pure Oil Company.—Mr. Boyle and Mr. Archbold each cited in full the former voting-trust agreement of the Pure Oil Company. Mr. Lee later furnished the commission with a copy of the present voting trust agreement, which contains some important changes from the earlier one.

This agreement states that the purpose of its formation is to prevent at all times a diversion of the resources and business of the Pure Oil Company from their intended use and courses, in opposition to monopoly in the business, and to permanently protect and maintain what are known as the independent interests in the petroleum industry. The holders of 16,000 shares, being more than a majority, vest the voting power of such shares in 15 persons for 20 years, and it is agreed that one-half of all shares hereafter subscribed shall similarly be transferred, but this shall not give to purchasers any right other than provided in the trust agreement. The trustees are to vote for the election of all directors to the full number of shares so held, as a unit. In case of difference of opinion among the trustees a four-fifths vote of the shares held in trust shall decide the matter. One-third of the trustees retire annually and their successors are elected by the

general stock holders. Any trustee may be summarily removed by three-fifths of the trustees together with three-fifths of the shareholders in trust. By similar vote, but in no other way, the trust agreement may be modified.

2. Rules of Pure Oil Company.—Mr. Boyle also submitted the by-laws and regulations of the Pure Oil Company. The following quotations will give a clearer idea of the precise nature of this organization. They show clearly the purpose of the Pure Oil Company to acquire control of other corporations, and to prevent the stocks of such corporations from falling under the control of outside interests.

"1. The business of the company shall be the producing, purchasing, transporting, storing, and selling of crude petroleum and its products, and aiding other companies and parties in the production, transportation, storage, manufacturing, and sale of the same. The corporation may acquire, hold, manage, and dispose of any stocks, shares, bonds, and other interests in or issued by any corporation, joint stock company or limited partnership association engaged in, or aiding, or promoting the producing, transporting, storing, refining and selling of crude petroleum or its products, or in any business incident thereto."

"5. Interests of the company will be represented by shares which may be divided and transferred, including preferred, common and deferred shares, to be issued, held and transferred, subject to the by-laws and regulations of the company."

"6. A majority of all the shares of the company shall be held in a permanent trust approved by all the shareholders, to secure the control of the company and the faithful maintenance of the policy agreed on for conducting the business of the company in the interest and for the protection of all concerned in its affairs. The shares so held shall be designated as trust shares."

"8. No preferred stock shall be issued except as cash to the extent of one hundred dollars for each share of such stock issued shall be paid into the treasury of the company to the credit of capital, or of surplus, or of the guaranty and redemption fund, to be created as prescribed in section 2 hereof, as may be deemed advisable."

"9. The deferred shares of the company may be issued for cash, investment securities, property, services, payment of expenses, making disbursements of any kind, and in exchange for shares of other classes issued by the company at the discretion of the directors, with the written consent of the owners of a majority of the shares of the company at the time outstanding.

"10. The holders of preferred stock shall be entitled to receive cumulative dividends thereon of one dollar and a half per share quarterly, in full, before any dividend shall be payable on the common stock."

"12. The guaranty and redemption fund shall be applicable to the general uses of the company, but may be applied to buying shares of all classes, in

the order of their priority or right to dividend, as stipulated, at the lowest rates at which any shares of the same class can be bought, not over one hundred and ten dollars per share, on demand of the several owners and holders of shares, respectively, made within a prescribed time after the payment of dividends."

"13. * * *. The shares of any class so purchased may, when authorized by the owners of a majority of all the shares of the company, be resold at any time, at the discretion of the directors, at any price not less than that at which they were severally purchased; or they may be retired from the classes to which they belong, and be placed in the treasury of the company, to be held, reissued and sold for its use and benefit, subject to such conditions as the directors may prescribe, in accordance with the regulations of the company."

"15. The owners of a majority of the trust shares, acting together, shall have the right to convey to the company, absolutely or in trust, permanently or temporarily, and subject to such conditions as may be stipulated in such transfer, any securities regularly yielding net income, provided that the receiving and holding of such securities shall not subject the company to any prejudice, or embarrassment, or legal liability to pay any money on account thereof; and no such temporary transfer in trust shall be terminable until the well-established net income of the company from its regular business and other sources of permanent revenue shall be equal to the maximum amount to which it may be raised by such temporary transfer in trust."

3. "Trust" Character of Pure Oil Company.—On the basis of this voting trust agreement Mr. Boyle and Mr. Archbold declare that the organization of the Standard Oil Company was fully as justifiable in its nature as that of the Pure Oil Company, and that the latter is as much a trust as the former ever was. Mr. Boyle especially emphasizes the clause seeking to make the voting trust, as he states, perpetual, by providing that it may be dissolved only by the winding up of the Pure Oil Company, or by the consent of the equitable owners of four-fifths of the shares held in trust, together with four-fifths of all other shares of the company, after providing for the redemption of all preferred and common shares of the company then outstanding at \$110 per share. It is to be noticed, however, that this clause is modified by the new voting trust agreement, which provides that the trust may be cancelled by a vote of three-fifths of both classes of shareholders, on the redemption of the preferred shares only, at \$110 per share. Moreover, the charter of the company itself expires in 46 years.

4. Denial of "Trust" Character.—Mr. Phillips and Mr. Emery are exceedingly emphatic in denying that the Pure Oil Company is a trust in any such sense as the Standard Oil Company is. The sole duty of the trustees, as holders of a majority of the shares, is to vote along with other stockholders in electing directors. The directors manage the affairs of the company. The large number of the

trustees, fifteen, is due to a desire to make the body representative of the interests of the oil country.

The formation of the voting trust was rendered absolutely necessary by the attempt of the Standard Oil Company, through the National Transit Company, to secure control of the Producers Oil Company and the United States Pipe Line Company, through the purchase of shares—a transaction which Mr. Phillips describes fully.

The Pure Oil Company was not organized for the purpose of securing a monopoly, as the Standard Oil Company was, but to prevent a monopoly and to preserve competition in the petroleum industry. It is not the purpose of the Pure Oil Company to get control of any other person's business or to absorb its competitors, but merely to put the business of its own constituents in such a form as to prevent its destruction. The company and its members desire only a fair portion of the oil business, not the whole of it. If it were possible for this company to obtain a monopoly of the entire market, Mr. Phillips would not desire to be connected with it; the responsibility would be too great. Although the Standard Oil Company does not control the entire industry, yet its control of over 80 per cent. of it is sufficient to constitute a monopoly and to enable it to fix prices. The Pure Oil Company, on the other hand, has none of the characteristics of a trust in the sense of an industrial combination or monopoly, as defined in statutes, dictionaries and common thought.

Mr. Emery added also that the independents feared that when the voting trust of the United States Pipe Line expires, as it will in a short time, the Standard Oil Company will secure control of still more of its stock and attempt to control it. This is one of the motives for the organization of the Pure Oil Company, and the attempt to secure control through it of the stock of the other independent corporations. It has not yet, however, been decided finally that the Pure Oil Company shall consolidate the others, but it is being seriously discussed.

5. Voting Trust of United States Pipe Line Company—Mr. Archbold also cited in full the voting-trust agreement of the United States Pipe Line Company. This agreement states that the voting trust is created in view of the fact that the company is organized by persons each interested peculiarly in the oil business, and for the purpose of securing and furnishing to each an independent outlet for his products, both crude and refined, not controlled or influenced by others hostile to their respective interests. In order to keep the control of the stocks of the company in hands friendly to the independent interests, the signers of the agreement vest their respective interests in the stocks of the company in A. D. Wood as trustee for the period of five years from April 1, 1893, unless sooner terminated by a vote of three-fourths of the stocks so held in trust. No sales of stocks so held in trust shall be made by the equitable owner thereof during the continuance of the trust. The trustee has the full power to elect officers, but is bound to vote

for persons interested in the business of refining, producing and exporting oil, and to fulfill the general purpose of the contract.

Mr. Emery replies to this that the voting-trust agreement of this company also was rendered necessary by the attempts of the Standard Oil Company to control it.

ATTEMPTS OF STANDARD TO CONTROL INDEPENDENT PIPE LINES.

Mr. Lee, Mr. Phillips, Mr. Emery and others testify that the Standard Oil Company has made attempts to secure control of all of the independent pipe lines and organizations and of the Pure Oil Company by purchasing their stock. Through the National Transit Company it secured a large proportion of the shares of the Producers Oil Company, Limited, and placed them in the name of John J. Carter. He brought suit to secure a right to a voice in the organization, but since it was a limited partnership, the courts upheld the rights of the company to deny him admission. The Standard Oil Company purchased, through the National Transit Company, \$383,000 of the capital stock of the United States Pipe Line Company, and has successfully brought suit to secure the right to vote this stock.

Mr. Davis, who speaks from information rather than from personal knowledge, gives essentially the same facts.

He adds that the Standard Oil Company has bought up a considerable number of oil wells along the independent pipe line of the Producers and Refiners Oil Company, forcing it to lay longer pipe lines to other wells. The Standard paid high prices for these wells.

Mr. Archbold admits these purchases of stock in the Producers Oil Company and in the United States Pipe Line. They were made as an investment, "and with a view to having such knowledge as we could have rightfully through such ownership—as we should acquire in the progress of the affair." The proportion held by the Standard Oil Company was actually less than one-half in each case. The company was so opposed in the exercise of its ownership in the Producers Oil Company that it sold out to Mr. Carter. This sale was in good faith and the Standard has no control over the stock after the transfer. At one time Mr. Carter did own more than a majority of the stock, but under the Pennsylvania law, which the witness considers "a very queer one," the courts held that he could have no voice in the company, which was a limited partnership, without its consent.

The courts have upheld the ownership of the Standard Oil Company in the United States Pipe Line, and it is recognized on the board of directors. It has never done anything to injure the business of that company, and "if that iniquitous voting trust is ever dissolved the shareholders will awake to a feeling that somebody else than those who have managed it could do something for it."

Mr. Rogers confirms the testimony of Mr. Archbold generally on this subject, although he is uncertain as to the proportion of the stock of the Producers Oil Company held by the Standard and Mr. Carter. He does not know whether Mr. Carter was furnished with money to buy this stock by a trust company in New York to which he was introduced by the Standard Oil Company, although it is possible.

Mr. Phillips's description of the purchase of stock in the independent pipe lines by the National Transit Company differs from that of Mr. Archbold in certain details. As high as 220 was paid for stock in the Producers Oil Company, although it was then earning no profits. In March, 1894, before the time when the Standard claims to have sold its stock to Mr. Carter, it turned over the stock to him temporarily, and he attempted to vote it at an important meeting. On January 16, 1896, he claimed that he bought this stock from the National Transit Company. On the trial of the suit by which he attempted to secure admission to the company it was proved that he had borrowed the \$300,000 for the purpose from a trust company in New York; and when questioned Mr. Archbold and other agents of the Standard Oil Company declined to answer regarding the ownership of that money.

Mr. Phillips testifies that the amount of the stock of the United States Pipe Line Company secured by the National Transit Company was \$383,000 out of a total of \$1,190,000. When suit was brought to secure the right of attending the meetings of the company and of voting the stock, which had been refused by unanimous vote of the other stockholders, the lower court decided in favor of the National Transit Company. The suit was never tried on its merits in the Supreme Court of Pennsylvania, but the appeal was quashed on a technicality. The Standard Oil Company takes advantage of its one director upon the board of the United States Pipe Line Company to secure information and to injure that company. This testimony is confirmed by Mr. Emery.

Regarding a letter submitted to the commission declaring that, through the ownership of stock in the independent companies, the Standard Oil Company had brought them into virtual harmony with itself, Mr. Phillips denied the charge entirely.

PROPOSITIONS FOR COMBINATION WITH STANDARD.

1. Facts as to Such Propositions—In connection with the attempts of the Standard Oil Company to get control of the present independent interests, Mr. Archbold testifies that approaches with a view to combination with the Standard have been made from the side of the independents. Nearly every prominent independent, including Mr. Lee, Mr. Phillips, Mr. King, and others, has made some proposition or advance looking toward a combination of interests, but the Standard Oil Company has declined, believing such combination to be illegal, and lacking faith in the men proposing it. Mr. Archbold denies specifically that the Standard ever sent

an agent to propose a combination. On being questioned as to whether such advances on the part of the independents were not forced upon them by the fact that the Standard had secured control of a large part of the stock of their pipe line companies, as well as by the crippling of their business in Germany, Mr. Archbold states that he believes that these matters had nothing to do with the proposition. He says that the proposition was simply for a division of business, so that each interest should have a share of the market; not for sale to the Standard Oil Company.

Mr. Phillips replies to these statements of Mr. Archbold that it is true that three or four years ago he himself and certain others did call upon the officers of the Standard Oil Company. This was after the Standard had bought up a number of the independent refineries connected with the independent pipe lines, and also large amounts of the stock of the independent pipe lines. The Standard also was making every possible effort to prevent the independents from marketing oil in Germany, and had bought out Mr. Poth, who had been acting for the independents there. The independents sought simply to obtain cessation of hostilities. In lieu thereof the Standard Oil Company proposed to buy the pipe line system, and when this was refused one of its officers proposed to buy the producing territory of these independents, which was also refused. There have been no recent overtures by the independents to the Standard Oil Company.

Mr. Phillips states further that the Standard Oil Company has frequently sought to secure the moral support of independent refiners and producers, or to withdraw them from opposition, by buying their property and otherwise. The Standard Oil Company once bought from Mr. Phillips a large amount of oil lands and attempted to influence him at the same time to consent to cease all opposition to that company. Certain of the refiners who have been bought out have been given positions in connection with the Standard Oil Company.

Mr. Emery also testifies that there has been no proposition on the part of the independent pipe lines to combine with the Standard Oil Company. At the time when he was president of the United States Pipe Line Company a resolution was passed for the appointment of a committee to confer with the Standard Oil Company to ascertain if some arrangement could not be made by which it would permit that pipe line to be laid under the railroads. The resolution did not give any authority to discuss the sale of any portion of the property, and the witness is sure that the committee made no such propositions.

2. Reasons for Refusing to Combine With Standard—Mr. Lee testifies that a Pennsylvania law formerly prohibited the consolidation of competing pipe lines, but the Standard Oil Company secured its repeal in 1895. The independent local and seaboard pipe lines could sell out at a high valuation to the Standard Oil Company, but they are largely owned by the producers of crude petroleum, who believe that the price of their product is increased

by the competition of these pipe lines and of the independent refiners who secure their oil from them. The owners of from 40 to 50 per cent., probably, of the crude production are shareholders in these pipe lines.

Mr. Phillips declares that the producers of crude oil who are interested in the independent pipe lines feel that they cannot afford to allow the stock to pass into the hands of the Standard Oil Company at any price. He is unable to state the value of their stocks, but since the Pure Oil Company has succeeded in getting a fair market in Germany, he considers them very valuable, especially for the reasons already cited.

Mr. Phillips further states that the producers of crude oil are undoubtedly receiving much higher prices, probably 25 cents per barrel, on account of the competition of the independent lines with the Standard in purchasing oil. During the time when the Standard was cutting prices most severely against the independent refiners the independent pipe lines reduced their charges, the producers making the sacrifice for the benefit of the refiners. The independent line has, however, never paid producers less than the Standard was paying, and has frequently taken the initiative in advancing prices from one to five cents per barrel.

There is no doubt, also, that the independent refiners are much better off because of these pipe lines; in fact, without them none would be in existence today. The producers and refiners have united for mutual protection.

EFFECTS OF INDEPENDENT MOVEMENTS ON PRODUCERS AND REFINERS.

The reasons just stated by the defenders of the independent pipe line organizations for their refusal to sell to the Standard Oil Company point out the beneficial effect of these pipe lines upon producers and refiners.

This beneficial effect is denied by Mr. Boyle. He believes on the whole that these independent lines have been wasteful. They have not paid dividends, save a single dividend of 5 per cent. by the United States Pipe Line at a time when it had no fixed charges for indebtedness; so that the capital invested in them has been to that extent a burden on the oil industry. The Producers Pipe Line has not sufficient capital back of it to enable it to handle large quantities of oil with the rapidity and certainty with which the Standard Oil Company can do so. Thus the first pipe line built by the independent organization into the McDonald field in 1891 reached only a few wells on the outskirts of that field, while the National Transit Company, controlled by the Standard Oil Company, was forced to build new tanks and lay pipes with enormous rapidity to keep pace with the exceedingly rapid development of that field. On the whole, apparently, the producers, so far as they are actually reached by the independent pipe lines, have, in Mr. Boyle's judgment, profited somewhat by the higher

prices for oil. The independent pipe lines pay from one to nine cents per barrel more than the Standard Oil agency, so that the real charge for pipage, which is nominally fifteen cents per barrel, may fall to six cents as compared with the twenty cents charged by the Standard Oil Company. But what is thus gained by the producers is lost by them in the failure to receive dividends from their investments in the pipe lines.

The independent pipe lines have not had the effect of reducing the price of refined oil, nor have they in any way benefited consumers. They have enabled independent refiners to make money much faster than ever before.

Mr. Boyle does not consider that the transportation of refined oil by means of a pipe line is an achievement of any particular significance.

METHODS OF ATTACKING COMPETING REFINERS AND DEALERS.

SPECIAL CUTS IN PARTICULAR PLACES.

1. Evidence of Opponents of Combination—Several witnesses make the broad statement that it is the practice of the Standard Oil Company to attack its competitors by making special reductions in prices in the places where they seek to do business, while maintaining prices at higher rates at non-competitive points, and also by special cuts to individual customers. These witnesses testify that the Standard Oil Company often secures full information as to shipments by its competitors and as to the persons who are their customers, and use this information to drive them out of business. Where a dealer purchases oil from independent refineries, the Standard Oil Company sometimes establishes competing dealers or threatens to do so.

Many specific statements on this subject were made by the different witnesses, a summary of which follows:

Mr. Monnett, attorney general of Ohio, submitted the following list of prices at competing and non-competing points in the State of Michigan:

Name of Town and State	Condition of Trade	Price of Kerosene	Price of Gasoline
		Cents	Cents
Detroit, Mich.....	Competition.....	5.5	7
Adrian, Mich.....	No competition...	8
Ann Arbor, Mich.....	" " ...	7.75
Clifford, Mich.....	" " ...	8
Howell, Mich.....	" " ...	8
Grand Rapids, Mich.....	Competition ...	5.5	6.25
Monroe, Mich.....	No competition...	7.5	8.75
Kalamazoo, Mich.....	Competition ...	5.5
Bay City, Mich.....	No competition...	7.75
Lansing, Mich.....	Competition ...	6	7.25
Coldwater, Mich.....	No competition...	8.25
Jackson, Mich.....	Competition ...	6.5	7.75
Saginaw, Mich.....	"	6

Name of Town and State	Condition of Trade	Price of Kerosene	Price of Gasoline
Mount Clemens, Mich.....	No competition...	8	8.5
Marlette, Mich.....	" " ...	8
Muskegon, Mich.....	" " ...	8
Battle Creek, Mich.....	Competition ...	6.25
Benton Harbor, Mich.....	No competition...	7.25
Cleveland, Ohio.....	Competition ...	4.75	6
Sidney, Ohio.....	No competition...	8.75	10
Dayton, Ohio.....	Competition ...	6.5	6.5
Xenia, Ohio.....	No competition...	8
Hamilton, Ohio.....	" " ...	7.5
Oberlin, Ohio.....	" " ...	7.5
Troy, Ohio.....	" " ...	7
Youngstown, Ohio.....	Competition ...	6
Canton, Ohio.....	" " ...	6
Warren, Ohio.....	" " ...	5.75
Galion, Ohio.....	No competition...	8
Newark, Ohio.....	" " ...	8

Among the leading competitive points are New York, Philadelphia, Pittsburg, Chicago, Milwaukee, Rock Island, Evansville, Memphis, St. Louis, Des Moines and Kansas City. Competition is seldom possible, except where there is water transportation competing with the railways. The independents have little opportunity on the Pacific coast on account of the rules of the railways.

Mr. Emery is emphatic in his testimony on this point. He himself attempted to distribute oil in Philadelphia between 1891 and 1896, but lost more than \$50,000 on account of the cutting of prices by the Standard Oil Company. He was forced to sell oil at three cents per gallon when it was being sold in New York at eight cents. Within four weeks before the time he testified he had sent oil to a certain point and the Standard Oil Company had reduced the price one cent per gallon at that point immediately.

The Standard Oil Company employs persons to watch the business of its competitors, and often sends in advance, when it learns that a shipment of oil has been made to a particular market, and cuts the price before the oil arrives there. The witness makes this statement from his personal experience. It is confirmed broadly by Mr. Lec.*

In certain cases the first cuts in prices are made by the competitors of the Standard Oil Company. This is sometimes necessary where a customer declares that he is in the habit of buying from the Standard or prefers to do so. Ordinarily the aim of the witness and of other independent refiners is to maintain prices, merely securing a fair proportion of the business, and the beginning of cutting usually comes from the other side.

2. Competition at New York City—Mr. Lee testifies that in New York, Brooklyn and Jersey City, in March, 1896, the price to local dealers was 9 to 9½ cents per gallon, while the witness maintains that seven cents would have paid a handsome profit. When the Pure Oil Company began marketing oil in opposition, the Standard Company cut the price to 5½ cents per gallon, where it has remained practically unchanged. The decline in the price of

crude oil at the same time was scarcely more than 10 per cent. A similar experience was met with in Philadelphia, where prices are now even lower than in New York. The purpose of these excessive cuts was to destroy the competitors. The number of competitive points, however, is increasing as the independent interest is growing in strength. These points are usually at a great disadvantage in rates of transportation.

Mr. Westgate corroborates the testimony of Mr. Lec as to the cutting of prices below cost in New York City and Philadelphia after the Pure Oil Company began business there. Prices were reduced from March 20 to April 4, 1896, from 9½ to 7 cents. Oil is still sold at a loss there.

Referring to the above testimony of Mr. Lec, Mr. Archbold testifies that the average price of refined oil to retail dealers during March, 1896, was 7.98 cents, instead of from 9 to 9½ cents per gallon. In the same month the average price of crude oil per barrel at the wells was \$1.42. In April the Standard Oil Company's price for refined oil in New York was 7.31 cents, the price of crude being \$1.22. In May, refined 6.94 cents, crude \$1.14; in June, refined 6.72 cents, crude \$1.15; in July, refined 6.23 cents, crude \$1.09. No oil was sold at 5½ cents per gallon, as stated. It would be entirely impossible to make considerable variations in price between different customers. Such variations would very soon be made known, and the practice would be dishonest. (The figures above shown appear to indicate that the reduction in the price of refined oil during the period referred to was about twice as great as the reduction in crude. A fall from \$1.42 to \$1.09 per barrel amounts to approximately three-fourths cent per gallon, while the fall in the average price of refined oil was 1.65 cents.)

3. New York State, etc.—Mr. Westgate has found that the Standard Oil Company will not cut prices where he does only a limited proportion of the business in any particular place. Thus at Syracuse the prevailing price of water-white oil has recently been 7½ cents a gallon, and the witness handles only about one-tenth of the business. But at Auburn, 25 miles south, the price has been about two cents less, because the witness has attempted to handle one-third or one-half of the trade. He has found it his best policy to compete on a small scale. He knows of one instance, however, where an independent refiner sent a barrel of oil as a gift to a friend in Maryland, not for selling, but for his own use. The Standard Oil Company discovered the shipment, and sent at once a carload of what was considered the best oil the people there had ever received, at the same time making a heavy cut in price.

The witness cited the following as specific instances of special cuts made by the Standard Oil Company to customers of independent refiners. A letter to him from Shortsville, N. Y., March 23, 1899, from a firm dealing in oil, states that an agent of the Standard Oil Company had said to one of their customers that the Standard was going to force them to buy oil from it, and had cut the price

of oil to seven cents (it had formerly been 10). The witness was accordingly compelled to furnish oil to this firm at such a figure that it should not lose money, which took away all his profit. The witness also submitted a letter sent by the agent of the Standard Oil Company at Portland, Ore., to a dealer in South Bend, Wash., who had informed the agent that oil manufactured by the witness was being sold there. The letter states: "You can rest assured that if another carload of Sunlight oil arrives at your place it will be sold very cheap. We do not propose to allow another carload to come into the territory unless it comes and is put on the market at one-half its actual cost. You can convey this idea to the young man who imported the carload of Sunlight oil." The letter is signed "Standard Oil Company, by George C. Flanders." In Hoboken, N. J., a threat was made against a German dealer that his business would be ruined unless he bought Standard oil, which was offered to him at cut prices. He declared that he would blow up the Standard warehouse with dynamite if his business was ruined, and the Standard agent made an arrangement to furnish him oil, while still allowing him to handle independent oil. At Fulton, N. Y., the Standard established retail peddlers to drive out a man who was peddling Mr. Westgate's oil. To compete the more effectively, they furnished their men with Mr. Westgate's own oil, bought through other parties, and they cut the price from one cent to four cents a gallon.

Mr. Archbold replies to these charges by stating that the peddler at Fulton, N. Y., referred to by Mr. Westgate, had been enticed away from the Standard Oil Company, and was cutting prices against that company, so that it was forced to put on a competing peddler.

The man at Hoboken referred to by Mr. Westgate was a man of violent temper and an anarchist. He has not been in the oil business for a number of years. The agent of the Standard Oil Company at Jersey City denies having threatened him with a cut of prices, and also having come to any agreement or understanding with him.

As to the letter written by Mr. Flanders to a dealer of South Bend, Wash., it was a foolish action, for which Mr. Flanders had no authority whatever. The letter was in fact intended to be jocular and to deny a claim that he was selling oil of an inferior quality, a charge which is often brought against the Standard Oil Company unjustly.

4. Southern States—Mr. Rice testifies that he has been engaged in refining petroleum since 1876 at Marietta, O. He has repeatedly been driven out of various local markets which he has sought, especially in the South, by special cuts made by the Standard Oil Company in particular towns and to particular customers. He declares that the Standard Oil Company has temporarily cut prices below cost to his particular customers, leaving the prices unchanged to nine-tenths of the dealers in town. "They can clean me out on any one car I may send to any one town."

The Standard Oil Company has also made threats against dealers handling Mr. Rice's oil. At one time the Chess Carley Company wrote to Mr. Rice's agents at Nashville, Wilkinson & Co., threatening to establish a grocery store and cut prices on all goods as well as on oil. The company did afterwards set up a grocery store at Columbus, Miss., in order to force merchants to buy its oil. In 1885 the Chess Carley Company made a contract with R. M. Ong, of New Orleans, a copy of which was submitted by the witness in evidence, with a declaration that it was undoubtedly genuine. By this contract Mr. Ong was to be paid a sum of \$48,000 in monthly payments during five years. In exchange therefor he sold to the Chess Carley Company the entire profits of the business on illuminating oils and other petroleum products. He was himself to conduct the business and to make no charge except for drayage actually paid out. Mr. Ong agreed to sell no petroleum not supplied by the Chess Carley Company, and to conduct this branch of the business in the best manner possible to promote the interest of that company, and under its general directions.

Regarding the above testimony of Mr. Rice, Mr. Page states that the Chess Carley Company did actually establish one such grocery store at Columbus, Miss., but no other. This was before the Standard Oil Company possessed complete control of the Chess Carley Company, and the witness believes that the Standard itself has never made any such threats or actually established competing stores.

5. Competition in Ohio—Mr. Clark testified that he had been employed as a warehouseman by the Standard Oil Company in Marietta, O., and later at Springfield as a country tank-wagon man, at Columbus as cashier, at Urbana as manager for the Standard Oil Company at that place, and finally at Newark as manager, the latter station being much more important than Urbana. The witness gave the following account of the reasons for his leaving the employ of the Standard Oil Company:

The Standard Oil Company has in Ohio an inspector, Mr. Lockwood, who goes over three States, inspecting the condition of the various stations, the work of agents, etc. The form of inspection report is given by the witness. When this inspector visited the witness during his agency at Newark, at one time the witness was in a bad humor and, not knowing the official position of the inspector, he objected to receiving suggestions from him. This led to his being suspended, although he was told that this was not a discharge. Suggestions have since been made by the Standard Oil Company with a view to taking him back, but the witness is unwilling to return. He objects especially to the practice of deducting from the salary of the agent any losses due to errors, whether of himself or of others.

Mr. Mathews, selling agent of the Standard Oil Company for the central and southern parts of Ohio, testifies in detail in refutation of the evidence of Mr. Clark. He states that Mr. Clark's evidence was obviously prompted by spite, owing to the fact

that he had been dismissed from the service of the Standard Oil Company on account of a shortage in his accounts and not for the reason stated by Mr. Clark in his testimony. The inspector referred to by Mr. Clark having visited the station at Newark was the traveling auditor and had nothing to do with the regular inspecting system. Mr. Clark had been negligent in sending in his regular reports and on investigation was found to be short in his accounts. The final amount of shortage was \$231, part of which was made up by Mr. Clark and the remainder by his bondsmen. He would have been indicted by the grand jury for embezzlement save for the fact that the various items taken were small and could not be joined together in the indictment, so that the offense was only petty larceny.

Mr. Mathews testifies further that Mr. Clark never held such responsible position under the Standard Oil Company at various places as he claimed. He had not had the opportunity to be familiar with details of business concerning which he testified.

Neither Mr. Mathews nor any other employe of the Standard Oil Company has made propositions to Mr. Clark with a view to re-engaging him in the company's service. An affidavit by Mr. Foutz to this effect was submitted.

Mr. Clark states that in Ohio no two stations have the same price for oil, and the differences are not due solely to freight rates. At competitive points the prices are considerably lower. Thus in 1898 the price of gasoline at Newark, where there was no competition, was $7\frac{1}{2}$ cents, while at Columbus, under competition, it was $5\frac{1}{2}$ cents. At the same time oil was about two cents cheaper at Marietta than at Newark, although there was no difference in the conditions of competition. When competition has been driven out, prices are raised to the old high level or to one still higher. Thus at Newark at one time oil sold as low as four cents, but afterwards was raised to 13 or 14 cents. The Standard Oil Company, where it has to meet competition, usually keeps oil at a somewhat lower price than its competitors. There may be times when its price is higher, but the average is lower. Many dealers are willing to pay more for independent than for Standard oil.

While Mr. Clark was employed by the Standard Oil Company at Marietta, the company hired a man named Davis to compete with a tank-wagon driver named Curtis, who had been buying oil of the independent Argan Refining Company. He was furnished a horse and wagon and sold oil so cheap that the competitor had to come to the Standard Company to arrange to buy oil from it. The price had been seven cents during this competition, but was then raised to 12 cents. The competitor again began to buy Argan oil, and was again brought back to the Standard by the employment of a Mr. Ebright, who "played the farmer racket" in selling against Mr. Curtis.

Concerning the alleged fraudulent methods of competition at Marietta, O., testified to by Mr.

Clark, Mr. Mathews states (substantiating his evidence by a certified transcript from the testimony of William Ebright and by an affidavit of W. A. Reed, local agent at Marietta when Clark was employed there) that Mr. Clark was then only an office and warehouse boy, entirely unfamiliar with the conduct of the business, and that his evidence was untrue and malicious in every particular. The man Davis referred to was not employed by the Standard Oil Company at any time. He was an independent oil peddler and bought oil outright at the ruling market prices from the Standard Oil Company, selling it at prices fixed entirely by himself. The man named Ebright was in precisely the same position as Mr. Davis. It was not true that he pretended to be a farmer or otherwise deceived concerning his character in business.

While Mr. Clark was manager for the Standard Oil Company at Urbana, O., a man named Helmick, whose father had been twenty years a dealer in oil, established a competing business, buying oil from the Cleveland Refining Company. The witness, accompanied by two traveling agents of the Standard, visited Mr. Helmick and threatened him with excessive cuts in prices. Some cuts were actually made, from eight to six cents, and through these and the threats the competitor was forced to give up business and finally went to the poorhouse. He had put up a building to handle oil and this was an entire loss. The witness believes that this excessive competition by the Standard was the cause of his failure, not his own incompetence.

Mr. Mathews, replying to this testimony of Mr. Clark, states that Mr. Helmick bought only one carload of oil from independent dealers, and after he had sold about one-half of it became satisfied that he would lose money on account of leakage and poor quality, and the Standard Oil Company took the remainder off his hands. The Standard Oil Company did not drop prices while Mr. Helmick was in business, nor were threats made by the two agents of the Standard Oil Company referred to by Mr. Clark. Both of these agents submitted affidavits denying Mr. Clark's allegations. Mr. Hurley, a notary public, also submitted an affidavit that he had seen Mr. Helmick and that the latter had declared the testimony of Mr. Clark in reference to himself untrue, especially in regard to the cause of his going to the poorhouse. Another affidavit shows that Mr. Helmick continued in the oil business about two years after the time referred to by Mr. Clark; that he afterwards went to the poorhouse, but that on August 31, 1899, he was employed in a canning factory at Wapello, Iowa. Mr. Cone, a township trustee of Urbana township, furnished an affidavit that he believed Mr. Helmick's going to the poorhouse was due to the extravagance of his family and other domestic troubles. Mr. Powers, a drayman who had hauled oil to Mr. Helmick's building, stated that it was a mere shed built of refuse lumber and not worth more than \$10.

Mr. Clark states further that at Columbus, while he was employed by the Standard Oil Company, one

Shoemaker was hired at a regular salary and furnished oil at prices so low that he could undersell representatives of the Cleveland Refining Company. Customers supposed that he was an independent dealer. A boy was also hired to watch the tank cars received by competitors and the amount of oil sold. The prices were then cut so that the competing dealers were forced to agree to maintain prices at a fixed point.

All these statements are denied by Mr. Mathews in detail.

While Mr. Clark was agent of the Standard Oil Company at Newark, a Mr. Donaldson started business, buying oil from the independent firm of Scofield, Shurmer & Teagle. The witness was told that he should have a two weeks' vacation if he would get rid of this competitor. He became friendly with the owner of the shed where Mr. Donaldson stored his oil, promised him work for the Standard Oil Company, and succeeded in buying the shed, in the absence of Mr. Donaldson, for \$2.50. He removed the barrels and tanks and had the shed hauled away. While Mr. Donaldson was competing a boy had been hired to follow his wagon and discover his customers. Mr. Mathews, the canvassing agent of the Standard Oil Company, would then visit these customers, test the quality of oil in their lamps, and offer oil at reduced prices. The Standard Oil Company also, after buying the shed, hired the driver formerly employed by Mr. Donaldson and had him deliver oil to Mr. Donaldson's customers. Mr. Mathews sent a letter to the witness complimenting him upon his success in the transaction.

The statement of Mr. Clark as to the manner in which Mr. Donaldson was driven out of business at Columbus is denied by Mr. Mathews, supported by the affidavit of Mr. Hollingsworth. Mr. Clark bought the so-called warehouse, which was only a small shed, about four feet by four, entirely on his own responsibility and without direction from any superior officer. He was reprimanded afterwards for having done so. The price of \$2.50 paid was all the shed was worth. Donaldson was not driven out of business by this purchase, but rented a barn and continued thereafter.

6. Statement of Policy by Combination—Mr. Archbold testifies that he has no doubt that the Standard Oil Company, when closely pressed with competition at any point, tries to hold its trade by cutting prices, and would not declare that it had never cut prices below the cost of production, although such a case would be a rare one. Such cutting of prices is the natural law of trade. Mr. Archbold believes that ordinarily the competitors of the Standard begin the fight. He does not consider it advisable in most cases to sell goods at a loss for any purpose, but believes that if prices were cut to cost or below it the Standard Oil Company could endure the strain much longer than a smaller competitor.

Mr. Dodd states, in reply to a schedule of questions, that the prices of refined oil are the same throughout the United States, allowing for cost of

transportation, and that they average lower, transportation considered, than in foreign countries. He stated that agents have no authority to make special cuts in special sections of the country, but has no doubt that prices have been cut to meet lower prices made by competitors.

Mr. Page also admits that the Standard tries to keep its trade and makes prices to do so. He presumes that during such competition prices are lower than where there is no competition, to a reasonable degree. But he adds that the Standard's policy is regularly to sell as cheaply as possible in order to increase the volume of business.

Mr. Mathews states that the Standard Oil Company never cuts prices first in any field, but when a competitor reduces prices it does not hesitate to meet the cut in order to hold its business.

Mr. Boyle also states that oil refiners generally, like most other manufacturers, find themselves with surplus stocks during certain years and certain seasons, and hold out inducements to purchasers to take off the surplus at reduced prices. This is the only method, unless a combination can be formed sufficiently strong to hold back goods for higher prices. The Standard Oil Company especially aims to extend its markets in foreign countries, and to do so often sells with little or no margin of profit, especially when it has a surplus production. (This is also admitted by Mr. Archbold.) The Standard doubtless cuts prices for a similar reason in this country from time to time, just as other manufacturers do. The witness has heard that it has the further object in making such cuts of driving out competitors from particular localities, but he has never personally seen such a case, his observation being limited to the oil-producing country itself.

DIFFERENT PRICES TO DIFFERENT DEALERS.

Mr. Clark testifies that it was customary for the Standard Oil Company, at the stations where he was employed in Ohio, to make different prices to different dealers in order to hold their trade, these prices being often based on reports from local agents as to purchases of competitive oil. The witness states various instances, but especially one at Newark, where one dealer was charged seven cents for gasoline and his next neighbor 9½ cents. In another case, Showman Brothers were charged 7½ cents for oil, Mr. Rankin six cents, while Mr. Hagmeier was given rebates on the nominal prices of one cent on gasoline and two on oil.

These charges are denied by Mr. Mathews. The various tank-wagon drivers are not allowed to discriminate between one buyer and another, but must charge all the same price for the same grade of oil. Mr. Clark could not cut the price when he was a tank-wagon driver without paying the difference out of his own pocket. A statement that at Columbus empty barrels were taken back at an exorbitant price in order to hold customers is also false.

It is nevertheless true that at times there may be some differences between different customers, owing to the existence of contracts for furnishing

oil at certain prices for a period of time. It was true that at Newark, while Mr. Clark was there, there were such differences in the price of gasoline, owing to the market advance in the general price, while some dealers remained under previous contracts. The statement specifically made that Mr. Rankin was charged six cents for oil and Showman Brothers 7½ cents is entirely untrue. Mr. Rankin, in fact, was charged 1½ cents per gallon more than Showman Brothers, because he bought oil in barrels instead of in bulk, but an equivalent amount was refunded when the barrels were returned empty. Mr. Hagmeier was allowed a rebate of one-half cent per gallon on both oil and gasoline under a special contract, but did not receive such rebates as one or two cents. An affidavit of Mr. Hagmeier to this effect was presented, and also an affidavit stating that Mr. Clark had secured his previous statement acknowledging the receipt of rebates under a pretense that it was necessary to explain a shortage in his accounts.

The witness has never known of discriminations between different buyers under such special contracts which amounted to more than one-half cent per gallon. Such rebates are granted in consideration of an agreement that the dealer shall buy exclusively from the Standard Oil Company. Differences in prices of lubricating oil also exist under special contracts, being largely conditioned on the quantity of oil purchased and on the expense of delivering it.

WATCHING OF COMPETITORS' BUSINESS.

1. Evidence of Opponents of Combination—Several witnesses testify to a practice of the Standard Oil Company of securing information as to the business of competitors, their shipments, customers, etc. It is believed by some that the employes of competitors are hired to furnish such information.

Thus Mr. Westgate testifies that the Standard Oil Company keeps an accurate record of every barrel of oil that the independent refiners ship to each place. The information may not be received from the local freight offices, but perhaps from junction points. The witness knows that this is the case because his customers have told him that traveling men of the Standard Oil Company have informed them that they knew of shipments coming. The traveling men report whether dealers buy Standard or independent oil, and the reason. Customers of independents will then sometimes be offered oil under cost.

Mr. Monnett testifies that the Standard Oil Company frequently employs agents to follow up rival companies, ascertaining their customers, and then seeking to take them away. They drive competition out from certain places and are then enabled to charge rates sufficiently high to establish a fund for attacking competition elsewhere.

Mr. Monnett further states that testimony was given in the Ohio suits to show that clerks of competitors, for example, of Scofield, Shurmer & Teagle,

of Cleveland, had been bribed to furnish information as to the amount of oil shipped, names of customers, and other details of the business of these competitors. In this case the person bribed disclosed the fact to his employer.

Mr. Emery believes that the Standard Oil Company still receives statements from railway companies as to shipments by others, such as were agreed upon in the contract with the South Improvement Company. He states, as an example of the practice, that about a year ago he shipped two barrels of oil, along with a larger shipment, to a gentleman in Dubois, Pa. These barrels were not placed in the car until after business hours, and no one knew of their shipment. But before the oil reached Dubois the purchaser was met by an employe of the Standard Oil Company, who complained of the fact that he was dealing with Mr. Emery. Other cases where information must have been given by railway officers are numerous.

Mr. Gall, a wholesale dealer in refined petroleum at Montreal, testifies that the Standard Oil Company frequently sent a man to open tank cars shipped by independent refiners to the Gall-Schneider Company, to see exactly what they contained. The witness was recently able to detect a man in the act, and the explanation that it was due to a mistake is not to be believed. A representative of the Standard Oil Company at an earlier period jokingly told the witness the numbers and contents of several cars of oil which had just been received.

Mr. Gall testifies further that it is common for the Standard Oil Company to send a man to watch the delivery of oil, and then to send their own agents to the purchasers, cutting prices, and otherwise seeking to prevent competitors from securing trade.

Mr. Davis has been engaged in an independent refinery in Marietta, O. At one time his shipping clerk was approached by an agent of the Standard Oil Company, who offered to pay him for reporting the names of persons to whom oil was shipped, the invoice price, etc. The witness believes that every barrel of oil he shipped from his works was made known to his competitors. Their traveling men would then follow each shipment and often it would be necessary to reduce the price in order to retain the customer. In such cases the consumer probably received no benefit from the lowered prices, but only the dealer.

Mr. Clark testifies that, while agent of the Standard Oil Company, he was required to make reports each week of the business of competitors, the customers supplied by them, the prices, etc. On the basis of these reports, the general manager at Columbus would send instructions as to methods of holding or taking away customers. Sometimes the manager would come himself and make special arrangements as to prices.

The following letter shows the practice of requiring reports as to competition:

May 25, 1897.

Dear Sir:—I forward to you today a supply of blanks, same as sample herewith inclosed, which is to take the place of the little slip that has formerly been used for reporting daily competitive oil. Will you kindly fill out one of these blanks weekly, commencing with June 1, and whenever the month ends in the middle of the week, make out one on the last day of the month for the portion of the week not covered in the last week you report? Enter upon this report all competitive oil or gasoline that you have been able to locate during the week, and if during the week you have been unable to locate any competitive shipments, then write across the face of the blank "Nothing to report" and mail it to this office. Be sure to mail it whether you have competitive receipts to report or not. If there is anything about this report that you do not understand, please confer with me at once, as it is very important that it should be made out promptly and forwarded regularly. Trusting that I will have your hearty co-operation,

I am, yours very truly,

B. A. Mathews.

W. H. Clark, Newark, O.

2. Reply of Standard Oil Witnesses—Mr. Archbold declares that it is not the policy of the Standard Oil Company to obtain information from employes of its competitors, and that if through the action of some overzealous employes this were attempted it would be disapproved. The company does naturally seek information from its own agents as to the business of competitors, but none which they cannot rightfully secure.

Concerning the watching of the business of competing dealers, referred to by Mr. Clark, Mr. Mathews testifies that it is the practice of the Standard Oil Company to ask its salesmen and agents to keep their eyes open and inform the company as to those from whom different dealers are buying, and as to the general condition of business. This is required as much for the sake of ascertaining that the agents are attending to business as for any other purpose. The witness does not recall any case where anyone has been employed to follow a competitor's wagons and find out at what prices he sells. In no case has the Standard Oil Company secured reports as to the business of rivals from employes of those rivals.

ALLEGED FRAUD AND DECEPTION BY STANDARD.

1. Different Grades From Same Tank—Mr. Clark states that while he was agent of the Standard Oil Company at various places in Ohio he made it a practice, under direction of the company, to sell nominally different grades of oil at different prices from the same tanks. There are only three different grades actually handled—the Diamond White, Water White and Eocene. As many as eight different prices are made with from one-fourth to one-half cent difference between them. Thus at Marietta prices ranged from 6 to 10½ cents. If a cus-

tomers considered a certain price too high he would be offered a lower grade at a lower price, but the oil would be drawn from the same tank. At Springfield a man was hired to run a tank wagon, but resigned when directed to carry out this practice. If a customer demanded oil direct from Cleveland, barrels would be painted red and branded with a stencil sent from Cleveland. At Newark the oil was sold directly to tank wagon men, and they learned from an employe of the company the practice of selling different grades from the same tank. Each customer is thus satisfied and given what he wants.

Mr. Mathews denies in detail all the allegations of Mr. Clark concerning fraudulent practices in selling nominally different grades of oil at different prices from the same tanks, and submits affidavits of W. A. Reed and C. W. Foley, agents of the Standard Oil Company, at the different places where Mr. Clark was employed, and of W. W. McMahon and C. M. Taland, tank-wagon drivers at Springfield, stating that no such practices have been at any time resorted to either by the Standard Oil Company directly, or, through its suggestions, specific orders were always given prohibiting such deception. The facts are that at Marietta, for example, the company has really three different grades of oil, but sells them under several different names, although at precisely the same price for oil of the same grade. Thus Water White, Red Star Water White, Silver Light, and Crystal are simply trade names for the one grade, water-white oil. They have been established by custom in different localities to meet local demands. At a few points near Marietta, Eocene, a better grade of oil, is furnished customers under the name of Hyperion, on account of the saving in freight in doing so.

Mr. Mathews also submitted affidavits of C. W. Foley and R. A. Foutz, stating that the tank-wagon driver at Springfield, who, as stated by Mr. Clark, resigned because he did not desire to deceive in the quality of oil, really resigned because he did not like tank-wagon work and for no other reason, and had so stated to the affiants.

The quality of oil does not depend on the degree shown by the fire test. The three grades sold by the Standard Oil Company all have the same fire test of 120 degrees by the Foster cup. Oils may be of exactly the same fire test but different in illuminating power, and the latter determines quality.

Mr. Westgate incidentally gives testimony which may corroborate Mr. Mathews. He states that in his refinery he manufactures five grades of oil, varying in price from 3.90 cents to 4.50 cents, at present. Special brands are sometimes put upon oil to suit different customers, but this does not imply any deception as to the quality. The witness bills his oil at the names and prices of his own brands, but affixes any name desired.

2. Deceptive Tests.—Mr. Clark also states that the oil sold by the Standard Oil Company in Ohio is mostly refined from Lima oil, and of inferior quality, smelling of sulphur. A German has invented a method of brushing the sulphur out of the

oil. The Standard Company controls this patent, but the method is exceedingly expensive. The Standard Oil Company seeks to deceive customers as to the quality of its oil by unfair tests. The witness has been directed orally by his superiors as to methods of making such tests, but has no written evidence. The deception is accomplished largely by turning the wick in the lamp high when Pennsylvania oil is being used and low when Ohio oil is being used. The oil handled by independents is mostly Pennsylvania oil and of higher quality.

Mr. Mathews denies that the Standard Oil Company resorts to unfair tests of lamps to show the superior quality of its oil. Competitors in Ohio had been marketing oil at a reduced price containing some oil made from Ohio crude. Dealers sometimes mixed these inferior oils with oil furnished by the Standard Company, and the latter was forced to visit customers, especially retail storekeepers, and show by actual tests the superior quality of the Standard's oil. It would have been entirely impossible to deceive by turning the flame higher in one case than in the other, as alleged by Mr. Clark. The various agents and employees of the Standard Oil Company, to whom Mr. Clark specifically refers as having knowledge of frauds in lamp tests, all submitted affidavits denying that such frauds had been practiced and stating that similar lamps, burners, wicks, and chimneys were used in testing different kinds of oil, and that at the beginning of the test the height of the flame in each lamp was the same.

3. Adulteration of Lubricating and Similar Oils.—Mr. Clark testifies that at Marietta he mixed gasoline worth 7 cents per gallon with turpentine worth 38 or 40 cents, under direction of his superior, in order to cheapen it. At Columbus, so-called boiled linseed oil was made by heating raw oil to 125 degrees and adding a small quantity of Japan drier. Miner's oil was made by mixing 2 gallons of "miner's stock," which costs about 6 or 6¼ cents, with 3 gallons of cotton-seed oil. The product sells at from 22 to 34 cents. Paraffine oil was sent from Cleveland in blank barrels, and these were labeled as different qualities of machine or rubbing oil and sold at different prices without change of quality. The witness is not aware that the same methods have been used by independent refiners.

Mr. Mathews denies in detail these charges, and submits the affidavit of Adam Paulus, mixer at Columbus, to support his evidence. The dryer used in making boiled linseed oil at Columbus was pure linsed-oil dryer, which cost 10 cents per gallon more than linseed oil and increased the cost of the prepared oil, and the oil was heated to 225 degrees. The statement that miner's oil is made by compounding cotton-seed oil with 40 per cent of petroleum is false. The Ohio law, which is rigidly enforced, would absolutely prevent more than about 14 per cent of petroleum being used. The price of miner's oil is regulated by the price of cotton-seed oil, running about 2 cents per gallon below. The prices charged for miner's oil are lower than stated by Mr. Clark.

The statement that lubricating oil is received in barrels with blank heads and shipped out to meet the requirements of the trade without regard to the actual contents is untrue and absurd.

The statement that gasoline was mixed with turpentine is also false. Any buyer can detect such adulteration of turpentine instantly by the use of an ordinary hydrometer, which all druggists keep.

Mr. Davis gives evidence tending somewhat to conform that of Mr. Clark. He states that most refineries have a department in charge of an expert who compounds mineral oils with animal oils and makes various extractions from paraffine. There are wide differences in grade of such compounded oils, and there is much opportunity for experience and skill. It is possible for oils of practically the same quality to be sold at very different prices. The witness believes that the Argan Refining Company sold a quality of lubricating oil at 70 or 80 cents which was practically identical with that sold by his company at 22 or 23 cents.

4. Copying of Brands, Etc.—Mr. Westgate testifies that he is manufacturing a high quality of oil known as Sunlight. The Standard Oil Company has copied this brand for sale in New York State, putting its own name on the barrels. At Fulton, N. Y., the Standard Oil Company established two retail peddlers to compete with one who had been purchasing oil from the witness. They were furnished with oil refined by the witness, and it was offered to customers, under the brand put on it by the witness, at a reduced price. This oil was probably obtained from the Merchants' Refining Company of Buffalo, to which a shipment had been made a little time before by the witness.

Replying to the above statement of Mr. Westgate, Mr. Archbold testifies that on careful investigation he finds that, so far from the Standard Oil Company using Mr. Westgate's brands, the opposite is the case. The Standard had long been using yellow barrels in certain territory, and when Mr. Westgate began to do business there he used the same color, with a view to thereby furthering his trade. Mr. Archbold denies absolutely the charge of copying brands.

Mr. Davis also testifies that the refinery in which he was interested at Marietta made special brands of oil for particular customers. It sometimes found that these names were used by other refineries, apparently for the purpose of taking away trade. At one time a shipment of oil to the Cleveland and Marietta railroad was made, and it was later discovered that several of the barrels contained 5 or 6 gallons of water each. These had the brand of the witness's refinery, but he has the impression that they had been substituted by competitors for the purpose of injuring his trade, or else that the water had been put in by a competitor.

COMPETITION IN FOREIGN MARKETS.

Mr. Lee testifies in some detail as to the conditions of competition in foreign markets, especially

Germany, his evidence being confirmed by less detailed statements of Mr. Westgate.

Prior to 1895 the Standard Oil Company had cut prices abroad so that export oil was sold in New York below the cost of crude at the refinery. The independents had long been marketing oil in Germany through a man named Poth, but he sold out to the Standard in 1896. The Standard used unfair methods of competition, tying up all the tankage. To enable the independents to compete, the Pure Oil Company was organized, and the refineries agreed to sell it oil at cost, leaving to it the marketing of oil abroad. It erected stations at Hamburg and Rotterdam, is erecting one at Mannheim, and it has rented one at Amsterdam. It has its own tank steamers and tank cars, and is now doing a profitable business, prices in Europe being reasonable. Mr. Lee states, though he does not clearly explain the method, that the German government prevents excessive competition, because it will not allow business to be conducted at a loss. This statement is made on the basis of experience of Mr. Poth and of the agents of the Pure Oil Company.

Mr. Emery also describes the competition of the Standard Oil Company with the independents in Germany. After the Standard had bought out Mr. Poth, Mr. Emery was sent to Germany by the independents, and immediately let a contract for the construction of tanks in Amsterdam. In Hamburg the legislative body passed a law furnishing ground on which to build tanks. The Russians suffered equally with the Americans from the competition of the Standard Oil Company.

Mr. Emery likewise testifies that the government of Germany in some way secures to all competitors fair conditions and prevents unfair competition, but he is not certain as to the precise method by which this is done. In 1895 he went with Mr. Poth, the agent of the independents in Germany, before the imperial ministry at Berlin to make complaint of the fact that oil was being sold on the Rhine at from 1½ to 2 cents a gallon less than on the Elbe. Mr. Emery also had a conference at St. Petersburg with the prime minister of Russia, and with Mr. Nobel, the great Russian oil producer. Their views agreed with those of the independent American refiners—that they were suffering unfair competition in Germany, and that they desired to see it rectified. The independents have secured an official permission from the German government to sell oil, being required to file their American charter and being subject to a certain supervision, the precise nature of which Mr. Emery does not know.

Mr. Archbold declares that Mr. Lee's statements concerning governmental control of competition in Germany are "silly."

According to Mr. Archbold's testimony, below quoted under the heading "Crude oil," the prices of refined oil are constantly kept in substantially the same relation to those of crude, although there are sometimes variations one way or the other. In reply to a question as to whether refined oil was not sometimes sold at the seaboard at less than the

price of crude, Mr. Archbold said: "I should say that is a very exceptional case. I do not recall. * * * In competing with the Russians at certain times for certain markets, we have made prices for refined that were as low as the crude product, * * *. but they have been very exceptional cases, and it is not the case today." These cuts have been made especially in the far east, and the company has relied on the profits from by-products to offset them.

OUTPUT AND PRICES OF REFINED OIL.

PROFITS, COST OF REFINING, ETC.

MONOPOLISTIC CHARACTER OF THE STANDARD OIL COMPANY.

1. Generally—There is a general consensus among the opponents of the Standard Oil combination that it has a sufficient control of the markets for refined oil to practically constitute a monopoly. The business of independent refiners is confined to a few sections of the country, and the larger proportion of their oil is sold abroad. It was testified that the Standard Oil Company now controls from 90 to 95 per cent. of the business of refining. Mr. Lockwood declared that the independent refiners, including the Ohio field, handle about 4 per cent. of the oil product.

Mr. Phillips declares that, although the Standard Oil Company has no legal advantages under the laws incorporating it, it has practically been able to monopolize the oil business. Controlling at least 80 per cent. of the business of refining, it is able largely to fix prices. The witness believes that but for the Standard the public would have been better served, at lower prices.

Mr. Archbold submitted, in reply to the evidence of Mr. Lockwood and others, the following statement showing the amount and proportion of oil refined in the United States by the Standard Oil Company and by other refiners during the years 1894 to 1898, inclusive:

Year	Standard Oil Co.		Others		Total
	Barrels	Per cent of Total	Barrels	Per cent of Total	Barrels
1894...	18,118,933	81.4	4,145,232	18.6	22,264,165
1895...	18,348,051	81.8	4,084,720	18.2	22,432,771
1896...	16,341,161	82.1	3,569,719	17.9	19,910,880
1897...	18,141,479	82.4	3,876,706	17.6	22,018,185
1898...	19,999,939	83.7	3,914,999	16.3	23,914,938
Total.	90,949,563	82.3	19,591,376	17.7	110,540,939

2. Competing Refineries—Mr. Davis testifies that there are about 12 or 15 independent refineries in Pennsylvania. They are not formally combined, but have common interests in pipe lines. They refine about one-tenth of the oil.

Mr. Lee and Mr. Emery testify that the various independent refiners are not at all directly connected with one another, although each owns stock in the various independent pipe lines and in the Pure Oil Company, which markets a part of their production abroad. It has been proposed to combine the refineries completely. The Producers and Refiners Pipe Line sells oil to the independent refiners, the United States Pipe Line conveys their oil to the seaboard, and the Pure Oil Company buys oil from them. Any dividends of these companies go to the refiners as far as they are stockholders. The separate refiners market their own oil to a considerable extent. Some of them have stations and special agents, but most sell to ordinary merchants.

Mr. Emery adds that the various independent refiners compete actively with one another, both in the domestic and in the foreign trade. Although part of the export oil is sold through the Pure Oil Company, the refiners also sell separately in almost every European country.

Mr. Monnett testifies that the Standard Oil Company has practically no opposition in Ohio from competing pipe lines or refineries. He believes that Scofield, Shurmer & Teagle have some arrangement by which they are allowed to survive. Other apparently competing companies are under the control of the Standard Oil Company in one way or another.

Replying to this testimony (on the hypothesis that Mr. Monnett includes in his statement the production of crude petroleum, as well as its transportation and refining), Mr. Archbold testifies that in the Lima district alone there are more than 1,600 companies, partnerships and individuals engaged in producing oil, in which the Standard Oil Company has absolutely no interest whatever. There are eight large active concerns refining oil, which the witness names, besides several smaller concerns. These companies during five years, from 1894 to 1898, have done a business of 14,647,949 barrels.

Mr. Lee refers to the list of independent refineries published in the report of the Committee on Manufactures in 1888. Of these he is aware that the following have been absorbed by the Standard Oil Company: New York, Borne, Scrymser & Co., Lombard, Ayres & Co.; Pittsburg, Bear Creek Refining Company, Globe Refining Company, Oil City, Keystone (torn down); Franklin, most of the refineries shut down; Bradford, no refineries now in existence; Parkersburg, one absorbed by the Standard; Titusville, Schwartz's, National, and Western refineries combined into Union Refining Company, absorbed by the Standard and torn down, also International Works torn down; Philadelphia, Boss-hart & Wilson. The Standard Oil Company has also leased a number of refineries at high rates and then shut them down, thus paying a bonus for idleness. The purpose is to check competition.

Mr. Davis was largely interested in a small refinery at Marietta, O. It handled chiefly Macksburg oil, which is rich in paraffine and lubricants. These had been sold in considerable amounts to the

Baltimore & Ohio Southwestern Railroad, but its managers became interested in the Argan Refining Company, at Marietta, and the withdrawal of its patronage, together with discriminations in rates, which the witness believes to have existed, led largely to the closing of his refinery. A further difficulty was that the Buckeye Pipe Line Company charged 35 cents per barrel for piping oil from wells owned by the witness and his associates in the Corn-ing field, 40 miles distant. The railways also charged a similar rate for hauling crude oil from the field to the refinery.

3. Colorado Refineries—In evidence before the sub-commission on mining in Colorado, it was brought out that the refineries handling the product of the oil field in that State are forced to sell all their output to a distributing company, which is only a branch of the Standard combination. Mr. Archbold, when questioned on this subject, stated that there was certainly no compulsion, as had been charged, upon the refiners to sell to the Standard. He declared that he was not familiar with the subject, but the act must be voluntary. Mr. Boyle also stated that he was not familiar with the situation in Colorado, although he has understood that the Standard does not itself refine the product in that field, but buys the output of the other refineries.

4. Control by Standard in Canada—Mr. Gall, who is a wholesale oil dealer at Montreal, testifies that the total amount of refined oil products manufactured in Canada in 1898 was 21,153,192 gallons, of a value of \$1,723,293. The Standard Oil Company in July or August, 1898, secured complete control of all the refineries in Canada, of which there were five then in operation and four temporarily closed. All of these except the former Imperial Oil Company plant and one at Sarina have been dismantled. Mr. Gall believes it possible, however, that these existing refineries have almost as great capacity as the old ones, and sufficient to refine the entire Canadian production of crude oil. In fact, owing to the tariff of 5 cents per gallon on the importation of oil, it is much cheaper for the Standard to refine oil in Canada.

Mr. Gall testifies further that his company formerly handled largely Canadian oil, but that since the Standard Oil Company secured control of the refineries there it has been impossible for his company or any other organization to obtain oil from the Standard Oil Company except by promising to buy exclusively from it. The Standard Oil Company has two or three times sent men to the Gall-Schneider Company making such a proposition for exclusive patronage of the Standard.

Mr. Archbold testifies that the condition of the refining business in Canada has been very much disorganized; that the Standard Oil Company has comparatively recently entered the field, and that it now is doing, he thinks, about 75 per cent. of the refining in Canada.

5. Purchase of Refineries by Standard Oil Company—Mr. Lee, Mr. Westgate and Mr. Emery all testify concerning the recent attempts of the Stand-

ard Oil Company to buy out competing refineries. One main purpose in this attempt is to secure the stock held by those refineries in the United States Pipe Line and the other independent pipe line organizations. Quite high prices have often been offered for these properties, but in most cases the owners have declined to sell, largely as a matter of sentiment, even though they expected to be driven into bankruptcy from long-continued losses through the competition of the Standard Oil Company. Offers have been made, Mr. Lee believes, to all of the independent refineries.

Three large independent refineries in the oil regions have been bought out since 1895 by the Standard Oil Company and have been dismantled. One of these belonged to Mr. Ramage, another was the National Refining Company, and the third the Continental Refining Company. All of these were first-class and modern, but they have been entirely dismantled. To destroy them thus was a waste of capital which it had taken years to build, and the purpose of the Standard Oil Company was undoubtedly to destroy their competition as well as to injure the independent pipe lines. All of these refineries had contracts to take oil from these pipe lines, and the withdrawal of their patronage has involved a serious loss, since it costs little more to handle a larger quantity of oil through the pipe lines. The Standard declined to sell any of the material of the dismantled plants to other independent refineries.

Mr. Archbold admits that the Standard Oil Company has frequently purchased and dismantled plants of its competitors.

"We have at times bought refineries with the expectation of succeeding to the volume of business done by them. We have universally replaced the capacity of these refineries to better ones and better-equipped construction at more favorable points. We would not buy refineries and dismantle them for the pleasure of doing it."

"Q. Incidentally, in connection with that, it might be a more convenient way of holding your market in a locality where competition would figure?—A. Precisely."

Mr. Archbold testifies further that the purchase of refineries in Titusville was no exception to the above statement. The Standard Oil Company utilized the property of one of these refineries in establishing a plant in Puerto Rico and of another in establishing one in Kansas. There is at all times an excess of capacity in the refineries of the country, and the sole purpose in abandoning any plant is to conduct the business at a point where it can be more economically done.

Mr. Davis states that the Argan Refining Company, at Marietta, was recently leased to one of the branches of the Standard Oil Company at 6 per cent. on \$200,000 for ten years. The owners have since practically sold out to the same parties, this apparently being due to the suit brought against them for joining the trust. The witness believes that he could put up as good a plant for \$75,000, but he does not think that the Standard Oil Company often

pays high prices for competing plants. He believes that Scofield, Shurmer & Teagle are making profits.

6. Control of Competition by Pipe Lines—Several witnesses testify, directly or by implication, that one of the chief means by which the Standard Oil Company has been enabled to drive out competition has been its control of the pipe lines for handling crude oil. Compare on this subject the testimony under the headings: Pipe Lines; Railway Discriminations.

Mr. Davis, who is interested in wells in the new Corning field near Marietta and in a refinery at Marietta, testifies that the price of the Corning oil is fixed by the pipe line at 17 cents less than Macksburg oil, although it is in some ways of as good quality. The witness desired to pipe oil from his wells to the refinery at Marietta, but was charged 35 cents per barrel pipage, the ordinary rate throughout the oil fields being 20 cents. Practically he was forced to sell oil at the Corning field to the pipe line company and to buy from it oil of about the same quality at 17 cents more. This was one means used by the Standard Oil Company, apparently, to drive his refinery out of business.

7. The Matthews Case—Mr. Lockwood refers to the case of Mr. Matthews, of Buffalo, and the alleged conspiracy of the Standard Oil Company to blow up his refinery, but does not state the facts in detail. He refers to the fact that Mr. Matthew's partner, who had been bribed to betray him, was kept under cover for four years, with an assumed name, but finally confessed to Matthews. Matthews secured verdicts for \$270,000 against the Standard Oil Company in civil damage suits, but his creditors, under the receivership to which he was forced to submit, had to settle for \$17,000.

Mr. Archbold submits a detailed statement of the facts concerning the case referred to by Mr. Lockwood. In 1881 Matthews and two others were confidential employes of the Vacuum Oil Company, whose chief officers were H. B. and C. M. Everest. The Standard Oil Company was interested in the stock of this company, but had no control of its affairs. Matthews and his associates conspired to leave the employ of the Vacuum Oil Company and to establish a small business in Buffalo, taking advantage of their knowledge of the processes and patrons of the Vacuum Oil Company, and expecting that that company would be forced to buy them out. The Vacuum Company brought suit for infringement of its patents. At this time one Miller, who had left with Matthews, was re-employed, at his own solicitation, by the Vacuum Company. Later, however, he again left this company, went over to Matthews, and through his statements an indictment was brought by the grand jury against the directors of that company, charging it with conspiracy against the Buffalo concern. The balance of evidence in the case was overwhelmingly in favor of the Vacuum Company. The judge held that there was not any evidence against the directors belonging to the Standard Oil Company and directed the jury to acquit them, but Messrs. Everest were

held guilty by the jury, plainly under the influence of the plea of the district attorney. Mr. Archbold declares that all the charges concerning the attempted blowing up of the Buffalo works are the purest fiction, and submits a copy of an affidavit signed during 1888 by six of the jurors in the case, stating that it was not their intention individually, nor, as they believe, the intention of the jury as a body, to hold the defendant guilty of conspiracy to destroy the Buffalo works, but that the conviction was based on the enticement of Miller from the employ of that company. These jurors also recommended that the punishment be limited to fine without imprisonment. A note is appended to the signature of one of the six, saying that he swore to the recommendation only.

The statement that Matthews secured civil verdicts for \$270,000 is untrue. He brought a suit for \$20,000, and the judge set aside the verdict of the jury granting that amount as excessive. He later brought suit for \$250,000, which was never brought to trial. Mr. Archbold does not know concerning any settlement that may have been made of this suit out of the courts.

EFFECT OF COMBINATION ON PRICES.

1. General Statistics—All the witnesses testify in opposition to the Standard Oil combination express the opinion that it has not reduced the price of refined oil as compared with crude oil to any such degree as would be the case under open competition. They especially argue that care must be exercised against the fallacy of failing to distinguish between the reduction of the price itself, which depends largely on the price of crude oil, and that of the margin between refined and crude. The reduction of this margin is generally admitted, but it is declared to be by no means commensurate with the improvements in the processes of refining. The greatly improved uses of by-products are especially pointed out as having made possible a much greater reduction in prices.

It is to be observed especially that the prices of refined oil given in the tables ordinarily quoted are the export prices at New York. Export oil is of a somewhat lower grade than the water white oil used in this country.

According to Mr. Boyle's testimony, there are no satisfactory records showing the price of water white oil in this country. The price varies from place to place according to the cost of transportation, special contracts, etc. The witness believes that if it were possible to find some one standard market in this country where a record has been kept of the prices of a standard grade, such as water white oil, from year to year, these figures would give a fair basis for judging the influence of the Standard Oil Company upon American consumers. Cincinnati was suggested as a point where such records had been to some extent maintained.

2. Statements of Opponents of Combination—In addition to the general opinions, above referred to,

as to the effect of the Standard combination on prices, specific statements were made as follows:

Mr. Lee believes that the cost of refining has fallen during the past 20 or 25 years from $2\frac{1}{2}$ cents to one-half cent per gallon, while the margin of difference between crude and refined has fallen little. The prices for refined oil fixed by the Standard are not based on the cost of refining or of crude oil, but are entirely arbitrary. To a considerable extent, probably, it sells oil ahead and afterwards puts up the price of crude, so that its competitors will not be able to meet its prices for refined.

Mr. Rice declares the claim that the Standard Oil Company has reduced the price of refined oil to be absurd. Mr. Thurber's comments on this point pay practically no attention to the influence of the price of crude oil upon refined. There was a reduction in the price of refined oil from $6\frac{1}{2}$ cents in 1861 to $26\frac{1}{2}$ cents in 1870, before the Standard Oil Company came into existence. Mr. Rice also dwells upon the great difference between the price of export oil and that which domestic consumers have to pay. During the severe competition in foreign markets in 1896 the price of refined oil to retail dealers in New York was $9\frac{1}{2}$ cents per gallon, and that of export oil $4\frac{1}{2}$ cents per gallon. In 1892 oil was selling in Texas, Utah, Idaho and other Western States at four times the export price, and in many nearer States, such as Missouri and South Carolina, at double the export price.

Mr. Page declares that it is unfair for Mr. Rice to compare the export prices of oil, which are prices practically at the mouth of the refinery, with those at distant points, where the freight rates and expenses of distribution are high. He says that it is the general policy of the Standard to reduce the cost of refining in every way and to sell as cheaply as possible with a view to increasing the demand of the consumers by lower prices.

Mr. Westgate testifies that the reductions in the price of refined oil are not due simply to the advantages of the Standard Oil Company in production. In the early days the by-products—benzine, gasoline, etc.—were entirely worthless. They constitute about 20 per cent. of the crude product and are now worth about as much as refined oil. The quotations of prices ordinarily given are those in barrels at the seaboard. The barrels were formerly worth \$2 or \$3, now 88 cents, which makes a difference of about two or four cents per gallon in the price of oil. The export price, moreover, gives no information as to the average prices received in this country. When a cut is made in the export oil it may easily be offset by increasing prices of domestic oil. Nevertheless, the witness believes that the Standard Oil Company employs the best brains in manufacturing oil and has brought forward many improvements and inventions. But if the company now possesses any superior methods, the independent refiners do not know it. The independents can produce as good goods, and as economically, the witness believes, as the Standard Oil Company.

Mr. Emery believes that the people generally would get oil at 50 per cent. less than at present if there were active competition over the entire country. In another place he estimates that European consumers get their oil, quality considered, 25 per cent. cheaper than the average American consumer.

The witness has bought refined oil in California in cans at 20 cents per gallon, of precisely the same quality that he was selling at his factory in Pennsylvania of 4½ cents. Similarly he has bought gasoline at 25 cents per gallon of a kind which he was selling at 4 cents. The freight, according to open rates, from Pennsylvania to the Pacific coast, is about 6½ cents per gallon, allowing for leakage and other losses, so that oil might be sold there at from 10 to 12 cents per gallon. The witness does not know what proportion of the prices charged was the retail dealer's profit.

Mr. Monnett admits that the Standard Oil Company has taken advantage of various improvements in production and transportation—pipe lines, tank cars, development of by-products, etc.—but declares that it can no more claim to have reduced prices by its own efforts than to have reduced the price of calico from 75 cents to 4½ cents per yard. It has been profiting by many millions through non-competitive prices, notwithstanding such general decrease in prices.

3. Canada—Mr. Gall submitted a statement of the prices which he paid for refined oil at St. Johns, Quebec, before and after the Standard Oil Company secured control of the refineries of Canada (August, 1898). The price, delivered, ranged from 11 to 14¾ cents between September, 1892, and June, 1899. At the latter date it was 13½. Since then the Standard Oil Company has raised the price to 17½ cents. The price of crude oil in Canada has not risen with such rapidity as in the United States. During 1898

it stood at \$1.40 per barrel, and in June, 1899, at \$1.45. It has since been raised to \$1.60, but this represents an increase of only one-half cent per gallon during a time when refined has been raised four cents. The increase in the price of crude has been made with a view to encouraging production, since it is cheaper for the Standard to refine Canadian oil, on account of the tariff on importation.

Mr. Gall attributes the high prices of oil in Canada largely to the tariff on refined oil, which is now five cents per gallon, having been reduced somewhat by the last Conservative government in 1896. The present Liberal government has promised to remove the tariff altogether, but has so far failed to do so. The tariff is excessively high. The cost of Ohio oil at Toledo ranges from three to five cents, so that the tariff is fully 100 per cent. The rates on other commodities under the Canadian tariff are from 10 to 50 per cent. The only remedy for the monopoly of the Standard Oil Company and the maintenance of excessive prices is the removal of this duty.

Owing to the likelihood of the removal of the Canadian tariff on oil, it is considered a very risky investment to establish a refinery there now, since without the duty it would be entirely unprofitable. Nevertheless, the Standard Oil Company has made enough profit from the Canadian business to cover the cost of the refineries it purchased.

4. General Reply of Standard's Defenders—Replying to the above testimony that the Standard Oil Company has not lowered prices to consumers, Mr. Archbold referred to the table showing the comparative prices of crude and refined oil since 1870 as proving the contrary. He also submitted the following tables showing the average prices of oils in New York, Chicago and Cincinnati as proving the same point:

Average prices received for deliveries of standard white illuminating oils at New York City, Chicago, Ill., and Cincinnati, Ohio, during years 1885 to 1899, inclusive.

[Prices given are cents per gallon in bulk, exclusive of the package; 2½ cents per gallon added will give average price, including barrel.]

To the statement that were it not for the existence of the Standard Oil Company consumers would get oil at a much lower price Mr. Archbold replies that it would evidently tend to increase prices if two-thirds or three-fourths of the active capital and equipment engaged in refining should be withdrawn, and also that the opponents of the Standard are inconsistent in testifying that at existing prices the independents cannot make a fair profit. If it is true, as claimed by Mr. Lee, that the Standard makes \$1.50 to \$2 on every barrel of oil, while the independents would be satisfied with 10 cents, the independents are not now efficient servants of the public.

In reply to Mr. Lee's statement that if there were 50 concerns engaged in manufacturing petroleum just as wide markets would be obtained throughout the world as at present, while consumers would secure as low prices and all refiners would make a fair profit, Mr. Archbold submitted a list of 66 refineries now existing independent of the Standard Oil Company, the average duration of operation of which has been fourteen years.

Mr. Archbold further expresses the opinion that the Standard Oil Company, notwithstanding the fact that it controls more than 80 per cent. of the refined oil production in this country, is unable permanently to exact excessive prices. He admits that it might temporarily have such power, but

declares that if it exercised the power injuriously or arbitrarily the combination would lose business and perhaps provoke heavier competition. He hopes, and on the whole believes, that the Standard Oil Company is able to get prices higher than it could do under severe competition, admitting that there is a certain amount of monopolistic power coming from the aggregation of capital itself, but he adds that this monopolistic power is very slight at present. The lessened cost of doing business on a large scale more than compensates to the consumer, in Mr. Archbold's opinion, for the monopolistic power of getting higher prices. Part of Mr. Archbold's testimony in detail is quoted below:

"Q. Now, the general result, then, is this: By virtue of your greater power you are enabled to secure prices that on the whole could be considered steadily somewhat above competitive rates?—A. Well, I hope so. I think we have better merchandizing facilities, better marketing facilities, better distributing facilities and better talent than a competitor can have.

"Q. I am not asking with reference to your power of making profits, but it is with reference to getting the prices from the consumer.—A. Prices are what make the profit. If we had a better average price, we could get a better profit.

"Q. You think, generally speaking, that you get prices for oil slightly above competitive prices?—

A. Well, I should think so; I could not answer—that is a very general question and very difficult to answer. I could not answer that specifically. I hope that we do.

“Q. Of course, in this investigation we are seeing if we can get some general principles on which legislation might be based, and these questions are to bring out, if we can, the power that so great an organization has in fixing prices. Would you say, then, that in the case of an organization that controls perhaps 80 per cent. of the markets of the country there is a monopolistic element that enters in which enables them to hold prices above the regular rate? Is there a monopolistic power that comes merely from the power of capital itself?—A. Undoubtedly, there is an ability, and when that ability, as I have said, is unwisely used, it is sure to bring its own defeat.

“Q. If that ability goes to get an exorbitant price, of course it will invite competition, but when that ability is kept within modest limits, would you still say that it was in the power of such an organization to get the benefit of the monopolistic power that comes merely from the power of capital itself?—A. Well, I should say that that would be a very restricted power, a very restricted limit. The competitors in this country are very active.

“Q. What?—A. The competitors are very active; they are alert at all points with their small offerings in the hope to find just such a condition as you describe.

“Q. Certainly.—A. But, as I say, as business is and as it has been for many years, we could not have that ability to any considerable extent as merchants.

“Q. If the ability were operative only to a slight extent, would it still be enough, do you think, to make a difference between what we may call a moderate dividend, say 6 or 7 per cent., and a pretty high dividend of between 15 and 20 per cent?—A. Well, that involves so nice a question that I could hardly undertake to answer it; but generally, as to the effect on the community, I should say—

“Q. Generally on the prices in the United States?—A. I should say that the lessened cost incident to doing business in a large volume would more than compensate the consumer for any ability in getting higher prices.

“Q. Then, that leads to this point, whether the large capital does itself give an organization the power to get a somewhat higher price than it could in the market provided the competitors were substantially equal in power?—A. Oh, it may be so; but that is a difficult question to answer.”

Mr. Thurber expresses the belief that the reduction in the price of refined oil was from 25.7 cents in 1871 to 5.7 cents in 1898. This is attributable partly to increased production of crude oil, but more largely to improvements in manufacture and transportation attainable only through aggregation of capital.

Mr. Boyle believes that the Standard Oil Company has been beneficial to the producers as a whole

and to the public generally. The producers now are prosperous and satisfied with the prices they are obtaining. Without the organization of the Standard Oil Company the business could never have been developed as fully as it has been, through the superior organizing and marketing ability of the combination.

COST AND PROFITS OF REFINING—BY-PRODUCTS.

Closely connected with the subject of prices is the cost of refining and the rate of profit. Opponents of the combination believe that it makes excessive profits on each barrel of oil refined, and confirm this by pointing to the high dividends and the great value of the stock of the Standard Oil Company.

Thus Mr. Lee testifies that with refined oil selling at 9½ cents in New York, as it did in 1896, the Standard Oil Company should have received a profit of nearly 100 per cent. above the cost of refining. The witness believes that the Standard now makes from \$1.50 to \$2 on every barrel of oil. The difference in price between crude and refined oil during the past 20 years has decreased only slightly, while the cost of refining has fallen from 2½ cents to less than one-half cent a gallon, so that profits have greatly increased.

Mr. Phillips estimates that the Standard Oil Company has made an average profit of \$1 per barrel on all oil produced during its existence. He declares that its existing plants have practically been paid for entirely out of its profits. The value of its stock is nearly \$500,000,000, and the number of barrels of oil produced during the past 17 years is about \$500,000,000, these figures representing to the Standard a profit of about \$1 per barrel. The average price of crude oil itself has been only about 90 cents. Mr. Phillips, like Mr. Lee, declares that the independent refiners would be satisfied with a profit of 10 cents per barrel, which is more than they earn now. He admits that the higher profits of the Standard are partly due to superior utilization of by-products.

Detailed estimates as to the cost of refining and the margin of profit were not presented in evidence. Several witnesses pointed out that the by-products of refining, which are of great value, must be considered, and that they complicate the calculation.

Mr. Westgate, an independent refiner, testifies, broadly, that the cost of refining oil is about one-half cent per gallon, but adds that where crude oil is three cents and refined oil is sold at four it does not follow that the clear profit is one-half cent. There is a loss of quantity of from 5 to 7 per cent. in refining, and some by-products of lower grade are sometimes worth as much as refined oil, but sometimes less.

Mr. Monnett states that it has been brought out repeatedly in the Ohio suits and trust investigations that refined oil could be delivered in Ohio at a cost of four cents a gallon or even lower.

Mr. Rice declares that from 1871 to 1880 the cost of refining oil did not exceed one cent per gallon,

from 1880 to 1890 one-half cent, and since 1890 one-fourth cent, although to the average independent refiner the cost has been about one-eighth cent higher than this. He states further that during the past 10 years oil could have been sold in this country, on the average, at $2\frac{3}{4}$ cents per gallon. He calculates that the market price of crude oil has averaged only $1\frac{3}{4}$ cents per gallon; that the cost of local pipage to the seaboard has not exceeded one-eighth cent each, while he adds one-fourth cent for the cost of refining, and one-half cent as the average rate of freight paid by the Standard Oil combination to interior places. The Standard makes a still higher profit on oil refined from Ohio crude, which costs very much less per barrel.

Mr. Davis states that the cost of fuel and some of the chemicals used in refining has been considerably less during the past three or four years than before. The independents themselves buy their sulphuric acid chiefly from the Standard Oil Company, which furnishes it cheaper than other dealers. Twenty years ago the by-products, benzine, tar, etc., were largely thrown away, but they are now often worth more than the refined oil.

Mr. Archbold testifies that the improved methods of utilizing by-products in recent years have greatly increased their sale, and that they substantially equal in value the refined oil itself. On its being pointed out that notwithstanding the increased profits from this source the margin of price between refined oil and crude oil had not been materially decreased during a number of years, Mr. Archbold states that there is a point below which it is not possible to reduce prices, and that, in his opinion, the profits of the Standard Oil Company have not increased during the past six years. He also states that in calculating the profits of refining illuminating oil is not considered by itself, but the value of all products jointly is taken, the price of each being fixed according to demand.

ECONOMIES OF COMBINATION AND CONSEQUENT ADVANTAGES.

GENERALLY.

Mr. Archbold declares that large corporations are necessary, especially in view of rapidly growing foreign commerce, and maintains that the Standard Oil Company has done very much to develop foreign trade in petroleum. It has also been beneficial to the consumers generally in furnishing them goods of vastly improved quality at greatly reduced prices, and in distributing oil to the most remote sections of the country promptly and cheaply. During the early years of the petroleum industry the methods of production, manufacture and transportation were very crude and the average quality of oil unsatisfactory. The Standard Oil Company brought to the business ample capital, employed the best possible talent in all branches, used the most progressive methods and the most perfectly equipped and favorably located refineries, and inaugurated

new systems of transportation. One of the chief advantages of combination is that the best formulas and processes can be employed in every one of the separate establishments.

Mr. John D. Rockefeller, in an affidavit, replying to interrogatories from the commission, states: "I ascribe the success of the Standard to its consistent policy to make the volume of its business large through the merits and cheapness of its products. It has spared no expense in finding, securing and utilizing the best and cheapest methods of manufacture. It has sought for the best superintendents and workmen and paid the best wages. It has not hesitated to sacrifice old machinery and old plants for new and better ones. It has placed its manufacturing at the points where they could supply markets at the least expense. It has not only sought markets for its principal products, but for all possible by-products, sparing no expense in introducing them to the public. It has not hesitated to invest millions of dollars in methods for cheapening the gathering and distribution of oils by pipe lines, special cars, tank steamers and tank wagons. It has erected tank stations at every important railroad station to cheapen the storage and delivery of its products. It has spared no expense in forcing its products into the markets of the world among people civilized and uncivilized. It has had faith in American oil, and has brought together millions of money for the purpose of making it what it is, and holding its markets against the competition of Russia and all the many countries which are producers of oil and competitors against American oil."

Mr. Boyle believes that the success of the Standard Oil Company proves that it was the fittest to survive, and that its methods have been most skillful. There was nothing 20 years ago to prevent other organizations from being formed to control pipe lines and to develop the oil business, but they failed to do so. The Standard then invested \$3,000,000 in one pipe line, incurring what was considered a very great risk. Its officers had the courage, energy and ability to strike out where others feared to enter. But the pipe line system has been only one factor in the success of the Standard. Its greatest superiority has been in its ability to market its products, in its organizing mercantile capacity. Mr. Boyle does not consider that the Standard Oil Company is especially superior in its methods of manufacturing. Neither the Standard Oil Company nor the independents have the monopoly of inventive genius. The Standard, however, is entitled to more credit than it has received for its achievements in refining Lima oil satisfactorily.

The witness believes that the ability of the Standard Oil Company has had a great influence in making the oil business as extensive and prosperous as it is today. Without this organization the business would be carried on on a much smaller scale.

TRANSPORTATION AND LOCATION OF REFINERIES.

Mr. Dodd, solicitor of the Standard Oil Company, in his statement summarizes the advantages

of the methods of the Standard in regard to transportation as follows:

"1. They have cheapened transportation, both local and to the seaboard, by perfecting and extending the pipe line system; by constructing and supplying cars by which oil is shipped in bulk; by building tanks for storage of oil in bulk; by purchasing and perfecting terminal facilities for receiving, handling and reshipping oils; by purchasing and building steamers and lighters for river and harbor service; by building wharves, docks and warehouses for foreign shipments; by purchasing and building ocean steamers for carrying oil in bulk, and by employing in foreign countries the same special methods for storing and transporting oils in bulk, by which means alone the markets of Europe are today held by American oil against Russian competition."

Mr. Rockefeller and other witnesses emphasize the economy of the pipe line system, and the need of large capital to make it successful.

Mr. Dodd states that some of the refineries which entered the Standard Oil Trust were abandoned because of unsatisfactory location or ill adaptation for the desired work, being replaced by others at more convenient locations and superior plants. In fact, during the past 18 years all the plants of the combination have been practically made over and rendered more effective.

Mr. Page urges with special emphasis that the Standard Oil Company has considerable advantage over its competitors in the cost of transporting oil by rail, owing to the fact that it has many refineries in different places and can supply the consumer from the nearest point, while the owner of a single refinery has to ship much longer distances. The point is made in reply to charges that the Standard secures lower freight rates than its competitors, and is more fully summarized under the heading "Railway Discriminations."

Mr. Lee believes that oil can be refined cheaper in the interior than on the seaboard. Land, labor and fuel are all cheaper and water is abundant.

Mr. Emery testifies that the Standard Oil Company has in recent years been inclined to rebuild refineries in Pennsylvania, and to do a relatively small proportion of its business near New York and elsewhere on the coast. Fuel is cheaper in Pennsylvania and it is in every way the proper place for refining oil. The Standard Oil Company has spent millions in new plants in Philadelphia and also in the oil districts.

PROCESSES.

Mr. Dodd summarizes the advantages of combination in regard to the processes, etc., as follows:

"By uniting the capital, skill and acts, and the various processes and patents of a number of persons, as well as their secret processes, and by building up manufactories on a more extensive and perfect scale, with improved machinery and appliances, and by locating them in the centers of the trade

they were intended to reach, the manufacture of oil has been much cheapened and improved.

"By spending large sums in the investigation of methods of utilizing Ohio and Indiana oils, and by purchase of various patents, they have succeeded in making a superior article of illuminating oil out of what for some years seemed an almost worthless product.

"By uniting with the business of transporting and refining businesses necessarily collateral thereto, to-wit, the manufacture of barrels, tin cans, boxes for inclosing cans, paints, glue, sulphuric acid, etc., and by union of capital and skill, obtaining the best machinery and manufacturing on a large scale, they have cheapened these products."

Mr. Dodd enumerates the patents held by the Standard Oil Company in 1882, on machinery and processes. Most of these have to do with the manufacture of cans, boxes and barrels. There is one patent upon stills for refining and distilling oils, one on an apparatus for separating petroleum products, and several upon the manufacture of lubricating and hydrocarbon oils, paraffine and vaseline.

Mr. Lee believes that the Standard Oil Company has no appreciable superior processes or economies in production. There may be some slight difference in favor of large refineries, but one with a capital of \$500,000 would be able to secure every by-product at the lowest possible cost. The independents produce oil as cheaply as the Standard, and of better quality. The making of tin cans and barrels can also be done as cheaply by other manufacturers.

Mr. Emery declares that the Standard Oil Company has not improved the methods of refining especially, but that, on the contrary, if the business had been entirely open to competition, there would have been more rapid development than has taken place. As early as 1872 the company with which the witness was connected was employing every device which is now used for making illuminating oil. The process of distillation, in fact, is not difficult, and is practically the same now as in 1860, cylinder stills being used both then and now.

Mr. Westgate does not consider competition against the Standard Oil Company impossible so long as fair conditions prevail. Mere aggregation of capital is not the difficulty. The advantages in the matter of transportation and the cutting of prices below the cost of production are the causes of the Standard's ability to drive out competitors. These evils should be checked by law.

BY-PRODUCTS.

Considerable testimony was adduced as to the superior advantages of the large capital of the combination in manufacturing and marketing the by-products of petroleum. This advantage was generally admitted by the opponents of the Standard.

Mr. Archbold testifies that there has been a decided increase in the value of by-products in the refining of oil during the past 10 or 15 years. The

leading products are gasoline, naphtha, paraffine, lubricating oils, and vaseline products. He does not consider that a refinery with a capitalization of only \$500,000 could secure these by-products in anything like as economical a manner as the Standard Oil Company does with its great specialization of methods. The by-products are now substantially equal in value to the illuminating oil itself.

Mr. Emery testifies that fully 200 by-products of petroleum are used for medical purposes, besides the use of aniline dyes. Lubricating oils and paraffine wax are not, strictly speaking, considered by-products. The wax may be taken out of refined oil at a certain distillation, if it is profitable to do so, or it may be broken up by heat and left in the illuminating oil. Until recently the various by-products were not of very great value. The witness has sold paraffine wax as low as $1\frac{1}{4}$ cents per pound within three years, but it is worth to-day from 3 to 4 cents per pound. Paraffine wax is used largely in making joints of pipes, and in covering all electrical conductors, as insulators. It is mixed with stearin for making candles.

Mr. Emery acknowledges that the Standard Oil Company has greatly developed the amount, quality and sale of by-products, but declares that other active refineries could have devised the same methods if they had had the opportunity. As a matter of fact, during a long period of time the Standard Oil Company had the exclusive control of the refining business, and naturally was the only one to make improvements. Many of the inventions in this regard have been made in Europe.

Mr. Emery does not know whether the by-products of petroleum may equal in value the refined oil, as stated by the Standard Oil Company. His own refinery uses Bradford crude oil, which is specially rich in lubricants. He makes, for the most part, only the crude stock for refined by-products, such as cosmoline, but sells from \$30,000 to \$35,000 worth of them monthly.

Mr. Phillips believes that so far as the processes of producing and refining crude oil are concerned, the independents are on a par with the Standard, but the Standard has an advantage in selling, because of its accumulated capital enabling it to handle all the by-products, etc. The superior utilization of the by-products partly accounts for the greater profits of the Standard Oil Company.

Mr. Davis states that a large refinery with facilities for making gasoline and other by-products is much more profitable than one which makes only illuminating and lubricating oil. But it is scarcely a safe investment to attempt to manufacture these by-products. The railways are largely consumers of lubricating oils, and these deal almost exclusively with the Standard Oil Company. Even a large investment would be likely to prove unprofit-

able. The refinery controlled by the witness had a capacity of about 8,000 barrels per week. A refinery of that size is confined to the manufacture of illuminating and lubricating oil. This refinery sold its by-products, without finishing them, to Scofield, Shurmer & Teagle, and elsewhere, but never secured a profit from them.

PURCHASE OF COAL.

Mr. Lee believes that the Standard Oil Company like other large consumers of coal, is able to secure it at low prices. It practically fixes what it will pay. This has an injurious effect on the wages of coal miners.

Mr. Archbold denies that the Standard obtains special rates on coal and declares that it buys in the open competitive market.

ADVANTAGE OF FOREIGN TRADE.

Mr. Archbold urges especially, as a justification of the methods of the Standard Oil Company, that large aggregation of capital has been absolutely necessary to the successful development of the export trade in petroleum. Any restriction in the amount of capitalization allowable would greatly hamper that company and other large American corporations in competing with foreign corporations. The Standard Oil Company has been conspicuously active in reaching out and securing markets over the entire world. If it had not been so energetic, the producers of oil in Russia and elsewhere would have secured a very much larger proportion of the foreign markets than they now possess. The Standard Oil Company constantly meets strong competition, probably on the whole growing competition, from oil produced in other countries. Mr. Archbold submitted a partial list of corporations and firms engaged in producing and refining petroleum in Russia and various other countries, with their approximate capitalization, showing how extensive is the investment and how vigorous the competition encountered by the Standard Oil Company. The Standard Oil Company has no interest in any of the concerns. In Russia, especially, the business is getting into the control of men of great wealth and ability—such as the Rothschilds, Nobel Brothers, and prominent English capitalists. There is a rapidly developing petroleum industry in Japan, Sumatra, and Java.

The witness submitted the following statements, showing the amount of refined and crude oil, respectively, produced in different countries, with the percentage of the total assigned to each. He maintains that most of the refined oil produced by each country is the product of crude oil obtained in that country.

World's Production of Refined Illuminating Oil, 1897.

Mr. Archbold also submitted the following statement showing the proportion of the total export trade in petroleum products done by the Standard Oil Company.

VALUE OF EXPORTS.

Total value of petroleum products exported from the United States for the years 1861 to 1871, inclusive, amounted to..... \$199,030,333

Value of exports from 1872 to 1898, inclusive (i. e., since the organization of the Standard Oil Company)..... 1,246,846,381
Value of exports by the Standard Oil Company 1,126,401,021
Standard Oil Company, 90.34 per cent of total.

Mr. Page states that the Standard owns a number of bulk tank ships, and also some sailing vessels which are used for shipping oil in cases to the far East. The Standard has many agencies throughout the world, mostly under charge of American citizens.

Mr. Page testifies further that the price of Russian crude oil is much lower than that of American oil and that the Russians are competing actively in various markets, but especially in the Asiatic trade. They have tank steamers for transporting oil to India and even to China and Japan.

The witness has heard and believes that the German government recently issued an order requiring the government-owned railroads to burn exclusively Russian oil in preference to American.

Opponents of the combination present little evidence about foreign oil, although they make statements concerning the conditions of export trade generally, the efforts of independent refiners to find foreign markets, and the methods of competition of the Standard Oil Company against these.

Mr. Phillips, however, maintains that the Standard Oil Company was not the pioneer in shipping oil abroad, but that before its existence a large proportion of the foreign countries had already been reached. He believes that a wider distribution of petroleum would have existed if the Standard had never been formed. The Standard Oil Company has no better talent than others engaged in the same business.

On the general subject of export trade Mr. Lee states that ordinary export oil would not be permitted to be sold in some of our States, but is still of quite high quality. The independent oil is superior to that sold by the Standard, which the witness believes, is partly refined from Lima oil. About 40 per cent of all the crude oil manufactured is exported in the shape of refined oil, while lubricating oils and by-products would bring the proportion up to fully 50 per cent. Germany is the largest oil market in the world, both the Standard and independent companies doing extensive business there. Russian oil is not largely used in Germany. The Standard Oil Company controls most of the business in France. The independents do little business in Asia, Africa, or South America.

Mr. Emery submitted an estimate of the amount of American Oil consumed in European countries. Germany consumes about 6,000,000 barrels; Great Britain, 3,000,000; France, 2,000,000; Norway and Sweden, 1,200; Denmark, 600,000. Practically all of this is sold by the Standard Oil Company, the largest exportation of the independents in any one year having been 400,000 barrels, almost entirely sold in Germany.

Mr. Lee believes that the Standard Oil Company is not transporting oil from this country in tin cans as largely as it formerly did, but that it is supplying its Eastern markets largely with Russian oil and making tin cases abroad.

In reply to this, Mr. Archbold submitted a statement showing the number of tin cans manufactured by the Standard Oil Company in this country and elsewhere from 1894 to 1898. These figures show, for the most part, a steady increase in the number manufactured in the United States, and relatively less increase abroad. A total of 223,116 5-gallon cans were manufactured in this country and less than 13,000,000 abroad. The company is compelled by freight rates and tariffs to manufacture some tin cans in Mexico and in Italy, but nowhere else.

During the same five years there have been exported from the United States 109,861,221 cases (each case containing two tin cans) of petroleum, all but 7,463,041 by the Standard Oil Company, while the exports from Russia have been only 53,128,120 cases. The witness submitted a detailed statement of exports to different countries by the Standard Oil Company and by other American refiners, to show the enterprise of the Standard Oil Company in securing foreign markets.

QUALITY OF TRUST PRODUCT.

Mr. Lee believes that the oil refined by the Standard Oil Company has deteriorated in quality within 20 years, since the company has used a considerable proportion of Lima oil for refining, which contains arsenic and sulphur.

To this statement Mr. Archbold replies that, as the result of careful work on the part of the Standard Oil Company, it has been possible to secure refined oil from Ohio crude fully equal to that from Pennsylvania crude. The independent refiners of Pennsylvania have done a great injustice to the producers of Ohio by depreciating the quality of their product and attempting to keep it from being considered on the exchanges as a good delivery.

Mr. Emery denies, from his experience as a refiner, having in his employ as good a chemist as can be found, that sulphur can be entirely eliminated from oil containing it. The chemists of Europe who test the quality of oil imported always detect the presence of sulphur, and on that account practically exclude oil refined from Ohio crude. Such oil is confined in its use almost altogether to the United States and Mexico.

Mr. Rice declares that Ohio oil is decidedly inferior, and that, despite modern improvements in refining it, the sulphur and other impurities cannot all be removed. The refined oil from Ohio crude is mixed with that from Pennsylvania crude, but even then it forms a white film on the lamp chimney, gives an offensive smell and is otherwise unsatisfactory. Mr. Rice declares that the profits of the Standard Oil Company on oil refined from Ohio crude are much higher than on other oil, owing to the lower price of the crude.

Mr. Gall says that his Canadian customers seem to consider the American oil which he sells them much better than what the Standard was selling as Pennsylvania oil. He believes that the Standard had been giving them the Ohio product for years, and putting it off as Pennsylvania oil. Mr. Gall sells Ohio oil also, and makes a difference, generally of about a cent or a cent and a half a gallon, between it and Pennsylvania oil.

Mr. Monnett refers, without quoting it in detail, to a pamphlet issued in England declaring that American oil furnished by the Standard Oil Company is inferior to Russian oil, and describing the illegitimate means resorted to by the Standard Oil Company to prevent Russia from entering English markets.

Mr. Archbold declares that this pamphlet referred to is a scurrilous publication issued by one of the yellow journals of London, which has been practically subsidized by Russian producers. A committee of Parliament investigated the quality of American and Russian oil and fully upheld the safety and quality of American oil.

Mr. Emery explains in detail the methods of refining and the various qualities and tests of oil. When the crude oil is distilled the lighter products pass over first—first the volatile gas, next gasoline, benzine, etc. The first illuminating oil to pass over is the lightest in weight and will burn at about 110 degrees (fire test). It will flash at 85 degrees, but will then go out. This grade of oil was formerly legally used in most of the American States, but later laws have raised the fire test, so that most oil used in this country is from 120 to 150 degrees fire test. Only a limited amount of oil of this higher test can be obtained from crude, and in obtaining it the quality of the lighter grades of oil is lowered.

Mr. Emery considers that 110-degree oil is entirely safe for ordinary use. It will not give so bright a light as 150-degree oil, but will last longer in burning.

One hundred and ten-degree oil is the ordinary export oil. The Germans apply a rigid test to secure the maintenance of this standard. Mr. Emery believes that, in view of the lower price of such oil, it is the most economical for use, and that this is the reason why it is admitted freely by Germany.

CRUDE OIL—EFFECT OF COMBINATION.

EARLY HISTORY OF OIL INDUSTRY.

1. Discovery and Progress—Mr. Boyle presented detailed statements concerning the early development of the oil industry. Oil was refined from coal and shale in considerable quantities during the early part of the present century. Rock oil or petroleum was often observed in connection with salt wells and springs in Pennsylvania and Kentucky and elsewhere, and in 1829 a large flow of oil was secured from a salt well in Kentucky. As early as 1853 and 1854 there was an organized effort to produce petroleum from oil springs and surface gravel in Pennsylvania. E. L. Drake was the first to experi-

ment in drilling especially for oil, and he was first successful in August, 1859.

The industry developed very rapidly, but was greatly hampered by the difficulty of transportation—since the oil district was 30 miles from the nearest railway—and by the lack of barrels for transportation. The first flowing wells were struck in 1861, and produced so largely that prices declined from \$20 per barrel to practically zero, there being then no way of storing and transporting oil in such quantities. There was a marked improvement in 1862, and during 1863 transportation by boats enabled oil to reach markets more readily and improved prices. In order to float boats the device was used of damming the water in Oil Creek and letting it out in sudden floods. Small pipe lines for conveying oil were introduced about this time, and during 1863 and 1864 railways were constructed into the oil territory. During the latter year many stock companies were formed and speculation was excessive. The price of oil was forced up in July, 1864, to \$13.75 per barrel. The cost of transportation was still very great, and during the war a tax on crude and another on refined petroleum was levied by the national government.

In 1865 improvements in drilling, such as the use of casing, torpedoes, etc., were introduced, and pipe lines began to be used more extensively for transporting oil from the wells to railway points. The cost of transportation of oil from Pithole to New York in December, 1865, was \$5.55 by one route and \$4.59 by another.

During 1866 and 1867 production increased rapidly and prices fell greatly. There were a number of bank failures. Mr. John Ponton, in a pamphlet entitled "The Crisis in the Oil Region," estimated that a profit of \$504 could be secured during the first year of production of the average oil well, costing \$3,500, by the use of gas as fuel for pumping; but if coal should be necessary for pumping there would be a loss of \$1,507. He advocated a restriction of output. But meantime improvements in transportation were being made, which soon brought renewed prosperity to the oil producers.

In 1869 the Petroleum Producers Association of Pennsylvania was organized especially for the purpose of securing statistics of production, and thus protecting the producers from the depression of prices by speculators. A circular stating the ob-

jects of this association was submitted by the witness. Prices were higher than during any of the three previous years. There was, however, a decline during 1870. About 1871 the first discoveries of oil in the Bradford field were made, but the field was not developed until considerably later. During 1872 the Butler and Clarion fields were rapidly developed, so that there was soon an overproduction of oil.

Mr. Emery also makes a brief statement of the early history of the oil business, dwelling especially on the history of pipe lines.

2. Oil Exchanged and Speculation—In the early days of the oil business the prices received by producers were determined in part by the so-called dump men, owners of "dumps" or tanks, who gathered up, and sold again, the oil of the small producers. The dump man developed into a refiner later on; and as a refiner he especially made a business of handling oil from the bottoms of tanks, not salable on the general market. The agents of larger refineries went from place to place, buying oil directly from producers and often following the prices of the dump men. Later on these agents became more systematic in their methods and finally met regularly at special places to deal with producers. Thus originated oil exchanges, which at first were more in the form of chambers of commerce, but later took on more distinctly the form of exchanges. The oil exchanges at Titusville, Oil City and Franklin were organized formally about 1871. These became numerous and speculation upon them rapidly increased, both among producers themselves and among outside persons. The producers who refrained from speculation invariably got wealthy, while those who speculated became poor.

STATISTICS OF PRODUCTION AND PRICES.

Crude oil is produced in a number of different States of this country and in numerous foreign countries, especially Russia. The quality known as Pennsylvania oil, which is also found largely in New York, West Virginia and a part of Ohio, is considered much superior to Ohio or Lima oil and that found in California and other States, as well as to Canadian and Russian oil.

The following statement was submitted by Mr. Archbold:

Crude Oil Production, by States, Years 1896, 1897.

[Barrels of 42 gallons.]

States	1896	1897	Increase or decrease	Increase or decrease	Average value per barrel		
					1896	1897	
							<i>Per Cent.</i>
Pennsylvania	19,795,779	18,439,180	1,356,599		\$1.186	\$0.795	6.9
New York	736,606	771,606	35,000		1.179	.786	4.8
West Virginia	10,005,966	13,078,011	3,072,045		1.180	.788	30.7
Ohio (Pennsylvania oil)	3,365,365	2,877,193	488,193		1.180	.788	14.5

1. Pennsylvania Oil—Mr. Boyle and Mr. Archbold submitted the following table showing the average daily production of Pennsylvania crude oil from 1870 to 1898, the average price of crude oil

per barrel of 42 gallons and of refined per gallon, and the variations in stocks on hand. It should be noted that the price of refined oil includes the value of the barrel, worth about 2½ cents per gallon:

Production and Prices of Pennsylvania Oil.

Year	Average daily production	Average price per barrel	Refined per gallon	Stocks increased	Stocks decreased	Total stocks
	<i>Barrels.</i>			<i>Barrels.</i>	<i>Barrels.</i>	
1870	15,350	\$3.90	\$.0265½	203,872	544,626
1871	15,800	4.40	.24¼	12,626	532,000
1872	17,925	3.75	.235½	552,223	1,084,423

1898	85,206	.91¼	.0631	752,101	11,541,753

Since 1870 the daily production has increased 450 per cent.; the price of crude oil has declined 75 per cent., and the price of refined about 75½ per cent.

Mr. Lee gives figures showing the highest and lowest prices of crude oil for each year since 1869 to 1897, and explains some of the chief fluctuations. The South Improvement Company was formed in 1872 and largely controlled transportation, by this means depressing prices of crude oil. New discoveries of oil in Butler county further decreased prices, but in 1876 and 1877 the working out of this field and increased speculation again raised prices largely. The rise in 1883 was due to the practical giving out of the Cherry Grove field, opened in the previous year, and to the decline in the Bradford field. The increase from 1888 to 1890 was due to restriction of production by agreement. The heavy production of the McDonald field then greatly reduced prices, while the increase in 1895 and 1896 was made arbitrarily by the Standard Oil Company.

Mr. Davis states that the Macksburg oil field, about 25 miles from Marietta, produces a high quality of oil, containing much paraffine, and known as "white sand oil." More recently the Corning field has been discovered 40 miles northwest of Marietta. The oil is in many ways as valuable as the white sand oil, but the price is fixed by the Standard Oil Company, through its pipe line, at 17 cents per barrel less. The production of oil in these two fields is about 10,000 barrels per day, while in the Lima field it is about 60,000 barrels per day.

2. Canadian Oil—The production of crude petroleum in Canada is confined almost altogether to western Ontario. The total production is about 750,000 or 800,000 barrels per year. Practically all of this is refined and used in Canada, and in addition about 38 per cent. of the entire amount of refined products used is imported from the United States. Most of the crude production is in the hands of small owners, but the Standard Oil Company controls about 25 per cent.

Mr. Gall testifies that Canadian oil is much inferior to Pennsylvania oil, and even to Ohio oil. The difference in price made by his company between Pennsylvania and Ohio oil is usually about 1½ cents. The witness believes that the Standard Oil Company has been selling Ohio oil in Canada under the name of Pennsylvania oil.

3. Russian oil is not as productive of illuminants as American oil, and the refined oil is inferior in quality, containing some sulphur. The basis of American oil is paraffine, and from 75 to 78 per cent. of illuminating oil can be obtained from Pennsylvania crude. The basis of Russian oil is asphalt, and it gives only about 25 per cent. of refined oil. California oil also has an asphalt base.

METHODS OF LEASING LANDS.

In many instances oil producers buy lands, but the more common custom is to lease them for oil purposes, giving the owner one-eighth. The lease usually runs for 20 years.

Mr. Monnett mentions one-sixth as the average amount that goes to the land-owner in Ohio.

The proportion of the value of oil going to the land-owners as royalty had varied from one-half to one-eighth, the latter proportion now prevailing in most parts of the oil fields.

COST OF DRILLING WELLS.

Mr. Emery, who has drilled several thousand oil wells, testifies that in the lower oil regions, where wells are sometimes as deep as 2,000 feet, the cost is often \$8,000 or \$10,000. In the upper region the cost was formerly about \$2,500, the average, perhaps, for both regions being about \$4,000. But it would be impossible to drill wells at these figures today, since the price of iron, which is largely used in casing, has doubled.

Mr. Davis states that the cost of producing oil had decreased materially until 1899, when the increase in the price of iron for casing, tubing and machinery increased the cost of sinking wells. The cost of production varies greatly in different fields according to the depth, the kind of casing which must be used and the amount of production. The cost of drilling may be \$5,000 or \$6,000. Expert drillers are paid \$4 or \$5 per day.

Most labor in the drilling of oil wells is done by contract, so that it is difficult to estimate the average rate of wages or the average length of time the men are employed. The wages differ considerably according to the skill of the worker; a first-class man is likely to earn as much as \$1,000 in a year. The labor, both in drilling and in refining oil, is well cared for, and is loyal to the producers and to the Standard Oil Company.

PROPORTION OF CRUDE PETROLEUM CONTROLLED BY STANDARD.

Mr. Lockwood testifies that the Standard Oil Company owns a large percentage of the Ohio fields and has been acquiring much production in the Pennsylvania and Virginia fields. Its policy has been to depress the price of crude oil, so that lands could be purchased at low figures. Thus the price of Lima oil was kept down to between 10 and 20 cents, after the Standard Oil Company had introduced its pipe lines and had influenced the railways to fix high rates for transportation, so that it practically fixed the price of oil. The purchases in the Pennsylvania and Virginia fields also were made just before the great rise of prices in 1896 and 1897. By increasing prices after these purchases of land the public was made to pay for the investment. Moreover, stocks had been reduced to between 4,000,000 and 5,000,000 barrels, and the law of supply and demand, as well as the desire of the Standard Oil Company to make profits, forced an increase of price.

Mr. Phillips confirms the general features of this testimony.

Mr. Lee states that the Standard Oil Company controls from 23 to 25 per cent. of the production of crude oil. More than half of the entire produc-

tion is owned by men who produce less than 10 barrels a day each. The owners of from 40 to 50 per cent. hold stock in the independent pipe line and marketing companies. The effect of the production of crude by the Standard Oil Company has been to reduce prices. It is able, by its large capital, to drill deep wells and secure high production. It has also leased large blocks of oil lands in West Virginia and has held them for future development.

Regarding the Ohio field, Mr. Davis testifies that when territory is found to produce oil in profitable quantities, various companies, such as the South Penn Oil Company, the Ohio Oil Company, the Carter Oil Company, etc., which are believed to be creatures of the Standard Oil Company, buy up the ground largely. They have plenty of capital and pay fair, even exorbitant prices, overbidding their competitors.

In reply to the charges of Mr. Lockwood that the Standard Oil Company had used its control of prices of crude oil to depress the value of oil lands and secure practically the entire control of crude production in Ohio, Mr. Archbold submitted the following statement, showing the amount and proportion of the total crude output, both in Pennsylvania and Ohio, produced by the Standard Oil Company. It is to be noticed that while the proportion of Pennsylvania oil produced by that company has rapidly increased, the proportion of Lima oil controlled by it for some time decreased rapidly and later increased only slowly. (While Mr. Lockwood's statement referred to ownership of land and Mr. Archbold's to production of oil, some degree of correspondence between land ownership and oil production would naturally be expected.)

Production of Pennsylvania and Lima Crude Oil by Standard Oil Company and Others, Years 1890 to 1898, inclusive.

[Expressed in barrels of 42 gallons.]

EFFECT OF STANDARD OIL COMBINATION ON PRICES.

I. Opponents of Combinations—Several witnesses testify that the practical monopoly of the Standard Oil Company in the purchase of crude oil has been employed by it to depress prices, greatly to the injury of producers. The Standard Oil Company has control of far the greater proportion of the pipe lines in the oil regions, and producers have no choice but to sell to these pipe lines at the prices fixed by them. The evidence to the effect that this power of depressing prices has been used in order to buy up oil lands at low figures has been already referred to. It is especially claimed by witnesses that the practice of the Standard Oil Company since 1895 of disregarding the prices of oil made on the exchanges has given it still greater control over the market.

Mr. Lee's testimony is especially full on this point. He states that there has been a great fall in the price of crude oil since 1870, when it was \$4.90 per barrel, the price in 1897 ranging from 65 to 96 cents. This decrease, while partly due to new discoveries of oil, cheaper drilling of wells and im-

proved methods, is largely owing to the combination of refiners. For 10 years previous to 1895 the average price of crude oil was kept below 80 cents, which is to most producers unprofitable. This low price was not mainly due to overproduction. Thus, when the Bradford oil field was opened in 1881 production increased greatly, so that 39,000,000 barrels were in stock in 1884, yet the price was reduced only to \$1.12 or \$1.15, as compared with \$1.24 in 1880. In 1887 the stock had fallen to 31,000,000 barrels, and the production was about the same as in 1884, but the price had fallen to 66 cents. The arbitrary limitation of production from 1887 to 1889 increased prices somewhat, but less than was anticipated. Since January, 1895, the Standard Oil Company has ceased paying the market prices for oil, as fixed on the exchange, and has simply announced the prices it would pay daily. The range of prices, however, has been higher since 1895, averaging \$1.05. This has not been chiefly due to increased competition of independent pipe lines, although they pay often from one to nine cents per barrel more than the Standard Oil Company, and undoubtedly tend to keep up prices. The sudden increase in

price to \$2.60 in 1895 was entirely arbitrary, apparently intended to injure independent refineries.

Crude oil producers as a body have been losing steadily, but they continue to drill and to pump oil, largely because of the speculative possibility of striking large wells and the hope of better conditions in the future. The witness believes that the cost of producing a barrel of crude oil now averages from \$1 to \$1.20. Mr. Lee declares that he believes, in fact, that the oil-producing counties would have been better off if they had never produced a barrel of oil. The price of logal pipage has not been reduced by the Standard Oil Company since 1870.

The producer who happens to strike a well with a large flow could of course sell much below the producer whose well yields a small quantity, since the cost of drilling in each case is about the same. But the greater part of the production is from small wells and the price must be sufficient to enable them to be drilled, aside from the matter of the speculative drilling of wells in hope of large production. The result is that the owner of a large well secures a very high profit from a normal price.

Mr. Monnett states that the laws of various States and other obstacles make it almost impossible for independent pipe lines to be laid. The Cudahys of Chicago have been trying for years to secure pipe line privileges in Indiana and Ohio. The companies belonging to the Standard charge prices so high as to prevent independent refiners or producers from shipping. Producers in Ohio are practically compelled to sell to the pipe line companies at the price they may fix, having no other means of outlet. The pipage rate in Ohio everywhere is 20 cents per barrel. The Buckeye Pipe Line Company has had a gross income in three years of \$19,495,495 from Ohio business, while the land-owners have received for the leases of their land only \$9,747,000.

In the Ohio field, to judge from Mr. Monnett's testimony, the Standard Oil Company itself produces much of the oil by lease from the owners of the land, paying them 60 cents per barrel for one-sixth of the oil. In any case it practically fixes the price of crude oil by its control of the pipe lines. The witness gives a rough estimate that the Standard makes gross sales of about \$120,000,000 and a profit of about \$50,000,000 annually from Ohio oil. The witness does not know precisely what proportion of the crude product is controlled by the Standard Oil Company, but thinks it is much more than one-half. By its control of transportation the Standard causes the producer to accept less than the true value of his oil.

2. Reply of Standard Oil Company—As evidence that producers have received fair prices and profits, Mr. Boyle submitted a table of figures showing the annual production of crude oil by barrels since 1860, the average price and the total value. Combining these figures for 10-year periods, we find that from 1860 to 1869 the 27,944,500 barrels produced were valued at \$111,142,603; from 1870 to 1879, 108,535,306 barrels were valued at \$207,892,617; from 1880 to 1889, 241,544,250 barrels were valued at \$206,-

623,341, while from 1890 to 1898, 293,220,986 barrels were valued at \$253,113,285. Mr. Boyle also submitted the following table showing the number of wells drilled and the estimated cost of drilling for decade periods as compared with the value of crude oil produced:

Years	Wells drilled	Cost per well	Total cost	Value of crude oil
1860-1870 ..	5,000	\$4,000	\$20,000,000	\$111,142,603 00
1870-1880 ..	20,259	3,000	60,877,000	207,892,617 47
1880-1890 ..	32,132	2,000	64,264,000	206,623,341 56
1890-1899 ..	43,490	2,000	86,980,000	253,113,285 00
Total....	100,881	\$232,121,000	\$778,771,847 03

If we suppose that one-fourth of the value of crude oil produced has gone to the owners of the lands, the balance remaining to the producers, after deducting the cost of wells and the amount paid to land owners, for the entire period of 39 years, would be \$351,957,885. The average cost of lifting oil may be estimated at 25 cents per barrel, which would amount to \$87,989,471, leaving for the profits of the producing business \$263,968,413, or an average per year of \$6,768,420.

In the figures for the cost of wells are included 15,000 dry wells, the statistics for producing and dry wells being carefully compiled by newspapers in the oil district since 1875. The witness does not consider that the amount of bonus or rental paid by producers to owners of oil lands before opening production should be considered as an element in the cost of production. It is essentially a speculative venture, in which the producer takes his chances of great profit or of loss.

Mr. Archbold replies, especially to the statements of Mr. Lee as to the unprofitableness of crude oil production, that the population of tens and even hundreds of thousands which now occupies the oil regions, once a comparative wilderness, and the cities, towns and railroads, are sufficient evidence that the industry has been beneficial. He also submitted a table, nearly identical with the one submitted by Mr. Boyle, showing the yearly production and total valuation of crude oil since 1859. Deducting from this total valuation one-eighth to represent the royalty going to owners of the land (this royalty being at the rate of one-eighth now prevailing, although as much as half of the oil has sometimes gone to land-owners), Mr. Archbold arrives at the conclusion that the producers themselves have received a total of \$673,704,847 during the past 40 years.

In further evidence on this point Mr. Archbold submitted a list of about 800 prominent oil producers who are, he declares, prosperous and well to do.

On this point Mr. Phillips testifies that a great many of the oil producers are quite well to do, although very few are considered millionaires; but the majority are comparatively poor. They would

have been much better off but for the depression of prices by the Standard.

Mr. Archbold declares that the estimates made by Mr. Monnett as to the amount of gross receipts and profits of the Standard Oil Company from Ohio oil are altogether too unintelligible and ridiculous. He does not consider it worth while to go into a detailed reply. He seems, however, to understand that Mr. Monnett's estimate referred to sales of refined oil products in Ohio. It did refer, in fact, to the total sales of products made from Ohio crude.

3. Overproduction and Prices—So far as there has been a depression of prices below remunerative rates, it is explained by Mr. Boyle as due to overproduction. He points out that there has been a constant tendency toward such overproduction of crude oil. Thus for nearly ten years, during the eighties, stocks of approximately 40,000,000 barrels of oil were being carried by the producers in tanks owned by the National Transit Company. This large surplus on hand greatly decreased prices. Attempts to restrict production have usually failed, especially because of new producers coming into the field.

The witness is inclined to believe that depression in prices of crude oil to some extent injures refiners as well as producers. A medium price is more advantageous for refiners than either a high or a low one. Nevertheless the witness does not think that the Standard Oil Company has made less profits during times of low prices for the crude product. The value of the Standard's stock has not fallen. The maintenance of its profits has been due in part, apparently, to the reduction in the cost of refining oil during the period of low prices for crude oil. Notwithstanding the excessive production, especially during the eighties, Mr. Boyle believes that the producers of crude oil as a class have made enormous profits. The cost of production has greatly decreased in many cases.

To the suggestion that producers might gain by refining their own oil and saving the profits that come to separate refiners, Mr. Boyle replied that such attempts had frequently been made, but had always failed. The producers are likely to lack the experience and skill in manufacturing and in disposing of goods which are necessary. Mr. Boyle also admits that during the earlier periods of the oil business such smaller refineries controlled by producers were handicapped by railroad discriminations in favor of large refiners.

METHOD OF FIXING PRICES.

The Seep Purchasing Agency, of Oil City, on behalf of the Standard Oil Company, posted on January 23, 1895, a notice quoted by Mr. Boyle, that thereafter the prices paid by it to the oil producers would be "as high as the markets of the world will justify, but will not necessarily be the price bid on the exchange for certificate oil"—that is to say, the Standard Oil Company thereafter fixed prices itself in view of the condition of production and demand throughout the world.

This change was rendered necessary, as stated in the notice and as believed by Mr. Boyle, by the fact that

very little oil was actually being sold on the exchanges, so that it was unfair for the prices fixed by such sales to apply to the great quantity of oil handled by the Standard Oil Company. Moreover, speculators on the exchanges had been able to manipulate prices in ways not justified by market conditions. Producers themselves sometimes sold oil to themselves at higher prices in order to fix the price for the Standard Oil Company.

Speculators also resorted, especially during the early eighties, to the practice of circulating false rumors concerning the production and discovery of wells for the purpose of illegitimately influencing prices. Out of this evil grew up the practice among the larger speculators of employing "scouts" to watch the development in different fields and give information as to the production. The large stocks which were on hand during this period enabled bear speculators to sell short in large quantities without ever covering their sales, and the effect was to depress prices to producers.

Mr. Boyle admits, practically, that the producer has little part in making the price of oil under the new system, although he has the option to refuse the price offered. The claim of the Standard Oil Company is that the markets of the world determine the price.

The effect of the practice of fixing things in this way has been to make fluctuations less marked and to keep the margin between the crude and refined oil more uniform. Mr. Boyle supposes that as soon as crude oil advances refined oil is also advanced in about the same proportion, in most cases. The witness submitted detailed tables showing the average price of crude and refined oil by months for the four years preceding the adoption of this new policy and corresponding prices for numerous dates during the four years after the policy was introduced, the latter figures showing apparently all the changes that have been made in the price of crude oil by the purchasing agency. He calls attention to the fact that the price of refined oil includes the value of the barrel, which amounts to about 2½ cents per gallon, while the value of crude oil is in bulk.

The amount of oil bought by the Seep Purchasing Agency, which is believed to be a representative of the Standard Oil Company, is probably about 80 per cent of the crude oil produced, both in Pennsylvania and Ohio. Mr. Boyle believes that this method of fixing prices by the Standard Oil Company is beneficial to the producers and the consumers also. The amount of speculation in oil has been very greatly decreased, and speculation tended to depress the price to producers, especially when it took the form of gambling on margins. The real effect of the present system is that the consumer makes prices.

On being questioned further concerning the methods of fixing the prices of crude oil, Mr. Boyle stated that he believed that the price of crude followed closely the price of refined, and that the price of the latter was fixed by the demand for oil in Europe. There is undoubtedly some person connected with the Standard Oil Company whose business it is to watch the foreign markets and to decide whether the company shall sell oil at the figures offered by consumers abroad. The various local markets throughout the country have

little influence in determining the price of crude. The changes in the price of crude are usually a full cent at a time, occasionally 2 cents, or even more.

Mr. Archbold testifies that the Standard Oil Company purchases about 80 per cent of Pennsylvania crude oil through its general purchasing agent, Mr. Joseph Seep, of Oil City, and his forty or fifty sub-agents. The attempt is to fix prices in accordance with the world's markets.

"We have before us daily the best information obtainable from all the world's markets as to what the offerings are and as to what is possible to sell for, and we make from that the very best possible consensus of prices, and that is our basis for arriving at the current price."

Q. "Generally speaking, are the relative prices of the crude oil and the refined oil kept substantially uniform?" A. "Oh, substantially so. Of course it is not always the same. Of course it seems possible sometimes to get a higher price, and we are glad to avail ourselves of the opportunity, and sometimes we have to take a closer margin and still buy the crude, and there, of course, we suffer a loss."

Mr. Davis testifies that when a producer has oil to sell he goes to the agent of the pipe line company, who ascertains by telegraph the amount of oil to the credit of the producer and the price offered. The price is fixed altogether by the Standard Oil Company, though occasionally brokers make bids at higher rates for a few days. A producer can sell his oil to any agent wherever he may happen to be.

RESTRICTION OF PRODUCTION.

Somewhat in confirmation of Mr. Boyle's statement concerning the effect of overproduction in depressing the prices of crude oil is the fact that various attempts have been made by the producers to restrict the output of oil with the avowed purpose of thereby raising prices. The most effective of these restrictions was that of 1887.

1. Early restrictions.—Mr. Boyle describes in detail the earlier movements for restricting production. The Petroleum Producers' Association of Pennsylvania was organized in 1869. A circular issued in 1870 by this association states that its object is primarily to gather correct information concerning the production of oil, stocks on hand and prospects, in order to protect producers against misrepresentation and depression of prices by purchasers. About this time it became evident that stocks were continually increasing, and a movement was inaugurated under the name of the Petroleum Producers' Agency to store all oil above a certain amount and keep it from the market. A circular of this agency was submitted by the witness in which its purpose was stated to be to prevent unwise competition between producers and sellers, and to secure a fair price for whatever amount of oil the world requires, unaffected by the fact that there is more produced than consumption demands. Calculations were made to show that an increase of daily production depressed prices in much more than equal proportion. The agency proposed to buy oil at \$5 per

barrel so long as the general market would warrant it and to take all remaining oil for storage at the expense of the producers.

This plan failed to go into operation because of the enormous production in Butler county.

The first effective shut-down in production and drilling for crude oil was brought about in 1872. For thirty days there was an almost entire cessation of output in all the fields. The increased prices thus secured tended to encourage drilling immediately after the restriction was dropped, but the chief cause of the rapid decline in prices during 1873 and 1874 was the discovery of new wells and the deepening of the old wells to the "fourth sand." In 1874 there was a local shut-in movement in Clarion county. In 1876 the plan was again started of pooling the surplus oil as a means for advancing the market, but other conditions soon raised prices so that it was unnecessary. Large new production during 1878 led to the formation of the Producers' Protective Association, which lasted for two years. This organization soon became aggressive, and brought suits against pipe line companies and the Standard Oil Company. It had, however, little beneficial effect, production being practically not limited at all and prices steadily falling.

2. Restriction of 1887.—Mr. Boyle further testifies that in 1884 there was again an attempt to establish a general combination of producers to restrict drilling. Through the refusal of the operators who were securing large wells in the new Thorn Creek district, the movement was only partially successful, but it led to the organization of the Producers' Associated Oil Company, with a capital stock enabling it, when necessary, to purchase oil property in order to curtail production.

This new organization made an agreement with the Standard Oil Company in 1887 for reducing production. The conditions at that time were worse than ever before. Great stocks of oil had been accumulated through the heavy production of the Bradford field. The stock in 1887 was 31,000,000 barrels. Prices were below a remunerative point, while the Standard Oil Company was losing by the deterioration of the oil in store. This movement to restrict production was the most thoroughly organized which had ever been attempted, and its success was rendered certain by the fact that all the different branches of the oil industry were alike interested, and were co-operating. Although there were 14,000 producers of crude oil, fully 85 per cent of them were brought into the agreement. The movement developed gradually from June to October, 1887, being furthered by various secret and public meetings of the Producers' Protective Association. Conferences were held with the Standard Oil Company and an agreement was finally made to be restricted for one year by one-third, beginning November 1, 1887. This contract was carried out with fair success.

In consideration of the advantage to itself the Standard Oil Company turned over to the producers 6,000,000 barrels of oil at the market price at the time of the contract, 62 cents per barrel, the producers thus securing the profit from the anticipated rise in price. Mr. Boyle states that when the oil was actually turned over the price already stood at 71 cents.

In 1888 further agreements were entered into among themselves by the producers in the association, especially with a view to equalizing the amount of oil which could be produced by each individual. These agreements were called respectively the boundary line drilling contract and the interior drilling contract. The most important provisions follow:

"Hereafter the number and location of wells for the production of petroleum along or adjacent to the exterior boundary line of any producer on either side of said line shall be determined by the agreement of the producers interested in the production along said boundary line, or, in case of their failure to agree, by three arbitrators, one to be chosen by the producer or producers on one side of said boundary line, one to be chosen by the producer or producers on the other side of the said boundary line, and the third arbitrator to be chosen by the two so chosen by the producers aforesaid.

"But no decision of such arbitrators shall be permitted to deny altogether the right of a producer to drill when he can not drill at all without drilling within 800 feet of the boundary.

"No well shall be drilled on or within 800 feet of any boundary line until its location shall have been fixed by agreement of adjoining producers or by award of arbitrators, as hereinbefore provided. * * *

"We, the undersigned, producers of petroleum, do hereby agree to and with each other that we will not drill any wells for the production of petroleum on any form or tract of land owned by us, except along or adjacent to exterior boundary lines of our respective properties, to a greater extent, exclusive of boundary line wells, than one producing well for each twenty acres and each fractional part of twenty acres, provided that additional wells may be drilled with the consent of the local assembly of the Producers' Protective Association for the district in which the particular property may be situated and of the general executive board of said producers' association, or, in case such consent can not be obtained, upon the allowance of the arbitrators, or a majority of them, one to be chosen by the person or persons desiring to drill, one to be chosen by the local assembly of the Producers' Protective Association for the district in which such property is situated, and the third by the two so chosen."

It was not thought possible to bring all the producers into the contract. The owners of large wells in the new Washington field made a great profit by keeping up production at the higher prices. Nevertheless, the effect of the movement was admitted by Mr. Boyle to have been a "hypnotizing" of competition. The price of crude oil was advanced about 25 cents per barrel by the restriction, so that the producers benefited materially.

The price of refined oil to consumers was advanced about three-fourths of a cent per gallon, a difference somewhat less than the advance in crude oil. The loss thus occasioned was partly borne by the Standard Oil Company as the chief refiner of oil, but the company gained by the added prosperity of the producers and the added harmony between them and itself.

Mr. Lee testifies, in less detail, confirming a num-

ber of the essential facts stated by Mr. Boyle concerning the restriction of 1887. He adds that as a result of this restriction the production was decreased by 17,500 barrels per day, and by 1889 the stock on hand was reduced to 9,000,000 barrels. The price was raised somewhat by this movement, but not to the extent anticipated, and the arrangement was thereafter abandoned.

Mr. Archbold testifies that the shutdown movement of 1887 was entered into by the Standard Oil Company only at the urgent request of the producers, and was not in any sense initiated by the company. This statement was supported by Mr. Phillips.

3. Effect on Labor—According to Mr. Boyle, the effect of the agreement of 1887 to practically cease the drilling of new wells was naturally to injure the laborers in that occupation. For their relief 1,000,000 barrels of oil were set aside from the 6,000,000 purchased by the producers from the Standard Oil Company, while the Standard added another 1,000,000 barrels for the same purpose, the profits from the rise in price of this oil being paid to the drillers. Meantime the drillers had formed a strong organization and adopted a scale of prices.

The purpose of thus setting aside 2,000,000 barrels of oil for the drillers was rather a business than a philanthropic one. The object was to prevent the oil well workers from engaging in other fields or working for producers outside of the shut-in agreement. It had been the custom during previous shutdowns also to take care of labor. The drillers did not suffer especially during the shutdown, since drilling for gas was active, and the restriction did not refer to Ohio and Indiana oil.

EFFECT OF COMBINATION ON LABOR.

Mr. Archbold testifies that the Standard Oil Company has never had any serious difficulty with its employes in any department; that the entire 35,000 are well paid, contented, and zealous for the company. Mr. Archbold believes in combination of labor just as in combination of capital. Labor and capital are moving on irresistibly toward more thorough organization in themselves and closer and more harmonious relations between one another.

Mr. Lee, an opponent of the combination, admits that the Standard Oil Company has paid and still pays good wages, although not better than those paid by the independent refiners. The employes are mostly competent and of high class. Nevertheless, the tendency, by closing down part of the refineries, is toward displacement of labor, and the centralization of industry in one organization gives it a greater control over labor than competing concerns could have. The Standard Oil Company pays very high salaries to its superintendents and department heads, so there may be no net saving in wage payments by the combination.

Mr. Clark does not consider that the wages paid by the Standard Oil Company to its employes at distributing stations are higher than those of independent dealers or than wages generally. He worked

for the company for six years, beginning as a boy of 19, and his pay was raised only from \$15 per month to \$2.50 a day, the latter sum being received when he was manager of the station at Newark, O. He hired men or boys to drive hoops, fill barrels, care for drays, etc., at from 60 to 75 cents per day. They could have earned more elsewhere, but hoped to work up. Hours of labor average fully 12 per day. Mr. Mathews says that this statement as to hours of labor is misleading and untrue.

RAILWAY DISCRIMINATIONS BEFORE INTERSTATE COMMERCE ACT.

DISCRIMINATIONS ADMITTED BEFORE INTER-STATE COMMERCE ACT.

Much testimony was presented concerning the granting of special rates to the Standard Oil combination, and other forms of discriminations or advantages obtained by it from the railways. A large part of the testimony brought forward by opponents of the combination, especially so far as regards actual rebates or differences in rates, related entirely to the period previous to the adoption of the interstate commerce act in 1887. While the witnesses defending the combination presented some evidence in rebuttal as to these early discriminations, they admitted frankly that the practice of securing rebates and special rates had existed prior to the adoption of that act, while denying absolutely any violation of law since that time.

Thus Mr. Archbold testifies that previous to 1887 practically all shipments of oil, or of freight of any kind in large quantities, were made under special contracts between large shippers and the railways. The tariffs issued gave no clew to the actual rates charged. This practice was injurious, on the whole, to the shippers, and was particularly contrary to the interests of the Standard Oil Company. The various shippers, owing to the fear that some competitor might receive lower freight charges, cut prices to consumers in order to retain trade, thus often giving consumers more than the reduction from the published schedules actually secured. Since the practice has ceased the condition of business has been much more settled, and the witness attributes the increased profits of the Standard Oil Company since the passage of the interstate commerce act in part to this change. These special contracts were usually made at the instance of the railway companies, soliciting traffic of large shippers, rather than at the instance of the shippers themselves.

Mr. Page also admits that the Standard received rebates from published rates, but declares that all other oil shippers did the same, and that in certain instances others received greater rebates than the Standard. He cites as instances shipments by Scofield, Shurmer & Teagle, and also shipments from Nashville by independent dealers.

Mr. Page states further that, so far as his own experience goes, the Standard Oil Company in securing such rebates made no arrangement with the rail-

ways as to what they should charge to other shippers.

Mr. Rockefeller also admits the former universality of the practice of rebates from tariff rates. He adds as follows:

"Each shipper made the best bargain he could, but whether he was doing better than his competitor was only a matter of conjecture. Much depended upon whether the shipper had the advantage of competition of carriers. The Standard Oil Company of Ohio, being situated at Cleveland, had the advantage of different carrying lines, as well as of water transportation in the summer, and taking advantage of those facilities made the best bargains possible for its freights. All other companies did the same, their success depending largely upon whether they had the choice of more than one route. The Standard sought also to offer advantages to the railways for the purpose of lessening rates of freight. It offered freights in large quantity, carloads and trainloads. It furnished loading facilities and discharging facilities. It exempted railways from liability for fire. For these services it obtained contracts for special allowances on freights. These never exceeded, to the best of my present recollections, 10 per cent. But in almost every instance it was discovered subsequently that our competitors had been obtaining as good, and, in some instances, better rates of freight than ourselves.

Witnesses opposing the combination, however, consider that these early discriminations inured almost wholly to the benefit of the Standard Oil Company. Thus, Mr. Emery, Mr. Lockwood and Mr. Rice, in particular, declare that the growth of the Standard Oil monopoly between 1870 and 1880 was almost entirely due to railway discriminations, and other witnesses less specifically state the same thing. They claim that the Standard received large rebates from railways on shipments made by its competitors. The gross profits of the combination from discriminations are alleged to have been enormous, ranging into millions of dollars yearly.

Mr. Rice declares with great emphasis that railway discrimination was the "father and breeder of trusts." Were it not for discriminations neither the Standard Oil Company nor any other of the great combinations would have been possible. The Standard Oil Company was the first and may be considered the parent of all trusts. It had a direct influence in the organization of many later combinations.

As to the question whether the Standard Oil Company in its earlier days received payment from the railways on oil shipped by its competitors, Mr. Rockefeller, in an affidavit submitted to the commission, stated that he knew of no such instance. The only case where such an arrangement was temporarily entered into was that of George Rice, hereafter referred to, which was made by an agent and which was repudiated by the company, the money received being refunded.

Mr. Page also testifies that, so far as his own experience goes, no such rebates on shipments by competitors have been received.

Mr. Rockefeller also denies that the Standard Oil Company increased its profits by the advantages it received from railways. "Whatever advantage it received in its constant efforts to reduce rates of freight was deducted from the price of oil. The advantages to the Standard from low freight rates consisted solely in the increased volume of its business arising from the low price of its products."

SOUTH IMPROVEMENT COMPANY.

The first conspicuous case of discriminations between shippers in the oil business was in connection with the South Improvement Company, as to which much testimony was presented.

1. Organization and Relation to Standard Oil Company—Opponents of the Standard combination maintain that the South Improvement Company was organized by the same men who formed the Standard combination, and that the methods of the company were continued by the Standard. Mr. Lockwood declares that 10 out of 13 incorporators of the South Improvement Company were later connected with the Standard combination. Mr. Emery and Mr. Rice, on the basis of the testimony of William G. Warden before a committee of Congress on March 30, 1872, quote the list of stockholders of the South Improvement Company as follows: William Frew, 10 shares; W. P. Logan, 10 shares; John P. Logan, 10 shares; Charles Lockhart, 10 shares; Richard S. Waring, 10 shares; W. G. Warden, 475 shares; O. F. Waring, 475 shares; P. H. Watson, 100 shares; H. M. Flagler, 180 shares; O. H. Payne, 180 shares; J. A. Bostwick, 180 shares; William Rockefeller, 180 shares, and John D. Rockefeller, 180 shares. Of these men Messrs. Flagler, Payne, William Rockefeller, J. D. Rockefeller and Bostwick were members of the Standard Oil Company.

Mr. Boyle, editor of the Oil City Derrick, believes that the South Improvement Company had its origin among the railways rather than among refiners, and states that the conviction was general in the oil region that the Pennsylvania Railroad and others were really behind the organization. The change in the locality of the production of oil toward the south tended to reduce the business of the Erie and New York Central railroads in handling oil, and they sought this agreement with a view to keeping up their proportion of the traffic. The agreement was made with certain Philadelphia, Pittsburg and Cleveland refiners. The South Improvement Company purchased one of the numerous special charters which had been granted by the legislature prior to the new constitution of 1873. This charter had been intended chiefly for other purposes, but was very broad in its scope.

Mr. Emery submitted the full text of the charter of the South Improvement Company. From this it appears that by act of the Pennsylvania legislature of May 1, 1871, the South Improvement Company was created and vested with all the powers conferred by the act of April 7, 1870, on the Pennsylvania Company. The powers of this company, as shown by its act of incorporation, were extremely

broad, including the authority "to construct and operate any work or works, public or private, designed to include, increase, facilitate, or develop trade, travel, or the transportation or conveyance of freight, live stock, passengers, or any other traffic, by land or water, from or to any part of the United States." The company was also empowered to exercise the right of eminent domain, for the purpose of erecting any work in connection with the exercise of its powers, and to hold the securities of other companies, or in any other way to combine with them.

2. Contract With Railroads—Mr. Lee, Mr. Lockwood and Mr. Rice refer in greater or less detail to the contract made between the South Improvement Company and the trunk railroads reaching the oil regions, securing discriminating rates in favor of that company. The testimony of Mr. Emery on this point, however, is much more detailed and is followed in the summary given below.

Mr. Emery submitted a copy of the contract between the South Improvement Company and the Pennsylvania Railroad, dated June 18, 1872. By this contract the South Improvement Company agrees to ship 45 per cent. of all the oil transported by it over the Pennsylvania Railroad, and to divide the remainder equally between the Erie Railway and the New York Central. The South Improvement Company also agrees to furnish suitable tankage facilities for shipping petroleum and receiving it at its destination, and to keep records of the amount of petroleum and its products shipped over the railroads concerned, both by itself and other parties.

The railways agree to allow the South Improvement Company rebates on all petroleum and its products carried by them, and to charge all other parties not less than the full rates specified in the contract. These gross rates, according to several witnesses, were very much higher than those previously existing. The railroads also agree to furnish to the South Improvement Company manifests and way-bills of all petroleum or its products transported over their lines by all parties whatever.

It was, however, provided that similar rebates and advantages should be paid to any other party who should furnish an amount of transportation equal to that furnished by the South Improvement Company, and equal facilities for promoting the petroleum trade. This is the provision under which it is claimed that all parties had equal opportunities and advantages from the railways. Mr. Emery, however, insists vigorously that it would have been absolutely impossible for anyone else to secure the amount of business necessary to meet this requirement of the railways. The very contract itself prevented any competitor from obtaining such equality in business.

A further clause of the contract provides that the railway "shall at all times co-operate, as far as it legally may, with the party hereto of the first part, to maintain the business of the party hereto of the first part against loss or injury by competition * * * and to that end shall lower or raise the gross rates of transportation over its railroads and

connections, as far as it legally may, for such times and to such extent as may be necessary to overcome such competition."

The following are some of the gross rates and rebates provided for in the contract:

Rates and Rebates According to Contract.

ON CRUDE PETROLEUM.

	Gross rate*	Rebate*
From any common point to—		
Cleveland	\$0 80	\$0 40
Pittsburg	80	40
New York	2 56	1 06
Philadelphia	2 41	1 06
Baltimore	2 41	1 06
Boston	2 71	1 06

ON REFINED OIL, ETC.

From Pittsburg to—		
New York	\$2 00	\$0 50
Philadelphia	1 85	50
Baltimore	1 85	50
From Cleveland to—		
Boston	2 15	50
New York	2 00	50
Philadelphia	1 85	50

*For each barrel of 45 gallons.

Mr. Emery insists that this contract between the South Improvement Company and the Pennsylvania Railroad was actually signed and went into effect, notwithstanding statements to the contrary. He quotes from the testimony of P. H. Watson, president of the South Improvement Company, before a committee of Congress on April 5, 1872, in which Mr. Watson stated that the contract was approved by the board of directors of the South Improvement Company at a meeting at which he (Mr. Watson) was not present. The original contract has been submitted in evidence in previous investigations and is signed by P. H. Watson and by J. Edgar Thompson, president of the Pennsylvania Railroad.

Mr. Rice declares that the arrangement by which the South Improvement Company was to receive rebates on all oil shipped by its competitors meant that practically the rebates paid to the Standard on each barrel of oil shipped by itself were 19 times greater than the nominal amount of rebate provided in the contract, since the shipments of independent refiners were 19 times greater than those of the Standard Oil Company. On this basis he calculates the amount of rebates received by the South Improvement Company as arranged from \$7.60 to \$25 per barrel.

Mr. Archbold testifies that the contract entered into by the South Improvement Company and the railways was abolished before it became operative. He has no knowledge that a similar contract was shortly afterwards made with the Standard Oil

Company, and denies that the Standard in any sense continued the policy of the South Improvement Company. He has always disapproved of that company.

3. Abandonment of Discriminating Contract—So great was the indignation among oil producers and refiners over this contract of the South Improvement Company that it was cancelled almost before it went into force, and the charter of the company was subsequently repealed.

Mr. Emery submitted a copy of the report of the executive committee of the Petroleum Producers' Union describing the growth of knowledge and of public opinion concerning the contract of the South Improvement Company, and showing how the indignation meetings which were held led finally to the abandonment of that contract and to the repeal of the South Improvement Company's charter. On March 25, 1872, the railways which had been concerned in the arrangement with the South Improvement Company signed a contract with the representatives of the oil producers and refiners, agreeing that the former rates on crude and refined oil should remain unchanged and that there should be no rebates or drawbacks allowed, or any discriminations made in any way whatever. This contract contained a list of rates which should prevail—in most cases about 40 per cent. less than the gross rates provided for in the contract with the South Improvement Company.

LATER DISCRIMINATIONS DURING THE SEVENTIES.

1. General History—It was the general opinion of witnesses opposed to the Standard combination that this contract made with the railway companies was not lived up to for any length of time, but that discriminations in favor of the Standard Oil Company, fully as great and as unjust as those provided for in the contract with the South Improvement Company, continued to be made throughout the seventies. Practically all of the statements made are based on previous testimony in suits and official investigations.

Thus, Mr. Emery declares that heavy rebates continued to be paid to parties connected with the South Improvement Company and the Standard Oil Trust from 1872 up to 1880, and that it was on this account that the great majority of the refineries of the independents were driven out of business. In evidence of this he submitted extracts from the testimony of Frank Rockefeller, an independent refiner, who had been driven out of business in Cleveland, before a committee of Congress in 1876. Mr. Rockefeller testified that the members of the Standard Oil Company had not hesitated to tell competing refiners in Cleveland that unless they sold their property to the Standard Oil Company it would become valueless, because that company was receiving advantages from the railways. He heard J. D. Rockefeller and H. M. Flagler make this statement. About 20 refineries in Cleveland sold out under the influence of this threat. Mr. Rockefeller was of the opinion that heavy rebates were being paid to the

Standard Oil Company, and were being divided by that company with certain individual officials of the railways. He believed further that there was a pool or arrangement for dividing the amount of oil shipped among the various railways.

Mr. Emery also cites the testimony of George H. Blanchard, then general freight agent of the Erie Railroad, before the Hepburn investigating committee in New York, that he had become convinced that the Empire Line had received a large drawback from the Pennsylvania Railroad within two weeks after the railroads agreed not to discriminate. Mr. Emery also submitted a letter from the general freight agent of the New York Central, dated September 9, 1874, increasing the open rates on refined and crude oil materially and allowing a rebate on refined oil equal to the amount paid for the transportation of crude oil by rail from the mouth of the pipe lines to the respective refineries upon the basis of 14 barrels of crude oil to every 10 barrels of refined shipped. It was further agreed that a rebate of 22 cents per barrel should be paid on all oil coming from pipe lines maintaining the agreed rate of pipage.

Mr. Rice declares also, on the basis of existing testimony, that at one time during the seventies the freight rate from Cleveland to New York for the Standard Oil Company was nominally 60 cents per barrel, from which was deducted the amount of transportation charges on crude oil from the oil wells to Cleveland, amounting to 35 cents per barrel on crude oil, on the basis of 14 barrels of crude to 10 of refined, so that the actual rate paid by the Standard Oil Company on refined oil was only about 11 cents per barrel. The freight rate to the competitors of the Standard at the same time was \$1.90 per barrel.

Mr. Rice, referring to the above-mentioned circular issued by the New York Central Railroad, in 1874, agreeing to refund 22 cents per barrel from the freight charges on oil coming from such pipe lines as maintain agreed rates of pipage, declares that this rebate practically destroyed the value of all independent pipe lines immediately. The pipe lines in the combination which maintained the agreed rates could bid 22 cents per barrel more for crude oil than their competitors and the latter could secure no business whatever. In support of this position Mr. Rice quotes the evidence of E. G. Patterson and the argument of Simon Sterne before the Hepburn committee in 1879.

Mr. Rice quotes from the testimony of Messrs. Lombard, Bush and Gregory, independent oil refiners at the seaboard, as to conversations with Mr. Scott and Mr. Cassatt, of the Pennsylvania Railroad, apparently during the later seventies. Each of these gentlemen declared that he had asked these officers whether equal freight rates would be given to them if they shipped as much oil as the Standard Oil Company. The reply was that equal rates would not be given, and that the higher the freight rates were made the greater would be the discrimination against the independent shipper. These officers stated that the Standard Oil Company was

the only power that could keep peace between the trunk lines.

Mr. Emery testifies that the result of the suit of the Commonwealth of Pennsylvania vs. the Pennsylvania Railroad was the discovery of evidence which led to the finding of an indictment against John D. Rockefeller and others in 1879. The case, however, was never tried. The defendants attempted to secure a change of venue, and afterwards applied to the Supreme Court of Pennsylvania for relief, which they secured through some process of law not understood by the witness. Finally, on account of lack of funds and the fear of further delay, Mr. Campbell, president of the Producers' Protective Association, settled the case on receipt of \$40,000, which was used in defraying expenses. A contract was also made by which the railroad agreed to grant no more rebates.

Mr. Lockwood testifies that in the case of Pennsylvania vs. the Pennsylvania Railroad Company it was testified by Mr. Cassatt that the open rate on oil at one time was \$1.90 per barrel, while the Standard Oil Company received a rebate of \$1.10 on oil shipped by itself and its competitors. The Standard also received allowances for terminal charges, the terminal facilities having been placed in its hands by the railways, which reduced the actual freight charges to 35 cents. A letter written in 1878 by Mr. Daniel O'Day to Mr. Cassatt stated that the New York Central and Erie roads were paying rebates of not less than 30 cents per barrel on all oil carried, and demanded from the Pennsylvania road a rebate of that amount, dating back several months. The rebate was granted, Mr. Cassatt having evidence that the roads above named were paying rebates, as stated, of from 20 to 35 cents. In another suit it was shown that the profits of the Standard Oil Company during four years at this period were more than \$2 per barrel of oil.

Mr. Rockefeller, in an affidavit replying to interrogatories, states that to the best of his recollection the greatest rebates were paid by the railways from 1877 to 1879. The Standard then had an agreement for the special 10 per cent. commission, and in addition rebates amounting, as the witness believes, to 64½ cents on refined oil were paid by the railways to equalize with shipments made by the Erie Canal. These rebates, however, were open to all persons who shipped by rail. The impression of Mr. Rockefeller is that the Erie Railway, at least, did not collect the higher rate from the shippers and later make rebates from it, but actually lowered the rate to all shippers.

2. Empire Transportation Company—Mr. Lee and Mr. Rice refer to the discriminations made by the railways against the Empire Transportation Company by which it was driven out of business. In 1877 and 1878 freight rates were cut to eight cents per barrel during this fight.

Mr. Archbold explains the transaction by which the Standard Oil Company absorbed the Empire Transportation Company, referred to by Mr. Lee. The Empire Line and the Green Line were corporations whose stocks were owned by the officers and

managers of the Pennsylvania road. Through these companies the railway became interested in pipe lines and in oil refining. The Standard claimed that the road discriminated in favor of its own refineries. In view of this fact the Standard Oil Company refused to ship over the road, and thereby finally forced the sale of the pipe lines and refineries to the Standard Oil Company.

3. Gross Amount of Rebates, 1877-1879—Several witnesses referred to the testimony of Mr. Cassatt, in the case of the Commonwealth vs. Pennsylvania Railroad, in 1879, as to the high rebates paid from 1877 to 1879; and also to the estimate made by Mr. Emery before the House Committee on Manufactures in 1888 that the gross amount of rebates received by the Standard from October 17, 1877, to March 31, 1879, was no less than \$10,155,218.

Mr. Archbold explains the methods employed by Mr. Emery in making the estimates referred to by Mr. Lee as to the amount of rebates received by the Standard Oil Company from 1877 to 1879. Mr. Emery calculated that the Standard Oil Company received a rebate of 64½ cents per barrel on refined oil, and various rebates, ranging from 29 cents to 22½ cents, on crude oil. He took the average of all these figures, claiming 55 cents as the average rebate thus received by the Standard Oil Company. He then calculated this rate of rebate upon the entire consumption of oil in this country, from October 17, 1877, to March 31, 1879, reaching the total of \$10,155,218. This involved the entirely false assumptions that all oil consumed was shipped eastward, and all shipped by the Standard Oil Company; that all trunk lines paid the same rebate as the Pennsylvania Railroad; that the shipments of oil on which 64½ cents rebate was paid equaled the shipments of oil at the lower rebates. The evidence of Mr. Cassatt refers only to one trunk line, the Pennsylvania Railroad, and shows the following facts:

"I. That the Standard Oil Company shipped no oil over the Pennsylvania Railroad until July, 1875. That the Pennsylvania Railroad was then interested in refining in competition with the Standard, and not only allowed the Standard no preferences, but discriminated against it to such an extent that the Standard stopped shipping over the road in March, 1877.

"II. That in October, 1877, the Pennsylvania Railroad and the Standard entered into an agreement by which the Standard Oil Company was to have a commission of 10 per cent. on all freight furnished by it in consideration of the Standard agreeing to equalize oil freights on the four trunk lines.

"III. That this agreement did not effect a discrimination even to that extent as against other shippers over the Pennsylvania Railroad prior to May 1, 1878, because said shippers had contracts extending to that date, which were excepted in the contract with the Standard.

"IV. That the Pennsylvania Railroad was willing and offered to carry oil for all shippers on the same terms with the Standard, excepting only 10 per cent. commission, for which it demanded like considerations.

"V. That it did continue to carry for all shippers who did all their business over its line as low as for the Standard, commission included.

"VI. That shippers not using the Pennsylvania Railroad were able, after May 1, 1878, to get oil east by the Erie Canal lower than by rail, and shipped their oil by that route, in consequence of which the Pennsylvania Railroad shippers were paying greater freight rates than other shippers.

"VII. In consequence the Pennsylvania rate was reduced to those who continued to ship by that line 44½ cents on refined, making the net rate \$1, said 44½ cents being paid as rebate.

"VIII. For the same reason, namely, to meet canal rates, in July, 1878, the rate to those who shipped by rail was further reduced 20 cents, the 20 cents being paid as a rebate, and refunded back to May 1, 1878.

"IX. That these rebates were paid to all shippers who shipped entirely by rail, and were for the express purpose of putting them on an equality with those who shipped by canal.

"X. The same is true of the rebate allowed on crude oil during the same period, except 10 per cent. paid to Standard and 22½ cents paid to the American Transfer Company, the latter being the pipe line's share of a through rate.

"XI. That the rebates which were paid from May 1, 1878, to equalize rail and canal shipments, were discontinued December 8 of the same year, when the canal was closed.

"XII. All payments of rebates entirely ceased March 31, 1879."

Mr. Emery defended the estimate made by him, reaffirming his testimony on this subject presented before the House Committee on Manufactures in 1888. The three separate figures for rebates, which were taken to secure the average of 55 cents, on which Mr. Emery based his estimate, were, respectively, 64½ cents, 51½ cents and 49 cents. The calculation of these rebates on the entire amount of oil shipped in every direction and by all the railroads is, in Mr. Emery's opinion, justifiable, since rebates are known to have been paid by all roads on practically all oil shipped. It appears that Mr. Cassatt also admitted in the case above referred to that the Pennsylvania Railroad alone had paid fully \$4,000,000 in rebates during this period, which is about the proportion calculated by Mr. Emery as paid by that road. Mr. Emery submitted in evidence the book of testimony in the case above named.

4. Tidewater Pipe Line, 1879—Mr. Rice states that in 1879 the Tidewater Pipe Company laid a six-inch pipe to Williamsport, Pa., and secured special rates from the Reading and Central New Jersey railroads to the seaboard. In order to compel this company to sell out to the Standard Oil Company competing railways cut rates on freight to 15 cents per barrel from the oil regions to the coast, this amount barely paying for the fuel used in the engine. In support of this statement Mr. Rice quotes from the annual report of Mr. Gowen, president of the Philadelphia & Reading Railroad.

ARRANGEMENTS BETWEEN PIPE LINES AND RAILWAYS.

1. Contract of National Transit Company and Pennsylvania Railroad, 1881—Mr. Rice quotes from a letter of Mr. Newlin, attorney for the plaintiffs, in the case of Fennaille & Despeaux vs. the Pennsylvania Railroad Company, in the circuit Court of the United States for the eastern district of Pennsylvania. This letter states that it was proved in that suit that a contract was made on May 6, 1881, between the National Transit Company and the Pennsylvania Railroad Company, by which the transit company guaranteed to the railroad one-third of the transportation of oil to the seaboard. The rates on oil thus carried, so far as furnished by the National Transit Company, were to be much lower than the open rates to the public. Thus, by way of Foxburg to Communipaw, the through rate including the charge of the local pipe line to Foxburg, 20 cents, was 68 cents. On oil furnished by the pipe line company to the railroad at Foxburg the pipe line company was to receive as its share one-fourth of this open rate, namely, 17 cents, and one-half of the difference between this one-fourth and the public rate, i. e., 68 cents, was to be paid to the railway—that is, 25½ cents was to go to the railway. The difference between the share of the open rate coming to the railroad, 48 cents, and its share of this secret rate was 22½ cents, being practically a rebate of that amount to the Standard Oil Company, although the word rebate nowhere occurs in the contract.

This same letter refers to the contract made in 1884, more fully described below.

Mr. Page states that Mr. Newlin's deduction concerning the rebates to the National Transit Company under this contract of 1881 were erroneous. The court before which the suit referred to was brought, granted a motion for non-suit on the ground that the entire case rested on a misunderstanding of the terms of this contract. Mr. Page submitted a letter from George T. Bispham, of Philadelphia. The latter explains in detail the method by which Mr. Newlin made the calculation as to the amount of rebate above referred to. Mr. Dodd's letter quotes the two sections of the contract upon which Mr. Newlin's charge is based as follows:

"The through rates from the discharging point of the gathering pipes in the region to the destination of the oil, whether the same shall be shipped entirely by rail or trunk pipe and rail, shall be fixed by the trunk line railroad companies, provided they can agree upon the same, and the transit company agrees to accept thereof as the share due to its through pipes the proportions hereinafter fixed."

"Whenever the through rate from the exit point of gathering pipe shall be less than forty (40) cents per barrel, the local or gathering pipe shall be considered as entitled to a rate equivalent to only one-fourth ($\frac{1}{4}$) of the rate which shall be formed by the addition of the said through rate to the public rate which the local pipe charges, and one-half ($\frac{1}{2}$) of the difference between this one-fourth and the said public rate shall be considered as due to be

paid to the railroad company, but this difference shall never be such as to make the local pipe receive less than ten (10) cents per barrel."

Mr. Dodd's letter states that Mr. Newlin's error consists in confounding the "through rate from exit point of gathering pipe" with the "public rate which the local pipe line charges." Mr. Newlin takes one-half of the difference between 17 cents and 68 cents, the latter being the railway rate, as the sum paid over to the pipe line company by the railways. As a matter of fact, he should have taken one-half of the difference between 17 cents and 20 cents, "the public rate which the local pipe line charges," there being no other reference to public rate in the section. This half amounts to 1½ cents instead of 25½ cents. Moreover, the entire arrangement applies only where the through rate is less than 40 cents per barrel, and Mr. Newlin's inference to the contrary is baseless.

The fact is, as stated by Mr. Page and Mr. Dodd, that the Standard Oil Company paid exactly the same rate as other shippers over the Pennsylvania Railroad from and to the various points named, but that, on such oil as was carried partly by pipe line and partly by rail, a through rate was made, of which the pipe line naturally received a share. At this time the seaboard pipe line of the Standard did not reach beyond Hamilton, Pa. In order that the railway might be compensated in part in case it made an exceedingly low rate of freight, below 40 cents per barrel for the through rate, the pipe line company agreed to take a part of the charge of its local pipes, which are to be clearly distinguished from its seaboard line, and pay it to the railway. So far from any rebate being made in favor of the Standard, this might be considered a rebate in favor of the railway.

2. Contract of National Transit Company and Tidewater Pipe Company, 1883—Mr. Rice testifies that on October 9, 1883, an agreement was made between the National Transit Company and the Tidewater Pipe Company, which had previously been competing, for a division of traffic, the Tidewater Pipe Company being allowed 11½ per cent. of the total pipe line transportation. Within three months after this contract was made the railways advanced the tariff rate on refined oils by 87½ cents per barrel, thus giving a great advantage to the Standard Oil Company, which could pipe its oil to the seaboard at a cost estimated by Mr. Rice as amounting to seven cents per barrel, and could then refine it there. Mr. Rice declares that the contract made with the Pennsylvania Railroad Company in 1884, more fully described by Mr. Emery, was intended to influence the railroad to maintain high rates to the seaboard, thereby giving the Standard a great advantage through its ownership of the seaboard pipe lines. Although this contract of 1884 may not now be actually enforced, the railways and the pipe lines still charge precisely the same rates to the seaboard, and these rates are very much higher than those which were charged by the railways prior to the agreement with the pipe lines. This statement is upheld by a quotation from Mr.

Franklin B. Gowen, formerly president of the Reading Railroad.

3. Contract of 1884 Between National Transit Company and Pennsylvania Railroad—Mr. Emery refers to the contract made in 1884 between the National Transit Company and the Pennsylvania Railroad, a copy of which was submitted. This contract contains the following clauses:

"The transit company agrees that all petroleum brought to the Atlantic seaboard by all existing carriers, whether rail or pipe, now engaged in transporting such property, or which may hereafter engage in such transportation in conjunction with the transit company's pipe lines, shall be ascertained monthly, and so much of it as shall have been shipped in the refined state shall be reduced to its equivalent in crude oil by considering that one and three-tenths (1 3-10) gallons of crude are required to make one (1) gallon of refined oil. It further undertakes and agrees that if of the total so transported the railroad company shall not have moved in its cars twenty-six (26) per centum thereof the transit company shall cause to be delivered to cars furnished by the railroad company at Milton, Pa., such quantity of crude petroleum as shall, when added to the amount which has been actually transported by the railroad company to the seaboard in said month, make the total transported by the railroad company in said month equal to twenty-six (26) per centum."

"The railroad company shall be entitled to one-half of the current through rates thereon."

It was further agreed that all joint rates for the transportation of oil from any delivery point of the local pipe lines to any refining or terminal point should be fixed by the railroad company in concurrence with the transit company. It was also provided that the rates on refined oil and other products should be fixed upon the following basis: From railroad stations in the oil regions to any eastern point the rates should equal 1.3 times the current rate on crude oil to the same point; from Pittsburgh the rate to the east should be equal to 1.3 times the current charge on crude oil to such eastern point from rail points south of Oil City, deducting 1.3 times the charges for moving a barrel of crude oil from the local pipe to Pittsburgh.

By another contract made on the same day it was provided that, instead of the railway company being compelled to furnish cars and transport the additional oil which might be delivered to it by the National Transit Company to make up the 26 per cent. agreed upon, the National Transit Company itself should transport through its pipe such extra quantity. The transit company should then pay to the railway on the oil thus carried by itself the amount of freight payable to the railway at the rates provided for in the other contract, deducting a sum ranging from six to ten cents per barrel as its compensation for transporting this oil.

Mr. Emery declares that the purpose of this contract was to keep up railway rates in order that independent shippers might not have equal facilities for slipping their oil to the seaboard. The railway

accepted the percentage of traffic assigned to it as a compensation for thus keeping up rates. According to Mr. Emery the actual cost of transporting oil in a pipe line from the oil regions to the seaboard is not more than five cents per barrel. Were it not for this contract they would have sought oil freight by cutting rates very materially. As it is, the rate fixed at the time of this agreement, by the consent of the National Transit Company, as provided, was 45 cents per barrel. It has since been raised and is at present 52.1 cents per barrel in bulk.

Mr. Emery declares further that about 26 per cent. of petroleum products would necessarily be transported by rail in any case. Lubricating oil, tar, gasoline, etc., cannot be shipped through pipe lines.

The witness believes that this contract, or one essentially the same, is still in force. He bases this statement upon the fact that a representative of the Buffalo, Rochester & Pittsburg Railroad at one time proposed to Mr. Emery to arrange for shipping oil over that road to the Erie Canal, saying: "They do not see fit to recognize us as an oil road, and I am going to do some of this business." As soon as these negotiations became known, however, the Buffalo & Rochester received its proportion of the business and discontinued the arrangements with Mr. Emery.

Mr. Rice submitted a letter from Mr. Newlin showing that it had been proved in the case of *Ladenburg, Thalmann & Co. vs. the Pennsylvania Railroad Company*, that under this contract of 1884 there had regularly been a deficiency in the share of the oil transported by the railway company. The following statement of the settlement for the month of September, 1884, furnished by the comptroller of the National Transit Company, shows the working of this system:

Total number of barrels so transported.....	1,574,961
Railroad company's share.....	409,490
Amount carried by railroad.....	325,596
Deficiency	83,894
	=====
On this deficiency the railroad company was allowed on New York oil, at one-half of the current through rate, 45 cents, equals 22½ cents per barrel, on 43,665 barrels.....	\$9,824 63
Less compensation allowed transit company for pumping the same, at 9 cents.....	3,929 85
Total.....	\$5,894 78
	=====
The railroad company was allowed on Philadelphia oil for 40,229 barrels, at one-half current through rate, 40 cents, equals 20 cents per bbl..	\$8,045 30
Less allowed National Transit Company for pumping same, at 8 cents.....	3,216 32
Total.....	\$4,827 48
	=====
Total payment by the National Transit Company to the Pennsylvania Railroad Company for deficiencies for the month ending Sept. 30, 1884..	\$10,722 26

Mr. Dodd, solicitor of the Standard Oil Company, in a letter submitted by Mr. Page, explains the reason for the arrangement provided for in the contract above referred to. The pipe line of the combination had just been completed to the seaboard. It could

not have reached that point without the consent of the railway company, as no free pipe line law then existed in New Jersey. It was still necessary to have a traffic contract with the railroads and to deliver oil to the railroad at different points for shipment to Philadelphia. Accordingly, in addition to agreeing to divide the rates on oil carried by pipe lines and partly by rail, in the same way as was provided by the contract of 1881, it was further agreed that if the railway company did not move 26 per cent. of the oil the transit company should pay it the deficiency.

4. Pipe Lines in Ohio—Mr. Rice states that it was testified by Mr. O'Day, general manager of the pipe line system of the Standard Oil Company, in 1888, that the Chicago & Atlantic Railroad allowed the combination to lay its pipe lines on the railway's right of way from the Lima oil fields to Chicago without charge, in view of the profit to be received from the transportation of the material for constructing the line. After the pipe line was completed the railway rates on oil were raised from 20 to 87 per cent. above those formerly existing, to the injury of independent shippers of oil. The present rate from Lima to Chicago is 40 cents per barrel, which is eight times as much as it costs the Standard to pipe its crude oil to its great refinery at Whiting.

Mr. Rice testifies that the receiver of the Cleveland & Marietta Railroad allowed the Standard Oil combination to lay its pipe lines on the railroad's right of way from the Macksburg field to Parkersburg, W. Va., but refused to allow the pipe line of the witness even to cross the tracks of the railroad.

REFUSAL TO FURNISH CARS.

Mr. Emery, when he was producing oil in the Bradford field and operating a refinery at Philadelphia, was unable to secure tank cars for transporting his crude oil to the refinery. The Pennsylvania Railroad owned 1,126 cars; but, as the witness believes, by order of the Standard Oil Company, all but 248 of these cars were sent out of the State, and he was unable to secure more than one in a week or longer for carrying on his business. An officer of the Rochester & Pittsburg Railroad told him that that road was threatened with a loss of its coal traffic if it hauled Mr. Emery's oil.

Mr. Lockwood also stated that one of the chief ways in which the railways discriminated against the independent refiners was by refusing to furnish cars to men who had oil to ship, or by furnishing only a few, or by delaying them unduly.

DISCRIMINATIONS AGAINST MR. GEORGE RICE.

1. Relations Between Mr. Rice and the Standard—Mr. Rice, who has owned a refinery competing with the Standard Oil Company, at Marietta, O., since 1876, makes numerous charges of discriminations against himself by the railway companies, especially on shipments toward the south. Most of

these charges relate to the period previous to the passage of the interstate commerce act.

Mr. Lockwood also refers to the discriminations against Mr. Rice, but his statements are less detailed than those of Mr. Rice himself, and need not be summarized.

Mr. Archbold testifies that Mr. Rice has not for many years been directly occupied in refining, but has made a business of attacking the Standard Oil Company—in which Mr. Archbold believes he has been financially aided by other opponents of the company—and of attempting to compel it to buy out his refinery at an exorbitant price. As far back as 1886 he demanded \$500,000 for the refinery, which was worth possibly \$25,000 or \$30,000. He based his demand on the statement that he had already inaugurated a number of suits before the Interstate Commerce Commission, and would push them unless it were granted. He also threatened to injure the Standard Oil Company by making what are known as "cut quotations" in the market for refined oil. In support of these statements concerning Mr. Rice, Mr. Archbold submitted extracts from testimony of Mr. Rice on cross-examination in the suit of the State of Ohio vs. the Buckeye Pipe Line Company, taken February 20, 1889. Mr. Rice then stated that he had at one time offered his plant to the Standard Oil Company for \$50,000, and still earlier for \$20,000; that later on he demanded \$500,000, and in June, 1890, sent one Mr. Orvis to the Standard Oil Company with a proposition to sell at the same amount, the understanding being that Mr. Rice was to do nothing further in the way of litigation or anything of that kind.

Mr. Rice's testimony in this suit also showed that he had personally employed two attorneys as counsel to assist the attorney general of Ohio in a suit for contempt instituted against the Standard Oil Company.

Replying to these statements of Mr. Archbold, Mr. Rice testifies that no one ever furnished him a dollar to aid him in any fight he has made against the Standard Oil Trust or the railroads.

Mr. Rice also declares that the charge that he attempted to blackmail the Standard Oil Company in order to compel it to pay a large price for his refinery is entirely untrue. This has been the stock in trade of the Standard Oil Company in opposing him for 18 years. Mr. Rice quotes from his previous testimony in suits against the Standard Oil Company. In this Mr. Rice stated that in 1882 Mr. F. B. Squire, the present secretary of the Standard Oil Company of Ohio, came to him at Asbury Park and offered him \$250,000 for his oil properties, including his crude oil producing properties as well as the refining plant. In 1886 Mr. Rice offered his properties to the Standard Oil Company for \$250,000 and \$50,000 per year for five years. A letter from Mr. Archbold, dated December 13, 1886, submitted in evidence, shows that the Standard Oil Company was then willing to discuss the deal further with Mr. Rice. In 1887 the witness offered his "plant" (apparently only his refinery) at \$125,000, and \$25,000

annually for five years. It is not true, as charged by the Standard Oil Company, that Mr. Rice then said to Mr. Archbold that it would be better for the Standard Oil Company to make a deal with him, and that by so doing parties would be deterred from encouraging a line of action against the Standard Oil Company. The Standard has produced evidence in the form of letters from one Edgar P. Hill, addressed to the Standard Oil Company, stating that he was in a position to negotiate with Mr. Rice, and advising the company to come to some arrangement with him, owing to the effect which he might have upon public opinion, and in bringing legal proceedings against the company. Mr. Rice denies having had any arrangement or conference with Mr. Hill on this subject, and states that these letters were thrown out as being incompetent evidence in a case before the courts in 1887, although they were afterwards submitted as evidence before the House Committee on Manufactures in 1888.

Mr. Rice declares that his property was actually worth the \$500,000 which he demanded from the Standard Oil Company. It is absurd to point out that he had offered to sell during the seventies at a lower price, since he had increased his plant to five times its previous capacity, and had included in the offer his producing properties, which consisted of about 200 acres of oil land, with from 150 to 200 barrels per day production. Mr. Rice calls attention to the fact that his testimony in the Ohio investigation has been misprinted, making it appear that negotiations for the sale of his property were conducted in 1897 instead of 1887, and making it appear that he testified that the capacity of his refinery was 10,000 barrels per annum instead of 100,000.

Mr. Rice also exhibited a pamphlet prepared by himself in 1881, entitled "Black Death," together with another pamphlet of the same title, with red printing on the margin, defending the Standard Oil Company and attacking Mr. Rice in strong language.

In rebuttal of the above evidence Mr. Page submitted an affidavit from Mr. F. B. Squire, dated December 1, 1889, stating that in 1876 Mrs. George Rice informed him that Mr. Rice wished to sell his entire oil property, including crude production, for \$24,000. The affidavit continues:

"I met Mr. Rice several times after this and he kept urging the matter. In the summer of 1881 or 1882 he invited me to meet him and his wife at Asbury Park. I did so. They there made me an offer to sell the property, stop all prosecutions and be friendly with the Standard Oil Company for \$250,000—\$50,000 to go to me for my good office if I could bring it about. I reported the result to Mr. Archbold, including the offer to me, and it was immediately declined. I advised Mr. Rice, who called at my office the next day and stated that the company would regret this act. Immediately after this Mr. Rice published the pamphlet called 'Black Death.'

F. B. Squire."

Mr. Rice submitted a supplemental affidavit denying the statements made by Mr. Squire and further

explaining his negotiations with the Standard Oil Company. The affidavit states:

"The real truth of the matter is that in the year 1876 Mrs. Rice and myself were boarding in New York at the same place with said Squire, and Mrs. Rice was acquainted with a Mrs. Waring, who was also an acquaintance of said Squire. That in some conversation with Mrs. Waring the matter of the oil business came up between them, and subsequently the said Squire spoke to deponent about his oil interests and said he possibly could sell some of it to the Standard Oil Company if he was so disposed to part with it. That the result of several conversations was that deponent informed Squire that if he or the Standard Oil Company desired to purchase my refining plant (which was only a small part of my entire oil properties and interests in the oil or petroleum business) he or it could have the same for \$20,000, as my wife was very desirous that I should get out of the refining business, and it was finally offered to Squire for that sum, which was not accepted.

In the summer of 1882 I was stopping with my wife at Asbury Park, where Squire, on his own solicitation, came to see me, and he then and there offered me \$250,000 for my entire oil properties, including production, pipe lines, storage tanks and refinery plant. I never offered the said Squire the sum of \$50,000 commission or any other sum to make said sale; nor did he suggest it or demand it, or any other sum whatever, nor did I say to him that the company would regret their act if they did not purchase from me, nor was I ever aware that said Squire had an office, except by hearsay, at Cleveland, O. As this latter alleged interview occurred in the summer of 1882, as I testified before your commission, and as my pamphlet, 'Black Death,' was published on December 15, 1881, it is superfluous to swear to it, that, because said proposition was not accepted by said Standard Oil Company, I immediately published said pamphlet as retaliatory against said company."

Mr. Rice further testified that in 1889 he gave evidence of Mr. Archbold, at a special term of the Supreme Court of New York City, concerning this offer of Mr. Squire to him, and that Mr. Archbold did not deny it. Further, in 1889, Mr. Archbold stated that in the negotiations between Mr. Rice and himself in 1886, Mr. Rice's producing property was not referred to, and that he (Mr. Archbold) now heard concerning the producing property for the first time. This, Mr. Rice declares, substantiates his statement that the early offers made by him at a low price refer only to his refinery.

2. Louisville & Nashville Railroad—Mr. Rice submitted a letter from Chess, Carley & Co., a representative of the Standard Oil Company, to Mr. Culp, general freight agent of the Louisville & Nashville Railroad:

Chess, Carley & Co., Louisville.

J. M. Culp, Esq., G. F. A.

Dear Sir:—Wilkinson & Co., Nashville, received car of oil Monday, 13th, 70 bbl., which we suspect

slipped thro' on the usual 5th-class rate—"in fact, we might say," we know it did—paying only \$41.50 freight from here. Charges \$57.40. Please turn another screw.

Yours truly,
CHESS, CARLEY & Co.

June 16, '81.

Wilkenson & Co. were Mr. Rice's agents at Nashville. Mr. Rice declares that within five days the rates to Nashville were raised 50 per cent. He does not know whether the Standard Oil Company paid this full rate or not, but thinks it fair to presume from general experience that it did not. He admits that it is an extremely difficult thing to prove that rebates have been received.

Mr. Page refers to the alleged discriminations against Mr. Rice in connection with the above letter. He states that Chess, Carley & Co. were not then directly controlled by the Standard Oil Trust, although the Standard Oil Company of Ohio had an interest in the business. Mr. Carley was manager, with complete control. The letter quoted was written by Mr. Hathaway without the knowledge of Mr. Carley. Mr. Hathaway had formerly been in the employ of the Louisville and Nashville Railroad, and it was a common expression in the office of the railroad at that time that the machinery was loose and that it should be tightened by turning a screw. The expression, therefore, naturally crept into the letter. The shipment of oil by Mr. Rice to Nashville had been billed at less than the regular tariff rate which other shippers were paying, less than Mr. Carley was himself paying, and Mr. Hathaway calls attention to its being an error to be corrected.

Mr. Page further testifies that he believes from information that Mr. Rice received the letter above referred to with a number of statements and letters which the railway company sent to Mr. Rice in connection with a later claim made by him concerning an alleged overcharge. If the railroad had construed the letter as demanding a discrimination against Mr. Rice, it would not have allowed it to go into his hands in this way. Mr. Culp testified before the House Committee on Manufactures in 1888 that he had never seen this letter, but that he would have put the interpretation upon it which has just been mentioned.

Mr. Rice declares further regarding the above letter that he considers the explanations given of it by Mr. Culp and Mr. Carley before the House Committee on Manufactures in 1888 to be exceedingly lame and untrustworthy. He is willing to pit his own statements against those of these witnesses. It is certain that the railway rates were raised 50 per cent to Mr. Rice within 5 days.

3. Rates Higher Than from Standard's Shipping Points.—Mr. Rice also testifies that in 1885 the railway rates from Marietta to Memphis and New Orleans were suddenly doubled without previous warning. The officers of the local railway at Marietta declared that this was done solely at the instance of the connecting roads, but Mr. Rice believed otherwise. The rate was restored

after some correspondence, but in the following year the rates were again raised from 43 to 162 per cent. The witness declares that rates from Parkersburg, twelve miles from Marietta, where the Standard Oil Company has a large refinery, were not raised at all. He brought suit to forfeit the charter of the Cincinnati, Baltimore and Washington Railroad and the Queen and Crescent Railroad. He proved, as he states, that the former road had discriminated in favor of the Standard Oil combination from 43 to 162 per cent. and the latter from 29 to 212 per cent. He also proved other large discriminations. The court simply contented itself with deciding that the roads must not charge less per 100 pounds on tank-car shipments than on barrel shipments. This decision, Mr. Rice declares, was not obeyed. As the result of these unfair rates, Mr. Rice was driven out of 19 of his 24 agencies, losing his business in 39 out of 73 towns, all within 5 months.

4. Rebates on Crude Oil Shipments.—Mr. Rice submitted a letter from Mr. Pease, former receiver of the Cleveland and Marietta Railroad Company, to Mr. Rapello, its solicitor, together with Mr. Rapello's reply, these letters having passed in February and March, 1885. Mr. Pease writes that Mr. O'Day, representative of the Standard Oil Company, had compelled Mr. Terry, of the railroad, to make a 35-cent rate on all oil shipped from the Macksburg field to Marietta by other shippers than the Standard, and to pay to the combination a rebate of 25 cents per barrel on all oil thus shipped, making \$25 per day, approximately, of clear money on Mr. Rice's oil alone. The Standard Oil Company itself was to pay only 10 cents per barrel. The receiver queries as to whether he might not be prosecuted on the ground of unjust discrimination. Mr. Rapello replies that such a prosecution might be possible, but believes that the profits from the arrangement with the Standard Oil Company, whose shipments are very much greater than those of Mr. Rice, are sufficient to compensate for any losses or sums which would have to be refunded.

Mr. Rice declares that he very soon discovered the discrimination which was being made against him, the former rate of 17½ cents per barrel having been doubled in order to make the 35-cent rate. Suit was brought against the railway company in the United States Circuit Court, and Judge Baxter ordered the receiver to be removed. In his opinion, which is quoted by Mr. Rice, he recites as proven the facts above referred to concerning the discrimination, and declares that the desire of the receiver to increase his earnings does not justify such discrimination. "Railroads are constructed for the common and equal benefit of all persons wishing to avail themselves of the facilities which they afford. * * This franchise carried with it other and correlative obligations. Among these is the obligation to carry for every person offering business, under like circumstances, at the same rate. Unjust discriminations are in violation of sound public policy and are forbidden by law."

A master was appointed to ascertain the amount

of rebates paid on Mr. Rice's oil to the Standard Oil Company, and this amount was duly recovered by him.

Mr. Rice states that the decision of Judge Baxter was made before the passage of the interstate commerce act, showing that, in the opinion of the courts, discriminations were illegal without any special statute. In fact, the addition of a penalty of fine and imprisonment by the interstate commerce act is considered by Mr. Rice to have had practically no beneficial effect, since the law is continually violated.

Being questioned as to whether receivers are not forced to make discriminations in order to compete with other roads which make discriminations, Mr. Rice declares that receivers, being representatives of the courts, ought to be especially circumspect in conforming to the law, whatever might be the effect upon the earning power of the railway.

Regarding this last-mentioned case, Mr. Archbold quotes all the most important parts of the testimony of Mr. O'Day before the Committee of the House of Representatives in 1888. Mr. O'Day then testified that an arrangement was made by him in 1882 or 1883 with the Cleveland and Marietta Railroad Company for a through freight rate from the Macksburg, Ohio, oil fields to Marietta by pipe line and railway. The joint rate was to be 35 cents per barrel, and it was Mr. O'Day's opinion that 20 cents was to go to the pipe line, which was a Standard organization, and 15 cents to the railway, although a letter was submitted as evidence to show that the railway received only 10 cents. Mr. O'Day further testified that this rate of 35 cents was to apply to all oil transported by the railway, whether passing through the pipe line or not. At first it was arranged that a rebate equal to the proportion of the joint rate going to the pipe line should likewise be paid to the Standard Oil Company on all oil. About \$200 or \$250 was thus paid by the railway on oil not passing through the pipe line, but this sum was returned to the railway by the advice of Mr. Dodd, solicitor of the Standard Oil Company. This refunding was made before suit was brought to dismiss the receiver of the railway, a proceeding with which the Standard Oil Company had nothing to do.

Other statements of Mr. Rice refer to the period since the interstate commerce act.

RAILWAY DISCRIMINATIONS SINCE IN TERSTATE COMMERCE ACT.

GENERAL STATEMENTS.

1. Opponents of Combination.—Much evidence was submitted on both sides as to the question whether rebates and other forms of discriminations in favor of the Standard Oil combination are being granted at present. Little testimony was brought forward to prove that it still receives actually lower rates for shipments over the same tracks than its competitors. The chief instance which it was en-

deavored to prove had to do with the underbilling of the weight of cars by the Standard. This is taken up in detail later on. Much evidence was also submitted as to (1) advantages in tank-car shipments over barrels; (2) lower rates where the Standard's shipments are the largest than where the independent refiners chiefly ship; (3) indirect advantages of different sorts.

Witnesses testifying in opposition to the Standard Oil combination, however, are of the opinion that direct discriminations and rebates are still received by the Standard Oil combination. This opinion is expressed by Messrs. Lee, Lockwood, Emery, Phillips and Davis.

Mr. Rice testifies that the officials of the Standard Oil Company are either presidents or directors in companies controlling one-fifth of the total railway mileage of the United States, and attributes this fact to their having secured discriminations from railways in the oil business. At a comparatively early date various railway officials had taken stock in the Standard Oil Company and the relation between the combination and the railways is still exceedingly close. Mr. Rice believes that railway tariffs on oil were formerly and are still practically dictated by the Standard.

Mr. Page denies the charge that railway tariffs are ever issued from the office of the Standard Oil Company in New York, although he admits that the company has of course consulted with railroads in regard to the tariffs, as all large shippers probably do.

Mr. Page further denies that any official of the Standard Oil Company who is connected with any railway has ever made a special rate or arrangement for the Standard Oil Company, or has ever asked for any undue share of the business of that company. The Standard's business itself would necessarily suffer if attention were thus paid to the individual interests of different stockholders.

Mr. Rockefeller makes practically the same statement as Mr. Page.

Mr. Rice expresses the opinion that the railways evade the interstate commerce act by paying commissions to nominal agents for securing freight, although he doubts whether the Standard Oil Company finds it necessary to employ agents in order to secure such commissions.

Mr. Page denies absolutely that the Standard has ever received, either directly or indirectly, any commissions from railways since the inter-state commerce act.

Mr. Emery submitted as evidence of the existence of discriminations generally the letter of the receiver of the Baltimore and Ohio Railroad to the Interstate Commerce Commission, dated December 22, 1898. This letter states:

"Within the territory north of the Ohio river and east of the Mississippi the railroad carriers are transporting the larger part of the interstate traffic at rates less than those shown in the published tariff filed with your commission, which are by statute the only lawful rates.

"While this condition continues there will exist

the unjust discriminations and the unjust preferences and advantages between persons, localities, and particular descriptions of traffic, the prevention of which is the main object of the act of Congress establishing your commission. Only by securing the uniform charging of the published rates can the just equality of service and of charge required by law be secured either between persons or between localities."

The letter goes on to say that such discriminations and secret rates have been to some extent checked by joint associations of railways. Since under the decision of the Supreme Court of the United States joint associations and agreements are held illegal, the railway company applies to the interstate commerce commission to vigorously enforce the law, and agrees to co-operate with the commission in so doing, both by itself maintaining rates and by giving information concerning violations of the law by other common carriers.

Referring to the above letter of Receivers Cowen and Murray, Mr. Page denies that the Standard Oil Company has ever received any rebates or advantages from the Baltimore and Ohio Railroad since the passage of the inter-state commerce act.

2. General Denial.—Mr. Archbold, vice president of the Standard Oil Company, replying to Mr. Lee's testimony, denies that the Standard Oil Company has received rebates of any sort from railway companies since the passage of the inter-state commerce act in 1887. The only case specifically referred to by Mr. Lee goes back to 1889 and was not strictly a case showing discriminations in favor of the Standard Oil Company, but rather discriminations, so called, in favor of the tank shippers as compared with barrel shippers of oil.

The Standard Oil Company has sought to uphold the inter-state commerce act in every way, and is decidedly in favor of that act. It is possible that railways have since the law was passed offered rebates to the Standard Oil Company, but if so it has always refused and will continue to refuse to accept them. The witness submitted letters from officers of the leading railways of various sections of the country in reply to a circular inquiry sent out by the Standard Oil Company, asking whether the respective roads had been granted any advantages to that company, "either by direct tariff, rebate, underbilling, or in any other way." These letters each specifically deny that any such preferences have been given to the Standard Oil Company, and many of them further state that the Standard Oil Company has used its influence with the railways to maintain agreed tariff rates and to support the inter-state commerce act. The letters referred to are from the following railways: Atchison, Topeka and Santa Fe; Baltimore and Ohio; Boston and Maine; Chicago and Alton; Chicago, Milwaukee and St. Paul; Chicago and St. Louis; Delaware, Lackawanna and Western; Erie Railroad; Great Northern; Lake Shore and Michigan Southern; Louisville and Nashville; New York Central and Hudson River; Northern Pacific; Pennsylvania Railroad; St. Louis and San Francisco;

Southern Pacific; Southern Railway; Union Pacific; Wabash Railroad; Western New York and Pennsylvania.

Mr. Archbold further states that it is suspected that the competitors of the Standard receive some advantages and special rates. He refers also to the low rates received by the United States Pipe Line on rail shipments in New Jersey.

Mr. Phillips denies that the independent refineries receive any advantages or discriminations from the railways. The low rates received on oil from the terminus of its pipe line in New Jersey to New York are open rates, and in proportion to the rates from Oil City and other more distant shipping points.

Mr. Page repeatedly makes the same assertion as Mr. Archbold, that the Standard has received absolutely no advantages from the railways since the passage of the inter-state commerce act, and asserts that in his position as an officer of the Union Tank Line Company he would be certain to know of any such discriminations. He asserts that it is impossible to doubt the truth of the statements made by the presidents and officers of the various railways whose letters on this subject are quoted by Mr. Archbold. He adds that the reasons why the Standard has not received and asked for rebates, in spite of the well-known fact that some large shippers have received such advantages since the passage of the inter-state commerce act, are, first, because to do so would be against the law, and secondly, because the company knows from past experience that if it receives cut rates on oil shipments, other oil shippers will do the same.

Mr. Page likewise comments upon the fact that the opponents of the combination, notwithstanding their active efforts to prove violations of law, have during more than 12 years been able to bring forward only one case, which is explained as being a clerical error. It would have been impossible, in view of the immense number of railway employes, to keep rebates and discriminations secret.

In the further refutation of the general evidence as to the importance of discriminations in favor of the Standard Oil Company, Mr. Page submitted evidence to show that the total tonnage of oil moved by the railroads of the United States is less than one-half of 1 per cent of the entire tonnage.

Mr. Rockefeller, in an affidavit submitted to the commission, made the following statement on this subject:

"7. Q. Has the Standard Oil Company received any financial favors from any railroad since 1887?—A. To my knowledge, none whatever.

"8. Has the ownership of stock in railroad companies by officers of the Standard Oil Company given the Standard any advantages with those railroads over its competitors? If so, give particulars. A. It has not. Stockholders and officers of the Standard have invested in stock of railway companies. But in no instance have they done so for the purpose of influencing the policy of the railway companies, nor to the best of my knowledge and belief has any attempt ever been made through

such ownership to influence any railway in favor of the Standard."

3. Rejoinder.—In view of the statements of numerous railway officers that no discriminations have been granted to the Standard by their roads, Mr. Emery declares that these high officers may perhaps be ignorant of the existence of discriminations which are actually made. He would desire to have the auditors and bookkeepers compelled to testify and the books of the companies brought into Court. In the case below referred to against the Pennsylvania Railroad information of rebates was secured in this way, when the president and general freight agent of the road had sworn that none had been paid. The witness believes that that company would have paid almost any sum to prevent its books from being examined by the Courts.

Mr. Emery believes that railway discriminations are responsible for the oppressive monopolies which exist in almost every line of business; that but for them there would have been no trusts. He refers to the excessive prices of coal in the northwest as showing a combination in that business.

Referring to the above series of letters from railway managers, Mr. Rice declares his belief that the Southwestern Railway Company, at any rate, actually does indulge in freight discriminations, such as are charged by Receivers Cowen and Murray, of the Baltimore & Ohio Railroad.

LOGAN, EMERY & WEAVER CASE.

Mr. Emery states that the case of Logan, Emery & Weaver vs. The Pennsylvania Railroad Company was brought in 1887, but was continued until 1890, largely through the delays of the railway. The president of the Pennsylvania Railroad, and its general freight agent, testified in 1890 that positively no rebates had been paid, at least since 1887. But the auditor and assistant auditor of the road, as well as a bookkeeper who had been employed in keeping the accounts of one department for twenty-six years, testified that rebates of from 8 to 28 cents per barrel had been granted since 1887. Mr. Emery also quotes the testimony of B. B. Campbell in this suit, showing that the Bear Creek Oil Refining Company, with which Mr. Campbell was connected, had received rebates on shipments from Coleman Station to Philadelphia, Communipaw, and Bolivar, from October 1st, 1884, to July 1st, 1888, a year and a half of this time being after the passage of the Inter-State Commerce Act. The total amount of rebates received was \$48,101. After long delay and difficulty the Court issued an order requiring the Pennsylvania Railroad to produce its books, and these were actually brought to the place of trial. They were, however, never examined. The witness believes that they would have incriminated the officers of the company, and that it would have been willing to pay a very large sum to escape showing them. The attorney of the railroad accordingly approached the plaintiffs and offered to settle the case. Mr. Emery's partners were very much discouraged, and disgusted, and were too poor to carry the suit further. They feared that the railway company would succeed in continuing its dila-

tory methods and piling up the expenses of the case. Accordingly the proposed settlement was finally accepted, the railway paying \$35,000 and the expenses of the suit. It does not appear that the Standard Oil Company was concerned in this case.

The above evidence was confirmed in its general outlines by Mr. Lee, who was attorney in the suit.

FAVORABLE RATES FROM STANDARD SHIPPING POINTS.

I. General statements.—Considerable evidence was also presented to show that the Standard receives peculiar advantages in the way of lower freight rates from its larger shipping points than prevail from points where its competitors make most of their shipments. The representatives of the Standard Oil Company state that the only advantage enjoyed by the combination results from the location of its refineries at places nearer to the point of consumption. The large number of refineries owned by the Standard in different places makes the average distance which it must ship less than that of the independent refiners having a single establishment. So far as rates per mile are sometimes less from one point than from another, this is a common practice among railways, depending upon the amount of shipments.

Thus Mr. Page testifies as follows:

"Commissioner Prouty's arguments seem to be to the effect that the Standard Oil Company had advantages by reason of having its refineries and distributing plants at Chicago and the Atlantic seaboard, as well as that at Lima, Buffalo, and other middle State points, as compared with a refiner who had his works only at Cleveland or in the Pennsylvania oil regions. We admit that by having its refineries and distributing plants at Chicago for the West, at Buffalo, Lima, and Parkersburg for the middle States and the South, and at the Atlantic seaboard for the East and New England, we have decided advantages over a refiner who has his works only at one point, and who tries to compete with us in selling oil throughout the country. We claim, however, that such an advantage is a fair one, and can not be overcome by any fair or reasonable adjustment of freight rates. We further claim that by having our refineries and distributing points located at various points throughout the country we can and do distribute more cheaply and sell the oil at a less cost to the consumer, and it is more to the interests of the country at large for the consumer of oil to get it at a low cost than it is to try to fix freight rates on any basis that will permit one manufacturer at one point to distribute his products throughout the United States."

Mr. Page adds that the rates on oil from different points in the Pennsylvania fields are made on a uniform basis, and similarly from the Ohio field, so that there is no difference in favor of the Standard as regards places really similarly situated.

Mr. Lee and Mr. Monnett testify that independent shippers are especially benefited where water transportation can be secured in competition with rail transportation. The latter points out, for example, that the rates to New Orleans from Northern shipping points are lower than to places 150 miles north of there. Com-

pare on this subject the evidence as to differences in rates for short and long hauls.

2. Whiting rates.—Mr. Monnett testifies that the Standard Oil Company gets an advantage over its competitors by securing lower rates from points where it has refineries than are made from points where competing refineries exist. Thus it has transferred most of the business of its Cleveland branch to Whiting, Ind. The freight rate to New Orleans from there is 23 cents per barrel, as against 33 cents from Cleveland, and this injures severely the competing company of Scofield, Shurmer & Teagle.

Mr. Westgate states that formerly the rate on oil from Titusville to the Pacific Coast was 78½ cents per 100 pounds, but since the Standard Oil Company established its new refinery at Whiting, an added rate of 17½ cents to Chicago has been made, the rate from Chicago remaining 78½ cents.

As regards this difference in rates to the South, alleged to exist between shipments from Cleveland and those from Whiting, Mr. Page states that Whiting is considerably nearer to New Orleans than Cleveland. On its being pointed out that there is a greater difference between the respective rates in the case of petroleum products than in the case of linseed oil, Mr. Page states that railways adjust their rates from different points according to the amount of traffic and to other conditions. Chicago is naturally a large shipping point for linseed oil, and the traffic can bear a higher relative rate from there than it can from Cleveland. The Standard Oil Company has located its refinery at Whiting because it is nearer the great West, which is a large consumer of oil. The company thus has an advantage over those shipping to the West from more eastern points. It should be borne in mind that the Standard transports crude oil from Ohio fields to Whiting by means of pipe lines.

3. New York and New England.—Mr. Westgate states that he formerly shipped oil to various points in eastern New York and New England at the regular carload rate for Boston and so-called Boston points, but recently the through rates to numerous places have been withdrawn from this adjustment and local and arbitrary rates on oil, different from those on other commodities, added to the through rate. The Red Line rate to Boston from Buffalo is 23½ cents per hundred on oil, but to various other places in Massachusetts the rate has been made 33 cents. The witness is practically excluded from such cities as New Haven and Providence, and from Vermont points. A recent circular of the Red Line states that oils on the Central Vermont Railroad and the New York, New Haven and Hartford Railroad can not be taken at the rates named in the regular tariff, but are subject to arbitrary rates. The rate on oil to Burlington, Vt., in 1895, as quoted by the Lake Shore Railroad, was 44½ cents; to St. Johnsbury, Vt., 36½ cents; to Newport, Vt., 38½ cents per 100 pounds. The two last-named stations are entered in the Red Line traffic book as taking Boston rates, which are 23½ cents.

On April 12, 1899, the general agent of the Green Line system wrote to the witness that the Delaware &

Hudson had ordered that on shipments from Whitehall, N. Y., to various points in New England and New York, named in the list, additions of from 5 cents to 14 cents per barrel must be made to the Boston rate of 23½ cents from Titusville. The agent called the attention of the railroad to the fact that these rates amounted to about 2½ cents per ton per mile, but no change was made, save to add certain other stations (between Saratoga and Northcreek), which should bear rates of from 6 to 18 cents in addition to the Boston rate.

The witness, in fact, has found that the railways do not appear to wish to handle independent oil. Very few agents solicit oil trade, as they do other kinds of freight business. The commercial agent of the New York, Chicago and St. Louis Railroad writes under date of April 12, 1898, that the road can not name satisfactory rates on oil from Titusville to Vermont. The manager of the New York Central Fast Freight Line (Red Line, White Line, Blue Line, etc. writes, December 5, 1898, that oil is not a commodity which they are allowed to handle on fast freight lines. The witness considers oil somewhat more dangerous to handle, but little more than other freight.

The difficulty as to railway rates on oil, in Mr. Westgate's opinion, appears to be largely that arbitrary rates are fixed in different places at the will of the railways, apparently with a view to favoring shipments by the Standard Oil Company. Rates are higher from places where the independent refiners do their manufacturing and shipping than from those where the Standard Oil Company is located. The witness believes that oil should be classified as sixth-class freight or, at any rate, as fifth class, and should bear the regular tariff rates prescribed for other goods of the same class.

Mr. Archbold disclaims all knowledge of recent changes in freight rates in New York or elsewhere, such as are referred to by Mr. Westgate. He doubts exceedingly whether any have occurred recently, nor does he know of any rates which work peculiar disadvantage to the competitors of the Standard Oil Company.

Regarding the statements of Mr. Westgate, Mr. Page testifies that the Standard makes East Boston a main distributing point for a large section of New England, shipping oil from there as far as to Portland on the north and by Newport on the south. This station is supplied partly by rail and partly by steamer shipments from the company's refineries at the seaboard near New York and Philadelphia. The Standard Oil Company also ships to some extent from the Pennsylvania oil region to New England, and in so doing pays precisely the same rate as others. It is not denied that by having refineries located on the seaboard the Standard has an advantage in supplying oil to New England over competitors having refineries in Cleveland, or in the oil region, but under no fair adjustment of rates could these more distant refineries be placed on an equality.

As to the reason of the railways for refusing to make a through rate on oil from the West to New England points, so that the rates to Newport and other places are much higher than to Boston, Mr. Page testifies

that the railways have their own methods of fixing through rates. In some cases they make through rates, while in others they charge local rates to different points in addition to the through rates to the central points. The witness particularly denies that Mr. William Rockefeller has ever influenced the rates on the New York and New Haven Railroad.

4. Advantage of Standard in shipments in and to Canada.—Mr. Gall, a wholesale dealer in petroleum products at Montreal, testifies that shortly after the Standard Oil Company in 1898 purchased all of the existing refineries in Canada, the through freight rates on oil over the Canadian Pacific and the Grand Trunk from American points to Montreal were nearly doubled, the purpose being, as he believes, to favor the Standard Oil Company in its business, since that company was refining oil in Canada and did not have to pay these high rates. The rate in April, 1898, from Warren, Pa., to Montreal was $23\frac{1}{2}$ cents. At present it is $43\frac{1}{2}$ cents, and this change has been due entirely to the increase in rates on the Canadian roads, the rate from Warren to Buffalo being still $8\frac{1}{2}$ cents. The rate from Toledo was formerly $29\frac{1}{2}$ cents, but it has been raised to $46\frac{1}{2}$ cents per barrel. Owing to these increases in the freight it is impossible in Canada to sell at a profit even Ohio oil, which costs at Toledo only from 3 to 5 cents per gallon, at 17 cents per gallon, which is the price now fixed by the Standard Oil Company for Canadian oil, the latter being scarcely equal in quality to Ohio oil.

The company with which Mr. Gall is connected, together with the Sun Oil Refining Company of Hamilton, made complaint before the railroad committee of the privy council of Canada in June, 1899, concerning these excessive charges, and also concerning the discrimination which then existed on local shipments between Canadian oil and American oil.

At that time the railways were in the habit of demanding from shippers a statement whether oil was American or Canadian. In shipping from Montreal to St. Johns the witness has paid \$1.08 per barrel on American oil and 54 cents on Canadian oil. The original bills of lading were submitted in evidence. This discrimination has been acknowledged by the railways, and has been stopped.

The rates referred to from Buffalo to Montreal, 35 cents per 100 pounds, are much higher than those from Sarnia to Montreal, on the same class of goods, although the distance from Sarnia is 77 miles greater. The Standard Oil Company has large refining works at Sarnia. The rate from Buffalo and Suspension Bridge to Montreal is 35 cents, and that from Sarnia to Montreal 25 cents per 100 pounds.

The witness also believes that secret rates are made to the Standard Oil Company on its shipments of American oil, much lower than the open rates. He has made this charge before the railway committee, but is unable to submit definite evidence in support of it as yet.

The witness believes that the increase of rates referred to was made at the instigation of the Standard Oil Company. For some time before the increase it was impossible for the independent shippers to ascertain what the proposed rates would be. The Standard Oil

Company made very large shipments to Canada immediately before the higher rates went into effect. The witness believes that it had knowledge of the change that was to be made.

The Michigan Central Railway, as the witness has been informed by one of its officers, refused to increase freight rates when other roads did so, and the result is that the Standard Oil Company has taken away all its freight from the Michigan Central.

The Standard Oil Company is also shipping oil to Canada by vessel from New York, as well as transporting oil from Sarnia to Montreal by water.

The witness does not believe that this action of the railways is in any sense due to political influence, or to a desire to discriminate against the United States generally, although it has been the case in the past that Canada-owned railways, partly with the sanction of the government, have discriminated in various ways against the American shipper.

Mr. Westgate, an independent refiner at Titusville, testifies that when the rate on oil from Buffalo to Montreal was advanced from 23 cents to 35 cents per 100 pounds, he sought to obtain a rate on the New York Central to Adirondack Junction, nine miles from Montreal, with a view to having his oil switched the remaining distance. But the New York Central made its rate to that point 35 cents also. This would amount to 1.65 cents per ton per mile, while the average rate per ton per mile on oil is about 73 cents. The witness is thus practically shut out from the Montreal market.

As to freight rates to Canada, Mr. Archbold does not believe that there are any discriminations in favor of the Standard Oil Company. The advance in rates recently made on American oil from Buffalo to Detroit over the Canadian roads was in the interest of those roads and injurious to the Standard itself, since that company pays these rates in full and ships over 75 per cent of the American oil consumed in Canada. He knows of no rates that are not open to all comers.

Mr. Page confirms this statement, but adds that he does not know the proportion of the shipments by the Standard from this country as compared with the oil it manufactures in Canada, but does know that its shipments from the United States were greater last year after the advance in rates than before.

SHORT AND LONG HAUL.

Mr. Rice submitted statements concerning a large number of discriminations existing at the present time between rates to terminal points and to intermediate points, especially on the shipment of oil. These rates are taken from the public tariffs of the respective railways. All of them refer to shipments over Western and Southern railways. Among other discriminations mentioned are the following: Over the Union Pacific from Chicago to San Francisco the rate on oil is $78\frac{1}{2}$ cents per 100 pounds, while the highest intermediate rate, to Humboldt, Nev., is \$1.75, or a charge 122 per cent higher than for a haul 325 miles less. This difference applies to oil only, whereas on other commodities of the fifth class, in which oil belongs, the greatest difference between the charge for the full distance and the intermediate distance is only 12 per cent. From

St. Louis to Galveston, Texas, over the St. Louis, Iron Mountain and Southern Railway, the tariff rate on oil is 33½ cents, while the rate to Aldine, Texas, is 55 cents, or 64 per cent more for a haul 63 miles less. The greatest discrimination shown is over the Louisville & Nashville Railroad. From Louisville to Mobile the tariff rate is 18 cents per 100, while to Flomaton, an intermediate point, it is 56 cents, making 211 per cent higher charge for 61 miles less haul. Mr. Richardson declares that on the Southern roads there is no difference in the charge in favor of terminal as against intermediate points on other classes of commodities, but only on oil.

Mr. Rice testifies further that he proved in his suits that the Southwestern railways have allowed the Standard Oil combination stop-over privileges for its cars, billed to the terminal points, by which means part of the oil in a tank can be unloaded at the high-rate intermediate points. According to a letter from the Interstate Commerce Commission, dated July 12, 1897, this stop-over privilege was still allowed at that time.

RAILWAY RATES AND PIPE LINES.

Several witnesses declared that the Standard Oil combination still has a great advantage from the fact that it transports crude oil from the producing regions to its refineries on the seaboard and at Whiting, Ind., by means of pipe lines. The cost of transportation is believed by these witnesses not to exceed from 5 to 8 cents per barrel, while the public charge of the pipe lines for transportation is several times that amount, being about the same as the railway rates, which are believed to be fixed largely by agreements with the pipe line companies. For evidence as to the earlier arrangements with the railways, which the witnesses believe to exist still.

Mr. Davis states that he has sought to transport oil from wells controlled by him in the Corning field to Marietta, where he was interested in a refinery. The charge made by the pipe line company was 35 cents per barrel, and after long delay in securing a reply to his telegram the Toledo and Ohio Central Railroad made a rate of 35 or 36 cents per barrel, which was practically prohibitive.

UNDERBILLING OF CARS.

1. Generally.—It is charged by opponents of the Standard combination that it is favored in certain cases by having the weight of the contents of its tank cars underbilled. This charge is denied specifically with regard to Inter-state shipments by representatives of the Standard Oil Company, and the instances where such underbilling has occurred are explained as occasional errors. The evidence is not so clear as to underbilling of tank cars in shipments within the State.

Mr. Rice expressed the belief that there is a certain amount of underbilling of weight in the case of all tank-car shipments, owing to the fact that the weight per gallon is estimated at 6.4 pounds. The standard weight of illuminating oil is not less than 6.7 pounds, so that the underbilling is 4.68 per cent. Lubricating oils are billed at 6¾ pounds per gallon, but this is

sometimes as much as 15 per cent less than the actual weight.

Mr. Page explains the reason for the adoption of the standard of 6.4 pounds per gallon. It applies to all petroleum products, including the lightest, such as gasoline. The different products range from 5¼ to 7½ pounds per gallon, but 6.4 pounds has been found by careful investigation to represent the actual average on the basis of the amounts shipped. This method of calculating an average weight for the contents of tank cars saves an immense amount of difficulty to shippers and railways. To actually weigh cars in each case, or to test the exact weight of the contents per gallon, would involve great effort.

2. New York case.—Mr. Westgate testifies that he has seen within the past three or four years freight receipts for oil billed from Olean, N. Y., at the rate of 24,000 pounds for cars containing 7,000 to 7,200 gallons. The weight of oil is 6.4 pounds per gallon, which would make the real weight of these cars 44,800 or 46,080 pounds. The Standard Oil Company pre-pays the freight, apparently with a view to concealing these underweights. The witness is of the opinion that every car shipped from the refineries is billed on this basis. In another instance he heard of a person who bought crude oil from the Standard and received freight bills at the rate of 24,000 pounds for cars containing 6,000 to 6,600 gallons, but who afterwards received a corrected bill at the actual weight. This underbilling was not an ordinary error. The witness himself is compelled to pay on the full weight, which makes his charges 50 to 100 per cent more.

Mr. Archbold absolutely denies that the Standard Oil Company has an arrangement with railways with reference to underbilling of tank cars, as charged by Mr. Westgate. He submitted to the Commission a book known as the "Tank Gauge Handbook," giving the number and the full capacity of every car used. This book is in the hands of all railways, and is the basis for billing oil. The witness also submitted letters from the general freight agents of the Western New York and Pennsylvania Railway and the Erie Railroad, the only roads reaching Olean, N. Y., each denying positively that any arrangement for underbilling cars exists, and stating that on the contrary freight has been charged, and collected on the basis of the maximum number of barrels each tank could contain at an estimated weight, formerly 6.3 pounds per gallon, but later 6.4.

Mr. Page likewise testifies as to the impossibility of underbilling tank cars. The railways charge freight on the capacity of the tank car, no matter whether it is loaded to full capacity or not. The weight is estimated on the basis of 6.4 pounds per gallon, whatever be the actual weight per gallon of the contents.

3. New York, New Haven and Hartford case.—Mr. Rice refers to the evidence in a suit before the Interstate Commerce Commission in 1897 to show that in that year two cars of naphtha, containing 100,986 pounds actual weight, shipped from East Boston to Newport, R. I., were charged at a weight of 48,000 pounds by the New York, New Haven and Hartford Railroad, in which Mr. William Rockefeller is a director. He states that Mr. Page explained that this was

due to a clerical error and paid the balance due, but Mr. Rice believes that a similar discrimination has existed in regard to all shipments, this single case only having accidentally come to light.

Mr. Page takes up this case in detail. He submitted a letter from Mr. Hall, the vice president of the New York, New Haven and Hartford Railroad, to the Inter-State Commerce Commission, stating all shipments made over that road from East Boston to Newport from April 6, 1896, to December 6, 1897. On three separate occasions two or three cars were received by that company from the Boston & Albany Railway billed at a weight of 24,000 pounds each. The weight thus given was accepted through the error of the agent of the New Haven road, and without any misrepresentation on the part of the shipper. The errors were subsequently discovered, and the difference in freight collected.

Mr. Page explains the reason for the billing of the oil at 24,000 pounds by the Boston and Albany as follows: "Our works are located at East Boston on the Boston and Albany road. The Boston and Albany road have to switch any car from Boston to East Boston, where the cars are delivered to the New Haven road. That switching charge, as I recall it, is \$6 per car; either \$4 or \$6 per car. The Boston and Albany road, like many other roads, wishes to show its tonnage, whether the rates are per car or per 100 pounds; and where the rate is per car, as in this instance, it probably uses 24,000 pounds, which is the usual carload weight; it is the minimum carload weight. They simply put in 24,000 pounds. The testimony shows, and I swear now, that we did not give the Boston and Albany road 24,000 pounds as the weight of those cars, nor did we give them any weight. We did notify, not only directly, but through this book, the actual weight of all those cars, and it was simply an error of the New Haven road, as shown in the testimony, and as offered by Vice President Hall, that the New Haven road took in error the constructive weight of the Boston and Albany in their bill, instead of taking the actual weight, which they had in their power to get, and should have got."

As to whether it was the general custom of the Boston and Albany to bill cars at this minimum rate of 24,000 pounds to other stations, Mr. Page declares that he does not know. If this be the case, the Standard nevertheless pays the same rate as all other shippers.

Mr. Page also submitted extracts from the testimony before the Inter-State Commerce Commission in its investigation of these cases, and further extracts are quoted in a footnote. Mr. Kidder, agent of the Boston and Albany Railroad, at East Boston, stated that the receipts furnished by the Standard Oil Company regularly contained no statement as to weights, and that it was the ordinary custom to ship tank cars of naphtha at the minimum weight of 24,000 pounds to all local points. The witness had never before seen a copy of the "Tank Gauge Handbook," containing the capacity of tank cars.

Mr. Keyes and Mr. Davis, employees in the freight department of the New York, New Haven and Hartford road at Boston, testified that they had no copy of the "Tank Gauge Handbook" in their office. It was

the custom to bill tank cars at the weight named in the waybill of the Boston and Albany unless instructions to the contrary were received. Such instructions were, however, sent by letter from the Standard Oil Company in almost every case, stating the weight of the oil.

Mr. Winlock, assistant general freight agent of the New Haven road, testified before the Inter-State Commerce Commission, confirming the statements of Mr. Keyes and Mr. Davis. He submitted a letter from the Standard Oil Company, dated February 9, 1897, stating the actual weight of two cars, which had been billed by the railroad at 24,000 pounds, this letter having been overlooked by the clerks in the office. Mr. Winlock further stated that the agents of the road billed tank cars at their actual weight in the case of inter-state shipments, but was not prepared to answer the question as to whether a different rule was followed for shipments within the State. It is not clear whether the inability to answer is due to ignorance or unwillingness. Mr. Winlock specifically denied, however, that there was any understanding with the Standard Oil Company by which cars were billed within the State at less than actual weight. Extracts from this testimony before the Inter-State Commerce Commission follow:

"Q. You are the man who would know about that rule, if there was any? A. I have already said I think it is the same. I am not absolutely positive of the different rates which apply on inter-state business.

"Q. I am not talking about rates; I am talking about a rule as to the billing of these cars, and my question is this: When you bill a tank car to an inter-state point—a point without the State of Massachusetts—do you bill it at its actual weight; and when you bill a car to a point in the State of Massachusetts do you bill it at a weight of 24,000 pounds? A. That is a question that I could not answer.

"Q. Do you mean to say that you have no knowledge about it? A. No, sir.

"Q. You mean you don't want to answer that question? A. I mean I don't want to answer that question.

"Q. (By Mr. Page) You have no understanding with the Standard Oil Company, or any instructions from your superiors, by which you are to bill cars within the State at less than the actual rate? A. None whatever.

"The Commissioner. Not the actual rate?

"Q. At less than the actual weight. You have no understanding with us by which you should bill cars at 24,000 pounds within the State because of our inter-state shipments, have you, or for any reason? A. We have no instructions from you—

"Q. Or understanding with us? A. We have no understanding with you at all, Mr. Page, of any kind.

* * * * *

"Q. In other words, Mr. Winlock, the rates that you may name us within the State have no connection or no bearing in regard to inter-state business? A. None whatever.

TANK AND BARREL SHIPMENTS.

Much testimony was presented to show that great advantages had been formerly given to shippers of oil

in tank cars, as compared with those using barrels, and that some differences in this regard still exist. It is admitted by some that all tank-car shippers enjoy equal advantages, but it is urged that the Standard Oil Company controls most of the tank cars.

1. Early difference in rates per hundredweight.—Prior to 1888 it was customary, if not universal, that lower rates per 100 pounds should be charged for freight on oil in tanks than in barrels.

Mr. Rice believes that the higher rates on oil in barrels which formerly existed were made at the instance of the Standard Oil Company, and not because of any preference of the railroads for tank-car shipments. Up to 1888, he states, the Pennsylvania Railroad carried oil in barrels, including the package, for the same rate per gallon as in tank cars, but afterwards changed so as to require the shipper to pay for the weight of the package.

Mr. Rice further declares that he has proved gross discriminations, exclusively in favor of the Standard Oil Trust, by the Southwestern railroads since the adoption of the Inter-State Commerce Act. Although he does not make this point clear, many of these discriminations were apparently between tank-car shipments and barrel shipments, and no specific evidence is submitted to show that the tank-car rates made to the Standard Oil Company were not open to the general public. Mr. Rice submitted tables showing the difference in mills per gallon charged to the Standard Oil Trust and to himself for shipments over the Louisville and Nashville Railroad from Louisville and Cincinnati to various southern points. The percentage of difference between these rates ranges from 66 2-3 to 333 per cent. Similar tables as to the rates over the Cincinnati, New Orleans and Texas Pacific, Newport News and Mississippi Valley, and St. Louis and Iron Mountain roads show differences ranging from 40 to 267 per cent. These differences were proved to exist up to April 1, 1888, and despite an order of the Inter-State Commerce Commission, the Missouri Pacific Railroad was still carrying tank cars by lump sum on May 28, 1888.

Mr. Rice states that he proved that in November, 1887, seven or eight months after the Inter-State Commerce Act took effect, he was paying on barrel shipments of oil from Cincinnati to Birmingham, Ala., four times as much freight as the Standard Oil Company was paying on tank-car shipments. He was paying 59 cents per 100 pounds on 400 pounds to the barrel, amounting to \$2.36; while the Standard only paid 16.8 cents per 100 on 315 pounds, amounting to 52.9 cents per barrel. The discrimination was 346 per cent.

Mr. Page admits the difference which existed, after the passage of the Inter-State Commerce Act, between the rates on oil in tank cars and in barrels. This was not a discrimination between individuals, since rates in each case were published and open to all. The Inter-State Commerce Commission, in 1888, ordered that the rates per 100 pounds on oil in tank cars and in barrels should be the same, the weight of the barrels being included in the weight charged upon. The railroads accordingly adjusted their tariffs in this way, and they still remain on that basis. The Standard Oil Company was at that time, as the witness believes, shipping

more oil in barrels than in tank cars, so that it was injured as much as its competitors.

This decision of the Inter-State Commerce Commission in 1888 is also referred to incidentally by other witnesses.

2. Charge for weight of barrel.—Two or three witnesses opposed to the Standard combination refer to the fact that discriminations in favor of the Standard have been proved, since 1888, before the Inter-State Commerce Commission, which has ordered damages to be paid to the shippers injured. It appears from the evidence of these same witnesses, however, and still more clearly from the evidence of Mr. Archbold and Mr. Page, that the case referred to is one of difference in charges between tank shipments and barrel shipments.

The railways complied generally with the order of the Inter-State Commerce Commission of 1888, above referred to. Later on, the independent refiners of Pennsylvania secured an order from the commission that the weight of barrels should be disregarded in charging for shipments of oil. The railways have not complied with this order or paid the damages assessed on account of the charge made for the weight of barrels.

Mr. Page explains precisely the status of the suits before the Inter-State Commerce Commission as to barrel shipments. Several years ago the commission made an additional decision that the weight of the barrels must not be included, but should be carried by the railroad free. This order the railroads refused to obey, and they also refused to pay the damages which were assessed by the commission later on account of the charge made for the weight of the barrels. The case is now pending before the United States Court in Pittsburg.

Mr. Page adds that a large proportion of the oil shipped by the Standard Oil Company is transferred from tank cars to barrels at distributing stations and shipped in that way to local points, so that the Standard is subject to these charges upon the weight of the barrels, the same as other shippers.

Mr. Page and Mr. Archbold further testified that the Standard Oil Company itself will have a large claim for repayment by the railways of the freight paid upon barrels, if the above decision is sustained by the courts. Mr. Archbold, however, declares that he considers the requirement that barrels be carried free to be unjust.

Mr. Rice brought in 1889 complaints before the Inter-State Commerce Commission concerning the Southwestern railroads, raising questions as to the like classification of barrel and tank oils, the charge for the weight of the package, the return of tank cars free, and the existence of lower rates on cottonseed oil in tank cars than on petroleum, the latter, which were proved to exist, constituting an advantage to the owners of tank cars. These cases were never decided, being "held open for additional evidence."

3. Relative advantages of tank cars and barrels.—There was disagreement among the witnesses as to the question whether a relatively lower charge for oil in tank cars than for oil in barrels is justifiable. The

relative advantages to the railways of the different methods of shipment were discussed.

Mr. Page declares, in the first place, that it is entirely fair at least to charge for the weight of the barrel, because it is itself a merchantable article and its value is added to the price of the oil sold, while the same is not true of the tank car.

It was pointed out by the opponents of the combination that tank cars are returned free of charge, while barrels are not. Tank cars must be returned empty, while the box cars used for barrels can contain a return cargo. To this Mr. Page replies that box cars used for oil can seldom be employed for other purposes, so that these also are usually returned empty, and free of charge.

Mr. Page testifies further that tank-car shipments are more economical generally to the railways. The average capacity of the tank car is 140 barrels, whereas it is seldom possible to carry more than 60 barrels in a box car. The tank car is universally loaded by the shipper and unloaded by the consignee, while the box car is very often unloaded by the railroad in its own depot.

Mr. Rice denies that it is an advantage to the railways to handle oil in tank cars. He quotes the evidence of John S. Wilson, general freight agent of the Pennsylvania Railroad, before the Inter-State Commerce Commission in 1888. Mr. Wilson stated that oil in tank cars was exceedingly dangerous; that in case of collision or other accident the oil would catch fire and flow to great distances, while, on the other hand, the separate barrels can often be saved; and that the necessity of returning tank cars empty made them less economical than box cars for barrel shipments. Mr. Rice admits, however, that a tank car carries more oil than a box car, and saves the weight of barrels; but he believes that there is no advantage to the railways in the loading and unloading of tank cars, since barrels also are loaded and unloaded by the owners of the oil, not by the railways.

On his point Mr. Westgate testifies that Mr. Motheral, a confidential officer of the Green Line in Oil City, stated in 1888, before the Inter-State Commerce Commission, that for five years the loss on oil shipped in barrels had been twenty-seven thousandths of 1 per cent., while the loss in tanks was forty-three thousandths of 1 per cent. The risk on oil is somewhat greater than on ordinary freight, but the witness believes that it should be classified as sixth class, or at least fifth class freight.

4. Mileage on tank cars.—Mr. Rice declares that the 8,000 tank cars owned by the Standard Oil combination are paid for every three years by the mileage of three-fourths of a cent per mile each way, which is paid by the railways for the use of these cars. He admits that the same mileage is paid to other owners of tank cars, but states that the Standard has most of these cars. Box cars can be used to bring back other freight, but the railway pays for hauling the empty tank cars.

Mr. Page denies that the payment of three-fourths of a cent per mile by the railways to the Union Tank Line Company for the use of its tank cars is excessive, and also that the Tank Line Company is making extraordinary profits. The company receives no other payment whatever for the use of its cars than this mileage

rate. It receives no commission from the Standard Oil Company, and has no other sources of profit. Owing to the fact that the consumption of petroleum in the summer is small, a large part of the equipment of the company is earning nothing whatever during a considerable portion of the year. Moreover, the rate paid to this company by the railways is the same as is paid by the owners of other tank cars, of whom there are 170 or 180, holding an aggregate of 7,420 cars, as compared with the 5,851 owned by the Union Tank Line Company. As a matter of fact, since its formation, in 1891, the Union Tank Line Company has never paid a dividend, and the actual earnings have been only 4.5 per cent. per annum on the investment. The company does not pay excessive salaries; hence this is not an explanation of its low profits. The business is continued because it is a necessary arm of the petroleum industry. The present owners of the Union Tank Line Company and of the Standard Oil Company are the same, and the Standard continues the business because it is the most economical way to handle oil. Probably the reason why the two corporations are kept separate is that the Union Tank Line Company is in a better position to run cars than the Standard Oil Company would be, since the latter is also doing a manufacturing and marketing business.

5. Indirect advantages to tank shippers.—In addition to lower rates, it is claimed that the Standard combination receives minor indirect privileges and advantages on its tank car shipments.

Thus Mr. Monnett states that the Union Tank Line Company receives an allowance from the railways for loading and unloading its own shipments, while the rates for shipments are very much lower in tanks or carload lots than in part carloads. This latter difference the railways justify on the ground that shipment of oil and gasoline contaminates other goods in the cars.

Mr. Rice also complains of the injustice of the difference between the charge for oil in tank cars and that for oil in less than car lots.

Mr. Archbold denies absolutely Mr. Monnett's statement that discriminations are made in favor of the Union Tank Line Company or the Standard Oil Company. "The rates fixed by the railroads in connection with tank car lots and single barrel or part car lots have been the same to all, and carried with them no discrimination whatever in favor of the Standard Oil Company."

Mr. Rice further declares that up to March 15, 1890, the railways allowing a deduction of 62 gallons from the actual contents of each tank car, amounting to $1\frac{1}{4}$ per cent of the shipments. From March 15, 1890, to September 1, 1892, this deduction was 42 gallons. Mr. Rice considers that there was no justification for this deduction.

Mr. Page explains the practice of allowing "outage" on tank car shipments. It was found by actual experience that there was an average loss of weight through leakage and otherwise, of about that amount during the transportation of a tank car of oil. It was not just that the shippers should pay freight on oil which was not actually delivered. The outage is allowed to all shippers, and constitutes no discrimination.

Mr. Rice declares that the Southwestern railways do an injustice by the rule that tanks containing petroleum, which are intended to be used for permanent oil stations, shall be transported at actual weight at the oil rate. The railway become the judge as to whether the tank car is intended for that purpose.

Mr. Page replies that this practice seems to be perfectly just, and if the railroads wished to discriminate in favor of the Standard Oil Company they would carry the tank free, as they do the regular tank car.

Mr. Rice testifies that the Central Freight Association also provides that tank cars will be received only when consigned to points where proper unloading and storage facilities exist. The railway is the judge as to the character of such facilities.

A further advantage was given in 1891 by the Southern Pacific Company in favor of shipments in a peculiar box tank car combination, exclusively owned by the Standard Oil Company under patent.

Mr. Page declares that the first rule above mentioned means simply that the railways will not allow a tank car to be unloaded in their depots or yards by improper methods, which might result in leakage or accident. The box tank cars referred to contain a space between the tanks which can be used for other loads. The transcontinental railroads charge for returning ordinary tank cars, but not for these, because they can be so used.

6. Furnishing of tank cars by railways.—Mr. Rice testifies that it is practically impossible for independent shippers of petroleum to secure tank cars from railways. If they use such cars they have to furnish them themselves at a very considerable expense. The Standard Oil Company, at an early day, bought up all the tank cars from the railways, as the witness believes, with the understanding that the railroads should not build other cars. The witness has himself supplied some tank cars, but refers especially to the attempt on his part to secure certain cars from the Milton Car Works in 1887 on the installment plan of payment. This method, he declares, is the customary manner of paying for cars, but credit in this case was refused on the ground that the financial supporters of the car company had been unwilling to advance the money for the construction of the cars on account of some supposed controversy which they claimed to exist between the Standard Oil Company and the railroads on the one hand and Mr. Rice on the other.

Mr. Rice believes that all railways should own tank cars, and furnish them to the shippers in the same manner as other cars.

Mr. Page expresses the opinion that it would be a burden upon the railroads to require them to furnish tank cars to the shippers. The tank car is a special car for a special purpose, similar to the special cars used for numerous other kinds of shipments. The ownership of the tank cars would not insure the railroads the transportation of oil, and if every road had a sufficient number of tank cars to handle all the business which sometimes passes over its lines, it would have to own many more than would ordinarily be employed.

INDIRECT ADVANTAGES OF STANDARD.

1. Changes in rates for Advantage of Standard Oil Combination—Mr. Rice submitted an extract from the Paint, Oil and Drug Trade Review of January 25, 1893, containing a large number of telegrams and letters, written in November and December, 1888, between officers of the Southern Pacific Railroad and of the Transcontinental Association, on the one hand, and officers of the Standard Oil Company at New York and San Francisco, on the other.

The transcontinental freight rate was then 82½ cents. The railways proposed an increase. The officers of the Standard Oil Company desired to secure the continuance of low rates for the time being, until that company should be able to stock up on the Pacific coast, and that the rate should then be raised to \$1.25, with the arrangement that it should be again reduced, and thereafter changed from time to time, without public notice in advance, at the dictation of the Standard Oil Company. There was considerable correspondence as to the amount of this lower rate which was to be maintained temporarily for the advantage of the Standard Oil Company, but it was finally fixed at 90 cents. The following extracts from the correspondence show that the railway companies made the agreement to shift the rates at the instance of the Standard Oil Company:

San Francisco, November 14, 1888.

W. Sproule, San Francisco:

Say to Tilford that association will probably consent to following agreement: Oil rate from Cleveland to be \$1; at this rate he can stock up; after doing so he to notify Chairman Leeds, who, after giving necessary notice, will advance rate to \$1.25, and continue that rate until such time as Tilford notifies him of reduced stock, when he will again reduce it to \$1 to enable him to stock up.

J. C. Stubbs.

Personal.]

Standard Oil Company,

San Francisco, December 4, 1888.

W. H. Tilford, Esq.,

Vice President Standard Oil Company,
26 Broadway, New York.

Dear Sir:—I will telegraph you this afternoon as per translated copy of message herewith attached, which is self-explanatory.

I herewith hand you a copy of a letter I have just received from Mr. Sproule, assistant general freight agent of the Southern Pacific Company, this city. This letter I interpret to mean the 90-cent rate is for us to stock up from time to time, and that the \$1.25 per 100 rate will be in effect whenever we may desire. This \$1.25 rate is what Mr. Sproule refers to in the latter portion of his letter, as my offer of 90 cents to Mr. Stubbs was on condition that he has the rate of \$1.25 put in effect when we might ask him. This letter also reads as if the 90-cent rate

and the \$1 rate was to be put in effect January 1. No doubt Mr. Stubbs was unaware that we were stocked up at the present rate of 82½.

The Transcontinental Association adjourned at Chicago yesterday, and I understand that Mr. Stubbs is now on his way home. I will see him on his arrival here, and if Chairman Leeds, of the Transcontinental Association, has been notified to put the 90-cent rate in effect January 1 I will have the same corrected by wire and the \$1.25 rate put in. As soon as Mr. Stubbs reaches home I will telegraph you whether it is intended that the 90-cent rate should be put in effect January 1 or the \$1.25.

Yours truly, E. A. Tilford.

San Francisco, December 6, 1888.

J. C. Stubbs, Chicago:

If it is not already agreed upon that the \$1.25 rate is to go into effect January 1, on petroleum and its products from Cleveland and Pittsburg to the Pacific coast, will you kindly telegraph Chairman Leeds to put this rate in effect on the day mentioned. Please answer. E. A. Tilford.

Personal.] Southern Pacific Company,
Office of General Freight Agent,
San Francisco, December 8, 1888.

Mr. E. A. Tilford,

President Standard Oil Company, City.

Dear Sir—I beg to inform you that I am in receipt of advice that on January 1 the rate on petroleum oil and its products will be to \$1.25 per 100 pounds on carload shipments from agreed eastern points.

Yours truly, Wm. Sproule.

Mr. Sproule was assistant general freight agent of the Southern Pacific Company, Mr. Stubbs was general traffic agent of that company, and Messrs. W. H. Tilford and E. A. Tilford were officers of the Standard Oil Company.

Another letter shows that the Standard Oil Company had already, before the increase to \$1.25, on January 1, took place, secured a stock sufficient to last for four months.

Mr. Rice explains that these telegrams and letters were secured through an employe, either of one of the railways or of the Standard Oil Company, who had been discharged.

Mr. Page, on behalf of the Standard Oil Company, testifies that he knows nothing about the above correspondence, but that at least since March 2, 1891, the rates on oil from eastern points to California have been absolutely unchanged.

2. Exclusive Shipment of Standard's Oil—Mr. Emery declares that it is still the practice of the Standard Oil Company to seek arrangements with railway companies by which they shall handle oil exclusively for the Standard, threatening that otherwise it will be forced to cut prices to meet competi-

tion to such a degree as to be unable to pay reasonable railway rates. It also seeks to make arrangements between competing roads for a division of the traffic, and for the exclusion of independent shippers. On account of such discriminations, and of the special cuts made by the Standard Oil Company in the markets sought by its competitors, Mr. Emery has found it impossible to ship oil to any considerable number of places in the United States, 70 per cent. of his product going to Europe. The witness asserts that he could compete fairly with the Standard Oil Company if he could secure equal railroad rates.

3. Control of Terminal Facilities—Mr. Rice declares on the basis of testimony of officials of the Standard Oil Company, and of the railways, that the combination owns all terminal facilities for handling oil on four of the trunk lines from the oil regions to the seaboard.

Mr. Lockwood also states that the railways during the 70's turned over the terminal facilities at New York to the Standard Oil Company, so that the independent refiners could not use tanks, but were forced to ship in barrels.

4. Purchase of Oil by Railways—Mr. Lee believes, without positive knowledge, that while the Standard receives no direct rebates from railways, it is paid double prices for lubricating oils used by the roads, this constituting a form of discrimination in its favor. None of the leading railways buy lubricating oil of the independents.

Mr. Rice also declares his belief, based on hearsay, however, that the Standard Oil Company receives excessive prices for its lubricating oils sold to the railways. He quotes from the advertisement of the Galena Oil Company, a branch of the Standard Company, in which it is stated that Galena oils are used on nineteen-twentieths of the total railway mileage of America.

Mr. Davis states that the refinery in which he was interested formerly supplied some lubricating oil to the Baltimore & Ohio Southwestern Railroad. The directors of that road bought stock in the Argan Refining Company. The witness's refinery has since found it impossible to sell oil to the railroad, no matter how much the price might be cut, although he has no direct knowledge that it prefers Argan refinery. The railroad has considerable influence on dealers along its line, who can often get oil from it in small quantities.

Mr. Clark states that while he was agent of the Standard Oil Company at Newark, O., he furnished from 60 to 150 barrels of refined oil per month to the Baltimore & Ohio Railroad. The bills for the quantity were made out and sent to Columbus to have the prices fixed. The witness was allowed to have no direct dealings with the railway companies as to freights, handling of cars, etc. He did not sell lubricating oil to railroads.

Mr. Page denies that the Standard Oil Company is favored by railways in the purchase of lubricating oil. The Galena Oil Company is specially engaged in the manufacture of lubricating oil for railway purposes, and owing to the superior and uniform

quality of its oils they are used on a large proportion of the railways. The company guarantees to the railways that the cost of lubrication per train mile, for a certain period of time, shall not exceed the cost of oils previously used; usually, in fact, it guarantees a reduction. The actual prices per gallon are higher than those of some low grades of oil, but as measured by lubricating power they are lower. The price is made the same to all railways, regardless of quantity, although the form of guaranty varies. Oil is usually sold to the railways under contracts for three or five years, and these contracts are naturally made by the central officer and not by purchasing agents of local divisions.

The Galena Oil Company does not sell largely to manufacturers or others than railways. So far as it does so it makes them the same price, but its oils are less fitted for that purpose.

The Galena Oil Company has increased its business tenfold since the Inter-State Commerce act went into effect, which indicates that it did not secure its control of the railway business in connection with any system or rebates existing prior to that time. Independent producers still furnish considerable oil to railways.

5. Excessive Rates on Oil Well Supplies—Mr. Lockwood submitted a receipted freight bill showing the charges on a carload shipment of oil well supplies for a distance of 49 miles in Pennsylvania to be 5.95 cents per ton per mile. He has paid on shipments of one and two tons 13.57 cents per ton per mile. Statistics show that the average cost of moving freight in this country is 0.85 cent per mile. He is not aware that these rates were higher than those paid by other shippers.

RELATION OF THE PRESS TO THE COMBINATION.

SUBSIDIZING OF OHIO PAPERS.

According to Mr. Monnett, the Standard Oil Company of Ohio has organized what is known as the Jennings Publishing Advertising Agency, which distributes advertising for the company in various newspapers and makes contracts with them by which certain material defending the Standard Oil Company is published as news and editorial matter, but duly paid for. The company also purchases large numbers of newspapers containing such notices, thereby practically buying the support of the press. The following is a copy of part of a contract submitted in evidence in the Ohio suits against the Standard: "The publisher agrees to reprint, on news or editorial pages of said newspaper, such notices set in the body type of said paper and bearing no marks to indicate advertising as are furnished from time to time by said Jennings Agency, at the rate of — per line, and to furnish such agency extra copies of paper containing such notices at four cents per copy." The witness also exhibits an extract from the Lima Times-Democrat, which was published under such a contract.

PITTSBURG PAPERS.

Mr. Boyle testifies that none of the newspapers of Pittsburg give the same courtesy to the Standard Oil Company as to other interests. The Standard has at various times been viciously attacked by persons associated with the Producers' Protective Association, and has had to pay the newspapers advertising rates to secure the insertion of replies to the most outrageous lies. In the Derrick, which Mr. Boyle manages, both parties have been treated alike.

OIL CITY DERRICK.

Mr. Lockwood maintains that the Standard Oil Company has bought the Oil City Derrick and has hired a man (Mr. Boyle) to run it, but his assertion appears to be based primarily on the nature of the material published in the paper, which is bitterly opposed to independent movements. The paper has been sued by Senator Lee and Senator Emery for libel. The Titusville Herald and the Pittsburg papers seem also to be under the control of the Standard Company, and publish what is furnished by it.

Mr. Boyle, proprietor and publisher of the Oil City Derrick, testifies that the Standard Oil Company is not now and has not been for many years interested in that paper. The witness owns all the stock except four shares held to qualify the other directors. The paper is not, as is often assumed, an organ of the Standard Oil Company, but of the oil producers generally. Within the last 10 years there has been no occasion for adverse criticism of the Standard Oil Company, but there would have been such criticism if it had been called for. The paper is not opposed to all independent movements, but only to those involving unnecessary outlay of money and consequent taxation of producers. The duplication of a pipe line is, in the opinion of the witness, such an unnecessary outlay, as is shown by the fact that pipe lines established within the last 10 years have never paid dividends. The witness insists that he does not appear before the commission at the solicitation of the Standard Oil Company.

Mr. Boyle testifies further that fully half a dozen libel suits have been brought against him as editor of the Derrick, all by officers and members of the Producers' Protective Association. In two cases conviction was obtained, in two there was confession of judgment, and in one a failure to convict. These suits were all taken into another county where the people and the courts were prejudiced in favor of the Producers' Association. Mr. Boyle protests bitterly against the unfairness of the various trials.

STANDARD OIL COMBINATIONS.

Note.—About the year 1872 leading refiners of oil began to combine for the purpose of making the business more profitable. The combination was by means of purchase of stocks and interests of various com-

panies, and until 1882 the combination was solely by stock ownership in the hands of a limited number of individuals, who controlled the corporations as agencies in a common business. In 1882 these owners entered into the trust agreement. The companies whose stocks they owned in whole or in part were not then competing companies. The individuals named as trustees had controlled them by virtue of absolute ownership of a majority of their stocks. Under the trust the stocks were placed by their owners in the hands of the trustees who exercised all the powers of the owners. In exchange for the stocks the trust issued trust certificates, and the profits were divided on these. When the trust was dissolved in 1892, the same conditions existed as before the trust was formed. The individuals, then trustees, continued to control the companies by virtue of absolute ownership of a majority of their stocks; consequently the corporations named have been, many of them since 1872,* separate agencies carrying on business as a unit for the individuals, who are their common stockholders. In June, 1899, a new corporation was organized in New Jersey, with a capital of \$110,000,000, to combine into a single, more compact organization, the separate companies which had been of late years controlled through ownership of a majority of their stocks by the few individuals who had formerly been trustees of the Standard Oil Trust. This new company is intended to unite again in compact form all of the separate companies, which have been *working* together ever since the formation of the trust.

WASHINGTON, May 11, 1899.

TESTIMONY OF MR. JAMES W. LEE.

Former State Senator of the State of Pennsylvania.

The commission met at 11 a. m., May 11, 1899. Vice-Chairman Phillips presided, and introduced Mr. James W. Lee, who testified in regard to trusts.

PERSONAL HISTORY—THE INDEPENDENT OIL COMPANIES

Q. (By Mr. Phillips). Will you give your name, place of residence and business? A. James W. Lee. I reside at Pittsburg, Pa. I am at present engaged in practicing law. I am also connected with the independent pipe lines and independent oil companies. There are four companies. I am president of three of them and attorney for the fourth.

Q. Will you please name these companies? A. The first company to be organized was the Producers' Oil Company, Limited, with its general office at Warren, Pa. The second to be organized was the Producers and Refiners' Oil Company, Limited, with its general office at Titusville, Pa. The third was the United States Pipe Line Company, which is organized exclusively for the transportation of oil, both refined and crude, by means of pipe lines. One terminus of its pipe line is at Oil City; the other is intended to be finally at New York. The fourth company is the Pure Oil Company, which has the right to engage in the production, transportation, manufacture and marketing of oil and its products. That company was organized

three years ago last November, and was the last to be organized. All four are owned by substantially the same persons, and operated together.

Q. Where were you admitted to the bar. A. I was admitted to the bar in 1869, at Franklin, Venango county, Pa., which is one of the original oil counties.

Q. Did you practice law in Franklin after being admitted there? A. I practiced law in Franklin until five years ago, when I removed to Pittsburg.

Q. Who was your partner in the law business there? A. My first partner was Mr. S. C. T. Dodd, now of the Standard Oil Company of New York. I was afterwards in partnership with Mr. George S. Christwell, now judge of the county, and Mr. Hastings.

Q. Have you ever held any public office? A. Only two. I was mayor of the city in 1875, and served two terms of four years each, in the State Senate of Pennsylvania, beginning in 1879.

EARLY HISTORY OF THE OIL BUSINESS.

Q. Had there been any attempts at legislation in regard to free pipe lines, or unjust discrimination, before you were elected, and had you any part in such legislation while in the senate? A. If you will permit me, probably it would be interesting to the commission to have a very brief statement as to the beginning and growth of the oil business, especially that branch of it that relates to transportation.

Q. We should be pleased to hear you. A. The first oil was discovered, as is generally known, by Col. E. L. Drake, who drilled for it in 1859, and ever since—

Q. (Interrupting) On Oil Creek? A. On Oil Creek, which is a tributary of the Allegheny river. The first well was probably about 18 miles distant from the river. Then oil was developed along Oil Creek to the south. A production of 200,000 barrels was reached in 1861 and 1862. The means of getting it to market at that period was by loading it into bulk boats on Oil Creek, building temporary dams and cutting them, thus producing an artificial flood, and running the boats out on the flood into the river, and then by the river to Pittsburg, where the refineries were.

THE FIRST PIPE LINES.

The first pipe line, I think, was constructed in 1865 or 1866. It ran from Pithole, on the left of Oil Creek, down Oil Creek about five miles to the Allegheny river. It was built to carry the oil to the river; there it was loaded into boats and so conveyed to market. From that time the business of transporting oil by means of pipe lines increased. The oil wells spread first north to Tidioute, in Warren county, then south into Clarion county, then into Armstrong and Butler, and finally into Allegheny county, N. Y. By about 1880 they spread over a region some 300 miles long and 40 miles wide. As the field extended it became necessary to employ pipe lines. They were first built extensively in 1871 and 1872. The capital was very small at first. The company, which is now the National Transit, was started under another name, with a capital of about \$4,000; and it grew very rapidly until the capital

reached millions. By 1877 the number of barrels that it transported reached about 15,000,000 a year, I think. I may not be entirely accurate in these figures, but it was a very large amount. Other pipe lines were started, but the united pipe lines soon came into control of the people who are now known as the Standard Oil Company—the Standard Oil trust. Small lines were built in various parts of the oil field, to convey the oil to the railroads. There were no lines leading to the seaboard till 1883.

THE RAILROADS AND THE STANDARD OPPOSE THROUGH
PIPE LINES—LEGAL OBSTACLES.

A pipe line law had been passed, which limited the laying of pipe lines to certain counties. Efforts were made, from 1870 on, to obtain a general state law, which should allow the laying of pipe lines and give the right of eminent domain to companies organized for that purpose. That was opposed by the railroads, and also by the Standard Oil Company when it came into existence. That bill was introduced in successive legislatures, beginning with 1870. It failed each year until 1883, when it was finally passed. I was present in the legislature in 1879 when the bill failed, and again in 1881 when it failed. In 1883 it was passed only by agitation. The people who were interested in having it passed—the oil people—held mass meetings through the agricultural counties of eastern Pennsylvania, and got the farmers to send petitions to their own representatives to vote for the bill. Then it passed the House by a meagre majority.

Q. Were you present in that Legislature? A. I was present in that Legislature and attended a number of mass meetings that were held. I remember at one mass meeting small handbills were circulated through the audience saying that if this bill became a law their orchards would be destroyed, their springs would be polluted, and death would lurk under their doorsills. Of course that was a very effective way of frightening people who were not at all acquainted with that means of transportation. But it is a good deal safer and a great deal more economical than any other method of transportation. I do not think that there has been a single life lost in transporting oil by means of pipe lines in twenty years; and there were a great many lives lost in transporting it by railroad prior to that time.

RELATIONS OF THE STANDARD OIL TRUST TO THE
RAILROADS.

Q. (By Mr. North) Were those the real objections to the passage of the bill? A. No; the real objections were that it would give to people who desired to enter the business the opportunity of doing so. The real objection was that it would interfere with the Standard Oil Company's exclusive right to operate these lines, and their power to secure unfair advantages over all competitors by combinations with the railroads. If any

proof on that subject is desired, I would like to submit it right now. I have heard the statement made under oath. Mr. A. J. Cassatt, who was the vice president of the Pennsylvania Railroad in his testimony given before the master in a case that was instituted in Pittsburgh in the Supreme Court of Pennsylvania, gave his testimony in regard to that subject. (Reading). Q. Did you understand at that time that these railroad companies and the United Pipe Lines had united with the Standard Oil Company in order to force the transportation company out of the refining business? The Empire Transportation Company was a company which owned a large number of tank cars. The president of it was Joseph D. Potts. Mr. Potts was probably as fully acquainted with the subject as any man who ever lived in the United States; a man of very great ability and with very wide knowledge of that subject." (Reading). I believe they did; I believe that was the object of their onslaught upon us." That is the testimony of Mr. Cassatt.

GETTING RID OF THE EMPIRE TRANSPORTATION CO.

Q. (By Senator Daniel.) Who was prosecuting? A. The Commonwealth of Pennsylvania against the Pennsylvania Railroad. The Standard had a combination with three trunk lines to force the Pennsylvania Railroad to exercise its option to buy the cars of the Empire Transportation Company and to stop the refining of oil (so as to give the Standard Oil trust a monopoly of the business. That is on Page 177 of a book that was published by the Government. It was an investigation before the Committee on Manufactures in 1888.

Q. (By Mr. North) By the Pennsylvania Legislature? A. No; of Congress. (Reading) "Q. Was it after the Standard had threatened to withdraw its patronage from your road? A. Well, they had not threatened to withdraw their patronage from our road at the time, but they had protested very strongly against the Empire Line being interested in that New York refinery I spoke of before, and had complained that the Empire Line was giving facilities to that refinery, on account of their interest in it, they did not give to them, and had been endeavoring for several months to get us to insist upon the Empire Line going out of that refining business." That is the testimony of Mr. Cassatt on Page 178. Joseph D. Potts testified before the same committee of Congress on Page 261. He was the president of the Empire Transportation Company (Reading). "Q. I will call your attention to this subject. Do you not know, and did you not know at that time, through railroad officials or other sources, that the Standard Oil Company complained of the impropriety of a transporting line, upon which they were dependent for their supply of oil, being also engaged at the same time in competition with them in refining? A. Yes, sir; that was the point that was made." And at that time the transportation company's cars were purchased by the Pennsylvania Railroad, and their refining plant by the Standard Oil Company, and they went out of business.

METHODS USED TO PREVENT THE PASSAGE OF THE PIPE
LINE BILL.

Q. (By Mr. Phillips.) What methods, if any, were used by the Pennsylvania railroad and the Standard Oil Company, or either of them, to prevent the passage of the pipe line bill in 1883? A. All methods that are usually known, I think, in Legislatures.

PRODUCTION OF CRUDE OIL BY THE STANDARD IN 1883.

Q. (By Mr. Farquhar.) How much control of oil production did the Standard Oil Company have in 1883, compared with all others? A. Of oil production?

Q. Yes. A. I think about 5 per cent.

Q. Five per cent of all? A. Yes; you are speaking of production now. They had none directly, I think; it was through companies that were supposed to be, as they term it, affiliated with them, such as the Forest Oil Company, and probably the Anchor Oil Company, and one or two others.

THE STANDARD'S POWER BASED ON RAILROAD DIS-
CRIMINATIONS.

Q. Then what you say is that the foundation of the strength of the Standard Oil Company, after the passage of the act in 1883, lay in their means of making combinations, particularly of pipe lines, and securing the whole control? A. Their great power lay in the discriminations which they obtained from the railroads over all other persons. That is found in the testimony before the same committee, on page 191.

THE STANDARD'S METHODS OF PREVENTING THE LAYING
OF PIPE LINES.

Q. (By Mr. Phillips) What methods did they take, if any, before the passage of this through pipe line law, to prevent others from getting through to the seaboard? A. It was impossible to get the line to the seaboard without having the right of eminent domain. It would be useless to attempt it; because any one owning a little piece of land could absolutely prohibit the pipe lines passing over it. The original pipe line law only extended to certain counties, and as the oil business grew it went beyond the counties to which the law applied. It was difficult to lay lines even within the oil producing counties.

Q. (By Mr. Phillips) Were there other attempts to lay lines to the seaboard, and how did they undertake to circumvent them. A. I understand that when attempts were made to lay lines to the seaboard tracts of land were purchased—strips in front of the pipe line stations—so that the line could not be built without crossing them. By this means the Standard could prevent the laying of any pipe line, and I think did prevent it; so that it became absolutely necessary, in order to lay a line to the seaboard, that a corporation organized for that purpose should have the right of eminent domain.

THE STANDARD'S CONTROL OF TRANSPORTATION.

Q. (By Representative Otjen.) You said that in 1883 they controlled 5 per cent of the production. What per cent of the transportation did they control at that time. A. I think they controlled 90 per cent of it.

Q. Even at that time? A. Yes. A number of smaller pipe lines were laid through the oil country, and these were rapidly absorbed by the National Transit or the United Pipe Lines, which was a Standard organization. So that in 1883 they practically had command of all the transportation of crude oil.

Q. (By Mr. C. J. Harris.) Has it been their policy to control all new lines that have been laid since then? A. Yes.

Q. No matter what the cost? A. No matter what the cost.

AMOUNT OF THE STANDARD'S REBATES FROM THE
RAILROADS.

Q. (By Mr. Phillips.) Would they obtain rebates from the railroads? A. They obtained rebates from railroads. That is probably quite an old subject, and it is fully gone into here in the testimony of Mr. Cassatt. That is easily accessible to the commission. They got their power by means of rebates. They got a rebate not only on the oil they shipped themselves, but on the oil everybody else shipped; a very excessive rebate. The rebate was so much that nobody else could stay in the business.

Q. How much did that rebate amount to in any given period of time? A. On Page 191 of the report of the Committee on Manufactures Mr. Cassatt said that at that time it was 80 cents a barrel.

Q. In round sums, do you know how much they obtained in the course of a year or such a length of time, from all the railroads. A. I should say it would run into the millions; probably as high as eight to ten millions a year.

Q. In rebates? A. I think so.

Q. Is the precise sum stated in that testimony. A. The precise sum is stated on Page 191 (reading) "Q. I mean the tariff rate? A. One dollar and ninety cents. Q. What is the actual rate? A. If shipped to the Standard Oil Company at that time it would be 80 cents a barrel." It was just one-half, and it was even higher than that. I think it was higher than \$1.16 a barrel.

THE STANDARD'S CONTROL OF TRANSPORTATION.

Q. (By Representative Otjen.) What percentage of transportation do they control now? A. They control probably about 88 to 90 per cent of it.

THROUGH PIPE LINES A BENEFIT TO THE OIL INDUSTRY.

Q. (By Mr. Farquhar) Was the establishment of these pipe lines to the seaboard a positive advantage to the oil industry of Pennsylvania as a whole? A. I think so.

EFFECT OF TRUSTS UPON THE CONSUMER.

Q. (By Mr. Phillips. How, in your opinion, do trusts affect the consumer? A. I think the trusts themselves seek to create the impression that the organization of trusts and the introduction of what they call the "economies of manufacture" reduce the price of the manufactured article to the consumer. I think that is, in fact, wholly erroneous—that instead of decreasing the cost to the consumer they increase the price to the consumer until it becomes absolutely extortionate. One would suppose that would be the case from the mere fact that these trusts are organized for the purpose of securing a complete monopoly of the business in which they are engaged. They permit no one else to engage in the same business if they can prevent it. They pay enormous prices for other establishments in the same line, for the purpose of closing them up and thus obtaining a complete monopoly of the business. When they have accomplished that, or approximately accomplished it, they have absolute control of the prices to the consumer; and I do not believe that any body of men anywhere, and especially when organized for the purpose of profit, can be trusted with the inordinate power of absolute fixing prices to the consumer. One would expect that they would fix extortionate prices in order that their profits might be high.

PRICES AT COMPETITIVE AND NON-COMPETITIVE POINTS.

I believe that it can be shown, in fact, that this has been the effect of the creation of trusts; and especially of the trust which was the first, and to this day is the greatest, the Standard Oil Trust. Now, that they do charge extortionate prices, it will be a very easy matter for this commission to prove, by simply getting the prices at which they sell refined oil at all points where they are without competition, and comparing them with the prices they obtain where there is a competitive market. I think it is always well to deal in the concrete rather than the abstract, and I will give an example which the commission can readily verify. In New York and Brooklyn and Jersey City, in 1895 and 1896—they were selling oil to the local merchants, and to what are known as the wagon trade as well as retailers, at 9 and 9½ cents a gallon. The Pure Oil Company having been organized on the 9th day of March, put a wagon on the streets in New York, and sold ten gallons of oil the first day at 9 cents a gallon. As soon as the Standard Oil Company knew that the Pure Oil Company was doing business in the city of New York and vicinity, they commenced a rapid reduction of their prices, until in July, 1896, they had reduced the price to 5½ cents a gallon for the best quality of water-white oil, in small quantities, at retail out of their wagons in the city of New York. On March 9, when the price was 9½ cents a gallon, the price of crude petroleum was \$1.30 a barrel. That is a trifle over 3 cents a gallon. Crude oil is always measured by barrels of 42 gallons each. Three cents a gallon would be \$1.26. When they put the price at 5½ cents a gallon, crude oil was \$1.15 a barrel. In other words, they reduced the price of refined oil by

\$1.68 a barrel, while crude declined only 15 cents. Now, 9¾ cents a gallon was an inordinate price for refined oil in New York, and 5½ cents was below cost; they could not make the oil, transport it to New York, and sell it for that price and get cost for it. The condition is the same in Philadelphia, where there has been competition for two years.

Q. (By Mr. North.) How long did that continue? A. We put additional wagons on in a small way, and I do not hesitate to say we have lost money in New York every month since we started three years ago last March.

Q. Prices remain the same as they are fixed? A. Practically the same; they are a little better now, although crude oil is no higher. Crude oil was \$1.15 in 1896; it is now \$1.13; yet the prices of refined are a little higher now than then. But I do not hesitate to say that by the competition which we introduced at least \$3,000,000 has been saved to the people of Greater New York during the last three years.

Q. (By Mr. Phillips.) How about Philadelphia? A. The situation is the same in Philadelphia. The Pure Oil Company has been doing business in Philadelphia since the 19th day of June, 1896. And prior to that time another company, which our company succeeded, had been doing business there for years. The price of oil in Philadelphia is even lower than it is in New York.

Q. (By Mr. C. J. Harris.) This saving to consumers would not probably have been made without the competition? A. Oh, no; I think the price would have been maintained throughout the entire period at 9½ cents.

Q. (By Mr. Farquhar) This commission understands that these prices are carried by both competing companies in New York at a loss? A. Certainly at a loss. Their purpose is to drive competition out; and unless the company has a considerable capital it will be driven out. No individual can compete with them. They have absolutely destroyed all individual enterprise in the oil business.

Q. Would it not have been a better business method to adopt the price of the opposition company? That would have involved no loss to the company, but simply standing in as a competitor at the real cost without a profit. A. If you sold at all you had to sell at their price. We did not care to do business at a loss. We should have liked to avoid it if possible.

Q. (By Mr. C. J. Harris.) They made the reduction? A. They made the reduction and they made the cuts, and they did it to make it destructive.

Q. (By Mr. Farquhar) The cut, you said, was made from nine and a half to five and a half? A. Yes; from March to July.

Q. Were you in competition at the time of the nine-and-a-half rate? A. Yes; we commenced in March, 1896.

Q. At the nine-and-a-half rate? A. Yes.

Q. Was the price put down to five and a half at once, or was the first reduction to a middle figure? A. The first reduction, I think, was to eight, and then to seven and a half, then to seven, and quickly down to five and a half.

Q. (By Mr. North) Could you state the figure at which the oil could have been sold at that time with a

reasonable profit? A. Seven cents would have given a very handsome profit both to them and to us.

Q. (By Mr. Kennedy) I would like to ask the Senator to say something about the price of the same quality of oil in the States where the Standard has not this competition. A. The prices are very high. When you get entirely away from competition they get what prices they please.

Q. Can you name a case in any city. A. No. I can not give you the figures of other cities from memory; I know the figures here because it was business to know them.

Q. (By Mr. Phillips) These figures will be obtained and presented to the commission, no doubt in satisfactory shape? A. And it is true that wherever there is no competition their prices are high.

Q. We are still on the question how, in your opinion, do trusts affect the consumer? A. Give the trust the absolute power to fix prices, and they always fix them high. That is the only way they can get their inordinate profits on their watered stock, and the consumer, of course, must suffer. There is no question about it. No government should allow the power of absolutely fixing prices for the consumer on a given product to be lodged anywhere if it can be prevented.

THE NUMBER OF COMPETITIVE POINTS.

Q. (By Mr. North.) Are there many competitive points in the United States? A. Yes; there are a number of competitive points in the United States where the independent people have stations for distributing points for oil, but usually, I think at a very great disadvantage in their rates.

Q. Is the number of these competitive points increasing or decreasing? A. I think they are increasing as the independent interest is increasing. If that should diminish, they would correspondingly diminish.

THE INDEPENDENT COMPANIES MAKING LESS MONEY THAN THE STANDARD.

Q. (By Mr. Farquhar) In proportion to their capital are the independent companies making as much money as the Standard? A. I think not, if we are to judge by their declared dividends. I see that the Standard recently declared, for the last three months, a dividend of 3 per cent and a special dividend of 9. That would make 12 per cent in three months on a capital of \$100,000,000, if the statement can be relied upon.

REFINED OIL FIRST TRANSPORTED IN PIPE LINES BY THE INDEPENDENTS.

Q. Through how many States did this pipe line need to go before it reached the seaboard? A. Pennsylvania and New Jersey. Probably it would be interesting for the commission to know that the independent interests first undertook the transportation of refined oil long distances by means of pipe lines. The independents laid a pipe line to transport refined oil from Oil City through Titusville and Warren, Bradford and Wilkesbarre, Pa., to

Hampton Junction, N. J., for the purpose of reaching New York harbor. That line has been in operation four years, and has transported millions of barrels of refined oil, without the condemnation of a single barrel; and it was the only means that enabled the independent refiners to live. Without that they would have been driven out of business by the railroads.

OBSTACLES PUT IN THE WAY OF THE INDEPENDENTS' PIPE LINE.

Q. (By Mr. Farquhar.) Did these pipe lines find any trouble at all in getting their right of way? A. Oh, yes; certainly. Even in Pennsylvania they were hindered and delayed and stopped in a great many ways in reaching Wilkesbarre. Men went in advance of them and took options on the right to lay a line at very high rates, for the purpose of establishing rates for this line that was coming. They would offer to take an option for the right of way over a farm at very much more than the value of the entire farm.

Q. Is not that the usual way with a railroad or with a pipe line, that the second customer is the one that is very apt to pay an enormous rate? A. The first person that went through was not pretending to lay a line, but simply to fix the price for the one that did lay the line.

Q. (By Mr. Phillips.) Will you give an account of the start made with the United States Pipe Line, the double line, to ship both refined and crude? Will you state to the commission what adverse circumstances you met in the State of New Jersey in trying to get to New York? A. The line was projected by way of Hancock, on the Delaware River, and through New York to the Hudson River. When we reached a place near Hancock, on the Delaware River above New York, we found the Erie Railroad there with cannon and every appliance necessary to prevent the laying of the line. We also found that it would probably take us some years to get the land for that line through to New York, because the pipe line law of New York had been so amended as to make it very difficult to lay another pipe line. The law was not arranged to develop that plan of transportation, but to prevent the laying of additional lines. So we gave up the project of going to New York by way of Hancock, and started from Athens south to Wilkesbarre.

Q. That is Athens, Pa.? A. Athens is in Pennsylvania, about four miles from the New York line. We intended to lay the line directly across through New Jersey to the bay at New York, where a company with which we are associated, the Columbia Oil Company, has loading facilities. We reached the Delaware River and crossed it. Then we met the first objection, from the Belvidere Railroad, owned by the Pennsylvania. Although we owned an acre of land at the crossing, they enjoined us from crossing that by means of a bill in equity filed before the vice chancellor. His decree was reversed by the Court of Errors and Appeals, the highest

court in New Jersey, and we crossed the road; but they kept us back a year. Our line was completed to that point, but we were delayed a year in getting that link. Then we met our next difficulty in crossing the Delaware, Lackawanna & Western Railroad. We owned a line there. They undertook to take that line out. We maintained our position by force, but we had a delay there, and some of our men were hurt. We retained the line, and it is still there; it is still in litigation. We crossed under the Essex Canal at a culvert, owning that crossing, and reached Hampton Junction, and 51 miles from the harbor of New York. There are two lines from Bradford, Pa., to Hampton Junction, one for crude oil and the other for refined.

THREE GRADES OF OIL IN ONE PIPE LINE.

Three different grades of oil are transported through the same line. They push out a poorer grade with a better, and it is turned into its own tank by means of a valve. They run that second grade until they have transported the amount desired; then put in a third grade until they have transported the amount that is desired of that, and then repeat the process.

Q. (By Mr. Phillips.) Explain how you have been transporting these mixed grades to your markets. A. In pumping the oil along the line it does not mix for a distance of 50 feet; though of course that poorer grade mixes with the better for a short distance in the line.

Q. (By Mr. Farquhar.) Does the Standard use that same system? A. No, I think not.

Q. (By Mr. Phillips.) Are you the first to pump refined oil to New York? A. The first company that ever pumped refined oil any distance by means of the pipe line. I think the Standard is pumping distillate from the fields in Ohio for treatment.

NO FEELING AGAINST SENDING OIL AWAY TO BE REFINED

Q. (By Mr. Farquhar.) Was there not a feeling in Pennsylvania, and the oil district, against the transportation of crude oil, as withdrawing the benefits of refining from the localities? A. No, I think not; there is a pretty liberal spirit on that subject; they are selling oil to be refined wherever it can be refined cheapest.

REFINING DONE CHEAPEST IN THE INTERIOR.

Q. (By Mr. Farquhar.) Then you state that there is advantage in getting to the seaboard for your refining? A. No; I think the oil can be refined cheaper in the interior, and transported as refined by means of pipe lines.

Q. Giving employment to the locality where the oil is produced? A. Yes, I think so. I think so for several reasons: Land is cheaper, labor is cheaper and fuel is cheaper, and water is abundant and of a good quality.

Q. And living is cheaper? A. Living is cheaper.

Q. And it tends to diversify labor? A. Yes.

Q. Is there a better market at the seaboard for what you call the by-products or residuum than there is at your local refineries in Pennsylvania? A. I am not competent to answer fully. I think that the market for the by-products is all over the country, and probably one part of the country is as valuable a market as another.

THE STANDARD BELIEVED TO GET RAILROAD FAVORS IN PRICES FOR LUBRICATING OILS.

Q. (By Mr. Phillips.) Does the Standard have the monopoly of lubricating oil, especially as to the railroads of the United States? A. I want to mention something that I do not positively assert to be true. I do not know it to be true, but it is a matter of belief with me. I believe the Standard is getting as great advantages and discriminations from railroads as ever; but I think they get them in an entirely different way, and in such a way that I do not see how the matter can be reached. The purchasing of oil for a great many of the railroads has been largely taken out of the hands of the purchasing agents and put into the hands of the president or some managing director. I think that the Standard get their rebates from the railroads by means of the prices at which they oil those roads.

Q. By lubricating oil? A. Yes.

Q. Does that require a large amount? Is it a very large item of expenses? A. I think the railroads of this country can be lubricated for one-half the amount which they pay today, and a large profit made out of it; but the railroads are simply giving rebates in that way.

Q. (By Mr. Farquhar.) As a business proposition, does it make any difference to a man selling oil to a railroad whether he goes to the president of the railroad or to a purchasing agent? A. Yes, I think it makes a difference; because the purchasing agent is supposed to buy his oil at the very lowest prices. It is different in the case of the president.

Q. (By Mr. Farquhar.) Is there any proof by which you know that the purchasing agent gets competitive prices on oil? A. No.

A REFINERY WITH \$500,000 CAPITAL CAN GET ALL THE BY-PRODUCTS.

Q. (By Mr. Jenks.) The statement has been frequently made that, owing to the very large capital of the Standard, they get the refined very much cheaper than the independents do, because they are able to get more by-products. Can you tell us whether you, for example, have as good facilities for refining as the Standard? A. I presume that in refining a large quantity of oil there would be a slight difference in favor of the large refinery; but I think it would be so slight as to make no real difference. I think the independent people make just as good oil as the Standard Oil Company, and better.

Q. Do they get also substantially the same by-

products? A. They can get also the same by-products if they have the facilities to make them.

Q. Does it require anything like the capital the Standard has to get an establishment big enough to make use of these by-products? A. Oh, no.

Q. How large? A. I suppose a capital of \$500,000 would make a complete refinery with a perfect division of labor, so as to get out every by-product at the very lowest possible cost.

THE STANDARD HAS NO ADVANTAGES IN COST OF PACKAGES.

Q. Would the same thing hold with reference to the materials they use in shipping? With reference to the cost of tin cans and barrels? A. The making of tin cans is a very simple process; it is all done by machinery, and they are made very rapidly. I think others can manufacture them just as cheaply as they do. Barrels can be manufactured just as cheaply as the Standard Oil Company can make them. I judge they cannot manufacture these things any cheaper than other people, because they do not do the other parts of the business any cheaper than the other people. They are not any better producers than the independent producers, nor as good; and they do not transport the oil any cheaper through a given size of pipe than we do.

THE STANDARD'S ADVANTAGE IS NOT IN PRODUCTION BUT IN DISCRIMINATIONS.

Q. When you say that they are not as good producers as other people, do you mean that they do not take as good care in their refining as the others do? A. I think very possibly they do not. If an oil company is in the business of producing oil individually, they are giving their own personal attention to that specific thing. In the case of the Standard Oil Company, all their production must be under the supervision of paid agents, who are not as skillful in the business as the men that have been in it for thirty years themselves.

Q. In your judgment, then, any advantage they have comes from some special discriminations or through monopoly, and not from any legitimate advantage they have through large capital? A. I think you are entirely correct; they have not much advantage, so far as the actual doing of the business is concerned, except through discriminations.

THE STANDARD MAKES A HUNDRED PER CENT ON ITS REFINED OIL.

Q. (By Mr. C. J. Harris.) You said the price of oil was 9½ cents in March, 1896; that would give them at wholesale rates a profit of 50 per cent., would it not, according to their own figures? A. It would give them a profit of 100 per cent.; the cost of oil would be—

Q. (Interrupting.) I do not mean on the crude, but I mean after it was refined? A. It would give

them 100 per cent. They could buy the oil so as to make the profit very close to 100 per cent.

Q. That is a pretty big profit for a wholesale business, is it not? A. I think so.

COMPETITIVE POINTS—THE RAILROADS PREVENT COMPETITION ON THE PACIFIC COAST.

Q. (By Representative Otjen.) I understood you to say there are about a hundred competing points; where are they? In what part of the country? A. I can give you a good many of them: New York, Philadelphia, Pittsburg, Chicago, Milwaukee, Rock Island, Evansville, Memphis, St. Louis, Des Moines, Kansas City.

Q. Any on the Pacific coast? A. They have such a great advantage, by means of rules the railroads have adopted, that it is almost impossible for independent companies to sell large quantities of oil on the Pacific coast. The Interstate Commerce Commission has assessed against a number of railroads, in favor of the independent refineries, the sum of \$86,000, which it has found that the railroads should pay to the independent refineries by reason of discriminations; and suits are pending for that sum in the United States Circuit Court at Pittsburg.

Q. (By Mr. C. J. Harris.) Does not the Standard Oil control the country trade almost exclusively? A. Very largely they control trade which only railroads reach. The competitive points are where you can get away from railroads and get water transportation.

Q. (By Mr. Kennedy.) Has the Standard Oil Company been making attempts to secure control of these independent companies? A. In 1894 and the beginning of 1895, they had conferences with some of the independent refineries. The independent pipe lines declined to sell. A number of refiners declined to sell; but they did, at that time, purchase oil refineries along our pipe line, which were under contract to take oil from us; and, although they were in good condition, and one of them was practically new, they tore those refineries down and destroyed them.

Q. Did they offer much more than the properties were worth? A. Yes; they offered more than the properties were worth.

Q. (By Mr. Phillips.) What other methods did they take to get control of the independent pipe lines? A. They reduced the price of oil at the seaboard, so that oil was sold at the seaboard for a long period below the cost of the crude in the oil region, and the refineries had to suffer a large loss.

THE STANDARD BUYS STOCK IN INDEPENDENT COMPANIES AND GETS A DIRECTOR IN ONE.

Q. Did they or did they not purchase stock in any of these independent pipe line companies? If so, how much and in what companies? A. The first company we organized was the Producers' Oil Company, Limited, with a capital of \$600,000. There were 1,095 subscribers to the stock. They were

scattered over about 300 miles, in territory widely separated from each other and from the officers, and the Standard Company started to get control of that company. They had a bank cashier working for them in nearly every town throughout the whole region where the stock was owned, and they had agents in the field. They commenced purchasing that stock at par, and before they got through they paid as high as 220. They secured a majority of the stock—\$1,000 over one-half. Then they brought suit to get into the company. They were beaten. The stock was put in the name of John J. Carter. He claimed to be the owner. It was owned by the National Transit Company, and they transferred it to him on the 16th day of January, 1896. He brought suit to become a member of that company without being elected to membership. It was a limited partnership, and the law provided that no one who purchased stock could become a member without being elected by a majority in number and value of their interests. He alleged that he was one of the original subscribers to the stock, and that by buying additional stock he was entitled to vote such additional stock at the meetings, and he asked for a transfer to him. That was denied by the company. He lost in the court below and in the supreme court. That was one of the means they were taking to get control. He told me he had purchased stock for the purpose of getting control of the company and changing its policy from one opposed to the Standard to one in harmony with it. They bought stock in the United States Pipe Line; and in order to prevent their getting control of that stock the majority was put in the name of three trustees who could vote it at all meetings of the company.

Q. About how much stock did they purchase in the United States Company? A. Some \$350,000 to \$400,000 out of the \$1,200,000 paid-up capital. We refused to recognize them as stockholders in that company. They brought suit to get in, and they won in the court below. The case was taken to the supreme court and, on a technicality, the appeal to the supreme court was quashed.

Q. Have they or have they not a director in that company? A. They have one director in that company now.

Q. How did they obtain that director? A. They obtained that director by the purchase of stock, and through the decree of the court that they should be entitled to vote at the election.

THE INDEPENDENT COMPANIES ARE SEPARATE, BUT OWNED PRACTICALLY BY THE SAME PEOPLE.

Q. (By Mr. Kennedy.) Have the independent companies found it necessary, in order to protect themselves against the encroachments of the Standard, to enter into a form of combination? A. Only as to control; combination of interest. They are practically owned by the same people. They would be much stronger, undoubtedly, if they were welded into one organization.

Q. Then, practically, they are not independent, but independent of the Standard Oil Company? A. They are independent of each other and also independent of the Standard.

Q. Did you say whether they were controlled by the same people? A. By way of illustration, the refineries are all owned by different people, individuals or companies; each man owns his own refinery, and each company owns its own refinery. They take oil from the pipe lines and pay us the 15 cents pipage, while the Standard pipage is 20 cents. We have always maintained a uniform price of 15 cents for local pipage. They sell their oil where they please; bid against each other, and bid against the Standard. They are entirely independent.

INDEPENDENT COMPANIES ABSORBED BY THE STANDARD.

Q. (By Mr. A. L. Harris.) How many independent companies have been absorbed by the Standard Oil Company? A. I should say over a hundred in the last twenty years.

Q. Is there such a thing as a list of those companies and the amount of capital of each? A. Yes; there is a list of the refineries that were obtained and dismantled in the testimony of Senator Emery before the Committee on Manufactures in 1888.

WHY THE REMAINING INDEPENDENTS REFUSE TO SELL.

Q. (By Representative Livingston.) What stands in the way of absorbing the remaining companies? The fact that they produced enough to meet the demand, or are they trying to work at lower figures because they are not willing to sell? A. Because they are not willing to sell; that is one reason.

Q. (By Mr. Farquhar) Do you mean by that that there is so much profit in the independent lines that they can ask two prices and will not sell? A. No; we refused to sell at 112—that is, 12 per cent above cost—when we expected to go into the hands of the sheriff and be sold out. We maintain those companies largely as a matter of sentiment, and as a protection to the independent producing interests.

Q. Do they stay out of sentiment or feeling toward the consumer, or is it because there is a large profit, present and prospective, in keeping them out of the Standard Oil Company? A. No; men naturally want to remain in the business they have selected, and with which they are acquainted; they are satisfied with moderate profits, and they do not like to be driven out of their business. There is an American pride in being able to maintain a place in a business that a man feels that he is entirely competent to carry on, and has adequate capital to carry on if he has a fair chance.

Q. (By Mr. Farquhar) Is it not a fact that the independent companies of this country are making money, and making a sufficient percentage on their capital, and is not that one of the reasons why they do not sell? A. That is true just at present; but this proposition to purchase them was made after they had been doing a

losing business continuously for twenty months, and in that twenty months had lost \$200,000 among them in actual money. Then they declined to sell.

PRACTICAL EXPERIENCE OF MEMBERS AND MEN OF THE
STANDARD OIL COMPANY.

Q. You mentioned the fact some time ago that you thought those who were interested in the independent companies, and had been brought up in the business, and had long experience in it, are better managers than the agents that the Standard Oil Company employ in refining, or transportation, or selling. Is it or is it not a fact that in their acquirement of these plants, the Standard Oil Company has usually taken the expert mixers and refiners of those concerns into the working force of the Standard Oil Company itself? In other words, under the controlling spirits of the Standard Oil Company to-day, have not the men in the field had as wide experience as any independent company can have? A. No, I think not. I think, with the exception of one trustee, none of the trustees have had any experience.

Q. What is the experience of Mr. O'Day? A. He has had experience as a pipe line man. Mr. Archbold, I think, has had quite a large experience as a refiner. I think he is a competent man in that business.

Q. When they absorbed the Galena Company, did they not take the best operatives of that company into the employment of the Standard Oil Company? A. What Galena do you refer to?

Q. The Ohio. A. That is located at Franklin. I think the same men are in that company that have always been in it.

PRESENT CONDITION OF REFINERIES THAT WERE RE-
PORTED AS INDEPENDENT IN 1888.

Q. (By Mr. A. L. Harris) Please turn to page 438 of that report. (House Reports, First Session, Fiftieth Congress, 1887-88, Volume IX.) How many of those companies in that list are in existence at the present time? A. I can not speak of Cleveland. Of New York, Borne, Scrymser & Co. have been absorbed by the Standard, and I think Lombard, Ayres & Co. They are marked there, though, as affiliated with the Standard then. Pittsburg: Bear Creek Refining Company is a Standard works now, I understand; Iola Oil Works is a very small works; and the Globe Refining Company, I think, is Standard. Oil City: The Keystone Refining Company was wrecked and torn down; Standard became the purchaser of it at sheriff's sale, I think. The ground is bare now with the exception of a few tanks.

Q. (By Mr. Phillips) By whom was it torn down? A. The Standard.

Q. (By Mr. A. L. Harris.) As you go on please state what has become of the different companies that have gone out of existence and how they went out of existence, whether acquired by the Standard Oil Company, etc. A. Reno: The Mutual Oil Company was purchased by the Standard in May, 1895, wrecked and torn down; nothing left standing but a chimney as a

monument of disaster; I am not sure but the chimney is down now. Franklin: Those are small refineries; they are not running, I think; I think the most of them are shut down. I do not know anything about those at Buffalo, Toledo, Findlay, Lima, Bradner, Smith's Ferry, Boston, or Baltimore. Bradford: Those are not in existence now; I do not know what became of them. Parkersburg: One of the refineries that was in existence at that time has been absorbed by the Standard. Marietta: I am not informed as to those refineries. Titusville: Rice, Robinson & Witherop are running now as an independent company. John Schwartz's refinery was practically destroyed by the flood. He then united with the National Refining Company in the Union Refining Company. That was bought by the Standard in 1895 and torn down. The International Works (J. P. Thomas) was absorbed and purchased by the Standard in 1895. It was practically a new works and in fine condition, but it was torn down. The National Oil Company was united with the Union, and the Union was purchased and torn down by the Standard. The same is true of the Western Refining Company; they went into the Union; they united those refineries, leaving but two practically of that number now in existence at Titusville, and one that has been erected since by the Manhattan Oil Company, known as the Oil Creek Oil Works. Clarendon: I am not familiar with those; they are small works; I think one of them is still operated by the independents; I think the other is not in operation now. San Francisco: I am not informed as to that. Philadelphia: Bosshart & Wilson are not in business. As to the others I am not informed. Florence, Colo.: I am not familiar with them. This list was made, I see, in 1888.

BONUSES FOR IDLENESS.

Q. (By Mr. Phillips.) Have you any information in regard to the paying of a large bonus or premium for refining works to remain in idleness, or have you any information in regard to their paying sums of money to persons to stay out of the business? A. I know that within the last five years, and prior to that, they leased a number of refineries, and simply shut them down, and allowed them to remain idle. As to persons receiving money to remain out of business, I have no personal, absolute knowledge of that subject; only common rumor.

Q. Do you know as a fact that they have leased works that have been shut down for a period of years? A. Yes, I know they have.

Q. And paid large sums of money? A. Yes, I know that has been done.

CONSUMERS WOULD PAY LESS IF THE STANDARD OIL
COMPANY DID NOT EXIST.

Q. (By Representative Livingston.) What, in your opinion, would be the price of oil to the consumers if the Standard Oil Company should be abandoned? A. I believe that the average price to the consumer, all over the United States—all over the world—would be

very much less than it is to-day, at the same price for crude oil.

Q. Why? A. The reasons are that anyone who is permitted to take whatever he chooses is never moderate in his taking. They have the ability and power to take from the consumer just what they please, where there is no competition; and I do not think that anybody would be moderate under such circumstances. I do not believe that anybody should be trusted with unlimited power to fix prices.

Q. You think, then, that competition would so rule and control the independent companies that they would be forced to sell oil for a lower price than the Standard now charges? A. Yes; I have not a bit of doubt about it.

PROFITS OF THE INDEPENDENTS AND OF THE STANDARD.

Q. That being true, what interest has the independent company in forcing the disintegration of this company? A. Just this interest: they stand always in mortal dread of being entirely wiped out. They do not know whether they can live six months or a year; they always have to fight for their lives, and they do not make fair profits even now; they have not made what would be called fair manufacturing profits at any time in the last five years.

Q. (By Mr. North.) What do you call fair manufacturing profits? A. They would be entirely satisfied to do this business at 10 cents a barrel on the oil that runs through their refineries. I think the Standard makes \$1.50 to \$2 on every barrel that goes through its refineries.

Q. About what per cent? A. That would be about 10 cents a barrel on the amount the independents refined.

Q. What per cent of profit on the investment? A. With oil at \$1 a barrel, that would be about 10 per cent.

Q. Which you call a very good manufacturing profit? A. Yes, I should say so. I have heard independent refiners say they would be entirely satisfied to enter into a contract for any number of years, to make 10 cents a barrel on every barrel of crude oil they refined; and with oil at \$1 a barrel, that would be about 10 per cent. profit.

THE FOREIGN MARKET—THE PURE OIL COMPANY.

Q. Have you any knowledge of the price at which the Standard sells its product abroad? A. The Pure Oil Company was organized in 1895 for the purpose of aiding the independent refiners—organized in an open meeting held at Butler, January 24, 1895. The purpose was stated to be to organize a company that would take the oil from the refineries at cost; they were willing to refine oil at cost if they could live that way. They were willing to say they would continue in the business and give it to the new company at cost, without making a cent. This company was organized for the purpose of taking that oil at cost and marketing it abroad.

Q. (By Mr. Phillips.) Please state what means the Standard had taken to destroy the market abroad that these independents were working on?

A. They had made the market abroad so bad that oil was sold in New York for a number of months below the cost of the crude at the refinery, without anything for refining it and without anything for transporting it from the refineries to New York. The refiners had lost large sums of money. Then they said they could not continue unless they were aided by the producers. We formed the Pure Oil Company for the purpose of taking the oil at cost, in order to enable them to stay in the business and not be driven out by the Standard Oil Trust. There was an open meeting, held in the opera house at Butler, and the stock of that company was subscribed there to the amount of \$65,000 in a few minutes. It went on until it now has a capital of \$375,000, with an authorized capital of \$1,000,000, and that company has been buying oil from the independent refiners and marketing it abroad. They have a station erected at Hamburg, Germany; their own tankage, their own tank cars. They have one at Rotterdam, Holland; their own tankage, barrel houses, pumping outfits. They are erecting one at Mannheim, on the Rhine in Germany, and they rent a plant at Amsterdam, Holland. Those plants were established, one of them two years ago last October, the other a year ago the first of April, and the third is in process of erection. The oil is transferred to those plants by means of tank steamers, pumped out and distributed just as the Standard distributes it throughout Germany.

DISCRIMINATION PREVENTED IN GERMANY.

I want to say here, and I say it with a blush for this country, that everyone can do business in Germany on an equal footing, and nobody has any advantage over another. It ought to be true in the United States. It is a sad thing.

Q. (By Senator Daniel.) Please explain that a little. A. They do not permit any discrimination; they will not allow it.

Q. By whom? A. The government will close up an establishment and keep it from doing business if they enter into discrimination.

Q. (By Representative Livingston.) You mean to say they prevent trusts and combinations? A. I think they do; at least they prevent trusts and combinations having any advantage over an individual.

Q. (By Mr. North.) Or fixing of prices? A. They will not permit that; they will not permit anybody to do business at a loss.

Q. For the sake of destroying a competitor? A. Yes. They will not allow that.

GERMAN BUSINESS OF THE INDEPENDENT REFINERS. COURSE OF THE STANDARD.

Q. You have not quite answered the question I originally asked you. A. What was that?

Q. I wanted to know how the foreign prices of the Standard Oil Company compared with the domestic prices. A. Prior to that time the independent refineries sold nearly all the oil they marketed in Germany to a man by the name of Poth.

He frequently said he could not do business in Germany at a loss—which we have found to be true—and of course that gave him a right to say what he could pay for oil. He got rich out of the purchase of oil from the refiners in a period of a few years.

Q. (By Mr. Phillips.) Independent refiners? A. Independent refiners; and finally he sold out to the Standard Oil Company. After he had done it he was overwhelmed with grief when he found the refiners had stood by him. He went home and died within three days. He is dead and his business is carried on by the Standard Oil Company.

Q. Did they take any means to buy tankage? A. They would often tie up all the tankage at a given point, and they sold oil abroad at low prices for a period.

Q. (By Mr. North.) At lower prices than they were selling for in this country at the same time? A. Yes.

QUALITY OF EXPORT OIL.

Q. (By Mr. Jenks.) What is the quality of export oil compared with what is used here? A. The oil for export, while it is called a second-grade oil, is really about as good a burning oil as the very highest quality. The refiners tell me they would as soon burn what is called export oil as "water white." It does not burn quite as white, but it is a good quality of oil.

MARKET CONDITIONS IN GERMANY AND ENGLAND.

Q. (By Mr. North.) Are you able to carry on competition in foreign countries without those disadvantages which you encounter at home? A. A great deal better in foreign countries than in America. Competition is preserved in Germany to a very much greater extent than in the United States. It is in England, too.

Q. (By Mr. Phillips.) Is the Pure Oil Company making a profit? A. The Pure Oil Company is making a profit; doing a profitable business.

Q. (By Mr. North.) Selling at market rates abroad? A. Selling at market rates and doing a good business.

DIFFERENT RESULTS OF PURCHASES OF INDEPENDENT PLANTS BY THE STANDARD AND OTHERS.

Q. (By Mr. Ratchford.) You stated that 100 or more of these companies were absorbed by the Standard Oil Company. Has there been any such thing as transfer of property or plant from one of these independent concerns to another at any time? A. Very frequently; that is, interests will be sold.

Q. They have bought and sold to each other? A. They change ownership to some extent.

Q. The reason that others have not sold to the Standard Oil Company is because they are unwilling to sell? A. Yes.

Q. If these independent concerns have bought and sold and changed ownership, have they not been absorbed by each other in the same sense in which

the Standard Oil Company has absorbed some of them? A. No. A works is not absorbed in changing ownership. The business is carried on just as it has been carried on before.

Q. When an independent company buys another company or plant or property it continues to operate it? A. Yes.

Q. The only difference, then, between them and the Standard is that in the one case the plant is bought for the purpose of operation, and in the other for the purpose of destruction, leaving it waste? A. Very frequently it is bought for the purpose of destruction.

Q. I should think the term "destroyed" or "laid waste" would be a better term than "absorbed." A. I would say absorbed—dismantled—which means destroyed.

THE STANDARD'S PRODUCT HAS DETERIORATED.

Q. Has the quality of the product of the Standard Oil Company improved during the past twenty years? A. I think it has deteriorated in quality. I would like to give a reason for that: Prior to twenty years ago they did not use any Lima oil, or oil that has sulphur in it; within the last twenty years they have used a very large proportion of Lima oil. Therefore, I think their manufactured oil generally is not as good as it used to be.

Q. (By Mr. Phillips.) For what reason is the Lima oil mixed? A. The Lima oil is said to contain arsenic and sulphur; one clouds the chimney and the other makes a bad odor.

Q. (By Mr. Ratchford.) How about the by-products? A. No doubt they make their by-products very lucrative to themselves.

THE PRICE OF REFINED OIL HAS FALLEN ONLY WITH THE PRICE OF CRUDE.

Q. Have their prices been materially reduced during the past 20 or 25 years? A. I read a statement made before this commission by a gentleman who, I think, was not at all familiar with the oil business, Mr. Thurber, of New York. The prices have not been correspondingly reduced with the cost of the material employed. In other words, there has not been a relative reduction in the price of refined, as compared with the cost of the crude. I think they had nothing to do with the making of the cost of the production of the crude. All improvements in drilling the oil wells and in producing crude have been made by the people who were actually engaged in that business; many of them workmen.

Q. Are you prepared to say whether or not the cost of, say, half a dozen other articles of common use has or has not fallen proportionately with that of the products of the Standard Oil Company? A. Yes; I think nearly all staple articles have been reduced within the last 20 years in larger degree than the price of refined oil.

Q. (By Senator Daniel.) Has not the price of the crude article fallen much more in proportion than the price of the refined? A. Undoubtedly. I am going to speak of that hereafter.

THE STANDARD'S PROFIT PER GALLON HAS INCREASED.

Q. (By Mr. Jenks.) You suggested that Mr. Thurber had brought up some figures. I think this chart here [pointing to chart on the wall] shows the figures that have been quoted so frequently by the Standard Oil Company, and that were quoted by Mr. Thurber. This upper line [indicating] shows the price of refined, the lower, the cost of the crude; the perpendicular distance between them shows the cost of refining plus the profit. These figures are often quoted by the Standard to show that they have very largely reduced the cost; these are the dates here [indicating]—the Standard Oil started about 1872—up to the time of the formation of the trust in 1882. Can you tell us whether or not these average figures show definitely the way in which the Standard fixes its prices? A. Your dots there between your lines indicate the cost of refining plus the profit.

Q. Plus the profit, because this, the lower line [indicating], is the price of the crude, and this, the upper line [indicating], is the price of the refined. The third line drawn with reference to the base line shows the difference between the two.

Mr. Farquhar. Would not that diagram show that since the Standard came into the trust they have run the refined and the crude almost parallel?

Professor Jenks. There has been a slight reduction all the time, and of course the Standard men will say, as anyone would, that when you get the price of crude down to less than a cent a gallon there is not any probability of getting it reduced much below that. I thought Senator Lee would explain that, because those are the figures often quoted.

A. I am told by the refiners that in 20 years the cost of refining has been reduced from 2½ cents a gallon to less than one-half cent. Of course those lines, being parallel, show a very much larger margin of profit.

THE STANDARD'S PRICE FOR REFINED OIL HAVE NO RELATION TO COST.

Q. (By Mr. Jenks.) Also state further, with reference to the way they fix their prices, whether it is merely arbitrary? A. I do not think the Standard Oil Company fixes its prices on the basis of the cost of refining and cost of crude at all. They rather try to avoid doing that. They do not want the public to understand how they fix their prices. They are entirely arbitrary. They have had very low prices for refined oil when crude was very high, and very high prices for refined oil when crude was very low.

Q. (By Mr. Phillips.) Does not that come about through their selling and supplying the market for a number of months ahead? A. Probably through their selling ahead, and then putting up the price of crude, so that their competitors may have to pay a high price for the crude, while they themselves are manufacturing the crude they have already pur-

chased, to make refined which they have sold at a high price.

THE BETTER CONDITIONS IN GERMANY AND ENGLAND HAVE ENABLED THE INDEPENDENTS TO LIVE.

Q. (By Mr. Kennedy.) You stated that the conditions of competition in Germany and Great Britain have been such that you could make a profit there, and the Standard Oil Company could not drive you out; and in this country their methods have been ruinous to you, so that you could not make a profit. Has the profit you have been able to make in Germany and Great Britain in years past been the means of enabling your companies to live, notwithstanding the methods of the Standard in this country? A. Yes.

Q. How long have you been operating in these countries? A. In Germany for three years next October. The price of export oil, which is a second grade oil, has been almost as high as "water white" oil. The cost of drilling the oil wells and obtaining oil is very much greater within the last three or four months than it was last year on account of the advance in our materials and the prosperous conditions of the country; but they have kept the water white oil, the oil sold in this country, very low during this last year.

SELLING BELOW COST TO CRUSH COMPETITORS NOT PERMITTED IN GERMANY AND ENGLAND.

Q. I understand that the Standard has in some instances almost given away oil to drive out competition. Is it true that they could not give away oil if they wanted to in Germany or Great Britain? A. No; I do not think they would be allowed to do that there.

Q. The government would come in and say, "You cannot sell this oil a cent a gallon less than the other people?" A. I do not think they would be permitted to do that.

Q. (By Representative Otjen.) I presume that would be with the understanding that they were doing it with the object of crushing somebody else out? A. Yes; that would be the object.

Q. (By Mr. Kennedy.) The government would be the judge of their motive? A. I do not think they would be permitted to do it.

Q. (By Mr. Farquhar.) Is there any act of Parliament that would prevent their giving away oil or selling it at half price? A. The government is simply mildly despotic.

Q. How do you reconcile that with the fact of American meats coming into competition with the German, and cutting the English price probably 33 per cent? A. I suppose those are sold at a profit. They do not prevent the selling of the goods, but they will not allow one company to have an advantage over another, and they will not permit business to be done at a loss.

Q. (By Mr. Kennedy.) I would like an explanation of how they would prevent a company from

doing business at a loss? A. They will close you up.

Q. (By Mr. North.) You mean to say they guarantee that every man who goes into business shall make a profit? A. No. He can quit when he pleases.

Q. (By Senator Daniel.) Are you speaking from an examination of the German laws on the subject? A. Speaking from a knowledge of business done there in the last ten years.

Q. Give us some item of your own knowledge.—A. In regard to business with Mr. Poth he said to us that he was not permitted to do business at a loss. Their books are open to inspection under some law.

Q. Where was that?—A. In Germany.

Q. What place—A. He was doing business at Hamburg and Mannheim and a number of other places in Germany. He said he could not do business at a loss; therefore he must do business at a profit. Since we have got in there, our agents say they are not permitted to do business at a loss. They will not allow us to sell goods at a loss and do a losing business. We can close up and quit.

HOW THE STANDARD MAKES PRICES HIGH TO CONSUMERS AND YET RUINS COMPETITORS.

Q. (By Mr. Jenks.) You said the prices were considerably higher in your judgment than they would be if there had been anything like free competition, and yet that it was very difficult for these independent refiners to get along and make a living. Please tell us a little more accurately what the methods of the Standard are that make these two things consistent.—A. In any market reached by independent oil they will put the price down so low that there is no profit in marketing oil; and at points not reached by the independent refiners they will put the price up so as to recoup their loss at the competitive point. They have accurate information as to every shipment. For instance, a shipment will be made by an independent refiner, and before that oil reaches its destination they will land a cargo of oil in the same place, to be sold at a very much reduced price. They will reduce their prices two or three days before that oil arrives, so as to prevent the man who bought it from selling it again. If he buys it once he is to lose on it, because he has paid a higher price than he is able to sell it for. Then they send some one to him to tell him, "You can not buy independent oil. You must buy from us." That is the method of every trust.

Q. (By Senator Daniel.) Have they done that in Germany?—A. No; they are not allowed to do that in Germany.

THE STANDARD HAS THE BUSINESS IN FRANCE.

Q. (By Mr. Jenks.) Now, you will perhaps add a word with reference to the way they get along in France.—A. I do not know much about the French,

except that the Standard Oil Company does most of the business of France.

EXPORT OIL—TESTS REQUIRED BY STATE LAWS.

Q. (By Representative Livingston.) Can that oil be sold in the States?—A. In some of the States. It can be sold in Pennsylvania. Generally it is not up to standard required in the States here, or not considered so. It is probably as good oil in fact as is burned in the United States, but it is excluded by reason of statutes that have been passed.

Q. What is the gravity of the oil you send over there?—A. It is called 73 Abel test. I am not familiar practically with the specific gravity.

Q. What does the State law of New York require, or of any other State—110?—A. Yes; 110, or about 120 to 150. One hundred and fifty is the highest grade of water white, and about 48 gravity. I have heard them use that expression in connection with water white. One hundred and fifty, 48 gravity, is considered the best oil.

AMOUNT OF OIL EXPORTED.

Q. (By Mr. Jenks.) What proportion of the refined product is exported and what proportion is consumed here?—A. About 40 per cent of all the crude manufactured is exported in the shape of refined—that is, besides lubricating oils.

LIMITATION OF PRODUCTION IN 1887.

Q. Along a good many lines of industry it has been found necessary, where the competition was sharp, to export large quantities. Has this large export business, perhaps on the whole, enabled the Standard to keep prices higher than they could otherwise? Has there been any special attempt to limit production here in order to keep prices up?—A. There was at one time a movement to limit the amount of crude produced; that was in 1887. They reduced it about 17,500 barrels a day in that year. That is fully entered into in this book (referring to "The Derricks Handbook of Petroleum").

AMOUNT OF OIL EXPORTED.

Q. (By Representative Livingston.) I have been furnished with the statement of the statistics for last year, to the effect that about 52 per cent of all oils were exported.—A. I said 40 per cent of the amount manufactured from the crude oil is exported in the shape of refined. In addition to that 40 per cent, if whatever lubricating oil was sent abroad were added, it would probably make it about 50.

COMPETITION AND PRICES ABROAD—PENNSYLVANIA OIL, LIMA OIL, RUSSIAN OIL.

Q. Abroad, where the oil of the independent refineries goes, which is not of such grade as can be consumed in the States here, does it come into competition with oil sent there and sold by the Stand-

ard?—A. Yes; the Standard is doing a very large business in Germany. Germany is the largest oil market in the world. Although the population is about the same as France, it uses probably twenty times as much oil as does France. I think I am not far wrong in that.

Q. Does the sale of the oils from the independent refineries bear down the prices of the Standard Oil Company's product there?—A. No; they sell at very fair prices. Even for the last two years abroad the prices have not been excessive, and they are reasonable all round.

Q. You mean the Standard Oil Company's?—A. The Standard prices and the independent prices.

Q. What if you should withdraw or be forced out of the market?—A. We think their prices would be very much increased.

Q. (By Mr. Farquhar.) Is there any difference between the grade of standard oils sold by the Standard Oil Company generally in Germany and that of the independent companies?—A. We think we sell a very much better oil than they do, for the reason that we do not manufacture any but Pennsylvania oil, while they do manufacture and export some Lima oil that we believe is mixed with the other. I do not speak positively about that, for I do not know.

Q. (By Mr. Kennedy.) Do you meet much competition in Germany from the Russian oil fields?—

A. The Russian oil has not been largely used in Germany because it does not climb the wick as well as Pennsylvania oil or American oil, and the Germans have their own lamps and they do not change them readily. It has not been largely used, although the Standard has been pushing the introduction of Russian oil. It is said it has bought a large amount of Russian oil, and has been trying to push that in the German markets as against American oil.

THE STANDARD HAS NO APPRECIABLE ADVANTAGES IN PROCESSES.

Q. (By Mr. Jenks.) The Standard Oil Company has often claimed that it has a decided advantage by virtue of the patents it has succeeded in getting with a large number of establishments that have been purchased. In your judgment does it have much advantage along that line?—A. No; I think their process of manufacture is very similar to that employed by the independent refiners.

Q. (By Mr. Farquhar.) Suppose you add "formula" to patent in that question?—A. I do not believe they have much advantage in that regard, if any.

CUT PRICES FOR COAL—EFFECT UPON THE MINERS.

Q. (By Mr. Jenks.) Do they have any advantage in the matter of getting fuel cheaper?—A. Yes; I think that all the large consumers have an undue advantage in securing fuel. I think that has served to very much depress labor. In other words, when

they want an amount of coal they practically fix their price. They say, "We will take this coal if you will furnish it at a certain price; if you do not furnish it at that price we will not take it." As they use a large amount, the coal companies must furnish it, and in order to get even they cut the men. That is why the miners have been cut down from good prices to poor prices—by the demands of these large companies for coal and other raw material at too low a price. The operators must furnish it, and in order to furnish it they must cut their men.

The commission took a recess from 1 p. m. to 2 p. m.

EFFECT OF TRUSTS ON PRODUCERS OF RAW MATERIALS.

Q. (By Mr. Phillips.) The question is, How do trusts affect the producer?—A. The reason why I desire to state first why, in my opinion, the effect of trusts upon the consumer is to make him pay a higher price for the manufactured article is because in doing so it is their aim and object to get a complete monopoly of the business. When they have once gotten a complete monopoly of marketing a certain manufactured article, they have the producer of the raw material as absolutely in their power as they have the consumer. They can fix for him whatever price they please and compel him to take it, and the only thing they do consider is whether he will remain in the business and produce that raw material for them at a given price. They simply allow the producer of the raw material to get about cost out of it, or a very little margin, if any, of profit. Now, speaking of the Standard Oil trust, prior to the time when they virtually obtained a monopoly, the price of crude oil was very much higher than it has been at any time since.

PRICES OF CRUDE OIL, 1869 TO 1897.

In 1869 the price was as high as \$7 per barrel: in 1870, \$4.90; in 1871, \$4.75; in 1872, \$4.10—no, higher than that, \$4.55; in 1873,—now their power began to be felt, not as the Standard, but as the South Improvement Company—in 1873 the price declined; the highest price in 1873 was \$2.75 and the lowest was \$1.05. In 1874 the highest price was \$2.07½ and the lowest was \$0.82½. In 1875 the highest price was \$1.82½ and the lowest price was \$0.97½. In 1876 the highest price was \$4.23¾ and the lowest was \$1.98¾. In 1877 the highest price was \$3.69¾ and the lowest \$1.96¼. In 1878 the highest price was \$1.63¾ and the lowest \$0.95¾. In 1879 the highest price was \$1.28¾ and the lowest \$0.705¾. In 1880 the highest price was \$1.24¾ and the lowest \$0.86¾. In 1881 the highest price was \$1.01¼ and the lowest \$0.805¾. In 1882 the highest price was \$1.37 and the lowest \$0.615¾. In 1883 the highest price was \$1.24¾ and the lowest \$0.97¾. In 1884 the highest price was \$1.155¾ and the lowest \$0.75. In 1885 the highest price was \$1.125¾ and the lowest \$0.75¾. In 1886 the highest price was \$0.91¾ and the lowest \$0.66. In 1887 the highest price was \$0.90 and the lowest \$0.65¾. In 1888 the highest price was \$1 and the lowest \$0.82¼. In 1889 the

highest was \$1.12½ and the lowest \$0.86. In 1890 the highest price was \$1.07⅝ and the lowest \$0.72¼. In 1891 the highest price was \$0.81⅜ and the lowest \$0.61⅛. In 1892 the highest price was \$0.63½ and the lowest \$0.53. In 1893 the highest price was \$0.80 and the lowest \$0.54¾. In 1894 the highest price was \$0.95¾ and the lowest \$0.80⅝. In 1895 the highest price was \$2.60 and the lowest \$1.00⅝. In 1896 the highest price was \$1.50 and the lowest \$1.05. In 1897 the highest price was \$0.96 and the lowest \$0.65.

RELATIONS OF THE STANDARD TO THE PRODUCERS OF CRUDE OIL.

These are the quotations from the open market. In January, 1895, the Standard Oil Company quit paying the market price for oil, as it was bid upon the oil exchange, and simply hung out the price they would pay for what are known as credit balances, amounts standing to the credit of each individual producer upon their books. They would pay that price and no other.

Q (By Mr. North.) What effect did that have on the market?—A. It enabled them to fix absolutely the price of oil. Speculation, the general trade in oil, had no effect upon the prices. They controlled the price absolutely by determining what they would pay.

Q. (By Mr. Phillips.) Did this shut up buyers and the oil exchange?—A. Well, it almost entirely killed speculation, and drove brokers in oil into doing business in other lines. You will observe, from the figures I quote, that, prior to the time of the Standard Oil Company combination, competition largely controlled the industry. The prices of crude oil were very much higher than they have been since. Beginning with 1895, they averaged about \$1.05 a barrel. During the ten years prior to that the average of crude oil was below 80 cents. That was generally an unprofitable price. Men could not produce oil and get cost for it, and maintain the production.

Q. (By Representative Otjen.) Still some men could?—A. Yet the general industry could not do it at the price that prevailed for ten years prior to 1895. So I say the effect of the trust upon the producer of the raw material has been to compel him to take an unremunerative price for the oil product. You might ask why he did not sell his product elsewhere. The pipe line runs to the well, the oil is taken into the pipe line, and as they had absolute control in the refining business, or almost so, they were able to fix the price at which they would take that oil. There were no outside purchasers of that oil; if they produced it there was no other place to put it.

Q. The pipe led to the lines connected with the refineries of the Standard Oil Company?—A. Yes.

Q. (By Representative Livingston.) You had no other connection?—A. There were no other connections. There were some few independent refineries; but they bought all their crude from the Standard

Oil Company and paid them 20 cents, local pipage rate.

OVERPRODUCTION DID NOT DEPRESS THE PRICE OF CRUDE OIL.

Q. Prior to 1895, for ten years, you say the oil averaged about 80 cents.—A. Less than 80 cents.

Q. Since that about \$1.05.—A. Yes.

Q. What had the overproduction and underconsumption to do with those prices during that period? A. I think, nothing. There was a time when there was an overproduction. In 1881 the Bradford field, was opened. The production in McKean county, known as the Bradford field, averaged very close to 81,000 barrels a day during 1881. That created a heavy stock of oil, until, in August, 1884, there were 39,000,000 barrels of oil in stock.

Q. That must have depressed the price.—A. The price of oil was higher in 1884, as you will see by the tables, than it was subsequently, when the stock was reduced one-half and the production was smaller. Take the year 1884 and compare it with 1897.

Q. In 1880 it was \$1.24 and 1884 it was \$1.12 or \$1.15; there was a decrease between 1880 and 1884 of ten cents a barrel?—A. The average was higher in 1884 than in 1880, as given by months in this table. Then take 1887; the production was not as great in 1887 as it was in 1884.

Q. And yet the price was lower?—A. The average price in 1887 was about 66 cents a barrel. The stock was then 31,000,000; it had been 39,000,000 in 1884. The production was, I think, about the same in 1887 as in 1884; I can tell in a moment by looking.

RESTRICTION OF PRODUCTION IN 1887.

Q. (By Mr. Jenks.) Was there not an effort made to restrict production at about that time?—A. There was an effort made, and it succeeded. By arrangement with the Standard Oil Company, in 1887, the producers purchased from the Standard 6,000,000 barrels of oil at a fixed price of 62 cents, and shut in their production to the extent of 17,500 barrels a day.

Q. (By Mr. Phillips.) Reducing that much?—A. Reducing that much.

THE CONDITIONS THAT MADE HIGH PRICES OF 1870.

Q. I would like to bring your attention to the price of 1870, \$4.90 a barrel; in 1890 you got \$1.07 highest and 72 lowest. What was it that enabled the producers of that oil to live at \$1.07, when in 1870 they got \$4.90?—A. In 1870 the producers made a great deal of money. They had a good market. Buyers came into the field to seek the producer, and to buy the oil directly from him and pay him. Some days it would go up half a dollar a barrel when there was competition for it. Many people were getting it for independent refineries. They would go right to Oil Creek to meet the pro-

ducers, and say: "How much petroleum have you—a thousand barrels? I will give you \$4 for it;" and make a contract right on the spot. Open competition for the oil made the price.

THE COST OF DRILLING WELLS HAS DIMINISHED, BUT NOT THE COST OF TRANSPORTATION.

Q. Has the cost of production been very greatly lessened since that?—A. Yes; they are drilling wells at very much less cost than in 1870.

Q. The pipe system reduces the cost of transportation? A. No; transportation has not lessened.

Q. I mean from the line out?—A. The line runs to the well. The price of local transportation has never been changed since the Standard Oil Company introduced their lines. When they laid their first lines 2-inch pipe was worth about 35 cents per foot; last year it was worth 6 cents per foot. They charged 20 cents then, and they charge 20 cents now; there has never been any decrease in the cost to the producer, or to any one who desires to have oil transported by local pipe lines.

Q. What is the surplus in barrels at present?—A. The surplus stock of oil is a little over 11,000,000 barrels in Pennsylvania oil and about 14,000,000 barrels in Lima oil. A year ago Lima had more than 22,000,000 barrels surplus. Pennsylvania has increased its surplus about a million barrels the last year.

Q. The market is not glutted with that oil?—A. No; the stock is not more than should be carried for safety.

CRUDE OIL HAS BEEN PRODUCED AT A LOSS, ON THE WHOLE.

I want to say one thing in regard to the producers. I have been intimately acquainted with them since I was a boy; I have lived among them; they have been my clients; I have been familiar with their business. I have never known a more energetic, able, and determined lot of men than the producers of petroleum, and yet, as a body, they have not grown rich, but rather poor. There were individual instances of producers becoming wealthy—many of them—but they were engaged in speculative business, in which there are always chances of certain persons becoming rich. I believe the great body of producers have put money in rather than taken it out.

THE TOTAL PRODUCT IN 1879, 1890, 1891.

Q. What was the total product of the oil wells in 1870 and the total product in 1890?—A. The production of Pennsylvania oil in 1890 was about 35,000,000 barrels; I think the production in 1870 was not over 5,000,000 barrels. That is from recollection. I am a little way from the exact fact, but not far. I think the production was about 90,000 barrels a day in 1890. In 1891 it ran up above 100,000

barrels a day by the discovery of the McDonald field, which was very prolific.

CAUSES OF CHANGES OF PRICE OF CRUDE OIL.

Q. I want to get a basis for an opinion as to what produced this rapid decline of prices from 1870 to 1890; that is the reason I asked this question.—A. That was entirely arbitrary; there was nothing to reduce prices so destructively as that.

Q. Did the consumption increase as fast as production?—A. I think consumption kept pace with production.

Q. Is there any way of showing that?—A. The export tables will show that it is true as to export oil, and I think it is certainly true as to home consumption.

Q. (By Mr. Farquhar.) How do you account for the abnormal prices of 1876 and 1877?—A. There was an open competitive market, and the Standard Oil Company was not really a factor in it yet. Those prices were the effect of speculation in the open exchanges.

Q. You mean to say those prices were entirely speculative prices, and not product prices?—A. People bought oil for manufacture as well.

Q. (By Mr. Phillips.) Had not the discovery of fourth-sand oil under the third-sand deposit something to do with lowering the prices very materially about 1873? Were the very high prices of 1876 and 1877 the result of a reaction of the very low prices that preceded?—A. I think the discovery of the Butler field, which was a very prolific field of oil, had something to do with the lowering of the prices in 1873, 1874 and 1875. Then there was a reaction. Oil went as low as 46 cents in 1873 or 1874.

Q. I have known it to be sold as low as 40 cents. A. Yes; since.

A MANUFACTURING COMBINATION CAN DEPRESS THE PRICE OF RAW MATERIAL.

Q. You said a moment ago in your opening remarks that the refineries controlled the producers of raw material; is that not true with all refining and manufacturing? Take flax, take cotton, take hemp, anything you please; does not the manufacturer, in the last analysis, control the price of the raw product just as these refineries control the price of crude oil?—A. But if there are a great many persons in the manufacture, there is competition between them, and that affects prices.

Q. Provided there is no combination there?—A. Yes; but where there is a combination the price is fixed arbitrarily. The combination simply fixes the price and the producers must take it.

REFINING BY PRODUCERS—OWNERSHIP OF WELLS.

Q. If these producers should refine their own oil, what would be the result?—A. Then they would have to meet the Standard Oil Company in the refining markets.

Q. Would the Standard Oil Company have to go out of existence if the producers should refine their own oil?—A. If they refined it all, certainly; but the Standard people are producers.

Q. (By Mr. North.) To a considerable extent?—A. About 23 to 25 per cent, I should say, of the entire production.

Q. (By Representative Livingston.) Will you please tell us how many independent wells there are? A. I think there are from fifty to sixty thousand wells in existence. Over one-half the production is owned by men who own less than 10 barrels a day apiece, so you can see the extent of the independent production.

Q. There is no way for those independent producers to refine oil, is there?—A. They are attempting to do it in the companies I represent. They are attempting to transport it, and their independent refineries are attempting to refine it. The stock of the Producers Oil Company, Limited, and the Producers' and Refiners' Oil Company, Limited, is owned chiefly by producers.

Q. (By Mr. Kennedy.) It seems to me this independent question is becoming a little bit mixed. When you say "independent producers of oil," do you include these individual companies?—A. I include all companies that are not under the control of the Standard Oil Company.

Q. Then you say the Standard Oil Company produces only about 25 per cent of the oil that is produced?—A. Twenty-three to twenty-five per cent.

Q. That is, these independent producers produce 50 per cent of the oil?—A. Probably 75.

THE EXPORT TRADE—CONDITIONS AND EFFECT.

Q. (By Mr. Farquhar.) In what form were your first exports to Europe? Was it refined petroleum or crude?—A. Both refined and crude were exported.

Q. In what year was oil exported first?—A. I think oil was exported to Europe as early as 1870; probably before that.

Q. What effect does the export trade in oil have on the market?—A. It gives a market for just the kind of oil they use, and to that extent widens the market.

Q. (By Mr. North.) You get a drawback on tin plate?—A. We have never transported any oil in cases.

Q. Does the Standard Oil Company transport any oil in cases?—A. To some extent, but I think largely supplying their Eastern market from Russia and making tin cans—

Q. Drawback has at one time been a large source of revenue to them?—A. It has enabled them to manufacture their cans here, getting a drawback on the tin they used in the manufacture.

Q. (By Mr. Farquhar.) Has not this export trade equalized the profits between the producers in this country and the sales in their home market and Europe more than ever in the prices there?—A. It has helped to do it.

Q. Suppose you were in a measure restricted to

prices that you would call not living prices, would you not have the export market in Europe with equal prices there, as you say? You could live if you had to sell 60 per cent of your product at a loss and made a small profit on the other 40 per cent?—A. It would not take long to waste our capital at that.

Q. So you say you must hold a place in the home market as well as the European?—A. I think that the foreign markets do help the independent interests to maintain their foothold, and the Standard seems to have a greater facility in crowding out independents in America than there.

Q. Does this foreign market tend to maintain the domestic price?—A. I think it does.

Q. This foreign consumption seems to be enlarging all the time; does that not go against the idea of a monopoly on the part of the company which produces only 25 per cent of the whole crude product of America?—A. They produce only 25 per cent, but they virtually control 50 per cent more, because they fix the price on that additional 50 per cent. Therefore I do not think the foreign market does minimize the effect of the Standard Oil Company monopoly.

WHY THE PRODUCTION IS KEPT UP, THOUGH MOST PRODUCERS LOSE.

Q. You wish to say that the producers of this country do not receive a fair price for their product? A. They certainly have not. I do not think that the counties which have produced oil are as well off as they would have been if they had never produced a barrel of oil; yet about 800,000,000 barrels of oil have been taken out of those counties.

Q. (By Mr. Kennedy.) At an average cost of what?—A. I think the average cost of taking it out has been about \$1; and for ten years, when production was great they got very much less than that.

Q. (By Mr. Phillips.) Perhaps you might explain to the commission why the production could keep up under these circumstances. A. It is a speculative business. One man would come in and drill a well, get a thousand-barrel well and grow rich. The hope of that sort of thing led men to put a great deal of money into drilling these wells. They all hoped to get large wells; they did not find them. More money has been put into the business in ten years than has been taken out of it. Still people make money, though prices are low. There are wells that run as high as 15,000 barrels a day. Of course a man who has a well of that kind will make a large amount of money.

CAUSES OF CERTAIN FLUCTUATIONS OF PRICE.

Mr Jenks. I want to see if you have made clear the causes for three or four of the most important fluctuations. I understood you to say that the South Improvement Company was formed in 1872, and that within the two years there was a great fall in price. What influence did the South Improve-

ment Company have in the way of forcing these prices down, if any?—A. I think it had the effect of forcing prices down, because they had combined with the railroads and controlled transportation to a very great extent, and the producers became frightened. Eighteen hundred and seventy-three was the panic year. You will remember the panic had some effect on prices. At that time, also, there was a new discovery, in Butler county. That promised to be a very prolific field; and it proved to be.

Q. Those two factors worked together?—A. Yes.

Q. Then in 1876 and 1877 there was a decided increase in price. You state that was partly due to speculation and partly to the fact that the Butler oil field had been largely worked out and the Bradford field had not yet been opened.

Q. There was in the year 1883 quite a decided rise, yet it was limited. I think the highest price was—

Q. It was not so high as it had been before?—A. \$1.24¾ per barrel.

Q. What time was that in the year?—A. I don't recollect just now. It was the average for the year. That was largely due to the giving out of the field known as the Cherry Grove field, which was opened in June, 1882. The wells were very large, but they did not last a great while. In the fall of 1882 they commenced to decline, and because of that decline the prices went up.

Q. (By Mr. Phillips.) Did not the Bradford field decline at that time very materially?—A. A great many people thought the Bradford field was giving out. I think that was owing to the decline of the Cherry Grove field and also the decline of the Bradford field.

Q. In the years 1888, 1889 and 1890, did that increase come largely from the limitation of the production of the Standard Oil Company?—A. My recollection is that the stock of oil was reduced from 31,000,000 barrels in August, 1887, to about nine or ten millions in 1889. That, of course, would account for that rise, although it ought to have been much greater.

Q. There is another decided increase in 1895.—A. In 1893 the price was decidedly low. The McDonald field ran as high in 1891 as 81,000 barrels a day, and at one time 91,000. That caused quite a reduction in price; that was a natural reduction.

Q. In 1894 the prices were \$0.95¼ highest, and \$0.80⅝ lowest; in 1895 it went up to \$2.60. That was a tremendous rise.—A. That was entirely arbitrary. The Standard advanced the price 25 cents per day for a period of about seven days, running the market from \$1.12 to \$2.60 per barrel.

Q. (By Mr. Farquhar.) Was that helpful to producers?—A. It helped the producers that had oil on hand to sell.

Q. Still, in the succeeding year, it only went down to \$1.50, so that was but a year's holdings of oil.—A. It went lower than that, I think—to \$1.05 at the lowest.

THE COST OF PRODUCTION OF CRUDE OIL.

Q. (By Mr. North.) Are we to infer from your testimony that the Standard Oil Company arbitrarily fixed the price of crude oil at a figure which it knew to be below the cost of production?—A. Yes; that is undoubtedly true, for in 1887 the price was maintained at 65 cents for months. Everybody knows it can not be produced for that. That is away below cost of production.

Q. (By Mr. Phillips.) As a whole?—A. As a whole, I mean, it can not be produced for that.

Q. (By Mr. North.) Will you state your judgment as to the cost of production at the present time?—A. It would, of course, be only an opinion. I think it can be produced now, and the amount of production maintained, at from \$1 to \$1.20 per barrel; but without much profit.

Q. The cost would vary according to local conditions?—A. Yes.

Q. (By Representative Otjen.) And the flow of the well?—Yes. Over one-half of the wells now being operated produce less than half a barrel of oil per day; over 25,000 wells produce less than half a barrel a day, wells actually working every day.

Q. (By Mr. North.) Are not all those wells producing at a loss?—A. In some places, where they couple them up, one man will operate probably 30 or 40 wells; then there is some profit at the present price of oil, but very little. In some cases they operate them at a loss. I have asked some of them why they continue to do that, and they said, with the hope that prices will advance so that these wells will become profitable.

Q. (By Mr. Jenks.) These prices that you give are prices at the wells?—A. At the wells.

THE COST OF PIPING.

Q. Piping is still 20 cents?—A. Yes; local piping.

Q. Could you give any estimate as to what the cost of piping is now?—A. I think the cost of pipeage would be between 7 and 8 cents a barrel.

THE SHUT-IN MOVEMENT OF 1887.

Q. (By Mr. Phillips.) Senator Lee has referred several times to what was called the "shut-in" movement in oil, or limiting the production. It might be interesting and profitable if he would state what led up to that "shut-in" movement, and what action, if any, was taken in regard to the labor employed throughout the fields?—A. The price of the oil was below the cost of production during the year 1887. The average price that year was about 66 cents a barrel. The Standard Oil Company said that they wanted to treat the producers fairly, but that they had an excessive stock of oil on hand—31,000,000 barrels—deteriorating in value, and that if we wanted to have a better price production must be decreased, so that they could use up that stock of oil, and take it off the market, and save loss by wastage. A number of the leading producers met a

number of the Standard people at Niagara Falls and, after discussing the subject, the producers agreed to limit their production, in order that the Standard might dispose of that excessive stock of oil. I met with them, and I remember the contract by which the producers purchased from the Standard Oil Company 6,000,000 barrels of oil, to compensate them for limiting the production, and also to compensate the labor they employed; because it would cut off the revenue of the men who were in the industry. Mr. Phillips, who was in that movement, insisted that we should set aside 2,000,000 barrels of oil to compensate the laboring men who were in the industry, and who would be thrown out of employment by cutting off the drilling of wells.

Q. The executive board of the Producers' Protective Association?—A. Yes; it was the executive board of the Producers' Protective Association that took that action, and the reason for doing so is well expressed in the preamble of this contract. I will read that. It is on page 69 of that same book—Committee on Manufacturers, 1888.

"Whereas there has accumulated, in past years, an excessive stock of crude petroleum, which is deteriorating in quality, and a portion of which each year becomes sediment, valueless for any purpose, and the carrying of which excessive stock requires the expenditure of vast sums annually; and whereas in consequence of the existence of said stock the price of crude petroleum has for the past year been largely below the cost at which the same was produced; now, in order, as far as possible, to preserve the said stock from further waste and to conserve the public interest and our own, this agreement witnesseth: * * * "

Then the producers agreed to reduce their production 17,500 barrels per day, and purchase 6,000,000 barrels of oil from the Standard Oil Company at 62 cents. They were to give the profit of 2,000,000 barrels of it to the well drillers and pumpers who would be thrown out of employment, and to keep the profit on 4,000,000 barrels. That oil was sold separately; and the laboring men actually realized about \$50,000 more profit for their share than the producers did out of the 4,000,000 barrels.

Q. How was the money distributed?—A. That was distributed through their organization, the Well Drillers Union. They were allowed \$1 a day for the time they were unemployed by reason of this movement.

Q. (By Mr. Jenks.) The Standard Oil Company was itself in this movement?—A. The Standard Oil Company put up a million barrels and the independent producers put up a million barrels for the laborers.

Q. (By Mr. Phillips.) Have you anything else to say in regard to production?—A. No; I have not. I believe that if there had been fifty concerns engaged in the manufacture of petroleum, just as wide markets would have been obtained, and that while the consumer would not have paid any more for his oil, the producers would have realized a much better price and would have had a handsome profit. As it is, I think they have not made any profit.

Q. (By Representative Livingston.) Where is the balance of that money now?—A. I think the Standard Oil Company could explain that. I think they have realized in the neighborhood of five hundred millions in profits or more.

THE PIPE LINE COMPANIES—CUSTOMS OF THE BUSINESS.

Q. (By Mr. Jenks.) Will you explain to us briefly the system of pipe line service and the use that the producers can make of the pipe lines? Tell us how they give a ready market.—A. The oil is gauged by gaugers, who run it into the line for the oil company and give the producer a ticket showing the amount of oil that is run in that day. That is telegraphed to the pipe line office, and they keep books showing the amount of oil due each producer. Any day a man can call at the pipe line office and sell whatever amount of oil stands on the books to his credit at the price that the pipe line company fixes. If he desires, when he gets a thousand barrels, he can take out a certificate. That is, a certificate saying that he is entitled to 1,000 barrels of crude oil from such and such a line.

Q. (By Mr. North.) That certificate is negotiable?—A. Yes. It can be sold on the open market.

Q. (By Mr. Jenks.) Then it practically amounts to this, that any producer can every day receive cash for what he has put in?—A. Yes; that is it; and it is true of all pipe lines. They must buy whatever is offered to them; not by law, but as a custom of the business.

LIMITED ACTIVITY OF THE INDEPENDENTS IN FOREIGN MARKETS.

Q. (By Mr. Kennedy.) Have the independent companies followed the Standard into the Eastern markets,—A. Only in a limited way. The independents have not sold oil to any extent in India or China or South America or Africa.

Q. The Standard Oil Company has worked up the markets in all those countries, has it not?—A. They do sell oil in all those countries, yes. That is so far away from home that with our limited amount of oil it would be unsafe to enter into competition with them there.

OIL EXCHANGES—NEW YORK AND OIL CITY.

Q. (By Mr. Farquhar.) Do you care to say anything about the New York Oil Exchange?—A. I think not. When the exchanges were in existence and doing business, the Oil City Exchange always fixed the prices.

EFFECT OF THE STANDARD'S ENTERING THE PRODUCING FIELD.

Q. (By Mr. Phillips.) What effect, if any, upon the production of oil, has been produced by the Standard's having entered the producing field in recent years?—A. On production?

Q. On producers or production?—A. I think it has tended to reduce the price of crude. They are very able competitors, and they could go into very deep fields to drill by means of their money, and could drill very deep wells and help keep the production high.

Q. Have they or have they not monopolized a large amount of the prospective oil territory under lease?—A. They have leased it in very large blocks in West Virginia, paying an annual rental and holding it for future development.

Q. Has that in any material way prevented producers from obtaining leases.—A. Undoubtedly, to whatever extent they secured the territory and kept others from coming into it; and with their large means they have been able to secure and hold very extensive blocks of territory.

THE STANDARD PAYS GOOD WAGES, BUT NO BETTER THAN THE INDEPENDENTS PAY.

Q. (By Mr. North.) Are you familiar with the course of wages among the workmen in the main?—A. Yes.

Q. Will you tell the commission how their wages compare today with those prior to the organization of the Standard Oil Company?—A. I do not think wages are as high as they were before the Standard Oil Company began business, but I do not think it is owing to that fact. It was a new industry, and in a new industry of that kind wages are always high. They have paid, and do pay, very good wages.

Q. The Standard Oil Company?—A. Yes; but not any better than the independent producers pay; in some cases not so good. But they—I want to do justice to them in that regard—I think they do pay good wages.

Q. (By Mr. Ratchford.) The claim has been made by the Standard Oil Company that they pay the highest rate of wages to all branches of labor employed, including pipe line men, traveling salesmen, etc. Is this claim, in your judgment, correct, or otherwise?—A. I think they pay a certain class of men in their employ very high wages. To men that are looking after departments of their business I believe they pay very high salaries. To ordinary labor I think they pay just what the independent producers pay, and others engaged in the same industry.

Q. Traveling salesmen?—A. I have no knowledge on that subject.

THE STANDARD OIL COMPANY MANUFACTURES 90 PER CENT OF THE OIL.

Q. (By Mr. A. L. Harris.) Can you furnish this commission with a list of the independent refineries now doing business?—A. Yes.

Q. With the amount of output substantially?—A. Substantially.

Q. You have not that amount?—A. No.

Q. Can you furnish the commission with the list

of refineries now operating either by or with the Standard Oil Company?—A. No; I could not do that.

Q. What changes have been made since April, 1888, as defined on page 350 of the book from which you have quoted?—A. You mean what refineries have gone over to the Standard?

Q. Yes.—A. I think they control 90 per cent. They manufacture 90 per cent of all the crude oil manufactured in the United States. If they do that, there is only 10 per cent left for others; and controlling 90 per cent, they can absolutely control the price. They are able to sell at a loss until they have driven their competitors out of the business; they have done that repeatedly.

A COMBINE IS HARDER TO DEAL WITH THAN AN INDIVIDUAL.

Q. (By Mr. Livingston.) Suppose there was no Standard Oil Company. Suppose that I, as an individual, manufactured 90 per cent of all the crude oil produced in the United States. Would not I, as an individual, just as emphatically control the price as the Standard now does,—A. Yes; undoubtedly.

Q. The trouble is not so much that the Standard Oil Company are a combine, but rather that they manufacture the crude oil. Does not the simple fact that they manufacture 90 per cent, whether they are in a combine or out of a combine, give them the absolute power to fix the price?—A. Yes; but I think that I would rather compete against an individual owning 90 per cent than against a trust owning 90 per cent, for the reason that when the trust does anything wrong there is always some other wicked person that does it, and not the person who is caught. If you were doing it you would have to be responsible individually for whatever was done. But in a large combination of that kind you never can reach the person that does the wicked thing—it is always somebody else.

THE STANDARD OIL COMPANY A MONOPOLY IN RESTRAINT OF TRADE.

Q. (By Mr. North.) Do you regard the production of 90 per cent of refined oil as constituting a practical monopoly of that business?—A. Certainly.

Q. Then you think the Standard Oil Company is a monopoly in restraint of trade?—A. I do, undoubtedly.

Q. And that it exists in defiance of the laws of the United States?—A. Yes.

PRICES PAID BY THE STANDARD OIL COMPANY AND THE INDEPENDENTS.

Q. (By Mr. A. L. Harris.) You stated that after 1895 the Standard Oil Company ran down their price. I desire now to know whether the independent companies made any effort to increase the price fixed by the Standard Oil Company?—A. The

companies with which I am connected have at times paid from 1 cent to 9 cents a barrel more than the Standard Oil Company was paying; at times they have paid the same price. They have never paid less, except that once by accident, for half a day, we paid half a cent less, I think.

Q. Did that have any effect on the price offered by the Standard Oil Company?—A. I question it. We had a better price; I do not know what brought it about.

Q. If it made no impression on the price they offered, it is very good evidence that they control the price of crude oil?—A. They would hold their price at a fixed point, no matter what we paid.

RAILROAD DISCRIMINATIONS.

Q. (By Mr. Farquhar.) You said that the Standard Oil Company had been able to secure discriminating rates from railroads for the transportation of their products. Can you state to the commission any cases in which it has been proved in open court, or before the Inter-State Commerce Commission, that they did receive discriminating rates from railroads?—A. Yes; in the case of a bill in equity filed in the supreme court of Pennsylvania, on page 191 of the report of the Committee on Manufactures, 1888, you will find the testimony of Mr. Cassatt, that they had received 80 cents a barrel from the Pennsylvania Railroad.

Q. Was this a sporadic case, or was it general?—A. It continued until the Standard wiped out all the refiners between Titusville and Pittsburg at that time.

Q. At that time?—A. Yes.

Q. How long did that last?—A. It lasted probably a year.

Q. Would you say now that they still receive a discriminating rate from the roads?—A. That I have no proof of; but I was attorney in a case brought against the Pennsylvania Railroad by Logan, Emery and Weaver, when the general freight agent of the road said there had been no discrimination, the president of the road said the same, and a number of their chief officers; but when we subpoenaed their auditors, they came and testified that there had been discriminations. Those discriminations ran from 3 cents a barrel up to 28 cents a barrel. The amount of them in one year, as against Logan, Emery and Walker, was something over \$24,000. They were testified to by both auditors, and the auditors' statements were brought in showing the exact amount.

Q. (By Mr. Jenks.) When was this?—A. My recollection is that the suit was tried in 1889 or 1890. They compromised the suit and paid \$30,000 for these discriminations.

Q. (By Mr. Farquhar.) Do you independent companies own tank cars?—A. Yes; the independent refiners own tank cars. The Producers' Oil Company, Limited, own 48.

Q. Has there been any discrimination on the part of railroads in hauling these cars?—A. Yes.

Q. As between the independents and the Standard?—A. Yes.

Q. State as explicitly as you can where it has occurred and when.—A. It has occurred on nearly all the roads, and those questions are in litigation. The Inter-State Commerce Commission assessed against the Pennsylvania and other roads a sum equal to \$86,000. Suits brought by the independent refiners against the railroads, for the recovery of that money, are now pending in the circuit court at Pittsburg.

Q. You spoke some time ago about the rebate. Will you state the average price of oil when the 80-cent rebate was given?—A. It fluctuated, of course; but it was from \$1.50 to \$2.50 a barrel.

Q. (By Mr. A. L. Harris.) What was the character of the rebates at the time you speak of in the Pennsylvania oil district? What I mean is this: What was the amount of the rebate, and whom did that rebate go to in that district?—A. That rebate was in the shape of checks, I suppose, or cash, and it has been estimated to have amounted to ten millions of dollars. It went to the Standard Oil Company chiefly, I suppose. I do not know how it was divided.

Q. (By Mr. Phillips.) Is it or is it not in the testimony of Mr. Cassatt—was it not given, and the length of time, with the receipts of amounts?—A. It is in testimony on pages 242 and 243 of the work on trusts.

Q. Can you give the commission the exact amount in dollars?—A. It is estimated to be, from October 17, 1877, to March 31, 1879, \$10,155,218.

Q. For how many months?—A. From October 17, 1877, to March 31, 1879; a year and five months.

Q. (By Mr. A. L. Harris.) Was it paid to the railroad and then paid back to the Standard Oil Company?—A. The independent shipper would ship his oil and pay the open rate—we will say, \$1.80; and 80 cents of this freight that he paid was handed over to the Standard Oil Company. They got the rebate not only on the oil they shipped, but on the oil he shipped. No one could stand that. I do not say that 80 cents is the amount, but they did that in some instances.

Q. (By Mr. Jenks.) Governor Harris has asked you if you could furnish a list of the refiners that are in your company. Would you be willing to add to the list of those establishments also the capital stock of each one and the market value of it before it came in? Do you think you could get it?—A. Yes.

Q. I presume it may be a matter of record—and the capital in case any firms came in that were not corporations. Were any of them bonded?—A. I think they were principally out of debt.

Q. So that there would be no bonds to put into a list of that kind. Did any of them have preferred stock as well as common stock?—A. I think not; not any of the refining companies.

Q. Would you be willing to give the details in reference to their stock?—A. I think they would be entirely willing to submit them to the commission.

Q. You will be kind enough to add that to the list?—A. Yes.

Q. You said this morning that you knew of a number of refineries that had been purchased by the Standard and dismantled,—A. Yes.

Q. Can you give us a list of those?

REASONS FOR DISMANTLING REFINERIES.

Q. (By Mr. Farquhar.) What are the usual reasons for dismantling a plant? A. Those plants were under contract with the Producers and Refiners' Oil Company, Limited to take oil from them. I can conceive two reasons for dismantling them: First, to prevent them from being in the trade as competitors; second, to injure the Producers and Refiners' Oil Company, Limited. The Standard declined to sell any of the material to the other independent refineries. They paid large prices for them and wasted the material; at least, they dismantled them, and refused to sell them to other independent refineries.

Q. When the commission hears representatives of the Standard Oil Company, that question of the commercial and legitimate reasons for dismantling may come before us. I should like your position on it. A. I think it was done to take them out of competition, and to injure the only competitor that was in that field. I know of no other reason. They were good plants, well located. There would certainly be no reason for paying a high price for a plant and merely tearing it down, unless there was some design of that kind.

ONLY A MODERATE RISE OF PRICE WHEN PRODUCTION OF CRUDE OIL WAS LIMITED.

Q. (By Mr. Livingston.) Seventy-five per cent of this oil is produced by the independent oil companies outside of the Standard Oil Company. If they could by consent and agreement reduce the production one-half, what effect would that have on the independent companies? Would it largely increase the price of crude oil? A. They did enter into an agreement to reduce the production 17,500 barrels a day, and it did not largely increase the price of crude, though it reduced the stock from 31,000,000 to 9,000,000.

Q. It did not? A. It did not; it increased it to some extent, but not to the anticipated extent.

DISADVANTAGES TO EMPLOYEES OF HAVING ONLY ONE POSSIBLE EMPLOYER.

Q. (By Mr. Phillips.) Have you any further remarks to make or information to give in regard to the effect on labor?

Q. (By Representative Livingston.) Do you mean to say that it is lessening the price of labor? Is that the idea? A. I am not speaking so much of what has been done by trusts, but my opinion is this: That when all the people that are skilled in any branch of industry come to be employed by a

single concern, and there is nowhere else to go to seek that kind of employment, they are largely under the control of that one institution, both as to their wages and as to everything else, and that such a condition is hurtful to labor, because there is no competition then for labor in that given line. Suppose all the men that are skilled in refining, for instance, are employed by one institution, and a man is discharged by that institution for some fanciful reason; there is nowhere for him to go to get employment. Now, I think that is a positive injury to labor. If fifty concerns were in the business, when a man ceased for any reason to be employed by one, he could go to another. If there is only the one employer, that man is driven out of that industry altogether, and must seek something new. He can not be as profitable either to himself or to the public in any new capacity as he would be in a capacity in which he is highly skilled. Maybe he has attained such an age that he can not go into any new business; then that man's labor is lost to the world. I know of instances where a trust has discharged a man because he had had some difficulty with, we will say, the general manager of a particular plant, and the manager immediately reported that man to all the other institutions and said, "This man is not to receive employment." For a year—in the case I have in mind; I do not care to give names—he was out of employment and could not get it. That was his business; he knew it; he had been in the business for ten years; and he could not get employment in any other institution connected with that trust. Now, I think that all those questions come in; and that the trust is always hurtful to labor because, just as it controls the price of the crude product, it will absolutely control the labor in that given industry. Suppose you have a trust with regard to all industries; then there is no place for a man to go. If he is thrown out of employment, where will he go to get work? Every man ought to be able in this country, rich as it is, to have a chance for employment. So I think that in that way it affects labor. There is another way. Under these conditions men are made subservient; their manhood is to some extent destroyed. They are not the same independent class of Americans that they would be if they felt that, if they were discharged by this employer, they could go to some other and get employment. It belittles men and injures them in every way. Therefore, I think the trusts are hurtful to labor.

LABOR ORGANIZATIONS—THE STANDARD OIL COMPANY AND ITS MEN.

Q. (By Mr. Kennedy.) Do you believe that combinations such as you have been talking about make the organization of labor more logical and necessary to the welfare of the working men? A. If they do not organize and keep organized I do not know what will become of them.

Q. (By Representative Otjen.) Are the men employed in the oil industry generally organized? A.

There is an organization known as the Producers' Protective Association, organized for the purpose of protection. They have not had any meetings in recent years because they have been devoting their time to the business part of the defense of their industry. They have not had any time to look after anything else.

Q. (By Mr. North.) Are the employes of the Standard Oil Company organized into a trade union? A. I do not know. I want to say for the employes of the Standard Oil Company that, as far as I know them, they are competent, polite and a good class of men. So far as the producers are concerned, they have no fault to find with the class of men they employ to do their business. They are really good men. They have to employ that class of men.

Q. (By Mr. Kennedy.) Is it a fact that the Standard Oil Company's employes are comparatively well paid and well treated, and are always loyal to the Standard Oil Company? A. I know nothing about the question of loyalty. We have never attempted to inquire into that, but I think they are reasonably well paid.

POWER OF TRUSTS OVER THEIR MEN—THEY HAVE PAID
FAIR WAGES THUS FAR.

Q. (By Mr. Ratchford.) It is claimed by a great many laboring men and labor organizations that a trust which controls a number of establishments, by reason of that large control of industry, is able to close down one or more of them in order to reduce wages or to lengthen the hours of labor or to bring about some undesirable condition for the working people and at the same time suffer no loss in their product, because they can transfer their business to some other establishment for the time being. What is your opinion on that phase of the question? I should think that would be true, for the reason that if they have a complete monopoly of the business, it does not make any difference what their output is. They can close half their establishments, and put out half the product, and double the price on it. They can put the price where they please; their is no power to control them anywhere.

Q. Have you any recollection of any instances in which that took place, or in which there is reason to believe that it was the cause of the trouble? A. No, I do not recollect any at present. Trusts have not been long in existence, except in a few instances. It was necessary for these trusts to have the good will of their employes; and they have paid them fairly good wages and have not been in trouble with their labor.

Q. It is claimed by the friends of trusts pretty generally that they treat their workmen better, pay them higher wages and grant more agreeable conditions generally than do individual employers or smaller companies. What is the truth about that? A. I think there is nothing in that.

Q. Generally speaking? A. Taking them all into consideration, I do not believe that is true.

STABILITY OF EMPLOYMENT.

Q. (By Mr. Farquhar.) Does a trust usually give more stable employment than individuals and smaller corporations? A. I think that the length of the period that they have been in existence has not been long enough to determine that question. A great many individuals and companies have had employes for ten to fifteen and twenty and thirty years. The trusts have not been in existence so long as that.

Q. Is it not usual among the employes of the Standard to say: "As long as you behave yourself and attend to your business you will stay?" Is not that always the inducement held out to foremen and others in the Standard to keep their men? A. Oh, they follow the business rule. When the exigencies of the business require it, they cut their employes without giving much reason for it. I do not know that they do that very thing; I do not charge them with that.

TRUSTS DISPLACE LABOR.

Q. (By Mr. C. J. Harris.) When they dismantle a factory, what becomes of the men that have worked there? A. They find some other employment if they can.

Q. (By Mr. Ratchford.) To what extent, if any, does the operation of the trust displace men—traveling salesmen, foremen, or superintendents; labor of any kind? A. I think it very largely displaces labor, but I do not know that it decreases the cost, because I think they add to the salaries of men that are in charge. They pay very high salaries to leading men. I think that the liberal payments, instead of being given to a number of men, are given to one or two, and they cut the laboring forces. I think it would do away with a great many traveling men, because the trust can fix their own price, and people must come and pay it.

Q. You seem to be pretty positive that labor is displaced in the operation of a trust? A. I have not a bit of doubt of it.

Q. (By Representative Livingston.) Has the Standard Oil Company done any reducing of the wages of their employes in years gone by? A. They did, during the depressed period, reduce wages.

Q. During what period? A. During the panic of 1893, and subsequent to that. Probably not more than others; I do not know about that.

THE INDEPENDENT REFINERIES ARE INDEPENDENT.

Q. (By Mr. Jenks.) Do the different companies of your organization work together in harmony? A. Yes.

Q. Have you been able in your organization, since you came together and are working in harmony, to dispense with the labor or services of many of your higher priced men, your traveling men, and so on? A. We never have employed any traveling men in this country. The refineries are all independent;

they are not at all connected with our companies. Each refinery is an entirely independent concern. They simply buy oil from us, and we buy oil from them, just as we would buy it from anybody else.

Q. (By Mr. Phillips.) Do they own stock in these pipe lines? A. They own stock in the various pipe lines, and also in the Pure Oil Company. While they own stock, they own their refineries independently. There are the Independent, the Penn, the Continental, the Germania, the Crystal, the America, the Emery Manufacturing Company, the Columbia, and the A. L. Confer; they all own their plants. Sometimes two or three persons own one. In the Independent Refining Company, I think, there are only three persons; in the Continental I think there are but two. There are several others owned by one or two persons, and they are all independent.

RELATIONS OF THE REFINERIES TO THE INDEPENDENT COMPANIES.

Q. (By Mr. C. J. Harris.) Your companies do not pretend to be a trust, do they? A. Oh, no; we are trying to keep away from trusts as far as we can.

Q. (By Representative Livingston.) If I understand, each of these independent companies owns stock in the general company? A. Yes; in the United States Pipe Line Company, and also in the Producers and Refiners Oil Company, Limited.

Q. And you view that pipe line as the agent of those other companies? A. No; as an independent company in which various persons own stock. The companies stand each on its own footing as to dividends.

Q. Who pays the incidental expenses of this independent pipe line? A. The company itself. It charges 15 cents for local pipage to the refiners. They have 15 cents' pipage to pay the expenses, and if anything is left, that is the profit.

Q. (By Mr. Phillips.) Was there or was there not a movement on foot to unite the various pipe line companies and the refineries? A. There have been suggestions of that kind. It has been thought that we should be stronger if we were united into one organization.

Q. (By Representative Livingston.) You charge 15 cents for piping, and out of that you pay all your current expenses? A. Yes.

Q. You have a monopoly on that; you are a kind of a trust, are you not? A. No; the Standard is competing with us in the fields we are in; they rob us of that feature, I should think. Ten per cent. could hardly be claimed to be a monopoly, and we are not 10 per cent. even; we are about five.

Q. (By Mr. Phillips.) If these various companies became united, should you be willing, as an officer in each one of the four, to submit to thorough inspection of the books and accounts, and the profits that such an organization might make? A. We should be very glad if the government would inspect us and everybody else; we should be glad to suffer an inspection in order to have some other people inspected.

SOME REFINERIES HAVE AGENTS—THE MOST OF THEIR OIL IS SOLD THROUGH MERCHANTS.

Q. (By Mr. Farquhar.) How do these independent companies put their burning and lubricating oils on the American market? A. Each refining company markets its own oil. They get orders, and some of them have stations. For instance, one company I know has a station at Rock Island, Ill., and one in Chicago; and through these stations it markets almost all its refined product.

Q. Have these independent companies permanent agencies for the sale of their oil? A. Some of them.

Q. Or do they drum for their custom? A. Some of them have permanent agents in certain places, shipping the oil to them and having facilities for storing it.

Q. Do you know whether the greater part of their product is put into the field through their own agents or through other oil houses in those cities? A. I presume that the greater part of their product that is marketed in the United States is sold through merchants or others who are in the business.

QUALITY OF THE PRODUCTS OF THE STANDARD OIL COMPANY AND THE INDEPENDENTS.

Q. That being the case, the Standard Oil Company and your independent companies come into open competition there for the market? A. Certainly.

Q. Do you know of any better qualification for the sale of oil, independent of monopoly, than the quality of the oil and the prices? A. The quality undoubtedly should affect the price.

Q. The Standard Oil Company, coming in with a better quality of oil and selling at an equal price with the other, would limit the field? A. If they made a better quality of oil.

Q. I say, presuming that they do; I made the question in that way. A. Well, but they do not.

Q. Is it not a fact that no company, whether a monopoly or not, can hold the American market unless it sells a better oil at an equal price? A. No; I should not say that would be true, absolutely.

RAILROAD FAVORITISM.

Q. You said this morning that some of the railroads have taken the buying of lubricating oil out of the hands of the purchasing agents, and that the oil is bought by one of the officers—the vice president or the president of the road. Is it not a fact that in the economy of the equipment of the railroad, if you ran a poor lubricating oil you would lose by it more than the little cent or two that you might save on the gallon? A. Undoubtedly.

Q. Would it not ultimately ruin the machinery and ruin the road? A. Yes.

Q. Without any favoritism question to speak of in the selling between these people? A. I would not say that.

Q. Do you not think that years ago, while favor-

itism did prevail in purchasing lubricating and burning oils on railroads and among large consumers, there was a favoritism and a large one, and that now the economy of railroads is such that even in their stationery and printing, where management used to be left with local agents and division superintendents, it is now concentrated in one head or function in the management of the road? Isn't it the same with the purchase of oil? A. No; I think oil is made an exception.

Q. You do? A. Yes.

Q. Can you deny that while temporarily the advantage might be given, for personal reasons, to the men who canvass, or to the company that offers to sell the oil, in the course of a year or two, the best product will stick—that is, at an equal price with any other? A. That would be true if they were looking solely to the interest of the road; but if they had some ulterior purpose in purchasing, it would not be true.

Q. I am discussing the purely business proposition. A. As a purely business proposition that would be true; and if a man was doing it for himself, it would be all right.

Q. So there is no monopoly that can be held in any product, in the United States or anywhere else, as long as you put the product or article on the market at an equal price? A. I do not think that is true.

Q. Why is it here, in textiles and things of that kind that this country produces, that the product is the finest? And will they not hold the market for years against all other producers? A. That may be true. It ought to be true always, but I am afraid it is not.

Q. (By Representative Livingston.) Do you sell your oil in States where they have an oil inspector? A. Yes.

Q. You have no trouble with the laws of Georgia? They have an inspector, and you sell your oils there without let or hindrance? A. Yes.

Q. Does the Standard? A. Yes.

Q. They are supposed to stand the same test. A. All have to. I think that with the general public they are on an equal footing. So they are to a large consumer that is purchasing for himself; but in the case of an officer of a railroad, there may be some reason why he wants—

Q. To shut out? A. To shut out competitors in favor of them.

Q. But that is a good business reason, isn't it? A. Not always, I am afraid.

Q. Usually? A. I do not think it is usually.

Q. Would you not try to gain the European market, to shut them out of it by putting down the prices in Europe? A. I think they could purchase just as good oil for one-half the price they are paying. If that is the case, your argument would not hold.

FREIGHT REBATES.

Q. In reaching the market—I use the State of Georgia as a mere illustration—in reaching the market in Georgia, what advantages are granted to the

Standard Oil Company over your companies? Any? A. Yes, we think so.

Q. In the way of rebates? A. We think so.

Q. Have you established that? A. It has been established in a number of cases; yes.

Q. Brought to your attention? A. In Georgia? No, sir.

Q. Well, I only used that as an illustration. Has it been brought to the attention of the Interstate Commerce Commission? A. Oh, yes; and they have assessed damages for that freight discrimination.

Q. They have collected it? A. It is in process of collection now; they are still fighting.

Q. (By Mr. Farquhar.) I think the commission would be much obliged if you would furnish it with the names of these cases that have come into court, where there was sworn evidence to sustain these allegations, where they occurred, the defense made, and whether cases are now in process of litigation. A. I will do that.

NONE OF THE PRINCIPAL RAILROADS BUYS LUBRICATING OIL FROM THE INDEPENDENTS.

Q. (By Mr. Phillips.) Do any of these independent refiners secure a market for lubricating oil on any of the principal railroads of the United States today, or could they if united? A. They do not now, and I doubt whether they could if united. It is a very doubtful question.

THE INDEPENDENTS REFUSE TO SELL OUT TO THE STANDARD OIL COMPANY—THE REASON.

Q. (By Mr. Kennedy.) Would you state as your belief, judging from the experience of the past, that the Standard Oil Company would, if it could, tomorrow purchase all these refining companies, paying for them more than their real value? A. I do not know whether they would do that now or not. They have offered to do it in the past. They made that offer in the fall of 1894 and in January, 1895.

Q. Do you believe that if such an offer should be made the independent companies would refuse it? A. I think they would. They have done it.

Q. So then the public must suppose that the independent companies have a good thing in the way of business? A. No, that doesn't follow. The people who are interested in these pipe lines have a very large interest at stake in their producing properties. They own about 75 per cent. of 80,000 barrels of oil a day; in other words, 600,000 barrels of oil a week. That amounts in a year to about 20,000,000 barrels of oil. We believe that the price of that oil is largely dependent upon having an open competitive market for refined oil. Their pipe lines will give them an open competitive market, and therefore they would not give them up. They had rather have them wiped out, if they must be. We were at a point where we expected them to be wiped out; but we were willing to suffer that rather than to sell them. We passed an act of the legislature that we could not sell them, and nobody could sell them,

but they got that repealed. The Standard had that repealed, and a little while afterwards it purchased the Crescent pipe line. That law, prohibiting independent pipe lines from consolidating, was passed in 1883, at the same time when the free pipe line law was passed. That continued to be the law until 1895, when the Standard Oil Company secured its repeal. They had got a bill passed to repeal it two years before, but the governor of Pennsylvania at that time vetoed the bill. They got the repeal bill through again in 1895, and the governor signed it. So that the independent people who secured the passage of this bill were like Cortez when he went to Mexico. They were willing to burn their ships, and either stay in Mexico and fight it out or fall.

THE INDEPENDENT ORGANIZATION INCLUDES THE OWNERS OF 40 OR 50 PER CENT OF CRUDE PETROLEUM.

Q. (By Mr. Jenks.) Did I understand you to say that about 75 per cent. of the producing capacity of the Pennsylvania oil field was in your organization? A. No; about 75 per cent. is owned by independent producers, not affiliated or associated in any way with the Standard Oil Company; some of them are not our stockholders.

Q. About what per cent of the oil producing fields do you have in your organization? A. I think possibly about 40 or 50 per cent.

Q. (By Mr. Phillips.) That is, stockholders? A. Yes.

Q. But the lines themselves do not own anything? A. No, the lines themselves do not.

IN THE LONG RUN, THE PRICE MUST BE HIGH ENOUGH TO PAY THE LEAST FORTUNATE PRODUCER WHOSE OIL IS NEEDED TO SUPPLY THE MARKET.

Q. (By Mr. Ratchford.) Speaking of the advantages of the larger concern, I want you to make a comparison as to the large and small producers. We will suppose, for instance, that A has oil wells producing 10 barrels per day, B produces 10,000 barrels per day; how can A compete with B in the open market? A. He cannot; but he ought to have an equal chance, for that very reason.

Q. The cost of developing a well is about the same whether it flows or whether it is dry? A. Yes.

Q. Is not the advantage of B over A as great as the Standard Oil Company over B? A. You are comparing the manufacturer with the producer.

Q. Admitting that A produces 10 barrels per day and B produces 10,000, are the advantages of B over A as great as the advantages of the Standard Oil Company over B, as the larger producer of the two? A. I do not see how you can make that comparison. You are comparing two entirely different things; you are comparing the manufacturer with the producer and one producer with another.

Q. The point I wish to bring out is simply this: Inasmuch as the cost of boring a well is the same, or nearly the same, whether it yields much or little, the individual who is fortunate enough to make a

good strike, with a few additional laborers to run it, can handle 10,000 barrels as cheaply as the man who is not so fortunate handles, perhaps, only 10 or 100 barrels; and because of his greater output he can, if he will, sell at a smaller margin of profit. A. He can; but the price is usually fixed by the man who has the smaller well, for this reason: If he does not get a price that returns him at least the cost of production, he must quit. The price may not be fixed, if it is fixed arbitrarily, at a price which enables him to live. But if it enables a man who produces 10 barrels a day to live, the man who produces 10,000 per day from a small number of wells is simply getting a fortune.

Q. I understand you to say the small producer fixes the price? A. No; but the price must be fixed so that he can produce, or the small well must be abandoned.

Q. Is that price fixed by mutual arrangement? A. No, it is fixed arbitrarily by the Standard Oil Company.

MOST OIL COMES FROM VERY SMALL WELLS.

Q. (By Mr. Phillips.) Is it or is it not an ascertained fact that the greater part of the production is coming from small wells and the greater number of small producers? A. Over a majority of that production is from wells that produce less than half a barrel a day.

THE REMEDYS FORBID DESTRUCTIVE COMPETITION.

Q. What is your idea as to the remedy? A. That is a very difficult question. I want to be understood as giving simply my own view of it. The most difficult thing is to find a remedy for the evil.

Q. (By Representative Livingston.) It is no trouble for a man to know he is sick. A. No; you can diagnose the case a great deal better than you can apply the remedy. I suppose the real evil ought to be reached. The real evil is not so much in the aggregation of capital. No one objects to a man being rich, if he acquires his money honestly. No one objects to his engaging in business. We object to his driving others out of business, and doing it by the use of unfair methods. No one objects to large aggregations of capital engaging in business, if they do it fairly and honestly, and are willing to enter into fair, honest competition. I would try, if possible, to prevent them from abusing their power. I would make it a criminal offense: say, in a few words, that any person or corporation that engages in destructive competition shall be guilty of a misdemeanor and be punished with fine and imprisonment both.

Q. (By Mr. Farquhar.) You mean that as a national or State law? A. We could not apply a national law except to inter-state commerce. It would have to be a State law where it concerned commerce within the State.

Q. How would you define "destructive"? A. I would leave that to the courts and juries; they will find a way out. That is the question of intent;

and that always enters into a criminal offense. If a man starts to sell a product, not for the purpose of getting a market for his goods, but to drive somebody else out of the business, that is destructive competition. Let the jury find that intent from the evidence. Let them find it from the price, if they please. If the price is away below the cost, and they maintain that price for a long period, not just for a single sale, that is destructive competition. That is a crime—one of the highest crimes; nothing in this country has done so much damage in recent years as destructive competition, entered into deliberately. It is one of the most deliberate offenses that can be committed. No man need engage in it; he can easily avoid the penalty by avoiding the crime. That is one way.

LIMIT THE CAPITAL OF MANUFACTURING CORPORATIONS
TO \$1,000,000.

If I had the doing of it, I would never charter a corporation, except for public purposes, with over \$1,000,000 capital. That is large enough in any business to secure a perfect division of labor. I think that ought to be the limit of commercial companies. There is not much danger in this country from a company with \$1,000,000 capital. One man said to me: "This is our business. I can lose \$100,000 and spread it over half a million and not feel it. Your company cannot lose \$100,000; it does not have it to lose; we will drive you out of business.

AS TO QUASI-PUBLIC COMPANIES, REGULATE THEIR
CHARGES.

Q. (By Mr. A. L. Harris.) Would you include transportation companies in that bill also? A. No, I would call that business public or quasi-public. I think that all telegraph companies, all electric light companies, where they are in cities or where they deal directly with the public, all traction companies, should be under severe regulation. The price of those goods can be regulated because they have a fixed unit. Fix the price of the thousand cubic feet of gas. Fix the fare for the carriage of passengers. You have no way of getting at a commercial company. If you can limit their capital to \$1,000,000, you will have a remedy. If you do not do that, you must do something else, or else the country is going to be ruined by these large aggregations of capital.

NO ANTI-TRUST LAW CAN BE OF SERVICE, UNLESS IT
LIMITS THE SIZE OF CAPITALS, OR MAKES DESTRUCTIVE
COMPETITION A PENAL OFFENSE.

Q. Would you reach the trouble better by what is commonly called the anti-trust laws, or in the corporation acts of the different States? A. They would have to be real anti-trust laws; you would have to say that no company should have more than \$1,000,000 capital. You can have a perfect division of labor with \$1,000,000 capital; and all political

economists say that is all that is desired by the aggregation of capital. That is not what the trust desires. The trusts desire to get into position to squeeze somebody; drive somebody out of business; whereby they can levy tolls on the public generally. That is what the trusts are for.

Q. (By Representative Livingston.) You recommend State laws controlling and regulating trusts; what would you recommend us to do with the State of New Jersey, that starts them? A. I do not know what you could do with the State of New Jersey. I do not suppose that any legislation could be secured in New Jersey. This will probably have to be reached by securing a healthy public sentiment first.

Q. If one State in the Union is allowed to issue charters just as she pleases, and do as she pleases, those charters are operated in all the other States, how are you going to legislate? A. You could say in the State of Georgia that no trust should be possible in that State. Suppose a dozen States should pass laws that no trust should be possible or no corporation should do business in those States with a capital of over \$1,000,000; that it would enable independent companies to go in and do business in those lines. I do not object to the amount of capital. I only limit it to \$1,000,000 because a company with \$1,000,000 capital cannot engage in destructive competition. It might be mean in a small way, but it could not do much damage. A company with \$100,000,000 or \$500,000,000 capital can drive everybody out of that business; and the question is, Will they not do it? There is no way of curbing their power except by restricting their capital, or else making it a penal offense to engage in destructive competition.

THE DUTY ON OIL IS PERHAPS MEANT TO PROTECT THE
FUTURE.

Q. Have we any import duties on oil? A. Yes; there is an import duty of 10 cents a barrel.

Q. How does that help? A. There is no oil imported into this country. It does not help anybody, because there is no oil imported.

Q. Does not keep anybody out? A. No one.

Q. Why is it put on? A. I do not know; for the protection of the future, perhaps.

OVER-CAPITALIZATION LEADS TO EXCESSIVE CHARGES.

Q. In addition to large aggregations of capital, is not the public also in danger of overcapitalization? A. Undoubtedly. Having overcapitalized these trusts, they will want to show an earning power to the holders of stock; and in order to do that they must collect extortionate profits from the consumer if they have a monopoly. That will tend to drive the directors or trustees of these trusts into obtaining from the public excessive profits.

Q. (By Representative Livingston.) Do not all overcapitalized organizations go into bankruptcy inevitably? A. I think a great many of them will.

TRUSTS KILL INDIVIDUAL ENTERPRISE

Q. (By Mr. Ratchford.) What effect, in your judgment, has the organization and operation of trusts and the large moneyed corporations upon the personal ambition, the individual enterprise of the American people? A. I think it is very rapidly stifling it.

Q. Could you state whether or not, in your judgment, large numbers of individuals are kept out of business by reason of those things? A. No question about it.

Q. You spoke of destructive competition; can you conceive of any way in which that destructive competition could be brought about more forcibly and more fully than by the tearing down and destroying of the rival establishments? A. No; I do not know a more flagrant means of destroying competition than by paying exorbitant prices for competing plants in good condition and tearing them down. That's a notice to everybody that they do not propose to have competition.

Q. That probably works great hardship to communities in which these plants are torn down? A. Undoubtedly; it is a waste of that much capital, which it has taken years to build up. If a man burns his own home he is guilty of arson; if he destroys a new plant out of mere animosity and desire to injure some one else, I do not know why he should not be guilty of an offense.

INCOME TAXES AND INHERITANCE TAXES.

Q. (By Representative Livingston.) Instead of preventing combinations of over a million dollars, as you suggested, suppose you levy an income tax of 50 per cent on the profits? A. I am afraid they would lie about the profits.

Q. Would not that be a fairer way to do it? A. I would be willing to do anything to wipe them out and give the people a fair chance. I think that would do the work if you could enforce it.

Q. (By Mr. Farquhar.) Would any State or court regard that as constitutional, or any European court? A. I have no hostility to any individuals. I simply would like to see some limitation put upon the powers of trusts in the interest of the people themselves.

Q. (By Representative Livingston.) It would not be class legislation if Congress should lay a tax on the incomes and profits of all trusts and combinations? A. I should dislike to see any law passed that would recognize their existence.

Q. (By Mr. Phillips.) What would you think of an inheritance tax, levied in some graded proportion to wealth? A. I am afraid that would be open to objection unless it is uniform; and if it were uniform it would be avoided very largely, would it not, by people making gifts prior to their death?

GOVERNMENT VISITATION DESIRABLE BUT NOT SUFFICIENT.

Q. (By Mr. Farquhar.) Have you any other remedy for destructive competition than the limitation of capital to \$1,000,000? A. Government visitation might alleviate the evil, but that would only result in publicity. They do not seem to care much about that; they are largely defying public opinion.

Q. (By Mr. Phillips.) Would you be in favor of government inspection of corporations? A. I think that ought to be done; the power of visitation was a common-law right in England to the founder of a corporation. He had the power of visitation, and as the State creates the corporation it certainly should have the power of visitation. It has an undoubted right to do it.

PRACTICABILITY OF PUNISHING DESTRUCTIVE COMPETITION.

Q. (By Representative Otjen.) If you make destructive competition a criminal offense, how would you enforce the penalty against corporations? A. I would make it apply to any person, corporation, or agent of a corporation. You cannot imprison a corporation, but the fine would apply to it.

Q. You would simply have to enforce the penalty in the shape of a fine? A. Make all officers guilty of the offense. They are willing to risk anything, violate any moral obligation or rule; but there is one thing they do not like to do—they do not like to take any risk of imprisonment.

Q. It would be competent to fine a corporation found guilty of destructive competition, but would it also be competent to imprison the president or directors? A. The law can say that any corporation, and all the officers thereof, and all the agents or employes connected with the corporation engaged in the destructive competition, shall be guilty of a misdemeanor, and on their conviction shall be fined \$500 and undergo imprisonment of one or two years in the penitentiary.

Q. (By Mr. Ratchford.) Do you believe the law should define exactly what destructive competition means? A. Leave that to the courts and juries.

THE SHERMAN ANTI-TRUST LAW. THE INTER-STATE COMMERCE COMMISSION.

Q. (By Mr. A. L. Harris.) Have you any suggestions to make as to amendments that would make the Sherman anti-trust law more effective than it is now? A. I have not, at this time; I would like to look that over again.

Q. Will you please do that and see whether it can be made a basis for a future remedy? A. I think the law has had some good effects.

Q. Is it possible to bring it under the jurisdiction of the Inter-State Commerce Commission in any way? A. That is a pretty difficult question. That

is a question a great many people have considered; I have been thinking of these questions for perhaps thirty years. I have been brought into pretty close contact with them for that period.

THE OIL TRADE IN CANADA.—RAILROAD DISCRIMINATION
THERE.

Q. (By Mr. Jenks.) Do we export oil to Canada?
A. Yes; we sell a great deal there.

Q. Does your company sell any in Canada? A. Yes.

Q. Have you come in contact there in any way with discrimination in railroad rates? A. There has been conflict there. There has been trouble about railroad rates there recently.

Q. Has your own establishment come in contact with that? A. Yes; I think they have.

Q. Can you give the facts about that? A. No; I do not believe I can now.

District of Columbia, County of Washington, ss.:

I swear that the statements made by me of my own knowledge in the foregoing report of my testimony before the Industrial Commission are true, and that all other statements I believe to be true.

J. W. LEE.

Sworn and subscribed before me this 9th day of September, 1899.

WM. CALVIN CHASE,
Notary Public.

Washington, D. C., May 16, 1899.

TESTIMONY OF HON. FRANK S. MONNETT.

Attorney-General of Ohio.

The commission met at 10.50 a. m., Vice-Chairman Phillips presiding. Hon. Frank S. Monnett, attorney-general of the State of Ohio, testified.

Q. (By Mr. Jenks.) Will you be kind enough to state your full name and address? A. Frank S. Monnett, Columbus, Ohio.

Q. You hold the position of attorney-general of the State of Ohio at the present time? A. Yes.

Q. In the carrying out of your official duties have you found it necessary to bring suits against some of the great industrial combinations? A. Yes.

SUITS FILED BY THE STATE OF OHIO AGAINST INSURANCE
COMPANIES.

Q. What ones in particular? A. We filed the first suits against eleven insurance companies, which included British, Canadian, and American companies, charging them with being in a state combination through local boards, or through a com-

munication between local boards, amounting to a state organization; and also with being in an interstate combination at Chicago through a state organization. These cases have been pending, and are now in the hands of the court with 800 pages of printed testimony of the various witnesses. If the members of your commission care to have any of them, we can furnish you with the official copy of the testimony, and from that you can get the names of such witnesses as are available on the lines you want.

SUITS AGAINST THE STANDARD OIL COMPANY OF OHIO.

The next suit that we had was the State of Ohio ex rel. attorney-general against the Standard Oil Company of Ohio, which, I believe, has been pending since 1891. A decree was rendered March 2, 1892, against the Standard Oil Company of Ohio, it having been charged with being a member of the Standard Oil Trust, or being one of the constituent companies of the Standard Oil Trust. By an order of the supreme court of the State in November, 1897, I was directed to bring it (the Standard Oil Company of Ohio) before the court for contempt, charging it with having violated the decree rendered March 2, 1892, in not withdrawing from the trust in good faith, but in simply shifting or modifying the former system of doing business, so as still to get the benefits of the trust combination or arrangement. In accordance with that order from the supreme court I filed a complaint in contempt, a copy of which I will furnish your commission, to which complaint the court gave an order for service upon the defendants, and the defendants thereupon came into court with an answer attempting to justify their conduct subsequent to the decree, to which answer we filed a reply with some twenty-nine interrogatories addressed to the president of the Standard Oil Company, who is also the chairman of the liquidating trustees, and also the chairman of the former nine trustees of the Standard Oil Trust, Mr. John D. Rockefeller, of New York, formerly of Cleveland, Ohio. Mr. Rockefeller answered these printed interrogatories under oath in part and demurred to part, which, under our code, he had the right to do, and part he refused to answer on the ground that they were irrelevant.

The court overruled the demurrer or the refusal to answer the main interrogatories; that was objected to, and they then came into court with a supplemental list of answers. Thereupon we took additional—rather, Mr. Rockefeller's—testimony in the way of depositions under a master appointed, and of that testimony I will give such data as your commission desires. In their testimony, as disclosed by the interrogatories, and by Mr. Rockefeller in person, and the secretary, F. B. Squires, of Cleveland, we were able to find data that warranted the State in filing suits against such constituent companies of the original trust as were doing business in Ohio.

SUITS AGAINST CONSTITUENT COMPANIES OF THE
STANDARD OIL TRUST.

We filed independent suits against The Buckeye Pipe Line Company, a constituent company, which is the transporting company of the crude product; against The Ohio Oil Company, known as the "producing" company, which makes leases or contracts with the owners of oil in the rock, usually farmers; against The Solar Refining Company, which has functions substantially the same as the Standard Oil Company of Ohio, which is a refining company; and against The Standard Oil Company of Ohio, anew.

FOUR CAUSES OF ACTION.

In these suits substantially four causes of action were made. In the first instance we charged them with violating the public policy of the State, our procedure being based upon the constitutional right of the attorney-general to institute proceedings in quo warranto against any corporation that offends against the existing statutes of the State or against the public policy of the State, and with confederating and attempting to evade the decree of the supreme court in the decision of March 2, 1892, against the Standard Oil Company proper.

DOING A TELEGRAPH BUSINESS.

The second cause of action was based upon what is known as our "anti-trust act," the Valentine-Stewart act, which was passed a year ago and took effect July 1, 1898. On taking the testimony at Lima, Ohio, in the case of The Buckeye Pipe Line Company, it was disclosed that they had a telegraph system, which, from a lawyer's standpoint, it was conceded, a company, doing a business of the nature they were, might have as an incident to their business, being a means of communication between their different posts; but in the testimony it was disclosed that they were exchanging business with the Western Union Telegraph Company, had stated monthly balances, and were acting as common carriers of telegraph messages in Ohio for whosoever applied to them. It was testified that they had produced election returns and other news in advance of the regular system. As they were exercising this franchise outside of their corporate authority, we make it an additional cause of action against them, charging them with exercising this ultra vires power. We have taken testimony to establish this, which I can furnish the commission. Under the Ohio law it would be necessary for them to have a special charter for that class of business.

It was disclosed and is in evidence, as claimed by the State, that in relationship existing between the constituent companies (to which I will refer later), there were separate telegraphic contracts for the Ohio Oil Company, the Buckeye Pipe Line Company, and the Solar Refining Company, differing from the contract they had with their customers or the public generally. They used the Western

Union blank contract for the ordinary telegraphic service, but had a separate contract and a separate account with each of these constituent companies, raising the legal presumption, as we claim, from the evidence, that they have a system organized about as follows:

THE ORGANIZATION OF THE BUSINESS DESCRIBED.

They have a purchasing or "producing" company, the Ohio Oil Company, which makes the original contract with the owners. The oil is then turned over to the Buckeye Pipe Line Company, known as "the crude product" company, which, in conjunction with the other pipe line companies, owned by Standard people, makes a complete system, and which, as we understand it, constitutes a single system, the Buckeye Pipe Line Company having the Ohio field, but doing business in Indiana also, which, subsequently to this suit, they turned over to the Indiana Pipe Line Company, also one of the constituent companies of the original trust combination. Then from the "crude product" or transporting department, with its telegraphic system, connected with all departments and all pipe lines, the oil is transferred to the respective refineries which are at Whiting, Ind., a suburb of Chicago, at Cleveland, Ohio, at Lima, Ohio, and at Parkersburg, W. Va.

The Buckeye Pipe Line Company delivers the crude oil to the refineries. The refined product, the kerosene and the gasoline, is transported to dealers and customers through another constituent company, the Union Tank Line Company, which has a system of tankage stations, i. e., distributing points such as county seats, and cities of from 3,000 to 5,000 inhabitants and upward. They have contracts with railroads, which you can go into more fully than we have, and which will disclose the nature of the relationship to the railroads. This company gets a rate for their tank line, in shipping to the tank stations by the carload or train load, with an allowance for loading and unloading their own product, while for barrel lots and part carload lots the rates vary. According to the trust investigation of Ohio the charges for shipping by part carload lots are as much as 400 per cent of the charges for shipping in carload lots and delivering at tank stations by the Union Tank Line.

THE POWER OF THE TRUST DEPENDS UPON ITS CONTROL
OF THE TRANSPORTATION SYSTEM.

The State claims this whole system of transportation to be an advantage which the Standard Oil Companies have as shippers, and by means of which they defeat competition. In other words, the secret of the power of the Standard Oil Trust will be found to be the discriminations or favors that they secure by controlling or monopolizing the transportation of the crude product and the discriminations they receive by various devices in transporting the refined oil; e. g., the discriminating rate in favor of

carload lots and train loads, with allowances for loading and unloading their own product. When other shippers adopt similar methods, the Standard invents still other methods to evade fair competition.

Q. You understand this discrimination to be, in spirit at any rate, a violation of the inter-state commerce act? A. The inter-state commerce act applies to inter-state commerce; I refer to State commerce, namely, to Ohio and Ohio roads. On examination you will find the railroads are permitted to give a different and more favorable rate for carload lots or in tanks than in barrels. The argument that they adduce is that the return of gasoline barrels contaminates all other shipments; that they can not ship any other freight in such cars. If you examine the freight charges in cases where a competing pipe line has been constructed along a railroad, that formerly had a fixed rate, you will find that instead of the competitive pipe line which parallels the railroad lowering the price, it has absolutely raised it, showing that the independent shipper is discriminated against. He can not compete because rates have been raised, and he must pay their price if he ships through the pipe line.

ORGANIZATION OF THE TRUST.

Starting with the Standard Oil Company of Ohio, shall I explain how it entered the trust, and give the names of the other constituent companies, with the capital stock of each?

Q. Have you also the dates of the organization of these different companies, with the names of the leading officers? A. Yes; I can furnish them. The Standard Oil Company of Ohio was organized originally the 10th day of January, A. D. 1870, and is commonly known as The Standard Oil Company. It had \$1,000,000 stock. It increased that stock the 12th day of February, A. D. 1872, to \$2,500,000. On the 13th day of March, A. D. 1875, it increased its capital stock by State authority to \$3,500,000. It remained in this condition from 1875 to the 2d day of January, A. D. 1882. It had 35,000 shares of stock at a par value of \$100 a share, which would make the par value of the total \$3,500,000.

Mr. Rockefeller's testimony is ambiguous as to whether they transferred the stock directly to the Standard Oil Company of Ohio first, or whether, as owners of the stock, they transferred that to the trustees of the Standard Oil Trust; but in any event all the stockholders agreed to the trust contract of 1882. Two days afterwards they modified it. The company in Ohio had originally 9 directors of the Standard Oil Company and they were afterwards reduced to 7; the 7 continued to vote the 9 shares. The theory of the Standard Oil Company was that a corporation could maintain its existence by 7 directors holding each a share of stock. They did this to comply with the statute. Seven directors could elect a president and secretary and necessary officers, and the remaining stockholders would be at liberty to assign their stock to trustees. Other companies did the same, thus organizing and maintaining a trust. In other words, they argued, the corporation would not be responsible for the acts

of the individual stockholders, and that theory ran through the entire organization of the trust; viz: that stockholders could act independently of the corporation. The suit was begun by my predecessor, General Watson. The 34,993 shares had passed out of the hands of the stockholders into the hands of the 9 trustees.

THE CONSTITUENT COMPANIES.

There were three classes of companies that entered into the combination. First, they had all the stockholders and members of the following 14 companies: The Acme Oil Company (New York); Acme Oil Company (Pennsylvania); Atlantic Refining Company of Philadelphia; Bush & Co., Limited; Camden Consolidated Oil Company; Elizabeth Acid Works; Imperial Refining Company, Limited; Charles Pratt & Co.; Paine, Ablett & Co., Limited; Standard Oil Company (Ohio); Standard Oil Company (Pittsburg); Smith Ferry Oil Transportation Company; Solar Oil Company, Limited; Stone & Fleming Manufacturing Company, Limited. All the stockholders and members of these corporations and limited partnerships were required to sign an agreement to turn in their stock (except enough to preserve State organizations), as I have explained to you. A second class of companies consisted of the interests of W. C. Andrews, John D. Archbold, and a long list known as the individual owners, who signed the original trust agreement. A third class consisted of corporations, 25 in number, which assigned a controlling interest in the companies to the trustees. They were: The American Lubricating Oil Company; Baltimore United Oil Company; Beacon Oil Company; Bush and Denslow Manufacturing Company; Central Refining Company, of Pittsburg; Chesebrough Manufacturing Company; Chess-Carley Company; Consolidated Tank Line Company; Inland Oil Company; Keystone Refining Company; Maverick Oil Company; National Transit Company; Portland Kerosene Oil Company; Producers' Consolidated Land and Petroleum Company; Signal Oil Works, Limited; Thompson & Bedford Company, Limited; Devoe Manufacturing Company; Eclipse Lubricating Oil Company, Limited; Empire Refining Company, Limited; Franklin Pipe Company, Limited; Galena Oil Works, Limited; Galena Farm Oil Company, Limited; Germania Mining Company; Vacuum Oil Company; H. C. Van Tine & Co., Limited; and Waters-Pierce Oil Company. These 39 companies, with the long list of individuals, are all that entered into the original Standard Oil Trust. The respective stockholders, partnerships, and individuals, on an appraisal agreed upon, received new trust certificates for their proportionate interests in the stock or assets transferred to the trust.

APPRAISEMENT OF THE BUSINESS OF THE CONSTITUENT COMPANIES.

Q. Will you tell us, first, how this appraisal was made and what its basis was? A. Well, the consideration for the transfer and conveyance of

the money, property, and business of each of the Standard Oil Companies was trust certificates of the Standard Oil Trust, issued by the trustees of the trust, equal in par value to the appraised value of the money, property, and business so transferred. The stock was to be delivered to trustees provided for in the trust agreement and their successors, and no stock was ever to be issued by any of the contracting companies except for money, property, or business equal at least to the par value of the stock so issued, nor was any stock issued by any of said companies for any purpose, except to the trustees herein provided for, to be held subject to the trusts hereinafter specified. There was not any watered stock. They entered the trust at the actual appraised value; the appraisers were interested men, and it would have been of no advantage for them to inflate it. They attempted to get actual value, and on that basis they issued trust certificates.

Q. Probably the selling value at ordinary sale?
 A. It was placed on the income value—its selling value. The trust agreement provided for 9 trustees to be elected. The first three were John D. Rockefeller, O. H. Payne, and William Rockefeller, and they were elected to hold office until the first Wednesday of April, 1885. The next three were J. A. Bostwick, H. M. Flagler, and W. G. Warden, to hold office until the first Wednesday of April, 1884; and the next three, Charles Pratt, Benjamin Brewster, and John D. Archbold, to hold office until the first Wednesday of April, 1883. The trustees were thus a continuous body. In the beginning there was one-third for 3 years, one-third for 2 years, and one-third for 1 year, who held office until their successors were duly elected and qualified. The 39 original companies were subsequently merged into 20 companies. A list of the 20 companies and the capital stock, the nominal capital stock as they now exist, is about as follows:

Companies	Appraised value	Capitalization
Anglo-American Oil Co., Limited	\$ 6,913,639 49	\$ 5,000,000
Atlantic Refining Co.....	8,631,376 67	5,000,000
Buckeye Pipe Line Co.....	7,941,038 15	10,000,000
Eureka Pipe Line Co.....	1,547,055 16	5,000,000
Forest Oil Co.....	3,528,813 11	5,500,000
Indiana Pipe Line Co.....	2,014,053 91	1,000,000
National Transit Co.....	25,796,712 97	25,455,200
New York Transit Co.....	4,999,300 00	5,000,000
Northern Pipe Line Co.....	707,067 00	1,000,000
Northwestern Ohio Nat. Gas Co..	1,396,760 00	3,278,500
Ohio Oil Co.....	8,260,378 04	2,000,000
Solar Refining Co.....	711,793 87	500,000
Southern Pipe Line Co.....	3,279,018 28	5,000,000
South Penn Oil Co.....	3,021,654 87	2,500,000
Standard Oil Co., Indiana.....	1,038,518 61	1,000,000
Standard Oil Co., Kentucky.....	3,604,800 78	1,000,000
Standard Oil Co., New Jersey...	14,983,943 30	10,000,000
Standard Oil Co., New York....	16,772,186 29	7,000,000
Standard Oil Co., Ohio.....	3,426,014 72	3,500,000
Union Tank Line Co.....	3,057,187 41	3,500,000
	\$121,631,312 63
Capitalization 20 corporations...	102,233,700 00
Excess.....	\$19,397,612 63

The capitalization of these 20 companies is \$102,233,700; the excess of value over and above their capitalization at the date of this inventory was \$19,397,612.63.

THIS INVENTORY WAS BASED UPON THEIR OWN TESTIMONY.

Q. Will you make it clear what you have based this inventory upon and who took the inventory?

A. It was taken by the representatives of the trust certificate holders, I think.

Q. (By Mr. North.) On what basis was that appraisal made; do you know that? A. I asked Mr. Rockefeller the following questions: "Give the surplus money in the hands of each and every constituent company, corporation, and limited partnership as represented by trust certificates of the Standard Oil Trust on or about January 1, 1892, and how much after the payment of their last dividends, stating when such dividends were declared and paid and the total amount of each, and whether said dividends were turned over in each and every case to an official representing the Standard Oil Trust." And this was the answer he gave:

"I have not in my possession or power data showing the surplus money in the hands of each and every constituent company, corporation, and limited partnership, as represented by trust certificates of the Standard Oil Trust on or about January 1, 1892, nor the amount of such surplus money in their hands after the payment of their last dividends. During the year 1892 a careful inventory and appraisal was made of all the assets of said companies, and the result was found to be as follows:" (The above figures are taken from this complete answer.)

Q. That was their own appraisal? A. That was their own appraisal. We were obliged to take that, as they refused to produce their books. There is a matter now pending before the courts of Ohio whether or not it invades constitutional privileges if they are required to disclose their books for such purposes. We have asked for the books, or original testimony, so far as it bears upon our litigation.

DIVIDENDS AND THE VALUE OF THE TRUST CERTIFICATES.

I then asked for the last dividends of said companies, prior to November, 1897. The copy of the record of the Ohio supreme court proceedings, that I leave with you, will give you the list of the companies and the amount of dividends paid by each. Some of the companies pay quarterly dividends, some annual, and others, apparently, have declared no dividends for the last year.

LIST OF DIVIDENDS.

The last dividends of said companies prior to November 9, 1897, were as follows:

Anglo-American Oil Co., Limited, June 15, 1897.	\$ 506,480 00
Atlantic Refining Co., Mar. 15, 1897.....	1,999,600 00
Buckeye Pipe Line Co., Sept. 15, 1897.....	3,999,780 00
Eureka Pipe Line Co., Sept. 15, 1897.....	599,868 00
Forest Oil Co., Oct. 30, 1891.....	287,100 00
Indiana Pipe Line Co., March 15, 1897.....	999,450 00
National Transit Co., June 15, 1897.....	2,545,475 00
New York Transit Co., Mar. 15, 1897.....	1,999,600 00
Northern Pipe Line Co., Sept. 15, 1897.....	232,244 25
N. W. Ohio Natural Gas Co., Sept. 15, 1897....	29,497 50
Ohio Oil Co., June 15, 1897.....	999,887 50
Solar Refining Co., June 15, 1897.....	147,234 50
Southern Pipe Line Co., Sept. 14, 1892.....	300,000 00
South Penn Oil Co., June 15, 1897.....	2,498,900 00
Standard Oil Co. (Indiana), Mar. 15, 1897....	699,300 00
Standard Oil Co. (Kentucky), Mar. 15, 1897...	1,998,000 00
Standard Oil Co. (New Jersey), Sept. 15, 1896..	2,499,775 00
Standard Oil Co. of New York, June 15, 1897...	1,749,725 00
Union Tank Line Co.—No dividends declared.	

No dividend, the company claims, has been paid by the defendant company since the distribution of surplus made March 17, 1892. Prior to August 5, 1891, the defendant company was the owner of a large number of tank cars, most of which had accumulated under the management of the trustees, which were rented to other companies. Its stockholders and directors determined that it should discontinue the transportation business, and on August 5, 1891, the defendant company sold its tank cars to the Union Tank Line Company, and received in payment therefor the sum of \$3,500,000. Of this sum, on March 17, 1892, it handed over to the trustees \$3,219,540 for distribution by them among the holders of trust certificates, this being the distribution referred to in the answer filed by this company, and, the company claims, the only distribution or payment made by the defendant company to the trustees since the former decree of this court. This sum, or the balance remaining thereof after settlements of contracts, agreements, and accounts by said trustees, as shown in their resolution of May 16, 1892, was distributed to the holders of the trust certificates. The surplus since accumulated in the hands of the defendant company amounts to \$700,000, which is invested in Government bonds.

The answers to the preceding interrogatories are all we have to show to whom, in every case, dividends were paid. They were paid in each case by the company declaring the same to its stockholders of record, the liquidating trustees receiving dividends from companies other than this defendant upon that portion of the capital stock of the said several companies which is held by them, awaiting reissue to the dividend owners thereof on surrender of trust certificates.

Q. (By Mr. Jenks.) They are not all quarterly? A. No.

Q. Can you give the distinction? A. I can not give you the distinction. I will furnish you with a list of the entire dividends, at the last payment, including the quarterly, which amounts to some-

thing over 24,000,000. According to that, the value of trust certificates is to be estimated at about 480 or 500 per cent, and since they have it in their power to control the retail price of oil, they can, by raising or lowering it, make a dividend at about what they please. They have raised the retail price of gasoline and oils at noncompetitive points since this suit was instituted, and it has had the effect of increasing the value of their trust certificates. I can give you the dividends that have been declared since 1892.

Q. Could you furnish us the prices at competitive and noncompetitive points, A. Yes; I will do that later. Just prior to the date of General Watson's decree they organized a Union Tank Line Company, and they took out of the business of the Standard Oil Company of Ohio the assets formerly used in the transportation of the refined products, amounting to \$3,500,000, so that these constituent companies now have their respective departments. As I narrated in the opening of my testimony, although substantially the same men are in control, the companies have different functions. On March 17, 1892; they turned over to the trustees of the trust for distribution, after the decree of the court against the trust (which is one of the things we claim to be a violation of the order of the court) the \$3,500,000 assets so acquired; and that was distributed among the holders of the trust certificates after the courts ordered them to withdraw from the trust. They were interrogated further as to what they have since done with the accumulations of the Standard Oil Company. They have attempted to account for their accumulations by charging off in profit and loss accounts by way of depreciation in the plant. These figures I can furnish you. Mr. Squires claimed (he refused to produce the books) and gave as his conclusion February 7, 1895, that \$230,019.96 was charged off for depreciation of plant December 31, 1894, and on or about May 31, 1896, they charged off \$1,200,000 more for depreciation of plant. They hold \$700,000 in Government bonds.

Q. Is that amount charged off for depreciation supposed to include the dismantling of any plant they had purchased and put out of operation? A. No. The Standard Oil Company, as a "going" concern, had accumulated assets all these years, according to our theory. They only redeemed 51 and a fraction per cent of trust certificates, or enough to have the control, and they continue as they always have. These Standard Oil trust certificates are still on the market, and are nourished in some way, or they would not be paying these trust-certificate dividends. The other 19 companies must at least be nourishing them. The Standard Oil Company of Ohio had to account for the distribution of its income. It had this theory, viz, that it has earned nothing since the decree, but will not produce the commercial books to corroborate it.

BOOKS BURNED BY THE TRUST:

Q. How about the charge of burning their books? A. We adjourned on the night of February 15, on

Thursday, and they were required to appear before the court on the following Tuesday to show reason why they should not abide by the order of the master and the decree of the court and produce their commercial books. We received an anonymous communication that they had burned their books. We subpoenaed certain parties and had them testify as to the fact. The information to the State, after following up the matter, was that they had burned 16 boxes of books. I give you Mr. McNirney's testimony touching upon the subject.

Attorney-General Monnett then read extracts from the testimony of Mr. John McNirney as to the burning of the books. The direct examination of Mr. McNirney in full is as follows:

John McNirney, of lawful age, being by me first duly sworn, as hereinafter certified, deposes and says as follows:

Q. (By Mr. Monnett.) State your name and residence to the notary. A. John McNirney, 85 Oregon Cleveland, Ohio.

Q. What is your business, Mr. McNirney? What company are you working for? A. The Standard Oil Company.

Q. How long have you been working for them, and what time? A. Three years next September, as car builder and repairer.

Q. On what street is their car-building works? A. On Broadway, I believe.

Q. Where are the general offices of the Standard Oil? A. As I understand, on Euclid avenue, what they call the Standard block; and they have got another general office for the shop on Broadway.

Q. Then part of the works is on Independence street, is it not? A. I believe it is. Now, I don't know anything about that. I know that the works where I work is on Broadway.

Q. In the car shops? A. In the car shops; the hill shop.

Q. You may state whether or not you were called, on or about Saturday the 19th of November, to the general offices to do any work in the way of removing boxes or books, or anything. A. Yes; I was.

Q. You may state just what the work was, and commence with the first. What time of day did you get there? A. We got there about 11 o'clock in the forenoon.

Q. What was the first thing you did? What did you help do? A. The first thing we did was to lower a lot of books from the fifth story to the ground floor.

Q. Lower them? A. I didn't say books; I say boxes. I don't know what was in the boxes. To lower a lot of freight boxes—supply boxes. We call them supply boxes.

Q. Did you help pack the boxes or anything? A. No, sir.

Q. Whom did you lower them to? What teamsters, if you know any of them? A. There was a teamster there, but we was going to take the books—I say boxes—out in front; but, as I understood, the janitor objected and said we must take them out in front; we must take them out in the rear of the

building.

Q. You lowered these boxes with a tackle from the rear window? A. No; on the passenger elevator.

Q. You lowered them with that? A. With that; yes, sir.

Q. What was done with them after that? What teamster? A. We took them up again. When they objected, we took them upstairs again.

Q. Then what was done with them? A. Then we lowered them from the back window in the yard in the rear.

Q. What kind of a device did you use to lower them with? A. A tackle.

Q. What teamsters, if any, got them? A. I could not tell you. I could not swear to the name of the teamster. I know him, but in our capacity we don't come in contact with teamsters very much.

Q. Was Edward O'Hearn one of them? A. I could not swear that was his name. I would not swear that was his name. I know him personally, but I don't know his name. I meet him every day, but I don't know what his name is.

Q. You would know him if you saw him? A. Yes.

Q. A black-mustached man, about your age? A. An Irishman.

Q. A little heavier set? A. Yes, sir. I would know him if I saw him again. I see him every day. I don't know his name.

Q. Was there any other man assisting? A. Yes, sir.

Q. Who assisted you? A. Moran.

Q. Moran; what is his business? A. He is a car builder and laborer.

Q. Do you know a man by the name of Gabeline? A. Yes; I know him.

Q. Did he assist you? A. I believe he was at—

Q. Where was he; at the offices or at the car works? A. At the general offices.

Q. Do you know a man by the name of Shafer? A. Yes.

Q. Was he assisting in any way? A. I believe he was there, too.

Q. At the general offices? A. At the general offices.

Q. What did they do? A. They assisted to lower the boxes.

Q. After they were removed and taken down the tackle, then where were they taken to? A. I believe they went to the warehouse.

Q. Did you ever afterwards see them; and if so, what did you do with them? Did you after that see the same boxes? A. I saw the books; I don't swear they are books, because I don't know what was in the boxes.

Q. Where were they when you saw them the next time—the same boxes? A. In the warehouse.

Q. You may state, then, if you had anything to do with the opening or burning any books about that time? A. Yes, sir; we did burn some of those books next Monday. No; we didn't burn them all; I don't think we burned all we took out. I did not keep no track, and wasn't interested, and don't know how many books we burned.

Q. Did you have more than one burning; were you at it more than once? A. Yes, sir; twice. The first lot we burned in the car shop furnace.

Q. What sized books were those? A. Large and small.

Q. Give the size of the biggest ones, the thickness. A. That high [indicating].

Q. That would be 2½ feet high? A. Well, I don't know. I say about 20 inches.

Q. The books were about 20 inches? A. The chest about 20 inches, and they come up to the top.

Q. About how thick were they? A. All sizes; I didn't pay no special attention. We burned some big boxes and some small ones. I wouldn't swear how big they were.

Q. You held this way: about 8 inches high and 6 inches wide. A. We didn't pay much attention, because we had to get them in there quick. I know they were large, heavy books, almost as much as a man could lift, some of them; what I call ledgers—large books.

Q. Did you burn up loose papers? Yes, sir; we burned papers and letters in a sack.

Q. How many were left to burn the next night or on Monday night, you say? A. I think we burned 9 chests and 6 sacks. Those sacks were all letters; copying books, I should think, or something like that. Loose papers, waste paper, I say.

Q. Letter-press books and letters and waste paper? A. I should say waste paper.

Q. How many chests were there originally, about; do you remember how many made a load? Sixteen, I believe, made a load; 16 chests.

Q. At the furnace, who helped you throw them in? A. Moran.

Q. What is his position? A. Car builder and repairer.

Q. What is his first name, do you know? A. I couldn't tell that; you know, although I know him 2 or 3 years, yet I don't know his name. We work with them every day and don't know their first names.

Q. Is he your boss? A. He is a young fellow; he used to cut bolts; he was a kid, about 20 years; he used to cut bolts.

Q. Were there any of the books that were not burned that were concealed down there in that package or hid away?

(Objected to.)

A. What I know—I don't think we burned all the books, because we took more than we burned, as far as I know. I don't know anything about that.

Q. Who else about the offices up there—at the general offices—assisted in this in any way besides Moran; do you know? A. In the burning of the books?

Q. Either at the offices or in the burning of the books; what other parties? A. I don't know their names.

Q. What part did Gabeline—did he help take them out of the boxes? A. No; he didn't help to take anything out of the boxes. He did not know what was in the boxes.

Q. He just helped move the boxes up at the offices? A. Yes, sir; we were short-handed, and they sent a party from the car shop to assist us load the boxes at night.

Q. Were the boxes themselves loaded at night, after they were taken down by the tackle? A. The boxes were locked, securely locked; I don't know whether they were securely locked; some of them had no locks on.

Q. You described, if I understood you, as having taken them down, or a part of them down in the elevator first, and then the elevator man— A. The janitor objected, and we had to take them up, if I understood that.

Q. The reason you had to take them back again and he would not let you come down the front way, you had to take them out of the back window? A. Yes, sir; that is the reason we had to lift them to the third story and lower them out of the back. We could have done very quickly if we could have taken the boxes in the front.

Q. What street, then, was the wagon backed up on? A. There is no street there; it is a yard.

Q. How many different teamsters do you think had a hand in handling the stuff? A. Now, I think there was about three; I don't know the names of the teamsters; the first load I don't know anything about. They took the first out on Friday—took that up to the offices, and we destroyed that load in the morning. I don't know who brought that load up.

Q. Was it Saturday morning that you destroyed them? A. Yes; Saturday morning, and O'Hearn, I guess, was the man's name that took the two loads on Saturday night.

Q. Were they the same boxes each time, and return the empty boxes? A. No; I would not say the same boxes; they have lots of boxes—any amount of them, hundreds of boxes.

Q. What kind of sacks were those? A. Gunny sacks; common ones.

Q. About how high would they be when they were full? A. About that high [showing].

Q. About two feet high? A. Potato sacks; what commissioners use for potatoes.

Q. Gunny sacks, such as commissioners use for putting potatoes in? A. Yes, sir.

Q. The first time you burned them, about what hour did you commence burning them down there in the car shops? A. I don't know about the hour; probably 8 o'clock.

Q. Saturday morning? A. Half past 7 or 8.

Q. On Saturday morning was the first? A. Yes, sir.

Q. Then when did you commence on the second time? A. We commenced then about—Monday we commenced about 10; maybe half past 10.

Q. The same parties present each time? A. Yes, sir. Now, not all parties, because only two of us fired the pump-house boilers.

Q. Why did you change from the car-shop furnaces to the pump-house boiler? A. As I understood it, because they put the steam down—the books would not burn.

Q. How do you mean—putting the steam down? A. In the car shops they fire with shavings from the cooper shop and car shop; there is nothing but bones and shaving and small stuff goes in there.

Q. It don't keep a steady fire? A. Yes; the shavings keep a steady fire; but when books went in they didn't burn rapid enough to keep steam up, so the steam went down.

Q. And then you had to go over to the other shops. What kind of furnaces have you at the second shop? A. Just a common—I guess Sterling boiler; I don't know the name of the boiler. I know we fired the boiler from about 10 o'clock, I guess, till half past one—we put these books in.

Q. Large, solid books burn fast or slow? A. I judge they burn kind of slow. Paper burned all right and kept up good steam.

Q. But the heavy books in the first furnace practically put the fire down so low that you could not run? A. I don't know, but that is what I understood.

Q. How far is the second furnace from the first one—the same building? A. No; there is the pump house on the river, and the car shop is on the hill.

Q. The last books were burned by the river in the pump house? A. Down by the river.

Q. Who all did you see up there at the general offices besides the two you have given? Moran is one you have given and Gabeline is another. A. He don't know anything about the burning of those books.

Q. Moran helped you at the general offices; Moran helped you at each place at the general offices? A. Through the whole transaction.

Q. Through the whole transaction? A. Yes.

Q. From whom did you get your orders to go up to the general offices and do the burning? A. The car shop foreman.

Q. That is Mr. Moran? A. No.

Q. Who is the car shop foreman? A. His name is George Fields; he is the car shop foreman, or was at that time, because the master car builder was away at that time, and he was acting as master car builder.

Q. When did he give you these orders, with reference to the first that you started out; on the same day; on Friday? A. What orders?

Q. To go after these books, or to go up to the general offices? A. Yes, he gave me orders to go up to the general offices and get these books.

Q. About what time of day was that on Friday? A. On Friday, I should judge, about half past 9 or 10 o'clock in the morning. We got up there about 11. I should say, as near as—I would not swear to the exact time, because I don't know, though it was before dinner time when we got up there; the clerks were all there yet.

Q. The clerks were all in the office yet? A. When we got up there.

Q. Was anybody in the office when you were moving these boxes out? A. They were all in there—all the clerks.

Q. Did anybody up there give you directions about getting them out other than Moran? Who

gave you directions about where to get the boxes up at the offices? A. They had the boxes tagged for distribution.

Q. What places were they tagged to—to what places were you to take them? A. Well, now, I couldn't tell that; I don't know whether they were tagged for the car shop or just Charles Hogan, for distribution.

Q. Who is Charles Hogan? A. He is general superintendent, as I understand.

Q. Tagged to him. Where does Charles Hogan hold forth? A. What is that?

Q. Where does Charles Hogan have his headquarters, at the Broadway or Independence street shop? A. I believe his headquarters is at Broadway.

Q. What kind of a looking man is he? A. A fine looking man.

Q. Black-mustached man? A. No. He is a young man; he has got no mustache at all; smooth-shaven, clean-faced; not a very oldish man. He is superintendent. He can tell you more about those books than I can.

Q. That is Charles Hogan? A. Charles Hogan.

Q. I was informed he could, but we were not able to subpoena him yet.

Q. (By Mr. Jenks.) You believe these books that were burned were the ones you required Mr. Squires to produce? A. That is the fair legal presumption from the testimony, considering the size of the books the size of the boxes, the number, the circumstances, and the refusal to produce them afterwards, although Mr. Kline in open court stated that they had not destroyed them, that they had them yet, and that they would not produce them on request of the chief justice of the court. They absolutely refused to produce them, and relied upon their constitutional privilege to refuse to answer. The exact testimony as to the burning of the books I will furnish you for your own conclusions. The only purpose in bringing it in here is to show you we are adopting their explanation as to profits, the way they distribute them, etc. the reason being that we do not have the substantive evidence which they keep from the public.

Q. You have spoken of the trust certificates—perhaps you can furnish us a copy of those. A. Yes; I also hand you this list of dividends declared by the Standard Oil Trust and the amounts. It is part of Mr. Rockefeller's testimony.

DISTRIBUTION OF TRUST CERTIFICATES—SALARIES.

Q. (By Mr. Phillips.) For what period? A. Covering from 1892 to date, if you wish them. If you care to have it, I will furnish you a copy of a share of trust certificates that were issued to the original stockholders, Mr. Rockefeller receiving more than any other man. He received, January 1, 1882, for his stock in the Standard Oil Company of Ohio alone 191,700 trust certificates. His interests in the Standard Oil Company of Ohio netted him in trust certificates alone, at that time, a par value of \$19,170,000. Mr. Rockefeller receives \$30,000 a year salary, as

I understand it, from the Standard Oil Company of Ohio, which was the amount he received originally as chairman of the trustees of the Standard Oil Trust. The trustees of the trust held 466,280 shares. They also hold more than half of 35,000, about 23,314. Mr. Rockefeller seems to have held the majority of these, or the balance of power—that is, of the 17,000 shares he holds 9,585 shares.

MR. ROCKEFELLER HAS ABSOLUTE CONTROL.

Q. That gives him, individually, absolute control?

A. Yes; it is a scheme whereby, when these 20 companies were once in the trust under the control of the 9 trustees, Mr. Rockefeller could control the trustees. It is practically a one-man power for the whole organization, and when you look at it, he, as an individual stockholder, assigned to himself as a trustee, and then as a trustee assigned to himself as liquidating trustee, which he is still. He has, with his henchmen, the power to fix his own salary and those of the trustees, and when sifted to the bottom I think it is a fair deduction to say that he has control.

Q. (By Mr. Jenks.) If I understand you, he does not need the aid of his "henchmen?" A. Not for part of these companies. Before a man could have his trust certificates reconverted into constituent stock and get out of the trust he would have to hold \$66,000 worth. In other words, the men who hold the larger amounts and who are the trustees, are able to convert their certificates and still hold the balance of power in the 20 constituent companies, having the voting power now as they had before. They have, to all intents and purposes, the opportunity, at least, to absolutely control the 20 companies as much as they had before the decree; the decree has not bothered them except in bookkeeping.

Q. Will you make it a little clearer how the organization of this company brings that about? A. I understand that the owners of the original constituent stock, in turning it all over to the 9 trustees, got in return a fractional part of the stock of every one of the other companies. When they came to convert their trust certificates back into constituent stock they did not own a distinct portion in any one company, but a portion in all the 20. They might have enough trust certificates to secure, we will say, two shares in a large company and but three or four in any others, but not enough to secure more than fractional shares in the small companies, from which they could receive no dividends, fractional shares not paying dividends. Therefore, there is no inducement to persons holding trust certificates to turn an investment paying 35 per cent on their original purchase into something for which they can get nothing, viz, scrip or fractional shares. Such persons are forced to stay in the trust, or hold trust certificates; but the larger owners can get theirs reconverted, and they, being so few in number, and being trustees, are still in command.

AMOUNT OF DIVIDENDS PAID BY THE TRUST.

Q. You stated that the holders of the trust certificates were receiving 35 per cent on these certificates. A. I will give you the exact figures. I should say that the 972,500 original trust certificates only represents a part of them, for they had it in their power under this contract to issue practically what they pleased. December 15, 1898, the liquidating trustees, that is, Mr. Rockefeller, representing the Standard Oil Trust certificates, held their meeting November 3, 1898, at 26 Broadway, and December 15, 1898, adopted the following resolution:

New York, December 15, 1898.

At a meeting of the liquidating trustees of the Standard Oil Trust, held November 3, 1898, the following resolution was adopted:

Resolved, That there be divided, from the income of the stocks still remaining in the hands of the liquidating trustees, a sum equal to three dollars (\$3) upon each share of said trust; also a further special sum equal to four dollars (\$4) upon each share of said trust, payable on and after December 15, and that the transfer book be closed from 3 p. m., November 16, to 10 a. m., December 16, 1898.

Enclosed please find check on National City Bank of New York for your proportion of the distribution, in accordance with the above resolution.

No acknowledgment.

(Signed) WM. T. WARDWELL,
Assistant Treasurer.

The following is the form of the check:

No. A B 2523. New York, December 15, 1898.

National City Bank.

Pay to the order of Geo. Rice forty-two dollars.

Trustees to liquidate Standard Oil Trust.

By H. M. Flagler,

\$42.00

Treasurer.

Being quarterly payments, these dividends would be at the rates of 12 and 16 per cent per annum, which would be nearly 30 per cent for that year on the original basis of value. According to this, 35 per cent would seem to be a fair deduction. In 1892, after distributing \$3,121,725 surplus, which they had on hand, among the holders of 972,500 shares, they distributed \$3.21 on each \$100 of surplus. On March 15, June 13, and September 15, they paid \$3 a share upon the trust certificates. On May 20, September 15, and December 15, 1893, they paid \$3 a share, and on March 15, September 15, and December 15, 1894, \$3 a share.

Q. (By Mr. Phillips.) Is \$3 a share generally a quarterly payment on \$100? That amounts to \$3,000,000 per quarter, \$12,000,000 per annum. A. Their dividends at one place were given at \$24,000,000. That included the dividend on stock, 51 per

cent of the trust certificates having been turned back into stock, while 49 per cent are still held as trust certificates. That is the dividend annually on the trust certificates.

Q. Three dollars per share each quarter? A. Yes. On March 15, 1895, they paid \$3 a share, less the income tax, which, I suppose, was returned to them; on June 15, 1895, they paid \$3 a share, less 6 cents per share, in anticipation of the income tax, the income tax case then being in the hands of the court; on August 21, 1895, they paid \$3 a share, and on November 20, 1895, they paid \$3 a share and \$5 extra. The next quarter, March 17, 1896, they paid \$3 a share and \$5 extra.

Q. That would be \$13,000,000 in that quarter? A. Yes; that quarter. On August 4, 1896, they paid \$3 regular and \$7 extra; on November 5, 1896, \$3 regular; on November 18, 1896, \$3 regular and \$2 extra; on May 19, 1897, \$3 regular and \$7 extra; on November 17, 1897, \$3 regular and \$5 extra. That takes it up to time for which I asked data. I have summarized here somewhere the total dividends paid up to that date. I think I can get that for you. I have summarized it in a statement to the court.

SALARIES, ETC.

What the 20 constituent companies paid out to directors and their respective officers we have no means of ascertaining, except for the one Ohio company. It is probable their salaries run from \$40,000 to \$50,000 for the president of the larger companies. Of course, under the decree of the court, they have to pay these salaries through some other device than the trustees. They must now pay them through the constituent stock companies. Mr. Rockefeller, on cross-examination, said he receives his income or dividends from his holdings, just the same now as he did when they were in the trust, but in a different form. He receives them as holder of a certain number of shares in the 20 companies, which he says are now resolved into constituent stock, while before that he received it in dividends on trust certificates. Mr. Corrigan's testimony and the pleadings set forth that Mr. Rockefeller held, since 1892, a large block of these trust certificates as collateral security and was the beneficiary of the income for his protection. As I said, that was in a separate suit, and will be found in the testimony of Mr. Corrigan.

VALUE OF TRUST CERTIFICATES BASED UPON INCOME.

The present value of the certificates based upon income is 500 times 972,500. As a prominent judge puts it: "There is no expert who is better qualified to testify as to the value of a plant than the shrewd manipulator and buyer in the open market. Considering the fact that three-sevenths of the trust certificates have not been reconverted, in connection with Mr. Rockefeller's testimony that he gets his interest just the same now as he did before, the pres-

ent value of the aggregate stock of the companies and the trust certificates may be fairly estimated at \$486,250,000, provided they have not issued, as they could under the trust agreement, more than the original amount of trust certificates. If that is all of the trust certificates that are out; they would now be worth, instead of \$97,250,000, their original estimated value, at least five times that amount; and if the constituent stock is worth, in the hands of the trustees or the holders, the same, being in a different form only, that would be the stock value.

Q. (By Mr. Jenks.) Have you anything further in regard to evasions or profits that you can furnish? A. No; you can make your deductions from these figures, I guess.

THE PURCHASING AND DISMANTLING OF COMPETING PLANTS.

Can you give us any information on the question of the purchase by the Standard Oil Company of competing companies and the dismantling of their plants? A. The refining plant at Whiting, Ind., has absorbed the business of the plant at Cleveland since 1892, making a fair deduction from Mr. Squires's testimony that they charged off the two items I have heretofore given you. They have reduced their men more than two-thirds in Cleveland and transferred them to other fields. If you will call Mr. D. W. Brown, of Cleveland, and Scofield, Shurmer & Teagle, you will get the data on this subject. I am only giving the conclusions. After establishing the new plant at Whiting, they got a freight rate to southern fields, e. g., New Orleans, of 23 cents a barrel, as against one of about 33 cents and a fraction from Cleveland; in other words, Scofield, Shurmer & Teagle, competing from Cleveland, were handicapped by the difference between 33 cents and 23 cents in freight rates, almost 50 per cent more freight in sending to a distributing point in the south. The commercial wisdom of their establishing a plant at Whiting and shipping at a lower rate over the Illinois Central is very apparent, for no other competitor could start from Whiting or ship from there. While they would not dare, under the inter-state commerce law, have a different rate for different people from Cleveland or from distributing points, they managed to get different rates by changing their refineries to noncompeting points.

As to the dismantling of the plants at Marietta, I think I can give you the data from Senator Davis's testimony. They practically dismantled all the competing concerns there and at Parkersburg, and left nothing but a burnt-out crater. The last one to go was the Argan Refining Company, which they could not dislodge because its owners, Mr. Rawn and Mr. Peabody, were the directors of the Baltimore and Ohio Southwestern Railway, and the oil trade was a source of large profit. One of the opportunities for discrimination in freight rates consists in the bookkeeping arrangements between the Standard Oil Company and the railroads concerning the price to be charged up against the roads for lubricating

oil furnished by the Standard. As they did not furnish the lubricating oil to the Baltimore and Ohio Southwestern under Mr. Rawn, they could not freeze out or exterminate the Argan Company; hence they bought the plant, paying \$12,000 a year to remain idle, and are now dismantling it. They have taken up the pipe line leading to the plant. Although the Argan continued selling oil, apparently in competition with the Standard Oil Company, it was in fact the Standard Oil Company's own plant. The Argan people get \$12,000 annually, besides a bonus that was paid down. I think the plant is to remain idle for 10 years, but at the end of 10 years, at the rate of the present disintegration, it will continue to remain idle. I advise you, if you will allow the suggestion, to get ex-Senator Davis, of Marietta; he is a very intelligent gentleman and can give you the data with reference to the destruction of competing plant at that point. Mr. Peabody was the other man who had an interest in the Argan. They furnished the lubricating oil to the Baltimore and Ohio Southwestern from the Argan. The Argan was able, with that advantage, to compete with the Standard, which could not destroy them.

Q. Have you any information in reference to the prices paid by the railroads to the Standard for lubricating oil? A. No; I can not give you correct data; you can get railroad men on that point; if you call Ira Rawn, of Cincinnati, you can get the information; Mr. Peabody died about six weeks ago. After the Corning field was opened up, above the Macksburg field, they raised the transporting price of the pipe line to 17 cents. At 17 cents it was unprofitable for the owners of those fields to ship to Parkersburg or Marietta. In gaining control of the transportation department, you will find, gentlemen, lies the secret of the maintenance of discrimination in favor of commercial trusts.

TRANSPORTATION COMPANIES EXERCISE PUBLIC FUNCTIONS, AND COULD BE CONTROLLED.

If Congress would enact laws, or if the executive officers would bring these companies before courts, they could be punished, for it is to be remembered that the right of eminent domain can not be exercised by corporations except as granted to them. The right of eminent domain is authority for a corporation to take private property for public purposes. If, after it is once so taken, the corporation having that governmental function vested in it were held down to the same strictness in its exercise that the Government holds all other officers exercising similar functions, there would be very few of these industrial combinations. It is a plain proposition that these trusts must necessarily link themselves with sovereignty, and it is entirely inconsistent with the fundamental principals of the Government that corporations so obtaining private property should use such property in any other manner than for the public good. If an assayer, or a man commissioned to coin money, who is only exercising a governmental function, should clip the coin and make it

light weight, and profit by the difference, he would no more be violating the principals of the franchise he is exercising, in a moral or commercial sense, than these men who take public property, as a pipe line company or a railroad company, for the purpose of a common carrier, which they can get only through power from the State, and afterwards use it for private ends. The remedy is simple; it is one in which the courts have never once faltered when it is presented to them. When a corporation exercising governmental functions, such as the right of eminent domain, does not return the contractual relation to sovereignty required of it, viz, that of a common carrier, its charter should be taken from it, or, if that be too drastic, the franchises it is now exercising should be taken away. Whenever a common carrier or railroad company undertakes to water its stock or to discriminate between one town and another, or whenever it undertakes to get advantage through a tank line freight rate as compared with a barrel rate or other means of shipping, it could be easily made a ground for forfeiture; it is all under legislative control. It is a violation of the fundamental contract they made when they accepted the charter. It is not true that it is due to a difference in talent and ability that such men as the trustees of the Standard Oil Trust have been able to defeat their competitors; it is a matter of a criminal abuse of the commercial privileges they have received. The railroad company or the pipe line company has no more right to abuse the power granted it by the State in its charter than the man who is coining money on contract for the Government has to coin 50 cents of metal into a dollar; it is just as much a crime as the violation of any other governmental function exercised by an executive officer.

GOVERNMENT SHOULD MAINTAIN COMPETITION.

Q. Would you favor the regulation of rates by the Government itself? A. I have answered that. While I am not a believer in Government ownership, with the present limited civil service, I do say that the remedy is for the Government to maintain competition. The competition of giants with one another will regulate their conduct, but a pigmy can not compete with a giant. There is no one man so strong that, if the Government does not assist him, he will not find a competitor.

Q. Is it your idea that the pipe line companies should be forbidden to discriminate, or that the Government should hold the rates down to what is reasonable? A. If a pipe line company charges 20 cents, when it costs less than one-tenth of a cent a barrel per mile for shipping, it is an abuse of a governmental function, and the company ought to have its charter taken away for excessive charges. Persons obliged to compete under the circumstances are like farmers who should have to pay \$3 to \$5 a load for hauling their wheat, while some one else has the public right of hauling his for a dollar.

Q. Have you any specific suggestion as to how that rate could be held down? A. The Cudahys, at

Chicago, would run a pipe line; they have been for years trying to get a pipe line privilege in Indiana and Ohio. One of the independent men, of New York, said he would give \$24,000 for three miles of line to connect up his lines with the seaboard. Whenever a common carrier is undertaking to thwart a competitor the Government should interfere. If the owner of a public utility is obliged to submit his rates to open competition there will be no more oppression in that department than in any other.

GROSS RECEIPTS AND PROFITS FROM THE BUSINESS IN OHIO.

To illustrate, the Buckeye Pipe Line had a gross income in 1898, ending May 1, from the Ohio fields, as I understand it—and this is the sworn report of Mr. Theodore M. Tole—of about \$6,763,094.64.

Q. What is Mr. Tole's official position in connection with the organization? A. He is called the tax agent of the Buckeye Pipe Line Company. He is of New York. You will find him also making reports for the Standard companies, although these companies claim they are not a trust and have no connection with the trust. They have a faculty of having the same tax agent and the same attorneys and the same telegraph companies and other common agents, that give it a colorable union, to say the least. The gross receipts were \$6,763,094.64. The universal rate everywhere, except on oil right from the field at Corning, has been 20 cents a barrel. In 1897 their gross receipts, at 20 cents a barrel, were \$6,800,833.19. Their gross receipts for 1896 were \$5,941,567.85. The total gross receipts for these three years are \$19,495,495.68 for the Ohio business. Counting the shipping price at 20 cents a barrel, the total amount received from the Ohio fields for three years would be 97,472,475 barrels, or over 30,000,000 returned for taxation, is the amount shipped through the Buckeye Pipe Line. The leasor gets 60 cents a barrel for one-sixth of the oil, and at that rate the landowners received out of their Klondike of wealth, for the three years, \$9,747,000. We have no means of knowing what additional royalties or sub-contracts they make. At the rate of \$4 a barrel, the noncompetitive price of oil, the gross receipts for Ohio would be about \$120,000,000 a year.

Q. This is refined oil you are speaking of? A. This is the refined oil at their noncompetitive price of selling. They get 8 to 11 cents. I will assume in this that when the Buckeye Pipe Line Company give us the gross receipts for Ohio business their oath is correct, and that they get 20 cents a barrel for all the Ohio oil shipped. The Ohio landowners, for the three years, receive a little over \$3,000,000 annually. It takes about four barrels of crude oil to make three of refined, and the shrinkage of one barrel, or one-fourth, is made into by-products, such as paraffin, axle grease, etc., for which they get as much as the refined oil, so that they practically average, as experts tell me, \$4 a barrel, making, at this time, about \$120,000,000 gross from the Ohio

product. Figuring it in round numbers, all over $3\frac{1}{2}$ to 4 cents per gallon is net profit; it can be delivered at that price in Ohio. In fact, they cut it down to 4 cents a gallon whenever they have competition. They get 8 to 11 cents when there is no competition. The value of all the farm products of Ohio (I mean by farm products wheat, wool, oats, barley, live stock, etc.—taken from the tax return valuations is between \$52,000,000 and \$53,000,000. The oil combination's profits, if our deduction is correct, are about equal to the combined incomes of the farms in the State. In other words, by their system of noncompetition, consumers, on the one hand, pay much more, and the producers, on the other, receive that much less than they should. They drive the producer and consumer that far apart. There is no secret in the refining of oil; there is no patent on shipping; it is simply in stealing the powers of the Government, thereby controlling transportation. The State is now seeking to take away the charters of such companies as abuse their powers and franchises in this way.

BASIS OF THE LEGAL PROCEEDINGS IN OHIO.

Our action is based upon the statutes of Ohio and upon the cases of Darcy vs. Allein (Coke's Reports), and Richardson vs. Buhl et al. (77th Michigan, 632; the Salt Company against Guthrie (35th O. S., 666); and Emery vs. Ohio Candle Company (47th O. S.). It is no new principle. That will be the remedy. Under our Ohio law, when a corporation violates its charter by ultra vires acts, or is exercising a franchise contrary to the statutes, the State revokes the charter, the courts appoint two trustees, who have the functions and powers of a receiver, who take charge of the business and wind it up and sell it to law-abiding investors. The iniquity of the Oil Trust in Ohio is for the owner or the one producing the oil and getting barely the lowest competitive price for it to be paying at the same time a trust price for the refined product; and it is no answer to say that a small number of people get the best wages because they are hired by the trust, when the great body of the people are contributing in receiving a mere pittance for crude oil.

EFFECT OF THE STANDARD OIL COMPANY ON WAGES.

Q. Can you give us any data regarding the effect of the Standard Oil Company on wages? You called attention to the fact some time earlier that it threw a great many people out of employment through the destruction of competing plants. A. That you will get from men who have the actual data. It necessarily throws all the men out of employment when they dismantle a plant.

Q. The specific data on this point you have not yourself? A. I can give you the original testimony later, when it is printed; but if you will get Mr. Davis and Mr. Butts, of Marietta, and Mr. Rice, formerly of Marietta, they can give you the exact data and the losses. I have given you the facts

concerning the Argan Company. The trust shuts out all competition in the payment of wages, because while men may go into the oil field and buy oil they can only ship it through the trust's transportation department. There is no competition in selling, for there can be no competition where the Standard is the sole buyer. If you select an oil field anywhere in Ohio, you can not get to a refinery except through their pipe lines. It is true they furnish you a market but if you do not take their price you can not start up; you can not refine; the moment you refine and go to ship you find yourself blocked; they will destroy your plant by reducing the value at a given point and raising it at noncompetitive points, so that they will be no losers themselves. I have a few statistics on the prices of oil at competing points and noncompeting points which I will leave with the commission if they care to have it.

RELATIONS OF THE STANDARD OIL COMPANY AND THE PRESS.

Q. Can you give us any information with reference to the influence of this company on public sentiment? It is asserted, is it not, that they control the press more or less completely? A. Well, in view of the fact that some newspaper reporters are here, I presume it would not be a very wise thing to discuss that. The Standard Oil Company of Ohio, after this suit was begun, through Henry M. Apthorpe, of Cleveland, and Mr. Jennings, of Columbus, organized what is known as the Jennings Publishing Advertising Agency. At the time we took our testimony at Marietta we found several men who had received marked copies of certain papers in Ohio making a fervid defense of the Standard Oil Company; and while they did not try to abuse the court, they were abusing the attorney-general and other officers of the court, which meant, in fact, the court. It was said that capital was being driven out of the State; that the Standard Oil Company was liberal in wages; that they had given largely to charity, and that they were also about to donate something to one of the State universities. I was handed a contract while I was examining a witness at Marietta, a typewritten contract, that they had negotiated the week before for one of the Marietta papers.

Q. That is, to purchase the paper outright? A. No; the earlier part of this contract referred to advertising the paraffine and other by-products of the company, and then they had six or eight lines which contracted for space on the editorial page, where their matter was to appear as news, and if it did not so appear, or there was any mark of advertising about it, the papers were not to receive any pay. For such matter as would be furnished them, by boiler plate and other means known to the newspaper world, they got from 20 cents in the larger cities down to 4 cents in the smaller ones, for news items: and then if the county papers were assiduous in defending the merits of the trust's charitable undertakings they would take thousands of copies of

them and send marked copies to proper parties. If you have run across some of your constituents who are being oppressed by the price of oil, they should be satisfied thoroughly by marked copies of Gunton's Magazine and the Sandusky, Ohio, papers.

Q. (By Mr. Phillips.) You do not mean to say that Gunton's Magazine is in favor of trusts, do you? A. If you want to get the best, get Gunton; I think Mr. Tole's speech was there. A leading daily in the State has been having a great many articles in favor of the trusts on one page, while on other pages appeared articles demanding anti-trust legislation, although Ohio has perhaps as stringent a law as any State in the country. They were demanding more legislation and investigation. Now, you might say they imagined our trust investigation last winter was done to put off ultimate action. We find that investigations similar to this are very useful in enabling a legislature to get down to bed-rock facts, as in the short session of legislatures no committee can do what you are doing, and when legislation is backed up by public sentiment the law can be enforced. I have aimed not to be partisan in the matter, but I feel that the operation of some of the trusts in Ohio has been so against the average citizen that anything that can be done to relieve them ought to be speedily done.

STANDARD OIL COMPANY AND POLITICS.

Q. Have you any information as to attempted influence of the Standard Oil Company in politics, aside from what you have already explained and aside from any connection with the press? A. Well, I expect it would not be advisable for me to discuss that. Mr. Harris lives in Ohio; he may give you the names of contributors; I suppose we could all give names of people we suspect collect these funds, but I do not want to testify on that.

Q. It may be you can file official papers with us or give us transcripts of testimony in the case of the alleged attempt at bribery of the attorney-general of Ohio? A. I can give you just what I file with the court, when the testimony is through. I shall be glad to give you an official transcript of whatever is taken.

METHODS OF DRIVING OUT COMPETITION.

Q. Can you give us any official information with reference to any other trust organization in the State of Ohio besides the Standard Oil Company? You have already spoken briefly with reference to combinations of insurance companies; can you tell us with reference to any others? A. Before I leave the Standard Oil Company it might be interesting to the commission to speak of the means which they adopt for driving out competitors. Mr. W. H. Clark, of Newark, Ohio, for seven years an employe of the Standard Oil Company in their retail department, would give, I think, full information to the commission on the subject. After he left the employ they arrested him, charging him with embezzlement; they only found this charge against

him, as his testimony showed, after he commenced selling independent oil for an independent company. He has had the same experience as the testimony before our trust committee showed that all competitors have. His sworn testimony is that he sold four grades of oil for the Standard Oil Company out of one tank; that he turned the faucet to the right for one kind, to the left for another; and that if that did not suit the customer he went to the front end of the wagon and switched the faucet there a little. The Standard Oil Company corroborated that a little, except that they said they gave a higher grade of oil than that called for, if they did not have the grade desired, at the same price. That was their defense to it.

They have a plan of sending agents around—I think competitors call them buzzards—where there is competition, to follow up the competitor's wagon, take the name of the customer and the amount of oil sold, and mail it to the central office of the division. A special agent of the Standard Oil Company is then sent out who follows up the competitor, making tests. He will clean up the lamp of the customer of the competitor, make a test, and then leave their own oil of as high a grade as the competitor's. If they can not succeed in that way they then commence cutting rates, and the rates are cut below a living price or until they have driven out the competitor. Then the man who is inspecting and following the competitor goes to another town where they have competition. When they have driven out competition in a given town the oil goes back to the old price. They sold oil for 4 cents at Dayton, where they had competition, while at Urbana it was 8. These towns are but a short distance apart. You will find when you get experts upon it that they not only had the same grade of oil at different prices in the same town at the same time, but that they have had as much as 50 and 60 per cent difference in towns 30 miles apart.

THE TRUST PROBLEM STATED BY LORD COKE.

The experience has been substantially, I think, as Lord Coke put it in that original proposition. I would like that to go into my testimony. He laid down the proposition that every court from that day to this has substantially followed. I cite that case, which is approved, and which is a very good analysis for a commission or a court to go by. It is the old case of *Darcy against Allein* (Coke's Reports, Part XI, 84 b). He says: (1) "That the price of the same commodity will be raised, for he who has the sole selling of any commodity may well make the price as he pleases." (2) "The incident to a monopoly is, that after the monopoly is granted the commodity is not so good and merchantable as it was before, for the patentee, having the sole trade, regards only his private benefit and not the commonwealth." (3) "It tends to the impoverishment of divers artificers and others, who before, by the labor of their hands in their art or trade, had maintained themselves and their families, who will now

of necessity be constrained to live in idleness and beggary."

Q. (By Mr. North.) What is the date of that case?

A. It is an old case, two centuries old; it has been cited by all our authorities. It is an analysis of the effect of trusts; you have the benefit of all the courts in England and this country who have followed that decision.

POSITION OF THE ENGLISH COURTS.

Q. Are there any analogous English cases? A. Oh, yes; they commenced in Queen Elizabeth's time by the sale of franchises, by which one person could buy and sell exclusively all of one commodity; and in the case of salt and iron, where court favorites having exclusive control had become so rich and arrogant in dividing with sovereignty, the courts, independent of parliamentary acts and independent of precedent, revoked their charter, or individual franchise, for it was then called a franchise. Since then, if you look down through the reigns of the Georges and Victoria, you will find that they have had parliamentary legislation and court decisions down to date against monopolies. Under some parliamentary acts they have sustained a limited monopoly. In transportation you will find England has sustained what we call pooling, but under our decisions pooling is as obnoxious as any trust. The steamship companies have succeeded in getting a parliamentary act relating to pooling in rates that has been sustained.

Q. (By Mr. Jenks.) In the *Mogul Steam Navigation* case?

Q. (By Mr. North.) Have you any knowledge of the methods of the German Empire in that case? A. No; nothing more than a text-book knowledge, the same as you have access to. You have access to all that.

Q. (By Mr. Jenks.) Can you take up the case of some of the larger companies that you have brought suit against? A. Well, I have brought suit against the brewery trust of Cleveland.

PRESENT STATUS OF TRUST LITIGATION IN OHIO.

Q. (By Mr. Phillips.) Before passing to that, would you be willing to give to the commission the present status of the litigation against the Standard Oil Company in your State? A. The Standard Oil proper of Ohio, as I said in the beginning, has a decree against it; it is an adjudication that it is a trust in Ohio; that it is a scheme or system whereby the stockholders or a majority of them entered into this combination, and that their act is the act of the company. The corporate fiction will be ignored when the acts of the stockholders accomplish corporate oppressions, and so far as this one company is concerned, which was the only one party to the original contract, it is a denounced contract. The violation of the decree, their failing to withdraw from the trust, is what the contempt proceedings were instituted for under the order of the court. We have taken the testimony of Mr. Rockefeller by in-

terrogatories, also parol testimony of about two days, and the testimony of F. B. Squires and that of John D. Archbold. We took the testimony of numerous other witnesses outside of this suit. The company refused to give substantive testimony from their commercial books, and the officers so refusing are now before the court under a charge of contempt. The evidence is being printed and submitted, and the case will be heard probably in the second week of June. The punishment for violation of the original decree can amount to any fine that our supreme court sees fit to inflict commensurate with the wealth of the client or defendant. It could amount to \$700,000 if the court chose to inflict so much of a penalty. I think it is deserved, and I am maintaining that the punishment in contempt, besides a fine, could extend to taking the charter away without further action. But as there is no precedent for taking a charter away as punishment in contempt, we have an independent action for that purpose against the Standard Oil Company of Ohio, charging them with additional offenses. Now the later suits were commenced for the purpose of forfeiture of the charter and the testimony taken in those proceedings is quite voluminous. We have a suit pending against the Buckeye Pipe Line Company under the charges I have related to you, with a large amount of testimony taken, and witnesses are now before the court for contempt for refusing to answer questions submitted to them. So that the executive department, the attorney-general's office, has presented the testimony up to the point where the court will have to decide what they can be compelled to answer. Their defense is that it is violating the Federal Constitution as well as that of the State to compel them to disclose their acts of a private nature. We contend that when the sovereignty inquires into the acts of its creatures it does so in accordance with the visitatorial power which is reserved to the State, and that it is simply a legal anomaly to say that the government can create a creature and then not control it, just as the national banking act permits the National government to investigate the banks. So that if the contempt proceedings are heard in June—and I think they will be—and if we are successful and the officers of the company are held in contempt, they will incur the penalty. Mr. Rockefeller's testimony has disclosed the amount, more than half, of the trust certificates that the stockholders have redeemed up to the filing of the petition, in November, 1897. We should then be in this condition: We should have the transportation department for the crude petroleum of all the other companies that do business in our State under control, and it should be in the hands of a company that would permit competition and an open and equal chance to all producers.

Q. (By Mr. North.) As a result of winning your pending suit? A. Yes; the Standard Oil Trust or the Standard Oil Combination could not exist without the control of the transportation of the crude petroleum and this suit aims at the very heart of the trust, namely, the transportation department. It would effectually control it. It needs no further

legislation. The National Congress can not regulate it so far as Ohio is concerned, because it is an Ohio creature, but so far as inter-state business is concerned you would have jurisdiction over that. The remedy is primarily with the attorney-generals of the various States where the charters are granted. The attorney-general of New Jersey could solve this question in sixty days if he would take the charters away from New Jersey companies that are violating the public policy of the country, viz, that no creature of the government can use its power to the injury of the government or to the injury of the people.

Q. Do you believe that the Federal Government can accomplish anything through the jurisdiction over the corporations created by one State and doing business in a great many others?

WITNESSES IN TESTIFYING SHOULD NOT BE HELD TO INCRIMINATE THEMSELVES.

A. You have been having that fought out in the Supreme Court of the United States in the Stockyard Cases. They held they could not. The Addy-ston Steam-pipe Case, that is now being argued, is on the same point; but all corporations, like the Union Pacific, that have been created by the Federal Government and are doing inter-state business, are reached by the Sherman anti-trust act. Michigan, I think, has adopted an anti-trust act similar to ours this year, but introduced a clause like that in the inter-state commerce act, which provides that any witness testifying concerning a trust shall not be held to criminate himself, and the testimony so given can not be used against him. The United States Supreme Court has said that this exemption shall be given to a witness, and that any testimony that he has given is a privileged communication, the same as it would be before a Congressional investigation like this. That will prevent a witness from stating, as they do in case of material testimony, among other objections, that it tends to criminate them. The Standard Oil Company refuses to give testimony now in Ohio because the testimony would tend to criminate the officers. But that Michigan clause will forbid the witness from using that constitutional prerogative by making it a privileged communication, and all trust laws should contain that clause.

Q. (By Mr. A. L. Harris.) Which State report is that oil case in? A. Forty-nine, O. S.

Whereupon the commission took a recess until 2 p. m.

Washington, D. C., Tuesday, May 16, 1899—p. m.

Hon. Frank S. Monnett again on the stand and examination resumed:

Q. (By Mr. Phillips.) Does any member of the commission desire to ask any questions?

Q. (By Representative Otjen.) What did I understand to be the income, the profits, of this trust in Ohio during the year? A. The gross receipts from non-competitive prices would be 120-odd million dollars; and, taking the best information as given before our various investigations that the refined oil could be

livered in Ohio for less than 4 cents a gallon, it would make a net profit on the Ohio oil, which is about 40 per cent of all the oil produced in the United States, in the neighborhood of \$50,000,000—\$50,000,000 to \$53,000,000.

OIL CAN BE RETAILED IN OHIO AT FOUR CENTS.

Q. Did I understand you to say that it is your opinion that the oil could be sold in Ohio at 4 cents a gallon; that that is about the cost price of oil? A. It can be retailed at 4 cents in Ohio at a profit.

Q. At 4 cents? A. Yes; 4 cents. There is testimony placing it at a point even below that. Is that too low a price?

Q. That is the refined oil? A. That is the refined oil. There was testimony that the cost was lower than that; but that is for the refined oil.

Q. In places outside of Ohio there would simply be in addition the cost of transporting it? A. Yes; the cost of transportation depends usually upon the arrangements from the distributing centers with the Union Tank Line Company.

Q. Of course in some places it would be higher than in others? A. At water points like New Orleans and New York, where they meet the competing water lines, the rates are much lower than they are e. g., 150 miles north of New Orleans.

Q. Is that true of such places as Detroit, Chicago, and Milwaukee? A. Yes; as compared with such points as Duluth, Detroit, Milwaukee, Buffalo, and Cleveland, you will find, if you investigate any transportation department, that the rates on all commodities at inland points are much higher, as a rule. In other words, the low through freight rate is made up by charging excessive local rates; and that is true of oil as well as of other commodities. The competition—from testimony before our railroad commission last winter—of the Canadian Pacific, a subsidized government road, compels our roads, in order to compete, to make a cheaper rate per ton per mile than they have had where they did not come into direct competition with the subsidized railroad, and when they are practically below cost at a competing point they must make that up at inner shipping points, so that there is discrimination against inland States like Ohio, Indiana, and Illinois, so far as the local shipping is concerned, to keep up the general average.

THE CHARGES OF BRIBERY AGAINST THE STANDARD OIL COMPANY.

Q. (By Mr. Kennedy.) I should like to ask the witness whether he has any knowledge of attempts by the Standard Oil Company to interfere with judicial proceedings against them by resorting to bribery? A. As I said to the commission this morning, the bribery charges made against them are made officially in a complaint in the Supreme Court, beginning with General Watson, naming the parties, and bringing the case down to myself. I will furnish the commission the data we have alleged and set forth therein, with their answer and motion and my supplemental complaint,

and when the testimony is taken, which will no doubt be kept in record, I will furnish the commission that also, if it is desired. To go into the merits of the pending case I do not believe advisable. It is a matter purely with the court—a contempt matter—and will be furnished from our office just as it transpired. Mr. Watson, I suppose, will be ordered to testify before the commission at an early date. I can give you the testimony that was adduced, showing that they purchased competitors' clerks at times to furnish them, clandestinely, information as to the working of their competitors. At Cleveland, Ohio, a Scofield, Schurmer & Teagle man was to get so much a month for furnishing their rivals information. He was to furnish the amount of oil shipped, the names of the customers, the cost price, and all the details every evening to the Standard Oil Company. These arrangements were made by John Squires and afterwards by B. F. Squires, according to sworn testimony.

Q. Were they successful? A. The one I have described was partially successful. The man was bought up in some way—I do not know how—was found out. At least, he gave up the information to his employer. Testimony might be furnished to you of the witnesses in reference to Jennings' Advertising agency. That system is in vogue all over the State; wherever they can successfully do so, they employ an agent or employe of a rival company. There is one instance where an employe at the railroad station was to leave the information at a given saloon near the depot, where the Standard Oil agent gathered it. They jump onto the wagons that are hauling oil and ascertain the destination of their rivals' oil. This information is all furnished to the Standard Oil offices. They get such information free from the agents of the railroads, if they can, and if they can not they get it from others. I do not know whether you call it proper, and whether a man is at liberty to sell his time and inform the Standard Oil Company of what is going over his railroad. I suppose there is no criminality about that; yet it would be bad ethics in a postmaster to permit such information to be furnished through his employes. The Squires' bribery of a clerk was the only case of hiring rivals' clerks to furnish the data. This was brought out in court in a contest between Scofield, Schurmer & Teagle and the Standard Oil Company. Mr. Brown, of Cleveland, can give you the names and further details on that subject.

EFFECT OF PIPE LINES ON FREIGHTS.

Q. You spoke this morning about railroads in Ohio which have pipe lines paralleling them, and which are in league with the Standard Oil Company, to the detriment of independent small producers. I do not understand that you were specific in regard to these railroads. Can you be now? A. I did not put it in that way. I said that only as a deduction, viz, that where a pipe line company had been run parallel to a railroad company—I was speaking of the conducting of the whole business—that the records would show that the freights for shipping oil were raised after they had a competitor in a pipe line. The natural result would ordinarily be that severe competition by the pipe line

would bring railroad rates down lower than they were before. You can draw the inference from this that through some arrangement the rates, instead of being lowered by competition in these particular cases, were raised. I am basing that, of course, upon testimony.

Q. Do you care to say what railroads? A. I think when that came out that the Erie was spoken of; the C. & M., down by the Macksburg oil field, was one of the companies; and the Lake Shore, I think, was charged with that in a contest in which Virgil P. Kline was fighting the Lake Shore for discrimination in rates.

REDUCTION IN THE PRICE OF OIL NOT DUE TO THE STANDARD OIL COMPANY.

Q. (By Representative Otjen.) It is claimed by the Standard Oil people and their advocates that by their combination and improved business methods they reduce the price of the oil product. What is your information upon that subject? A. That is the favorite argument of Mr. Dodd and others. Calico ran down from 75 cents to 4½ cents per yard, and they might as well have credit for it; and we used to haul wheat by wagon for \$10 a load across Ohio, where they now ship it for a small fraction of a cent per ton per mile. I think that they, like every other producer, had to keep within reasonable bounds in their prices, but they have been profiting at the rate of millions out of non-competitive rates, notwithstanding the price was reduced. I think they are not entitled to the credit of the reduction because of improved methods or the great amount of oil discovered, any more than of the reduced price of any other commercial commodity. I present here a table which shows the Standard Oil Company's prices of kerosene and gasoline from tank wagons on the same day at different towns in Michigan and Ohio, where they had competition and where they had not. The figures for towns in Michigan are taken from the sworn testimony furnished our trust commission last winter. The figures for Ohio towns were prices in 1896.

Names of Towns and State	Conditions of Trade	Price of Kerosene	Price of Gasoline
Detroit, Mich.....	Competition	5.5	7
Adrian, Mich.....	No competition...	8
Ann Arbor, Mich.....	" "	7.75
Clifford, Mich.....	" "	8
Howell, Mich.....	" "	8
Grand Rapids, Mich.....	Competition	5.5	6.25
Monroe, Mich.....	No competition...	7.5	8.75
Kalamazoo, Mich.....	Competition	5.5
Bay City, Mich.....	No competition..	7.75
Lansing, Mich.....	Competition	6	7.25
Coldwater, Mich.....	No competition..	8.25
Jackson, Mich.....	Competition	6.5	7.75
Saginaw, Mich.....	" "	6
Mount Clemens, Mich.....	No competition..	8	8.5
Marlette, Mich.....	" "	8
Muskegon, Mich.....	" "	8
Battle Creek, Mich.....	Competition	6.25
Benton Harbor, Mich.....	No competition..	7.25
Cleveland, Ohio.....	Competition	4.75	6

Names of Towns and State	Conditions of Trade	Price of Kerosene	Price of Gasoline
Sidney, Ohio.....	No competition..	8.75	10
Dayton, Ohio.....	Competition	6.5	6.5
Xenia, Ohio.....	No competition..	8
Hamilton, Ohio.....	" "	7.5
Oberlin, Ohio.....	" "	7.5
Troy, Ohio.....	" "	7
Youngstown, Ohio.....	Competition	6
Canton, Ohio.....	" "	6
Warren, Ohio.....	" "	5.75
Galion, Ohio.....	No competition..	8
Newark, Ohio.....	" "	8

Since this table was first published, at Newark, O., and since we took testimony exposing the Standard Oil Company's practice of charging three or four different prices for oil out of the same tanks, competition has come in and the price of oil has been reduced to four cents.

Q. It is your opinion, then, that the lowering of prices has been due to other causes than any which could be attributed to the Standard Oil Company? A. The Standard Oil Company has taken advantage of each improvement for refining or handling oil. They seized upon, as every other commercial institution would, the improvement that would bring profit out of the by-products. Then there has been a great improvement in methods of boring for oil, and the pipe line system, which was originally introduced by other parties than the Standard Oil Company, has simplified the method of transporting the crude product. The tank-car system has been a big improvement in saving the use of barrels. If the government protects these giants, it must keep competition open so that they will compete with one another just the same as small men compete with one another. The eternal law of competition will prevent the excessive profits and greed that the government does not seem able to prevent when a monopoly is fostered through exclusive grants in the transportation department.

COMPETING COMPANIES IN OHIO.

Q. (By Mr. A. L. Harris.) What companies are competing with the Standard Oil Company in Ohio now? A. There is only a limited competition; I think Scofield, Schurmer & Teagle; and a man by the name of Peter Shull, at Mansfield, has an independent agency, but only a limited territory. Scofield, Schurmer & Teagle originally had a contract whereby they were limited in the amount they were to sell to what would enable them to live.

Q. They have competition with more than that? A. They have competition, but it is not a successful competition either with regard to the pipe lines or the tank line. Neither is competition in rates successful, according to the claims of competitors.

Q. How do they get clear of the competition of the small companies in Ohio? A. If you take the testimony of Senator Davis you will get more accurate information on that question. I have to do more with the legal phases. One way is that which I have nar-

rated. They have what their competitors call "buzzards," who follow up competitors, as I have explained; and they have had for a long time several rates, or various favorable rates, with the railroad companies. They soon became strong enough through this means to control a part of their territory and to sell at a non-competitive price, or a price high enough to enable them to establish a competitive fund. In this way and through their advantage in the transportation department they were able to undersell and run out small men.

Q. Have they followed up the fields in Ohio? A. Yes; I understand they have, which is perfectly logical so far as that enterprise is concerned. They have expert prospectors who are always on the ground the minute that a field is discovered. With their system of transportation, under their own control, they determine the value of the well and can get pretty nearly the licn's share for their portion.

STANDARD OIL COMPANY CONTROLS THE PRICE OF THE
CRUDE PRODUCT.

Q. Even in the new field they substantially control the price to the producer of the crude oil? A. Certainly, certainly; Senator Davis will give you an account of the plan whereby they shut out the producers in the Corning field by raising the freight rates 17 cents per barrel. They ship and condemn oil according to their own methods and fix the price according to their own standard. The oil market price, which is under the combination's control, is sent out from Oil City every morning to the oil fields.

Q. Is there any indication at present of the old system of rebates that they once had? A. On the Lake Shore? No; they have various freight rates. You will find, when you get into the transportation department, that favorite railroads get some advantages. They do not need to resort to the old-style rebates. They can charge their own prices, which amount to rebates, when they own the pipe line or own a controlling interest in the railroad.

Q. (By Mr. Farquhar.) What portion of the crude product of the United States does the Standard Oil Company itself own? A. Well, according to the testimony, they control, either directly or indirectly, from 90 to 97 per cent. of all the crude product. That, of course, I get only from the testimony; I have no means of gathering the data.

Q. Of that 90 per cent., do you know how much they own? A. How much they own?

Q. Own. A. No; I do not personally know. Ninety per cent. is the estimate; 90 per cent. is the lowest estimate of the amount they control.

Q. That is, you mean by the expression "control" that they have control in purchasing the crude oil from others. But the question I asked was, Do you know, can you approximate, how much the Standard Oil Company directly own of the crude oil product? A. No; I cannot furnish you with that data.

Q. Would you think it was half? A. I should think it was a great deal more than that.

Q. (By Mr. Phillips.) That is, in the Ohio field?

A. I know it is a greater per cent. than that in the Ohio field. If they have control of the transportation from a new field, they do not need to own any of it, so far as the producer is concerned. If they determine how much they are going to pay for it and are not satisfied they can fix the producer's price at whatever it costs to produce, simply living wages, and let him bore and worry over the cost of getting it from the rock.

Q. (By Mr. Farquhar.) As a business proposition, is it not in testimony that they only own 75 per cent. of the whole product?

Q. (By Mr. Phillips.) Does not that refer to the Pennsylvania and the Virginia fields—to what is known as the white-sand oil—and not the Ohio?

RELATION OF THE STANDARD TO INDEPENDENT COMPANIES IN FOREIGN MARKETS.

Q. (By Mr. Farquhar.) I understand that, but you speak of their control. Is it not true that the independent companies, independent pipe lines and others, have and exercise a certain freedom in selling their oils in foreign markets and otherwise, independent of the Standard or independent of its practices? A. When you come to the question of their relationship with the steamship companies, the interests they have in them, the arrangements they are enabled to make through acts of the British Parliament, the way they head off the Russian oil, etc., you will have to get witnesses that know. All you can observe is the result. There is a little book, recently published, which will explain the way they manipulate the English oil market and give you the details more accurately than I can give them.

Q. (By Representative Otjen.) What is that? A. It was handed to me while Mr. Archbold was on the stand in New York. I do not remember the name now, but can furnish it to you.

Q. (By Mr. A. L. Harris.) Is Cook the author? A. No; it was a little red book, a pamphlet about four by six inches, and contained all the testimony as to how they managed to control the Russian oil market, *i. e.*, I mean prevent the Russians controlling the English market.

Q. (By Representative Livingston.) Whose testimony is it; I do not understand? A. It is simply a pamphlet, prepared by someone, that is circulating in England. It gives the history of the Standard Oil Company's control of the English market.

Q. I would like to know something official. Of course we cannot receive that book as an official statement. A. I cannot give you that book's source of information.

Q. Which line of steamers is the Standard Oil Company interested in? A. You can get hold of all the information relating to their entire system of water transportation, as well as their system of land transportation. There are witnesses than can furnish you that. If you get some of the independent oil dealers in New York that are competing by water (there are three or four firms down there), they will inform you.

Q. (By Mr. Phillips.) Are they all independent re-

finers? A. They are independent refiners; they have not their pipe lines quite through to seaboard. They have been able to have their system of pipe lines, like the Standard, but they have competitors there. Of course there is no way of controlling a water highway except through the methods of shipping, viz, classification of freight.

Q. (By the Chairman.) Does any member of the commission care to ask anything further? A. It would be impossible by means of my investigation to reach anything outside of what we came in contact with ourselves, but you will find it all. There are people, or witnesses, who will furnish you that.

Q. (By Representative Livingston.) Do the independent refiners have any arrangement with the transportation companies by which they can compete across the water with the Standard Oil Company? A. That I cannot furnish you; you can get that, however. I understand they ship oil "camel-back" and almost every other way in the old country. In some places they have a fair competition, and in others, we think, they do not. So far as Ohio and the United States are concerned, the secret of the difference between their success and that of the others lies in their gaining control, as the testimony has shown, through the powers they receive from the government and through the transportation companies. That is my theory of it.

COPIES OF STOCK AND TRUST CERTIFICATES.

Q. (By Mr. Jenks.) You said this morning that you could furnish a copy of the trust certificate issued to the certificate holders under the old trust form. Can you also furnish a copy of the stock certificates that they issue at present to the stockholders? A. I think so. [showing book.] Here is a lithograph copy of the Standard Oil Company's capital stock certificate after they increased to \$3,500,000. Do you care to have it read? That is one of the stock certificates.

Q. Make that a part of your testimony with one of these other similar forms. A. There are two of these here, and then I have here also a printed form of the trust certificate. They do not always put the exhibits in connection with the testimony, and you have to look for them at the close of the testimony. Here it is on Page 51 of Part II of the Record in the case of the State of Ohio *ex rel.* the Attorney General vs. the Standard Oil Company. Well, Mr. Rockefeller's own personal one is here, and that will give you an idea. (Reading)—

STANDARD OIL COMPANY.

No. 301. Capital, \$3,500,000. 9,244 shares.

Incorporated under the laws of the State of Ohio.

This certifies that J. D. Rockefeller is the owner of ninety-two hundred and forty-four shares of the capital stock of the Standard Oil Company, transferrable only on the books of the company in person or by attorney on surrender of this certificate.

Witness the seal of the company and the signatures

of the president and secretary, at Cleveland, Ohio, this 28th day of November, 1892.

(Signed)

J. D. ROCKEFELLER,
President.

(Signed)

F. B. SQUIRE,
Secretary.

(Seal.)

(Standard Oil Company,
Cleveland, Ohio.)

(Reading.)

Know all men by these presents:

That we, John D. Rockefeller, Henry M. Flagler, William Rockefeller, John D. Archbold, Benjamin Brewster, Henry H. Rogers, Wesley H. Tilford and O. B. Jennings, trustees for winding up the Standard Oil Trust, by W. H. Tilford, our attorney in fact, and John D. Rockefeller, of ———, do hereby constitute and appoint John Bensinger, of New York City, our true and lawful attorney for the purposes following, to-wit:

Whereas, John D. Rockefeller has placed in the hands of said attorney assignment No. A 365 for $\frac{2958854}{972500}$ of the amount of corporate shares held by said trustees on the first day of July, 1892, in each of the companies whose stocks were so held.

Now the said attorney is hereby authorized to secure from each of said companies transfer upon their corporate books of said stock and stock certificates for whole shares, and scrip for fractional shares thereof, and when the said certificates and scrip are received from all the companies referred to the said attorney shall deliver the same to John D. Rockefeller, and the said assignment of No. A 365 shall at the same time be delivered to the said trustees.

And the said attorney hereby agrees to obtain the said certificates and scrip and to deliver the same and the said assignment as above specified.

(Signed in print.)

JOHN D. ROCKEFELLER,
HENRY M. FLAGLER,
WILLIAM ROCKEFELLER,
JOHN D. ARCHBOLD,
BENJAMIN BREWSTER,
HENRY H. ROGERS,
O. B. JENNINGS,
WESLEY H. TILFORD.

(Signed in ink.)

W. H. TILFORD, Attorney in Fact.
JOHN D. ROCKEFELLER, per Geo. D. Rogers.
JOHN BENSINGER.

Q. This is the form of the stock certificate in lieu of the trust certificate? A. They authorized him to transfer that, and then he received from the constituent companies, the 20 companies I mentioned to you this morning, his share of each of those. All those forms are here, if you care for them. The correct trust certificate is here also. I do not suppose you care to have the legal intricacies; they show how they got out of the trust and how they got into it. On Page 125 there is a copy of the Standard Oil stock certificate.

That was the original trust certificate, or copy, then, of 34,993 shares, or 35,000 shares less the seven shares.

THE CONTRACT WITH THE NEWSPAPERS.

Q. That will be sufficient, I think, along that line. You spoke this morning also with reference to the contract that was made by the Standard Oil Company or its representatives with some of the newspapers. Can you furnish us with a copy of that contract or give us its substance? A. Mr. Cook gave the first testimony at Marietta on this point. The testimony that was afterwards given was in reference to the Xenia Herald's contract. George W. Cooke, of Marietta, has given the essential parts of it here, I notice, in his testimony; and I think I can furnish it to you from the record.

Q. Will you be kind enough to quote that accurately as it was given in the testimony? A. I thought I had the page showing some of the publications for which he received pay. Here I see his exhibit (reading): "Whether the Standard Oil Company of Ohio is in a trust or out of a trust is a question for the courts to decide; but whether the consumers of oil are getting a better quality at less cost and handling with greater safety than formerly is a question for the people to decide. In the commercial affairs of life it is things, not words, that count in making up the balance sheet of loss or gain, of benefit or injury. Monopoly and octopus, combines and trusts, are haughty words, but the best goods at lower prices are beneficial things. It is much easier to say harsh words than it is to make good things cheap."—*Lima Times-Democrat*.

Q. This material was furnished by the company? A. Furnished him by the company. I see here on Page 82 of the typewritten copy of Mr. Clark's testimony (reading): "The publisher agrees to reprint, on news or editorial pages of said newspaper, such reading notices set in the body type of said paper and bearing no marks to indicate advertising, as are furnished from time to time by said Jennings agency, at the rate of — per line, and to furnish such agency extra copies of paper containing such notices at four cents per copy." To be fair to the company, a little bit of newspaper controversy arose. They claimed that in that there were two words left out, and it proved to be so, for afterwards when we obtained the original contract the words "acceptable to the publisher," were left out; in his testimony here those words do not appear, and therefore it was claimed in the Jennings suit that this contract was not correctly copied. But although the printed form did not contain the words "acceptable to the publisher," it made no difference in effect, for the subject matter published must have been acceptable or it would not have been published.

COMPETITION WITH THE STANDARD.

Q. (By Mr. Phillips.) Some time after the discovery of the limestone rock, or what is denominated as Lima or Trenton limestone rock oil, did or did not the price settle to 15 cents per barrel, more or less, for a year or so after it was discovered? A. That I do not

know. As to such details the active dealers can give you them. The temporary glutting of the market would reduce the profits until it became regulated again.

Q. During the time of the Standard Oil Company's control independent pipe lines have frequently been built in the different fields, have they not? A. Yes.

Q. Do you know by what methods they undertook to compete with these independent pipe lines? Was it by reducing the pipeage of the oil, or by putting a premium on the oil piped, or both? Do you know? A. Sometimes they temporarily raised the price to producers so that in the producing field the competing pipe line company could not pipe the oil temporarily at the price; and in other cases they would watch that pipe line company's refining customers and would break them up when they sold the refined product. Mr. Davis has had sad experience in that line; he can give you the details of that.

OTHER COMBINATIONS' PROFITS NOT SO GREAT AS THE STANDARD'S.

Q. Do you know of any other company, corporation, trust or monopoly in recent years that has made such a vast sum of money as has been made by the Standard Oil Trust? A. The nail trust ran up the price of nails, until the company cleared a large amount of money in a few months.

Q. I mean, made it in hand, accumulated the fortune? A. The nail trust ran up nails from 86 cents to \$3 and something, and they cleared \$7,000,000 in a shorter time than the Standard would have made a similar sum.

Q. I have alluded to the larger accumulations. A. Oh, no; none that I know of.

Q. Can you summarize briefly what methods they have pursued? You have passed over a number of them. Could you summarize to this commission what methods they have pursued to secure this fabulous sum of money?

Q. (By Representative Livingston.) You mean the nail trust?

Q. (By Mr. Phillips.) No, no; the Standard. A. You will have to obtain those facts from the men who come in contact with their methods; beginning with the Pennsylvania road and the freight blockades and the pipe-line fighting, and coming up to the fights they now have in the courts. It would be impossible for me to give you accurate data. I expect Mr. Phillips here can give you some points on that fight. There are several witnesses you can get upon that point. I suppose Mr. Lee could have given you something; I understand he has testified.

STANDARD OIL COMPANIES IN DIFFERENT STATES.

Q. (By Mr. A. L. Harris.) In what State did the Standard Oil Company get the charter under which it is operating now? A. The Standard Oil Company of Ohio is chartered under Ohio laws; the Standard Oil Company of Indiana is chartered under Indiana laws. There is also a Standard Oil Company of Penn-

sylvania. The Buckeye Pipe Line Company is of Ohio. The Union Tank Line is a New Jersey corporation. I suppose there are ten or twelve States represented. If you want to know why we let the trust live in Ohio, it is because we cannot help ourselves.

Q. (By Mr. Farquhar.) You proceeded against the company under the Ohio law? A. The Standard Oil Company, not the trust. I will write out a list of the companies for you. They are in different States, but all act together to accomplish a common result, viz, to make the trust certificates valuable. The original contract was denounced by the court, but it still bears fruit in dividends collected by holders of trust certificates.

DISCRIMINATIONS IN FREIGHT RATES WITHIN A STATE.

Q. (By Mr. A. L. Harris.) I thought they were incorporated in the different States? A. On Page 26, in this report, Mr. Harris, there are some tables in reference to the advancement of freight rates growing out of the competition in oil. This is our Ohio trust investigation report and shows where they increased the freight before and after a certain period from 16½ cents in 1888 to 19 cents in 1898. On the Rock Island road they increased the rates from 18½ cents in 1888 to 29½ in 1898. These tables can be furnished you, and they will show you the discrimination against independent shippers. The freight was increased for the independent companies, when compared with the rates in force when the Standard was shipping by railroad.

Q. (By Mr. Farquhar.) In your investigation of these affairs did you ever find that the railroad charter regulates freight charges? A. We have a statutory freight regulation; a maximum rate.

Q. Maximum rate? A. They cannot charge more than so much per ton per mile for certain specified commodities; in that sense, I mean.

Q. In what sense? A. The fixed rate is as high as five cents a ton per mile. The competitive rate for coal to Duluth has been as low as one-seventh of a cent a ton per mile, so that the statutory rate of many years ago has practically given no protection to the shipper in recent years.

Q. If an Ohio road delivers coal at Lake Erie at a lower rate for a long haul than for a short one, provided it must do this to get the extra tonnage needed in order to pay dividends and make profits for the road, if it still keeps under the maximum rate, do you call it discrimination? A. What I referred to especially may be illustrated by facts. The town of Nelsonville, which is perhaps 60 miles below Columbus, has received the same kind of groceries or freight from Baltimore at a rate no greater than they were charging from Columbus. In other words, the wholesale grocers of Baltimore were able to compete with those of Columbus because of the discrimination in the transportation of freight. By means of through freight rate discriminations like this great terminals such as New York and Chicago are placed upon a competitive basis with the inland cities. That is the most extreme case that we have. There was another case where the total charge for shipping coal from the Hocking

field to the Dayton asylum was the same as the rate, over a road controlled by the same company, to Sandusky City, and through, I think, to Duluth. But these figures on coal discriminations can be furnished you from freight-rate tables, *i. e.*, within the State; there is no law against discriminating on long and short hauls. We contended, by a bill before the Legislature, which was defeated by a strong lobby, that the rate for State roads ought to be based upon the interstate rate, and that we ought to have the same rate per ton per mile on our State business that the Interstate Commerce Commission requires on inter-state business. We fought for that very strongly, but were defeated. Our theory is that while it is necessary to maintain corporations by an income sufficient to bring proper return for investment, and while it is conceded by everybody that corporations are a necessity and that we should not be hostile to them, the State commerce should not be levied upon in short hauls in order to reimburse companies for their losses in competing at waterway terminals. Or, in other words, they ought so to distribute their charges as to equalize them between the inland cities and the terminal points.

Q. Can a railroad, chartered in Ohio and under an Ohio maximum freight rate law, make rates independent of the inter-state commerce rates themselves? A. Yes.

Q. The same as the constitution of New York with the New York Central? A. Yes.

Q. (By Representative Livingston.) I suppose the Standard Oil Company and independent refiners get special rates on oil that they ship? A. That is a pretty severe charge to make against any railroad.

Q. I am not making any charge; I am asking you a question. A. I suppose the independents do not get the same rates as the Standard does.

Q. Which do not get as much? A. The independents do not get as favorable classifications of freight. The Standard is always getting rates through some special classifications, or allowances for loading and unloading, or in contracts for lubricating oil, etc.

Q. Oh, yes; they could get all the oil facilities. I believe the independent refiners are fighting the Standard Oil Company? A. That may be, but at many disadvantages. I do not think they have an opportunity to fight; it is not a fair contest.

Q. It is a contest of some kind? A. Yes.

PRICE OF OIL WOULD BE REDUCED WERE IT NOT FOR THE STANDARD OIL COMPANY.

Q. If the Standard Oil was destroyed would the price of oil to consumers be reduced? A. Most assuredly.

Q. Would not that reduce the price from the independent refiners to the consumers also? A. I presume it would.

Q. What interest have the independent refiners in fighting the Standard Oil Company? A. Because there is a legitimate profit to be made in the business, and all they ask is that the government keep its hands off, and not use its power to assist the Standard people.

Q. You are against the protection of the Standard

Oil Company by the government? A. I am against any corporation getting assistance from the government to the exclusion of others. Everybody is entitled to the same privilege.

TRUST FOSTERED BY THE GOVERNMENT.

Q. Do you call that protection or subsidy? Or what would you call it? Is it help? A. It amounts to this: Does a sovereign State have the right to delegate governmental functions to a transportation company, be it a railroad company or a pipe line company, and when such a company has received such powers through its charter and by the exercise of the right of eminent domain has condemned private property for public uses, ought the State to permit it to devote that property to private ends? It is manifest that this contract with sovereignty requires such a corporation to give every man the same opportunity to use the railroad or pipe line. There are no powers delegated by a government such that one man can take advantage of another, if the governmental functions so granted are fairly exercised. The board of directors of a railroad who are exercising the right of eminent domain have no more right to give you or me a rebate, to the injury of another shipper, than the county treasurer would have to charge us one mill or two mills and in turn give me back half my taxes. It is just as much an offense for men to exercise these governmental functions wrongfully as it would be for a taxing officer to give rebates in taxes. That is our position.

Q. Your position is that, it being a public franchise given by the State, all the cities of the State are equally interested? A. That is it exactly. The board of directors of a railroad company is exercising governmental functions as much as a Congressman is. As I said this morning, if a man is coining a dollar for the government he has no more right to cut it in two and put half in his pocket than a board of directors has to organize a railroad and exercise the right of eminent domain over private property and then afterwards abuse the right thus granted by fostering a monopoly. And there is where, if you allow me, the modern remedy that is being advocated of absolute government ownership is a mistake, because the government owns them now in the sense that the government can control. They get their life from the government; they have sovereignty breathed into them by the government; they can not exist without the government; they can be destroyed by the government at any time.

Q. Is the only wrong which you charge against the Standard Oil Company that of discriminating against some of the cities of your State as compared with others? Is that the only wrong they are guilty of in seeking discriminating freight rates? Is that all the wrong? A. Oh, no; that is the basis of their getting the advantage. We say they get the advantage from the government by charters, the powers of which they abuse. That is one of the wrongs, but that is not the only offense committed by them.

THE REMEDY FOR THE EVILS OF THE TRUST COMBINATION.

Q. How would you remedy that wrong if you were on this commission and were asked to suggest a remedy? A. If I were on this commission, I should say that so far as State charters are concerned, that is a matter for State control; an offense against a State charter is a subject for State punishment. The States originally ceded to the Federal Government certain powers only, and reserved unto themselves all that they did not so cede. One of the powers reserved to themselves is that of granting charters to incorporated companies, and this is peculiarly within their rights. When you come to corporations that are doing interstate business, then your commission can step in, and you have the right to investigate that and Congress to control that by Federal legislation. Attorney-General Griggs was right, and so were President Harrison and President Cleveland, when they enunciated the doctrine that the remedy is peculiarly a matter within the State's control.

Q. I have brought you right down to the point again. Would you do that by levy and sale, or by condemnation of the stuff when you catch it on the train, or how would you reach it? Suppose, in inter-state commerce, that a Standard Oil tank was going across from the State of New York to Virginia, and we knew it and seized it in Pennsylvania, and that, after that, the tank of oil, being in possession of the marshall or sheriff, was condemned or confiscated. Would that be your remedy? A. The Sherman Act was pretty nearly that drastic; it would be a good remedy. The Sherman Act has been sustained, and it has gone that far. If a desperate remedy is required for a desperate case, and that proved to be hard, and you enforced it on the dealer, the roads would get a modification of the law; but I do not think anything is too severe to stop the abuse that is going on.

Q. Suppose the tank was condemned and the engine and cars hauling it were all condemned and confiscated; would you think it would break up the evil? A. I should think it would break it up, but I do not believe it necessary to be that severe. I would not interfere with all innocent shippers on the train. You may have mail and express and through freight. Here a punishment of an especial character is needed; take the property that is involved in the offense. If it is the buyer, why, stop the buyer; if it is his oil, stop the oil.

Q. That would be a punishment upon the party that owns the oil, but none on the railroad? A. Then, where you have your through railroads or inter-state roads, take the charter away.

BETWEEN THE FEDERAL AND STATE GOVERNMENTS AN ABSOLUTE REMEDY IS EVER PRESENT.

Q. That goes back to the State authority? A. It goes to the United States if you have a Federal

charter. The Union Pacific has a Federal charter. Between the Federal government with a Federal charter and the States with a State charter there is an absolute remedy ever present and never divested from the people; it is constitutional; the legislature cannot take it away. In our State private property is ever held inviolate by the constitution. The attorney general, to illustrate, is a constitutional officer, and it is his duty to appeal to the courts to forfeit every charter the powers of which are abused, independently of the court's ordering him to do so. That is, he does not have to get a form of written order from the governor, or the legislature, or the court. By the constitution the power is vested in him to bring before the highest tribunal any corporation so offending, as much as the prosecuting attorney is vested with power to bring a criminal before the grand jury. We have many such cases now pending before the courts. I take it that the Supreme Court of the United States and the supreme courts of the States will do a corporation no harm when doing right, and if they are in the wrong they will be punished. It is the legal and constitutional way to try these matters, and they should not be subject to mob rule.

Q. (By Mr. Farquhar.) Are the independent producers chartered corporations in your State? A. Why, the Argan is. I do not know, but I think Scofield, Schurmer & Teagle are a partnership. I do not know of a single independent one that is alive.

Q. You spoke of the remedy. I don't think it is clear to the commission exactly what you may call the gravamen of the complaint of the independent producers? A. The Standard, by means of controlling transportation, causes the producer to receive always less than the true value for his oil. This is effected by discrimination in rate tariffs. The Standard has been able to determine the price of crude oil and the rates for shipping it, and the independent producers of the State demand protection so that they can obtain equal shipping facilities, which they do not now get.

Q. What more protection can they get than the farmer who is selling 50-cent wheat in the West? Do not these independents with their oil sustain the same relation to the railroads as the farmer with his wheat? A. When the wheat shipper is at a non-competitive point on a railroad and when the company, in order to meet competitive rates at a point like Duluth, charges such a price that he can only receive 50 per cent. of the value of his product in the markets of the world, he is injured in just the same way as the oil producer by excessive charges for transportation.

Q. (By Mr. Farquhar.) And without remedy? A. He has his remedy.

Q. What is his remedy? A. The Federal court held last year that the interstate commercial rate cannot be so low that tribute must be levied upon State commerce in order to maintain traffic; or, take the converse of the proposition, you cannot make the State traffic so high and the interstate so low that the State shipper is contributing to the inter-

state shipper. The remedy that I suggest must be finally adopted is this: That the State and interstate rates must be so adjusted that the burdens will be equalized. Whenever you have accomplished that you have demonstrated the fundamental principle that the public highway is controlled by the public; the railway is a substitute for the highway. The public owns these highways, and there must be an honest classification of freight rates, and a fair allowance for loading and unloading, and the roads must not abuse this principle in order to grant favors to certain shippers. There can be an absolute destruction of vested interests by classification of freights and by charging exorbitant local rates. Four hundred per cent. more on a ton per mile basis is required to carry freight from Columbus, O., to Cardington, O., than from Columbus, O., to Cleveland, O.

Q. (By Mr. Ratchford.) I should like to have you revert to the subject of the proposed law in Ohio and explain the main features of it a little more fully to the commission. You were touching upon it a little way back and then went to another subject. A. You have the Ohio statute here; I can take it up briefly. We have passed an anti-trust law, and it went into effect July 1, 1898. We have quite a number of cases pending under it. There are the cases of the beer trust, the Standard Oil Company, the Buckeye Pipe Line Company, the Solar Refining Company and others.

PROPOSED LAW FOR THE REGULATION OF FREIGHT RATES IN OHIO.

Q. I have reference to the law looking to the regulation of freight rates. A. The general proposition was to amend our maximum freight rates, bring them down somewhere near the commercial competitive rate, and then make the interstate rate per ton per mile the basis or measure of the per ton per mile rate for Ohio business; in other words, to apply the long-and-short-haul clause of interstate commerce to Ohio business, and not permit discrimination against inland non-competitive towns and in favor of competing towns like Cleveland and Cincinnati. That is all there was of it. It was a per ton per mile for local business the same as a per ton per mile on through business, exactly. Just to make it perfectly clear to the commission, the bill proposed that the same tonnage rate per mile be charged for a 10 or 20-mile haul as for a 50 or 100-mile haul. It allowed a variation of 10 per cent. only for a shipment of less than 20 miles.

Q. Did the railroad companies oppose that? A. They opposed that violently.

Q. What was the position of the coal companies? A. I do not think they appeared before the commission. Mr. Rend was there on the first trust investigation; he was an unwilling witness; we caught him and subpoenaed him.

Q. Do you know whether the coal men of Ohio ever complained against this discrimination in freights? A. Yes; they have now filed complaint

in my office; I think Collins and Fahy are among them; they are now out gathering testimony on this. In order to maintain the coal trust, coal cars of the independent coal producers were side tracked. That is the complaint. I will furnish you testimony here from the gentlemen who were discriminated against. While they told us they were getting the same rate, they said they did not get the same conditions. They could not get their coal delivered in time to fulfill their contracts with customers. By such means the independent coal producers' customers were destroyed. I have given Mr. Jenks the names of the gentlemen; I think that they will testify on these points, and give you a little data, because one of them was an employe, at the time, of one of the leading railways involved in the matter.

Q. What were the principal objections raised by the shipping companies against that law? A. The most intelligent reason given was, I think, by the gentleman representing the Erie or the Lake Shore; he stated that if the freight rates were all adjusted on that basis he believed it would be exactly fair, but that certain manufactures were now built up, and certain centers prosperous on the other system, and it would demoralize and derange towns and industries, and that it would create panic in one place and flush times in another, before it would be possible to get back to the normal condition of affairs. The Pennsylvania Company has a gross income of \$15,500 per mile; if it could distribute that gross income in that way it would make no difference to the company; it has to have that much—\$15,500—to pay dividends on its stock and pay for repairs, taxes and employes. It makes no difference to the railroad company itself where that comes from, and they would just as lief distribute it equitably between local and through shippers, but the moment they attempt that trouble arises on account of the great competing centers like Chicago and Duluth, where the companies come in contact with the Canadian Pacific and the water ways; and they cannot undertake it, because, when they meet water, they have to make water rates.

Q. Have you any reason to believe that the producers of coal in your State were induced by any coercive means to keep their hands out of that fight? A. Well, the ways of the lobbyists are so mysterious we do not have an opportunity to find out.

Q. However, you are of the opinion they favor equalization of rates? A. I think so, yes. I think every independent producer would favor equalization of rates. We do not want Baltimore to compete with Columbus in shipping groceries to Nelsonville; we do not want the wealth of Ohio poured into New York and Chicago; we want our share of it; and would have it if we had no discriminating rates. By discriminating in transportation you can dry up the most fertile valley on the face of the earth; you can reduce all the little cities along the line of a railroad to villages, and give this wealth to the great centers, by discriminating in railroad rates alone.

Q. (By Mr. Phillips.) Are there not a number of chartered companies in Pennsylvania controlled by

producers that are operating in your State, for instance, the Empire Oil Company and perhaps the Victory Oil Company? They may have been chartered in New York State; but are there not a number of chartered companies controlled by producers doing business in your State? A. As far as the oil business is concerned, my opinion is based purely upon conclusions of testimony taken; they do not practically compete in their respective territories; for instance, the Standard Oil Company of Ohio has its territory and the Pennsylvania Oil Company sells in a portion of Ohio, but practically they do not compete, because they are all one system, although they claim they are acting independently. They never wage a war between any of these different companies. I never heard of one.

WHAT WILL BE THE EFFECT OF PRESENT INDUSTRIAL DEVELOPMENT ON GOVERNMENT.

Q. (By Mr. Kennedy.) I should like to ask you if it is your opinion that the evolution which is now going on, if unchecked, will lead to a control of the industries of this country and to control of the government by a few hundred or a few thousand men? A. Well, that is mere conjecture. I feel as though we are under a republican form of government. We have as socialistic a form of government as man has ever been able to invent; and as soon as the people have an opportunity to control matters in the way I suggest—to take away charters, as well as grant charters—a condition of affairs will never rise whereby the monarchical institutions you suggest will be substituted for our republican form of government. Monarchies represent primogeniture and the principles of tying up property in a few hands. All this is what brought on our Revolution. I do not think we will drift back into these abuses, although we have made rapid strides in the last two years toward these monarchical ways. I believe it has gone about as far as it will go. Commissions like your own honorable body are getting the facts impartially; Congress and the people will know of the evil; you will diagnose the disease. There have been a good many patent medicines advertised to cure government ills, but they do not reach the disease. I think when you go through with this investigation and procure data you can give us more light on these questions. I know this from three years of experience in my office. I know, so far as the State is concerned, that it has absolute power to regulate many of the abuses you refer to, namely, the abuses of governmental powers exercised by creatures of the State.

Q. Would not the result which I suggested be realized if other industries were controlled in the way that a few men in the Standard Oil Company control the oil production of the country? A. Yes; that would be the result. The socialists are advocating that this abuse be continued, and claim that it will demonstrate the possibility of government ownership. When a few men get possession of all public utilities the socialists propose taking them

away. That is their theory. The government ought to own all public utilities, and ultimately the only way to demonstrate the possibility of such a system will be to allow a few people to demonstrate it first. Men with power like Rockefeller and others will demonstrate the feasibility of central ownership and control, and then the government can take their place.

Q. That is the point I wished your opinion on. A. If we always had men like Rockefeller to run such things it might be better for the public than government ownership.

GOVERNMENT OWNERSHIP OR CONTROL AT PRESENT
WOULD BE DANGEROUS.

Q. Would it be preferable to have the government control these public utilities or to have a few men, the representatives of the corporations, run the industries pertaining to them and run the government, too? A. The Federal government has 100,000 employes now and it almost raises a panic every time we have a presidential election, so great is the demand for spoils. I do not know what would happen if you added any more to that. It looks to me as if, under the present civil-service rules, the government ownership of any or all these utilities would create such a public disturbance that our institutions would be in danger.

LOCAL GOVERNMENT OWNERSHIP SUCCESSFUL.

We have a great many instances of public ownership in Ohio; 76 per cent. of the waterworks plants are owned by cities, and many electric light and gas plants. Local powers are granted to cities, giving them the opportunity to buy street railways; that can be followed up by rights to maintain interurban roads. The experiment has been successful, as no doubt you know, in the old country. Glasgow, Vienna and other cities owning their public utilities.

I have been converted to that theory, viz, that cities should be given the right to determine for themselves what public utilities they desire to own or control. It will furnish a check to further abuse of municipal franchises operated by private companies.

FRANCHISE TAXES IN OHIO.

Q. (By Mr. Farquhar.) I suppose you have in Ohio a law the same as the Ford franchise bill of New York, taxing that class of property? A. We are pioneers on that principle, you know. We have the Nichols law, where we take the stock valuation as the tax valuation, and not the value of physical tangible property. Other States have been following our law. Michigan has been following it, even extending it to railroads; we have not proceeded that far. We substituted the excise tax—one-half of 1 per cent. for an additional tax upon railroads. Since I have been in public office we have had a fight on that, but the law passed. We drew from

the Pennsylvania Company \$96,000 additional tax under the excise law; we collected \$450,000 under the excise law, the one-half of 1 per cent on gross receipts. That is what New York is doing now, except that New York proposes to make it 1 per cent.

SUIT AGAINST THE BREWERY TRUST.

Q. (By Mr. Jenks.) Take up the suits against some of these other combinations, outside of the Standard Oil Company. A. Yes; we have other suits; one against the Cleveland and Sandusky Brewing Company, which is now operating a trust; some ten breweries have placed their property in a pool and paid a promoter \$30,000 for mortgaging their property back to themselves, and attempting to raise the price of beer over their competitors. The trust is on the same plan as the other trusts; we have testimony that one man asked \$5,000,000 for his plant, which was only worth two and a half million; they would not buy, and then undertook to destroy his business. They would not cut the prices of beer; but wherever there was a competitor with a long established business and possessing the good will of the business, they would buy him out. If the plant was worth \$10,000, they bought it for fifteen or twenty thousand, if it could not be obtained for its true value; and then put their beer in the place of the independent dealer's beer. They went out and bought up his customers, and almost raised a commercial and industrial war among the saloon men in the bar-rooms of Cleveland. We commenced suit three weeks ago against this brewery trust, under the Valentine-Stewart act.

THE TRUST PROMOTER.

Q. You raised one point that you did not bring out clearly, viz, the question as to the power of the promoter. A. The Standard Oil Company trust is not run by a promoter. Other trusts will take a firm of attorneys and draw up one of these contracts and start out and get options on the leading industries that are making a profit in any one craft or business. The owners will sign options to sell their plants for a given amount to an individual, who becomes in fact a trustee. When he gets all the options he can on competing plants they then organize a corporation, usually in New Jersey, and this individual turns these plants all over to the trust, and claims it to be an absolute sale to a new company. The courts in Missouri have recently walked right through that fiction and held that trusts cannot be disguised by one corporation buying the plants for the purpose of deeding them to one man, who deeds the same to a company formed for the purpose of buying in competing plants. A promoter works it up; the new company issues bonds—first-mortgage bonds—and sells them, and the promoter pockets the profits. In this particular case he received \$30,000.

Q. That is a matter of evidence? A. That is a matter of evidence. It is from a statement gathered

by attorneys preparing the testimony for our contest. It is the testimony of men who have made affidavit. It amounts to this: Ten companies are paying a man \$30,000 to get them to combine their interests into one company. It is a mere myth, it is a South Sea bubble scheme; but there are always men glad to try it.

Q. In the case of the brewers' combination that you have spoken of what was the amount of stock they issued, as compared with the valuation of the plants? A. They issued preferred stock usually for about the amount of the actual value of the constituent plants.

Q. That is true in this specific case? A. Yes; and the common stock may be from three to five times that, and represents nothing except speculative value.

Q. Do you recollect how it was in this specific combination? A. No; I cannot give that. I know they issued mortgage bonds enough to pay for the actual property purchased. They have not transferred a single share of trust stock in four weeks, since the suit was filed. A great many of the interested parties are German, and they expressed a desire to settle—to have the investments put back into competing companies.

THE CRACKER TRUST.

Q. Can you mention any other combinations in Ohio that have been prominent? A. Well, we have a suit pending now against the cracker trust. Under their promise, so far as Ohio territory is concerned, they agreed not to violate any State laws. Although we have not taken testimony, we have filed interrogatories. They have a system of bonuses that they give back to the customer if he buys exclusively of them, and the only evidence we have of their violating the tacit understanding with the State is in the case of a new cracker firm which recently leased grounds and buildings in Columbus and bought machinery. When it was found they were leasing a building and buying machinery, the president of the cracker company sent for them and told them that if they undertook to go into business (that is their statement to me) the cracker company would ruin them. The reply was that contracts were out for cracker machinery and the construction of buildings, and that suits for damages would follow if proceedings stopped. Thereupon the trust agreed to take the plant off their hands whenever it was completed. Those trusts are not so dangerous, because I do not believe that when competition can enter any trust can long thrive. The New York trust could not; the whisky trust could not. Only when they get some private advantage in the transportation department do they ultimately thrive.

Q. Have you any information of still others in the State of Ohio? A. We have the tobacco trust, but we have not filed a complaint in that case as yet. The next suit filed was that against the tin plate trust, ten days ago, in Cincinnati, by the prosecuting attorney.

SUIT AGAINST THE CENTRAL PASSENGER ASSOCIATION.

Q. That is substantially all that you have direct evidence against so far? A. We have a suit pending against the Central Passenger Association.

Q. (By Mr. Phillips.) Is that the American Tin Plate Company to which you referred earlier? A. Yes. He said he had evidence now to start the suit; I do not know what the name of it is. The Central Passenger Association has grown up since the decision in the Joint Traffic Association case of the United States. We base our suit on the strength of that decision. So far as Ohio business is concerned, we claim that the Ohio courts have jurisdiction over railroads over railroads in the State and can prevent them from pooling their issues through the Central Passenger Association and issuing thousand-mile tickets with rebates, holding up \$30 and giving back ten after the mileage book is used up, in case it has not been transferred. It is questioning their power to pool rates for the purpose of selling thousand-mile tickets. We insisted that, since that joint-traffic decision we must have competition between railroads so far as Ohio business is concerned.

Q. (By Mr. Jenks.) If I understand you, the different railroads of the State of Ohio have agreed to issue thousand-mile tickets for \$30 and give a rebate of \$10 when the ticket is used up. A. The Central Passenger Association is made up of different railroads. They sign the tickets individually. They have an executive committee located at Chicago; and they have by-laws and a constitution that we have had furnished us through interrogatories that were attached to their pleadings. They sell a thousand-mile ticket which connects over the different railroads that are in the combination, and then return \$10 in case the ticket is not transferred. It is really a scheme to prevent scalping. It is aimed at the scalper, but is really a scalping system. The railroads themselves furnish directly to scalpers thousand-mile tickets that are good over a number of roads. This system destroys the competition that small travelers used to enjoy. The Central Passenger Association is organized to prevent competition.

Q. Are there other combinations concerning which you have information? A. That is all.

TRUST LEGISLATION.

Q. Have you further suggestions to make as to remedial legislation? A. Here is a copy of the Ohio statute. We collated different trust statutes last year very carefully when we drew this act, and based it upon the trust investigation. We find that if we had to do it over we would add that clause I spoke of in this morning's testimony, exempting any witness from testifying from incriminating himself. That has been approved by the United States Supreme Court. That clause should be added to the statute. Texas has this year added a special amendment to this act that has substantially the same features. At least, they have an act reaching directly the insurance companies; but as we had an

anti-trust insurance law in our State, we did not incorporate it here. They suggested State confiscation—merely duplicate damages—while the Sherman act made it triplicate.

Q. (By Mr. A. L. Harris.) How many States have similar laws? A. Twenty-six States have anti-trust laws, if I have the facts correctly, and this winter there have been quite a number of bills pending. I do not know what finally passed.

Q. (By Mr. Ratchford.) Have you studied the measure pending in the Michigan legislature on this subject? A. Yes.

Q. What is your judgment of it? A. They have adopted ours; we forwarded them a copy; they put in the amendments we suggested. We are not entitled to the credit of our bill. It is a composite bill of the New York, Illinois and Texas laws. We did the same last year; we took the latest acts for a guide; and they are doing the same now.

Q. (By Mr. North.) Would a law of that kind in three-fourths of the States be a sufficient remedy? A. It would correct all but the interstate features.

Q. Would not it practically compel suspension of business on the part of trusts? A. It would; yes.

Q. (By Representative Otjen.) You have indicated how the trusts might be run by the State, but supposing these corporations are organized in New Jersey, as many of them are, how would you reach them in Ohio? A. We have reached them in nearly all the States under the insurance legislation, or what is called offense against the comity of States. A State can legislate and impose conditions upon which a foreign corporation can come into it. We have, under our trust law, reached them; a foreign corporation is reached the same as a domestic corporation so far as they do business in Ohio contrary to trust laws.

Q. There would then be very little distinction between companies organized in any other State and in your own State? A. There is no distinction. States have more power and control over a foreign corporation than over a foreign individual; a corporation must do business in a foreign State upon such terms as the State authorizes.

Q. (By Representative Livingston.) Do you consider Section 11 of the Ohio law a very practical one, where it authorizes the recovery of damages to twice the amount, to protect the State? I mean to ask this question: Are a great majority of the people so situated that they can take advantage of that clause? A. No; the average man is not; the small dealer is not damaged enough to warrant him in doing so. They baffle him by wearing him out with vexatious litigation. He cannot litigate as a large rival concern might do. For instance, a poor girl in Chicago took a contract for laundry and the laundry trust there followed up her customers. She sued the combination and recovered a verdict of \$5,000, which has been sustained; but litigation of that kind is expensive, and in this case the attorneys took it through. They bore the expense to get it through, so that ordinarily it is not an effective remedy. It is well to have them in cases where the damages are enough.

Q. Have you any suggestions to make to the commission concerning interstate regulation? A. No; I am not conversant with that at all; I have given my attention entirely to the State feature.

AFFIDAVIT.

State of Ohio, County of Franklin:

I swear or affirm that the statements made by me of my own knowledge in the foregoing report of my testimony before the Industrial Commission are true, and that all other statements I believe to be true.

F. S. Monnett.

Sworn and subscribed before me this 20th day of September, 1899.

Geo. C. Blankner,
[Seal.] Notary Public.

Washington, D. C., June 8, 1899.

TESTIMONY OF W. H. CLARK, NEWARK, OHIO.

The commission met at 2 p. m., June 8, 1899, Vice Chairman Phillips presiding. Mr. W. H. Clark testified.

Q. (By Mr. Jenks.) Will you kindly give the commission your full name and address? A. W. H. Clark, Newark, Ohio, 203 North Fifth street.

Q. Have you been engaged in selling oil for the Standard Oil Company? A. Yes.

Q. At what different places have you been engaged in this business? A. Marietta, Urbana, Springfield, Columbus and Newark.

Q. For how long a time? A. I went to work in 1893.

Q. And have been working all the time between 1893 and now? A. Solidly, up to February 7.

METHODS USED IN BREAKING UP THE BUSINESS OF COMPETITORS IN MARIETTA, OHIO.

Q. What kind of work have you been doing at these different places? What has been your experience with the Standard Oil Company, and what are their methods of doing business? A. I was first employed at Marietta, O., as office boy.

Q. At what time? A. In the fall of 1893, I think. I went there as office boy and was later promoted to warehouseman or cooper. There we had quite a time. We had the Producers' Refining Company, the Argan Refining Company, the George Rice Oil Company and the Marietta Oil Works to contend with. While there Mr. Curtis, an oil driver, a colored fellow, was buying of the Argan. We got Mr. Frank Davis to compete with him, i. e., with the Argan price; we had Mr. Davis put his oil down cheaper than the Argan Oil Company.

Q. Was Mr. Davis a dealer before? A. No; he was furnished a horse and wagon and I hired him by the week. Things went on that way for a time. After awhile Mr. Curtis got tired of his business and came to us and told us that if we would make some arrangement so that he could buy oil of the

Standard Oil Company he would. We made the arrangement and took a mortgage on Mr. Davis's wagon. We put up a bluff, foreclosed the mortgage and let him go.

Q. As soon as Mr. Curtis came to terms with you, did you stop the business of Mr. Davis? A. Yes, and the price went up.

Q. Can you tell us about the price at which you sold, while Mr. Curtis was selling the oil of the competing companies, and then what the price was afterwards? A. The oil was 7 cents while Mr. Davis was selling, and when he quit oil went up to 12 cents.

Q. And further? A. After Mr. Curtis bought of us a little while he went back to the Argan again. I forget the name of the man who managed the Argan, but he went back again. Mr. B. A. Mathews, Columbus, O., sent down Mr. Ebright under a salary, and we played the farmer racket. We went out and got a big cart and barrel with a faucet in it, and went around selling cheap oil.

Q. Who was Mr. Mathews? A. He was manager of the Standard Oil Company stations of the Ohio Southwestern.

Q. And was Mr. Ebright a man that had been sent down by him to do this work for you against Mr. Curtis? A. Yes.

Q. About how long did Mr. Curtis keep up competition, the first time, before he yielded? A. I think it was about three or four months.

Q. What was the result of the competition, the second time, by Mr. Ebright? A. Why, we cut the price again and Mr. Curtis had to come back to the Standard Oil Company again. After I left Marietta I went to Springfield, O., and took a country tank wagon. While at Marietta we sold our oil all over the surrounding country. We had probably 15 or 20 towns; we sold up the Muskingum as far as Beverly, up the Ohio as far as Newport, and down the Ohio as far as Frost, on the B. & O. Railway. We had two storage tanks, besides our gasoline, and we sold eight grades of oil.

DIFFERENT GRADES OF OIL SOLD OUT OF THE SAME TANK.

Q. Two storage tanks from which you sold eight grades of oil? A. Yes; we had eight different prices. We sold O. S. T., i. e., Ohio State Test, the Prime White, the Water White—

Q. Can you give us the prices of these different grades? A. I cannot remember them now; there was about one-half cent difference. We had to change the prices to suit the customer. We had the Red Star, the Water White, the Crystal Light, the Eocene, the Hyperion and the Silver Light, while at Marietta.

Q. Do you say the difference of price between these different grades was about one-half cent on an average? A. Yes; we would begin about 6 cents a gallon and run as high as 10½ cents.

Q. If you were selling a man this oil at 10½ cents and he thought that price too high, did you agree to sell him a lower grade at 9 or 9½ cents, and furnish

it out of the same tank? A. Yes; and furnish it out of the same tank under a different name.

Q. Was that generally by the orders of the Standard Oil Company? A. Yes.

PUTTING GASOLINE IN TURPENTINE.

Q. What men, for example, gave you the order to do that? A. Mr. Hollingsworth and Mr. Mathews. They said that people did not know what they wanted, and that we should give them what we thought they needed. If a man came in there and wanted to buy a good oil for 10 cents we gave the best oil we had, of course, and charged him 10 or 10½ cents. We sold turpentine at Marietta to W. H. Styer and Siler Brothers, druggists there. We would often get a barrel of turpentine and to increase the profit we would put three or four gallons of gasoline in the turpentine. Gasoline is worth 7 cents and turpentine 38 or 40 cents. We poured the gasoline right in the hole of the barrel.

Q. Was that also under instructions from the Standard Oil Company? A. Yes; the boss was there, and said he would teach us a trick in turpentine, and he taught us.

Q. Have you anything further concerning the price of oil while you were in Marietta? A. I think of nothing in particular.

Q. (By Mr. Phillips.) Do you mean to tell the commission that you sold the same quality of oil from the same tank under different names and at different prices? A. Yes.

Q. The oil was of the same quality and yet different in price? A. Yes.

Q. (By Mr. Jenks.) After leaving Marietta, where did you go? A. To Springfield.

Q. And what position did you hold there? A. I was country tank-wagon man.

METHODS AND PRICES AT SPRINGFIELD, OHIO.

Q. Can you tell us something of your experience there? A. When I went to Springfield I had 21 towns outside of that place, and after awhile the trade became so heavy I could not hold it. I could not take enough oil to satisfy the trade. Finally, Mr. Mathews and Mr. T. L. Cragin, his brother-in-law, came over there. They shipped in another wagon from the Milburn Wagon Company, Toledo, O., and Mr. Foley, the agent at Springfield, went out and hired George Blazer to go to work. Mr. Blazer came down, and on the first trip went to Cedarville. While down there he found the prices were mixed up; he did not know what to do, and I think brought most of it back. Mr. Cragin was there and told Foley to explain to him about how to sell the different grades out of the same tank, by turning the faucet one way for one kind and a different way for another. Foley did not want to tell him, and said: "You tell him yourself." Finally, between the two, they told Mr. Blazer how it was.

Q. Did you overhear this yourself? A. Yes; and Mr. Blazer said: "If I cannot work for an honest

company I will quit." He quit that day. This was George Blazer, Springfield, O.; he lives near the East street shops.

Q. Is that something you know from having heard it yourself? A. Yes.

Q. Go on from there? A. While at Springfield I sold George H. Bell, at Cedarville, Water White at 6 cents and Silver Light at 6½ cents. I have often sold as many as four grades, the same as the rest of them, but out of the same tank at four different prices.

Q. Were the prices uniform to different customers? A. No.

REBATES: ANYTHING TO HOLD TRADE.

Q. Not even when the grade was named the same. A. No; we gave them the same and made a ticket out for the same; but we rebated them.

Q. That is, you would rebate to some customers and not to others? A. Not to the others.

Q. Did you have any principle with reference to these distinctions; or, if anyone objected, did you just simply provide for him? A. We always had to do something for a kicker. Anything to hold the trade; that was what we were there for; to keep other companies out.

Q. Was there much competition there? A. We had the Charles Ludlow Oil Company and a Cleveland company, but I do not remember the name.

Q. Did you at any time cut prices below cost against some of these other companies? A. Why, we would cut in case we had to; we would sell as low as 4 cents, and still charge other customers 7 cents.

Q. You said that, in order to drive the Argan out of business, you sold to Mr. Curtis at Marietta cheaper than they could furnish oil to him. A. Yes.

Q. Were you doing the same thing here? A. Yes. Our instructions were: Get the trade, regardless of prices.

Q. Had you much opposition in Springfield. A. Yes.

Q. Do you know who were the independent companies selling there? A. There was only one in Springfield, the Charles Ludlow Oil Company; but afterwards it was consolidated with the Standard Oil Company.

Q. Can you tell anything else of your experience on the tank wagons?

Q. (By Mr. Kennedy, interrupting.) How long were you engaged in that work, selling several different grades of oil out of the same tank? A. About seven years.

Q. Did you feel that you were engaged in dishonest work while doing that? A. I spoke to them about it; they said it was not for me to say what to do, but to do what was said. That is the reply they gave me.

Q. Did the Standard Oil Company pay you well, while in their employ? A. Not very well.

Q. (By Mr. Jenks.) What wages did you get in these different positions? A. When in Springfield I got \$35 a month, but went to work in the morning

at 4 o'clock, and many a night worked until 9, 10 or 11, before getting in. I had one trip through Lawrenceville, North Hampton, Tremont, Terre Haute and Bowlesville.

Q. (By Mr. Kennedy.) Did you leave the employ of the Standard Oil Company because you could not engage in this dishonest practice?

MANY GRADES OF OIL ONLY NOMINAL.

Q. (By Mr. Farquhar, interrupting.) You speak of selling different grades of oil out of one tank. How do you construe the word grades? Is it a title or a condition? A. It is a brand on the barrel.

Q. And that is all it was? A. Yes.

Q. So you men were selling different names instead of different grades, with only one grade in the tank? A. Yes. We called it a grade, but still it was only a name.

Q. (By Mr. Phillips.) There are different grades of oil sold, are there not? A. Yes; the Standard Oil Company, I believe, makes three grades altogether.

Q. (By Mr. Jenks.) There are three grades of refined oil. You have not known any more? A. No.

Q. And how many different grades do they pretend to have which they sell at different prices? I think you named eight. A. Yes; I have seen a dozen grades sold at different stations.

Q. And you think they sell at as many as a dozen prices at different stations from these three actual grades? A. Well, there was just about one-half to one-fourth cent's difference in the price sometimes; Silver Light was always one-half cent more than Water White; Red Star was one-fourth cent more than Water White; but they all came out of the same tank.

Q. Would they sometimes be selling under as many as a dozen different names at one station? A. They sold under eight names at each station; but when we got to Columbus and Urbana we dropped Hyperion and the southern names, and put in the new names. There were about eight grades at each station.

Q. Out of three real grades they sold about eight nominal grades on an average? A. Yes.

Q. (By Mr. Phillips.) What are the three grades that the Standard Oil Company makes, to which you refer? Can you name them? A. I think the correct names are Diamond White, Water White, and Eocene.

THE TEST OF DIFFERENT GRADES.

Q. Can you tell what the test of these different oils is? A. The Diamond White is 150 degrees open cup and 120 closed cup. The State test is 120 degrees, and 120 degrees is what we test it ourselves. There is about ten degrees difference in each one. Of course, the cheaper the oil the lower the test; the better the oil the harder it is to ignite.

Q. How did you happen to leave your position at Springfield, O.? A. Mr. Mathews came there

and raised my salary and sent me as cashier to Columbus, O.

Q. What salary did you then get? A. I was getting \$35; he raised me to \$40 and sent me to Columbus.

COMPOUNDING OILS AT COLUMBUS, OHIO.

Q. What was your business at Columbus, cashier at the works? A. While I was there I had charge of the works and all the shipments. I took care of all the money, received orders, and sent out bills. We did considerable mixing in Columbus. When a person wanted a barrel of boiled linseed oil and we had none, we had an agitator heated up to 125 degrees and put in three gallons of Japan dryer; that made boiled linseed oil. When a person wanted miners' oil we would get three barrels of cottonseed oil and mix it with two barrels of miners' stock and make miners' oil out of it.

Q. Then in this Columbus establishment; instead of selling merely refined petroleum, you also sold other kinds of oil? A. That was the habit over all that district; the oil was shipped from there; all paraffin oil came from Cleveland in blank heads. If a person wanted rubbing oil for furniture, ozone, paraffin, diamond paraffin, golden machinery, or a good straight machinery, we got it in blank heads; turned out whatever they wanted and charged prices accordingly.

Q. In connection with the sale of these different kinds of oil, do you mean to say you regularly manufactured linseed oil there or sometimes had the genuine boiled linseed oil? A. No; we never had any of that.

Q. (By Mr. Phillips.) Was the genuine linseed oil worth more per gallon than that which you manufactured? A. In boiling and handling the oil a certain per cent. is lost. We took a low oil with a little Japan dryer, but the dryer being thicker than the linseed oil, does not mix, so we put it in a range that held five barrels and heated it up to 125 degrees, when the dryer would come to the top and we would mix it; that would make it a dark color and it would go off for linseed oil all right.

Q. Was it as valuable as boiled linseed oil? A. No.

Q. (By Mr. Jenks.) How much money was saved by this mixing process, do you suppose? A. Anywhere from 5 to 6 cents per gallon.

Q. Besides boiled linseed oil, what others did you make in this same way? A. To make miners' lamp oil we took three barrels of cottonseed oil and two barrels of miners' stock and mixed them.

Q. Was that for the purpose of saving on the cost? A. Certainly; paraffin was worth 10 cents, extra golden machine 12 or 13 cents, and light rubbing oil was worth 14 cents. We just branded the oil to suit the customers, and gave them what they wanted.

Q. And gave substantially the same thing? A. The same thing in every barrel.

Q. (By Mr. Ratchford.) I should like to get the process of compounding the miners' oil. Do you

say it was three barrels of linseed oil and two of other oil? A. Three barrels of cottonseed oil and two of miners' stock.

Q. What did the oil generally sell for after the mixing took place? A. Miners' oil varies. Sometimes it is as low as 22 cents and goes up to 34 cents. The miners' stock, I think, costs about 6 or 6¼ cents; the price of the cottonseed oil depends, of course, on the market; the American Cottonseed Oil Company, of Cincinnati, regulates the market.

Q. What do you understand by miners' tar? Do you handle any paraffin wax? A. We handle it only in pound cakes and 20-pound slabs, but we do not use it for that purpose at all—it would not do.

Q. (By Mr. Jenks.) In the position you held at Columbus as cashier you know, of course, about the details of the business, i. e., how this mixing was done; but did you yourself take part in it? A. No; but every day I would have to go out in the warehouse and make a report for the time. Mr. Adam Paulus would come to me and say he wanted to mix up some miners' stock and would like a number of barrels; I would deduct them from my stock report each day, so that the report showed what we sold and what we had left in stock; it showed every empty barrel left at the station at night.

Q. To whom did you make your report? A. I made it to the general office in the Wheeler building. A boy would come down and get it every day.

Q. Did I understand you to say that the mixer did that work as his regular business? A. No; he mixed oils, but when he did not have that work to do he would take care of the machinery.

Q. Was it your business to furnish the different kinds of material he wanted? A. He would order so many barrels and I would see that he got them. These barrels were dumped into the kettle and he sat there and stirred it up. I would stay there to see that he dumped it in. I would charge him up with so much oil, and give him credit for the empty barrels he had taken.

Q. After this oil had been mixed did it come into your hands again, being the different oils of the stock you had to sell? A. Yes.

Q. (By Mr. Farquhar.) Have you had any experience outside of your work for the Standard Oil Company in compounding oils? A. No.

Q. Do you know any of the other formulas of the compounders of oil in the United States? A. Well, I have been around refineries, but I never noticed that they compounded at all.

Q. Are you aware there is such a business in refineries? A. In my talk with other people I find they never compound as we did.

Q. But you don't know anything about compounding outside of what you saw in the works of the Standard Oil Company? A. I do not.

METHODS OF MEETING COMPETITION AT COLUMBUS.

Q. (By Mr. Jenks.) Have you anything further to say with reference to your experience as cashier in Columbus? A. We had our secret process there as at other places. We had our rebates at Colum-

bus, which made oil about one cent a gallon cheaper, on account of the Cleveland Refining Company being there as a competitor. When they came there it was pretty hard work for the Standard Oil Company, so they hired Mr. E. W. Shoemaker to start the Shoemaker Oil Company. Mr. Shoemaker came up and the Standard Oil Company had painted on Charlie Carr's wagon in big letters, "Shoemaker Oil Company." We often got orders, the same as Down & Milliken, at Washington Court House, for carloads of oil; they had to buy cheaper, so the Standard cut the old prices at Washington Court House; that is, they cut prices and sent it to Shoemaker at reduced prices, and branded it Shoemaker Oil Company.

Q. That is, it was supposed they had bought from the rival of the Standard Oil Company when they were buying from the Shoemaker Oil Company? A. Yes.

Q. (By Mr. Phillips.) And was that used by the Standard Oil Company to supply both? A. Yes; Mr. Mathews said that he stood their share of the loss, and if there was any loss the Standard Oil Company stood it on these cut prices. Mr. Shoemaker drew a straight salary and loaded his wagon at the Standard's warehouse. Mr. Clarence Tolan, who was his bookkeeper and cashier at the Shoemaker Oil Company, boarded with me at Mrs. Dickson's, on North High street. He was bookkeeper and cashier at the Shoemaker Oil Company and I was cashier and bookkeeper down at the Standard Oil Company's works. We were together all the time, boarded together, and went together.

Q. Were both of you receiving pay from the Standard Oil Company? A. Yes.

Q. Did you say that Shoemaker was paid a salary? A. Yes.

Q. Do you know that for a fact? A. Mr. Mathews swore to it as a fact before Mr. Monnett, in Columbus.

Q. (By Mr. Phillips.) About what was the magnitude of the business while you were cashier there? What would your footings show each day in the month? A. Well, lots of days it ran up to \$700 or \$800. I have known one wagon, that of Mose Gradwohl, to take in \$200 in one day.

Q. Have you anything further with reference to the work at Columbus? A. I do not think of anything more.

Q. (By Mr. Phillips.) Do you know about how much the competitors of the Standard Oil Company sold in Columbus? A. Clarence Trimble told me that we were about on an even basis. Mr. B. A. Mathews hired a boy to go and see how much oil they were shipping out each morning. We would go down to the station every day and watch the tank cars which they got, and watch their business, too.

Q. (By Mr. Jenks.) Did he report to you every day? A. He would take account of the tank cars and give us the number and we would send the report to Columbus.

Q. (By Mr. Phillips.) Were the competitors driven out of business in Columbus while you were there? A. Well, they cut prices so that those peo-

ple came and arranged with the Standard to hold prices up to a certain point. Prices remained the same excepting what few rebates we had.

Q. Do you not know how much they were permitted to sell? A. No, I do not.

Q. Or what proportion of the trade they obtained under that arrangement? A. No, I do not. They had an arrangement; they went from one to the other; if the Standard Oil Company telephoned down there to raise prices, they would raise them.

Q. (By Mr. Kennedy.) Did the other companies in Columbus also sell many different grades of oil from the same tank? A. They never handled but three grades that I knew of.

Q. Three? A. Yes. They handled Penoline, Safety Light, and Electric Light.

Q. Do you mean they had one grade of oil in a tank and sold three different grades out of it? A. No; they had three storage tanks; we had 10 at Columbus; we had our cottonseed, linseed, turpentine, and two water tanks; we had 10 tanks, and they had, I think, four; one held 5,000 barrels and one held 10,000 barrels; and we had another one that held 1,000 barrels.

Q. Do you know of their having deceived the public in the same way the Standard Oil Company did? A. Not that I know of.

AGENT'S SPECIAL COMPETITION REPORT.

Q. (By Mr. Jenks.) Were you in a position to find out? Were you in a position where you would have been likely to find out if they were deceiving the public the same way as the other people did? A. We always made it a point to go around and see what they got; that was always our instructions, just the same as though it was our business. I probably have got some of the Columbus letters with me now. I have one here dated May 28, 1896 (reading): "W. H. Clark, Urbana, Ohio. Dear Sir: Herewith inclosed please find competition list to be filled out by you the 1st of June. Please fill out carefully and return, and add to this list any parties you know of who are buying all or portions of their goods outside. Yours very truly, B. A. Mathews."

Here is another letter dated July 3, 1896 (reading): "W. H. Clark, Esq., Urbana, Ohio. Dear Sir: Inclosed please find competition sheet to be filled out very carefully and returned to me as soon as possible after you receive it. Please give full information with reference to parties on list, and where names do not appear of parties who are buying outside, please enter them, giving full information. Yours very truly, B. A. Mathews."

Q. Have you a copy of the competition sheet with you? A. I think I have one; the competition got a little fast on us, and this was sent to me: "May 25, 1897. W. H. Clark, Newark, Ohio. Dear Sir: I forward to you today a supply of blanks same as sample herewith inclosed, which is to take the place of the little slip that has formerly been used for reporting daily competitive oil. Will you kindly fill out one of these blanks weekly, commencing June 1,

and whenever the month ends in the middle of the week, make out one on the last day of the month for the portion of the week not covered in the last week you report. Enter upon this report all competitive oil or gasoline that you have been able to locate during the week, and if during the week you have been unable to locate any competitive shipments, then write across the face of the blank 'Nothing to report' and mail it to this office. Be sure to mail it whether you have competitive receipts to report or not. If there is anything about this report that you do not understand, please confer with me at once, as it is very important that it should be made out promptly and forwarded regularly. Trusting that I will have your hearty co-operation, I am, yours very truly, B. A. Mathews." I have not one of these blanks.

Q. Have you not one of those competitive lists?
A. I have not, but I can get one.

Q. Were you ordered to fill up the competition blank regularly or not? A. Yes; we filled them out; first on the blank was the producer, then the name of the town, and the price he bought at.

Q. How did you find that out?

Q. (By Mr. Phillips.) From whom he bought?
A. We would get around him and talk to him to see if we could get out of him what he paid for the oil.

Q. (By Mr. Jenks.) You spoke of having a boy for that? A. Yes; it was his business to notice every tank car that came in for the competitors.

Q. Was that boy paid regularly by you to do that work? A. He was regularly paid for that work.

Q. By you? A. Yes; he drew \$15 a month; his name was Clarence Trimble.

Q. (By Mr. Phillips.) After sending in these reports, what instructions did you get about meeting this competition? A. Well, in some cases we were not ordered to do anything, but the next time we had any business transactions we were to attempt to get their trade; and even if it cost us a dollar or two we were to try to get hold of it.

Q. (By Mr. Jenks.) You say if it cost you a dollar or two. Do you mean that you were to cut prices that much? A. Sometimes we would buy empty barrels, but we would cut that much sometimes. If we had to pay more than market prices for them, we would say that we would take them in at so much apiece. I do not mean barrels of oil, but empty barrels.

Q. That is, if they would take your oil instead of that of your competitors you would take the barrels at an exorbitant price? A. Take them all; yes.

Q. Do you recollect any other methods you employed in order to crush competition? A. There is nothing that I think of at Columbus.

Q. (By Mr. Phillips.) Do you know of any other instances of selling under assumed names excepting the ones you mentioned at Columbus? A. Only at Columbus.

Q. (By Mr. Jenks.) How long were you at Columbus? A. I went the 20th of March and staid until the 16th of December.

STANDARD OIL COMPANY'S METHODS AT URBANA, OHIO.

Q. Then what change did you make? A. Then I was promoted to be manager of the Standard Oil Company at Urbana, Ohio.

Q. You say you were promoted. What increase of salary did you get? A. They did not increase my salary at first, but paid my board until March; then they raised me \$15 a month.

Q. That is, you had had \$35, then \$40 and board, and then you were raised to \$55? A. Yes.

Q. Will you tell us with reference to your experience at Urbana? As manager you really had full charge of all their business? A. Full charge; yes.

Q. Did you receive instructions directly from Mr. Mathews? A. I received instructions directly from Mr. Mathews; and when any business around there had to be seen to I was the one to look after it. Everything fell to me; but things ran along smoothly. I had no competition. Charlie Ludlow did not come out. He bothered us once in a while, but we did not pay any attention to him. Finally Mr. William Helmick, who had formerly been in the oil business there under his father, Mr. John Helmick, but who, after his father died and left him some money, bought a farm and went to farming, came there. When he saw he could not do anything farming he sold his farm and invested his money in the oil business for the Cleveland Refining Company.

Q. Do you know how large an investment he made? A. I do not know the amount. I know the first shipment he got in was 300 and some dollars, and I remember he told me his bill. Finally Mr. H. S. Hollingsworth, of Columbus, came over. He takes care of a good deal of the business for Mr. Mathews at present as well as then. He came over then, and he and I went out to Mr. Helmick's house and tried to scare him out of it. We told him we were going to cut prices and everything, and Mr. Helmick was kind of nervous. Finally Mr. Welsh, of Springfield, came up.

Q. Was Mr. Welsh another employe of the Standard Oil Company? A. Yes; he was a cooper man, and worked at the cooper shop in Springfield. All three of us talked with Mr. Helmick about oil, and about selling us the oil at the price he paid for it. He refused to do that at first. Finally we worked a bluff on him about cutting the price, and did cut it a little in one or two places where he was selling. He had to dispose of his oil the best way he could.

Q. In these places where you cut did you cut below what he had been paying for the oil? A. Yes.

Q. Then I suppose you threatened to cut still further? A. Yes; to cut still further if he stayed in the business.

Q. How much did you say you would cut? A. I think oil was selling at wholesale in Urbana for 8 cents, and I believe we cut to 6 cents, or about that. I know it went down about 1½ to 2 cents.

Q. And you made threats to cut it still further? A. Yes.

Q. How far? A. We told him we would go 1

cent a gallon further. Finally he quit the business and went to the poorhouse. His sister from Iowa came and took him out, and he is out there now.

Q. (By Mr. Phillips.) Was that caused by the purchase of \$300 worth of oil? A. He had most of the trade; he was a citizen there and the people liked him. He could have handled the trade there and made an honest living. When he came he put up a building. We would not take the building off his hands, and would not help him out any at all. We just closed in on him like any other person; and when you close in on them pretty hard, you know what happens.

Q. (By Mr. Kennedy.) Did you not say you started up there and had no competition until he came? A. Yes; we had no competition to speak of until he came in.

Q. (By Mr. Jenks.) And when he came, he put up this building and began buying oil, and you agreed, if he would quit, to take his oil off his hands? A. We were willing to agree to do that, but he would not do that. We worked a bluff on him. His wife was on the stair steps in the hall and stayed there and cried. We had quite a time when we were there.

Q. You did not, then, take any oil off his hands? A. I think we got about four or five barrels. We just painted those over and shipped them out in the name of the Standard Oil Company.

Q. But he must have disposed of the oil he had at some price? A. He disposed of it all over town; wherever he could drop five barrels he dropped it.

Q. He must have sold his building for something? A. No; he did not get anything out of his building. The council of Urbana does not allow over one barrel of oil or gasoline at any one place; more than that must be 200 feet from any building. He had to build his building away out of town, so that it was no good to him.

Q. So you think that, owing to your competition and threats, he practically lost all his money? A. He lost it all.

Q. (By Mr. Kennedy.) In other words, you think the Standard Oil Company drove that man to the poorhouse? A. I think that is what caused it.

Q. (By Mr. Farquhar.) Had this man had any experience in buying oil before that? A. His father had been buying oil for 20 years of the Standard Oil Company, and had their tanks there. He was in the business probably 20 years.

Q. Did this son have experience? A. He worked for his father all the time and drove his wagon.

Q. Did they come in opposition to the Standard Oil Company? A. They came there and the Standard Oil Company bought them out. Finally the old man died, leaving his money to his son, who then started up.

Q. But he did not know his business? A. He knew the oil business.

Q. (By Mr. Kennedy.) Did you not say this man had failed as a farmer just previous to his going into the oil business? A. Well, his wife did not like the farm. He did not make much money, and was not doing much on the farm. His wife did not like it

and was in town all the time. He could not stand it, and so he sold his farm.

Q. (By Mr. Phillips.) And put the money into the oil business? A. And put it into the oil business.

Q. You spoke of his going to the poorhouse. How did he come to go to the poorhouse? On account of failing in health, or from not getting any employment? A. You see, Urbana is a kind of a little town; it has two strawboards there, and Barley, Kent & Co.

Q. (By Mr. Jenks.) What is their business? A. They make furniture. There is not much work, so he did not get anything to do. That is all he could do.

Q. Was the man strong, so that he might have worked? A. He could have worked. I do not suppose he was stout enough to do hard manual labor, but he could do work, like driving around and waiting on the trade.

Q. Probably he could not go into this furniture establishment, or any place like that, to get regular work? A. No; it was too heavy for him.

Q. Have you anything further with reference to your experience as manager in Urbana? A. No; I stayed there until fall, then I went to Newark, Ohio.

Q. (By Mr. Phillips.) How much did the Standard Oil Company's trade amount to, in Urbana, a month? A. We would run by the month, I suppose, about 40,000 or 50,000 gallons; our line went as far as Mechanicsburg on the east, West Liberty on the north, Tremont on the south and St. Paris on the west, making quite a scope.

Q. (By Mr. Kennedy.) Did you also sell several grades of oil out of the same tank in Urbana? A. Yes.

Q. (By Mr. Jenks.) Were the general methods there the same as at other places? A. Yes.

MANY DIFFERENT PRICES FOR OIL AT NEWARK, OHIO.

Q. Then you went from there to Newark? A. Yes.

Q. Was that in the nature of a promotion also? A. They promised me a raise when I went to Newark; they changed my salary to \$2.25 per day; that made more money than what I was getting on account of the days.

Q. So you did get an increase in salary there? A. Yes.

Q. What position did you take at Newark? A. I was manager at Newark.

Q. Was your business the same generally as it was in Urbana? A. Yes; but Newark was a larger station than Urbana.

Q. How much more business did you have to oversee there? A. Our Newark business ran about 80,000 gallons per month.

Q. Can you tell us with reference to your experience there? A. At Newark the business was much harder than it was at Urbana on account of the fact that we had from 20 to 25 prices. We sold J. P. Lamb & Co. gasoline at 7 cents; Mr. J. M. Brown, in the store beside them, we charged 9½ cents. We charged Mr. Rankin 6 cents for oil, and drove right down to Showman Brothers and charged them 7½

cents. We then drove to Mr. Hagmeier and made him a ticket out the same as the others, but we always rebated him. I think I have his receipt here now. Here is one.

Q. Will you read it? A. (Reading): "February 28, '09. Mr. Clark, when agent of Standard Oil Co., has paid me a great many rebates on goods which were receipted for when given. Geo. J. Hagmeier."

Q. About how much of a rebate did you make, Mr. Hagmeier? A. One cent on gasoline and 2 cents on oil that he picked up.

Q. When you were selling to others at 7 cents you billed his at 7 with a rebate, so you really sold him at 5? A. Yes.

Q. Did you make that to Mr. Hagmeier on direct instructions from the office? A. Mr. Mathews himself was in the office in November; he told us in Newark; he told me to give it to him.

PRICES FIXED BY THE MANAGER AND NOT THE AGENT.

Q. How much discretion did you have with reference to making rebates and making special prices? You, of course, were under general orders, as you have just said, to get the trade and keep the trade? A. Yes.

Q. Were you at liberty without instructions from Mr. Mathews to make a rebate of 2 cents a gallon wherever you thought it was necessary? A. No; I would write him that some customer, or somebody, was buying outside oil, and then we would either come over or send Mr. Hollingsworth, his secretary. They would tell me to go any make the arrangement—authorize me to go and make the arrangement.

Q. You did not have authority to make any special price yourself without direct instructions in each separate case? A. No; I could not change the price to anyone; I had to sell at the price they told me. If any customer was buying outside oil, I would write them to come over, and they would come over or tell me to make the arrangement.

Q. So all of this change in prices was always under special instructions for each particular case? A. Yes; I always wrote those letters to Mr. Mathews personally; I did not write them to the office.

Q. Were your letters to Mr. Mathews always marked "personal?" A. I would write to Mr. Mathews personally.

Q. That is, you did not dare to write to anybody but Mr. Mathews? A. I would write to Mr. Mathews personally, i. e., put his name on the letters so that nobody but him would open them.

Q. (By Mr. Farquhar.) Were those changes in rebates or prices made by your suggestion to Mr. Mathews? A. If I lost a customer, if a customer went to buying outside, I would write to Mr. Mathews about it, and he would come over, or write to me to make that customer a certain price.

Q. Then it was your representation to Mr. Mathews that caused the change in price? A. No; he always told me to go and make the price.

Q. How did you know what price to make if you

did not write him? A. I did not know what price to make and he would come there and tell me what to do; sometimes he would say: "Cut half a cent, or 1 cent, or 2 cents." I just reported to him on a slip of paper. I met the competition if the customer was buying somebody else's oil.

Q. (By Mr. Jenks.) It was on your report that Mr. Mathews made these cuts? A. I sent in a report every week just like the one I read; he read those slips and wrote me a letter and asked if I could not get those people in line. Then, if the name went in a couple of times and I told him I could not get them in line, he would come over and authorize a cut.

Q. (By Mr. Phillips.) He did not authorize you to make the cut? A. No; I could not cut at all.

Q. (By Mr. Farquhar.) In other words, in your business as canvasser for trade, you could easily find a customer at a certain price or a certain rebate, and you suggested that to Mr. Mathews and then the cut was made? A. No; I could not do that.

Q. I did not say you could. That is the reason you misconceived my question; I want to find out if a suggestion was made to Mr. Mathews. Would they have to be buying the outside oil? A. As long as it was one of our customers buying our oil, I could not make any suggestion to him because I never paid any attention at all; but if any person bought outside oil and I would report any outside oil, then he would go looking it up.

Q. In getting new customers, and in getting customers certain rates, how else could you? How could Mr. Mathews know anything at all about it without you informed him? A. I sent him in a report every week.

Q. Yes; certainly. So that all these cuts and suggestions, there, were on the part of the Standard Oil Company? A. Yes; Mr. Mathews made them himself.

Q. Did you have any positive orders from the Standard to make the cuts—any suggestions? A. No; I reported each week the customers that were buying outside oil, and he would wait about one week and write a special order to do the best I could. If I could not do anything, I would go ahead the next week and say: "I am not selling any oil." Then he would come over there himself and say: "You make them a cut of a cent a gallon and see if you cannot get them to come in again." He might say half a cent or 2 cents, and whatever he says goes; I could not change the price; I could not guarantee a man any price.

Q. As the agent of the Standard Oil Company you were just as anxious to get a customer as the Standard Oil Company was? A. Certainly; I had nothing to do with the price.

Q. (By Mr. Jenks.) The only discretion you had was with reference to the fact that you could give the name of the oil you sold him; and if he asked for a high grade, you would sell him a higher grade out of the same barrel and for the same price? A. Occasionally, if a man wanted a little better oil, or something, I could brand it Silver White, or Red Star, and give it to him out of the same tank.

Q. Did he get it at the price that had been fixed for that brand? A. I would tell him I would give him some of this oil and a little better price on it, and he would not know. It was just the same as Capitol Cylinder and other oils we sold there in Newark. We charged the Newark Ice and Cold Storage 32 cents for Capitol Cylinder, and went up to the Newark waterworks and charged them 31 cents. Those prices were made by Currier, a special man.

Q. Was Currier a special agent of the Standard Oil Company? A. Yes.

Q. Also in the office at Columbus? A. Yes.

Q. A man who came up to give you those instructions? A. Yes; he came around and made those prices; that is, I did not have anything to do with it. He would come around and cut the prices where he thought it was necessary.

Q. And you just delivered the oil? A. I just delivered the oil; and I would deliver it to them at the price he sold it to them for a year. If he sold it to them at a certain price and gave them a contract for another price for a year, I would look to see what the price was and charge them that price.

PROCEEDINGS AGAINST THE AGENT OF SCOFIELD, SCHURMER & TEAGLE, OF CLEVELAND.

Q. Did anything come up at Newark besides driving these competitors out? A. Nothing except that Mr. Al. Donaldson started there for Scofield, Schurmer & Teagle, of Cleveland. After he had been in business awhile and seemed to be doing pretty well, I went down and bought his building while he was away. I had a man, Mr. Retburg, break a lock off, and we went in and threw his tanks and barrels out and loaded the building, the whole thing, on a dray, and hauled it off. When he came back he had no warehouse.

Q. Had he leased this building. A. Yes.

Q. (By Mr. Phillips.) Had his lease expired? A. No; the lease was on yet, but I had the man sign a contract that no oil should go on that lot.

Q. Would he not have recourse on this man for the oil and the damage done him? A. He just got scared and sold us his wagon, all the oil he had, the desk in his office, and everything. We got the whole shooting match.

Q. Who fixed the price? You say you went down there and bought it. Did you have the discretion to fix the price, or was it done under orders from Columbus? A. I suppose the man wanted \$5; Mr. Mathews did not say just what he wanted to pay. He wanted to know what price I could buy it for. Finally Mr. Hollingsworth said if I would get him out he would give me two weeks' vacation on salary.

Q. So that you had discretion to get rid of a rival? A. It cost \$2.50 and the Standard Oil Company paid for the building.

Q. Did Scofield, Schurmer & Teagle establish a new office? A. No; they dropped it. His writing desk is now in the Standard Oil Company's office in Newark.

Q. How much did you say you paid for the building? A. I paid \$2.50. It was just a shed warehouse. It was a poor thing, but it was worth more than that.

Q. (By Mr. Kennedy.) Did you ever in any of these cities sell oil to any customers below the usual rate except for the purpose of driving out competitors? A. No.

Q. Did you ever bestow favors on any individuals? A. No.

Q. (By Mr. Jenks.) What inducement did you give the owner of this shed to sell it for \$2.50? One would not suppose that that was enough to induce a man to enter into any such business as that? A. Well, I got to talking around him, and kept around him.

Q. Was he a special friend of yours? A. Yes; we had a lot of repairing of oil tanks. The wholesale storage tanks got to leaking and I gave him all the work. The Standard Oil Company always paid for the work, and I gave him what work I could and helped him out.

Q. So that he did not merely get this consideration of \$2.50 for his shed, but also, practically, a promise of work from time to time? He was also a good friend of yours and he did it for friendship's sake more than anything else? A. Yes; for friendship; but it was not what the building was worth; the building was worth a dozen times that.

Q. (By Mr. Phillips.) Did he know you were going to take possession of this building the way you did, when he was out of the city? A. Who, Donaldson? No; he did not know anything about it until he came back and found everything gone. Besides, he had Mr. Charles Sessor working for him. He stayed in the office and Mr. Sessor drove the wagon around town. Finally, Mr. Hollingsworth and I made arrangements to hire Mr. Sessor at \$10 a week, and put him around right on Al's trade. Mr. Sessor had worked for him, and knew his trade and where to go to. We told him that if he could not get the regular price at any time to take what he could get, and keep the cans full all around while he could.

Q. (By Mr. Jenks.) What pay did he get before? He got 75 cents a day to follow the oil wagon on a bicycle. Then I hired Roy Jones at 75 cents to follow Al around and see where he stopped. Then the next day, Mr. E. G. Mathews, our canvassing agent, would go to those houses and explain to them how good the oil was and clean their lamps and fill them up, and have them send our wagon around there to let them try this oil at the reduced price.

Q. Did you have any instructions to pay this boy 75 cents per day to go around and follow up competitors? A. Yes; and I had to bring the boy around to Mr. Hollingsworth, who had a talk with him before we hired him.

Q. Who went with you to take this building when you bought it? A. I went down the street and got a crowd of fellows and brought them up.

Q. What did you pay them? A. A dollar, I think, for the whole bunch.

Q. Cash or drinks? A. Both, I think; I gave them a dollar and went with them.

Q. Did you get your vacation? A. I have not got it yet; yes, I guess I have got it now.

Q. They said you were to get two weeks' vacation if you got rid of the competitor. Why did you not get your vacation; you got rid of him? A. They said I was too busy. The man at Washington Court House rode out on his bicycle and got hit by a train. We had to send Mr. Milliken down there until they could order a man from Zanesville. I did not have any extra men.

Q. They did not express positive approval? A. I have a letter here from Mr. Mathews complimenting me on the way I got rid of him. This is a special punishment they award, that they have for their friends.

Q. (By Mr. Kennedy.) I suggest that the witness state the substance of the letter, if he cannot find it.

Q. (By Mr. Jenks.) If you cannot find it, will you state what the letter said? A. (Quoting): "I wish to compliment you on the way you got him out of business." It was a very short letter—just a little short piece on the top of it.

Q. If you can hand me the letter afterwards, will you do so? A. Yes; it came to me typewritten afterwards; it was just a short quotation.

Q. Now, in reference to this business in Newark? A. He complimented me on pipe fitting. I did some pipe fitting under Mr. Paulis's supervision. I got the compliments both at once. I was surprised.

Q. Have you any further instances in mind of driving out rivals or any other special methods employed at Newark? A. No; we never used any methods except our cut.

Q. Except what? A. Except having different prices for different people. We used that more in Newark than anything else.

Q. Do you recall how many grades of oil you were selling there—that is, nominal grades? A. Three; that was all. We had three storage tanks, one 14,000-gallon tank, one 18,000 and one 4,500.

Q. You did not pretend to have more than four grades of oil? A. No, we had one gasoline and three grades of oil.

Q. I understood you to say a little while ago that in most places where you were selling oil you had as many as eight different grades? A. We had three grades; that was all we had. We sold Diamond White, Prime White, O. S. T., Water White, Crystal Light, Silver Light, Eocene; and when we had a man who wanted oil from Cleveland we painted the barrels red and branded them, I believe. I know they sent us a stencil from Cleveland.

Q. They sent you a stencil from the Cleveland office? A. And it was marked Standard Oil Company, Cleveland, and we had those barrels painted red. I forget what name we put on for him.

Q. And you filled those barrels out of the same tanks and put the Cleveland brand on and sold it with that brand? A. Oh, yes; each of those brands.

Some had the same brands and some different brands.

Q. (By Mr. Phillips.) Did you sell the same brands at Newark as at the other places? A. We dropped the Hyperion at Newark and put the Diamond White on the cheap list.

Q. (By Mr. Jenks.) Will you tell us again with reference to the amount of trade you had at Newark as compared with the amount at Urbana? A. We had about a third more, I suppose. At Urbana they ran about 50,000 and at Newark it was 80,000.

Q. (By Mr. Phillips.) That is, 80,000 gallons per month? A. Eighty thousand gallons.

Q. (By Mr. Jenks.) When you left Newark where did you go? A. I went back to Urbana.

Q. Was the change in the nature of a promotion this time? A. No; Mr. Hurst, who had been agent at Newark, wanted his place back, and Mr. Mathews gave it to him.

Q. He had been manager there before, and you took his place? A. I took his place. He went away somewhere, but he returned and wanted his place back. I got my place back at Urbana.

Q. You went back as manager at Urbana? A. Yes; I went back as manager at Urbana.

Q. Were your wages cut down? A. No; they remained the same.

Q. As you had at Newark? A. Yes.

Q. Was there anything different in carrying on the business at Urbana the second time? Did you have any new experience? A. No; not during the time I was there. I went back and staid six weeks.

Q. Only six weeks that time? A. Only six weeks, and everything went along quiet.

Q. Then where did you go? A. I went back to Newark again.

Q. To what position? A. Manager of the Standard Oil Company.

Q. Had Mr. Hurst left again? A. He went on the mail force, carrying mail.

Q. Working for the United States government? A. Yes.

Q. Were your wages the same the second time at Newark? A. Yes, but they paid board for me for six weeks when I came back.

Q. So there was a little increase for a time? A. Yes.

Q. How long did you stay this last time at Newark? A. About two years.

Q. And up until last February? A. Yes.

COMPANY'S METHODS ADOPTED BY OWNERS OF TANK WAGONS AT NEWARK.

Q. Did anything new happen during your last residence at Newark with reference to the methods of business? Are there any special instances that you have in mind? A. Nothing, except that the tank wagons occasionally made a little kick, and we would give a little reduction and then cut it off again.

Q. Explain a little more in detail what you mean by that. A. When one of the customers would

kick, we would cut the price to him half a cent a gallon; in fact, we cut the price to all the wagons a cent a gallon. We sold them gasoline cheaper than we sold the stores. Oil sold at the same price.

Q. The tank wagons were not owned by the Standard Oil Company; you sold a little directly to the wagons? A. We simply sold to them.

Q. And they would retail it out? A. And get what they could for it.

Q. These tank wagons had how many grades? A. They had three spaces.

Q. They would have that many grades of oil? A. No; they had two spaces for oil and one for gasoline.

Q. Do you know whether they were in the habit of giving different names in the same way you had done when you ran the oil wagons? A. My man there, Mr. King, was, you might say, the head of these fellows. More of them paid attention to whatever he said than to anyone else. He was an employe of the Standard Oil Company for a year and a half or two years. Through him they got to selling any kind a person wanted. If you wanted 15-cent oil you could get it; if you wanted 10-cent oil you could get it.

Q. They adopted the methods they learned from the company? A. Yes.

Q. I suppose that is a method anyone might develop for himself? A. Mr. King said that if he could work it for other people he could work it for himself.

HOW WITNESS CAME TO LEAVE EMPLOY OF STANDARD OIL COMPANY.

Q. Will you tell us how you came to leave the employ of the Standard Oil Company? A. Well, I came in one evening when Mr. E. C. Lockwood was there.

Q. Who is Mr. E. C. Lockwood? A. He is a kind of general man from Cleveland.

Q. Standard Oil Company manager? A. Yes. He goes around and inspects the stations and property; he looks over everything about a station and makes a report on its condition, whether the yard is clean, etc.

Q. Special inspector. Is that about it? A. Yes.

Q. Sent about? A. He has three States that he travels over.

Q. Is this blank from which you have here on which he makes his report, so far as you know, the general one he sends from each station? A. Yes; that is the one sent from each station.

Q. Will you offer this in evidence here? A. I will leave you the copy. We had one taken every two or three months at that station. When he came there to make the inspection, I came in at night and had worked a little hard and was tired, and I suppose cross. Anyhow, he came in there all dressed up, and I was not in a very good humor. He began to tell me how to do things; how to do this and that thing in the yard.

Q. How to do what? A. He wanted to tell me

how to blue barrels, count staves, weigh oil, and all that sort of thing. I had done that for seven years and I did not think he could tell me.

Q. Did you know who he was? A. I did not know at all that he held a position, so I told him he could not. He said I might lose my position by it, and I told him I did not care about that. I gave him a good jawing and never thought all the time that he was a person connected with the oil company. I did not know who he was. In consequence I got a lay-off. I never got a discharge, and I never have gone back.

Q. How was that done? By Mr. Mathews? A. Yes.

Q. Have you a letter? A. I have the letter in my pocket.

Q. Will you be kind enough to read it?

Q. (By Mr. Phillips.) Give the date of it, please? A. (Reading inspection report.)

EXHIBIT A.—INSPECTION REPORT.

Date, October 3, 1896.

Station —, Newark, Ohio.

No. 1: Is date received written or stamped on each empty barrel? Old stock of Hurst's on hand not dated.

No. 2: Are shipping tags, also date, left on until barrel is used; and if no shipping tag, is shipper's address written on barrel? See above.

No. 3: Are oldest barrels worked up first? Demand has been such that all new and most of old stock has been used.

No. 4: Are all cripples worked up currently? Same cripples on hand as when Hurst left. Mr. Clark states that he has worked up cripples coming in while he has been here.

No. 5: Are light machine barrels steamed out as soon as received? Yes.

No. 6: Are barrels bunged properly?

No. 7: Are barrels properly filled?

No. 8: Are all bung staves removed when weak at the bung-holes?

None filled or prepared by hand account yesterday. Busy shipping day and all barrels used.

No. 9: Are barrels painted good color? Paint dull account, I think, of paint, as Hurst had some trouble.

No. 10: Are barrels neatly stenciled? None prepared. See above.

No. 11: Are barrels properly glued? None prepared. See above.

No. 12: Are tank wagon or warehouse buckets and gauges on filling tanks correct? Verified by Mr. Cragin and Mr. Henderson.

No. 13: Are same buckets or measures on tank wagons or at warehouse used for both oil and gasoline? No.

No. 14: Are tank-wagon faucets in a leaky condition? No.

No. 15: Are the tank wagon and dray kept clean? Were as clean as weather past week would permit.

No. 16: Are the horses properly cared for? Had not been curried this a. m. Stables not cleaned.

No. 17: A. What is their average feed? 6 to 89 to oats. B. Cost of oats, 32 cents; corn, 35 cents; hay, \$9. C. Cost of new shoes, \$1; resetting, 50 cents. D. Have you been able to get any better prices on hay, feed, or shoeing? Price is 60 cents better on shoeing. E. What check is there that full quantity of feed purchased is received? City weight; Hurst has been paying \$1.50.

No. 18: Any leaky valves around plant? No.

No. 19: Any leaky joints or pipe around plant? No.

No. 20: Any leaky tanks around plant? No.

No. 21: Is glue trough and kettle and vicinity kept clean? Yes.

No. 22: Is sawdust on hand to dry up any oil that might leak or spill on the floor? Yes.

No. 23: Is ground kept dry around tank car unloading place? Grounds were wet, due to a leaking connection on a car being unloaded. Had Mr. Clark throw dry dirt on ground and place a bucket under tank.

No. 24: Is ground kept dry around tank-wagon loading place? Yes.

No. 25: Are shovels kept over all sand barrels? Yes.

No. 26: Are grates and doors properly locked up when agent is absent? Yes.

No. 27: Is pump room in good condition? Yes.

No. 28: Are pumps well packed and in good clean condition? Yes.

No. 29: Any unfilled orders on hand that should have gone out? No.

No. 30: Any deliveries on previous days that have not been reported? No.

No. 31: Does tank wagon, dray or any of the buildings or tanks need painting or repairs? No.

No. 32: Is the warehouse, office and yard kept in orderly and clean condition? Warehouse much cleaner than kept by Hurst. Yard and office clean.

No. 33: What time did the agent get around in the morning? 6 a. m.

No. 34: How much time does he take for dinner? 30 minutes.

No. 35: What time does he leave at night? 5:30 to 9 p. m.

No. 36: Are they keeping sample or each tank car received properly labeled and kept in the dark three months before dumping? Samples on hand not labeled. Instructed Mr. Clark that they should be.

No. 37: Is oil inspected before tank car is dumped? Yes.

No. 38: Is there any old lubricating oil or specialties on hand. If so, give us memo. showing filled dates on barrels. See inventory, a decrease over last inventory. Mr. Clark has sent out some of the old boarders.

No. 39: Any barrels not properly gauged? Test at least ten barrels and give agent's gauge and correct gauge of each. None prepared or gauged. Account yesterday being shipping day.

No. 40: What prices paying for coal? \$1.25,

grade nut. Have you been able to get any better figures? Not on quantities purchased.

No. 41: How many barrels of each grade prepared? None. How many filled of each grade? None.

No. 42: Are weeds cut down in yard? Yes.

No. 43: Is agent sending in competition report? Yes.

GENERAL REMARKS.

Make a careful and personal inventory of all stock and material on hand and return attached to this report. See inventory.

H. S. Hollingsworth.

It is just a check, you know. I will leave that.

Q. We will put it in the testimony, then, and make it a part of the record, so you need not read it all over. A. When he came there to make the check we got on the outs. I would not help him at all, and I kind o' threw things in his way. Every time I could I would do it, either the oil or the barrels or anything, so that he could not inspect it. Finally I got a letter from Mr. Mathews at Columbus.

EXHIBIT 2.

February 4, 1899.

W. H. Clark, Esq., Newark, Ohio.

Dear Sir: Owing to the difficulty in getting matters checked up at the Newark station, we have decided to discontinue your services for the present. Immediately upon receipt of this please turn over all papers, keys and everything belonging to the company to the bearer, Mr. W. W. Hughes, who will take full charge of the station for the present.

I do not wish you to consider this as a discharge, for the reason that if everything is in proper condition after we have thoroughly checked up the station there will be no difficulty whatever in having you reinstated.

Yours, very truly,

B. A. Mathews.

So I am not discharged at all.

Q. How long was this after you had had the inspector there? A. I think it came in about two or three days, just long enough for him to write after I had told him what I thought. He said he could not check up the account of the barrels while I was there.

Q. Have you had any further suggestions from the Standard Oil Company that you might be taken back into their employ again? A. They have been talking around. My brother-in-law worked for them at the same time I did. He had charge of the office there, and they were down there to see him the other day and wanted to know what I would work for them for.

Q. Who was that? A. Fouts.

Q. Who is he? A. I think, Mr. Mathews's man.

Q. A man who works with Mr. Mathews? A. Yes.

Q. He wanted to know what you would work

for? A. I told him I would work for \$500 a day, with six months' pay in advance, and that I would work one day and quit.

Q. What is your objection to working for them now? A. If the report which you send in every month should contain an error of \$2, they just take it out of your pay. They never send for you, but just take it out of your pay. It might be a mistake of a clerk on some bill, or something, or an error in figuring up the accounts of the tank wagons.

Q. If any mistake is made by one of their agents they simply deduct? A. Or any of them, of the men under me, if any one of them makes a mistake, it all comes out of my wages.

Q. Will you put one or two of these reports and letters in evidence here? A. Yes. So you see it don't help me so much after all. If there was any mistake made by any of the men they always took it out of me.

TESTIMONY AGAINST STANDARD OIL COMPANY IN OHIO.

Q. (By Mr. Kennedy.) Did you recently give testimony in Ohio against the Standard Oil Company, showing up its operations so far as you know them? A. Yes.

Q. That occurred after you left the employ of the company? A. After I had been laid off.

Q. When was that? A. I do not know. It was not very long after that. I do not remember the exact date at all. It was not very long afterwards.

Q. You told it freely there just as you tell it here, did you? A. I could not tell anything else. They asked me the questions, and what could I tell them?

Q. What I would like to know is this: If you had continued in the employ of the Standard Oil Company would you have been apt to give the same kind of testimony? A. Not in the humor I was toward them just then.

Q. Would this commission be apt to get testimony similar to this of yours from managers of the Standard Oil Company in other parts of Ohio? A. Ask any person there, and if they would come out and tell you the truth they would tell you just the same as I do.

Q. Would Mr. Mathews have testified the same?

Q. (By Mr. Jenks.) Mr. Mathews, for example, would he give similar testimony? A. Mr. Mathews did not know anything when they had him on the stand before Mr. Monnett. I saw by the papers that he did not know anything.

Q. Would you not have been apt to have been in the same position, if they had asked you, provided you had not been discharged by the Standard Oil Company? A. Well, if I was a Sunday school teacher like him, I do not think I would have said that I did not know, if I did know.

METHODS OF STANDARD OIL COMPANY'S COMPETITORS.

Q. (By Mr. Farquhar.) While you were agent for the Standard Oil Company, in those various towns, did any opposition company ever sell below

your rate to get a foundation? A. Why, no; Mr. Ludlow and those gentlemen sold at a cent higher than we did. We always kept below. We were the low people.

Q. Did you regard it as in the line of competition when another company was selling at a cent or a cent and a half a gallon more? Did you call that opposition? A. They always sold higher. They could not furnish it as cheap as the Standard Oil Company. The Standard Oil Company always sells cheaper than other people can make the oil, and ship it cheaper into the town.

Q. (By Mr. Phillips.) Do they get lower freights?

Q. (By Mr. Jenks.) Better freight facilities? A. Freight as well. I have a letter here with reference to freights.

Q. (By Mr. Farquhar.) You speak of opposition companies coming in. I want to know whether these opposition companies sold at the same rate as the Standard Oil Company, or above or below? A. Well, it would vary; sometimes they would sell at the same price, sometimes it would be a quarter of a cent higher, and sometimes a quarter of a cent lower, but the average was always higher than the Standard Oil.

Q. What amount of earnings could they get today if they had to get customers to pay more to an independent company than they would to the Standard Oil? A. Lots of them said they had no love for the Standard Oil Company; they treated them all too bad.

Q. In selling oil from the tank or from the store is there any friendship in it at all? Is it not a simple commercial transaction of buying a good oil for a low price? A. I talked to lots and lots of them. Lots of stores feel that they would be willing to pay more for the other oil than they would for the Standard Oil.

Q. Is there enough of that class of buyers to make a difference in buying and selling oil so that an opposition company can make a living and fight? Do you think any company can sustain itself on that kind of sentiment? A. The most of those people have been handling Pennsylvania oil. Of course that makes a difference, while our oil at Urbana and at Columbus came from Lima, from the Solar Refining Company, and had the sulphur in it.

Q. (By Mr. Jenks.) Do you think the oil of your rivals was better than your own? A. Yes; it was Pennsylvania oil.

Q. (By Mr. Farquhar.) Does the high standard of the oil explain the difference in price? For instance, was Scofield's oil of a higher standard than yours? A. No; Scofield's was not.

Q. Whose was? A. Charles Ludlow's and the Independent, of Mansfield.

Q. How could you take away their customers if you had a lower standard of oil? A. Why, we would give it to them so cheap that they really had to take it. If they did not buy it, we would get wagons on the street and sell it so cheap that they could not stand the competition.

PENNSYLVANIA OIL, COMPARED WITH OHIO OIL.

Q. (By Mr. Phillips.) Is it not a fact that the Pennsylvania oil, the crude oil, is worth considerably more than the Ohio? A. The Pennsylvania oil will run 30 cents a barrel more than the North Lima. What is the North Lima worth?

Q. I do not know. Is not North Lima worth 78 today?

Q. I do not remember the last quotation? A. Is not Pennsylvania about 105?

Q. 113. A. I know it always runs that way. We heard the North Lima got down to 52 cents a barrel during the summer.

Q. Is it not a fact that it is very difficult to deodorize the Ohio oil? Is it not mixed with sulphur and arsenic and very difficult to get a good illuminating oil out of it? A. Yes; the only thing is to get the sulphur out of it. There is a German who has invented a way of brushing the sulphur out with some kind of a brush, and has patented the arrangement: but, of course, it is awfully expensive. The Standard has bought the patent. It is just like churning milk; it will take the sulphur out, but it makes it awfully expensive to handle.

Q. Do you think any customer will buy what is called Lima oil and Pennsylvania oil at the same price? Will he not prefer the Pennsylvania oil to what is denominated Lima oil? A. Pennsylvania oil would be the best oil; there is more life to it; the Pennsylvania oil is what we get the paraffine out of, while the Ohio oil has sulphur.

Q. (By Mr. Farquhar.) From your experience, will you explain how many customers out of ten would buy the cheapest oil? A. If they knew it, the whole bunch of them would buy it.

Q. It is your own experience as a seller of that oil that the object of the general run of the customers is to get the cheapest and save a cent or half a cent? A. I have seen customers that would not buy it if you sold it to them two cents cheaper.

METHODS OF MAKING LAMP TESTS OF OIL.

Q. I mean the general run of customers. Do customers generally think as much about the quality as the price? A. Oh, yes; they do. We oftentimes make a lamp test just the same as Mr. Mathew's man. If a man kicks on that Ohio oil and has got the Pennsylvania, we go in and make a lamp test. We turn our Ohio oil low and his Pennsylvania oil high. If we turn the Ohio oil high it would give out more smell of sulphur, but we don't do that. It is just a little trick of ours in turning up the wick. We can fool any person on their oil that does not know. You can take any person and beat them on their oil.

Q. (By Mr. Jenks.) Were you regularly instructed by Mr. Mathews to make your tests in such a way as to beat your customers? A. Yes, we have two lamps for such purposes at each station.

Q. (By Representative Livingston.) How were your orders given to you to do that—to make those tests? A. He told us verbally, came and explained it to us.

Q. You got no letters; nothing in writing at all?

A. He never told us anything in writing; he always came and told us just how to do it.

Q. Can not you find something in writing on that line in some way or other? A. I do not know; I may have something.

Q. Do you think if you put a man on the stand here that he will not contradict you? A. They can not do it and tell the truth.

Q. Do you know they will do so, and prosecute you for fraud? A. Let them do it.

Q. Have you no way of substantiating what you have said? A. I will tell you this, that the Standard Oil Company does a lot of things that they do not let go down on paper in writing. Lots of times they will make a trip that will cost them \$2 or \$3 before they will write a letter.

Q. You are sure you have nothing in writing?

Q. (By Mr. Phillips.) Ask him if he cannot support this by other testimony?

Q. (By Representative Livingston.) I want to know if you cannot do it over their signatures? A. I have not anything here, I have no letters on that subject at all; I did not think about that.

Q. (By Mr. Phillips.) Are there any other persons that have this knowledge that would be willing to testify to these facts? A. D. J. Hull, at Urbana, has seen it tested often. W. Hughes, of Newark; H. S. Hollingsworth and E. G. Mathews, of Columbus; W. O. Reed, of Marietta. In fact, any of the agents; any of the high men.

Q. (By Mr. Jenks.) Are those men all in the employ of the Standard Oil Company now? A. Yes.

Q. Do you know anyone who is not in the employ of the Standard Oil Company who has had the same experience you have as to instructions for testing oil? A. I do not know of any, except those that worked around with me.

Q. Do you not think of anybody who is not in the employ of the Standard Oil Company? A. No; they are all head men and they are all holding their places.

BUSINESS WITH THE RAILROADS.

Q. (By Mr. Kennedy.) Have you handled lubricating oils? A. Yes.

Q. Do you know anything about the furnishing of railroads with lubricating oil and the prices charged them? A. We furnished the railroads lots of refined oil, but I do not know the prices charged. We always made out their bills, so many gallons, and then sent the bill to Columbus, and they put the price on it.

Q. Do you know anything about the price of lubricating oil? A. No; the agents never know anything about it, except the head men at Columbus.

Q. (By Mr. Jenks.) What railroads did you sell oil to in this way? A. The Baltimore and Ohio Railroad Company.

Q. That is the only railroad company you ever sold oil to? A. Yes.

Q. And you never knew what price they paid? A. We billed it to the Baltimore and Ohio Railroad Company, Baltimore, Md.

Q. Where did you deliver the oil to them? A. To the roundhouse at Newark.

Q. (By Mr. Phillips.) About how much per month did you deliver to the Baltimore and Ohio Railroad?
A. In the summer time about 60 to 80 barrels a month; and in the winter as high as 150.

Q. What quality of oil was this? A. It was Water White.

Q. Did you sell them lubricating oil? A. No; it was refined.

Q. Where did they buy their lubricating oil? A. They bought it of the Atlantic Refining Company of Pittsburg.

Q. Is that also the Standard Oil Company? A. I do not know; I don't think it is; I will not say about that.

Q. You simply sold them refined oil? A. We simply sold them refined oil, but I do not know about the Atlantic Refining Company. I remember their traveling men used to come to Newark to see us. I always used to bring them up to the station. They talked there so that I do not know; but that is one reason why I thought so. I am not positive.

Q. (By Representative Bell.) I want to ask about the rebates. Did you not speak a little while ago about having some rebates from the railroads? A. I said I was not allowed to pay freight to the railroads, or have anything to do with that—with the handling of the cars—at all, myself. Here is a letter sent to Mr. Mathews.

EXHIBIT 3.

Urbana, Ohio, 2, 21, 1896.

Standard Oil Company,

Columbus, Ohio:

Dear Sir—I wish you would write the New York, Pennsylvania and Ohio Railroad in regard to the way they handle our U T L cars. I have done my best to get rid of them properly as I never hold a car 24 hours. I ordered them to switch out an empty yesterday and it is not done yet and will not probably be switched out till tomorrow. Please write.

Yours, very truly,

W. H. CLARK.

Indorsed as follows:

W. H. C.:

That is all right. Our people have some sort of an arrangement with the Erie people in regard to tank cars by which they take care of the cars.

Yours, etc.,

2, 24.

B. A. M.

Q. (By Representative Bell.) You do not know anything about their freight arrangements with the railroads? A. No; I do not know anything about that. They said they had a private arrangement.

Q. That is the letter you referred to a little while ago? A. Yes.

Q. (By Mr. Jenks.) Is this last part in pencil, signed by Mr. Mathews himself? A. Yes.

Q. (By Mr. Kennedy.) Is that the way they do business? Do they send them a letter and they send you back the original indorsed in that way? A. Yes; they do that lots of times, and lots of times write across the end of a letter.

Q. They take the letter and turn it over this way [indicating] and write across the corner some little note—

their business, anything they want to have delivered? A. And send it back to me; some little short note; it is nothing; never kept in the file.

Q. (By Mr. Phillips.) Do you know anything about the pipe line system of Ohio, whether there have been any opposition pipe lines handling crude oil? A. I do not know. The pipe line runs from where we used to live by Beverly to Lowell; from Lowell it runs on down and follows the river to Marietta and on to Parkersburg. I knew their line when I boarded there with Mrs. Jordan. Charles Jordan was the agent of the Louisville and Ohio on the west side.

Q. Have you no knowledge of the pipe lines, of the Standard's competition along that line? A. Not much; I know they would use oil out of a certain place and pump it into the Buckeye pipe line. A certain well is pumping so much, or the Argan refinery, or some refinery has ordered so much crude oil. He would tell me; I did not hear it; he would just tell me what they said.

Q. (By Mr. Phillips.) Has any member of the commission any other question to ask the witness?

WAGES PAID BY THE STANDARD OIL COMPANY.

Q. (By Mr. Kennedy.) I would like to ask him again in regard to his compensation. Do you say that you did not consider your compensation liberal or fair? A. I worked for \$15 a month and paid \$12 a month board for six months; then I got raised to \$25, and then went to Springfield for \$35, and got my breakfast and supper and slept there and got my dinner wherever I was. I had to work from 4 or 5 in the morning until 9 or 10 or 11 o'clock at night. Would you think that was good wages or not?

Q. When you got \$15 a month, was not that as a boy—you were a boy? A. I was 19 years old and went into the warehouse and painted barrels and did all the work there was to do there.

Q. Will you state what the wages of the Standard Oil Company are as compared with the wages of other refineries in Ohio? Are they about the same? A. It is pretty hard to tell about these fellows—the head fellows; they get pretty big money, but the fellows I used to pay at the Standard Oil Company's station and the warehouse never got any more money than they could get any place else.

Q. Do you mean the Standard Oil Company people? A. Yes.

Q. How about the employes of the independent companies? Did you not know something about their wages? A. I do not know anything; I do not know what they pay; I never paid any attention to that; I never asked them at all.

Q. (By Mr. Phillips.) About what wages did you pay to persons under you? A. When I worked in Newark and Urbana, I think I got men for 75 cents a day; I think that is what I paid them. I worked Lee P. Adair, at Beverly, in the yard there for 60 cents a day; I got Fred Augenstein for 60 cents a day and then for 75.

Q. What did you say was the nature of their employment? A. They drove hoops on barrels, took care

of the team, drove the dray, or anything there was for them to do.

Q. Is that about the same wages as other people pay for similar kind of work in those places? A. No; the boys could have got more money in other places, but they wanted to work up.

Q. Did they expect to be promoted by working for Standard Oil Company more cheaply than they would for some other person? A. When they hired them they talked to them and promised to promote them as fast as possible. Lec Adair worked four or five months and got a raise of 15 cents a day; then he worked there over a year and did not get any more money out of it, and quit. I got a boy from Lowell, Fred Augenstein, who worked for a year and did not get any more wages, and quit.

Q. What were the hours that these men worked per day? A. They got to work about 5 o'clock and worked until dark. Lots of times in the summer, when the gasoline trade was heavy, we had to work every day until after dark. I have seen some days when we could get it out at 2 o'clock, but generally we would have to work late to get it out.

Q. You would average 10 or 12 hours a day? A. I would average 12 all the time.

Q. (By Mr. Kennedy.) Was your promotion pretty rapid? A. I was there six years and I got \$2.50. I do not know whether you would consider that rapid or not.

Q. (By Mr. Farquhar.) Did the men that you have spoken of have steady employment? A. Yes; they worked steadily; steady work for the company all the while.

Q. All seasons? A. Yes; they worked pretty steady the year round.

Q. (By Mr. Phillips.) Has any member of the commission any further questions to ask the witness?

Q. (By Mr. Kennedy.) Will you suggest the names of any men in Ohio doing work similar to that which you did who might be brought before the commission to corroborate your testimony? A. I do not know of any of them who can not do it; they would all tell you just the same; they can not tell you anything different.

Q. (By Mr. Phillips.) Who, for instance? You named quite a number. A. W. W. Hughes, I named; H. A. Day, Newark, Ohio.

Q. (By Mr. Jenks.) What is his position? A. He has a tank wagon branch at Newark. James King, Newark, Ohio, Standard Oil Company, is the man that used to paint the red barrels.

Q. (By Representative Livingston.) Have they numbers to their private residences? You cannot reach them that way. A. Newark is only a small town and you can reach them in that way. W. H. Donaldson, Newark, and Frank Hurst.

Q. Who is Mr. King? A. He is the man who used to work for the Standard Oil Company and used to paint the barrels; he was agent for seven years of the Standard Oil Company.

Q. (By Mr. Ratchford.) You have made a very full statement as to the discriminating policy of the Standard Oil Company, both in the matter of cutting prices and in the matter of selling goods under false names, and also in the matter of unequal prices for the same goods to customers. Do you believe from the con-

sumer's standpoint that this policy is beneficial or not; is it advantageous or not. A. We did not sell to the consumer.

UNEQUAL PRICES TO THE CONSUMER.

Q. You did not sell to the consumer? A. We wholesaled; we sold to the trade; we did not sell to the houses or any individual.

Q. Not to private houses; you delivered to the stores? A. Yes; we delivered it to the stores.

Q. (By Mr. Phillips.) Did you deliver it to the stores yourself?

Q. (By Representative Livingston.) Did that enable the consumer to buy oil cheaper?

DEALERS' PRICES UNIFORM.

Q. (By Mr. Ratchford.) If it reached the retailer by inequality of price, did it necessarily reach the consumer in the same way? A. No; most of the stores sell at the same price.

Q. Even though they buy at different prices? A. You see there is often stores that buy different grades and sell at the same price.

Q. Then oftentimes the same articles sell to the consumer for a like price? A. No; I said grades. Some stores will buy cheap oil and charge a high price, and some will buy the best oil at a high price and sell at the same price they do.

Q. Did I understand you to say a little while ago that you sold and parceled it out to consumers from the tank wagons cheaper? Yes; we sold them gasoline one cent cheaper than we sold the stores, under a contract until the 31st day of December. We gave them a contract for last year.

EFFECT OF STANDARD OIL COMPANY'S METHODS ON CONSUMERS.

Q. According to your testimony, then, has not the Standard Oil Company been discriminating in prices very largely?

Q. (By Representative Bell.) Cutting the opposition?

Q. (By Mr. Ratchford.) Do you believe that is an advantage to the consumer or a disadvantage? A. They generally made it up even when we were selling oil at 7 cents. We would have a fight, and after the fight we would get it higher than we had it before.

Q. That is not answering the question.

Q. (By Representative Livingston.) I do not think he understood it. A. Of course it is a benefit to the consumer right then. That was certainly true when they took it to the house at 6 cents where the stores had to pay 7. That was a benefit to the consumer.

Q. Yes? A. When we retailed it around to the houses at 6 cents they had to pay 7.

Q. (By Representative Livingston.) When they drove their competitors out of the market, was it

any better for the consumer? A. No; it went back to the old price.

Q. (By Mr. Farquhar.) Did they go back to the old price? A. They always said when crude advanced half a cent or a cent, raise oil a cent.

Q. Was it more usual to go back to the old price than to increase? A. Well, I suppose it would be more likely from time to time to go back to the old price; but after they had that fight at Newark, and sold at 6 cents, oil went up to 13 and 14 cents on the street. During that fight some people sold as low as 4 cents.

Q. Who did? A. J. P. Lamb. It was all over the windows and grocery wagons around town, "Water White Oil, 4 cents."

PRICES AT COMPETITIVE AND NONCOMPETITIVE POINTS.

Q. (By Mr. Jenks.) Do the regular prices in towns where there is no competition range higher than in towns where there is competition? A. Last summer we had no competition in Newark, and gasoline retailed, or wholesaled, for 7½ cents. In Columbus they had competition, and gasoline sold for 5½ cents; there was 2 cents difference between Columbus and Newark.

Q. Can you give any other instances of the same character? A. No two stations have the same price. All stations have different prices.

Q. Generally speaking? A. If I would quit working at Marietta and go to Zanesville, they would have different prices at that place.

Q. (By Mr. Phillips.) What has made that difference—competition? A. They always said it was the freight rate; that it cost more to handle it. It always seemed to me that where there was no competition they were charging different prices. At Newark last summer oil was a cent a gallon higher than at Columbus and gasoline about two cents higher; but at Marietta it was two cents cheaper than it was at Newark. That was before they had the trouble at Newark. Newark is generally one cent higher on oil and two cents higher on gasoline. My folks live at Marietta, and it was two cents cheaper than it was at Newark.

Q. (By Mr. Phillips.) Has any member of the commission further questions to ask the witness? Have you any brief statement to make that has not been covered by the questions that have already been asked you?

Q. (By Representative Livingston.) Do you know of any conduct of this company similar to that which you have related, but which is more public in character? A. Sir?

Q. Do you know of something of a more public character of which these people have been guilty concerning discriminations such as you have mentioned? A. I can think of nothing.

Q. That can be supported by evidence of other parties? A. I do not know of any at present.

Q. Did you ever see a lawsuit in a court house? A. I was never in a court house, except once when I took a deed in.

Q. Did you ever hear them testify? A. No; that was the only time I was ever in a court house.

Q. What court was that? A. Oh, there was no court going on; I just took a deed up to the court house.

Q. Has the Standard Oil Company been prosecuted by any body that you know of, in any cases either in a justice's court or a circuit court? A. I do not know; I am not posted on that. I was in Urbana when they were fighting there before the council. We were just in before the council, but never had any suit, or anything.

Q. You do not know of any court records that you could find? A. No.

Q. Has there not been any litigation concerning this question of methods you have been talking about? A. I do not know. If you have the papers of Mr. Monnett, they mention everything I have said here.

Q. (By Mr. Ratchford.) We have that case. A. Those papers include everything I have said.

Testimony closed.

AFFIDAVIT.

State of Ohio, County of Licking, ss.:

I swear that the statements made by me of my own knowledge in the foregoing report of my testimony before the Industrial Commission are true, and that all other statements I believe to be true.

W. H. CLARK.

Sworn and subscribed before me this 15th day of September, 1899.

[Seal.]

PHIL. B. SMYTHE,
Notary Public.

Washington, D. C., June 9, 1899.

TESTIMONY OF HON. THEODORE F. DAVIS OF MARIETTA, OHIO.

The commission met at 10.50 a. m., June 9, 1899, Vice Chairman Phillips presiding. Hon. Theodore F. Davis, of Marietta, Ohio, testified.

Q. (By Mr. Jenks.) Will you be kind enough to state your full name and address to the commission? A. Theodore F. Davis, Marietta, Ohio.

LOCATION AND NATURE OF BUSINESS OF WITNESS.

Q. How long have you been engaged in the oil business? A. I have had producing interests in the vicinity of Marietta for twenty-odd years.

Q. And as a refiner how much experience have you had? A. I have had a large interest in a small refining plant at Marietta for about six or seven years.

Q. Is your refinery running at the present time? A. It is not.

Q. Will you tell us, in the first place, with reference to your experience as a producer; where the oil fields are that you have an interest in, and what your experience has been in disposing of your oil? A. I first became interested in what is known as the

Macksburg field, about twenty-five miles from Marietta, as a producer; and upon the basis of that production we established a refining plant, hoping to transport, manufacture, and market our own product. We continued the business for about two years, but were finally compelled to give it up. It was not a success.

WHY THE REFINING BUSINESS FAILED.

Q. In what way did the failure come about? A. We were not able to market our product at a margin sufficient to pay us for handling. We were confined to one grade of oil that was better calculated for particular markets which we were not able to reach. We were not able to compound any other grades.

Q. Will you explain in detail about that? A. The product of some oil fields will make good lubricating oils, that are profitable; you can market them; they are rich in paraffin. Paraffin oil is largely used for lubricants this particular grade of oil was more rich in that product, and therefore the trade was confined largely to railroads; they were the large consumers, but we were unable to reach them, because of their connections; that is, we were able to reach them, but not to market our product. All or part of the properties of our competitors were sold to the managers of the railroad.

Q. Was your principal competitor the Argan Refining Company? Was the competition simply local? A. The Southwestern officials, the managers of the railroad of which I spoke, became owners of a large block of the Argan stock. It made no difference what we would propose in our quotations, we were not able to sell them goods at any price, though our goods were just as goods as theirs. We lost a valuable customer.

Q. Had you been selling this product to the Baltimore and Ohio Southwestern Railroad? A. We had sold some to it, but more particularly to other roads leading out of Marietta, i. e., the Cleveland and Marietta and Zanesville and Ohio.

Q. Was the Standard Oil Company at that time connected with this competing company? A. Not that I know of.

Q. You say you were deprived of the Baltimore and Ohio Southwestern, one of your most valuable customers, on account of some of the managers becoming stockholders in the Argan Company; but how did you lose your other customers? A. The other customers were located along the lines of those railroads and their several branches. We lost not only the railroad company itself as a customer, but their handling the product of this one concern enabled the merchants and dealers along the line to get oil at rates that we were not able to compete with.

Q. So that was really the reason of the stoppage of your refinery? A. That was one of the reasons.

EXPERIENCE IN REGARD TO TRANSPORTATION.

Q. Did you have reason to think they were getting advantage on freight rates? A. We had no

direct evidence of it, but we supposed it; they were acting very strangely; our information was only circumstantial; we had no means of knowing. We believed that we manufactured as cheaply as they did, and our freight rates being equal we ought to have controlled some of the trade, but we were unable to do it.

Q. What was your experience with reference to the transportation of the crude oil to your refinery, etc.? A. We had our own lines from the wells at Macksburg to the railroad; from there we shipped it in tanks to the works. I became interested in the Corning field, in Perry county.

PRODUCT OF MACKSBURG OIL FIELD COMPARED WITH THAT OF OTHER FIELDS.

Q. So far as your experience as a producer in the Macksburg field is concerned, did you have difficulties there—trouble with refining? A. Yes.

Q. (By Mr. Phillips.) Is the Macksburg field product what is commonly known as "white-sand oil?" A. Yes; the crude is the same as white-sand oil, and commands a similar price in the market.

Q. It is not the Lima field oil? A. Oh, no.

Q. (By Mr. Jenks.) What were you going to say about the Corning field? A. The Corning field was developed later; some of the people who owned the Maxburg field opened up the Corning field. Corning is about 40 miles northwest from Marietta, along two or three lines of railroad reaching Marietta. We undertook to market that oil or get some of our product to our works. We had some wells there.

Q. (By Mr. Phillips.) What kind of oil was that—was it the same as obtained from the Berea or the same as the Pennsylvania? A. That is a little different grade of oil, or at least there are some products in which it is not as rich as the Macksburg; there is just a little difference. They make a difference of 17 cents a barrel on the price. It is now being marketed for 17 cents less than white-sand oil.

Q. But it is white-sand oil nevertheless? A. Yes; we finally succeeded in getting a test of two or three tank cars, and we decided that in many respects it was just as valuable as white-sand oil, but we could not get it to our works by the railway for less than 15 cents a barrel more than we could get the white-sand oil for from the pipe line company. Then we undertook to gather it up from the fields and take it through their pipe lines.

CHARGE FOR PIPING OIL.

Q. Through what pipe line? A. The Buckeye Pipe Line; we bought that oil from them delivered to our works through their pipes.

Q. Did they pump the Lima oil through the same pipes? A. No, the Corning oil; that is quite a long way south Lima is 75 miles, at least, or 100 miles away.

Q. (By Mr. Jenks.) Do you mean that the pipe line company buys this Corning oil at 17 cents a

barrel less than they would pay for the higher grade of oil that you have in the other field? A. Yes.

Q. And was this same oil then carried to your refinery? A. Yes, but instead of charging us 20 cents a barrel for the pipage they charged us 35 cents.

Q. Will you explain the significance of that? A. It would be 17 cents less a barrel to the producers at their wells. We discovered that the oils in many ways were just as good or better than the oils people were paying \$1.13 for at the well, with 20 cents pipage. We could make a better product from that; but if we had to pay 17 cents a barrel more it would bring it down to where it was more profitable, or just as profitable, to ignore that and take our own product and sell it to the Standard Oil Company and buy from them a different grade of oil at about the same price.

Q. (By Mr. Jenks.) That is to say, they would buy oil from you, as producers of course, at 17 cents less than they would pay for this better quality of oil from the Macksburg field, and then sell the same oil to you as refiners at the same price as the highest quality of oil? A. Yes.

Q. So that as producers you were losing 17 cents, and as refiners you were gaining nothing. When they bought the first grade of oil, did they claim that it was inferior? A. Yes.

Q. And when they sold it to the refineries, they claimed that it was as high a quality as any that could be gotten? A. Yes.

AMOUNT OF OIL PRODUCTION.

Q. How does the amount of this white-sand oil produced in Ohio compare with the amount of the Lima oil? A. I am not familiar with that; the pipe line people make a monthly statement of the oil they produce and the amount in the different fields, and I know only in a general way about it. I suggest that that is a matter which you can get directly from their statistics. They furnish their purchasers or the dealers with a printed statement, as many of you gentlemen know, I presume, which is sent out about this time of the month.

Q. (By Mr. Phillips.) Is not the Lima production much the larger? A. Oh, yes; the production of the Lima fields, according to my recollection, is about 60,000 barrels a day.

Q. (By Mr. Jenks.) Then the high quality of oil from the Corning and Macksburg fields is relatively a small part of the production of oil in Ohio? A. Yes; I should think our field produced about 10,000 barrels a day, or in that neighborhood.

Q. You spoke of the advantage which your competitors had as producers on account of the pipe line connections. Will you make this point a little clearer? A. As producers we were not able to get our own products to our plant without being subjected to all the extra charges which I have already mentioned.

Q. Extra charges of the pipe line? A. Yes.

RAILROAD CHARGES FOR SHIPPING OIL.

Q. How about charges on the railroad? A. We were not able to get rates on the railroad at all satisfactory; they make it no less to us than the higher rate of pipage.

Q. Had you any reason to think there was any special discrimination of rates being made in the transportation of crude oil? A. We were compelled to get our oil in tank cars from two lines of road. One was the Toledo and Ohio Central, which had a branch running to Marietta. I made application for rates by wire, but I think it was at least thirty days before I got them to give me a rate at all; and when they did I found it would cost me about one cent a barrel more than to ship by the pipe lines; i. e., 35 or 36 cents a barrel.

Q. Did you infer from the delay that the railroads were more or less in the control of your competitors in the field? A. Yes; it seemed so to us. We put our own loading racks and our own lines to the tanks, and paid the same transportation rate as we would have paid if we had bought it direct.

Q. Do you know whether these special appliances required of you in the way of loading racks were also required of the Standard Oil Company? A. No, I do not.

Q. (By Mr. Phillips.) Were you ever engaged in litigation in regard to freight rates with the Standard Oil Company? A. No.

Q. Was there any litigation in regard to freight rates in your section of the country with which you are familiar? A. Mr. George Rice and Mr. McCarty had litigation, and, as I remember it, recovered finally from some of the transportation lines; but they afterwards became a part of the Standard Oil Company or the Buckeye Pipe Line. I was not engaged in the business at that time, and so did not familiarize myself with the case. I saw what was published in the newspapers and heard the case talked about.

Q. You yourself had no direct experience at that time? A. No.

THE OWNERSHIP OF THE OIL FIELDS.

Q. Was there any difficulty in buying up new oil fields? A. Well, there has been a good deal of property bought. After territory is found to be good paying property it is bought up very largely by some of the different branches of the Standard Oil Company; one, perhaps, will be the South Pennsylvania Oil Company, another the Ohio Oil Company, another the Carter Oil Company, another the United States Oil Company, etc.

Q. Are all these companies connected with the Standard Oil Company? A. Yes; they are all believed to be. I have no positive information as to that, but it is a common supposition that they are.

Q. But do you know as a matter of fact that the Standard Oil Company is connected with a large number of producing companies and has organized a large number? A. I have no positive information, but it is currently believed by all the oil people about Marietta that it is.

Q. (By Mr. Jenks.) Does the purchase of these oil fields by the Standard Oil Company, or the companies associated with them, simply mean that they have plenty of capital and can pay higher prices than their competitors? A. Yes.

Q. Have you any reason for believing that there is anything unfair in their methods of dealing in this respect? A. No; I have not. I have seen large properties sold to companies which we believed to be connected with them; they have always paid very fair prices; in fact, almost exorbitant ones in some cases.

Q. Is it simply a question of having a large capital at their disposal, with a willingness to pay well for the property they want to get control of? A. Yes.

CHARGES OF PIPE LINE COMPANIES, ETC. (RESUMED.)

Q. Let us go back again for a moment to the question of transportation and the charges that are made by the pipe line companies. Did you pay by the barrel? A. Yes.

Q. About how much does the barrel contain? A. Forty-two gallons is the Standard Oil Company's quantity; that amount is delivered or supposed to be delivered for a barrel of crude oil; formerly it was 41, but it has been 42 for a number of years. They have their own experts for gauging the tanks and make out their own gauge tables. Where a producer requests it they will furnish a duplicate, showing the capacity of each tank for each inch in height or depth. The producer can have a representative there when the tank is gauged. The producers soon got used to the system and paid no attention to it. The amount is reported to the pipe line company and credited on their books, and you can sell your oil whenever you please, 42 gallons for the barrel. I believe, however, they take up $2\frac{1}{2}$ per cent. for wastage by evaporation in addition to that.

Q. Why is that done? A. It is claimed by these people that that is about the fair average of the shrinkage or contraction by the leakage and evaporation.

Q. Then there is a waste when oil is handled by barrels or placed in tanks? A. It is never handled in barrels, but always in tanks and pipe lines.

Q. So this waste, they claim, exists in the pipe lines themselves? A. Yes.

Q. If you buy a thousand barrels of oil, will they deliver about $2\frac{1}{2}$ per cent. less than that because of this wastage? Is that the idea? A. No; they will deliver to your credit so many barrels of oil and have the wastage of $2\frac{1}{2}$ per cent. estimated or computed from the gauges.

Q. That is, when they are buying oil from you? A. Yes; when they are buying oil from us.

Q. Is that practically the universal custom in the case of all pipe lines? A. We have not had, for a number of years, any pipe line in the country but the Standard.

Q. They buy from you and pay you a certain amount, less $2\frac{1}{2}$ per cent., which they claim as wastage? A. Yes.

Q. (By Mr. Phillips.) Is it a fact that the Standard Oil Company have a large amount of sediment or surplus? A. Yes.

Q. Do you suppose that is accumulated from this

$2\frac{1}{2}$ per cent.? A. Of course I have no definite information as to that. It is supposed that we buy a part of it and that they also charge or assess for insurance on fire losses. It occasionally happens that a tank of oil is burned up.

Q. Is that assessment made on the producer in the particular division or locality?

Q. (By Mr. Jenks.) How is the assessment calculated? A. By reducing the credit balances. If you have 1,000 barrels, and 1 per cent. would take up the total loss, they charge it up.

Q. (By Mr. Phillips.) Have they any legal authority to make an assessment? A. I think it is mutual; I do not know whether or not it would stand in litigation; I have never known of anyone objecting to it.

Q. Have you ever known of any person bringing a suit to recover? A. No; they object, of course, but I have never known of anyone making a claim for it.

Q. The fact is, then, that this is generally quite a small amount on each producer, and that they do not feel justified in going to law in regard to it, but there is no law that could assess? A. No.

Q. But do they do it, nevertheless, generally? A. Yes; I understand so.

THE NECESSARY CAPACITY OF A REFINERY.

Q. (By Mr. Jenks.) How large a refinery did you have? What was the capacity? A. Well, about 8,000 barrels a week was our capacity; of course we could increase it at any time if the trade demanded it.

Q. Is a refinery of that size, properly built and equipped, able to refine oil as advantageously as one considerably larger? A. Well, it would be confined to one or two branches of the refining business—that is, the manufacture of illuminating and lubricating oil. But if one had a gasoline plant connected with the refinery it would add very materially to the profits.

Q. That is to say, in connection with every refinery there are a certain number of by-products which can be used to very great advantage as soon as your plant is large enough so that you can afford it? A. Yes.

Q. Do you have to have special facilities for that use? A. Yes.

Q. What do you do with these by-products that you have? A. We sell part of them to Scofield, Schurmer & Teagle, of Cleveland—paraffins and benzines. We have a good market for our surplus there, but never at a profit. We would just about get rid of it without carrying it in stock. We never were able—at least, we never seemed to be able—to get any profits out of by-products.

Q. Can you give any definite idea at all as to how much more profitable your establishment would have been had it been large enough for you to make the best use of the paraffin and other side products which you were compelled to dispose of substantially at cost? A. I have never made any estimate of that. It would be a mere approximation if I should, not having gone into it. I should have to make some little calculation, which I think would be foolish to attempt, because it would only be an approximation. It might differ quite a little from the real facts, if they were determined.

Q. If you had had double or treble the amount of

capital in your plant, with additional facilities for making use of the by-products, do you suppose that, selling your illuminating and lubricating oils at the same prices as before, the added profits from by-products would have enabled you to pay dividends on the capital and keep your establishment running, whereas the experience you did have compelled you to close down? A. Yes; I think so. I think if such a profit had been secured the business could have been continued successfully.

STANDARD OIL COMPANY'S MONOPOLY OF BY-PRODUCTS.

Q. (By Mr. Phillips.) Is it, or is it not, a fact that the Standard Oil Company has practically a monopoly of all these by-products, so that if your business had been increased you could not have found a market for any of them? A. The by-products would have gone up to consumers, of course. We should have no occasion to sell by-products if we could manufacture them and put them on the market. If we were selling crude by-products, with our regular product, to a customer, and we introduced a special arrangement for using these by-products in their crude state, we could not make any profit from their immediate sale, and of course we should lose that customer.

Q. If you had facilities for manufacturing a very large amount of lubricating oil, does not the Standard Oil Company so monopolize that trade with the railroads that it would be practically impossible to market in competition with them? A. The railroads are large consumers of low-grade lubricating oils, and unless you can get some connection with the railroad companies that consume them in large quantities, it is almost impossible to get around to the small dealer and market at a profit. The Standard companies practically have got such control that you must either get some railroad in with you or sell your by-products to some of their concerns, to be compounded into their grades and marketed.

Q. Is it not conceded by what we call the independent or outside refineries that the Standard Oil Company has practically a monopoly of the lubricating business, especially among all the prominent railroads? A. Yes.

Q. Would any big corporations, independent of the Standard Oil Company, be safe in investing \$500,000 or \$1,000,000 in manufacturing lubricating oil? Would there be any certainty of finding a market for it? A. I think it would be a rather hazardous undertaking; that is my judgment.

Q. (By Mr. Jenks.) If I understand what you say on that point, the substance is this: That a very large establishment that can put in the needed facilities for making the best use of the by-products has a decided advantage in the manufacture, but that, owing to the fact that the Standard Oil Company has apparently such close relations with the railroads and with the producers of these by-products, it is nevertheless a hazardous investment to make, owing to the difficulty in marketing? A. We look upon it in that way and have not made such an investment in our concern.

Q. But the advantage in the manufacture itself, you think, undoubtedly exists? A. Yes; I think so.

THE COMPOUNDING OF OILS.

Q. Can you give us some idea with reference to the way in which the different grades of oils are compounded? A. I do not know whether I can make myself understood about that. Most refineries have a department of that kind. They have a person who becomes expert in compounding mineral oils with animal oils, and in the filtration and extraction of oils from the paraffin. There is a very great difference in these different grades of oil in the markets. One consumer, in many cases, may pay five or six times as much for a particular grade of oil as some other consumer. For instance, 15 cents a gallon would be a fair price for some consumers; and for some grades of oil they get 75 or 80 cents, owing to the particular machinery that is used.

Q. If I understand you, then, the manufacture of lubricating oils is very largely a matter of compounding? A. Yes.

Q. And that is an art in which there is a chance for experience and the development of skill? A. Yes.

Q. But nevertheless the art of judging accurately the quality of lubricating oils is a somewhat difficult thing? A. Yes.

VARIATIONS IN THE PRICE OF LUBRICATING OIL.

Q. So that if a person is disposed to get two prices, or three or four prices, for the same quality of oil from different consumers he might be able to do it? A. Yes.

Q. Have you any reason for believing that any of your competitors were in the habit of getting different prices for the same grade of lubricating oil? A. Yes; we have become satisfied of it by coming in competition with them. The grades of oil we were manufacturing in the same town would often be selling at 22 and 23 cents a gallon, while they would be selling to the very same people with whom we came in contact for 70 and 80 cents—in a small way, of course.

Q. Who were those competitors? A. The principal one was the Argan Refining Company.

Q. What was the source of your information on this matter? A. We were located in the same place and our plants were close together. Our men intermingled, *i. e.*, they would work at one place for a few weeks and then change about, so that we became somewhat familiar with what our competitors were doing, as they seemed to be willing to get information about us.

Q. Your information, then, on this difference in prices came from men working for you who formerly worked for the Argan? A. Yes, or vice versa.

METHODS ADOPTED BY COMPETITORS TO SECURE INFORMATION.

Q. You intimated just now that your competitors sometimes secured information with reference to your methods of doing business in ways that were ordinarily not considered normal. What were some of the methods employed? A. On one occasion we had an office

boy who became shipping clerk, and attended to making shipments of oil by river and by rail. That young fellow was approached by an agent of the Standard Oil Company, who offered to pay him for a report from day to day, giving the names of the persons we were shipping to, the points shipped to, and the invoice price of the product.

Q. What was the result of that offer? A. Well, the young man was very much surprised, but was loyal to us. He came and gave us all the information he had. We advised him to go further and get further information, but the other people weakened. I guess they suspected we were getting onto their schemes; they never accomplished it, so far as we know, unless it was done without our knowledge. Sometimes in the evening, after we closed up, the office man would be the last one to leave. They held conferences once or twice right in our office and tried to induce him, for a consideration of a suit of clothes, or so much per month, or something of that kind, to give them that information.

Q. On this special case you think they failed to get the information they wanted on account of the fidelity of your assistant? A. I think so.

Q. Do you know any other case in which they did get information along this line? A. I did not have any positive information, but we believed that every barrel of oil shipped from our works either by steamboat or by rail was in some way reported to our competitors. That was only a matter of belief and conjecture, but the circumstances pointed strongly in that direction.

UNDERBIDDING OF COMPETITORS.

Q. What were the circumstances that pointed in that direction? A. Why, when we would make a shipment of oil and send invoices, their traveling men would frequently come in contact with that particular shipment; the people that we shipped to would write us saying that they had a quotation at a lower price, and in many cases we would have to meet that price or lose the customer. We would have to make a deduction on the invoice, or make an allowance on the next shipment, or something of that kind. Of course, it created a great deal of dissatisfaction. We would have to keep a man on the lookout all the time, traveling from one little town to another to see the small dealers.

Q. That is, then, I infer, practically a universal custom with those people; wherever you had a customer they would follow you up? A. Yes.

Q. (By Mr. Phillips.) As a rule, did they sell lower than you offered to sell? A. They offered it, and we ultimately would lose a customer unless we reduced the price.

Q. (By Mr. Jenks.) What was the effect of this operation? Did it reduce the price of oil to the consumer? A. I think not.

Q. Why not? A. The dealer would not change his price; he would continue to sell the oil and if he bought it at the same price offered by the Standard he would have advantage of the difference in price. The dealer would get the advantage of the difference in price.

Q. Do you think, then, that the price of oil was lower to the dealers and that they made better profits than they would have made save for this action of the Standard Oil Company? A. Yes.

Q. (By Mr. Phillips.) Was that only in particular localities? A. Yes; in localities where we were seeking a market. It may have been so in other localities, of course, but I have no information on that.

GENERAL EFFECT OF THE COMPETITION.

Q. (By Mr. Jenks.) What do you think has been the ultimate effect of this competition which you said finally compelled you to go out of business? Have you any reason to believe that prices have increased? A. Generally, I think they have been restored to a more uniform condition; in many localities they would get the same increased price.

Q. So that the general average of prices is probably higher? A. Yes.

Q. This cutting prices was ordinarily to satisfy customers at particular places? A. Yes.

Q. And was not a general cutting? A. No.

COMPOUNDING OF OILS (RESUMED).

Q. To go back to the question of mixing oils. Did you say that nearly all refineries have a special department for that work and a special mixer? A. Yes.

Q. And that a good many different brands are made in practically every refinery? A. Yes.

Q. Is all this to satisfy, so far as possible, the tastes and desires of different customers? A. Yes.

Q. And were you in the habit of making special brands for special customers? A. I do not think we did in lubricating oil, but we did in illuminating oil. Sometimes we found the same name used on oil that was manufactured by other concerns, apparently for the purpose of getting out under our brand. We had one brand that was considered superior by many consumers.

Q. What was that? A. It was called the Champion.

Q. And you had reason to believe that brand was sometimes used by your competitors? A. Yes.

Q. And put on an inferior grade of oil? A. Yes.

Q. Have you any specific instance in mind of an attempt of that kind or an attempt to make your customers believe that your oil was not up to the standard? A. Yes; I think of one particular case, that of the Cleveland & Marietta Railroad. They were customers of ours and we branded all of our oil under the brand that we were shipping it at. We supplied them with lubricating as well as illuminating oil. In one case we were informed by the purchasing agent that their inspector had discovered five or six gallons of water in some of the barrels of the last shipment we had made. We at once took the matter up and investigated it, and found that every barrel we had shipped out—at least every barrel of that particular invoice—was accounted for by having our brand on it. The other barrels, which it was claimed had water in them, had no brands at all. We had no information as to where they came from, but some one undertook to deprive us of that customer by sending a shipment of spurious oil and

then trying to make the particular officials think it was our product.

Q. Did you say there were four barrels that had water in them? A. Yes; I think there were four or five barrels.

Q. Did you think that somebody stole four barrels of your oil and put this spurious oil in the place of it? A. I do not know; I know ours had all been counted up and distributed along the line, and it was difficult to go to each point and to each agent that distributed it and find the barrel with the shipping mark. The four or five barrels of spurious oil had no marks to show where they came from. It may have been ours, but I do not see how it could have been unless somebody opened the barrels and put the water in.

Q. So there must have been some fraud in that special case? A. There was no doubt of it in our minds; we investigated it very carefully, and it resulted in establishing our reputation with that particular road, so that as long as we continued in the business we had their entire trade; the way it happened it turned out fortunate for us after all.

Q. What would have been the effect had you not been able to establish your case? A. It would have ruined us.

Q. You would have lost that trade? A. Yes.

THE COST OF PRODUCING OIL.

Q. How does the cost of producing compare with what it was a few years ago? A. It is less. Fuel is somewhat less, owing to the locality, of course. Coal has been cheaper for three or four years than it was ten years ago; and where natural gas is used the uniform price, I think, throughout the country is seven cents for each barrel of crude oil. Some of the chemicals that are used in the manufacture of oil are quite a little less. Sulphuric acid was 2½ cents, and is now about one cent a pound; but that is not a very material part of the cost.

Q. So that on the whole you think the cost of refining oil has decreased a little of late? A. Yes.

Q. Do you have any difficulty in getting the material which you have to use at good prices? A. No; not at all. In the case of the last we bought we had a contract by the year with the Standard Oil Company. We bought our sulphuric acid and other chemicals from them.

Q. Is it generally true that refiners of oil, who are competitors of the Standard Oil Company, have to buy material, for example, sulphuric acid, from them? A. Yes; generally.

Q. Do you not think they might be put at something of a disadvantage in that way? A. Yes; possibly. Although the last we bought from the Standard Oil Company was cheaper than people could get it elsewhere.

Q. (By Mr. Farquhar.) Is it not generally the case that sulphuric acid and other materials used in refining oil can be purchased from the Standard Oil Company cheaper than in any other market? A. Yes; I think that is right.

COMPOUNDING OF OILS REQUIRES KNOWLEDGE AND SKILL.

Q. Is the compounding of oil a scientific operation or simply a haphazard one? A. Well, there is a great deal that is haphazard; it is now becoming more a custom to go into it carefully and scientifically; but from my observation of refiners generally there is as much haphazard work in the compounding of oils as in any other business in manufacturing.

Q. If you were engaged in the compounding of lubricants would it not be your custom to send to the scientific schools for a full analysis before marketing the produce itself? A. It is sometimes required, but we do not always do it; it entails more or less expense that all want to avoid, if possible.

Q. Is it not generally a fact that many refineries have mixers or compounders now? Are mixing and compounding considered scientific attainments? A. Yes.

Q. Is not the compounding of lubricants and illuminants taught in every scientific school in the country? A. Yes; and in a great many colleges.

Q. Is it taught at Cornell University, for instance? A. Yes; and at the Ohio State University at Columbus.

RAILROADS PREVENT FAIR COMPETITION.

Q. In your business with the railroad companies, how close were the prices of the Argan or other competing companies to your own? A. Well, our experience soon led us to understand that any price we might make the railroad companies that they had control of would cut no figure; we had no means of knowing what they got; for instance, if they were getting 12½ cents a gallon and we offered it for 6 cents, we could not get that. We knew they were selling at 12½ cents to other people; of course, we do not know just what controlled it, but we were not able to get the trade.

Q. (By Mr. Jenks.) Did you, as a matter of fact, make the price lower to the railroad than to other customers? A. For a few times, just to satisfy ourselves that that was the condition of things; after that we paid no further attention to that particular trade.

Q. (By Mr. Farquhar.) What official of the Baltimore & Ohio Southwestern Railroad controlled the purchase of lubricants? A. They had a purchasing agent, who was not always the same party, but it seemed that a higher authority controlled their sending our requisitions for the oils they needed. A complete change was brought about in their methods of doing business, and soon after it was known that the officers of the road controlled considerable stock in the Argan Refining Company.

Q. Were the parties interested in the railroad also interested in the Argan? A. They finally acquired, as we believe, at least 50 per cent. of the stock of the Argan Refinery.

Q. The oils, of course, were called standard? A. Yes.

Q. Do you claim that the Argan was better or

poorer oil? A. It was intended to be substantially the same grade.

Q. Was it left to the purchasing agent to make a decision himself? A. Oh, yes.

Q. Then do you wish to impress upon the commission the idea that preference was given to the Argan Refinery because the railroad officials were interested in it? A. Yes; that is my belief.

Q. Have you no knowledge? A. None whatever, except the circumstance which led us to that belief, the general condition of things, and the fact that we were not favored with a part of their business.

Q. Can you tell the commission, from your own knowledge, whether the Standard Oil Company offered better terms than you did to the railroads? A. No.

Q. (By Mr. Phillips.) Did you say that you offered to sell at a much lower rate, and that they refused to purchase your oil? A. Yes.

Q. Is that the reason why you think there was unfair competition? A. That is it exactly.

Q. Do you believe it or know it? A. We believe.

Q. Because they would not purchase your oil, of equal quality at a much lower price than they were paying others? A. The influence did not stop at that particular point; but the fact that it was known along the entire mileage of that railroad and its branches that they were getting their illuminating and lubricating oils from this particular concern we believe influenced the dealers along the line, because they could get it in small quantities and without very much trouble. The same people being interested in the railroad and the Argan Refinery made, we believe, quite a difference in our trade along that line; we may be mistaken about it, but it so appeared to us at the time.

Q. (By Mr. Farquhar.) Do you not usually find that it is a pretty difficult thing to hold a customer where you have competition of that kind? A. Yes; and especially when the matter is in the hands of a purchasing agent.

Q. Do you have any faith in the old saying that "The purchasing agent was bought on both sides?" A. I do not know. They laughed at the statement, and so far as our concern goes we did not try to influence or trade in that way at all. It was on its merits, for what its value was; and so far as I know, we had no string to the purchasing agent of any company that dealt with us.

THE STANDARD OIL COMPANY AND THE PRICE OF OIL.

Q. (By Mr. Phillips.) It has been claimed that there has been a gradual decrease in the price of refined oil in the last twenty years, or since the Standard Oil Company began manufacturing oil. Now, is it or is it not a fact that that decrease is obtained by using quotations from New York, chiefly on export oil? Is it or is it not a fact that benzine, which is now higher in price than refined oil, was, in the early history of the refining business, dumped into the creek, and that the tar was not even used as fuel? A. Yes.

Q. Are not the by-products as valuable now, in many instances, or even more valuable than the refined oil itself? A. Yes.

Q. And by-products that were formerly considered useless? A. That is true, and when that condition prevailed there were great fluctuations in the value of the crude oil. As I remember, oil was at one time down to 37 and 40 cents a barrel, and at another time, when they were manufacturing just one grade, it sold as high as 20 cents a gallon. There were great fluctuations as to price of refined and crude oil. That may account for a part of this decreased price.

Q. (By Mr. Farquhar.) Do you not think that the fluctuations in the price of oil in 1872 were really due to overproduction, or do you think they were caused by monopoly? A. No; I think the cause was overproduction and the facilities for handling this crude oil.

Q. It was not a question of monopoly? A. We knew nothing of monopoly at that time.

Q. It was just a question of overproduction, when everybody was trying to sell and get the market? A. Yes; that, I think, influenced the price very considerably.

THE PROFITS OF THE STANDARD OIL COMPANY.

Q. (By Mr. Phillips.) Do you believe that the Standard has, in a great many instances during the last ten or twenty years, made more profit per barrel for every barrel of crude oil handled and manufactured into refined oil than they have paid for the crude oil itself? Is it right to infer, as some do, that they make more profit today on every barrel of oil that is manufactured than they pay for producing it? A. I hardly think they do, but they do make, as shown by their statements, a very considerable amount out of their transaction of oil through the pipe lines; they are very profitable.

Q. Take them together? A. Oftentimes the entire profit on a barrel of oil will be made on the transportation of it instead of the manufacture.

Q. (By Mr. Jenks.) Have the rates for piping decreased? A. That I do not know about. The Standard system has only been established at Marietta about ten years, and I know nothing of what may have occurred before that.

Q. Has there been any change in the charges for piping in your remembrance? A. Only at particular periods when there has been a contest over the control of a particular field, or something of that kind. I think they are paying 10 cents a barrel more for crude oil at Scio to-day than they are at Marietta or Pittsburg. The quotations show 10 cents a barrel more.

Q. Is the price of crude oil at Marietta the same it has been for some years? A. Oh, it has fluctuated some in the last five or six years, but not so very much.

COST OF PRODUCING CRUDE OIL, NOW AND FORMERLY.

Q. What is the cost of producing crude oil now compared with what it was five or ten years ago? A. It has increased very much. The material, i. e., casing, tubing, and machinery, that goes into the

production of oil, has increased in some instances, I should think, 90 per cent.

Q. (By Mr. Phillips.) Since when? A. In the last three or four months.

Q. Prior to that was it cheaper than it had been before? A. Oh, yes; very much cheaper. All materials going into the production of oil in the way of iron pipe, tubing, casing, boilers, and machines were very much reduced.

Q. (By Mr. Jenks.) The price of these materials has gone up, and there has not been much increase in the price of crude oil? A. No, no.

Q. Do you know whether the Standard Oil Company itself is interested in the production of these supplies or not? A. No; I have no information other than the general supposition of people who are consuming those products. Quite frequently you will find that their business relations indicate that they are somewhat interested but I have no knowledge of my own as to that.

Q. (By Mr. Farquhar.) Do you mean that there are parties interested in the Standard who are also interested in the tubing works, etc.? A. Yes.

Q. But the Standard, as the Standard, has nothing to do with it? A. No; I suppose not.

Q. (By Mr. Jenks.) Did you say that your chief competitor in the refining business was the Argan Company? A. Yes.

Q. Your chief competitor, then, was the Argan and not the Standard? A. The Standard had a very large plant at Parkersburg that covered part of the same territory that we both covered.

Q. But so far as you knew you were hampered as much by the Argan as you were by the Standard? A. Yes.

RELATION OF THE STANDARD TO THE ARGAN REFINING COMPANY.

Q. Was the Argan owned by the Standard at that time? A. No.

Q. But it has since been bought by the Standard? A. Yes.

Q. What has been the history of the Argan since then? A. Why, the Argan Refining Company was leased sometime within the year, I should say, by one of the branches of the Standard Oil Company—the Southern Refining Company, I think—on a basis of 6 per cent on \$200,000 for ten years, or, in other words, \$1,000 a month for ten years. They had employed quite a number of people, traveling men and office men, and just recently they left Ohio and went into West Virginia. That was about the time, I think, that Attorney-General Monnett commenced quo warranto proceedings, claiming that they were a part of the Standard Trust. They immediately moved their business office to Parkersburg, which is about twelve miles from Marietta on the Virginia side of the river. Since then it has been understood that the people who owned the stock of the Argan Refining Company had capitalized it and sold out their entire interest to the same people that leased it; so that they have in some way discounted the ten-year lease by cash payments, and the Argan Re-

fining Company has now practically abandoned its office at Parkersburg.

Q. It is understood that the purchasers of this stock are the managers of the Standard Oil Company to some extent? A. That is the supposition. I think if you have access to the testimony, taken by Mr. Monnett at Marietta, of Mr. Cram, who was the manager of the Argan Refining Company at the time this lease was made, you will find that he testifies as to just what was done in this leasing process. Since that time it is generally believed that the stock has been purchased by the same parties who made the lease. Perhaps you will not find that in this testimony.

NO SUGGESTION AS TO LEGISLATION.

Q. (By Mr. Phillips.) Have you any suggestions to make in regard to legislation regarding trusts and combinations? Do you think it is a question that can be dealt with properly by law? A. I have not given it the close attention that other gentlemen have, but I realize that it is one of the most difficult things to deal with or control by law. I have no suggestions on that line. I do not know how remedial legislation is possible; vested rights are acquired by innocent holders in different corporations and they are thrown together, so that I can not see how you can possibly separate them. There may be some way of doing it.

Q. Are you at all familiar with the pipe line business in Pennsylvania and Ohio, and especially in regard to the opposition the Standard has made to independent pipe lines? A. No; I never came in contact with that except in a very moderate way.

Q. You are not, then, familiar with the early history of the Standard in Pennsylvania? A. No; I am not.

Q. And their methods there in regard to pipe lines, purchasing refineries, etc.? A. No; I have no information in that direction.

Q. (By Mr. Kennedy.) To whom do you sell your product now? A. The crude oil?

Q. Yes. A. The oil produced in West Virginia I sell to the Eureka Pipe Line Company, and that produced in Ohio to the Macksburg division of the Buckeye Pipe Line.

Q. Are they both Standard Oil lines? A. They are in the same office and the same bookkeeper makes out the check which is given by one of their agents on New York.

Q. (By Mr. Phillips.) Are both owned by the Standard? A. Both are in the same office.

Q. (By Mr. Kennedy.) Do they pay you the market price for it? A. Yes.

REGULATION OF THE MARKET PRICE OF OIL.

Q. (By Mr. Farquhar.) How is the market price regulated? A. When you have oil to sell you go to the agent, who, before he gives you a price, wires to Pittsburg, where the books are kept, to see what your credit balance is; that is, the number of barrels of oil credited to your account and the particular grade. When he gets that information he will

give you the price; that is, the price is posted. You may or may not accept his offer.

Q. What influence have the independent producers of this country on the price of crude oil? A. They have influence only in special cases, and I do not recollect any of those in particular. I do not think they have any influence over it at all in our part of the country.

Q. None at all? A. Not at all.

Q. (By Mr. Phillips.) Is the price of oil there fixed by the board of exchange or by the Standard Oil Company? A. By the Standard Oil Company.

Q. Both crude and refined? A. They do not fix the price of refined, but they do the crude.

Q. They make the quotations in New York, do they not? A. I think they do.

Q. Do they make the quotations in all the oil fields for the crude? A. Oh, yes; wherever they have a purchasing agent.

Q. And is it wired to the agents what the price shall be each day or week, subject to change at any time by them? A. Yes; the holder of credit balances on their ledger may be a producer in Indiana, Ohio, West Virginia, or Pennsylvania and may sell to any of their agencies. It does not make any difference what one. I have often been in the office when producers in Indiana would come in and ask for their credit balances and get their checks just the same as men who produce oil within a mile of where the business was transacted.

Q. (By Mr. Farquhar.) Is it the New York branch or the Pittsburg branch that rules the market? A. It is the Oil City market; that is the one.

Q. Of the Standard? A. That controls the price of crude oil. Occasionally it is sold at quotations given by brokers when there is a little fluctuation. I have known it to be so for a few days, within two years, I think. When I go in to sell some of my crude oil they would say: "If you will allow us to put this on the exchange today, you may have the benefit tomorrow of the average exchange price instead of taking the specific or grade price at the time." I frequently would get a cent, a cent and a half, or two cents a barrel more by putting it on exchange. At other times the exchange was lower than the Standard market.

THE POSITION OF INDEPENDENT REFINERS.

Q. Is it your opinion that the independent refiners of this country are making money? A. I do not know outside of the firm I am interested in myself.

Q. Scofield, Schurmer & Teagle, of Cleveland? A. Apparently they are.

Q. Do they own oil wells? A. I really do not know.

Q. They are refiners proper of the oil and the by-products? A. That is what I understand.

Q. Is it not quite a wealthy firm? A. Yes.

Q. Has it not always been an independent firm? A. That has been the supposition.

Q. Do not large profits naturally accrue to a firm like that? A. Yes.

Q. Because a good many refiners have gone out of business, is it right to say that the Standard Oil Company drove them out or bought them out?—gave them a good price to get out? A. Why, take, for instance, our own concern right there under our eyes. I could have—

Q. (Interrupting.) Could you not have sold out in pretty good shape if you had desired? A. I was never approached on that. I would be very glad to, but I think I could have put up a refining plant as good as the one that was practically sold for \$200,000 for about \$75,000.

Q. (By Mr. Jenks.) That is the Argan? A. That is the Argan.

Q. (By Mr. Farquhar.) Of course, that includes good will and everything else that goes into an establishment of that kind. But, from your own experience, do you know whether it is customary for the Standard, when they find a good, strong refining plant, to crush it out or buy it up at a pretty good figure? A. They have not done that in a great many instances. They did not buy out Mr. Rice's plant.

Q. (By Mr. Phillips.) Is it, or is it not, a fact that the Standard bought a large number of refining plants at a good price, and wrecked them? A. Yes.

Q. (By Mr. Farquhar.) Is it not sometimes a good business proposition to dismantle plants when you have been getting good transportation facilities and getting the same quantity of oil and other products and attach to another pipe line, and let them go, leaving nothing but the bare walls? A. Yes.

Q. As a business proposition, any man will do that? A. Yes.

Q. (By Mr. Kennedy.) What is the market price of crude oil to-day? A. The last quotation I saw was \$1.13 at the wells.

Q. A barrel?

Q. (By Mr. Phillips.) White sand oil? A. The white sand oil.

COST OF PRODUCTION (RESUMED).

Q. (By Mr. Kennedy.) Can you state to the commission what the cost of production is? A. That varies a great deal; that is one of the uncertain quantities. I have spent a good deal of money in sinking wells with no return, but occasionally have been fortunate enough to get a well that was very cheaply produced and that gave a very satisfactory return. It is impossible to tell just what the cost is.

Q. In regard to the wells that are productive, can you say what the cost per barrel for the crude product is? A. That varies as to the field.

Q. What is it in your field? A. The nearest wells to Marietta are only about 400 feet deep and are very productive, while the Berea sand wells, in the Macksburg field, vary from 1,600 to 2,300 feet; therefore you can see that there is quite a little difference in the cost of wells in different fields. You have to use a great deal more casing in some instances than others—three or four strings of casing frequently. In our fields you use but one, because of the surface drilling.

Q. (By Mr. Phillips.) The cost of drilling is about

\$5,000 or \$6,000 to the well in different localities?

A. Yes.

Q. And some are more uncertain than others? A. Yes.

Q. (By Mr. Kennedy.) What is your own individual production? A. My own individual production?

Q. Yes. A. That varies considerably. It is now about 100 barrels a day.

Q. You have been in the business a good many years? A. Yes; I have several times thought I was in the business, but when I came to settle up I found I was not—I was behind.

Q. Is it not possible for you to compete now, if the Standard Oil Company does fix the price of the product? A. Yes, it is, where I get sufficient production to pay the expense of operating.

Q. (By Mr. Farquhar.) In a general way, do you think the exportation of petroleum over the whole world has been a great benefit to the country? A. Yes; I do.

Q. Do you think it has been one of the great factors in holding the balance of trade in favor of the United States? A. Statistics show that, of course; there is no question about it in my mind.

Q. (By Senator Mallory.) Did you not state, some time back, that the managers of the railroad at Marietta, being interested in the Standard Oil Company, influenced the dealers along the line of that road? A. The managers of the railroad company, being interested in the Argan Refining Company, made it appear to the ordinary village merchant that they were controlling that particular trade. In many cases they control the output of the coal mines that supply fuel for operating the road, and the managers and operators do their purchasing from the companies that are doing the work. In that way they secure indirectly control of the railroad company or the merchant.

Q. Do you mean the railroad employees? A. The coal producers, the coal operators.

Q. Purchase of the dealers? A. They were, in one instance, supplying the railroad company with their fuel and operating mines producing the coal, and of course they supplied them, or some one connected with them; not only the coal, but also the supplies that went into producing the coal.

Q. What I wanted to get at, or understand, was the influence which you referred to as controlling these dealers to their detriment? A. That was one. Whenever they had control, or were connected with the producing of coal or other things that were associated with the management of the road, they seemed to be able to cut us off.

Q. Do you say they had no direct influence? A. Not that we could put our hands on; we only inferred it; the circumstances impressed upon us the fact that it was going on.

Q. But you found it to be a fact that your business was being cut off all the time in various directions from various causes? A. Yes; we attributed part of it to that influence.

Q. To that influence? A. Yes.

Q. (By Mr. Kennedy.) A former witness before the commission said that he believed a new system of

rebates to railroad companies had grown up. It is this: They furnish lubricating oil to the railroad companies, who pay them a great deal more for it than it is worth in the market. Do you know anything on that subject? A. No; I do not; I have no information on that subject further than I have related.

WAGES PAID IN THE PRODUCTION OF CRUDE OIL.

Q. How do wages in the oil business compare with wages in other industries? A. What branch of the oil business; the drilling?

Q. Yes; the drilling. A. I think the wages for drilling have been fairly kept up. An expert driller commands from \$4 to \$5 a day for his services in our fields. The tool-dressers get about \$3 to \$3.50 a day; I believe that is about the range in our country.

Q. How about the pumpers? A. That, of course, depends upon the amount and the number of wells they have to care for. Their wages run from \$40 to \$70 a month in our field. Rig builders, *i. e.*, the people who put up the derricks, are getting fairly good prices. The contractors, the men who do the drilling and furnish the machinery, are getting from 60 to 80 cents a foot for drilling.

Q. The Standard has very little to do with fixing the wages in the fields? A. Yes; so far as the drillers are concerned, except when they may be interested in drilling wells, as they sometimes are. I know of one piece they bought which only had one well on it at the time. Now I think they have 20 on that property. Of course, they were interested in the drilling of those wells, which is usually done by contract.

Q. Is there any form of organization among the workingmen in the oil fields in your country. A. Not that I know of.

HOW OIL LAND IS HELD.

Q. (By Mr. Farquhar.) Is it generally the custom to lease oil lands or purchase them outright? A. The custom with whom?

Q. With the operators who sink wells? A. In a great many instances they lease on a royalty interest to the lessee, but they frequently buy. If they can make a satisfactory price they will buy the fee and the royalty interest as well.

Q. The rule is to lease, is it not? A. Yes; generally.

Q. (By Mr. Phillips.) Do they pay the rental until such a time as they care to drill upon the lands? A. Yes; if it is producing, they buy the right to continue operating and are at the entire expense of producing the oil and pay a royalty of one-eighth; one-eighth is the custom all through that country.

Q. (By Mr. Farquhar.) What is the usual time of oil leases? A. From 10 days up to 20 years.

Q. Twenty years? A. Most of them, or as long as oil is found in paying quantities.

Q. (By Mr. Phillips.) Do you mean by 10 days simply the time to begin operations? A. Yes; that is it.

Q. Then the lease holds as long as oil or gas is produced in paying quantities? A. Yes.

Q. Have you anything to state yourself that we have omitted that will be of benefit to the commission? A. No; I do not think of anything.

MOST BUSINESS MEN FOLLOW LIKE CUSTOMS.

Q. (By Mr. Ratchford.) Do you know of any business methods practiced by any of these refining companies that would not be practiced by others if they had the same power? A. I have given that subject a great deal of careful consideration, and I have never discovered it yet.

Q. You have never discovered any? A. No.

Q. Is it your opinion that these rival companies, battling against each other, use every means at their command to gain control of the markets? A. I think that is the rule; yes.

Q. What effect has this in the end on the consumer? A. It affects different localities differently, I believe. When you get far away from the oil centers, and give one or two concerns the opportunity to increase the price, it is my experience that they are going to do it, and do it right straight through.

AFFIDAVIT.

State of Ohio, County of Washington:

I swear or affirm that the statements made by me of my own knowledge in the foregoing report of my testimony before the Industrial Commission are true, and that all other statements I believe to be true.

THEO. F. DAVIS.

Sworn and subscribed before me this 18th day of September, 1899.

[Seal.] HENRY G. BOHL,
Notary Public in and for Washington County, O.

Washington, D. C., June 9, 1899.

TESTIMONY OF MR. THEODORE B. WESTGATE,
REFINER OF OIL.

The commission met at 10:50 a. m., Vice Chairman Phillips presiding. At 12:20 p. m. Mr. Theodore B. Westgate, oil refiner, Titusville, Pa., appeared and testified.

Q. (By Mr. Jenks.) Will you give us your full name and address? A. Theodore B. Westgate, Titusville, Pa.

Q. You are a refiner of oil? A. I am.

Q. How long have you been engaged in the business? A. About 13 years.

Q. Are you also interested in the production of crude oil? A. To a small extent.

Q. In what way? A. I am producing a little.

Q. As an independent refiner? A. Yes; it is so little, however, that it is hardly worth mentioning.

Q. Do you have your own refinery at Titusville? A. Yes.

Q. Are you associated with any of the independent producing companies? A. Yes; I am.

INDEPENDENT OIL COMPANIES—EFFECT ON PRICES.

Q. What ones? A. The Producers and Refiners' Oil Company, Limited, of which I am one of the managers. That is a transportation company. I am also a director in the Pure Oil Company, which is a marketing company.

Q. We have had some testimony here before with reference to the Pure Oil Company and its competition with the Standard Oil Company in New York City, Philadelphia, and perhaps other places. Can you give us any information with reference to the effect on prices of the competition of the Pure Oil Company?

A. Upon our opening up an agency in New York City the prices immediately dropped. We did not drop them, but the Standard Oil people did, and without any corresponding decline in crude oil. I cannot tell you the exact figures, for I have not my papers here. I can give it to you later, if you wish. There was quite a material drop. (Supplied August 19, 1899. "On March 20, 1896, the day the Pure Oil Company commenced selling Water White oil in New York City, our price and the Standard's was 9½ cents. On March 26 the price was cut by the Standard to 8 cents. This price was gradually dropped, until on April 4 it was 7½ and 7 cents.")

Q. (By Mr. Phillips.) So much so as to take away the profit? A. Yes; entirely. Oil was sold at a loss by the Pure Oil Company in New York City.

Q. Do they still continue to sell at a loss? A. Yes; it is still sold at a loss there.

Q. (By Mr. Jenks.) Do you recall any other places beside New York City where the Pure Oil Company went in as a competitor and followed prices down until it was selling at a loss? A. Philadelphia, Pa.

Q. Will you tell us regarding the different qualities of oil that you refine and the difference in prices of those various qualities? A. Taking the prices to-day as a basis?

Q. Yes. A. Do you wish me to state the qualities—that is, the brands—as I put them out?

Q. Yes; if you will. A. My highest grade of oil now is Sunlight, double refined. That is worth at the refinery to-day, in bulk, 4½ cents per gallon. My next lower grade is Headlight oil, which is one-fourth of a cent less per gallon. These grades of oil are water-white oil. My next grade of oil is Diamond Safety, which is one-fourth of a cent per gallon less than the last grade. My next grade is Silver Star, which is not water white but prime white. The first three named are water white, 150 fire test; the Silver Star is prime white, 150 fire test. I make 120 water-white oil, which is worth 4 cents a gallon. Export oil to-day is worth 3.90 at the refinery.

Q. Are these all the different grades you make? A. Yes.

Q. And there is a difference in price between them? A. Yes.

METHOD OF BRANDING.

Q. In branding these oils do you vary the brands at all to suit the whims of the individual customer when the oils are of the same grade? A. Yes; I do;

but I do not sell my Sunlight, double refined—my high-grade oil—under the brand of Diamond Safety; neither do I sell my Diamond Safety oil under the brand of Sunlight. A customer in northern New York may want his special brand put on my Sunlight, double-refined oil, and may call it Arc Parlor or Silver Star. Another man in Massachusetts may call it Starlight. There are 30 or 40 different brands that can be placed upon the same grade of oil with all due credit and due justice to the refiner as well as to the purchaser and customer.

Q. In that way you vary the brand to suit the wish of your individual customer, although you do not put a brand that would imply a high-grade oil upon what is really a low grade? A. No; I bill it out under the name of Starlight. I do not take the brand on the barrel. It goes in my invoice as Sunlight, double refined.

Q. But you let him sell it under whatever name he chooses? A. Under whatever he chooses; under the name of Standard Oil, if he chooses. I have no names used by the Standard. In northern New York my Sunlight, double refined, put in yellow barrels and branded American Oil Works, Limited, Sunlight, double refined, 150 water-white oil, was giving such entire satisfaction that they immediately began to copy the brand.

Q. You say "they?" A. I mean the Standard Oil Company. They put their name on the outside of the circle. I do not think I lost any customers by that. It only went to show that I was giving a high grade of goods; and anything that is worth imitating is certainly a good article; it was not injurious to me.

Q. (By Mr. Phillips.) Was their quality as good as your own that was upon the market? A. That I do not know. I received empty barrels of theirs from Potsdam which my customers had picked up, and which went to prove what my salesmen had testified to and written me.

METHODS OF THE STANDARD OIL COMPANY IN MEETING COMPETITION.

Q. Can you give us any further information with reference to the methods of competing employed by the Standard Oil Company which you may have gathered in your business? A. Sometimes the competition is very agreeable and runs along smoothly, and then all of a sudden there will be an outbreak, not in all localities, but in some particular locality. Whether that is occasioned by my refinery putting in too large a per cent of refined oil, I do not know. I wish you would bear in mind that I have no understanding with the Standard Oil Company as to how much oil I shall put in any district. They, however, keep a very accurate record of every barrel that the independent refiners put into each city, town, and hamlet. Their traveling men have to report each night concerning the customers in every town, whether or not they are their customers, whether they buy oil, and if not, why not, and whether or not there is any independent oil there. They keep closely in touch with the business. That

is one reason why they are such a success, because they know what we are doing. I have found severe competition at times, so severe, indeed, that I have been obliged to sell oil under cost to certain customers. That is, after a customer has proved to me that he is an established customer, it is certainly to my advantage to endeavor to protect him just as long as I can. We are very cautious, however, about that, because we have so many times finally lost customers whom we have protected for six months or a year. They turn us down, and the Standard makes some arrangement for the handling of their oil. I have in mind such a case at Peekskill, N. Y., which took place within the last year. We had such a case as that at Albany some eight years ago. I am thankful to say those cases are not in the majority, because we endeavor to use our customers so that at times of pressure they will stand part of the loss and we stand part. We can hold, perhaps, a majority of the trade. I have letters here which I could read you regarding the severe competition that exists in different parts of the State of New York and the west.

I would further state that my company has two agencies, one at Auburn, N. Y., and one in Syracuse, N. Y. The prevailing price for 150 water-white oil in Syracuse during the past winter and early fall was 7½ cents per gallon. The prevailing price for the same grade of oil in Auburn, 25 miles south, was about 2 cents less per gallon. If you would ask me the reason, of course I could not tell you. It is simply theoretical. I have demonstrated this, however, to my satisfaction, if not to yours, that if I sell a limited amount of oil, very limited, say a tenth of the consumption in Syracuse, there are nine chances in ten that the prices will not be cut. But it is different if I attempt to get one-third or one-half of the trade, as I did in Auburn. I wish to state, however, that the people who owned the distributing concern in Auburn had received this cut before I took hold of the business. It is to my interest to distribute my business, and I find it better not to attempt to compete in that way. With some customers, where I am not marketing by the tank wagon system, as I do in country towns and other places, I have a very heavy competition at times, which might be called an unjust, illegal competition.

Q. Is it your general policy not to attempt to drive the Standard out of any of its markets, but rather to get into some markets and secure only a small per cent of the trade, but not enough so that they will think it worth while to cut prices against you, and in that way to make your profits? A. That has been my method during the last five or ten years.

Q. (By Senator Mallory.) What were you going to say was the reason for the difference in price between Syracuse and Auburn? A. The reason, which, perhaps, I did not make plain, was that I was selling a larger percentage of the consumption of oil in Auburn than I was in Syracuse.

Q. If you pass a certain limit then they cut? A. What that limit is I do not know. I have established it in my own mind. Were I to go to Albany today and establish a tank wagon system, there is

no doubt that for the first few weeks there would be a cut in prices; but if with the first advance of the market I maintained a sort of half-normal condition and desired simply to put out enough oil to pay running expenses and make a small profit, the probabilities are that prices would be maintained at an advance in time.

A CUT IN REAL ESTATE PRECIPITATED.

Q. Has that been your experience to such an extent that you can put it down as a rule to be governed by in your business? A. No; there are no rules in the oil business. I wish to state, however, that sometimes even one barrel of oil will precipitate a cut by the Standard Oil Company. A friend of mine shipped simply one barrel of independent oil with an independent brand on it to Salisbury, Md., (I believe it was Salisbury). He sent it there as a present. A friend had told him that they were getting very poor oil there. The oil arrived, and the party to whom it was shipped, being a consumer and not a retailer, and having just bought a barrel of oil and put it on tap, in order to get rid of the barrel of oil presented him sold it to a ducky, who put it on his wagon.

Q. (By Mr. Jenks.) You mean the oil of good quality? A. Yes; the good quality; the independent oil. The ducky put it on his wagon and went peddling it through the town with the brand on the barrel. The Standard Oil Company at once began to investigate. Then they shipped in a carload of the best oil, the citizens said, that ever arrived in Salisbury, and made a heavy cut on the price of the oil; but, of course, there was no fight. The oil was not sent there to compete with the Standard Oil Company, but they are very alert; they will know unquestionably tomorrow morning what all my shipments were today. They know in New York city where the oil is billed to. They may not get it at the Titusville freight office, but if not there, they get it at the junction points, either Buffalo or one of the others. We know that because our customers have been apprised of the fact by some Standard traveling agent who has approached them and said, "We understand there is a car of oil on the way for you from Titusville." The customer does not know it is on the way. He knows he has ordered it, but he has not yet received the invoice. So you see our business is entirely given away by some one. I can not say positively it is the railroad companies. It is not the men in my office, because all the men in my own office are members of the firm.

EXAMPLES OF COMPETITION.

Q. Can you give one or two specimen cases of the competition that you have in mind? A. You understand, now, that is simply my side, or rather my customers' side of this business. I have not evidence here, nor in my possession, that the Standard Oil Company, or their agent, said this. I believe, however, that he did say it. This letter is from

Shortsville, N. Y.; it is one of my customers, Thomas & Harrington [reading]:

[Office of Thomas & Harrington, dealers in fine groceries, dry goods, boots, and shoes.]

Shortsville, N. Y., March 23, 1899.

T. B. Westgate, Esq.

Dear Sir: We take this opportunity of writing you to explain the situation in the oil business. Mr. Cady is here, and we told him just how things are. One of the merchants here wrote a letter to Buffalo in answer to an inquiry from the Standard people asking why there was not more Standard oil sold here. His letter was sent to New York, and they telegraphed to Buffalo to send a man to Shortsville at once. Their agent came and went to Mr. Hall, whom we supply with oil, and tried to get him to take some in the carload, but he refused, saying he could buy of us, and the agent made the following reply: "We have tried to treat Thomas & Harrington right, and have offered them oil less than they can buy elsewhere, but they still refuse; now we are going to force them to buy of us." The next day they cut the oil to 7 cents. We have held the price up to 10 cents, but our trade is leaving us and we must meet them. Now, under the circumstances, what is the very lowest price you can put in a carload of diamond oil for? Answer at once.

Yours, respectfully,

THOMAS & HARRINGTON.

The oil supplied to Mr. Hall was American Refinery oil—my oil.

Q. (By Mr. Farquhar.) Did you furnish them oil at a rate so that they could compete with the Standard Oil Company? A. Yes; I furnished them oil so they would not lose money, but there was no profit in it.

Q. (By Mr. Kennedy.) No profit for you? A. I can not tell you what price I got for it. I think it was one-fourth. We figured that we could give him from one-fourth to three-eighths of a cent a gallon on our oil. We are doing a fair business there—all the Standard Oil Company will let us do—and customers find that we can not cut prices from half a cent to a cent a gallon and be able to stand it without a loss. The fact that we can run on such small margins is due to the magnitude—the great volume—of the business.

Q. (By Mr. Jenks.) If, under the pressure of competition, you make a cut of three-eighths of a cent a gallon, are you taking all your profit away? A. Yes.

Q. And your ordinary margin? A. I wish you to understand this, however. We will say that the price of crude oil is three cents per gallon, and refining is one-half a cent a gallon. You would say, then, not being acquainted with the business, that if I sold water-white oil at four cents per gallon I would be making one-half a cent per gallon profit. You must take into consideration that there is a waste of from 5 to 7 per cent in refining; there are products, such as tar, that today is worth about

2½ cents per gallon. Tar has been as low as three-fourths of a cent per gallon. In figuring the prices of the high grade goods, therefore, we must not forget that there are low grade goods of very inferior value, selling at even less than the price of crude oil. Benzine a year ago was less than crude oil; today it is worth more than water-white oil, being the most valuable product we have; that is, in the illuminating oil business—not in the lubricating oil business. You see, then, that we have to take all of these things into account. In Fulton, N. Y., we have a customer by the name of W. S. Crandall. He is simply a retail peddler of oil, perhaps worth a few hundred dollars. He has been my customer for five years. He wrote me on April 7 the following: "The Standard Oil Company has put another retail peddler on the road. There was already one here, and this makes two retail peddlers they have here now drumming the trade. They have had one here for a year. He came April 1, 1898; about three weeks ago he approached my man and wanted to hire him, and offered him considerable more than I would pay him and a bonus of \$100 if he would go to work for him. He would give him a bond, with a contract to keep him employed for ten years; but he could make no impression on him, for he would not leave me. Now they have hired another man, and both the retailers and the man that wholesales are telling the people that they have a carload of American oil on the road that will soon arrive, and that they will be prepared to furnish the same oil at less than we are selling it." I should have said, previously to this, that the Standard has repeatedly tried hard to get this man away from me. Of course that is all right; there is no harm in that. If they can give him good goods in a general way on a margin of profit, that is straight business. Ten days after receiving this letter, May 26, I received another from Mr. Crandall, which I do not need to read, but he stated in that that a carload of oil—our oil—had been received by the Standard agents in Fulton and wanted to know if we had shipped it to them, and told me about what the qualities of the two grades of oil were. I immediately reported that we had not shipped a carload of oil to Fulton to the Standard Oil Company or any one else but himself. I asked him to get the date of the inspection on the gallon end of the barrel, and that would give me a way of finding out to whom I shipped that identical oil. He did that on May 26, and wrote me that he looked at the barrels and found that they were inspected by my inspector on April 2. The only carload of oil that I shipped out on April 2 in barrels was to the Merchants' Refining Company in Buffalo. I shipped it in a Western New York and Pennsylvania box car. Now, I am not prepared to say, gentlemen, that that identical oil in those barrels was my oil. They might have taken my oil out and put their own in at Buffalo, but in all probability they would not do that, because it is an expensive business. It probably was my oil. I know very little of the Merchants' Refining Company. They are a small company, and I understand that they buy Standard goods. I did not know that at the

time I sold this carload of oil to them; but that is the method they adopt to get the American Oil Works oil in there to compete with my man. They could not do it with their own goods. We certainly had one man in Fulton, N. Y., who had the spirit of our forefathers.

Q. What has been the effect? A. He says in another letter that the other man follows him around and endeavors to get the trade by fair means or otherwise. They offer to cut the price from one cent to four cents a gallon, and to give them what they claim is the same oil my customer is dealing out to the people of Fulton.

Q. Do you think their intention is to drive your man out, if possible, by selling your oil cheaper than he can sell it, and then afterwards put in their own? A. And drive him out of the business?

Q. Yes. A. In this particular case his consumption is so small that it is not myself that I care so much about as I do about him. Besides, it would establish a precedent which would keep him or other men from undertaking the same line of business in other places. The cancelling of six or eight cars a year that this man handles would have very little effect on my business, it simply affects him.

COMPETITION ON THE PACIFIC COAST.

Now, these letters that I have read and this evidence I have given is hearsay, and in a court of justice might not be admissible. I have, however, a letter from Portland, Ore., which I will give in evidence, which is to my mind evidence of the most flagrant violation of honest competition that I have met with. That is on paper. They are very cautious usually about what they do in the way of making threats. This letter is, as you see, from the Standard Oil Company, Portland agency, George C. Flanders, special agent, Portland, Ore. This letter is written to a firm in South Bend, Wash. I perhaps had better state now that I have been shipping oil in barrels from Titusville to a Mr. Copenspire, in South Bend, and that he had been selling a few carloads of oil in South Bend. It seems that Eichnor Brothers, of South Bend, had written a letter to the Standard Oil Company at Portland, Ore., describing the condition of the oil business there, in reply to which the Standard Oil Company, over the signature of Mr. George C. Flanders, special agent, wrote as follows [reading]:

Portland, Ore., March 28, 1894.

Eichnor Brothers, South Bend, Wash.

Gentlemen: Your favor of the 24th instant, giving information regarding Sun Light oil duly received and contents carefully noted. It seems that the consumers of coal oil in South Bend have a curious idea as to what kind of an oil constitutes a first-class burning oil. We will state for your information that never a drop of oil has reached South Bend of a better quality than what we have always shipped into that territory. They can name it "Sun Light," "Moon Light," or "Star Light," it

makes no difference. You can rest assured that if another carload of "Sun Light" oil arrives at your place it will be sold very cheap. We do not propose to allow another carload to come into that territory, unless it comes and is put on the market at one-half its actual cost. You can convey this idea to the young man who imported the carload of "Sun Light" oil. Thanking you kindly for this information, as well as past favors, we remain,

Yours truly,
STANDARD OIL COMPANY.
By Geo. C. Flanders.

Q. (By Mr. Jenks.) Have you any other information to give with reference to their methods of competing? A. I think of one method of meeting this which one of my customers in the east tried some seven or eight years ago. He was a German. He had good Bismarck blood in him, I judge, from what I will recite to you. I had sold him a number of carloads of oil, and the Standard agent of Jersey City came to him and said, "We must sell you the oil that you are jobbing here in Hoboken." He said, "No; I prefer to buy independent oil." The agent said, "We will name you a low price, and we will fix a marketing price so that you will make a good thing out of it." He said, "No; I prefer to run as I am running." The Standard agent then said, "If you continue in this, we will so cut the price here that we will drive you out of the business." He said, "You mean to make me lose all the money that I have made?" The agent replied, "Yes." He said, "If you will do that, do you know what I would do to you?" And continued, "I would go over to your warehouses and I would blow them up with dynamite; that is what I would do." He told me that in less than three days the Standard Oil agent was over to see him and a price was fixed; but he still continued to handle oil from my refinery.

Q. That is, by an agreement between the Standard Oil Company's agent and himself? A. Yes.

Q. Is your source of information the man himself? A. Yes; his own mouth.

Q. Have you finished with this special point? A. Yes.

Q. (By Mr. Farquhar.) I would suggest that the name of this man be given. A. Charles Frey.

Q. (By Mr. Jenks.) Was it at Hoboken or Jersey City? A. He was at Hoboken, and the Standard Oil agent was from Jersey City.

Q. Does this cover substantially what you have to say with reference to methods of competition, aside from the question of freight rates, that might come up? A. I think what I have stated is sufficient.

Q. (By Mr. Jenks.) You have had other experiences of somewhat similar nature, I suppose, but these are typical ones? A. Yes.

PURCHASING AND DISMANTLING INDEPENDENT REFINERIES.

Q. Do you know whether the Standard Oil Company, for the purpose of getting control of prices in certain sections of the country, has bought up competing oil refineries and then dismantled them? A. Yes; it has.

Q. What special instance have you in mind? A. Two large refineries in Titusville were bought up in the year 1895 by the Standard Oil Company, not simply to get the refineries, but to get the stock which they held in the United States Pipe Line and the Producers' and Refiners Oil Company, Limited. They wished to assume or get control of these pipe lines; they did not care a snap for the refineries. They made that statement. They made a proposition to all of us to buy out all of the refineries if we would put our pipe line stock in; and three of the largest refineries sold, two in Titusville, the Union Refining Company and the International Oil Company, Limited, and S. Y. Ramage, of Reno. You may ask, perhaps, if that did not lessen our own competition, those being drawn off and the refineries dismantled. The Standard dismantled them, and the iron was mostly sold for junk. It did, certainly, give us that much more field—that which these special independents had been working in; but in did not give their patronage to the United States Pipe Line and the Producers and Refiners' Oil Company, Limited, who needed it; it took it away. At that time we were having a very crucial test in the refining business and pipe lining. It did not give us the patronage which we, as pipe line men, desired and needed. It costs comparatively little more to run 100,000 barrels of oil a month through a crude pipe line than it does 75,000 or 60,000. It is always best to run full volume, and it took away not only their patronage, but their influence in our independent enterprises.

Q. (By Mr. Phillips.) Were they buying crude oil through those independent lines and also shipping refined? A. They were.

Q. Those refining companies? A. They were three of our largest refineries.

Q. (By Mr. Jenks.) So, as a matter of fact, the business of the independents was seriously damaged by these three refineries selling out to the Standard Oil Company? A. Yes; it was.

Q. Have you any information with reference to the prices that were paid for those refineries? A. I have not.

Q. What were the offers that were made to you? Were they what you would consider high under ordinary circumstances? A. The offer did not come to me in person from the Standard Oil Company, but through those who did sell and who had been in direct communication with the Standard people in New York. The price was not high; it was simply a constructive price—a cost price.

Q. That was all there was to it? A. That was all I was offered for my plant.

Q. Have you any knowledge with reference to trans-

actions on the part of the Standard Oil Company at any other time in the way of buying up refineries and dismantling them to get rid of competition? A. I know from hearsay, before my oil days, that such things were done to quite an extent. I have no personal, direct knowledge.

Q. Your own knowledge is practically limited to this experience in Titusville? A. Yes.

EFFECT OF THE STANDARD OIL COMPANY ON PRICES.

Q. Some other witnesses have spoken with reference to prices and the effect of the Standard Oil Company on prices. This chart, representing prices of crude and refined petroleum, shows the way the prices of petroleum have fallen. Will you tell us what, in your judgment, are the reasons for the decline in price of refined oil, as compared with the price of crude oil, since 1870? A. In the early days of refining, the by-products—what we term by-products, such as benzine, from which gasoline is made, and tar—were entirely worthless. They were either run into the creek at night or run into holes dug in the ground and burned. Their value then as a fuel was not realized, and refiners were buying coal and wood to refine oil with, when they were running into the creek what they might have used for fuel. I might say that the percentage that we now take out in these products—I do not know what they took, but it was practically about the same—is something like 20 per cent. of the crude product. About one-fifth of the crude oil product was entirely wasted, which to-day, in 1899, is worth a high price; for instance, benzine is worth more to-day than water-white oil, as I have already stated, and tar is worth nearly as much as crude oil. These prices fluctuate; tar has been worth 4 cents a gallon during the past eight years, but it has been down as low as three-fourths of a cent a gallon.

Q. So that in this way about 20 per cent. of the crude oil, which formerly was an absolute loss, is now saved and made as valuable, on the average, perhaps, as the refined oil itself? A. Yes. Then, too, the cost of refining has lessened very much. Approximately, oil can be refined for one-half cent per gallon—I refer now to illuminating oil and gasoline—whereas I am told that in the early days it cost about 2½ cents a gallon. The quotations which have been placed before you were based upon refined oil at the seaboard in 1898; that is to say, oil in barrels. In 1898 refined oil barrels were worth, in Titusville, 88 cents apiece. In the early days barrels were worth from \$2 to \$3, which makes a difference of from 2 to 4 cents per gallon in the value of a barrel, which would knock off considerable of this advance in price, as he has arranged his schedule.

Q. As a matter of fact, when we find oil quoted by the barrel, the value of the barrel is included in the quotation? A. Yes; the schedule is right, no doubt; but if the logic the witness uses is right, why should the Standard make the price of refined oil in 1895, when crude oil was \$1.35 a barrel, 4.9 cents per gallon, and in 1898, when crude oil was only 90 cents a barrel, 5.7 cents per gallon? You see, there is a difference there of 80 points. If they are cheapening, if they

are tending to lower the price, his table is all right, but I do not see the logic in the point that he makes. These prices are simply on export oil. Suppose we take last year's average price. Refined oil was 5.7 cents per gallon; if for some reason the Standard Oil Company sees in foreign countries a necessity for cutting the price of export oil 1 cent a gallon, making it 4.7 cents per gallon, they would simply have to advance the prices on home products 1 cent a gallon on the balance of the products to make up for that deficiency, and therefore you cannot determine prices in the oil business generally upon the prices of export oil alone. If his logic is true, he is giving all the benefit to the foreigner, because these prices he uses for the chart basis are on export oil; there is very little export oil used in the United States, supposedly. If his logic is true, he is helping the man over on the other side, and you and I have to pay higher prices for water-white, lubricants, and gasoline. Do you see the point I make?

PRICE OF EXPORT OIL NOT A CRITERION OF PRICES IN THIS COUNTRY.

Q. Do you mean that he uses figures which simply represent one quality usually sent abroad, and that the table therefore does not represent the average price of refined oil to the consumers or the wholesale dealers in this country? A. Yes; this is export oil and represents about 44 per cent. About 44 per cent. of the crude product is export oil.

Q. Your general conclusion, then, is that the figures cited in this table, or represented on the chart, are untrustworthy for the purpose of drawing any conclusion as to the general level of prices to the consumer or to the wholesale dealer in this country? A. That is certainly my conclusion. I believe, however, that the Standard Oil Company is employing the very best brains engaged in the manufacture of oil. They have certainly brought forward a great many inventions in the refining of crude petroleum. I certainly believe that. A man cannot help but see that they are improving every day. They are doing a great deal to bring out the very best there is in crude oil and make the most of it. That is their business. They probably do more than any man or any firm. Probably Mr. Van Sickle, who was an independent refiner in the sixties and seventies, brought forth more original ideas at that time that are still being used than any one refiner. He was a very practical man.

Q. You would be inclined to think, then, that on the whole this decline in prices that has come through improvements in methods of production is due, in part, to the work of the Standard Oil Company and in part to the inventions of the independent refiners, and that the honors might fairly be distributed between the two? A. You must not forget that with this decline in the prices of refined oil there has been a very heavy decline in crude oil; wells are bored and handled so much more cheaply. Originally one man with one pump, boiler and engine would pump one well; to-day little wells doing a half or quarter of a barrel are harnessed up to one big drive power, with 20 and 30, and even 40 other wells. So you see the expense of operating is

so greatly reduced that the cost of producing has become nominal compared with what it was 10 or 20 or 30 years ago.

Q. At the same time, in accordance with this table, the price of crude oil has not declined materially since 1879. In that year it was selling at 88 cents a barrel. Was it not \$1.05 in 1895? A. What is it now?

Q. So the price of crude oil, on the whole, seems not to have declined very much since 1879 and 1880, and of course the price of refined has also declined very much less since 1880 than it did between 1870 and 1880, according to this chart. Would it be right, then, in your judgment, for us to infer that the chief improvements in the methods of production were made between 1870 and 1880 rather than since 1880—improvements in the methods of refining? A. Between what years?

Q. Between 1870 and 1880, I will say, instead of since 1880? A. That would be simply speculative.

Q. It was during those years that the chief difference was made in the cost of the refined product. (No response.)

Q. (By Mr. Phillips.) Have the Standard people any superior methods of refining that are not known to the independents? A. If they have, we do not know it. Of course, if we did know it we would use the same; they do not give out their information, certainly not.

Q. Do you believe you can get out the whole value and make as good oil as they, both in by-products and refined material? A. I believe the independents put out as good goods in every way as the Standard Oil Company does, certainly.

FREIGHT RATES AND TRANSPORTATION.

Q. And as economically in proportion to the amount they put out? A. I believe we do; yes.

Q. (By Mr. Jenks.) The question of freight rates and the apparent advantage of the Standard Oil Company in that respect has come up a number of times. Have you any information that you can give us concerning the freight rates that you secure, and the influence of the Standard Oil Company upon the railroads, or the special advantages they get in the way of freight rates? A. With reference to oil rates, I have no reason to state that we are paying any higher rates per hundred than the Standard Oil Company is. They are not shipping anything from Titusville, but there are other given points, such as Olean and Buffalo. Buffalo would take a little higher rate, however; but I know that they are underbidding their cars. Since the establishment of the Interstate Commerce Commission the railroads, I think, have been very careful about giving rebates on oil, or perhaps on any other traffic; they may do it; I know nothing of the kind.

UNDERBILLING OF CARS.

But I have seen freight receipts in New York from one of my former customers wherein a car of 7,000 to 7,200 gallons was billed from Olean at 24,000 pounds. Now, that car weighs, according to the basis on which

we have to figure, 6.4 pounds per gallon—from 44,800 to 46,080 pounds. I give you the weight of 7,000-gallon tank cars of oil. Were I to bill that car or those cars I would have to bill it as I have stated, at actual weight—44,800 or 46,080 pounds. They also prepay their freight. Perhaps I should not say that, for I do not know it; but my customers, who have received oil from them, state that the Standard prepays all freight on oil, and I believe they do. They have been paying the same freight rate per hundred, but you see what a disadvantage I am working under if I have to bill 44,800 pounds where they can bill it at 24,000 pounds and get it through. I have seen three of these freight receipts, and my opinion is that every car that goes out of Olean, or any other of their refineries, is billed on this same basis; and I believe that is where they are getting the remarkable leverage; and I believe, also, if I were paying on the same basis as they are, or they were put on the same I am, we would not have to make such cuts or else go out of the town.

Q. Why not bill at still less than that? A. Twenty-four thousand is the minimum capacity, the minimum car weight in billing oil.

Q. Then you believe it to be true that the general custom that is followed is to bill every car at the minimum weight, although the car itself may be very much larger and heavier? A. Yes; at the minimum weight. I know one other incident. It is just hearsay, but the case of these receipts only confirms what I am about to say. A certain party in New York bought a few tank cars of crude oil from the Standard Oil Company, which were shipped from Olean. The cars arrived and the freight bills were presented for collection, because they were buying it f. o. b.; they bought it f. o. b. Olean; it was certificate oil put into tank cars; it was not refined; the freight bills were presented to the buyer, who noticed, to his surprise, that the cars were billed at 24,000 pounds; and the cars held from 6,000 to 6,600 gallons, which would be 38,400 pounds on a 6,000-gallon tank.

Q. (By Mr. Phillips.) Of difference? A. No; that is what I would have to pay; they were billed at 24,000 pounds, whereas they actually weighed 38,000 pounds and more. A few days later this buyer got a corrected bill from the railroad company billing them at actual weight with the regular rate, which he paid, of course. I do not believe these were errors. The three cars I speak of in central New York were not billed at the same time; they were billed at different times, and those things could not be errors. Every railroad has or should have what we call a tank-car book, giving the number and initial of all the tank cars in the United States and Canada, with the gallonage and the weight, figured at 6.4 pounds per gallon.

Q. (By Mr. Ratchford.) Six and four-tenths per gallon? A. Yes, per gallon; 6.4 pounds per gallon. Therefore, I say, these things cannot be errors on the part of the billing clerk. It only confirms my belief. It is my belief, of course, that they are getting their goods put through, when in tank cars, at 24,000 pounds, while I am paying on the same car for practically 50 or 100 per cent. more than the weight for which they are paying.

Q. (By Mr. Jenks.) Do you recall the dates of these receipts? How long ago was this? You say you have seen separate receipts; have you any idea about when that oil was shipped? A. It was about three years ago.

Q. So you think that, within four years at any rate, you have located three specific cases in which the Standard Oil Company has had its oil underbilled, i. e., at 24,000 pounds, where a fair billing would have been at least 44,000 pounds, and probably more? A. Yes.

RAILROADS DO NOT CARE TO HANDLE INDEPENDENT OIL.

Q. Have you other information with reference to freight rates in connection with the oil business? A. In reading these two letters I wish to show to the commission that for some reason independent oil is not a commodity that the railroads are desirous of handling. This one is from the commercial freight agent of the New York, Chicago & St. Louis Railroad Company; he is in Pittsburg. He writes (reading):

Pittsburg, Pa., April 12, 1898.

Subject: Rates on oil, Titusville to Vermont points.

Mr. T. B. Westgate,

Manager American Oil Works,
Titusville, Pa.

Dear Sir: In referring to conversation the writer had with you a short time ago in regard to rates on oil from Titusville to points in Vermont—

I regret exceedingly that at the present time we cannot name satisfactory rates on oil from Titusville to Vermont points.

We hope, however, to be able to do so in the near future and will advise you just as soon as possible.

Yours, truly, W. H. RICHARDS,
Commercial Agent.
HOWES.

Here is a letter from the New York Central Fast Freight Line, F. L. Pomeroy, general manager, Buffalo. He is the general manager of the Red Line, White Line, Blue Line, Canada Southern Line, and Midland Line (reading):

Buffalo, N. Y., December 5, 1898.

Messrs. American Oil Works, Limited,
Titusville, Pa.

Gentlemen: I have your favor of the 25th instant asking for rates on oil in tank cars and barrels from Titusville to Montreal, province of Quebec, and in reply would say that oil is not a commodity that we are permitted to handle by our fast-freight lines; therefore I have no authority to make or discuss rates on this commodity, but would refer you to Mr. S. Goodman, assistant traffic manager, New York Central & Hudson River Railroad, New York City.

Thanking you for the business which you are giving us of other kinds, which is fully appreciated, I am,

Yours, truly, F. L. POMEROY,
General Manager.

FREIGHT RATES ACCORDING TO THE RED-LINE TARIFF BOOK.

I wish to offer in evidence a Red Line tariff book. The Red Line is one of the lines of which Mr. Pomeroy is general manager. I take it that these lines are a sort of wheel within a wheel for some purposes. I am now billing oil at Titusville to certain points via the Red Line. This, as you men who are acquainted with the railroads understand, gives in alphabetical order the names of towns in Pennsylvania, New York and the Eastern States and their freight rates; that is, it gives what rate it takes; for instance, Abbing-ton, Mass., takes a Boston rate. Referring to the sheet that this D. A. V. M. Line provides me with, I find the Boston rate on oil in carloads is 23½ cents per hundred; in less than carloads, local, it is 33 cents a hundred. I am prohibited shipping carloads to certain points named in this; that is, carloads of oil. Other classified freight goes through and oil in local lots goes to some points; but to points on the New York, New Haven & Hartford (e. g., the first one I read, Abbing-ton, Mass.), I could not ship oil unless I paid 33 cents. I would have to pay an arbitrary price. This occurred, I should say, about three years ago, when the New York, New Haven & Hartford came into certain hands. We suppose it is controlled by the Standard Oil Company. Our territory is being narrowed each year by the roads which are in some way made servants, in my opinion, of the Standard Oil Company.

Q. If I understand you, this Red-Line rate book that you have shows that you can ship ordinary kinds of freight at Boston rates to all these local points. A. Yes.

Q. When you yourself attempt to get rates do they simply say they will not quote you any rate at all for carload lots of your product? A. I enjoy freight rates to some of these points. There are exceptions; for instance (reading): "Agents take special notice: Petroleum oils to points via Syracuse, on the Ogdensburg & Lake Champlain Division of the Central Vermont Railroad and points beyond, cannot be taken at rates named in this tariff. Shipments of petroleum oil destined to points on the New York, New Haven & Hartford Railroad (New Haven and Old Colony systems) cannot be taken at rates named in this tariff. Such shipments will be subject to arbitrary rates from the various junction points of the Boston & Albany Railroad." Now to points like Malone, which, on other freight, take a Boston rate, on oil of 23½ cents a hundred, I am compelled to pay 26½ cents per hundred. As I go beyond Malone to Rouse Point, I am obliged to pay 33 cents per hundred.

Q. Although through freight, ordinary freight will be sent for 23½ cents? A. First-class freight is 20 cents per hundred. Oil is listed a little higher than fifth-class. I can ship anything to most any of these points specified unless it is designated here as arbitrary.

Q. (By Mr. Phillips.) Why, in your opinion, did they make that difference—prohibit shipping to some points and allow Boston rates to others? A To keep us out of that territory.

Q. Would the difference be so great as to consume your profits largely? A. It, in some instances, prevents us from selling in those localities and causes the consumer to pay a higher price for his goods, because the Standard probably will sell a little bit under us, getting the benefit of the high freight rate which I have to pay from Titusville and which they do not have to pay from, say, a New York point north or a distributing point somewhere, such as Albany. I wish to show in connection with these, which I term exorbitant freight rates, that this Red-Line traffic book quotes a Boston rate to Adirondack Junction, on the St. Lawrence & Adirondack Railway, which is within nine miles of Montreal. Now, if I could ship oil there, as I should, on the Boston rate, which is 23½ cents, I could make good, fair profit; but I hold in my hand a telegram from Samuel Goodman—I believe he is the assistant traffic manager of the New York Central—in reply to a telegram, which reads as follows:

"5, 6, 1899. To American Oil Works: There are no through rates on oil, Titusville to Montreal, or for other points you name. Tariff from Buffalo to Montreal, Adirondack Junction, Beauharnois is 35 cents per 100 pounds via Utica, M. and M., St. L. & A. C. P., or I. Grand Trunk.

"S. GOODMAN."

He says that he quotes me a 35-cent per hundred rate from Buffalo to Adirondack Junction. That was the point named in the Red-Line traffic book, to which I should get through from Titusville on 23½ cents a hundred, if taking a Boston rate, which is named here; but instead he quotes me 35 cents a hundred from Buffalo there. Added to that, my 8 cents per hundred from Titusville to Buffalo makes a 43½-cent rate per hundred from Titusville to Adirondack Junction. I figured that out in miles and in ton rates. I will give the distance from Buffalo to Utica as 201 miles and from Utica to Adirondack Junction as 223 miles, making a total of 424 miles; the freight at 25 cents per hundred on oil would be \$7 per ton, which would be \$0.0165 per ton per mile. Now, the New York Central's average receipt per ton per mile on oil in 1890 was \$0.0073; in 1889, \$0.00712, in 1888, \$0.00557; the rate he quoted me is nearly three times the average receipt per ton per mile as given in their schedule in 1890, 1889, and 1888. This computation is on page 100 of a pamphlet containing a case in the circuit court of the United States for the western district of Pennsylvania, which I can give you. This was the testimony that I referred to that was brought before the Interstate Commerce Commission in 1888 in Titusville. The State of Vermont is the State where I have had the most trouble in marketing goods, and I wish to read a letter here from a division freight agent; he is a soliciting freight agent for the Lake Shore & Michigan Southern Railway Company (reading):

Cleveland, O., April 2, 1895.

The American Oil Works,
Titusville, Pa.

Gentlemen: Referring to our conversation of some time since relating to carload rates to Vermont points, I have looked into this matter very carefully and find that the following rates are the best at the present time:

Burlington, Vt., 44½ cents per 100 pounds, via Rutland.

St. Albans, Vt., 50½ cents per 100 pounds, via Rutland.

Richford, Vt., 54½ cents per 100 pounds, via Malone.

St. Johnsbury, Vt., 36½ cents per 100 pounds, via Bellows Falls.

Newport, Vt., 38½ cents per 100 pounds, via Bellows Falls.

The less than carload rate to St. Johnsbury, Vt., and Newport, Vt., is 33 cents per 100 pounds.

Note the attached letter we have from Mt. Chittenden, of the Central Vermont Railway.

Yours, truly,

W. F. ANDREWS,
Soliciting Agent.

Return the letter.

I wish to state here that St. Johnsbury and Newport, Vt., are booked in this Red-Line traffic book as taking Boston rates. They should therefore give me a rate of 23½ cents per hundred on oil to those points. This is not the Red Line, however, but the Red Line pro-rates with the Lake Shore. I think all work together for good except in the oil business. He does not name that to me; he has not named it. Maybe he knows that the less than carload rate in the Red Line book is 33 cents a hundred, but for some reason or other he cannot name me rates on carload lots into those points excepting as I have given them to you. You see that debars us. Such outlandish rates debar a manufacturer from going into territory where they want a good grade of oil, a light oil. Vermont is a good oil State; that is, for selling oil; and it curtails the business.

Q. (By Mr. Jenks.) You think that the Standard Oil Company simply comes into that territory from other shipping points where the rates are very much more favorable? A. It must be. They certainly are not paying such rates. They do not countenance any such thing as that.

FREIGHT RATES TO THE PACIFIC COAST.

While speaking of freight rates I wish to mention that a few years ago we enjoyed to the Western coast—Western terminals—a freight rate on oil in carloads of 78½ cents per 100 pounds.

Q. You mean to the Pacific coast? A. Yes; the Pacific coast; what they call terminal points on the Pacific coast. After the establishment of the Standard's refinery at Whiting, near Chicago, the freight rates from Titusville, Oil City, Warren and Pittsburg to those points on the Pacific coast were abrogated, and they would not give us a through rate, but we

must bill to Chicago at 17½ cents per 100 pounds, and then from Chicago west we added 78½ cents per 100 pounds.

Q. So that before the establishment of this refinery you had a rate to the Pacific coast, at terminal points, of 78½ cents, and afterwards your total rate through was 96 cents? A. Yes; that was after the refinery was built near Chicago, at Writing, Ind. I have a letter in my hand from Charles T. Hollowell, general freight agent, Green Line system.

(Letter referred to is as follows):

Oil City, Pa., April 12, 1899.

American Oil Works, Titusville, Pa.

Dear Sirs: On request of Mr. Westgate we made application to Delaware & Hudson for rates to points on that line north of Whitehall, and have only just received Mr. Wadsworth's letter quoting the following rates per hundred from Whitehall, which must be added to our Boston rate of 23½ cents from Titusville:

	Tank Cars	Barrels
	Cents.	Cents.
Chubbs Dock, New York.....	5	4
Dresden	5	4
Putnam	6	5
Wrights	8	7
Delano	9	8
Addison Junction	9	8
Crownpoint	10	8
Port Henry	10	8
Westport	11	9
Wadhams' Mills.....	11	9
Whallenburg	11	9
Essex	11	9
Willsboro	12	10
Port Kent.....	13	10
Plattsburg	13	10
Beekmantown	13	10
Sciota	14	12
West Chazy.....	13	10
Chazy	14	12
Coopersville	14	12
Rouse Point.....	14	12
Mooers Junction.....	14	12

We have again written Mr. Wadsworth calling his attention to the fact that the rates quoted are about 2½ cents per ton per mile, which is in excess of what other lines would charge for a similar distance, and will advise you if he makes any further concessions.

For points on the branch from Saratoga to Northcreek our Boston rate will apply, as shown in Group 3 of oil circular No. 22.

Yours truly, CHARLES T. HALLOWELL,
General Agent.

We have also called Mr. Wadsworth's attention to the fact that we asked for rates from Schenectady and not Whitehall.

I received a letter written April 19, 1899, from Mr. Hollowell, in which he says that Mr. Wadsworth, the

general freight agent, Delaware & Hudson, will not make any concession, so that if we ship oil to those points we must pay the enormous rate of 2½ cents per ton per mile above Whitehall, which, as a railroad man signifies, is an enormous rate, and far beyond what any other road would charge.

(The letter of April 19, 1899, above referred to, is as follows):

Oil City, Pa., April 19, 1899.

American Oil Works, Titusville, Pa.

Gentlemen: As advised you in our letter of the 12th instant, we again wrote the Delaware & Hudson people in regard to rates you had asked for on that road, and now have letter from Mr. Paul Wadsworth, G. F. A., April 17, advising that he can make no better rate than that already named you for points north of Whitehall, and also states that our oil circular rate of 23½ cents per 100 pounds from Titusville cannot apply to points between Saratoga and Northcreek, and those points will take the following arbitrary per 100 pounds additional:

	Tank Cars	Barrels
	Cents.	Cents.
Greenfield, N. Y.....	6	5
Kings	6	5
South Corinth.....	7	6
Hadley	9	8
Corinth	8	7
Stonycreek	12	11
Thurman	13	12
The Glen.....	15	14
Riverside	16	15
Northcreek	18	17

We regret that we have not been able to make better terms with them, but it would appear that it will not be possible to do any better.

Yours, truly, CHAS. T. HALLOWELL,
General Agent.

Q. Do you mean that you are charged 14 cents per hundred more for oil to Whitehall, or to one of these local points you have mentioned, than, in accordance with this Red-Line traffic book, is charged for ordinary freight? A. No; it takes an arbitrary rate.

Q. You simply think the charge is excessive? A. The charge is excessive; and, in fact, we are daily being narrowed down by the railroads. I cannot get to New Haven, or Providence, R. I., with oil on a Boston rate, according to this Red-Line traffic book. This Red-Line traffic book on all other roads takes a Boston rate to Providence and New Haven. What is the cause for it?

CHARACTER OF OIL AS FREIGHT.

Oil is a good freight to handle. Mr. Motheral, who is a confidential man of the Green Line in Oil City, gave statistics in 1888, before the Interstate Commerce Commission, relating to the loss and risk in handling oil by freight, which I will read from Page 189 of the

Pamphlet of testimony taken in cases 153, 154 and 163 before the Interstate Commerce Commission:

"Q. What is your opinion, from your own experience of the business, relative to the risk of fire from the transportation of oil by the two different methods, by tanks and barrels; which is the greatest?"

"A. It is greater in tanks.

"Q. How much? What relative portion should you say?"

"A. From 1882 to 1887, five years, the loss on oil in barrels was twenty-seven one thousandths of 1 per cent; the loss on oil in tanks was forty-three one thousandths.

"Q. That is the result of actual experience?"

"A. That is a statement made up from our office a year or so ago. I looked it up again to-day."

So you see the loss in transportation of oil is almost infinitesimal and my opinion is that, if we could keep about upon the same basis—not my refinery alone, but all refineries and all shippers of oil—as the Standard Oil Company, we should not be having this terrible experience that we have had at times. We could get prices, because they would not have the means to cut us.

Q. (By Senator Mallory.) Can you indicate what basis that is? A. I referred to that a few moments ago when I stated that they were underbilling. I have evidence where they have underbilled—i. e., oil that would weigh 44,000 pounds was billed at 24,000 pounds.

Q. (By Mr. Kennedy.) What did you say the wastage is in piping oil? Did you state that? A. I did not say.

Q. Just the wastage of tanks? A. You mean this railroad?

Q. Yes. A. These figures that I gave concerning the transportation of oil in tank cars are given by Mr. Motheral, probably one of the best-posted traffic men in the country, because the Green Line, up to that time, undoubtedly handled more oil freight than any one road.

Q. Have you any figures there in regard to wastage in pipe lines? A. No. From what I have read and from what my experience has taught me, the railroads do not cater for the independent oil trade. Until within the last two years we had very few railroad men soliciting oil trade; we have very few now; a few local lines solicit; but I do not remember of a New York Central, a Vermont Central, a New York, New Haven & Hartford, or a Boston & Albany man asking me for freight, and I ship in the neighborhood of from 12,000 to 14,000 barrels a month, going in directions that would be over their lines. During the construction of the United States Pipe Line, when we had a few tons of iron to haul to Athens and various points, and it was published in the papers that tanks were to be erected and that pipe was to be laid, there were traveling freight agents after us every day to get the shipment of those goods over their line—Lehigh, Erie, and other ways. We could ship iron, but the oil—we must not handle it. That is probably the password that goes over.

In connection with that Montreal business, I wish to state that we enjoyed, up to last fall, I think it was in October, a 23 cents per hundred rate from Buffalo, to Montreal, P. Q.

Q. (By Mr. Jenks.) Had you been shipping oil to Montreal regularly for some time? A. We had.

Q. For how long? A. Four years and over.

Q. At what rate did you say from Buffalo to Montreal? A. It was 21½ at one time, but it was advanced to 23.

CANADIAN REFINERIES PURCHASED BY STANDARD—ADVANCE IN FREIGHT RATES.

Q. For most of the time it was 23 cents from Buffalo to Montreal? A. Yes; but at the time the Standard Oil Company came into possession, either by purchase or lease, of all the refineries in Canada, at Petrolia and other oil points, the freight rates from Buffalo to Montreal advanced from 23 cents a hundred to 35 cents per 100 pounds. I got caught on that. I was not very sharp. They did not notify me of the advance. I sold a man a car based on the 23-cent rate, and it cost me 35. I was out the 12 cents per hundred.

Q. (By Mr. Phillips.) Did that 12 cents materially affect your prices? A. Twelve cents a hundred is nearly 40 cents a barrel. If I can make 10 or 15 cents a barrel on oil I am doing a good business. It practically cuts me out. I cannot sell oil in Montreal under these conditions. That is why I wired Mr. Goodman to get to Montreal via New York Central, via Utica and Malone, and this Adirondack division, but they did not want the trade.

Q. So you are practically shut off at this time? A. Yes.

Q. Since the Standard made the purchase of the oil fields and oil refineries in Canada? A. Yes.

Q. (By Mr. Jenks.) What are the railroads that made these Canadian rates? A. The Grand Trunk running from Buffalo to Montreal and the Michigan Central prorating with the Canadian Pacific from Buffalo to Montreal.

Q. Then, when you were asking for freight rates around this other way over the New York Central, you were merely looking for another way to get to these same places? A. I did not know but I could find the bars down and slip some oil in; but they put them up.

Q. Then you asked for rates to Adirondack Junction? A. Yes; that is the one I gave in evidence.

Q. That is some distance this side of Montreal? A. Yes; nine miles.

Q. But it was for the purpose of letting you into that Montreal market? A. That was the idea.

Q. Were you going beyond the New York Central line in asking for rates to Adirondack Junction? A. I was not; I could pay a switching charge of nine miles and get it in.

Q. Do these increased freight rates through Canada still continue? How long is it since the rate was put up from 23 to 35 cents? A. I believe it was in October last.

Q. And the rates are still held? A. I understand that the independent oil men in Montreal brought the matter up before the parliament, and that the railroads were either compelled or advised to withdraw that tariff and, according to the paper which

I saw, a Montreal paper, the railroads had withdrawn the tariff—that is, they had withdrawn the printed tariff, but the rate still remained the same, if I wish to ship a carload of oil in there. I think they have some very strong evidence in the matter; but I am not posted. I am not prepared to give it to you.

Q. (By Senator Mallory.) You have not attempted to ship any in there recently? A. Yes; I have a party up there and I have tried to sell, but he could not buy because the rate was too high.

What we shippers would like is this, that oil be classified. To some places we pay more than fifth class, and occasionally a little less than fifth class. If I were asked what class oil should be in, I should say it should be sixth class; but if we had a fifth class rate on oil our Boston rate would be 20 cents per hundred, and we are paying 23½ per hundred. We at one time enjoyed a rate of 78 cents per barrel to Boston, which would be 19½ cents per 100 pounds; but as the web grows tighter the rates go up, and our territory is made smaller.

Q. Is there more risk in the transportation of oil than ordinary merchandise? A. Mr. Motheral stated that the loss of oil in barrels in shipping was twenty-seven thousands of one per cent.

Q. (By Mr. Jenks.) Is it not to be concluded, then, from your testimony, that there is not much more risk connected with the shipping of oil than ordinary merchandise? A. There certainly is more risk.

Q. (By Senator Mallory.) Does that include loss by fire? A. Yes.

Q. But not leakage? A. No; I think the commission should insist upon this commodity being classified. It certainly is of magnitude enough to be classified, and you can see from the evidence I have given that there must be a "nigger in the fence" if we cannot get to certain points in a certain tariff book. We can get to certain points and not to others, and in one case we can get no rate whatever.

Q. (By Mr. Jenks.) Your objection is not so much against high rates as against rates that are not at all uniform to places that seem to be similarly located? A. That is true.

Q. And you also believe that the Standard Oil Company has its goods under-billed, constituting practically a direct discrimination against you? A. That is true.

LITIGATION CONCERNING FREIGHT RATES.

Q. (By Mr. Phillips.) Have you had any litigation with the Standard Oil Company, or any case before the Inter-State Commerce Commission, with regard to freight rates, or discrimination in freight rates? A. Yes; we have. We, the Independent Refiners' Association at Titusville and Oil City, in 1888, had a hearing before the Inter-State Commerce Commission.

We were awarded the claims that we demanded, or asked for. The claims were these: That we should have the same rate per barrel on oil shipped in a package as the Standard Oil Company—i. e., that they were paying on a barrel of oil shipped in

tank cars, or that they should quote us a rate per barrel, instead of giving us a rate per 100 pounds. After many days or weeks of session the commission decided in our favor, and awarded us in their best belief, what we asked for. Our awards amounted to something like \$88,000. We have been all this time, 11 years, trying to collect this, and we have a case coming up soon in the circuit court of the United States, Western Pennsylvania district, in Pittsburgh, bearing on this, which has been decided in our favor two or three times by various courts.

Q. (By Senator Mallory.) What road was that? A. They were the Western New York and Pennsylvania Railroad Company, the New York, Lake Erie and Western Railroad Company, the Delaware and Hudson Canal Company, the Fitchburg Railroad Company, the Boston and Maine Railroad Company and the Lehigh Valley Railroad Company.

Q. Were these companies responsible in the case you speak of? A. They were; yes.

Q. What is the status of that case today? A. The status of that case is a dormant one. They decided we should have this reparation, and also that oil should be shipped per barrel—that is, instead of charging us 400 pounds, as they do now per barrel, it should be taken at 320 pounds, actual weight of the oil, because the tank cars (the Standard Oil Company have their individual cars, and we have a few) are shipped full and come back empty, and also that the empty barrels should be shipped back with no charge, because if the oil was shipped in barrels the cars could be used to load freight back, whereas the tank cars come back empty. But they did not comply with the order given.

Q. The case, as I understand it, has been appealed to the circuit court? A. Yes.

Q. Has it made any progress in the circuit court since it was appealed? A. No, it has not.

Q. Is that what you mean by lying dormant? A. Yes; lying dormant; it comes up this fall.

Q. (By Mr. Phillips.) What court was it tried in before it was appealed to the Inter-State Commerce Commission, if any? A. I have not looked up whether it was a civil action or not.

Q. (By Mr. Jenks.) Do you expect a final decision in the case this fall? A. We do; yes.

Q. (By Senator Mallory.) Can you state in a general way the territory in which you deal? A. Yes; my territory is well defined. It is mostly in the State of New York. I sell some in Vermont, and New Hampshire, and occasionally a car scattered through different States; but that is simply a catch order.

Q. Do you ship to foreign countries at all? A. Not at the present time. The rates are high south.

Q. Do you deal with Cuba at all? A. No.

NUMBER OF INDEPENDENT COMPANIES IN PENNSYLVANIA.

Q. (By Mr. Kennedy.) How many independent refining companies are there in Pennsylvania? A. I should say twelve or fifteen.

Q. Are you connected with one or several of them? A. Simply one.

Q. Have not the independent companies some sort of a combination to protect their interests as against the Standard Oil Company? A. The only association we have ever had was that of the independent refiners of Titusville and of Oil City at the time of this suit, or this hearing. We have common interests in the United States Pipe Line, the Producers and Refiners Pipe Line, and the Pure Oil Company.

Q. That is the only kind of a combination you have? A. Yes.

THE PIPE LINE SYSTEM.

Q. (By Mr. Phillips.) Have you any specific knowledge about pipe line systems, the history of them in Pennsylvania, and the independent pipe lines prior to the organization of the United States Pipe Line and the Producers and Refiners' Pipe Line? A. I have some knowledge, but I think nothing that would be of any special benefit. I could tell you about the time since we organized the Producers and Refiners' Line, of which I am a director. We have had considerable trouble with the Standard Oil Company, who have bought up the production on our line, which caused us to lay lines more remote, but I suppose that is in the course of business. They paid high prices, however, for these properties, and it was a good thing for the individual producer that we were there, because he sold out his property at a very high price. That has been done to quite an extent.

Q. Prior to the organization of the Producers and Refiners Pipe Line Company were you getting your oil through the Standard lines? A. We were buying oil from the Standard.

Q. What pipage did you pay them? A. Twenty cents a barrel.

Q. What are you paying now for getting oil delivered at your refineries? A. We are paying the market price, 15 cents per barrel pipage.

Q. Do you get at this lower rate as good oil as you did when you were getting it from the Standard Oil Company? A. The majority of oil is better. We get poor oil from one district, near Oil City; each refiner has to take his portion; that is inferior oil, black oil.

Q. Does that go through the Producers and Refiners' Pipe Line? A. Yes, it does; about 4,000 barrels a month comes through that line.

Q. What kind of oil did you get through the Standard pipe lines before you owned this line? A. We got oil which was not of as high a grade, not as rich in illuminants as we are getting from the Producers and Refiners' Line.

Q. And paid practically five cents a barrel more for piping than now? A. Yes.

Q. And the oil was not of as good quality? A. No; it was not.

Q. (By Mr. Kennedy.) Can you state what percentage of oil of Pennsylvania is refined by the independent companies? A. I have not the actual

figures or data at my command, but I should say about one-tenth.

Q. The Standard Oil Company refines all the rest of it, 90 per cent of it? A. I believe they must have refined it or shipped it abroad.

Q. And the business is profitable, I suppose, to all these independent companies, is it not? A. It has been at times.

COMPETITION WITH THE STANDARD IN FOREIGN COUNTRIES.

Q. (By Mr. Phillips.) Will you state to the commission what method the Standard Oil Company took to circumvent your markets abroad, after the laying of the United States Pipe Line for shipping refined oil through to New York as well as crude? A. The price in our foreign markets, in Germany and Holland, were cut very low, so that we were obliged to sell export oil to one buyer (we have had but the one buyer, Phillip Poth,) very low in fact, at ruinous prices. It was only by the strictest economy that a number of refineries were kept out of the hands of the sheriff during the crucial time we had in 1893 and 1894.

Q. Did Poth handle your oil for a considerable length of time? A. He handled it for a number of years, and until a short time after the Standard Oil Company purchased these other refineries that I spoke of a short time ago. Then I understand that the Standard officials approached him and told him that we were on our last legs and that he had better get his money out of his stuff while he could. They paid him big money for his plant, and it was turned over to the Standard Oil Company entirely; his two sons-in-law were retained in the business. He had promised by all that was true and good to stand by the independent companies. We had sold him refined oil away below the cost of crude oil; but he got frightened when the Standard approached him in this way, and as I say he sold out. The shock was so great that he died within two weeks; we then established the Pure Oil Company—that is, we refiners and producers—and have been marketing our own goods in Germany.

Q. Did they also rent or buy the tankage abroad, so it was very difficult for you to dispose of all your oil? A. They did some of that; yes.

Q. Were you compelled to build tankage and establish stations in Germany? A. We were compelled to do so.

Q. Has your business there been a profitable one? A. Our returns have been very satisfactory in Germany.

Q. What were your profits while Mr. Poth was acting as your agent? A. There was very little in the refining business, just in marketing abroad. We sold him oil f. o. b. New York.

Q. You did not have any profits he made, if he made any, in Germany? A. Certainly not; prices have been good there.

Q. But you sold a good many cut cargoes, did you not? A. Yes.

Q. That is, below cost? A. Below cost, some.

Q. Have you sold any cut cargoes since to your agencies abroad, in the Pure Oil Company? A. No.

Q. They are quite uniform, are they? A. Quite uniform; yes.

RELATION BETWEEN THE STANDARD OIL COMPANY AND
THE INDEPENDENT COMPANIES.

Q. A former witness stated before this commission that if the Standard Oil Company were to offer the independent companies a price far beyond the value of their plants they would still refuse to sell out. Is that the feeling of the independent companies of Pennsylvania? Would they not sell for more than the value of their plants if offered that by the Standard Oil Company? A. Now, if you will define that I will answer you directly do you mean \$10 more?

Q. There was no specific sum named; it was said they would not sell to the Standard even if offered more than the value of their plants. A. If they were all like him they would not.

Q. Have the Standard people made any attempt to purchase stock or circumvent these independent pipe line companies in any way in order to get control of them? A. Yes; from the suits that have been in progress with John J. Carter and the Producers' Oil Company, Limited, it would seem that is what they are trying to do.

Q. Do you remember the capital stock of that company and how much they purchased? A. The capital stock is \$600,000. Mr. Carter originally owned \$3,000 worth of stock; he purchased about \$300,000 worth more. We believe it was for the Standard Oil Company. I can not testify that it was, but from all outward appearances it looked that way.

Q. Did they attempt to get control of this independent company after purchasing this stock? A. They did. Having the majority of the stock, they expected to elect the managers of the company. But the company, being organized in Pennsylvania under the special act of 1874, called the copartnership law or act, Mr. Carter would have to be voted in by a majority in number and interest in the Producers' Oil Company before he could vote that stock, and our people declined to vote him in. He has been in litigation with the company for the past three years or more, trying to get in. The courts have finally decided—the supreme court—that he was in error, and that the company must buy his stock at the appraised value. The appraiser was appointed, and that appraising has been taking place for the past five or six months. They are arriving at values, as the company are obliged to buy the stock that Mr. Carter owns. He has been voted into a portion of it, I believe.

Q. Have they bought stock in any other company? A. If I remember correctly, they have secured something like \$400,000 in the United States Pipe Line.

Q. How much of that stock has been sold, and

what is the capital? A. I believe the capital is \$2,000,000, and, if I remember rightly, the stock that is out is about \$1,200,000.

Q. Did they attempt to get anyone on the board of managers in the United States Company? A. They have one director in the United States Company; yes.

Q. Have they recently been purchasing stock in that company? A. Not to my knowledge.

Q. (By Mr. Kennedy.) That would be a legitimate way of getting control of those companies, would it not? A. Yes; that is one way, but perhaps you or I do not care to go where we are not wanted; that is the only way I look at it; you do not desire to go into a company if you are not wanted there.

Q. If they get control of these companies, do you have any idea they will run them at a profit to the stockholders? A. If they would run it, they would run at a profit; that is the way they run.

TRANSPORTATION SYSTEM THE CAUSE OF EXISTING EVILS

Q. (By Mr. Phillips.) Have you any statement you desire to make that we have not covered by asking questions? A. This question of the aggregation of capital is, of course, a large one for a small man to handle, but I do not fight the Standard Oil Company. It is not my business to fight them. I do not believe the Standard Oil Company, with their millions, could or would drive me out of business, if I had the same advantages (and that every American citizen should have) that they have on the transportation lines. If they do not have that advantage over me, it makes no difference how large the company is; if they are run on right lines, it matters little.

Q. (By Mr. Jenks.) If I understand you, then, the evils that come from the Standard Oil Company would be done away with if the inter-state commerce act could be enforced in both spirit and letter? A. That is what I mean; in short, I mean that oil should be listed as other freight is. And my opinion is that it would be a good idea to have a railroad examiner just as you have a bank examiner for national banks. If I have a grievance and think Jones or the Standard Oil Company is getting cheaper rates from a common point to Montreal than I am, let me file a complaint and have one of these examiners investigate the books of the railroad companies. It takes but a moment to find out where a grocery-man or a wholesale-oil man is buying oil. You are not giving away a man's business by going to a railroad company and ascertaining the freight rate and weight of his oil. The customer is not injured. I say that the complainant should do this because all men are human, and this is such a big business in shipping that we might not get justice even if a commissioner were appointed.

Q. Do you mean by that that it would be possible to buy up an inspector? A. Yes.

Q. Unless the complainant were to have the privilege of going also? A. Certainly. There are so few refineries that three or four railroad examiners

would, in my mind, be sufficient. Of course other shippers might demand the same thing, but I believe, the way things are, conditions are such that something of that kind is necessary. It strikes me so, because I do not believe that we are getting justice; and I do not believe that we can get it unless a thorough investigation is made.

Q. (By Mr. Phillips.) Do you think there should be laws allowing the inspection of freight passing over the railroads? A. Yes; I do.

Q. Have you anything further to suggest in remedial legislation for monopolies? A. I do not believe they are harmful when on right lines. I believe that illegal or illegitimate competition ought to be banished in some way, whether by legislation I do not know.

Q. (By Mr. Jenks.) By illegitimate competition do you mean special favors shown by railroads, and also this special cutting of rates in particular localities, of which you have already given us examples? A. I mean the cutting of prices below cost of production. The oil business and every other business should be run on its own merits; if the Standard Oil Company, or Armour, or my little works can not get trade by holding out good goods and by good, honest competition, by manly efforts, we are not worthy of the trade; we should certainly have something that will protect us.

Q. (By Mr. Ratchford.) By honest competition do you mean that every man shall be allowed to place his goods upon the market with the opportunity to make a reasonable profit? A. Yes; I do.

Q. (By Senator Mallory.) Do you also mean that public carriers are created for a public benefit, and should not be permitted to show favors to one set of producers as against another set? A. I can write a letter to Montreal, Quebec, soliciting trade, for instance, and send it for two cents. The Standard Oil Company pays two cents for the same kind of a letter. When I ship a carload of oil there that weighs 44,000 or 48,000 pounds, I pay freight on it accordingly; but from what I have seen, from what I have told you gentlemen, I am satisfied that their car goes through billed at 24,000 pounds, although it holds the same quantity as mine does. That is what I want; the majority of companies maintain that that is what I deserve.

AFFIDAVIT.

State of Pennsylvania, County of Venango, ss:

I swear that the statements made by me of my own knowledge in the foregoing report of my testimony before the Industrial Commission are true, and that all other statements I believe to be true.

(Signed) THEODORE B. WESTGATE.

Sworn and subscribed before me this 7th day of October, 1899.

[Seal]

Chester L. Kerr,
Notary Public.

Washington, D. C., June 17, 1899.

TESTIMONY OF MR. M. L. LOCKWOOD.

INDEPENDENT OIL PRODUCER.

The commission met at 10.55 a. m., Vice Chairman Phillips presiding. Mr. M. L. Lockwood, being duly sworn as a witness upon the subject of the oil industry, testified.

Q. (By Mr. Jenks.) Will you kindly give us your name and address? A. M. L. Lockwood, Zelenople, Butler county, Pa.

Q. What is your connection with the oil business? A. I am an oil producer.

Q. For how long a time have you been in that business? Since 1865.

Q. Are you an oil refiner also? A. No.

Q. You have, I believe, a statement ready to make to the commission. If you will kindly give us that, we will afterwards ask any questions that seem desirable.

Mr. Chairman and Gentlemen of the Industrial Commission:

Robert Lockwood came from England with Winthrop in 1630. One hundred and forty-seven of his descendants, one of whom was my great-grandfather, participated on the side of the colonies in the war of the Revolution. I refer to this that there may be no questions as to my Americanism.

It seems to me as though this reference is proper from the fact that it has become the custom of the monopolistic classes and all those who are fawning for favor at their hands to stigmatize as anarchistic and un-American any expression not in harmony with the present monopolistic condition of affairs.

I am a native of the State of New York. I left the farm in Erie county of that State in 1865 and went to the oil regions of Pennsylvania, and have been engaged in the work of producing oil ever since.

EARLY RAILWAY DISCRIMINATIONS.

Away back in the early part of the sixties some of the refinery men in the oil regions who did not have the ear of the railway managers were unable to get a freight rate over the railroads that would enable them to sell their oil in New York and the export cities at a profit. They were obliged to sell the refined oil to the men who afterward helped to create the Standard Oil Company, for these men even at that early date seemed to have an advantage in freight rates that enabled them to market oil at a profit when no one else could.

The facts which I shall present to you I desire not to be construed as against men, for I believe that the Standard Oil people are no better or worse than any other set of men would be, armed as they have been with practically exclusive advantages over the railways of the country. But the facts which I shall present to you I desire to be construed against an

accursed system of railway discriminations which has made this great curse, the Standard Oil Trust monopoly, a possibility—against a system that has enabled the Standard Oil Company people to drive into obscurity, bankruptcy, or servitude the men whose energy and enterprise developed the great oil-producing and refining industry of America, for before the blighting curse of railway discrimination was turned against the oil refinery men they prospered and grew rich in the refining business. They doubled the capacity of their refineries, adopted new and better processes, and were going forward in a business that promised much for themselves and their descendants.

But when the conspiracy between the Standard Oil Company people and the railways was consummated all men not included within the favored few were condemned to financial obscurity or ruin. No business ability however great, no better process however superior, could triumph, when the highways over which you must go to market were closed against you and manipulated in the interest of your competitors.

As long as there were open and equal rates over the highways of the country, many growing and prosperous refineries were built at every favorable point—at Franklin, Reno, Oil City, Rouseville, Petroleum Centre, Pioneer, Titusville, Warren, Pittsburg, Cleveland, and Corry. The competitive contest in the business forced hundreds of the best minds to the study of better and more economic processes in refining, and the most rapid strides were made in perfecting and cheapening cost.

Many refinery men made many buyers of crude oil, and the producer selling his oil in the competitive market was enabled to obtain a fair share of the profit in the business. The consumer buying his oil from competitive sellers was enabled to receive the benefit of each and every economy in the process of producing and refining petroleum.

THE SOUTH IMPROVEMENT COMPANY CONTRACT.

In 1872 the men who had been entrusted with the management of the highways of the country, understood so imperfectly their duty as common carriers to the public that they entered into a contract with the men who afterwards created the Standard Oil Company. This contract was known as the South Improvement Company contract, and was between a corporation of that name and five trunk railways—all of the railways that entered the oil regions of Pennsylvania.

This contract provided that the railways should increase the freight to about double what they had been charging on all oil shipped; that they should pay back a rebate to the South Improvement Company an amount about equal to said increase of freight rates; that they should pay to the South Improvement Company a like rebate on all oil that anybody and everybody else shipped; that they should break up and destroy all refinery men outside of the South Improvement Company by high rates of freight; and that they were to keep watch

and report to the South Improvement Company all the business and shipments which any of these outside refineries should make.

Now, Mr. Chairman and gentlemen, I desire here to say that everything that the railway companies publicly contracted to do for the South Improvement Company in 1872, the railway companies have since secretly and persistently done for the benefit of the Standard Oil people, as I will prove to you. I shall prove it, too, in the face of the fact that whenever any of the Standard Oil Company's people or their agents or the railway people who knew the facts have been subpoenaed to testify they have almost invariably refused to answer, shielding themselves behind that provision of law which provides that you shall not force a man to testify to that which will convict him of a crime.

The men who developed the oil regions of Pennsylvania were of the best families of the Republic. The ancestors of many of them helped to win our independence as a nation, and when the provisions of the contract of the South Improvement Company became known, it created such a furore in the oil regions as has seldom been seen. Men saw the principles of equal rights destroyed, the highways over which their products must go to market being in the hands of a set of brigands, who pledged themselves to rob the people of an average of more than \$1 a barrel on all the oil they produced, and give it to 13 men who constituted the South Improvement Company.

The public press of the oil regions at that time had not yet been subsidized and it gave the alarm. Men came together and consulted, meetings were called, and the more that was learned of the provisions of the South Improvement Company contract the more awful the crime which was attempted against the rights of the people developed to be. Mass meetings at Franklin, Oil City, Titusville, and Parkers were attended by thousands. Men determined that if the railways were to be used to destroy the great American right of equality they would have no railways, they would tear up their tracks and burn their bridges.

SOUTH IMPROVEMENT COMPANY CHARTER REVOKED.

The railway companies became alarmed. A committee of the producers and refiners went before the legislature, then in session at Harrisburg, and secured the repeal of the charter of the South Improvement Company. The railway officials made fair promises to give everybody equal rates, and the producers and refiners, thinking that they had won a victory and their rights would be respected, went about their business. Right here I desire to state that the battle of the producers in the oil regions has been continuously and persistently conducted upon that same principle. They asked no favors beyond this, that they should be accorded equal rights over the highways of the country.

But it soon became apparent that the railway companies were not keeping faith; that in fact they were doing for the Standard Oil Company people

secretly just what they had publicly contracted to do for the South Improvement Company. The independent refiners were fast being driven to the wall, while there was evidence of the greatest prosperity among the Standard Oil people's refineries. Very few of the facts of this period have leaked out, as when the Standard Oil Company people or the railroad people who knew the inside facts were subpoenaed to testify they almost invariably, under the advice of their counsel that their evidence might incriminate them, refused to answer.

But by the evidence in the case of the Standard Oil Company against W. C. Schofield, at Cleveland, Ohio, we learned that the profits of refining, including railroad rebates for four of these years, was an average of more than \$2 a barrel, a profit in refining which, if economically managed and honestly capitalized, amounted to more than 400 per cent annually; while at the same time the refinery men who did not have the favor of the railroad companies were being driven into bankruptcy and ruin, while the producers, much of the time, were forced to take a price for their oil below the cost of production, and the consumers to pay two prices for the oil that they burned in their lamps.

STANDARD OIL COMPANY SECURES CONTROL OF THE PIPE LINES.

I have a record of 26 pipe lines built in the early part of the seventies to transfer oil from the wells to the railways. These pipe lines were mostly built by producers in their struggle for deliverance from monopolistic control. The Standard Oil Company people, having secured control of the United Pipe Line and American Transfer Company, began a campaign to bankrupt, destroy, and absorb the pipe lines built by the producers. The Standard Oil people, having a large rebate on all the oil they shipped and on all the oil that anybody else shipped through any of these different pipe lines, could go into the field and pay a little more at the wells, and could sell oil at a little less at the seaboard than any other shipper, and still only use a small fraction of the large rebates which they were receiving from the railway companies; growing rich themselves while they were bankrupting and absorbing the pipe lines built from the meager means which the producers were able to wring from the grasping greed of this great monopoly. Finally the producers and refiners came to understand that the highways of the country—the railways—were in the hands of a set of highwaymen, who, every time they went to market, would rob them of all of their profit and a part of their principal and hand it over to the Standard Oil Company people, helping to fasten that monopoly upon us. Mr. Chairman, if you must be robbed it does not make any difference to you whether Dick Turpin does it through the instrumentality of a pistol, or whether John D. Rockefeller does it through the instrumentality of a railroad.

There could be but one end to that kind of business—bankruptcy and financial ruin of the inde-

pendent pipe lines. For the sworn evidence to prove all of the above statements, I desire to present the commission extracts from the evidence before the Inter-State Commerce Commission, before the courts, and before both State and national investigating committees.

RAILROADS PAY REBATES TO THE STANDARD OIL COMPANY.

I have stated that interested parties refused to testify, but there is always some way for the truth to come out. There arose a little unpleasantness between the Pennsylvania Railroad and the Reading Railroad, and we were enabled by subpoenaing the assistant comptroller of the Reading Railroad, in the case of the Commonwealth of Pennsylvania against the Pennsylvania Railroad and the Standard Oil Company, to bring into court the settlement sheets showing their settlements for the transportation of oil. Some of these sheets showing that there had been rebates paid to the Standard Oil Company to the amount of \$1.10 a barrel.

Mr. A. J. Cassett, third vice president of the Pennsylvania Railroad, being subpoenaed to testify in regard to these settlement sheets and the rate on oil, was asked the rate per barrel. The answer was: "\$1.90." Question. "What was the actual rate?" Answer. "If shipped by the Standard Oil Company, 80 cents a barrel." The open acceptance was \$1.90; but, after deducting the rebate of \$1.10 which the Standard Oil Company people received, the actual rate would be 80 cents. Now, further investigation showed that, through the terminal charges of corporations in which the Standard Oil Company was largely in control, the railway companies only actually had 35 cents a barrel to divide between themselves for the transportation of this oil for the Standard Oil Company, while an outside refiner and shipper would be obliged to pay \$1.90 per barrel. Question. "I understand you, Mr. Cassett, that this 22½ cents paid to the American Transfer Company is not restricted to oil that has passed through their lines?" Now, mark his answer, because it is a remarkable one. Answer. "No, sir; it is paid on all oil received and transported by us, as I have before stated." Question. "Now, you will find a drawback of \$34,000—\$41,000 less the \$7,000, the Buffalo, Philadelphia, and New York proportion. (Part of this oil was shipped over a road that was not in the combine.) Could you tell who that drawback was paid to?" Answer. "Forty-nine cents per barrel went to the American Transfer Company and the Standard Oil Company under the arrangement which I have already explained." The testimony of J. D. Archbold showed rebates paid to the Standard Oil Company of 64½ cents a barrel.

It was impossible about that time and during the growth of this monopoly for outside shippers to get any cars for transporting their oil. The testimony of W. L. Fox, who owned a pipe line, Warren Gray, and others shows that the railways refused to allow the independent shippers cars, and that they were unable to move their oil.

Q. (By Mr. Farquhar.) What year was that? A. That was in 1878, I think. I wish to present here an extract from a letter of Mr. Daniel O'Day to Mr. Cassatt, accepting the commission or rebate. Now, I suppose you know that Mr. O'Day is the general manager, almost the generalissimo, of the Standard Oil Company. A very large percentage of the brains of that concern is done up in that little Irishman's head. It reads as follows:

"I here repeat what I have once stated to you, and which I ask you to receive and treat as strictly confidential, that we have for many months received from the New York Central and Erie Railroad certain sums of money, in no instance less than 20 cents per barrel on every barrel of crude oil carried by each of these roads. I am constrained to say to you that in justice to the interests I represent we should receive from your company at least 20 cents a barrel on each barrel of crude oil you transport.

"In submitting this proposition I feel that I should ask you to let this date from the 1st of November, 1877, but I am willing to accept as a compromise (which is to be regarded as strictly a private one between your company and ours) the payment by you of 20 cents a barrel on all the crude oil shipped, commencing February 1, 1878.

"I make this proposition with the full expectation that it will be acceptable to your company, but with the understanding on my part that in doing so I am not asking as much of the Pennsylvania road and its connections as I have been and am receiving from the other trunk lines."

Now here is an extract from a letter of A. J. Cassatt to Mr. R. W. Downing, comptroller of the Pennsylvania Railroad.

Q. (By Senator Mallory.) What court was that case in? Was it in the supreme court of Pennsylvania? A. It was taken before an examiner of the supreme court. The extract is as follows:

"I agreed to allow this commission from and after February 1, until further notice, after having seen receipted bills showing that the New York Central Railroad allowed them a commission of 35 cents a barrel, and that the Erie Railroad allowed them a commission of 20 cents a barrel on Bradford oil and 30 cents a barrel on all other oil, and that they had been doing so continuously since the 17th of October last.

"Of this, however, you saw the evidence yourself in the bills which I submitted to you last week. Please therefore prepare vouchers in favor of the American Transfer Company, per Daniel O'Day, for this commission of 20 cents on shipments during February, March and April, and hereafter make settlements monthly."

In the same report will be found a letter from Mr. A. J. Cassatt to Mr. Daniel O'Day, dated May 15, 1878, in which he says: "Your favor of February 15 has been received, and direction has been given to allow you from and after February 1, 1878, the commission therein asked for, until further notice.

The statement of the Pennsylvania Railroad shows that the 20 cents a barrel agreed to amounted during the months of February and March, 1878, to \$68,753.50, which was paid over to the American Transfer
