Other men are but too mindful of it, if that can be. They are timid about infection; they tremble at the first touch of illness; they shrink from the mention of disease; they will leave any symptom unexplored and untraced within them, rather than incur the possibility that the physician may look grave over the indication, and hint the existence of that malady which is to ring the knell of life.

On the whole, an Apostle teaches us that the fear of death is a predominant feeling in man's nature. He says that Christ came to "deliver those who through fear of death were all their lifetime subject to bondage." It is natural to fear death. Death is one of those real dangers, which lose not, but rather gain, by a close and thoughtful inspection. It is a very serious matter, that within seventy years at the furthest, all but one or two of my readers will be in their graves, unless they shall have risen. It is a solemn thought, that, more surely than that any one of us will lie down to sleep to-night or rise from sleep to-morow, each one of us will have to pass through, separately and alone, that act of dying, and that state of death, of which there is no one to tell us either the nature or the consequences. No one comes back from death to enlighten us as to its essence: and if such a return were ordained for any, he could not make us understand; he could not put us, in imagination or in knowledge, in the place which each one must occupy some day by actual experience. Such a prospect is serious: only a fool can despise it. The fear of death is the natural feeling; and from that fear grows (the Apostle says) bondage. A man feels himself a slave. Here is a necessity which he cannot evade. Here is a thing to be borne, and a state to be entered, which he can neither avoid by skill, nor refuse by resolution, nor even know beforehand by any study, any philosophy, or any devotion. A man who is liable to this cannot be called free. Through fear of death he is all his lifetime subject to bondage.

In discoursing, from time to time, upon various attributes and titles of our Lord Jesus Christ, we could not fail to select this as one of the most distinctive,

CHRIST THE DESTROYER OF DEATH.

Our Saviour Jesus Christ, the text says, hath abolished death: hath abolished this great enemy, this stern tyrant, this universal devourer of man: abolished him—and yet, we say, he is: he is before each one of us, and none of us can escape him.

How is this? What is that destruction, or abolition, of Death, which Christ has made, or shall make, for us?

1. The context leads us to say, first, that Christ is the Destroyer of Death by His Word. "Who hath abolished death, and hath brought life and immortality to light through the Gospel."

We hardly consider how dark the grave must have been before Christ came.

I know that a few of the ancient philosophers thought out by reasoning, and taught as a dogma of their science, the truth of a life after death. It was a noble triumph of the unassisted reason. That man should thus have argued out, by pure philosophy, the tenet of his own immortality, seems to say to us, That Scripture must indeed be true, which tells us that God created man in His own image, after His own likeness; the image of His intelligence, the likeness of His reason, and of His foresight, and of His reflection.

And yet, if we read one of those writings in which the immortality of the soul is argued out by the greatest of Greek philosophers, I think we shall say that his argument could convince no one—could scarcely have convinced himself. Inaccessible by its subtlety to the common multitude, it must have been unsatisfactory by its fancifulness to the privileged few. It was a sound conclusion from unsound premises. It could scarcely be dignified with a higher praise than this, that it was "one guess amongst many" of the highest philosophy of Greece. Woe to the man who has to lean his whole weight for eternity upon such a basis! If instinct does not teach immortality, we shall look in vain for it to philosophy.

And even in the Scriptures of the Old Testament, a life after death can scarcely be said to be made the subject of express revelation. I know that there are passages, neither few nor doubtful, which imply it: hopes expressed by righteous men, for themselves, of a life with God hereafter; and intimations in the Prophets of an immortality for man, chiefly in the form of similitudes applied to the resuscitation of nations. Our Lord Jesus Christ Himself teaches us to look for these things in the Old Testament, and finds them for us in places where they might have escaped our research.

But I will venture to say this—that there is no such thing in the Old Testament Scriptures (till Gospel light is thrown upon them) as an abolition of death and a bringing of life and immortality to light.

It was reserved for Jesus Christ to destroy death, first of all by His Word.

Need I remind any one of the clearness and the fullness with which He makes a life beyond death the subject of express revelation? "Verily, verily, I say unto you, The hour is coming, and now is, when the dead shall hear the voice of the Son of God; and they that hear shall live." "The hour is coming, in the which all that are in the graves shall hear His voice, and shall come forth; they that have done good unto the resurrection of life, and they that have done evil unto the resurrection of damnation." "This is the will of Him that sent me, that every one which seeth the Son and believeth on Him may have everlasting life, and I will raise him up at the last day." "I am the Resurrection and the Life: he that believeth in me, though he were dead (though he have died), yet shall he live; and whosoever liveth and believeth in me shall never die." "I go to prepare a place for you: and if I go and prepare a place for you, I will come again and receive you unto myself, that where I am there ye may be also." "Father, I will that they also whom Thou hast given me be with me where I am: that they may behold my glory which Thou hast given me, for Thou lovedst me before the foundation of the world."

Thus Jesus Christ destroys death by His Word. To those who have learnt to trust Him—to those who believe that He came forth from God with a message of truth and reality for man—His word is enough: enough for faith, enough for conviction, enough for hope. He brings life and immortality to life by His Gospel.

2. And yet, so great is the danger, so terrible the foe, so critical the question therefore for each one of us, that it has pleased Him to add something to the bare word, "that by two immutable things we might have a strong consolation, who have fled for refuge to the hope set before us."

He destroyed death, secondly, by His works done below.

On three separate occasions—reserving one greater still and more decisive—Jesus Christ came face to face, and entered into a combat as it were hand to hand, with death.

He had just returned from a memorable conflict with a legion of possessing devils, and was come again to that side of the sea of Galilee on which most of His mighty works were done, when there came one of the rulers of a Jewish synagogue, and with every mark of respect and reverence besought Him to come and lay His healing hand upon an already dying child. It was in some respects a new request. Disease many times —but death once only before, and in a different region—had come under His restoring touch. In the first instance, it should seem, the word was "dying," not "dead." "My little daughter lieth at the point of death." But soon (if so) the message follows him, that she whom he had left dying was already dead. "Why troublest thou the Master any further?" was the unbelieving, or but half-believing, comment. Sickness He might have dealt with: but the last enemy of all is too strong even for Him. Yet the encouraging word of the Saviour emboldens him to hope even against hope. "Be not afraid," He said, "only believe." Hindered by many interruptions on His way, at last He reaches the house. And there, on the threshold, He rids Himself of the throng of followers, takes with Him just three witnesses from among the twelve Apostles, and then presents Himself upon the scene of mourning. Reproving the extravagant grief, always unseemly and in this case needless, He enters the chamber of death, with only the parents and the chosen three, and in words brief and commanding—of which St. Mark has preserved to us the actual sound as they fell from His sacred lips—He bids the dead child arise. Life comes back, and health with it: He who here gave, gives ever liberally and upbraids not: as in the miracle at Cana, a vast superabundance of wine—and as, in the miracle of the Desert, twelve superfluous baskets full of bread—so here, not a feeble spark of life, to be fanned by studious watching into the full glow of health; but life, and vigour, and appetite, all in one—"her spirit came again"—"straightway she arose and walked"—"and He commanded to give her meat."

Thus our Lord called back, by the word of His power, a soul newly parted, to inhabit again for a lifetime the tabernacle of the body.

But His hand is not limited by moments, nor arrested by the lapse of hours. As He recalls the child's soul from its recent flight, so at another time He revives the corpse in its burial, and at another opens the sealed tomb, and stays corruption itself in its visible course.

Approaching, one day, in His journeyings, the little town of Nain, He perceives, issuing from its gate, a funeral procession. Crowd meets crowd: "much people," the Evangelist says, "went with Him," and "much people" followed the dead man to his burial. It was a case for compassion. It was a young man's funeral; and he had left behind him a widowed mother, now childless too. That sorrow which awakened the sympathy of all, could not lack the sympathy of the Man of Sorrows: and so we read that, when the Lord saw her, He had compassion on her, and said to her, "Weep not"—and then put His hand upon the bier on which the dead was laid, and, stopping the bearers, addressed to the lifeless corpse itself the word of authority, "Young man, I say unto thee, Arise." That word was not spoken in vain. The word of authority was also the communication of power: "He that was dead sat up, and began to speak: and He delivered him to his mother."

There is yet a third record; if it be possible, more marvellous still.

There was one family upon earth, upon which Jesus bestowed more than common love, and in which He oftentimes found refreshment from the contradiction of sinners and the strife of tongues. A brother and two sisters were its surviving members; and for each of them, the sacred history tells, Jesus had a peculiar and a sacred bond of love. At length, during His absence in a distant part of Palestine, sickness enters the home. The brother lies in danger: and the first thought of the distressed sisters is of that absent Friend in whose power and tenderness they have long learned to confide. They send to Him, saying, "Lord, behold, he whom Thou lovest is sick." But, instead of hastening to their assistance, He remained for two days in the place where He was. At last He proposed to His disciples a journey into Judea; speaking of His friend in Bethany as already "sleeping," and of His purpose to go and "awaken" him. He had suffered the sickness to run on into death, that so the glory of God might be shown forth in the rising. Meanwhile His delay had seemed to the sorrowing sisters hard and unlike Him. If He had been there, they said, He could have prevented death: the thought of a resurrection was still above and beyond them. Each sister, according to her character, gave utterance to the regret almost in reproach: and Jesus Himself was profoundly moved as He looked upon the grief for which He had judged it right to leave room. But there was that in His heart, which, though it stopped not His sympathy, yet gave authority to His consolation. "Thy brother shall rise again." "If thou canst believe, thou shalt see the glory of God." He approached the grave. A stone lay at the cave's mouth. He bade them disclose the place of the dead: and then, after one brief thanksgiving, for the omnipotent strength of which He was conscious—for that "very present help" which He felt to be with Him for the mighty work which He had in hand—He calls forth the dead man from the inmost tomb, and sees the call answered by the instant return of His friend from the world of spirit to the world of sense.

A doubtful blessing for the man! to be recalled from his rest, to taste death twice over! to come back to a world of trouble and sorrow from the Paradise of the just made perfect! but yet an exchange needful for the confirmation of His Master's work, and a sacrifice cheerfully borne for His sake who demanded it.

3. Thirdly, Christ was the Destroyer of Death by His death.

The oft-quoted prophecy of the day of the Fall, "It" (the seed of the woman) "shall bruise thy head"—the head of the serpent—"and thou shalt bruise His heel"—had thus a fulfilment yet more condensed and concentrated than the words promised: for it was in the bruising of the heel that the bruising of the head was accomplished. "That through death," says the Apostle to the Hebrews, "He might destroy him that had the power of death, that is, the devil."

I know that there might have been a death of the Saviour, which would have had no such virtue.

If Christ had died and not risen, then would the victory at last have rested with His foe. A dead Saviour is none. A Redeemer holden permanently by death would have been powerless even to redeem Himself.

But this, St. Peter says, "was not possible."

Why not possible?

Because it would have gone against the plain word and promise of God.

God "loosed" for Him "the pains of death, because it was not possible that He should be holden of it: *For* David speaketh concerning Him, Thou wilt not leave my soul in hell."

Therefore, when I say that Christ destroyed death by His death, I mean by that particular death which He died; a death for sin, and a death unto resurrection.

We have spoken of Christ destroying death by His Word; by the plain predictions of His Gospel, which everywhere implies and everywhere expresses the certainty of a life to come.

But O, my friends, is that enough to destroy death? Merely to believe in an immortality?

Christ's word tells of a resurrection of life: but the same word speaks also of a resurrection of damnation.

Therefore you see—and even the more for Christ's Gospel—there may remain for the sinner a dread of death. Death is not destroyed by merely telling us, on the surest evidence, of an immortality: for an immortality may be of two kinds; an immortality of joy, or an immortality of sorrow; an immortality of life, or an immortality of punishment.

Now therefore we see why Christ's death should be added to Christ's Word, as the destroyer of death.

It is something, no doubt, that in this fearful future which lies before each of us, Christ should have gone before; Christ should have even known and passed through the state of death. O, it makes the grave more tolerable, and Hades more homelike, and the cheerless comfortless separation of soul and body less desolate and less terrible, to know that Christ has been there before; to have a Friend come back from all to tell us, I have endured; to say, I know the worst, and it can be borne; I have gone through all, and in it all my rod and my staff shall comfort thee!

But even this is not enough.

Christ's death had in it something different from the mere hanselling of a strange thing for those that should come after: something more than the mere feeling that a friend has borne this operation before me, or passed in the van through that enemy's gate, through which I in the rear must faintly struggle after Him.

What is it which makes death formidable? formidable in a sense beyond its mere strangeness, and beyond the mere pain, the physical pain, of its endurance?

Is it not sin?

"The sting of death is sin."

Now then, if the sting is taken out of death, its wound will be harmless: it will be like that which we have just called it—an operation—something sharp, no doubt, and painful—but only medicinal in its intent, and only remedial in its consequence.

That is what will indeed destroy death; if it loses its sting; if it becomes a thing which must be submitted to as a pain, but which is not the beginning of an insufferable wretchedness.

Death is the curse of sin. Natural death came into the world by sin.

But natural death is chiefly dreadful as the completion of spiritual death, and as the vestibule of the second death, which is death eternal.

If then Christ has taken away our guilt; has borne our sins, has made atonement for iniquity; has procured for us pardon from God, and love, and blessing, and eternal life; and this by His own obedience unto death: then the words are fulfilled which say that Christ is the Destroyer of Death by His death; by that death from which indeed He rose, but by that death wherein and whereby He bore and took away the sin of the world.

Yes, we may go down securely into the dark valley, may we but feel that our sins have been done away first; that God, for Jesus Christ's sake, has forgiven us all trespasses.

And thus our Lord Jesus Christ has been the destroyer of death already, in ten thousand times ten thousand instances.

Every Christian's death has been such a victory.

Every person who is enabled to face death manfully, through faith in Him who has died, is an example of that triumph over death which through death Christ gained.

You have seen such deaths, Christian friends, or you have read of them: and have they not made you feel that there was a reality in the Gospel? let me rather say, a reality in Him of whom the Word of God tells as having abolished death and brought life and immortality to light through His Gospel?

4. I have yet a fourth word to add: Christ destroys death finally by the great resurrection.

The words are St. Paul's. "The last enemy that shall be destroyed is death." And he tells us how. Even by that resurrection of the body, which can alone give to the *whole* of man victory over the grave, and over death and hell.

How often shall we repeat this evident maxim, that a disembodied soul is but half a man?

Our Lord so much assumes this, that He argues from a passage in the Old Testament, which speaks of God as the God of Abraham, and the God of Isaac, and the God of Jacob, that Abraham, Isaac, and Jacob must not only be living still as souls, but must be destined to a resurrection of the body.

The whole argument turns upon this. Man is soul and body. If there is to be a future life of man, it must be a life complete in both parts: a soul by itself is a ghost, and not a man.

True, St. Paul says the body that shall rise is of a different mould and making from the body that died.

He exhausts all similitudes in showing the possible variety and divergence of bodies; how manifold are the discrepancies, even in matter, between body and body; and yet how truly each is a body, and how gloriously the resurrection body shall fulfil the aspirations and repair the deficiencies of the body of our humanity and our mortality.

Not, then, until the morning of Christ's Advent will Death, the last enemy, be destroyed. Abolished by Christ's Gospel, in hope and faith; abolished by Christ's works below, in principle and in promise; abolished by Christ's death for sin, in virtue and power; Death shall not be abolished (it is the same word) in act and in deed, until the dead shall be raised incorruptible, and we (the then living) shall be changed into the same image.

Great and magnificent is the glimpse thus given of the powers and employments of the life that shall be revealed.

Not for purposes of dreamy contemplation or indolent praise shall we be clad, in the great day of the Lord, with bodies of beauty and glory.

Work, too, there will be for us: work, large and lofty, expansive and satisfying: work, without weariness or inconstancy: work, all from God, and for God, and in God.

Angelic functions, and more than angelic, may then be entrusted to us: for "they that shall be counted worthy to obtain that world and the resurrection from the dead are equal unto the Angels:" they can know thenceforth no pain nor sorrow nor weariness nor infirmity nor self-reproach: for the body of humiliation is changed into the likeness of His body of glory—they shall be like Him, for they shall see Him as He is. They too, like His holy Angels, shall then "excel in strength:" they, like his holy Angels now, shall then with new energy "do His commandments, hearkening" with open ear "to the voice of His words."

Therefore our latest thoughts must pass on into the region of faith, and see Death himself cast into the lake of fire, and his work finally defeated and undone by a transformation which shall make the powers of evil wish that they had let man alone in Creation gifts. So far is the Paradise Lost outshone and transcended by the Paradise Regained!

Christian friends! what shall be our part and lot in this abolition and destruction of the last enemy of man?

The question is answered by another question. What is our part now in that destruction of death which Christ our Saviour wrought by His own death?

Have we brought our sins to Him to be blotted out? Have we claimed our share in that forgiveness of sins which He purchased for us with His own blood?

If not, we are still (in our inmost souls) subject to that bondage which is the consequence of the fear of death. We cannot look forward into that mysterious region which lies within the black gate, without a serious misgiving as to the consequences—say, even the possible consequences—of the things done in the body; of evil done, and good left undone; of man disregarded or injured, of God forgotten, despised, and sinned against.

But, if we are Christ's; if, that is, we have seriously come to Him for pardon, and seriously devoted ourselves to Him for grace; then we are sharers in His victory over death and the grave, and when His glory shall be revealed, we shall be glad also with exceeding joy.

God give us all a place in that blessed home, of which it is written, "The former things are passed away," and "there shall be no more death!"

PAI MARIRE, THE NEW RELIGION OF THE MAORIS.

By AN ARMY CHAPLAIN.

LITTLE more than half a century has elapsed since the Gospel was first preached to the cannibals of New Zealand. The noble bearing of some Maori chiefs whom he met in the streets of Sydney had the same effect on the mind of the Rev. Samuel Marsden, Senior Chaplain of the colony of New South Wales, as the beauty of the Anglo-Saxon youths whom he saw in the market-place at Rome produced on the mind of Gregory the Great: in both cases it awoke the desire to communicate to heathen nations the knowledge of Christianity. Mr. Marsden at once put himself in communication with the Church Missionary Society, which, acting on his suggestion, sent out, in 1810, twenty-five persons, chiefly artisans, to undertake the conversion of the natives of New Zealand. On reaching Sydney they heard of the massacre of the crew of the "Boyd" by those for whose benefit they had come out, and being unable to find a vessel to convey them to their intended field of labour, they gave up the undertaking as hopeless. Nothing was done till 1814, when Mr. Marsden received as his guest, Hongi, a warlike Maori chief, whose name occupies a prominent place in the annals of New Zealand, and obtained from him the promise that all missionaries should be protected. On the strength of this, he set sail for New Zealand in a brig navigated by convicts, and reached the Bay of Islands in safety. He and the three missionaries who accompanied him were well received by the natives, and established themselves near Hongi's residence on a piece of land consisting of 200 acres, which they had purchased for twelve axes. Missionary stations were formed in different parts of the island: fresh labourers of different denominations hastened to till the field and prepare for the harvest; it may be said with truth that they met with more opposition from one another than they ever did from the natives. The latter heard the Gospel gladly, but though the missionaries had many hearers, not one professed himself a convert for the first six years after their arrival, and the Rev. Henry Williams admits with praiseworthy candour that they were "as insensible to the necessity of salvation as brutes." Matters continued in this state till 1830, when the good seed sown amid so many hopes and fears in this unpromising soil began to bring forth fruit; a sort of religious revival sprang up; the missionary churches were crowded with attentive audiences; the schools were filled with old and young anxious to be taught to read; thousands applied to be admitted into the Church. The day of small things had passed away; the conversion of the whole Maori race seemed close at hand. Religious works were circulated and read in every part of the island; many professed themselves to be Christians who had never seen the face of a missionary, or been sprinkled with the water of baptism. There were some who suspected that the change was too rapid to be permanent. That a great change had been effected in the manners of the people no one could doubt. They renounced their cannibalism; they gave themselves up to prayer and the study of the Scriptures; in every village might be heard the morning and evening psalm. Young proselytes full of enthusiasm spread themselves over every part of the island, and preached the Gospel with such fervour and success, that at least two-thirds of the Maori race were admitted into the Church through baptism. Their knowledge of Christianity was necessarily very imperfect; they displayed far more interest in the teachings of the Old Testament than of the New; and it was only natural for the missionaries to dwell specially on those passages which were best adapted to the intelligence of their hearers. The Maoris had reached about the same state of civilisation as the Hebrews in the patriarchal age; the narratives of the Old Testament possessed for them a peculiar attraction because they described a state of society analogous to their own, but it is doubtful whether many amongst them ever attained to any adequate conception of the sublime teachings of Christianity.

It is certain, however, that the missionaries acquired a great and legitimate influence over the Maori mind. Their lives were held to be sacred; they might travel in safety through any part of the island during the prevalence of war; they often acted as mediators between the combatants. During the Taranaki war of 1860-61, missionaries frequently visited the insurgents in their pas, and sometimes read the service of the Church of England over the slain. Until the present year, no missionary was called upon to seal his testimony with his blood: the natives, even while in arms against us, retained their respect for their former teachers, observed the Sabbath, and adhered to the new religion. It is only within a very recent period that a large proportion of them have rejected Christianity, and adopted a new religion of their own. This religion is known as Pai Marire. The exact origin of the name is unknown. *Pai* in the Maori language means "good," and *marire*, "to be quiet or still;" but there are expressions in that tongue quite as unintelligible to the uninitiated as those used by a London street boy would be to a foreigner. The same expressions are frequently used in a variety of different senses, so as often to puzzle those who are well versed in the Maori tongue. I have consulted several Maori scholars, but have failed to obtain any satisfactory explanation of the origin or meaning of the term *Pai Marire.* The literal meaning would be, "it is good to be quiet," but the principles and actions of the new sect are not at all in keeping with such a peaceful maxim. There is nothing of quietism in the new religion; the system of Molina and Pai Marireism have nothing in common. I am inclined to believe that the expression is a sort of political watchword, signifying "wait," or "bide your time." If such be its meaning, it would point significantly to the hopes that are cherished by those who have adopted it, for there can be no doubt that Pai Marireism is quite as much a political association as a new system of religion. It is supposed to have originated among the natives of Taranaki or Wanganui, who, there is reason to suspect, have long cherished a secret predilection for the religion of their fathers, though most of them have conformed outwardly to Christianity. The existence of the new religion was accidentally discovered during an engagement between the insurgents and the friendly natives at Wanganui in 1864. The former descended the river in their canoes till they reached an island where our allies lay in wait for them. They allowed the insurgents to advance within a few yards of the ambuscade, when they poured a destructive volley into them; sixty or seventy fell; the rest took to their canoes. One of them, while struggling in the water, was overtaken by one of our allies, who raised his war-club to dispatch him. As the blow descended on his head, he threw his arms wildly in the air and shouted "Pai Marire." Since that time the expression has become familiar to every Pakeha in New Zealand; the new religion to which it is applied has spread with wonderful rapidity through every part of the island, and may be regarded as the adopted faith of the whole party of the insurgents. Proselytising parties are traversing the country in every direction, working pretended miracles, speaking in unknown tongues, practising cannibalism and other barbarous rites, boasting of their victories, and predicting the speedy arrival of the time when the Pakeha shall be driven into the sea, and the Maori shall have his own again. Pai Marireism has not been confined to the insurgents; it has found favour with a large section of the population, who secretly sympathise with the native movement, though from prudential motives they have not thrown off their allegiance to the British Crown. The other evening, while enjoying a solitary ride near one of the native settlements, I encountered a weird-like Maori woman, who might well have been the original of an old picture of the Witch of Endor which haunts my memory. I greeted her with the usual salutation, and her only answer was "Pai Marire." "Wait a little," she seemed to say; "you may ride here at present, but the time is close at hand when you and the other Pakehas shall be driven into the sea. Pai Marire."

The apostasy of the Maori race from the Christian faith has been as sudden as their conversion. This result might perhaps have been anticipated: the character of a people is seldom changed in a day or a year; in the moral as in the material world, all that is lasting is usually slow of formation. Far be it from me to detract from the merits of the missionaries or to depreciate the value of their labours; it is not their fault that the vine of their planting, like the gourd of the prophet, has decayed as rapidly as it had grown. If no war had broken out between the two races; if they had continued to live together as brethren, cultivating the arts of peace, in process of time the Maoris might have become assimilated to their neighbours in religious civilisation. As it is, the good seed sown by missionary hands had not time to take root in the soil; it was crushed beneath the iron heel of war; or choked by the noxious weeds of ancient superstition.

It is doubtful, indeed, whether the sublime doctrine of forgiveness of injuries was ever thoroughly comprehended by the Maori mind; it is certain that the native converts have exhibited little of its spirit in their dealings with their heathen countrymen. In 1841 a quarrel arose between the Waitotara natives at Wanganui, who professed Christianity, and their neighbours the Patutokuto, who were heathens. The latter drove the Christians from their territory, laid waste the country, and retired at length to Te Toka, an impregnable pa or fort. The fugitives, strengthened by reinforcements from Taranaki, returned and blockaded this stronghold. The siege had continued for some time when Mr. Matthews, a missionary, appeared upon the scene to mediate between the combatants. It was agreed that the Christians should be allowed to enter the pa and shake hands with its defenders, who, after this ceremony, were to return to their own country. The gate of the stronghold was thrown open, and the infidels, regarding the presence of a missionary as a sufficient protection against treachery, advanced with their right hands extended: the Christians seized them with their left, and then assaulted their helpless foes with concealed tomahawks. A hundred men were slaughtered on the spot; and only forty escaped to relate what had occurred. This treacherous deed proves how little these professors of Christianity were imbued with its spirit.

Before the present war broke out, the Maoris were not very enlightened Christians; they were more deeply read in the Old than the New Testament; they retained many of their ancient superstitions, and their religion was a strange mixture of heathenism and Christianity, or rather Judæism. They believed in witchcraft; they had recourse to incantations in sickness; they prayed to their former gods as well as to the God of the Pakeha; their ideas of religion were as imperfect as those of the *pagani* whom the Church welcomed to her arms in the days of Constantine. *Grattez le Russe, et vous trouverez toujours le Tartare*, is a significant proverb applicable to the Maoris as well as to the subjects of the Czar. No real, internal, spiritual change had been effected among them; they had only the semblance of religion, the mere enamel of Christianity. There is a great cry among a certain class for results; and there may be something highly encouraging in the idea of a whole people converted to Christianity. The reaction has now set in; the Maori has thrown off the cloak of Christianity which sat so ungracefully on him, and appeared before the world in his true character. Pai Marireism has roused into action all those evil passions which were dormant, but not extinguished, and exhibited him to the world as the bloodthirsty cannibal his fathers were. It has not changed his nature; it has only shown what his nature is. It is not a new religion; it is only a revival of ancient heathenism, with a slight admixture of Judæism, as I have said. This revival has been effected through the influence of the *tohungas* or native priests, who always regarded the progress of Christianity with a jealous eye, though they outwardly conformed to it. By reviving the ancient heathenism they have revived their own influence, which was on the wane; and have obtained that hold over the popular mind which the missionaries formerly possessed. Before the introduction of Christianity, they were consulted on every occasion; no expedition was undertaken without their advice; no disease could be healed unless they pronounced the necessary incantations. They claimed the power to recall the spirits of the departed, and their skill in ventriloquism enabled them to personate them so well that their nearest relations and most intimate friends were deceived. They are undoubtedly the founders of the new faith, which they profess to have received from the angel Gabriel, who has favoured them with numerous interviews, and taken the Maori race under his special protection. The religion taught by the missionaries has been superseded by this fresh revelation; the Maoris now stand to God in the same relation as the Jews did under the Old Testament dispensation; they are his favourite people; they are the true Israel. Hence the great sympathy which they manifest for the Jews, whom they recognise as their co-religionists, and treat with unbounded respect. Intelligent Hebrews who have witnessed their religious ceremonies speak of them as Jews: but along with the Jewish element there is a large infusion of a bloodthirsty spirit. The Maoris have discovered many points of resemblance between the Jewish nation and themselves: both have been favoured with a special revelation; the Pakeha is the Pharaoh of modern times; Topare is the Maori Moses, who is to rescue them from a foreign yoke, and drown their oppressors in the Red Sea. The Jewish leader was invested with the power of working miracles: the same power has been conferred on the Pai Marire priests. By their incantations, they can draw vessels toward the shore and crush them on the rocks: the elements are subject to their will: their followers are invulnerable. This faith in their invulnerability must have received many a rude shock, but they still cling to it with a blind tenacity which no experience can weaken. Many a Pai Marire convert has been struck down by the bullets of the Pakeha, but these casualties have wrought no change in their religious belief; the influence of the priests is as great as ever. Fanaticism is blind to all evidence, deaf to every argument; it may die out gradually, but it cannot be extirpated by force.

While there are many points of resemblance between Judæism and Pai Marireism, there are also, it must be admitted, many points in which they differ. The votaries of the new faith practise cannibalism as a religious rite. This barbarous custom had died out; there may be a few aged natives still alive who tasted human flesh in early life, but no case of cannibalism is known to have occurred since 1842. The Maoris, as a race, were humiliated by the remembrance that their forefathers devoured one another like beasts of prey; and every allusion to this savage propensity was carefully avoided. The greatest insult that could be offered to a native was to insinuate that his father had eaten somebody, or that somebody had eaten his father; the vilest term of reproach was to call him a cooked head. You might call him a blockhead with impunity, but the slightest allusion to cooking in connection with his head was deemed an unpardonable wrong. Pai Marireism has changed all this. Its votaries do not use human flesh as an ordinary article of food, for this was never done in the most savage times. Human flesh was always considered to be *kai tapu*, or sacred food; it could only be eaten by warriors while in a state of *tapu;* and it was always a prohibited article to women. The story of the aged Maori convert who said, on her death-bed, that she could die happy if she had the leg of one little pickaninny to pick, may be very ludicrous, but it betrays a complete ignorance of Maori customs on the part of its originator. Cannibalism was practised by the *tapued* warriors of the tribe, and by them alone. It formed part of their religious system, and was rarely if ever indulged in for the mere purpose of satisfying the appetite of hunger. The worst injury a Maori could do to his enemy was first to kill him and then eat him; his religion encouraged him to carry out the promptings of natural revenge. The few Europeans who have been compelled to satisfy the craving of hunger with human flesh speak of it with abhorrence. Not so the Maori. "I have tasted human flesh," said a venerable Maori convert at a missionary meeting in this island, "*and it was sweet.*" The last words were spoken with such emphasis that a sort of cold shiver ran through the audience; and no wonder. The Pai Marire priests have revived cannibalism, but only as a religious rite. We know of only one well-authenticated case where they ate the flesh and drank the blood of their victim; but they have frequently mutilated the bodies of the slain in such a way as to leave little doubt that they had used certain portions of them. The revival and general adoption of this revolting and barbarous custom affords the clearest proof that a large proportion of the Maoris, while professing Christianity, were at heart the same bloodthirsty wretches as their forefathers who massacred the crews of trading-vessels, and feasted on their bodies.

Another peculiarity of the Pai Marire system is that its votaries claim to be possessed of the power of speaking in strange tongues. Long addresses are delivered by the priests in a language unintelligible to the vulgar. During the delivery of these addresses they are supposed to be under the immediate influence of the *atua* or spirit, and to speak as he gives them utterance. Their favourite cry, *wau wau*, resembles the barking of a dog, and is often heard at night from the pas which they occupy. The grossest immorality has been introduced into their religious worship, and the foulest orgies of heathenism have been revived. The minds of many have been unstrung by the intense excitement of this new species of fanaticism, and they remain silent for days together, as if bereft of all their faculties. It is melancholy to contemplate the change which this delusion, the offspring of lust and cruelty, has effected, in the course of a few months, in the character of a people, whose rapid conversion to Christianity was regarded as one of the greatest triumphs of missionary labour in the nineteenth century; and many who felt the warmest interest in their welfare are beginning to despair of them as a race. The missionaries who have laboured among them for years, and were once regarded with feelings of the deepest reverence, are denounced by the priests as the worst enemies of the Maori race. They are accused of having defrauded them of their lands, and induced others to do the same. The priests know that the only way to re-establish their own influence is to destroy that of the missionaries. The mission stations have been abandoned, and the churches where the pure morality of the Gospel was once taught are now polluted by the orgies of Pai Marireism.

This fanatical system has been countenanced by some of the more intelligent chiefs for political purposes. They know the power of the religious element in a long-protracted struggle; and without giving in to the delusion themselves, they are not unwilling to profit by it. They feel that this is the last struggle; they know that none fight so well as those who are inspired by the glowing fervour of fanaticism. It would be contrary to their interests to discourage a system which makes their followers rush upon our bayonets with all the blind fury of fanaticism; which serves to widen the gulf of separation between the two races, and swells their ranks with fresh proselytes from those tribes which have hitherto remained neutral. Pai Marire is a political watchword as well as a fanatical faith; its emissaries spread themselves over every part of the island, work their pretended miracles in every village, and gain proselytes from every tribe. These proselytes are bound to fight for the new faith: when the struggle is over, they are to be rewarded with the arms and lands of the Pakehas. All the evil passions of a half-savage race are thus appealed to; they have the promise of a reward in this world as well as in the next. The success of Pai Marireism in the nineteenth century is as striking as that of Mohammedanism when first preached by the followers of the false prophet. And there is no reason to believe that it is a mere passing gleam of fanaticism which will speedily disappear, for it is constantly on the increase — bands of neophytes marching to join the banners of revolt. The vanity of the people is flattered by having a religion, or a revelation exclusively their own; and the time, I fear, is close at hand when the whole Maori race will be given over to a delusion and to believe in a lie. When that period arrives, their extinction as a race cannot be far distant.

The new religion has been inaugurated by the commission of a great crime: the life of an amiable and inoffensive missionary has been sacrificed to propitiate the *atua* of the Pai Marire faith. Carl Sylvius Volkner, a native of Cassel in Germany, arrived in this island about eighteen years ago, and was employed ever since in missionary labour in different parts of the province of Auckland. Originally a private soldier in the Prussian army, he became deeply impressed with religious truth, and resolved to devote his life to the conversion of the heathen. After a brief training in a missionary institution at Hamburg, he was sent out as a catechist to New Zealand, and continued to labour in that humble capacity till his intelligence and piety attracted the notice of Bishop Selwyn, who admitted him into holy orders. He had been stationed for some time at Opotiki, a Maori settlement at Poverty Bay, on the east coast, and remained there till the present war broke out, when he and his wife removed to Auckland. His heart was still at Opotiki, and he resolved to return to his flock. Accompanied by another missionary of the name of Grace, he embarked at Auckland on the 26th of February on board a small coasting schooner commanded by Mr. Morris Levi, a Jew, and reached Opotiki on the 1st of March. As they sailed up the river, they observed a large number of natives assembled on the banks, but as yet they had no suspicion of any danger. When the schooner cast anchor, a brother of Mr. Levi, who keeps a store at Opotiki, and Tewai, the native interpreter, came on board, and warned the missionaries to provide for their safety, as the Maoris had made a solemn vow to take their lives.

I must now briefly glance at certain events which had occurred at Opotiki before the arrival of the schooner. On the 24th of February it was reported that Potare, a Taranaki chief, was on his way to Opotiki for the purpose of instructing the natives in the new faith, and obtaining recruits for the rebel army. On the 25th he was known to be within three miles of the village, when about eight hundred natives assembled to meet him. He was received with every demonstration of joy; a flagstaff was erected near the church, and the standard of the new faith displayed upon it. Among other devices on the standard was one of the letters of the Hebrew alphabet. A general review was followed by a general feast; the slaughtered bullocks were brought into the presence of Potare, who, holding a piece of each in his hand, pronounced an incantation, and then threw it away, after gorging himself with food, as the Maoris always do on such occasions. Potare condescended to favour the Jewish store-keeper with an interview. He expressed much sympathy with the Jews, because, like the Maoris, they had once been a great nation and had suffered much from the persecutions of their enemies. He spoke with much bitterness of the missionaries, and said that if he found Mr. Volkner, he would cut off his head, and send it as a trophy to Zerubbabel, the great prophet of the Pai Marire faith, at Taranaki. In the afternoon the people assembled to hear a lecture delivered by a prophet named Rereopa, who was once a policeman in Auckland. He carried in his hand the head of a soldier of the 70th Regiment, the sight of which caused much excitement among the natives, and, placing it at the foot of the worship post with the cap alongside, began an address which lasted for an hour and a half. He denounced Christianity, and spoke with much bitterness of the missionaries, who by their lies had been robbing them of their lands, their money, and their blood; he urged them to adopt the new religion, and concluded by holding up the soldier's head, and announcing that it would speak at sunset. Several natives came forward and applied their ears to the mouth of the skull, when, fancying that it spoke, they rushed off in terror over the plain. Potare then extended his right arm, and all the natives passed under it, in single file, into the church, where his followers began to dance, to shout, and to pray. As soon as one of the natives gave symptoms of being affected, he was seized by the shoulders by three or four of the priests, and rudely shaken, till he began to speak in unknown tongues. He was then swung round and round by the hand till he became insensible and sank to the earth, where he remained for days together, without moving or tasting food. The excitement was kept up during the whole night, and the most revolting scenes were enacted.

The following day was Sunday, but according to the Pai Marire faith, all days are alike. The natives continued to dance like demons round the worship post, and to mutter their gibberish, which they said was a language given to them by God, intelligible only to the initiated. Afterwards, Potare proceeded to Mr. Volkner's house and disposed of his effects among his own followers. There were several very inferior horses, which fetched only 5*l.* a head. Rereopa delivered another lecture in the afternoon; the same scenes were renewed in the church: and the natives were so powerfully affected that the greater part of them spent the night in the open air in a state of insensibility. The following day Potare, satisfied with the results of this great revival, prepared to depart in search of other proselytes, but promised to return in three days. It is melancholy to reflect that the fruits of many years of missionary labour were swept away by the brief visit of this arch impostor, and that the native catechist, whom Mr. Volkner had left as his substitute, was one of the first who gave in his adhesion to the new faith. Potare's party left, taking with them a soldier of the 57th Regiment, who had been taken prisoner at Taranaki; but Rereopa, the prophet, remained to complete the work of conversion. The same religious ceremonies were gone through during the night; the following day all the Bibles and Prayer Books were torn up, and scattered over the plain. On Wednesday, the 1st of March, the schooner was seen outside the bar, when, as we have already mentioned, Mr. Levi and Tewai, the native interpreter, hurried on board to warn the missionaries of their danger.

It was too late. They might have escaped at night, but before night came they were in the hands of their enemies. In the afternoon all hands were ordered ashore by the natives; and as soon as Mr. Volkner landed, two or three of them rushed upon him with ropes in their hands, but Mr. Levi pushed them aside. The two missionaries, and the crew of the schooner, were then shut up in a *whare*, and a guard of twenty armed men placed over them. The two Jews, who were left at liberty, were assured that they had nothing to fear, as they all belonged to the same religion. Mr. Volkner saw from the first that there was great danger, and prepared to meet his fate with Christian fortitude. "We must put our trust in God," he remarked to his fellow-prisoner. Next morning he requested an interview with the master of the schooner, and persuaded him to offer the cargo and everything they possessed as a ransom for their lives. This offer was at first accepted, but the thirst for blood proved stronger than the love of gain. The natives became fearfully excited, so that the two Jews deemed it prudent to keep out of the way. A party of half-castes went to the *whare* and summoned Mr. Volkner to accompany them to a meeting. On the way they told him that they were about to put him to death. He learned his fate without a murmur, and obtained their permission to kneel down and pray. When he rose, the natives stripped him of his clothes, bandaged his eyes, and proceeded to hoist him up to one of the loftiest branches of a large willow tree by means of a block and strap, which they had brought from the schooner. Accustomed to meet death themselves with savage indifference, his executioners were surprised to see tears flowing from his eyes. His body was left dangling in the air for an hour and a half, amidst the shouts and laughter of the fanatical mob; and it was observed that the women seemed to enjoy the horrible spectacle much more than the men, and were louder in expressing their enjoyment. Some idea may be formed of his sufferings from the fact that life was not extinct when the body was lowered and conveyed to the church. I have no wish to enter into harrowing details, or to cause my readers unnecessary pain; I shall therefore hurry over all that ensued. A space was fenced in close to the church, within which the body was spread out in the shape of a cross. The head was then separated from the body, the flesh removed from the chest and back, and the neck cut off with an old axe. The natives formed themselves into a line, so that all might be able to taste the blood as it flowed from the head and the body,—the women fighting like tigers as to who should have the most, and smearing their faces with that which fell upon the ground. Rereopa, the priest of the Pai Marire faith, the instigator of this great crime, scooped out the eyes of his victim with his fingers, and swallowed them in the presence of the whole assembly. The mutilated body was then thrown to the dogs, which snarled and fought for their share in the feast.

All the European settlers, nineteen in number, were then seized and bound. The brothers Levi were found concealed in the bush, and conducted to the house where the other prisoners were confined. The Maoris from Taranaki, on hearing that their co-religionists, the Jews, were bound, proceeded at once to release them, when all the other prisoners were set at liberty except Mr. Grace. In the evening the natives resumed their demon worship in the Roman Catholic church, and danced round the bleeding head, which was placed in the pulpit; and the excitement continued during the night. On the 4th of March, Rereopa left Opotiki; before leaving, however, he sent for the Messrs. Levi, and told them that they had nothing to dread, as they were Jews, but that Mr. Grace would be taken to Taranaki. On the same day Potare, the great Pai Marire chief, returned, and summoned all the Europeans to meet him in the church the following day. He blamed his followers for having put Mr. Volkner to death without the form of a trial, and agreed to release Mr. Grace on condition that Hori Tupea, a rebel chief who had fallen into our hands, should be set at liberty. It was agreed that the Messrs Levi and Mr. Grace should remain as hostages at Opotiki, till the "Eclipse" returned with Hori Tupea, when they should be allowed to return to Auckland; but nothing was done to carry out this arrangement. On the 8th of March Mr. Volkner's body, which had been left exposed and treated with every indignity, was decently interred close to that church where he had taught the doctrines of the Christian faith for so many years. No coffin contained the body: it was rolled in a piece of carpet provided by Tewai, the friendly native, and bound round with flax. No monument marks the spot where he reposes:

> "They carved not a line, they raised not a stone,
> But they left him alone in his glory."

On the 16th of March H.M.S. "Eclipse" hove in sight, and Mr. Lev' the master of the schooner, went on board, and had an interview with Bishop Selwyn, who had sailed for Opotiki as soon as he heard of Mr. Volkner's death. He was anxious that some attempt should be made to effect Mr. Grace's release, but Mr. Levi assured him that nothing could be done, but agreed to go on shore again for two friendly natives who were still at Opotiki. The natives could not be found, but Mr. Grace was seen looking with longing eyes toward the steamer. The generous Levi resolved to make a last effort to save his life. "Jump in," he said. In a moment Mr. Grace was prostrate in the hollow of the boat, while the two sailors literally pulled for their lives. Some women rushed off to give the alarm; several armed Maoris appeared on the beach: but, with the tide in its favour, the gallant little boat went on and reached the steamer in safety. A ringing cheer rose from the crew when Mr. Grace was seen in the boat. Mr. Levi was congratulated by all on the success of his gallant conduct. The friendly natives were afterwards released, and the two vessels returned to Auckland.

Carl Sylvius Volkner will long be remembered as the first and, I trust, the only Christian martyr of New Zealand.

P. C. B.

CHILD'S PLAY.

WHEN summer comes, the little children play
In the churchyard of our cathedral grey,
Busy as morning bees, and gathering flowers
In the brief sunshine. They of coming hours
Reck not, intent upon their play, the Time
Speeds like a spectre by them, and their prime
Bears on to sorrow.

Angel, cry aloud!
Tell them of life's long winter—of the shroud!
No! let them play—for Age, alas! and Care,
Too soon will frown, to teach them what they are!

Then let them play, but come with aspect bland,
Come Charity, and lead them by the hand;
Come Faith, and shew, amid life's saddest gloom,
A light from heaven that shines beyond the tomb!

When they look up, and high in air admire
The lessening shaft of that aërial spire;
So be their thoughts uplifted from the sod,
Where Time's brief flowers they gather to their God!

B.

ASSISI, AND ITS MEMORIES.

I AM not going to describe Assisi at length. I have no particular faculty for local details, and no particular interest in them; but I should like to recall at present a few impressions which linger in my mind associated with this ancient city—impressions which were very stirring at the time, and which remain with me among the happy recollections of a long season of recreation.

In travel, I confess that I find myself chiefly moved by the *human* associations of a place—the glory of its past history, the thought of the beautiful or noble lives that have lived in it, or the good and holy deeds that have been done in it. There is an excitement sometimes rapturous in the contemplation of grand scenery, and there is delight, at once humorous and instructive, in the observation of strange manners and customs. But the incessant hurry and novelty of a great tour wear off the edge of both these enjoyments. The most enchanting scenes, the most picturesque modes of life, even the rarest treasures of art which one had scarcely dreamed long years ago ever to see, fail to arouse the old keenness of interest. One becomes cynical even in the presence of Nature; it is a shocking feeling to confess; but it is not that the sense of the beautiful is lost, only that it has become weakened by satiety; the very groups on the steps of the Piazza di Spagna, so charming at first in their suggestion of a luxuriance of southern beauty and free artlessness of southern manners, become commonplace by experience, and at length weary by their monotony; while the reproduction of the same conventional forms of sculpture, and the frequent imitativeness of the sister art—an imitativeness, too, strangely centering around one or two subjects of ancient mythology and history,* which Christian feeling, not to speak of the treasures of the morally beautiful, should long since have banished from the canvass, are apt to destroy all freshness of artistic feeling, and make visits to galleries frequently one of the most joyless toils of the sight-sick traveller. If we could only see at leisure the few great pictures which most galleries alone contain—pictures which educate while they inspire the imagination, and raise us nearer to the conception of Divine beauty on earth or in heaven – it would be an infinite joy; but it is a weary task to wander from room to room, as at Naples, amidst masses of rubbish, good neither for the eye nor the heart. I own honestly that such things are not among my pleasant memories; that I would not make one *of a party*,—no, not for a great deal,—to see the sculptures of the Vatican by torchlight, nor even to visit the Coliseum by moonlight; that I get tired to death gazing at the large canvasses of Peter Paul Rubens in the Louvre—some of them the most unspiritual renderings of spiritual facts that a large but coarse imagination could suggest. But I delighted to wander alone and silently, or with a single companion, amongst the comparatively deserted sculptures of the Capitol—to gaze, always with renewed interest, on the worn, thoughtful, keenly-vivid face of Cæsar, or the sullenly beautiful (to me, even in its youthful form, with all its beauty and power, morally odious) face of Augustus; to spend a quiet, dreamy afternoon amidst the vast arcades of the Coliseum, while the lizards darted brightly over the warm stones, and the sun kindled with a glow every dank grassy nook of the mighty structure; and to conjure up, with no consistent effort, but in a strange, fragmentary, unchronological sequence, the brilliant and awful scenes on which the same walls and heavens had long ago looked. It was a rare pleasure, too, to isolate some picture of more than usual meaning, such as Guido's Beatrice Cenci, in the Palazzo Barberini: or Albertinelli's Visitation of Saint Elizabeth, in the Uffizi Gallery at Florence; or Giotto's frescoes of St. Francis; and give oneself up to thoughts of all they suggested—the inexpressible fulness of feeling or idea that rose up from the marvellous lines of the artist. Like one of these grand old pictures, Assisi remains in my memory—surrounded by a host of sacred and charming associations. It is the city of St. Francis; and there are few characters in Christian history so singular and interesting. He has always greatly attracted and delighted me since I first read Sir James Stephens' fine, although somewhat too rhetorical, sketch; and it had long been in my mind, if I ever had opportunity, to make a special pilgrimage to the City of the Saint, and spend a day amidst all its lively and impressive memorials.

I had accidentally acquired the means of making my visit as advantageous as possible. During my winter's residence in Rome, I had made the acquaintance of a venerable and accomplished Franciscan monk,—a man who, although devoted to the interests of his Order and his Church, had seen the world, and was something more than a monk; something more than the mere ecclesiastic in any Church—and most of all, the Church of Rome—is likely to be. He had been at the head of the Latin mission in Constantinople for many years, and had there learned to understand, if not fully to appreciate, Greek Christianity, and to open his mind to a wider horizon of knowledge than was customary with his brethren. His hard work was over. He had spent the prime of his days in the active service of his Order, and now he had returned to a quiet room in the Franciscan House beside the Tiber, in the Travestere, or Trans-Tiburtine, quarter, to spend the evening of his days. He was a delightfully simple, cordial, social old man. Friendliness and welcome beamed from his hearty face, when, with a friend who had long known him, I paid him a visit one cold afternoon. How cold it was I remember, as we drove along, and how chilly the fountain looked at the end of the bridge by which we crossed the Tiber in the pale, stifled gleam of the sun,—the icicles hanging around it! Think of this, dear reader, in sunny Italy! The long, open stairs of the convent were equally cheerless. Padre Carboni (I may call him) was not to be found at once. He was engaged in some of the frequent services of the establishment; but shortly he made his appearance with his keys dangling from his hand, and admitted us into his clean, comfortable rooms. All was plain, even to poverty, as became the vow of the Order; but there was nothing of the dirt or meanness which the persons and attire of many of the Franciscan monks, constantly to be met in Rome, present. We had come on no special business. My main wish was, to hear from such a man his view of his own Church, and the position in which he supposed it to stand to Protestantism, or rather, Protestantism to stand to it. Circumstances led me to believe that he would speak frankly and intelligently in these matters, and I was not disappointed. The prime difficulty was to establish a thoroughly available medium of communication between us; but at length we managed this by processes which it is unnecessary to explain to the reader.

---

* Nothing seems more astonishing in its way than the vitality in Art of what may be called certain typical indecencies, mainly taken from the Classic Mythology, but at least in one notable instance, also suggested by a portion of the Biblical narrative. It is difficult for one who is no artist, certainly, to understand what advantage such subjects can present to the artistic mind. Yet there would seem to be something perennial in their attraction, if the walls of the Paris Exhibition this season may be held as evidence.

I had a long, earnest talk with the Padre, rising now and then into keen discussion, which we did not fail to mellow with a good bottle of wine. The Franciscan vow does not lay any ban on good wine, and the friend who accompanied me had a grateful recollection of some peculiar vintage which he had enjoyed in the same rooms on a former occasion. My friend's recollection is apt to be vivid in such matters: the eyes of the honest Father twinkled with intelligent response: and the familiar bottles made their appearance. And so we talked on in the winter afternoon, till the shades gathered around us, and the quaint lamp was lighted, and some meagre but not unpleasant fare provided. I certainly came to understand better than I had ever done, how a vigorous, candid, and well-informed mind could adhere with honest satisfaction to the Roman religion; and not only so, but vindicate it with a perfect good faith, although, as I never felt more strongly than then, by mistaken and rationally inadmissible arguments. There are Protestants who report that there is much bad faith among ecclesiastics in Rome; that there are many who do not believe what they profess; who, in fact, are infidels as to the divine verities of our holy religion altogether, while the supporters of a corrupt ecclesiastical system. There may be such: I do not know. I can only say I saw nothing of them. What impressed me most with such ecclesiastics as I did see —and I saw some in well-known and important public positions in Rome—was the apparently clear honesty with which they held to their system of faith as a whole. It was rare indeed that they could be got to enter into much conversation about it. I found no other who would enter upon the subject with the same frankness as our good Franciscan; but not even Dr. Manning could have a more implicit confidence than he had in his spiritual position, nor could he defend it by better arguments. It was, in fact, in the main, the same course of reasoning by which this subtle English intellect, now elevated to the head of the Roman Catholic hierarchy in England, works, that my friend the Franciscan Father employed. His great idea was (is it not necessarily the idea upon which all exclusive Church pretension rests?), that the supernatural order, with its attendant privileges, is alone in the possession of the Roman Church; the Church *is* the Roman hierarchy, with the Pope at its head. The Divine is not an inward spiritual grace circulating in all Churches, and blessing man with its presence everywhere, more than they are ready to receive it; but it is also an external order, fixed and definite,—which order the Church of Rome alone represents—alone is. All other Churches are outside this supernatural order. Protestantism is in its nature essentially rationalistic; its history proves this. To me personally, as he passed the well-flavoured wine, he extended a most kindly recognition, and in his heart I daresay he allowed me to be a Christian (I am sure he treated me as one); but that Protestantism in every form was beyond the pale of the true supernatural he maintained, quite as Dr. Manning does in that graceful Pastoral with which he has recently favoured the English public.

I asked him what he made of the Greek Church. The subject occurred naturally, as I had just returned from the Levant, with which he was familiar. I saw I had made a point—hit a weakness in the joints of his logical armour; and with what utterance I could, I pressed the point. He was at a loss how to fit the Greek Church into his argument. It was impossible to ignore its antiquity, and its spiritual lineage from the Apostles; he could not accuse it of rationalism; he was reluctant to accuse it of schism and apostasy in the face of facts which he knew, however little many of his brethren may know them. He fell back, therefore, in a somewhat hesitating voice, on the old commonplace about St. Peter as the special founder and governor of the Church. I was glad to notice hesitation in his voice. Hesitation is a hopeful, too rarely witnessed sign, in any ecclesiastical argument. I did not think it necessary to press the matter any farther. It was plain we could not come any nearer one another; and it was time to take our departure. No doubt the good man felt, that if I had at length started a difficulty, he had as a whole made a triumphant argument. There was humility and kindliness in his heart, a cheering hesitancy in his tone, whatever audacity there might be in his logic. We parted the best of friends, finally smoothing away all acerbities of the long discussion in the mild fragrance of a Roman cigar. He lighted us down the cold steps with his swinging lamp, casting its upward beams on his sombre robes; and as we parted beneath the frosty starlight, he was full of promises—if he could be of any service to us. We asked him afterwards for a letter of introduction to the head of the Franciscan Convent at Assisi, when we were about to set out on our journey thither. He complied at once with our request, and made us the bearer of his kind remembrances to some old friends there. And so it is that we have wandered into this digression, which our readers will pardon, if not for its own interest, yet for the fact that our good old Franciscan by the Tiber remains indeliby associated in our minds with his Franciscan friends at Assisi.

The journey from Rome to Assisi is full of interest and beauty; but all diligence-travelling becomes at length miserably wearisome from sheer fatigue of posture, change and relieve your attitude as you will in the miserable space in which you are cooped up. Darkness closed upon us as we left the long sad stretches of the Roman Campagna behind us, and the picturesque form of Soracte could no longer be seen, as we drew nearer to it; the dim, dirty-looking streets of Civita Castellana found us shivering with cold, and so we left our outside seat and took refuge inside of the diligence. One of our companions, of whom we had but a slight acquaintance before, was already ensconced there, and my main remembrance during the night was the tones of his voice, narrating some "scene of clerical life," of which I only half caught the import, and in which I had not a grain of interest. Yet I could not so far help attending to it. I gathered that my companion, a very worthy and good man, was of a well-known school of Church politics represented by a well-known organ of Christian virtue in these islands. I dreamily pondered this fact in my snatches of sleep. It was a sort of revelation to me. I do not know that I ever met a living representative of this school before or since.

As the day broke pale over the still snow-clad summits of the Apennines we were approaching Narni, where we halted for some time. Our time, however, was too uncertain to permit us to visit the ruined bridge of Augustus, which, about a mile from the town, still spans the turbid waters of the Nar, as they rush through a finely wooded gorge. It formed the passage of the old Flaminian Way, along the course of which we had been travelling for some stages. We started to walk in advance of the diligence down the spacious valley through which our route lay. The beauty of the morning, as its first clear paleness passed into golden sunlight—and there was still a crisp, fragrant, freshness in the air—was intoxicating. There is no joy of sense perhaps so purely elevating as such a morning; yet, like all sensitive stimulus, however pure, it was followed by reaction as the freshness faded from the light, and the nervous system which had bathed, soothed, and braced itself in the freshness began to relax from unwonted fatigue. What a delicate, subtle, mysterious organism this nervous system! How sensitive to unbidden impulses! What potencies of joy, what potencies of misery also, does it enfold!

The diligence fortunately overtook us before the advancing heat became oppressive, and then through dust and under a brilliant sun we rolled on our way, past Spoleto, with its magnificent aqueduct and picturesque environs; past La Vene, through the charming vale of the Clitumnus, where the great white Umbrian ox, celebrated in the Roman triumphs, may still be seen;[*] past a small temple of "delicate proportions," which some classical antiquaries have not hesitated to identify with the temple described by the younger Pliny as dedicated to the river god Clitumnus, and described as ancient even in his time. It occupies in all probability the same site, but there are many evidences that it cannot be the same temple.

About four in the afternoon we reached Foligno. Here we remained all night. Assisi was within easy reach, and after a good night's rest we proposed to devote the next day to its interesting churches and associations. But now a difficulty occurred. I was a young traveller in Italy, and had but a partial experience of the rogueries of Italian Vetturini. For all bargain-making I have, moreover, an instinctive aversion. Bargain-making, where the medium of communication does not permit a sufficiently ready outlet for the indulgence of your wounded feelings when fraudulent extortions are attempted upon you, is a mere hopeless pain. Better to be cheated at once, however painful this is, and have an end of it. It was an infinite relief to me, therefore, to have met a companion to whom this bargain-making seemed something of a genuine art. All the ingenious delays of the process, the delicate advances, the adroit retreats, apparently delighted him. He showed himself a perfect master of fence, even for Italian subtlety, and the complicated transaction was at length brought to a conclusion. We secured a vehicle at something like one-fourth of the sum originally asked—no doubt of it! But what sort of a vehicle, and what sort of a ride we made in it, I shall not venture to describe.

Still more serious opposition sprung up to the day's enjoyment. Who was this Francis of Assisi that I could be so interested in him? Was it worth interrupting our journey—for we proposed a somewhat extended tour—to go to Assisi at all. Was this great interest in a Romish saint a becoming, or even lawful, feeling in Protestants? I felt an unexpected shock. I had counted on a day's quiet imaginative brooding. I was not thinking then of Romanism *versus* Protestantism; I was not thinking of any *ism* under the sun; I was thinking of what seemed to me a saintly, childlike, beautiful character, and of the strange legendary incrustations which had grown around it, and what could be their right historical reading, or whether they admitted of any such reading; and suddenly the dream was dispelled, and the realities of Low Church Protestantism, with that singular power of provocation which they have for some minds, were obtruded upon me. It was far from pleasant. I believe I expressed myself freely on the subject; but I was not to be moved from my pilgrimage. Had I not for many a day looked forward to it? And did I not bear letters of commendation from my Franciscan friend by the Tiber?

So after a somewhat tedious journey, for the distance, we reached Assisi. It lies on the brow of a long declivity, and presents, with its ruined citadel, and the massive abutments of the convent, something of the appearance of a huge fortress at a distance. Dante[*] has celebrated its picturesque beauty, the glory which encircles it as the scene of St. Francis's pious labours, and the sanctuary of the early Italian art, which sought to immortalise these labours. We tarried but a short time in the town itself, taking merely a passing glimpse of the portico of the ancient temple of Minerva, still standing, attached to a church known as the *Sta. Maria della Minerva*. Goethe, in his Memoirs, relates that he ascended the incline on which Assisi stands to inspect this remnant of ancient art, and that, enchanted with his visit, he did not venture to disturb its associations by proceeding to the other end of the town to visit the convent of St. Francis. It was just the opposite inspiration which we obeyed. We had had enough in the meantime of the mutilated monuments of Pagan art. The fragments of the temple of Minerva, therefore, scarcely arrested us. We hastened onwards to the convent, gained without difficulty access to the Superior, or his representative, as it proved,—for the Superior had gone out. We delivered our letter, and were received very courteously. Before our departure the Superior returned, and heaped all possible attention upon us. Even our friend who had doubted of the propriety of the visit was softened, and acknowledged how agreeably we had been welcomed and shown everything. He would have been very hard-hearted indeed who would not have been touched by the gentle grace and condescending politeness of the Franciscan Superior. There was a pensive dignity in his manner very charming, and the pathos of a quiet dejection, with the visible signs of declining health, at once arrested our interest. He no doubt felt that, with the strength of his own days, the glory of his Order was fast passing away. The spirit of the new system of things was proving too strong; a new Italian kingdom, with some ideas of political economy as well as political liberty, had begun to lay legislative hands upon it. It was impossible not to see, even in the course of our brief visit, many traces of the rapidly advancing revolution. Not only the stillness of devotion, but of decay, brooded over the churches and the halls of the convent. The great refectory, which had once teemed with its busy thousands, was deserted; the cloisters stood bare and empty; the cherished monuments of the saint; the frescoes of Cimabue; the glorious allegories of Giotto, were no longer shown with a consciousness of pride and of joyful possession, but rather as reminiscences of a departing greatness. The very frescoes themselves, especially the grand series illustrating the life and supposed miracles of the saint, seemed to sympathise with the decay of the institution as they showed the marks of age, here and there obliterated, and dropping in fragments to the ground. Some were already so indistinct that their story could no longer be traced. The marks of that strong early genius who heralded the glorious line of Italian art, still cling to the walls, but their meaning can no longer be clearly read. I could not look at them without a feeling of regret that no applications of modern art can save these fine conceptions, everywhere instinct with an archaic dignity and spirituality of thought under all their dim-coloured formal outlines, and even here and there their apparent childishness of external design. The groups of the cardinal Christian virtues, Poverty, Chastity, and Obedience, with which Giotto surrounded the high altar of the second, or middle, church, are still comparatively living, richly coloured, and divinely expressive, if not so fresh as when they came from his hands.

Piu sua ratezza, nacque al monde un sole
Come fa questo tal volte di Gange
Però chi di reso loco fa parole

There are really three churches attached to the convent at Assisi, rising one above another, or at least three sanctuaries within the great edifice,—one of the rare specimens of Gothic in Italy. The upper sanctuary, or church, contains the frescoes of Cimabue, illustrative of the life of Christ, and of that of St. Francis, as his imitator. In the second, or middle, church, besides the masterpieces of Giotto around the high altars, there are various pictures of Giotto's pupils, especially a celebrated Crucifixion by Cavallini, said to have excited the admiration of Michael Angelo for its grandeur; and what struck me more than all the others, a St. Francis receiving the Stigmata, attributed to Puccio Campana, also a scholar of Giotto, although one would fain recognise the hand of the master himself in it. In the under church of all, hollowed in a rock, is the tomb of the saint. It is singular enough, that while it was the first successor of St. Francis in the government of his Order, by whom this magnificent edifice was reared, for the express purpose of enclosing the remains of the saint, it continued for ages to be a vehement controversy among the members of the Order, whether the remains were really deposited there. Great doubt prevailed on the subject, and it was only within the present century, after 500 years of controversy, often violently renewed, that all doubt has died down. It is stated that an investigation in 1818, conducted by the general of the Franciscans, and authorised by Pope Pius VII., led to the discovery of the skeleton of the saint in a stone coffin. A congregation of cardinals confirmed the genuineness of this discovery, which was announced by Pius VII. to the Church, and all sceptics on the subject were henceforth threatened with excommunication. The necessity of strengthening the alleged discovery by infallible sanction and

Non dica Assesi che direbbe costo
Ma Oriente, se propico der vuole.
Par. XI.

Between Tupino and the wave that falls
From blest Ubaldo's chosen hill there hangs
Rich slope of mountain high, whence heat and cold
Are wafted through Perugia's eastern gate.
Upon that side
Where it doth break its steepness most, arose
A sun upon the world as duly this
From Ganges doth; therefore let none who speak
Of that place, say Assesi—or its name
Were lamely so delivered. But the East,
To call things rightly, be it henceforth styled.
Cary's Dante.

a decree of excommunication, is not a likely way of quieting doubts in some minds; but it must be allowed that the authenticity of the shrine of St. Francis is at any rate as well established as most shrines in Italy. The reverent Franciscan, as he approaches the dimly-lighted urn of travertine within the sacred enclosure at Assisi, may at least feel with confidence that the relics of the saint were native to the earth on which he kneels. Even the Protestant, as he stands silent beside the kneeling monk, is not here pained by any manifest lie inviting his regard. The dust of St. Francis may be there or not. This is to him a small matter; but it was here at any rate, in this town and near this place, that the humility, patience, gentleness, and unceasing self-denial of a devoted Christian life were exhibited and set before others as a light shining in a dark place.

In addition to the church and convent at Assisi, the traveller who has any thought of St. Francis in his mind, will not fail to visit, at the distance of about a mile and a-half, the fine church of the *Madonna degli Angeli.* This latter church, indeed, is nearer the ordinary route of travellers in passing from Perugia to Rome, or the reverse, than Assisi, which lies on the height above. The chief interest of this church consists—not in the frescoes of Overbeck, although these are very striking and fine, one especially, the Vision of St. Francis—but in the small, rude, Gothic chapel which it encloses. Within this chapel St. Francis laid the foundations of his Order upwards of six centuries ago. There is a quaint, antique simplicity about it; and as we entered its low archway, and surveyed its mean arrangements, and the original cell of the saint hard by, the life of St. Francis rose upon us more vividly perhaps than at any previous stage of our visit. Grand as were the impersonations of Cimabue, and divine the creations of Giotto, in the splendid edifice at Assisi, here, in the rude memorials now before us, was the true expression of the spirit of St. Francis. It was here that the words of the Gospel, as he read them one day, seized him with a literal earnestness that inspired his whole career. "Provide neither gold, nor silver, nor brass, in your purses, nor scrip for your journey, neither two coats, nor yet staves." "Behold what I desire; this is what I have longed for!" he joyously cried; and, throwing away his sandals, and exchanging his girdle for a rope round his loins, he went forth without even the staff or scrip of the mendicant, to proclaim the Gospel of self-denial. It was in the year 1209 that this inspiration came to him. Slowly at first he made his way, preaching repentance in the streets of Assisi, and saluting all he met—"The Lord give you peace!" A perfect passion for abnegation possessed him. He stripped the clothes from his back, and gave them to the beggars. He disposed of the goods which he ought to have carried to the market to repair the dilapidated altar of God. When reproached by his father, entreated by his gentle mother, and carried before the Bishop of Assisi, that he might receive more enlightened notions of the value of property, he exclaimed, "I would gladly restore not only the money, but the very clothes I wear." And so he despoiled himself of all his clothes but his hair shirt. "Hearken to me," he continued, "I have hitherto called Peter Bernardone (for this was his patronymic) my father. Henceforth, I will serve God alone; henceforth I will say, 'My Father who is in Heaven,' and no more." Gradually he gathered around him a few disciples: a rich burgess of Assisi, to whom also the voice of the Gospel had come with an earnestness which admitted of no question as to its literal meaning. "Sell all that thou hast, and give to the poor; thou shalt then have treasure in Heaven." Others of the lower orders, to whom poverty was no strange thing. Around his cell at the chapel of Porziuncula they formed a little band, weak in apparent influence, but holding a wonderful destiny in their hands. "Fear not," he said to them, "because you are small, and seem foolish. I have confidence in the Lord, who has vanquished the world. His spirit will speak by you; you will find some good ones who will receive you joyously; many proud, who will resist you. Bear all with sweetness and patience. Soon the wise and noble will be with us. They will preach with us before princes and nations. The Lord has given me to see this. I hear in my ears the sounds of the languages of all the peoples who will come to us: French, Spaniards, Germans, English. The Lord will make of us a great people, even to the ends of the earth."

Then, while the number of his disciples was still only seven, himself the eighth, he formally instituted them, and set them apart to their work of self-denying Evangelisation. "Go," he said, "two and two, and preach to men peace and patience. It is for this we are called. Tend the wounded; relieve the oppressed; reclaim the erring; be patient in trial, and without disquietude, for the Lord will accomplish his promise. Answer humbly to those who ask you; bless those who persecute you; and give thanks to those who injure you, and the kingdom of God will be prepared for you." Then all threw themselves on the ground before him; and, embracing each, he dismissed them, saying, "Lay all your cares upon the Lord, and He will sustain you."

Such was the great Franciscan Order in its commencement, before the papal sanction had been yet extended to it. A few feeble folk, led by one who seemed half a maniac in his absorbing passion for self-mortification; ejected by his father, stoned by the populace, clothed only in a coarse robe bound by a leathern sling, the gift of some compassionate hand, living in a rude cell shaped by his own hands —St. Francis yet felt himself already a mighty power. The inspiration of a great idea was swaying him—the *consecration of poverty.* Whatever we may now think, in the midst of the nineteenth century, of this idea, in the literal form in which it was interpreted by St. Francis, it was an idea undoubtedly which the circumstances of his age made *great*. The wild and coarse worldliness of the time needed some powerful principle of reaction to hold it in check, or to set any intelligible ideal of a higher life before it. St. Francis found this principle in the consecration of poverty. The life of our Lord, not merely in its spiritual meekness, but in its external accessories of poverty, dependence, and humiliation, was the only true life of the Christian. To be like Christ in all things—"to put on the Lord Jesus" literally, in all His pain, and suffering, and passion, for the sins of the world, and in no sense "to make provision for the flesh:" this was the motto of the saint of Assisi—the grand, if exaggerated, idea on which he founded his Order.

And it may be briefly said, that, whether many others sought honestly to realise the idea or not, Francis himself never swerved from it. It was the inspiring passion of his whole life. It is the key that explains the strange mysteries which have gathered round it, particularly that singular inexpressible marvel which to all Romanists is an object of profound faith and reverence, the alleged impression of the *stigmata*, or marks of the Saviour's sufferings, on his body. I do not know that there is any legend of the Roman Church so strangely interesting as this one, so beautiful, so suggestive, while to many minds perhaps, also, crude and painful in its materialism. Yet St. Paul said, "From henceforth let no man trouble me, for I bear on my body the marks (στίγματα) of the Lord Jesus." (Gal. vi. 17.) Whatever St. Paul may have more particularly meant by this expression, we have no doubt that the higher spiritual meaning which it bears was also in the main the meaning of St. Francis. It was the same divinely impassioned spirit of self-sacrifice, however encrusted by the superstitions of his time, which burned in the soul of the saint of Assisi. And there is something, it appears to me, very touching even in the materialistic form which the divine thought took in his mind, or at any rate in the minds of his followers. I could not help feeling this as I gazed upon the striking representation of it by Giotto's pupil. It was impossible to look at the awe-struck, half-kneeling form of the saint, thrown back in a deprecating yet solicitous agony of earnestness, while the mysterious influence gleamed upon him from heaven, without being deeply impressed. Nor did the impression vanish with the occasion. The powerful fascination of the mystery for the mediæval mind—how it grew up—what elements of truth it embodies or rests upon—the singular accumulation of evidence for it—and how this is to be explained without accepting the literal fact—all this continued to interest me greatly as an historical problem, the solution of which touches intimately many phenomena of mediæval biography and history. In another paper I may endeavour to give this solution, both for its own interest as a piece of historical analysis and for the light which it throws upon other mediæval legends. J. T.

ALFRED HAGART'S HOUSEHOLD.

By ALEXANDER SMITH, Author of "A Life Drama," &c.

CHAPTER XX.

THAT arch conspirator Miss McQuarrie sat in Mortimer Street waiting news. She kept her own secret of course. Nor had she long to wait, for on Wednesday morning the following letter was received:

"GREYSLEY, *April* 20, 18—.

"MY DEAR MISS MCQUARRIE,—Agreeable to instructions, I waited on Wedderburn Brothers, and laid your proposal before them. They were taken a good deal aback at first, and seemed unwilling to accede; but by degrees they were brought to a more favourable state of mind. Yesterday morning they consented to accept Mr. Hagart as a partner on the conditions proposed. Although I know the house to be thoroughly stable and solvent, I would not conclude negotiations without an examination of their business books, which I found satisfactory. It was arranged that you should pay 2500*l.*; that Mr. Hagart should receive a sixth share of the profits; that the utmost secrecy should be observed as to your share in the transaction; and that the accession of Mr. Hagart to the partnership should be made as public as possible,—that it should be advertised in the Greysley newspaper, that circulars should be forwarded to their business friends and correspondents, and that the old dingy sign of 'Wedderburn Brothers' should be taken down, and a new one, with the words 'Wedderburn Brothers and Hagart' painted thereupon in gilded letters, should be placed in its stead. I laid a good deal of stress on the matter of publicity; as from our conversation the other day, I gathered that such publicity would be grateful to the feelings of your friend.

"When I obtain your approval of what I have done, the deed of partnership will be formally drawn out, signed and witnessed.

"You will be gratified to learn that Wedderburn Brothers speak in the highest terms of Mr. Hagart's steadiness, character, and talent, and that the partnership is to be offered him in virtue of these qualities.

"I remain, dear Miss McQuarrie,
"Your obedient servant to command,
"JOSIAH HOOK."

To Miss Kate the letter was entirely satisfactory, and Jack had no sooner gone—for she read it seated at the breakfast-table—than she got out her old-fashioned writing-desk, and scribbled a note to Mr. Hook, expressing her complete approval of his arrangements, and instructing him to have the matter concluded without delay. When the note was folded and sealed, she rang for Ann, and sent her with it to the post-office.

When the note was despatched, Miss Kate arose and began to pace up and down the room, with her under lip stuck out, and her hands folded behind her back, as was her habit when she was immersed in thought. All kinds of ideas were coursing through her shrewd, old, worldly-wise, yet thoroughly tender and affectionate brain. She was a cynic, and she fed her cynicism on herself, as well as on others. She loved money, and was unwilling to part with it; and now having parted with a considerable sum for Hagart's good, she—without in the least repenting the step she had taken—was inwardly railing on Hagart for having made her do so. "The fool! Central America, forsooth! Tormenting himself and others with his quicksilver brain." These, and sentences of similarly uncomplimentary import, she muttered as she marched up and down. And as up and down she paced, a beam of April light came into the room, and in the brightness the portrait of the Governor of Ceylon seemed singularly alert and vivacious, and watched the coming and going figure with an interested regard. Of this Miss Kate seemed to become conscious, for she paused in her walk and looked up. "Humph, *you* fought, and were parched by the hot sun, and lived and died among strangers, and the money you earned with your life goes after this fashion. You would have thrown it in the sea rather." Miss Kate still looked at the portrait; but in a moment or so, the April beam died out, and with it departed all speculation out of the countenance of the Governor. It became merely an ordinary picture in an ordinary gilded frame; and Miss Kate resumed her march, her hands behind her back, and her under lip stuck out.

My own impression is that in thus marching up and down, Miss Kate was not so much scourging Hagart as she was scourging herself. I rather fancy that some subtle sense of having been generous, of having performed an action worthy of commendation, was at the bottom of the whole commotion. She had never been much in love with her fellow-creatures, she had never believed in their nobility, their disinterestedness, their purity of motive; and, true to her cynical instincts, she would not willingly take that credit to herself which she was unwilling to render to others. When she thought of the large sum of money which she had given away, this idea of generosity arose, and to get rid of it she flew to the opposite extreme, and almost made herself angry with the thought that she had given her money to a fool, in order to preserve herself and her sister from that fool's vagaries. And so poor Hagart suffered vicariously. She chewed carefully-selected bitters, in order to put a strange sweet taste out of her mouth. Such a sweetness was suspicious in a half-embittered life.

But as she marched up and down, the old face grew tenderer, and at last a pleasant light broke all over it. She suddenly remembered, by what occult power of association I cannot tell, that Jack's birthday fell on the following Monday. Then she thought what a nice thing it would be to hold it; then she thought what a pleasant thing it would be for the boy, if his father and mother would be present; then she thought it would be delightful, knowing what she knew, to witness these good people wearing their good fortune in its newest gloss. These notions took entire possession of her, and made her perfectly happy. The fruit looked so tempting, and smelt so pleasantly, that she could not help eating it; the idea was so agreeable that she could not forbear putting it into execution at once. So she sat down to her writing-desk again, and requested the pleasure of Mr. and Mrs. Hagart's company to dinner on the following Monday, being their son's birthday; and Ann had no sooner returned from posting the letter to Mr. Hook, than she was sent out again to post the letter to Mrs. Hagart.

When Jack returned from school he was told about the birthday dinner, and the invitation which had been sent, which caused him vast delight.

"When father has once been here," said he, "and gets to know you better, he won't ask to meet me at the station-house any more. He will come here at once."

"I dare say he will," said his aunt, with mysterious emphasis and a curious smile; "I don't think you will have any more meetings on the canal banks."

Two or three mornings thereafter a couple of letters were brought in, one addressed in a male, the other in a feminine hand; and Miss Kate knew instinctively that they came from Hagart and her sister. She opened her sister's first, with just the slightest possible tremor in her hands.

"GREYSLEY, *April*, 18—.

"MY DEAR SISTER,—We shall have much pleasure in dining with you on Monday next, on the occasion of John's birthday. It is very very kind of you to remember us.

"When your letter came I had just sat down to write to you. I have such a piece of good news to tell,—*such* good news that I can scarcely believe it to be true yet. The other afternoon, Mr. Hagart was called into the counting-house of Wedderburn Brothers, and was told that, in consideration of his great services, they wished him to enter into partnership with them; and that in the event of his consenting, they were prepared to allow him a sixth of the profits. The announcement came on Alfred like a thunder-clap, as well it might. When he came home and told me, I was almost beside myself. The matter is now entirely settled: the deed of partnership has been drawn up, and signed in proper order. What do you think of *that?* It will astonish you, I dare say. We shall be quite rich now, after all our struggles and anxieties. I have not yet calmed down: the good news has gone to my brain, as I once remember a glass of champagne going when I was a child, and I hardly know what I am about.

"And yet the news has made me sadder than I have been for years. I think of the little one that has been taken from me, of her scanty wardrobe, of the little I could do for her while she was with me, of what I could do for her *now* had she been spared. O sister, sister! I have been crying half the morning; but I try to comfort myself with the thought that God can give her more in heaven, than I ever could give her on earth, although I had the wealth of a queen.

"I have had to leave my writing for a little, and am calmer now. The pleasantest thing to me in this stroke of prosperity is the thought that it will reconcile you to my husband. I know you considered I did wrong in marrying a poor man: I feel that something of the old grudge still lingers in your heart against him: but all that will be changed now. You never knew Alfred. You only knew his slender purse. I know his worth, his talent, his kind heart. He has waited long for his reward, but it has come at last. I am but a poor pen-woman, and cannot express all I think and feel. I would like to hold you in my arms, and tell you everything. Be sure and tell John. He will be so delighted, poor boy!

"And now I must stop, for my head is in a whirl. Excuse this scrawl, and believe me ever,

"Your affectionate sister,
"MARGARET HAGART."

When Miss Kate had finished the perusal of this epistle she made a hurried grasp at the other, as if seeking some sort of relief. When she opened it she found it written on business paper, with an engraved heading "Wedderburn Brothers and Hagart, Greysley," running along the top. As she divined, it was from Hagart himself, and ran thus,—

"MY DEAR MADAM,—My wife will tell you with what pleasure we accept your invitation to dinner on Monday, and how much that pleasure is increased by the event it celebrates.

"You will doubtless be surprised by the heading of this letter. I am now a partner in the house in which I was formerly a servant, and am proud to say that the partnership has been offered me as a reward for my services, and—as I suspect also—as a means of permanently securing these. When offered, I at once saw it my duty to accept it.

"The motive which may have induced Wedderburn Brothers to make the proposal, can of course have no interest for you. It gives me, however, the utmost pleasure to inform you that the partnership has been offered and accepted. I am perfectly aware of the feelings you entertained—and perhaps still entertain—towards me. The feeling on your part was perfectly natural; and it was quite as natural that the knowledge that that feeling existed should give me pain. I love my wife too much to be indifferent to the opinions of her relatives. Were I still in my former position, I should never have addressed you, and should never willingly have met you; although all the while I would have cherished for you the sincerest regard, and the deepest gratitude for the kindness you have shown my son. A respect for your feelings, and my own proper pride, would have prevented all communication between us. But the case is different now. Without an indecent boast, I may congratulate myself that I have, unaided, and by the exercise of my own talents, gained a position of comparative opulence; and while I rejoice in this for the sake of your sister and my son, I rejoice in it not the less sincerely that it may show you that the poor artist on whom your sister bestowed her hand is perhaps not so contemptible a person as you may have at one time imagined.

"I do not, madam, claim your friendship, nor your kindly regards. Had this not happened, I should not have intruded myself on your attention. I have never before proffered you my hand. I proffer it now, because I know that now it is more likely to be accepted. I did not seek you in misfortune, I seek you now in success: with you remains the issue, and by that issue I abide.

"I remain, dear Madam,
"Yours most respectfully,
"ALFRED HAGART."

The perusal of this epistle put Miss McQuarrie a good deal out at first. The whole drift and movement of it was unexpected. There breathed from it a certain pride, an air of condescension, a generous cancelling and throwing away of undeserved wrong, which made the reader's eyes open in astonishment. The writer reposed so undoubtingly on the sense of his own merits; he so fully believed that what had been gained, had been gained by his own right arm, that Miss Kate's first impulse was to be angry, and her second to laugh outright. "Deuce take the man!" she muttered to herself; "he condescends to me as if he were a king. He'll begin to patronise me next." The letter troubled her, and she still held it in her hand, as if it was something to which she had not got to the bottom. Then she read it over again, studying it sentence by sentence. The letter pleased her much better on a second perusal. When she finished it she got up, and began to march up and down the room, with a slight colour in her face. "There's something in the man, after all. I suspect I shall like him better when I come to know him better. Don Quixote was a fool, but he was a gentleman. Hagart is a fool, too, but there is an authentic touch of the gentleman in him. This letter, everything considered, with its queer mixture of pride, dignity, and humility, might have been written by the Don himself. If the poor man but knew what an ass he makes of himself by his vapouring and his fine forgiveness! He puts me in mind of that crack-brained, cross-gartered fool, Malvolio, whom I used to read about in the play-book when I was a girl. But there is something noble in his letter. He does not know what secret influences have been at work, and he naturally takes all the credit of his success to himself. I suppose any man, situated as he is, would have done the same. Hagart should always ruffle it in the sunshine. The shade does not become him. His fine sentiments and a thousand-a-year would make excellent companions. He certainly did not thrust himself on me while he was in adversity,—that's a vast deal in his favour. I like proper pride, and the standing-up for one's self. A fool is bad enough, but a sneak is ten thousand times worse. Hagart is not a sneak, at any rate. You may cure a fool of his folly, but never a sneak of his sneakishness. The hungry, greedy cowardice of the sneak is the lowest thing I have yet seen in man. Thank God, Hagart is not a sneak. I must write congratulatory notes to these people, I suppose, for of course I must be as much delighted and astonished as they are. What a singular coincidence," and here the queer smile broke out again, lighting up the wrinkled face, "that I should have asked them to dinner, and that they should have such good news to tell me! One would almost think that the dinner had been given in honour of the good news. I must point out that to Margaret. Heigho! what a hypocrite I am getting in my old age, when I have taken to do a little good. I suppose virtue is like gold, it is unworkable without an admixture of alloy." And so Miss Kate sat down again to her writing-desk, and wrote a congratulatory note to her sister, and a frank, honest, outspoken—almost affectionate—one to Hagart. It was that writing that finally and for ever closed the family breach.

The cunningly-smiling missives were duly despatched, and when Jack came home to dinner in the afternoon his aunt communicated to him the wonderful news which had that morning reached herself. The boy felt as if a patent of nobility had been conferred upon him. There was a sudden unknown brightness in the air, the cold mutton became paradisaical food, and was eaten off a golden plate. He had never felt so happy in his life before, and he had never seen his aunt look so happy.

"There will be no talking of going to Central America now," said Miss Kate, when she had finished.

"No. Father, when we walked together, always said he would come to something, and he has come to something now. He is very clever, you know."

"But now that your father has become a rich man he will despise me, will he not? He won't recognise a poor relation like me."

"I am sure he will never do that," said the boy, quickly. "He will like you very much when he knows you. And I am sure you will like him, aunt. You only require to meet to be friends. He is not proud; at least, not proud in that way."

"But isn't it lucky this thing should have happened just now? The partnership could not have come at a better time. It seems almost providential, does it not?" And so with her own happiness, and with the boy's, Miss Kate played. It was like a new trinket, to be toyed with and fingered, and to be set in the best light and admired.

CHAPTER XXI.

On the Monday following, at half-past five o'clock, Miss McQuarrie and Jack sat in the drawing-room in Mortimer Street, waiting their guests. They had not waited long when a fly drove up to the door, and the bell rang. Jack went to the window, and saw his father and mother step out of the vehicle; and he had hardly resumed his seat when Ann threw open the door, and announced Mrs. and Mr. Hagart. Mrs. Hagart entered, looking very happy. She kissed Jack, and wished him many returns of his birthday; she kissed her sister, and held her in her arms for a moment; and then, turning round, formally introduced her husband. Hagart took the heavily-ringed hand stretched out to him, muttered the usual commonplaces, and then walked up to the fireplace and stood in an easy manner on the hearth-rug, with his back to the fire, surveying the entire room. Miss Kate and Mrs. Hagart were seated together talking, and Jack could scan his father's movements at leisure. Hagart's advance to the fireplace, and the establishment of himself on the hearth-rug, almost took the boy's breath away. It seemed like an invasion of the sacredness of the quarter-deck. Never before in his life had he seen his father so cool, self-possessed, and regardless of dignities. The hearth-rug was appropriated as a mere matter of course. Jack was astonished, but his astonishment was increased when his father, leaning his back against the mantel-piece, called out—

"And so, John, you have completed the first year of your teens! Time is passing, my boy. Remember that Alexander conquered Asia, and that Pitt was a prime minister, when they were not many years older than you are now."

Before Jack had recovered himself sufficiently for a reply, Ann had opened the door and laid a parcel on the table.

The parcel had no sooner been laid upon the table than Hagart advanced, and, unclosing it, revealed a richly-woven shawl. He then stepped toward the ladies. "Miss McQuarrie," he said, gallantly, "accept an ear from the field of Wedderburn Brothers and Hagart;" and saying so, with a deft hand he whipped the rich covering around Miss McQuarrie's shoulders.

At the moment Mrs. Hagart's face was very pretty with smiles and blushes. "The very night, dear, that Alfred obtained the partnership, he told me that his first duty would be to look out for the nicest shawl he could find; and next day I went into Greysley, and, going over the whole stock, fixed on that one. Don't you think it pretty?"

"Beautiful," said Miss McQuarrie, glancing from one shoulder to the other; "and I am sure I am very much obliged."

"It is my very best design, I think, and I am twenty times more pleased than you can possibly be," said Hagart; and then Ann opened the door and announced that dinner was ready.

Hagart proffered his arm to Miss Kate, saying as he did so: "One other obligation I ask, that you will do my present the honour of dining in it." Miss Kate gave a smiling assent, placed her hand on Hagart's arm, and the pair marched out of the room and went down-stairs.

Hagart's ease, self-possession, and gallantry were new to his son, and his surprise had in it the slightest tincture of alarm. As his mother and he were now in the room alone, he gave a hurried expression to his feelings.

"You foolish boy! Your father and Miss McQuarrie are fast friends now: besides, long ago, when I knew him first, your father was familiar with fine houses—much finer houses than even this. He seems to-day ten years younger. He is at his ease, of course—why should he not? Would you have him stand awkwardly near the door, as if he wished to steal the hats; or to look as if he did not know what to do with his hands? Take my arm, John." And so, in the wake of Hagart and Miss Kate, Jack and his mother went down-stairs and entered the lighted dining-room.

The Governor of Ceylon by the time the company had seated themselves must have had the entire contents of the table by heart, and summed up the expense, so earnestly had he been surveying it since the lights had been brought in. Hagart sat down opposite, but was not yet conscious of the inquisitorial gaze. If his conduct was easy in the drawing-room, it was quite as easy in the dining-room. He seemed never to have sat at a table less richly furnished. He talked, carved, joked, and passed the wine. Jack was mute with wonder, Mrs. Hagart was in a flutter of pleasure at her husband's brilliancy—the plume which had been so long draggled in the winter rain, was now burning like a flame of fire in the sunshine. Miss Kate watched Hagart narrowly, as if making up her mind finally about him. It was evident she was pleased on the whole; but every now and again, as the talk flowed on, a curiously meaning smile would gather about her mouth, the cause of which may be divined. When dinner was over and dessert placed on the table, Miss Kate, lifting her glass, said: "I have a toast to propose. This is John's birthday, and it is only proper that we should drink his health. Your good health, John!" "Your good health, John," said his mother, looking across the table at him with happy-rainy eyes. "Your good health, my boy," said his father, stretching across his hand and shaking his son's affectionately, "and may prosperity attend you." And poor Jack, while bowing his thanks, was terribly conscious that three pairs of fond eyes were bent on him.

It may have been to hide a slight flutter of parental feeling that induced Hagart to fill out a glass of wine at this moment and raise it to his lips. Whatever might be the motive, he did pour out the wine, and it was while in the act of drinking it that he encountered the eye of the watchful portrait. Without withdrawing his gaze, he placed the empty glass on the table, and asked: "Miss McQuarrie, may I ask whose portrait that is on the wall opposite?"

"My uncle, General McQuarrie, for many years Governor of Ceylon."

"Oh, indeed!" said Hagart. He dimly remembered hearing something of that distinguished military gentleman from his wife, years ago. Somehow the general's pertinacious watchfulness, and something in Miss Kate's voice—for people who have the good fortune to count Generals in their family are perfectly conscious of the fact—troubled him. Something of his old suspiciousness of his hostess returned. He had been pluming himself on his recent good fortune; but to be a partner of the firm of Wedderburn Brothers and Hagart was nothing to having been a General and the Governor of an Oriental island. Was she thrusting in his face the family greatness? For the moment he thought so, and, struggling with this uncomfortable feeling, he trifled with his empty glass and remained silent.

Miss Kate was of course ignorant of what was passing in Hagart's mind, but although she had known, she could not have acted in a happier manner. The light tap of her glass on the table woke our friend from his gloomy reverie, and when he looked up he saw Miss Kate smiling upon him. "I have proposed one toast already," she said, "and I think, before we leave the table, it is my duty, as it is certainly my pleasure, to propose another. We will drink prosperity to the well-known and distinguished firm of Wedderburn Brothers and Hagart," and so saying she smiled on Hagart again, bowed, and put her glass to her lips, while Jack and his mother tinkled their glasses in acclamation.

A sudden tide of generous crimson rushed over Hagart's face when Miss Kate had ceased speaking. He was ashamed of his suspicions. He felt that Miss Kate could not help having a distinguished relative. He felt certain that she had no intention of hurting his feelings. For the moment he almost hated himself for suspecting that she had any such intention. And as he saw that the whole table had its eyes fixed upon him, awaiting a response, he hurriedly swallowed a glass of wine, and cleared his throat, while the glasses tinkled again delightedly.

"Miss McQuarrie," he began, "as the sole representative present of the firm of Wedderburn Brothers and Hagart, the pleasant task devolves upon me of returning thanks for the toast which you have so kindly proposed. In the name of the firm I thank you from the bottom of my heart. To-morrow, when I meet my respected partners, I shall inform them of the kind wish you have this evening expressed." Here there was another tinkle of applauding glasses, and when it was over the orator resumed.

"I have not the honour to be a General of the British army, like my friend in the gilt frame opposite; no one is likely to call me Governor, except my son"—here a smile dimpled itself round the table—"yet at the same time I may express the belief that, in the present posture of my affairs, I have some slight reason for self-congratulation. The partnership which I have gained may be a poor thing, but 'tis my own, as Touchstone says. If there be any honour in my present position, I have acquired it—as your relative acquired his military rank—by my sword." Here Miss Kate's face flew all into a beam, and she tinkled her glass tremendously, which stopped the flow of the sentences. The thread of discourse being utterly snapped, Hagart blindly possessed himself of one of the ends. "This partnership was offered to me, I may state now, most opportunely. For some time back I had been meditating a step which would have caused great changes"—here a blank came over Mrs. Hagart's face, and Jack flushed up to the roots of his hair. He knew what was the step alluded to, and having held the conversation with his father which we know about, he felt almost an accomplice —"which would have caused great changes, and made us the denizens of another hemisphere. That dream has gone like many another. I can speak freely of it now. The partnership was offered me, and I accepted it. In the name of the firm I again thank you." He had said his say, but he could not flatter himself that he had said it well.

After this speech the glasses tinkled only in a half-hearted way. The allusion to the great scheme which Hagart had been concocting, and of which till now she had been entirely ignorant, made Mrs. Hagart silent. Jack felt awkwardly conscious. Miss Kate thought it prudent to make no sign. Hagart filled out another glass of wine, and drank it, glancing up at the general's portrait as he did so, and when he had placed the glass on the table Ann opened the door and announced that tea was laid in the drawing-room.

After tea Mrs. Hagart sat down to the piano, and began to play slow pibrochs and wailing coronachs. To Hagart and Miss Kate that slow monotonous music brought back the past. Hagart remembered his early days of courtship when first he heard these melancholy airs; the happy days when Hope flew before him on brilliant unwavering wings; when he was about to make a name in art; when his wife's cheek was rounder, her hair glossier, her voice not a whit more soft, her heart not nearly so tender—the days when he would have despised the partnership of which he was now so proud. Miss Kate sat apart on a settee, and at the call of the mournful notes, from a remoter distance, there flowed over her a more sorrowful wave of reminiscence. The past bloomed for her again, but it bloomed with the flowers and herbs of sorrow—rue, the passion-flower, forget-me-not, and love-lies-bleeding. With wistful eyes she was looking back to the far-off brightness of girlhood, almost sunken now beneath the horizon of memory. Her whole life seemed filled with the sound of falling tears and the sighing of farewells. To the player, from every vibrating key there came, not so much a sound as a ghost of childhood—of her early home, her father, her sister, of the family breach which seemed so cruel, so irreparable, but which was now happily healed. She sat unconscious of everything around her, playing an autobiography. To the boy, too, seated on a low stool close at hand, the weeping music brought imaginative influences. It came to him with a pleasant prophetic sadness—a sadness which he could not translate into anything definite, but which he felt the years in their courses would translate for him clearly enough.

After Mrs. Hagart rose from the piano, the influence of the wailing music still remained on Miss Kate's party. Conversation proceeded, but only in a half-hearted way, and the appearance of Ann with the spirit-case and glasses was by all felt as a relief. They drew around the table, and Hagart brewed a tumbler of punch, and ladled out a glass to the ladies, and a quarter of a glass to his son. He then made a fresh supply for himself. Talk revived around the punch, and they became comparatively merry. Then Jack began to yawn, and his father to remember that he had next morning to proceed to Greysley by the early boat. In a short time Miss Kate rang for bed-room candles, and the party broke up. When Jack reached his own room, he hurriedly undressed, and his head had no sooner touched the pillow than he was sound asleep.

When they reached their bed-room, Mrs. Hagart wormed the secret of the great scheme out of her husband. Up till the period of the speech in the dining-room she had no idea that Alfred's thoughts had been running on Central America. Although, when he walked into Greysley after the interview with his son at the station-house, Hagart had resolved to ask Mr. Moorfields to dinner, and get him to broach the emigration scheme to his wife, and talk her over into acquiescence, he had never carried that resolution into effect. He had experienced a decided check in his son's opposition, and he was certain that his wife's opposition would be yet more decided. Unexpected difficulties rose in his way; and these difficulties he was afraid that even Mr. Moorfields' showy manners and fluent tongue would not be able to remove. Then Wedderburn Brothers' offer of partnership came, and the great idea was relinquished entirely. The emigration scheme was checked by Jack, just as Napoleon was checked at Quatre Bras; the emigration scheme was defeated by the Wedderburn

Brothers as completely as Napoleon was defeated at Waterloo. The scheme became utterly disorganised, broken and routed, and scattered to the four winds of heaven.

To his wife that night he talked about it frankly enough, and that good lady it kept long awake. She felt that, all unknown to herself, she had been toppling on the edge of a horrible precipice; and with her husband asleep at her side she lay awake, filled with the devoutest thankfulness that from her and hers this evil thing had been warded away. In the offer of the Wedderburn partnership she discerned the working of the Providence that numbers the hairs of human heads, and by whom the falling to the ground of even one of the sparrows of the air is not unregarded.

When Miss Kate reached her own room she sat down in a soft-cushioned chair near the fire; and if a spectator had been present, he would have seen her shoulders shaking with laughter beneath her rich shawl. "That poor dear innocent Hagart," she muttered to herself, "is better than a play. He marches about in his partnership, and is as proud of it as a red Indian of his war-paint and his buffalo robe, fringed with the scalps of his enemies; and his squaw looks on with admiration, and regards her lord as the greatest and the best. It's perfectly beautiful, and only needs a stage and a row of footlights. He and General McQuarrie! The partner of Wedderburn Brothers and the Governor of Ceylon!" Here the old shoulders were convulsed again. "If they but knew, the Babes in the Wood! What a stramash there would be; and how Hagart would come tumbling down like a shot eagle. He would be off to Central America at once. He never could look me in the face again after his vapouring, and his fine letters and speeches. And yet I like the man, although I can't help laughing at him. I suppose we have a kindly feeling towards the people we laugh at." Here Miss Kate got up and took her present from her shoulders, drew a chair towards the light, spread the shawl carefully on the back of the chair, so that she might have a full and fair inspection of the same. She looked at it for a considerable time, turning the chair now this way and now that. "It's very nice and pretty of the two fools to have bought me this. Very nice and pretty indeed. This is one of his designs, he says. It must have been a clever head out of which all these Indian pines and arabesques came. His talent ought to bring him to something." Miss Kate took the shawl from the chair, folded it up, and placed it in a drawer. She then came back beside the fire, and stared into it while it slowly crumbled away. The old, wailing tunes which she had heard up-stairs were in her memory again, and she was alone with dead faces and long-departed voices. Mrs. Hagart, awake in her bed up-stairs, was thankful to Providence—little suspecting that Providence was incarnated in the wrinkled woman sitting down-stairs beside the dying fire.

CHAPTER XXII.

Mr. Hector McQuarrie had for some little time, as we heard from Mr. Hook, been meditating the sending of his daughters south to Hawkhead for a season, that they might enjoy the benefit of the schools. Hector had a large sheep-farm in Skye; he had been for many years a widower, and the education of his daughters had been confided to the care of a governess. The work of education went on smoothly enough at Uanvohr. Under the care of Miss Weston the girls acquired a bold sloping style of handwriting; some knowledge of music and French; a little history, out of which the dates were continually slipping, and then the entire historical fabric came to grief, as comes a pinned-up tapestry when the pins suddenly give way; an acquaintance with the simpler English classics, *Rasselas* and the *Vicar of Wakefield*, for instance; and a thorough proficiency in needlework. This was all very well, and Hector would probably have been quite contented with the education which Miss Weston was able to bestow on his daughters, if Miss Weston had been in a position to continue her services. But Miss Weston had her love passages. Years before, her troth had been plighted to a Student of Divinity; and as this Student of Divinity—having passed his trials before the Presbytery with flying colours, and developing a very pretty gift of pulpit eloquence—had recently been presented to the parish of Crossmy-Loof by a powerful patron, the period had arrived when Miss Weston must leave Uanvohr, and, with a changed name, take her place at the head of the manse-table. Miss Weston cried a good deal when she parted from her pupils—carried away a tress of Miss Oona's dark hair which curled as if there was life in it, and a sleek tress of Miss Maggie's brown, which lay quiet and shining, as if waiting to be stroked and fondled. The girls, to do them justice, were as sorry to part with Miss Weston as Miss Weston was to part with them. There was a great to-do, an inordinate amount of embracing and kissing on the morning on which Miss Weston was to leave. The cart was at the door, in which her trunks were placed and in which she was to take her seat; the girls with breaking hearts came out to have one last kiss; and Miss Weston, smiling through her tears, promised to send them a bit of her marriage cake, which comforted them greatly.

It was when Hector was first made aware of Miss Weston's approaching marriage that he wrote to Mr. Hook about sending his daughters south. Miss Weston's marriage took place during the summer; and it was arranged that Oona and Maggy should depart in August, so that they might be in Hawkhead when the schools should re-open. It was the opinion of Mr. Hook and Miss Kate, that when the McQuarrie girls came south they would to a certainty place themselves under the wing of Mrs. Stavert at Cuchullin Lodge. Such, however, did not turn out to be the case. Hector McQuarrie hated to be under obligations to any one. He knew perfectly well that most fathers in his circumstances would have sent his girls, either to Mrs. Stavert at Cuchullin Lodge, or to his sister at Mortimer Street. He knew, too, that his girls would be made welcome at either place; but then neither at Mortimer Street nor at Cuchullin Lodge could he board his daughters. He was resolved that when his girls went south they should be obliged to no one—that every service or civility rendered them should be fairly and honourably paid for. No one should ever boast that they had patronised his girls, or taken them by the hand, or bestowed on them an unrequited kindness. Hector McQuarrie defended himself against the world by his purse. There was a cold glitter of silver coins around him that repelled all advances—quite as dreadful to affection as a cold glitter of steel bayonets. To him the whole material and spiritual world was like a draper's shop; every article had its price attached to it in plain figures—ready cash, and no abatement. When he wanted anything—a cow or a kindness—he paid his money for it and asked no discount. He was an essentially fair man: he would no more impose on his neighbour than he would allow his neighbour to impose on him. He was generous, too, after a fashion; but his generosity was one-sided: he had no idea that it is more generous frequently to take than to give. Actuated by these motives and views of things, he resolved that his girls should neither reside with his sister nor Mrs. Stavert; and he accordingly sought out a relative of his late wife's, resident in Hawkhead, and of somewhat straitened means—a widow lady, Mrs. Wilson by name—who would gladly take charge of his girls, and who would quite as gladly take remuneration for her trouble.

The house of Uanvohr sat on the sea edge, and the rolling ground behind was islanded with birchwoods, and interspersed with spaces of pasturage and arable ground. The only road which connected the farm with the outer world ran along a deep green glen which was invisible from the door. To the north-east, at the head of the narrow bay, were splintered peaks, and the huge bulk of Marsco, lined and wrinkled as the face of a crone of a hundred years, gashed right across with the darkness of a ravine. Near the shore, immediately below the house, were the huts of the cotters; and here and there among the clumps of birchwood rose thin wreaths of blue smoke from turfen dwellings, which one would almost fancy had been dropped in those sheltered places by accident. Just where the coarse herbage and the sea-sand mingled, was a boat-house; beside it boats lay sideways and keel uppermost; and right away from these, and stretching in front of the smoking huts, herring nets were hung out on poles to dry. These cotters were dependants of the farm: men and women, they had served Hector McQuarrie in one capacity or another, and much kindly feeling existed between them. The girls especially were immense favourites with these simple people. They were constantly going in and out of the smoky dwellings, bearing messages, carrying wine and cordials for the ailing child, or bed-rid man or woman stitched with rheumatism. Miss Oona, too—who had a taste for the wild and marvellous, and was fond of Gaelic songs and superstitions—delighted to escape of an evening to the cotters' huts; and, in the orange glow of the peat fire and the light of the smoky lamp, would listen for hours to the old legends of the isles. And when the stories were done, proud was young Lachlan or Donald to escort the young lady to the house, while the stars were keen above, and the sound of the making tide could be heard on the shingly shore. At set of sun, on the evening before their departure—when the bay was a golden pavement, when the splintered peaks wore fiery edges, when the upper half of Marsco was bronze, the lower half in shadow; and when the rosy light fell prettily on boat-house and waving herring nets, on the cotters' huts smoking peacefully, and the undulating retreating ground with its birchwood islands—at set of sun that evening the girls put on their hats and went down to the huts to say good-by. The brown-kilted children stood aloof, the boys pulling red forelocks, the girls curtsying, as the young ladies passed; the men at work at the doors touched their bonnets, and when they entered, the women would wipe their best chairs and bring them forward, and break out with a strange querulous whine or fond groan: "Oh, my *Cuillen*, my beauty, my bold black-eyed, that's going to leave us, blessings be with you! God keep you in his arms till you return! Oh, my darling, my lamb, my brown baby, with her mother's eyes—Oh, my pet, it's my arms that would be proud to be your cradle!"—and so on, would pour the torrent of fond ejaculation with many a tender pressure, and kiss on cheek and forehead, between whiles. "God go with you, I pray, and bring you back again, my darlings!" Miss Oona was the spokeswoman on these occasions, and her words and smiles these poor people treasured as carefully as if they had been golden pieces. On this present afternoon she had many people to see, many parting words to say. She had to visit her nurse; shake hands with the grey-headed shepherd who had carried her home in his arms years before, when she had sprained her ankle in crossing the stream up among the hills; to visit Ean, the cripple; to look in upon Duncan, who had served her father faithfully in fair weather and foul, and who was now paralysed on one side; and, generally, to make loosely-knit growing girls happy by the information that she had left one of her old dresses for them up at the house. It was dark before their visits were over, and certain of the women accompanied them to the house, invoking blessings all the way, and at the porch door there was a final bout of kissing and embracing. "Oh, my pet, my darling, my beauty, it was my breast that fed you, my *Cuillen*. God bless you, and bring you back prettier than ever." Never did girls start on a journey attended by kinder wishes than did Miss Oona and Miss Maggie McQuarrie.

Next morning Hector McQuarrie having some farm business to attend to, left the house early, promising, however, that he would ride across to the little village at which the southward-going steamer touched, in time to accompany the girls on board, and consign them to the care of the stewardess, and bid them farewell. After the master left, the house was in vast commotion. The girls' trunks and the trunks of the maid who was to attend them, properly corded and addressed, were laid on the gravel at the front of the porch door, and the cart which was to convey them and their luggage up the deep glen and over the hills was already passing the cluster of barns and coming up the road. The maid servant was standing on the gravel, and shouting something to the driver. The hour of parting had now come. The girls had been ready to start for some little time, and had kissed and been kissed by all the female servants half a dozen times in the course of the morning. But, although they had been prepared for it, the actual moment came upon them sharply. Maggie in her own room, was breaking her heart over a brown terrier pup, the sole survivor of a litter of six weeks ago, the life of which had been spared at her earnest intercession, and which she had adopted as her pet. This pup she kept in a warmly lined basket, and fed it regularly with milk from the dairy. In the keenness of her pain she had flown up-stairs, caught up the little creature from its basket, and now, while it licked her fingers, she was pressing it to her bosom, leaning her cheek against its soft side, muttering words of endearment curiously compounded of Gaelic and English, her tears falling plenteously on its moist nuzzling nose. Oona, seeking the same relief as her sister, ran out of the house, and climbed a little eminence behind, from which a view of the bay and the hills could be obtained. "Oh, Marsco!" she cried, gazing on the familiar objects through her falling tears, "Oh, Marsco! Oh, sea! Oh, birchwoods, smelling sweetly after the rain! Oh, shore and boats! I am going among strange faces; to live with people I never saw, and do not love: how can I live away from you? Will you remember me when I am gone, as I will remember you? Will you be glad to see me when I come back?" At the very moment she was speaking, great wreaths of shining vapour were lifting off the rocky front of the monstrous hill, and wet lines beginning to shine out on it like silver; but through the thick veil of her falling tears the girl could not take note of the radiant changes. "Miss Oona! Miss Oona! Where are you? We're waiting for you. The cart's going to start." And at the call of voices the girl checked her sobs, dried her face, and came running down to the porch door, where the cart was standing with the trunks, and in which the maid and Maggie were seated—the latter with eyes red with weeping, and turning constantly to the window of the room in which she had left her pet—who was by this time selfishly coiled up in his basket and fast asleep, as is the manner of all pets, human and other.

When the cart got into motion, it drew after it all the Uanvohr domestics. They were unwilling to part with the girls yet, and they walked behind and alongside, wiping their eyes with their aprons, and talking rapidly in Gaelic. So accompanied, the cart reached the end of the road running from the house, and began to dip down into the long green glen. Here the cotters were assembled, men and women, to bid their young mistresses farewell. The cart stopped for a little, and then there was another bout of kissing, embracing, and hand-shaking, the air the while undulating with ejaculatory blessings. When the vehicle proceeded, the people remained, and Oona and Maggie could see them waving their hands till the rising ground hid them from view. The cart was now in the green solitariness of the glen, the parting was entirely over, the tears were dried on the girls' cheeks, and right a-head the steep road could be seen climbing up through the clumps of birchwood. The steep road was reached, and Donald the driver came down and walked alongside. When the cart was half way up the ascent, Marsco, azure with distance, became visible, the great wreath of vapour risen entirely from his crest and floating above him. Oona knew that at this point she would see the last of her mountain friend. "See Marsco, Maggie!" she cried. "There's Marsco bidding us good-by; he is taking off his cap to us." The quick pang was over; there was room for the play of fancy, and she kissed her hand to the mountain as if it had been a lover. "Don't you think he will be very lonely without us?" Maggie made no reply. She did not care in the least for Marsco; to her the terrier pup was metal more attractive.

When they reached the white village the first thing they saw was their father's red pony, Roger, haltered to an iron ring beside the merchant's shop. In a moment after, Hector and the merchant came out from the shop and assisted them to alight. At the village the girls had dinner, and meanwhile their trunks were placed in the boat which would pull out to meet the steamer. Dinner was no sooner over than the red-funnelled steamer lay-to in the bay, waiting passengers. The boatmen were getting matters to rights at the shore, Hector hurried his daughters down, the boat was pushed off, the stalwart fellows bent to their oars, and in a short time they were alongside the big vessel, the passengers looking down on them from the bulwarks. When they got on deck, there was little time to spare. Hector took the girls down-stairs, procured a berth for themselves and maid, commended them to the best attentions of the stewardess, whom he privately tipped. He then carried the girls up to deck again, for the steamer bell was ringing departure, and the boatmen alongside were getting impatient. "Now, dears," he said, as he kissed them, "you will be very comfortable, I hope. Write me as soon as you arrive. Mrs. Wilson will be waiting for you, and will have everything nice. You will see your aunt Kate and Mrs. Stavert, and you will remember me kindly to both. Now, Oona, good-by; good-by, Maggie. Be sure you write;" and as he kissed them for the last time, a tear glistened in his grey eye, as a rain-drop glistens on a flint.

The boat was thrown off, the paddles of the steamer churned the water into pale green foam, two handkerchiefs fluttered from the bulwarks, to which Hector waved his hat, and in a short time steamer and boat were invisible to each other.

The McQuarrie girls reached Hawkhead safely and in due course. They were received by Mrs. Wilson on landing; they attended a fashionable and flourishing institution for the education of young ladies; they called at Cuchullin Lodge and at Mortimer Street; and it was on a Saturday afternoon at Mortimer Street—Miss Kate had asked Oona and Maggie to bring over their needlework, and to spend the evening with her—that Jack first saw his cousins. That meeting he can remember perfectly to this day, although so many years have since then come and gone. The meeting was interesting in itself; and, besides, it was the next great event in the boy's life since the memorable dinner at which his father and mother were present.

When Jack entered the drawing-room on that Saturday afternoon, he was formally introduced to his cousins. He went forward, and a tall girl with a pale face, and black hair and wonderful black eyes, rose from her chair and took his hand, and hoped he was well, in an accent in which there was a foreign something—like the smell of the sea in the air—which was not unpleasing. This tall girl, dark-eyed and dark-haired, Jack knew to be his cousin Miss Oona McQuarrie; but he felt that their cousinship would not bring them one whit nearer—at all events, *he* felt that he could not presume upon that relationship. If it was ever fated that they should like each other, their cousinship would not help them to it; would perhaps be rather a stumbling-block in the way. There was a curious something in Miss Oona's manner which struck the boy—curious to him, but perfectly natural in the circumstances. In the first place, the girl was Jack's senior by two or three years, which made a vast difference; then Miss Oona, having heard of Jack, was a little curious as to the sort of cousin he should turn out to be; and with her hand still in Jack's, and with the foreign silver of her accent in his ear, she was endeavouring to come to definite conclusions concerning him. And to all this there may be added a certain hauteur of bearing; the natural reserve of unfamiliarity; and the just as natural condescension of the elder girl to the younger boy—it was these things in Miss Oona's air and manner, and felt at once by the boy's quick instincts, which gave Jack the impression, as he stood with her hand in his, that between them there was a gulf which cousinship should never be able to bridge. But this sense of subtle distance between the two was productive of benefit in another quarter. When Jack entered the room, Maggie rose as well as Oona, and—her cousin and her sister shaking hands—being aware by some swift clairvoyance that there was a jar somehow, she was naturally impelled to give the strongest expression to her own feelings, not only to gain relief to herself, but to cancel for Jack the slight hitch which she knew had occurred. So, when Jack turned to her, standing with her white dress and brown hair a little farther back in the dusk of the room, she came forward frankly, with her face all in a smile, and placed both her hands in Jack's, who felt at once that although their acquaintanceship was barely a moment old, he had known his pretty cousin for years and years. In fact, this sense of intimacy seemed to run away back as far as consciousness extended; and it was impossible for Jack to conceive a time when he had not known her. He had not sat by her side for five minutes till she had flowed in, filling up all the gaps and interstices of his life.

Jack slipped into an empty chair beside Maggie, and Miss Oona, who seemed entirely unaware of his presence, resumed the discourse which his entrance had interrupted.

"I have told you about our dancing master, but M. Lessels, the old French teacher, is the funniest and dearest little old man. He is as thin and brown as an old fiddle, aunt, and wears the greyest beard. It is such fun to see him open the class-room door with a sliding step, to take a pair of white gloves out of his side pocket, to draw them on his withered fingers, to fold back his coat cuffs, and then to proceed to business with a bit of chalk on a black board. He is a polite and ceremonious fossil. And he has the keenest feelings, too; for if one of the girls makes a mistake, he smites himself on the forehead with his white-gloved hand. Many a time I have made him smite his poor forehead."

And here Miss Oona laughed a little liquid laugh.

"I was without my lesson one day, and he was nearly distracted. He smote his forehead in despair; 'Ah, Mees McQuarree, I do not know what to do with you, you will be my death. You will be one honner, two honner, *five* honner years at the verb *avoir*, and you will not have it at the end.'"

It was a fact, although Miss Oona did not choose to mention it, that on the evening preceding M. Lessels' outburst, when that young lady should have been busy with her French grammar, she had been crying her eyes out till long past midnight, over the pathetic pages of *Thaddeus of Warsaw.*

"But my dear——" began Miss Kate, somewhat reproachfully.

"Oh, I hate French," cried the young lady; "I can't get on with it at all. I am sure I would learn my lessons if I could. But, to go on with M. Lessels. The other morning I was a little late in entering the class-room. He did not notice me when I came in, and I heard him say, 'Mees McQuarree is not here—of course. It is her translation day, and she will not come.' 'Good morning, M. Lessels,' said I, handing him a small moss-rose for his button-hole as I passed, and taking my place. 'Ah,' cried he, skipping back a pace or two, 'here is Mees McQuarree, and on her translation day! Will she have her translation with her?' 'This is *not* my translation day, M. Lessels.' 'Then that is the way you have come. Ah, Mees McQuarree, you will be my death, you will be my death.' And yet I think M. Lessels likes me better than any one of the girls."

"What makes you think that?"

"Because he has asked me and Maggie to tea once or twice, and I don't think he has asked any of the other pupils. He has a sister who is as bony as himself, who snuffs, wears ringlets, puts her poor hands in black thread mittens, and is as sentimental as a novel. If you just saw him, with his grey hair frizzed, and his white waistcoat on, in honour of his guests. We drink tea. M. Lessels plays on the flute, Mam'selle warbles a little French song like a canary, and when that is done the old gentleman talks of the Emperor with tears in his eyes,—for he was a soldier in his youth, and fought at Wagram, and other great battles. He showed me a medallion of the Emperor the other evening. What a beautiful face it was, aunt; what a mouth and chin. To think that such a man spoke the language almost makes me in love with French."

"Buonaparte was a great rascal, and his father was an obscure Corsican attorney," said Miss Kate, with some spice of asperity. "It would be better if M. Lessels taught you more French, and talked to you less about the Emperor, as he calls him."

Miss Oona rose in a coaxing way. "Now, aunty, don't be cross, or think me careless. My tongue runs away with me at times, and I am more attentive to my lessons than I say. I am indeed. To show you that I am industrious I have brought you this," and Miss Oona opened a little bag, and laid a piece of ornamental needlework on Miss Kate's knee, the precise nature or use of which it may be excusable in a male chronicler to be in ignorance. "Miss Stevens told me that I have produced the best bit of work this session."

Miss Kate looked at the needlework for a moment in silence. She then, without saying a word, opened the door of a cabinet, and took out a roll wrapped up in paper. "Look here, girls," she said as she resumed her seat, and opening the roll revealed a sad-coloured sampler. "I worked that when I was younger than either of you. And I was placed at no fashionable school, and had no fashionable mistress either. That was done before M. Lessels' Buonaparte was heard of."

The work of art spread on the old lady's knee was of the most curious description. In the centre was a many-windowed mansion, with an avenue running up to it, and fringed with triangular bushes. In the corners, right above the mansion, were trees of the knowledge of good and evil,—an Adam with an apple standing beneath the one, an Eve with an apple beneath the other, the serpent's mouth at her ear. Beneath the mansion, and on either side of it, two flying stags were represented, with their horns laid back and hounds after them in full cry. Around these images was worked an ornamental border; and just within the border meandered a scroll with the legend, "Catherine McQuarrie, whom God preserve, 1777." "You could not do that," said the old lady, "with all your teaching."

The girls were loud in their admiration. "What patience you must have had," said Oona. "Your fingers must have been nimbler, and your needles finer than ours."

"How very dim it is, Aunt," said Maggie; "all the colour has gone out of it."

"As it will go out of your cheek some day, if you live long enough," said Miss Kate, rolling up the sampler hurriedly. "It has faded, like myself, dear. Now, John, if you ring the bell, I'll tell Ann to bring up tea."

When tea was over, Oona went to the piano, and as Jack and Maggie were thrown together again they had some little talk.

"I did not know that I had a cousin like you," said the girl, "and I am very glad."

"But I knew you were my cousin, for Miss McQuarrie told me," said Jack.

"You are away from home, just as we are away from home?"

"This is my home now—but I have another."

"Were you sorry to leave home? Had you a soft brown beautiful terrier pup in a basket, which you were sorry to leave? I had."

"No; but I was sorry to leave my mother and Martha."

"Who was Martha?"

"The maid servant at home: we had only one."

"Oh! papa has a dozen. But then some of them milk cows and churn butter. Were you ever in Skye?"

"No, never."

"Would you like to go?"

"Very much. I have heard my mother speak about it."

"Oh, you must come in summer some year, and I'll show you everything,—the pretty flowers that grow in the pools of sea-water among the rocks, and the grouse eggs amongst the heather. I like Skye far better than Hawkhead."

"Do you. Why?"

"Because I have so many pets there."

And so on. The pauses of Miss Oona's music the boy and girl filled up with such bald disjointed chat, and became very intimate and confidential in consequence. It was very pleasant to Jack and to Maggie. The latter part of the evening sped much more rapidly than the earlier. In a remarkably short period, Miss McQuarrie's drawing-room clock struck ten, and then there was a thundering ring at the door. The maid had arrived in a hackney coach to take the young ladies home to Mrs. Wilson's.

When they were gone, Miss Kate said, "Well, John, how do you like your Highland cousins?"

"I like Miss Maggie best."

"Why?"

"I don't know. I suppose because she speaks to me."

"Don't you think Miss Oona pretty?"

"I can't say. I couldn't see her face for her eyes."

"Why that's the greatest compliment you could pay her eyes. I must tell her the next time I see her."

OCTOBER.—THE GREEN HILL-SIDE.

A SONG for dun October,
That tints the woods wi' broon,
And fills wi' pensive rustling
The wooded dells aroun';
While lintie, merle, and mavis
Nae langer pipe wi' pride,
Nor larks wi' song salute us
On the green hill-side.
Auld nests are noo beginning
To peep frae woods fast thinning,
And wi' nae thocht o' sinning
Lairds death are scatterin' wide;
While some are grumblin' sairly
O' fields that yield but sparely:
But Nature yet looks rarely
On the green hill-side.

What though our posie borders
In waefu' plight are seen,
Though stocks and staring dahlias
Hae tint their summer sheen,
Thy hoary dawns, October,
They ne'er were meant to bide,—
Unlike the halesome clover
On the green hill-side.
Though Robin's town-notes swelling
O' summer's flight are telling,
A sober thought compelling
That nane would seek to hide,
Shall we at hame sit chaunnering,
O' frost and famine maundering,
While wiser folks are wandering
On the green hill-side?

We'll see the souchin' peesweeps
In gathered flocks prepared,
To leave the glen and meadows
Whare love's delights they shared;
Their cheerfu' cries we'll hear nae
As owre our heads they glide.
Poor birds! they part in silence
Wi' the green hill-side.
And though nae lambkin's gambols
May cheer us on our rambles,
O' hips, and haws, and brambles *
Ilk brake we'll reive wi' pride,
And pu' the lingering gowan'
Whare, late, the cluster'd rowan,
In scarlet grandeur glowin',
Graced the green hill-side.

When streams the gouden sunset
Frae 'tween the hills and cluds,
While hangs the double rainbow
Aboon the sparkling woods,
In the herald lull that tells us
The storm-king by will ride,
Oh! wha would haste in terror
Frae the green hill-side?
What though the cluds close o'er us,
And glens grow dark before us,
Some bush frae blustering Boreas
Will ample beil' provide;
While thoughts we lang shall treasure—
The bairns o' purest pleasure—
Shall leap in canty measure
In the green hill-side.

Oh ye wha life are wearin'
Amid the city's smeek—
It's no' in noisy taverns
Ye Pleasure's face should seek.
'Mang "social tankards foamin'"
She cares nae lang to bide;
But weel she loes the freshness
O' the green hill-side.
For summer's flight she cares nae,
And winter's frown she fears nae;
To slight poor Toil she dares nae,
Nor frae him seeks to hide;
By burnies murmuring sweetly,
At morn or e'en she'll meet ye,
And wi' a smile will greet ye
On the green hill-side.

DAVID WINGATE.

* "Hips, and haws, and brambles"—wild berries.

WRITTEN AT SEA.

No. I.

I DID once chance in my dreams to meet one who had never seen the sea. He told me he thought it must be like a very great pond, wherein were always to be seen a crowd of ships with all their sails set, and whales and such like creatures swimming up and down among them. It has since appeared to me that some of those who have seen what he thus imagined, conceive of it no less unworthily—some indeed as unworthily, others only insufficiently. But who knows the sea aright? Its liberty, its variety, its joyousness, its magnificence, who can tell? John Bull's wont is, when the city grows too hot, to air himself on the sands, where he daily peers out for sails through a glass, and curiously wonders what he will do till dinner-time. It grows more and more his wont also to cross "the perilous narrow ocean," at its narrowest; but what a wonderful compound of unsavoury thoughts must the sea conjure up after such experience of it! "A very ancient and fish-like smell," to begin with; the shivering joy of a morning dip; bad novels and Marine Parade gossip; tar, shrimps, and certain queasy reminiscences of the mid-channel, not to be dwelt on:—surely the sea is "a joy for ever!" To speak seriously, coast associations are (*me ipso judice*) neither noble nor very delightful. It is better to have the cobwebs of city offices blown away after this manner than not at all, and children make perhaps cleaner dirt-pies of sea-sand than of anything else; but as to the romance or grandeur of the thing, why, one might as well read Dibdin's Songs. Sea-songs, like sea-novels, reflect nautical life fairly enough, its dash and roughness, its boyish pranks and dangers gallantly met; but nautical literature, whether in prose or verse, conveys an idea of the ocean just about as satisfactory as summer-lodgings at the coast do, or a four-hours' passage by steam. Yet out of these veracious sources, most people have to pick up what thoughts are in them of God's greatest earthly creature.

Some there are indeed, more familiar with it, in whose breasts "the rough rude sea" awakens far other thoughts. To timid dwellers on the coast, familiar with wrecks and breakers, with loss of life, and the dismal nights through which women keep signal-lights burning in their cottage-windows, it is a name of terror, a thing made to be the devourer of brave men,—hungry, insatiable, cruel. It is mournful to know how good reason the registers of shipping casualties afford for such a feeling in the coast population. This penalty we islanders must pay for our insular security and maritime wealth. Like

> 'The virgin tribute paid by howling Troy
> To the sea-monster,"

our annual offerings go down to the ever-opening jaws of the monster which roars round our border. The Minotaur is never appeased. By what payment, or how costly, shall we buy one year's immunity? There is a track all down our history and literature of this sacrifice to the seas. King's children have been victims; Sir Patrick Spens never "came sailing to the land;" young Lycidas was musically mourned in immortal verse; first-rates have gone down, not always with the roar of battle doing them military honours, but even in silence and still water; whole families perish, and hecatombs of souls in "Royal Charters" and the like. Such things are written, sung, and told; but of the yearly dole of petty wreckage which the sea takes from our coasters and fishing craft, what memorial lives, save a prosaic line in some shipping chronicle, or the weeds which here and there a widow wears for the broken and obscure remainder of her days? The jewel of an English home is swallowed where no diver can reclaim it; the sea is never the richer for it, but alas, that home is poorer! Is there not good cause that the seafaring folk who fringe our land, should think a great deal more anxiously of weather signs and storm-drums than about the æsthetics of the sea?

Seamen as a rule view their own element through eyes too exclusively professional. What profession indeed is alive to either the philosophy or the poetry which is in it? All of us run so deep down into the groove which tradition and routine wall in on either hand, that we are unable to peer over the rim to scan the wider bearings of our work on the great world without, or even stand aside to view our own place in the commonwealth of men as outsiders view it. There is that about the daily business of the meanest which might stir thoughts in the wisest. Some humble callings converse with nature close at hand, or as it were in her private workshops; and others are brimful of unwrit heroics; yet, as the soldier does like a martinet what others sing in bounding verse, so the peasant or shepherd will stride with heedless whistle over unregarded glories of the field, and the sailor will hear with listless ears the mystic music which ocean dashes day and night around him. To minds even of most tender observation there is over everything a bloom which, like the down of peaches, use will dull. Things near, though small, fill up the eye; and in this life of action, that which must be done, often done, and done well, with thought and care, for needful ends of existence, may be forgiven if it shut out things great and lasting, which press less closely on us.

I found a hint to muse from after this manner in a speech made the other day by one of our ship-officers, as he and I leaned together on the bulwarks, and watched the blue water glide, flecked and eddying past. "Ah," said he, lapsing into a moralising humour, "it is wonderful, when one thinks of it, what one sees at sea! Here is the ship to begin with: I wonder often how her masts stand such pressure on them, and don't snap!"

"Very wonderful," I said; but thought it more so that the petty belongings of one's craft can so creep into a soul and choke it up that it shall see no greater thing beyond it. But who of us can boast himself here above his brother? We are all too straitly cribbed and cooped within the things we handle. God give only that what is seen and temporal do not quite intercept faith's sight of those things, invisible and eternal, in which our higher life rests! It will matter less if in our small, narrow-visioned way, we see to work true to God, and bear ourselves nobly; duty is noble, wrap it up never so meanly. To such there will come a day of the loosing of these bonds from the spirit and a sudden widening of the soul's horizon.

I believe it will be found on reflection, that to most people the sea calls up a train of grander ideas than can be accounted for by anything they have ever seen of it. My dream-born friend, of whom I spoke, did not appear to me satisfied that his description quite equalled his own idea, though he found no better words to express it. The reason I take to be, that of this, as of most objects in nature, the vulgar conceptions which float loosely through men's minds and colour ephemeral writings, may be traced less to personal observation than to the language of thinkers and poets. Persons even who could not cite a single passage from either poet or thinker, are yet unconscious heirs to that larger "public opinion," which, generated by a long line of great seers, is broadened from one century to another, and being through reading and converse adjusted as well as diffused, comes to hang like an atmosphere around every subject of permanent moment and be a common patrimony, which the thoughtless ignorantly accept, and the most thoughtful cannot, if they would, decline. To the poets, especially, we owe whatever images of dignity connect themselves at once with the naming of the ocean. We conceive of it as they have seen it for us. Its vastness, still more its fury or terror, the unsearched wealth it holds beyond recovery, the restlessness of its motions and the dolefulness of its voice, with the triumphs of discovery, colonisation, trade, and war, which have persuaded us to claim almost national property in it: these features outline the picture of ocean, vague indeed, but large, which our poets have traced. It is not a complete, nor in every point a correct picture. In respect of both correctness and completeness we suffer possibly from this, that nearly all our chief English poets have known the sea only from the shore. Numbers, like Milton and Wordsworth, travelled abroad and visited southern shores; but, unless we can except Lord Byron, I do not recall one who was much at sea. For more reasons than those already hinted at, this puts the poet at a disadvantage. Lady Mary Wortley Montague has said, and Sir Walter Scott confirms her saying, that that portion of any country where its highlands descend into the flat land affords the most romantic scenery. By parity, it may be supposed that the most picturesque, as it is the most perilous, part of the sea should be the coast line where it meets the land. Perhaps it is so; but it does not follow that it is the part where the characteristic peculiarities of ocean most appear. For example, the coast is certainly the best place to learn the terribleness of waves; for, as those passions which run deep, so long as they have clear way, conceal their force and keep a steadfast front, but, being crossed, will chafe against that which hinders with senseless and destructive fury, so the violence of water is best seen where it finds a solid obstacle to stay its rush and fling it back, spent and baffled, upon the next following waters at its back; where also its effects remain in jagged cliffs tunnelled by the untiring waves, and a strand strewn with the morsels they have gnawed from the rock. But, for this very cause, it fails to show the natural action of undulating water; in truth, waves far out in open sea, and those which break upon the shore, differ so widely that, as far as I have observed, their whole moral significance suffers a change. Give them sea-room, they rise before the breeze with an easy natural curve, and heave their crests in licensed sportiveness till the topmost particles of water leap from their place into the air; and, falling back, spot the now hollow and receding wave with crisp white foam. Their whole motion is free, unchecked, instinct with life. It suggests joyful exercise of strength, with more strength in reserve. I never yet looked on the agitated surface of open ocean without being aware of this gladsomeness in its waves. They seem to toss themselves on high in good-natured rivalry of each other; now and then one bigger than the rest outleaps his fellows, to sink again with a sibilant gush, which for a moment drowns competition. All the while there is a cool plash as of intermittent cascades, a sound, hoarse, not dissonant, which dies and swells with the brisk breeze like the laughter of sea-gods at play. It is true, large waves, like their playfellows the porpoises, gambol heavily, with a lazy, elephantine carelessness, which seems to say, "We could, an if we would." But there is no touch of malice in their mirth; theirs is the excellence "to have a giant's strength," but not (you think) the tyranny to "use it like a giant." No doubt when your Lilliputian hand-built barks adventure themselves in the play of giants, they may chance to come by shrewd blows. If athletes box or strip for a fall, though it be a holiday match, what mother will trust her boy in the mêlée? I have seen considerable waves, but, at their roughest, never lost the feeling that, however it might prove death to us, it was not the less their sport. Leap they ever so wildly, there is about their majestic and unhampered sweep of moving curves a certain fearful exhilaration, compounded of gleefulness and terror, such as I never elsewhere experienced. It contrasts curiously, by the way, with the effect of falling water. Standing before a cataract which falls dense and wide in a single volume, the mind is stricken, crushed, stunned; partly because the roar is without variety or pause, partly that the heavy mass by its own weight moves sheer down, for ever down, as if it would bury itself and us together in the pool beneath. Whereas, here at sea, the prevailing motion is upward; the water seems against its own weight to rise, not as compelled, but spontaneously, seeking the upper air with the fitfulnesss of life in lightsome and ever-varied and renewed leaps. Of course the arrested leaper must return upon himself. Even in open water, that line in "Locksley Hall" about

> "the hollow ocean-ridges roaring into cataracts"

recurs to remembrance. But Tennyson—who, though not what is called a descriptive poet, abounds in touches exact enough to soothe the soul of a pre-Raphaelite—meant these words to picture the surf which breaks on a low shelving sand-beach. And rightly, for the top of a billow whose bottom part has grounded must fall over on the shore with a dull cataract-like roar, unlike the living plunge with which, when their force is spent, the deep sea receives its waves back into its own bosom. Besides, whatever depression the mind perceives in this reaction or ebb of a wave, is checked by the fresh leap which succeeds even while the eye looks, not to name the myriad brother-waves which leap all round.

I have dwelt on this buoyancy of waves in mid-ocean the longer, that I recall scarcely a passage in any poet which does justice to it. Poets, like the rest of us, have been more familiar with their aspect from the shore. The good old stock-terms, too, by which people describe the sea in agitation, as when they call it "angry," or "raging," or "cruel," or "fierce," are coast-bred. At times, no doubt, they have been suggested in a storm by the terror of the voyager, whose imagination, roused through danger, sees wrath in that which would engulf him, and credits the waves with purposing in malice what they by simple accident effect. But this belongs to higher poetry, the epithets cited never could have become what they are, conventional stuffing for every declaimer's periods, but for our familiarity with waves which lash the coast. Still more is it so with such adjectives (dear to some modern "spasmodic" rhymers) as the "hungry," "greedy," "creeping," or "crawling" wave, and the like. No wave left to itself ever demeans itself, or could appear save to a morbid fancy to demean itself, by "crawling," for example, like a reptile. Yet on the shore even this basest word becomes descriptive; for see what admirable use Kingsley makes of it in the best of recent ballads, to mark the slow, deceptive, deadly advance of the tide over a dreary reach of wet slime at the mouth of a tidal river:—

> "They rowed her in across the rolling foam,
> The cruel crawling foam,
> The cruel hungry foam,
> To her grave beside the sea."

It is verily the last noble attitude one can catch old ocean in, this same landward creeping of the tide. It eats up morsel after morsel of the shore, yet hugs it close in its wily arms. It glides so softly one can hardly hear it, yet overlays the land with death as cold as fate. It grovels flat at one's feet along the oozy mud; and, since we must step back, who shall forbid us to give it hard names as we go? But I had rather see it rage than creep, better it should thunder proudly in upon the land before a stiff breeze, so it keeps a manly place. Each wave races up the firm white sand upon its feet till it can run no farther, then, falling prone, dashes its head forward, impatient to claim the higher strand. Its spray flies up, and the roar with which it rattles the pebbles is heard far inland. Better still and nobler is the wrath of breakers against a rock-bound coast, where dry land breasts the flood, not bows low to meet it; no man can then believe the sea to be in sport. Its remoter waves toss free enough; but this last one which, in the full height and middle of its course, smites upon black rock, whose foundation, deeper than its own bed, is fixed of God for ever, does visibly resent the shock, for you see it fling itself, white with rage, far over the outlying fragments at the cliff's base and up in spouting jets of foam towards the very summit of the headland, as if it scaled a rampart to take forbidden land by storm. Beat back with deafening uproar, it sucks in its strength, withdraws its foot, and coils its back once more for a fresh advance.

Thus the awfulness of sea-action on the coast is drawn from resistance offered successfully to the moving body by a fixed one. It is no longer power in free exercise, but power broken in conflict. Two forces meet: one active, with the momentum of motion; the other at rest in passive resistance: the one warring, the other warred upon. They necessarily become types; the land in its feeble yet impassable sand-belt or towers of "ragged" granite, of all that is inflexible, whether in divine decree or human purpose; the other of passion, which, though weak (being essentially an incoherent thing), draws wild strength for a time from its headlong rush, and is for ever dashing itself to pieces against eternal law and the will of the righteous. The moral limit imposed on irregular desire is as certain as the "bars and doors" which, in the birthday of ocean, God "set" to "stay" its "proud waves." Nay, more so; for "though the earth be removed, and though the mountains be carried into the midst of the sea; though the waters thereof roar and be troubled, though the mountains shake with the swelling thereof," yet is "God a Refuge and Strength" to him whose firm purpose for the right is built trustfully on the Rock of Righteousness. Around the calm of Him who keeps silence, the violence of evil continually rages; against His strength of Justice it beats in vain.

BETHLEHEM, WITH THE CHURCH OF THE NATIVITY AND CONVENTS, FROM THE NORTH.

EASTWARD.

BY THE EDITOR.

IX.—BETHLEHEM TO SAMARIA.

Of all the places in Southern Palestine associated with Scripture History, Bethlehem is on the whole the most picturesque. The three convents attached to the Church of the Nativity, which crown the summit and the ridge on which the village is built, wear the massive and dignified look of an old mediæval fortress. The terraces, which, like gigantic stairs, descend to the lower valleys and the small alluvial plains and cornfields, have a fine bold sweep, and are rich in olives and fruit trees, the shade and verdure of which relieve the eye from the dazzling glare of the white limestone rocks and soil. The hills around are higher, and more varied than those which border the upper plateau, the cone of Jebel Fureidis breaking their otherwise tame outline, and the mountain ridge of Moab rising with its noble wall against the eastern horizon.

The "sacred localities" of Bethlehem are all seen under one roof. One can here pace along the oldest existing Christian church in the world. It was repaired by King Edward IV. of England; Baldwin was crowned in it; and it was built centuries before by the mother of the first Christian emperor. It is a noble structure, though it has but scanty ecclesiastical furnishings. In spite, therefore, of its roof, made from the cedars of Lebanon, and its grand rows of marble pillars, it looks cold, bare, and uncared for. It is possessed in common by the Greeks, Latins, and Armenians, whose chapels occupy the choir and transepts only, and whose respective convents, like competing places of business, are attached to its walls. The decayed state of its unoccupied nave tempts one to ask whether catholic love really calls forth the same amount of self-sacrifice for the building and repair of churches, not to speak of other "religious" works, as sectarian zeal does.

Beneath this old church, and reached by a number of steps cut out of the living rock, is the cave of the Nativity. Here, surrounded by the usual amount of tinsel and tawdry ornament, lamps, altars, and incense, is a hollow recess, in which it is alleged the Saviour was born. It is possible that this tradition, which can unquestionably be traced to a very early period, probably the second century, is authentic. The fact of cattle being kept in caves or grottoes, affording easy access and excellent shelter, is sufficiently common even now in Palestine, to warrant us in admitting that this cave may have been used as a stable.* But in spite of all probabilities in its favour, I could not associate the Incarnation with what the eye saw here. The spectacle did not help my faith, or even harmonise with it, as did those scenes in nature, associated with the life of Jesus, which the priest has not yet attempted to improve. Bethlehem itself—its lovely hills, its very air, with the blue sky over all, impressed me infinitely more.

Close to the sacred cave is an historical spot of unquestioned authenticity. It is the small cell where Jerome lived and died, fourteen centuries ago, and where he composed the Vulgate, and wrote treatises and letters enough to compete, in number, with those of John Calvin, or any other of those marvellous men who managed to attend to the affairs of Christendom, and at the same time to write whole libraries. The places in which such men lived give life to history. Their "local habitation" restores their personality, and gives substance to what might otherwise become a mere name. I know not what Jerome would think of many of our modern controversies, in which his authority is claimed by each of the contending parties; but it is a comfort to believe that when he lived he must have had fellowship with all who like himself delighted to realise the presence of Jesus, and to worship Him as God manifest in the flesh. And how much more must this be the case since he has gone to glory.

But it is not, of course, what one *sees* in Bethlehem which imparts to it such overwhelming interest. It is the one fact of all facts, the secret of the world's existence and of its whole history,—the Incarnation. Other events indeed are necessarily suggested while sitting under the shade of its old olives, gazing in silent meditation on the surrounding landscape. From these mountains of Moab came Ruth and Naomi. One of those fields stretching like a green landing-place at the foot of the broad stairs of cultivated terraces, was the scene of that exquisite idyll of Ruth gleaning "amidst the alien corn," which sanctifies common life, shedding a glory over every field of reapers, like that which rests over the lilies of the field, and is greater far than any which Solomon ever knew. To those far-off hills too, David sent his wives for safety, just as a Highland chief in similar circumstances would have sent his wife in the days of the clans, to relations, "far removed" it might be, yet strong in the ties of blood. David himself, first as the shepherd boy, and then as the brave chief, seemed again

---

* A writer, in *The Christian Witness* of last year, adduces some plausible reasons against the almost universally received opinion that the visit of the Magi was made to Bethlehem; and in favour of its being to Nazareth. It appears from Luke's narrative, that the Holy Family went from Jerusalem to Nazareth *immediately* after the presentation in the temple, or forty days after the birth of the child (Luke ii. 22—39). And Matthew informs us that immediately after the visit of the Magi they went to Egypt (Matt. ii. 14). It is true that Herod directed the Magi to go to Bethlehem, and that they probably left Jerusalem with that intention, but whether the *house* which the star led them to was in Nazareth or Bethlehem is not specified. The time required by Herod to hear of the birth of the child; to call the council of learned doctors to consult as to the place of His birth; to enquire diligently of the Magi as to the star; and then to order and complete the massacre, would seem to demand more time than forty days. The slaying of children whose maximum age was two years, would strengthen the idea that some time had elapsed ere Herod made up his mind to perpetrate this horrible *coup d'état.*

> "To walk in glory and in joy,
> Following his *sheep* along the mountain side,"

himself guided by the Lord his Shepherd. And it must have been the water of that old well, which still sends forth its living stream, that David longed to drink of. But these and other memories are lost in the story of David's Son, born in Bethlehem, "the least of the thousands of Judah."

The imagination gets bewildered in attempting to realise the facts connected with the Nativity. They fill the heavens above and the earth below with their glory. We instinctively look up to the sky and then to the hills, and dream of the night when the Angel of the Lord announced the birth of Jesus to the humble shepherds somewhere hereabout. On that ridge? on those knolls? in that mountain recess? In vain we ask! What we do know is, that as the Aurora flashes across the midnight of the North, so there once gleamed a heavenly host athwart this quiet sky, and filled it with the "Gloria in excelsis" which gives the only true promise of the world's redemption from evil, and restoration to God's immortal kingdom of righteousness, peace, and joy. We can never weary of the simple and sublime narrative:—"And there were in the same country shepherds abiding in the field, keeping watch over their flock by night. And, lo, the angel of the Lord came upon them, and the glory of the Lord shone round about them: and they were sore afraid. And the angel said unto them, Fear not: for, behold, I bring you good tidings of great joy, which shall be to all people. For unto you is born this day in the city of David a Saviour, which is Christ the Lord. And this shall be a sign unto you; ye shall find the babe wrapped in swaddling-clothes, lying in a manger. And suddenly there was with the angel a multitude of the heavenly host praising God, and saying, Glory to God in the highest, and on earth peace, good-will toward men. And it came to pass, as the angels were gone away from them into heaven, the shepherds said one to another, Let us now go even unto Bethlehem, and see this thing which is come to pass, which the Lord hath made known unto us."

As we read of these things we ask with surprise, Did they actually happen here? Is this Bethlehem?

Such questionings lead me to notice a thought which constantly forced itself upon me in Palestine. It was as to the altered impression which I would receive from the landscape through my rejection of the supernatural facts associated with it in Scripture History. Palestine, as the reader knows, is full of historical memories, which are not confined to any one spot, as for example to the capital, nor to one or two well known or more favoured localities, but are scattered all over the land. Almost every town and village, every hill and stream, recall some Bible narrative of persons or events. And a great portion of these, to us the most momentous and important, belongs to the region of the supernatural, or the miraculous. For verily Heaven lay about the infancy of the church of God, which was cradled and nursed in this Holy Land. Angels ministered to its wants, guided its tottering steps, defended it from every foe, revealed to it visions of its future glory, and sang to it songs of praise. Everywhere its tutors and governors had power given them to do works of wonder in the cause of truth and mercy.

Take away this supernatural element from Palestine, reduce everything to the mere patent facts of ordinary life, and it seems to me like separating the glory of the illumined atmosphere and sky from the earth; or like eliminating from man all that belongs to him as an immortal being made after God's image, with all the manifold mysteries which that creation involves, and reducing him, by the aid of chemistry, into the carbon, silica, and other constituents which compose his material being, so that he may be seen and handled, and his existence reconciled to science.

When I was in Greece, and gazed on that bright and glorious land from the Acropolis of Athens, I felt there was no mingling of the natural with the supernatural. That land of philosophy and poesy had its myths, no doubt, and its beautiful romantic dreams. Its rivers, valleys, and mountains are resplendent with the creations of the mind. These, like clouds illumined by the sun, brood over spots made for ever famous by heroic deeds, or by the teaching of great thinkers. But there is no difficulty felt in separating the prose from the poetry. This can be done without violence to the religious convictions of the present, or to the traditions of the past. The great men of old who created the myths, or transferred them from the religious faith of the peasant into the poems or dramas which make them immortal, would be the first to smile at our credulity if we seriously received their creations as facts. And the severest historical criticism would only bring our convictions into harmony with theirs. But it is different with Palestine. Its history and the supernatural are indissolubly bound together. He who would separate them, and deny the one as an element of the other, would be himself denied by prophets, apostles, yea by Jesus Christ. Greece without the supernatural remains the same to every man of learning and taste. Palestine without the supernatural fades into the light of common day, and from being a holy land, becomes a body of death to the whole Christian Church.

Another thought which forced itself upon me is the remarkable frequency with which the attempt to separate the natural from the supernatural would have to be made in Palestine. It would have to be repeated by the traveller almost every hour, and in every spot. He would have, for example, to strip Bethlehem of the whole story of the angels with their message and song. In Bethany it would be the same. The raising of Lazarus and the ascension of Christ would have to vanish beneath the rational magic wand. And as for Jerusalem, he would have to construct anew its whole history, including all the events in the life of Jesus—a task requiring at least a strong imagination and much patience. And so it would be throughout the whole land until he reached Tiberias, where the process would have to be repeated on its waves, its shores, and in every ruined town which once rang with the praises of the great Healer and Restorer. Well, suppose all this done, and the supernatural wholly swept from off the landscape, is there nothing miraculous left behind? Is there no wonder in "a holy land" being so full of falsehoods, myths, and superstitions, albeit they are the creation of simple loving hearts who did not intend to deceive, but had not sufficient culture to see that they were false? Is there no wonder in the fact that the holiest love of truth, and the greatest horror of falsehood in every shape and form, have been the invariable characteristics of those who believed in the Bible, and in the Christ of the Gospels, with all He is recorded to have said and done? Is there no wonder in men from all lands—some of them occupying "the foremost ranks of time"—coming to worship in "this mountain," still believing those supernatural events, and blessing God for them? Is there no wonder in the fact that miraculous events ended with Christ and His Apostles, and that since their day a debased, untruthful, and superstitious people have given birth to no marvels of any kind?

It is Vinet, I think, who has somewhere remarked that Christianity has a marvellous resurrective life, for though often slain and buried by its enemies, it ever rises again to live in human hearts. A remarkable contrast is suggested at Bethlehem between the strength of man and "the weakness of God." The first attempt to destroy Christianity in the person of Christ was here made by King Herod, surnamed the Great. He was the type of irresistible human power, while the young child was the type of unresisting human weakness. But now Herod lies on the summit of Jebel Fureidis, or the Frank Mountain, which, like a huge monumental tumulus, towers above Bethlehem as if raised "in memoriam" of the massacre of the innocents; while the child!——but who can describe what He has since become on earth and in heaven! Thus will all the enemies of Christ be one day put under His feet.*

Before bidding farewell to Bethlehem and its sacred associations, I may describe a commonplace incident which befel us on our way from Hebron, as illustrative of the supposed danger to which travellers are subjected.

Mr. M——, one of Colonel M——'s party, was riding along with me. We were far in the rear of the cavalcade, which, by the way, included our brave guard. Having abundance of time, we were leisurely chatting, and our steeds as leisurely walking, when all at once we saw six Arab-looking horsemen galloping towards us. They suddenly dismounted, and forthwith began to load their long guns. "Hollo! what does this mean!" one of us exclaimed. Various suggestions were hazarded, the most unpleasant, but most probable, being that an attack was about to be made on our baggage, which was at this time behind us, and out of sight. At once the unknown horsemen charged right down upon us, we of course disdaining to show any signs of fear or flight, but gallantly preparing our pistols, notwithstanding our being minus both powder and shot. Two of the troopers dismounted and demanded *backsheesh* from me. I replied by shaking my head, and begging with a look of poverty, and an outstretched hand, the same favour from them. Their next demand was for powder—*barūd* I think was the word. In the meantime I had wound up my musical snuff-box, and invited the two highwaymen, as I understood them, to receive more peaceful ideas by permitting me to lay the box on their heads. The usual results followed. There were the delighted expressions of "tayēeb! tayēeb!"—with the invariable exhibition of beautiful ivory teeth, framed in a most pleasant smile. And so we were allowed to depart in peace. We afterwards learned that the fierce robbers who thus spared our purses and our lives were—a detachment of Turkish police! So much for the fears and hairbreadth escapes of travellers.

We returned from Bethlehem to Jerusalem. Is not that one day's ride from Hebron to Jerusalem, *viâ* Bethlehem, enough to reward any traveller from England to Palestine, even though he should not take another? And yet it is quite possible to enjoy it, "wind and weather permitting," in a fortnight after leaving London!†

---

* A friend has directed my attention to the following allusion by Macrobius (a writer of the early part of the fifth century) to Herod:—

"Cum audisset inter pueros quos in Syria Herodes Rex Judaeorum intra bimatum jussit interfeci filium quoque ejus occisum: ait melius est Herodis porcum esse quam filium."

"When Augustus had heard that among the children whom Herod king of the Jews ordered to be put to death in Syria, under two years old, his own son too had perished, he said, 'It is better to be Herod's pig than his son.'" —*Saturnalia*, lib. ii. chap. iv.

† That is by taking the Italian and Adriatic route, and finding a steamer for Jaffa, on arriving at Alexandria.

One other night in Jerusalem, and then we resumed our tent-life, journeying northward.

Leaving Jerusalem by the Damascus Gate, we soon reached the low ridge of Scopus, whence we turned our horses' heads to take a last view of "the city of the Great King." We gazed on the now familiar domes and minarets, the gentle swell of the Mount of Olives rising above them like the roll of a great sea wave. We felt as if taking our last look of a dead parent. It was difficult to tear ourselves away, feeling that we should, in all probability, see the beloved object no more. Yet there came undefined and impalpable thoughts of a resurrection—gleams of a light beyond the grave—dim visions of a new Jerusalem better than the old—thoughts, not shaped into beliefs, of our living to see the land and its city yet connected with some evolution in the future history of the Church. But we had to depart. So at last, with one intense gaze which I doubt not ended in the case of us all in heartfelt thanksgiving for having been permitted to see the city whose "very dust is dear," we resumed our journey, to visit other scenes linked with the holy men of old and the holy Son of God.

The road to the north has little interest for the eye, until we get into the mountains of Ephraim. It runs along the flat watershed of the country, the valleys descending from it towards the Jordan on the east, and the maritime plain on the west. We passed Neby Samwil on the left, and Gibeah of Saul (Tel-el-Ful) on the right. We ascended this latter hill, or rather huge mound, which has another mound so near that a conversation can be held between persons on their respective summits,—both hills no doubt having been included in the old city. We thought of the terrible story of the wayfarer who, journeying to Mount Ephraim, sought refuge here for the night—a story which reveals the night-side of social life during an anarchical period of Jewish history, and is one of those inarticulate cries out of the depths for a king and deliverer from evil. We thought of Samuel and Saul, of David and Jonathan, with the events which took place here and in the neighbouring valleys, including the battle of Michmash, three miles off, whose din reached the anxious watchers on this citadel.

We passed on to Bireh, or Beeroth, where, according to tradition, the parents of Jesus first missed their boy, as the small caravan gathered together for rest. They had up till then assumed that he was "among kinsfolk and acquaintance,"—a fact which reveals how his early social life was like our own. We also noticed a peaked hill with a village on its summit, towering above a low range. It is the Orphah, or Ephraim, to which Jesus retired after the raising of Lazarus.

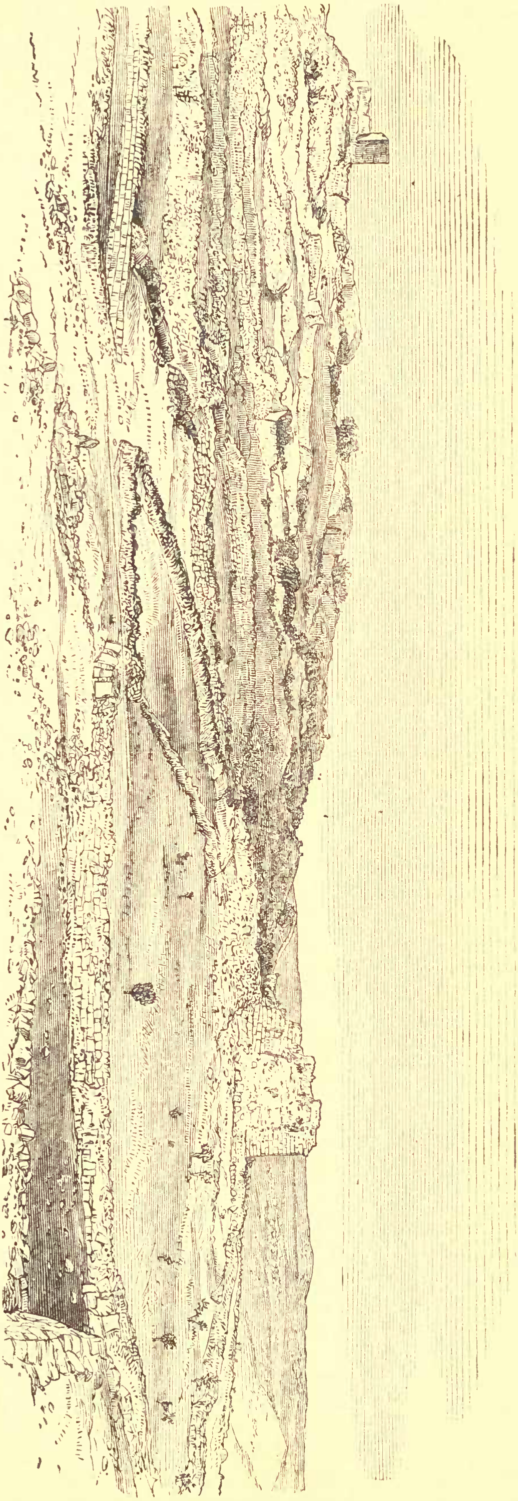
We reached Bethel, but in that illustrious spot saw nothing with the outer eye save stones of confusion and emptiness. Huge limestone blocks washed white with the rains, but with no verdure among them, cover the hill-tops. Yet here, probably where the wretched cluster of huts now stands, with the ruined tower rising among them, was once the Sanctuary of God. Here the Patriarchs erected the earliest altars dedicated to His worship. Here, too, was the seat of old idolatries, where the "golden calves" of Egypt were set up in opposition to the temple of Jerusalem, whose summit could have been seen from the spot, as the dome of the Mosque of Omar can be now. Here was that memorable vision afforded to Jacob, which has been realised by the union of earth and heaven, men and angels, in the person of the Son of Man and the Son of God. I felt in no way disappointed with the present commonplace look of the scene of these glorious spiritual revelations. To me it shed a light of hope and joy into the abodes of poverty, glorifying humanity in the commonest outward forms, and as existing in the commonest places. "The stones of Venice" never inspired me with such hope for man as the stones of Bethel, which had formed the pillow of Jacob.

Soon after passing Bethel we entered the mountains of Ephraim. The whole character of the landscape suddenly changed here. For the first time on our journey there was scenery worth looking at for its own sake. The hills assumed a bolder and more commanding form. There was more elbow room, so to speak, among them. There were high peaked hills, crowned with towers or ruins, and extensive groves of figs and olives; while a range of precipitous rocks with excavated tombs ran along a portion of our route. The road, however, was the worst we had yet seen, if indeed the bed of a torrent can be called a road. It was most difficult for our horses to keep their footing, as they cautiously felt their way through loose stones, and over muddy holes concealed by the stream. The pass through which we rode was one which few armies would attempt to force, if bravely defended. It terminated to the north in a green flat spot beneath a low wall of rocks, called, with great propriety, "the Robbers' Fountain," or Ain-el-Hamareyeh, and which all travellers avoid after sunset. One often wonders where the insolent, club-carrying, and backsheesh-asking rascals come from. For it is comparatively rare to see any villages along the road, which apparently leads for miles through solitude. But just as flies or vultures suddenly gather to any spot where food awaits them, so these Fellaheen, with dirty shirts, brown faces, keen eyes, white teeth, bare legs, and big shoes, creep from behind rocks, or descend hill paths, armed with club or gun, as if they lived in dens or caves of the earth. Needy scoundrels with bad consciences and good clubs or long guns can do much mischief during a single night, in districts innocent of both magistrates and detectives. So we left the Robbers' Fountain with that prudence which is at once moral and agreeable, and reached our tents on the high grounds of Sinjil, after an easy and pleasant ride of seven or eight hours. The traveller, provided his horse be good, and himself able and willing, can reach Nablous in one day from Jerusalem. But wishing to take things quietly, and not as if carrying the mail, we broke the journey by encamping here.

As usual after ablutions and dinner, we rejoiced in the stars, for the weather was splendid; and we put a stop for a time to the incessant jabber of the Arabs, who came in crowds from the neighbouring village, by indulging them with music from our inexhaustible box, instead of *backsheesh* from our far from inexhaustible purse.

Early next day, we sighted Shiloh to the east, but did not ride up to it, though it was only half an hour off our route. There is nothing to see at this famous spot, although one is glad to pause and gaze upon it from the distance. Its situation is well *pronounced* as seen from the path we travelled. It is a round low hill at the end of a plain, and leaning on a more elevated range above it. There are no remains at it of any importance. All around is grey, bare, and barren. But it is interesting to see the place where that man of highest and purest character, Samuel, ministered as a boy. His was a childhood which has been blessed to the comfort of many a parent, as revealing both God's fatherhood as a teacher of babes, and the meek obedience which even a simple-hearted child may possess and which (thank God) may be kept until old age! Here too ministered old Eli who, notwithstanding his piety and his possession of a high mood of mind which made him tremble for the ark of God, is an everlasting warning to parents, against the soft-hearted selfishness which will not restrain a self-indulgent family. During many a long year the tribes went up to the ark at Shiloh. But now all is silence, desolation, and barrenness, with nothing to be seen, yet much to be learned and remembered.

As we advanced on our journey, the valleys expanded into broader plains, and the paths became better; the whole country of Ephraim evidencing a fertility and agricultural richness which cannot be found in the rocky fastnesses of Palestine. One saw, from the nature of the country, how there must have been a strong



BETHEL, FROM THE SOUTH.

J. Graham, Photo.

temptation on the part of Ephraim to lean on his own arm of flesh, and to say, "I am rich and increased in goods and have need of nothing;" and also to seek to make himself the head of the nation, and to prefer Samaria to Jerusalem,—just as England would not brook to have Edinburgh for its capital.

The richest and most magnificent expanse of cultivated soil we saw on this journey was the plain of Mukhra, which extends for about seven miles. It suddenly burst on our view from the summit of a high ridge over which our road passed. The promontories of Gerizim and Ebal plunge their rocky headlands into it from the west, while a range of low hills separate it from the descent towards the Jordan on the east. We skirted this plain, until we sat down under the shadow of Gerizim, to read and to meditate, as pilgrims have done for centuries, at Jacob's Well.

There has never been a doubt entertained by the most sceptical or critical traveller regarding the authenticity of this well. Beyond all question it is the one at which our Saviour rested as he journeyed along the route which travellers generally follow from Jerusalem to Galilee. Every feature of the landscape starts into life as we read the narrative of His memorable conversation with the woman of Samaria:—the plain of cornfields which were then as now whitening to the harvest; the mountain rising above, on which the Samaritan temple was built; the neighbouring town of Shechem; the Samaritans worshipping, as they still do, towards "this mountain," and there only;—all are evidence of its truth, apart from the common and unbroken tradition.

The well is not what we understand by that name. It is not a spring of water bubbling up from the earth, nor is it reached by an excavation. It is a shaft cut in the living rock, about nine feet in diameter, and now upwards of seventy feet deep. As an immense quantity of rubbish has fallen into it, the original depth must have been much greater, probably twice what it is now. It was therefore intended by its first engineer as a reservoir, rather than as a means of reaching a spring. Then again, if any wall, as some suppose, once surrounded its mouth, on which the traveller could rest, it is now gone. The mouth is funnel shaped, and its sides are formed by the rubbish of old buildings, a church having once been erected over it. But we can descend this funnel, and enter a cave, as it were, a few feet below the surface, which is the remains of a small dome that once covered the mouth. Descending a few feet we perceive in the floor an aperture partly covered by a flat stone, and leaving sufficient space through which we can look into darkness. We sent a plumbline down into the water—with which the well certainly seemed to be abundantly supplied at the time of our visit.

Many have been puzzled to account for Jacob's having dug such a well here, when the whole valley of Shechem, only a quarter of an hour's walk off, is more musical with streams than any other in Palestine. But *some one* dug the well,—and who more likely than Jacob, not only to have on his own property what was in his time more valuable than a private coal mine would be to us; but also for the moral purpose of keeping his family and dependants as separate as possible from the depraved Shechemites?

Why the woman of Samaria should have come here to draw water, so far away from the valley and its many springs, is a question which may be more difficult to answer. I cannot think it could have been because of the superior quality of the water, for no cistern could afford a purer, cooler, or better quality than that which gushes everywhere along the Valley of Nablous. It seems to me that her motive was a superstitious one—a motive pertaining to her conscience. It was to her "a holy well," such as are frequented in Ireland as places of Roman Catholic devotion, or rather superstition. She was restless, dissatisfied, and unhappy; burdened with a sense of wrongdoing, and thirsting after what she had never found. Thus her whole state of mind in coming here to draw water, and her attempt to assuage the thirst of her spirit for peace, would be an unconscious preparation for her reception of the Saviour's teaching, which was so suited to reveal her plague, and also to heal her of it. It is evident that she was, considering her circumstances, well informed as to Scripture facts; that she was interested in the "Church" questions of her place and time, and had much of that kind of "religious" *feeling* (often possessed by persons of a susceptible and emotional temperament) which, where principle is wanting, gives birth at once to a sensuous superstition and a sensuous life. But before evil habits have "petrified the feelings," there is a stage at which such persons are more easily impressed than others with less heart though perhaps more "respectability."

How long will it be, we ask with eager longing, ere clergy and people shall truly possess the spirit expressed in these words?—"Jesus saith unto her, Woman, believe me, the hour cometh, when ye shall neither in this mountain, nor yet at Jerusalem, worship the Father. . . The hour cometh, and now is, when the true worshippers shall worship the Father in spirit and in truth: for the Father seeketh such to worship him. God is a Spirit: and they that worship him must worship him in spirit and in truth."*

This well is indeed a holy spot. One is glad that the contending ecclesiastical parties in the land have built their churches on places which

---

* Once when abroad I heard an eloquent sermon preached by a dignitary of the Christian Church, on this passage, in which he ridiculed "Sectaries," who, being but of yesterday, presumed to speak of "our fathers" as he and his brethren could do. He lamented their sin in daring to worship on any other mountain than "the true Jerusalem," his own church of course; where alone, by use of its appointed forms and rituals, God could be worshipped in spirit and in truth!

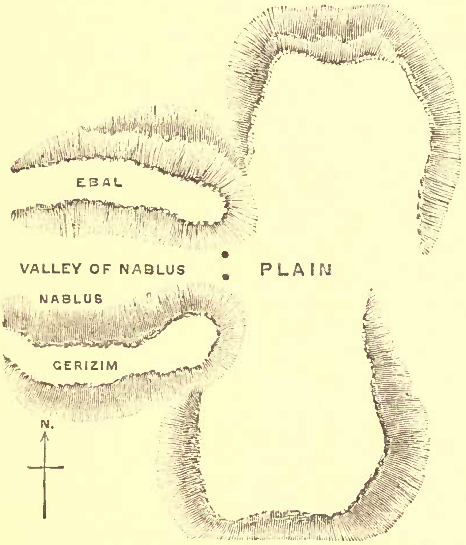
THE VALLEY AND TOWN OF NABLOUS (THE ANCIENT SHECHEM).

(From a Photograph by James Graham.)

have little historical value, and that a merciful Providence has preserved untouched, and open to the eye of heaven, such spots as that on the Mount of Olives "over against the Temple," and, above all, Jacob's Well. It is now said, however, that the Greek Church have purchased it, as the site of a church, for 70,000 piastres. Universal Christendom, to which it belongs, should protest against such "pious" profanation.

The two parallel ridges of Mount Gerizim and Ebal, as shown in the map, abruptly terminate with their rounded masses in the dead flat plain. The Valley of Nablous leads to the plain as a narrow strait to an inland sea. A mile and a half up this valley lies the town, nestled amidst an exuberance of foliage—vines, figs, pomegranates, oranges, and every fruitful tree, all growing beside inexhaustible streams of living water. Nothing in Palestine surpasses the picturesqueness of this spot when looked at from any of the surrounding heights. Travellers have no doubt seen places elsewhere of greater beauty. But here, in the midst of the white, bare, hot hills and plains, it stands alone in its glory of fruit and verdure, of running brooks and singing birds. Should any one penetrate these groves, however, he would find little of the art which helps Nature to produce that ideal of the beautiful after which she struggles. The grass grows wild, the ground is rough, while tangled shrubs and branches mingle with the trees as in a long-neglected garden.



Nablous, or Shechem, is to the Christian traveller a *standpoint* for meditation, just as Hebron, Bethlehem, Nazareth, and Tiberias are.

It was the earliest seat of the worship of the living God of which we have received any authentic information. To this plain of Moreh, or "the oak," Abraham first came from Padanaram, crossing the Jordan to the east, and ascending directly from it. At the head of the wady up which he must have travelled, is a village now called Salem or Salim, about two miles from Jacob's Well. It has been conjectured, with a high degree of probability, that this, and not Jerusalem, (which until centuries afterwards, in David's time, had no importance attached to it, and is but once in Scripture called Salem) was the place where Melchizedek dwelt as the priest of the most high God, and where he met and blessed Abraham. If so, this would account for the mention of "the oak," as being already known as the place where the worship of the true God had been established. It has moreover been maintained, with to me convincing argument, by Dr. Stanley, supported by Mr. Mills, that Mount Gerizim (on which Melchizedek may also have worshipped) was the scene of Abraham's intended sacrifice of Isaac. It suits the geography of the country much better than Jerusalem. Abraham could hardly have taken three days in going from Beersheba to Jerusalem, as the whole distance is but thirty-six miles. Besides, there is no point in the journey, taking any ordinary route, from which he could have seen the present Temple area, or even the site of Jerusalem, "afar off." But if he came to Gerizim from the same starting-point, his journey would have been about 60 miles, which is nothing for an Arab traveller to accomplish in three days, on the most common ass, more especially if he rose "very early in the morning" of the first day. If, moreover, Abraham journeyed, as no doubt he did, along the maritime plain, Gerizim is so situated that it must have been seen "afar off" on the morning of the third day.*

If to these associations connected with Shechem we add another, that it was the residence of Jacob, who followed the steps of his grandfather,—bought a parcel of ground, and dug a well,—we at once see the reason why the place was known to Moses and the Israelites in Egypt as the only spot in Canaan solemnly consecrated from the earliest patriarchal times to the worship of God. It was for this reason, no doubt, that Moses commanded the children of Israel to assemble at Shechem. And we read accordingly that Joshua assembled them, when "all Israel, and their elders, and officers, and their judges, stood on this side the ark and on that side before the priests the Levites, which bare the ark of the covenant of the Lord, as well the stranger, as he that was born among them; half of them over against mount Gerizim, and half of them over against mount Ebal; as Moses the servant of the Lord had commanded before, that they should bless the people of Israel. And afterward he read all the words of the law, the blessings and cursings, according to all that is written in the book of the law. There was not a word of all that Moses commanded, which Joshua read not before all the congregation of Israel, with the women, and the little ones, and the strangers that were conversant among them." It is not here said, as some imagine, that the summit of each mountain was occupied by the half of the great assembly. But they were "half of them set over against mount Gerizim, and half of them over against mount Ebal." Nor is it the case that the words even if read from the summits of the mountains would have been inaudible; for the experiment was actually made by Mr. Mills and a friend, who occupied places on the opposite hills, and read aloud the blessings and the curses, each being distinctly heard by the other.*

---

* The argument against this view, from the name "Moriah" being given to the site of the Temple, has no force, as it was evidently bestowed because of David's vision. "Solomon began to build the house of the Lord in the mount of *Moriah* (i.e. "the appearance of the Lord") where He *appeared* unto David his father."

Such an assembly as this of the united Church of God was never before witnessed, unless perhaps at Shiloh, when the tabernacle was set up; nor since then, unless when Christ's Church met on the day of Pentecost.

It was here, too, that another event took place full of sacred and dramatic interest—the burial of Joseph. Nearly five hundred years before the assembling of the people by Joshua, Joseph, as a young shepherd lad, passed through this plain in search of his brethren. What a life was his! But his influence did not end with his death. Though dead, he was yet a silent but most impressive witness to the people of faith in God and in His promises. How strange a sight was that body embalmed for centuries, carried through the wilderness for forty years with the ark of God, and finally buried by that vast assemblage, each one a blood relation, in the land of promise, and in the very field purchased by his father! What memories must have gathered round his grave! How undying is the influence of faith, hope, and love! This is what we are told of that remarkable funeral: "And the bones of Joseph, which the children of Israel brought up out of Egypt, buried they in Shechem, in a parcel of ground which Jacob bought of the sons of Hamor the father of Shechem for an hundred pieces of silver: and it became the inheritance of the children of Joseph."

There is no reason to doubt that the tomb shewn is really Joseph's. It remains, like that of his ancestors at Hebron, to witness again, it may be, to the truth of Bible history.

But we must not forget the modern Samaritans, whose existence invests Nablous with great interest. We pause and wonder as we realise the fact of a community, consisting of only about 150 souls, or forty families, living for nearly 3000 years separate from all other races on earth, with their own Pentateuch, ritual, sacrifices, and worship,† and surviving all the changes and revolutions of Palestine and of the world. Here they are still, worshipping towards Mount Gerizim, having no fellowship with the Jews, keeping all the great festivals prescribed by

---

* Mills' "Modern Samaritans," p. 59.

† All the great feasts ordained by Moses are kept by the Samaritans. Dr. Stanley and Mr. Mills both witnessed the observance of the Passover, and have given minute accounts of it. I quote the following from Mr. Mills, who saw it latest—in 1860. I may here say that the best account I have seen of this singular people is to be found in Mr. Mills' book, "Nablous and the Modern Samaritans." Murray. 1864.

"On the tenth of the month the sacrificial lambs are bought. These may be either kids of goats or lambs; the latter being generally, if not at all times, chosen. They must be a year old, males, and 'without blemish.' The number must be according to the number of persons who are likely to be able to keep the feast. At present they are five or six, as the case may be. During the following days, which are days of preparation, these are carefully kept, and cleanly washed—a kind of purification to fit them for the paschal service; a rite, in all probability, always observed in connection with the temple service (John v. 1). Early on the morning of the fourteenth day, the whole community, with few exceptions, close their dwellings in the city, and clamber up Mount Gerizim; and on the top of this their most sacred mountain, pitch their tents in a circular form, there to celebrate the most national of all their solemnities. . . I and the friends who had joined me at Jerusalem, had pitched our tent in the valley, at the foot of Gerizim; and on the morning of the 4th of May we clambered up the mountain. On reaching the encampment friendly voices greeted us from several tents, and having visited those best known to us, we rested for awhile with our friend Amram. Presently we took a stroll up to the temple ruins, and from thence had a perfect view of the interesting scene. . . The tents, ten in number, were arranged in a kind of circle, to face the highest point of the mountain, where their ancient temple stood, but now lying in ruins. Within a radius of a few hundred yards from the place where I stood, clustered all the spots which make Gerizim to them the most sacred mountain, the house of God. . . About half-past ten, the officials went forth to kindle the fire to roast the lambs. For this purpose, a circular pit is sunk in the earth, about six feet deep and three feet in diameter, and built around with loose stones. In this a fire, made of dry heather, and briars, &c., was kindled, during which time Yacub stood upon a large stone, and offered up a prayer suited for the occasion. Another fire was then kindled in a kind of sunken trough, close by the platform where the service was to be performed. Over this, two caldrons full of water were placed, and a short prayer offered. . . There were forty-eight adults, besides women and children; the women and the little ones remaining in the tents. The congregation were in their ordinary dress, with the exception of the two officers and two or three of the elders, who were dressed in their white robes, as in the synagogue. A carpet was laid on the ground near the boiling caldrons, where Yacub stood to read the service, assisted by some of the elders—all turning their faces towards the site of the temple. Six lambs now made their appearance, in the custody of five young men who drove them. These young men were dressed in blue robes of unbleached calico, having their loins girded. Yacub, whilst repeating the service, stood on a large stone in front of the people, with his face towards them. . . . At mid-day, the service had reached the place where the account of the paschal sacrifice is introduced: 'And the whole assembly of the congregation of Israel shall kill it in the evening' (Exod. xii. 6); when, in an instant, one of the lambs was thrown on its back by the blue-clad young men, and the *shochet*, one of their number, with his flashing knife, did the murderous work with rapidity. I stood close by on purpose to see whether he would conform to the rabbinical rules; but the work was done so quickly that I could observe nothing more than that he made two cuts. The other lambs were despatched in the same manner. Whilst the six were thus lying together, with their blood streaming from them, and in their last convulsive struggles, the young *shochetim* dipped their fingers in the blood, and marked a spot on the foreheads and noses of the children. The same was done to some of the females; but to none of the male adults. The

Moses, and eating their Passover "on this mountain," the oldest spot for the worship of Jehovah on the face of the earth! Such a fact stands alone. This undying dogmatism puzzles historians; this race, so noble looking, yet marrying only in their own small community, puzzles ethnographers, and creates in all feelings of wonder such as one might experience if in some distant land he came upon breeds of Mammoths, or Pterodactyles, which everywhere else were known only as fossils. To meet them here especially, at Jacob's Well, and under the same delusions as when Christ first preached to them and converted many of them, but adds to the wonder of a spectacle familiar to every traveller in Palestine.

The Hill Samaria, from the South-east.

We ascended Gerizim. It is a rather tough bit of climbing. I assigned this alpine occupation to my horse, and yet suffered sufficiently, after a day's ride, to sympathise with his patient but painful labours. There is much to interest one on the summit:—the scattered ruins; the massive remains of what some allege to have been the old Samaritan Temple, but what others say with I think greater probability, to have been a Roman fort. Then there is the unquestionable site of an old place of sacrifice; and the more questionable twelve stones

---

whole male congregation now came up close to the reader; they embraced and kissed one another, in congratulation that the lambs of their redemption had been slain. Next came the fleecing of the lambs—the service still continuing. The young men now carefully poured the boiling water over them, and plucked off their fleeces. Each lamb was then lifted up, with its head downwards, to drain off the remaining blood. The right fore-legs, which belonged to the priest, were removed, and placed on the wood, already laid for the purpose, together with the entrails, and salt added, and then burnt; but the liver was carefully replaced. The inside being sprinkled with salt, and the hamstrings carefully removed, the next process was that of spitting. For this purpose, they had a long pole, which was thrust through from head to tail, near the bottom of which was a transverse peg, to prevent the body from slipping off. The lambs were now carried to the oven, which was by this time well heated. Into this they were carefully lowered, so that the sacrifices might not be defiled by coming into contact with the oven itself. This accomplished, a hurdle, prepared for the purpose, was placed over the mouth of the oven, well covered with moistened earth, to prevent any of the heat escaping. By this time, it was about two o'clock, and this part of the service was ended. At sunset, the service was recommenced. All the male population, with the lads, assembled around the oven. A large copper dish, filled with unleavened cakes and bitter herbs rolled up together, was held by Phineas Ben Isaac, nephew of the priest; when, presently, all being assembled, he distributed them among the congregation. The hurdle was then removed, and the lambs drawn up one by one; but, unfortunately, one fell off the spit, and was taken up with difficulty. Their appearance was anything but inviting, they being burnt as black as ebony. Carpets were spread ready to receive them; they were then removed to the platform where the service was read. Being strewn over with bitter herbs, the congregation stood in two files, the lambs being in a line between them. Most of the adults had now a kind of rope around the waist, and staves in their hands, and all had their shoes on. 'Thus shall ye eat it; with your loins girded, your shoes on your feet, and your staff in your hand' (Exod. xii. 11). The service was now performed by Amram, which continued for about fifteen minutes; and when he had repeated the blessing, the congregation at which Joshua brought from the Jordan, but which it is now difficult even to number or to distinguish from the underlying strata. There is also the trough where the paschal lamb is roasted, some of whose burnt bones I gathered. And there is the magnificent view over the plain across the valley of the Jordan to the mountain beyond, and westward to the blue Mediterranean.

We of course visited the famous Samaritan synagogue. Our approach to it seemed to us at the time to be by an exceptional way, though it is possibly the ordinary road to this ancient sanctuary. I cannot recal each turn and winding; but I have a confused impression of an endless succession of narrow lanes, low vaulted passages, and almost pitch-dark cavernous tunnels, through which we were led, until we reached a steep narrow stair leading to the roof of a house, from which we passed along to a court with an orange tree growing in it, and thence into the small vaulted synagogue, the only place of worship of this ancient Church, in the whole world. In all this we recognised precautions against sudden attacks, such as we had noticed in entering our lodgings at Hebron.

The Samaritans professed to show us their old and famous copy of the Pentateuch. This we knew was a pious fraud, but we did not take the trouble to contradict them, as a sight of the real one can only be obtained with great difficulty, and would have simply gratified a vain curiosity in us. The old roll is of very high, but as yet unknown antiquity. Its possessors allege that it was written by the great-grandson of Aaron.

The morning was glorious when we rode out of Nablous. A luxurious atmosphere hung over the gardens, and subdued the sharp statuesque lines of the hills. A Turkish regiment, with strings of camels, was winding through the valley,—their band playing its wild music, and giving to the whole scene a true touch of Eastern life and barbaric power. We were told that they were going to keep some restless and tax-hating tribes in order, to the south of Hebron.

The ride from Nablous to Samaria, is along a good bridle-path, with pleasant scenery all the way, including a view of the upper part of the valley of Nablous, rich, as its lower portion, in abundance of water, and fruit and flower. We passed many picturesque village strongholds, like eagles' or rather vultures' nests, built on commanding summits, and having fertile valleys and groves of olives at their feet.

No old city in Palestine had a site so striking, so regal looking, as the "hill of Samaria." It is a shapely hill, rising at the end of a fine valley, and moulded into a fitting platform for a great temple. On all sides it is circled by noble terraces, which must have once borne splendid wreaths of vines and olives, furnishing wine and oil in abundance to its luxurious inhabitants. The summit of the hill is flat, and was evidently levelled for the site of the public buildings which occupied it from the days of Baal and Ahab, to those of Augustus and Herod. Fifteen columns rear their solitary heads on this flat, though it is uncertain to what building they belonged, or for what object they and their now fallen brethren were reared. It is when standing on this level that we can appreciate Omri's taste in making Samaria the site of his capital. The surrounding hills, plains, and valleys teem with every product of the soil. The Mediterranean is seen stretching its blue waters beyond the plain of Sharon; while its fresh breezes blow up the valleys and circulate all around. And one can see how easily besieging armies would have been visible on the amphitheatre of hills which surround Samaria on three sides, and from whence they could have looked down into the streets of the suffering city and witnessed its every movement.

Here there are very striking remains of a magnificent colonnade, composed of two ranges of pillars about 50 feet apart, and which it is conjectured—from the length of the terrace on which the sixty pillars yet stand—must have extended for about 3000 feet. It was probably the work of Herod, who adorned Sebaste.

There are also the ruins of a noble old church dedicated to St. John the Baptist. Few things are more sad than such ruins in Palestine, as they evidence a time when Christianity was so strong, and so hopeful of continued strength, that it built churches which shame most of those reared in later and richer times.

Close to the church is an old reservoir, which may have been the pool in which Ahab washed his bloody chariot. But all Samaria is ruins, nothing but ruins; and never were words more true than those which we read aloud here:—"Therefore I will make Samaria as an heap of the field, and as plantings of a vineyard: and I will pour down the stones thereof into the valley, and I will discover the foundations thereof."

The associations connected with the capital of Ephraim are very different from those suggested by the capital of Judah. They are all of abominable idolatries, cruel sieges, horrible famines, full indeed of dramatic interest, but more full of lamentation and woe.* When God's prophets appear in Samaria, or speak about it, it is but to lament and denounce its impiety, vices, and crimes. It was a powerful

---

once stooped, and, as if in haste and hunger, tore away the blackened masses piecemeal with their fingers, carrying portions to the females and little ones in the tents. In less than ten minutes the whole, with the exception of a few fragments, had disappeared. These were gathered and placed on the hurdle, and the area carefully examined, every crumb picked up, together with the bones, and all burnt over a fire kindled for the purpose in a trough, where the water had been boiled. 'And ye shall let nothing of it remain until the morning; and that which remaineth of it until the morning ye shall burn with fire' (Exod. xii. 10). Whilst the flames were blazing and consuming the remnant of the paschal lambs, the people returned cheerfully to their tents."

* Read, for example, 1 Kings xx.; 2 Kings vi. 12—33.

city, but "sensual minded, earthly, devilish." Yet that light of mercy and love which is in Christ for the chief of sinners, shone in the latter days on Samaria. When St. John—whose Boanerges' feelings were like the heaving waters of the deep ocean — desired fire from heaven to consume the Samaritans, who refused to receive Jesus into one of their villages, the Lord rebuked him, and said that He had come, not to destroy men's lives, but to save them; and simply turned aside to another village. "Thou art a Samaritan!" was one of the accusations hurled against Him. So indeed He was! —but in a deeper sense than Jew or Samaritan could understand. Verily as "a good Samaritan" He healed His brethren, sorely wounded by the enemy of soul and body; and by His example and teaching broke down the wall of hate which separated Samaritan from Jew, showing that if salvation was *of* the Jews, it was yet *for* the Samaritans, and for all men who would worship God in spirit and in truth. And so when giving commandment on the day of His ascension regarding the preaching of the Gospel, He remembered Samaria. And His disciples, too, remembered and obeyed His words, for Philip went down to preach there, as did also Peter and John, to strengthen the faith of the believers. So in spite of Omri and Ahab, and all the devil's work down to the days of Simon Magus, a church was formed, "and great joy was in that city"—a joy which no one has taken from its lowliest member, who passed in Christ from the old Samaria now in ruins, to the new Jerusalem eternal in the heavens!

Samaria—Remains of Herod's Colonnade, from the South-west.

REFLECTIONS SUGGESTED BY THE TWENTY-EIGHTH CHAPTER OF THE BOOK OF JOB.

By HENRY ROGERS, Author of "The Eclipse of Faith."

FULL though the Book of Job is of sublimity, there is probably no part of it more sublime than the twenty-eighth chapter, in which the patriarch, after reciting some of the principal achievements of which the daring genius and cunning hand of man is capable, and the "precious, hidden treasures" which reward his enterprise, affirms that there is *one* discovery which lies beyond the uttermost limit of mere sense or intellect, and yet so important, that none of the acquisitions of man's unaided skill and toil can be put in comparison with it. This is expressed in that emphatic *refrain* of this sublime effusion of lyric song: "But where shall wisdom be found? and where is the place of understanding?" In order to illustrate the great things which man's restless brain and courageous hand can do, he selects, by way of example, his *mining* operations, which were doubtless in that age, and perhaps may still be considered in our own, among the most remarkable proofs of his skill, sagacity, perseverance. His description of these, conceived in language of the most exalted poetry, shows that even in that remote age man had made no mean progress in the art of exploring the recesses of the earth, and dragging its treasures to the light of day; of smelting metals, and discovering the "diamond," the "onyx," and the "sapphire." "There is a path," (the patriarch says,) so secret, that the "eagle's" piercing eye has never spied it out, nor that of the "vulture" seen it; so wild and savage that the "lion's whelps have not trodden it, nor the fierce lion passed along it;" but which the keener eye of man, illumined by his lamp of artificial daylight, has descried, and his more daring footsteps explored. With persevering toil, not to be baffled in his insatiable search for the "treasures of darkness," he "putteth forth his hand upon the rock, and overturneth the mountains by the roots." Unappalled by the roar of subterranean waters, he "binds the floods from overflowing," or diverts them from their course by "cutting out rivers among the rocks." And so, compelling all his faculties to drudge in the service of his passion for material wealth, he triumphs over the most formidable obstacles, bends or breaks all the forces of nature that oppose his will, till at length his miner's lamp flashes on the unsunned "treasures of darkness," on the "place of sapphires, and of the golden ore." But still, though man can thus descend to the depths of the earth and fetch untold riches thence, these trophies of his intellect, enterprise, and dauntless courage, constitute not his *summum bonum*. And, therefore, "where shall wisdom be found, and where is the place of understanding? The depth saith, It is not in me: and the sea saith, It is not with me."—Nor are the spoils thus gotten at the price of infinite pains, toil, and danger, worthy of being compared with it: "It cannot be gotten for gold, neither shall silver be weighed for the price thereof. It cannot be valued with the gold of Ophir, with the precious onyx, or the sapphire. The gold and the crystal cannot equal it; nor shall the exchange of it be for jewels of fine gold; no mention shall be made of" the less precious "coral or pearls," inasmuch as "the price of wisdom is above rubies." And once more the patriarch asks, "Whence then cometh wisdom? and where is the place of understanding?" For answer, this time, comes one of the sublimest verses in the whole chapter: "Destruction and death say, We have heard the *fame* thereof with our ears." They can but indistinctly mutter hearsay rumours of what they cannot *know;* their desolate solitudes can but echo the voice of that supernal "Wisdom," in virtue of which, if she dwelt there, they would be "solitudes" and "desolate" no longer; for this true Wisdom has immortality for her dower, and whoso "findeth her, findeth *life*." And then comes the answer to the oft-repeated question. "Whence then cometh wisdom? God understandeth the way thereof, and he knoweth the place thereof;" for He, who formed this whole vast system of things, and gave all things their laws and limits, who prescribed to the "winds" and "waters" their just "weight" and "measure," who "made a decree for the rain, and a path for the lightning of thunder," He "saw and declared it." He, who was the author of all physical nature, also prescribed to his rational creatures the laws and conditions of their moral nature, in virtue of which alone they can find life and felicity: "And unto man he said, Behold, the fear of the Lord, *that* is wisdom; and to depart from evil is understanding!" It does not consist in mere knowledge; it cannot be attained by diving into the mysteries of the outward world, or attaining dominion over nature; by acquiring any of the forms of material good, or pushing physical science or civilisation to the uttermost; but by conforming to the great laws of our moral being. In proportion as these are complied with, man's true perfection and felicity, as essentially consisting in this conformity to the will of God, and consequent "departure from evil," will be secured. And not only so, but all other advantages will be most easily attained and most stably preserved by the same means,—meaner felicities being but part of the dower and retinue of virtue; while in proportion as the above moral conditions are violated, will such inferior good be lost or rendered insecure.

All the forms of this last are more naturally, indeed, the allies of Virtue; but they are capable of being sequestered from her, and cannot in their better forms even exist where she is wholly absent. But they are in *themselves* indifferent, being intrinsically void of moral significance; they are all capable of being used or abused, made subservient to moral good or moral evil. They may be, every one of them, simply the instrument of virtue or vice, just as gold may be used to reward or corrupt, or a sword to defend a man's life or take that of another. Even the electric telegraph, perhaps the sublimest trophy of man's skill, and so potent an implement of civilisation, is as ready to flash along its wires falsehood as truth; except as guarded by honesty at both ends, it becomes a huge serpentine coil of delusion and mischief; nothing better than a more diffusive and comprehensive lie, winged with lightning, and capable of compassing in an instant sea and land. Like every other appliance of civilisation, it is good or bad only as virtue or vice infuses into the subtle fluid it conveys, the still more potent moral element of truth or falsehood.

The Bible, in every part of it, is full of the same great lesson, and affirms that this Wisdom,—so mysterious and inaccessible, if it be sought in the wrong place or in the wrong way; which cannot be gained by plunging into the depths of the earth, or by soaring into the heavens,—is equally plain and obvious if we but look nearer home, and listen to the voice which speaks to us, not through external nature, but in the very laws of our moral constitution, especially as these are expounded and enforced in the volume of revelation: "To *man*, God saith, the fear of the Lord, *that* is wisdom; and to depart from evil is understanding." The same lesson is inculcated in those impressive words of Moses: "For this commandment which I command thee this day, it is not hidden from thee, neither is it far off. It is not in heaven, that thou shouldest say, Who shall go up for us to heaven, and bring it unto us, that we may hear it, and do it? Neither is it beyond the seas, that thou shouldest say, Who shall go over the sea for us, and bring it unto us, that we may hear it, and do it? But the word is very nigh unto thee, in thy mouth, and in thy heart, that thou mayest do it. See, I have set before thee this day Life and Good, and Death and Evil."

The principal, the *highest* proof that this is man's true Wisdom, is found in that *essential* felicity which the course it prescribes can *of itself* give; that felicity with which virtue, *as such*, (to use Butler's expression), fills the soul by its very presence and possession, quite apart from any secondary benefits; and which made even a heathen philosopher truly say that "Virtue is herself the soul's best recompence." But this Wisdom comes not undowered to those who embrace her. In all ways, it tends to the development and perfection of every principle and faculty of our nature: and hence we are told in the Proverbs that, "Length of days is in her right hand, and in her left hand riches and honour."

And as this conformity with the great moral laws of his nature must constitute the perfection and felicity of every individual man, so must it of any number of individuals; and as nations are but collections of units, so must it of communities also; and therefore the Book again tells us, that "righteousness only exalteth a nation."

It is true that God promised the ancient Israelites, by express donation, a blessing beyond the issues of his ordinary Providence, if they would but exactly "obey his laws, and walk in his ways;" that "He would raise them on high above the nations of the earth, and make their way prosperous." But it is not difficult to see, that if the demands of this true wisdom be complied with by any community, if the laws of man's moral constitution be obeyed, and in proportion as they are so, their natural *tendency* is to secure the elements of inferior, that is, of intellectual and material good. This, indeed, is (though not *always* realized) the obvious *tendency*, even in the case of individuals; but in communities it is a tendency which never fails. Virtue in the *individual*, does not necessarily involve outward well-being, though to be vicious in any marked degree does involve the loss of it; but so certain is the operation, as a general rule and on the great scale, of God's moral laws, that in proportion as they are obeyed, (other things being equal, nay, often when very unequal,) will communities be prosperous, and in proportion as virtue decays, will the foundations of that prosperity be sapped, and the fabric itself at last sink in ruin. Uncertain and precarious as we are apt to think the operation of the moral laws by which God governs the world, they are incomparably more stable and uniform than any others whatsoever into which the element we call "contingency" enters at all, or which have influence on human happiness. To employ an expression which I have used elsewhere:—Take a hundred *intelligent* men, or a hundred *rich* men, or even a hundred *free* men: while there is no one of any sense who would venture to say he had any sufficient data for calculating their success or happiness from these elements alone, there is no man who would not take any odds that of a hundred *honest*, *industrious*, *upright* men, the vast majority were certain to do well. That is true, for ever, which Milton so beautifully says, "Lordship and victory are but the pages of truth, justice, and honour."

While nothing can produce a deeply radicated and uniform virtue, but that regard to the Supreme Lawgiver which the patriarch makes correlative to "the departing from evil," and both of which conjointly constitute this "wisdom" *par excellence*; while it is true that "the fear of the Lord is the beginning of it," and the *love* of Him, its consummation; yet it is also true, that even the inferior forms of virtue,—*i.e.*, virtuous actions and habits, performed under the influence of inferior motives, (such is the regard which God has for the moral laws on which He administers the world,) shall be sufficient to determine the social well-being of communities; and their opposites, their social ruin.

In an age like the present, and in a nation like ours, in which the various forms of intellectual and material good are more and more pursued and cherished; in which the advance of knowledge, the progress of science, the extension of commerce, the increase of wealth, are sometimes spoken of almost as if they could constitute collectively the *summum bonum* of mankind, and would ensure prosperity independently of the moral conditions to which reference has just been made; or at all events, as if those conditions were of less consequence than the Bible says they are; it is perhaps well to reflect upon the lesson in this chapter in Job: especially as there is a class of speculators (though happily a small one) disposed to follow in the wake of a great but exceedingly erratic genius, who suddenly appeared among us like a meteor a few years ago, and as suddenly passed away. This philosopher held that the progress of civilisation is principally dependent on the progress of "knowledge;" and that of the *two* elements of knowledge—the "moral" and the "intellectual"—on which human improvement hinges, the former is comparatively insignificant. He affirmed that it was a constant and invariable quantity, while the latter was capable of indefinite expansion; that all mankind had always been possessed of the same amount of *ethical* knowledge, (if the argument is to be worth a button, they must also be supposed to have equally *applied* it,) whereas the accumulations of scientific "knowledge" may be without limit.

It is hard to say which is the greatest of four almost equally transparent sophisms, involved in this singular argument; first, of supposing (so palpably contrary to fact,) that the ethical "knowledge" of men, their speculative codes of morals, may be regarded as a "constant or invariable quantity:" secondly, of overlooking the fact that even if it were so, the true question (as already hinted) as to the bearing of morality on human improvement is not, What has been the abstract *knowledge* of man on the subject? what his speculative theory? but, as in other practical sciences, (navigation, or medicine, for example,) What is the degree in which it has been practically applied and exhibited in action? Thirdly; of forgetting that if this be not made the real question, then, on the same condition, any other branch of *knowledge* in which the conclusions are universally admitted, might with equal reason be represented as a "constant quantity," of comparatively little importance to civilisation; for it is only as it is practically *applied*, that it is of value in relation to ulterior progress, or can become the stepping-stone to further discoveries: and fourthly, of representing moral enlightenment, which is an inseparable condition—a *sine quâ non*—both of the very existence of human communities, and of their progress, as a less important element in the problem than intellectual or scientific knowledge, simply because the knowledge in the one case is supposed to be complete, and in the other, not; forgetting that the difference in the *nature* of the two may more than compensate for the difference in volume.

That these fallacies are all involved in this speculation, may be evinced in a very few words, and more would be superfluous; for however mischievous the aspects of the theory to which I now refer, on morals and religion, there is little fear of its imposing on the sound common-sense of Englishmen. Of the more elaborate critiques which the brilliant but eccentric speculations now adverted to called forth, I scarcely recollect one which did not, as by an instinct, and without always fully going into the reasons, single out this paradox, amidst a crowd of others, for emphatic condemnation.

First, then, this strange theory affirms that morals have been known, nearly, if not quite as well, in all ages and countries: so that moral truth is an invariable or unfluctuating, and therefore comparatively uninfluential, element in the progress of civilisation! Surely it is impossible not to demur to this statement as a matter of *fact;* though (as already said) if it *were* a fact, the real point for consideration, in virtue of the practical character of morals, is not how far they have been theoretically known, but how far they have been applied. But it may well be denied that morals, even as a theory, have been equally well known, or nearly equally well known, by all mankind in all ages. Indeed, it is perfectly astounding that any one can survey either the moral theories or the moral phenomena of the world, and affirm any such paradox. What! Have there not been thousands of speculators who, from the very diversity of the maxims and conduct of mankind, have doubted whether man has any moral nature at all? And have there not been ethical theories unblushingly founded on that very supposition? *i.e.* on the supposition that any code of morals is just the result of man's education, association, and varying notions of interest and expediency, and that all intrinsical moral distinctions, and all immutable moral obligation, are a vain dream? Again; is it possible to suppose that the savage who commits murder and indulges in cannibalism without shame and without remorse, is really on much the same level with a Socrates or a Plato, as regards his *knowledge* of morals? Or is a code which consecrates revenge, and hands it down as an heirloom, which consecrates theft, which consecrates murder, which consecrates piracy, just as good as every other? Or if it be said that we must not go to the lowest conditions of barbarism,—though in truth the argument admits of no such evasion, because it is professedly and essentially without limitations,—can we imagine that the theories of Plato or Aristotle, the first of whom pleaded, in his Utopian "Republic," for the community of women, and occasional infanticide; and both of whom would perpetuate and legalise slavery as a perfectly justifiable institution, and spoke with lenience and indulgence of vices that cannot be even "named among Christians,"—can we imagine that their theories are on the same level with moral codes which condemn all these things? Is it possible to imagine that those who, without a blush, sanctioned and practised the vices which distinguished the palmy days of Greek civilisation, and disgraced it, or the last ages of Roman civilisation, which could not well be disgraced,—vices which Paul has denounced in the first chapter of the Epistle to the Romans, and which are so lightly referred to in the pages of such writers as Lucian and Athenæus,—were as enlightened even in the *theory* of morals as the devout reader of the New Testament? I suppose not. I fancy most men would be disposed to take a very different view of the matter, and say, that though it is *true* the moral conceptions of mankind in general approximate more nearly to equality than their measures of intellectual or scientific enlightenment, yet there are great differences in their moral illumination notwithstanding; and that though men have generally been worse than their *theories* of morals, yet it is to be hoped, even in the interest of charity, that the worst classes of men have not been *quite* as plenarily enlightened as the best! This author was so anxious to prove the contrary, and to show that the New Testament is nothing, after all, in an ethical point of view, but a repetition of what the world was perfectly familiar with, that he did not hesitate to say,—"The system of morals propounded there contains no maxim which had not been previously enunciated: and that some of the most beautiful passages in the Apostolic writings are quotations from Pagan authors, is well known to every scholar." It must be confessed he gives but an indifferent specimen of his own scholarship in this ludicrous assertion; since, as has been well said in reply, the obligations of the Apostles to the Pagan writers are confined to the three short sayings—"For we are also his offspring"—"Evil communications corrupt good manners"—and "The Cretans are always liars!"

But, *secondly*, another fallacy in this representation of the inferior relative importance of moral truth to the progress of man and the advance of civilisation, consists in this;—that it utterly ignores the fact that morals, being a *practical* science,—the *value* of which does not consist in theoretic knowledge at all,—must, if we would estimate what it can or cannot do, view it in its *applications* and its *tendencies*. The question here is not how much men know, but how far they use their knowledge. It is here, as with medical science; *that* also, being practical, is of no value, except as it is applied; and may safely be represented not only as of little but of no influence on human welfare, if men be resolved to disregard its principles and refuse its prescriptions. The only way in which the objection to this author's theory, drawn from the *practical* character of Morality, can be obviated, so as to show that it is still a "constant" and unvarying, and therefore comparatively "inferior" element in human progress, is to double the original paradox, and affirm not only that men have an equal *knowledge* of morality, but have always practised it, and will always practise it, in the same invariable degree! that there has always been, and will always be, the same amount of virtue and vice, good and evil action, in the world! But though the patron of this speculation seems sometimes to express himself as though he thought so, it is to be presumed that one who auspicates such magnificent things of the progress of his species, could not seriously mean it; for if he did, it is difficult to see why he should have written his book at all, since on this theory the world in the most essential points would remain incapable of amelioration.

But, *thirdly*, if we represent morality as a stationary and constant element, obstinately looking at it merely as knowledge, and refusing to consider it as capable of indefinite practical applications, then (as already intimated by more than one critic) any *other* science, as well as morals, would come under similar condemnation, as a *sterile and profitless* province of human knowledge. It is so necessarily, unless we suppose it constantly applied in practice, and thus constantly facilitating the further development and application of other branches of knowledge, in virtue of that "common bond" which (as Cicero long ago observed) connects together the whole family of the sciences. Take, for example, the elements of Geometry. So far as discovered and recorded, they would be, except as practically applied, a stationary, constant element of our knowledge, like the theory of morals; which, according to our author, is comparatively powerless, because nothing or little is added to it from age to age. Take, again, the science of Mechanics; it has long since investigated, and reduced to mathematical formulæ, the conditions of equilibrium and motion; the endless new books that treat of it give us only in somewhat varied form, with more or less clearness, the same principles and demonstrations of the same science. If it be said that though the whole body of truths in Euclid's "Elements" or Newton's "Principia" does not vary, yet that these truths are continually facilitating the more successful development and application of man's general powers,—in subserviency to the practical arts, or as stepping-stones to the advancement of other branches of science, or even to the formation of new sciences,—this is all quite true; but it is much the same with morality considered as an *applied* science; only that this last has, in proportion as it is applied to life, incomparably greater, more diffusive, and more uniform influence over the whole powers of man.

And this leads me to the *fourth* fallacy; namely, that of concluding that a constant and invariable "element" in a result,—even though it be an absolute *sine quâ non*, without which the result cannot exist at all,—is necessarily of inferior importance to another element, merely because the latter may admit of indefinite enlargement. For if, as is the case with morals, the things thus represented as invariable are the essential condition of all advancement, and if in proportion as they are practically applied they will and must promote it, they may well be of more moment to the result than any special contributions to the sum of our knowledge. In fact, it might just as well be argued that our intellectual *faculties*, all of which have very narrow limits compared with the knowledge they are the instruments of accumulating for us; or that the "five senses," which are possessed by the generality of the race in far more unvarying perfection than a knowledge of morals, and applied with far greater practical diligence; which are always a constant quantity,—no art or skill enabling us to make them *six;* it might, I say, just as well be argued that all these are of less importance to human advancement than the *facts* of which they inform us, simply because to the number of these last we cannot set limits! A man who so argued would forget that the very accumulation of such facts would be impossible,—that the whole pile would vanish,—without these essential, though unvarying *organa* of knowledge.—And in like manner it may be shown that even if it were true as it is false, that the knowledge of morality was a constant quantity, men without it would be incapable of any steady progress. Concurrent action, mutual confidence, the conscientious use of our faculties, the tranquil pursuit of knowledge, security of property, and the stability of society itself, could be no longer hoped for.

Viewed in this light, we may, on purely logical grounds, claim for morals a more important because more essential place, in determining the conditions of man's progress and civilisation, than for intellect itself. It is granted, indeed, that the progress of knowledge must be supposed constant, as well as a constant practical advance in morals, if man is really to make solid, permanent, perpetual progress. But this I think may further be said;—that the moral element is not only just as *essential* to *any* degree of civilisation, but is more expansive in its effects in proportion to its influence, equally augments man's general power in proportion to that influence, and, *cæteris paribus*, would always insure the certain superiority of any community possessing it in a high degree, over one possessed of *equal*, and in time even over one possessed of *greater*, intellectual powers, endowed with inferior virtue.

1. It is just as *essential* an element to *any* civilisation. This is obvious; for if men were universally destitute of moral virtue, and of the mutual confidence, and power of conjoint action, that it alone can secure, there could be no more progress than is found in a prison of felons, or a den of lions. Even the champion of this singular speculation admits that men must have had more virtue than vice, for if it were *not* so, all progress would have been impossible; the race would have been destroyed, and not a soul left to mourn over man's degeneracy. Although, taking "virtue" in the most comprehensive sense, as embracing the entire scope of man's duties towards God, as well as towards his fellows, the Christian would deny the theory that man has more virtue than vice, yet in that restricted sense in which alone our author seems to recognise virtue as possible, it will be cheerfully acknowledged that there are more deeds performed daily (from whatsoever motives), which comply with at at least the *letter* of the laws of virtue, than the contrary; more truths spoken than lies—more acts of honesty than dishonesty—more people that pay their debts than cheat their creditors; and so on. If it were not so, the world must soon come to an end. This element is, therefore, just as *essential* to all civilisation, as knowledge and intellect; and more so in one respect, inasmuch as man, favoured with the culture of his moral nature, might, even if possessed of feebler intellectual powers than he has, make an indefinite, though it might be slower, progress in knowledge and civilisation; whereas, without the culture of his moral nature, even the highest intellectual powers would be but explosive and disorganizing forces, and prevent any stable progress in civilisation altogether.

2. But this is but a small part of the case. Not only is morality an equally essential condition of all civilisation: it is as capable of indefinite applications as a *practical* science,—the true light, as already said, in which to consider it. It is capable of giving, in proportion to its advance, in proportion to its influence over human life and character, not a uniform and unfluctuating, but a constantly accelerating impulse to man's progress, a constantly increasing force to the sum of his intellectual efforts. Unhappily the world has never yet seen what a rapid, solid, general advance in a thorough and consistent virtue could effect; but it is not a matter of theory, nor left to conjecture. All we have to do is to recur to our consciousness, and the experience of life, in order to see how much is lost by vice, or by an imperfect virtue, and to form an adequate conception of what would be, if all such moral obstacles to man's progress were taken out of the way. And perhaps the best way of forming a lively notion of the dependence of intellectual progress on morals, and of the constantly increasing momentum successive advances in virtue would give to the sum of the powers lodged in the human intellect, is to suppose its abstract tendencies all realized in some favoured community. Let us imagine, then, a society in which no man defrauds his neighbour, idles away his time, or impairs his health or his faculties by vice; no man who makes his neighbours lose their time or waste their ingenuity or property, in guarding against his proving a knave, or squanders his own time and ingenuity, in guarding against the villany of his neighbours; a community in which each man, in the exercise of perfect trust and confidence in others, and of inflexible rectitude of purpose in himself, is left in unmo-

lested liberty, safe from outward fears and from internal distractions, to devote his undivided energies to whatever can adorn, elevate, enlarge, and exalt humanity. Who can estimate the effect of thus setting free the entire energies of man in the pursuit of a higher civilisation? How incalculable the gain, even in means and time, for the further prosecution of knowledge; in the mere freedom from the necessity of guarding against our reciprocal wickedness! We should see a community in which no prisons need to be built or governed; in which no criminal law need be devised or administered; in which no criminal courts need be held; in which no armies need be levied nor paid for, nor (which is worst of all) consumed in war: in which none of the tremendous burdens incurred by war, would be felt or dreaded; burdens which absorb half the revenues of nations, occupy half the time of their senates, and in no inconsiderable degree destroy their population. If it be said that the energies thus exerted do in some degree promote civilisation by quickening the human mind, it may be granted; but I am afraid it must be called the devil's civilisation; and, at any rate, such a result is but a poor one compared with what might be attained by equal resources more legitimately employed; by as much thought, time, money, energy, tranquilly exerted on worthy objects under the direction of a perfect virtue.

Now if these abstract tendencies of virtue would, when *perfectly* realised, thus immeasurably enhance man's power, so will they in *proportion* as they are realised. And who can say with truth, that it is a less expansive element of progressive civilisation than knowledge?

3. It may be said that it is not only an *equally* expansive element, but that it is more than *co-ordinate* with knowledge in the result. Virtue is so potent that not only will it secure the superior progress to that one of two communities which possesses most of it, where intellect is equal; but it will and must insure in time the superior progress to that same community, even though intellect be inferior, unless that inferiority be enormous.

And here the reasoning of Butler in reference to the issues of any contest between mere force and reason, which he employs as an illustration of a somewhat similar proposition, (namely, the tendency of virtue to triumph over all power opposed to it, if time be given it,) may be applied. As to the contest between brute force and intelligence, he says that, let there be time enough and field enough, and anything like a *proportion* between the forces engaged, and the victory will infallibly remain with Reason. It *might* happen, he says, that a few men, landing on a desert island, might be surprised and overcome by lions, or other wild animals; and even if they were not disproportioned in *numbers*, yet unless time and opportunity were allowed to concert measures and give effect to that intrinsic superiority which Reason must ever possess over brute force, the same result might ensue. Yet in the end, he says, every one can see that Reason must (the above-named conditions of the contest being fulfilled) ultimately prevail.

Something like this may be said of the contest between virtue and intellect in a race of civilisation. Supposing time enough allowed for the experiment, and no monstrous disproportion between the intellectual power of two communities, and yet considerable disparity in virtue, that society in which most virtue resides, would in the end (though it might work onwards more slowly) secure a more solid and permanent civilisation than its antagonist; and if possessed of *perfect* virtue must, even with considerable inferiority in the sum total of intellectual force, outstrip its competitor;—not perhaps in the brilliancy of particular discoveries, but in the steady, solid, and durable advance in all that can really insure the elevation of man. For *such* civilisation would be attended with no drawbacks, be liable to no suspension, be exposed to no shipwreck,—as civilisation (no matter what the intellect which has produced it, or which may adorn it to the last), has more than once been when virtue has decayed. None of the time, talents, energies of the community would be wasted or lost. Whatever was once gained would be gained for ever; progress would know no retrogression; it would be a steady unbroken march "through the ages,"—even as we may conceive it will be in that world where the conflicting claims of all the elements of our nature are fully adjusted, but adjusted by each of them knowing its due sphere and office; a world in which what the Apostle says of Faith, Hope, and Charity, here, will be said of Power, Intellect, and Virtue: "And now abide Power, Intellect, Virtue—these three; but the greatest of these is Virtue."

One other paradoxical consequence of the speculation now referred to, involved in the application of a mathematical conception to a subject which does not admit of it, may just be mentioned. According to this theory, morality is but a constant and unvarying element of civilisation, while knowledge increases *without limit;*—the logical consequence, therefore, arguing on these mathematical principles, must be, that the ratio of the moral to the intellectual element must ultimately be a vanishing quantity! On the contrary, it may be safely maintained that whatever the vigour of man's intellect or the accumulation of his knowledge, morality must still be the predominant force if human progress is to be stable and continuous.

* * *

OUR INDIAN HEROES.

By JOHN WILLIAM KAYE.

X.—SIR CHARLES METCALFE.

In the summer of the year 1805, in the neighbourhood of the city of Muttra, in the Upper Provinces of India, where a division of Lord Lake's army was posted, two European gentlemen were conversing eagerly together in a tent. In the papers which lay upon the table, and the frequent references which were made to them, there were manifest signs that the intercourse between the two was not merely of a personal character. Except in respect of a common earnestness of manner, there was no sort of resemblance between them. The one was a tall, handsome, soldierly man in the very meridian of his life. The other was younger by many years; much shorter and much plainer. The elder of the two men was Colonel John Malcolm; the younger was Mr. Charles Theophilus Metcalfe—a civilian upon the establishment—who had accompanied Lord Lake's army into the field, in the capacity of Political Assistant to the Commander-in-Chief.

In the diplomatic service to which the young civilian was attached, there was, at that time, perhaps, no greater name than that of John Malcolm. It was the great harvest-time of fame. Reputations ripened a-pace in those days, and men seemed to rise, almost by a single bound, from a state of obscure subalternship into the full meridian blaze of historical renown. This had been Malcolm's lot within the six or seven years preceding this meeting with Charles Metcalfe in the camp at Muttra. To the latter, therefore, it was a great event. It stimulated his energies and rekindled his ambition. What the train of thought suggested, and what effect it had upon his actions, may best be told in young Metcalfe's own words. Writing to a cherished friend in Calcutta, he said:—"On the day after his arrival in camp, Colonel Malcolm, to my surprise (for I could scarcely call myself acquainted with him), entered in a full, friendly and flattering manner into the question of my intentions—with full confidence, he laid open to me the various plans which were in contemplation, gave me admission to all his papers, and by appearing to interest himself in my welfare, prepared me to listen to him with great attention. He expatiated on the great field of political employment now open in Hindostan, the necessity of many appointments and missions, the superiority, as he seems to think, of my claims, and the great risk, if not certain injury, of my quitting the scene of action. By holding out the offer of distinction, he gained the important outwork of desire, and the citadel of resolve was in danger of falling. It did not immediately yield, however, and notwithstanding all he said, I clung fondly to my rooted and long-indulged intention of returning to Calcutta and of paying my last respects to Lord Wellesley. There was, however, sufficient in what Malcolm said to induce me to reflect seriously on the step I should take. I did not converse with Malcolm again for five days, and in that period, the subject was ever in my mind, and I never experienced such irresolution on any occasion in which I had the power of self-decision. Exclusive of the reasons suggested by Malcolm for my remaining, others occurred to me which he could not mention. I have long, as you know, looked upon the political as my line of service, and although I have seen what people call native courts, and have passed over many countries, I have had the misfortune of being under men, whose talents, knowledge, and character, or rather want of these, I could not admire; who gave no encouragement to my desire to learn; who on the contrary rather made me sick of my pursuit of knowledge. I have felt myself degraded by my situation, and instead of studying acquaintance with the natives, I have shrunk from notice as much as possible. My knowledge, therefore, is only that which I acquired in the Governor-General's office, and which, though highly useful, does not in itself qualify a man to be a political agent. The opportunity of acting under a man of Malcolm's talents and reputation, established knowledge, inquisitive genius and communicative disposition, promises advantages of the most solid and certain nature and of real importance. I could not, however, give up my desire to visit Calcutta, and my second conversation with Malcolm ended in our agreeing that I should run down to Calcutta and return quickly. On the same evening, however, he strongly advised me not to go; and the next day we had a long conversation, which ended in my being very uncertain what to do. I think, however, clearly that I shall stay; but I never did anything with more reluctance. I long to see our glorious Wellesley before he quits us. Malcolm tells me that I cannot better show my gratitude to Lord Wellesley than by assisting in scenes in which he will always have great interest."

So after some further doubts and self-questionings he resolved to remain with the army and to take his leave of the "glorious Wellesley" by letter. "Malcolm," he wrote on the 11th of June, "who will manage all political concerns at head-quarters, has expressed a wish that I should remain on his account, expecting to derive more assistance from me than I fear he will. This subject fills my mind, and it is with very great difficulty that I can reconcile myself to the overthrow of my plans—plans which I have so long ruminated over with anticipated delight. I rest my chief consolation on Malcolm's character, and the useful knowledge that I shall obtain whilst with him. It is my intention to cultivate his intimacy zealously. His advances to me have been very flattering. I foresee one thing; he is a likely man to give my mind a turn towards literary pursuits, which have scarcely ever entered my imagination—nay, he already has. He himself is an enthusiast." And, because he was an enthusiast, he had succeeded nobly in life. Because he was an enthusiast, he had discerned the fine qualities of the young civilian, in whom also there was a pure and generous enthusiasm, waiting only for opportunity to display itself in great and good deeds. There was something thorough about him that especially pleased Malcolm. Young as he was, he expounded his views, in favour of the prosecution of the "great game," with all the resolution of a veteran politician. Steeped as he was in admiration of Lord Wellesley, he was still more ardent in his attachment to the political faith which he cherished, and he could perceive and discuss the shortcomings of the "glorious little man," which were then becoming apparent to the war-party in camp. No man knew better than Malcolm the real state of things at Government House, for he was in close and confidential correspondence with Colonel Arthur Wellesley, and the letters which he then received plainly indicated that much toil and trouble and sore vexation had weakened the gallant resolute spirit of the Governor-General, and that he was not now what he had been in the earlier years of his reign. Malcolm and Metcalfe, in close confidential talk, bewailed the change; and still more bitterly lamented that Lord Cornwallis was coming out to India, to undo, as they said, the great work of his predecessor. Greatly as they differed in age, in experience, and in many important points of character, they were bound together by ties of strong political sympathy, and it was a mutual pleasure to them to discuss unreservedly the past, the present, and the future, of a conjuncture of events unexampled in the history of our Indian Empire.

Charles Theophilus Metcalfe was then in his twenty-first year. Born in Calcutta on the 30th of January, 1785, he was the second son of Major Metcalfe, an officer of the Company's army, who had amassed a considerable fortune, as fortunes were amassed, rapidly, in the days of Warren Hastings, when a lucrative contract was a sure road to sudden wealth. Having made his fortune, he did as others did, carried it away to spend in England, and took his place among the "nabobs" of the eighteenth century. He bought an estate; canvassed, and with success, for the East India direction; and obtained for himself a seat in Parliament, in the good old days of Toryism and Pitt. As he always voted with the Minister, and had money enough to support a respectable position as a country gentleman, with a house in Portland Place, a baronetcy was not an unattainable object of ambition. So Major Metcalfe had not been many years in England before he rose up "Sir Thomas Metcalfe, Bart.;"* and what he owed in the first instance to the accidents of fortune, he afterwards dignified by his own native worth. He was a man of high integrity of conduct, endowed with a solid understanding rather than with any brilliant parts, and if he could not command the admiration of the world, he always enjoyed its respect.

In their early boyhood, his two sons, Thomas and Charles, were sent to a private school in one of the eastern suburbs of London—Bromley, beyond Bow, not far from the frontier-line of Middlesex and Essex; but after they had received, in worthy Mr. Tait's academy, the rudiments of their education, they were transplanted to Eton, where they boarded at the house of Dr. Goodall, afterwards head-master and provost of the college. There young Charles, or, *Academicè*, Metcalfe Minor, applied himself assiduously to his books rather than to cricket, to boating, or to fives. Over and above the Latin and Greek, which in those days were the be-all and end-all of public school education, Metcalfe Minor read, in his own room, a number of books, English and French, and improved himself by translating the latter. From the study of French he proceeded to that of Italian, and day after day, as his boyish journal declares, "read Ariosto." Of more robust and athletic pursuits we have no record under his own hand. But many years afterwards, worthy Dr. Goodall recorded that he "heard the boys shouting one day, and went out and saw young Metcalfe riding on a camel." "So," he added, rather pleasantly than logically, "you see he was always Orientally inclined."

That an East India Director should determine to provide for his sons in the East was only in the common order of things. Major Metcalfe had made a fortune in India with no great trouble, and his boys might easily do the same. The best thing of all in those days was "a China writership." The next was a writership in Bengal. So Thomas was set down for the former, and Charles for the latter. Thomas was a high-spirited, rather precocious boy; and having, at a very early age, been allowed to taste the delights of English society, was reluctant in the extreme to be banished to Canton. Charles was not much more eager to go Eastward; but his unwillingness was of a different kind. He loved Eton; he was warmly attached to some of his schoolfellows; he loved his parents and his kindred, and he loved his country. But he could plainly see that there were the best possible reasons for his going to India; and so he submitted, with a good grace, to the painful decree. At the age of fifteen he was taken from Eton, and sent out to Calcutta. He went, doubtless, because his father had gone there before him; because Major Metcalfe, being an East India Director, was very properly of opinion that Patronage, like Charity, should "begin at home." But if the whole Court of Directors had ransacked England, Scotland, and Ireland, in search of the likeliest boy in the three kingdoms to grow into a serviceable Indian statesman, they could not have found one with more of the right stuff in him than in Charles Metcalfe.

---

* These facts are stated without regard to strict chronological arrangement. Major Metcalfe was not created a Baronet until his son Charles had been some years in India.

On the 1st day of the year 1801, Charles Metcalfe set foot on Indian soil, and was soon in the full enjoyment of the strenuous idleness of the cold season in Calcutta. The novelty for a time was pleasing to him; so also was the independence of his new life; and all the chief people of the Presidency, the Governor-General, Lord Wellesley, included, opened their houses to him. But with the hot weather came weariness and exhaustion. The young civilian's spirits failed him; and before the month of June had been gasped out, he had written to his father, telling him that he hated India, and that all his happiness in life depended upon his being permitted to return home and obtain "a small place in Lord Grenville's office." Now, if Charles Metcalfe had been the son of a weak-minded mother, it is possible that her entreaties might have prevailed against the paternal judgment; but she was fortunately a lady in whom there was as much sound sense as good feeling; she saw at once that her son had written under a temporary depression of spirits, or in the language of the day, "vapours," which would soon pass away; and her expressive answer was—a box of pills. "You may laugh at my sending them," she wrote, "but I think you are bilious, and they will be of great service. . . . You study too much. You should dissipate a little. On account of your health you should relax. Ride on horseback. When intense thinking is joined with the want of exercise, the consequences must be bad." The answer of Major Metcalfe was drawn from his own book of experience. "I remember well," he wrote, "my own feelings, when I was an Ensign, and had been in the country about three months. I one morning (in a fit of bile) waited on the commanding officer with an intention to resign the service and return to England. Fortunately for me, the conversation at breakfast took a pleasant turn, in which I bore an active part, and a hearty fit of laughter got the better of my blue devils. I returned to my quarters with a determination to persevere." Indeed, it was a very old story. There is no incident with which Biography is more familiar, than this early fainting at the outset of the great march to Fame.

It was, perhaps, fortunate for Charles Metcalfe that in those days there were no overland mails. Many months elapsed before he could receive an answer to his appeal; and before the parental replies reached Calcutta, the young civilian had begun to take a more cheerful view of life, and to think that he might do something to distinguish himself in India, though he still clung to the belief that there were better prospects before him in England. Even then his young ambition had been fired. Whilst yet only in his seventeenth year, he wrote in his journal, "No one possesses more ambition than I do; and am I destined to be great? If I quit this country, I may be; and it is one of the reasons for my desiring it so ardently. I cannot help thinking, should I hereafter be great, of the fervour with which my biographer will seize upon these slight memorandums, and record them to an eager public as a proof of my indulging, in youth and in distant climes, the idea of becoming a great character on the theatre of the world." This was written in October; but before the end of the year delivery came in the shape of active employment. Lord Wellesley, who perceived that the youngster had good stuff in him, emancipated him from the control of the College of Fort William, and appointed him an Assistant to the Resident at Scindiah's Court.

On his way to join his appointment, Charles Metcalfe fell in with the camp of the Governor-General, and obtained Lord Wellesley's permission to accompany him to Lucknow. There he caught his first glimpse of the traditional splendour of the East, and found that the reality even exceeded the romance. "Everything," he said, "recalled to my memory the 'Arabian Nights,' for every description of any such procession which I ever met with in history, even the celebrated triumph of Aurelian when he led Zenobia and Tiridates (Tetricus) captives, of which Gibbon gives an account, was completely beggared by it." From Lucknow, he proceeded to join the camp of the Resident at Scindiah's Court. This high political office was then held by Colonel Collins—an early associate of Metcalfe's father, who spoke of him affectionately as his "old friend Jack Collins." But he had another name with the general community, who called him "King Collins," for he was a man of an imperious nature and an overbearing temper. Charles Metcalfe did not want temper, but he wanted tact; and he soon quarrelled with his chief. The old soldier resented the clever self-sufficiency of the young civilian, who argued and dogmatised, and was continually running himself against the angularities of King Collins. So there was a rupture. Metcalfe asked permission to resign his appointment, and then returned to Calcutta.

It was well that he did so; for soon after his return to the Presidency, a seat was given to him in what was called "Lord Wellesley's office." A little cluster of the most promising young civilians were gathered together in Government House, and did much important confidential work under the superintendence of the Chief Secretaries, or sometimes of the Governor-General himself. It was the best possible nursery for infant statesmen, and there were few who did not profit by the culture. Great events were then taking shape in the womb of

Time. We were on the eve of a great conflict, which was destined to change the whole aspect of our Eastern Empire, and to make the administration of Lord Wellesley the most momentous in the whole range of our Indian history. It was a great thing for young Charles Metcalfe to take even a humble ministerial part in these great transactions under the eye of the Governor-General. Lord Wellesley was one to encourage well those who served him well. To the men who did not grudge their work, he did not grudge his praise. A minister, in high place, who is slow to recognise the good services of his subordinates, may be a very clever man, but he is not a great statesman. What this noviciate in Lord Wellesley's office did for Charles Metcalfe, at the turning-point of his career, it is almost impossible to rate too highly. After a year and a half of this good training, he was thoroughly fit for active service. The "great game" had commenced. General Lake's army had taken the field; and in the spring of 1804, Charles Metcalfe was appointed Political Assistant to the Commander-in-Chief, and despatched to join the army at headquarters.

The General was a fine old soldier; but he had his weaknesses, and among them an habitual contempt for civilians; and indeed for much penmanship of any kind. He had an emphatic formula by which he expressed to those beneath him his desire that they should mind their fighting and not their writing. The presence in his camp of a boy-civilian, fresh from Government House, rather irritated him; and, perhaps, the members of his staff humoured the old soldier by sneering at the non-combatant clerk, who shared the pleasant excitements but not the dangers of the campaign. Young Metcalfe got some inkling of this, and quietly bided his time. An opportunity soon came. The army was before the strong fortress of Deeg. The storming-party was told off, and the non-combatant clerk volunteered to accompany it. He was one of the first to enter the breach. This excited the admiration of the old General, who made most honourable mention of him in his despatch; and, ever afterwards, throughout the campaign, spoke of him as his "little stormer."

It was soon after this that Colonel Malcolm joined the camp of the Commander-in-Chief, and took young Metcalfe into his councils. The war was then nearly over, for the treasury was well nigh empty, and the Company were on the verge of bankruptcy. There was, however, one last blow to be struck. Holkar was still in an attitude of hostility; but when the British troops drove him, as before narrated, across the Sutlej, and he was at last compelled to accept the terms offered to him by our Government, the "little stormer" was sent to convey to the Mahratta chief the assurances of our friendship and good will. He spoke modestly of this mission, and said that his task was an easy one; but it required both temper and tact, especially as the celebrated Pathan leader, Ameer Khan, was present at the meeting, and inclined to be insolent to the boyish English diplomatist, who had not by any means an imposing personal presence, and whose countenance could scarcely by any effort be made to discard its habitual expression of cheerfulness and benignity.

On the restoration of peace, Sir Charles Metcalfe was appointed an Assistant to the Resident at Delhi, where the Mogul Emperor, Shah Allum, old, blind and infirm, still maintained the shadowy pageantry of a Court. The Resident was Mr. Seton, a civilian of the old school, whose chief characteristic was an overflowing courtesy and politeness, which sometimes wholly swept away all the barriers of sound sense and discretion, and exposed him to not unmerited derision. In any other man, the strong expressions of admiration, with which he spoke of young Metcalfe's genius, might have been regarded as indications of discernment and prescience. But on the lips of Seton the language of flattery was habitual, and Metcalfe attached but little value to the praise of a superior who had been represented in a caricature of the day as saluting Satan with a compliment, and wishing "long life and prosperity to His Majesty." This weakness had unfortunately free scope for exercise at Delhi, where exaggerated respect was shown by Seton to the Mogul. Metcalfe often remonstrated against this, and by his remonstrances greatly perplexed the Resident, who could not show all the deference he wished both to his young friend and the old king. Metcalfe was soon sick of the ungenial work, which was even less profitable than it was pleasant. "I am, with respect to health," he wrote in June, 1807, "as well as usual, and that, I thank God, is very well; in spirits, too, pretty well; and, though the place is very dull, and I myself am no great enlivener of society, never fail to be merry on a favourable opportunity. I am tired of business, and long to have less to do—the nearest to nothing the better. . . . And now comes the dreadful tale. My finances are quite ruined, exhausted beyond any reasonable hope of repair. You know that I am very prudent: prudence is a prominent feature in my character; yet, ever since I came to this Imperial station, I have gradually been losing the ground which I had gained in the world, and at length I find myself considerably lower than the neutral situation of having nothing, and without some unlooked-for and surprising declaration of the fates in my favour, I see nothing but debt, debt, debt, debt after debt before me." But deliverance soon came. Certain new duties were imposed upon him, and his allowances were consequently increased. As these duties were of an administrative rather than a diplomatic character, the arrangement did not much please him; but he found consolation in the means it afforded him of extricating himself from debt. He determined to convert this addition to his salary into a sinking-fund for the payment of the claims against him; and resolutely adhering to the design, he paid off his debts to the last sixpence without any foreign aid.

And he was on the high-road to the realisation of a fortune. He was not one to remain long in a subordinate position, under such a man as Mr. Seton. There was, or there was supposed to be, a conjuncture which demanded the best services of all the best men in the country. The apprehensions which, as I have before written, sent Malcolm to Persia, and Elphinstone to Caubul, suggested the expediency of a mission to Lahore, and Metcalfe was selected to conduct it. In these days, it is no greater feat to go from Delhi to Lahore than to go from London to Scarborough. But in 1808 the Punjab was almost a *terra incognita* to us. We knew little or nothing of the "strange sect of people called the Sikhs." Some tidings had reached us of the rising power of a chief named Runjit Singh, who was rapidly consolidating by not the most scrupulous means an empire on the banks of the Hyphasis and the Hydaspes. In pursuance of the comprehensive scheme of defensive policy, which the designs of the French and Russian Emperors compelled us to initiate, Lord Minto determined to secure the good offices of the ruler of the Punjab and to bind him to us by treaty-obligations. For this work he selected Mr. Metcalfe; and seldom or never before had a mission of so much delicacy and difficulty been entrusted to so young a man.

Charles Metcalfe was only twenty-three years of age—an age at which at the present day many civilians of the new school first set their faces towards the East—when he went forth on this mission to the Court of Runjit Singh. On the 1st of September, 1808, the mission crossed the Sutlej. On the 12th, Runjit Singh, who had been flitting about in a somewhat erratic fashion, as though he could hardly make up his mind how to act, received the English officers at Kussoor. It is not the custom in these cases to go to business. The first visits of Oriental diplomacy are visits of courtesy and congratulation. "The Rajah," wrote Metcalfe, "met us on the outside of a large inclosure, and having embraced all the gentlemen of the mission, conducted us within, where tents had been prepared for our reception. As a compliment to us, the Rajah, from his own choice, used chairs at this meeting, partly collected from our camp and partly from his own, upon which he and the principal Sirdars present, and the gentlemen of the British mission, were seated. This interview was prolonged by the Rajah beyond the usual time of visits of ceremony; but nothing of consequence passed at it. The Rajah did not enter much into conversation, and made only two observations worthy of remark. One was an expression of regret for the lamented death of Lord Lake, of whom he observed that it would be difficult to find his equal, for that he was as much distinguished by his gentleness, mildness, humanity and affability as by his greatness as a military character. The other observation was in reply to one of his courtiers, who was remarking that the British Government was celebrated for good faith; upon which Runjit Singh said that he knew well that the word of the British Government included everything." Great words—and a great fact in those days. *Oh! si sic omnia!*

On the 16th, Runjit Singh returned the visit of the young English diplomatist; and three days afterwards, at another meeting, they proceeded to discuss the business of the mission. It would be a work of time to narrate all the details of the protracted negociations which then ensued. The Sikh ruler was full of jealousy and suspicion; and, therefore, he was very wary in his practice. He fenced and evaded with the greatest skill; and was continually watching for opportunities, which the young English officer never allowed him, of coming down upon him unawares or striking him at a disadvantage. The fact is that he thought Metcalfe had entered his country in the character of a spy, and that the negociation of a friendly alliance was intended only to mask some ulterior proceedings of a hostile character. His conduct was distinguished by an amount of inquietude and restlessness, which every now and then verged upon discourtesy, if not upon overt insolence to the British mission, and it is not improbable that many a man in Metcalfe's place would have resented the strange bearing of the Sikh chief, and have broken up his camp to return to the British frontier. But, even at that early age, the beautiful patience, which at a later time so perfected in him the true heroic character, displayed itself, to his own honour and to his country's good. He had been sent to perform a certain work, and he was resolute to do it in spite of all temptations to turn aside; and, therefore, he was slow to take offence: feeling that he might attribute to the barbaric ignorance and to the rude impulses of one who had never known restraint, much which in an European prince would have been wholly unaccountable and not to be forgiven. When, in all courtesy and respect, Runjit ought to have been pursuing to a close the negociation with the representative of the British Government, he was giving himself up to strong drink and to the unseemly exhibitions of dancing girls, and giving no sort of heed to the important business before him. There was method, perhaps, in madness of this kind. He was evidently anxious to gain time, that he might see what would be written down in the great chapter of accidents, and be guided to that which would best serve his individual interests. He was especially anxious to learn what was the real military strength of the British Government—most of all, what were the qualities of the trained native soldiers who constituted our Sepoy army. An unexpected incident gave him a glimpse of the knowledge which he sought. The negociations had been protracted, without any positive results, to the month of February, when one day Metcalfe's escort of British Sepoys came into collision with a party of Akalis, or Sikh fanatics—half soldiers and half saints. There was a sharp conflict between them; but, after a little while, the steady discipline of the little band of trained soldiers prevailed, and the Sikhs broke and fled. This appears to have made a great impression on Runjit's mind. He saw clearly that the English, who could make such good soldiers of men not naturally warlike, were a people not to be despised. There were ulterior results of even more importance to history, but that which immediately followed was the conclusion of the treaty, which had been so long in course of negociation. It was a treaty of general friendship and alliance between the British and the Sikh powers—a plain, straightforward, sensible treaty, unencumbered with details; and it lasted out the lives both of the Indian chief and the English statesman.

The manner in which Charles Metcalfe had conducted these difficult negociations placed him at once, notwithstanding the fewness of his years, in the foremost rank of the public servants of the Indian Government. From that time his fortune was made. On Metcalfe's return to India, Lord Minto invited him to the Residency; and not very long afterwards offered him the Delhi Residency, in succession to Mr. Seton, who had been appointed Governor of Prince of Wales' Island. "I shall," wrote the Governor-General to him, "with (or without) your consent, name you to the Residency of Delhi. I know your martial genius and your love of camps; but besides that inclination must yield to duty, this change will appear to fall in, not inopportunely, with some information and some sentiments conveyed to me in your letter of the 3rd instant." And then he added, in a strain of kindly jocoseness, "If you ask my reasons for so extraordinary a choice, I can only say that, notwithstanding your entire ignorance of everything connected with the business of Delhi—a city which, I believe, you never saw; and with Cis- and Trans-Sutlej affairs, of which you can only have read; and notwithstanding your equal deficiency in all other more general qualifications, I cannot find a better name in the list of Company's servants; and hope, therefore, for your indulgence on the occasion." I have read a great number of letters from Governors-General, offering high appointments to the officers of Government, but never one so pleasant as this—never one that so clearly indicated the personal affection of the writer for the man to whom it was addressed.

So, at the age of twenty-six, Charles Metcalfe found himself in possession of the high dignity and the large emoluments of an office coveted by men of twice his age and four times the length of his service. Yet he was by no means elated by his good fortune. It is hard, perhaps, to form a just estimate of the habitual feelings of a resident in India, so much is a man's cheerfulness affected by the climate; so great are the vicissitudes from a state of high animal spirits to one of feebleness and depression. The biographer should always consult the date of a letter written in India; but it will be no unfailing guide. The truth is that, by men who have much official work to do, private letters to friends in England are commonly written in a state of weariness and exhaustion; and, moreover, there is always something saddening in this communion with the old home; it suggests so many tender regrets and painful yearnings after unattainable bliss. It was not strange, therefore, that Charles Metcalfe should have written to England, from the Delhi Residency, to discourage one of his aunts from sending out her son to India. "Do not suppose," he added, "that I am unhappy or discontented. I have long since reconciled myself to my fate, and am as contented and happy as one far from his friends can be. I do not allow unpleasant thoughts to enter my mind, and if I do not enjoy what is beyond my reach—the inexpressible pleasure of family society—I at least am always cheerful and never unhappy. My father did what he thought best for me; and it is satisfactory to me to reflect that my career in India, except as to fortune, must have answered his expectations. It has been successful beyond any merits that I am aware of in myself." As he says, in the next paragraph, that he hopes to save 3000*l.* a year from his salary, I can hardly think that even Sir Thomas Metcalfe could have been much disappointed that his son could not do more financially at the age of six-and-twenty.

When Lord Minto returned to England he left Charles Metcalfe still at the Delhi Residency, and Lord Hastings found him there. There were stirring times then before the Government of India—the necessary after-growth of the sudden winding-up of the great game of Lord Wellesley's time. Few men were better acquainted with the politics of Upper India than the Delhi Resident, and the statesmen by whom Lord Hastings was surrounded were eager to obtain an expression of his views. They were strongly in favour of a "settlement." He knew that until vigorous measures had been taken to crush the Pindarrees, and to place upon a more satisfactory footing our relations with the substantive Mahratta States, there could be only a cry of "Peace, Peace!" where there was no peace. He drew up, therefore, some important state papers for the use of Lord Hastings, and, whether the Governor-General were or were not moved by them, it is very certain that the course pursued was in accordance with the views and recommendations of Charles Metcalfe.

And it is certain that such was the clearness and comprehensiveness of Metcalfe's views, and such the precision with which he expressed them, that the Governor-General saw plainly that it would be to his advantage to have such a statesman at his elbow. But there was some active diplomatic business yet to be done by the Delhi Resident. In the great political and military transactions which distinguished the administration of Lord Hastings, Metcalfe played an important part. The task which was set him did not in the sequel involve the rough work which fell to the share of Elphinstone and Malcolm; but it demanded the exercise of no little address. It was his to bring the great Pathan chief, Ameer Khan, to terms; to induce him to disband his levies and restore the tracts of country which he had taken from the Rajpoots. It was his also to bring all the great Rajpoot chiefs into friendly alliance with us; and though the conduct of one or two of them was of a slippery and evasive character, they were all finally persuaded that it was really to their interest that they should be brought under British protection. This done, and the war concluded, Charles Metcalfe accepted the offer of a place in the Executive Government, which had been made to him by Lord Hastings, and prepared, in the cold weather of 1818-19, to assume the office of Political Secretary, in succession to Mr. John Adam, who had been elevated to a seat in Council.

He turned his back upon Delhi with a sigh. He left behind him many dear friends. He loved the work that had been entrusted to him, because there was great scope for beneficent action, and he felt that he had not exerted himself in vain. In after years, he looked back with pardonable pride at the results of his administration. "Capital punishment," he said, "was almost wholly abstained from, and without any bad effect. Corporal punishment was discouraged, and finally abolished. Swords and other implements of intestine warfare, to which the people were prone, were turned into ploughshares, not figuratively alone, but literally also; villagers being made to give up their arms, which were returned to them in the shape of implements of agriculture. Suttees were prohibited. The rights of Government were better maintained than in other provinces, by not being subjected to the irreversible decisions of its judicial servants, with no certain laws for their guidance and control. The rights of the people were better preserved, by the maintenance of the village constitutions, and by avoiding those pernicious sales of lands for arrears of revenue, which in other provinces have tended so much to destroy the hereditary rights of the mass of the agricultural community."

The Political Secretaryship of the Indian Government is a high and important office; one that had been, and has since been, held by men second to none in the public service. Barlow, Edmonstone, and John Adam had been Metcalfe's predecessors, and had each in turn passed on from the Secretaryship to a seat in the Supreme Council. But those who knew him best, doubted whether the place would suit him; and he soon came to doubt it himself. Among others, Sir John Malcolm wrote to him, saying, "Had I been near you, the King of Delhi should have been dissuaded from becoming an executive officer, and resigning power to jostle for influence. But you acted with high motives, and should not be dissatisfied with yourself." But this was not all that Malcolm wrote to him at the time. "I recognise in all your letters," he said, "the unaltered Charles Metcalfe with whom I used to pace the tent at Muttra and build castles; our expenditure on which was subject neither to the laws of estimate nor the rules of audit." And now, though at a distance from each other, they began castle-building again. Malcolm was meditating a return to England, and he was eager to make over the administration of Central India to his friend. Another high civil officer, who had the charge of a contiguous tract of country, was also about to retire from his post; and it was considered whether these two great administrative fields might not be conjoined and placed together in Metcalfe's hands. "The union of Malcolm's charge and Marjoribanks'," he wrote in a rough pencil note on the face of a letter from Mr. Adam, "would be grand indeed, and make me King of the East and the West." But this Kingship was not in store for him. His services were required on another field of action. He was appointed Resident at Hyderabad in the Deccan.

Towards the end of the year 1820, accompanied by a few young friends who had been appointed his assistants, Charles Metcalfe set out for Hyderabad. As Political Secretary, he had been in constant correspondence with his predecessor, Mr. Henry Russell; and he had good substantial information, therefore, relating to the state of the country. But he found, upon the spot, that the disorders of which he had heard were more deeply seated than he had imagined. The Nizam had borrowed from an extensive banking-house at Hyderabad large sums of money at high interest, for the payment of his troops and other current expenses of his Government. The result was that his ministers were compelled to resort to many acts of oppression and injustice to wring money from the people to keep the machinery of the state from altogether suspending its action. It was plain that the interference of the British Government had long been imperatively demanded. Something had already been done; but something also remained to be done. "The more I see of the Nizam's country," wrote Metcalfe, after some six months' experience, "the more I am convinced that without our interposition, it must have gone to utter ruin, and that the measures which have been adopted were indispensably necessary for its continued existence as an inhabited territory. As it is, the deterioration has been excessive; and the richest and most easily cultivated soil in the world has been nearly depopulated, chiefly by the oppressions of Government. It will require tender nursing."

But all the nursing in the world could do nothing, so long as there remained the great cancer of the debt to eat into the very life of the State. The English money-lenders had got hold of the Nizam and his ministers. They were friends of the Resident and friends of the Governor-General; but the former determined to rescue the country from their grasp. He knew that it could not be done without sore travail; he knew that he would lose many friends and make many enemies; and that the cordial support of the Government was little likely to be obtained. Sir John Malcolm had written to him, saying, "Every step that you take to ameliorate the condition of the country will be misrepresented by fellows who have objects as incompatible with public virtue and good government as darkness is with light. . . . You have to fight the good fight, and to stand with the resolute but calm feelings such a cause must inspire against all species of attacks that artful and sordid men can make or that weak and prejudiced men can support. . . . I am quite confident in your ultimate triumph, though I expect that you will have great vexation and annoyance."

And truly he had; but, much as it cost him, he was resolute to go through it to the end. It was the sorest task that he ever set himself, for he was a man of warm affections, and it cut him to the heart to array himself against the personal interests of his friends. But he felt that the very life of the Hyderabad State hung upon his independent action, in the emergency that had then arisen. He was determined to inquire, where inquiry must of necessity have been exposure, and to cut off the stream from which so much had been poured into the coffers of his friends. It is a long story. The great banking-house of William Palmer and Company suffered greatly by Metcalfe's sturdy uncompromising conduct; and for awhile he fell under the displeasure of the Governor-General. But Lord Hastings had too many good qualities of head and heart not at last to do justice to a public servant who had striven only for the public good.

In 1825, Lord Amherst, who had succeeded Lord Hastings as Governor-General, invited Metcalfe to leave Hyderabad and to resume his old office at Delhi. He was then Sir Charles Metcalfe, Baronet; for his father and elder brother had passed away, and the title and estates of the family had descended to him. It was a conjuncture of great importance in Upper India; for the state of affairs of Bhurtpore had compelled British interference, and the army, under Lord Combermere, was marching against that celebrated fortress. To no man could the conduct of the political business of the campaign be entrusted with so much confidence as to Sir Charles Metcalfe. The events of the siege belong to history. Metcalfe, whose old martial instincts were again roused, watched the operations of the storm with the deepest interest, and had a narrow escape from injury, if not death, from the bursting of a mine.

He had now fairly earned a seat in the Supreme Council, and in 1827 it was conferred upon him. He then took up his residence in Calcutta; and was the most hospitable and the most popular of men. Of his public services no better account can be given than that which has been recorded in the words of Lord William Bentinck, with whom he worked, in perfect amity, for many years. "My connection," said the Governor-General, "with Sir Charles Metcalfe in Council, during more than six years, ought to make me the best of witnesses, unless, indeed, friendship should have blinded me and conquered my detestation of flattery, which, I trust, is not the case. I, therefore, unhesitatingly declare that whether in public or private life, I never met with the individual, whose integrity, liberality of sentiment and delicacy of mind excited in a greater degree my respect and admiration. The State never had a more able or upright councillor nor any Governor-General a more valuable and independent assistant and friend: and during the same period, of any merit that can be claimed for the principles by which the Indian Government has been guided, to Sir Charles must the full share be assigned. Neither has the access which my situation has given me to the public records and to past transactions led me to form a less favourable opinion of his preceding career. I need not enter into particulars. Suffice it to express my sincere impression that among all the statesmen, who since my first connection with India have best served their country and have most exalted its reputation and interests in the East, Webb, Close, Sir Arthur Wellesley, Elphinstone, Munro and Malcolm, equal rank and equal honour ought to be given to Sir Charles Metcalfe."

At this time (1835) Sir Charles Metcalfe had been appointed Lieutenant-Governor of Agra; but he left Calcutta, only to return to it. He had scarcely reached Allahabad, when news was received of the intended departure of Lord William Bentinck for England. As "Provisional Governor-General," therefore, in the absence of any substantive appointment to the high office, it was now Metcalfe's privilege to receive from him the reins of Government. He hastened, therefore, back to the Presidency, and arrived in time to shake the departing ruler by the hand, and to bid God-speed to him, and to that pearl of gentlewomen, his admirable wife. The dreams of the Eton Cloisters, the air-built castles of the Muttra tent, had now become substantial realities. He had said that he would some day be Governor-General of India—and now the great official crown was upon his head. It might not remain there long, but it was something to be Governor-General even for a day. Some believed that the substantive appointment would be, and all hoped that it might be, conferred upon him. Metcalfe, however, had no expectation of such a result. In the first place he knew that the influence of the Court and the Cabinet would assuredly prevail against the "old Indian" party at home; and, in the second, he felt assured that in the eyes of a large section of that party he had irremediably damaged himself by his conduct at Hyderabad. He was right. But the interregnum was one of unexpected duration. The appointment of Lord Heytesbury, made by the Tories, having been cancelled by the Whigs, there followed much discussion, involving much delay, with respect to the choice of a successor. The Court of Directors desired to appoint Sir Charles Metcalfe; but the Queen's Government prevailed, and finally nominated Lord Auckland to the post of Governor-General of India.

But not before the interregnum of the Indian civilian had been rendered famous by an act, which has, perhaps, been more discussed, and with greater variance of opinion, than any single measure of any Governor-General of India. He liberated the Indian press. Under the Government of his predecessor, freedom of speech had been habitually allowed, but the sword of the law still remained in the hand of the civil Government, and at any time it might have been stretched forth to destroy the liberty which was thus exercised. But Metcalfe was not content with this state of things. He desired that the free expression of thought should be the right of all classes of the community. He took his stand boldly upon the broad principle, that to deny this right is to contend "that the essence of good government is to cover the land with darkness." "If their argument," he added, "be that the spread of knowledge may eventually be fatal to our rule in India, I close with them on that point, and maintain that, whatever may be the consequence, it is our duty to communicate the benefits of knowledge. If India could be preserved as a part of the British Empire, only by keeping its inhabitants in a state of ignorance, our domination would be a curse to the country, and ought to cease. But I see more ground for just apprehension in ignorance itself. I look to the increase of knowledge with a hope that it may strengthen our empire; that it may remove prejudices, soften asperities, and substitute a rational conviction of the benefits of our Government; that it may unite the people and their rulers in sympathy, and that the differences which separate them may be gradually lessened, and ultimately annihilated. Whatever, however, be the will of Almighty Providence respecting the future government of India, it is clearly our duty, as long as the charge be confided to our hands, to execute the trust to the best of our ability for the good of the people." It would be difficult to gainsay this: but the Court of Directors of the East India Company had not such sympathy with these "high flown notions." The intelligence of what he had done reached them whilst the question of the Governor-Generalship was still an open one; it may have in some measure influenced the decision, but I scarcely think that it did. At all events, Metcalfe soon heard from England that he had lost the confidence of the Company. Lord Auckland had by this time arrived in India; and Sir Charles Metcalfe had returned to the Lieutenant-Governorship of Agra. From that place he addressed a letter to the official organ of the Company, in which he requested that if he had really lost the confidence of the Court, his provisional appointment of Governor-General might be withdrawn, and that he might resign his office and retire from the service of the Company. The answer to this was outwardly cold and formal. It expressed the regret of the Court that Sir Charles Metcalfe should have thought it necessary to make such a communication, and added that the continuance in him personally of the highest office which the Court had it in its power to confer ought to have satisfied him that their confidence had not been withdrawn.

But Metcalfe was not satisfied; so he forthwith sent in his resignation, and prepared to return to England. No man ever left India, carrying with him so many lively regrets and so many cordial good-wishes from all classes of the community. I can well remember the season of his departure from Calcutta. The Presidency was unwontedly enlivened by Metcalfe balls and Metcalfe dinners, and addresses continually pouring in and deputations both from English and Native Societies. It would take much of time and much of space to speak of all these; and I must refrain from the attempt to record them. But it may be mentioned that, on one of these farewell festal occasions, after Metcalfe's health had been drunk in the ordinary way, as a statesman who had conferred great benefits upon the country and a member of society beloved by all who had come within the circle of his genial influence, another toast was given in the words "Charles Metcalfe, the soldier of Deeg." The story of the "little stormer," then but rarely known, was told, and well told; and the military enthusiasm of the many officers there present was roused to the highest pitch. I shall never forget the applause of the assembly which greeted this unexpected tribute to the completeness of Sir Charles Metcalfe's character. All that gay assemblage in the Town Hall of Calcutta rose to him, with a common movement, as though there had been but one heart among them all, and many an eye glistened as women waved their handkerchiefs and men clapped their hands—and every one present thought how much he was loved.

So Metcalfe returned to England, in the early part of 1838, after an absence of thirty-eight years. He had no thought of any further employment in the public service, except that which might be entailed upon him by the necessities of a seat in Parliament. He had an abundance of the world's wealth; he was unmarried; and he had done so much work that he might well content himself to be idle at the close of his life. Moreover, there was another, and an all-sufficient reason why he should seek this autumnal repose. He had in India enjoyed better health than the majority of his countrymen, although he had taken no especial pains to preserve it. He had worked hard; he had lived well; and he had not resorted very freely to the great prophylactic agencies of air and exercise: still a naturally robust constitution had carried him through nearly forty years of unbroken work beneath an Indian sun. But the seeds of a painful and a fatal disease had been sown—at what precise time cannot be declared; but the first apparent symptoms manifested themselves at Calcutta, when a friend one day called his attention to a drop of blood on his cheek. It was the first discernible sign of a malignant cancer, which was to eat into his life and make existence a protracted agony. From that day there was perceptible an angry appearance of the skin. But the progress of the malady was so gradual, and it was attended with so little uneasiness, that neither did Metcalfe consult a medical practitioner, nor did the ailment attract the notice of the professional adviser who attended him. But, at the latter end of 1837, the malady had increased so much that he thought it necessary to take advice; the treatment was not effective, and soon afterwards Metcalfe returned to England. There he consulted Sir Benjamin Brodie, who prescribed for him, but without effect. There was, however, little pain, although the disease had assumed the shape of a decided ulcerous affection of the cheek; and so Metcalfe allowed time to pass, and neglected the complaint until no human agency could arrest it.

If he had thought more of himself at this time, he would have retired into private life, and not suffered any allurements to tempt him from his retirement. But he had not been much more than a year in England, when the Queen's Ministers invited him to accept the office of Governor of Jamaica. He believed it to be his duty to go; and he went. In August, 1839, he embarked, and on the 21st of September he assumed charge of the Government. There were many difficult problems to solve, for the emancipation of the blacks had produced a great social and industrial revolution; and the transition-state which had arisen required very careful and adroit management. I do not purpose to write here, in detail, of the events of Sir Charles Metcalfe's administration of the West Indian colony; nor, indeed, of the troubled politics of Canada, to which country he afterwards proceeded as Governor-General. He had been appointed to the former by the Government of Lord Melbourne; and now the Government of Sir Robert Peel invited him (1843), in a most difficult conjuncture, to proceed to the North American colony. It devolved upon the present Lord Derby, as Colonial Secretary, to make the offer of the appointment to him. The letter, proposing the arrangement, was playfully, but only too truly, described as Lord Stanley's "fatal missive." He went to Canada as he went to Jamaica, because he believed that it was his duty to go; but the arms of death were around him as he embarked.

There is nothing sadder, and there is nothing grander, in all history, than the last years of Metcalfe's life. The dreadful malady, which had for years so grievously afflicted him, now made life little more than an unceasing agony. But his stout heart and his clear head—his resolute devotion to the public service, and his high political courage in the face of a powerful antagonism—never failed him for a moment. Long after he was unable to write, for the consuming disease which preyed upon him had destroyed one of his eyes and threatened the sight of the other, he sate, in a darkened room, with his poor face bandaged up, and dictated to another weighty public despatches, and private letters *so* touching in their patience. In the midst of this life, rendered endurable only by a feeling that he was still doing some good to his fellows, and that it was God's will thus to afflict him, an intimation came to him from the Colonial Secretary, that Her Majesty had been pleased to raise him to the Peerage. But it was too late. The malady had been making fearful progress. With all his bravery of heart he could not struggle longer against his agony, and do his duty to the sovereign and the nation that he served. So he tendered his resignation; and on the 16th of December, 1845, he again found himself in England. He knew that he had been carried home only to die. No man had ever a larger circle of friends, and now their sympathy and affection solaced him in his dying days; but nothing could arrest the hand of death that had been laid upon him. He lingered in extreme pain until the 5th of September, 1846, and then, in an assured belief of the redeeming efficacy of Christ's blood, he rendered up his gentle spirit to his Maker.

He died at Malshanger, in the neighbourhood of Basingstoke, where his sister, Mrs. Smythe, had watched over him with tenderest solicitude to the last. But his remains were moved, in accordance with his own wish, to the family vault of the Metcalfes, in the little parish church of Winkfield, near his estate of Fern-hill. There may be seen a tablet to his memory on which are engraven words, written by the hand of Macaulay, who had served with him in India—words that summarise his public character as that of "a statesman tried in many high posts and difficult conjunctures, and found equal to all," and tell how "the three greatest dependencies of the British crown were successively entrusted to his care." "Public esteem," it is added, "was the just reward of his public virtue, but those only who enjoyed the privilege of his friendship could appreciate the whole worth of his gentle and noble nature." And this, indeed, is known to many—for he was very accessible, at all times; he had a larger circle of friends, perhaps, than any one of his cotemporaries; and to know him was to love him. He was very gentle and very genial, and there was a large-hearted unselfishness about him, such as has seldom been equalled. His kindness and charity towards others were as beautiful as the patience which clothed him as a garment; and in the extremity of his own sufferings, he had ever a heart to feel for the sufferings of others, and a healing hand to be stretched out to their relief.

HEREWARD, THE LAST OF THE ENGLISH.

By CHARLES KINGSLEY.

CHAPTER XXXVI.

HOW ALFTRUDA WROTE TO HEREWARD.

THE weary months ran on, from summer into winter, and winter into summer again, for two years and more, and neither Torfrida nor Hereward was the better for them. Hope deferred maketh the heart sick; and a sick heart is but too apt to be a peevish one. So there were fits of despondency, jars, mutual recriminations. "If I had not taken your advice, I should not have been here." "If I had not loved you so well, I might have been very differently off." And so forth. The words were wiped away the next hour, perhaps the next minute, by sacred kisses: but they had been said, and would be recollected, and perhaps said again.

Then, again, the "merry greenwood" was merry enough in the summer tide, when shaughs were green, and

"The woodwele sang, and would not cease,
Sitting upon the spray,
So loud, it wakened Robin Hood
In the greenwood where he lay."

But it was a sad place enough, when the autumn fog crawled round the gorse, and dripped off the hollies, and choked alike the breath and the eyesight; when the air sickened with the graveyard smell of rotting leaves, and the rain-water stood in the clay holes over the poached and sloppy lawns.

It was merry enough, too, when they were in winter quarters in friendly farm-houses, as long as the bright sharp frosts lasted, and they tracked the hares and deer merrily over the frozen snows: but it was doleful enough in those same farm-houses in the howling wet weather, when wind and rain lashed in through unglazed window, and ill-made roof, and there were coughs and colds and rheumatisms, and Torfrida ached from head to foot, and once could not stand upright for a whole month together, and every cranny was stuffed up with bits of board and rags, keeping out light and air as well as wind and water; and there was little difference between the short day and the long night; and the men gambled and wrangled amid clouds of peat reek, over draught-boards and chessmen which they had carved for themselves, and Torfrida sat stitching and sewing, making and mending, her eyes bleared with peat smoke, her hands sore and coarse from continued labour, her cheek bronzed, her face thin and hollow, and all her beauty worn away for very trouble. Then sometimes there was not enough to eat, and every one grumbled at her; or some one's clothes were not mended, and she was grumbled at again. And sometimes a foraging party brought home liquor, and all who could, got drunk to drive dull care away; and Hereward, forgetful of all her warnings, got more than was good for him likewise; and at night she coiled herself up in her furs, cold and contemptuous; and Hereward coiled himself up, guilty and defiant, and woke her again and again with startings and wild words in his sleep. And she felt that her beauty was gone, and that he saw it; and she fancied him (perhaps it was only fancy) less tender than of yore; and then in very pride disdained to take any care of her person, and said to herself, though she dare not say it to him, that if he only loved her for her face, he did not love her at all. And because she fancied him cold at times, she was cold likewise, and grew less and less caressing, when for his sake, as well as her own, she should have grown more so day by day.

Alas! for them. There are many excuses. Sorrow may be a softening medicine at last, but at first it is apt to be a hardening one; and that savage outlaw life which they were leading can never have been a wholesome one for any soul of man, and its graces must have existed only in the brains of harpers and gleemen. Away from law, from self-restraint, from refinement, from elegance, from the very sound of a church-going bell, they were sinking gradually down to the level of the coarse men and women whom they saw; the worse and not the better parts of both their characters were getting the upper hand; and it was but too possible that after a while the hero might sink into the ruffian, the lady into a slattern and a shrew.

But in justice to them be it said, that neither of them had complained of the other to any living soul. Their love had been as yet too perfect, too sacred, for them to confess to another (and thereby confess to themselves) that it could in any wise fail. They had each idolised the other, and been too proud of their idolatry to allow that their idol could crumble or decay.

And yet at last that point too was reached. One day they were wrangling about somewhat, as they too often wrangled, and Hereward in his temper let fall the words, "As I said to Winter the other day, you grow harder and harder upon me."

Torfrida started and fixed on him wide terrible scornful eyes. "So you complain of me to your boon companions?"

And she turned and went away without a word. A gulf had opened between them. They hardly spoke to each other for a week.

Hereward complained of Torfrida? What if Torfrida should complain of Hereward? But to whom? Not to the coarse women round her: her pride revolted from that thought;—and yet she longed for counsel, for sympathy,—to open her heart but to one fellow-woman. She would go to the Lady

Godiva at Crowland, and take counsel of her, whether there was any method (for so she put it to herself) of saving Hereward; for she saw but too clearly that he was fast forgetting all her teaching, and falling back to a point lower than that even from which she had raised him up.

To go to Crowland was not difficult. It was mid-winter. The dykes were all frozen. Hereward was out foraging in the Lincolnshire wolds. So Torfrida, taking advantage of his absence, proposed another foraging party to Crowland itself. She wanted stuff for clothes, needles, thread, what not. A dozen stout fellows volunteered at once to take her. The friendly monks of Crowland would feast them royally, and send them home heaped with all manner of good things; while as for meeting Ivo Taillebois' men, if they had but three to one against them, there was a fair chance of killing a few, and carrying off their clothes and weapons, which would be useful. So they made a sledge, tied beef bones underneath it, put Torfrida thereon, well wrapped in deer and fox and badger skin, and then putting on their skates, swept her over the fen to Crowland, singing like larks along the dykes.

And Torfrida went in to Godiva, and wept upon her knees; and Godiva wept likewise, and gave her such counsel as she could,—how if the woman will keep the men heroic, she must keep herself not heroic only but devout likewise; how she herself, by that one deed which had rendered her name famous then, and famous (though she never dreamt thereof) now and it may be to the end of time—had once for all, tamed, chained, and as it were, converted the heart of her fierce young lord; and enabled her to train him in good time into the most wise, most just, most pious, of all King Edward's Earls.

And Torfrida said yes, and yes, and yes, and felt in her heart that she knew all that already. Had not she too taught, entreated, softened, civilised? Had not she too spent her life upon a man, and that man a wolf's head and a landless outlaw, more utterly than Godiva could ever have spent hers on one who lived lapped in luxury, and wealth, and power? Torfrida had done her best, and she had failed, or at least fancied in her haste that she had failed.

What she wanted was not counsel, but love. And she clung round the Lady Godiva, till the broken and ruined widow opened all her heart to her, and took her in her arms, and fondled her as if she had been a babe. And the two women spoke few words after that, for indeed there was nothing to be said. Only at last, "My child, my child," cried Godiva, "better for thee, body and soul, to be here with me in the house of God, than there amid evil spirits and deeds of darkness in the wild woods."

"Not a cloister, not a cloister," cried Torfrida, shuddering, and half struggling to get away.

"It is the only place, poor wilful child, the only place this side the grave, in which we wretched creatures, who for our sins are women born, can find aught of rest or peace. By us sin came into the world, and Eve's curse lies heavy on us to this day, and our desire is to our lords, and they rule over us; and when the slave can work for her master no more, what better than to crawl into the house of God, and lay down our crosses at the foot of His cross, and die? You too will come here, Torfrida, some day, I know it well. You too will come here to rest."

"Never, never," shrieked Torfrida, "never to these horrid vaults. I will die in the fresh air! I will be buried under the green hollies; and the nightingales, as they wander up from my own Provence, shall build and sing over my grave. Never, never!" murmured she to herself all the more eagerly, because something within her said that it would come to pass.

The two women went into the church to Matins, and prayed long and fervently. And at the early day-break, the party went back laden with good things and hearty blessings, and caught one of Ivo Taillebois' men by the way, and slew him, and got off him a new suit of clothes in which the poor fellow was going courting; and so they got home safe into the Bruneswald.

But Torfrida had not found rest unto her soul. For the first time in her life since she became the bride of Hereward, she had had a confidence concerning him and unknown to him. It was to his own mother—true. And yet she felt as if she had betrayed him: but then had he not betrayed her? And to Winter of all men?

It might have been two months afterwards that Martin Lightfoot put a letter into Torfrida's hand.

The letter was addressed to Hereward: but there was nothing strange in Martin's bringing it to his mistress. Ever since their marriage, she had opened and generally answered the very few epistles with which her husband was troubled.

She was going to open this one as a matter of course, when glancing at the superscription she saw, or fancied she saw, that it was in a woman's hand. She looked at it again. It was sealed plainly with a woman's seal; and she looked up at Martin Lightfoot. She had remarked as he gave her the letter a sly significant look in his face.

"What dost thou know of this letter?" she enquired sharply.

"That it is from the Countess Alftruda, whomsoever she may be."

A chill struck through her heart. True, Alftruda had written before, only to warn Hereward of danger to his life,—and hers. She might be writing again, only for the same purpose. But still, she did not wish that either Hereward, or she, should owe Alftruda their lives, or anything. They had struggled on through weal and woe without her, for many a year. Let them do so without her still. That Alftruda had once loved Hereward she knew well. Why should she not? The wonder was to her that every woman did not love him. But she had long since gauged Alftruda's character, and seen in it a persistence like her own, yet as she proudly hoped, of a lower temper; the persistence of the base weasel, not of the noble hound: yet the creeping weasel might endure, and win, when the hound was tired out by his own gallant pace. And there was a something in the tone of Alftruda's last letter, which seemed to tell her that the weasel was still upon the scent of its game. But she was too proud to mistrust Hereward, or rather, to seem to mistrust him. And yet—how dangerous Alftruda might be as a rival, if rival she chose to be. She was up in the world now, free, rich, gay, beautiful, a favourite at Queen Matilda's court, while she——

"How came this letter into thy hands?" asked she as carelessly as she could.

"I was in Peterborough last night," said Martin, "concerning little matters of my own, and there came to me in the street a bonny young page with smart jacket on his back, smart cap on his head, and smiles and bows, and 'You are one of Hereward's men,' quoth he. 'Say that again, young jackanapes,' said I, 'and I'll cut your tongue out,' whereat he took fright and all but cried. He was very sorry, and meant no harm, but he had a letter for my master, and he heard I was one of his men. 'Who told him that?' Well, one of the monks, he could not justly say which, or wouldn't, and I, thinking the letter of more importance than my own neck, ask him quietly into my friend's house. There he pulls out this and five silver pennies, and I shall have five more if I bring an answer back: but to none than Hereward must I give it. With that I, calling my friend, who is an honest woman, and nigh as strong in the arms as I am, ask her to clap her back against the door, and pull out my axe. 'Now,' said I, 'I must know a little more about this letter. Tell me, knave, who gave it thee, or I'll split thy skull.' The young man cries and blubbers; and says that it is the Countess Alftruda, who is staying in the monastery, and that he is her serving man, and that it is as much as my life is worth to touch a hair of his head, and so forth,—so far so good. Then I asked him again, who told him I was my master's man?—and he confessed that it was Herluin the prior,—he that was Lady Godiva's chaplain of old, whom my master robbed of his money when he had the cell of Bourne years agone. Very well, quoth I to myself, that's one more count on our score against Master Herluin. Then I asked him how Herluin and the Lady Alftruda came to know aught of each other? and he said that she had been questioning all about the monastery without Abbot Thorold's knowledge, for one that knew Hereward and favoured him well. That was all I could get from the knave, he cried so for fright. So I took his money and his letter, warning him that if he betrayed me, there were those would roast him alive before he was done with me. And so away over the town wall, and ran here five-and-twenty miles before breakfast, and thought it better as you see to give the letter to my lady first."

"You have been officious," said Torfrida coldly. "'Tis addressed to your master. Take it to him. Go."

Martin Lightfoot whistled and obeyed, while Torfrida walked away proudly and silently with a beating heart.

Again Godiva's words came over her. Should she end in the convent of Crowland? And suspecting, fearing, imagining all sorts of baseless phantoms, she hardened her heart into a great hardness.

Martin had gone with the letter, and Torfrida never heard any more of it.

So Hereward had secrets which he would not tell to her. At last!

That, at least, was a misery which she would not confide to Lady Godiva, or to any soul on earth.

But a misery it was. Such a misery as none can delineate, save those who have endured it themselves, or had it confided to them by another. And happy are they, to whom neither has befallen.

She wandered on and into the wild wood, and sat down by a spring. She looked in it—her only mirror—at her wan coarse face, with wild black elf-locks hanging round it, and wondered whether Alftruda, in her luxury and prosperity, was still so very beautiful. Ah, that that fountain were the fountain of Jouvence, the spring of perpetual youth, which all believed in those days to exist somewhere,—how would she plunge into it, and be young and fair once more!

No! she would not! She had lived her life, and lived it well, gallantly, lovingly, heroically. She had given that man her youth, her beauty, her wealth, her wit. He should not have them a second time. He had had his will of her. If he chose to throw her away when he had done with her, to prove himself base at last, unworthy of all her care, her counsels, her training,—dreadful thought! To have lived to keep that man for her own, and just when her work seemed done, to lose him! No, there was worse than that. To have lived that she might make that man a perfect knight, and just when her work seemed done, to see him lose himself!

And she wept till she could weep no more. Then she washed away her tears in that well. Had it been in Greece of old, that well would have become a sacred well thenceforth, and Torfrida's tears have changed into forget-me-nots, and fringed its marge with azure evermore.

Then she went back, calm, all but cold: but determined not to betray herself, let him do what he would. Perhaps it was all a mistake, a fancy. At least she would not degrade him, and herself, by shewing suspicion. It would be dreadful, shameful to herself, wickedly unjust to him, to accuse him, were he innocent after all.

Hereward, she remarked, was more kind to her now. But it was a kindness which she did not like. It was shy, faltering, as of a man guilty and ashamed; and she repelled it as much as she dared, and then, once or twice, returned it passionately, madly, in hopes——

But he never spoke a word of that letter.

After a dreadful month, Martin came mysteriously to her again. She trembled, for she had remarked in him lately a strange change. He had lost his usual loquacity, and quaint humour; and had fallen back into that sullen taciturnity, which, so she heard, he had kept up in his youth. He, too, must know evil which he dared not tell.

"There is another letter come. It came last night," said he.

"What is that to thee or me? My lord has his state secrets. Is it for us to pry into them? Go!"

"I thought—I thought——"

"Go, I say!"

"That your ladyship might wish for a guide to Crowland."

"Crowland?" almost shrieked Torfrida, for the thought of Crowland had risen in her own wretched mind instantly and involuntarily. "Go, madman!"

Martin went. Torfrida paced madly up and down the farm-house. Then she settled herself into fierce despair.

There was a noise of trampling horses outside. The men were arming and saddling, seemingly for a raid.

Hereward hurried in for his armour. When he saw Torfrida, he blushed scarlet.

"You want your arms," said she quietly; "let me fetch them."

"No, never mind. I can harness myself; I am going south-west, to pay Taillebois a visit. I am in a great hurry. I shall be back in three days. Then—good-bye."

He snatched his arms off a perch, and hurried out again, dragging them on. As he passed her, he offered to kiss her; she put him back, and helped him on with his armour, while he thanked her confusedly.

"He was as glad not to kiss me, after all!"

She looked after him as he stood, his hand on his horse's withers. How noble he looked! And a great yearning came over her. To throw her arms round his neck once, and then to stab herself, and set him free, dying, as she had lived, for him.

Two bonny boys were wrestling on the lawn, young outlaws who had grown up in the forest with ruddy cheeks and iron limbs.

"Ah, Winter!" she heard him say, "had I had such a boy as that!——"

She heard no more. She turned away, her heart dead within her. She knew all that these words implied, in days when the possession of land was everything to the free man; and the possession of a son necessary, to pass that land on in the ancestral line. Only to have a son; only to prevent the old estate passing, with an heiress, into the hands of strangers, what crimes did not men commit in those days, and find themselves excused for them by public opinion. And now,—her other children (if she ever had any), had died in childhood; the little Torfrida, named after herself, was all that she had brought to Hereward; and he was the last of his house. In him the race of Leofric, of Godiva, of Earl Oslac, would become extinct; and that girl would marry—whom? Whom but some French conqueror,—or at best some English outlaw. In either case Hereward would have no descendants for whom it was worth his while to labour or to fight. What wonder if he longed for a son,—and not a son of hers, the barren tree,—to pass his name down to future generations? It might be worth while, for that, to come in to the king, to recover his lands, to——. She saw it all now, and her heart was dead within her.

She spent that evening neither eating nor drinking, but sitting over the log embers, her head upon her hands, and thinking over all her past life and love, since she saw him, from the gable window, ride the first time into St. Omer. She went through it all, with a certain stern delight in the self-torture, deliberately day by day, year by year, —all its lofty aspirations, all its blissful passages, all its deep disappointments, and found in it,—so she chose to fancy in the wilfulness of her misery, nothing but cause for remorse. Self in all, vanity, and vexation of spirit; for herself she had loved him; for herself she had tried to raise him; for herself she had set her heart on man, and not on God. She had sown the wind: and behold, she had reaped the whirlwind. She could not repent; she could not pray. But oh! that she could die.

She was unjust to herself, in her great nobleness. It was not true, not half, not a tenth part true.

But perhaps it was good for her that it should seem true, for that moment; that she should be emptied of all earthly things for once, if so she might be filled from above. At last she went into the inner room to lie down and try to sleep. At her feet, under the perch where Hereward's armour had hung, lay an open letter.

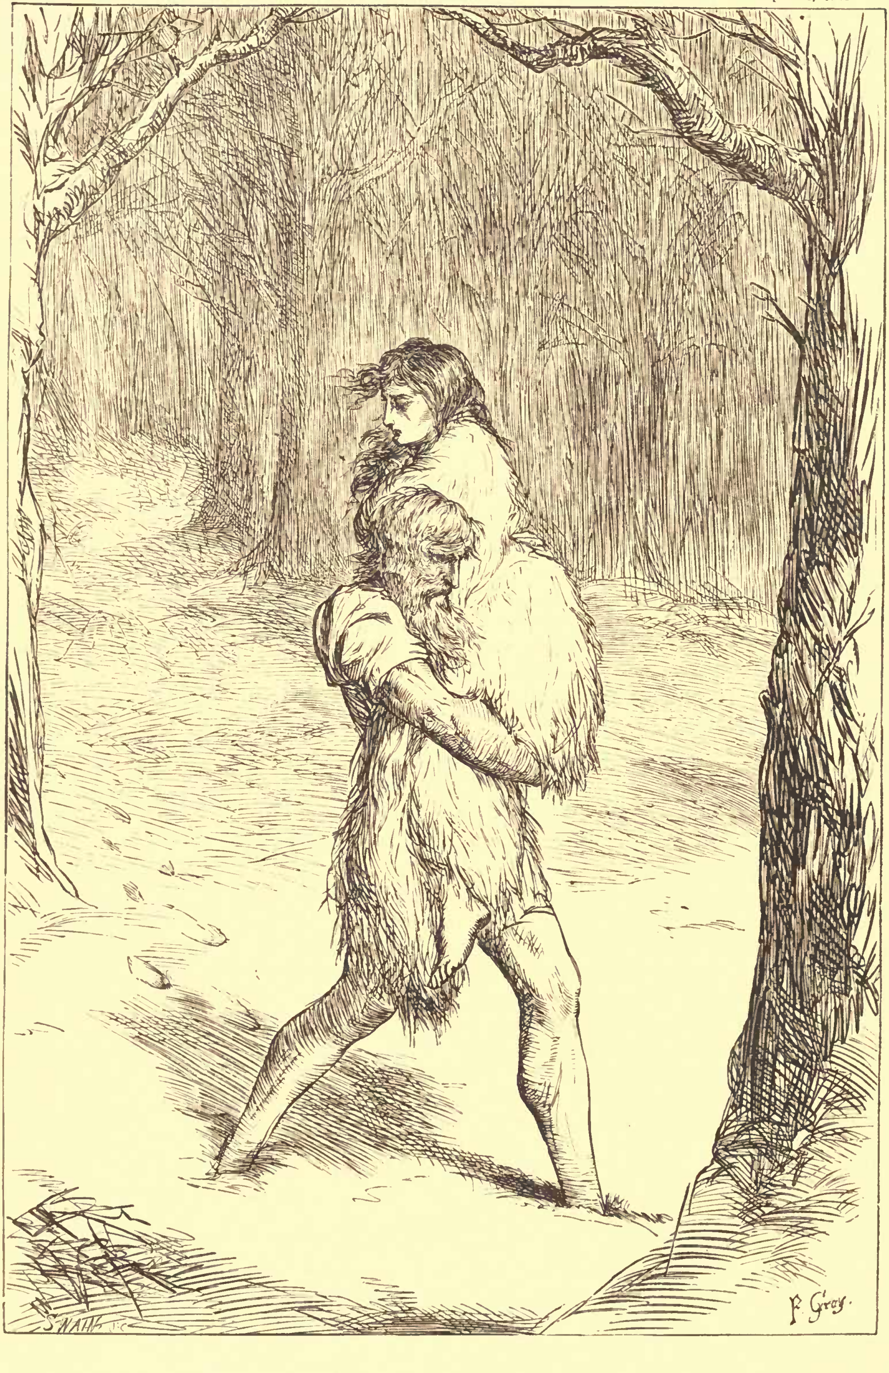
She picked it up, surprised at seeing such a thing there, and kneeling down, held it eagerly to the wax candle which was on a spike at the bed's head.

She knew the handwriting in a moment. It was Alftruda's.

This, then, was why Hereward had been so strangely hurried. He must have had that letter, and dropped it.

Her eye and mind took it all in, in one instant, as the lightning flash reveals a whole landscape. And then her mind became as dark as that landscape, when the flash is past.

It congratulated Hereward on having shaken himself free from the fascination of that sorceress. It said that all was settled with King William. Hereward was to come to Winchester. She had the King's writ for his safety ready to send to him. The King would receive him as his liegeman. Alftruda would receive him as her husband. Archbishop Lanfranc had made difficulties about the dissolution of the marriage with Torfrida: but



SWAIN Sc
F. Gray.

"MARTIN HURRIED ON, IN THE STRENGTH OF MADNESS."

Page 785.

gold would do all things at Rome; and Lanfranc was her very good friend, and a reasonable man—and so forth.

Men, and beasts likewise, when stricken with a mortal wound, will run, and run on, blindly, aimless, impelled by the mere instinct of escape from intolerable agony. And so did Torfrida. Half undrest as she was, she fled forth into the forest, she knew not whither, running as one does wrapt in fire: but the fire was not without her, but within.

She cast a passing glance at the girl who lay by her, sleeping a pure and gentle sleep——

"Oh, that thou hadst but been a boy!" Then she thought no more of her, not even of Hereward: but all of which she was conscious was a breast and brain bursting; an intolerable choking, from which she must escape.

She ran, and ran on, for miles. She knew not whether the night was light or dark, warm or cold. Her tender feet might have been ancle deep in snow. The branches over her head might have been howling in the tempest, or dripping with rain. She knew not, and heeded not. The owls hooted to each other under the staring moon, but she heard them not. The wolves glared at her from the brakes, and slunk off appalled at the white ghostly figure: but she saw them not. The deer stood at gaze in the glades till she was close upon them, and then bounded into the wood. She ran right at them, past them, heedless. She had but one thought. To flee from the agony of a soul alone in the universe with its own misery.

At last she was aware of a man close beside her. He had been following her a long way, she recollected now: but she had not feared him, even heeded him. But when he laid his hand upon her arm, she turned fiercely: but without dread.

She looked to see if it was Hereward. To meet him would be death. If it were not he, she cared not who it was. It was not Hereward; and she cried angrily, "Off! Off!" and hurried on.

"But you are going the wrong way! The wrong way!" said the voice of Martin Lightfoot.

"The wrong way! Fool, which is the right way for me, save the path which leads to a land where all is forgotten?"

"To Crowland! To Crowland! To the minster! To the monks! That is the only right way for poor wretches in a world like this. The Lady Godiva told you you must go to Crowland. And now you are going. I too, I ran away from a monastery when I was young; and now I am going back. Come along!"

"You are right! Crowland, Crowland; and a nun's cell till death. Which is the way, Martin?"

"Oh, a wise lady! A reasonable lady! But you will be cold before you get thither. There will be a frost ere morn. So, when I saw you run out, I caught up something to put over you."

Torfrida shuddered, as Martin wrapt her in the white bear-skin.

"No! Not that! Anything but that!" and she struggled to shake it off.

"Then you will be dead ere dawn. Folks that run wild in the forest thus, for but one night, die!"

"Would God I could die!"

"That shall be as He wills: you do not die while Martin can keep you alive. Why, you are staggering already."

Martin caught her up in his arms, threw her over his shoulder as if she had been a child, and hurried on, in the strength of madness.

At last he stopped at a cottage door, set her down upon the turf, and knocked loudly.

"Grimkel Tolison! Grimkel, I say!"

And Martin burst the door open with his foot.

"Give me a horse, on your life," said he to the man inside. "I am Martin, Hereward's man, upon my master's business."

"What is mine, is Hereward's, God bless him," said the man, struggling into a garment, and hurrying out to the shed.

"There is a ghost against the gate!" cried he, recoiling.

"That is my matter, not yours. Get me a horse to put the ghost upon."

Torfrida lay against the gate-post, exhausted now: but quite unable to think. Martin lifted her on to the beast, and led her onward, holding her up again and again.

"You are tired. You had run four miles before I could make you hear me."

"Would I had run four thousand!" And she relapsed into stupor.

They passed out of the forest, across open wolds, and at last down to the river. Martin knew of a boat there. He lifted her from the horse, turned him loose, put Torfrida into the boat, and took the oars.

She looked up, and saw the roofs of Bourne shining white in the moonlight.

And then she lifted up her voice, and shrieked three times,

"Lost! Lost! Lost!"

with such a dreadful cry, that the starlings whirred up from the reeds, and the wild fowl rose clanging off the meres, and the watch-dogs in Bourne and Mainthorpe barked and howled, and folk told fearfully next morning, how a white ghost had gone down from the forest to the fen, and wakened them with its unearthly cry.

The sun was high when they came to Crowland minster. Torfrida had neither spoken nor stirred; and Martin, who in the midst of his madness kept a strange courtesy and delicacy, had never disturbed her, save to wrap the bear-skin more closely over her.

When they came to the bank, she rose, stepped out without his help, and drawing the bear-skin closely round her, and over her head, walked straight up to the gate of the house of nuns.

All men wondered at the white ghost: but Martin walked behind her, his left finger on his lips, his right hand grasping his little axe, with such a stern and serious face, and so fierce an eye, that all drew back in silence, and let her pass.

The portress looked through the wicket.

"I am Torfrida," said a voice of terrible calm. "I am come to see the Lady Godiva. Let me in."

The portress opened, utterly astounded.

"Madam?" said Martin eagerly, as Torfrida entered.

"What? What?" she seemed to waken from a dream. "God bless thee, thou good and faithful servant;" and she turned again.

"Madam? Say!"

"What?"

"Shall I go back, and kill him?" And he held out the little axe.

Torfrida snatched it from his grasp with a shriek, and cast it inside the convent door.

"Mother Mary and all saints!" cried the portress, "your garments are in rags, madam!"

"Never mind. Bring me garments of yours. I shall need none other till I die!" and she walked in and on.

"She is come to be a nun!" whispered the portress to the next sister, and she again to the next; and they all gabbled, and lifted up their hands and eyes, and thanked all the saints of the calendar, over the blessed and miraculous conversion of the Lady Torfrida, and the wealth which she would probably bring to the convent.

Torfrida went straight on, speaking to no one, not even to the prioress; and into Lady Godiva's chamber.

There she dropped at the countess's feet, and laid her head upon her knees.

"I am come, as you always told me I should do. But it has been a long way hither, and I am very tired."

"My child! What is this? What brings you here?"

"I am doing penance for my sins."

"And your feet all cut and bleeding."

"Are they?" said Torfrida vacantly. "I will tell you all about it when I wake."

And she fell fast asleep, with her head in Godiva's lap.

The countess did not speak or stir. She beckoned the good prioress, who had followed Torfrida in, to go away. She saw that something dreadful had happened; and prayed as she awaited the news.

Torfrida slept for a full hour. Then she woke with a start.

"Where am I? Hereward!"

Then followed a dreadful shriek, which made every nun in that quiet house shudder, and thank God that she knew nothing of those agonies of soul, which were the lot of the foolish virgins who married and were given in marriage themselves, instead of waiting with oil in their lamps for the true Bridegroom.

"I recollect all now," said Torfrida. "Listen!" And she told the countess all, with speech so calm and clear, that Godiva was awed by the power and spirit of that marvellous woman.

But she groaned in bitterness of soul. "Anything but this. Rather death from him than treachery. This last, worst woe had God kept in his quiver for me most miserable of women. And now his bolt has fallen! Hereward! Hereward! That thy mother should wish her last child laid in his grave!"

"Not so," said Torfrida, "it is well as it is. How better? It is his only chance for comfort, for honour, for life itself. He would have grown a—— I was growing bad and foul myself in that ugly wilderness. Now he will be a knight once more among knights, and win himself fresh honour in fresh fields. Let him marry her. Why not? He can get a dispensation from the Pope, and then there will be no sin in it, you know. If the Holy Father cannot make wrong right, who can? Yes. It is very well as it is. And I am very well where I am. Women! bring me scissors, and one of your nun's dresses. I am come to be a nun like you."

Godiva would have stopped her. But Torfrida rose upon her knees, and calmly made a solemn vow, which, though canonically void without her husband's consent, would, she well knew, never be disputed by any there: and as for him,—"He hast lost me; and for ever. Torfrida never gives herself away twice."

"There's carnal pride in those words, my poor child," said Godiva.

"Cruel!" said she proudly. "When I am sacrificing myself utterly for him."

"And thy poor girl?"

"He will let her come hither," said Torfrida, with forced calm. "He will see that it is not fit that she should grow up with—yes, he will send her to me—to us. And I shall live for her—and for you. If you will let me be your bower woman, dress you, serve you, read to you. You know that I am a pretty scholar. You will let me, mother? I may call you mother, may I not?" And Torfrida fondled the old woman's thin hands. "For I do want so much something to love."

"Love thy heavenly Bridegroom, the only love worthy of woman!" said Godiva, as her tears fell fast on Torfrida's head.

She gave a half-impatient toss.

"That may come, in good time. As yet it is enough to do, if I can keep down this devil here in my throat. Women, bring me the scissors."

And Torfrida cut off her raven locks, now streaked with grey; and put on the nun's dress, and became a nun thenceforth.

On the second day there came to Crowland Leofric the priest, and with him the poor child.

She had woke in the morning and found no mother. Leofric and the other men searched the woods round, far and wide. The girl mounted her horse, and would go with them. Then they took a bloodhound, and he led them to Grimkel's hut. There they heard of Martin. The ghost must have been Torfrida. Then the hound brought them to the river. And they divined at once that she was gone to Crowland, to Godiva: but why, they could not guess.

Then the girl insisted, prayed, at last commanded them to take her to Crowland. And to Crowland they came.

Leofric left the girl at the nuns' house door, and went into the monastery, where he had friends enow, runaway and renegade as he was. As he came into the great court, whom should he meet but Martin Lightfoot, in a lay brother's frock.

"Aha? And are you come home likewise? Have you renounced the devil and this last work of his?"

"What work? What devil?" asked Leofric, who saw method in Martin's madness. "And what do you here, in a long frock?"

"Devil? Hereward the devil. I would have killed him with my axe: but she got it from me, and threw it in among the holy sisters, and I had work to get it again. Shame on her, to spoil my chance of heaven. For I should have surely won heaven, you know, if I had killed the devil."

After much beating about, Leofric got from Martin the whole tragedy.

And when he heard it, he burst out weeping.

"Oh, Hereward, Hereward! Oh, knightly honour! Oh, faith and troth, and gratitude, and love in return for such love as might have tamed lions, and made tyrants mild! Are they all carnal vanities, works of the weak flesh, bruised reeds which break when they are leaned upon? If so, you are right, Martin, and there is nought left, but to flee from a world in which all men are liars."

And Leofric, in the midst of Crowland Yard, tore off his belt and trusty sword, his hauberk and helm also, and letting down his monk's frock, which he wore trussed to the mid-knee, he went to the abbot's lodgings, and asked to see old Ulfketyl.

"Bring him up," said the good abbot, "for he is a valiant man and true, in spite of all his vanities; and may be, he brings news of Hereward, whom God forgive."

And when Leofric came in, he fell upon his knees, bewailing and confessing his sinful life; and begged the abbot to take him back again into Crowland minster, and lay upon him what penance he thought fit, and put him in the lowest office, because he was a man of blood; if only he might stay there, and have a sight at times of his dear Lady Torfrida, without whom he should surely die.

So Leofric was received back, in full chapter, by abbot, and prior, and all the monks. But when he asked them to lay a penance upon him, Ulfketyl arose from his high chair, and spoke.

"Shall we, who have sat here at ease, lay a penance on this man, who has shed his blood in fifty valiant fights for us, and for St. Guthlac, and for this English land? Look at yon scars upon his head and arms. He has had sharper discipline from cold steel than we could give him here with rod; and has fasted in the wilderness more sorely, many a time, than we have fasted here."

And all the monks agreed, that no penance should be laid on Leofric. Only that he should abstain from singing vain and carnal ballads, which turned the heads of the young brothers, and made them dream of nought but battles, and giants, and enchanters, and ladies' love.

Hereward came back on the third day, and found his wife and daughter gone. His guilty conscience told him in the first instant why. For he went into the chamber, and there, upon the floor, lay the letter which he had looked for in vain.

No one had touched it where it lay. Perhaps no one had dared to enter the chamber. If they had, they would not have dared to meddle with writing, which they could not read, and which might contain some magic spell. Letters were very safe in those old days.

There are moods of man which no one will dare to describe, unless like Shakspeare, he is Shakspeare, and like Shakspeare knows it not.

Therefore what Hereward thought and felt will not be told. What he did, was this.

He raged and blustered. He must hide his shame. He must justify himself to his knights; and much more to himself: or if not justify himself, must shift some of the blame over to the opposite side. So he raged and blustered. He had been robbed of his wife and daughter. They had been cajoled away by the monks of Crowland. What villains were those, to rob an honest man of his family while he was fighting for his country?

So he rode down to the river, and there took two great barges, and rowed away to Crowland, with forty men-at-arms.

And all the while he thought of Alftruda, as he had seen her at Peterborough.

And of no one else?

Not so. For all the while he felt that he loved Torfrida's little finger better than Alftruda's whole body, and soul into the bargain.

What a long way it was to Crowland. How wearying were the hours through mere and sea. How wearying the monotonous pulse of the oars. If tobacco had been known then, Hereward would have smoked all the way, and been none the wiser, though the happier, for it; for the herb that drives away the evil spirits of anxiety, drives away also the good, though stern, spirits of remorse.

But in those days a man could only escape facts by drinking; and Hereward was too much afraid of what he should meet in Crowland, to go thither drunk.

Sometimes he hoped that Torfrida might hold her purpose, and set him free to follow his wicked will. All the lower nature in him, so long crushed under, leapt up chuckling and grinning and tumbling head over heels, and cried—Now I shall have a holiday!

Sometimes he hoped that Torfrida might come out to the shore, and settle the matter in one moment, by a glance of her great hawk's eyes. If she would but quell him by one look; leap on board, seize the helm, and assume without a word the command of his men and him; steer them back to Bourne, and sit down beside him with a kiss, as if nothing had happened. If she would but do that, and ignore the past, would he not ignore it? Would he not forget Alftruda, and King William, and all the world, and go up with her into Sherwood, and then north to Scotland and Gospatric, and be a man once more?

No. He would go with her to the Baltic or the Mediterranean. Constantinople and the Varangers would be the place and the men. Ay, there to escape out of that charmed ring into a new life!

No. He did not deserve such luck; and he would not get it. She would talk it all out. She must, for she was a woman. She would blame, argue, say dreadful words—dreadful, because true and deserved. Then she would grow angry, as women do when they are most in the right, and say too much—dreadful words, which would be untrue and undeserved. Then he should resist, recriminate. He would not stand it. He could not stand it. No. He could never face her again.

And yet if he had seen a man insult her—if he had seen her at that moment in peril of the slightest danger, the slightest bruise, he would have rushed forward like a madman, and died, saving her from that bruise. And he knew that: and with the strange self-contradiction of human nature, he soothed his own conscience by the thought that he loved her still; and that, therefore—somehow or other, he cared not to make out how—he had done her no wrong. Then he blustered again, for the benefit of his men. He would teach these monks of Crowland a lesson. He would burn the minster over their heads.

"That would be pity, seeing they are the only Englishmen left in England," said Siward the White, his nephew, very simply.

"What is that to thee? Thou hast helped to burn Peterborough at my bidding; and thou shalt help to burn Crowland."

"I am a free gentleman of England; and what I choose, I do. I and my brother are going to Constantinople to join the Varanger guard, and shall not burn Crowland, or let any man burn it."

"Shall not let?"

"No," said the young man, so quietly, that Hereward was cowed.

"I—I only meant—if they did not do right by me."

"Do right thyself," said Siward.

Hereward swore awfully, and laid his hand on his sword-hilt. But he did not draw it; for he thought he saw overhead a cloud which was very like the figure of St. Guthlac in Crowland window, and an awe fell upon him from above.

So they came to Crowland; and Hereward landed and beat upon the gates, and spoke high words. But the monks did not open the gates for awhile. At last the gates creaked, and opened; and in the gateway stood Abbot Ulfketyl in his robes of state, and behind him the Prior, and all the officers, and all the monks of the house.

"Comes Hereward in peace or in war?"

"In war!" said Hereward.

Then that true and trusty old man, who sealed his patriotism, if not with his blood—for the very Normans had not the heart to take that—still with long and bitter sorrows, lifted up his head, and said, like a valiant Dane, as his name bespoke him, "Against the traitor and the adulterer——"

"I am neither," roared Hereward.

"Thou wouldst be, if thou couldst. Who so looketh upon a woman to——"

"Preach me no sermons, man! Let me in to seek my wife."

"Over my body," said Ulfketyl, and laid himself down across the threshold.

Hereward recoiled. If he had dared to step over that sacred body, there was not a blood-stained ruffian in his crew who dared to follow him.

"Rise, rise! for God's sake, Lord Abbot," said he. "Whatever I am, I need not that you should disgrace me thus. Only let me see her—reason with her."

"She has vowed herself to God, and is none of thine henceforth."

"It is against the canons. A wrong and a robbery."

Ulfketyl rose, grand as ever.

"Hereward Leofricsson, our joy and our glory once. Hearken to the old man who will soon go whither thine Uncle Brand is gone, and be free of Frenchmen, and of all this wicked world. When the walls of Crowland dare not shelter the wronged woman, fleeing from man's treason to God's faithfulness, then let the roofs of Crowland burn till the flame reaches heaven, for a sign that the children of God are as false as the children of this world, and break their faith like any belted knight."

Hereward was silenced. His men shrunk back from him. He felt as if God, and the mother of God, and St. Guthlac, and all the host of heaven, were shrinking back from him likewise. He turned to supplications, compromises—what else was left.

"At least you will let me have speech of her, or of my mother?"

"They must answer that, not I."

Hereward sent in, entreating to see one, or both.

"Tell him," said Lady Godiva, "who calls himself my son, that my sons were men of honour, and that he must have been changed at nurse."

"Tell him," said Torfrida, "that I have lived my life, and am dead. Dead. If he would see me, he will only see my corpse."

"You would not slay yourself?"

"What is there that I dare not do? You do not know Torfrida. He does."

And Hereward did; and went back again like a man stunned.

After awhile there came by boat to Crowland all

Torfrida's wealth: clothes, jewels: not a shred had Hereward kept. The magic armour came with them.

Torfrida gave all to the abbey, there and then. Only the armour she wrapped up in the white bear's skin, and sent it back to Hereward, with her blessing, and entreaty not to refuse that, her last bequest.

Hereward did not refuse, for very shame. But for very shame he never wore that armour more. For very shame he never slept again upon the white bear's skin, on which he and his true love had lain so many a year.

And Torfrida turned herself utterly to serve the Lady Godiva, and to teach and train her child as she had never done before, while she had to love Hereward, and to work day and night, with her own fingers, for all his men. All pride, all fierceness, all care of self, had passed away from her. In penitence, humility, obedience, and gentleness, she went on: never smiling: but never weeping. Her heart was broken; and she felt it good for herself to let it break.

And Leofric the priest, and mad Martin Lightfoot, watched like two dogs for her going out and coming in; and when she went among the poor corrodiers, and nursed the sick, and taught the children, and went to and fro upon her holy errands, blessing and blessed, the two wild men had a word from her mouth, or a kiss of her hand, and were happy all the day after. For they loved her with a love mightier than ever Hereward had heaped upon her; for she had given him all; but she had given those two wild men nought but the beatific vision of a noble woman.

CHAPTER XXXVII.

HOW HEREWARD LOST SWORD BRAINBITER.

"On account of which," says the chronicler, "many troubles came to Hereward: because Torfrida was most wise, and of great counsel in need. For afterwards, as he himself confessed, things went not so well with him as they did in her time."

And the first thing that went ill was this. He was riding through the Bruneswald, and behind him Geri, Wenoch, and Matelgar, these three. And there met him in an open glade a knight, the biggest man he had ever seen, on the biggest horse, and five knights behind him. He was an Englishman, and not a Frenchman, by his dress; and Hereward spoke courteously enough to him. But who he was, and what his business was in the Bruneswald, Hereward thought that he had a right to ask.

"Tell me who thou art who askest, before I tell thee who I am who am asked, riding here on common land," quoth the knight, surlily enough.

"I am Hereward, without whose leave no man has ridden the Bruneswald for many a day."

"And I am Letwold the Englishman, who rides whither he will in merry England, without care for any Frenchman upon earth."

"Frenchman? Why callest thou me Frenchman, man? I am Hereward."

"Then thou art, if tales be true, as French as Ivo Taillebois. I hear that thou hast left thy true lady, like a fool and a churl, and goest to London, or Winchester, or the nether pit—I care not which—to make thy peace with the Mamzer."

The man was a surly brute: but what he said was so true, that Hereward's wrath arose. He had promised Torfrida many a time, never to quarrel with an Englishman, but to endure all things. Now, out of very spite to Torfrida's counsel, because it was Torfrida's, and he had promised to obey it, he took up the quarrel.

"If I am a fool and a churl, thou art a greater fool, to provoke thine own death; and a greater——"

"Spare your breath," said the big man, "and let me try Hereward, as I have many another."

Whereon they dropped their lance-points, and rode at each other like two mad bulls. And, by the contagion of folly common in the middle age, at each other rode Hereward's three knights and Letwold's five. The two leaders found themselves both rolling on the ground; jumped up, drew their swords, and hewed away at each other. Geri unhorsed his man at the first charge, and left him stunned. Then he turned on another, and did the same by him. Wenoch and Matelgar each upset their man. The fifth of Letwold's knights threw up his lance-point, not liking his new company. Geri and the other two rode in on the two chiefs, who were fighting hard, each under shield.

"Stand back!" roared Hereward, "and give the knight fair play! When did any one of us want a man to help him? Kill or die single, has been our rule, and shall be."

They threw up their lance-points, and stood round to see that great fight. Letwold's knight rode in among them, and stood likewise; and friend and foe looked on, as they might at a pair of game cocks.

Hereward had, to his own surprise and that of his fellows, met his match. The sparks flew, the iron clanged: but so heavy were the stranger's strokes, that Hereward reeled again and again. So sure was the guard of his shield, that Hereward could not wound him, hit where he would. At last he dealt a furious blow on the stranger's head.

"If that does not bring your master down!" quoth Geri. "By ——, Brainbiter is gone!"

It was too true. Sword Brainbiter's end was come. The Ogre's magic blade had snapt off short by the handle.

"Your master is a true Englishman, by the hardness of his brains," quoth Wenoch, as the stranger, reeling for a moment, lifted up his head, and stared at Hereward in the face, doubtful what to do.

"Will you yield, or fight on?" cried he.

"Yield?" shouted Hereward, rushing upon him, as a mastiff might on a lion, and striking at his helm, though shorter than him by a head and shoulders, such swift and terrible blows with the broken hilt, as staggered the tall stranger.

"What are you at, forgetting what you have at your side?" roared Geri.

Hereward sprang back. He had, as was his custom, a second sword on his right thigh.

"I forget everything now," said he to himself angrily.

And that was too true. But he drew the second sword, and sprang at his man once more.

The stranger tried, according to the chronicler, who probably had it from one of the three bystanders, a blow which has cost many a brave man his life. He struck right down on Hereward's head. Hereward raised his shield, warding the stroke, and threw in that *coup de jarret*, which there is no guarding, after the downright blow has been given. The stranger dropped upon his wounded knee.

"Yield," cried Hereward in his turn.

"That is not my fashion." And the stranger fought on, upon his stumps, like Witherington in Chevy Chase.

Hereward, mad with the sight of blood, struck at him four or five times. The stranger's shield was so quick that he could not hit him, even on his knee. He held his hand, and drew back, looking at his new rival.

"What the murrain are we two fighting about?" said he, at last.

"I know not; neither care," said the other, with a grim chuckle. "But if any man will fight me, him I fight, ever since I had beard to my chin."

"Thou art the best man that ever I faced."

"That is like enough."

"What wilt thou take, if I give thee thy life?"

"My way on which I was going. For I turn back for no man alive on land."

"Then thou hast not had enough of me?"

"Not by another hour."

"Thou must be born of fiend, and not of man."

"Very like. It is a wise son knows his own father."

Hereward burst out laughing.

"Would to heaven I had had thee for my man this three years since."

"Perhaps I would not have been thy man."

"Why not?"

"Because I have been my own man ever since I was born, and am well content with myself for my master."

"Shall I bind up thy leg?" asked Hereward, having no more to say, and not wishing to kill the man.

"No. It will grow again, like a crab's claw."

"Thou art a fiend." And Hereward turned away, sulky, and half afraid.

"Very like. No man knows what a devil he is, till he tries."

"What dost mean?" and Hereward turned angrily back.

"Fiends we are all, till God's grace comes."

"Little grace has come to thee yet, by thy ungracious tongue."

"Rough to men, may be gracious to women."

"What hast thou to do with women?" asked Hereward fiercely.

"I have a wife, and I love her."

"Thou art not like to get back to her to-day."

"I fear not, with this paltry scratch. I had looked for a cut from thee, would have saved me all fighting henceforth.

"What dost mean?" asked Hereward with an oath.

"That my wife is in heaven, and I would needs follow her."

Hereward got on his horse, and rode away. Never could he find out who that Sir Letwold was, or how he came into the Bruneswald. All he knew was, that he never had had such a fight since he wore beard; and that he had lost Sword Brainbiter: from which his evil conscience augured that his luck had turned, and that he should lose many things beside.

CHAPTER XXXVIII.

HOW HEREWARD CAME IN TO THE KING.

After these things Hereward summoned all his men, and set before them the hopelessness of any further resistance, and the promises of amnesty, lands, and honours which William had offered him, and persuaded them—and indeed he had good arguments enough and to spare—that they should go and make their peace with the king.

They were so accustomed to look up to his determination, that when it gave way theirs gave way likewise. They were so accustomed to trust his wisdom, that most of them yielded at once to his arguments.

That the band should break up, all agreed. A few of the more suspicious, or more desperate, said that they could never trust the Norman; that Hereward himself had warned them again and again of his treachery. That he was now going to do himself what he had laughed at Gospatric and the rest for doing; what had brought ruin on Edwin and Morcar; what he had again and again prophesied would bring ruin on Waltheof himself ere all was over.

But Hereward was deaf to their arguments. He had said as little to them as he could about Alftruda, for very shame: but he was utterly besotted on her. For her sake, he had determined to run his head blindly into the very snare of which he had warned others. And he had seared—so he fancied—his conscience. It was Torfrida's fault now, not his. If she left him—if she herself freed him of her own will—why, he was free, and there was no more to be said about it.

And Hereward (says the chronicler) took Gwenoch, Geri, and Matelgar, and rode south to the king.

Where were the two young Siwards? It is not said. Probably they, and a few desperadoes, followed the fashion of so many English in those sad days—when, as sings the Norse scald,

> "Cold heart and bloody hand
> Now rule English land"—

and took ship for Constantinople, and enlisted in the Varanger-guard, and died full of years and honours, leaving fair-haired children behind them, to become Varangers in their turn.

Be that as it may, Hereward rode south. But when he had gotten a long way upon the road, a fancy (says the chronicler) came over him. He was not going in pomp and glory enough. It seemed mean for the once great Hereward to sneak into Winchester with three knights. Perhaps it seemed not over safe for the once great Hereward to travel with only three knights. So he went back all the way to camp, and took (says the chronicler) "forty most famous knights, all big and tall of stature, and splendid—if from nothing else, from their looks and their harness alone."

So Hereward and those forty knights rode down from Peterborough, along the Roman road. For the Roman roads were then, and for centuries after, the only roads in this land; and our forefathers looked on them as the work of gods and giants, and called them after the names of their old gods and heroes—Irmen Street, Watling Street, and so forth.

And then, like true Englishmen, our own forefathers showed their respect for the said divine works, not by copying them, but by picking them to pieces to pave every man his own court-yard. Be it so. The neglect of new roads, the destruction of the old ones, was a natural evil consequence of local self-government. A cheap price perhaps, after all, to pay for that power of local self-government which has kept England free unto this day.

Be that as it may, down the Roman road Hereward went; past Alconbury Hill, of the old posting days; past Wimpole Park, then deep forest; past Hatfield, then deep forest likewise; and so to St. Alban's. And there they lodged in the minster; for the monks thereof were good English, and sang masses daily for King Harold's soul. And the next day they went south, by ways which are not so clear.

Just outside St. Alban's—Verulamium of the Romans (the ruins whereof were believed to be full of ghosts, demons, and magic treasures)—they turned, at St. Stephen's, to the left, off the Roman road to London; and by another Roman road struck into the vast forest which ringed London round from north-east to south-west. Following the upper waters of the Colne, which ran through the woods on their left, they came to Watford, and then turned probably to Rickmansworth. No longer on the Roman paved ways, they followed horse-tracks, between the forest and the rich marsh-meadows of the Colne, as far as Denham, and then struck into a Roman road again at the north end of Langley Park. From thence, over heathy commons—for that western part of Buckinghamshire, its soil being light and some gravel, was little cultivated then, and hardly all cultivated now—they held on straight by Langley town into the Vale of Thames.

Little they dreamed, as they rode down by Ditton Green, off the heathy commons, past the poor, scattered farms, on to the vast rushy meadows, while upon them was the dull weight of disappointment, shame, all but despair; their race enslaved, their country a prey to strangers, and all its future, like their own, a lurid blank—little they dreamed of what that vale would be within eight hundred years—the eye of England, and it may be of the world; a spot which owns more wealth and peace, more art and civilisation, more beauty and more virtue, it may be, than any of the God's-gardens which make fair this earth. Windsor, on its crowned steep, was to them but a new hunting palace of the old miracle-monger Edward, who had just ruined England.

Runnymede, a mile below them down the broad stream, was but a horse-fen fringed with water-lilies, where the men of Wessex had met of old to counsel, and to bring the country to this pass. And as they crossed, by ford or ferry-boat, the shallows of old Windsor, whither they had been tending all along, and struck into the moorlands of Wessex itself, they were as men going into an unknown wilderness: behind them ruin, and before them, unknown danger.

On through Windsor Forest, Edward the Saint's old hunting-ground; its bottoms choked with beech and oak, and birch and alder scrub; its upper lands vast flats of level heath; along the great trackway which runs along the lower side of Chobham Camp, some quarter of a mile broad, every rut and trackway as fresh at this day as when the ancient Briton, finding that his neighbour's essedum—chariot, or rather cart—had worn the ruts too deep, struck out a fresh wandering line for himself across the dreary heath.

Over the Blackwater by Sandhurst, and along the flats of Hartford Bridge, where the old furze-grown ruts show the trackway to this day. Down into the clayland forests of the Andredsweald, and up out of them again at Basing, on to the clean crisp chalk turf; to strike at Popham Lane the Roman road from Silchester, and hold it over the high downs, till they saw far below them the royal city of Winchester.

Itchen, silver as they looked on her from above, but when they came down to her, so clear that none could see where water ended and where air began, hurried through the city in many a stream. Beyond it rose the "White Camp," the "Venta Belgarum," the circular earthwork of white chalk on the high down. Within the city rose the ancient minster church, built by Ethelwold—ancient even then—where slept the ancient kings; Kenulf, Egbert, and Ethelwulf the Saxons; and by them the Danes, Canute the Great, and

Hardacanute his son, and Norman Emma his wife, and Ethelred's before him; and the great Earl Godwin, who seemed to Hereward to have died, not twenty, but two hundred years ago;—and it may be an old Saxon hall upon the little isle whither Edgar had bidden bring the heads of all the wolves in Wessex, where afterwards the bishops built Wolvesey Palace. But nearer to them, on the down which sloped up to the west, stood an uglier thing, which they saw with curses deep and loud,—the keep of the new Norman castle by the west gate.

Hereward halted his knights upon the down outside the northern gate. Then he rode forward himself. The gate was open wide: but he did not care to go in.

So he rode into the gateway, and smote upon that gate with his lance-butt. But the porter saw the knights upon the down, and was afraid to come out; for he feared treason.

Then Hereward smote a second time: but the porter did not come out.

Then he took the lance by the shaft, and smote a third time. And he smote so hard, that the lance-butt flew to flinders against Winchester Gate.

And at that started out two knights, who had come down from the castle, seeing the meinie on the down; and asked:

"Who art thou, who knockest here so bold?"

"Who I am, any man can see by those splinters, if he knows what men are left in England this day."

The knights looked at the broken wood, and then at each other. Who could the man be, who could beat an ash stave to flinders at a single blow?

"You are young, and do not know me; and no shame to you. Go and tell William the king, that Hereward is come to put his hands between the king's, and be the king's man henceforth."

"You are Hereward?" asked one, half awed, half disbelieving at Hereward's short stature.

"You are—I know not who. Pick up those splinters, and take them to King William; and say, 'The man who broke that lance against the gate is here to make his peace with thee,' and he will know who I am."

And so cowed were these two knights with Hereward's royal voice, and royal eye, and royal strength, that they went simply, and did what he bade them.

And when King William saw the splinters, he was as joyful as man could be, and said:

"Send him to me, and tell him, Bright shines the sun to me that lights Hereward into Winchester."

"But, Lord King, he has with him a meinie of full forty knights.

"So much the better. I shall have the more valiant Englishmen to help my valiant French."

So Hereward rode round, outside the walls, to William's new entrenched palace, outside the west gate, by the castle.

And then Hereward went in, and knelt before the Norman, and put his hands between William's hands, and swore to be his man.

"I have kept my word," said he, "which I sent to thee at Rouen seven years agone. Thou art king of all England; and I am the last man to say so."

"And since thou hast said it, I am king indeed. Come with me, and dine; and to-morrow I will see thy knights."

And William walked out of the hall leaning on Hereward's shoulder, at which all the Normans gnashed their teeth with envy.

"And for my knights, Lord King? Thine and mine will mix, for a while yet, like oil and water; and I fear lest there be murder done between them."

"Likely enough."

So the knights were bestowed in a "vill" near by; "and the next day the venerable king himself went forth to see those knights, and caused them to stand, and march before him, both with arms, and without. With whom being much delighted, he praised them, congratulating them on their beauty and stature, and saying that they must all be knights of fame in war." After which Hereward sent them all home except two; and waited till he should marry Alftruda, and get back his heritage.

"And when that happens," said William, "why should we not have two weddings, beausire, as well as one? I hear that you have in Crowland a fair daughter, and marriageable."

Hereward bowed.

"And I have found a husband for her suitable to her years, and who may conduce to your peace and serenity."

Hereward bit his lip. To refuse was impossible in those days. But——

"I trust that your Grace has found a knight of higher lineage than him, whom, after so many honours, you honoured with the hand of my niece."

William laughed. It was not his interest to quarrel with Hereward. "Aha! Ivo, the woodcutter's son. I ask your pardon for that, Sir Hereward. Had you been my man then, as you are now, it might have been different."

"If a king ask my pardon, I can only ask his in return."

"You must be friends with Taillebois. He is a brave knight, and a wise warrior."

"None ever doubted that."

"And to cover any little blots in his scutcheon, I have made him an earl, as I may make you some day."

"Your Majesty, like a true king, knows how to reward. Who is this knight whom you have chosen for my lass?"

"Sir Hugh of Evermue, a neighbour of yours, and a man of blood and breeding."

"I know him, and his lineage; and it is very well. I humbly thank your Majesty."

"Can I be the same man?" said Hereward to himself, bitterly.

And he was not the same man. He was besotted on Alftruda, and humbled himself accordingly.

WRITTEN AT SEA.

No. II.

To get clear out to sea, not in paltry channel crossings or a coasting voyage, but in open water, where you lose sight of land and feel the long swell of ocean, is to be made free of a larger world than landsmen inhabit. For there is a unity about this mass of water which covers about three-fifths of the globe, that does not obtain in respect of its remaining solid parts. On land, we live in a territory. Nature, first, by the sea itself or by mountain ranges or by rivers hard to cross or such other troublesome obstruction, has shut us all in and circumscribed us. Ethnical barriers come next; diverse tongues and types of character make those beyond the hill or river alien and bid each dwell among his own people. Lastly, political restraint, citizenship, and the undefined but most potent bond of social consuetude, are wrapped about a man; and he is a prisoner,—at home only in one realm or country or dale. Earth is partitioned off and mapped and owned; her many chambers, how convenient soever to dwell in, have each its own class of tenants, and the doors between are strait and few. But once at sea, we change all this. We are in a territory unconfined and unpossessed, which runs round the globe, embracing it. Liquidity, mobility, equality of substance and unbrokenness of surface, give to the ocean as a whole a certain character of oneness which the land wants. Huge as it is, it is to the mind, a single thing, simple, without parts; and all this one huge thing is mine to dwell on or to roam over, equally mine to all its limits, once I ride free upon the free and open face of it. Men cannot map the ocean. They may pretend indeed to write a name upon some chosen portion of it and find it not inconvenient in use; but the so-called "Sea" wants boundaries in fact. No man knows when he sails out of it or into it. Who can erect any dominion or constitute property in it? Nature, which has set up none of her own, suffers no barriers of our planting. She vindicates rather to every creature a right of unhindered passage from one sea to another by the very passage of the Seas themselves, as into one another and through each other they for ever pour their kindred waters. For each spot of ocean seems to me to stretch out its hands to every other. I suppose it is true enough scientifically, that the very water on which our ship floats to-day may, for any cause known to the contrary, pass by successive currents, upper or under, and through gradual intermixture, to the furthest North or South the ice will suffer it, may enter any river's mouth, wash any harbour bar, and pass unchallenged through any strait in East or West. The sea is open to its own waters. It is homogeneous, uniform, and in unbroken interaction throughout all its parts. Or, if not in strict science, it is so very eminently to the spectator's fancy. Should there be hidden laws which forbid the waters of the Atlantic from ever doubling the Horn to mix with South Pacific waves, or some mysterious wall to make the China Seas as impervious as the land they wash, I for one cannot here believe it. To me the paths of ocean stretch in glorious freedom from beneath my feet to every quarter, and I will not have their march arrested. No, let the glad waves sweep as they list. The channels of the great deep are theirs, and whithersoever they will they go: whithersoever they and the winds please; and we go with them.

The unity of the ocean, filling the mind with so vast an idea, and widening the circle of water which the voyager can see around his ship till in his imagination it embraces the whole globe, must be one material element in that sense of the sublime which every one acknowledges at sea. Instead of finding itself limited by a horizon which suggests enclosure, as some petty rising ground or at most a range of distant hills, the eye sweeps round a line as far off as the curvature of the globe. While it dwells upon the more remote water, too, it becomes aware of a filling in of distance, finer aërial gradations develope themselves, wavelets are seen to flash fainter and fainter at each other's back; and what looked, at a careless glance, a near and sharp line recedes indefinitely as the eye gazes and grows confused with sky-tints beyond, till the mind feels actually beckoned on and allured into invisible reaches of water, where, far out of sight, similarly receding waves are repeating themselves without end. The soul swells with the amplitude of space spread before it, and, from the vastness of this creation of His, conceives larger conceptions of God's greater greatness. Like the sky for height, is the sea for width: He "measures it in the hollow of his hand."

But the impressiveness of a prospect at sea, even in its most ordinary state, is not due to one cause, but to an assemblage of all the recognised elements of sublimity. Indefinite vastness and mystery, simplicity of form with endless vicissitudes of motion and sound, a slumbering strength which casts all other measures of strength out of reckoning, fitfulness that looks capricious, and a terrible destructiveness which fear interprets as cruelty, above all, man's helpless solitariness in the midst of it;—where else shall we find in nature so many or such powerful factors to stimulate at once and exhaust the imagination? Of course these all reach their height, some of them indeed only appear, in a storm, when the strength of the waters is awakened and their voice uttered aloud, and in their hands the staggering ship is as a plaything to a child. But in quieter hours we feel as it were the suspicion of this majesty: it is there, and we know it. Like a low ground-swell after winds have passed is the soul's under-tone of awe in presence of the sea in calm. We clothe it, however placid, with attributes borrowed from its fury. Memories of the storm make its smile deceitful. And in the low plash of sunlit waves we hear the same voice disguised which boomed artillery-like through the night-time of fear. Nay, this very uncertainty and changefulness form a fresh, and, I think, peculiar element of awe. Men watch ocean at play with such feelings as one would the gambols of a wild beast:—feelings which surely do not enter, or only feebly enter, into any land scene. Perhaps, of all natural spectacles, that which might be best compared with the sea in a gale for a combination of grand and especially of terrible associations, would be a thunder-storm by night in the heart of huge and savage mountains. Let Byron's well-known lines on such a storm among the Alps stand for an example:—

"Oh night,
And storm, and darkness, ye are wondrous strong,
Yet lovely in your strength, as is the light
Of a dark eye in woman! Far along
From peak to peak, the rattling crags among,
Leaps the live thunder! Not from one lone cloud,
But every mountain now hath found a tongue,
And Jura answers, through her misty shroud,
Back to the joyous Alps, who call to her aloud!

And this is in the night!—Most glorious night!
Thou wert not sent for slumber! let me be
A sharer in thy fierce and far delight—
A portion of the tempest and of thee!
How the lit lake shines, a phosphoric sea,
And the big rain comes dancing to the earth!
And now again 'tis black—and now the glee
Of the loud hills shakes with its mountain-mirth,
As if they did rejoice o'er a young earthquake's birth." *

Here are solitude and feebleness in the spectator with the mystery of darkness about him, the vague vastness of enormous masses stretching to an unknown distance around, and sounds which stun the ear, carrying to the mind the sense of natural forces whose unmeasured strength is aroused to action; in short, the same factors are here which make a sea-storm terrible, and some of them at least in nearly equal degree: yet all their terribleness passes with the storm. Visit the Alpine pass in tranquil sunshine; no shade of fear, arising from an apprehension of possible storm, lingers over it; for aught you feel, its peace might have been as deep ever since creation. Now, I for one do not find it so with the sea. To me it never seems quite to forget its savage fits. Be it that its repose is too easily exchanged for violent disturbance, or that we are too familiar with the risks which attend its disturbance, the sense of insecurity may always be detected haunting the back parts of the soul and lending a certain seriousness to the gayest sea. For one thing, the sea is never to be seen completely still. Its very rest is restless.† English poetry has no picture of absolute calm more highly wrought than that in "In Memoriam," where the mourner, standing on a dewy morning upon downs which overlook the sea, watches for the ship that brings its "dark freight" home. Morning, the furze upon the wold, the plain, the air, each adds its separate touch to repeat and deepen the impression of soundless, motionless calm; so does the sea: only here in the last stanza, the stillness is broken. No sound indeed can be heard so far away, but there is motion; and the artist's skill is tasked to use this one moving thing so that it shall not mar but make more pathetic that "dead calm" towards which the whole picture leads us, even the last great stillness which hath fallen upon the dead:—

"Calm on the seas, and silver sleep,
And waves that sway themselves in rest,
And dead calm in that noble breast
Which heaves but with the heaving deep." *

Here as I write, becalmed off the Canaries, there is not a sound upon the water. Pearly blue beneath a soft blue sky, it heaves but makes no noise; slow lazy heaves which, sunward, twinkle into tiny sparks of gold, but elsewhere dimple only into shifting streaks that stain with duller blue the pearly surface. There is not breeze enough to lift the shred of bunting which ought to tell how the wind sits. Yet I know not how it is, these monotonous pulsations of water, these quiverings of light, these ripples succeeding each other in an everlasting unrest, touch in me, as I sit, a chord of uneasiness. I cannot feel as I have felt on land, in lonely places, in the hush of noon, when the knolls were hazy with heat, and the leaves made no stir, and the earth beneath breathed as mutely as the sky above it. For this always-heaving sea seems by its very motion to suggest change. I cannot trust it. I know that it is instinct with terrible might. Can I forget how soon, beneath a fuller-breathing air, these soft undulations may become the tossing of big waves? Am I not at the mercy of an inconstant treacherous thing, whose lightest movement betrays its own uneasiness, whose uneasiness a breath will agitate into fury?

A passing word in one of the Prophets puts a moral meaning into this surface restlessness of the ocean. The wicked, Isaiah said, are like it. To one who knows anything of the evil power which sin has to vex and perturb the spirit of a man, it appears marvellous when for long periods in the life of one upon whose heart passions work and in whose memory old misdeeds dwell, his demeanour exhibits nothing but unbroken placidity. That the wicked should be, not safe only from disaster without, but to all seeming free from inward trouble, crosses our ideas of moral fitness. When was it known that ease of mind sprang from a root of crime? Yet no one who speaks from observation will deny that

† "Undulates in sleepy rest."—Moore.

* Compare this with Byron's very powerful sketch of the floating corpse in the "Bride of Abydos" (ii. 26):—

"As shaken on his restless pillow
His head heaves with the heaving billow."

many bad men enjoy real and not merely affected gaiety of spirits, and bear their secret burden with a face serene from thoughtlessness, not from art. To him, however, who ponders it justly, this aspect of peace will appear more terrible in its deceptive uncertainty than a summer sea. Beneath the smiling surface lies a sensitiveness to the lightest touch, a liability to be discomposed, which, if you look narrowly, discovers itself even at its quietest, by tremulous unrest. For, like the sea-surface, unreconciled human nature trembles in the act of smiling. A breath from God can stir it; or, if no breath stir, it seems to have a source of motion within itself, and cannot but sway and pulse to and fro in virtue of its own discontent. Just as, on the very calmest day, tiny wavelets will tap the beach and hiss among its pebbles, and the boat rocks idly on the water which idly babbles against its sides; so at best the evil heart stirs uneasily within itself, it knows not why. By a force without or a force within, may it, like the sea, be at any moment urged into violence. By a force within: for if passion, in steadier tidal flow or currents that shift and contend, once begin to rise, the soul doth straightway beat impatiently against the barrier of circumstance wherewith (as the sand confines the sea) God hath set a term to the strivings of his creature, and, retreating with a moan, leaves its broken tangle and wreck behind it. Far more, however, by the force from without. There is a Wind, in the dread of which this evil heart lives always; for the Wind hath power over it from God to tear up its deep places and toss its quiet into uproar.

The wicked heart knows, or, if it does not choose to know, yet by God's mercy it cannot choose but fear, that the Breath of the indignation of the Most High shall one day sweep down upon it, darkening all heaven with storm and opening up its secrets by the lash with which He lashes it into open, rebellious complaint. For in that day of apprehended tempest, this present discontent underlying sunny ease shall give place to loud voices of self-upbraiding, passion, and pain. These voices shall not be laid to rest any more for ever. "The wicked are like the troubled sea, when it cannot rest, whose waters cast up mire and dirt. There is no peace, saith my God, to the wicked."

J. OSWALD DYKES.

CHRIST THE LIGHT OF THE WORLD.

By C. J. VAUGHAN, D.D.

XI.—CHRIST THE SINNER'S FRIEND.

"A friend of publicans and sinners."—Matt. xi. 19.

THE words were spoken in reproach. It was an enemy who said this.

But, like many other words meant as reproach—like the inscription upon the Cross itself, meant in mockery, but hereafter (God grant it) to be verified in glory—this designation has come to be an honour: and we all count it a privilege and a happiness to be able to gaze upon this title, as one of the brightest jewels of our Saviour's crown.

CHRIST THE SINNER'S FRIEND.

Who is a sinner? and what is it to be the friend of a sinner? and how is Christ shown and proved to be such? these are some of the questions which we must seek to answer, if we would speak aright or meditate profitably on this inspiring theme.

"All have sinned."

Yes, the infection of sin is in all, and the working of sin is in all, and the manifestation of sin has been in all, and the guilt and condemnation of sin is upon all. There is no one of us who is not a sinner—or who, as being such, does not need a friend.

But some are worse sinners than others. There is a difference in heinousness between one kind or form of sin and another. No code, divine or human—save, perhaps, one of which a half-fabulous tradition tells—ever professed to make all sins or all sinners equal.

One man sins against light, against education, against conviction, against warnings and mercies and renewed trials innumerable; sins, and sins again, and will sin—persists in his sin, and loves his sin—till at last he drags down upon himself ruin, almost no one pitying. And another man sins more than half in ignorance: has been so reared and so nurtured in the very haunts and homes of vice, that it would indeed have been a prodigy and a miracle if he had not fallen: and when he is brought to account for crimes which he cannot gainsay, every thoughtful man, and every humane man, and every Christian man, not only laments the issue, but exculpates the poor transgressor from more than half the criminality of his sin. And a third man is not, in these senses, a transgressor at all: he has been kept all his life from gross stains of sin: early instruction, a good disposition, a careful training, excellent examples, a Christian home, have had their due, their natural influence: he has learned to bridle appetite, to say No to inclination, to rouse himself to duty, to struggle (not unsuccessfully) after usefulness and honour: and though the Adam leaven is in him, and though he has his faults, and though in the sight of God he is a sinner still, and though when he stands before God in judgment he will want a better plea than his respectability or his innocence, yet it would be false and therefore mischievous doctrine, to confound him in one sweeping charge with the former, or to overlook the clear line of visible demarcation which severs him from even the better of the two classes earlier spoken of.

All have sinned: but there are degrees, and there are kinds, and there are complexions and characteristics, of sin.

Then of which kind of sinner do we now speak?

Of each kind, and of all kinds, Christian readers, which can value a Saviour.

We leave out none, when we call Christ the sinner's Friend.

And yet, alas! some will leave themselves out.

I mean, that there are some who do not enough feel their own sinfulness, to care for a Divine, an Almighty, and an All-merciful Friend.

They will see what they are—what they are at the best—some day: they will see it in some cloudy and dark hour of distress and sorrow: they will see it in some moment of humiliation which they look not for and reckon not: they will see it probably in the hour of death: they will see it, if not sooner, in the great day of judgment:—but at present they see it not. In a general way they are willing to call themselves sinners even now; but sin has not found them out: they know not as yet "the plague of their own heart."

And therefore, practically, the subject of this reading will have no charm for them. They are sinners, and Christ is the sinner's Friend; but at present they will let Him be so for others, and they will not come themselves to ask that that sacred, that saving relationship, may be established and cemented and realized for them. "Ye will not come to me, that ye might have life."

Man excludes them not: and certainly God excludes them not. O, let them not ignorantly or wilfully exclude themselves!

Now, what is it to be a sinner's friend? It is not difficult for a sinner to find a friend (so called) who will sin with him; who will show him new ways of sinning; who will encourage him in forgetting duty; or even (though this be less common) who will pity him and stand by him when sin has brought forth sorrow.

And it is not difficult, on the other hand, for a sinner to find a friend (so called) who will give him good advice; look down upon him with commiseration from a pinnacle of self-righteous virtue; or even point him with cold direction towards the gate of self-denial and the opening path of virtue.

But neither the one nor the other of these is the friend of whom we are in quest.

The one loves the sin, and the other loves not the sinner.

Now, therefore, instead of pursuing the question in a dry abstract way, let us bring in at once the main part of our subject, and show, God helping us, what sort of friend Christ is to sinners; how Christ showed and proved Himself to be, in deed and in truth, the sinner's Friend.

1. He showed it, first of all, by the very object and purpose of His coming.

"Christ Jesus came into the world to save sinners."

I separate this from the effect of His coming. The endeavour is the first thing.

If a man throws himself into the cold river at mid-winter to rescue a drowning woman, we honour the attempt: we say, whether he succeeds or fails, That man has a feeling heart: and if he fails, if he gives his life in vain, if both sink, we say, He did what he could—he gave his all. We separate easily and justly between the endeavour and the result.

Now therefore I say first of all that, when Jesus Christ came into the world in the hope and for the purpose of saving sinners, He showed Himself the sinner's Friend. If He even failed in saving—if He even mistook the way—the heart of friendship and of love was in the effort, and you should love Him for having tried to save. That was why He left Heaven. That was why He consented to forego for three-and-thirty comfortless and suffering years His original glory. That was why He came to be born of a woman, and to taste all the privations, and all the lonelinesses, and all the desertions, and all the pains, which make up the total sum of earth's sufferings and of sin's penalties.

2. He showed Himself the Friend of sinners by the words which He spoke below.

The most impressive and the most memorable of His Parables are of this special character: they were addressed to sinners, and they breathed a spirit of tenderness, a spirit of encouragement, and a spirit of love, towards those whom common men look down upon as sunk below redemption.

There is one Gospel which treasures up a multitude of these sayings.

The 15th and 18th chapters of St. Luke are a storehouse of such comfort.

The parable of the Lost Sheep—the parable of the Lost Piece of Money—the parable of the Prodigal Son—the parable of the Pharisee and the Publican—are all examples of the way in which Jesus Christ dealt with sinners.

And what do these say?

(1) A man has an hundred sheep. One strays from the flock. Over pathless wilds, along bleak mountain sides, the ignorant straggler pursues his wandering: frightened, disconsolate, wretched, yet powerless to find or to retrace its way.

How does the owner argue?

Does he say, I have ninety and nine left to me—let this foolish wanderer go? I will not waste time and strength, I will not endanger those that remain, in the endeavour to catch and to bring home just this one?

Not so.

He leaves the ninety and nine; leaves them anywhere—"in the wilderness," our Lord says; and for the time lives only in the one lost; tracks it by skilful thought, follows it with long patience; and if he succeeds—if he overtakes, if he recovers it—he thinks more of it, for the time, than of all the rest together; calls his friends to rejoice with him, and regards it with the twofold joy, of one who receives a gift, and of one who gains a prize.

So is it in Heaven, Christ adds in the moral of the parable, when one sinner comes to repentance. There is joy there, more jubilant and more transporting, over the one sinner repenting, than over the ninety-nine just persons who need no repentance.

(2) A woman has ten pieces of silver: the careful savings, perhaps, of forethought and self-denial, for the payment of a half-year's rent, or the purchase of a year's clothing. One of these ten is missing. All the care and all the economy of months are thus defeated and disappointed. The rent will be short of its amount by one-tenth part: the purchase contemplated will be maimed and spoilt by this unexpected misfortune. What can be done? Does she comfort herself by thinking that it is but one out of ten—that nine pieces remain? Does she resign herself to the loss, and beseech her landlord to accept the nine for the ten? Nay, she refuses to acquiesce in aught less than the recovery of the missing coin: she waits not even for the dawn, but by night lights her candle, and sweeps the house, and seeks diligently till she find it: and then, in the joy of that success, she calls together her friends and neighbours, and bids them to rejoice with her, because she has found the piece which she had lost.

O what a parable for sinful men! How meet an utterance for the sinner's Friend! How apt a correction of that common and most natural feeling, God cannot care for the loss of such a one as I am—a mere insignificant atom in His vast universe—a being spoilt by sin, and unworthy of the least of His regard, who is the Lord of sinless Angels and righteous men!

(3) An undutiful and unloving son asks of his father the present possession of that which shall be his own. He would escape from home: he would find for himself more congenial company, and enjoy a licence of irregular living which cannot be his under a father's eye. The request is granted. He takes with him the gifts of his father's bounty, and goes to squander them in sin and riot in a far country. Presently comes a famine—a famine without—a famine too within. He feels in his heart and in his soul the griping hand of want. He sinks to the lowest and vilest offices; to feed swine, to share the swine's husks: this is now the ambition of him who once lived in a house of plenty, and knew not, but by name, the very existence of poverty. At last he bethinks himself of a return. In his father's house the hirelings have abundance: he will go, and petition for a place amongst them: lost as a son, he will return a servant. How is he greeted? Needs it long supplication, many entreaties, and bitter tears, to move his father's heart to softness? Nay, before he speaks, he is answered: "While he was yet a great way off, his father met him," and the announcement of the prodigal's return is the signal for merriment and dancing.

When was this Parable, like the two former Parables, spoken? Was it not on the very occasion of a murmuring against Christ, on the part of the Pharisees and Scribes, that He was the sinner's Friend? "This man receiveth sinners, and eateth with them!" Yes,—then this young man is the sinner, and God is the Father: and the young man has taken his Father's gifts, and treated them as if they were twice his own—his own to use, his own to abuse—and he has escaped from the Father's home, and thought to live happily by himself, without God in the world—and he has tried the experiment, and found that there is, after all, something in man's heart which wants and cries out for and will not be satisfied without God—he has found that the pleasures of sin are always bitter in the retrospect, and at last become torments in the very using—and so he has bethought himself, in the land of his misery and of his exile, of a love never-failing and unexhausted—he has risen and returned, and re-sought his spurned and outraged home—and God, his Father, instead of reproaching him, has met him half way, and interrupted his confessions by the voice of fatherly forgiveness—has taken him in, and made him a feast, and counts that a day of joy and gladness which has brought back, however soiled and scarred, a living soul from the grasp of hell and death.

It is, again, the very utterance of the sinner's Friend!

(4) Two men have gone up at the hour of prayer into the Temple courts. And one presses forward, and stands forth for all to see, and speaks aloud, and makes supplication—and what is it? It is a thanksgiving, not a confession: a thanksgiving for his own virtues: a boastful self-vaunting, and comparison of his good with others' evil!

Afar off, as unworthy to draw near where God is, there stands a sinner—one whom men point at as an outcast and an alien from Israel—and he dares not to lift so much as his eyes toward Heaven, but can only smite upon his breast, and say, "God be merciful to me a sinner!" The pent-up sins of years are gathered, as it were, into one single utterance, and he plunges in, as all-defiled and all-guilty, into the fountain opened in the blood of Jesus for sin and for uncleanness.

And it is he—it is the poor sinner—who goes down to his house justified! The other came, and the other returns, self-complacent, self-satisfied, self-admiring: but this one, the altogether sinner, has upon him the hand of blessing, has within him the answer of the Divine forgiveness.

It is the Gospel of the sinner. He who thus spake is of right the sinner's Friend.

3. Again, Christ claimed for Himself this title by His conduct to sinners during His life below.

(1) The common reproach against Him was well-founded. He did eat and drink with publicans and sinners. No door was ever closed where He sate and rested: no rude repulse ever met, where He was, the application of the needy or the access of the sinful. If the Pharisee would have Jesus, he must have sinners with Him at his table; and if he complained, he drew down upon himself the only severity of the Saviour—that which exposed self-deception and rebuked hypocrisy.

So was it when, into the house of Simon the Pharisee, there came in after Him, unbidden and unregarded, a woman who was a sinner. Her presence, no doubt, was an affront to the sleek, self-satisfied host: she was a sinner—known for such, no doubt, by common rumour—she was not a fit associate for the decorous and religious world—why was she there? What brought, what detained her? She is weeping there behind the feet of Jesus—washing His feet with her tears, and wiping them with the hair of her head. The Pharisee draws from His tolerance of her an unfavourable inference. "If He were a Prophet, He would have known" her character, and treated her with the abhorrence which she deserved. But the sinner's Friend "had something to say" to the man who thus argued. Two persons owe money to the same creditor—one a large, the other a trifling sum: neither can pay—both are excused: which will love him most? The Pharisee himself has to say that he supposes the one whose debt was the larger. True—then this woman will naturally love more than Simon? This poor, despised, guilty outcast, having been forgiven a heavier debt of sin, will be more thankful, and more devoted in her love, than he who in his own idea owed God nothing? Yes, the Saviour might come into that house of the Pharisee, and no signs of peculiar honour shall greet or repay His presence—no water for the feet—no anointing oil—no reverent kiss of welcome: this is natural, for Simon feels himself no sinner, nor counts it, therefore, any great thing if he be privileged to entertain the sinner's Friend. And natural, too, was it, on the same principle, that this poor sinful woman should honour Him; that she who had been much forgiven should love much that Lord who was to buy her pardon with His most precious blood. She is the forgiven one—she the saint.

(2) Sometimes the person in question is not only a general but a particular sinner. There was a person brought to Jesus in the Temple courts by the Scribes and Pharisees to see what He would say to her. She was a person guilty of a most heinous sin, and they, her enemies and His, would fain draw from Him, by His treatment of her case, something which they might make merchandise of, as an expression of dissatisfaction or variance with the Mosaic Law. "The Law commands that such should be stoned: but what sayest Thou?" He must either sign the warrant of execution, or else set Himself up as a rival legislator to Moses. The wisdom of God is not thus limited. There is a third course. "He that is without sin among you," such is His answer, late but timely, to the accusers' question, "let him first cast a stone at her." She is guilty, she deserves the penalty—but who shall be the executioner? Whose hand shall be first upon her to put her to death? Surely the hand of the sinless; the hand of him whose conscience bears against himself no accusing witness: if there be one among you—perhaps there is one—whose soul is clear in this matter—whose life is free and his heart pure from the sin of uncleanness—he is the proper person to execute vengeance upon her, who unquestionably deserves to die! And, strange to say, among all those Scribes and all those Pharisees—teachers of the Divine law, and "simular men of virtue" as they were—there was not one who could accept the challenge; not one who could say, "My life is clear, and my heart pure—I will throw the first stone." They went out, convicted by their own consciences, beginning at the eldest even unto the last, till Jesus was left alone, and the woman standing in the midst. Then at last, face to face with that guilty one whom He had delivered from the human vengeance, He brought her into that truer and higher court, for which they, the human accusers, had cared nothing, and in the very act of absolving, added also the highest of all motives for reformation, when He said, "Neither do I condemn thee: go and sin no more." Yes, He who thus dealt with guilt was in deed and in truth the sinner's Friend.

(3) And surely not for nothing was one of the latest acts of that Divine life an act of tenderness towards a sinner. On the Cross itself Jesus claimed, and proved his claim to, this title. Beside Him there hung a dying malefactor: placed there, no doubt, to add to the shame of the sinner's Friend; and that the Scripture might be fulfilled which said, "And He was numbered with the transgressors." This man was dying uncheered by one ray of comfort: he was not innocent—he was not a martyr—he was not witnessing to a truth, nor confessing a Saviour—he was simply being executed—executed for a great crime, and dying for it by slow degrees, through long-protracted hours. But in him, at the eleventh, yea, at the twelfth hour, grace wrought, and wrought wonders. When his comrade, the third sufferer, railed on Jesus—bidding Him, half in mockery, put forth His Divine power, if He possessed it, in saving Himself and them—this man rebuked him: this man spoke of the fear of God: acknowledged the justice of his sentence: confessed, too, the innocence of Jesus, and even turned to Him, a dying man, spoke of His kingdom, and craved his remembrance in the day of His glory. Sinner as he was, and dying for his sin—hardened through long years of iniquity, yet now suddenly (as it should seem) brought to a sense of sin, and to a genuine heart-deep repentance—Jesus saw in him one of those for whom he was pouring out His

precious blood; saw in him (as it is written) of the travail of His soul, and was satisfied; and left for ever on record a proof of the omnipotence of His grace, in the words, as of a Prince, an Arbiter, and a Judge, "Verily I say unto thee, To-day shalt thou be with me in Paradise." To-day shalt thou be my companion in those realms of the blessed dead, from whence there shall be also, in due season, a resurrection of light and life and immortality.

4. And now can we carry yet one step further the revelation of this character of the sinner's Friend? Can we show that death certainly had no effect upon it? that the risen Jesus, yea, that the ascended Jesus, was, and is still, the sinner's Friend?

Blessed be God, the Gospel Book closes not with even that latest manifestation, in death itself, of the Saviour's spirit, but goes on to show that it abode with Him through death and the grave; awoke with Him in resurrection, and with Him ascended into the heavens.

(1) To whom did He first appear after His resurrection? Was it not, St. Mark being the witness, to Mary Magdalene, out of whom He had cast seven devils?

(2) And to whom did He vouchsafe one of the most remarkable of all the evidences that it was indeed, in all the fulness and reality of His Person, He Himself alive from the dead? Was it not to the Apostle who doubted? to him who had said, in the workings of a self-will surely not without blame, Except I see this and this—see it for myself, and touch also, and handle—I will not believe? Was not this a mark of His consideration still for human weakness, of His mercy still upon human sin?

(3) And at all events what can we say of the special grace vouchsafed to the Apostle Peter, when after his threefold fall, so full of pain and grief to his Master in the last hours of His earthly strife, he was specially sought out by his Master's presence after the Resurrection, and called thrice to confess his love for Him whom in His latest sorrow he had thrice denied?

These three records make the risen Saviour especially the sinner's Friend.

(4) And what shall we say of one yet later? of one which reveals Him to us in Heaven, at the right hand of God, and tells us of His merciful dealing with a man who had "compassed sea and land" to destroy and make havoc of the faith of a crucified Lord? Well may that man say, in one of his last communications to the Churches, "This is a faithful saying, and worthy of all acceptation, that Christ Jesus came into the world to save sinners, of whom I am chief. Howbeit for this cause I obtained mercy, that in me first Jesus Christ might show forth all long-suffering, for a pattern to them who should hereafter believe on Him to life everlasting."

And "Jesus Christ is the same yesterday, and to-day, and for ever."

(5) What is His work, what His office, now? Is it not that of a Priest? that of One charged with the whole burden of human sin, perverseness, and misery, that He may both make intercession for it perpetually with God, and also strive with it by constant influences of grace and good within? What is the office of the Intercessor, and what is the office of the Minister of the Holy Ghost to man, save the undying ministry of the sinner's Friend?

There are certain things necessary to this office: and with the brief mention of them we will conclude.

(1) The sinner's Friend must Himself be free from all spot and stain of sin.

It is a mistake, though a common one, to imagine that sympathy with the sinner can only be gained by intermixture with his sin.

Just in proportion as there is sin, there is no sympathy. Sin is selfishness: and he who has tasted himself of the forbidden fruit, always desires to give of it to others also. It was so in the first sin: it is so still, and always. Sympathy is not increased, it is destroyed, by participation in the sin.

"Such an High Priest became us, who is holy, harmless, undefiled, and separate from sin." If He were not Himself holy and sinless, He could not in reality be the Friend of the sinful. There would be in Him a taint and bias of sinful privity and sinful concurrence, which would not strengthen but destroy the reality of the Divine sympathy.

(2) Nevertheless, in the second place, the sinner's Friend must be able to feel for, and to feel with, the sinner.

He must partake of the nature, or He could not feel for the fallen. He must Himself have been "tempted in all points," or He could not be "a merciful and faithful High Priest to make reconciliation for the sins of the people." "We have not an High Priest who cannot be touched with the feeling of our infirmities, but who was in all points tempted like as we are, yet without sin."

(3) The sinner's Friend must be Almighty to save.

What is a sinner?

i. He is one who has a load upon him: the load of unforgiven iniquity; the burden of good things which he has left undone, and cannot do—the burden of evil things which he has done, and cannot by tears or pains or efforts make undone.

The sinner's Friend must be able to take this load off from him; to say, I have borne thy transgressions—I have carried thy sorrows—I have done, and I have undone—I have wrought for thee a perfect righteousness—I have cancelled for thee the accusing debt of sin.

This is what Jesus Christ has done, once for all, for us, on the cross of atonement and of expiation.

ii. Again, a sinner is one who has an infirmity: an inability to please God; a fatal weakness towards that which is good, and a fatal predisposition towards that which is evil; insomuch that, if forgiven, he cannot walk uprightly; if ransomed from the hand of the enemy, he will again fall into it, and be a second and a third and a thousandth time captive.

The sinner's Friend must be able to undertake for him in the future; to say, I am thy Life—I will live in thee—I will communicate to thee day by day a new spirit—I will work in thee both to will and to do—I will make my strength perfect in thy weakness—I will make thee more than conqueror through Him who loved thee.

This is what Jesus Christ does for all who come to Him; by virtue of His constant intercession, His prevailing grace, His in-dwelling Spirit.

(4) Finally—and I place this by itself—the sinner's Friend must be always accessible.

The emergencies of life, of the spiritual life not least, are unforeseen and sudden. If we could only approach the mercy-seat on one day in the year, or at one hour in the day, we might perish between times, no one regarding. We want an ear ever open, a heart ever listening and ever prompt to feel. The sinner's Friend must be as constantly accessible as the sinner himself is ever weak and ever tempted. He must say, At whatever hour, of the day or of the night, the enemy draws nigh, come to me instantly, and fear not. Whether it be "the pestilence that walketh in darkness," or whether it be "the sickness that destroyeth at noonday"—in either case, and in every case, I am thy refuge—"I am thy shield, and thine exceeding great reward." The name of Christ is a strong tower: the sinner runneth into it, and is safe.

We may be reluctant, but Christ is gracious. We may be unbelieving, but He abideth faithful. The sinner's Friend is Himself all-holy: the sinner's Friend is touched with our infirmities: the sinner's Friend is Almighty to save: the sinner's Friend is ever accessible, ever near, ever present.

"How shall we escape, if we neglect so great salvation?"

ALFRED HAGART'S HOUSEHOLD.

By ALEXANDER SMITH, Author of "A Life Drama," &c.

CHAPTER XXIII.

In the present chapter the chronicler must don a pair of seven-league boots, and traverse rapidly a series of years. This story, whose progress has been as slow as an English river meandering through flat plains, has now to enter on an interval of rapids; and when the unwonted acceleration is over, its future will be as slow and humdrum as has been its past. The chapter will not be a long one, but before it is finished the McQuarrie girls will have become women; Jack will have finished his university career, will have had a seat for long in the office of Messrs. Hook and Crook, and become versant in all the outs and ins of their extensive business; Miss McQuarrie's form will be more bent, her face more puckered, but her eye will have retained its keenness, and her brain its nimbleness; in Mrs. Hagart's glossy hair, time will have put not a few silver threads; and around Hagart's head—now slightly bald by the way—there will be shining the nimbus of a permanent prosperity. Having shod himself with the shoes of swiftness, let the chronicler now proceed!

While resident in Hawkhead the McQuarrie girls were frequently at Mortimer Street of an evening, and just as frequently were they at Cuchullin Lodge. By the Staverts they were made welcome; and Jack, who occasionally accompanied them, was made welcome also. Jack admired the Cuchullin gardens and the Cuchullin knick-knacks—the old swords, the old cabinets, the old Bohemian glasses with the cracks across them which were the vouchers of age, and the old pictures representing snuffy saints and martyrs. In a sort of distant way he liked Miss Flora, who was a showy girl, a few years older than himself, and who patronised him; much better he liked Miss Kate Stavert, who was one or two years his junior, and whom he could patronise. After a general and somewhat indefinable manner he liked the Stavert lads—Torquil, Norman, and the rest of them—bearing grand Highland names. Stavert also, whom he had before met on a memorable occasion, had a place in his favourable regards. But Mrs. Stavert he did not like; and he was conscious, by a swift instinct, that precisely to the same extent that lady did not like him. She was a tall, blonde, smooth woman, cheeked like a faded peach, with eyes of no particular colour, which dilated and contracted in a peculiar sort of way. Her manner was soft, her step was soft; her light hair was softly and smoothly braided; her voice was soft and ingratiating. When in company she was continually whispering to her neighbour in confidential asides. She smiled frequently, but somehow her mouth and eyes had cut acquaintance, and never could be brought to smile in concert. Her smile was as artificial as her rouge—that is if she rouged, of which I am not in the least aware. I have taken Mrs. Stavert down to dinner twice or thrice, and while she abused my best friends to my face, she was careful to tell me how much she admired my talents and my person and my manners; and I felt very much as if, preparatory to being swallowed, I was undergoing the process of lubrication. I confess I was scared by the soft voice and the politely-malign eyes contracting and dilating on me like a cat's. In truth, there was something feline about Mrs. Stavert altogether. Her pleasant manners were like a cat's paw—velvety, yet with talons concealed in the velvet. She was vain, and delighted to lie coiled up in the fire-light of approbation. When pleased, the pupils of her eye contracted, the lids came sleepily down, and you almost thought you could hear her purr. So long as you stroked her with the pile it was agreeable enough; if you stroked her against the pile, up shot the electric spark, and out of the soft-stepping velvet came the claws. On all Jack's visits to Cuchullin Lodge, Mrs. Stavert was studiously polite, but to the boy's simple, unvitiated sense that politeness never seemed sincere. He did not like her. If left alone in a room with her, he would have felt uneasy; and without knowing why, he was certain that she did not like him. It is hardly worth while being a hypocrite in this world. People are not so easily deceived as people suppose. The great art in social tactics is to conceal art; and the man who is known to be cunning, is never cunning enough. False colours are only of use to the privateer or the blockade runner so long as they are believed not to be false. Test the spurious coin of regard on the counter of instinct, and you know it in a moment by its ring.

The wintry stars shone keen above Cuchullin Lodge, and save a speck of light from one chamber the entire mansion was dark. Within that chamber lay Mr. Stavert and his wife, careful even in the night watches of their own and their children's interests. Above the matrimonial couch Sleep hovered on downy wings, preparing silently to descend. Jack and the McQuarrie girls had visited them that night, and there had been a little family dance, and thereafter a little family supper. The guests had gone, the youthful members of the family were deep in dreams in rooms beneath; but in the upper chamber, with its speck of light, the fond parent pair were yet awake and plotting. Just before I shall play eaves-dropper, Mrs. Stavert had shot after Jack one of the arrows of her spite. Stavert turned uneasily on his pillow.

"Now, Eliza, look here," he said, "I dislike that boy as much as you possibly can, and it is just because I dislike him that I don't wish to hear you give expression to your feelings. I dislike him, but I don't wish to show him that I dislike him—which I am sometimes tempted to do. You are in no such danger. You are too much a woman of the world to be betrayed into the expression of your true feelings. We have our daughter Kate, Eliza"—and at this oracular statement, even in the dimness of the bedchamber, Mr. Stavert's eyes went into the corners that were next his wife.

"Well?" said the lady.

"She must marry young Hagart. I have made up my mind about that. They are about the same age, and every way suitable. We have some years to come and go upon, and we can easily throw them together and get them to take a liking for each other. It is important that Hagart should take a liking for Kate, because, if needful, we can force her into a marriage against her inclination, while we cannot force him. He will have all his aunt's money, and if Kate marries him, it will come into the family. We should have got it in the first place, of course; but then, if we cannot catch the rain with one dish, we can catch it with another."

"If we get it through marriage," responded his spouse, "it will be just as good as if we got it under Miss Kate's will. As the dear girl's mother, I shall of course be her closest counsellor, and we shall make the young man do as we please. Unlike furniture, money is as valuable at first as at second hand."

"As we arranged, darling," Stavert went on, the marriage of Jack and Miss Kate being finally decided upon, the opinions of neither of these young people being consulted, "I spoke to Torquil to-day about Miss Oona McQuarrie, and urged him to get into her good graces as far and as speedily as possible. I merely dropped the hint, and in a moment the lad snuffed Miss Oona's fortune afar off. Hector married late in life, and has been a cautious, saving man all his days, and by this time he must have lined his purse extremely well. Didn't you think that Torquil was very attentive to her when she was his partner in the quadrille, and at the supper-table to-night, and that she was rather pleased with his attentions? I did. The smile never left her black eyes all the time."

"And that smile I rather fear. Miss Oona will be much more difficult to manage than John Hagart. But by care and attention both may be managed. Just leave them in my hand. We have plenty of time to work in, and if one mode of action fails, we can try another. Good night."

And Sleep, with downy wings outspread above the matrimonial couch, slowly settled down.

In due time Jack left the Hawkhead High School, and was entered a student of the Hawkhead University. This university—famous to all the ends of the earth—with its smoke-blackened, long-extended, and quaintly-carved and windowed frontage; its flagged and antique courts, with well-worn and griffin-surmounted staircases springing therefrom; its low-roofed and indifferently lighted class-rooms; its green behind, in whose shady and sequestered alleys studious students walked arm-in-arm, and in whose centre the game of football was being constantly contested—the university, old and weather worn, stood in one of the dingier portions of the city, and lent thereto a dignity and a sacredness which were much needed. We know what we are, but we know not what we shall be; and it pains me to think that in a little while the famous university will be a famous university no longer. Learning is about to take its flight westward to a spick and span new building on a sunny hill; and the old halls, which have heard so many eloquent voices, are about to be transformed into a central railway station. And yet, in such a change, there is a certain fitness and propriety. The old building has brought its fate upon itself. It was the cradle of the infant steam-engine; and it is perhaps right that, when it has done its work, and fulfilled its original purpose, it should become the main home and haunt of the Locomotive. Like Frankenstein, it will be slain by the monster it has created.

When the early winter days are closing in, the streets surrounding the Hawkhead University bristle with "lodgings to let;" and then all of a sudden a troop of flamingoes seem to have alighted on the Hawkhead pavements. During the entire day the streets surrounding and leading to the university are dotted with scarlet specks. At Hawkhead the students attending the classes in the faculty of arts wear scarlet cloaks; and when Jack's new one was sent home to Mortimer Street the evening before matriculation, he was forced by Miss Kate to equip himself in the glowing toga and to endure her private inspection. The old lady, while regretting that the soldierly scarlet should ever be degraded to a scholar's use, was on the whole sufficiently complimentary. Next day in his gaudy habiliment Jack sallied forth, and while walking along felt painfully conscious that every one was taking private note and cognisance of him. The veteran students whom he passed wore cloaks torn and frayed, and smeared with ink; but his was virgin scarlet unsoiled by work or combat, and to every one it was dreadfully apparent that he was a green-horn and a freshman. The Hawkhead students are exposed to the rude chaff of the streets; but for that chaff the older men care no more than a weather-beaten mariner cares for a splash of spray. This ordeal of the morning in question Jack had to pass, and his gown being hatefully glaring and new, and his feelings sensitive, he endured on his march to the university much real affliction. He had hardly turned the corner of Mortimer Street when a small baker's boy, carrying a basket of rolls on his head, transfixed him with his eye. Jack walked past with as much dignity as he could assume; but he had not proceeded ten paces, when the wicked baker's boy deliberately took the basket of rolls from his head, placed it on the pavement, and then, curving both hands around his mouth, howled out, "Oh the puppy, oh the puppy" (Anglicè *poppy*, but a play on the word was evidently intended by the wretch). And this salutation, which went through Jack's soul like a bolt of ice, was caught up by another small boy at the next corner of the street, whose way lay in the same direction as Jack's, and who beguiled the tedium of that way by howling out the above opprobrious epithet, and observations still more irreverent at intervals. Our young friend ran the gauntlet of jeering and mockery with considerable fortitude, till nearing the university he was by a troop of children assailed with a round chorus sung in rude cadence:—

"Collie dowg,
Lift up yer lug,
An' let the gentry by ye."

At this greeting all the scarlet in Jack's mantle rushed into his face, and he fervently resolved that he should obliterate that pestilent brightness of tint which attracted so much public observation and irreverent comment, and of which but yester-night he was so proud—that he should shred it up with knives, that he should spill a bottle of ink upon it, that he should bribe the maids at home to clean their blacking brushes upon it, that he should throw it in the gutter and dance upon it—that, in fact, he should do everything in his power to make the garment as dingy and as like an old soldier's tattered uniform as possible.

The scarlet mantle got dingy enough in a short time, however, and Jack became careless of popular jeer or remark. A new life lay around him in the university, and he tasted all its novel sweetness. He made many friends, he attended the debating societies, he read and talked—in every way his mind opened and he obtained new visions of the wondrous world. He has often told me of his Humanity professor—a true scholar and gentleman now gone to his rest; of his haughty features, his proud blood, his grey eye that froze ignorance or stupidity into a statue. "Do you mean to tell me, sir," he would say rising on an unhappy culprit in the white wrath of scorn, "do you mean to tell me, sir, in cold blood, that so and so is so and so?" And when he did rise after that fashion the class felt that the professor was not in a humour to be trifled with. Another university anecdote John is fond of repeating, and at which he laughs consumedly yet, as if it were a joint of fun which never grows less, at which you can cut and come again for ever. "Will you please define Instinct, Mr. ——," quoth the bland professor on class examination day to a country student whose face was composed of mouth and eyes. "The Thirst for Blood," responded the rustic in a sepulchral voice, eyeing his professor hungrily the while. Into all that was stirring or picturesque in his new life the young fellow entered heartily. He was a capital hand at football on the college green. He liked the debating societies and the wordy strife; and at the time he gained considerable applause by his advocacy of the claims of Napoleon to the title of a man of genius as against those of the Duke of Wellington. When the angry scarlet mantles streamed down the street—a sufficient walking-stick firmly clenched in each scarlet mantle's fist—blue policemen in flight or pursuit—Jack was sure to be one of the crowd—in the van if advancing, in the rear if in retreat. While a body of students were retiring once through the snowy streets, policemen hanging persistently on its skirts and making a capture now and then, a wild charge was made—scarlet-mantled student clashing desperately against blue-clad policeman, the walking-stick pitted against the official truncheon—and this wild charge, with cap gone and bleeding forehead, Jack valorously led. So led, the wedge of streaming scarlet mantles scattered for the time their blue adversaries; but the victory was not obtained for nothing. Hard blows were given and received, and just in the moment of success Jack was smitten down. Him, therefore, his companions assisted home; and with a broken pate and discoloured optics delivered over to the tender charges of Miss Kate. Did that lady grieve over her nephew's disfigured countenance, and upbraid him for his riotous and ungentlemanly conduct? Not a whit. On the contrary, Miss Kate, who came of a fighting race, and who had a lot of the old blood about her heart, was prouder of her nephew's broken head than if he had brought home an armful of college prizes; and the discoloured eyes, slowly passing through rainbow changes of blue, green and yellow to their original condition, were dearer to her than any professor's certificate of proficiency and irreproachable conduct. For, rightly or wrongly, to the old lady's thinking, college prizes and certificates of proficiency gave evidence of cleverness only, whereas the broken pate and the bruised face showed courage, and that moral quality she placed at the head of all manly virtues. I am inclined to believe that Miss Kate, while in attendance for a fortnight on John's sofa, felt more tenderly towards that young gentleman, had in reality a deeper respect for him, than she ever had before. She regarded him as in some sort a gallant soldier borne bleeding from the field of honour. While Jack was so attended, a policeman in another quarter of the town, who had no sofa to lie upon, was suffering from a dislocated shoulder and a couple of broken ribs, and of these injuries my young friend was in main part the author. Miss Kate did not know the condition of the poor Irishman; and even if she had known, I much fear she would not have expended much sympathy upon him.

Nor were occasional snowball riots and combats with policemen the only striking scenes to which the university introduced Jack. At Hawkhead, in common with the other Scottish universities, a Lord Rector fell to be elected every three years; and it was when my young friend had finished his course in arts, and was addressing himself to the study of law, that the election to this high and responsible office came round. The Hawkhead students were divided into two camps, Liberal and Conservative; and of the latter body—much moved thereto by the influence of Miss Kate—Jack became a zealous adherent. In the hands of these two parties the election lay, and both sought earnestly for a befitting and talented representative. Committees were held in various places during the day, midnight conclaves sat in the old class rooms, to the disgust of the worthy janitor, whose duty it was to turn off the gas and lock the door, after the heated young men had departed; and at last the camps had chosen their men: the Conservatives put forward William Wordsworth, the venerable poet; the choice of the Liberals fell on Lord Turniptop, a local nobleman of considerable wealth and influence. These candidates had no sooner been fixed upon, than the university corridors became alive with squib and satirical poem. The Conservatives grew witty on his lordship's agricultural tastes, and wished to know if the ancient university of Hawkhead had become a market-garden, and if guano had at last taken the place of the classics. The Liberals bespattered Wordsworth in the most handsome way, and reprinted certain well-known passages from the *Edinburgh Review*, and from Lord Byron's *Don Juan* and *Vision of Judgment*. As the day of election drew near, the rival committees held nightly meetings in the university, and listened to, and cheered to the echo, the most eloquent and inflammatory addresses. On one of these occasions, Jack appeared before the Conservative committee, with an elaborate essay on the genius of William Wordsworth, and the moral and political tendency of his writings, in his pocket, the reading of which, it was fondly hoped, would kindle the Conservatives to yet more fiery zeal in the good cause, and convert at once from the error of their ways what benighted Liberals might be present. Accompanied by the members of the Conservative club, Jack marched into the crowded class-room, and side by side with the chairman took his seat on the tribune, beneath the solitary gas lustre. The benches away into the gloom of distance were crowded with eager faces; and the entrance of the orator of the evening and his party was welcomed with a burst of welcoming Conservative cheers, through which ran a hollow bass of Liberal groans, portending tempest. In a few words the chairman opened the meeting, and then announced that Mr. John Hagart would favour them with an address. Amid a tremendous uproar, Jack got up, placed his MS. on the reading table before him, and began. The Liberal enemy, who were present in great numbers, were anxious to hear what my friend had to say, and so with but moderate interruption, he went on to pass a high eulogium on the immortal poet, "Who yet," I quote verbatim, "gilds the hills that gird Rydal Water, as by the solemn radiance of a setting star." Here uprose enthusiastic Conservative cheers, answered by satirical Liberal cachinnations. Put on his mettle by cheer and counter cheer, Jack proceeded to state that Wordsworth was in the highest and best sense a Conservative, "that he was Conservative not only through his judgment, but through his imagination and his reverential eye. To him," he went on, "the scar of ancient earthquake on Helvellyn, the ivies on Brougham Castle, the torn battle flags that hang in the chapel of the seventh Henry, are the sacredest things. In our present parliament he sees the Saxon Witenagemote—in the Speaker of the House, Alfred the Great." This flight being on the whole pretty well received, Jack proceeded to hold up to contempt "that ridiculously bedizened magpie of poetry, Lord Byron, who stole from Wordsworth, and at the same time abused him; who wrote heartless libels on the man whose shoe latchets he was unworthy to unloose, libels which, to the disgrace of a so-called Liberal committee, have been raked from their noisome resting-places, and been allowed to disgrace the walls of our venerable university." This arrow went home, and through the Conservative cheer was heard the Liberal yell of rage, while certain aggrieved individuals got upon benches and gesticulated unheard. Jack had by this time lashed himself into a noble indignation; with a flushed face he confronted his excited auditory, and in a voice which was heard clearly across the tumult, he shouted, "Libels, I repeat, which by their presence have disgraced the walls of this university! conduct more atrocious, more infamous——" Here a dissonant bray, as if a troup of wild asses had stationed itself in one of the corners of the room, drowned all lesser noise; and Jack's eloquence was brought to a stop. The tumult became tremendous, the braying continued, cat-calls and whistlings arose on all sides, and the floor was vigorously thumped by boot-heel and walking-stick. After a while some sort of quasi order was resumed, and Jack proceeded with his discourse. He was about to point out some of the more nice and recondite beauties of the poet he so much revered, when again, from out the distant corner, came the hideous bray. This noise was the noise of the Liberal enemy, and of course could not be endured. The chairman arose, and made imploring dumb show, but was for a while unsuccessful. By the time a lull came he had lost his temper, and taking advantage of it he called out, "Gentlemen, certain donkeys from the Liberal common [interruption], where they have been browsing on congenial food—Thistles and Turniptop, [hideous uproar] have found their way here. As on the placard calling this meeting, and affixed to the college walls, it was intimated that the presence of gentlemen was requested, the donkeys alluded to are palpably intruders; if these animals do not desist from the noises, which however natural to themselves, are just as naturally distasteful to us, it shall be my duty to have them forcibly extruded. And I call upon every gentleman present to support the chair." On the delivery of this speech, from the dark corner came a mightier chorus of braying than ever. The angry chairman glanced inquiringly around his committee; he read eager assent in their eyes; and at once they left the tribune, and clambering over and along the crowded benches, made their way to the distant corner, where sat the disturbers of the peace. In a short time from the dark corner proceeded the sound of personal conflict. Every one was now standing on desks and benches, to behold the tug of war, when all at once the gas was turned off, and confusion was worse confounded. In the darkness, Liberal was ignorant of Conservative, and Conservative could no longer vex Liberal; and in a quarter of an hour the excited young men were cooling themselves in the wintry moonlight as they dispersed through the college courts; and when they were all gone the janitor locked the class-room door, much pleased with the success of his *ruse*. Three days after it was announced in the Hawkhead newspapers that Lord Turniptop had been elected Lord Rector, by a large majority.

"Our institutions are in danger," the chairman of the Conservative club—who was the son of a respectable tallow-chandler—remarked to Jack, as on the day after the announcement of the election of Lord Turniptop, the young men walked towards the office of Messrs. Hook and Crook, where Jack had for some little time back been in possession of a desk. "Our institutions are in danger. The democratic tide is encroaching on all our ancient landmarks. The existence of church and state is imperilled; in a short time England will be no place for a gentleman to live in. *I'll* emigrate, for one." And disgusted by the election of the Liberal and agricultural Lord Turniptop, Jack also heaved a sigh over the departing greatness of his country.

During the years over which this chapter extends, the most eminent success attended the firm of Wedderburn Brothers and Hagart. Their business had increased wonderfully, the house was noted for the elegance of its designs, and in the best markets its shawls competed successfully with the choice productions of Norwich or Paris. Alfred still held a sixth share in the profits, but that sixth share had during recent years quadrupled in value. It was astonishing in how short a time he became familiar with prosperity: equally astonishing how that prosperity steadied him, how within the limits of severest common sense, it compressed the fluctuations of what Miss Kate called his "quicksilver brain." Hagart was a much more amusing person in evil fortune than in good—less amusing to an uninterested spectator, but more agreeable to live with, his wife thought with an occasional sigh for the old times. All the ancient, half-absurd, half-poetic vivacities—which sprang like wallflowers from the chinks of ruins—became curbed; the ancient perilous flightiness and eager vagaries of hope and desire, disappeared; and by comparison with his former self, he became staid, prudent, self-possessed, self-reliant. I have in my time read and heard certain praises of poverty, how in its chill air the hardier virtues bloom, but have always suspected those praises to be hollow and insincere. One noticeable fact is, that they are never written or spoken by poverty-stricken men, but always by men in tolerably comfortable circumstances. Men praise poverty, as the African worships Mumbo-Jumbo, from terror of the Malign Power, and a desire to propitiate it. To bring the best human qualities to anything like perfection, to fill them with the sweet juices of courtesy and charity, prosperity, or at all events a moderate amount of it, is required—just as sunshine is needed for the ripening of peaches and apricots. There are some natures that will take hurt from any condition of life; and the man that prosperity ripens into a spendthrift, is precisely the man that poverty would have soured into a churl. Resignation to the will of Heaven, say under the conditions of fell disease, is of all human virtues the most graceful: and, although he has many more pleasant things to leave, it is a virtue much more easily practised by the rich man than by the poor one. The rich consumptive patient has gone to Madeira; for the alleviation of his disease, he has procured the best medical skill, and transported himself to the balmiest of climates, but, in spite of all, he is told that his hour is rapidly approaching; and so, with the scent of oranges at his open window, and the long drowsy roll of the tropic surf in his ear, without a murmur he resigns himself to the decree, and awaits the end. Take the poor city clerk. He is told his lungs are deeply affected, and that his sole chance of life is a voyage to Madeira, and residence there; but on account of a scant purse, that voyage and that residence are sheer impossibilities; and so in a dim chamber, and with but a muslin screen slung across the window to save him from the insolent pertinacious curiosity of the houses across the way, his ear pierced with the cry of the passing costermonger, he lies unmurmuring, resigned, ready to live or die as the Lord will. Both are equally resigned; but which of the resignations is the more pleasant sight in the eyes of angels? Not that of the rich sufferer, with the scent of oranges at his open window, we may be sure. He is resigned after exhausting every chance of life; the other is resigned with one chance not yet exhausted, with one die not yet thrown, a chance which poverty prevents him from taking advantage of, a die which poverty prevents him from throwing. I know that rich men die perfectly resigned at Madeira and elsewhere: I know that poor city clerks die resignedly at home, with no finer element to respire than smoky London air. I know it is hard for the rich man to die, but how much harder for the clerk? especially how harder for *him* to die without a murmur—without a sigh for the unattainable! Let us all pray to be preserved from poverty.

Miss Kate McQuarrie was correct when she remarked that Alfred Hagart and a thousand a-year would accord admirably well. In the golden smile of guineas our friend became curiously sedate; prosperity did not in the least turn his head, for the reason perhaps that he was always expecting prosperity, that he regarded it as an estate of which he was the lawful heir, and on which sooner or later he would enter on possession. He exhibited nothing of the vulgar pride and self-glorification of the upstart; at the bottom of which lie surprise, wonderment, and unfamiliarity. All his life he was conscious that he deserved success; success had been long looked for, and when it came he was not in the slightest degree astonished. He came into it as a king comes into a throne from which he was long exiled, but which was his by right all the while. And of Hagart's prosperity the world soon had palpable evidence. A white marble monument in due time marked Katy's resting-place in the Greysleyan cemetery. He removed from his suburban residence to one of the best houses in the western outskirts of the little town, and in the new house Martha was not the only servant. Nay, more, about the time that Jack entered the office of Messrs. Hook and Crook, Hagart on one of the western Greysleyan hills was rearing a new and elegant villa, with spacious dining-room and drawing-room; a lot of sleeping apartments, a library, with a deeply recessed window filled with stained glass, so that on Sunday afternoons when he read Sir Thomas Browne's *Urn Burial*, or Jeremy Taylor's *Holy Living and Dying*, the coloured light would suffuse the page; a far-out looking tower, which gave a noble view of Greysley in its smoke below, the Hawkhead river journeying to the sea, and occasionally, when a sunbeam came out, a glimpse of Hawkhead itself, with dwindled spires and chimney stalks against the ashy distance. Hagart had a taste. If Duke of Devonshire he would have created Chatsworth. And before the door there were sloping terraces; out from one wing of the house projected an airy conservatory filled with flowers, in the hues of which he took immense delight; and behind were gardens, with southern-looking walls, against which fruit-trees were trained. In all these things Hagart took much delight,—most of all, I think, in reading Sir Thomas Browne in the recessed window of the library while the glass hued his page. "Sir Thomas Browne, Lord Bacon, Jeremy Taylor, and those old stately-sentenced writers," he said to me as we sat over our wine in the new dining-room after dinner, "should always be read with some little ceremony. One should dress before reading them, just as one dresses for dinner. That's the reason I like to read them when the sun is shining on the stained glass in the library. To my mind the richly-solemn colour suits the richly-solemn thought. The peal of the organ should accompany the rolling periods." Prosperity, as I have said, improved Hagart much. He became a changed man, to a great extent. In the early days he was like a bare tapestry: in the days of which I write he was like a tapestry covered all over with brave devices. Prosperity brought out his latent tastes, just as fire brings out writings in sympathetic ink. So far as my observation went, Mrs. Hagart did not develope much in the burst of sunshine. She was then, as I had ever known her, affectionate, gentle, tender, true, mistress of the kindliest eye, mistress of the softest voice. She liked to talk to me about the old time, the old hardships, the old house; she would laugh pleasantly over her husband's brilliant schemes; could even poke a little fun at the Central America notion; but in her heart, I rather suspect, there was a constant ache and void. The little child which had gone out from her on the wintry day had never been forgotten, and I fancy now never will. One thing occasionally struck me as curious, and that was, that these good people expressed at no time any desire to have Jack back again from Aunt Kate. They saw him frequently, of course; once a month or so he spent a night with them, and turned the windows in the far-out looking tower into a smoking room; and then they occasionally in return visited him at Mortimer Street. That Mrs. Hagart should have been content to allow her son to remain with Miss McQuarrie was perhaps not to be wondered at;—but Hagart? He objected to the project when as a poor man it was first mooted to him; and now, when he had become a rich man comparatively, he was content to let things remain as they were. The truth is, that although he did not know, and perhaps never would know, how deep was his debt, he had come to like Miss Kate and to feel grateful to her. The boy was contented in Hawkhead, and why should he interfere with that contentment? Besides, as I suspect is always the case with natures fine at the core, success had made Hagart humble. He had drunk the champagne of prosperity, and on him it had a sedative influence. He was no longer flighty and self-assertive, and he no longer indulged in curious outflamings of personal dignity. What was the use now? When you have won your battle you naturally lay down your arms. When you have presented your little bill to Fate, and she has paid you to the uttermost farthing, you are not in the least inclined to repine. When the world takes a man at his own valuation, the man does not grumble.

CHAPTER XXIV.

During the year over which the last chapter extended, the McQuarrie girls were frequently in Hawkhead; for three or four winters they were in attendance on the fashionable educational institutions, and subsequently they made flying visits to the city, either resident at Cuchullin Lodge or Mortimer Street for the time being; so that at the period of this present writing, John Hagart was on terms of entire intimacy with his cousins, more particularly with Miss Maggie. So far had this cousinly intimacy extended, that when Miss Maggie was at Hawkhead, John was as often in her company as he could possibly contrive; and when in summer the girls returned to Uanvohr, with Miss Maggie, John carried on a somewhat voluminous correspondence. John's letters were filled with satirical descriptions of the evening parties he attended, of Hawkhead belles and beaux, of Miss Kate, of the office of Messrs. Hook and Crook, and the like. Miss Maggie's—for that young lady gave him letter for letter with the most methodical punctuality—expressed the deepest interest in these matters, echoed and reflected them; and were full, besides, of the unexciting incidents of rural life, and always brought with them—to John's sense, at least—the smell of the Uanvohr birches. This correspondence had opened accidentally—that is to say, when the young people parted they had come under no covenant to correspond—but one letter had drawn on another, till at last, on both sides, the habit had been fairly formed, and could not be broken now without positive pain and regret. In John's writing-desk there had accumulated two or three packets of Miss Maggie's letters, full of pleasant trifling; and to the post night which would bring him another he always looked forward with interest. Was John in love with his pretty cousin? If he had asked that question of himself, he would have answered by a decided negative. He would have pled guilty to liking: not guilty to love. But liking is love in bud. He was in love; but he was unconscious of it—as most quiet equable natures are for a while. You have walked out at early morning before the sun has visibly risen, and in the cool beamless light seen every object preternaturally clear, passionlessly distinct; and you have fancied in the strange distinctness of objects and in the perfection of coolness and silence that the world is waiting for something,—that the guard of honour has assembled, but that the king has not entered an appearance,—and before this conceit has had time to form itself in your brain, like one red-faced with haste, up bounces the sun, and the far-off hills, so coldly distinct a moment before, lose outline in a flush of heavenly roses, and the stream is covered with patines of fine gold, and the white cloud reddens passionately like a cheek, and beneath it the lark sings in rapture; and the cool emotionless atmosphere is all at once pierced with the arrows of sun-fire, and the dumb colourless dawn has passed into a vocal morn, glittering with all the hues of the humming-bird. There is the progress of the passion in image. John Hagart was in the dawn state when he was writing and receiving the letters: he was passively in love: but the time was coming when that love would become active; when he would become *conscious* that he was in love, and when that consciousness would transfigure the ideal world for him, just as the rising of the sun transfigures the material one. We can all remember such immortal moments. If we do not, we have not drunk the wine of life with the foam on.

With the contents of the majority of the letters accumulating in John Hagart's writing-desk we have no concern, and so let them lie in their own sweetness; but with *one* of Miss Maggie's epistles, received about this time, we have such intimate concern that I shall print it at length. It was received on a Wednesday night; and before he went to bed, John perused it and reperused it at least a dozen times. Here it is:

"Uanvohr, *Thursday.*

"My dear Cousin,—I received your letter at three o'clock this morning and read it in bed. The boy who was sent to —— with the post-bag lost his way coming home across the hills, and so was several hours late. I was very disconsolate at the non-arrival of the messenger, and went to bed as one goes on a wet night, perfectly certain that when one awakes the morning will be sunny. I knew that I would have your letter in the morning at any rate. When the boy came, Mary, who knew what I was expecting, brought it up to my room at once.

I was very glad to get it, although I was wakened out of my sleep, and had to read it by my bed-room candle.

"And so you thought Miss Kate Stavert looked very well when you met her at the Flower Show! She must have improved since I saw her last. I admit she has a nice figure, but she has not a regular feature in her whole face. She is a pleasant good-tempered girl enough, but not one of my beauties. Didn't you think her pink parasol rather showy? But that is the fault of the Hawkhead ladies; they all dress like dahlias, hollyhocks, and tiger-lilies.

"However, I shall soon see Miss Kate Stavert, and be able to judge for myself. And this brings me to the first part of my news. Papa had a letter from Mr. Stavert the other day, to the effect that we—that is Oona and I—must be very dull at Uanvohr just now, and closing with an invitation to us to spend a month at Cuchullin Lodge. Wasn't it very nice and kind of him to remember us in our desolate estate? Papa will, I expect, allow us to go south in a week or two. I shall be very glad for one. I shall be glad to have another old-fashioned tea at Mortimer Street with dear old aunt. I hope her cold is better. Has she finished her sampler yet? When I come I shall see whether you have improved in your dancing since last winter. Can you accomplish a galop yet without stumbling, or go through a waltz without getting giddy? When I come I'll put you through your dancing paces.

"And now for my second bit of news, which is serious. I wrote you, I think, two or three letters back, that we had heard some strange reports about Mr. Willoughby's extravagances and wild conduct before he came to live near us at the foot of Marsco. Oona would not listen to these reports, and declared that she could instinctively pick out what nobleness there was in a man; and that she was satisfied that whatever might have been Mr. Willoughby's early follies, he was good and honourable at the core. Papa, however, was not so entirely satisfied, and rode over to Marsco House. Mr. Willoughby at once admitted that the reports which had been circulated about him were quite true; he confessed that he had been very foolish; that he had gambled a little, and dissipated a good deal; but that he was now entirely reformed, and that, by God's blessing, he would continue so to the end. Papa came home, had a long conference with Oona, and in a day or two thereafter the engagement was formally concluded,—only it was arranged that the marriage will not take place for a year, Henry to be on his good behaviour during that time.

"A week or two ago he came over to Uanvohr, and I saw a lover for the first time in my life. What a handsome one he was!—tall (a good head and shoulders higher than you), light-haired, blue-eyed, and with a step which makes you think that he had always walked on ground he could call his own. He was extremely gallant, and devoted himself entirely to us—actually helping us to pluck gooseberries and to plant saplings. He was of course especially attentive to Oona—every look was a declaration of love, every word homage; and of course she was very proud to lead about such a lion in a silken leash. But with all his quiet tones and manners, I suspect there is a hidden fierceness in him. There is a smouldering fire in his eye, which the slightest affront would poke into flame. If you had just seen him the day Oona's horse bolted! It is this sheathed fierceness which is the great attraction to Miss Oona, for she has not a little of it herself. I believe he would fear no man, and would be tender to any child or woman.

"Just a week ago to-night I had gone to bed, feeling tired, leaving Oona busy with a book downstairs. I do not know how long I had slept, when I was roused by the shutting of the door of my room. I started up, and there was Oona standing in the middle of the floor with a bed-room candle in her hand, her hair loose about her shoulders, and her face like a ghost's. She laid down the light on the table, and flung herself face downwards on the bed-clothes. I was nearly frightened out of my wits, and called out, 'What is the matter? what has happened, Oona?' She then got up, threw her arms around me, and began to cry. 'Oh, Maggie, my heart is broken! Henry was drinking at the Narrowkyle market to-day, and has been fighting with a drover—as if he were no better than a drover himself. He promised me on his honour as a gentleman that he would be wild and reckless no more. I am degraded, Maggie; he holds me in little esteem. He does not love me; he never could have loved me.' 'Who told you, Oona?' 'The men have just come home from the market, and Effie heard them talking about it'—(Effie is Oona's foster-mother, you must know, and loves her as her own child)—'the fight between the drover and the gentleman was in everybody's mouth. Effie could not rest after she had heard the news, and so she came wandering about the house; and seeing by the light in the window that I had not yet gone to bed, she tapped on the pane, and then I got up quietly and let her in. Effie told me all about it.' 'But perhaps, Oona, the story may not be true; or it may be grossly exaggerated.' 'It *is* true, it must be true,' cried she, withdrawing her arms, rising up to her full height, and stamping her foot. 'I'll pluck him out of my heart, although I should pluck out my life with him. False, cruel, cowardly. He has dragged my name through the mire. People will point the finger at me, and—and will pity me, pity *me*.' And then she burst into crying again, and began marching up and down the room like a wild thing, and wringing her hands. I cried, too; and not knowing what to say or do, just watched her marching up and down, when she suddenly stopped and came towards me with a perfectly calm face with a smile upon it. 'Don't cry, dear; it's not worth crying about. I am sorry I have vexed you. It's all over.' Then she kissed me just as she used to do, bade me good-night, and, taking up the candle, was gone in a moment. When she left me my brain was in a terrible whirl, and I did not sleep a wink all night.

"Next morning Oona went to papa and told him her story, and insisted that the engagement should be broken off at once. Papa—who did not think knocking down a drover at a fair such a mighty crime, particularly if the drover was insolent—demurred, but Oona was peremptory; and so, after a good deal of argumentation, a letter bearing Oona's decision was despatched to Mr. Willoughby at Marsco House. I suspect when he received it the poor young man was a good deal surprised, because next morning, a little after breakfast, he came across the loch in his boat to make explanations. He was closeted with papa and Oona for a long time. What was said I don't know, but when he was going away—it happened that I was crossing the landing on the stair above at the time—I heard him say, 'I must accept your decision, of course, Miss McQuarrie; but if you had ever loved me, you would not be so cruel.' 'Pardon me, Mr. Willoughby; if I had *not* loved you, I would not have been so cruel, as you call it. It is my love which has placed the barrier between us.' That was all I heard, and it was a peep of light into the interior of Oona's heart. I could not love a man so intensely as she, and I suppose for that very reason I would be more soft-hearted towards him.

"Oona told me in the course of the day that the engagement was entirely broken off, although Henry had not been drinking at the market as she had been told, and had received provocation before he struck. And she requested that the subject should never more be mentioned between us. Of course I shall obey. But I think that Oona likes to talk about it all the same, and that she goes down to Effie's hut to talk.

"So now my long letter is brought to a close. I dont know whether it was worth my while to write with so much particularity, as the affair is making a great noise in the country, and some rumour of it will be sure to reach Hawkhead before we arrive there. But I have told you the truth.

"Believe me,
"Your affectionate Cousin,
"MAGGIE."

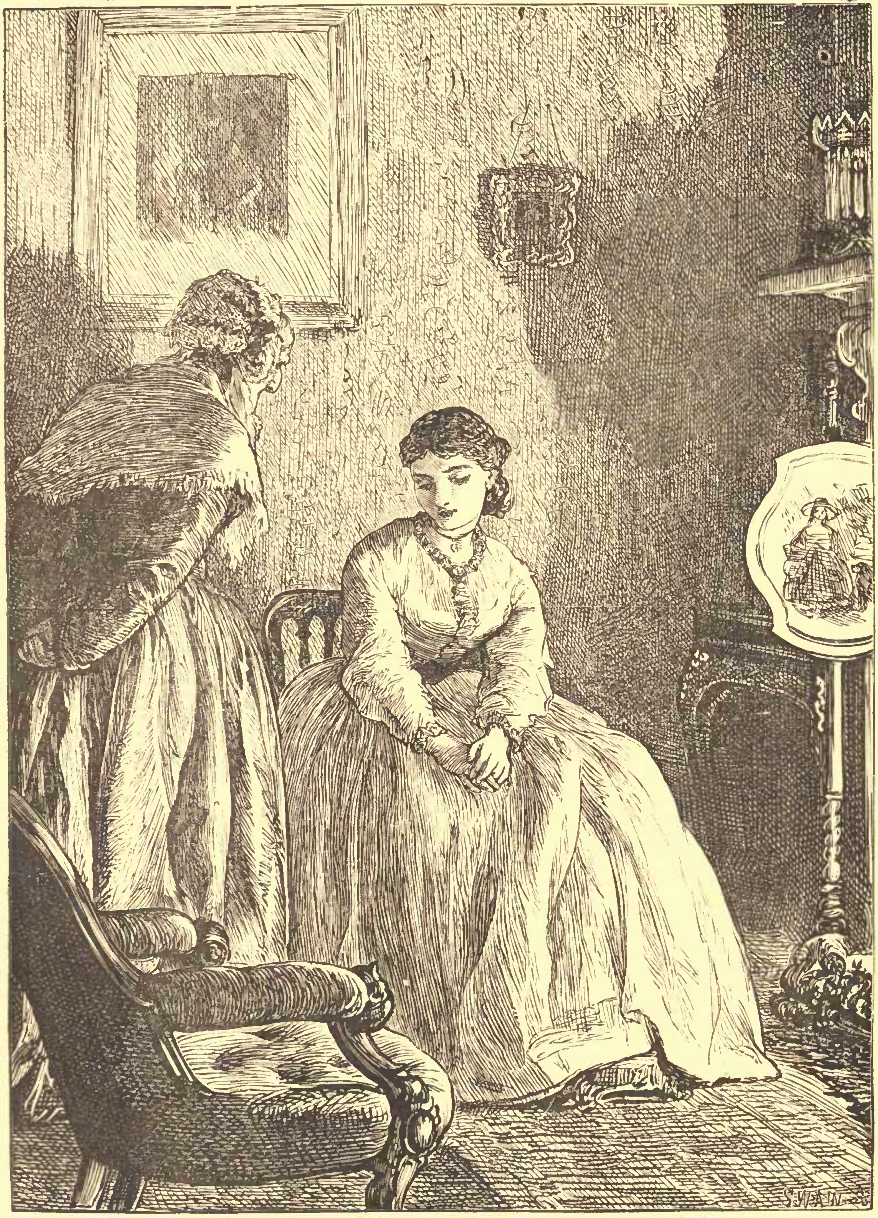
This was an unwonted epistolary effort on the part of Miss Maggie, and John Hagart perused and reperused it with no inconsiderable puzzlement. The reader will have noticed the abrupt manner in which Mr. Willoughby's name is introduced, and that abruptness was felt by John as well. And the odd thing was that it should be so, because incidental mention of that gentleman had been made in certain of Maggie's foregoing epistles; but then his name had always been mentioned in connection with Oona, and in the affairs of Oona John had only a secondary interest. What interested him in Maggie's letters was Maggie herself. Now however that Mr. Willoughby had become interesting to Maggie on her sister's account, he had become of interest to John also; and so, to make himself aware of the entire state of the case, he went to his writing desk, took out a roll of the Uanvohr Correspondence, and doubled back upon it, seeking information concerning Miss Oona's discarded lover. The information thus obtained gathered from sentences scattered here and there, may be briefly summarised. Henry Willoughby was descended of a good old English stock, and rich withal. He was born in India, where both his parents died when he was nine years of age. He was then sent to England and placed under guardians; at the university he was regarded as clever, but could never betake himself to regular work: then he boated, wined, and hunted. Coming up to London with some vague idea of reading law, he made ducks and drakes of a considerable portion of his money. This was the worst part of his career. He pulled up; went down to the Western Islands in company with a friend to slaughter grouse; came to Skye, became interested in sheep-farming, found Marsco House and Farm for sale, purchased it, and established himself. At the house of a neighbour who had assembled Christmas guests he met Miss Oona McQuarrie and fell in love with her. Of course exaggerated rumours of his London career followed him to his Hebridean retreat; and having gathered all this from the letters before him, John could see at a glance why, as a prudent father, Hector McQuarrie, before he would consent to his daughter's marriage, stipulated that Henry Willoughby should undergo a year's probation; and equally clearly could he understand how a proud girl like Oona should revolt at her engaged lover brawling at a cattle market, and how she should wince at such brawling becoming the talk of the country. Henry had been reckless before he had seen and loved her; must not that recklessness be deeply seated when it had broken out in such a flagrant manner after he had done both, and when its suppression was the condition under which happiness was alone possible? Before he went to bed, John had the whole circumstances of the case before him, and had he been asked, could have given a lawyerly opinion thereupon.

As Maggie surmised, rumours of the breaking off of the engagement, and of the circumstances which led thereto, were not long in reaching Hawkhead. One day at dinner John was somewhat startled by Miss Kate suddenly saying to him,

"And so Miss Oona's engagement with Mr. Willoughby is broken off!"

"Yes, so I hear," said her nephew, cautiously—not liking to venture far on the perilous topic.

"I am very glad the girls are coming shortly, I must have a little talk with Oona. She must beware of pride. It's a cruel deity, and to propitiate it, we often sacrifice our dearest and best."



"DON'T ASK ANY QUESTIONS. THE SUBJECT IS VERY PAINFUL."

Page 809.

CHAPTER XXV.

THE McQuarrie girls arrived at Cuchullin Lodge in due course; and one evening they came to Mortimer Street, bearing to John Hagart an invitation from Mrs. Stavert to assist at a little dance on Tuesday evening of the following week. John was delighted with the invitation, and accepted it gladly. He was still more delighted with the bearers of the invitation. Over his cousins the years had passed, making changes. Oona was not a whit taller than when John saw her first at Mortimer Street on the evening she made so much fun of M. Lessels, her French teacher—in truth, she did not seem so tall as when on that often-remembered evening she rose upon him with her dark eyes; but she was woman grown now, and beautiful, although of no common type. There was still the same strange foreign kind of ring in the silver of her speech; her eyes, which all along John had supposed to be black, were deep blue and lashed with darkness; her cheeks had that serious roundness and fulness that we see on antique casts and gems; and down on a broad, low forehead came the black-blue hair in natural ripples. Her face was open candour and truthfulness itself. The greatest liar looking into her eyes could not help being veracious for once. And she had a fine figure, whose graceful, unconstrained, unsolicited undulations while walking or dancing were akin to the wavings of the breeze-bent birches of Marsco. By a natural instinct of taste she preferred white dresses, the pallor of the garment bringing out in keenest relief of contrast the darkness of eyes and hair. In appearance Maggie was as different from Oona as it was possible for a sister to be. She was several years younger, to begin with, and was not nearly so tall. Her hair was brown, her eyes were dove-like; she had the prettiest little rosebud of a mouth, around which smiles were continually hovering like bees; and above all, she had the pleasantest, most heart-felt, most musical cackle of a laugh, which reminded you irresistibly of the flickering of sunshine on the surface of a stony brook. Maggie laughed often, and had she been a coquette it might have been suspected that she used her laugh as other beauties use their eyes. She was a general favourite, for in her manner there was a clinging, appealing, deferential something which flattered you and made you like her at once. She clung around you, and climbed into your favour, convolvulus-like—with beauty of blossom and touch of fairy tendril. The girls were to remain at Mortimer Street that night; John could see Oona, could hear Maggie laugh—and laughter came as natural to her as fragrance came to a flower—and was consequently as happy as a king.

In the course of the evening, while John was initiating Maggie into the mysteries of chess, Miss Kate, who all the time had been watching her opportunity, approached Oona. "Come into my own room, my dear; I have something very special to say to you." And with that she led the way.

They had no sooner got into the room, in which a comfortable fire was burning, than Miss Kate turned suddenly round. "I wish you to tell me, my dear, about your engagement with Mr. Willoughby, and the reason it has been broken off."

In a moment the serious pale face became all one pained rose. "Oh, don't ask me, aunt," cried the young lady. "I did not expect you would have known anything about it, else I would not have come. Don't ask any questions. The subject is very painful."

"I *have* heard about it, and you may be certain that other people have heard as well. I know the subject is painful, but the pain I inflict to-night may prevent a greater pain years hence. You love this man, Henry Willoughby?"

After a little pause Miss Oona said "I did."

"Which with a girl like you means 'I do.' Very well. And is this man whom you say you 'did love,' and whom I think you do love, a gentleman? You know what I mean by the term—something more than a handsome face, something deeper than a well-filled purse. Is he?"

Miss Oona, who had so much to say against her lover, was extremely glad to have the opportunity of saying something in his favour, and so she answered with pleased emphasis, "He is. As true a gentleman, I believe, as ever breathed; only— " and here the voice broke a little.

"Only what?" asked Miss Kate, coming down upon her niece at once.

"He deceived me." faltered Miss Oona.

"And did this 'as true a gentleman as ever breathed' deceive the girl whom he professed to love?" was the quick rejoinder. "There seems a screw loose there. Something like a contradiction in terms."

"But you don't understand me quite. That's not what I mean."

"Then what *do* you mean?"

Miss Oona, thus driven to the wall, was forced to make the statement which all the while she had been striving to avoid. "I knew, papa knew," she proceeded, "that Mr. Willoughby before he came to reside in our neighbourhood, and before I knew him, had led an irregular life—nothing dishonourable, perhaps, to be laid to his charge, but at the same time a life erratic, fruitless, wild. All this he promised to reform; and papa would not allow the marriage to take place till the expiry of a year, so that the sincerity of his reformation might be tested. To these terms he consented, and the next thing I heard, aunt,"—here the young lady spoke quick and flushed all over with indignation,—"was that Mr. Willoughby had gone to the market at Narrowkyle, had sat drinking in the booths there with men of low birth and no education, and that finally he got into a disgraceful brawl with an insolent drover and knocked him down; all this while he knew the terms of our engagement and the reason why such terms had been imposed,—and in a public place, too, where people knew the relation in which we stood to each other. I at once insisted on the engagement being cancelled. Mr. Willoughby had flagrantly broken his part of the compact, and I was no longer bound to stand to mine. Look to what he has exposed me! The people are talking about me. My name is as familiar in their mouths as their tobacco."

It was all out now. The whole case was laid before Miss Kate.

That old lady listened with much patience. "Now, Oona," she said, "I wish to ask you one or two questions. Was Mr. Willoughby really drinking in the booths at Narrowkyle?—was he to any appreciable extent the worse of liquor?"

"He says he was not."

"And do you believe him?"

"I do. But he had no right to be in the drinking booth at all. That was not the place for him."

"Perhaps he was engaged in the study of character, my dear," said the old lady, with a slight smile. "The charge of intoxication, if ever made, must be given up. And now about the drover. He was insolent, I think you said?"

"Brutally insolent, I am told, and insolent because a man of immense power, and who thought he could take what liberty he pleased. He insulted Henry, and Henry knocked him down."

"And upon my word I honour Henry, as you call him, for it," said the old lady, as she rose and marched up and down the room. "Do you mean to tell me, girl," she went on, turning suddenly to her niece, "that you would wish the man you love to have acted differently under the circumstances? Would you vow to love, honour, and obey a man who fears another, whether that other be drover or king? If you do, the blood that flows in your veins is not mine."

"But then, aunt, you must admit that it was an unfortunate occurrence. If Mr. Willoughby's life had been blameless previously it would not have been so bad; as it is, it seems as if bad habits had taken such possession of him, that even for my sake he cannot forego them."

"I don't think it a bad habit to knock down the man who insults you," said the old lady.

"If Henry had been prudent he would not have allowed himself to be involved in any brawl, he should have taken care to have preserved my name from the mouths of the common people."

"Then it seems to me, that you would have been better pleased if instead of Henry knocking down the drover, the drover had knocked down Henry. *That* piece of news would have come to you like a bouquet, I suppose. *That* would have been a nice thing in the mouths of the common people. But who cares about the people? If you marry Mr. Willoughby, you will marry him to please yourself, not to please them. The common people have a great deal too much to say now-a-days."

Notwithstanding her bold front, Miss Oona was not fighting for victory. Her heart was all the while on the side of the enemy, and she was secretly pleased with Miss Kate's vigorous onslaughts. It would not do, however, to show any signs of yielding, and so she said:

"You are a skilful advocate, aunt, and have driven me from several of my positions, but I don't admit I am beaten. I can't argue with you, and I don't think that this is a case that can be decided by argument. I feel *here* that Mr. Willoughby has acted wrongly, imprudently, selfishly"—and as she spoke, the young lady placed her hand upon her heart.

"If you fall back on your heart I have nothing further to say. Over that slippery ground I can't follow you. I dare say, in all matters of this kind, instinct is your best guide. I will admit, if it pleases you, that Mr. Willoughby has acted foolishly, but because he has done so, is it necessary that you should act in a manner yet more foolish? Don't peril the happiness of a lifetime on a pique. Pride's chickens have bonny feathers, but they are an expensive brood to rear,—they eat up everything, and are always lean when brought to market. On such a matter I can speak with authority. A man who has been fifty years in his grave I loved once, and I quarrelled with him as you are about to quarrel with Mr. Willoughby. He is dust long ago, which the winds have blown hither and thither. Look at me! Don't cry, Oona. I shan't say another word. I shall leave the matter in your own hands. I wished to speak with you, and I have done it. And now, when you have wiped your eyes, we will join Maggie and John in the other room."

And so the interview was brought to a close.

CHAPTER XXVI.

THE little dance at Cuchullin Lodge came off on the Tuesday evening specified, and to ensure its success, the entire resources of the Cuchullin household were laid under contribution. In the drawing-room, sundry frowning carved cabinets of oak were removed, and a hundred knick-knacks stowed away beyond the whisk of tempestuous dresses. The door of the apartment was taken off and the entrance looped up with white curtains, the floor was waxed, forms covered with red cloth were ranged along the walls, and a seat near the door was reserved for the use of the musicians. Mrs. Stavert, with her best smile on, and glowing in purple silk, received her guests beneath the temporary canopy of white curtains, while her two youngest daughters from fancy baskets handed each on entrance a programme of the proceedings, at the top of which was emblazoned in silver the battle-axe of the Staverts, and to which was attached a tiny pencil by a bit of blue ribbon. Behind the lady of the house, stood Mr. Stavert and his sons, clad in full highland costume; and still further back, just beneath the lights, in a loving sisterly group, stood the McQuarrie girls, and Miss Flora and Miss Kate Stavert. Mrs. Stavert had stood beneath her canopy for a considerable time, and still carriage wheels were heard on the gravel outside, and still, with their names shouted before them, her friends came flowing in. About ten o'clock, there was a cessation in the number of arrivals, the musicians seized their instruments, and a quadrille was formed. Gallantly to the head of the room Sir Peter McCalico led Mrs. Stavert, gallantly to the foot of the room Mr. Stavert led Lady McCalico, and the dancing began. The first dance was ceremonious, and composed to a considerable extent of the elder people. When it was over, the elders retired from active duty. Mr. Stavert retired with a friend into the depth of one of the windows. Mrs. Stavert sat at the foot of the room near the door while the dance proceeded, and when it was done she fluttered about, providing partners for unappreciated damsels and solitary young men. The obese knight, his unwonted exertions over, leaned his elbow on the mantelpiece, talked of the variations of stock, and began to marvel at what hour supper would be served, and if it would be his fate to carve the turkey.

Dancing had continued for some little time before John Hagart reached Cuchullin Lodge. Making his way across the floor of waltzers—in the whirling maze he noticed the waving tartans of Torquil and Norman—he reached the side of Mrs. Stavert, and was pleasantly rallied by that lady for his dilatoriness. "Young men are so different since I remember. When I was a girl, a young man would have looked forward to an evening like this for a whole fortnight, and would have been punctual to a moment—just as if the party had been a dinner one. I can't guess what can be the reason. I am sure the girls are as pretty and as sweet-tempered as those your father used to dance with."

"I suppose they are," said John, "but I could not help being late. The truth is, we have been busy in the office lately, and I had an important paper to draw up, and got it finished only an hour ago. I came as soon as ever I could, you may be sure."

"Business of course must be attended to before everything, and I am glad you are so devoted to it. 'The hand of the diligent maketh rich,' you know. Kate, my love, you have not seen Mr. Hagart!"

Miss Kate to all appearance had not seen John, but at the maternal voice she came forward with a smile. At the moment she was without a partner, and she and John were whirling amongst the waltzers immediately—a course of conduct on John's part which Mrs. Stavert witnessed with much satisfaction and inward approval.

When the dance was concluded, and Miss Kate conducted to a seat, John Hagart, amid the general buzz of conversation and laughter, sought out his friends. From the arm of a rising young Hawkhead doctor, Miss Flora Stavert bowed as he passed and graciously extended her hand. He noticed Miss Oona in a distant corner of the room in close conversation with Torquil. He was lucky enough to catch Miss Maggie's eye; and that young lady, bowing to a young gentleman who wore an eye-glass, withdrew her hand from his arm, and came forward with the frankest greeting:

"Dear me, John, what has kept you? I have been looking for you all the evening."

"I had a tiresome paper to write at the office, and had to finish it before I left. I was engaged besides with some private business, which may turn out a good thing for me after a little. Mr. Crook, one of our partners, has become infirm of late years, and it has been arranged to-day that I shall take over all his work, and become his successor in the firm. So you see I have been busy, and in luck to boot. I hope you have been enjoying yourself?"

"But indifferently. Mrs. Stavert paired me off with a dreadfully tall young man with an eye-glass, who dances, as he says, from a sense of duty. I hate eye-glasses in general, and that young gentleman's in particular. It looked down upon me like the open mouth of a cannon from a castle parapet." And here Miss Maggie shook her head, and wrinkled her forehead into a pretty look of comic horror.

"Well then, seeing you have now secured a partner to your liking, may I have the pleasure of the next dance with you? What is it to be?" And John began to consult the card which hung at his button-hole.

Miss Maggie held up hers. "The next four dances are round ones, and you see I have written myself down as engaged to you for them all. I wish to see what improvement you have made. You danced very nicely with Kate Stavert a little ago."

"I am glad to hear it. I trust I shan't forfeit your good opinion. Now then." And to the music Miss Maggie and John spun away among the whirling figures.

Although not at all a dancing man, John enjoyed himself extremely that evening. The music was good, the floor was good, and Miss Maggie was charming. He danced better than he ever danced before in his life, and his partner was profuse in her compliments. He was almost tempted to consider himself a man of wit, for at his gay remarks Miss Maggie broke into low musical laughter—very delightful to his ear and to his vanity.

Three of the four dances had been danced, and while the pair were waiting for the music to strike up for the fourth, Mrs. Stavert came sailing up to them with a gentleman of no particular age in her wake. "Mr. Wardour desires the pleasure of dancing the next dance with you, Maggie," she said with her blandest smile.

"But I am engaged to Mr. Hagart for the next dance," said Maggie, in a slight tone of alarm.

"But you can't dance with Mr. Hagart all night, my dear. Dancing engagements are not binding between near relations. Mr. Hagart and you are cousins, and you can dance with him any time you choose. You must sacrifice your own private inclinations to the general benefit. Miss Maggie McQuarrie, Mr. Wardour!"

Miss Maggie curtsied, Mr. Wardour bowed and muttered an inaudible something, then he extended his arm, and Miss Maggie, placing her hand on it, was led away.

"Kate, my darling," cried Mrs. Stavert, "you must really take pity on Mr. Hagart. He is without a partner and looks so solitary and woe-begone. You must really take pity on him." And John putting the best face he could on the matter, marched off with Miss Kate Stavert. And I am certain that, during the dance that followed, Miss Kate thought John Hagart the stupidest young man in the room, and the gentleman of uncertain age Miss Maggie the most chilling and inaccessible of young ladies.

When supper time came Stavert emerged from the shadow of the window, gave his arm to Lady McCalico, and carried her downstairs, the company pairing off as inclination or the exigencies of dancing directed, and the rear being brought up by Mrs. Stavert and Sir Peter McCalico. When the last gentleman was seated, he found himself in the immediate proximity of the turkey, and as there was considerable demand for that noble fowl, it irked him that he had to send away all the more favourite and succulent slices. Greatness has its drawbacks. It is a pleasant thing to be the first man in a company,—not so pleasant to have an appetite and to be carver in general for the company. Sir Peter McCalico had to carve the turkey not for himself but for others. Such had been his hard fate at almost every supper table during that winter and spring. Over this bitter destiny the obese knight sighed. It was the fly in the ointment of his social greatness.

At the supper table the elders tarried, and the younger people went up-stairs to resume dancing, and the dancing was conducted with so much spirit that the room soon became hot, and the second drawing-room was thrown open in which tired dancers might promenade. Torquil had devoted himself in the most unmistakeable manner to Miss Oona McQuarrie during the whole of the evening, and in this withdrawing-room, watching a favourable opportunity, he made formal proffer of his hand and heart. This interesting event was preconcerted. The Staverts, like the Czars of Russia, had a family policy, and this policy Torquil was carrying out. Some hint of the misunderstanding between Miss Oona and Mr. Willoughby had reached the ears of the dwellers in Cuchullin Lodge, and it was resolved by the family that a blow should be struck at once. And in accordance with family arrangements Torquil struck the blow, but he struck it in all sincerity too, and with the most anxious desire that it should succeed.

Although Miss Oona was thunderstricken for a moment, she was disposed to treat the matter lightly. "You foolish boy," she said, "you must go and dance with some one else. There are plenty of pretty girls in the room, and one face will obliterate the other. You know I am three years older than you, and I look upon you as a very young man indeed. Had I not done so, I would not have accepted your constant attentions to-night."

"But no new face will ever make me forget yours, Miss Oona"—

"Nonsense. The love that is born in an hour will not outlive the hour. Choose another partner, and the love you have danced yourself into, you can easily dance yourself out of."

"But my love for you has not been born in an hour"—Torquil would have said more, but the rustle and talk of the elder people coming up-stairs was distinctly heard, and Oona was more than ever anxious to have the interview brought to a close.

"Now, Torquil, this must be brought to an end, and I daresay to-morrow you will think yourself very foolish. Take me into the drawing room, and don't make a goose of yourself and of me. The people have come up-stairs, and may be here immediately."

The pain that passed into the lad's face gave him a look of dignity. "Let us go," he said, "I would rather die than compromise you in the least."

Oona turned round on him at once, and placed both her hands on his arm: "Torquil, are you in earnest? Am I to understand that—that you are sincere in what you have said?"

A flame of hope rose in Torquil's countenance, not so much at the words as at the concerned tone in which the words were spoken. "I am perfectly sincere, Oona, and it pains me much that you doubt my sincerity. I have loved you for long, ever since you came from Uanvohr almost, but I never loved you so much as I do to-night. Do you believe me?"

"I am very, very sorry, Torquil, and I heartily beg your pardon if I have said anything that may have hurt you. But I must deal honestly with you. I cannot return this affection: it is utterly beyond my power. This answer is final, and you must accept it as final. I am sorry for the pain I cause you, but the pain will soon be got over, I hope; and if it cannot be got over, it must just be borne. We must all do that. I trust you understand me, and that you believe the words I say are as painful to me as they can be to you. Shall we go, now?"

A loud clapping of hands came from the dancing-room, but Torquil did not hear. He bowed silently to his fate; and when they passed through the curtains to the dancing-room, Miss Oona felt that the eye of Mrs. Stavert was fixed upon the pair.

The faces of both told tales; and the scrutinising eye lingered on them, and made its own silent comments. Happily, however, they could not have entered at a better time for avoiding general observation. As they came in they became witnesses of a great sight, and one which fully explained the burst of hand-clapping which Oona had heard a minute or two previously. A couple of broadswords lay crossed on the waxed floor, and around them, to appropriate music, with one hand gracefully reposing on his haunch, the other high in air, Mr. Stavert, slightly excited by supper, was performing Gillie Callum to the delight of the whole room, with the one or two exceptions that may be imagined. Stavert was devoted to the customs and garb of the Gael; he had a shapely limb, and on his performance of the sword-dance he especially prided himself. Nimbly he footed it around the glittering blade-points and the basket-handles. Now he penetrated for a moment into the perilous spaces described by the weapons, and then he backed out and danced round and round in a solemn manner. Then the music quickened; and with body slightly curved, one hand still on his haunch, the other still in air, he advanced boldly on the sword-blades; now his shoe-buckles flashed in front of them, now behind, now on the right side, now on the left, and never for an instant were the blades displaced. As the deft feet twinkled now here, now there, there were encouraging shouts and much clapping of hands, which made the deft feet all the defter. People stood up on forms that they might the better behold the wonderful sight; and between the shoulders of well-dressed guests might have been seen peering the delighted faces of the female domestics of the house. It was but seldom that the master contributed to their amusement. At the triumphant close he bowed to the company, lifted the swords, sheathed them, and then walked with them away into the shadow of the window.

After this exhibition the dancing became more vigorous than ever, but to a certain extent it had changed its character. It became much less formal. The decorous quadrille and the giddying waltz were forsworn, and reels and country-dances took their places. The elder people, too, were drawn into the vortex. Stavert was mighty in the Reel of Hulichan; and Sir Peter McCalico—his sufferings in the matter of the turkey entirely forgotten—led Mrs. Stavert down the room in a country-dance. At the merry climax of the evening, John, despite the watchful eyes of Mrs. Stavert, secured Maggie for a reel, which materially sweetened his departure. With the warmth of her frank hand still in his, he quietly stole from the room and went home in his cab, which had been waiting outside for a considerable time. The bonfire of the dance was at its brightest an hour after midnight; thereafter it began to decay, but its last embers did not expire till far in the morning.

Mrs. Stavert's little dance was over, but it cannot be said that that lady looked back upon it with any considerable satisfaction. Several of her schemes had been more or less frustrated. She was seriously annoyed at John Hagart and Miss Maggie: she was downright angry with Miss Oona. She had drawn her own conclusions from the faces of the young people as they entered the room, and these conclusions had been verified in every particular in a hurried conversation with her son towards the close of the evening. Torquil told his mother that, in conformity with the family policy, he had proposed to Oona, and that his proposal had been quietly but firmly rejected. To do the young man justice, he uttered no complaint. He frankly owned that he was unworthy of Oona—that he felt he was unworthy of her all along; and that his rejection, although absolute, had been couched in the most considerate terms. He declared that he never admired and loved so much as now, when that love and admiration was hopeless. These statements made Mrs. Stavert yet more angry. That her son had been rejected was bad enough—it was worse that he should feel disposed to kiss so devotedly the hand that rejected him. Where was his pride, his manhood, his self-respect? She had never been able to forgive any one who had wronged or slighted her; and it was her opinion that Oona had both wronged and slighted her son. She could not for the life of her understand Torquil's humbleness and tenderness of spirit; and had it been possible, she would have been angry with him also. Looking back on the dance, Miss Kate Stavert was not better pleased than was her mother. She had meant to captivate John Hagart, whom she had been all along taught to regard as her own private property; and John Hagart, in the seeing of the entire room, had allowed himself to be enslaved by that light-headed fool Maggie McQuarrie, with—as the young lady phrased it herself—her look of stupid innocence, and her laughter when she has nothing to say for herself. Of all the denizens of Cuchullin Lodge, the one who looked back on the dance with the greatest pleasure was Miss Flora. Her plans had in no way been crossed, her vanity had not been wounded. She liked the rising young Hawkhead doctor, and the doctor had attached himself to her the entire evening, and been vastly agreeable.

Stavert and his sons had gone into Hawkhead, and an hour before noon the ladies were sitting at a late breakfast and discussing the events of the previous evening. Mrs. Stavert was desperately sulky, and while pouring out tea had indulged in the luxury of rating the maid. This produced an awkward pause, and, to break the silence mainly, Flora inquired of the company generally:

"When did John Hagart leave? I don't remember seeing him for the last hour or so?"

"I really can't say," said Miss Kate. "I didn't see much of him during the evening."

"If you wish to know anything about Mr. Hagart you had better ask Miss Maggie," said Mrs. Stavert, playing with her spoon. "Mr. Hagart had not the politeness even to bid me good night. Miss Maggie will know when he went, because she danced with him the entire evening."

"Me! Mrs. Stavert," cried poor Maggie, her face all in a crimson flush.

"Yes, you. The whole room remarked it. I should be sorry if one of my daughters had conducted herself so imprudently."

Maggie's eyes filled at once, and a slight colour came into Oona's face as her grave voice came to the rescue:

"I think, my dear Mrs. Stavert, you are too hard on Maggie. If she did dance two or three dances with John Hagart last night, I don't see any harm in it. You know that John is her cousin, that she has known him for many years, ever since she came to school here first; and besides, she was a stranger to all the other gentlemen in the room. I think her dancing with John Hagart was both natural and right."

"I was not aware that you were an authority on the proprieties," sneered the elder lady.

"Mamma!" put in Flora, in an alarmed, deprecating tone. Kate was silent; the little passage of arms, so far as it had yet gone, was not altogether unpleasing.

"I am totally unable to comprehend your meaning," said Oona, her dark eyes looking directly into Mrs. Stavert's grey green ones.

Mrs. Stavert winced a little, but spleen would have its way. "May I ask you," she said, her thin mouth drawn by an uneasy smile, "why you refused my son's offer last night?"

It was Oona's turn now to colour and tremble. "Did Torquil tell you that I had refused him? It was very wrong of him to tell you, at least in a way to make you angry. But I can't believe it. He is too noble not to have done me justice. The interview was as painful to me as it could possibly be to him; and I refused his offer for the most sufficient of all reasons."

"You refused him," said Mrs. Stavert, speaking deliberately so that every spiteful accent might go home and rankle, "you refused him because you are still hankering after Mr. Willoughby."

"Mr. Willoughby!" cried Miss Oona, half rising.

"Yes, Mr. Willoughby—the adventurer, the waster of his substance in riotous living, the lover of low company, the brawler in drinking booths and cattle markets, the man whom your father has forbidden his house; it was for his sake you refused Torquil—I know it."

Henry Willoughby had never so useful an ally as Mrs. Stavert, and had he been present he ought to have kissed her out of sheer gratitude. Oona rose up to her full angry height, her cheeks burning, her eyes flashing. "You are saying what you know is not the truth, Mrs. Stavert. Mr. Willoughby is no adventurer, no waster of his substance in riotous living. He is an honourable man and a gentleman. You know, you know—" here the tears washed away the sentence. "Let us leave this at once, Maggie. This is no place either for you or for me. I am sorry I cannot say good-by to Mr. Stavert or to Torquil. They would not have permitted this. Good-by, Kate; good-by, Flora."

Mrs. Stavert felt she had gone too far, and was willing to smooth matters, to apologise even, but Oona rejected all pacific overtures with the queenliest scorn. In half-an-hour the McQuarrie girls were proceeding from Cuchullin Lodge in a cab towards Hawkhead with their luggage strapped on the roof. Mrs. Stavert was sitting at home brooding gloomily over the *fracas*, and inwardly marvelling what her husband and Torquil would say when they returned and heard the news.

John Hagart was busy in his room at the office of Messrs. Hook and Crook when two young ladies were announced. To his consternation Miss Oona and Miss Maggie entered. He saw by their faces that something disagreeable had occurred, and jumping up he closed the door and enquired what was the matter. Maggie began to cry, and Oona related the scene at Cuchullin Lodge, laying as little stress on Torquil's proposal, and on Mrs. Stavert's accusations with regard to Henry Willoughby, as she could. John's indignation was unbounded, and he gave free vent to it. "What are you going to do now?" he said. "You must come home with me to Mortimer Street. Miss Kate will be glad to see you, I am sure. Come along; your cab is still at the door, and I shall go with you myself. My work must just wait for a little." And so he put away his papers, closed his desk, conveyed the ladies to the cab, and told the man to drive to Mortimer Street.

When John got home he told the man to wait, and entered in rather an excited state of mind. He got hold of his aunt and told her all that had occurred, with many an interjection and passionate parenthesis. When he had placed the girls fairly under the wing of Miss Kate, he went down to the cab and told the man to drive to the office. The drive, which did not occupy a quarter of an hour, was a memorable one to the young man. For, thinking, as he drove along, of Mrs. Stavert's cruel conduct, of Maggie's beauty and distress, he made the discovery that he loved her. Into the cold clear dawn of liking the sun of conscious love had arisen, and everything became vocal and many-coloured. He was almost frightened at the strange happiness that flowed in upon him. "It's very lucky," he thought to himself, "that I am to succeed Mr. Crook. I'll shelter the poor darling then from every rude glance and every rude word." From that day forth Mrs. Stavert stood in John Hagart's black book.

The girls remained at Mortimer Street for a fortnight, and when they were leaving for home John succeeded in whispering in Maggie's ear, "Keep up your heart, and I'll come to see you in summer," and had for reward a tender pressure of the hand.

* * *

ON LIGHT.

BY SIR JOHN F. W. HERSCHEL, BART.

PART III.

DOUBLE REFRACTION.—POLARIZATION.

IN that most wonderful work, the Optics of Sir I. Newton, among the queries annexed at the end, occurs this very singular one: "Have not the rays of light several sides, endued with several original properties?"[*] The conception intended to be conveyed, as further illustrated by Newton himself, embodies that abstract notion of polarity which Dr. Whewell in his "Philosophy of Inductive Science," expresses by "opposite qualities in opposite directions," or, as we should prefer to say, for this purpose, "different qualities in different directions," with reference (that is) to surrounding space and the objects therein situated. The same form of the general conception, as regards light, which Newton employed to designate the very same peculiarity in its habitudes, was adopted by Malus in his first announcement of the remarkable discovery which introduced the term POLARIZATION into optical language. "We find," says he, "that light acquires properties which are relative only to the sides of the ray—which are the same for the north and south sides of the ray" (*i.e.*, of a *vertical* ray), "using the points of the compass for description's sake only, and which are different when we go from the north and south to the east and west sides of the ray." The polarization of light has in fact been an integral part of the science of optics (wanting only a name to designate it) ever since this suggestion of Newton, who derived it from the contemplation of one of what Bacon calls "instantiæ luciferæ," *luminiferous instances*, exhibiting the property or "nature searched after" "in an eminent manner," or in its clearest or most manifest form; and who described with the utmost clearness and precision the phenomenon in which its manifestation consisted in the special case before him.[†] We shall, therefore, approach the subject from Newton's point of view, choosing for our illustration the very phænomenon which led him to the singular conclusion embodied in his query.

As we have already stated when speaking of refraction generally, a ray of light incident on any transparent crystal (certain specified classes of crystals excepted) is subdivided by refraction into two distinct rays, pursuing different paths within the crystal, and of course emerging from it at different points, and so, of necessity, reappearing, not as a single, but as two distinct and separate rays, each pursuing its subsequent course independent of the other through space. Of these, when traced, one is found to have been refracted in the plane of its incidence on the transmitting surface, and according to the ordinary simple "law of the sines" already explained. It is therefore said to be *ordinarily* refracted, and is called the *ordinary ray*. The other, except in special cases, deviates after refraction from the plane of its incidence, more or less according to the situation of that plane with *respect to the faces of the crystal:* and, moreover, in respect of the amount of its flexure, does not conform to the simple law of the sines, but to a rule much more complex in its expression, called the *law of extraordinary refraction;* this ray being designated as the *extraordinary ray*. Such is the case if the original, incident ray be one directly emitted from the sun, a candle, or any *self-luminous* body. But if in place of such a ray, we employ either of the two rays so separated as above described, for transmission through a second crystal of the same kind, the result will be very different. If it fall upon such second crystal in the same manner, according to the same angles and with the same relative situation as to its plane of incidence with the sides of the crystal, as in the case of the original incident ray, it will *not* be further subdivided, but refracted *singly; if an ordinary ray, ordinarily*, and *if extraordinary, extraordinarily.* Its refraction will also be single, if the second crystal be turned round *on the ray as an axis* exactly through a right angle; but in this case the second refraction, if an ordinary ray have been used, will be *extraordinary*, and *vice versâ.* In every intermediate situation of the second crystal, it will be subdivided into two, the one ordinarily, the other extraordinarily refracted, *but the two fractions will be found to differ in relative intensity:* generally speaking, the more according as the conversion of the second crystal has been through a less angle from its first position, and they are equal when the angle of conversion is 45°, 135°, 225°, or 315°, *i.e.*, exactly halfway between the rectangular positions of the crystal.

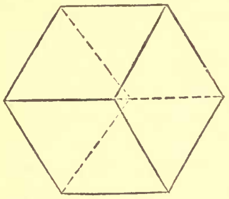
All these particulars are easily and elegantly exhibited by means of two crystals of the mineral called Iceland spar (crystallized carbonate of lime), a mineral of perfect and colourless transparency, which, if fractured, will always separate itself along its three "planes of cleavage" (which in this mineral are singularly distinct and palpable) into forms whose type is the obtuse rhomboid (whose six faces, all equal and similar rhombs of 101° 32′ and 78° 28′, are united three and three, by their obtuse angles, at the opposite extremities of a line called the axis of the rhomboid, the shortest that can be drawn across it, and to which it is symmetrical, as shown in the annexed figure).

---

[*] "Optics," Book iii., Quæry 26. 4th Edition.

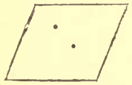
[†] The same phænomenon is described, and with no less clearness and precision, by Huyghens, in his admirable work, "Traité de la lumière," published in 1690, fourteen years before the Optics of Newton—and from that epoch, or from 1678, when that treatise was communicated to the French Academy, must date the *discovery* of the polarization of light *as a fact.* Huyghens, moreover, *correctly* attributed it to a peculiarity impressed on the vibrations of the ethereal medium. But the picturesque phrase of Newton embodies the idea in a form easily apprehended, while it seems to have floated rather vaguely before the mind of his great predecessor, not so much as a general attribute, but as a specialtv limited to the case in question.

FIG. 10.



If such a rhomboid be laid down on an ink-spot on white paper, or, still better, on a small pinhole in a plate of metal and held up to the light, the ink-spot, or the dot of light will appear through it doubled: the two images being separated, in the direction of the shorter diagonal of the face through which they are seen, by an interval of about one-ninth part of the thickness seen through. Thus, if over the first rhomboid another of equal thickness be laid *conformably* (*i.e.*, so that all the faces of the second shall be parallel to the corresponding ones of the first), the only effect will be that the apparent separation of the two images will be doubled, just as if a single crystal of double thickness had been used. But if from this position the upper crystal be turned slowly round in its own plane upon the lower, kept firm; two other images will make their appearance between the former, at first very faint and almost close together, but, as the rotation of the upper crystal continues, gaining strength (while the others grow fainter) and opening out from each other in a direction transverse to the line of junction of the first. When the angle of rotation attains 45°, four images are seen of equal intensity, after which the two first grow fainter, and at 90° vanish,—the whole of their light having passed into the other two—and so on alternately. When the upper rhomboid has made an exact semi-revolution on the other, the image is single, and contains the whole of the incident light. In this case, the ordinary ray has been refracted ordinarily, and preserves its situation; the extraordinary extraordinarily, but its displacement by the second refraction being exactly equal and opposite (in consequence of the now reversed position of the refracting rhomb) to that by the first, it is brought to coincidence with the other, and the two united form one image.

FIG. 11.



The opposite sides of a rhomboid being parallel, both the ordinary and extraordinary rays after transmission emerge parallel to the incident ray, by a necessary consequence of that general law of retro-version, in virtue of which a ray of light, whatever path it may have pursued from one point to another, can always retrace that path; the opposite faces being symmetrically situated with respect to the axis. And the same is true for a parallel plate of this or any other crystallized substance artificially cut and polished, whatever be the position which such plate may have held in the interior of the crystal from which it is cut. Now it is found, by cutting from rhombs of Iceland spar parallel plates in various directions, that there is one through which a ray of ordinary light can be transmitted perpendicularly without being divided into two. This is the case when the faces of the plate are at right angles to the line above designated as the *axis* of the rhomboid. And generally that a ray which within the crystal pursues a path parallel to this axis, will emerge from it single, whatever be the situation of the surface of emergence. The axis, then, is *a line of no double refraction*, and in the case of the substance in question (or of any crystallized body whose *primitive* form is the acute or obtuse rhomboid, the regular hexagonal prism, and some others, comprising all those primitive forms which can be described *as symmetrical to one line and to one only*) it is the only direction endued with this property. And on the other hand, the amount of the double refraction or the angular separation of the two rays into which the incident ray is divided, is greatest when they lie in a plane perpendicular to this axis. On account of these properties, the line in question is sometimes called the *optic axis* of the crystal.

If a crystal of Iceland spar, or any similar body, be cut into the form of a prism, in such a manner as to have its refracting edge parallel to its optic axis, neither of the two refracted rays will emerge parallel to the incident one, or to each other. They will diverge, including an angle between them, greater as the refracting angle of the prism is greater, exactly as if the medium had two different refractive indices. And in this particular case both refractions follow the ordinary "law of the sines," and there is no deviation of either ray from the plane of incidence. And what is extremely remarkable, not only the refractive indices, but the dispersive powers of the two refractions differ, in some cases widely, so as to give two spectra (when a sunbeam is refracted) of very different lengths. In the case of Iceland spar, the respective refractive indices for the ordinary and extraordinary ray are 1·654 and 1·483. It is in consequence of this great difference that the two images of a point, seen through a rhomboid of the mineral, appear unequally raised above their natural level; that seen by the ordinarily refracted rays, appearing nearer the eye than the other.

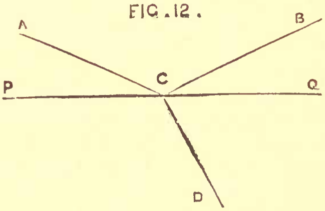
By the employment of such a prism as here described, it is easy to insulate either the ordinary or extraordinary refracted ray, and examine it separately. Suppose, for instance, the latter to be stopped by a screen, and the former only allowed to reach the eye. If before doing so it be made to pass through a second such prism, whose refracting edge is parallel to that of the first, it will be refracted *singly* and *ordinarily*: if the edge be held perpendicularly to that of the other, then, *singly* but *extraordinarily*. In every intermediate position the image will be doubled, more of the light passing into the extraordinary image, and less into the ordinary, according as the angle at which the edges cross is increased from 0° to 90°; and at 45° of inclination the light is equally divided between the two. This, it is obvious, could not be, if the ray were indifferently disposed with respect to surrounding space. There subsists in it a difference of properties depending on situation—a difference *analogous to* that between a square rod and a round one. It has acquired *sides* in its passage through the crystal, which it preserves in its subsequent course through space till it meets some body whose action on it may bring their existence into ocular evidence. It would seem almost as if light consisted of particles having polarity, like magnets; and that in its passage through a doubly refracting substance these came to be arranged, half with their poles in one direction (as regards the sides of the crystal), and half in a direction at right angles to the former. And this is the way in which Newton conceived it, as he himself distinctly states (Opt. Quæry, 21); and as it necessarily must be conceived if the corpuscular theory were to be adopted. How it is explained on the undulatory hypothesis, we shall presently see.

It was while gazing one evening in 1808, through such a prism of Iceland spar as we have just described, from his study in the Rue d'Enfer at the windows of the Luxembourg Palace in Paris, that M. Malus, at that time engaged in studying the law of extraordinary refraction in this body, happened to notice that the reflexion of the sun on a window of the palace disappeared from one of its images, in a certain position of the prism, and from the other when held at right angles to that position; while in the intermediate situations, the glare was visible in both images, unequally divided, however, between them, except when held in a situation exactly intermediate, or at 45° from its first position:—in a word, that the light reflected from the window had acquired precisely the peculiarity which would have been impressed on it by previous transmission through a similar prism. To this peculiarity he gave the name of POLARIZATION, and light so affected has ever since been said to be POLARIZED.

Total and partial polarization of light by reflexion.—The angle at which a ray of light must be incident on glass that the reflected ray may acquire this property is 56° 45′ from the perpendicular, or at an inclination of 33° 15′ to the surface, and in this case the polarization is *complete*, or the whole of the reflected light has acquired the property in question.* If at any other obliquity, it is only *partially* polarized, or a portion only of the reflected light has acquired it; how this portion is to be distinguished and separated from the *unpolarized* portion, we shall presently explain. Suffice it here to observe that this latter portion bears a greater proportion to the whole reflected beam, as the angle of incidence deviates more from that above specified (which is called the *polarizing angle*). The plane in which reflexion has been made is called the plane of polarization; and two rays which have undergone reflexion at the polarizing angle in planes perpendicular to each other, are said to be *oppositely polarized.*

The angle of incidence 56° 45′ has this peculiarity—that if we consider the directions subsequently pursued by the two portions into which a ray so incident on glass is divided, the one pursuing its course by reflexion in the air, the other by refraction within the glass, these two directions include a right angle as in the annexed figure, where A C is the incident, C B the reflected, and C D the refracted rays, at the surface of a glass P Q. Where the angle A C P or B C Q is 33° 15′, Q C D is 56° 45′, and D C B is a right angle. The law of polarization *so announced*, as Sir David Brewster has shown, is general, and extends to all media, whatever their refractive powers. Thus, for water, the polarizing angle is 53° 11′, and for diamond 68° 6′—numbers concluded from this simple rule (equivalent to the geometrical property above stated) that *the index of refraction is in all cases the tangent of the polarizing angle.*

FIG. 12.



If a ray of light so polarized by reflexion be received on such a prism as is above described, held with its refracting edge (*i. e.*, the optic axis of the crystal) at right angles to the plane of reflexion, or parallel to the reflecting surface, it will entirely pass into the ordinary, or most refracted image; *vice versâ*—if the prism be turned round 90°, so as to have its edge parallel to the plane of reflexion (*i.e.*, of polarization), wholly into the extraordinary. The same interchange will of course take place if the prism be held immoveable and the reflecting glass turned round, so as to change the plane of reflexion, and thus we perceive that rays *oppositely polarized* are distinguished by the character of passing *entirely* into the one or entirely into the other of the two images when so refracted. A beam of light partially polarized may be regarded as a mixture of two portions, the one wholly polarized, the other wholly unpolarized; and a beam of *unpolarized* light may, conversely, always be regarded as a mixture of two equal rays oppositely polarized, in *any* two planes at right angles to each other.

---

* In point of fact the differently coloured rays are not all polarized at exactly the same angle, so that this is rigorously exact only for homogeneous light. But the difference is so trifling that it is purposely here kept out of view.

If a ray reflected from any medium at the polarizing angle (and therefore wholly polarized) be received on a second surface of the same medium at the same angle of incidence, *and in a plane coincident with* that of the first reflexion, it undergoes partial reflexion just as an unpolarized ray would do, and both the reflected and refracted portions retain their polarization. But if the plane of the second incidence be at right angles to that of the first, *no portion of the light is reflected*, but the whole passes into the refracted ray, retaining its polarization,—just in the same manner as, had it been incident on our doubly refracting prism held with its edge at right angles to its plane of polarization, it would have wholly passed into the extraordinary ray. *Vice versâ*, if the ray extraordinarily refracted by such a prism be received on a glass plate at the polarizing angle of incidence, no reflexion will take place if the edge of the prism be parallel to the plate. Hence we are entitled to conclude that it is the very same property which is impressed on light in both cases, and that a ray polarized by reflexion differs in no respect from one which has received this property by passing through a doubly refracting crystal.

A ray partially polarized by reflexion at a greater or less incidence than that at which it would have been completely so, may be wholly polarized, or nearly so, by repeated reflexions at the same angle. This, which might be concluded *à priori* by considering that the unpolarized portion differs in no respect from ordinary light, and is therefore susceptible of so receiving partial polarization, while the polarized portion retains its polarization unchanged by reflexion, is verified by experiment.

If a ray partially polarized in any plane be received on the doubly refracting prism already mentioned, with its edge perpendicular to the plane of polarization, the polarized portion will pass wholly into the ordinary image, while the unpolarized will be equally divided between the two. Thus the two images will be unequally bright. By turning round such a prism, then, till a position is found at which the contrast between the two images is most striking, this plane will be discovered, and the difference of their illumination is the measure of the quantity of polarized light in the beam.

Polarization of light by refraction.—When light is incident on glass or any uncrystallized transparent body *at the polarizing angle*, the reflected portion (a small percentage, not more than one-twelfth of the whole light) is wholly polarized in the plane of incidence, as already stated. The refracted beam (by far the larger portion), when examined in the mode just described, is found to be *partially polarized in a plane at right angles* to that of incidence, and the amount of polarized light which it contains to be precisely equal to that in the reflected beam. Thus we see that when light falls upon such a surface, the greater portion passes unchanged, while the other is divided into two equal portions *oppositely polarized*, the one being reflected, the other transmitted, and intermingled with the unpolarized part.

If a parallel plate of glass be used for this experiment, the same process is repeated at the hinder surface. An equal percentage of the unpolarized portion is similarly divided between the reflected and transmitted rays, oppositely polarized, and as the transmitted polarized portion is, *ipso facto*, guaranteed from subsequent reflection at the polarizing angle, the total amount of polarized light in each of the two beams is nearly doubled. If behind this a second parallel glass plate be applied, the same process is again repeated on the remaining unpolarized portion, and so, by multiplying the plates, the whole incident beam is ultimately divided equally into a reflected and a refracted beam completely polarized in opposite planes. Such at least would be the case were the plates perfectly transparent and infinite in number; but as these conditions cannot be fully realized, the transmitted beam is never completely polarized, though enough so to afford a very convenient mode of viewing many optical phenomena. On the other hand, if the plates be truly plane and their surfaces exactly parallel, the reflected beam is wholly polarized, and as its intensity is nearly half that of the incident light, this affords an excellent mode of procuring a polarized beam available for purposes of experiment. A frame containing six or eight squares of good window glass laid one on the other, and backed by a sheet of black velvet, is one of the most convenient and useful of optical instruments, and will be frequently referred to in what follows as a "polarizing frame," a similar series set transparently being termed a "polarizing pile."

Other modes of polarization.—There are certain doubly refractive crystals, more or less coloured, which possess the singular property of absorbing or stifling in their passage through them, *unequally*, the two oppositely polarized rays into which they divide the incident light. Two bodies especially have been noticed in an eminent degree with this property—the one a mineral occurring more or less frequently among the rocks of igneous origin, called the tourmaline, the other an artificial chemical compound, the iodo-sulphate of quinine. The former crystallizes for the most part in long prisms of many sides, terminated by faces, three of which belong to the primitive form, an obtuse rhomboid, when it is that of the prism itself. In consequence, like all crystals of this class, it is doubly refractive, and if artificially cut and polished into a doubly refracting prism, having its refracting edge parallel to that of the rhomboid, an object viewed transversely through it will appear double, provided the eye be held quite close to the refracting edge, but if ever so little removed, so as to look through a greater thickness of the substance, one of the images will be observed to diminish rapidly in intensity, and at a certain, usually very moderate, thickness to disappear altogether, as if extinguished by a deeper colour or a higher degree of opacity in the medium, the other remaining undiminished. The unextinguished ray is, of course, completely polarized, and *that* in the plane of the section of the prism at right angles to the edge. If, instead of cutting the crystal into such a prism, it be formed into a flat plate, with its faces parallel to the axis of the rhomboid, such plate will in like manner extinguish one of the pencils into which a ray incident perpendicularly on it is divided, allowing the other to pass, and the pencil so transmitted is completely polarized in a plane perpendicular to the axis of the plate. This property of a tourmaline plate renders it invaluable as an optical instrument, affording the readiest and most convenient means of procuring a polarized beam of light for the examination of crystals and other purposes. Its only drawback is, that this mineral is most commonly coloured with a strong tint of blue or green, which affects the colour of the transmitted light. Some specimens, however, while equally effective in destroying one of the refracted pencils, are yet but slightly tinged with colour as respects the other, which is therefore transmitted fully polarized, but with only a slight tinge of brownish yellow. The other substance, of late much resorted to for the same purpose, the iodo-sulphate of quinine, crystallizes in very thin scales like mica, of a purplish brown hue, which in like manner polarize completely one half the incident light, which passes freely through them, the other half being extinguished. This curious property was discovered by Mr. Herapath, who first formed the compound in question.

When two parallel plates of tourmaline cut from the same crystal in the mode above described, or two laminæ of Mr. Herapath's quinine salt, are laid one on the other conformably (or with their axes parallel), the light polarized by one passes freely through the other; but if the one be turned round on its own plane on the other, the intensity of the transmitted beam gradually diminishes, until the axes cross at right angles, in which position the combination is quite opaque. A similar gradual diminution of light, up to complete extinction, takes place when a ray polarized by reflexion from glass, or in any other manner, is received on such a plate, made to rotate in its own plane. The effects are just what might be expected to happen if a flight of *flattened* arrows were discharged at a grating of parallel wires. Those only whose planes were parallel to the wires would be able to pass, and having passed one such grating, would penetrate any number of others placed conformably behind it, but not if placed transversely. This is a simile, not an explanation, but it conveys, though coarsely, to the mind a conception of the distinction between polarized and unpolarized light, not to be despised as an aid to the imagination.

If a "polarizing frame" of glass plates, such as above described, be laid down before an open window, and, the eye being held near it so as to embrace a large illuminated area or "field of view," a tourmaline plate be looked through, and turned slowly round in its own plane before the eye, a position will be found in which the appearance of a dark cloud comes over the frame, extending over a very considerable visual angle; the central portion being completely obscure; and the darkness shading off at the borders by insensible degrees. Within this "polarized field," a vast variety of brilliant and beautiful optical phenomena, hereafter to be described, are very conveniently and elegantly exhibited. One effect is very striking. If instead of a black velvet backing, the glasses be laid on any bright surface, the printed page of a book, for instance—this, which, without the interposition of the tourmaline, cannot be discerned for the glare of light reflected from the glasses, becomes distinctly visible, and may be read with facility when that glare is taken off in the manner described. So, too, by looking through a tourmaline plate held transversely, on the surface of a pond at the polarizing angle, the reflected light from the surface being destroyed, the objects at the bottom, the fishes, &c., are distinctly seen, though completely invisible to a bystander. So, too, by polarizing alternately in a vertical and a horizontal plane, the light of one or more lamps, night signals may be made, and a message transmitted, visible *and interpretable as signals*, to a distant spectator provided with a tourmaline plate, while a bystander not so provided, though he see the lamps, will have no suspicion that any such communication is in progress.*

Polarization of the sky light.—The light of a clear and *perfectly* cloudless blue sky is partially polarized in a plane passing through the sun, the eye, and the point of the sky examined. At each point in that great circle of the celestial concave, which is 90° remote from the sun's place, the amount of polarized light which it sends to the eye bears a very considerable proportion to the total illumination, amounting to nearly a fourth of the whole. At every other inclination of the visual ray to the direct sunbeam, the proportion is less, and in the neighbourhood of the sun, or of the point on the horizon directly opposed to it, very small. When examined in a mode hereafter to be described, by the intervention of a tourmaline plate, and a crystallized lamina, this gives rise to a series of exceedingly beautiful and brilliant phenomena, productive of the greatest astonishment to those who learn for the first time by their exhibition, that totally different, and even opposite qualities, characterize different portions of an illuminated surface apparently so perfectly uniform and homogeneous. This effect is supposed to originate in the reflexion of the solar rays on the particles of the air itself, an explanation encumbered with many difficulties, but the best (indeed the only one) that has yet been offered.

---

* I mention this to prevent a patent hereafter being taken out "for secret communication at a distance by means of polarized light."

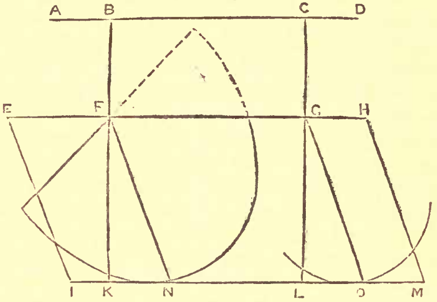
Polarization interpreted on the undulatory theory.—According to any conception we can form of an elastic medium, its particles must be conceived free to move (within certain limits greater or less according to the coercive forces which may restrain them) in every direction from their positions of rest, or equilibrium. It by no means follows, however, that the nerves of the retina are equally susceptible of excitement by vibrations of the luminiferous ether (in which they may be conceived immersed) in all directions. In the case of sound, the tympanum of the ear which receives the impulse of the aerial medium, would appear to vibrate like the parchment of a drum, by the direct impact of its waves perpendicular to its surface. It is, therefore, sensible to such of the movements of the vibrating medium *only* as are in the direction of the sound-ray, and not at all to transverse vibrations. But if we conceive the nervous filaments of the retina as minute elastic fibres, standing forth at right angles to its plane, like the bristles of a brush (the reader will pardon the apparent coarseness of the illustration, which is only intended *as* an illustration of what may be, and no doubt is a process of transcendent delicacy), immersed in the ether; it is evident that movements of the latter parallel to their direction *would not*, but that those transverse to it *would* tend to throw them into vibration, just as ears of corn would be little or not at all agitated by a straight and slender rod moved up and down between the stalks, or to and fro in the direction of its own length, but violently by a transverse horizontal motion of the rod.

Whatever be, at any instant, the motion of an ethereal molecule, it may always be resolved into two, one in the direction of the ray in the act of propagation, and the other in a direction transverse to it, in the plane of the wave surface. If the sensation of light be supposed to be produced by the former resolved portion, no account can be given of the phænomenon of polarization; such movement being equally related to surrounding space in all directions outward from the ray as an axis. The contrary is obviously the case with the other resolved portion. Suppose one end of a long horizontal cord fastened to a wall, the other held in the hand, and tightly strained. If a small vibratory motion cross-wise to the cord be given to the hand *in a horizontal plane*, an undulation *confined to that plane*, will run along the cord; if in a vertical one, then will the undulation be wholly performed in a vertical plane. If the propagation of a wave along a stretched cord be assimilated to that of a ray of light, the former of these cases will convey the idea of a ray polarized in a horizontal, the latter in a vertical plane. If the movement of the hand (always transverse to the cord) be not confined to any particular plane, but take place sometimes in one, sometimes in another, at all sorts of inclinations to the horizon—the undulation which runs along the cord in this case will convey the idea of an unpolarized ray (according to Sir David Brewster, however, a partially polarized ray would, in this manner of viewing it, be assimilated to the case when the vibratory movement should neither be strictly confined to one plane, nor altogether irregular, but confined in its deviations from it to some angular limit less than a right angle).

There is nothing to lead us to believe that the vibratory motions of the particles of material bodies, especially those in the state of gases in the act of combustion, in virtue of which they are luminous, are necessarily confined to any particular plane. Many thousands, or even millions, of vibrations in one plane may be succeeded by as many in any other, according to the direction and frequency of the shocks which give rise to them within an interval of time inappretiably short, and without prejudice to the continuous perception of the vibratory movement communicated to the ether *as light*. The act of polarization consists then in the *subsequent* arrangement, at some definite point in the line of progress of the ray, of all these vibratory movements, into parallelism with each other, or into a single plane from which they have afterwards no tendency (*per se*) to deviate. As the particles of crystallized bodies must be conceived to be arranged in definite lines and planes, it is easily conceivable that, whether among them, or in conjunction with them, the ethereal molecules may be confined in their vibrations to two particular planes determined by the internal constitution of the crystal, and that a vibratory movement propagated into a body so constituted should *ipso facto* resolve itself into two such movements in these two planes (according to the general mechanical principle of the composition and resolution of motion), that it should be so propagated during its progress through the crystal, and that at its emergence into free space, each vibration should thenceforward subsist separately, there being nothing to change it. Again, it is no less conceivable that in these vibrations the molecules of the ether moving in one plane may be differently impeded by, or stand in a different connexion with those of the medium, from those moving in the other, and that, in consequence, their propagation of the movement may be effected with a different velocity, and thus give rise to a difference of refractive power, which, as we have seen, depends on the proportion of velocity of the light in and out of a medium. In the case of one set of vibrations, again, the propagation of the medium may be equally impeded or influenced in all directions of the ray—in which case a wave starting from any point in the surface would run out spherically within the crystal, while in that of the other the amount of obstruction might vary with the direction of the ray, and thus give rise to a wave running out *with different velocities in different directions* from its centre of propagation, and therefore *not spherically*.

To this conclusion, but without passing through the intermediate considerations which have led us up to it, Huyghens (who certainly had formed no conception of transverse vibrations), appears to have *jumped*, by one of the happiest divinations on record in the history of science, viz., that in the double refraction of Iceland spar, while the ordinary ray is propagated in a *spherical*, that of the extraordinary spreads from its point of origin at the surface of the crystal in an *elliptical* wave, the form being that of an *oblate spheriod* of revolution, having its polar axis parallel to the axis of the rhomboid, and bearing to its equatorial diameter a definite numerical proportion, viz., that of eight to nine (very nearly). Making this assumption, and laying it down as a principle (capable of demonstration), that the direction of a ray of light in such a mode of propagation is not that of a perpendicular to the surface of the wave at any point, but that of a line drawn from the centre of the wave to its point of contact with a plane, touching at the same time all the wave surfaces in progress, at the same time, through the crystal, which have originated in one and the same plane wave sweeping over its external surface (just as in the explanation of ordinary refraction given in our first part, in the case of spherical waves, in which case the latter line *is* perpendicular to the wave surface), he was enabled to explain every particular of the double refraction in Iceland spar, so far as the *direction* of the extraordinary ray is concerned, including its deviation from the plane of the angle of incidence, and its non-conformity with the ordinary law of the sines, except in special cases. The results of his reasoning have been compared with experiment, with extreme care, by M. Malus, as already mentioned, and found exactly in accordance with fact. We cannot, of course, in an essay like the present, give any account of the special conclusions, or of the mathematical reasoning on which they are founded; which involve more geometry than the generality of our readers are likely to possess. But we can put into a very few words, and we think make readily intelligible, the main feature of the reasoning, that which determines the deviation of the extraordinary ray from perpendicularity to the wave surface, and from the plane of incidence.

FIG. 13.



* Let A B C D represent a plane wave descending perpendicularly upon the upper surface E H (supposed horizontal) of a crystal of Iceland spar, of which E H M I is the principal section, or that cutting through both the obtuse angles of the rhomboid, and in which its axis lies. The light then which this wave conveys will be incident perpendicularly on the surface E H, or in the direction of the lines B F, C G, and these lines continued to K and L, on the lower surface, would be the course of the *rays* B F, C G, supposing them to undergo the *ordinary* refraction. Considering now the *extraordinary*; suppose the portions E F, G H of the surface screened, and only the portion F G of the wave allowed to enter. This on striking the surface, will excite at every point over its whole extent a luminiferous vibration, which will be propagated within the crystal in a spheroidal wave, having its shorter axis parallel to that of the crystal: and all these spheroids being equal and similar, the plane which touches them all, and which *is*, in effect, the doubly refracted *plane wave within the crystal*, will advance parallel to the surface E H. Suppose it arrived at the other surface I M, and let N, O, be the points of contact of that surface with the spheroidal elementary waves whose centres are F and G, at that moment. Then will N O be that portion of the posterior surface which will *first be struck* by the refracted wave. The portions beyond on either side, I N and O M, will *subsequently* receive the divergent undulations, which (as we have already explained) give rise to diffracted fringes bordering the shadows of the screens E F, G H. Thus we see that the space between N and O, and not that between K and L, will receive the full illumination from the aperture F G, which has therefore been propagated obliquely in the direction of the lines F N, G O, and not of the perpendiculars F K, G L.*

The deviation of the refracted ray from *the plane* of incidence, and from that of ordinary refraction, will be readily understood when it is borne in mind that whether at a perpendicular or an oblique incidence, a *plane exterior wave* is transformed by the extraordinary, as well as the ordinary refraction, into a plane *interior* one, and that the plane of incidence *of a ray* is perpendicular to both these planes. It cannot therefore contain the extraordinary refracted ray (which is a radius of the spheroid) without containing at the same time a normal to the elliptic surface of propagation at its point of contact with the interior plane wave, that is to say, unless it contain also the axis of the spheroid. In other words, the extraordinary ray will always deviate from the plane of incidence, unless in the case when that plane coincides with some one of the meridians of the spheroid in question.

Since there is no double refraction in the direction of the axis of the rhomboid, it follows that in that direction the velocities of propagation of the ordinary and extraordinary rays within the crystal are the same, and that therefore, supposing the two corresponding undulations propagated from the same point in its surface to run out internally, the one in the form of a spherical, the other of a spheroidal shell, these shells will have a common axis, viz. :—the shorter axis of the spheroid, which will therefore wholly include the sphere, being in contact with it at the poles of the spheroid. *Cæteris paribus*, too, it is equally obvious that, when we come to consider different sorts of crystals possessing the property of double refraction, the intensity of this quality, or the amount of angular separation of the two refracted rays at the same incidence, will be determined by the greater or less amount of ellipticity of the spheroid in question. Should this ellipticity be *nil*, the spheroid will coincide over its whole extent with the sphere, and there will be no double refraction. This is the case with all crystallized bodies, whether mineral or artificial salts, whose primitive form is the cube. In some cases (comparatively rare ones), of which quartz or common rock crystal is an example, the spheroid is of the kind called *prolate*, or one formed by the revolution of an ellipse round its *longest* diameter, and is therefore wholly contained within the sphere. In these, then, the velocity of the extraordinary ray within the crystal is less than that of the ordinary, and the latter ray, which is the more refracted of the two in Iceland spar, is in such crystals the less so. On comparing different crystals, however, it is not found (which perhaps might have been expected) that the ellipticity of the spheroid in question is determined solely, or even principally, by the degree of obtuseness of the rhomboidal form of the crystal. It appears to be regulated far more by the chemical and other physical qualities of the material.

---

* This and the next paragraph may be passed over by the general reader.

* This is Huyghens's explanation, and the correct one.

(*To be continued.*)

AUTUMN.

AUTUMN is near to her death;
All through the night may be felt her languidly scented breath
Coming and going in gasps, long drawn 'mid the shivering trees,
Out on the misty moors, and down by the dew-drench'd leas.

Her face grows pallid and grey,
The healthy flush of her prime is solemnly fading away,
And her sunken cheeks are streak'd with a feverish hectic red,
As she gathers the fallen leaves and piles them about her bed.

Her bosom is rifled and bare;
Gone is the grain and the fruit, and the flowers out of her hair—
Whilst her faded garment of green is blown about in the lane,
And the glance of her lover the sun is coldly turn'd on her pain.

She lies forlorn and alone;
The little chorusing birds have a wailing, unhappy tone,
As they fly in a crowd to the hedge, when the evening mists arise,
To curtain the bed of death and shadow the closing eyes.

But to-night the silent cloud,
Dropping great tears of rain, will come and make her a shroud—
Winding it this way and that, tenderly round and round,
Then catch her away in its arms from the damp unwholesome ground.

All her labour is done:
Perfected, finish'd, complete, 'neath the wind and the rain and the sun;
All the earth is enrich'd—the garners of men run o'er—
There is food for man and beast, and the stranger that begs at the door.

Swiftly approaches the night:
Whatsoever thy hand finds to do, do it with all thy might;
Labour right on to the end; let thy works go forth abroad;
Turn thy face to the sky, and enter the joy of thy Lord.

N.

EASTWARD.

Plain of Esdraelon and Galilee.

AFTER leaving Samaria we passed, at some distance to the left, a gently swelling hill rising out of the plain, called *Tell Dothain.* Strange that the name of *Dothan* should still remain attached to this spot. Most willingly would we have turned aside for an hour to visit the place where that story of Joseph and his brethren, which for ages has been read with breathless interest by the young child and the aged saint, began to unfold itself; and where also that wondrous scene occurred for the account of which I refer my readers to 2 Kings vi. 8—23. But we were prevented by that want so common in a world where men's lives are short—the want of time.

It is worth noticing, however, that the caravans from Gilead to Egypt still enter the hill country at Dothan, passing thence to the maritime plain by Gaza. I have never heard of the pit into which Joseph was let down having been discovered. But it is only a few years since this locality was identified; and no doubt our ignorance of it and of many spots associated with caves, rocks, and other unchanged features of the country, would to a large extent be dispelled, if such a society as that which has been formed for the exploration of Palestine were properly encouraged.*

---

* Why does this society not appeal to the provinces and great commercial towns for support? It would be sure to get the necessary funds if some of its leading

Our next halt was at *Jenin* (the ancient Engannim of Joshua xxi. 29), and there, on a grassy field, with a sparkling stream of water rushing past, we pitched our tents. Unseen frogs, more numerous than could be accommodated in the grand orchestra of the Crystal Palace, croaked a concert all night long. The village of Jenin rose above us; but we did not visit the dishonest and disorderly settlement, having been advised to give it what sailors call "a wide berth." We were a strong party, and showed our sense of security by adding to the brilliancy of the moon the light of a few Roman candles, whose loud reports and starry rays impressed the Arabs with some respect for our power. So at least we fondly believed, although it was as well that they did not put our strength to the proof.

Jenin is on the edge of the great plain of Esdraelon, which we had to cross on our way to Nazareth. What a strange "Blue Book" of Turkish rule is this same plain of Esdraelon! It is one of the most fertile in the world. It might present such a scene of peasant prosperity, comfort, and happiness as could not be surpassed on earth. But instead of this it is a rough uninhabited common, and, but for the bounty of Nature—which, with never-failing patience and charity, returns an hundred-fold whatever is here committed to its soil—it would be a dreary wilderness. Unfortunately there are beyond the Jordan a numerous and wide-spread race of scoundrels, who live in tents, gallop about on fine horses, brandish spears, fire long guns, tell lies, rob their neighbours, and possess no virtue under heaven that is not serviceable to their greedy pockets or hungry stomachs. Romance they have none, unless it be the romance of plunder. Their "Arabian Nights" are but nights of robbery. The Turkish Government, or even a London "Limited" Company possessing ordinary sense and enterprise, might, with a dozen rifled cannon placed in commanding positions, keep these Ishmaelites at bay, and defy them to steal west of the Jordan. But as things are now managed, the Bedouin make a raid as a matter of amusement or profit. They swarm like locusts from the Hauran, cover the great plain, pitch their black tents, feed their camels, gallop their horses, reap the crops, shoot the peasants, and then return to their lairs beyond the Jordan, there to crunch their marrow-bones at leisure with none to molest them or make them afraid.

Much is said about the power of a certain Agyhil Agha who reigns over the plain, and is employed as a sort of detective, on the principle, I suppose, of setting one thief to catch another. Agha, from suspicion or jealousy, was at one time dismissed by the Government of Constantinople, and another governor, or pasha, or detective, put in his place. But he attacked the Turkish troops who were sent to seize him, and massacred about eighty of them. Having thus shown his talent and force of character to the satisfaction of the Sublime Porte, he was forthwith reappointed police officer of the district. Such is Turkish "government." There is no doubt, however, that Agyhil Agha is a powerful chief, and exercises much authority over the district, protecting Christian and Moslem with even-handed justice, and being a great terror to evil-doers from the Hauran. Travellers are therefore recommended to obtain, for guide, councillor, and friend, one of Agha's troopers, who, when paid reasonable black mail, will secure the lives and property of those committed to his charge. Our worthy dragoman Hadji Ali did not, however, deem it necessary to adopt this precaution, although he expressed anxiety to see us safely across the Pirate Gulf. Begging my pistol, he loaded it, and gallantly went ahead as guard and scout.*

We pushed on from Jenin towards Jezreel, which is about seven miles to the north. The low point on which Jezreel is situated runs into the plain of Esdraelon from the high ridge of Gilboa, dividing it into two unequal bays. Approaching Jezreel from the south, there is little apparent ascent, but the plateau on which it is built falls rapidly on the north side, by a descent of 200 feet or so, to the other portion of the plain, which lies between it and the range of the Little Hermon, or El Duhy, and which is called the plain of Jezreel, though it is but a bay of Esdraelon. On or near the spot where Ahab's Palace is likely to have stood is an ancient tower, built I know not when, nor by whom. We ascended to its upper story, and there, through three windows, opening to the east, west, and north, obtained an excellent view of all the interesting portions of the surrounding landscape. Beneath us lay the famous plain, a rolling sea of verdure, yet lonely looking, being without inhabitants. We saw no villages or huts dotting its surface, not even a solitary horseman, but only troops of gazelles galloping away into the distance, and some birds of prey, apparently vultures, wheeling in the sky, and doubtless looking out for work from their masters the Bedouin. This green prairie stretches for upwards of twenty miles towards the Mediterranean. It is the more striking from its contrast with the wild bare hills among which we had been travelling, and with those which look down immediately upon it. It separates the highlands of Southern Palestine from the hill country of the more lowland north, as the plain along which the railway passes from Lochlomond to Stirling separates the highlands of Rob Roy from

---

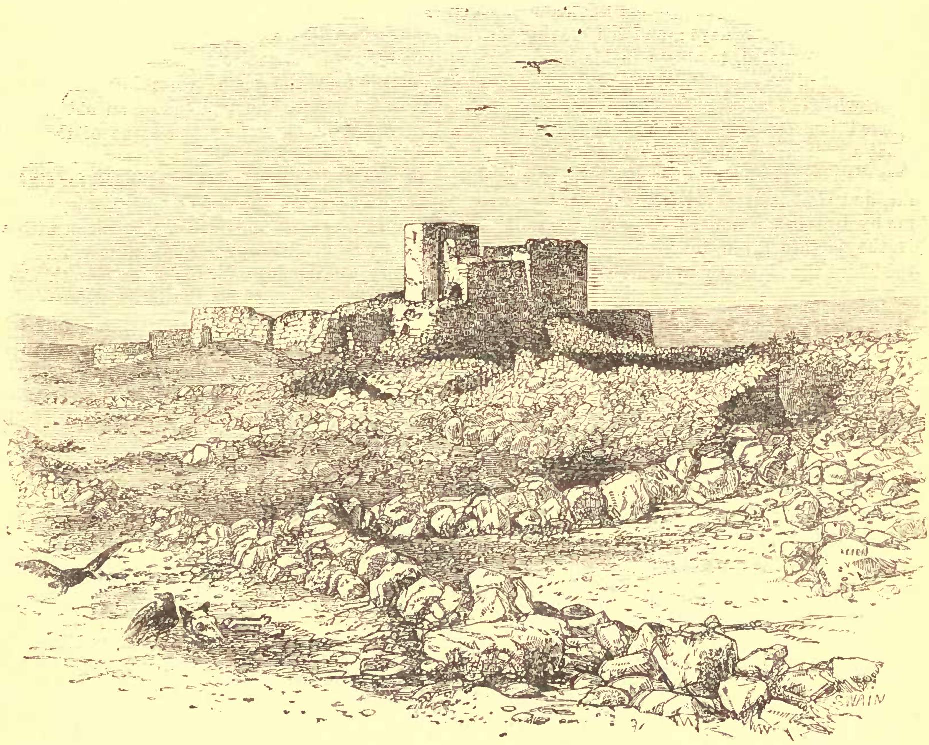
members would only take the trouble to bring its claims *viva voce* before the general public.

* Though we laughed at Hadji's fears, and put them down to a little love of display or of excitement, yet I learn from M. de Pressensé's narrative of his tour, that our former fellow-traveller, the ex-Duke of Modena, was robbed on this plain a few days after we crossed it! As a warning to travellers, I may here state that my pistol, which was sent home in a box from Beyrout, was, on examination by the Custom-house officers at Liverpool, found to be loaded. Never having loaded it myself, and being ignorant of Hadji's having done so, I very carelessly did not think of examining it before it was packed.

the lowland hills of the Campsie range that rise above the valley of the Clyde.

This tower of Jezreel is another of those points of view which commands a number of famous historical places, the sight of which, with their relative positions, gives great clearness and vividness to the Bible narratives. Standing on the tower, we see, through the window looking northward, three or four miles off, the range of the Little Hermon (a *fac simile* of the Pentlands, near Edinburgh), with the village of Shunem on one of its slopes. Through the eastern window the view is filled up by the rolling ridge of Gilboa. The western window opens to the plain vanishing in the distance with the long ridge of Carmel, and other hills bounding it to the south, and the hills of Galilee to the north. With map and Bible in hand, let us look through these open windows, and see how much of the past is recalled and revivified by even one view in Palestine.

Through the opening to the north, we see Shunem, where dwelt the good Shunamite, whose little humbly-furnished chamber in the wall welcomed the great prophet "who oft passed by" that way, and who must have been familiar therefore with every object which now meets our eye, as well as with many others that have passed away. We see at a glance how the afflicted mother, with the thoughts of her dead child and of "the man of God" in her heart, would cross the plain to the range of Carmel, ten or twelve miles off. We also see how from its summit the Prophet would see her riding over the plain, and how he would have accompanied her back again.



Mount Carmel.

Jezreel, from the East.

Hills of Nazareth.

[J. Graham, Photo.

And Shunem, with Gilboa seen out of the eastern window, recall two great battles familiar to us:—the battle of Gideon with the hordes of the Midianites who swarmed along the sides of Hermon, and the battle of Saul with the Philistines who occupied the same position.

From Gilboa, Gideon with his selected army descended. Immediately beneath it we can see the fountain—gleaming like burnished silver in the sun's rays—where doubtless Gideon had separated the rash and the cowardly from his army. Descending at night with his select band from these rocky heights, he must have passed the narrow valley which lay between him and Shunem. Then with three hundred lights suddenly revealed and gleaming on every side, as if belonging to a great army, and with the piercing war-cry of "The Sword of the Lord and of Gideon!" he fell like a lightning-stroke on the sleeping and careless host, who, seized by a panic, fled in terror before the pursuing warriors, down the steep descent to the fords of the Jordan.

On the same place, too, the host of the Philistines, which made Saul sore afraid, pitched their tents on the night before they attacked the king and his son on Gilboa. One sees how Saul must have then travelled to En-dor. It lies two hours off on the other side of Hermon. He must have gone round the right flank of the enemy, crossing the shoulder of the hill to reach it. One of the most dreary spectacles of human misery was that journey to the foul den of the witch of En-dor! We see the tall form, bent like a pine-tree beneath the midnight storm, but every inch a king in spite of his disguise, enter the cave in darkness and bow down before the deceiving hag. How touching his longing to meet Samuel, who had known and loved him in his better days; and his craving desire, however perverted, to obtain in his loneliness the sympathy of any spirit, whether alive or dead. And when he sees, or rather believes that the wicked impostor sees, the form of his old friend, what a wail is that from a broken heart:—"I am sore distressed! The Philistines make war against me, and God is departed from me, and answereth me by dreams no more!" The only parallel to it is the picture given by Shakespeare of Richard the Third the night before he was slain:—

> "I shall despair:—there is no creature loves me;
> And if I die, no soul shall pity me."

But Saul was loved by one whom his proud and eager ambition dragged down with himself on the bloody battle-field; and he was pitied by one who had ever reverenced his kingly head, and had dispelled the brooding darkness from his soul by the cunning minstrelsy of the harp. And the sweet singer of Israel has for ever invested those sterile hills of Gilboa with a charm, by his incomparable lament for Saul and Jonathan,—by the womanly love which it breathes for his old friend, and the chivalrous generosity, the godlike charity, which it pours out in tears over his old enemy:—"Saul and Jonathan were pleasant in their lives, and in their death they were not divided!"

As if to make the scene of that battle-field still more complete, the top of the hill of Beth-shaan (now called Beisan) rises, like Dumbarton rock, close under the hill of Gilboa, and overhangs the valley of the Jordan. To the gates of its citadel the bodies of Saul and his three sons were fastened, until removed by the brave men of Jabesh-gilead,* from the opposite side of the Jordan, who thus testified their remembrance of the time when Saul had delivered them, thirty years before, from the Amorites.†

But the interest and teaching of this old battle-plain are not yet exhausted. As we look out of the opposite window, towards the south and west, we see to the left a long line of low hills which here and there send points into the plain, with retiring bays and valleys between, and end at the smooth ridge of Mount Carmel. On the shore of one of those green bays, seven or eight miles off, we see Taanach, and four miles or so beyond, Megiddo, past which "the waters of Megiddo" flow to join the Kishon. Now it was from Tabor, which is concealed from us by the ridge of the Little Hermon, that Barak, at the instigation of Deborah, marched about twelve miles across the plain from the north, and amidst a storm of wind and rain attacked the chariots of Sisera in the marshes of the Kishon, and gained that famous victory which freed Israel from the terrible thraldom in which they had been held by the heathen Canaanites.

At Megiddo, too, the good Josiah was killed in his brave but foolish attempt to stay the progress of the king of Egypt when going to attack the Assyrians.

Again we notice from the same window, a few miles off in the plain, what looks like a ruin. It is El Fuleh, the remains of an old Crusaders' fortress, and famous as the scene of the "battle of Mount Tabor," where a French force of 3000 men under Kleber, resisted in square, for six hours, a Turkish army of 30,000, half cavalry and half infantry, and, when joined by Napoleon with fresh troops, gained the battle. After all it was a fruitless victory to Napoleon, for Sir Sidney Smith checked his Eastern progress by the brave defence of Acre—another scene of battle almost belonging to the plain of Esdraelon. It is strange indeed to have thus connected in the same place, battles fought by Barak, Gideon, Saul, and Napoleon! It is probably from the fact of this place having been of old the great battle-field of Palestine, that in the book of Revelation it is made the symbol of the mysterious conflict called "the battle of Armageddon" or "the city of Megiddo."

And there are other associations still suggested by the landscape. The most tragic and dramatic histories in the Old Testament are recalled by the place we stand on, and by Carmel in the distance. For on that height beyond Megiddo, and on a spot which with highest probability can be identified, the great Elijah met the prophets of Baal, in a terrible world conflict, God himself testifying to His faithful servant, who apparently was a solitary witness for His being and character. From that spot, twelve miles off, the prophet, borne up by an ecstatic fervor at such a crisis in his own life and in the life of the nation, ran, amidst the storm of wind and rain, before the chariot of Ahab to this Jezreel:—"It came to pass in the mean while, that the heaven was black with clouds and wind, and there was a great rain. And Ahab rode, and went to Jezreel. And the hand of the Lord was on Elijah; and he girded up his loins, and ran before Ahab to the entrance of Jezreel."

To this Jezreel the same Elijah, after having been threatened by the murderess Jezebel, returned from his mysterious and awful journey through the wilderness to Horeb. Weak and fearful as a man, but strong in God, he came to slay Ahab and Jezebel with the sword of his mouth for the murder of poor Naboth. "And the word of the Lord came to Elijah the Tishbite, saying, Arise, go down to meet Ahab king of Israel, which is in Samaria: behold, he is in the vineyard of Naboth, whither he is gone down to possess it. And thou shalt speak unto him, saying, Thus saith the Lord, Hast thou killed, and also taken possession? And thou shalt speak unto him, saying, Thus saith the Lord, In the place where dogs licked the blood of Naboth shall dogs lick thy blood, even thine. And Ahab said to Elijah, Hast thou found me, O mine enemy? And he answered, I have found thee: because thou hast sold thyself to work evil in the sight of the Lord."

---

* 1 Sam. xxxi. 11.

† 1 Sam. xi. 3, 4.

And here too, where we stand, occurred all that terrible and almost unequalled tragedy recorded in the 9th chapter of the 2nd Book of Kings, when Jehu was selected as a most willing instrument in God's Providence for executing judgment on an infamous family. The whole living scene of horror seems to pass before our eyes;—King Joram living here with his mother, Jezebel, while recovering from his wounds;—King Ahaziah, courtly but unprincipled, coming from Jerusalem to visit Joram;—the sudden appearance of Jehu, driving furiously along the plain, from Jabesh-gilead, and easily seen six miles off;—the meeting of the kings with him in the vineyard of Naboth, probably near yonder fountain in the plain which had watered the poor man's garden of herbs;—the death of Joram;—the flight of Ahaziah to Jenin, and then to Megiddo, where he died;—the hurling of the wicked Jezebel out of the window, in spite of her paint and her hypocrisy, and her destruction by the wolfish dogs, which does not pain me, but indeed gives me great satisfaction—she was so vile! And then—for the horrible history of the place is not over—the ghastly pile of seventy heads of the sons of Ahab slain at Samaria, and the subsequent massacre of all connected with the house and palace of Ahab.

All these incidents are recalled from the tower of Jezreel as we gaze on the several places where they occurred, and which brings them up with as much vividness as the field of Waterloo recalls the events of that great battle. But Nature has resumed her quiet reign over the hill of Jezreel. All is silent and desolate now; Baal and his worshippers have passed away, and so have the calves of Bethel and of Dan, and the very memory of those events and their actions has departed from the land. Evil, like a fierce hurricane, always blows itself out; while good, like the sun, shines ever on from generation to generation. And so while Ahab and Jezebel have ceased to influence the world except as witnesses for God's righteous opposition to evil, Elijah, once alone and broken-hearted, and anxious to find a grave, lives in the heart of the Christian Church, as one transfigured with his Lord, and the type of every faithful brother.

We were very thankful to have stood on this tower of Jezreel. It is a noble pivot for memory to turn upon. It made whole chapters of history much clearer to us.

We crossed the plain, and passed through Shunem. There are no "great ladies" there now, as it is a very squalid village; nor did its inhabitants appear to be descendants of any good Shunamites, male or female, for we were pelted with stones when passing through. Fortunately, however, they were neither very large nor very near, serving only to make us quicken our pace, and Hadji to scold in fierce guttural Arabic with pistol in hand. The attack was made by a number of boys, from the heights, and was doubtless prompted by the universal love of mischief peculiar to the young portion of our race, rather than by any hatred of Nazarenes peculiar to the place.

We crossed Hermon, and found ourselves in a small decayed village on the edge of another bay of Esdraelon, which rolls between the hills of Galilee and Hermon to the north. Hadji Ali recommended us to halt here, as it was an excellent place for lunch, having shelter from the heat, good water, and above all a friendly sheik, who would sell him a good lamb. But the village had attractions to us which Hadji knew not of. It was Nain. It is poor, confused, and filthy, like every village in Palestine, but its situation is very fine, as commanding a good view of the plain, with the opposite hills, and especially of Tabor, that rises like a noble wooded island at the head of the green bay. And Nain, in the light of the Gospel history, is another of those fountains of living water opened up by the Divine Saviour, which have flowed through all lands to refresh the thirsty. How many widows, for eighteen centuries, have been comforted, how many broken hearts soothed and healed, by the story of Nain,—by the unsought and unexpected sympathy of Jesus, and by His power and majesty. It was here that He commanded those who carried the bier of the widow's only son to stop, and said to the widow herself, "Weep not," and to her son, "Arise!" and then "delivered him to his mother," the most precious gift she could receive, and such as a divine Saviour alone could bestow.

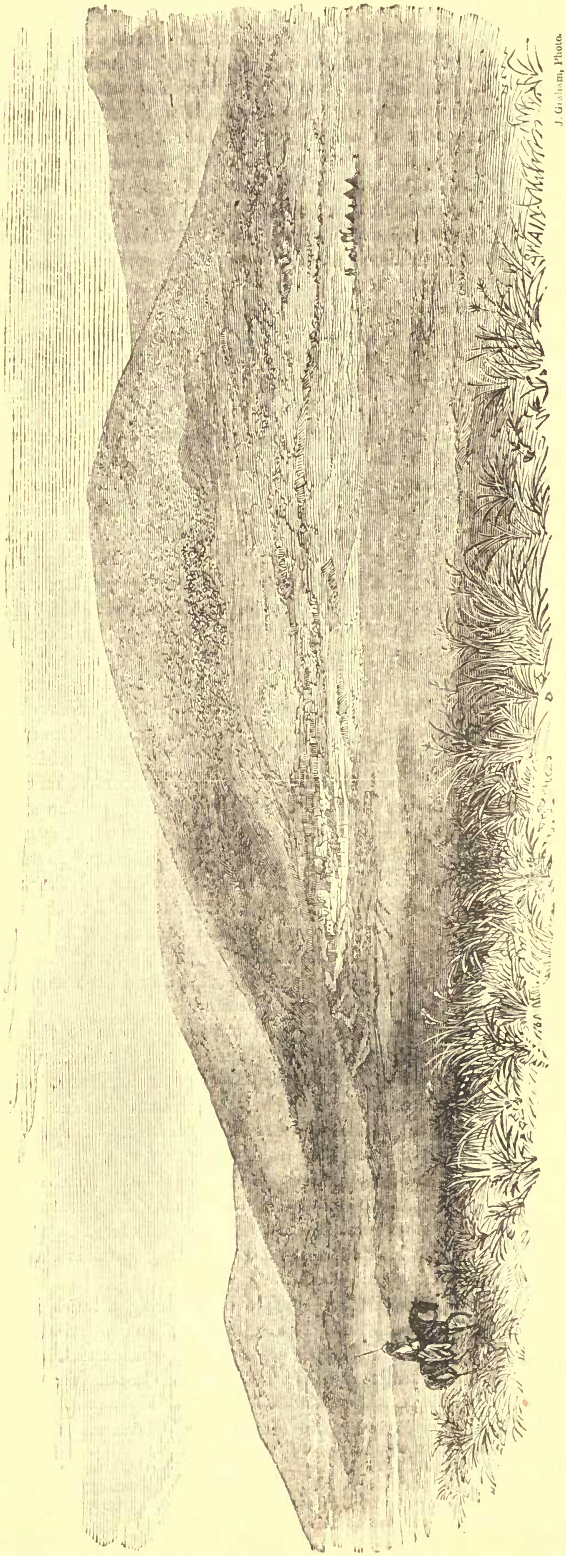
What has Nineveh or Babylon been to the world in comparison with Nain? And this is the wonder constantly suggested by the insignificant villages of Palestine, that their names have become parts, as it were, of the deepest experiences of the noblest persons of every land, and every age.

There are many remains of old tombs to the east of the village, and one may conjecture that it was as our Lord came into the city from Capernaum, that he met the procession going towards the tombs in that direction.

Hadji's hopes as to our getting a lamb in Nain were fulfilled. The sheik sold us one, and the moment the bargain was concluded, he unexpectedly drew his knife, and killed the animal in our presence.*

---

* Before flaying the lamb, an incision was made in the skin near the hind foot, when the sheik, applying his mouth to the orifice, inflated the whole skin. This seemed to make the operation of flaying much easier. For aught I know, this practice may be common, but I never saw it before or since.



J. Graham, Photo.

THE PLAIN OF JEZREEL, SHUNEM, AND LITTLE HERMON.

We crossed the plain and began to ascend the hills of Galilee which rise abruptly from it. The day was unpleasantly hot, and the sun beat on us with a heat more burning than we had hitherto experienced in Palestine. The ascent of the mountain, too, was by a wild path, which, as when descending to El Heramyeh, was for some time along the channel of a torrent. There is another path further north, which is shorter, I believe, but it is rougher still. But the end of our day's journey was the early home of Jesus. And who would grudge any amount of heat or fatigue when pushing on for such a destination! We soon descried the white houses of Nazareth, and with an eager inquiring look gazed on the inland basin, as I may call it, which, like a green nest, lies concealed from the gaze of the outer world among these beautiful secluded hills. We entered the town, and held straight on by church and convent, until, through narrow crowded bazaars and filthy lanes, we reached the further outskirts, and found our tents pitched in an olive grove whose venerable trees have sheltered many a traveller. How much of the pleasure derived from seeing an object, such as a great work of art, or a scene of beauty or of historical interest, is derived from sympathy with others who have experienced the same feelings? Not alone, therefore, but with thousands who had gone before us, we travelled through Palestine, and looked out from the olive grove on the hills of Nazareth. I did not visit any church, Greek or Latin. I had no wish to see the Holy Place of the Annunciation, as pointed out by the Greeks in their church at one end of the town, or by the Latins in theirs at the other. I had not even the curiosity to examine the place in the Franciscan Convent where that house of the Virgin once stood which was conveyed by angels to Loretto, and which, having received the sanction of the Infallible Church in 1518 through the Papal Bull of Leo X., is daily visited by greater crowds of admiring pilgrims than any holy place in Palestine, or perhaps in the world. I was much more anxious to exclude every thought

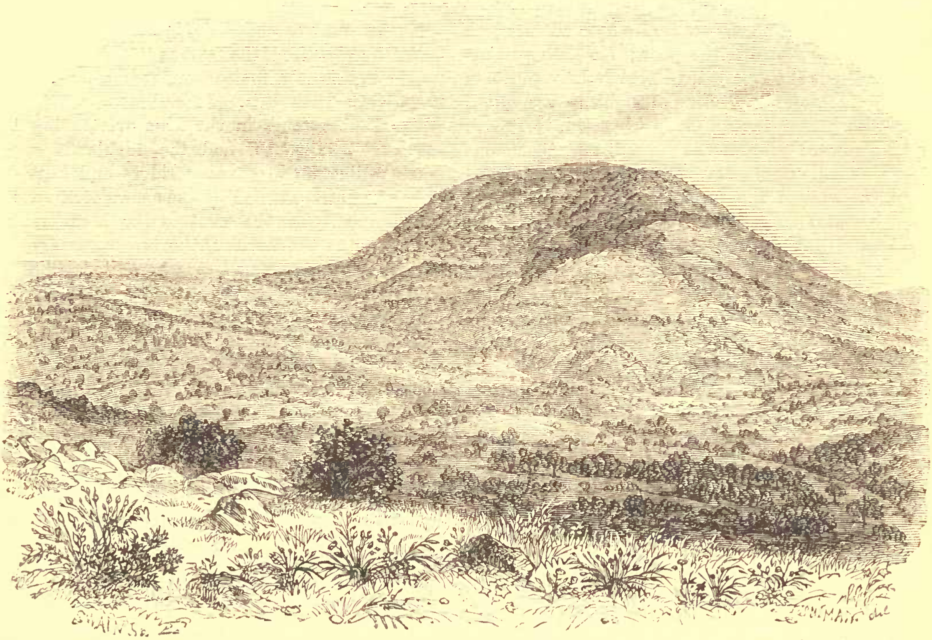
NAZARETH, FROM THE EAST.

and object which could distract my mind when seeking to realise this place as the home of Jesus of Nazareth.

When the sun set I took a walk, all alone, along the hills. The night was illuminated by a full moon, which seemed to stand out of the sky as if it did not belong to the depths of blue beyond. Every object was revealed with marvellous clearness; while the dark shadows from rock and tree, from "dell and dingle," with the subdued light veiling the bare white limestone, gave not only relief to the eye, but added to the beauty and picturesqueness of the scene. A low undulating ridge of hills encloses the green plain that lies like a lake, with Nazareth built on one of its shores. I soon reached a point opposite to the town, where I sat down, protected from the intrusion of any chance traveller or prowler by the deep shadow of a tree. Thence, amid a silence broken only by the barking of the never-silent dogs, I gazed out, feeling painfully, as I often did before, the difficulty of "taking it all in." I inwardly repeated "This is Nazareth! Here—in this town—among these hills—Jesus was brought up as a child, and was subject to His meek and loving mother, 'full of grace;' here as a boy 'He grew in wisdom and in stature;' here for many years He laboured as a man for His daily bread; here He lived as an acquaintance, neighbour, and friend. For years He gazed on this landscape, and walked along these mountain paths, and worshipped God among these solitudes, 'nourishing a life sublime' and far beyond our comprehension. Hither, too, He came 'in the Spirit,' after His baptism by water and by the Holy Ghost, and His consecration to the ministry; and after that new and mysterious era in his hitherto simple and uneventful life, when he was tempted of the devil. Here He preached His first sermon in the synagogue in which it had hitherto been His 'custom' to worship and to receive instruction; and here, too, he was first rejected, the dark cloud of hate from His brethren gathering over his loving soul. And one of these rocks became a rehearsal of the Cross of Calvary. Can all this," I asked myself, "be true! Was this indeed the scene of such events as these!"



J. Graham, Photo.

Mount Tabor, from the North.

There was nothing very grand in the appearance of the place, yet the circumstances under which I saw it prevented any painful conflict arising in the mind between the real and ideal. The town, with its white walls, all gemmed with lights scintillating with singular brilliancy in the mountain air, seemed to clasp the rugged hill-side like a bracelet gleaming with jewels. Masses of white rock shone out from dark recesses. The orchards and vineyards below were speckled with patches of bright moonlight breaking in among their shadows; while peace and beauty rested over all.

The question may naturally suggest itself to the reader, as it often does to the traveller, whether an earthly setting to such a picture as the life of Jesus has not a tendency to weaken one's faith in the divinity, in proportion as it compels him to realise the humanity of Christ's Person? The reply which each traveller will give must necessarily be affected not only by his previous belief regarding Christ's Person, but by the proportion of faith, so to speak, which he has been more or less consciously in the habit of exercising with reference to our Lord's divine and human nature. Whether it was that in my own case the humanity of our Lord has ever been very real and precious to me, I know not, but the effect upon my mind of the scene at Nazareth was, if possible, to intensify my faith in His divinity. For as I gazed on that insignificant and lowly town, so far removed at all times from the busy centres of even provincial influence, I remembered how, in that memorable sermon preached there to His old acquaintances and kinsfolk, these words were uttered by Him:—"The Spirit of the Lord is upon me, because He hath anointed me to preach the gospel to the poor; He hath sent me to heal the brokenhearted, to preach deliverance to the captives, and recovering of sight to the blind, to set at liberty them that are bruised, to preach the acceptable year of the Lord:" and that same Jesus added, "This day is this scripture fulfilled in your ears." I then recalled the previous life of the Man who dared thus to speak;—how since His boyhood He had lived among the people whom he then addressed a life marked by no sign or wonder, but only by holiness, which men were too commonplace and unholy to see,—a life too in its ordinary visible aspects so like their own, that when He thus spoke all were amazed as if a great king had been suddenly revealed who had been from childhood among them in disguise; and they asked with astonishment, "Is not this Joseph's son?"

Recalling this, and contrasting that past with all that had since sprung up out of the holiest hearts, and all that had been accomplished on earth in the name of Jesus, then arose again the question put 1800 years ago:—"Can any good thing come out of Nazareth?" And what reply could I then give to it from personal experience, and from the light cast upon it by "the long results of time?" As a minister and member of the Church of Christ, and as a representative of a vast multitude on earth, and of a greater multitude now before the throne of God, I could but say, "Yea!" As sure as there is a right and wrong, as sure as there is a God, the highest good that man can possess and enjoy, has come to us out of this very Nazareth! From an experience tested in every land, in every age, in every possible variety of outward and inward circumstances, we know that Jesus of Nazareth has proved himself to be what He said He was when He preached that first sermon; we know and can testify that in our own spirits He has verily "fulfilled that word"—that He has healed our broken hearts, delivered us who were captives to sin, restored our sight when blind, and given us that light which carries with it its own evidence of truth, and enables us to see God, filling our hearts with joy and gladness! This was my reply.

And a further question may suggest itself—"Who was, or who is, this person, Jesus of Nazareth, to whom we owe all this good?" A man like ourselves? Yes, but surely more than a mere man! The very perfection of His humanity points to something above humanity. And our faith is not in a Christ that was, to whom we owe all this good, but in a Christ that is—in one who "was dead, but is alive and liveth for evermore," and who is found to be the resurrection and the life of every man who has faith in Him. Therefore it was that, believing and knowing this, the Divine Person of Christ, as I gazed at lowly Nazareth, reached the sky, and filled the whole earth with His glory!

Next day we ascended the hill above the town to enjoy the view from the famous "Wely." There is not in Palestine a more commanding or more glorious view than this. It embraces a landscape which almost takes in the hills overlooking Jerusalem to the south, and the highlands of the north rolling up in crossing ridges and increasing in height until crowned by the snows of the majestic Hermon. To the west is the Mediterranean stretching to the horizon, the brown arms of the bay of Acre embracing it where it touches the land; while to the east are the hills of Gilead beyond the Jordan, vanishing in the pathless plains of the Hauran. Within this circumference every object is full of interest. The magnificent plain of Esdraelon lies mapped beneath us with its verdant bays, surrounded by famous shores. The view also among the hills of Galilee is most beautiful, varied as it is by rich inland plains too remote for the ravages of the Bedouin, and by picturesque and broken knolls clothed with wood, vines, and olives, and surrounded by verdant grass and corn-fields. There is one bright gem in the centre of all, Cana of Galilee, where He who came eating and drinking sanctified for ever the use of all God's gifts, calling none of them common or unclean, and the memories of which will for ever mingle with the joys of the marriage feast. All around us were the "ruins famed in story," which we had seen on the previous day.

One thought was constantly present—Jesus must often have gazed on this view and recalled the events recorded in Old Testament history suggested by it. It is remarkable that in His first sermon preached at Nazareth He alludes to the two great prophets, Elijah and Elisha, who made this plain illustrious by their deeds. What His thoughts and anticipations were, as He meditated on all the past for many a year, cannot be guessed by us. Enough that we were privileged to walk where He walked, to see what He saw, and, best of all, to know the truth of what He taught.

From the "Wely" we pursued our journey to Tiberias, and bade farewell to Nazareth. Why attempt to describe our road? No one who has not travelled it will *see* it from any words of mine, and those who have seen it need not have recalled to them what, after all, is not particularly worth remembering.

The most striking view on the road is that of the famous "Kürün," or "Horns of Hattîn." The general appearance of the hill is this—

I have applied the word famous to these "horns," not because of the view either of them or from them, though both are striking; but because they mark the traditional Mount of the Beatitudes. This tradition has more in its favour than most traditions, as the position of the mountain with reference to the Lake of Tiberias in its neighbourhood, and the formation of the "horns," reconcile the narrative of the circumstances in which "the Sermon" seems to have been preached, first from one height, and then from a lower. Dr. Stanley says regarding it:—"It is the only height seen in this direction from the shores of the Lake of Gennesareth. The plain on which it stands is easily accessible from the lake, and from that plain to the summit is but a few minutes' walk. The platform at the top is evidently suitable for the collection of a multitude, and corresponds precisely to the 'level place' (τόπου πεδινοῦ), to which He would 'come down' as from one of its higher horns to address the people. Its situation is central both to the peasants of the Galilean hills, and the fishermen of the Galilean lake, between which it stands, and would therefore be a natural resort both to 'Jesus and His disciples,' when they retired for solitude from the shores of the sea, and also to the crowds who assembled 'from Galilee, from Decapolis, from Jerusalem, from Judæa, and from beyond Jordan.' None of the other mountains in the neighbourhood could answer equally well to this description, inasmuch as they are merged into the uniform barrier of hills round the Lake; whereas this stands separate—'the mountain' which alone could lay claim to a distinct name, with the exception of the one height of Tabor, which is too distant to answer the requirements."

It was on these horns also that the last great battle of the Crusaders took place. A strange comment this on the Beatitudes! The first and best account of this famous battle was published by Dr. Robinson. Enough for me to tell, that on the 5th of July, 1187, the army of noble knights, 2000 in all, with 8000 followers, drew up in order of battle around the Horns of Hattîn to meet the brave and generous Saladeen. The Crusaders had behaved in a most treacherous manner to the Moslems, and had grossly broken their treaty with them. Saladeen was more righteous than they. They carried as their rallying banner the true cross from Jerusalem; but the Moslems had its justice on their side, though not its wood. After days of suffering and after many gross military mistakes, the Crusaders found themselves terribly beaten, and all that remained of them on the evening of this awful battle-day gathered on and around the Horns of Hattîn. King Guy of Lusignan was the centre of the group; around him were the Grand Master of the Knights Templars, Raynald of Chatillon, Humphrey of Turon, and the Bishop of Lydda, the latter of whom bore the Holy Cross. All at last were slain or taken prisoners, and the Holy Land was lost. Few know these Crusaders' names now, or care for them. They were famous in their day, and had their ballads and lady-loves, and were the admired of many a pilgrim. But they represented an age that was passing away, for it had done its work in the world. Yet who can see with indifference the spot where that storm of battle roared, amid the gleaming of axes, the flashing of swords, the streaming of banners, the loud cries and yells of victory or despair, and know that it was the burial-day of the Crusades, and the triumph for a time of the Moslem, without stopping his horse, gazing on the scene, sighing, meditating, and then—alas for the bathos as well as the pathos of human nature!—probably lighting his cigar.

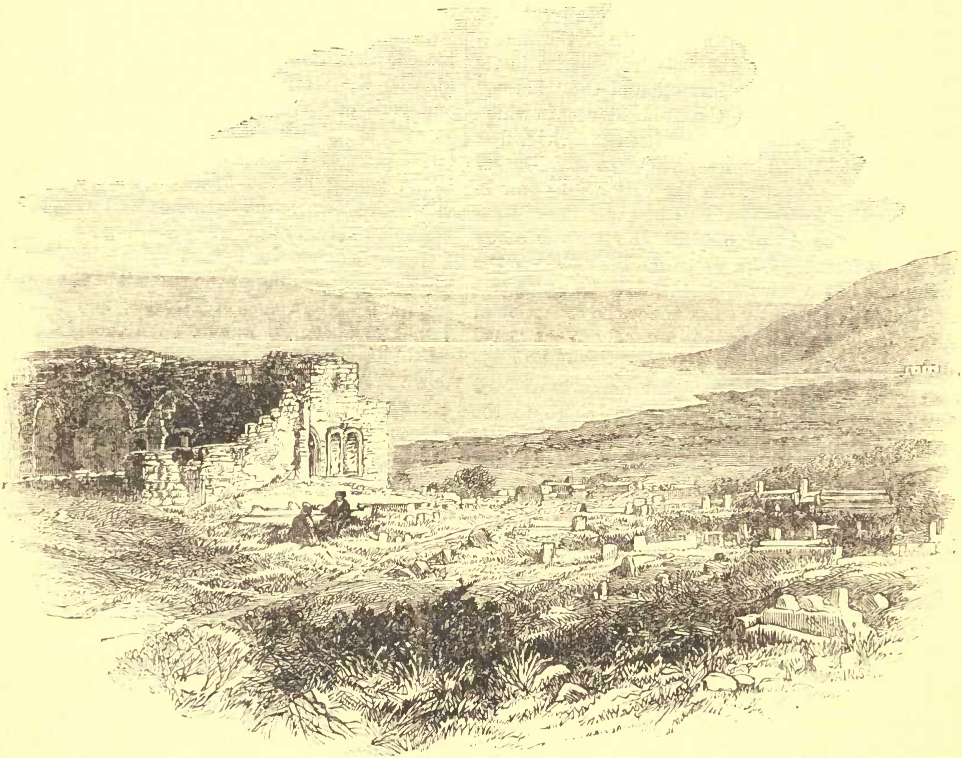
We rode along the upland ridge which ends in a gentle ascent leading to the summit of the hills that form the western side of Tiberias, and rise about 1000 feet above its waters. We thought that we would have had time to ascend this height and look down from it upon the whole Lake. But the distance to it was greater than we anticipated, and so, descending the steep sides of the hill, we gained the ordinary track which leads round its base to Tiberias. We soon came in sight of the Lake, and thus had another dream of our life realised! Passing round the town, with its many ruins, few palms, and great poverty, we reached our tents, which we found delightfully pitched on the shore of the Lake, and at a safe and pleasant distance from the town.

The first impressions made upon me by the scenery of the Lake of Tiberias are very easily described. *Visibly* it was but a lake, and "nothing more." The east and west shores possess very different characters. The eastern shore has the same aspect as that of the Dead Sea—the same kind of terraced look, as if caused by a series of volcanic upheavings, at long intervals.* The western shore is decidedly Scotch, owing, I presume, to its trap (?) as well as its limestone. Its rounded hill-tops and broken grass-covered slopes certainly wore to me an old familiar look, recalling the hills of Moffat, or those round many of the Scotch lakes.

The desolation of the shores of the Lake is another feature which at once strikes us. We see no trees—no white specks of houses—no trace of life—but a dead monotony without any variety of outline to give picturesque interest. The Lake is about fourteen miles long, six to seven broad at its centre, and five at Tiberias. Yet there is no town on its shores but this ruined Tiberias; and so wholly given up to the lawless Bedouin is its eastern side that there is danger in landing there unless under the protection of some chief, to whom liberal backsheesh must be paid. Yet this Lake was in our Saviour's days one of the busiest scenes in Palestine, with a dozen or more flourishing towns on its shores, gay palaces giving to it the air of wealth and splendour, and a thriving traffic enlivening its waters. As Dr. Stanley remarks, "In that busy stir of life were the natural elements, out of which His future disciples were to be formed. Far removed from the capital, mingled, as we have seen, with the Gentile races of Lebanon and Arabia, the dwellers by the Sea of Galilee were free from most of the strong prejudices which in the south of Palestine raised a bar to His reception. 'The people' in 'the land of Zabulon and Nephthalim, by the way of the sea beyond Jordan, Galilee of the Gentiles,' had 'sat in darkness;' but from that very cause 'they saw' more clearly 'the great light' when it came: 'to them which sat in the region and the shadow of death,' for that very reason 'light sprang up' the more readily. He came to 'preach the Gospel to the poor,' to 'the weary and heavy laden'—to 'seek and to save that which was lost.' Where could He find work so readily as in the ceaseless toil and turmoil of these teeming villages and busy waters? The heathen or half-heathen 'publicans' or tax-gatherers would be there, sitting by the lake side 'at the receipt of custom.' The 'women who were sinners' would there have come, either from the neighbouring Gentile cities, or corrupted by the license of Gentile manners. The Roman soldiers would there be found quartered with their slaves, to be near the palaces of the Herodian princes, or to repress the turbulence of the Galilean peasantry. And the hardy boatmen, filled with the faithful and grateful spirit by which that peasantry was always distinguished, would supply the energy and docility which He needed for His followers. The copious fisheries of the lake now assumed a new interest. The two boats by the beach; Simon and Andrew casting their nets into the water; James and John on the shore washing and mending their nets; the 'toiling all the night and catching nothing;' 'the great multitude of fishes so that the net brake;' Philip, Andrew, and Simon from 'Bethsaida' the 'House of Fisheries;' the 'casting a hook for the first fish that cometh up;' the 'net cast into

---

* The view of Tiberias given by Roberts in his "Sketches of the Holy Land" does not recall to me a single feature of the scene except the sweep of the bay in the foreground. In everything save buildings Roberts is wofully inaccurate. I have seen no photograph or drawing which gives any correct idea of the shores of the Lake of Tiberias such as Hunt gives of the eastern side of the Dead Sea in his picture of "The Scapegoat."



F. Bedford, Photo.

Tiberias.

the sea, and gathering of every kind'—all these are images which could occur nowhere else in Palestine but on this one spot, and which from that one spot have now passed into the religious language of the civilised world, and in their remotest applications, or even misapplications, have converted the nations and shaken the thrones of Europe."

The town of Tiberias is not certainly very lively to look at, though its insect-life has obtained a world-wide notoriety. I never entered it, as I more and more felt that any supposed gain to my stock of information from the spectacles of filth and poverty which I knew it contained would only be a loss to me in seeking to realise the holy past. I therefore saw its walls only, and these were so shaken, cracked, and crumbled by the great earthquake which occurred in 1857, that their chief interest consists in the visible effects of that fearful earth-heaving. The present town is comparatively modern. The ancient one was built by that Herod who "feared John" the Baptist, "knowing that he was a just man and a holy, and observed him; and when he heard him, he did many things, and heard him gladly." Yet he murdered him. It was this same sensual and superstitious tyrant to whom Jesus, when He met him face to face for the first time on the day of His crucifixion, preached the awful sermon of *silence;* for Herod "questioned with Him in many words, but He answered him nothing!" The ruins of the old city are scattered over the space between the hills and the Lake to the south, as far as the hot baths. Mingled with the shells on the shore are innumerable small bits of what had formed mosaic pavements. We easily gathered many specimens.

We had hardly reached our tents and got settled in them when a boat loaded with Jews, pulled past us from the baths to the town. The number of people in it sunk it to the gunwale, reminding us oddly enough of the little boats and tall forms which are represented in Raphael's cartoon of "The Miraculous Draught of Fishes." A number of men were standing in it singing and clapping their hands in chorus. It was a rather joyous scene,—a rare thing in these parts. We were told that it was a wedding procession.

There are only two boats on the lake, and we sent a messenger to the town to secure one of them for us after dark, requesting that some fishermen with their nets would accompany it. For other reasons than they could conjecture, we were anxious to "go a fishing." They came accordingly, when the stars and moon were out in the sky. Friends who had travelled with us from Jerusalem accompanied us, and we rowed out on the Lake. Few words were spoken, but each had his own thoughts, as these rough men cast out their nets for a draught, wholly ignorant of other fishermen who long ago had done the same. They were thinking only of backsheesh, and possibly of our folly in giving it, the chances of getting anything where we let down the net being so small. It is unnecessary to suggest the memories which arose as the net was dropped in the calm sea rippling under the moonlight; or as, after encircling a wide space for our prey, we "caught nothing." Were Peter and the sons of Zebedee, and the other Apostles, all of whom were chosen on the shores of this Lake, just such men as these? Were they such "earthen vessels," made rich only by the treasures of grace with which the Lord filled them day by day through His divine teaching? And if not so supernaturally educated and upheld, how have such men taught the world, become famous, and given names to the innumerable places of Christian worship which have been in all lands called after St. Peter, St. James, St. John? The Divine Spirit alone, who filled the man Christ Jesus, could have transfigured commonplace fishermen and publicans into Apostles, and made a commonplace lake a theatre of wonders.

We bathed in the Lake. I mention this otherwise trifling fact, as it accidentally made us aware of the singular distance to which sounds are conveyed along this shore. Our party had scattered themselves for convenience, and I was alone, when my friends began to converse at a considerable distance from me. I was astonished beyond measure when, considering the space between us, I heard what was spoken in the tones of ordinary conversation. This induced us to continue the experiment of talking, which ended in our conviction that, making all allowance for the well-known fact of sound being conveyed by water, we had never known any place where the tones of the voice could be so far heard. Our words sounded as in a "whispering gallery." It was evident that on this shore a vast multitude might be addressed with perfect ease. Tiberias is 400, some say 600, feet below the level of the sea, and its banks are high. Does this account for the clear reverberations?

This Lake is, without question, the most interesting in the whole world. There is no part of Palestine, not excepting Jerusalem even, which is more associated with our Lord's life and teaching. Yet it is impossible to fix on a single spot here, as on the Mount of Olives or at Jacob's Well, and affirm with certainty that there Jesus stood and spoke. His steps cannot be discerned upon the deep; we only know that His holy feet walked over these waters, and that His commanding voice calmed their stormy waves. He had walked and taught on many places along the broad beach which stretches between the hills and the sea;—but where, we cannot tell! The silence of those lonely hills was often broken by His prayers at night, but God's angels alone know the spots where He uttered his "strong supplications," or those which He watered with His tears.

Opposite Tiberias is the Wady Fik, with its ancient tombs near the road leading to the famous stronghold of Gamala, and with steep hills descending into the Lake. This is generally admitted to have been the place where our Lord healed the Gadarene demoniac,—a narrative which reveals at once man's spiritual and physical misery when possessed by evil; his weakness in attempting to free a brother from such tyranny; the gracious power of Jesus, Lord of the unseen world, in casting out the evil spirit; the blessed results visible in the man himself, sitting "clothed, and in his right mind," at the feet of Jesus; the wise and loving work given the restored man to do, "Go to thine own house, and show what things the Lord hath done to thee;" and the overflowing of grateful love which impelled him to proclaim to the whole city the glad tidings of a deliverer from Satan.

Seated on the shore of the Lake, one naturally asks, where did that memorable scene occur recorded in the last chapter of St. John's gospel? If ever a narrative shone in its own light of Divine truth, it is this one. Its simplicity and pathos, and its exquisite harmony with all we know and believe of Jesus, invest it with an interest which must ever increase with its study. The whole of the memorable scene comes before us as we ponder over the events of those few days:—the weary night of toil, foreshadowing the labours of the fishers of men—the unexpected appearance of the stranger in the shadow of early dawn—the miraculous draught of fishes, a prophecy of future ingatherings to the Church of Christ—the instinctive cry of the beloved Apostle, "It is the Lord"—the leap of Peter into the sea at the feet of his Master—the humble meal, with such a company as has never met on earth again—the reverential silence first broken by our Lord—the thrice repeated question addressed in righteousness and love to him who had thrice denied Him—the all in all of that question, which involved the essential principle of Christian love, "Lovest thou me?"—the all in all of the command, which involved the essential rule of Christian practice, "Follow thou me"—the duty of those anxious about others shown by the reply to the inquiry, "What shall this man do?" "What is that to thee? follow thou me!"—the announcement of a martyr's death made to him, and to him only, who, from fear of death, had denied his Lord, conveying the blessed assurance that, even *in extremis*, Peter would glorify Him;—and the lesson taught to the Church of the untrustworthiness of even apostolic traditions, seeing that in the very lifetime of the Apostles a false tradition had gone abroad regarding the death of St. John, the true story being carefully reported by the Apostle himself:—all this, and more than words can express, is vividly recalled as we sit on this shore; yet it is in vain that we ask, On what precise spot did these events take place?

But there is no real cause of sorrow in our ignorance of such localities. The places where Jesus lived and taught were denounced by Him in terrible words. These words have been fulfilled, and the ruins, or rather the complete obliteration, of Capernaum once exalted to heaven, and of Chorazin and Bethsaida, only typify the ruin of the souls of those who in any place receive not the truth in the love of it. Yet the truth itself remains to us, quite independently of the mere accidental circumstances of time and place in which it was first spoken; and the words of Jesus, uttered in a few minutes, will ever remain the salt of the earth and the light of the world. The "Peace, be still," will calm many a storm; "It is I, be not afraid," will bring strength to many an anxious soul; "Lovest thou me?" will search many a heart; "Follow thou me" will direct many a pilgrim. The world will for ever be influenced, and the Church of God nourished, by the teaching given beside these waters;—by "the sermon on the mount;" the parables of "the sower," "the tares," the "treasure hid in the field," the "merchant seeking goodly pearls;" and by the lectures on "*formality*" (Matt. xv. 1), "*faith*" (John vi. 22), and on "*humility*," "*forbearance*," and "*brotherly love*" (Mark ix. 33).

The day we spent at Tiberias was Good Friday, and though we Presbyterians keep no day specially "holy" except the Lord's-day, yet knowing how many brethren "esteem this day above another" and "regard it unto the Lord," we remembered with them the great event, which is dear to us all, as being the life of the world. We could not forget that it was near this district that He "began to show to His disciples how He must suffer many things of the Chief Priests and Scribes, be killed, and rise from the dead on the third day;" and that when Peter began, in his ignorance, to rebuke Him, He taught those precious lessons of self-denial which every Good Friday should recall as its practical teaching to all of us.

THOUGHTS SUGGESTED BY THE FAILURE OF THE ATLANTIC TELEGRAPH EXPEDITION.

By HENRY ROGERS, Author of "The Eclipse of Faith."

THE failure of the recent attempt to lay the Atlantic cable was a grievous disappointment, not only to the eminent men of science who had expended such rare resources of knowledge and skill, and so vast an amount of patience and perseverence, on this great enterprise; not only to the capitalists, who have cast so many hundreds of thousands of pounds into the sea; but to the nation at large. The public took the liveliest interest in its fortunes, and devoured the brief telegrams which for a few days made the heart throb with alternate hope and fear, as greedily as if each man had a personal stake in the venture; it endured the long interval of silence during which it was possible only to conjecture, and at last hung over the mournful records of the great catastrophe in which so much intellectual and material wealth had been wasted, with little short of the most vivid feelings with which it ever watched the progress of a great campaign, or waited for the tidings of some decisive battle which was to close it.

Yet the failure need not produce despair of the object's being attained at last; nor, if it be taken aright, is it without its valuable lessons.

It need not produce despair;—for if the thing is to be accomplished by human effort at all, and if it will really repay the cost of accomplishing it; in other words, if there be no insurmountable physical obstacles to success, and no conclusive economic reasons for abandoning the project (for, whether it be physically possible or not, it is clear that men will not, unless mad, venture on more than a certain number of such costly experiments), it is certain to be accomplished at last. And we may draw favourable omens from what has ever been the history of similar great enterprises; they have been prosecuted amidst fluctuations of fortune, alternate hopes and fears, and in spite of many failures; but all this, again, has not been without its benefit. It has called forth the virtues of fortitude and patience, and stimulated to higher efforts of invention, in dealing with the difficulties thus opposed: benefits which in nine cases out of ten are yet more valuable than the immediate success of any one project. For the qualities thus elicited are the conditions of all human progress.

And if, as many of us probably cannot but fear, the project is not to be accomplished by *this* route, it will, doubtless, by some other. The end,—that of linking together the two great continents of Europe and America by the great bond which telegraphic communication implies,—is so momentous, that the attempt will hardly be abandoned while one spark of hope remains. *Aut viam inveniam, aut faciam*, the enterprising spirit of modern civilisation will say: "We shall find a road, or make one."

For surely it would be a strange anomaly if not only the Old Continents, and the New, were *separately* traversed by that friendly lightning, which is the most subtle product of civilisation, and so important an instrument of its further progress, but three out of the four,—Europe, Asia, and Africa,—were linked together by it, while a deep and impassable gulf still separated the Transatlantic hemisphere from ours. Surely it would be a strange anomaly if universal civilisation thus advanced with a limping and lame pace; with Mercury's "winged sandal" on one foot, and an old shoe on the other; or like poor Peter Schlemihl, when suddenly surprised by the bear, with the seven-leagued boot on his right leg, and only the ordinary means of locomotion with the other. It would certainly be curious if we were but ten minutes in transmitting our thoughts, however trivial, to the extremities of India or China, or in knocking at the gates of Pekin or Ispahan, while it still took ten days to convey a message (though the world's peace might hang upon it) to the President of the United States!

And if the project be, as it seems, so necessary to the development of civilisation and the interests of humanity, at least if these are to advance *pari passu*, we have every reason to hope that this (and, for similar reasons, many other equally gigantic enterprises) will in time be brought to successful issue. For by an older charter than that of the Baconian philosophy, and by the express command of Him who can and will render the laws and forces of nature subservient to us, so far as our welfare is really involved in such subservience, man is encouraged to take possession of the earth, and subdue it: "Be fruitful," the Almighty said, "and multiply, and replenish the earth, and *subdue* it."

It is as though God had said, "In virtue of those powers lodged in the human intellect, and in virtue of *numbers*, by which alone those powers (comparatively feeble in each individual of the race,) can be successfully exerted, aspire to a dominion over the external world, animate and inanimate; *subdue* it; yoke the laws and forces of physical nature in your service; so far as their subservience is really essential to your welfare and progress, they shall be subservient by *my* express ordination." It is not only a command, but involves a promise and prediction; as full, surely, of hope and encouragement to such as believe in the divine authority of the Scriptures, as can be the doubtful, however confident, vaticinations of merely mortal prescience.

But the failure is also fraught with instruction. It is calculated to teach us lessons which we are all too apt to forget: the sense of dependence;

the feeling of humility; self-knowledge; the consciousness that success, after all, must hang on a thousand favourable conditions, (some of them seemingly trivial enough), which man cannot command, and which yet must happily conspire with man's foresight and energy, or that foresight and energy will be all in vain. In the case of the Atlantic Telegraph, how small, how utterly insignificant an obstacle it was which once and again arrested the whole machinery of the great enterprise, frustrated all the forethought and sagacity which had been expended on it, and perhaps was the principal, if not immediate cause of ultimate failure;—an inch or two of wire which nobody suspected to be there, or if there, likely to do any mischief, pressed by the paying-out machine into the core of the telegraph! It reminds one of what Pascal says so sarcastically of the dependence of man—the Monarch of the world—on the veriest trifles in existence: "Be not surprised that he reasons ill just now; a fly is buzzing in his ears; it is quite enough to render him incapable of all sound deliberation. If you wish him to discover Truth, be pleased to chase away that insect which holds his reason in check and troubles that mighty mind which governs cities and kingdoms."

Nor is it of little moment to remember that the dominion of nature which the great charter already alluded to guarantees to man, must be conjoined with a recognition of Him who alone can give effect to it. If there be indeed a God; if consequently it be both fitting in itself, and necessary for the true perfection and felicity of man, that man should recognise his relation to his Creator; if the sense of dependence, the attitude of fealty, be appropriate to Him; we may be assured that, whatever the powers with which he may have been gifted, they cannot in the end be successfully exerted except in compliance with the laws of his being, and therefore in harmony with the relations in which he stands to the Supreme Lord. And how easily may He frustrate man's ambitious aspirations, if these are resolved to leave Him out of account; and that without any express interposition. It is enough to leave man to form and pursue those vain shadows, to which there is no more seductive tempter than that arrogance of soul, which the ambition of being independent of God is so apt to inspire! How infinite are the mazes of error (seen in the history of all human speculation) in which he may be suffered to wander, and in which he has been, in fact, so often lost! Infinite are the chimeras, the impossible achievements, in which he may lose his time and toil, waste his faculties, and squander his wealth. How often has he done so before, and never more often than when he has been deluded by the dreams and fallacious hopes to which spurious pretensions of science have prompted,—projects as vain as squaring the circle, solving the problem of perpetual motion, discovering "potable gold," the *elixir vitæ*, or the transmutation of metals; on which (as he once did on these) he may vainly waste years of intense thought and toil, which if wisely and legitimately expended, might bear the most precious fruits. In this, as in *other* directions, "vaulting ambition" is ever prone "to overleap itself."

It must be confessed that science has often, and not least in our day, been apt, in the elation of past successes, to indulge in a good deal of bombast and rhodomontade about the destined triumphs of man over nature; to speak in strong poetic licence of "making storm, flood and fire the vassals of his will;" as if science itself were to be absolutely independent, instead of holding everything as a mere feudatory under the Sovereign Lord; as if it were privileged to conquer by its own strength and in its own right; and as if, also, there was to be no limit to its powers! It accordingly often gives a very different draft of its relations to nature than that which is conveyed in the ancient Command and Promise just adverted to. Impatient of all control, ambitious of being independent, it is sometimes pleased to represent the forces of nature, not as auxiliaries which a Power, greater than they or it, *designs* to subordinate in a measure to man's will, and make subservient to his use, but as hostile forces, which for the greater honour of man's prowess and the gratification of his pride, are perforce to be chained to his chariot-wheels and yoked to a reluctant service, because he, the human god, has so resolved!

In a similar manner, man is too apt to represent that indefinite, but still, at the utmost, moderate dominion which he is to attain over nature, as *absolutely* without limit. Hence it is well that he should be taught the futility of this notion; now, by encountering unanticipated obstacles which shall baffle his wisest schemes; now, by the occasional outbreak of the more resistless forces of nature, before which man's power and skill are utterly impotent; which at once terrify and abash him when he is confronted with them. These still more effectually teach the above lesson; they are like "that Leviathan," which the patriarch is challenged to tame, and to "make him his servant for ever:"—"Lay thine hand upon him; remember the battle; do no more."

The earthquake, the volcano, the hurricane, the ocean in its fury, the "pestilence that walketh in darkness," teach man how limited, after all, is and must be his command of the greater or the more subtle forces of nature; that if they minister to him, it is at a higher bidding than his; that they are no mere drudges of his pleasure, and do not own him as their supreme feudal lord. One of the stanzas in Byron's well-known description of the ocean is instructive in this point of view, though we may lament the misanthropy which spoils the sentiment of the verse, and laugh at the bad grammar which mars the close of it:—

"Man's steps are not upon thy paths,—thy fields
Are not a spoil for him; thou dost arise
And shake him from thee! The vile strength he wields
For earth's destruction thou dost all despise,

Spurning him from thy bosom to the skies,
And send'st him, shivering in thy playful spray,
And howling, to his gods, where haply lies
His petty hope in some near port or bay,
And dashest him again to earth:—there let him lay." *

Much more sweetly and wisely, because with much more of the spirit of humanity, does Scott touch the contrast between man's insignificance and nature's vastness and grandeur, in the well-known strains in which he makes Staffa apostrophise the architects of the "holy fane" of Iona:—

"Where, as to shame the temples decked
By skill of earthly architect,
Nature herself, it seemed, would raise
A minster to her Maker's praise!
Not for a meaner use ascend
Her columns, or her arches bend;
Nor of a theme less solemn tells
That mighty surge that ebbs and swells,
And still between each awful pause
From the high vault an answer draws,
In varied tone, prolonged and high,
That mocks the organ's melody.
Nor doth its entrance point in vain
To old Iona's holy fane,
That Nature's voice might seem to say,—
'Well hast thou done, frail child of clay!
'Thy humble powers that stately shrine
'Task'd high and hard;—but witness mine!'"

No doubt man is destined to advance perpetually in knowledge, and consequently in power, (which is but its application): but though we cannot tell exactly how far he may go, we may easily discern that there *are* limits within which his uttermost achievements will certainly fall. No man expects to soar to "the corners of the moon," or to dive to the earth's centre, or "to bore a hole to the Antipodes,"—as Voltaire maliciously feigns of Maupertuis; no one expects any such things any more than to carry out the project of another humorous writer, namely, to "equalise the temperature of the frigid and torrid zones by towing down the icebergs of the Polar Seas and hanging them on the equinoctial line to dry." No one expects to shut the mouth of volcanoes, to arrest the lightning, to control the earthquake, to say to the stormy ocean, "Hitherto shalt thou come, but no further: and here shall thy proud waves be stayed." No one expects to cure all disease, to abolish death, to make man immortal.

When the happy bride was smitten down the other day by lightning on the Alps, all that man's feeble electric mimic could do was to transmit the sad tidings home; and it was well said by one of the papers, that it impressively rebuked the braggadocio language, in which presumption too often speaks of men's "triumphs over the forces of nature." Man's *spurious* lightning could only chronicle the terrible and resistless power of the *true.*

Man, no doubt, can do wonderful things; the discoveries of astronomy, the triumphs of navigation, the powers of steam, of the railroad, of the telegraph, show us how great and how true is that dominion which God has given him. By combined and continued action he can even appreciably modify climate itself. Still, in general, what he does is great only *relatively;* for Nature works on so vast a scale, that man's mightiest and grandest fabrics are comparatively little more than ant-hills; the longest railroads, the deepest mines, are mere scratches and pin-holes on the earth's surface. And if he intermit or abandon his works, how soon with silent force does she cover the proudest monuments of his skill and labour, and bury them so thoroughly in her tomb of living green, that he can hardly dig out even the traces of them!

"Wonderful," said a lecturer whom I lately heard—a lecturer most deservedly popular, but a little disposed to magniloquise on man's achievements, and to forget man's limitations:—"Wonderful! that little man, taking his stand on this earth, should be able to calculate the distances, and, in a manner, speculate on the laws and physical constitution of Jupiter and Saturn." "Very wonderful," thought I, "it certainly is; but as to 'little man's *taking* his stand,' that, my good fellow, is a sad mistake. He is *compelled* to take it, and cannot get away from it; there he must crawl, much as if he were a pismire. He is tied by the leg to his planet: if it were not so, he would soon gladly 'take his stand' on those distant orbs of which you are so eloquently dissertiug, and cease to *speculate*, because he would then *know*, about their laws and constitution. You ought, while deservedly expatiating on the 'greatness,' not to leave out the correlative 'littleness' of man."

It is well, especially in these days when men are invited freely to spend their money in promoting great scientific projects—and they cannot spend it better, provided it is not wantonly thrown away on plainly impossible or unremunerative enterprises—to remember, not only that there are obvious physical limits to man's power, when confronted with the more overpowering forces of nature, but there are far stricter *economic* limits also: that is, there are ten thousand great things which man might do, by mere numbers, time and industry, which it is yet certain he never *will* do, simply because, as we say, they can never *pay.* There are some things, for example, which man can make, which would never *pay*, simply because, when made, even the physical limits of his power would prevent him from using. He *could*, by perseverance and numbers, build a ship ten times as big as the Great Eastern, but it is pretty certain he never will, (in fact the Great Eastern seems a trifle too big for him); for in all probability, were it built, no one mind could secure that unity and simultaneity of effort, necessary for the effective management of it; nay, in all probability, no power that man could employ could launch it; and if it were launched, no skill that could be employed in putting its materials together could keep them together, against the strain which such a mass would experience when placed on an unstable element.

---

* Strange! that the poet should not have seen, or seeing, should have refused to take a little pains to correct this gross vulgarism,—which is now immortal as the poem.

As regards this last point, by the way, one of the most striking spectacles that can show the difference between God's work and man's, may be occasionally seen at the seaside. There may we sometimes see nearly the whole of a ship that has been wrecked, and driven to shore in successive fragments, the several parts of which have been put into mere juxtaposition. There is nearly the whole ship, only without any connection of part with part. And what do we see? All that man has put together, parted, rent asunder completely, to the last bolt, rivet, cramp, nail, by the ceaseless grinding and crushing of the ocean and the rocks. But what nature, or rather, God put together, is for the most part, coherent still. Each massive timber shows traces, indeed, of the mighty forces by which the cohesion has been tried; the surface is abraded, rough and ragged with half-made splinters, but still defying, in its tough cohesion, the utmost fury of wind and wave.

But to return for a moment to what I have called the economic limit of human enterprise. There are a thousand great things,—miracles of engineering skill, for example,—far greater than man has accomplished, which man *might* do, but which it is certain he never will do, simply because they cannot be remunerative. Wherever the result is simply so much superposition of matter on matter, or wherever the only condition of the work is persevering and patient toil, there is no reason why man should not, by mere numbers, do things infinitely more wonderful than he has ever yet done; but the economical limit is as imperious in these cases, as in other cases is the physical limit. If man can bore through Mont Cenis, there is, perhaps, no good reason why he should not bore through the Andes from east to west, if it could answer any purpose remunerative of the cost. He could in the same manner erect a pyramid ten or a hundred times as big as that of Cheops; or could level Mont Blanc spadeful by spadeful. But *cui bono?* And that question limits many achievements as effectually as though physical impossibilities stood in the way.

This question of the *economic* limit is specially interesting in relation to one important class of enterprises just now. To ascertain it is the great *desideratum* in reference to the extent to which it is wise to resort to submarine telegraphy. Whether, indeed, there be not physical limits, which will render it impossible permanently to maintain a line through more than a certain distance, or at such depths as those in which the Atlantic telegraph now lies, is still the subject of most interesting experiment. *A priori*, however, there does not seem any impossibility of a physical character; nothing in the mere distance or depth that will impair the conductivity of the wire, and nothing that will imply insurmountable obstacles in laying it. So, at least, the best judges say, and to a certain extent experience has confirmed it; for the Atlantic cable has been laid, and apparently *did* speak, or rather squeak, for a moment, though it died before it attained the full power of articulate speech. If it was born almost dumb, still it did mutter something. The probabilities are, then, that in a given number of trials what has been once done may be done again. But whether it can be *so* done that the work shall last long enough to *pay*, —whether the economic limit be not, in this as in so many cases, far within the physical limit, it will be well for all speculators in the matter narrowly to consider. For unless it can be laid down so as to last for many years without any flaw in its working, it seems in the highest degree improbable that it can be anything else than a losing speculation: and for this simple reason, that whereas all submarine lines of telegraph, like other lines, are liable to accidents, any such fault occuring in a line of such extent as the Atlantic Telegraph, would seem not to admit of repair; and if so, the only remedy in case of a flaw, would be to lay down another cable. Now if interruptions in this cable, in proportion to its *length*, occur with anything approaching the frequency with which accidents have occurred on other lines; if the only remedy in any such case should be found to be the laying down of a new cable, and if the laying down each new cable is to be attended with a cost at all comparable with that of the recent experiments, it is hardly possible to suppose the project can be successful as a *commercial* speculation. If it be from its length liable to more flaws than cables of less length, and if when they occur it cannot be "fished up" and repaired like any other, but must be left to rot at the bottom of the ocean, and a new one substituted in its place, then it requires great faith to believe that it can ever be remunerative.

That there must be abstractedly *some* length at which this limit of *economic* impracticability must be reached would seem to be demonstrable thus: As a flaw or fault in a telegraph cable may occur anywhere, every yard laid down affords an additional chance of one. If sufficiently long, therefore, the occurrence of a very frequent accident will become almost a certainty; but the very same circumstance which makes an accident somewhere in its whole length so probable, namely, its length itself, will make it impossible to "fish it up" and repair it; that is, we approach at the very same time to a *maximum* of probabilities of an accident, and a *minimum* of chances of repairing it.

Whether the Atlantic Telegraph is of such a length as reaches or transcends this limit, (and if it does not, it is hard to suppose that any other cable will, for it will hardly be necessary to have one longer, or so long), is the very point to be decided by future experiments. At present we seem to be much in the dark as to the length at which any one stretch of submarine telegraph can be depended upon for such a duration of safe working as will make it permanently pay. It may be that beyond a certain limit, say of 500 or 600 miles, accidents may be so numerous, and the difficulties of recovering and repairing a cable so great, that it will not answer to lay one down. If this should ultimately turn out to be the case, we must seek to achieve the Transatlantic Telegraph by one or more of the circuitous routes proposed,—taking only moderate portions of submarine cable at any one stretch. Thus shall we find the old proverb come true, that "the farthest way about is the nearest way home." And, indeed, if the stations and the line can be guarded, it matters not; for to the electric messenger it is all one, whether it has ten or a thousand miles to travel, more or less. To such an incomparable "Puck," it matters not whether he be commissioned to knock at our next neighbour's door, or "to put a girdle round about the earth in five-and-twenty minutes."

In the meantime, we must wait with patience the result of future experiments; only here, as in other cases, let those who cannot afford to throw away their money well consider whether *they* are the parties who are called upon to make such costly experiments. Certainly, the hope of gain is not sufficiently definite to justify any one who cannot well afford to lose. Scientific men give the toil of their brain, their time and their lives, to these grand enterprises; it is proper that great capitalists should second their efforts by such means as *they* have to give, and take their chance of losing what they can afford to lose, or of gaining a great prize; of verifying the old proverb about "making a spoon or spoiling a horn." They may thus be great benefactors of their species, at the same time that they benefit themselves; and if neither be the case, they can sit down content to bear the cost of the experiment. But let not those, who wish to make a little provision for wife and children, endanger it in the hope of doubling it.

Similar observations apply to such an enterprise as that of M. de Lesseps. There may be no physical impossibility about any such work, any more than there was about the attempt of Nero to cut the Isthmus of Corinth. That M. Lesseps' project is not physically impossible is plain from what has been already said; for it is one of those which simply imply so much time, toil, and money. Man can supply all, if he pleases. But what will be the expense of the adequate maintenance of such a work—how long it will last without such repairs as will be tantamount to the cost of frequent reconstruction—how often it will be in parts choked with sand—how often, for other reasons, rendered for a time *impassable*, and therefore for such time unprofitable, all this is matter of future experiment; and everyone must wish that the cost might be borne by those who can afford to bear it. Perhaps the same may be said of the prodigious tunnel now in course of construction through Mont Cenis.

The "Public" is often rebuked for distrusting, even deriding, the brilliant projects and inventions of scientific genius; which, it is said, are first laughed at as the dream of visionaries and enthusiasts, and then loudly applauded and eagerly adopted; while their authors struggle in vain to get a fair hearing for them, and too often die in poverty after having spent their all in perfecting some piece of mechanism which is to make the world rich, though it has made them poor. And so, when praise and reward are alike valueless, a statue and a niche in the Temple of Fame are voted by acclamation! The sad story has been too often told. Still, though it may be hardly worth while to enter on the defence of the poor "Public,"—being, as Horace Walpole says, "quite big enough to take care of itself,"—there is something to be said in its behalf in this matter, notwithstanding. In its general distrust of new and startling discoveries, which transcend its experience and therefore its measures of probability, it still acts pretty much in accordance with the very maxims of that "inductive" philosophy, the chief triumphs of which it is thus supposed to depreciate or despise. It is precisely because it has found pretensions falsified in so great a number of cases, in comparison with those in which it has found them verified; the number of theories which could not be realised, and of machines that would not work, compared with those that will; of the number of flaming "patents" and magnificent promises that come to nought; it is on these grounds that the world, and not unreasonably, exercises a preliminary distrust of high-sounding promises, as to the probable fulfilment of which in the *particular* case, experience can tell them nothing, while of the frequent non-fulfilment of which, *in general*, it can tell them so much. The world's incredulity, in fact, however lamentable may be the results in special cases, is a very philosophical incredulity. And the proof is found in this: that nobody in the world doubts that if, in every case, or a majority of them, the promises of the transcendant success of new scientific applications had been fulfilled, (as it has been in the case of gas, the steam-engine, or railroads), the "Public" would long since have been cured of its imputed incredulity, and taken, as usual, its conclusion as to the future from an indication of examples in the past.

In truth, though this distrust of novel scientific pretensions on the part of discoverers and inventors is a commonplace of invective against the world in general, it is by no means certain that the world does not quite as often run into the very opposite error, namely, of embracing every specious project too readily and greedily; just as it will also take quackish nostrums in spite of large experience of their futility. For how many specious projects does this same unreflecting "world" find the capital,—which it might just as reasonably throw into the sea!

Take for example, the Great Eastern steamship.

It is true that she "behaved so well" in the recent expedition, that one cannot help forming more favourable auguries respecting her, and hoping that her brilliant future will obliterate the remembrance of her disastrous past. But whether it will hereafter be commercially profitable to employ vessels of so large a size or not, there certainly was enough, when the project was first propounded, to startle the doubts of a world which is accused of being so suspicious of novelties! It was, in many respects, in most prodigious defiance of all the ordinary lessons of experience. A thousand things in her construction, as to which experience was silent, were perfectly novel. She was to be built without a dock, and experience had so little to say in the matter that she cost 100,000*l.* only to get her into the water. If she met with an accident, there were few ports in the world large enough to receive her; she drew water enough to bring her within the reach of rocks of the existence of which no charts could inform her; and once in her brief history she seems to have been brought by that very cause into the greatest jeopardy. As to the economic limit, it seemed yet more problematical. There was hardly a port in the world to which she could take a full cargo; and if she took one to many, and made a voyage almost of circumnavigation in delivering it, she would lose in time, and its cost, the advantages of her larger freight. If she went only partially filled she would not pay the expense of maintenance,—as indeed was proved to be the case. It might again have struck the imagination that it was hardly wise to send so much to sea "in one bottom"—"to put so many eggs," as the saying is, "into one basket"—as must be the case if she was to have her complement of passengers and cargo; that if she should be lost, it would be the same thing as if a city were destroyed; that it would be on that account very doubtful policy of any government to use her as a convenient transport ship; for if she went to the bottom, it would be tantamount to the loss of 10,000 men, without a battle. All these and a thousand other things might, in the prodigious novelty of this experiment, have so powerfully affected the imagination of people as to make them at least as prone to that distrust of great scientific improvements with which they are so often charged, as in other cases. Yet there does not seem to have been much difficulty in getting the shares taken, and the money subscribed. Precisely the same may be said of the world's willingness to take up a thousand visionary projects launched by "Companies" of all kinds; so that there is reason to suspect that credulity rather than incredulity is the prevailing temperament of mankind in this matter.

If none but large capitalists were ever engaged in such ventures,—if they who can afford to lose were the only persons involved, one would not much care about it. Where there is a reasonable chance of success, a moderate sum of money, if it can be easily spared, cannot be better risked or lost than in an attempt to decide the worth of some scientific project which may largely involve the progress of civilisation and the interests of humanity.

BABY.

BY THE AUTHOR OF "POLLY."

O WHEN did Baby come?
When half the world was dumb,
Babe was dressed in white,
In the black, dead night.

O Baby came from where?
That place is very fair;
The middle of the skies,
The heart of Paradise.

O who sent Baby here?
It was an angel dear,
A spirit of purple flame;
Love is that angel's name.

O who was Baby's shield
Down from the heavenly field
Along the pathway dim?
—One of the cherubim;
His sword he took with him.

His golden head he bowed
To cleave the hindering cloud:
A seraph shone behind
Singing through the wind.

Singing and shining thus,
They brought the gift to us,
And in the dead of night,
The child was wrapt in white.

O God,—who art the Lord
Of the cherub with the sword,
And the seraph with the lamp,—
Let both of them encamp

Beside the hushing tent
Of the creature that is sent
From the middle of Thy sky,—
To guard, to beautify;

To make the inaudible breath
More terrible than Death,
And light the unconscious face
As from a heavenly place
With the wonder of Thy grace!

OUR INDIAN HEROES.

By JOHN WILLIAM KAYE.

XI.—MAJOR ELDRED POTTINGER.

The father of Eldred Pottinger was an Irish gentleman—Thomas Pottinger of Mount Pottinger, in the county of Down, who married Charlotte, the only child of James Moore, another Irish gentleman, whose place of residence, however, was for the most part in the Danish capital. This lady had many and great accomplishments and strong literary tastes, which might have borne good fruit, but that death cut short her early promise; she passed away from the scene, after a few years of wedded happiness, leaving behind her an only son, the subject of this memoir.

Eldred Pottinger was born on the 12th of August, 1811. He was scarcely two years old when his mother died. But he seems to have inherited from her a love of letters and a readiness in the acquisition of languages, which was very serviceable to him in later days. He was docile, and in all things quick to learn; but it was soon apparent that there was a sturdiness of character and a love of enterprise in him, which rendered it more likely that the tendencies of his manhood would be towards a life of strenuous action than to one of studious repose. His father took a second wife, and little Eldred, after a time, went to live with his step-mother, who in due course had children of her own. But Eldred was ever to her as her own son, and he loved her tenderly as a mother. He was very affectionate and very sociable, and often, when his father was absent in his yacht, the pleasant companionship of the boy was a source of comfort to Mrs. Pottinger never to be forgotten. It is an undiscriminating injustice that makes step-mothers the *bêtes noires* of domestic history. The "injusta noverca" is in real life a rarer personage than is commonly supposed. At all events the relationship at Mount Pottinger had nothing that was not beautiful about it. No distinctions were ever recognised there. The gentleness and tenderness, the forbearance and self-denial of young Eldred towards his little brothers and sisters is still gratefully remembered; and I am assured by one of the latter that not until she had nearly reached the age of womanhood was she aware that Eldred was not her own brother.

High-spirited and adventurous as he was, he was very tractable, and, save in one particular, seldom got himself into any boyish scrapes. He was very fond of playing with gunpowder; and once very nearly blew himself up together with his brother John. His military instincts were even then developing themselves, for nothing delighted him more in his play-hours than to erect mimic fortifications and to act little dramas of warlike attack and defence. One of these last had nearly a tragic termination; for having, in execution of some warlike project or other, heaped up a number of heavy stones on the crest of the garden wall, some of them fell upon and well nigh killed an old man or woman who was seated on the other side. But though forward ever in active adventure, he was by no means an inapt or inattentive scholar, and he pursued his studies, in his father's house, under a private tutor, with very commendable success. It happened, however, that, on one occasion, when in his fourteenth year, he fell out with his preceptor on some point either of discipline or of learning, and the tutor threatened him with personal chastisement. The high spirit of the boy could not brook this, and he declared that if the threat were carried into execution, he would run away and seek his fortune in some remote place. The time, indeed, had passed for home-teaching. The instincts of young Eldred turned towards foreign travel and military adventure. He delighted to peruse the records of great battles, and it is remarkable that of all the books which he read in his youth the one which made the deepest impression upon him was Drinkwater's narrative of the siege of Gibraltar. For a youth of this temper it seemed that the Indian Army opened out a field admirably calculated to develop his powers. So a nomination was obtained for him to the Company's military seminary at Addiscombe.

He was little more than fourteen, when he went to Addiscombe. Young as he was, he took a good place in his class. But he was esteemed among his comrades rather as an active manly, courageous boy; very honourable, truthful, trustworthy, and staunch. Even in his childish days, it had been observed that he could keep a secret better than most grown people. He was sure to keep it if the interests of others were concerned. When he was at Addiscombe, he committed a grave academical offence. The story has been variously told to me, and I am afraid that the balance of evidence is not much on the side of the more favourable version of it. It is traditionary in his family that he invented a new kind of shell—said to have been something very clever for a youngster of his years; and that he exploded it one day to the consternation of the authorities, and very probably to the extreme peril of his comrades. But his Addiscombe cotemporaries believe that he was moved to this exploit less by a love of science than by a love of mischief, and that in reality he merely charged an old shell with gunpowder, and fired it from a mortar in the college grounds. Fortunately the question is one which it is not material to decide. There was as much good promise in the mischief, as there would have been in the scientific ardour of the young artilleryman;

and it is far more important to note, that though others were implicated with him, Gentleman-Cadet Pottinger took upon himself all the responsibility of the breach of college rules and tried to bear all the punishment. It well nigh cost him his commission; but nothing would induce him to give up the names of those who were associated with him in the affair of the shell.

After the usual period of two years spent at Addiscombe, Eldred Pottinger went up for his final examination, and came out as a cadet of Artillery. He selected the Bombay Presidency because his uncle, Colonel Henry Pottinger, was fast rising to distinction under that Government. Having joined the head-quarters of his regiment, he devoted himself very assiduously to the duty of mastering professional details both military and scientific. In the knowledge of these he made rapid progress; and in due course was appointed quarter-master of a battalion. Having served thus, for some time, on the Regimental Staff, he was, through the good offices of his uncle, who then represented British interests in Scinde and Beloochistan, appointed to the Political Department as an assistant to his distinguished relative. Though he had at no time any great amount of Oriental book-learning, he had a considerable colloquial knowledge of the native languages, which he improved under his uncle's superintendence. But an eager longing for active employment had taken possession of him, and there was that, in the political atmosphere at the time, which rendered it likely that the coveted opportunity would soon present itself. And it soon came. Events were taking shape in the countries between India and Persia, which made it a matter of no small importance to the British Government in the East that they should obtain accurate information relating to all that was passing in Afghanistan; and as Eldred Pottinger was willing to penetrate that country, as an independent traveller, his uncle the Resident was well disposed to accept the offer. It was in truth precisely the kind of service, which the adventurous spirit of the young artilleryman was most eager to embrace; and so he went forth, full of hope and expectancy, as one loving danger and excitement for its own sake, and longing to be of service to his country; but moved little by personal ambition, for he had none of the vanity of youth, and self-seeking was far from him. His enthusiasm was of a sturdy, stubborn kind. It cannot be said that he had much imagination; but he had something still better, an abiding sense of his duty to his country.

He started, in the disguise of a Cutch horse-dealer, and journeyed onwards towards Caubul, with a most unostentatious retinue, and attracted little attention, as he went. The route which he took was that of Shikarpoor, Dehra Ismael Khan, and Peshawur. At Caubul, he determined to push his way on, through the rugged country inhabited by the Imauk and Hazareh hordes, to Herat, the famous frontier city of Afghanistan, assuming for this purpose the disguise of a "syud," or holy man, from the lower part of the country.

Here his adventures commenced. He was eager to explore this rugged and inhospitable hill-country, knowing well the dangers of the route, but knowing also the importance of obtaining correct information relating to it. "As I had made up my mind," he wrote in his journal, "against the advice of the few acquaintances I had in Caubul, and there was some suspicion that Dost Mahomed would prevent my proceeding to Herat, on quitting the place I gave out that I was going out with Syud Ahmed, to see the defile of the Logur River. After dark I left the house on foot, having some days previously sent the horses to a caravanserai, and thence ordered those I intended taking to join me at the bridge, where my guide also met and escorted us to his house at Vizierabad, a few miles from the city."

He had not proceeded far before he fell in with a man who had known Sir Alexander Burnes, and who strongly suspected that Pottinger was a Feringhee. "We here met a traveller from the opposite direction," he wrote in his journal, "an acquaintance of my guide, who had been a pack-horse driver with the kafila, which Sir A. Burnes accompanied to Balkh. He was struck by the fuss my guide was making about me, and appeared to discover me. He joined us, and commenced talking of the 'Feringhees' and 'Sikunder Burnes.' He told me that officer had employed him to collect old coins at Balkh, and, praising his liberality, gave me several hints that he expected I would be equally so, and give him a present. But to all I turned a deaf ear, and would not be recognised, though I listened with all complacency to his stories, and chimed in with the usual explanations in his pauses, so that, as his acquaintance would give him no information, he finally took leave of us, evidently in much doubt as to the correctness of the surmise." A few days afterwards he was again suspected. A Kuzzilbash asked him whence he came—if from Lucknow. "I feared," said Pottinger, "he had been there, so said 'from near Shahjehanabad;' upon which he informed me that Lucknow was a very fine city, and the only place in India which the Feringhees had not taken; that he had never been there himself, but knew a person who had. Seeing him pause for an answer, I replied that he, doubtless, was right; that I myself had the honour of being acquainted with a Syud whose friend had been to Lucknow."*

But a far more serious difficulty awaited him in Yakoob Beg's country. This man was a noted Hazareh chief, who was wont to levy black mail upon all travellers, and, if it suited his purpose, to sell them off into slavery. He was not a bad man, after his kind, but he was surrounded and influenced by a crew of unscrupulous ruffians, and Pottinger and his companions were for some time in danger of losing either their liberties or their lives. Detained for several days in Yakoob Beg's fort, the young English officer was rigorously examined, and was often at his wits' end to answer the questions that were put to him. Of the dangers and difficulties by which he was surrounded, he has given an interesting account in his journal. "The chief," he says, "was the finest Hazareh I had seen, and appeared a well-meaning sensible person. He, however, was quite in the hands of his cousin, an ill-favoured, sullen, and treacherous-looking rascal. I, by way of covering my silence, and to avoid much questioning, took to my beads, and kept telling them with great perseverance, no doubt much to the increase of my reputation as a holy personage. Syud Ahmed did the same to cover his ignorance of the Sheeah forms. This turned the conversation on religious subjects, and I found that these people knew more than we gave them credit for, and though on abstruser points I could throw dust in their eyes, yet on the subject of everyday duties I was completely brought to a stand-still by my ignorance of the Sheeah faith, and fear, lest I should, by mentioning Soonee rules, cause a discovery. Syud Ahmed was equally puzzled, and felt in full the false position I was in, and the want of a skilful and clever aid to take the brunt off my shoulders. Hoosain did all he could, but he was too distant to prompt me, and by several blunders, or rather inappropriate attempts of his to support me, I was regularly floored, and at last had to declare that I had not a proper knowledge of these things. I had been a soldier and had not studied, but would do so now. The confusion I showed, and the ignorance of some of my answers, raised the suspicion of the chief's cousin, who, on one of the party asking if the Feringhees had not conquered all Hindostan, said, 'Why, he may be a Feringhee himself. I have always heard that the Hindostanees are black, and this man is fairer than we are.' I am sure we must all have shown signs of confusion at this. For my own part, I felt my cheeks tingle, and my presence of mind fast failing me, particularly as the whole assembly turned towards me. I had, however, no time for observation, and found I must say something for myself. Hoosain had at once commenced a vigorous denial, in which he was joined by the Caubul merchant; yet the chief, a shrewd fellow, paid no attention to them, and evidently appeared to think there was some truth in it; and the multitude, ever prone for the wonderful, were already talking of the Feringhee in no very complimentary terms, scarcely one paying attention to my defenders. I, therefore, addressing the chief, said that such inhospitality had never before been heard of, that here I had come as a pilgrim trusting to his aid, that I had chosen an unfrequented and barren road because inhabited by the Mussulmans in preference to the easier road, as it is well-known the Afghan people treat them well, and only tyrannise over the sect of the lawful Caliph; that in India there were Moguls, Pathans, and all sorts of people from cold climates, that, truly, much of it was hot, but that parts were cold to the north, and snow always lay on the mountains, and that if he asked my friends, they would tell him that I was a Kohistanee and a true believer. The chief appeared satisfied with this, and turned his attention to Syud Ahmed and the others, who were all talking together at the top of their voices; and the multitude, on finding me speak as others did, and that I had no monstrosity about me as they doubtless fancied a Feringhee should have, had gradually turned their attention to those who made most noise; and I, having succeeded in satisfying the demand for an answer, was glad to be silent. My companions, however, carried their explanations too far, and the accuser, besides being obliged to make an apology, was taunted and badgered so much, that even a much less rancorous man would have been irritated and vowed vengeance, and seeing that my attempts to quit them only added to his anger, I was obliged to hold my peace. It being now sunset, the chief got up and said, 'I'll not prevent you from saying your prayers; as soon as I have finished mine, I will return.' We immediately broke up, and set to performing the necessary ablutions, and then commenced prayers. I had no taste for this mockery, and not considering it proper, never before having attempted it, was rather afraid of observation. I, fortunately however, by the aid of Hoosain, got through properly, at least unremarked, and then had recourse to the beads till the rest had finished. Syud Ahmed, however, got into a scrape; the Caboolee detected him as a Soonee, but he was pacified on Hoosain acknowledging that the other was but a new convert going to Meshed for instruction."

---

* These and all the following extracts are from the unpublished journals of Eldred Pottinger.

Days passed; Pottinger and his companions were still detained; so they began to meditate flight. The operation, however, was a hazardous one, and it seemed better to wait a little longer in the hope of receiving the chief's permission for their departure. Meanwhile, there was no little danger of the real character of the party being discovered, for their baggage was subjected to a search, and many of the articles in Pottinger's possession were such as, if rightly understood, clearly to divulge his European origin. Among these was a copy of Elphinstone's "Caubul," which puzzled them greatly. "On the 6th," wrote Pottinger in his journal, "the chief had evidently an idle day—he came before breakfast, and afterwards coming a second time, examined our loads. There was a small tin can with medicines in it, which attracted his attention, but the danger of it was escaped by saying we were merely transporting it. The printed books were at first passed over, but, being unwatched, one of the meddlers hanging about took Elphinstone's 'Caubul' up, and happened to open at a print. We were nearly floored at once, the whole party declaring it was an idol. Hoosain, however, swore that it was not, and that the houses of Kuzzilbashes in Caubul were full of such pictures. A small parcel of reeds next struck their attention, and they would not rest satisfied till opened, when they found some pencils and a pair of compasses which I had tied there to preserve their points. They were lost in astonishment, and when I said the compasses were for the study of astronomy, a pursuit which the Persian sect, for the purposes of astrology, pay much attention to, I was surprised to find it was in the Hazareh estimation a forbidden science. However, a few names and assertions got us over that. The hangers-on had, in the meantime, got hold of a note-book of mine in which was a catalogue of generic terms in English, and the equivalents in Persian and Pushtoo. This puzzled them greatly, and the party being joined by a neighbouring chief, the brother-in-law of Meer Yakoob, and a Syud, both of whom could read, there was a general examination of the writing, and no explanation would satisfy them; at last, tired of guessing, they gave it up and retired. . . . The chief asked me how I would like to live with him, and on my replying that if in the summer I found it so cold what would I do in the winter, he said, 'Such a delicate person as you would die in a week. It is only we' (pointing to his miserable half-starved clansmen) 'who can stand the cold.' The chief here made a slight mistake (from judging by himself, I suppose): he was certainly a well-fed hearty-looking fellow, who could have stood or given a buffet with a right good will. As for the others, they were melancholy anatomies, apparently made but to prove in what misery, brutality, and ignorance, the human kind can exist. The half-clothed barbarians of Southern Asia have an idea that all persons of fair complexion must be delicate, while we in general attribute delicacy to a dark skin. Their poor—from the want of clothing—expose their bodies to the vicissitudes of the weather, and it becomes tanned, and consequently they think it a mark of hardiness, while their wealthy and great, always covered and housed, retain, in a great measure, their lightness of colour. Hence it is considered the badge of delicacy and effeminacy."

His prospects were now anything but cheering. His companions were taken ill, and there seemed to be too much reason to apprehend that he would be detected and imprisoned. Another source of disquietude was the extreme dislike of his honest truthful nature to the imposture which he was compelled to act. "In the evening," so he wrote in his journal, "Hoosain was also taken ill with intermittent fever, and Syud Ahmed fancied that he had a relapse. I was, therefore, more alone than usual, and at the time I should have avoided reflection; but I was obliged to review the actions of the day, which had, indeed, followed so fast upon each other, that I had not a previous moment to consider the results. Now that I looked back, well knowing the imposition I had been practising, I could not conceal from myself the true state of the case, and that a discovery had really been made; but that hitherto good fortune had saved us. For the barbarians were not certain in their own mind, though a grain more evidence or the speech of a bold man would probably have decided the affair. I also felt my total incompetency to meet them alone, from my inadequate knowledge of their language and customs; and, as people in my situation generally do, I blackened my prospect a great deal more than it deserved." Thus he meditated for awhile, but he was a man naturally of a cheerful and sanguine nature, so he cast away unavailing anxieties and fortified himself for the work before him. "At last," he continued, "finding that I could do nothing, I judged it better to join Hoosain's servant in an inroad on our provision-bag, which he was very vigorously undertaking, than pursue such bootless ruminations." And, indeed, as he said, his prospects were not so bad as they seemed. For, on the following day, the morning of the 7th of August, the Hazareh chief yielded to the persuasions of the strangers and suffered them to depart in peace. They had scarcely, however, recommenced their march, when, to their dismay, they were summoned back again. What followed may best be told in Pottinger's own words. It must be premised that he had propitiated Yakoob Beg by the gift of a detonator gun. "We, congratulating ourselves on getting off, were gladly climbing the rocky glen which led down to the castle, and had nearly reached the top of the mountains, when we were aware of several men running after us at speed and shouting for us to turn back. We had no choice left, so obeyed. I never saw such a change come over a party, particularly as the slave-dealers were let go, and we alone called back, the messengers specifying that the chief wanted me. I made up my mind that I was to be detained, and certainly was too annoyed for further talk; it however struck me the chief might want a turn-screw or bullet-mould, and I left Syud Ahmed behind to unload the pony, and, if he could find them, send them after. For this purpose we halted opposite the strangers' hut and left our cattle. Hoosain and I having made this arrangement, and charged the others to be cool, with as much unconcern as we could muster, proceeded on alone. We had got then within a few yards of the esplanade in front of the castle where the chief was, when we heard a shot, and then a shout of exultation. What this meant we could not make out; but whatever it was, it had the effect a good shout always has of raising my spirits, and I felt that it would have been a great relief to give so joyful a hurrah myself; but as I thought, we reached the open space, and a few yards took us within speaking distance of the chief, who in answer to 'Peace be unto you,' replied, 'You may go now,—I don't want you; I only sent for you to make the gun go off, but it is gone off.' I turned to be off too, wishing him most devoutly a passage to Tartarus, but Hoosain had been too seriously frightened to let him go off so quietly, and burst out into so eloquent an oration that he perfectly delighted me, and astonished the Hazarehs. He asked the chief, among other things, 'Do you expect that we are to return from Herat, if you choose to send every time your gun misses fire?' He in fact quite overthrew the chief by his heat, and that worthy only appeared anxious to get out of reach of such a tongue."

Without much further adventure, the travellers reached Herat on the 18th of August, having been twenty-six days on the road, eight of which were days of detention. Soon after their arrival they narrowly escaped being carried off and sold into slavery. "On our first arrival," wrote Pottinger on the 20th of August, "we went about unarmed; but happening to go to the Musula, a building about 800 yards from the gate of Muluk, built by Gowhur Shah Begum, the wife of Shah Rook Sooltan, as an academy, without the walls, we were very nearly carried off by the people who live near it in a rendezvous for slaveholders. We were only saved by Syud Ahmed's presence of mind, who, on being questioned, said we had come with a party to a neighbouring garden to pass the day, and that our companions were coming after us. On this they went off, and we made the best of our way back to the city with a firm resolution never again to venture out without our arms, and it is a rule every one should follow in these countries, unless attended by an armed escort. However, in any case, a sword should always be carried, if not by yourself, by an attendant. So universal and necessary is the custom, that the Moollahs always travel armed even with an army."

At this time, Shah Kamran, the reigning prince of Herat, with his Vizier Yar Mahomed, was absent from his capital, on a campaign in the still-disputed territory of Seistan. On the 17th of September they returned to Herat, and all the population of the place went forth to greet them. They had scarcely arrived, when news came that Mahomed Shah, the King of Persia, was making preparations for an advance on Herat; and soon it became obvious that the Heratees must gird themselves up to stand a siege. Yar Mahomed was a base, bad man; but he was not a weak one. He was a man-stealer, a slave-dealer, of the worst type: a wretch altogether without a scruple of conscience or an instinct of humanity. But he was, after his kind, a wise statesman and a good soldier; and he threw himself into the defence of Herat with an amount of vigour and resolution worthy of a hero of a higher class. Shah Kamran was little more than a puppet in his hands. To this man, Pottinger, in the crisis which had arisen, deemed it right to make himself known. The fall of Herat would manifestly be an event injurious to British interests. He was an artillery officer, skilled in the use of ordnance, and knew something of the attack and defence of fortified cities, from the lessons of Straith and Bordwine. Might he not be of some use in this emergency? The first step to be taken was to make the acquaintance of Yar Mahomed. So he went to his quarters. "He received me," wrote Pottinger, "most graciously; rose on my entrance, and bade me be seated beside himself. He was seated in an alcove in the dressing-room of his bath. As it is not customary to go empty-handed before such people, I presented my detonating pistols, which were the only things I had worth giving. After this interview I went about everywhere boldly, and was very seldom recognised as a European. A few days afterwards I paid a visit, by desire, to the king." From this time, the disguise which had sate so unpleasantly upon him—which had, indeed, been a thorn in the flesh of his honesty and truthfulness—was abandoned. He was under the protection of the King and the Wuzeer, and, save under their authority, no man dared to molest him.

Eldred Pottinger was the least egotistical of men. He was provokingly reticent about himself in all the entries in his journal. In some men this might have been traced to caution; for his journal might have fallen into hands for which it was never intended. But in him, it was simply the modesty of his nature. It is not to be gathered from what he has written, in what manner the Vizier of Herat and the young English officer first became friends and allies, or what was the exact character of the relations established between them. Yar Mahomed was far too astute a man not to see clearly that the presence of an English officer in the besieged city might be turned to profitable account; whilst Pottinger, on his part, saw before him a grand opportunity of gratifying the strong desire which had glowed within him ever since he was a child. The Persians invested Herat, and his work began. It need not be said that the young artillery-man held no recognised position, either of a military or a political character. He was merely a volunteer. But there were Russian Engineers in the Persian camp; and there was never perhaps a time when a little European skill and knowledge were more needed for the direction of the rude energies of an Oriental army. There was much in the mode of defence which excited Pottinger's contempt; much which also evoked his indignation. The following passage from his journal illustrates both the want of humanity and the want of wisdom they displayed:—"I have not thought it necessary to recount the number of heads that were brought in daily, nor indeed do I know. I never could speak of this barbarous, disgusting, and inhuman conduct, with any temper. The number, however, was always in these sorties insignificant, and the collecting them invariably broke the vigour of the pursuit, and prevented the destruction of the trenches. There is no doubt that great terror was inspired by the mutilation of the bodies, amongst their comrades, but there must have been, at least, equal indignation; and a corresponding exultation was felt by the victors at the sight of these barbarous trophies and the spoils brought in. From the latter, great benefit was derived, as it induced many to go out who otherwise never would have gone out willingly; great benefit was derived from the arms and tools brought in on these occasions; but though the Afghan chiefs fully acknowledged and felt the value of proper combination for this purpose, they were too irregular to carry through any arrangement. It always appeared to me desirable that every sortie should consist of three distinct bodies: one of unencumbered light troops to break in on and chase off the attackers, the second body to be kept together as a reserve to support the first in case of a check, but not to follow them further than to a position sufficiently advanced to cover the third party, which should be armed with strong swords or axes, and be ordered to destroy the works and carry off as many tools or arms as possible on the return of the sortie. If successful, the prize property should be equally divided and given to the men on the spot. It is worthy of remark that all the sorties were made with swords alone, and that, though many slight wounds were given, very few men were killed outright; and that the Afghans, having apparently exhausted the stimulus that carried them on at first, or wanting confidence in their weapons, never once attempted to meet the Persian reserves—the first shot from which was invariably the signal for a general retreat."

Affairs were obviously now in a bad way; and, three days before Christmas, Yar Mahomed, not knowing what to do, sought the young English officer's advice. "Mirza Ibrahim," wrote Pottinger in his journal, "the Vizier's private secretary (I may call him), came to talk quietly over our prospects. I suggested that some one should be sent to the Persian camp to sound the chiefs, and I would go with him; and he told me no Afghan would venture, and that no Sheeah would be trusted; but he would see what the Vizier said. It was our idea at this time that the city must eventually fall. All hopes of diversion until the Equinox had failed. For my own part I could not understand what kept the Persians back. They had an open breach, and no obstacle which would have checked British troops for a single moment. The Afghans were badly armed, and their fire of small arms could easily have been kept down, while the scattered and desultory exertions of a few swordsmen against a column could have availed little. The Persians, however, had begun scientifically, and in their wisdom did not comprehend what was to be done when the enemy held out after they had established themselves on the counterscarp. Their practice under our officers did not go further, and in this unheard-of case they were at a loss, and the European officers still with them did not appear to have influence enough or skill enough to direct the attacks further."

The monotony of the siege was now and then broken by some exciting incidents, which Pottinger has detailed in his diary with the unadorned accuracy of a soldier's pen. The following may be taken as a fair sample of the whole, and it derives an additional interest from the fact that it exhibits the danger to which the young Englishman, even in the front, was continually exposed:—"*April 18th.*—The Vizier ordered the Afghans to cease firing, and sit down under cover; they, however, though beaten with the musketry, drew their swords, brandished them above their heads, shouting to the Persians to come on. As might have been expected in such a storm of musket balls, this bravado caused several casualties. Several men received bullets through the hands and arms. One fellow, more fool-hardy than the rest, kept brandishing his huge Afghan knife, after the others had complied with repeated orders to sheath their weapons, and had the knife destroyed by a bullet which struck it just above his hand. I had gone down to the spot to see the mine sprung, and was sitting on the banquette with the Vizier and a party of chiefs, who, while he was preparing, were bantering the man whose knife was broken, and who came to beg a sword instead, when a bullet came in through a loophole over my head, and smashing a brick used for stopping it, lodged in Aga Ruhyia's lungs, who was standing opposite, one of the splinters of the brick at the same time wounding him in the face. The poor fellow was a eunuch of Yar Mahomed's, and was always to be seen wherever any danger was; he died in two or three days. I had been but the moment before looking through the clods on the top of the parapet, with my breast resting against the loophole, watching the Persians, who were trying to establish themselves in the crater of the mine, and the Afghans in the counterscarp who were trying to grapple the gabions and overset them, so that the scene was very interesting, and I had not sat down with the chiefs until Dyn Mahomed Khan actually pulled me down by my cloak, to listen to the jokes passed on the man who had his knife destroyed, and thus I escaped Aga Ruhyia's bullet."

It would demand the space of a volume to narrate in detail the incidents of this protracted siege. Throughout many long months the young English artilleryman was the life and soul of the defence. But there were many great advantages on the side of the Persians, and at last, towards the end of June (1838), the Heratees were almost at their last gasp. Yar Mahomed was beginning to despond, and his followers were almost in a prostrate state. Food was scarce; money was scarce. There was a lack of everything, but of the stubborn courage which continued to animate and sustain the solitary Englishman. On the 28th of June, the Persians made a desperate attempt to carry the place by assault—and it would have been carried, if the wonderful energy of Eldred Pottinger, in this crisis, had not rescued it from the grasp of Mahomed Shah. The story is so modestly told by the young hero, from whose journal I now quote, that the real history of his gallantry appears but faintly on the record. "*24th of June*, 1838.—In the morning about eight, the enemy opened a heavy fire on all the four sides of the city, and continued it till about half-past ten, when it ceased, and a perfect calm succeeded. During the firing it was observed that the enemy was assembling in great force, and that the fire was principally directed at the Fausse-braies. The Vizier, however, would not take warning, remaining quietly at his quarters, which deceived the garrison, and made many think that the signs of the assault were illusory. Indeed, most of the men had gone to sleep, when suddenly the reports of two or three guns and the whizz of a rocket in the air was heard. The enemy immediately opened a heavy fire, but the musketry was feeble: it gradually, however, became more sustained, and the roar of the cannon on all sides was continued. The Vizier, on the first alarm, repaired to the gate of Mulick with a small body of men as a sort of reserve. The assaults were on the gate of Arak, on the breaches in the west face, the gate of Kandahar, the Pay-in-ab, and the Boorj of Kowajah Abdoolah Misr. At all the others but this last, attacks were repulsed. There the column, headed by its officers, threw itself across the narrow passage of the ditch into the lower Fausse-braie, which it mastered, after a brief but bloody struggle, by the total destruction of its defenders. From this, pressing on direct up the slope, exposed to a fire which destroyed nearly all its officers and leaders, the column entered the upper Fausse-braie, which, after an equally bloody struggle, it mastered, and a few of its most daring men pushed on in front and reached the head of the breach, but were driven back into the upper Fausse-braie by the opportune arrival of the reserve under Dyn Mahomed Khan; and there, while some of the Persians were trying to establish a lodgment, others renewed the attempt to reach the summits of the breaches. But owing to the arrival of a large party of volunteers, the enemy failed to make head upon the breach, and recoiled upon their own men on the exterior slope of the upper Fausse-braie, where they were partially covered; but, still undismayed, they renewed their attempts, while the fire from their breaches was so heavy that no one could show his head above the rampart. On hearing this, the Vizier mounted and went by the gate of Kandahar to the Fausse-braie, sending orders for different chiefs to go to the aid of those on the summit of the breach. In spite of all advice, and even entreaty, his own party was allowed to struggle on in advance, and he arrived nearly alone. Sooltan Mahomed Khan at the same time arrived on the rampart to his brother's assistance, and gave him most opportune aid. The Vizier and his party, arriving at the traverses about a third of the way from the end of the upper Fausse-braie, found the men retreating by twos and threes, and others going off with the wounded: these were stopped. The Vizier, however, was alarmed. At first, he sat down about half way, whence, after some trouble, those about him insisted on his going on or sending his son.* He chose the former, and sent the latter to the gate of Kandahar to stop stragglers and skulkers and attend to orders. The Vizier himself then went on past two traverses, to the last one held by the garrison; but on finding the men at a stand-still and insensible to his orders or entreaties to fight, he turned back to go for aid. The moment he turned, the men began to give way. He made his way to the first place he had sat down at. There, by showing him the men retreating and the evident ruin that must follow, he became persuaded to stop. Then they succeeded in bringing him back to the first traverse, which having but a narrow passage, his people and those about could turn back those who were, coward-like, retreating. From this he sent for aid; but foolishly, in spite of all advice, again allowed the men to go on by twos and threes, so that they did nothing. At last, a Sooltan arrived with about fifty men, when, on a short consultation, it was resolved to send him down into the lower Fausse-braie, to push along, that while those on the rampart were ordered to attempt an attack down the breach, those on the Fausse-braies on the east side should push on the other flank of the Persian column. Pursuant to this, Yar Mahomed, after much entreaty and even abuse, advanced the third time, and finally ventured past the last traverse, where seeing the men inactive, he seized on a large staff, and rushing on the hindermost, by dint of blows he drove on the reluctant. Some, crowding up in narrow parts, seeing no escape wildly jumped over the parapet and ran down the exterior slope, and some straight forward; the people on the other side making their rush at the same time. The Persians were seized with a sudden panic; abandoning their position they fled outright down the exterior slope and out of the lower Fausse-braie; after which the business ceased. When the Vizier first arrived, the enemy had all the upper Fausse-braie between the two arched traverses at the angle, and between these none of the fire of the garrison can reach: some of the Persians at the unflanked part of the tower, about three quarters of the way from the bottom, had lodged themselves, one in particular made a loophole with some bricks, whence he fired at those in Fausse-braie, but at last was silenced. The Persians had two ensigns planted at the top of exterior slope, which were three times thrown down and as often brought back; their batteries kept up a tremendous fire on the rampart, but their small-arm fire was weak. The Vizier with the main reserve reached the point at about one, or perhaps a little before it, and the last and decisive charge took place about half-past four. A great many of the troops on the Afghan side showed the white feather, and also a great many behaved beyond praise. The Vizier did not behave so well as expected; he was not collected, nor had he presence of mind to act in combination; the Urz-begy was greatly frightened, and did much harm by unnerving the Vizier, who with difficulty could be prevented from following his suggestions, to leave the Fausse-braie and muster the men in the city. The defenders—the people about*—abused, and several times had to lay hold of the Vizier and point to him the men, who turned as soon as he did. At last he got furious, and laid on as before mentioned, without even knowing whom he struck. The alarming state of things at this point, and the frequent messages for aid, put in motion nearly half the garrison and all the chiefs of distinction, so that when the business was over, men came pouring in so as to fill the upper Fausse-braie; but the men appointed for the defence of the Fausse-braies were so panic-struck, that they took advantage of the watch being temporarily removed from the gates to abscond, and it was with great difficulty that a sufficient number of the garrison could be procured to defend the point. We returned by the Fausse-braie to the gate of the Mulik, visiting the posts attacked. The Vizier was very bewildered after the affair.—The assault on the gate of Kandahar was repulsed, and the Persians chased back into their trenches; but the danger at the south-east angle prevented them following up the advantage. At the south-west angle, or Pay-in-ab, the Persians can scarcely be said to have attacked, as they never advanced beyond the parapet of their own trenches; it was evidently a mere feint. At the western, or Arak gate, a column composed of the Russian regiment and other troops under Samson, and of those under Wuly Khan, marched up to the counterscarp, but Wuly Khan being killed, and Samson carried off the field wounded, the men broke and fled, leaving an immense number killed and wounded; the latter were nearly all shot by idlers on the rampart, or murdered by the plunderers who crept out to strip the slain. The other attack on the centre of the north-west face was repulsed in like manner after reaching the counterscarp."

---

* By "those about him," the reader is to understand Eldred Pottinger. It is known that he seized Yar Mahomed by the wrist, dragged him forward, and implored him to make one more effort to save Herat.

It is not to be doubted that the Heratees owed it to the young Englishman that Herat did not, at this time, fall into the hands of the Persians. But this can be gathered only incidentally from Pottinger's journal. The entry of the following day runs only in these words:—"*June 27th.*—At Sultan Mahomed Khan's post he behaved very well, as before mentioned, on the day of the assault; but the way he boasted of his conduct, the manner in which he distorted facts, and depreciated the actions of others, was the most laughable that I have ever witnessed; I also could not help feeling provoked at it. I do not know from what reason it is boasting and lying always anger us, and make us desirous of setting the narrator correct, and punishing him. I was more especially annoyed at the manner in which he underrated the Persians, who really behaved very well. They had great difficulties to overcome, and a greater number of Afghans than their own was opposed to them. A man coming in from the Persian camp reported that Wuly Khan and Barowski were killed, and that Samson was severely wounded; that an immense number of the principal officers had fallen, and that the men were quite broken-spirited. After him arrived a man from Kurookh; he said he had left a detachment of 6000 Orgunjees, who only waited for orders to foray, or even attack the Persian outposts; I was surprised to find my share of the business of the 25th had reached Kurookh. The moment the man arrived he seized and kissed my hands, saying he was rejoiced he made so great a pilgrimage."

But the great things which had been done by the individual gallantry of this one English gentleman increased the difficulties of his position. It was soon plain that the Heratees really wished to get rid of him. The entries in his diary show the perplexities in which he was placed:—"*July 8th.*—Had a visit from the head Jews, to thank me for my interference, and found that they were still in fear; moreover, they wanted me to pay or lend the amount, but I refused. The Persians wrote to Yar Mahomed Khan, that they would give up Herat to the Vizier, if he would but send Kamran and me to them as prisoners; I told him he had nothing to do but to tell them to go, and I would go to them of myself if they said that was all they wanted. He appeared to perfectly understand the deceitful nature of the offering. The Afghans he knew would not hear of the Shah's going out: the whole day was spent in devising schemes to raise money. The Persian fire at the Kandahar gate still continued. During the day the wind was hot, and in the evening it blew a gale. *July 19th.*—I afterwards went to the Vizier's, fully intending to demand my dismissal if I heard anything about it. On, however, broaching the subject, the Vizier spoke so decidedly and correctly as to the obligation he felt under, that my fears were totally abated, and I did not open the subject of my departure; to stay, however, appears not a little dangerous. The game appears up, if speedy aid does not arrive, and whence that is to come I do not see. The chiefs here have held out too obstinately to be able to trust in the Persians' clemency; and though they must be the prey of whoever first arrived to their aid, they will not yield to Persia if they can help. *July 25th.*—About eleven at night, the Persians sprung a mine under the passage of the ditch at Samson's attack, but the charge and position were miscalculated, and it failed to produce any effect; at the same time the Vizier received a letter from Hadjee Abdool Mahomed in the Persian camp, upbraiding him for joining with infidels against Islam, and for holding on by the skirt of the English, from whom he could never receive any advantage; that they would fatten him and give money as long as suited their interest, as they do in India, and when they had made a party in the country and knew all its secrets, they would take it for themselves; that the Government found such was what they wanted to do in Persia, but had on the discovery prevented it by turning them away; and that until the Envoy of these blasphemers—myself—was also turned out of the city, they would not allow the Mooshtuhid to venture into the city. A note to the same effect was received from the Vizier's brother, with the addition that the Russian Envoy would not send his agent till I left. *July 26th.*—In the morning, the Afghans had a consultation of what they would answer. At last it was resolved the Vizier should write in answer, that the Englishman is a stranger and guest, that he had come to the city, and in the present state of affairs the Afghans could not think of turning him out of the city: for in the distracted state of the country he could not arrive in safety in his own country, and if anything happened to him it would be a lasting disgrace to the Afghan name, and as a guest he must go or stay according to his own pleasure; moreover, the Vizier wrote that he did not hold out in expectation of aid from the English, that he had no wish to join that state against Persia (Iran), from his connection with which he had no wish to tear himself, but that the Persians would give him no choice, but surrendering or fighting, which he did from necessity and not from being so absurd as to wait for aid from London. *July 28th.*—According to engagement I went to Hadjee Mirza Khan's post in the afternoon; I arrived a little before the Vizier, and had an amusing insight into affairs. We had tea as a commencement, and then dinner was served, consisting of pilaos, ragouts, vegetables, and pickles. A large pilao and a portion of each of the rest was served on large circular copper trays, one for every two persons. The Vizier, on Hadjee Mirza telling of the abuse the Persians had heaped upon me, and their demand that I should be turned out of the city, said he had told the women who had assembled in his house to see him (his relations), and that they had declared they would not allow of it,—they would die first; and finished by remarking they had more spirit than the men, who would have consented to give me up. *August 6th.*—In the evening, when the Persians had gone, went to the assembly. The Vizier told me the whole business being upon me, that the Persians made a point of obtaining my dismissal, without which they would not treat. They were so pressing that he said he never before guessed my importance, and that the Afghan envoys, who had gone to camp, had told him they had always thought me one man, but the importance the Persians attached to my departure, showed I was equal to an army. The Afghans were very complimentary, and expressed loudly their gratitude to the British Government, to the exertions of which they attributed the change in the tone of the Persians; they, however, did not give the decided answer they should have, but put the question off by saying I was a guest. *August 30th.*—The movement of the Persians is spoken of with increased positiveness, but no certain intelligence could be procured, notwithstanding the Afghans were grumbling at the delay of the English, and Yar Mahomed himself was one of the agitators of this feeling,—he giving out in public that, in his opinion, the English Government intended to drop the connection, that it wanted merely to destroy the Persian power, and did not care if the Herat power was at the same time rooted up. All sorts of absurd rumours were rife, but a very general opinion, originating from the Persian zealots, was that the British and Russian Governments were in alliance to destroy Mahomedanism and partition off the country, dividing India from Russia, between them."

---

* See note above.

Soon after this, the siege was raised. The Persians, moved perhaps, more than by aught else, by the demonstration made by the British in the Persian Gulf, struck their camp and Herat was saved—saved, as we may believe, under Providence, by the wonderful energy of the young artilleryman, who had done so much to direct the defence and to animate the defenders. We shall never very accurately know the full extent of the service which Eldred Pottinger rendered to the beleaguered Heratees; and for this reason (as I have before said), that the extreme modesty of the journal, which lies before me, has greatly obscured the truth. He was at all times slow to speak of himself and his doings; and it can be gathered only inferentially from his narrative of the siege, that he virtually conducted the operations of the garrison. That the Persians believed this is certain; and it is equally clear, that, although Yar Mahomed and other Heratee chiefs, being naturally of a boastful, vain-glorious character, endeavoured to claim to themselves the chief credit of the victory, the people in the surrounding country knew well that it was to the personal gallantry of the young Englishman that they owed their salvation from the Persian yoke.* But the work now was done; and there was good reason to believe, that a single man having accomplished what an army had been organised to do, the army would have been broken up, and the policy of invasion abandoned. But the "great game" of 1838 was still to be played out. The British army, though diminished in bulk, was to march into Afghanistan, for the restoration of the Suddozye dynasty, of which Shah Kamran of Herat was an off-shoot. And Eldred Pottinger, having now no more active service to render to his Government, quitted the Afghan territory, and went down to meet the stream, military and political, which was then, in 1858-59, surging upwards towards Caubul. It is narrated of him, that joining the camp of the Governor-General, in the upper provinces, he was warmly welcomed by Lord Auckland, who received, with the liveliest interest, the information with which he was laden, and would have listened with admiration to his narrative of the stirring scenes in which he had been engaged, if he had spoken more of himself and his actions. He was of course invited to join the Government circle at dinner; but nothing was known of his arrival, until the guests were assembling in the great dinner-tent. Then it was observed that a "native," in Afghan costume, was leaning against one of the poles of the tent; obviously a shy, reserved man, with somewhat of a downcast look; and the Government-House Staff looked askance at him, whispered to each other, wondered what intruder he was, and suggested to each other that it would be well for some one to bid him to depart. But the "some one" was not found; presently the Governor-General entered, and leading his sister, Miss Eden, up to the stranger, said, "Let me present you to the hero of Herat." Then, of course, there was a great commotion in the tent, and, in spite of etiquette, the assembly burst into something not unlike a cheer.

---

* It should be explained that, although the demonstration in the Persian Gulf really caused the raising of the siege, Herat would have been carried, before that demonstration, but for the resolution of Eldred Pottinger.

When the invasion of Afghanistan had been proclaimed, and the army of the Indus had gone forth to do the unjust bidding of the Government, and Shah Soojah had been placed upon "the throne of his fathers," there was small likelihood of such a man as Eldred Pottinger being neglected, for the services which he was able to afford were those which were most needed in such an emergency. Whilst he had been doing such great things at Herat, the arrangements for the formation of the Caubul Embassy had been made; and so it was not easy at once to find a fitting place for the young Bombay artilleryman. But after awhile he was appointed a political agent in the Kohistan, or country to the north of Caubul (officially styled Political Agent on the Toorkistan frontier); and there the great movement for the expulsion of the British from Afghanistan found him in the early winter of 1841. His head-quarters were in the castle of Lughmanee, some two miles from Charekur, where a regiment of Goorkhas, in the service of Shah Soojah, was garrisoned. In the Lughmanee Castle, the enemy attacked the political agent and his staff, and they, with their little escort, were in peril of total annihilation. It was a rising of the whole country, and how could they hope to escape? But, by wise arrangements, which eluded the vigilance of the enemy, Pottinger with a few followers contrived to make good his retreat to Charekur, under the shadow of the night. He had scarcely thrown himself into that place, when the enemy began to rage furiously against the people of the King and his supporters. The time for negotiation had passed; so Pottinger, divesting himself of his political character, took command of the guns, and prepared to resist the insurgents.

But there was an enemy which it was impossible to resist. The little garrison held out manfully against vastly superior numbers; but they were perishing from thirst. The insurgents had cut off their supplies of water, and there was no hope for them. Reduced to this strait, they were summoned to surrender. The condition to secure their safety was that Christians and Hindoos alike should accept the Mahomedan faith. "We came to a Mahomedan country," answered Pottinger, "to aid a Mahomedan sovereign in the recovery of his rights. We are, therefore, within the rule of Islam, and exempt from coercion on the score of religion." They told him that the King had ordered the attack; and he replied, "Bring me his written orders. I can do nothing without them."

But the thirst was destroying them. The last drop of water had been served out; and when they endeavoured to steal out in the night to obtain a little of the precious moisture from a neighbouring spring, the enemy discovered them and shot them down like sheep. There was failure after failure, and then the disciplined fighting men became a disorganised rabble. The few that remained staunch were very weak, and they had but a few rounds of ammunition in their pouches. With this little body of Goorkha troops, and two or three officers—for many had been killed—Pottinger determined to fight his way to Caubul. He had been badly wounded, and the pain was insufferable; but he exerted himself to keep together the little party of distracted men. All his efforts, however, were in vain: they straggled and fell by the wayside; and at last it became painfully apparent that no man could do anything for his neighbour, and that the best service that an English officer could render to his country would be to save himself. Two only escaped. Pottinger and Houghton reached Caubul; and of the native garrison, only a single sepoy of the Goorkha regiment and two men attached to the civil departments succeeded in making good their flight.

When Eldred Pottinger reached Caubul, he was compelled, for some time, to nurse his wounds; but, before long, the great crisis of the insurrection brought him again to the front. Sir William Macnaghten, who was at the head of the British Mission, was slain by Akbar Khan; and every man in camp then felt that Pottinger was the man above all others to extricate the English from the difficulties which hemmed them in, as with a ring of fire. It was on the 23rd of December, 1841, that the Envoy was killed. On the 25th, Pottinger wrote to Major Macgregor, who was Political Agent at Jellalabad:—

"CAUBUL, *December* 25, 1841.

"MY DEAR MACGREGOR,—We have had a sad Comedy of Errors, or rather tragedy here. Macnaghten was called out to a conference and murdered. We have interchanged terms on the ground he was treating on for leaving the country; but things are not finally settled. However, we are to fall back on Jellalabad to-morrow or next day. In the present disturbed state of the country we may expect opposition on the road, and we are likely to suffer much from the cold and hunger, as we expect to have no carriage for tents and superfluities. I have taken charge of the Mission. Mackenzie, Lawrence, and Conolly are all seized. The first two I fear for. The latter is quite safe. The cantonment is now attacked.

"Yours, very truly,
"ELDRED POTTINGER."

Five days afterwards, he wrote to Captain Mackeson at Peshawur, disguising the language of his letter in French and signing his name in Greek, because there were those in the enemy's camp who could read English.

"CANTONNEMENTS À CABOOL,
30me *de Décembre*, 1841.

"MON CHER MACKESON,—J'ai eu le plaisir de recevoir votre lettre du 12me au feu Envoyé. Notre situation ici est des plus dangereuses. L'Envoyé était tué à une conférence, qui avait lieu hors d'ici, le 23 de ce mois. Quand je prenais charge je trouvais qu'il avait engagé du part du gouvernement de quitter Afghanistan, et de donner *hostages* pour que le Dost soyait mis en liberté, aussi que pour préliminaires il avait rendu le Balla Hissar et les forts qui dominent les cantonnements. Ces acts et le manque des vivres faisaient les cantonnements untenable, et les quatre officiers militaires supérieurs disaient qu'il fallait résumer le traité au lieu de forcer une marche rétrograde sur Jellalabad. Nous avons aujourd'hui finis les termes du traité, et nous espérons partir d'ici demain ou après demain. De leur promesses je m'en doute, malgré que les ordres ont été expédiés pour que nos troupes quittent Candahar et Ghizny. Il faut que vous tenez ouvert le Khyber, et que vous soyez prêt nous aider le passage; car si nous ne sommes pas protégés, il nous serait impossible faire halte en route pour que les troupes se refraichissent, sans laquelle j'ai peur qu'ils soient désorganisés.

"Votre ami,
"Ελδρεδ Ποττινγερ.

"Après aujourd'hui j'écrirai mon nom en lettres Grecques. Lorsque le Cossid vous remettra cette lettre vous lui donnerez trois cent rupees."

It was hard to say what Eldred Pottinger suffered, when he found himself compelled to negotiate with the enemy for the surrender of Caubul and the evacuation of the country. He vehemently opposed himself to the weak policy, which had been agreed upon before he was placed in the direction of affairs. He protested; he remonstrated; but all in vain. The military authorities had determined that they could fight no longer, and that there was nothing to be done but to make an ignominious retreat from the country, which they had so proudly invaded. The explanation of the circumstances, which at last compelled him, sorely against the promptings of his own courageous heart, to negotiate with the Afghan chiefs for a safe conduct, is on record. "We received," he wrote, in a report to Government drawn up at a subsequent period, "a tender from Mahomed Oosman Khan, offering to escort the army to Peshawur for the sum of five lakhs of rupees, as had been offered him (he said) by Sir W. Macnaghten. At the same time, letters from Captains Macgregor and Mackeson were received, urging Sir William to hold out, and informing us of the reinforcements which were on their way from India. The information from the city showed that feuds were running high there, and that Shah Soojah appeared to be getting up a respectable party for himself. When I informed General Elphinstone of these facts, he summoned a council of war, consisting of Brigadier Shelton, Brigadier Anquetil, Lieut.-Colonel Chambers, Captain Bellew, and Captain Grant. At the Major-General's request I laid the above-mentioned facts and the enemy's tenders before these officers, and also my own opinion that we should not treat with the enemy, because—*firstly*, I had every reason to believe that the enemy were deceiving us; *secondly*, I considered it our duty to hold aloof from all measures which would tie the hands of Government as to its future acts; and *thirdly*, that we had no right to sacrifice so large a sum of public money (amounting to nineteen lakhs) to purchase our own safety—or to order other commanding officers to give up the trust confided to them—for it was especially laid down by writers on international law that a general had no authority to make any treaty, unless he were able to enforce the conditions, and that he could not treat for the future, but only for the present. The council of war, however, unanimously decided that remaining at Caubul and forcing a retreat were alike impracticable, and that nothing remained for us but endeavouring to release the army, by agreeing to the tenders offered by the enemy; and that any sum, in addition to what had already been promised by Sir William Macnaghten, if it tended to secure the safety of the army, would be well expended, and that our right to negotiate on these terms was proved by Sir William Macnaghten having agreed to them before his assassination. Under these circumstances, as the Major-General coincided with the officers of the council, and refused to attempt occupying the Balla Hissar; as his second in command, who had been in there, declared it impracticable, I considered it my duty, notwithstanding my repugnance to and disapproval of the measure, to yield, and attempt to carry on a negotiation. For the reasons of the military authorities, I must refer you to themselves."

So the name of "Eldred Pottinger, Major,*" was attached to the Treaty; and on the 6th of January, 1842, the British army was under arms to march out of Caubul. But the escort, which the Afghan chiefs had promised for the protection of the conquered, had not been sent. "The military authorities, however," wrote Pottinger, in the report above quoted, "refused to wait; and notwithstanding my advice to the contrary marched out of our entrenchments." There was nothing but death before them; for the snow had fallen heavily, and the wretched Hindostanee soldiers could not bear up against the rigours of the Northern winter. Pottinger clearly foresaw this, and endeavoured to impress upon the military authorities the importance of so clothing the Sepoys as to resist the severities of the winter, and enable them to escape the destructive bitings of the frost. "Major Pottinger told us," says a writer of note in the *Calcutta Review*, "that when the retreat was decided on, and no attention was paid to his, Lawrence's, and Conolly's advice, to concentrate in the Balla Hissar,—he urged the officers to have all the old horse-clothing, &c., cut into strips and rolled round the soldiers' feet and ankles after the Afghan fashion, as a better protection against snow than the mere hard leather of shoes. This he repeatedly urged, but in vain, and within a few hours the frost did its work. Major Pottinger said that there was not an Afghan around them, who had not his legs swathed in rags as soon as the snow began to fall."

Then came that memorable retreat through the dreadful snow, of which history has but few parallels. The Afghans, whom there was no one to hold in restraint, swarmed down upon our unhappy people, and massacred them, benumbed and helpless as they were, almost without resistance. At last, the Barukzye chief, Akbar Khan, who had slain Sir William Macnaghten, appeared upon the scene, and promised to escort the remnant of the army safely to the British frontier, if three hostages were given up to him as a guarantee for the evacuation of our outposts in other parts of the country. Brigadier Shelton and Captain Lawrence were named; but Shelton refused to go; so Pottinger offered to take his place, and the offer was accepted. George Lawrence and Colin Mackenzie were his companions. From that time, in the early part of January, to the September of the same year (1842), Eldred Pottinger remained a prisoner in the hands of Akbar Khan. All the circumstances of this memorable captivity are well known, for there are few who have not read the interesting journals of Vincent Eyre and Florentia Sale. To the bold front which he assumed, when tidings came that General Pollock was advancing victoriously upon Caubul, the captives owed it mainly, under Providence, that they finally obtained their release. As briefly told by the historian of the war there is something almost ludicrous in the confidence of this little band of Englishmen. For we are told that at Bameean, "they deposed the Governor of the place, and appointed a more friendly chief in his stead. They levied contributions on a party of Lohanee merchants who were passing that way, and so supplied themselves with funds. And, to crown all, Major Pottinger began to issue proclamations, calling upon all the neighbouring chiefs to come in and make their salaam; he granted remissions of revenue; and all the decent clothes in the possession of the party were collected to bestow as *khelats* (dresses of honour)." And there was wisdom in this; for so true is the old Latin adage, "Possunt qui posse videntur."*

But when General Pollock's army marched back triumphantly to the British Provinces, it was a matter of official necessity that the conduct of Major Pottinger, who had signed a treaty for the evacuation of Afghanistan, should be submitted to investigation. A Court of Inquiry was therefore held, over which Mr. (now Sir George) Clerk presided; and what was then elicited only contributed to throw greater lustre on the young artilleryman's name. It was an inquiry of which no man doubted the result. After this Eldred Pottinger went down to Calcutta; and after a brief residence there, determined on a visit to his family in Europe. During his residence at the Presidency, as I well remember, the attempts to lionise him were very unsuccessful. Everybody was struck by the extreme modesty of his demeanour. He was shy and reserved, and unwilling to speak of himself. His uncle, Sir Henry Pottinger, was then at the head of our affairs in China. Moved by feelings of affection and gratitude, he resolved to pay his distinguished relative a visit; and during this visit, in a disastrous hour, he caught the Hong-Kong fever, and on the 15th of November, 1843, a career of the brightest promise was cut short by untimely death. The romance of Indian History has few more interesting chapters than the story of Eldred Pottinger—the defender of Herat.

---

* He had been promoted to a brevet majority and created a Companion of the Bath for his services at Herat.

* His services as chief political officer with the Caubul prisoners were highly appreciated by those who shared his captivity, and they subscribed to present him, after their release, with a testimonial, which he never lived to receive. But it was requested by the subscribers, who one and all mourned his decease, that it might be kept as an heirloom in his family.

HEREWARD, THE LAST OF THE ENGLISH.

By CHARLES KINGSLEY.

CHAPTER XXXIX.

HOW TORFRIDA CONFESSED THAT SHE HAD BEEN INSPIRED BY THE DEVIL.

After a few days, there came down a priest to Crowland, and talked with Torfrida, in Archbishop Lanfranc's name.

Whether Lanfranc sent him, or merely (as is probable) Alftruda, he could not have come in a more fit name. Torfrida knew (with all the world) how Lanfranc had arranged William the Norman's uncanonical marriage, with the Pope, by help of archdeacon Hildebrand (afterwards Pope himself); and had changed his mind deftly to William's side when he saw that William might be useful to Holy Church, and could enslave, if duly managed, not only the nation of England to himself, but the clergy of England to Rome. All this Torfrida, and the world, knew. And therefore she answered:

"Lanfranc? I can hardly credit you: for I hear that he is a good man, though hard. But he has settled a queen's marriage suit; so he may very well settle mine."

After which they talked together; and she answered him, the priest said, so wisely and well, that he never had met with a woman of so clear a brain, or of so stout a heart.

At last, being puzzled to get that which he wanted, he touched on the matter of her marriage with Hereward.

She wished it, he said, dissolved. She wished herself to enter religion.

Archbishop Lanfranc would be most happy to sanction so holy a desire, but there were objections. She was a married woman; and her husband had not given his consent.

"Let him give it, then."

There were still objections. He had nothing to bring against her, which could justify the dissolution of the holy bond: unless——

"Unless I bring some myself?"

"There have been rumours—I say not how true—of magic and sorcery!——"

Torfrida leaped up from her seat, and laughed such a laugh, that the priest said in after years, it rung through his head as if it had arisen out of the pit of the lost.

"So that is what you want, Churchman? Then you shall have it. Bring me pen and ink. I need not to confess to you. You shall read my confession when it is done. I am a better scribe, mind you, than any clerk between here and Paris."

She seized the pen and ink, and wrote; not fiercely, as the priest expected, but slowly and carefully. Then she gave it the priest to read.

"Will that do, Churchman? Will that free my soul, and that of your French Archbishop?"

And the priest read to himself:

How Torfrida of St Omer, born at Arles in Provence, confessed that from her youth up she had been given to the practice of diabolic arts, and had at divers times and places used the same, both alone and with Richilda, late Countess of Hainault. How, wickedly, wantonly, and instinct with a malignant spirit, she had compassed, by charms and spells, to win the love of Hereward. How she had ever since kept in bondage him, and others whom she had not loved with the same carnal love, but only desired to make them useful to her own desire of power and glory, by the same magical arts; for which she now humbly begged pardon of Holy Church, and of all Christian folk; and, penetrated with compunction, desired only that she might retire into the convent of Crowland. She asserted the marriage which she had so unlawfully compassed, to be null and void; and prayed to be released therefrom, as a burden to her conscience and soul, that she might spend the rest of her life in penitence for her many enormous sins. She submitted herself to the judgment of Holy Church, only begging that this her free confession might be counted in her favour, and that she might not be put to death, as she deserved, nor sent into perpetual imprisonment; because her mother-in-law according to the flesh, the Countess Godiva, being old and infirm, had daily need of her; and she wished to serve her menially as long as she lived. After which, she put herself utterly upon the judgment of the Church. And meanwhile, she desired and prayed that she might be allowed to remain at large in the said monastery of Crowland, not leaving the precincts thereof, without special leave given by the Abbot and prioress in one case between her and them reserved; to wear garments of haircloth; to fast all the year on bread and water; and to be disciplined with rods or otherwise, at such times as the prioress should command, and to such degree as her body, softened with carnal luxury, could reasonably endure. And beyond—that, being dead to the world, God might have mercy on her soul.

And she meant what she said. The madness of remorse and disappointment, so common in the wild middle age, had come over her; and with it the twin madness of self-torture.

The priest read, and trembled; not for Torfrida: but for himself, lest she should enchant him after all.

"She must have been an awful sinner," said he to the monks when he got safe out of the room; "comparable only to the witch of Endor, or the woman Jezebel, of whom St John writes in the Revelations."

"I do not know how you Frenchmen measure folks, when you see them: but to our mind she is

—for goodness, humility, and patience comparable only to an Angel of God," said Abbot Ulfketyl.

"You Englishmen will have to change your minds on many points, if you mean to stay here."

"We shall not change them, and we shall stay here," quoth the Abbot.

"How? You will not get Sweyn and his Danes to help you a second time."

"No, we shall all die, and give you your wills, and you will not have the heart to cast our bones into the fens?"

"Not unless you intend to work miracles, and set up for saints, like your Alphege Edmund."

"Heaven forbid that we should compare ourselves with them! Only let us alone till we die."

"If you let us alone, and do not turn traitor meanwhile."

Abbot Ulfketyl bit his lip, and kept down the rising fiend.

"And now," said the priest, "deliver me over Torfrida the younger, daughter of Hereward and this woman, that I may take her to the King, who has found a fit husband for her."

"You will hardly get her."

"Not get her?"

"Not without her mother's consent. The lass cares for nought but her."

"Pish! that sorceress? Send for the girl."

Abbot Ulfketyl, forced in his own abbey, great and august lord though he was, to obey any upstart of a Norman priest who came backed by the King and Lanfranc, sent for the lass.

The young outlaw came in—hawk on fist, and its hood off, for it was a pet—short, sturdy, upright, brown-haired, blue-eyed, ill-dressed, with hard hands and sun-burnt face, but with the hawk-eye of her father, and her mother, and the hawks among which she was bred. She looked the priest over from head to foot, till he was abashed.

"A Frenchman!" said she, and she said no more.

The priest looked at her eyes, and then at the hawk's eyes. They were disagreeably like each other. He told his errand as courteously as he could, for he was not a bad-hearted man for a Norman priest.

The lass laughed him to scorn. The King's commands? She never saw a king in the greenwood, and cared for none. There was no king in England now, since Sweyn Ulfsson sailed back to Denmark. Who was this Norman William, to sell a free English lass like a colt or a cow? The priest might go back to the slaves of Wessex, and command them if he could: but in the fens, men were free, and lasses too.

The priest was piously shocked and indignant; and began to argue.

She played with her hawk, instead of listening, and then was marching out of the room.

"Your mother," said he, "is a sorceress."

"You are a knave, or set on by knaves. You lie; and you know you lie." And she turned away again.

"She has confessed it."

"You have driven her mad between you, till she will confess anything. I presume you threatened to burn her, as some of you did awhile back." And the young lady made use of words equally strong and true.

The priest was not accustomed to the direct language of the greenwood, and indignant on his own account, threatened, and finally offered to use force. Whereon there looked up into his face such a demon (so he said) as he never had seen or dreamed of, and said:

"If you lay a finger on me, I will brittle you like any deer." And therewith pulled out a saying-knife, about half as long again as the said priest's hand, being very sharp, so he deposed, down the whole length of one edge, and likewise down his little finger's length of the other.

Not being versed in the terms of English venery, he asked Abbot Ulfketyl what brittling of a deer might mean; and being informed that it was that operation on the carcase of a stag which his countrymen called eventrer, and Highland gillies now "gralloching," he subsided, and thought it best to go and consult the young lady's mother.

She, to his astonishment, submitted at once and utterly. The King, and he whom she had called her husband, were very gracious. It was all well. She would have preferred, and the Lady Godiva too, after their experience of the world and the flesh, to have devoted her daughter to Heaven in the minster there. But she was unworthy. Who was she, to train a bride for Him who died on the Cross? She accepted this as part of her penance, with thankfulness and humility. She had heard that Sir Hugh of Evermue was a gentleman of ancient birth and good prowess, and she thanked the King for his choice. Let the priest tell her daughter that she commanded her to go with him to Winchester. She did not wish to see her. She was stained with many crimes, and unworthy to approach a pure maiden. Besides, it would only cause misery and tears. She was trying to die to the world and to the flesh; and she did not wish to reawaken their power within her. Yes. It was very well. Let the lass go with him.

"Thou art indeed a true penitent," said the priest, his human heart softening him.

"Thou art very much mistaken," said she, and turned away.

The girl, when she heard her mother's command, wept, shrieked, and went. At least she was going to her father. And from wholesome fear of that same saying-knife, the priest left her in peace all the way to Winchester.

After which, Abbot Ulfketyl went into his lodgings, and burst, like a noble old nobleman as he was, into bitter tears of rage and shame.

But Torfrida's eyes were as dry as her own sackcloth.

The priest took the letter back to Winchester, and showed it—it may be to Archbishop Lanfranc.

But what he said, this chronicler would not dare to say. For he was a very wise man, and a very staunch and strong pillar of the Holy Roman Church. Meanwhile, he was man enough not to require that anything should be added to Torfrida's penance; and that was enough to prove him a man in those days—at least for a Churchman—as it proved Archbishop or Saint Ailred to be, a few years after, in the case of the nun of Watton, to be read in Gale's "Scriptores Anglicania." Then he showed the letter to Alftruda.

And she laughed one of her laughs, and said, "I have her at last!"

Then, as it befel, he was forced to show the letter to Queen Matilda; and she wept over it human tears, such as she, the noble heart, had been forced to weep many a time before, and said, "The poor soul!—You, Alftruda, woman! does Hereward know of this?"

"No, madam," said Alftruda, not adding that she had taken good care that he should not know.

"It is the best thing which I have heard of him. I should tell him, were it not that I must not meddle with my lord's plans. God grant him a good delivery, as they say of the poor souls in gaol. Well, madam, you have your will at last. God give you grace thereof, for you have not given Him much chance as yet."

"Your majesty will honour us by coming to the wedding?" asked Alftruda, utterly unabashed.

Matilda the Good looked at her with a face of such calm childlike astonishment, that Alftruda dropped her "fairy neck" at last, and slunk out of the presence like a beaten cur.

William went to the wedding; and swore horrible oaths that they were the handsomest pair he had ever seen. And so Hereward married Alftruda. How Holy Church settled the matter, is not said. But that Hereward married Alftruda, under these very circumstances, may be considered a "historic fact," being vouched for both by Gaimar, and by the Peterborough Chronicler. And doubtless Holy Church contrived that it should happen without sin, if it conduced to her own interest.

And little Torfrida—then aged, it seems, some sixteen years—was married to Hugh of Evermue. She wept and struggled as she was dragged into the church.

"But I do not want to be married. I want to go back to my mother."

"The diabolic instinct may have descended to her," said the priests, "and attracts her to the sorceress. We had best sprinkle her with holy water."

So they sprinkled her with holy water, and used exorcisms. Indeed, the case being an important one, and the personages of rank, they brought out from their treasures the apron of a certain virgin saint, and put it round her neck, in hopes of driving out the hereditary fiend.

"If I am led with a halter, I must needs go," said she, with one of her mother's own flashes of wit, and went. "But, Lady Alftruda," whispered she, halfway up the church, "I never loved him."

"Behave yourself before the King, or I will whip you till the blood runs."

And so she would, and no one would have wondered in those days.

"I will murder you, if you do. But I never even saw him."

"Little fool! And what are you going through, but what I went through before you?"

"You to say that?" gnashed the girl, as another spark of her mother's came out. "And you gaining what——"

"What I waited for for fifteen years," said Alftruda, coolly. "If you have courage and cunning, like me, to wait for fifteen years, you too may have your will likewise."

The pure child shuddered, and was married to Hugh of Evermue, who is not said to have kicked her; and was, according to them of Crowland, a good friend to their monastery, and therefore, doubtless, a good man. Once, says wicked report, he offered to strike her, as was the fashion in those chivalrous days. Whereon she turned upon him like a tigress, and bidding him remember that she was the daughter of Hereward and Torfrida, gave him such a beating that he, not wishing to draw sword upon her, surrendered at discretion; and they lived all their lives afterwards as happily as most other married people in those times.

CHAPTER XL.

HOW HEREWARD BEGAN TO GET HIS SOUL'S PRICE.

And now behold Hereward at home again, fat with the wages of sin, and not knowing that they are death.

He is once more "Dominus de Brunune cum Marisco," Lord of Bourne with the fen, "with all returns and liberties and all other things adjacent to the same vill which are now held as a barony from the Lord King of England." He has a fair young wife, and with her farms and manors even richer than his own. He is still young, hearty, wise by experience, high in the king's favour, and deservedly so.

Why should he not begin life again?

Why not? Unless it be true that the wages of sin are, not a new life, but death.

And yet he has his troubles. Hardly a Norman knight or baron round but has a blood-feud against him, for a kinsman slain. Sir Aswart, Thorold the abbot's man, was not likely to forgive him for turning him out of the three Mainthorpe manors, which he had comfortably held for two years past, and sending him back to lounge in the abbot's hall at Peterborough, without a yard of land he could call his own. Sir Ascelin was not likely to forgive him for marrying Alftruda, whom he had intended to marry himself. Ivo Taillebois was not likely to forgive him for existing within a hundred miles of Spalding, any more than the wolf would forgive the lamb for fouling the water below him. Beside, had he (Ivo) not married Hereward's niece? and what more grievous offence could Hereward commit, than to be her uncle, reminding Ivo of his own low birth by his nobility, and too likely to take Lucia's part, whenever it should please Ivo to beat or kick her? Only "Gilbert of Ghent," the pious and illustrious earl, sent messages of congratulation and friendship to Hereward, it being his custom to sail with the wind, and worship the rising sun—till it should decline again.

But more: hardly one of the Normans round, but, in the conceit of their skin-deep yesterday's civilisation, look on Hereward as a barbarian Englishman, who has his throat tattooed, and wears a short coat, and prefers—the churl—to talk English in his own hall, though he can talk as good French as they when he is with them, beside three or four barbarian tongues if he has need.

But more still: if they are not likely to bestow their love on Hereward, Hereward is not likely to win love from them of his own will. He is peevish, and wrathful, often insolent and quarrelsome: and small blame to him. The Normans are invaders and tyrants, who have no business there, and should not be there, if he had his way. And they and he can no more amalgamate than fire and water. Moreover, he is a very great man, or has been such once, and he thinks himself one still. He has been accustomed to command men, whole armies; and he will no more treat these Normans as his equals, than they will treat him as such. His own son-in-law, Hugh of Evermue, has to take hard words,—thoroughly well deserved, it may be: but all the more unpleasant for that reason.

The truth was, that Hereward's heart was gnawed with shame and remorse; and therefore he fancied, and not without reason, that all men pointed at him the finger of scorn.

He had done a bad, base, accursed deed. And he knew it. Once in his life—for his other sins were but the sins of his age—the Father of men seems (if the chroniclers say truth) to have put before this splendid barbarian good and evil, saying, Choose! And he knew that the evil was evil, and chose it nevertheless.

Eight hundred years after, a still greater genius and general had the same choice—as far as human cases of conscience can be alike—put before him. And he chose as Hereward chose.

But as with Napoleon and Josephine, so it was with Hereward and Torfrida. Neither throve after.

It was not punished by miracle. What sin is? It worked out its own punishment; that which it merited, deserved, or earned, by its own labour. No man could commit such a sin without shaking his whole character to the root. Hereward tried to persuade himself that his was not shaken; that he was the same Hereward as ever. But he could not deceive himself long. His conscience was evil. He was discontented with all mankind, and with himself most of all. He tried to be good,—as good as he chose to be. If he had done wrong in one thing, he might make up for it in others; but he could not. All his higher instincts fell from him one by one. He did not like to think of good and noble things; he dared not think of them. He felt, not at first, but as the months rolled on, that he was a changed man; that God had left him. His old bad habits began to return to him. Gradually he sank back into the very vices from which Torfrida had raised him sixteen years before. He took to drinking again, to dull the malady of thought; he excused himself to himself; he wished to forget his defeats, his disappointment, the ruin of his country, the splendid past which lay behind him like a dream. True: but he wished to forget likewise Torfrida fasting and weeping in Crowland. He could not bear the sight of Crowland tower on the far green horizon, the sound of Crowland bells booming over the flat on the south wind. He never rode down into the fens; he never went to see his daughter at Deeping, because Crowland lay that way. He went up into the old Bruneswald, hunted all day long through the glades where he and his merry men had done their doughty deeds, and came home in the evening to get drunk.

Then he lost his sleep. He sent down to Crowland, to Leofric the priest, that he might come to him, and sing his sagas of the old heroes, that he might get rest. But Leofric sent back for answer, that he would not come.

That night Alftruda heard him by her side in the still hours, weeping silently to himself. She caressed him: but he gave no heed to her.

"I believe," said she bitterly at last, "that you love Torfrida still better than you do me."

And Hereward answered, like Mahomet in like case, "That do I, by heaven. She believed in me when no one else in the world did."

And the vain hard Alftruda answered angrily; and there was many a fierce quarrel between them after that.

With his love of drinking, his love of boasting came back. Because he could do no more great deeds—or rather had not the spirit left in him to do more—he must needs, like a worn-out old man, babble of the great deeds which he had done; insult and defy his Norman neighbours; often talk what might be easily caricatured into treason against King William himself.

There were great excuses for his follies, as there are for those of every beaten man: but Hereward was spent. He had lived his life, and had no more life which he could live; for every man, it would seem, brings into the world with him a certain capacity, a certain amount of vital force, in body and in soul; and when that is used up, the man must sink down into some sort of second childhood, and end, like Hereward, very much where he began: unless the grace of God shall lift him up above the capacity of the mere flesh, into a life literally new, ever-renewing, ever-expanding, and eternal.

But the grace of God had gone away from Hereward, as it goes away from all men who are unfaithful to their wives.

It was very pitiable. Let no man judge him. Life, to most, is very hard work. There are those who endure to the end, and are saved; there are those, again, who do not endure: upon whose souls may God have mercy.

So Hereward soon became as intolerable to his Norman neighbours, as they were intolerable to him.

Whereon, according to the simple fashion of those primitive times, they sought about for some one who would pick a quarrel with Hereward, and slay him in fair fight. But an Archibald Bell-the-Cat was not to be found on every hedge.

But it befel that Oger the Breton, he who had Morcar's lands round Bourne, came up to see after his lands, and to visit his friend and fellow-robber, Ivo Taillebois.

Ivo thought the hot-headed Breton, who had already insulted Hereward with impunity at Winchester, the fittest man for his purpose; and asked him over his cups, whether he had settled with that English ruffian about the Docton land?

Now, King William had judged that Hereward and Oger should hold that land between them, as he and Toli had done. But when "two dogs," as Ivo said, "have hold of the same bone, it is hard if they cannot get a snap at each other's noses."

Oger agreed to that opinion; and riding into Bourne, made inquisition into the doings at Docton. And—scandalous injustice—he found that an old woman had sent six hens to Hereward, whereof she should have kept three for him.

So he sent to demand formally of Hereward those three hens; and was unpleasantly disappointed when Hereward, instead of offering to fight him, sent him them in an hour, and a lusty young cock into the bargain, with this message—That he hoped they might increase and multiply; for it was a shame of an honest Englishman if he did not help a poor Breton churl to eat roast fowls for the first time in his life, after feeding on nothing better than furze-toppings, like his own ponies.

To which Oger, who, like a true Breton, believed himself descended from King Arthur, Sir Tristram, and half the knights of the Round Table, replied that his blood was to that of Hereward, as wine to peat-water; and that Bretons used furze-toppings only to scourge the backs of insolent barbarians.

To which Hereward replied, that there were gnats enough pestering him in the fens already, and that one more was of no consequence.

Wherefrom the Breton judged, as at Winchester, that Hereward had no lust to fight.

The next day he met Hereward going out to hunt, and was confirmed in his opinion when Hereward lifted his cap to him most courteously, saying that he was not aware before that his neighbour was a gentleman of such high blood.

"Blood? Better at least than thine, thou barelegged Saxon, who has dared to call me churl. So you must needs have your throat cut? I took you for a wiser man."

"Many have taken me for that which I am not. If you will harness yourself, I will do the same; and we will ride up into the Bruneswald, and settle this matter in peace."

"Three men on each side to see fair play," said the Breton.

And up into the Bruneswald they rode; and fought long without advantage on either side.

Hereward was not the man which he had been. His nerve was gone, as well as his conscience; and all the dash and fury of his old onslaughts gone therewith.

He grew tired of the fight, not in body, but in mind; and more than once drew back.

"Let us stop this child's play," said he, according to the chronicler; "what need have we to fight here all day about nothing?"

Whereat the Breton fancied him already more than half-beaten, and attacked more furiously than ever. He would be the first man on earth who ever had had the better of the great outlaw. He would win himself eternal glory, as the champion of all England.

But he had mistaken his man, and his indomitable English pluck. "It was Hereward's fashion, in fight and war," says the chronicler, "always to ply the man most at the last." And so found the Breton; for Hereward suddenly lost patience, and rushing on him with one of his old shouts, hewed at him again and again, as if his arm would never tire.

Oger gave back, would he or not. In a few moments his sword-arm dropt to his side, cut half through.

"Have you had enough, Sir Tristram the younger?" quoth Hereward, wiping his sword, and walking moodily away.

Oger went out of Bourne with his arm in a sling, and took counsel with Ivo Taillebois. Whereon they two mounted, and rode to Lincoln, and took counsel with Gilbert of Ghent.

The fruit of which was this. That a fortnight after Gilbert rode into Bourne with a great meinie, full a hundred strong, and with him the sheriff and the king's writ; and arrested Hereward on a charge of speaking evil of the king, breaking his peace, compassing the death of his faithful lieges, and various other wicked, traitorous, and diabolical acts.

Hereward was minded at first to fight and die. But Gilbert, who—to do him justice—wished no harm to his ancient squire, reasoned with him. Why should he destroy not only himself, but perhaps his people likewise? Why should he throw away his last chance? The king was not so angry as he seemed; and if Hereward would but be reasonable, the matter might be arranged. As it was, he was not to be put to strong prison. He was to be in the custody of Robert of Herepol, Chatelain of Bedford, who, Hereward knew, was a reasonable and courteous man. The king had asked him, Gilbert, to take charge of Hereward.

"And what said you?"

"That I had rather have in my pocket the seven devils that came out of St. Mary Magdalene; and that I would not have thee within ten miles of Lincoln town, to be Earl of all the Danelagh. So I begged him to send thee to Sir Robert, just because I knew him to be a mild and gracious man."

A year before, Hereward would have scorned the proposal, and probably, by one of his famous stratagems, escaped there and then out of the midst of all Gilbert's men. But his spirit was broken: indeed, so was the spirit of every Englishman; and he mounted his horse sullenly, and rode alongside of Gilbert, unarmed for the first time for many a year.

"You had better have taken me," said Sir Ascelin aside to the weeping Alftruda.

"I? helpless wretch that I am! What shall I do for my own safety, now he is gone?"

"Let me come and provide for it."

"Out! wretch! traitor!" cried she.

"There is nothing very traitorous in succouring distressed ladies," said Ascelin. "If I can be of the least service to Alftruda the peerless, let her but send, and I fly to do her bidding."

So they rode off.

Hereward went through Cambridge and Potton like a man stunned, and spoke never a word. He could not even think, till he heard the key turned on him in a room—not a small or doleful one—in Bedford keep, and found an iron shackle on his leg, fastened to the stone bench on which he sat.

Robert of Herepol had meant to leave his prisoner loose. But there were those in Gilbert's train who told him, and with truth, that if he did so, no man's life would be safe. That to brain the gaoler with his own keys, and then twist out of his bowels a line wherewith to let himself down from the top of the castle, would be not only easy, but amusing, to the famous "Wake."

So Robert consented to fetter him so far, but no farther; and begged his pardon again and again as he did it, pleading the painful necessities of his office.

But Hereward heard him not. He sat in stupefied despair. A great black cloud had covered all heaven and earth, and entered into his brain through every sense, till his mind, as he said afterwards, was like Hell with the fire gone out.

A gaoler came in, he knew not how long after, bringing a good meal, and wine. He came cautiously toward the prisoner, and when still beyond the length of his chain, set the food down, and thrust it toward him with a stick, lest Hereward should leap on him and wring his neck.

But Hereward never even saw him or the food. He sat there all day, all night, and nearly all the next day, and hardly moved hand or foot. The gaoler told Sir Robert in the evening that he thought the man was mad, and would die.

So good Sir Robert went up to him, and spoke kindly and hopefully. But all Hereward answered was, that he was very well. That he wanted nothing. That he had always heard well of Sir Robert. That he should like to get a little sleep: but that sleep would not come.

The next day Sir Robert came again early, and found him sitting in the same place.

"He was very well," he said. "How could he be otherwise? He was just where he ought to be. A man could not be better than in his right place."

Whereon Sir Robert gave him up for mad.

Then he bethought of sending him a harp, knowing the fame of Hereward's music and singing. "And when he saw the harp," the gaoler said, "he wept; but bade take the thing away. And so sat still where he was."

In this state of dull despair he remained for many weeks. At last he woke up.

There passed through and by Bedford large bodies of troops, going as it were to and from battle. The clank of arms stirred Hereward's heart as of old, and he sent to Sir Robert to ask what was toward.

Sir Robert, "the venerable man," came to him joyfully and at once, glad to speak to an illustrious captive, whom he looked on as an injured man; and told him news enough.

Taillebois' warning about Ralph Guader and Waltheof had not been needless. Ralph, as the most influential of the Bretons, was on no good terms with the Normans, save with one, and that one of the most powerful—Fitz-Osbern, Earl of Hereford. His sister, Ralph was to have married: but William, for reasons unknown, forbade the match. The two great earls celebrated the wedding in spite of William, and asked Waltheof as a guest. And at Exning, between the fen and Newmarket Heath—

"Was that bride-ale
Which was man's bale."

For there was matured the plot which Ivo and others had long seen brewing. William had made himself hateful to all men by his cruelties and tyrannies—and indeed his government was growing more unrighteous day by day. Let them drive him out of England, and part the land between them. Two should be dukes, the third king paramount.

"Waltheof, I presume, plotted drunk, and repented sober, when too late. The wittol! He should have been a monk."

"Repented he has, if ever he was guilty. For he fled to Archbishop Lanfranc, and confessed to him so much, that Lanfranc declares him innocent, and has sent him on to William in Normandy."

"Oh, kind priest! true priest! To send his sheep into the wolf's mouth."

"You forget, dear sire, that William is our king."

"I can hardly forget that, with this pretty ring upon my ankle. But after my experience of how he has kept faith with me, what can I expect for Waltheof the wittol, save that which I have foretold many a time?"

"As for you, dear sire, the king has been misinformed concerning you. I have sent messengers to reason with him again and again: but as long as Taillebois, Warrenne, and Robert Malet had his ear, of what use were my poor words?"

"And what said they?"

"That there would be no peace in England if you were loose."

"They lied. I am no boy, like Waltheof. I know when the game is played out. And it is played out now. The Frenchman is master, and I know it well. Were I loose to-morrow, and as great a fool as Waltheof, what could I do, with, it may be, some forty knights, and a hundred men-at-arms, against all William's armies? But how goes on this fools' rebellion? If I had been loose, I might have helped to crush it in the bud."

"And you would have done that against Waltheof?"

"Why not against him? He is but bringing more misery on England. Tell that to William. Tell him that if he sets me free, I will be the first to attack Waltheof, or whom he will. There are no English left to fight against," said he, bitterly, "for Waltheof is none now."

"He shall know your words when he returns to England."

"What, is he abroad, and all this evil going on?"

"In Normandy. But the English have risen for the King in Herefordshire, and beaten Earl Roger; and Odo of Bayeux and Bishop Mowbray are on their way to Cambridge, where they hope to give a good account of Earl Ralph; and that the English may help them there."

"And they shall! They hate Ralph Guader as much as I do. Can you send a message for me?"

"Whither?"

"To Bourne in the Bruneswald; and say to Hereward's men, wherever they are, Let them rise and arm, if they love Hereward, and down to Cambridge, to be the foremost at Bishop Odo's side against Ralph Guader, or Waltheof himself. Send! send! Oh that I were free!"

"Would to heaven thou wert free, my gallant sir!" said the good man.

From that day Hereward woke up somewhat. He was still a broken man, querulous, peevish: but the hope of freedom and the hope of battle woke him up. If he could but get to his men! But his melancholy returned. His men—some of them at least—went down to Odo at Cambridge, and did good service. Guader was utterly routed, and escaped to Norwich, and thence to Brittany—his home. The bishops punished their prisoners, the rebel Normans, with horrible mutilations.

"The wolves are beginning to eat each other," said Hereward to himself. But it was a sickening thought to him, that his men had been fighting and he not at their head.

After awhile there came to Bedford Castle two witty knaves. One was a cook, who "came to buy milk," says the chronicler; the other seemingly a gleeman. They told stories, jested, harped, sang, drank, and pleased much the garrison and Sir Robert, who let them hang about the place.

They asked next, whether it were true that the famous Hereward was there? If so, might a man have a look at him?

The gaoler said that many men might have gone to see him, so easy was Sir Robert to him. But he would have no man; and none dare enter save Sir Robert and he, for fear of their lives. But he would ask him of Herepol.

The good knight of Herepol said, "Let the rogues go in, they may amuse the poor man."

So they went in, and as soon as they went, he knew them. One was Martin Lightfoot, the other, Leofric the Unlucky.

"Who sent you?" asked he surlily, turning his face away.

"She."

"Who?"

"We know but one she, and she is at Crowland."

"She sent you? and wherefore?"

"That we might sing to you, and make you merry."

Hereward answered them with a terrible word, and turned his face to the wall, groaning, and then bade them sternly to go.

So they went, for the time.

The gaoler told this to Sir Robert, who saw all, being a kind-hearted man.

"From his poor first wife, eh? Well, there can be no harm in that. Nor if they came from this Lady Alftruda either, for that matter; let them go in and out when they will."

"But they may be spies and traitors."

"Then we can but hang them."

Robert of Herepol, it would appear from the chronicle, did not much care whether they were spies or not.

So the men went to and fro, and often sat with Hereward. But he forbad them sternly to mention Torfrida's name.

Alftruda sent to him meanwhile, again and again, messages of passionate love and sorrow, and he listened to them as sullenly as he did to his two servants, and sent no answer back. And so sat more weary months, in the very prison, it may be in the very room, in which John Bunyan sate nigh six hundred years after: but in a very different frame of mind.

One day Sir Robert was going up the stairs with another knight, and met the two coming down. He was talking to that knight earnestly, indignantly: and somehow, as he passed Leofric and Martin he thought fit to raise his voice, as if in a great wrath.

"Shame to all honour and chivalry! Good saints in heaven, what a thing is human fortune! That this man, who had once a gallant army at his back, should be at this moment going like a sheep to the slaughter, to Buckingham Castle, at the mercy of his worst enemy, Ivo Taillebois, of all men in the world. If there were a dozen knights left of all those whom he used to heap with wealth and honour, worthy the name of knights, they would catch us between here and Stratford, and make a free man of their lord."

So spake—or words to that effect, according to the Latin chronicler, who must have got them from Leofric himself—the good knight of Herepol.

"Hillo, knaves!" said he, seeing the two, "are you here eaves-dropping? Out of the castle this instant, on your lives."

Which hint those two witty knaves took on the spot.

A few days after, Hereward was travelling toward Buckingham, chained upon a horse, with Sir Robert and his men, and a goodly company of knights belonging to Ivo. Ivo, as the story runs, seems to have arranged with Ralph Pagnel at Buckingham, to put him into the keeping of a creature of his own. And how easy it was to put out a man's eyes, or starve him to death, in a Norman keep, none knew better than Hereward.

But he was past fear or sorrow. A dull heavy cloud of despair had settled down upon his soul. Black with sin, his heart could not pray. He had hardened himself against all heaven and earth, and thought, when he thought at all, only of his wrongs: but never of his sins.

They passed through a forest, seemingly somewhere near what is Newport Pagnel, named after Ralph his would-be gaoler.

Suddenly from the trees dashed out a body of knights, and at their head, the white bear banner, in Ranald of Ramsey's hand.

"Halt," shouted Sir Robert; "we are past the half-way stone. Earl Ivo's and Earl Ralph's men are answerable now for the prisoner."

"Treason!" shouted Ivo's men; and one would have struck Hereward through with his lance; but Winter was too quick for him, and bore him from his saddle; and then dragged Hereward out of the fight.

The Normans, surprised while their helmets were hanging at their saddles, and their arms not ready for battle, were scattered at once. But they returned to the attack, confident in their own numbers.

They were over confident. Hereward's fetters were knocked off; and he was horsed and armed, and mad with freedom and battle, fighting like himself once more.

Only as he rode to and fro, thrusting and hewing, he shouted to his men to spare Sir Robert, and all his meinie, crying that he was the saviour of his life; and when the fight was over, and all Ivo's and Ralph's men who were not slain, had ridden for their lives into Stratford, he shook hands with that venerable knight, giving him innumerable thanks and courtesies for his honourable keeping; and begged him to speak well of him to the king.

And so these two parted in peace, and Hereward was a free man.

CHAPTER XLI.

HOW EARL WALTHEOF WAS MADE A SAINT.

A few months after, there sat in Abbot Thorold's lodgings in Peterborough, a select company of Normans, talking over affairs of State after their supper.

"Well, earls and gentlemen," said the Abbot, as he sipped his wine, "the cause of our good king, which is happily the cause of Holy Church, goes well, I think. We have much to be thankful for when we review the events of the past year. We have finished the rebels; Roger de Breteuil is safe in prison, Ralph Guader unsafe in Brittany, and Waltheof more than unsafe in—the place to which traitors descend. We have not a manor left which is not in loyal Norman hands; we have not an English monk left who has not been scourged and starved into holy obedience; not an English saint for whom any man cares a jot, since Guerin de Lire preached down St. Adhelm, the admirable Primate disposed of St. Alphege's martyrdom, and some other wise man—I am ashamed to say that I forget who—proved that St. Edmund of Suffolk was merely a barbarian knight, who was killed fighting with Danes only a little more heathen than himself. We have had great labours and great sufferings since we landed in this barbarous isle upon our holy errand ten years since; but, under the shadow of the Gonfalon of St. Peter, we have conquered, and may sing 'Dominus Illuminatio mea,' with humble and thankful hearts."

"I don't know that," said Ascelin, "my Lord Uncle; I shall never sing 'Dominus illuminatio,' till I see your coffers illuminated once more by those thirty thousand marks."

"Or I," said Oger le Breton, "till I see myself safe in that bit of land which Hereward holds wrongfully of me in Docton."

"Or I," said Ivo Taillebois, "till I see Hereward's head on Bourne Gable, where he stuck up those Normans' heads seven years ago. But what the Lord Abbot means by saying that we have done with English saints I do not see, for the villains of Crowland have just made a new one for themselves."

"A new one?"

"I tell you truth and fact; I will tell you all, Lord Abbot; and you shall judge whether it is not enough to drive an honest man mad to see such things going on under his nose. Men say of me that I am rough, and swear and blaspheme. I put it to you, Lord Abbot, if Job would not have cursed if he had been Lord of Spalding? You know that the king let these Crowland monks have Waltheof's body?"

"Yes, I thought it an unwise act of grace. It would have been wiser to leave him, as he desired, out on the down, in ground unconsecrate."

"Of course, of course; for what has happened?"

"That old traitor, Ulfketyl, and his monks bring the body to Crowland, and bury it as if it had been the Pope's. In a week they begin to spread their lies—that Waltheof was innocent; that Archbishop Lanfranc himself said so."

"That was the only act of human weakness which I have ever known the venerable prelate commit," said Thorold.

"That these Normans at Winchester were so in the traitor's favour, that the king had to have him out and cut off his head in the grey of the morning, ere folks were up and about; that the fellow was so holy that he passed all his time in prison in weeping and praying, and said over the whole Psalter every day, because his mother had taught it him—I wish she had taught him to be an honest man—and that when his head was on the block he said all the Paternoster, as far as 'Lead us not into temptation,' and then off went his head; whereon, his head being off, he finished the prayer with—you know best what comes next, Abbot?"

"Deliver us from evil, Amen! What a manifest lie! The traitor was not permitted, it is plain, to ask for that which could never be granted to him: but his soul, unworthy to be delivered from evil, entered instead into evil, and howls for ever in the pit."

"But all the rest may be true," said Oger; "and yet that be no reason why these monks should say it."

"So I told them, and threatened them too; for, not content with making him a martyr, they are making him a saint."

"Impious! Who can do that, save the Holy Father?" said Thorold.

"You had best get your bishop to look to them, then, for they are carrying blind beggars and mad girls by the dozen to be cured at the man's tomb, that is all. Their fellows in the cell at Spalding went about to take a girl that had fits off one of my manors, to cure her; but that I stopped with a good horsewhip."

"And rightly."

"And gave the monks a piece of my mind, and drove them clean out of their cell home to Crowland."

What a piece of Ivo's mind on this occasion might be, let Ingulf describe:

"Against our monastery and all the people of Crowland he was, by the instigation of the devil, raised to such an extreme pitch of fury, that he would follow their animals in the marshes with his dogs, drive them to a great distance down in the lakes, mutilate some in the tails, others in the ears, while often, by breaking the backs and legs of the beasts of burden, he rendered them utterly useless. Against our cell also (at Spalding) and our brethren, his neighbours, the prior and monks, who dwelt all day within his presence, he raged with tyrannical and frantic fury, lamed their oxen and horses, daily impounded their sheep and poultry, striking down, killing, and slaying their swine and pigs; while at the same time the servants of the prior were oppressed in the Earl's court with insupportable exactions, were often assaulted in the highways with swords and staves, and sometimes killed."

"Well," went on the injured earl, "this Hereward gets news of me—and news too—I don't know whence, but true enough it is—that I had sworn to drive Ulfketyl out of Crowland by writ from king and bishop, and lock him up as a minister at the other end of England."

"You will do but right. I will send a knight off to the king this day, telling him all, and begging him to send us up a trusty Norman as abbot of Crowland, that we may have one more gentleman in the land fit for our company."

"You must kill Hereward first. For, as I was going to say, he sent word to me 'that the monks of Crowland were as the apple of his eye, and Abbot Ulfketyl to him as more than a father; and that if I dared to lay a finger on them or their property, he would cut my head off.'"

"He has promised to cut my head off likewise," said Ascelin. "Earl, knights, and gentlemen, do you not think it wiser that we should lay our wits together once and for all, and cut off his?"

"But who will catch the Wake sleeping?" said Ivo, laughing.

"That will I. I have my plans, and my intelligencers."

And so those wicked men took counsel together to slay Hereward.

CHAPTER XLII.

HOW HEREWARD GOT THE REST OF HIS SOUL'S PRICE.

In those days a messenger came riding post to Bourne. The Countess Judith wished to visit the tomb of her late husband, Earl Waltheof; and asked hospitality on her road of Hereward and Alftruda.

Of course she would come with a great train, and the trouble and expense would be great. But the hospitality of those days, when money was scarce, and wine scarcer still, was unbounded, and a matter of course; and Alftruda was overjoyed. No doubt, Judith was the most unpopular person in England at that moment; called by all a traitress and a fiend. But she was an old acquaintance of Alftruda's; she was the king's niece; she was immensely rich, not only in manors of her own, but in manors, as Domesday book testifies, about Lincolnshire and the counties round, which had belonged to her murdered husband—which she had too probably received as the price of her treason. So Alftruda looked to her visit as to an honour which would enable her to hold her head high among the proud Norman dames, who despised her as the wife of an Englishman.

Hereward looked on the visit in a different light. He called Judith ugly names, not undeserved; and vowed that if she entered his house by the front door he would go out at the back. "Torfrida prophesied," he said, "that she would betray her husband, and she has done it."

"Torfrida prophesied? Did she prophesy that I should betray you likewise?" asked Alftruda, in a tone of bitter scorn.

"No, you handsome fiend: will you do it?"

"Yes; I am a handsome fiend, am I not?" and she bridled up her magnificent beauty, and stood over him as a snake stands over a mouse.

"Yes; you are handsome — beautiful: I adore you."

"And yet you will not do what I wish?"

"What you wish? What would I not do for you? what have I not done for you?"

"Then receive Judith. And now, go hunting, and bring me in game. I want deer, roe, fowls; anything and everything, from the greatest to the smallest. Go and hunt."

And Hereward trembled, and went.

There are flowers whose scent is so luscious that silly children will plunge their heads among them, drinking in their odour, to the exclusion of all fresh air. On a sudden, sometimes, comes a revulsion of the nerves. The sweet odour changes in a moment to a horrible one; and the child cannot bear for years after the scent which has once disgusted it by over sweetness. And so had it happened to Hereward. He did not love Alftruda now: he loathed, hated, dreaded her. And yet he could not take his eyes for a moment off her beauty. He watched every movement of her hand, to press it, obey it. He would have preferred instead of hunting, simply to sit and watch her go about the house at her work. He was spell-bound to a thing which he regarded with horror.

But he was told to go and hunt; and he went, with all his men, and sent home large supplies for the larder. And as he hunted, the free, fresh air of the forest comforted him, the free forest life came back to him, and he longed to be an outlaw once more, and hunt on for ever. He would not go back yet, at least to face that Judith. So he sent back the greater part of his men with a story. He was ill: he was laid up at a farmhouse far away in the forest, and begged the countess to excuse his absence. He had sent fresh supplies of game, and a goodly company of his men, knights and house-carles, who would escort her royally to Crowland.

Judith cared little for his absence; he was but an English barbarian. Alftruda was half glad to have him out of the way, lest his now sullen and uncertain temper should break out; and bowed herself to the earth before Judith, who patronised her to her heart's content, and offered her slily insolent condolences on being married to a barbarian. She herself could sympathise—who more?

Alftruda might have answered with scorn that she was an Adeliza, and of better English blood than Judith's Norman blood; but she had her ends to gain, and gained them.

For Judith was pleased to be so delighted with her that she kissed her lovingly, and said with much emotion that she required a friend who would support her through her coming trial; and who better than one who herself had suffered so much? Would she accompany her to Crowland?

Alftruda was overjoyed, and away they went.

And to Crowland they came; and to the tomb in the minster, whereof men said already that the sacred corpse within worked miracles of healing.

And Judith, habited in widow's weeds, approached the tomb, and laid on it, as a peace-offering to the manes of the dead, a splendid pall of silk and gold.

A fierce blast came howling off the fen, screeched through the minster towers, swept along the dark aisles; and then, so say the chroniclers, caught up the pall from off the tomb, and hurled it far away into a corner.

"A miracle!" cried all the monks at once; and honestly enough, like true Englishmen as they were.

"The Holy heart refuses the gift, Countess," said old Ulfketyl, in a voice of awe.

Judith covered her face with her hands, and turned away trembling, and walked out, while all looked upon her as a thing accursed.

Of her subsequent life, her folly, her wantonness, her disgrace, her poverty, her wanderings, her wretched death, let others tell.

But these Normans believed that the curse of Heaven was upon her from that day. And the best of them believed likewise that Waltheof's murder was the reason that William, her uncle, prospered no more in life.

"Ah, saucy sir," said Alftruda to Ulfketyl, as she went out. "There is one waiting at Peterborough now who will teach thee manners, Ingulf of Fontenelle, abbot in thy room."

"Does Hereward know that?" asked Ulfketyl, looking keenly at her.

"What is that to thee?" said she, fiercely, and flung out of the minster. But Hereward did not know. There were many things abroad, of which she told him nothing.

They went back, and were landed at Deeping town, and making their way along the King Street, or old Roman Road, to Bourne. Thereon a man met them, running. They had best stay where they were. The Frenchmen were out, and there was fighting up in Bourne.

Alftruda's knights wanted to push on, to see after the Bourne folk; Judith's knights wanted to push on to help the French: and the two parties were ready to fight each other. There was a great tumult. The ladies had much ado to still it.

Alftruda said that it might be but a countryman's rumour; that, at least, it was shame to quarrel with their guests. At last it was agreed that two knights should gallop on into Bourne, and bring back news.

But those knights never came back. So the whole body moved on Bourne, and there they found out the news for themselves.

Hereward had gone home as soon as they had departed, and sat down to eat and drink. His manner was sad and strange. He drank much at the midday meal, and then lay down to sleep, setting guards as usual.

After awhile he leapt up with a shriek and a shudder.

They ran to him, asking whether he was ill.

"Ill? No. Yes. Ill at heart. I have had a dream—an ugly dream. I thought that all the men I ever slew on earth, came to me with their wounds all gaping, and cried at me. 'Our luck then, thy luck now.' Chaplain! Is there not a verse somewhere—Uncle Brand said it to me on his death-bed—'Whoso sheddeth man's blood, by man shall his blood be shed?'"

"Surely the master is fey," whispered Guenoch in fear to the chaplain. "Answer him out of Scripture."

"Text? None such that I know of," quoth Priest Ailward, a graceless fellow who had taken Leofric's place. "If that were the law, it would be but few honest men that would die in their beds. Let us drink, and drive girls' fancies out of our heads."

So they drank again; and Hereward fell asleep once more.

"It is thy turn to watch, priest," said Guenoch to Ailward. "So keep the door well, for I am worn out with hunting," and so fell asleep.

Ailward shuffled into his harness, and went to the door. The wine was heady; the sun was hot. In a few minutes he was asleep likewise.

Hereward slept, who can tell how long? But at last there was a bustle, a heavy fall; and waking with a start, he sprang up. He saw Ailward lying dead across the gate, and above him a crowd of fierce faces, some of which he knew too well. He saw Ivo Taillebois; he saw Oger; he saw his fellow-Breton, Sir Raoul de Dol; he saw Sir Ascelin; he saw Sir Aswat, Thorold's man; he saw Sir Hugh of Evermue, his own son-in-law; and with them he saw, or seemed to see, the Ogre of Cornwall, and O'Brodar of Ivark, and Dick Hammerhand of Walcheren, and many another old foe long underground; and in his ear rang the text—"Whoso sheddeth man's blood, by man shall his blood be shed." And Hereward knew that his end was come.

There was no time to put on mail or helmet. He saw the old sword and shield hang on a perch, and tore them down. As he girded the sword on, Winter sprang to his side.

"I have three lances—two for me and one for you, and we can hold the door against twenty."

"Till they fire the house over our heads. Shall Hereward die like a wolf in a cave? Forward, all Hereward's men!"

And he rushed out upon his fate. No man followed him, save Winter. The rest, dispersed, unarmed, were running hither and thither helplessly.

"Brothers in arms, and brothers in Valhalla!" shouted Winter as he rushed after him.

A knight was running to and fro in the Court, shouting Hereward's name. "Where is the villain? Wake! We have caught thee asleep at last."

"I am out," quoth Hereward, as the man almost stumbled against him; "and this is in."

And through shield, hauberk, and body, as says Gaimar, went Hereward's javelin, while all drew back, confounded for the moment at that mighty stroke.

"Felons!" shouted Hereward, "your king has given me his truce; and do you dare break my house, and kill my folk? Is that your Norman law? And is this your Norman honour?—To take a man unawares over his meat? Come on, traitors all, and get what you can of a naked man;* you will buy it dear——Guard my back, Winter!"

And he ran right at the press of knights; and the fight began.

> "He gored them like a wood wild boar,
> As long as that lance might endure,"

Says Gaimar.

> "And when that lance did break in hand,
> Full fell enough he smote with brand."

And as he hewed on silently, with grinding teeth and hard, glittering eyes, of whom did he think? Of Alftruda?

Not so. But of that pale ghost, with great black hollow eyes, who sat in Crowland, with thin bare feet, and sackcloth on her tender limbs, watching, praying, longing, loving, uncomplaining. That ghost had been for many a month the background of all his thoughts and dreams. It was so clear before his mind's eye now, that, unawares to himself, he shouted, "Torfrida!" as he struck, and struck the harder at the sound of his old battle-cry.

And now he is all wounded and be-bled; and Winter, who has fought back to back with him, has fallen on his face; and Hereward stands alone, turning from side to side, as he sweeps his sword right and left till the forest rings with the blows, but staggering as he turns. Within a ring of eleven corpses he stands. Who will go in and make the twelfth?

A knight rushes in, to fall headlong down, cloven through the helm: but Hereward's blade snaps short, and he hurls it away as his foes rush in with a shout of joy. He tears his shield from his left arm, and with it, says Gaimar, brains two more.

But the end is come. Taillebois and Evermue are behind him now; four lances are through his back, and bear him down to his knees.

"Cut off his head, Breton!" shouted Ivo. Raoul de Dol rushed forward, sword in hand. At that cry Hereward lifted up his dying head. One stroke more ere it was all done for ever.

---

* *i.e.*, without armour.

And with a shout of "Torfrida!" which made the Bruneswald ring, he hurled the shield full in the Breton's face, and fell forward dead.

The knights drew their lances from that terrible corpse slowly and with caution, as men who have felled a bear, yet dare not step within reach of the seemingly lifeless paw.

"The dog died hard," said Ivo. "Lucky for us that Sir Ascelin had news of his knights being gone to Crowland. If he had had them to back him, we had not done this deed to-day."

"I will make sure," said Ascelin, as he struck off the once fair and golden head.

"Ho, Breton," cried Ivo, "the villain is dead. Get up, man, and see for yourself. What ails him?"

But when they lifted up Raoul de Dol his brains were running down his face; and all men stood astonished at that last mighty stroke.

"That blow," said Ascelin, "will be sung hereafter by minstrel and maiden as the last blow of the last Englishman. Knights, we have slain a better knight than ourselves. If there had been three more such men in this realm, they would have driven us and King William back again into the sea."

So said Ascelin; those words of his, too, were sung by many a jongleur, Norman as well as English, in the times that were to come.

"Likely enough:" said Ivo; "but that is the more reason why we should set that head of his up over the hall-door, as a warning to these English churls that their last man is dead, and their last stake thrown and lost."

So perished "the last of the English."

It was the third day. The Normans were drinking in the hall of Bourne, casting lots among themselves who should espouse the fair Alftruda, who sat weeping within over the headless corpse; when in the afternoon a servant came in, and told them how a barge full of monks had come to the shore, and that they seemed to be monks from Crowland. Ivo Taillebois bade drive them back again into the barge with whips. But Hugh of Evermue spoke up.

"I am lord and master in Bourne this day, and if Ivo have a quarrel against St. Guthlac, I have none. This Ingulf of Fontenelle, the new abbot who has come thither since old Ulfketyl was sent to prison, is a loyal man, and a friend of King William's, and my friend he shall be till he behaves himself as my foe. Let them come up in peace."

Taillebois growled and cursed: but the monks came up, and into the hall; and at their head Ingulf himself, to receive whom all men rose, save Taillebois.

"I come," said Ingulf, in most courtly French, "noble knights, to ask a boon in the name of the Most Merciful, on behalf of a noble and unhappy lady. Let it be enough to have avenged yourself on the living. Gentlemen and Christians war not against the dead."

"No, no, Master Abbot!" shouted Taillebois; "Waltheof is enough to keep Crowland in miracles for the present. You shall not make a martyr of another Saxon churl. He wants the barbarian's body, knights, and you will be fools if you let him have it."

"Churl? Barbarian?" said a haughty voice; and a nun stepped forward who had stood just behind Ingulf. She was clothed entirely in black. Her bare feet were bleeding from the stones; her hand, as she lifted it, was as thin as a skeleton's.

She threw back her veil, and showed to the knights what had been once the famous beauty of Torfrida.

But the beauty was long passed away. Her hair was white as snow; her cheeks were fallen in. Her hawk-like features were all sharp and hard. Only in their hollow sockets burned still the great black eyes, so fiercely that all men turned uneasily from her gaze.

"Churl? Barbarian?" she said, slowly and quietly, but with an intensity which was more terrible than rage. "Who gives such names to one who was as much better born and better bred than those who now sit here, as he was braver and more terrible than they? The base woodcutter's son?—The upstart who would have been honoured had he taken service as yon dead man's groom?——"

"Talk to me so, and my stirrup leathers shall make acquaintance with your sides," said Taillebois.

"Keep them for your wife. Churl? Barbarian? There is not a man within this hall who is not a barbarian compared with him. Which of you touched the harp like him? Which of you, like him, could move all hearts with song? Which of you knows all tongues from Lapland to Provence? Which of you has been the joy of ladies' bowers, the counsellor of earls and heroes, the rival of a mighty king? Which of you will compare yourself with him—whom you dared not even strike, you and your robber crew, fairly in front, but skulked round him till he fell pecked to death by you, as Lapland Skratlings peck to death the bear. Ten years ago he swept this hall of such as you, and hung their heads upon yon gable outside; and were he alive but one five minutes again, this hall would be right cleanly swept again! Give me his body—or bear for ever the name of cowards, and Torfrida's curse."

And she fixed her terrible eyes first on one, and then on another, calling them by name.

"Ivo Taillebois—basest of all——"

"Take the witch's accursed eyes off me!" and he covered his face with his hands. "I shall be overlooked—planet-struck. Hew the witch down! Take her away!"

"Hugh of Evermue—The dead man's daughter is yours, and the dead man's lands. Are not these remembrances enough of him? Are you so fond of his memory that you need his corpse likewise?"

"Give it her! Give it her!" said he, hanging down his head like a rated cur.

"Ascelin of Lincoln, once Ascelin of Ghent,—There was a time when you would have done—what would you not?—for one glance of Torfrida's eyes.—Stay. Do not deceive yourself, fair sir. Torfrida means to ask no favour of you, or of living man. But she commands you. Do the thing she bids, or with one glance of her eye she sends you childless to your grave."

"Madam! Lady Torfrida! What is there I would not do for you? What have I done now, save avenge your great wrong?"

Torfrida made no answer: but fixed steadily on him eyes which widened every moment.

"But, madam"—and he turned shrinking from the fancied spell—"what would you have? The—the corpse? It is in the keeping of—of another lady."

"So?" said Torfrida, quietly. "Leave her to me;" and she swept past them all, and flung open the bower door at their backs, discovering Alftruda sitting by the dead.

The ruffians were so utterly appalled, not only by the false powers of magic, but by the veritable powers of majesty and eloquence, that they let her do what she would.

"Out!" cried she, using a short and terrible epithet. "Out, siren, with fairy's face and tail of fiend, and leave the husband with his wife!"

Alftruda looked up, shrieked; and then, with the sudden passion of a weak nature, drew a little knife, and sprang up.

Ivo made a coarse jest. The Abbot sprang in: "For the sake of all holy things, let there be no more murder here!"

Torfrida smiled, and fixed her snake's eye upon her wretched rival.

"Out! woman, and choose thee a new husband among these French gallants, ere I blast thee from head to foot with the leprosy of Naaman the Syrian."

Alftruda shuddered, and fled shrieking into an inner room.

"Now, knights, give me—that which hangs outside."

Ascelin hurried out, glad to escape. In a minute he returned.

The head was already taken down. A tall lay brother, the moment he had seen it, had climbed the gable, snatched it away, and now sat in a corner of the yard, holding it on his knees, talking to it, chiding it, as if it had been alive. When men had offered to take it, he had drawn a battle-axe from under his frock, and threatened to brain all comers. And the monks had warned off Ascelin, saying that the man was mad, and had Berserk fits of superhuman strength and rage.

"He will give it me!" said Torfrida, and went out.

"Look at that gable, foolish head," said the madman. "Ten years agone, you and I took down from thence another head. Oh, foolish head, to get yourself at last up into that same place! Why would you not be ruled by her, you foolish golden head?"

"Martin!" said Torfrida.

"Take it and comb it, mistress, as you used to do. Comb out the golden locks again, fit to shine across the battle-field. She has let them get all tangled into elf-knots, that lazy slut within."

Torfrida took it from his hands, dry-eyed, and went in.

Then the monks silently took up the bier, and all went forth, and down the hill toward the fen. They laid the corpse within the barge, and slowly rowed away.

And on by Porsaud and by Asendyke,
By winding reaches on, and shining meres
Between grey reed ronds and green alder-beds,
A dirge of monks and wail of women rose
In vain to Heaven for the last Englishman;
Then died far off within the boundless mist,
And left the Norman master of the land.

So Torfrida took the corpse home to Crowland, and buried it in the choir, near the blessed martyr St. Waltheof; after which she did not die, but lived on many years,* spending all day in nursing and feeding the Countess Godiva, and lying all night on Hereward's tomb, and praying that he might find grace and mercy in that day.

And at last Godiva died; and they took her away, and buried her with great pomp in her own minster-church of Coventry.

And after that Torfrida died likewise; because she had nothing left for which to live. And they laid her in Hereward's grave, and their dust is mingled to this day.

And Leofric the priest lived on to a good old age, and above all things he remembered the deeds and the sins of his master; and wrote them in a book, and this is what remains thereof.

But when Martin Lightfoot died no man has said; for no man in those days took account of such poor churls and running serving-men.

And Hereward's comrades were all scattered abroad, some maimed, some blinded, some with tongues cut out, to beg by the wayside, or crawl into convents, and then die; while their sisters and daughters, ladies born and bred, were the slaves of grooms and scullions from beyond the sea.

And so, as sang Thorkel Skallason—

"Cold heart and bloody hand†
Now rule English land."

And after that things waxed even worse and worse, for sixty years and more; all through the reigns of the two Williams, and of Henry Beauclerc, and of Stephen; till men saw visions and portents, and thought that the foul fiend was broken loose on earth. And they whispered oftener and oftener that the soul of Hereward haunted the Bruneswald, where he loved to hunt the dun deer and the roe. And in the Bruneswald, when Henry of Poitou was made abbot,* men saw—let no man think lightly of the marvel which we are about to relate as a truth, for it was well known all over the country—"upon the Sunday, when men sing, 'Exsurge quare, O Domine,' many hunters hunting, black, and tall, and loathly, and their hounds were black and ugly with wide eyes, and they rode on black horses and black bucks. And they saw them in the very deer park of the town of Peterborough, and in all the woods to Stamford; and the monks heard the blasts of the horns which they blew in the night. Men of truth kept watch upon them, and said that there might be well about twenty or thirty horn-blowers. This was seen and heard all that Lent until Easter." And the Norman monks of Peterborough said how it was Hereward, doomed to wander for ever with Apollyon and all his crew, because he had stolen the riches of the Golden Borough: but the poor folk knew better, and said, That the mighty outlaw was rejoicing in the chace, blowing his horn for Englishmen to rise against the French; and therefore it was that he was seen first on "Arise O Lord" Sunday.

---

* If Ingulf can be trusted, Torfrida died about A.D. 1085.

† Laing's Heimskringle.

But they were so sore trodden down that they could never rise; for the "French† had filled the land full of castles. They greatly oppressed the wretched people by making them work at these castles; and when the castles were finished, they filled them with devils and evil men. They took those whom they suspected of having any goods, both men and women, and they put them in prison for their gold and silver, and tortured them with pains unspeakable, for never were any martyrs tormented as these were. They hung some by their feet, and smoked them with foul smoke; some by the thumbs, or by the head, and put burning things on their feet. They put a knotted string round their heads, and twisted it till it went into the brain. They put them in dungeons wherein were adders, and snakes, and toads, and thus wore them out. Some they put into a crucet-house—that is, into a chest that was short and narrow, and they put sharp stones therein, and crushed the man so that they broke all his bones. There were hateful and grim things called Sachenteges in many of the castles, which two or three men had enough to do to carry. This Sachentege was made thus:—It was fastened to a beam, having a sharp iron to go round a man's throat and neck, so that he might no ways sit, nor lie, nor sleep, but he must bear all the iron. Many thousands they wore out with hunger. . . . They were continually levying a tax from the towns, which they called Truserie, and when the wretched townsfolk had no more to give, then burnt they all the towns, so that well mightest thou walk a whole day's journey or ever thou shouldest see a man settled in a town, or its lands tilled . . . .

"Then was corn dear, and flesh, and cheese, and butter, for there was none in the land. Wretched men starved with hunger. Some lived on alms who had been once rich. Some fled the country. Never was there more misery, and never heathens acted worse than these."

For now the sons of the Church's darlings, of the Crusaders whom the Pope had sent, beneath a gonfanon blessed by him, to destroy the liberties of England, turned, by a just retribution, upon that very Norman clergy who had abetted all their iniquities in the name of Rome. "They spared neither church nor churchyard, but took all that was valuable therein, and then burned the church and all together. Neither did they spare the lands of bishops, nor of abbots, nor of priests: but they robbed the monks and clergy, and every man plundered his neighbour as much as he could. If two or three men came riding to a town, all the townsfolk fled before them, and thought that they were robbers. The bishops and clergy were for ever cursing them: but this to them was nothing, for they were all accursed and forsworn and reprobate. The earth bare no corn: you might as well have tilled the sea, for all the land was ruined by such deeds, and it was said openly that Christ and his saints slept."

And so was avenged the blood of Harold and his brothers, of Edwin and Morcar, of Waltheof and Hereward.

And those who had the spirit of Hereward in them, fled to the merry greenwood, and became bold outlaws, with Robin Hood, Scarlet, and John, Adam Bell, and Clym of the Cleugh, and William of Cloudeslee; and watched with sullen joy the Norman robbers tearing in pieces each other, and the Church who had blest their crime.

And they talked and sung of Hereward, and all his doughty deeds, over the hearth in lone farmhouses, or in the outlaw's lodge beneath the hollens green; and all the burden of their song was, "Ah that Hereward were alive again!" for they knew not that Hereward was alive for evermore: that only his husk and shell lay mouldering there in Crowland choir; that above them, and around them, and in them, destined to raise them out of that bitter bondage, and mould them into a great nation, and the parents of still greater nations in lands as yet unknown, brooded the immortal spirit of Hereward, now purged from all earthly dross—even the spirit of Freedom, which can never die.

CHAPTER XLIII.

HOW DEEPING FEN WAS DRAINED.

Ill war and disorder, ruin and death, cannot last for ever. They are by their own nature exceptional and suicidal, and spend themselves with what they feed on. And then the true laws of God's universe, peace and order, usefulness and life, will reassert themselves, as they have been waiting all along to do, hid in God's presence from the strife of men.

---

* Anglo-Saxon Chronicle, A.D. 1127.

† Ibid., A.D. 1137.

And even so it was with Bourne.

Nearly eighty years after, in the year of Grace, 1155, there might have been seen sitting, side by side, and hand in hand, upon a sunny bench on the Bruneswald slope, in the low December sun, an old knight and an old lady, the master and mistress of Bourne.

Much had changed since Hereward's days. The house below had been raised a whole story. There were fresh herbs and flowers in the garden, unknown at the time of the Conquest. But the great change was in the fen, especially away toward Deeping, on the southern horizon.

Where had been lonely meres, foul watercourses, stagnant slime, there were now great dykes, rich and fair corn and grass lands, rows of pure white cottages. The newly-drained land swarmed with stocks of new breeds: horses and sheep from Flanders, cattle from Normandy; for Richard de Rulos was the first—as far as history tells—of that noble class of agricultural squires, who are England's blessing and England's pride.

"For this Richard de Rulos," says Ingulf, or whoever wrote in his name, "who had married the daughter and heiress of Hugh of Evermue, Lord of Bourne and Deeping, being a man of agricultural pursuits, got permission from the monks of Crowland, for twenty marks of silver, to enclose as much as he would of the common marshes. So he shut out the Welland by a strong embankment, and building thereon numerous tenements and cottages, in a short time he formed a large 'vill', marked out gardens, and cultivated fields; while, by shutting out the river, he found in the meadow land, which had been lately deep lakes and impassable marshes (wherefore the place was called Deeping, the deep meadow), most fertile fields and desirable lands, and out of sloughs and bogs accursed made quite a garden of pleasaunce."

So there the good man, the beginner of the good work of centuries, sat looking out over the fen, and listening to the music which came on the southern breeze, above the low of the kine, and the clang of the wild-fowl settling down to rest, from the bells of Crowland Minster far away.

They were not the same bells which tolled for Hereward and Torfrida. Those had run down in molten streams upon that fatal night when Abbot Ingulf leapt out of bed to see the vast wooden sanctuary wrapt in one sheet of roaring flame, from the carelessness of a plumber who had raked the ashes over his fire in the bell-tower, and left it to smoulder through the night.

Then perished all the riches of Crowland; its library too, of more than seven hundred volumes, with that famous Nadir, or Orrery, the like whereof was not in all England, wherein the seven planets were represented, each in their proper metals. And even worse, all the charters of the monastery perished, a loss which involved the monks thereof in centuries of lawsuits, and compelled them to become as industrious and skilful forgers of documents as were to be found in the minsters of the middle age.

But Crowland Minster had been rebuilt in greater glory than ever, by the help of the Norman gentry round. Abbot Ingulf, finding that St. Guthlac's plain inability to take care of himself had discredited him much in the fen-men's eyes, fell back, Norman as he was, on the virtues of the holy martyr, St. Waltheof, whose tomb he opened with due reverence, and found the body as whole and uncorrupted as on the day on which it was buried; and the head united to the body, while a fine crimson line around the neck was the only sign remaining of his decollation.

On seeing which Ingulf "could not contain himself for joy; and interrupting the response which the brethren were singing, with a loud voice began the hymn 'Te Deum Laudamus,' on which the chaunter taking it up, enjoined the rest of the brethren to sing it." After which Ingulf—who had never seen Waltheof in life—discovered that it was none other than he whom he had seen in a vision at Fontenelle, as an earl most gorgeously arrayed, with a torc of gold about his neck, and with him an abbot, two bishops, and two saints, the two former being Usfran and Ausbert, the abbots, St. Wandresigil of Fontenelle, and the two saints, of course St. Guthlac and St. Neot.

Whereon, crawling on his hands and knees, he kissed the face of the holy martyr, and "perceived such a sweet odour proceeding from the holy body, as he never remembered to have smelt, either in the palace of the king, or in Syria with all its aromatic herbs."

Quid plura? What more was needed for a convent of burnt-out monks? St. Waltheof was translated in state to the side of St. Guthlac; and the news of this translation of the holy martyr being spread throughout the country, multitudes of the faithful flocked daily to the tomb, and offering up their vows there, tended in a great degree to "resuscitate our monastery."

But more. The virtues of St. Waltheof were too great not to turn themselves, or be turned, to some practical use. So if not in the days of Ingulf, at least in those of Abbot Joffrid who came after him, St. Waltheof began, says Peter of Blois, to work wonderful deeds. "The blind received their sight, the deaf their hearing, the lame their power of walking, and the dumb their power of speech; while each day troops innumerable of other sick persons were arriving by every road, as to the very fountain of their safety . . . and by the offerings of the pilgrims who came flocking in from every part, the revenues of the monastery were increased in no small degree."

Only one wicked Norman monk of St Albans, Audwin by name, dared to dispute the sanctity of the martyr, calling him a wicked traitor who had met with his deserts. In vain did Abbot Joffrid, himself a Norman from St. Evroult, expostulate with the inconvenient blasphemer. He launched out into invective beyond measure; till on the spot, in presence of the said father, he was seized with such a stomach-ache, that he went home to St. Albans, and died in a few days; after which all went well with Crowland, and the Norman monks who worked the English martyr to get money out of the English whom they had enslaved.

And yet—so strangely mingled for good and evil are the works of men—that lying brotherhood of Crowland set up, in those very days, for pure love of learning and of teaching learning, a little school of letters in a poor town hard by, which became, under their auspices, the University of Cambridge.

So the bells of Crowland were restored, more melodious than ever; and Richard of Rulos doubtless had his share in their restoration. And that day they were ringing with a will, and for a good reason; for that day had come the news, that Henry Plantagenet was crowned king of England.

"'Lord'," said the good old knight, "'now lettest thou thy servant depart in peace.' This day, at last, he sees an English king head the English people."

"God grant," said the old lady, "that he may be such a lord to England, as thou hast been to Bourne."

"If he will be—and better far will he be, by God's grace, from what I hear of him, than ever I have been—he must learn that which I learnt from thee: to understand these English men, and know what stout and trusty prudhommes they are all, down to the meanest serf, when once one can humour their sturdy independent tempers."

"And he must learn, too, the lesson which thou didst teach me, when I would have had thee, in the pride of youth, put on the magic armour of my ancestors, and win me fame in every tournament and battle-field. Blessed be the day when Richard of Rulos said to me, 'If others dare to be men of war, I dare more; for I dare to be a man of peace. Have patience with me, and I will win for thee and for myself a renown more lasting, before God and man, than ever was won with lance!' Do you remember those words, Richard mine?"

The old man leant his head upon his hands. "It may be that not those words, but the deeds which God has caused to follow them, may, by Christ's merits, bring us a short purgatory and a long heaven."

"Amen. Only whatever grief we may endure in the next life for our sins, may we endure it as we have the griefs of this life, hand in hand."

"Amen, Torfrida. There is one thing more to do before we die. The tomb in Crowland.—Ever since the fire blackened it, it has seemed to me too poor and mean to cover the dust which once held two such noble souls. Let us send over to Normandy for fair white stone of Caen, and let carve a tomb worthy of thy grandparents."

"And what shall we write thereon?"

"What but that which is there already? 'Here lies the last of the English.'"

"Not so. We will write—'Here lies the last of the old English.' But upon thy tomb, when thy time comes, the monks of Crowland shall write—

'Here lies the first of the new English; who, by the inspiration of God, began to drain the Fens.'"

EXPLICIT.

WRITTEN AT SEA.

No. III.

The sea is indescribable from its variety. I have, indeed, heard it complained of on the score of sameness; but were I provoked by such an accusation to affirm that there is more variety at sea than on land, something could be said to defend the paradox. It is true, the great annual revolution of the seasons tells feebly on the water: nor is one spot of ocean unlike another, as diverse landscapes are; yet to those minuter changes which from hour to hour diversify the face of Nature, and offer to him who watches her like a lover unfailing joy, to each fitful wind, and casual play of sun or shadow at morning, noon, or night, the ocean lies unspeakably more open than any single scene on shore. Its hues vary less than those of earth, but its forms more; since, instead of rigid lines bounding dale and knoll, its watery mounts are momently shaping themselves anew in every possible form of size and curve. It trembles to every breath of air, and mirrors each mood of heaven. Lying with bared breast beneath the open face of the sky, it answers sensitively to the softest change of light. And, as it glooms or flashes, swells or sinks, in obedience to things so nimble, delicate, and changeful as air and light, its changes come to be delicate and nimble as their own.

But, leaving comparisons, consider how complex and varied are the forms (to say nothing yet of the colours) of ocean, and how rapidly they shift. Each state of the sea has its peculiar motion; and to each motion of the sea belongs a peculiar set of curved lines. When a stiff breeze is about to agitate the surface of a calm sea, it seems to send before it, as its *avant-couriers*, certain long rolling breakers, whose crested heads, invading the smooth water, urge it into fuller pulses and stain it with its earliest streaks of snow. In proportion to the force and duration of the gale behind them, so are these rollers heavy and slow, their curves large, and their lines prolonged. But when the wind, thus heralded, itself arrives, the sea is smitten into quite other waves. Quicker and shorter, with a finer top and a deeper recurve, are the billows raised by the actual impact of an eager breeze. Let the breeze freshen, and with every increase of pressure, the ocean-furrows sink into hollower troughs, run into acuter ridges, their lines roughen, and their angles sharpen. Very large may be the scale on which these forms are drawn, if there is abundance of sea-room all round, with the wind full and steady; yet it is on curve and angle more than on size of scale that the effect of wave-motion depends, and, as these must alter with every alteration either in the force or the direction of the wind, there is room here for endless variety. How glorious does the sweep of glassy curve become when the breeze rises to a gale, and the willing sea, obeying the tyrant and compelling wind, lifts its curled tops to the clouds out of caverns that yawn like graves! Wait till the storm is falling, and you will see this contest of waves, each apart and definite, give place again to a slow steady undulation which stretches far across the sea, and rolls from you away to leeward. Swell follows swell, as if drawn after the flying wind; but all its surface, whether on the upper or under curve of the swell, is itself broken by very tiny and irregular wavelets, which rise for a moment into keen ridges, and even points, and quickly sink again. Deceived by this rapid short movement on the face of the water, the eye must look over larger spaces, if it would detect that deeper and more prolonged undulation which really governs and slowly bears, or seems to bear, along the whole mass of restless waters. Lower and slower as the wind dies off, the swell by degrees rocks itself into smoothness; and the sea is calm.

But there are far more causes of variety in the motion of the sea than the mere increase or subsidence of the wind. All wind is itself undulatory, moves not with equal speed and pressure, but pulse-wise, in slighter puffs or more decided gusts; as the steersman knows well, and as anyone may feel who but holds his hand up to it. Every such wave of wind will produce a corresponding wave of water. But as air is both more elastic and far swifter than water, the sea-wave will be still propagating itself after the wind-wave which raised it has passed. Fresh blasts, differing from the first in force and somewhat in direction also, are continually coming to raise fresh waves and to disturb the old. Tides and currents create further complication. Variations of barometric pressure, too, are now suspected of playing a large part in wave disturbance; and agents still less known may lurk behind. From all these arise variations and complexities incalculable. Far from being a continuous series of resembling curves, stepping to time at each other's back, and keeping their order "as the tides obey the moon," waves are the most irregular things in nature. Let us sit here in the stern, since to-day we have wind enough to test it, and note what we see. When your eye gets used to the tumbling motion, you observe that the waves are of all magnitudes; every fifth or sixth (say) exceeds its fellows; two moving in slightly different courses sometimes clash their white heads against each other; the space left in the pause of these great billows is filled up by a crowd of lesser heaves which never reach the height to break into spray at all; all the sides of every wave, too, are corrugated and fretted by a myriad inequalities, minute rigid lines, creases delicate as those left in silk-paper which has been crushed and flattened again. Neither is the summit-line of two waves identical, nor of the same wave at two successive moments in its history; one wave breaks from beneath the very feet of another, rising ere the one behind it has ceased to fall; now, a breadth of sea is flattened out into tolerable evenness, its blackness unbroken, when presently you look, and it is all alive with crests of spray; here is a wave which seems to rush head foremost, as if it used the adjacent water for solid beach and ran its foam along the surface of it, while others there are less nimble in the race which fail in their rush and falling too soon back, their hollow rear is spotted with the trail of their froth:—everything, in short about these moving forms speaks of lawless diversity, of uncertainty that baffles expectation, and variety that outnumbers reckoning.

Meanwhile, all this ceaseless change of form is overspread with more obvious and still lovelier changes of colour. What is the colour proper to the sea? The choice lies betwixt green and blue, and authorities are divided. The language of descriptive poetry wavers. Shakespeare, to whom I am so loyal that I hold it literary treason to doubt his kingly authority, has "green" throughout; not once, so far as I know, is his sea "blue."* I was turning over the other day a borrowed copy of Byron (who is the poet of ocean, if not he?), and found he gives the preference the other way. "Dark blue" he uses at least twice as generally descriptive of the ocean: in the opening of the "Corsair," and near the close of "Childe Harold"; "green" I think not at all. The conflict of such names is reconcileable,—Shakespeare called it as he saw it from the English shore; Byron, as he knew it in the Mediterranean Sea. In shallow water, especially in the neighbourhood of land, the sea-blue, when seen by transmitted light, is softened into that peculiar dull, grey-green, with which Shakespeare, like most untravelled Englishmen, was familiar. This fact has furnished our accurate Tennyson with a simile in the "Idylls of the King":—

---

* See *Macbeth*, Act ii., Scene 2; *Midsummer Night's Dream*, Act iii., Scene 2.

"He spoke, and one among his gentlewomen
Display'd a splendid silk of foreign loom,
Where, *like a shoaling sea, the lovely blue
Played into green*."

And, if I recollect aright, Byron, poet and swimmer, when he has in more than one passage to describe the hue of sea-water—as it looks to him who, in-instead of gazing down upon it, is actually immersed in it—calls it green. Here, at least, is one, so beautiful that I must quote it:—

"How many a time have I
Cloven with arm still lustier, breast more daring,
The wave all roughened; with a swimmer's stroke
Flinging the billows back from my drench'd hair,
And laughing from my lip the audacious brine
Which kiss'd it like a wine-cup, rising o'er
The waves as they arose, and prouder still
The loftier they uplifted me; and oft,
In wantonness of spirit, plunging down
Into their green and glassy gulfs, and making
My way to shells and sea-weed, all unseen
By those above, till they waxed fearful." *

A hue, similar to this glass-green seen by the diver, may be observed when the thin wedge of a billow's crest is for an instant reared betwixt you and the day. This is to my eye the loveliest of all ocean colours. A delicate, transparent green, formed, not by direct transmission, but rather, I think, by the passage through the wave of strong diffused or reflected light, it has the tenderness and brilliancy of the light which lives in jewels. Like an emerald, it gleams on the forehead of the wave.

Salt water, then, so long as you look through manageable distances, appears more or less green; but at depths where the plummet does not touch, or only just touches, bottom, it is blue. Not the bright, cheerful blue which Italian seas reflect to Italian skies, nor the opaque black-blue of the North Atlantic, when over it hurtling rain-clouds lour; but a full, strong, regal colour, rich and soft,—a blue unmixed with other shades, but which, when it passes into anything, will pass most easily into deepest purple. When the sea is disturbed, indeed, as by the passage of a keel, the countless air-bells which are sucked down beneath the eddies change this powerful blue into paler tints. Very beautiful is the ship's wake on such a gusty day as this. The counter agitation wrought by our motion has smoothed out the waves and left tiny whirlpools in their place. The surface of the water is like a restless floor of marble, whose dark blue ground is variegated with every shade down to tenderest azure, and marled with creamy streaks and loops of perfect white. But to gaze down into unbroken water, whose depths no lead has searched, is like looking up through the night when only the light of stars is in the sky. Beneath us, as above, is the blue of space—transparent, dark, mysterious, infinite.

It is rarely, however, one sees this solid colour, proper to the sea, whether green or blue; for its surface lies commonly at such an angle to the eye that it partially takes by reflection the colours of the sky. Who does not know how infinite these are, and how changeful? Let the light be pure, and the whole sea glitters with a transparency and brilliancy in its tints never equalled on land. Brilliant spangles of gold perplex the eye that looks sunward; brilliant azure elsewhere underneath the azure sky; while, opposite the sun, where soft-tinted clouds dapple the horizon, the smooth water gleams with roseate, saffron and amber dyes. When the air is murkier and the heaven overcast, the faithful water loses this transparency of hue. Heavy opaque blues and greys chequer the dull floor. A colourless sky looks down on a colourless sea. In ordinary weather, in fact, it is the delicacy of its neutral tones which gives to the water-surface its chief charm to the eye. You see nowhere such greys as at sea—greys clear and silvery, greys soft as pearls, greys dusky dim, greys touched with ever so faint a suspicion of gayer, richer colours. They pass by finest gradations into and out of one another; they play across the chord of colour with every changing hour. A bright cloud stains them for a moment. Before squall and shower, there runs athwart them a bar of blackness, like the frown upon a pleasant face. Deep noon swallows them up in its intensity of blue. Morning and evening come to steep them in warmer colours. What wonderful combinations of colour are to be seen when the thousand lights which make the western sky resplendent are broken and repeated and confounded in moving water. For lights which burn in heaven, fixed and single, are caught but confusedly by the restless sea (as all heavenly light is on the earth); multiplied into ten thousand copies, yet not one copy perfect. I well remember noting this confusion of reflected hues in water, as I stood by Loch Fyne one autumn evening and watched the sun, after a louring day, go down behind the Inveraray hills. The cloud-line had lifted till it lay over Dhuinequoich (just touching the highest peak) in a horizontal bar of tawny-tinged and threatening grey. Below it, the sky glowed an intense, pale-primrose fire, against which the black-green hills stood relieved like very night. For though the sun had sunk, its light shone upward through the clear space, and smote the broken shreds of emptied rain-cloud into sullen russet; while under the rain-cloud, and embosomed within the clear space itself, were seen pale ghosts of other cloudlets, striated and remote, in colour of a most delicate amethystine violet. Thus, all above was defined; but underneath this pomp of well-ordered colours lay the loch, all a-tremble throughout its breadth with a pearly tremulous light, compounded of ashen grey and violet in the main, but pulsing off through infinite gradations into a myriad deeper tones as it caught, now one and now another, of the lights in heaven.

It is the incessant motion of sea-water which thus confounds colours and baffles description of them. Say you have numbered all the hues which ever touch the cheek of ocean, have you described it? Then you have as good as seen the beauty of a lover's mistress when you have heard him count over ruby lip and ivory teeth, eyes which sparkle, and a cheek that burns. No: it is in the combination and the play of feature that beauty dwells. So there is in the face of ocean a living movement, with an answering play of dancing light and shadow, which no words can paint. Innumerable tints blend or interchange in one moment's glance at a sea scene. Each wave—nay, each wavelet on a wave—is a jewel with a hundred facets, and has turned them to the light at countless angles 'ere you can point its place.' It twinkles, flashes, lightens, darkens, even as you look; lifts itself to the sun and sinks again; shifts through hues as many and as delicate as those on a dove's neck.

---

* "*The Two Foscari*," Act i., Sc. 1.

After all this has been advanced in favour of the variety which, in various states, ocean offers to the observer, the fact remains to be conceded, that there is about it a certain terrible monotony. The winds of God wander over it for ever, now ploughing it into tempest, and anon touching pulses light as those of a sleeping girl; not a brief humour of the heaven but finds an answer in its face by night or day: and yet it is, in spite of all, unchanged, impassible. As sensitive as it is to casual, momentary impressions, so incapable is it of change. A child's toy-boat can cleave its waters, yet navies pass and leave no track behind them. Zephyrs wrinkle its forehead; "time writes no wrinkles" there. Neither the convulsions of Nature nor the ingenious labours of men work the least change on it. It cannot be tamed or marred or sullied or sweetened. Barren, bitter, cold, secret, fitful, untired, it rolls and moans the same for evermore. Dwell on the thought, and it will perhaps seem to you, as to me it has at times seemed, that this impassibility is the most awful thing about this awful ocean—a thing terrible to think of. Then there is its oppressive monotony and loneliness. Substantial sameness reigns amid endless fluctuation. Day after day, the sky is an unchanging hemisphere, the sea an unchanging circle. Day after day, the voice of waves hums one dull sad monotone in the ear. League after league, day after day, and still the horizon is the same, and the sea before is as the sea behind us. We are the centre of a solitary world. It is surprising indeed how destitute of life the open ocean seems to one who voyages over it. The friendly sail, sole link to bind this floating fragment to its kindred human world, is but an occasional sight in blue water; and though the waters themselves swarm with moving creatures, they hide their population from human eye. Here and there a herd of porpoises chasing each other through the surf; the occasional blow of a whale in colder latitudes; or, where the sun is overhead, the merry arrowy leap of flying-fish: but these are rare; and, but for these, a waste plain of water tumbles round us untouched by any interest of sentient life. The air is kinder than the water: its winged things gather to us, and sport and wheel about the vessel's wake. Our own coast gull bore us company through the North Atlantic; the regal albatross, whose wide strong pinions and fierce beak claims an eagle's place among ocean birds of prey, sweeps over southern seas, now brushing the billows with the tip of its wing, and now soaring overhead in steady poise; the nimble petrel, beloved of seamen, flutters, swallow-like, in crowds about the stern, and dips its breast in every sea. Since we reached the latitude of the Cape of Good Hope, yet other birds of lesser name, but as fair plumage, are become familiar convoys. They serve to enliven the way, these hardy children of the wave, and we are thankful for them. For, when all is said, it is a lonely and a weary thing to voyage long and far from land, upon the bare sad main. It soothes the mind at first to a quiet indolence, which, in persons of an active habit, degenerates by and bye into *ennui* hardly to be dispelled by trifling pastimes, but which deepens the serious and sadder moods of a contemplative man, adds to the burdensome mysteries of life, and sets the soul more than ever apart to dwell with thought and meditate spiritual things. When the cloven waters are healed again behind our swift-gliding keel, and we, who for an hour kindled up the lone place with thought and passion, have passed on to invade as lonely places, who stays behind? Who fills the vast space of empty air and barren sea? Who dwelleth with the sea-fowl? Who is there to watch the incessant rise and fall of waves, or hearken when their hand-clapping swells or dies? I think of the desolate spirits balked of their evil work on men and sent forth to wander in desert places seeking rest but finding none; and I wonder, if these boundless, homeless waters be their "desert place," if it be their shriek I hear, as, pinioned in the viewless winds, they scour the restless plain for ever. Peace, vain speculation! Faith is aware of one Presence always present here. One inhabits ocean solitudes, who hears the cry of hungry birds, before Whom no wave breaks unseen. His breath arouses, His finger checks, the wildest course of waters. With ineffable joy, He broods upon the deep, lives in its life, admires His own hands' works, and receives well pleased their unconscious homage. It is good to be alone upon the face of ocean, if we are alone with Him.

J. OSWALD DYKES.

CHRIST THE LIGHT OF THE WORLD.

By C. J. VAUGHAN, D.D.

XII.—CAST OUT AND FOUND.

"And he said, Lord, I believe. And he worshipped Him."—John ix. 38.

The man spoken of was one who, having been blind from his birth, had lately received sight under the healing hand of Christ. One of those casual meetings—as we call them—which are sometimes so full of significance both in the natural and in the spiritual life of man; one of those casual meetings which sometimes bring a weak man into the society of a tempter, or (on the other hand) a faulty man into the company of one who is to be, under God, his evangelist and guide towards Heaven; had here thrown a person into the way of Jesus. "As Jesus passed by," from a scene of rebuke and blasphemy and intended violence, "He saw a man which was blind from his birth." Viewed on the one side, it was a chance meeting: viewed on the other side, it was anything rather; it was the working out in time of an eternal purpose: it was the revelation in act of a mystery hid through long generations: it was the hand of grace seeking out its destined object: it was the bringing of a spoilt life and a blinded soul into His presence, through whom "the works of God should be made manifest in him."

And the result had followed. Through a process which we must in reason regard as rather typical than remedial—a process of anointing the eyes with clay, and then of washing in a common pool; just enough to furnish a connecting link, as it were, between the will that wrought and the miracle which resulted; to show a carnal mind that the work was Christ's and not another's, without in the smallest degree explaining how He wrought—the man blind from his birth came back from Siloam seeing. And this return, in which benevolence should have rejoiced, and for which piety should have given thanks, was the signal for a new outbreak of that hostile malevolence against the Saviour Himself, of which this Gospel furnishes so many graphic descriptions. A system of questioning and cross-questioning and re-questioning is adopted by the Pharisees towards this plain unlettered man, which could end in nothing but the triumph of truth, and the discomfiture of malice; the gradual refining and elevating of a mind honest but ignorant, and the discovery of that bad motive in the breast of the judges, which betrayed itself, sometimes in the tone of an affected eagerness for information, sometimes in the profession of a disinterested candour, more often in the language of utter contempt, cold sarcasm, or vulgar threatening. At last, all attempts to shake the fact or to intimidate the witness having been frustrated and brought to nought, the sentence of excommunication was formally pronounced; and he who would confess Christ—though it were but in the bare statement (unaccompanied by any inference) of truth and fact—must pay the penalty of his honest boldness, by being cast out from the communion of his nation's worship, from the approval of all whom he had been taught to reverence, and the sympathy of every one whom he had to love. "They cast him out."

"Jesus heard that they had cast him out: and when He had found him, He said unto him," &c.

1. We have here an illustration of Christ's *choice of seasons* for His deepest personal intercourse with souls. "Jesus heard that they had cast him out:" it was then that "He found him." When all else is lost, then is the great finding. Jesus found him, and he found Jesus. It is more than a parable. It is a simple fact, made true over and over again in that spiritual world which has its laws and its events, its battles and its victories, as truly, as certainly, as any that are going on in the world of flesh and blood; only just with a veil over them; just with that little film of sense to obscure them, which in reality rests far more upon the eye that looks than upon the object looked on. How true is it, that it is when men have cast out, that Jesus finds!

There is something very fascinating in the good opinion of others. It makes life smooth, of itself. Many things may go against a man: fortune may have been fickle, health precarious, home-comforts few, ambitious hopes disappointed, heart's wishes crushed and mortified. Still, if men speak well of him; if he is looked up to as a wise man, as a great example or a great authority; if there is the slightest chance of his being remembered when he is gone, or quoted when he is in dust; you feel that that man is not entirely to be commiserated: his very losses are gains: men have not cast him out for them, but rather added them to his claims to honour. The very blasts of this world's sorrow which have shaken that man's dwelling, bared his garden of flowers, and his orchard of fruits, have but wrapped more tightly round him the mantle of his self-esteem: men have not cast him out: the storms of life have only driven him in!

Contrast this condition with another.

A man has done something wrong. Self-confidence, and vanity, and careless living, have ended (as they end every day), in a dreadful fall. A man has erred from virtue. Sin has found him out in shame. He has broken one of those two or three Divine commandments which the world has taken under its patronage. It mattered not so long as his sins against God were not sins also against the world: but the evil heart could not always be coerced within these exact limits: the poor ignorant boy has stolen; the poor silly girl has listened to the flatteries of a seducer; the weak purposeless youth has violated in some particular what is called the code of honour; some one not usually weak has been pierced between the joints of the harness, by an arrow from some bow drawn almost at a venture by the foe of man: he has fallen, and the world itself cries shame.

We might go yet nearer to the exact case before us, and picture to ourselves a man who has dared to offend the prejudices of that which calls itself the religious world: a man who had once been the idol of a popular party; had seen with its eyes, and spoken with its tongue, of the mysteries of God: crowds had listened, the religious press had applauded: his severer utterances had been called faithful, and his gentler tones had been persuasive as the accents of an Angel. At last he presumed to think a thought of his own; a thought which dived deeper and soared higher into the secrets of Revelation than was the wont of his party: wrong or right—and he thought that he had the Spirit of God—he was now independent: he had broken loose from man's trammels: he had given himself, as he humbly hoped, to a truer and a surer than any human guidance: and as he was led, so he spake, not as pleasing men, but God who trieth the hearts. Instantly, or by sure degrees, popularity left him: at last, he was as a man wondered at: he had gone forth alone into the wilderness in quest of God: and men cast him out!

It matters not in what particular direction we seek our illustration of the state spoken of: this we say, that whatever the cause, or the manner, or the nature of the casting out, that is the condition not least but most favourable to the finding of, to the finding by, the Saviour. "Jesus heard that they had cast him out: and when He had found him, He said unto him."

There is around all of us by nature a thick massive coating of pride and self-esteem. It is an easy thing to declaim upon the duty of humility, the loveliness of a lowly spirit, or the beauty of a character divested wholly of self. But the very person who so speaks, speaks perhaps of that which he knows not. The veiling of pride, the disguising of pride, the limiting and moderating and coercing of pride, is one thing—itself not always easy for all men. The putting off of pride, the eradication of pride, the washing or the burning out of pride, from a man's heart, is quite another thing: done, perhaps, but in a few; even in them at last imperfectly as well as bitterly and by slow degrees. Nevertheless it must always be in proportion to this divestiture of pride that Jesus Christ finds a man: and it is because the being cast out by the world has a tendency—though not a certain efficacy—in this direction, that it is a state favourable to that finding. A man may be cast out, and yet not found. Even the reproach of the world may foster pride, as well as its flattery. Pride is the common growth of nature: all circumstances favour it till God works: we must not wait for reproach, or, even if it comes, it may not work in us salvation.

But speaking possibly to some who may feel themselves lonely and desolate upon earth; to some who know a little, however little, of reproach and reviling; who have either brought upon themselves the displeasure of others, or have had it thrown upon them unjustly; I would earnestly bid you to ponder with thankfulness this one consideration: that it is when a man is cast out, that Christ is nearest to him; if he be as yet careless, for conversion; if he be already faithful, for strengthening and for consolation. In proportion as you are divested of self-esteem, in proportion as you feel your own poverty and blindness, in the same degree are you at your best for Christ's converse: look up to Him, feel after Him, cry out to Him, wait for Him, and He Himself, even before you call, will answer!

2. We have here an illustration of the *method* of that intercourse of Christ with the soul, of the season of which we have spoken. This man had begun in great ignorance. He did not know who Christ was. He speaks of "a man that is called Jesus." How accurate would that saying be on the lips of many of us! "A man that is called Jesus." A man whom some people talk of as a living Person, as a loving and guiding Friend, as a merciful High Priest, as a compassionate Saviour. I hear the words; but I know Him not for myself, nor understand the thing thus spoken of! It was so once with this man. Even after his cure, he only supposed that "He was a Prophet." We do not read even of a great eagerness to return to bless his Benefactor. "He went his way, and washed, and came seeing." The marvellous fact is soon told, and for the moment it was all. Not until enquiry began, not until he was called to account, and something of opposition and even of persecution threatened him, does anything of deeper feeling manifest itself, and a tone almost of heroic firmness in the maintenance of truth prepares us for the great and final confession, "Lord, I believe!"

Thus far the lesson before us is that of all Scripture: "To him that hath shall more be given." He who well uses the light he has, shall find that light shining more and more unto the perfect day. He who tells manfully, and acts consistently, what he knows of Christ, shall know more and feel more and love more, until faith itself is lost in sight.

But we would look more carefully into the present converse itself.

"When Jesus found him, He said unto him, Dost thou believe on the Son of God?"

"Thou." The word is emphatic in the original. "Thou—believest thou?"

We are glad to escape into the crowd, and shelter ourselves behind a Church's confession. But a day is coming, in which nothing but an individual faith will carry with it either strength or comfort. It will be idle to say, in a moment of keen personal distress, such as probably lies before us in life, and certainly in death and in judgment, "Every one believes—all around me believe—the world itself believes in the Son of God:" there is no strength and no help there: the very object of Christ's finding thee and speaking to thee is to bring the question home, "Dost *thou* believe?"

A trying, a fearful moment, when Christ, face to face with man's soul, proposes that question! Perhaps that moment has not yet come to you. You have been fighting it off. You do not wish to come to these close quarters with it. The world does not press you with it. The world is willing enough that you should answer it in the general: and even if you ever say, "I believe in Jesus Christ His only Son our Lord," it shall be in a chorus of voices, almost robbing the individual of personality, and making "I" sound like "We." But if ever your religion is to be a real thing; if ever it is to enable you to do battle with a sin, or to face a mortal risk; if ever it is to be a religion for the hour of death or for the day of judgment; you must have had that question put to you by yourself, and you must have answered it from the heart in one way. Then you will be a real Christian, not before!

What a natural answer! "He said, Who is He, Lord, that I might believe on Him?" Yes, Who is He? I would fain have some one to love with all my heart, and to trust with all my soul; some one always with me, always the same, tender to feel, wise to guide, strong to save: but who is He? I must see Him; I must apprehend Him; I must hear Him speak, and speak to me; I must be able to speak to Him, and get an answer: Who is He? Tell me, "Who is He, that I might believe on Him?" It is the cry of many hearts: of some, I doubt not, among my readers: it is the cry of many hearts, longing and even fainting for the answer: and it is also the idle utterance of many voices, never giving time nor thought to the great question, and yet grudging evermore because it will not be satisfied; Who will tell me of a Saviour? Who, when He is pointed out, will show me the way to Him? And who, when the way is shown, will convince me that He is no mere phantom, but the ever-living, the almighty, the all-wise, and the all-sufficing One? These last have not yet been "cast out," that He should "find" them! But the other, the serious, the wrestling, the travailing and heavy-laden, they, when they ask, "Who is He?" shall hear in no long time, from the excellent glory, this strange, this thrilling response,

"Thou hast both seen Him, and it is He that talketh with thee."

Seen Him? Already seen Him, and yet not known Him? Yes, seen Him, it may be said to us, in His ordinances, and in His worship; seen Him at His Font and at His Table; seen Him in His Word, and in His works; seen Him in the world and in the Church; seen Him, above all, in the controversies of conscience and in the strivings of His Spirit. Grave rebuke! This was the gate of Heaven, and I knew it not! Yet strong consolation! So near, so present—"which we have seen with our eyes, which we have looked upon, and our hands have handled, of the Word of Life; for the Life was manifested, and we have seen it . . . that ye also may have fellowship with us—" O strange world! in which Christ moves, invisible yet real: in which He indeed comes unto His own—creatures of His hand, objects of His Redemption—and His own may, if they will, receive Him! Yes, "Thou hast both seen Him, and it is He that talketh with thee!" So then, I have no new revelation to wait for: the word is not in heaven, that thou shouldest say, Who shall go up for me into heaven, to bring it to me, that I may hear it and do it? it is very nigh thee; in thy mouth and in thy heart; that Word, which is Christ Himself; that Word, which is at once healing and strength and eternal life!

We take the reply as designed to facilitate acceptance. Who is He? Thou hast seen Him: He is here: He is talking with thee! Thou hast but to receive, but to listen, but to throw thyself upon a present help and a present love; and thou art saved: the Saviour has found thee, and thou hast found a Saviour!

Half and more than half the miseries of our spiritual being, would be cured at once by the application of this remedy. "Thou hast seen Him." More near to thee than thou to thyself; more real than the thing thou touchest, or the voice thou hearest; more ready for the spirit's sight and for the soul's handling, than the countenance that is dearest to thee, or the hand that is nearest; take Him to thee at once! Speak to Him, for He hears! Offer to Him thyself—the best of thine affections, and the best of thine energies—He will accept, He will bless, the sacrifice. A veil there is over Him: for His countenance is as the sun when he shineth in his strength, and thou couldest not bear the brilliance: His voice is as the voice of many waters, and Angel-hosts tremble at its utterance: in mercy to thee, He flashes not upon thee the lightning of His presence, and "seals up the seven thunders" even while "they utter their voices:" but none the less is He real and present, and the day that is coming shall be just the "unveiling," just the "manifestation," of One whom already thou hast seen, and who already has talked with thee.

"And he said, Lord, I believe. And he worshipped Him."

This man had thought of the Messiah as of some distant, some half-unreal being. Now he found himself in His presence. And that presence was indicated, not now by miraculous signs—not by the wind, or the earthquake, or the fire—but by that still small voice which convinced while it comforted. One sign he had witnessed; the sign of his own healing. From that sign he had argued power, he had argued a mission, he had argued the character of a Prophet. But it was converse with Jesus—it was hearing Him speak—it was the receiving from His lips, in the tone of undoubting truth, the assurance of His own Divinity—which drew from Him for the first time the words, "I believe," and the sealing act of worship.

And is it not thus still?

We have all heard of Christ with the hearing of the ear. We have all, for years of life, met together on His holy day to repeat Creeds which tell of Him, and to join in a worship framed on the supposition of His Messiahship. But, after all, it is not thus that a man enters into the faith which saves. Go apart with Him, for one moment, in life's cloudy and dark day: let Him find thee in thy secret chamber, when friends are unkind or adversaries busy: let an earnest cry, wrung from the heart by sore need, call Him to thy rescue, and confess to Him that aching void which none else can fill: and that day, that hour, will be the real date of thy discipleship; the day and the hour at which a creed passed into a faith, and a homage into a devotion; at which the long-heard-of became the late-seen, and the nominal object of thy hope and of thy trust first heard from thy soul the words, "I believe," and first in deed and in truth saw thee worship.

"Let us hear the conclusion of the whole matter."

(1) It says surely to some, *Suspect your prosperity.* The world smiles upon you, the world fawns upon you, and all men speak well of you. It is pleasant. You feel yourselves the happier: nay, you say you feel yourselves the better for it. All the virtues come easily to the prosperous. Good temper, courtesy, gratitude, thanksgiving itself, all seem natural to the happy. And yet, remember, our Lord says, "Woe to you that laugh now!" "Woe to you when all men speak well of you!" Remember too, it was when the man was cast out, that Jesus found him. Suspect your prosperity. Judge yourselves, that you be not judged. The day of your sifting has not yet come: beware lest, when it comes, it find you practically without a faith and without a Saviour!

(2) And to others it says, *Accept your adversity.* You are poor, you are sick, you are lonely, you have fallen from a better standing, you have come back (it may be) a childless widow to a place which you left a wife and a mother—these reverses are, every day, amongst us—all things are against you, and you are ready to say to your Lord Himself, "Show me wherefore Thou contendest with me." Now then think of him who was "cast out" as sinful and vile and refuse, and whom then, just because He heard that men had cast him out, Jesus found, communed with, and saved. Hear that same voice in your solitude, and let it say to you, "It is thy Saviour that talketh with thee!"

(3) And to others it says, *Do not miss salvation by looking too far for it.* Naaman thought it a small thing to wash in Jordan: the cleansing of the leper, he said, must be a greater matter than that! And so men fancy that to find a Saviour must be a matter of difficulty; of wide and distant and long research: they never can believe that one simple word, spoken from the heart, in a common room, on a common day, can really bring them face to face with the Redeemer and the Saviour and the Comforter. And yet it is even so. When He is found, it is as One whom we have already seen and talked with; as One so near to us that we might have received Him any day; so near to us that there is even now but a step, but a veil, between us and Him! It is a grievous thing to miss One who is as close to us as our own soul, just because we would take it for granted that He must be looked for afar off.

(4) Finally, to us and to all the history says, *Christ is all.* "He that hath the Son hath life: He that hath not the Son of God hath not life." *He* opened the eyes, *He* came in quest, *He* found, *He* spake: and His question was, "Dost thou believe on the Son of God?" Just that—nothing more. Then what of us, who can do everything else, and yet do not believe? What of us, who say, "God will not condemn me, because I am moral, because I am a payer of just debts, because I am regular in worship, and never take His name in vain?" Yes, but *are you a Christian?* Do you believe on the Son of God? Do you say from the heart to Christ, "Lord, I believe," and worship Him? Many Christians (so called) are only Deists: they believe in God, but they believe not in Christ. Friends and brethren, let us look into it while we may! Soon, this chapter tells us so, soon "the night cometh, when no man can work." While we have the light, let us walk in the light. Everything that offends, cut it off: everything that offends, pluck it out. From a death-bed, or from beyond death, you will look back with satisfaction on nothing that was not right. "Lord, I believe: and whatsoever Thou sayest unto me, I will do. Lord, I believe: and though now I see Thee not, yet will I endure as seeing Thee who art invisible. Thy strength is sufficient for me: for Thy strength is made perfect in weakness. When Thou sayest to me, Dost thou believe? give me grace to answer, with a firm faith and a good courage, My Lord and my God!"

* * *

ALFRED HAGART'S HOUSEHOLD.

By ALEXANDER SMITH, Author of "A Life Drama," &c.

CHAPTER XXVII.

On the evening of the day on which the McQuarrie girls left Mortimer Street on their return to Uanvohr, Henry Willoughby sat in the library at Marsco House reading *Samson Agonistes* with the lemon sky of March sunset broken by the pointed gloom of the pine wood outside. The young man read till the light began to fail, and then he closed the book, his finger still keeping the place, and paced up and down through the apartment, his mind filled with austere music. "The reading of Milton always humiliates me," he said to himself, as he strode backwards and forwards. "What immeasurable altitude and solitariness of soul, what cruel purity and coldness as of Alpine snows! Chaucer gossips, Spenser dreams, Shakspeare is mobile as flame, now Clown, now Emperor; now Caliban, now Ariel; at home everywhere, taking his ease in every condition of life,—but Milton is never other than himself; he is always autocratic—the haughtiest, scornfulest, stateliest, loneliest of human spirits. He daunts, repels, frightens, yet fascinates. He would sing the song of Paradise, and he left the task to the close of life, when smitten with blindness, pierced with ingratitude, and fallen on evil days and evil tongues—perfectly conscious that he could become immortal whenever he pleased. Gracious Heaven, what a *will* the blind old man had, making time, infirmity, and sorrow his slaves! Other poets are summer yachts, moving hither and thither on the impulse of the vagrant wind; Milton is an ocean steamer, with steadfast-pointing needle, plenty of coal on board, and which, relying on internal resources, and careless alike of elemental aids or hindrances, bears straight on its determined way, deviating not a hair's-breadth, come hurricane, come calm. What power, what energy in everything he does! His lines are like the charging files of Cromwell's Ironsides. Compared with this man, what am I? Clay in the hands of circumstance to be made or marred—without force, resolution, will—a spineless caterpillar, a blown arrow of thistledown, a mere thing of shreds and patches; with no virtue in my goodness, no hardihood in my evil—a something marching shabbily from birth to death, a poltroon, a fool—" and here the young fellow, having worked himself into a rage, threw down the book impatiently, and going forward to the window stared out on the lemon-coloured sky which the black needles of the pine wood fretted.

He had not looked out long when the crunch of footsteps were heard on the gravel, and the shadow of a man shot past the corner of the house, speedily followed by the man himself—a middle-aged man, half shepherd, half keeper, with a gun across his shoulder and a terrier at his heel. Perhaps the master of Marsco was glad of this interruption to the current of thoughts which were by no means agreeable. At all events, he threw up the window and called out—

"Well, Rory, this is a beautiful evening. Were you coming to see me?"

"Yes, sir," said Rory, touching his bonnet, while the terrier made a sudden rush into the shrubbery. "*Smoorach*, *Smoorach*, come here, you sinner! You were speaking about having a shot at a heron, and as this is a fine evening, I thought I would come up, whatever. *Gaghey*, *gaghey*, *Mahoö!*" cried Rory, as he stamped his foot on the gravel, and at the storm of gutturals, the terrier, which had returned from its raid, slunk away in the direction of the kitchen.

"But do you think we will get a heron to-night," said Henry.

"Hoot, yes. They'll be fishing on the low rocks at the early moon-rise, and the moon will be up in half an hour."

"Well, then, I don't care although I should try my luck. I have nothing better to do in any case. Wait there till I get my gun and shot-belt—or rather, go into the kitchen, and have something from Jones. I'll be with you in ten minutes."

When Henry Willoughby got down to the gravel walk, Rory came out of the kitchen, drawing the back of his hand across his mouth as he did so. "This will be a fine night for the herons," he said; "they are fattest in the early winter moon-lights, but they are in good condition yet. Are you ready, sir? I've told Jones to take care of the terrier till I come back. He would make a noise and disturb the birds if he came with us."

The pair then passed out of the gate, and Rory led the way across undulating ground covered with natural birchwood, toward the low rocky shore. The early twilight was falling. The lemon-coloured light was still lingering around the splintered peaks that rose to the west of the great bay, wan lemon-coloured light that was dying momently: while above a dark round hill on the other side, a cone of tender radiance shot upward, the *avant courier* of the moon. In a little while, above the dark hill peered the full-faced spring moon herself, and the rocks, almost undistinguishable before, came out in a flicker of glister and gloom, and the making sea was traversed by a faint mesh of tremulous lustre. As the light increased, felt more than heard or seen was the stir of life along the shore, in the distance motion and the sound of wings, and the fine flute-like call and recall of birds. Paler grew the lemon light above the peaks, higher rode the moon, and broader and more vivid grew the net of trembling light, till at last all was silver and silence and the cold splendour of the making tide. The fallen sun had drawn his last skirt of sunset after him; and the moon had no rival save the shadows which were afraid of her, and which hid themselves from her ray behind rocks and in hollow places.

For some little time Rory marched on in front, then he slackened his pace and allowed Henry to walk alongside. "I was over at Uanvohr yesterday and saw Mr. McQuarrie," he said suddenly. "I was bringing a stag-hound pup for Miss Oona—of a grand breed, sir. It's the only kind of dog Miss Oona cares for."

At the name, Willoughby's heart gave a great jump, and the blood so rushed to his face that he was glad only the moonlight beheld it. "I hope you found Mr. McQuarrie well," he said after a pause.

"Quite well. He told me that Miss Oona and Miss Maggie were coming home by the first steamer."

"Coming home! What are they coming home for? I thought they were to remain in the south all spring and summer."

"I don't know indeed, but he told me they were coming home. Ah, Mr. Henry, perhaps you will make it up with Miss Oona when she comes. It's you that would be the handsome couple. I was just saying so to Mr. McQuarrie."

"What right had you, you rascal, to speak about Miss McQuarrie and me," cried Henry, turning on his companion angrily.

"I was just saying——"

"You had no business to say a word, and to Mr. McQuarrie above all men. Your tongue will bring you into trouble."

Henry strode in advance for a few paces, but his annoyance was short-lived; in a minute or so he asked in an altered tone, "And what did Mr. McQuarrie say?"

"I'll tell you that," responded Rory briskly, as he sidled up to his master. "He just put his hands in his pockets and leaned his back against the dyke and laughed. 'It may come all right yet, Rory,' he says, 'and we may both dance at the wedding. Young ladies don't know their own minds sometimes, Rory,' he says, 'and say no when they mean yes.' He has seen big Duncan, sir."

"And who is big Duncan, pray?"

"Big Duncan! The man you knocked down in the booth at Narrowkyle. I'm told, sir, your arm was just like a flash of lightning, and Duncan fell all his length like a tree. He met with his match and more, sir, when he met with you."

"Humph! He saw big Duncan you say?"

"Yes, and Duncan told him—Duncan's head's not right yet, sir—that he was sorry that he had insulted the gentleman, and that he had got nothing more than he deserved. Duncan's a very decent man, when he's sober."

"Did Duncan tell Mr. McQuarrie what was the cause of quarrel, and *why* I knocked him down."

"I don't know, indeed. Mr. McQuarrie did not say. Duncan takes all the blame to himself, whatever. But, Mr. Henry, the black rocks yonder, sticking like seals' heads out of the bed of moonlight, is a grand fishing place for the herons. They come down with the tide on their way to roost. We must get down yonder."

Under Rory's guidance, Henry crept down over broken boulders to the shore, and the twain ensconced themselves under the shadow of a rock that stood up against the glittering sea. When they were fairly ambushed, Rory reconnoitred the shore and the low rocks, but there was no heron, only a disturbed cormorant scudding down the moonlight with outstretched neck, and a sound of flurried wings. If a shot was to be had that evening, there was nothing for it but to wait patiently. So they stood in the rock shadows, seeing nothing but the broad wrinkled glitter of the moonlight, and the plash and gurgle of the making tide. Utter silence came back when the cormorant had gone.

As he stood there in the gloom of the rock, the expected heron was to Henry of but little account; the return of Miss McQuarrie to Uanvohr in such an unexpected manner dwelt in his mind to the exclusion of everything else. It puzzled him. He could not make it out. It was evident that the return was intentional, and that something extraordinary had occurred. Finding no solution in his own thoughts, he turned to his guide.

"Did Mr. McQuarrie——"

"Speak low, Mr. Henry, speak low."

"Yes, yes. Did Mr. McQuarrie tell you why Miss Oona—the Misses McQuarrie, I mean—were coming home so unexpectedly? Did he throw out no hint? Do you know, or can you guess, why they are coming home?"

"He only told me, Mr. Henry, that they were coming home by the first steamer; and I told you because I thought you would like to hear."

"Did he know that you were coming across to Marsco this evening?"

"Of course he knew, because I told him I was coming."

"And do you think he told you that you might tell me?"

"Ah, Mr. Henry, why should I know that? It's not for me to guess; you can guess better than I can."

"But, Rory——"

"Wheesh, wheesh, there's the heron."

And sure enough, skirting the shore, and coming with the tide, was the heron in its long slow lagging flight. It had been feeding higher up the coast, was on its way home to roost, but was not indisposed to secure yet another fish before retiring. As it passed, Henry could see its head turned in alert outlook, and the moon silvering its floating crest, and beautifully curved wing tips. The gleaming tide had now almost submerged the low rocks, and over one of these, at about fifty yards distance, the noble bird hung in doubtful poise for a moment, then it descended, and furling its mighty wings, broke the cold dazzle of the sea almost as darkly as the rock on which it stood. All motion had ceased, and it seemed a bird carved in stone.

"Now, Mr. Henry, now," whispered Rory.

Crack went the gun, and the stone was untenanted—but there was a silvery plash and tumult beyond it; and as the reverberation travelled along the glimmering coasts, it awoke the liquid pipings of innumerable sea-birds. Rory was on his feet in an instant, "You've shot him, Mr. Henry, you've shot him! A splendid shot!" And he clambered over the rocks, and dashed into the water like a water-dog, whence in a few moments he emerged trailing the dead wet heron after him by the legs.

"Oh, Mr. Henry, ye've made a pretty shot. I never saw a prettier! Ye've hit her just under the wing. It's you that has the steady hand and the quick eye," continued Rory, as he laid the dead bird down on the rock at the feet of his master. "I never saw a heron shot so prettily before, and I have seen many trying it. There's nobody could do it but yourself, Mr. Henry—and by moonlight, too!"

Henry looked at his prey for a few moments with a slight touch of compunction. "What call had I to do this?" he thought to himself. "I have extinguished a life because time hung heavily on my hands—a life that, so far as I can see, was quite as useful as my own—and have broken the first sleep of a hundred sea-birds besides. I took the poor thing at a disadvantage too, while it was quietly looking after its supper. Well, well, I have saved a fish, perhaps, for the dinner of a cotter's children to-morrow. Death overtook it while meditating death; and there is a sprat the more wagging his tail in the sea-silver, through my interposition. Take it up, Rory, and let us go home," said he aloud; "the evening is getting cold, and you are wet to the waist." And so saying, the young man shouldered his gun, and began to march homeward at a great pace.

Rory seized the bird and followed. When he came up, Henry said, "You must be very cold, I fear."

"Hoots no, sir. I would wade far deeper any time of the night for you, Mr. Henry."

"I am much obliged, I'm sure."

"Oh, Mr. Henry, but you're a splendid shot," proceeded Rory in his most ingratiating tones as he came alongside, "you're the best I ever saw. When you lay your finger on the trigger it's death to beast and bird. Of all the gentlemen shooters I see coming about the country, you're by far the best. It was a grand shot you——"

"Hold your tongue, you unconscionable liar and flatterer," cried Henry, half angry, half laughing. "You know as well as I that shooting a heron sitting quietly on a stone is no greater feat than shooting a squatting rabbit. Don't I know that if I were leaving the island to-morrow, you would flatter my successor, whoever he might be, just as you flatter me?"

At this unexpected rebuff, Rory was stricken dumb; and as they had now left the shore and were entering on the undulating ground covered with birchwood, there was no further opportunity for conversation, and so Rory, much to his disrelish, was forced to keep his admiration of his master's prowess to himself and to trudge silently at his master's heel.

When they reached the lighted porch at Marsco, Henry entered and threw down his gun, Rory remaining outside.

"Take the heron round to the kitchen, Rory."

"Yes, Mr. Henry," said Rory, in a penitential tone.

"And, Rory," said Henry, as he disengaged himself from his shot-belt.

"Yes, sir," and Rory came back a pace.

"At what time, do you know, does the steamer from the south arrive—the steamer you spoke about?"

"Miss Oona should land at——"

"Who asked you about Miss McQuarrie? How dare you mention her name? Don't do it again."

"Very well, Mr. Henry," said Rory apologetically, and beginning his retreat to the kitchen, much marvelling at his master's crossness of temper.

But Henry stepped out into the moonlight. "At what hour is she to arrive?"

"Miss Oona or the steamer, Mr. Henry?"

"Oh, confound you, either, both—I suppose they will come together," and Henry, despite his vexation, could not help laughing.

"At two o'clock to-morrow, sir, Mr. McQuarrie is to drive over in his dog-cart to meet them and to bring them home."

"Oh, he is, is he?" said Henry, thoughtfully; "and, Rory——"

"Yes, Mr. Henry."

"Go to Jones, and tell him to give you something to warm you; I'm sure you must be very cold."

"I'll do that, Mr. Henry," said Rory, briskly, while he ducked, took off his bonnet, and alertly disappeared.

When Henry Willoughby entered the library, in which a fire was burning, *Samson Agonistes* lay on the table where he had flung it impatiently a couple of hours before, but its perusal that night he did not resume. He threw himself in an easy chair, and sat there silently—the firelight playing the while on his face and light curling locks—revolving Rory's unexpected communication. "These girls are not coming home for nothing," he thought to himself. "I wonder what can have happened. Can I have anything to do with their coming home? Who knows? If that fellow, Rory, were not such a thundering flatterer and liar, I should almost suppose that Mr. McQuarrie was not unwilling that I should know of the circumstance. What if I ride across to-morrow and see them land? What! I don't see why I shouldn't." Here Henry, flushing all over with the idea, got up and marched backwards and forwards through the fire-lighted apartment. "I'll do it," said the young man to himself resolutely, after a pause. "The apple will not fall unless the tree be shaken. A girl worth winning is worth running some risk for. I believe Oona loves me, for all that has come and gone; and the misunderstanding, if it did not involve consequences so serious, would be all too absurd." The pacing up and down was here continued silently for a little. "What an ass I was not to have made a clean breast of it when at Uanvohr! It would have been the easiest thing to have explained that I did not go to Narrowkyle of my own accord, but only to look after that poor dear Merleton, and got into a squabble with those drover fellows on his account. Easy enough, but for my diabolical pride. Unjustly accused, as I conceived, I was idiot enough to stand on my dignity and to disdain explanation or defence. All that may be righted to-morrow." Another long pause, during which there was no cessation in the walking up and down. "How the darling looked that day in her father's room. How swift, imperious. All the affronted woman up in arms of sorrow and anger—proud as a wronged queen. But yet she might have trusted me more. Having secured her love, how could she fancy I was the base Judean to throw that pearl away! And yet I never loved and admired her half so much as then. In her presence no man could be guilty of a meanness, or do a cowardly act, or tell a lie. Merely to look into her face is to add a cubit to the moral stature of a hind—then all poetry becomes possible, and heroism the most ordinary method of acting. To think of that high heart beating for me—of that proud neck bent in submission, those eyes filled with the dews of meek surrender?"

But why go on with a lover's fond extravagances! What a beautiful world lovers live in. The passion draws everything into its service, and ennobles it, just as Marie Theresa knighted the entire Hungarian army that fought under her banner. Then is rascality eliminated from human nature, and all men are brave because they are capable of the divine madness; then are all women good and beautiful because they are the loved one's sisters. There is no such charitable personage as your lover—he clothes a whole out-at-elbows world in goodly qualities and noble vestures. I admire Miss Oona McQuarrie myself, but Mr. Henry Willoughby, at least as he walked up and down in his library on that March evening, would very possibly have considered my admiration shamefully chilly and burdened with limitations.

When the young man had wearied himself with pacing up and down, and had come to an end of his rapturous ejaculations, he rang the bell. "James," he said, when the servant appeared, "I am going to ride to-morrow. I'll start by 11 o'clock. You will have my mare ready by that time—and, James, I wish my boat to be waiting for me at Ardoch Inn, a couple of miles this side of Uanvohr, you know, to-morrow evening about five. I'll leave the mare at the Inn, and one of the boys can go across for her on the following day." As he went up-stairs to bed, he said to himself, "I'll ride all the way with them if the coast is clear, and will surely have an opportunity of making up matters, or of putting matters in a proper train for a making up."

Mr. McQuarrie had driven across from Uanvohr to the fishing village at which the steamer touched, he had taken the horse out of the dog-cart and sent it round to the stable of the Inn, he had transacted business in the Merchant's shop, and he was now standing whip in hand watching a man in his shirt sleeves posted on a little eminence, who was making desperate signals with his arms. All of a sudden the man came running down, and as he approached he called out, "The steamer is just gone into Eig, Mr. McQuarrie, an' will be here in an hour. It's a beautiful day for Miss Oona and Miss Maggie, Mr. McQuarrie."

"Thank you, Donald," said the old gentleman.

At the sound of hoofs, Mr. McQuarrie turned round, and beheld Henry Willoughby pulling up in front of the Merchant's shop. The rider dismounted hastily, threw the bridle to one of the bare-headed urchins standing at the door, and came forward.

"Bless me, Henry Willoughby, who should have expected to see you here! You are quite well, I hope?" said Hector, as he shook the young man's hand cordially.

"My fellow, Rory, told me that your daughters were to arrive to-day, and I thought I should ride across to see them."

"Yes!"

"I am anxious"—here the young fellow coloured slightly, and felt some difficulty in proceeding—"I wish very much to see Miss Oona again, Mr. McQuarrie. She has been away, and has had time to think over matters, and I am in hopes that she may be induced to reconsider her determination."

"Come this way, Henry," and the old gentleman slipped his arm into Henry's; "we are within ear-shot, and there have been too many tongues in the matter already. Well?" he continued, in a tone of interrogation, when they got a little bit away from the houses and the keen ears of the listening urchins.

Henry again stated the motive which had induced him to ride across that day.

"You have done quite right," said Hector, "and some fifty years ago I should have done the same, had I been circumstanced as you are. Now, Henry, let us perfectly understand one another. I had a good opinion of you before, and I have a good opinion of you still. I don't care, man, although you had been fighting at fifty fairs and had knocked down a hundred drovers, I should be the last man to throw a stone at you on that account. I mind at Falkirk once"—here the old gentleman began to chuckle over the reminiscence of his former prowess.

"But," said Henry, "I have never yet explained how I went to Narrowkyle, and how I became involved in the quarrel."

"Well, well, that's Oona's business. Explain it to her. She has got to marry you; I have not. It was at Falkirk, in the year 18—, a grand market that and splendid prices for stirks, and at the end of the day a battle royal took place between the Highlanders and Lowlanders. Trotternish and I were standing looking on, when a wild creature from the Braes drew a knife and began flourishing it about. *That* of course couldn't be permitted, so we went in on the rascals with the butt-ends of our riding whips. Talk of felling drovers! We soon put a stop to that quarrel. A gentleman should never be ready with a blow, but he should always be able to give one at the proper time. Ay, it's an old story that, Henry. The grass has been green over Trotternish's grave for twenty years now, and his head was as white as mine when they laid it in the coffin. But what was I speaking about when I began the story?"

"You were saying I should explain——"

"Ah yes, yes, I remember. The whole thing lies in a nutshell. It's rumoured in the country that you were slightly wild, reckless, unsettled, you know; you were engaged to Oona on the condition of your good behaviour. And then the next news that came was your appearance in the booth at Narrowkyle and your *mêlée* there. I don't think much of that:—you can't expect me to look on such matters with a young girl's eyes. But when the story came, Oona's pride was hurt; she conceived you regarded her affection as a thing of little moment, and so she would have died rather than have married you. And from her point of view the girl was perfectly right. I don't say it was *my* point of view, but then I am not to marry you, as I said before. Girls are skittish creatures, Mr. Henry. They are like wild colts on the hill-side, you come with fair words and a bag of oats, and are just about to slip the bridle over their necks, when they are off and whinnying at you from a mile's distance. I found out all that in my own love-making time—to which I can look back as to a wonderful summer I spent long ago."

"But the affair at Narrowkyle has been much exaggerated. I can explain the whole thing; and should have explained it at our last interview, but that I thought Miss Oona jumped too hurriedly to her conclusions, and some motive of foolish pride kept me silent."

"You were like two nuts in a fire at Hallowmass eve, burning away briskly for a while, till, puff!—you are off in different directions. You were a couple of fools—that is to say, you were both in love. But, Henry, you must deal with Oona, not with me. You must see Oona herself. I shall be very glad if the matter can be properly arranged, for I always liked you, Henry, you know. But it is entirely Oona's business, and it is for her to decide."

"Do you think, Mr. McQuarrie, that time and consideration may have reduced Miss Oona's anger? I trust——"

"Fie, fie, Mr. Henry. I am speaking to you as your friend, not as Oona's father. You would not have me tell tales out of school?"

"Oh, I beg your pardon! I didn't mean——"

"Don't blush, man. The foolishest speech may be excused to a lover. It's all right. I was only joking. How should I know? Oona has been living with a wonderful old sister of mine, down in Hawkhead, and *she* may have had some influence. Besides——" he was on the eve of mentioning that Miss Oona had been fighting for the good name of a certain Mr. Henry Willoughby at Cuchullin Lodge, and had left the house in consequence of the aspersions thrown thereupon, but on second thoughts he resolved on keeping that interesting bit of information to himself.

As they walked backwards and forwards, Hector asked after a little pause, "Do you go back straight to Marsco, Henry?"

"No. I have ordered my boat to wait me this evening at Ardoch Inn, and if you'll permit I'll ride as far as Uanvohr."

"All right. The girls will have some one to talk to on the way, and give them the news of the country. Nothing ever happens at Uanvohr, you know. But I had better get the horse put in, for the boat is going out yonder to meet the steamer."

Hector bustled about in the Merchant's shop for a while, had certain parcels stowed away in the body of the vehicle, and got the horse harnessed. By that time the steamer had slid into the bay, and when the two had walked slowly down to the landing-place the steamer was gone, the boat approaching, and Henry with a heightened pulse descried two female figures seated in the stern.

The two gentlemen were standing on the rock as the boat came on. "Oh, Oona," whispered Maggie, all in a flutter, "there's papa and Mr. Willoughby waiting for us. What can have brought Mr. Willoughby, Oona?"

Over Miss Oona's face a happy flush followed the words, as music follows a touched piano key. "Hush, Maggie; how can I know?"—and the next moment the boat bumped on the rocks, which threw the girls into an opportune confusion, and gave Oona time to become mistress of herself.

Maggie stept out first and kissed her father, and shook hands with his companion; Oona followed, she touched her father's cheek with her lips and then turned with a frank word and smile to Henry.

"I heard only last night that you were coming home, and rode across to see you arrive."

"It was very kind of you, Mr. Willoughby. I am sure we are very much obliged."

"Now then, dears," cried the old gentleman; "hurry, hurry. We have a long way to drive. Come along, come along. Mr. Willoughby will look after your wraps and things."

Henry jumped into the boat, and began to collect shawls, bags, and miscellaneous items of feminine luggage. When he had completed his task Hector had reached the door of the Merchant's shop, and was assisting his daughters into the back seat of the dog-cart. The young man came up in great bustle, and when he spread a shawl over the knees of the young ladies and tucked it carefully around their feet, he was rewarded by Miss Oona with the brightest of smiles and the most silvery words of thanks.

The McQuarries' boy had jumped up beside his master. "All right, now?" asked the old gentleman, seizing the reins and turning half round. "That'll do: *chir*, Maggie, *chir!*" and away in front of the Inn went the dog-cart, and after it came Henry on his mare.

Henry had enjoyed many a pleasant ride, but never one so pleasant as on that afternoon. When they were half way across, the early spring sunset began to dress the road in rose, and to turn every pool into a sheet of gold leaf. The air had grown chill, too, and the girls had drawn a shawl over their hats, and out of that covering the rosy faces with the rosy light on them peeped on Henry as he rode behind—a pleasant sight to see. Nor was there lack of talk and merriment as they went; Maggie was the principal speaker, and Henry joked her about Hawkhead, her dancing parties, her conquests, and inquired specially about that remarkable cousin, Mr. John Hagart, of whom he had occasionally heard; and at every sally and inquiry Maggie's laughter rang in the coloured air like a silver bell. Oona chatted frankly enough also; but when the party reached the head of the road and began to descend the long glen which led to Uanvohr, and when the giant bulk of Marsco became visible, with its ravines and torrent lines, she became strangely silent, and over that silence Henry, as is the manner of foolish lovers, pondered, and drew sweet and bitter conclusions.

In a short time the dog-cart drew up at the point where the roads divided, the one leading to Uanvohr, the other to Ardoch Inn. Henry had taken off his hat to the ladies, and was preparing to bid them adieu, when Oona suddenly exclaimed—

"Papa, had not Mr. Willoughby better stay at Uanvohr to-night? It's a long way to Marsco, and it will be dark before he can ride there."

"But he is not going to ride to Marsco, my dear. His boat has been waiting him for an hour at Ardoch Inn down there."

"But you will remain, Mr. Willoughby, to-night? I have a great deal to say to you to-morrow, and it is better to have it said at once."

"Certainly, if you wish it, Miss McQuarrie."

"Well, then, have you arranged?" cried the old gentleman. "Does Mr. Willoughby stay at Uanvohr, or go on to Ardoch?"

"He stays at Uanvohr, papa."

"Very well; go on, Maggie."

And so Henry found himself that night a guest at Uanvohr.

CHAPTER XXVIII.

During the night the weather changed. When the dwellers at Uanvohr met at the breakfast-table, a dim wall of mist obscured the line of splintered peaks on the opposite side of the bay; and between that wall of mist, and the shore immediately below the northern window, there rolled a dark grey windy sea flecked with patches of foam. The view from the westward-looking window of the same apartment was not a whit more inspiriting. Great plashes of rain came against the panes at intervals, and as Henry looked out while chipping his egg, thin veils of vapoury spume were drifting along the green hill-sides, the gaunt trees near the house were swaying to and fro, and in the direction of the barns a female domestic was seen scurrying for a moment, with her gown drawn over her head. The atmosphere affected the spirits of our friends. Oona was singularly grave, silent, and preoccupied; Mr. McQuarrie drank an inordinate number of cups of tea, and grumbled at the weather all the while; and Henry and Maggie made a rather dismal attempt at cheerful conversation. After breakfast was over, the girls retired, Mr. McQuarrie lay down on the sofa, and while engaged in the perusal of a three-days-old newspaper, very sensibly fell asleep; and Henry went to the rain-blurred window, and looked out on the grey sea beruffed with foam, and the wall of mist beyond, and attempted to amuse himself watching the wheeling flight of the uncomfortable-looking sea-birds. But he could not be amused, he had nothing to do, nothing to read, no one to speak to. Then Mr. McQuarrie on the sofa, sinking into profounder slumber, began to snore audibly. The stertorous sound brought out in the keenest relief the dismalness of the day. Happily at this juncture Henry heard the notes of a piano, and going across the passage into the drawing-room, he found Miss Maggie seated at the ancient and somewhat metallic-toned instrument; and so in lack of more congenial occupation, he employed himself in turning over the music sheets for her.

He had not been so employed for long, when a step was heard in the passage, and then at the door of the room, which was standing ajar, Oona appeared in her walking dress, gloved and booted, wearing a long oilskin cape, and a Glengarry bonnet with a sprig of dried heather stuck in the silver badge at the side, and with an umbrella in her hand.

"Goodness gracious me!" cried Maggie, pausing in her task. "You surely don't mean to say that you are going out to walk, Oona; you are certain to be either washed away or blown away;" and out came the burst of sunny laughter, brightening the dim room almost, which John Hagart so much loved to hear.

"Just for a little bit, Maggie. And Mr. Willoughby will be kind enough to accompany me, perhaps."

You may be sure that Mr. Willoughby procured his hat and was at her side in a moment.

It certainly was not a day in which ordinarily constituted young persons would have chosen to have gone abroad, but perhaps it had its advantages notwithstanding. If it rained it gave Henry the opportunity of sheltering Oona with the umbrella. The wind was strong, but it loosened a reckless ringlet or two from beneath the Glengarry bonnet, and when it blew so violently as almost to impede progress it induced Oona to accept the aid of Henry's arm—all of which were pleasant things in their way.

"What a shocking day it is, to be sure," said Henry, as a gust came down on the pair nearly turning the umbrella inside out.

"Perhaps you would rather go in, Mr. Willoughby? you are certain to get wet," said Oona, coming to a full stop.

"Go in! not a bit. I like wind and rain, I assure you. I think this is extremely pleasant," said the illogical and slightly incoherent young man. "Besides," he continued, returning to comparative common sense, "when we get into shelter of the rising grounds yonder, we shall be in a comparative lull."

So they walked on and reached the shelter of the rising grounds, where there *was* a comparative lull. All this while Oona had something very important to say, but could not bring herself to begin. At last, like a bather on a brink, who ends timidity and reluctance by taking a bold header, she plunged into *medias res* at once.

"Mr. Willoughby, I have brought you here to ask your pardon very humbly."

"My pardon, Miss McQuarrie!"

"Yes. I have been debating the matter in my own mind all the morning, and have resolved at last on taking this step. It had to be done, and I thought it best to have it done quickly. I have acted wrongly; and when one so acts it seems to me the best way always to make the wrong right in the frankest and directest way. I thought I was doing my duty when—when we parted at Uanvohr, but I find now I was misled by the light of a false pride. I have schooled myself to make this confession, Mr. Willoughby, and I have made it. Will you forgive me?"

Here Henry performed, in the circumstances, the somewhat difficult feat of holding the umbrella against the wind with his left hand, and of getting possession of the hand of Miss Oona with his right.

"I don't think I have anything to forgive, and if I had, forgiveness would have been yours all along. You know that, Oona. Let it all be forgotten, and let matters between you and me come back to their former position."

But Oona was resolved to sit down in sackcloth and ashes before him. "I have acted hastily, wrongly, ungenerously, Henry. I thought only of myself. I believed my anger justice. I would run no risk, I would take everything and give nothing. You must feel that I have been selfish, and you must forgive me, Henry. I shall not be happy unless you do so."

The right hand held the umbrella now, and the left was round the oilskin cape. "You have my forgiveness, then," said he, drawing her towards him, and looking down on her face with a fond smile. "My forgiveness, dearest, fully, unreservedly: my forgiveness for ever and ever. Don't speak about it any more. Are you happy now, Oona?"

"Oh so happy, Henry, so happy."

Lovers should have a quarrel now and again for the mere pleasure of making it up. Our lovers were enjoying the full sweetness of a dissolved estrangement. Never in the world before did rain bespatter, or wind tash and dishevel, a happier pair than they did at that moment.

After they had gone on a little way, Henry said, "The time has now come when I must make a little explanation. If it had been made before it might have saved pain, and for the delay it is my turn to crave forgiveness, and forgiveness I need much more at your hands than ever you did at mine. You were hurt, Oona, that, in the view of my antecedents and of the relationship in which I stood to you, I should have been seen in the Narrowkyle booths at all, were you not?"

"There was the pang, Henry, there was the pang."

"But the pang has gone now, darling?"

"All gone;" and Oona smiled trustfully up at him; "the wound has healed and left not a scar."

"Then I did not go to Narrowkyle on my own account. An old University friend of mine, who has been sent down here out of the sight of his friends, was staying with me at the time. I had to keep a sharp eye and a tight hand on him. Somehow or another he had heard of the market and had gone across early in the morning. I knew what the consequences would be, and drove to Narrowkyle at once. When I got there I found poor Frank in a condition in which I trust he will never be seen by his mother or his sisters. It would break their hearts. He was surrounded by a lot of hulking fellows who were making his humiliation a subject of brutal laughter, and it was to save him from insult that the quarrel arose of which you have heard so much."

"Oh, Henry, why didn't you tell me this before?—it would have saved all."

"Because, darling, I thought you pulled me up too hard, that you did not sufficiently trust me, that you rushed too impetuously to an unfavourable conclusion."

"I knew it, I knew it. You felt all the while that I was wilful, hasty, selfish, ungenerous," cried Miss Oona, as she donned her robes of sackcloth and ashes once more. "You felt it although you would not say it, Henry, and yet you have borne with me all this time. Oh, Henry, you may forgive me, but I never shall be able to forgive myself."

"But you mustn't speak in that way," and the arm was again round the oilskin cape, and the wearer of the said cape was again drawn close. "I should have told you the whole affair frankly at the time. A foolish feeling of pride prevented me—no more noble motive, I fear. You have much more to forgive than I have, darling. Will you forgive me?" And as he spoke he came to a full stop, and glanced down at the wind-blown locks and the Glengarry bonnet which was laid against his breast.

"Yes, Henry."

"And yourself—for I won't have a one-sided forgiveness."

"Ye—yes, Henry."

While the young people were thus running races and outstripping each other in generosity, and sweetly forgiving each other in the rain, Hector McQuarrie awoke on the sofa. He got up and went to the window and saw the rocking trees, and the pale spume of rain drifting along the hill-sides. The day was quite as unpromising as when he fell asleep. He wondered what had become of his guest, and hearing the notes of Miss Maggie's piano, he went to the drawing-room to seek Henry. "What has become of Henry Willoughby?" he asked, when he found his daughter alone.

"He has gone out with Oona, papa."

"Gone out with Oona! What are the two fools doing out on a day like this?"

"I don't know, papa. Oona said she was going out, and asked Henry to go with her."

"Humph!" said the old gentleman, as he turned on his heel, and went back to the dining-room.

When he got again into the light, a droll smile was playing on his weather-beaten visage. "Love keeps out the rain better than a waterproof," he muttered to himself. "I never yet heard of a lover catching cold. Love prevents any evil effect arising from damp feet—it's a capital thing in a climate like this. It's very cold," he continued, shivering internally; and then he went to a sideboard which stood in one corner of the room, took out a glass and a spirit-case in which herbs were swimming, filled the glass three-quarters full, quaffed it, put back the glass and the spirit-case again, went to the sofa, dallied with the three-days-old newspaper, and in ten minutes was as soundly asleep as he had been previously.

CHAPTER XXIX.

One night in the bitter spring weather the curtains were drawn in Mortimer Street, and Miss Kate McQuarrie, with a warm fleecy shawl wrapped around her shoulders, half sat, half reclined in an easy chair before the fire. The truth was, the indomitable old lady, for the first time in her life almost, had become invalided. She had caught cold one Sunday on the way home from church—indeed, the very storm which chilled Miss Kate was the one that, on its way northwards, enveloped our lovers at Uanvohr—and had been for a week or ten days, now, strangely out of sorts. Being unused to illness she did not take it well—she was hasty, querulous, and impatient. "Ugh, ugh," she said as, recovering from a paroxysm of coughing, she drew the fleecy shawl closer around her, "this can't last long. Asthma has got its finger and thumb on my windpipe at last. I am bankrupt in breath, and must live on a halfpenny worth a day. I suppose I mustn't grumble. If wanted elsewhere, I really wish another messenger than this wheezy one had been sent to lodge the citation. Ugh, ugh,—when on earth will that boy come home? Ever since Mr. Crook became paralysed they are working him like a slave. I wish he would come home. I'm fairly blown, and I suppose I am near the end of my race. It's been a long and a weary one, but there's a long rest for all—a long rest." And here the old lady drew the shawl yet more closely around her shoulders, and stared intently into the fire.

In a few minutes Ann opened the door, with a letter, and Miss Kate, half turning round, stretched out her hand for it.

"It's for Mr. John," said Ann, hesitating for a moment.

"Did I say it wasn't for Mr. John?" cried the old lady testily. "Do you think I am going to eat Mr. John's letter? Give it to me here."

Ann delivered the letter and retired abruptly—in dread of a second volley.

Miss Kate turned again to the fire, and examining the epistle discovered thereupon the Hebridean postmark. "What a correspondent that girl is, to be sure," she muttered, still playing with it. "She writes like a public office or a board of clerks. I wonder if her letters laugh. John and she are a pair of extremely loving cousins indeed. But I must keep it for the poor boy; it will be a lump of sugar in the tea-cup of his life." Here she got up and placed it carefully on the mantelpiece. "Ugh, ugh," she said, as she sat down, "that finger and thumb again!" She leaned back in the cushioned chair, still staring in the fire. "Uanvohr! I wonder how brother Hector is holding out? We have not met for years and years, and I think I should like to see him once again. I wish that boy would come."

Miss Kate had not to wish long, for almost as soon as she had given utterance to the words John Hagart entered the apartment.

"You are late, John."

"Yes. I had a lot of work at the office, and have only got through with it. I hope you feel better this evening, aunt."

"Not much. I am a beggar in breath; you can whistle away in an hour what would serve me for a week. But never mind me—there's a letter for you on the mantelpiece, John. I suppose you know from whom."

John did know, although he made no reply. In fact he knew the letter would be waiting him, and he struck work at the office half an hour earlier in consequence.

"May I read it, aunt?" he asked, as he lifted the letter from the mantelpiece and took his seat at the table beneath the light.

"Of course, read it, you foolish fellow; why hain your golden apples for me?"

The letter was from Miss Maggie, and John read it with eager eyes.

"UANVOHR, *April* 18—.

"MY DEAR JOHN,—I wish to-day I had a gold pen to write with, and perfumed ink to dip it in, and pink paper to write on, and white wax to close it with, and a seal with the motto, *Love conquers all things*, to seal it with! Do you know that Oona and Mr. Willoughby have made it all up? Oona took the initiative, came forward frankly with an open hand, and confessed that in breaking the engagement a month or two ago she had acted wrongly and hastily. Wasn't it noble in her? I suspect that a conversation she had on the matter with dear Auntie, and the fight at Cuchullin Lodge, helped much to bring it all about. The wedding is to take place in summer, and I am to be the chief bridesmaid. Oona is to wear a white *moire antique*, and I pink tarletan, with ruches and sprigs of heather. But I need not tell you about these things, as I suppose you are so frightfully ignorant that you don't know what a *moire antique* is, or what ruches are.

"Mr. Willoughby has explained to Oona why he went to Narrowkyle, and his explanation is perfectly satisfactory. He went to save a friend, and it was in defence of his friend that he became involved in the brawl. You see the evil idle tongues do. It was painful to Oona at the time, but *all's well that ends well.*

"And now you must excuse this hurried epistle. I am much engaged to-day. Papa won't be home till evening, and Oona and Mr. Willoughby have gone to visit a waterfall, and, of course, all duties fall to me.

"Believe me ever,
"Your affectionate Cousin.

"P.S.—The wedding is to take place in summer, and you are to be here in summer—could not both those great events happen simultaneously? I should like it so much. Try!"

"Here's such news, aunt," cried John, when he had finished his letter. "Oona and Mr. Willoughby are friends again; the marriage is to go on after all, and Maggie is to be chief bridesmaid, she says."

"I am very glad to hear it, John; and how did the reconciliation come about?"

"It seems that Mr. Willoughby is staying at Uanvohr, and while there Oona told him she had acted hastily in breaking off the engagement—and so it's all right now. The wedding is to take place in summer, and Maggie wishes me to come up to Uanvohr then. What do you think? I have often wished to look up all my friends in the north."

"And then we shall have another marriage, I suppose. When birds pair in spring-time the period of nest-building is not far off. You needn't look so foolish, John. Don't you think I have a pair of eyes in my head? Don't you think I can notice what is going on under my nose?"

John, with a very red face, laughed uneasily. "Nonsense, aunt," he said.

"And so the wedding is to take place in the summer!" the old lady went on, taking no notice of the young man's exclamation. "There will be changes before then. I am very glad of it, however. I always liked Oona much better than I liked Maggie, although, I dare say, you are of a different opinion." And here Miss Kate fell into a sort of a muse, and again stared intently into the fire.

John Hagart was silent. He thought at the moment that silence was his best policy.

"John," Miss Kate said, after two or three minutes' pause, "I wish you would write Oona in my name, telling her how highly I approve of her conduct, and with how much sincerity I wish her every happiness. I would write to her myself to-night were I able. You'll do it for me. Just put my wishes in your own words. Will you, John?"

John said he would have very great pleasure, and he brought over his writing-desk from a side-table.

"And while you are writing, John, I think I shall have a little snooze. I feel very tired and weak to-night, and you will be as well pleased to be undisturbed. Just bring my footstool a little nearer. Thank you. Don't let me sleep too long. That'll do. The shawl is very nice. Thank you again, John; you are very good."

And so Miss Kate, with her shawl carefully wrapped round her shoulders, sank back into the warmth and softness of her easy chair and closed her eyes. John watched her, and did not begin his letter till he knew she was asleep by the position of her hands and the sound of her breathing. He then wrote to Miss Oona as directed. The letter was not long, and was soon sealed and addressed. As it was too early to wake his aunt, who was sleeping comfortably, it struck him that he could not employ his half-hour better than by writing to Maggie. So he got hold of another sheet of paper, and while his pen was swiftly travelling down the second page, he heard his Aunt suddenly call out, "Yes. Coming!"

John looked up on the instant, and there was Aunt Kate sitting bolt upright in her chair, and looking towards him, her shawl fallen off her shoulders, her hands trembling, and an alarmed look in her eyes.

"Who called my name, John? Was it you? Did you hear anything?"

"No one called you, aunt. I have not spoken since you went to sleep; no one has been here."

"But I heard my name called distinctly. The sound is ringing in my ears yet," said Aunt Kate, slowly becoming mistress of her hands, and the light of alarm dying out of her eyes as she became conscious of surrounding objects. "I was called by name as if from a great distance, and the voice was a voice I know, or have known. What can it have been?"

"You have been dreaming, perhaps," said John, "and only fancied it."

Miss Kate had again lain back in the cushioned chair, and instead of the look of alarm which had been there a moment or two before was the strangest smile on her face which John had ever seen. An inscrutable smile of infinite content which lay like a light; and in the light the plaits and creases of care, the lurking lines of worldly wisdom and shrewd humour, the furrows of sorrow and the dried up courses of ancient tears were smoothed out, and in their places had come an almost infantile repose, a wonderful youthfulness, which were beautiful to see, but which scared John by their irrelevancy and inappositeness. The eyes were closed, but on the face lay that gleam of alien beauty.

"I knew your voice, Richard, across the wastes of seventy years," she said to herself, yet distinct enough for John to catch. "Lonely have you been there; lonely have I been here. I am coming, Richard." And she passed her hands across her face, shutting out the strange expression, and then in a little while, John, who was looking on awe-stricken, saw the tears trickling down between the withered fingers.

But this emotion on the part of Aunt Kate was but of short duration, and when she removed her hands, but for a certain unusual tranquillity, her face had regained the ordinary look.

"Have you written the letter to Uanvohr?" she asked.

"Yes," said John.

"That's right. Be sure and post it to-morrow. I'll wear my grave-clothes, John, before Oona wears her wedding dress."

"Don't say that, aunt," cried John, who came to her side. "Don't let a dream frighten you so. You are very nervous, and a good night's sleep will put you right."

"You don't know the finger and thumb I feel on my windpipe, John—and then I believe in dreams and omens. But there's no use in talking of these things at present. I have a great deal to do, and but little time to do it in. You can go to Uanvohr in summer if you like, John—it's perhaps the best thing you could do. And now, John, you will go to Dr. Watkins to-morrow and tell him to come here. He can do nothing for me, but his presence will satisfy you and my other friends, and save all reproaches. You needn't go to-night, to-morrow morning will do quite well. And, John, I should like you to write to your mother at once, and tell her I wish her here. Write the letter, and make it as little alarming as possible. Just say I am rather unwell, and that I wish to see her. Now I think that's all I have to say to-night. Ring the bell for Ann, and she will assist me to my room. You'll be sure and write to Greysley before you go to bed, and have it posted early. Good night, John, good night." And by the time that the old lady had played for a moment with John Hagart's brown hair and kissed him on the forehead, Ann was in the room.

John, when his aunt had gone, strove to make himself believe that the voice was merely a nervous delusion, and that when once the bitter spring winds were over, the invalid would be well again; but before he went to bed he wrote to his mother, summoning her to Miss Kate's bedside. Next morning, after hearing that his aunt had spent a rather restless night, he went to the office, calling on Dr. Watkins and posting his letter on the way. The Doctor was to go to Mortimer Street at once, and John was to call on his way home to hear his report.

John called on Dr. Watkins in the afternoon on his way home, and was shown into the library. The Doctor came in almost instantly.

"How did you find my aunt?" John inquired anxiously.

"She is very weak," said the Doctor, "very weak indeed."

"But is her illness dangerous?"

"Well, for a young and strong person it would not be dangerous. But, Mr. Hagart, you must remember your aunt is very old, and that the rope is so frayed and worn that it cannot endure much strain now."

"Do you think she will die, Doctor?" asked the young man with a sort of gulp.

"To tell you the truth," said the Doctor, "I expect she will run down some morning like a watch —will stop from sheer exhaustion. But we will do everything we can do for her, you may depend upon that. She has had a wonderful constitution, you know, and that may hold out for yet a little."

John did not ask any more questions; he was anxious to see how matters stood, and so he went home carrying a heart with him which was heavy as lead.

When John came home Miss Kate had fallen asleep, Ann told him, and that during the day she had inquired several times if her sister had yet arrived, although each time she had remembered that Mrs. Hagart, even if she had started on the receipt of the message, could not possibly be at Mortimer Street before the evening. She had been restless all the day, but she was now sleeping peacefully. And so the young man after dinner—he felt that day how dreary a thing it was to dine alone—sat down to finish his letter to Maggie, the conclusion of which contrasted strangely with the gaiety of the opening sentences.

While John was writing, his mother was driving rapidly in a hackney-coach from Greysley to Hawkhead. The good lady was in a state of sad perturbation. She knew perfectly well that Miss Kate would not send for her unless she was sore bestead, and she was prepared to expect the worst on arrival. She loved her sister sincerely, and was grieved that illness had overtaken her; but with the natural sorrow there was mingled a certain feeling of bewilderment. She had known hardships and misfortune herself, she had wept over a dead face, sorrow and she had been year-long companions, and a personal catastrophe would have seemed the most ordinary thing in the world. But that anything should go wrong with Miss Kate, with whom she had associated every idea of stable prosperity, of invariable success, seemed to her wonderful, unaccountable; something like a suspension of the laws of nature, and the unhinging of all things.

Mrs. Hagart lay back in the carriage, while the cold April moon shone out overhead, and the shadowy trees, like the dark plumes of funeral hearses, flitted rapidly past on either side of the road. Her mind went back to the old times; to her father's house; to her marriage and the estrangements consequent thereupon; to Miss Kate's kindness to her children; to the one that remained; to the far dearer one taken away, and dearer *because* taken away; to the making up of the family breach;—and thinking of all this, and how the entire wrong thing had become right again, and of the duty on which she was at the time engaged, the poor lady threw herself back in a corner of the vehicle, and wept outright; and it was not till the cold stars, and the dark flitting ghosts of trees, and the silence of the country road, were exchanged for the far-radiating lines of lamps of Hawkhead, the blaze of shop windows, the continuous rattle of wheels, and the din and movements of intent crowds, that she regained comparative composure; and even then, glancing out of the window of the vehicle on the glare of light, and the bustle and pressure of passengers, she marvelled how many death-beds there were that night in the noisy, brilliant city, and how many of the dusky cases that hurried past for a moment in the shop lights bore hearts as sore as hers. "Hundreds on hundreds," she said to herself; "hundreds on hundreds could take me by the hand to-night."

Mrs. Hagart had no sooner reached Mortimer Street than John was out on her in the lobby in a moment. He gave her what information he could concerning the condition of the invalid. He carried her into the room which had been prepared for her, and she had barely laid aside her bonnet and shawl when Ann appeared at the door.

"Please ma'am," said Ann, "Miss McQuarrie is awake now. She heard the door-bell, and is anxious to know if you have arrived. Will you come this way, ma'am?"

Mrs. Hagart followed Ann at once, and when she entered the sick apartment, there was Miss Kate propped up on pillows in bed, looking gaunt and pale, her hands lying lax on the top of the bedclothes. At the step she turned half round, and a look of pleasure visited the dim eyes. "I thought it was you, Margaret. It was very kind of you to come so soon. Place the candle on the table near my bedside, Ann, and then you can leave the room. You will be called if you are wanted."

Ann did as she was directed, and left the room. "Kiss me, sister," said the old lady when they were alone; "I am going on a long journey. You have been crying, Margaret," she continued, quickly, as she caught Mrs. Hagart's face as she bent forward in the candlelight. "Is it worth crying for?"

"Don't speak in that way," said Mrs. Hagart, as she placed her arms round Miss Kate, and kissed her. "Don't speak in that way; you will break my heart if you do. You must not speak of dying, Kate."

Miss Kate lay back on her pillow for a few moments. "Do you remember the day of Katy's funeral, Margaret?"

"Ah, yes."

"Do you remember my telling you of the man I loved, and still love?"

"Yes," said Mrs. Hagart, in wonderment.

"*He* called me last night. I heard his voice calling my name as distinctly as I heard him long ago calling it from the red sunset cliffs behind the house, or from the boats in the bay, in the years when I was happy. And I knew his voice, and awoke, crying, 'Yes, I am coming;' and I'm going, Margaret; and it's best. We have been separated for years and years; he on one rueful shore, I on another; and Death, the ferryman, is coming across to take me to him. We will understand each other now. If we have both sinned in pride, we have suffered, and God has accepted the expiation. Youth has been omitted in my life, and I am going back to it. That which was sown in corruption, shall rise in incorruption, and this mortal body shall put on immortality. Before a week is out, the coffin lid will press upon my face; but I shall feel younger then,—far younger."

To all this Mrs. Hagart could only reply by caresses and tears, and after a little while Miss Kate went on.

"Don't cry, Margaret; what's the use? I have had ninety years of it, and I have no right to grumble, I am sure. Now, then, attend to me, for I have many things to say to you. I am going away, and I must set my house in order before I go. Are you paying attention, Margaret?"

"Yes, sister, yes."

"Then in the lower drawer, yonder, you will find all the things I need when it's over. I made them years ago."

"Oh, Kate, Kate, don't speak in that way."

"But I must, my dear. What do you think I brought you here for? I didn't expect to give you pleasure, you know. You must listen to me, and you must remember what I tell you also."

Here Mrs. Hagart wiped eyes that were next moment wet again, and Miss Kate went on.

"I don't wish many people to be here when they take me away. I wish my brother Hector, and my lawyer, Mr. Hook—he'll have something to do in any case when the company comes back; and John, of course, and Mr. Stavert."

Here the old lady lay still for a little while. "It'll be a fine ploy this for Stavert," she went on. "He was always a grand hand at a funeral. He's a liking for the cakes and the wine. I should almost like to say good-bye to him, for all that has come and gone between us; and Hagart, yes, you must have Hagart. Alfred Hagart has been a prosperous man of late years."

"God has been very good to us; Alfred has been very prosperous ever since he came to know you, Kate. It almost seems as if a special blessing had come with the reconciliation."

Here for a moment there was a flicker of a droll smile on Miss Kate's face. "Yes, indeed, Margaret, it almost seems so. Do you think the reconciliation had anything to do with it? But never mind that now. You can discuss the matter with Alfred when I am gone away out of earshot. Now, I have much to say to you yet. Where was I?—Oh, yes, you are to have our brother Hector, and Mr. Hook, and John, and Stavert, and Hagart, at the funeral; that will be enough, I think. I suppose you have heard from John that Oona's engagement had been broken off?"

Mrs. Hagart said she had heard of the broken engagement.

"Then it's made up again; and be sure and tell Hector when you see him that it was one of my last wishes that this marriage should not be delayed. Why should they delay it? Why should my grave lie in the way of a bride to church. Don't let my dying stop the wedding a single hour. At all events, tell Hector that I did not wish it to stop it. You will be sure and tell Hector that?"

Mrs. Hagart gave the required promise.

"And now, Margaret, John gets the house here and the furniture, and what little money I have left, barring a few legacies. He has been a great comfort through all the years he has stayed with me. And he will need it too, for I rather think that, before long, he will be presenting you with a daughter-in-law; that he will be taking a mate from the Uanvohr nest. He might do worse, Margaret. I leave you nothing, dear, save a few trinkets, which are sacred by the touching of dead fingers; you will value them, I know. Had you needed money, I should have left you some; but you don't need it now. Well, I think that is all I have to say. If you think I have forgotten anything, Margaret, I hope you will mention it, for I am tired and sleepy, and my time for sleeping or waking is but short."

During all this talk there was sore distress at the good sister's heart as she half sat, half leaned on the bedside. One topic, all-important as it seemed to her at such a moment, had been entirely overlooked by Miss Kate, and she would have introduced it before had opportunity been granted her. The opportunity, she conceived, had now come.

"You have forgotten nothing, I think, in the way of temporal matters, and I shall fulfil every one of your wishes; but oh, sister, sister, if you are to leave us, would you not like to have a clergyman to pray with you?"

Miss Kate turned her eyes quickly round on the appealing face. "I thought, Margaret, you had known me better. For this hour I have waited more than fifty years, and I was not a fool to put off preparations till it came upon me like an armed man. I have been lonely in my religion, as I have been lonely in my life. My temporal and eternal affairs I have transacted myself. Weak and frail, and scant of breath, I know that my Redeemer liveth. His right arm will sustain me and carry me. He walked along the road on which I am now entering, and took away its loneliness and terror. Not in my own merits I trust, but in His."

In a moment, Mrs. Hagart's arms were around her sister, and the tears were falling thickly on her face.

"Now, don't cry, Margaret; I don't think this dying is worth the shedding of a tear. Now, you must go to bed. Ring the bell for Ann; she will watch with me to-night."

"But you must allow me to sit up with you to-night," pled Mrs. Hagart.

"You will do nothing of the kind. In a night or two you will have to wait, and so you had better take what rest you can just now. Ring the bell for Ann, dear: it's her duty to wait on me, and she's paid for it; and then go and have some supper, and a little talk with John, and think as tenderly as you can, both of you, of the old dying woman here."

And so Mrs. Hagart rang the bell; and when she went into the room where John was sitting, she threw herself down on the sofa, and broke into a great fit of weeping.

Mrs. Hagart *had* to wait one night. Somewhat less than a week after, Ann, Mr. Hagart, who had come from Greysley, and John, were waiting in the sick room. Dr. Watkins had been at Mortimer Street several times during the day, and was just gone. Miss Kate was in a sleepy comatose condition. Ann had, in a whisper, expressed her opinion to Mrs. Hagart that a change would come with the turn of the night. A little after midnight Miss Kate said, "Margaret."

Mrs. Hagart went and leant over her.

"I think I am getting into calm water now. Who is in the room with you?"

"Only Alfred and John."

"I should like to shake hands with them and say good-bye." And at the word Mrs. Hagart motioned Alfred, who came forward to the bedside.

"Is that you, Alfred Hagart?" said Kate, when she felt his hand.

"It is me," said Alfred, huskily.

"I am glad you are here. I have been able to help you and yours, and it's a pleasant thought now. I'm going away; good-bye, good-bye. Think as kindly of me as you can when I am gone."

"John?"

"Yes, aunt."

"Our partnership is at an end now, John. Be a good man. Be a good man. You will know how precious goodness is when you come to lie on a bed like this. Is this your hand? God bless and keep you, John."

Miss Kate lay still for a little while, and then she called again, "Margaret?"

"I can't see you, Margaret. Surely the candles are very dim. Have you any message for Katy? Kiss me yet again before I go. Oh, Margaret."

And when on that spring morning sparrows began to chirp about the windows and to carry straw in their bills for nests beneath the slates and in the cosy corners of garfoyles and spouts; and the vegetable-carts to come rolling through the street carrying with them the scent of primroses; and the coffee-shops to open for the benefit of the breakfastless artizan hurrying to work; and the night policemen to disappear from every beat—in the sunny light of that spring morning Captain Kate, still and white as a mound of snow, lay in a white bed in Mortimer Street, her warfare done, her long campaign closed. Let us draw down the blind and leave the room!

CHAPTER XXX.

HECTOR MCQUARRIE arrived at Mortimer Street from Uanvohr the night before the funeral, and went into the silent room with Mrs. Hagart—with whom he felt comparatively a stranger—to have a last look at the dead. What passed between them on that occasion it is not for me to say. They remained together a long time. Mrs. Hagart related the circumstances of Miss Kate's death, as a matter of course, and delivered the message with which she was entrusted respecting Oona's marriage. When they came out Mrs. Hagart's eyes were red; Hector was grave and silent, and in a short time went off to stay with his wife's poor relation, Mrs. Wilson. Whatever Hector's thoughts might have been, he kept them strictly to himself.

Next day a hearse, dolorously plumed, with a string of mourning coaches behind it, paced slowly through Mortimer Street, drawing many a face to the window as they went. In about an hour the mourning coaches returned alone, and out of them stepped Alfred Hagart, John, Hector McQuarrie, Mr. Stavert, and Mr. Hook. The gentlemen went into the dining-room, the blinds of which were drawn up for the first time for several days, and as they took their seats the Governor of Ceylon eyed them suspiciously from the wall. They had assembled to hear Miss Kate's will read, and to this professional duty Mr. Hook solemnly addressed himself. First of all he placed a japanned box on the table, then he drew in his chair, then he opened the box ceremoniously: from the box he produced the document with its seals and signatures of witnesses, and the document he proceeded to read in a professional voice that to one or two of the auditors at least seemed harsh and grating. It is perfectly needless to quote the will at length; and its provisions created little surprise. With the exception of certain legacies to servants, arrangements relative to the disposal of trinkets to this person and the other, John Hagart was made the inheritor of the entire property of the deceased, including the house in Mortimer Street, with the furniture and plate. Mr. Hook finished reading at last, and then there was in the room a curious little sigh of relief, and Mr. Stavert ventured to hazard a remark about the weather—which remark fell to the ground like a spent arrow.

Perhaps at that especial moment Mr. Stavert felt more uncomfortable than he had ever done in his life before. He had known for long that not one penny of Miss Kate's money would he finger, but then he knew just as well that Alfred Hagart, and Mr. Hook, and perhaps Hector McQuarrie too, were aware that for long he had lived in the expectation of coming in for something handsome when the old lady died. He fancied that every one would think him disappointed. He was anxious not to look disappointed, and so he made the irrelevant remark about the weather, of which no one was thinking at the time, and which came to such conspicuous grief. Mr. Stavert had ridden in the same coach with the lawyer and found him reserved. He would have liked to have talked with Hector, whom he had never before seen, but then he remembered how his wife had treated Hector's daughters. He would have liked to have spoken to Alfred, but then it occurred to him that years ago he had certain passages with Alfred on the subject of Miss Kate—passages, the remembrance of which might be disagreeable in the circumstances. So he remained silent, contemplating his hat which lay before him on his knee. Then he drew out his watch, and muttered something about an engagement. Then he got up, bowed to Mr. Hook and Hector, shook hands with Alfred, and hoped Mrs. Hagart was well, which of course drew an inquiry—probably as sincere as the other—as to the health of Mrs. Stavert. John was standing near the door. "I have to congratulate you," he said.

"And I wish from my heart," said John, colouring a little, "that I had no cause for congratulation."

"Old people must die, you know," returned the other, "and as they can't take their money with them, it is a pleasure to see it left in good and deserving hands; your good fortune has given me much pleasure, I am sure," said Mr. Stavert, as he passed into the lobby.

After Mr. Stavert's departure the party broke up. Mr. Hook placed the will in the japanned box which he took with him. Hector was engaged to dine with Mrs. Wilson, and in the evening Mr. and Mrs. Hagart returned to Greysley, leaving John in Mortimer Street alone. He wore his good fortune in its newest gloss that night, but he could not take pride in it. A bag of ducats is an admirable thing, but when the bag is brought you by the skeleton Death, the bony fingers strike a chill and the most fine gold is dim. But only for a little; the chill dies out and the gold pieces brighten.

Next day, while John Hagart was busy at the office, one of the clerks entered with the request that he would speak with Mr. Hook in his own room.

When John entered the bureau of his chief, a leathern-covered office-chair was placed on either side of the fireplace, and between these chairs, and with his back to the fire, Mr. Hook stood, perusing certain documents through his double eye-glass. Mr. Hook's countenance was grave, professional, and John saw at a glance that important business was on hand.

"Ah," said Mr. Hook, laying down the papers and letting the double eye-glass drop, "I wish to have a little conversation with you, Mr. Hagart; but before I begin you will allow me to congratulate you on your good fortune, which I trust you will live long to enjoy. I must have the pleasure of shaking hands with you," and the professional look vanished for the moment from his face, and a cordial one took its place.

"I am very much obliged to you," said John as they shook hands.

"Of course I was in the deceased Miss McQuarrie's secrets all along, and had the honour of her entire confidence, and her wishes as to the disposal of her property were as well known to me as they were to herself. And it is only to-day that I am in a position to speak to you as I am doing, and as I am about to do. I congratulate you most sincerely Mr. Hagart. Will you be seated?" and as Mr. Hook dropped into one of the leathern-covered chairs, and crossed one leg over the other, the professional look came back.

"The matter on which I am about to speak," proceeded Mr. Hook with a trifle of hesitation in his voice, "happened several years ago. The seal of secresy was placed upon me at the time, with regard to the transaction which I am about to make known, and that seal was not to be broken during the period of Miss McQuarrie's life. Whether it should be broken *now* has been to me the subject of anxious consideration. I have come to the conclusion that, having due regard to the memory of my deceased client, and to your interests as her heir and representative, the seal should be broken. I think it due also to myself to say that I have taken counsel with Mr. Crook—who although unable to return to the professional career which he so long adorned, is one of the shrewdest advisers. I took counsel with Mr. Crook, and he is decidedly of opinion, looking at the matter from every point of view, that the seal of secresy is no longer binding, and this seal of secresy I am about to break."

Here Mr. Hook adjusted the double eye-glass on his nose, and laid his hands on the papers before him.

"You will doubtless remember when your respected father—who was looking well yesterday, I was happy to see—became a partner in the firm of Wedderburn Brothers?"

John said he remembered the circumstance perfectly well.

"And have you any idea as to the motive which induced Wedderburn Brothers to offer Mr. Hagart a partnership?"

"The motive of interest, of course. Wedderburn Brothers found my father's services so valuable that they were anxious to secure them permanently. It was on that ground they proposed the partnership, and they could have no other reason for so acting."

Here a light smile played for a second on Mr. Hook's lip. "It is quite natural that you should so think. I conducted the negotiations, and here is a copy of a letter which I addressed to Miss McQuarrie, stating the terms on which Wedderburn Brothers were willing to admit your father as a partner of the firm. This letter," went on Mr. Hook, as he handed it across, "states the sum to be paid, the conditions on which the partnership was to be offered, and here"—handing across another paper—"is Wedderburn Brothers' receipt in full. And now you have the secret history of the partnership."

"Then my aunt bought the partnership, and arranged that the partnership so purchased should be offered to my father on the ostensible ground of his valuable services?"

"Exactly," said Mr. Hook. "You have hit the motives which actuated my client, very neatly. Your father at the period of this transaction contemplated emigration, and Miss McQuarrie was anxious to keep him at home, and to make him contented at home. You will see at a glance that for the success of the plot it was necessary that your father should be kept in ignorance of Miss McQuarrie's share in it. It is for you to decide whether he shouldn't be kept in ignorance still."

The reading of the papers and Mr. Hook's talk sent John's mind away back to the old time, to his conversation with his father about Central America by the canal bank, to the letters which his aunt received from Greysley, announcing the great fact of the partnership having been offered and accepted,—to his birthday dinner and Miss Kate's toast, and his father's speech in reply,—and the blood rushed to his face when he thought how they had all been Miss Kate's puppets, and with what an amused gravity she must have pulled the strings and watched the family drama. "What a set of fools she must have thought us at times!" he said to himself.

"I fear that my communication has not given you entire pleasure," said Mr. Hook, who through his double eye-glass had watched the blood rise in his young friend's face.

John laughed somewhat in awkward sort. "Well, perhaps not unmixed pleasure. We all thought that the partnership had been offered in the most perfect good faith, and strictly on the ground on which it was said to have been offered. We were all very proud of it, and at times I fear we wore very ridiculous airs in poor aunt's eyes. But she conferred on us all a great benefit, and she could not have conferred it in any other way."

"Yes, she flung a benefit in at your father's door, and then ran away in case she should be discovered."

"I am extremely indebted to you, Mr. Hook, for all this information, but it seems to me that as the secret has been kept so long, and so successfully, it should be kept still longer. The communication you have made to me, if made to my father would pain him extremely. The wisest plan is to let the matter remain as it is."

"Unquestionably, Mr. Hagart. This little bit of secret history would not even have been made known to you but for the danger of your stumbling upon it, either when looking into your Aunt's affairs, or going back upon the past business of this office. It would have startled you, and might have caused mischief. I quite agree with you that these papers after having seen the light this forenoon, should return again to their seclusion."

And so the papers, after having told their story, were folded up and put away, and Mr. Alfred Hagart was allowed to dream his golden dream, undisturbed.

Miss Kate slept peacefully in the Hawkhead cemetery, with the Spring rain falling on her breast. And in due time the sky lifted itself above the city in an immeasurable arch of blue, and troops of white-winged clouds scudded across on the free wind. Then the gilded vanes of the city churches began to sparkle, and jaunty city clerks to come into their offices with jonquils stuck in their buttonholes, and for entire hours during the day the lazy sunshine would sleep along one side of the principal thoroughfare. Then water-carts began to dispense their treasures in the dusty streets; mercers and jewellers, mindful of the comfort of their customers, erected awnings over their hot shop-fronts; and butchers and confectioners grew restive under the plague of flies. And Miss Oona McQuarrie's marriage drawing near, John Hagart began to make preparations for his journey North.

I drove with that young fellow to the railway station, and could not help smiling at his boisterous mirth. "What a jolly thing it is to get out of harness!" he cried. "I shall now wash out all the inkstains from my soul."

"But I don't quite like to part with you," I said, after he procured his ticket and got his traps put to rights. "I have a presentiment that next time I see you, instead of John Hagart the bachelor I shall behold John Hagart the married man."

"Nonsense," said he, with a pleased colour in his face and a merry ring in his laugh. "You are a confirmed croaker, you know."

"We shall see, we shall see. You have my best wishes anyhow, whether married or single," said I as the train moved off.

One evening about a fortnight after the following letter reached me:—

"Uanvohr.

"My dear Tompkins,—You have been a very prophet. Miss Oona's marriage takes place in a couple of days, and Miss Maggie, who was to have been a bridesmaid, is now to have bridesmaids of her own. In two days Miss Oona will become Mrs. Henry Willoughby, and in two days, my Tompkins, Miss Maggie will become Mrs. John Hagart. Father and mother arrived here yesternight, and everything is merrier than the merriest marriage-bell that ever rang.

"I cannot comprehend my happiness. I do not know the amount of it. It is a bag of gold pieces which I have not counted. I will not speak to you of my wife that is to be. You will see her soon. Only this will I say, that I have spoken to her of you, told her of all your good qualities, told her that you are my oldest friend and my dearest, and that she has taken quite an affection for you. She knows that I am writing you, and desires me to send her love. Remember, my Tompkins, that this change in my life will make no difference in my feelings of regard to you. There will always be a knife and fork for you at Mortimer Street, and you must dine with us at least once a week.

"This is a grand place—green shores, great peaks with mists curling round them, a noble bay, the most splendid sunsets. To look on noble scenery is a great pleasure at all times, but how much is that pleasure enhanced when one is in love!

"Henry Willoughby is a fine fellow, and is the next happiest man in the world after myself—and after myself, in a couple of days, he will be blest with the most charming wife.

"But I am called down to the boats. Adieu, we shall send cards.

"Yours, most sincerely,

"John Hagart.

"Thomas Tompkins, Esq."

This letter did not in the least surprise me, but it annoyed me slightly, nevertheless. When a boy gets a piece of nice plum-cake to eat, and while eating it takes care to inform the world that it is so remarkably good, all the boys within earshot who have no plum-cake, don't like it. I, however, comforted myself with the thought, that, if I had been in John Hagart's place, I would, in all probability have been as exuberant as he, and that if he had been circumstanced as I was, he would have felt even as I did. What a curious pleasure happy people take in thrusting their happiness in other people's faces. It is a pleasant thing for the rich man to make rattling cataracts of silver pieces in his breeches pocket, but it is not such a pleasant sound for a penniless man to hear. A hungry tramp never feels half so hungry as when, nose flattened against the pane of a baker's shop, he beholds a batch of smoking loaves laid on the counter.

In due time the cards came, very pretty pieces of pasteboard indeed, adorned with silver cord. One of those interesting missives informed me that Mr. and Mrs. John Hagart would be at home on ——

With the cards came a note from Alfred Hagart himself.

"UANVOHR.

"MY DEAR TOMPKINS,—The marriage is over, and the two happy couples have just driven off. What a curious blank came over the whole of us when the young people left! They are all to dine with me at Greysley on Monday fortnight. Come! We old fogies—I almost think of you as an old fogie, and I know you will not be angry with me when I call you one—can have our own talk when they have gone. We can sit silently by the side of the fire and feel all the time that we are good companions. Wife sends love.

"Yours ever,
"ALFRED HAGART."

I liked the father's letter better than the son's. It was more in consonance with my mood of mind. I think that newly-married people are the most disgustingly selfish people in the world. They are happy, and they expect that every one else should don their wedding favours, and smile in answer to their smiles.

On the evening of the Monday fortnight I drove out to Greysley, and dined with Alfred Hagart and his guests. I saw the young people in the light of the honeymoon. Henry Willoughby was as handsome a fellow as you would see in a summer day's journey, and his wife was every whit his equal in the matter of good looks. John was delighted to see me; and Mrs. John came up with a smile and a blush, put her little hand in mine, and hoped that as I was one of John's best and oldest friends, I should become one of her best—and in due time one of her oldest—friends, also. And of course I could only press the frank little hand in mine, and hope in return that I should.

The dinner was a pleasant one. Alfred was radiant, Mrs. Alfred Hagart was very quiet. After all she is a woman more to my taste than either of her nieces—the past and the present being mingled in her thoughts, I daresay. We were all merry as befitted the occasion, and when the wine was placed on the table, Alfred Hagart made an appropriate speech, which caused the brides to sit with downcast eyes, the bridegrooms to thump the table with the handles of their dessert-knives, and Mrs. Hagart—bless her! I could have placed my finger on the gay sentence that provoked the tears—to cry a little.

In due time the ladies retired, and John and Henry went up to the smoking-room in the tower, where Alfred and I promised to join them. When we were left alone we became silent.

"This has been a very pleasant evening," said I, not knowing what to say, and anxious to say something.

"It has, and it hasn't. Do you know these young people make me feel very old? The time was when I thought a man old at thirty. Now I strive to think that he isn't old at sixty. I have slid into the zone of grey hairs, and bald pates, and prosperous paunches, and strive to make myself as comfortable as I can. But it won't do. The afternoon may be pleasant enough, but it's nothing like morning. Then one knows that one has the whole day before one, and can waste an hour without any sense of impoverishment—just as if one were to spend one pound out of a thousand. A son's marriage is an event in life, and I think I have experienced all the events that are likely to fall to my share. There is nothing very strange or new before me now, till the crowning event of all—that makes an end of life altogether."

"If we hadn't to die life would become a very humdrum affair on our hands. But why should we drift into this kind of talk at present?"

"I suppose because in life everything suggests its opposite. But you are quite right. Fill your glass, Tompkins. You have been the friend of my fireside and of my son's. You know all that has come and gone with us, the good and the evil. I think my wife values your friendship more than the friendship of any other person living—she does so *now* at least. This is an auspicious occasion, Tompkins. When I look back upon my past, and see the fight I have waged, and how, without aid from anyone, I have achieved independence—wealth some, perhaps, would call it—I consider I am not unreasonably proud of myself. My son has brought home his wife, and, I will say it, a prettier and a sweeter-natured no man was ever blest with. Her sister and her husband are here also. They are all under my roof to-night. Now then, before we go up-stairs, I have a toast to propose—Alfred Hagart's Household."

"Alfred Hagart's Household," said I, as I drained my glass, and thereafter we went up-stairs.

That dinner took place some years since. The knife and fork still wait me in Mortimer Street, but John Hagart and his wife are not my only friends there now. There is an Alfred Hagart of another generation, and a little maid, Kate Hagart by name, who reminds me of a little Kate I knew long ago; and a Henry Willoughby Hagart who considers that I was created for the sole purpose of bringing him sweetmeats; and an Oona McQuarrie Hagart, who has worn that name for six months only, who sucks her thumb industriously, who has not yet ceased to marvel with big round grey eyes at the strange world in which she finds herself, and who has the most wonderfully dimpled elbows and cheeks—a young lady of whom I am extravagantly fond, and who is called my little wife. So I am not without companionship. John Hagart and his wife are my dear friends; but their children are friends every whit as dear.

THE END.

JANET'S QUESTIONS.

JANET! my little Janet!
You think me wise, I know;
And that when you sit and question,
With your eager face a-glow,
I can tell you all you ask me:
My child, it is not so.

I can tell my little Janet
Some things she well may prize;
I could tell her some whose wisdom
Would be foolish in her eyes;
There are things I would not tell her,
They are too sadly wise.

I can tell her of noble treasures,
Of wisdom stored of old;
To the chests where they are holden
I can give her keys of gold;
And as much as she can carry
She may take away untold.

But till her heart is opened,
Like the book upon her knee,
What is written in its pages
She cannot read or see:
Nor tell till the rose has blossomed
If red or white 'twill be.

And till life's book is opened
And read through every age,
Come questions, without answers,
Alike from child and sage;
Yet God himself is teaching
His children page by page.

I still am asking questions
With each new leaf I see;
To your new eyes, my Janet,
Yet more revealed may be.
You must ask of God the questions
I fail to answer thee.

I. C.

ON LIGHT.

BY SIR JOHN F. W. HERSCHEL, BART.

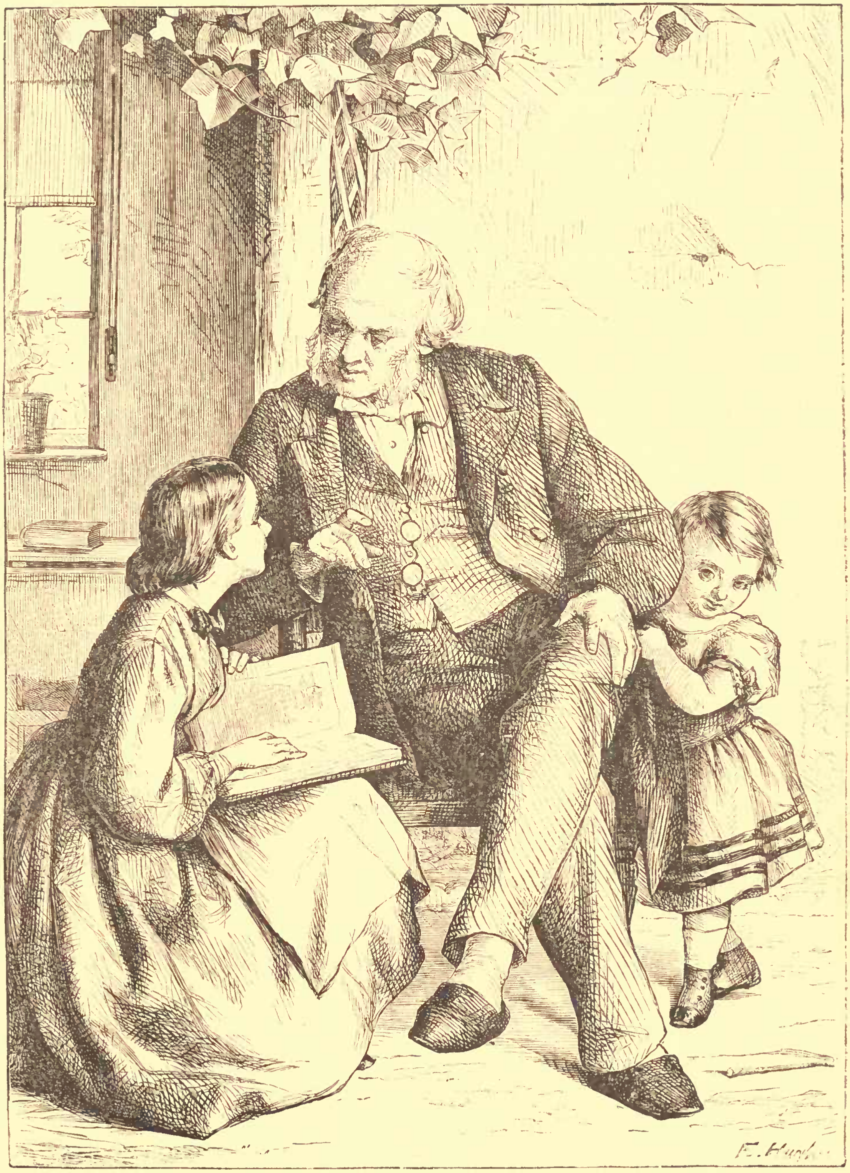
PART III.

DOUBLE REFRACTION.—POLARIZATION.

(Concluded from page 822.)

Of the interference of polarized rays.—The assimilation of a ray of light to a series of equidistant waves running along a stretched string, will afford a very clear conception of the interference of polarized rays. Suppose a vibratory movement *in a horizontal plane* to be communicated to one end of such a string, and to propagate along it such a series of waves, which will therefore all be confined to the same horizontal plane. If then a simultaneous movement, exactly equal and similar, *and in the same plane*, were communicated to a point in the string exactly half a wave breadth in advance of the point where the first series originated, each point in its length anywhere in advance of both these origins of movement would be always solicited by two equal and opposite impulses, the one of which would contradict the other, and in consequence it would remain at rest, and the two series of waves would destroy one another. If the origin of the two vibratory movements were distant from each other by a whole wave breadth, they would conspire to produce a double extent of vibratory excursion all along the string. All this is merely recapitulatory of what was stated, in Part II., when explaining the general nature of the interference of rays. But it is evident that these conclusions only follow if the interfering vibratory movements are performed *in the same plane*. Supposing them performed in planes at right angles to each other, no such mutual destruction or reinforcement of movement can take place. Two movements at right angles to each other, communicated at the same instant to the same material molecule, combine, in virtue of the mechanical principle of the composition of motions, to produce a movement intermediate in direction; and can in no case destroy each other.

It follows from this, that if such be really the nature of the luminous vibrations and such the true explanation of the phænomenon of polarization—interference can only take place between rays polarized in the same plane—such complete interference at least as shall result in the extinction of both, in the manner above described. This conclusion is, happily, capable of being brought to the test of experiment, and the result is found to be in exact accordance with the *à priori* reasoning. The experiment is simple and direct. Let two small holes, or, better, parallel slits very near each other in a thin opaque screen, be placed between the eye and a very minute and brilliant point of light; and viewed through a lens, as described in a former paragraph; so as to see the diffractive fringes. Now over the holes or slits let two plates of tourmaline of precisely equal thickness and in every respect similar be applied (to secure which



JANET'S QUESTIONS.

conditions, the two halves of a single plate worked to exact parallelism and cut across, may be used). Then if the axes of these plates be parallel, in which case the light passing through both the apertures will be similarly polarized, the fringes will continue to be seen. If one of them be slowly turned round in its own plane till its axis comes to be situate at right angles to that of the other, they will gradually decrease in intensity and at length disappear altogether when this rectangularity is precisely attained. In the first case, then, the rays have interfered—in the last, not: while in the intermediate states a partial interference takes place, the more complete the nearer the axes are to parallelism. How *this* is operated we shall now proceed to explain.

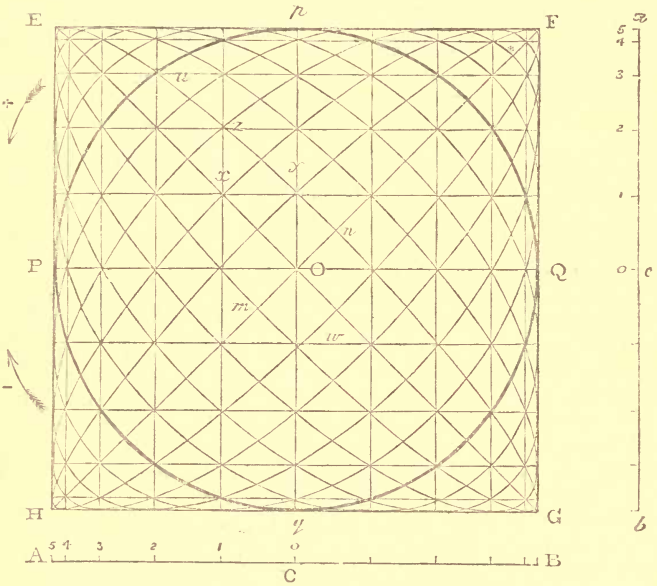
Circular and elliptic polarization.—If we regard the vibratory movement of any single particle of an elastic medium in its most general mode of conception, we shall find that it may always be considered as capable of resolution into three rectilinear vibrations in three planes at right angles to each other, each going on *as if* the others had no existence: and its place in space at any instant will be had by estimating its distance on one side or the other of its neutral or central position, (those of perfect equilibrium and rest,) reckoned along each of the three lines in which these planes intersect (which, after the manner of geometers, may be considered as three rectangular axes, or co-ordinate lines) which it would have attained at that instant in virtue of each separately, and independent of the others. This is nothing more than the enunciation of one of the simplest of mechanical laws, that of the composition and resolution of motions. But the theory of movements propagated through elastic media (a theory far too elevated and intricate to admit of any explanation in these pages, and whose results the reader must take for granted) further teaches us that a vibratory movement once set up and steadily maintained, according to a regular law of periodicity in any one molecule of such a fluid will, sooner or later, (according to its distance and situation,) reach every other, which, from that moment will be agitated by a vibratory movement precisely similar in its phases, (though of inferior extent in its excursions,) to the original movement, and *performed in the same period of time.* It matters not whether the medium be or be not equally elastic in all directions. This will affect the *rate of progress* of a wave through it in different directions, and by consequence the form of the wave, and the length of time that has to elapse before the molecule in question begins its vibratory movement; but once set up in any molecule, that movement will be maintained, so long as it is, so to speak, fed from behind—so long as successive waves continue to pass through it. In the theory of light, the eye being insensible to vibratory movements in the direction of the ray, we have only to consider those components of the motion which lie in a plane at right angles to that direction, and which, for the present, we will suppose to be that of the paper before us.

Let us consider, then, the kind of motion which an ethereal molecule will assume, under the influence of two such vibratory movements simultaneously affecting it, in directions transverse or otherwise inclined to each other, but both directions lying in one common plane, that of the paper, or of the wave-surface, each of which will therefore represent the vibratory movement proper to a ray polarized in a plane at right angles to our paper, and intersecting it in its line of direction. And first, for simplicity, let us suppose the two vibrations of equal intensity (*i.e.*, in both which the molecular excursions on either side of the point of rest are equal), and that their directions form a right angle with each other. Let A B and a b, fig. 14, represent two such lines of vibratory movement, C, c, their central points, or the positions of rest of the molecules when undisturbed, and C A, C B; c a, c b; their extreme excursions to and fro. The times of vibration being equal, (which is an indispensable condition for the union into one of two distinct luminous rays: as a red ray, for instance, cannot interfere with a violet one,) let each be supposed divided into the same number of equal parts (say 360). Then supposing the molecules to set out at the same instant from C and c, they will arrive at A, a, respectively in 90 such units of time, will have returned again to C, c, in 180; have reached B, b, in 270, and again returned to C and c, in 360. In so doing, however, their motions are not uniform, but most rapid when traversing the central points, and gradually retarded as they recede from these: so that in equal intervals of time the spaces traversed along the lines C A, c a, will be unequal. Then let the whole time (90) of describing C A, be divided into five equal times of 18 each, and suppose that at the end of the 1st, 2nd, 3rd, 4th, and 5th of these, the molecule has arrived at the points 1, 2, 3, 4, 5. It is demonstrable, then, that the several distances C 1, C 2, C 3, C 4, C 5, of these points from C will be to each other in the proportion of the Sines of 18°, 36°, 54°, 72°, and of 90° or radius; and the same is true of c 1, c 2, c 3, c 4, c 5.

This premised, we are now in a condition to trace the movement of a molecule affected at once by both these causes of displacement. Let it be O. Then at the expiration of the first interval of 18 units of time it will in virtue of the vibration parallel to C A, be carried to a distance equal to C 1 in a direction O P parallel to that line, and will be found so far from the line O p parallel to c a. And in virtue of the other vibration similarly it will be found at the same time at the distance c 1 (= C 1) from O P, or in the direction O p parallel to c a. In virtue of both movements, then, it will be found at x, the extremity of the diagonal of the square O x at that moment. And similarly at the end of the 2d, 3d, &c., interval, it will be found at the extremities of the diagonals of the squares next in succession, and as these all lie in one line, O E, 45° inclined both to

O P and O p, it appears that in this case the resultant vibration will be rectilinear, and will be performed along the diagonal E G of the square E F G H; and thus it appears that the superposition of two rays of equal intensity, polarized in opposite (*i.e.*, rectangular) planes, results in the production of a ray polarized in a plane 45° inclined to each of the former. Moreover, the square of the diagonal being double that of either side of a square, and the intensity of a ray being measured by *the square* of the vibrational excursion of its ethereal molecules, the intensity of the compound ray will be double that of the components, or, equal to their sum. And, *vice versâ*, any polarized ray may be considered as equivalent to two rays, each of half its intensity, polarized in planes 45° inclined on one side, and on the other of its plane of polarization. It need hardly be observed that if the molecule in starting from O be moving in the direction C A, in virtue of the one vibration, and of C b in virtue of the other, —that is, if it be commencing its first semi-vibration in the one direction, and its second in the other, or again in other words, if the vibrations differ in phase by an exact semi-undulation; all the same reasoning will apply, with this only difference: viz., that the resultant rectilinear vibration will be performed along the other diagonal, H F, of the same square.

Fig. 14.



It appears, then, that a change of phase in the vibrations of one of the component rays, of half an undulation, exactly reverses the polarization of the compound ray, and causes its vibration to be performed along the diagonal H F, instead of G E. Let us now examine by what sort of gradations the one of these movements passes into the other, when the phase of one of the vibrations C c is changed gradually. Suppose, for instance, the vibration a b (so, for brevity, we will designate it) to be in advance of the vibration A B by one-twentieth part of a complete undulation, so that at the moment when C starts from C in the direction C A, c shall have already got to I in the direction c a. Then at that moment our molecule O will be not at O but at y. After the lapse of one-twentieth more of a period, C will have got to I in the direction C A, and c to 2 in the direction c a, and O, actuated by both movements, will have arrived at *z*, having of course described in the interval a line *y z*, connecting these two extremities of the diagonal of the rectangle *xyz*. And exactly in the same way, at the expiration of the next twentieth of a period, it will be found in *u*, the extremity of the diagonal of the next rectangle—and thus tracing its course step by step through the whole twenty, which constitute a period, we shall see that it will have described a narrow ellipse, having m n for its shorter axis, and E G for *the direction of* its longer, and touching the four sides of the square E F G H. If the initial difference of phase be two, three, or four twentieths of the period, it will be seen, by following out the movement in the same way, that more and more open ellipses will come to be described as represented in the figure; and that, when this difference amounts to five twentieths or a quarter undulation, the movement will be circular in the direction p P q Q, or of the arrow marked thus +. The difference of phases still continuing to increase, this will again degenerate into an ellipse by a continued elongation in the direction H F, and contraction in the direction E G, till it passes at length, after another quarter-undulation of phase-difference, into the straight line H F. The circulation in all, however, being in the same direction, or +. On the other hand, if instead of supposing the vibration a b to be initially *in advance* of A B by one-twentieth, we suppose it to be so much *in arrear*, we shall have the same ellipse n E m described as in the former case, but in the opposite direction, that of the arrow marked —, as will be easily seen by going through the successive steps of our reasoning: and so for all the rest; so that in the case of a circular revolution, the direction of the rotation will be one way or the other, according as the vibration a c is a quarter-undulation in advance or in arrear, in respect of phase, of A C.

This, then, is what is meant by circular and elliptic polarization. It is easy to extend the reasoning above stated to cases which the component vibrations are of unequal intensity (or extent of excursion), or make other than a right-angle with each other's directions. We have only to suppose our lines A B, a b, and their parallels P Q, p q, inclined to each other at the angle in question, and of unequal length; to divide them similarly (*i.e.*, in the same proportion) in the points 1, 2, 3, 4, 5—and we shall obtain a set of ellipses, none of which, however, can in either of the cases have its axes equal, or pass into a circle, for this plain reason—that no circle can touch internally all the four sides of any parallelogram except a square.

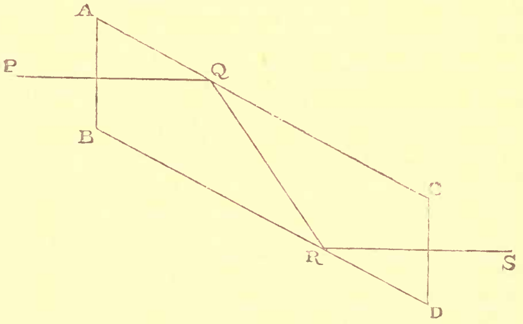
Conversely, a ray circularly polarized may be considered as compounded of, and may (by suppressing either of them and letting the other pass, through a tourmaline plate) be resolved into two equal rays, each of half its intensity, polarized at right-angles to each other, and differing in phase by a quarter-undulation. If one of them be in advance of the other by that phase-difference, the rotation will be in one direction—if in arrear, in the other. Elliptic polarization on the other hand, when it exists, may be recognized by the possibility of resolving the ray so polarized into two oppositely polarized, and either of unequal intensity, or, if equal, differing in phase otherwise than by a quarter-undulation.

Finally, a ray polarized in any one plane may be regarded as equivalent to two equal rays, circularly polarized in opposite directions of rotation, and having a common zero-point.

A ray of ordinary light may be considered as a confused assemblage of rays, polarized indifferently in all sorts of planes. It is, therefore, a mixed phænomenon; and to study it in its simplicity, we must in idea break it up into its component elements, and examine their phænomena *per se*. Now it results, from a series of experiments too extensive and refined to be here detailed, and from reasonings upon them which the generality of our readers could hardly be expected to follow, that when a ray, polarized in any plane, undergoes reflexion in a different plane, the reflected portion comes off in all cases more or less elliptically polarized —that is to say, that it consists of, or can be resolved into, two rays, the one polarized in the plane of incidence, the other in a plane at right angles to it—that both these portions have undergone a change of phase at the moment of reflexion, but *not the same for both*, so that arriving at the surface in the same phase, they quit it in different, and therefore constitute by their superposition an elliptically polarized ray. The amount of ellipticity varies, for each reflecting medium (according to the nature of its material) with the angle of incidence at which the reflexion takes place, and also with the inclination of the plane of incidence to that of the primitive polarization of the incident ray. If the reflexion take place on ordinary transparent media of not very high refractive power, as glass, or water, and at the polarizing angle, the degree of ellipticity is so slight that the vibration may be considered as rectilinear, and the reflected ray as completely polarized in the plane of incidence. As the refractive power of the surface increases, the ellipticity impressed is greater, and in some substances, of very high refractive power, such as diamond, and all those bodies which possess what is called the *adamantive lustre* (a consequence of such high refractive power) it is considerable. From such bodies accordingly it is not possible, at any angle of incidence to obtain a reflected ray completely polarized in one plane. And when we come to reflexion from polished metals,* the ellipticity becomes very considerable. In consequence, only a very imperfect polarization of the reflected light in the plane of incidence can be obtained by reflexion from any metallic surface at any angle.

In all the above enumerated cases, the degree of ellipticity increases *with the reflective power* of the medium of which the reflecting surface is constituted; which itself stands in intimate connexion with the magnitude of the *refractive* index. It might naturally, therefore, be expected to attain its maximum possible amount, or that the ellipse should become a circle in the case of total reflexion. This can only take place, however, when the reflexion is made on the *internal* surface of a transparent medium. This accordingly happens in the case of a beautiful experiment of M. Fresnel, who found that a parallelopiped of glass,† A B C D, fig. 15, being cut and polished, having the acute angles at A and D, each 54° 37′, and a ray P Q, polarized in a plane 45° inclined to the plane of the section A B C D intromitted perpendicularly at the face A B, so as to be reflected internally at Q on the side A C, in which the reflexion being at an angle of inci-

Fig. 15.



---

* All metals, even the densest, are in some slight degree transparent, and all have enormously large refractive indices. The transparency of gold is perceptible in gold leaf, which transmits a green light. That of silver is perceptible in the thin films deposited on glass in Liebig's process for silvering mirrors—the transmitted light being bluish.

† The glass used was that known in France as "Verre de St. Gobain."

dence 54° 37′ was total; and again at R, at the same angle, on the opposite side D B, it emerged from the face D C, along the line R S, circularly polarized. In this case, the plane of reflexion making an angle of 45°, with that of original polarization, the reflected ray will consist of two *equal rays*, oppositely polarized; and of these the one in *each* act of reflexion has lost, in the other gained, an exact 16th of an undulation, making an 8th *difference* at each reflexion, or a quarter after both; so as to emerge under all the conditions of circular polarization. In consequence, when analysed at its emergence by a tourmaline plate, it is found to undergo no change of brightness on turning the plate in its own plane, whereas the original ray, P Q, would have been wholly extinguished at each quarter revolution.

Another mode of communicating circular polarization to a ray, is to transmit it at a perpendicular incidence through a parallel plate of any perfectly colourless and transparent doubly refracting crystal, of such thickness, that in the passage through it of the two waves, parallel to its surfaces, into which the incident wave (supposed plane) is divided, (the one conveyed by ordinary refraction, the other by extraordinary, and therefore travelling with different velocities in the crystal,) the one shall have gained or lost, after emergence, exactly a quarter of an undulation on the other. For as the corresponding rays emerge of equal intensity, and oppositely polarized, they here also fulfil all the conditions of circular polarization. If the thickness of the plate be such, that the difference of phases is more or less than an exact quarter (or any number of quarters) of an undulation, the compound ray will be elliptically polarized, and the degree of ellipticity will be determined by the thickness of the plate.

It may be asked, in what does a ray so circularly polarized differ from an ordinary unpolarized ray, seeing that the latter may always be regarded as compounded of two ordinary rays of half the intensity oppositely polarized? We reply, *in this:* viz., that if again transmitted through another such glass parallelopiped, *similarly situated*, the difference of phase will be doubled. The emergent ray then will consist of two equal rays oppositely polarized (and therefore not interfering), differing in phase by half an undulation, and which therefore (by what we have before shown) compound a single ray polarized in a plane half-way intermediate, or 45° inclined to the original plane of polarization; whereas a ray of ordinary light so transmitted would show no signs of polarization in any one plane more than in any other.

The most remarkable cases of circular polarization, however, are those which occur when a ray is transmitted along the optic axis of a crystal of quartz, and some few other crystals, as also through certain liquids. The phænomena so exhibited cannot be explained, or even described, however, till we shall have said something

OF THE COLOURS EXHIBITED BY CRYSTALLIZED PLATES ON EXPOSURE TO POLARIZED LIGHT.

Uniaxal crystals.—If a plate cut from a crystal of Iceland spar, so as to have its faces perpendicular to the axis of the primitive rhomboid, be placed close to or very near the eye, and before it a tourmaline plate having its axis vertical, so as to polarize all the light incident upon it in vertical planes passing through the eye; and if any brightly illuminated white surface, such as a white cloud, or a sheet of paper laid in the sunshine, be viewed through it: or if, instead of a tourmaline plate, a "polarizing frame" of glass plates, such as above described, be laid horizontally, and the reflexion of a *clouded* sky be in like manner viewed through the crystal; in the "polarized field" so obtained nothing especial is seen which would lead to a suspicion that the crystal were other than an ordinary piece of glass. But if, in this state of things, between the crystal and the eye, be placed another tourmaline plate, *having its axis horizontal*, a magnificent set of coloured rings will be seen, the exact counterpart of the reflected rings described by Newton (see p. 568) (only infinitely more vivid and brilliant), in every respect but these:—First, that they are all divided into four quadrants of coloured light by a dark cross passing through their common centre, and having its arms vertical and horizontal; and, secondly, that the rings themselves are of unequal brightness in different parts of their circumference, being most luminous at the middle points of the quadrants into which the cross divides them, and fading away very gradually on either side of these points, till they cease to be traceable and are lost in the darkness of the cross. On the other hand, if the tourmaline plate between the eye and the crystal (which we shall call the "*analyzing plate*," or the "analyzer," for a reason which will presently appear) be placed with its axis *vertical*, a series of rings will also be seen: but they are, now, the complementary series—those seen by transmission in the Newtonian experiment; and the cross, instead of black, is now white. Lastly, if the analyzing plate be placed obliquely, both sets of rings will be partially, and, as it were, confusedly, exhibited, the one dislocating the other, in consequence of the brighter annuli of the one set abutting upon the obscurer of the other, the reds on the greens, the purples on the yellows, &c., the preponderance in light, distinctness, and extent, falling to the share of that set which the position of the analyzer most favours.

It is manifest that these colours originate in the interference of two series of undulations propagated with different velocities within the crystal, and which therefore must necessarily belong the one to the ordinary, the other to the extraordinary, pencils into which the incident light is divided, which, as before shown, travel with different velocities within its substance. These pencils, however, during their progress through it, are proceeding in different directions (by reason of the double refraction of the medium) and are oppositely polarized—so that, while within the crystal, they cannot interfere. Their interference, then, must be accomplished after their emergence, when their directions have been again reduced to parallelism, and they have been (wholly or partially) brought to a common plane of polarization by the action of the second tourmaline. Let us, therefore, examine how this is brought about. And first, along the vertical arm of the *black* cross, the whole of the incident light being polarized in the plane of a vertical section of the crystal containing its axis, will pass into the ordinary pencil, and none into the extraordinary—so that there will be nothing to interfere with it, and emerging wholly polarized in that plane, will be wholly stopped by the analyzing tourmaline—the result being darkness. But if this tourmaline be turned 90° round in its own plane, it will be wholly transmitted, and the arm of the cross in question will be white. As regards the horizontal arm of the cross, in like manner, the visual ray throughout its whole extent is inclined to the axis in a plane at right angles to that of the primitive polarization. The light, therefore, incident in this plane through the first tourmaline will pass wholly into the extraordinary pencil, and will therefore emerge polarized in a plane *at right angles* to the (now) *horizontal* section of the crystal containing its axis in which its direction lies, *i.e.*, again, in a *vertical* plane, and will be stopped, for the same reason, by the second tourmaline, so that this arm of the cross also will be black in the horizontal, and white in the vertical, position of the analyzer. Let us now consider a ray incident in a plane 45° inclined to the vertical, or in a plane intermediate between the arms of the cross (the axis of the crystal being in all cases supposed held horizontally). The incident ray then will fall on the crystal in a section through its axis 45° inclined to that of its primitive polarization, and will therefore be equally divided between the ordinary and extraordinary pencils. These portions will emerge parallel, and of equal intensity, though differing in phase by such a number of undulations, and parts of an undulation, as the latter, by reason of its greater velocity, has gained on the former. In this state they are both incident on the second tourmaline, having its axis 45° inclined to both their planes of polarization, which therefore will subdivide each of them into two equal portions oppositely polarized, *suppressing or absorbing one, and allowing the other to pass*, and the transmitted portions, being of equal intensity, similarly polarized (viz., both in the plane of the axis of the analyzing plate), and differing in phase, will interfere and give rise to the phænomena of coloration in the manner already sufficiently explained. It remains now to account for the colours being arranged in regular succession in rings round the centre of the black cross (which corresponds to the axis of the crystal). Now the colour developed, or the *order of the tint*, in the series of the Newtonian rings, increases with the difference of phase, and this difference increases with the difference of velocities of the two pencils within the crystal, and with the length of the path traversed with those velocities. Both these increase with the inclination of the visual ray to the axis of the crystal, since along the axis there is no double refraction, which increases gradually from that direction outwards up to a right angle. This, then, explains the progressive increase of colour or order of tint in proceeding from the centre outwards. The circular arrangement is a consequence of the symmetry of the crystalline plate in all directions around its axis, the amount of double refraction being the same at equal obliquities to that line in all directions around it, as also the increase of thickness traversed, by rays equally oblique in all directions to the surfaces of the plate. It only now remains to explain how it happens that, in this situation of the analyzing plate (at right angles to the polarizing one), the tints are those of the *reflected*, not of the transmitted series in the Newtonian rings. And the reason is very similar to that by which, in the colour of their plates, the difference of phase is assumed (justifiably assumed) to commence, not from zero, but from half an undulation. Of the two partial systems of waves that interfere, in the case considered, that which belonged to the ordinary pencil in the crystal passes, as an extraordinary one through the analyzing plate. Now it is a law, susceptible of demonstration, but which it would lead us too far aside at present to demonstrate—that in the transition from an ordinary to an extraordinary refraction, half an undulation is gained. With the other portion of the interfering pencil, no such transition takes place. Half an undulation then has to be reckoned in addition to the phase-difference due to the simple passage of the two rays through the crystal—just as is the case in the Newtonian reflected rings, and with the same result.

If we follow out the same chain of reasoning in the case when the analyzing plate is parallel to the polarizing one, the conclusions will be identical up to this last step. But here the cases differ. Neither of the interfering pencils here at its entry into the second tourmaline undergoes extraordinary refraction, and there is accordingly no semi-undulation to be added to the phase-difference. The rings, therefore, will have the characters of the transmitted series of Newton's colours.

In the generality of uniaxal crystals, the tints of the rings, when the crystal itself is colourless, (or as nearly as its colour will allow,) follow a succession identical with that of the Newtonian colours of their plates. I have elsewhere called attention, however, to several instances of deviation from this rule, some of which are of so remarkable a nature as to deserve special mention. The most remarkable is in the case of one variety of the mineral called apophyllite which (from the peculiarity in question) I have proposed to call *Leuco-*

cyclite, in which the rings are almost devoid of colour, being merely a succession of dark and light circles, much more numerous than the coloured ones usually seen, and the more remote of which, from the centre, graduate into feeble shades of purplish and yellowish light. The physical interpretation of this phænomenon is as follows. Since the *colours* originate in the superposition of rings about a common centre, differing in diameter for the several coloured rays (as already explained in Part II.) throughout the spectrum, it follows that in this case, no such difference of diameter, or but a very slight one exists. Now, for crystalline plates so cut, of a given thickness, the apparent diameters of the rings seen are a measure of the doubly refractive energy. The more intense this energy the closer and more compact the system of rings;—for this obvious reason, that the same difference of phases between the ordinary and extraordinary pencils is developed at a less angle of inclination to the axis; and the difference of phases is a direct result of difference of velocities in their internal propagation; and this again, of the doubly refractive energy. Hence we conclude that in the *leucocyclite* all the coloured rays throughout the spectrum undergo equal, or very nearly equal, *separation* at a given angle of incidence, by *double refraction*, and that therefore in a doubly refracting prism cut from this substance, the two spectra formed by a sunbeam would be of precisely *equal lengths*, though unequally refracted, or that the highest index of refraction would be accompanied with the least *dispersive power*. I have not made the experiment, but that such would be the case there can be no doubt. In the spectra formed by an Iceland spar prism, the reverse is the case—the higher refractive index corresponding to a much higher dispersive power, and the most refracted spectrum being much longer and much more brilliantly coloured than the least.

Another highly remarkable example of this kind is found in the mineral called Vesuvian, a uniaxal crystal of a greenish hue, which to a certain degree interferes with the vivid development of its coloured rings. It does not, however, prevent their being well observed—and they present this very singular anomaly, viz., that the system of rings formed by the red rays is considerably *smaller* than those formed by the violet, and in consequence that the order of tints in the rings formed in white light is inverted, so that, of the spectra formed by a prism of this substance, the more refracted ought to be the shorter, and the least coloured. This kind of anomalous action is, however, carried still further in another variety of uniaxal apophyllite, in a plate of which perpendicular to the axis rays of a medium refrangibility *form no rings at all*, so that for such rays the substance *is singly refractive.* Proceeding from this medium refrangibility towards either end of the spectrum, rings are formed, contracting in diameter, as the red or violet end is approached, but most rapidly towards the red. It would not be too much to expect that if a prism could be formed of this mineral (unfortunately very rare), and a bright point illuminated in succession with all the prismatic rays viewed through it, beginning with the red, two images would at first be seen, the one formed by ordinary refraction, fixed, the other gradually approaching it—at a certain stage of the illumination coinciding with it; then crossing to the other side and separating more and more from it as the light verged more to the extreme violet. The experiment, which would be a very beautiful one, is recommended to the attention of those in possession of such crystals which they may not be indisposed to sacrifice.

Of the colours developed by circular polarization.—Quartz, or ordinary *rock crystal* is uniaxal: and when a plate of it of moderate thickness, cut from one of the six-sided prisms in which it usually occurs at right angles to its axis, is examined in the mode above described with a polarizer and analyzing plate, a superb system of coloured rings and black cross is exhibited—but with this peculiarity, that the cross does not come up to the centre, and that the interior rings are blotted out and obliterated by a round patch of coloured light, whose tint, when the tourmalines are at right angles, varies with the thickness of the plate; being white when very thin, and passing, for plates successively increasing in thickness, through all the series of tints of Newton's transmitted rings. Keeping to one plate, the tint also varies on turning round the analyzing plate in its own plane, and with this very extraordinary peculiarity, viz., that while in some crystals a certain succession of colours is observed, on turning it from right to left; in plates of the same thickness cut from other crystals the same succession is seen on turning it from left to right. Yet more singular, is the fact that this inversion—this right-and-left-handedness in the succession of tints corresponds to, and is predictable beforehand from, the appearance of certain small obliquely posited facets on the crystal previous to polishing, which lean unsymmetrically in some crystals to the right, in others to the left hand of the axis held up straight before the eye. In all other respects the crystals are identical.* A similar right-and-left-handedness in the external form of their crystals, accompanied with the very same optical phænomena, has been remarked by M. Pasteur in the salts called *paratartrates* and their crystallized acid.

The account given by the undulatory theory of these phænomena is this. Quartz (to adhere to our first chosen instance) is uniaxal, but it differs from Iceland spar and others of that class in a most essential point first noticed by Mr. Airy, viz: that the sphere and spheroid representing the simultaneous surfaces of the ordinary and extraordinary waves propagated within them, though having a common axis, do not touch each other internally. Hence, in the direction of that axis, though there is, *at a perpendicular incidence*, no double refraction, there *is* a difference of velocity in the two rays. Now the theory at present adopted is, that owing to some peculiarity at present not understood, when a polarized ray (which may always be considered as compounded of two circularly polarized ones of opposite characters as already stated, *i.e.* in which the particles of the ether circulate in opposite directions) is incident on a quartz plate, in this manner, the crystal operates an analysis of the ray and *resolves it into* two such rays circularly polarized, which it propagates *as such*, the one as an ordinary, the other as an extraordinary one. On their emergence at the opposite face of the plate they recompound a plane-polarized ray, but, having gained or lost on one another, by reason of their difference of velocity in their passage through it, a number of revolutions or part of a revolution proportional to the thickness of the plate, the two circular rays at the instant of their reunion have no longer a *common zero-point* as at their entry, and from this it may be demonstrated* that the plane of polarization of the recomposed will not be coincident with that of the incident ray, but will have been turned round, *in the direction of the rotation of the ray which travels fastest within the quartz*, through an angle also proportional to the thickness of the plate. As the angle of displacement, moreover, differs for the differently coloured rays of the spectrum, the effect will be that, when passed through an analysing tourmaline the different colours will be differently absorbed, and the result will be the production of a compound tint in the beam finally delivered into the eye, the colour of which will vary with the rotation of that plate in its own plane, as observed.

---

* Amethyst consists of thin alternate layers of right-handed and left-handed quartz superposed, parallel to their axes.

It is not in crystallized bodies only that this singular effect is produced. Strange as it may seem that a colourless, transparent, and perfectly homogeneous *fluid* should deviate the plane of polarization of a ray passing perpendicularly through it at all; still stranger that it should do so constantly in one direction for the same fluid, but in opposite directions for different fluids; strangest of all, that even vapours should be found possessing the same property; such is the case. Thus, oil of turpentine and its vapour turn the plane of polarization to the right hand, solution of sugar to the left, and so for a variety of other substances.† This property has been made the basis of an elegant instrument called the saccharometer, by which the quantity of sugar contained in a given solution is ascertained by simple inspection of the tint so produced.

Struck by the fact, apparently so singular, of a "right-and-left-handedness" inherent as it were in the molecules of material bodies—by the correlative fact of such a tendency, or so to speak idiosyncrasy, manifesting itself in the forms of crystals—and again, in quite a different field of scientific research, in the action of an electrified cylindrical wire on a magnetized needle placed parallel to its direction, (which turns the north end of the needle to the right or to the left according to the direction of the current *along* the wire): it early occurred to the writer of these pages that it was scarcely possible that such singularities should stand in no natural connexion. Between two of the cases adduced the connexion had been proved by himself. It remained to enquire whether the third could be brought into obvious relation to the other two. Accordingly on the 14th of March, 1823, having prepared a long spiral coil of copper wire enclosed in an earthenware tube, furnished with a polarizing reflector at one end and an analyzer at the other; by the kindness of the late Mr. Pepys, he was permitted to bring the coil into connexion with the great magnetic combination of the London Institution, consisting of one enormous couple, expressly arranged for producing the greatest possible magnetic effect. His expectation was that light would appear in the dark polarized field on making the contact, and be maintained during its continuance. The experiment, however, proved unsuccessful. No *direct* action upon *light* could so be made manifest. At a later period, however (1845), by introducing into a similar coil a certain highly refractive glass consisting chiefly or wholly of borate of lead, as well as a variety of other solids and liquids (water among others), Professor Faraday succeeded in communicating, temporarily, and during the continuance of the passage of the current, the property in question to them.

Biaxal Crystals. By far the greater number of crystallized substances do not present that *single symmetry* (symmetry on all sides of a single central line or axis), which we have spoken of as indicative of a single axis of double refraction, and of a spherical propagation of the ordinary, and spheroidal of the extraordinary ray, within them. In all or nearly all these, two lines inclined to one another at an angle greater or less according to the nature of the substance, can always be found (either by a careful examination of the crystal in polarized light through the faces of its natural form, or by cutting and artificially polishing plates of it), which possess the properties of such axes;—along which, that is to say, refraction is single for a ray passing either way out of the crystal; and in which when examined in polarized light with an analyzing plate between the eye and the crystal, coloured rings are seen. The simplest and readiest instance of a crystal of this kind is furnished by a sheet of ordinary mica, such as may easily be procured in large sheets. If a sheet of this be held before the eye in a polarized field perpendicularly (an analyzing plate being interposed) and turned round in its own plane, two portions will be found at right angles to each other, in which the polarization of the incident light is not disturbed, and the field remains dark. Of the two planes perpendicular to the plate in which the plane of polarization cuts it in these two positions, one is the "principal section" of the plate, and contains its "optic axes." These may be brought into sight by holding the eye (armed with the analyzer) quite close to the mica, and inclining the latter, either forward or backward in one of these two section-planes so as to make an angle of about 35° with the visual ray on either side of the perpendicular. In either situation a set of coloured rings will be seen, not circular, but of an oval form, about a common centre, and intersected, not by the two arms of a black cross as in Iceland spar, but by one vertical dark bar cutting centrally across them. This dark bar is converted to a white one, and the colours of all the rings changed to their complementary ones, by turning the analyzing plate through 90° in its plane.

---

* Our necessary limits forbid us to give the steps of the demonstration, which, however, are very obvious.

† Mr. Jellett, of Trinity College, Dublin, has, I am informed, recently discovered a liquid which is *right-handed* for one end of the spectrum, but *left-handed* for the other!

In mica, the angular separation of the optic axes is too large to allow both these sets of rings to be seen at once, so as to examine the nature of their mutual connexion. In nitre however, in which it is only about 5° (within the crystal), this may be very conveniently done, by cutting from the clear transparent portion of a large hexangular-prismatic crystal (such as may always be found in searching over a lot of the ordinary commercial saltpetre) a plate about a quarter of an inch thick, perpendicular to the axis of the prism, and polishing its faces. If this be placed between two crossed tourmalines, and held up against the light, the normal phænomenon of the biaxal rings will be seen in its utmost perfection, as in fig. 16, the upright and horizontal lines in which indicate broad brushes as it were of shadow, cutting across the system of ovals, and breaking them up into four similar quadrants. If, retaining the tourmalines in the same position, the nitre plate be turned round in its own plane, this cross breaks up into two curved arcs, as represented in fig. 17, corresponding to a movement through a quarter of a right angle,—then, as in fig. 18, corresponding to 45° of change, and so on till after a quarter of a revolution the original appearance of fig. 16 is restored. If the tourmalines instead of being crossed, are laid parallel, the forms of the ovals are the same, but the colours complementary, and the cross and curved branches white.

The forms of these curves are governed by a very simple and elegant general law, common to all biaxal crystals, and applicable to every angular separation of the axis; and when this separation is small, as in the case before us, they may be regarded as "lemniscates," of which the property is this, that for every point in the circumference of each oval the *product* (not as in an ellipse the *sum*) of two lines drawn to the two centres or foci, is invariable, and for successive ovals proceeding outwards from either focus, these products increase in regular arithmetical progression. When the two foci coincide, that is to say, when the two axes of the crystal coalesce, and it becomes uniaxal, the ovals pass into circles, and we fall back upon the circular rings and cross proper to that class of bodies.

Neglecting the bending which the rays undergo at their emergence from the posterior surface of the crystal, or conceiving the eye as immersed within its substance, it is evident that when looking in the direction of either of the foci of the ovals, the visual ray will be directed along one of two axes, or *lines of no double refraction;* while if looking towards any point in the circumference of any one of the ovals, the visual ray will traverse the crystal in such a direction that an ordinary and an extraordinary ray following that path shall gain or lose on each other so many semi-undulations, or parts of one, as shall correspond to the tint developed in that direction; and that, therefore, in all the directions marked out by the circumference of each individual oval, the tints being the same, the phase-difference, *and therefore* the difference of velocities of the interfering rays, *and therefore again*, the amount of double refraction in that direction is the same. The forms of these ovals, therefore, stand in immediate and intimate connexion with the law of double refraction in such crystals, and with the forms of the two wave

Fig. 16.

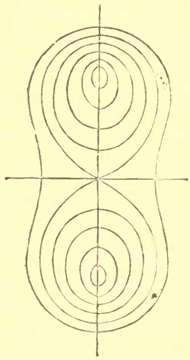


Fig. 17.

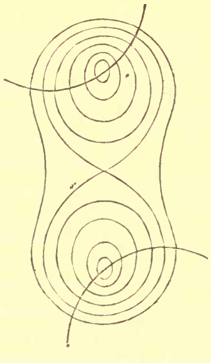

Fig. 18.

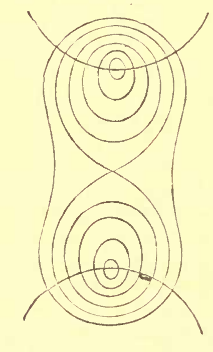


surfaces belonging to the ordinary and extraordinary rays. The theory of these wave-surfaces belongs, however, to a higher department of geometry than we could hope to make intelligible in these pages. Suffice it to say that as delivered by M. Fresnel and his followers it explains all the facts in the most complete and satisfactory manner, and has even led to the prediction, antecedent to observation, of some phænomena so apparently paradoxical as to stand in seeming contradiction with all previous optical experience, and which any one, antecedent to their verification by trial, would have pronounced impossible.*

One highly important conclusion from this theory must, however, be noticed. The directions within the crystal of the two axes of double refraction on the "optic axes" stand in no abstract *geometrical* relation to those of the angles and edges of its "primitive form," or to its axes of symmetry. They are resultant lines determined by the law of elasticity of the luminiferous ether within its substance as related to its crystalline form, and *to the wave-length of the particular coloured ray transmitted.* They are not, therefore, the same for all the coloured rays. In the generality of biaxal crystals, the difference of their situations and of the angle between the two, is but small, but in some, as in the salt called Rochelle salt (tartrate of soda and potash), it is very great, amounting to at least 10°, by which the direction within the crystal of either axis for the extreme red rays differs from that for the extreme violet.*

It is time, however, to bring this long article to a conclusion. To describe the variety of splendid and singular phænomena, developed in every department of physical enquiry by the use of polarized light, not one of which has hitherto afforded any, the smallest, ground for doubt as to the applicability of the undulatory theory to its complete explanation, would require volumes. We would gladly have said something of the magnificent phænomena exhibited by "macled" crystals,† by unannealed, or compressed glass; of the changes produced by change of temperature on the optical relations of bodies, and of the colorific and chemical rays of the spectrum; but our limits forbid it. Suffice it to add, that what the telescope and the microscope effect for us in the discovery of outward and visible form, the properties of light, and especially of polarized light, effect in subjecting to our intellectual vision the intimate structure of material bodies. Within the compass of the smallest visible atom they open out a world of wonders—a universe *sui generis*, and for each atom of a different material a different one—all, however, related and bound together in one vast harmony.

PRESIDENT LINCOLN JUDGED BY HIS OWN WORDS.

"By thy words thou shalt be justified, and by thy words thou shalt be condemned."

PART II.

FROM THE OPENING OF THE CIVIL WAR TO THE EMANCIPATION PROCLAMATION OF JAN. 1, 1863.

When Congress met in Extraordinary Session on July 4, 1861, four more States had seceded—Virginia, Arkansas, North Carolina, and Tennessee—whilst the Governors of the Border States of Kentucky and Missouri were attempting to take up a position of neutrality, and Secession movements in Maryland had had to be suppressed, chiefly through the somewhat high-handed energy of General Butler. The Confederate capital had been established at Richmond, as if to bid defiance by its proximity to Washington. General Lee had been appointed to the chief command of the military and naval forces of Virginia. The National Armoury at Harper's Ferry, the Navy Yard at Gosport, had been burned to prevent their falling into Secessionist hands. The seizure of national property in the South and South-West had gone on. Various Federal garrisons had been compelled to surrender. Internal war had broken out in Missouri, in Tennessee, from which latter State the only loyal Southern senator, Andrew Johnson, had made his way through difficulties and dangers of all sorts to Washington. In Virginia the Federals had occupied Arlington Heights, on the Virginian side of the Potomac, and various movements and skirmishes had taken place on the border, including a somewhat disastrous one (to the Federals) at Big Bethel (June 10). On the other hand, the North had responded enthusiastically to the call for men, and forty western counties of Virginia had refused to follow the remainder of the State into Secession, and had organised themselves into a new loyal State, under the name of "Western Virginia."

The President in his Message, after a brief summary of the proceedings of the Secessionists to the bombardment of Fort Sumter, pointed out that this act was in no sense a matter of self-defence upon the part of the assailants:

> "They were expressly notified that the giving of bread to the few brave and hungry men of the garrison was all which would on that occasion be attempted,

---

* We allude to the phænomena of "*conical refraction*," discovered by the late Sir W. R. Hamilton, in following out Fresnel's researches.

* See a paper by the author of these pages in *Phil. Trans.*, 1820, "On the action of crystallized bodies on homogeneous light, where the singular phænomena to which this gives rise are fully described.

† These may find a place elsewhere. The phænomena alluded to have not, so far as I am aware, been hitherto described.

> unless themselves, by resisting so much, should provoke more. They knew that their Government desired to keep the garrison in the fort, not to assail them, but to maintain visible possession, and thus to preserve the Union from actual and immediate dissolution; and they assailed and reduced the fort for precisely the reverse object—to drive out the visible authority of the Federal Union, and thus force it to immediate dissolution. . . . And this issue embraces more than the fate of these United States. It presents to the whole family of man the question, whether a constitutional republic or democracy—a government of the people by the same people—can or cannot maintain its territorial integrity against its own domestic foes. It presents the question, whether discontented individuals, too few in number to control administration, according to organic law, in any case, can always, upon the pretences made in this case, or on any other pretences, or arbitrarily, without any pretence, break up their Government. . . So viewing the issue, no choice was left but to call out the war-power of the Government; and so to resist force employed for its destruction, by force for its preservation."

He then proceeded to review the course of events since the fall of Sumter; dwelt for awhile on his suspension of the writ of *Habeas Corpus;* and after explaining his own views as to the right interpretation of the Constitution on the matter, deferred it entirely to the better judgment of Congress, and closed with a somewhat lengthened discussion of the alleged "right of secession." His concluding words were:—

> "It was with the deepest regret that the Executive found the duty of employing the war-power in defence of the Government forced upon him. . . He felt that he had no moral right to shrink, *or even to count the chances of his own life*, in what might follow. In full view of his great responsibility, he has so far done what he has deemed his duty. You will now, according to your own judgment, perform yours. . . And having thus chosen our course, without guile and with pure purpose, let us renew our trust in God, and go forward without fear and with manly hearts."

The fall of Sumter had been the answer of the South to the pleadings for concord of the President's "Inaugural." Its triumph at Bull Run (July 21) seemed to many a victorious refutation of the arguments of his first message against the right of Secession. The "Sumter" swept the West Indian seas of Federal merchantmen. Confederate batteries at Aquia Creek almost blockaded the Potomac, and stopped communication by sea with Washington. The civil war in Missouri continued with varying success. The loyalists of East Tennessee fled in numbers from a Confederate reign of terror, only "Parson Brownlow" in his journal, the *Knoxville Whig*, still proclaiming Unionist principles. Faithful Western Virginia, repeatedly invaded, had to be repeatedly cleared of Confederate invaders by McClellan, by Rosecranz. Kentucky, on the other hand, was inclining more and more to the Union. And a future series of Federal lodgments on the sea coast of the revolted States was inaugurated by the successful occupation of Hatteras Inlet in North Carolina.

The war was thus fully engaged; by the South to destroy the Union, by the North to maintain it. But how was it to be maintained? By respecting and protecting slavery, on which the Southern Confederacy was founded, or by striking that Confederacy through slavery itself? General Butler's ingenious application to slaves of the principle of "contraband of war," had, at an early period (May 27), commenced an attack upon the "patriarchal institution." Absurd it certainly would have been to return fugitive slaves to disloyal owners. Accordingly, General Butler had been authorised (May 30) to retain and employ such fugitives. Subsequently (Aug. 6), an Act was passed, forfeiting the services of all slaves "required or permitted to take up arms... or to work or be employed in any military or naval service whatsoever," against the United States. The right of property in slaves as against the nation was thus abolished: but not slavery itself; the master's privilege was destroyed, but no right was given to the slave. General Fremont, in command in Missouri, thought he could go further. By proclamation (Aug. 31), he instituted martial law throughout his department, and declared that the slaves of persons taking an active part against the Government should be "free men."

Mr. Lincoln disallowed this step (Sept. 11, 1861). The motives of the act seem to have been twofold: First: an anxiety not to travel, if possible, one inch beyond the letter of the law in the matter; Second: an equal anxiety not to outstrip public feeling generally, and especially that of the Border States. Perhaps, Mr. Lincoln miscalculated the strength of the Unionist sentiment on the one side, and of the Abolitionist sentiment on the other. But even were it so, who shall dare condemn him? To every thinking man, the mere confiscation of the slaves of rebels contained a pledge of future emancipation. Was it worth while, for the sake of hastening by a few months the fulfilment of that pledge, to peril the cause of the Union, at a time when no one signal success had given lustre to its banners? What if the allowance of General Fremont's order had thrown all the Border States at once into secession? Can we undervalue that peril, when we look back and see that the single one of those Border States which actually seceded, Virginia, has been practically the only resistent element in the Confederacy? that when, after setting the whole Federal power at defiance for four years, she was finally conquered, she carried the whole Secession with her in her fall?

A few months later (Nov. 1), the faithful old Virginian, General Scott, gave up the command-in-chief of the United States armies to General G. B. McClellan. Another successful and momentous lodgment was effected by the Federals on the Southern coast, at Port Royal and Beaufort, South Carolina (Nov. 7), and another at Ship Island, off the Louisiana coast; and a couple of Virginian counties (Accomac and Northampton) submitted to Federal rule. Civil war continued to rage in Missouri, Kentucky, and Tennessee; and a most serious complication with England arose, through the seizure (Nov. 8), by Captain Wilkes, of the

Confederate Commissioners, from on board the Trent. In spite of the popular clamour (especially of all covert friends of the South) which indorsed the act, President Lincoln took upon himself to disallow it, and the Confederate Commissioners were given up.

It was under these circumstances that Congress met for its ordinary session (Dec. 2, 1861). In his first "annual" Message, after referring, in terms of perfect moderation, to the relations of the United States with foreign nations, and to various questions of national defence and internal communication, Mr. Lincoln said—

> "I am unable to discern any good reason why we should persevere longer in withholding our recognition of the independence and sovereignty of Hayti and Liberia. Unwilling, however, to inaugurate a novel policy in regard to them without the approbation of Congress, I submit for your consideration the expediency of an appropriation for maintaining a *chargé d'affaires* near each of these new States."

Now Hayti and Liberia are two self-governed negro republics, the one of revolted, the other of enfranchised slaves. The United States had not as yet recognised either (although the latter had been founded by their own citizens) as worthy of diplomatic notice. According to the principles of the new Confederacy, they could not be so recognised. Mr. Lincoln, on the contrary, was "unable to discern any good reason" why negro republics should not stand on a footing of equal sovereignty with any polity founded by the white man. In his eyes "slavery, subordination to the superior race," was not the "natural and normal condition" of the negro. He was entitled to freedom, if he could win it—by arms if need be—and in freedom to self-government. Did not the man who had lately disallowed General Fremont's proclamation for enfranchising those slaves whom the law only declared to be confiscated, thus sufficiently vindicate his own consistency?

Nor was this all. Referring to the Confiscation Act, Mr. Lincoln proceeded to indicate the first outlines of his colonization policy which he afterwards earnestly, but only in part successfully, urged upon Congress. Hints of yet broader measures were indeed already thrown out. "The Union must be preserved, and hence, all indispensable means must be employed. We should not be in haste to determine that radical and extreme measures, which may reach the loyal as well as the disloyal, are indispensable." What was this, but a guarded warning that universal emancipation might become in time "indispensable?"

After a vivid sketch of the progress of the war since the assault on Fort Sumter, the President concluded by insisting, as in his former Message, on the Secession being "largely, if not exclusively, a war upon the first principle of popular government —the rights of the people."

The early part of the year 1862 saw considerable progress on the part of the Federals, everywhere except in Virginia, where "Stonewall" Jackson was beginning to win for himself a brilliant reputation. Kentucky was cleared from all organized military resistance, except at the south-west corner. The Federal gunboats, pushing up the Tennessee and Cumberland rivers, into Tennessee, took Fort Henry (February 6), and with the aid of the land forces under General Grant, Fort Donelson (February 16). Nashville, capital of Tennessee, was occupied, and senator Andrew Johnson named military governor of the State. Union gunboats ascended the Tennessee as far as Florence, Alabama, and were well received. A further portion of the coast of North Carolina was occupied, a lodgment effected on that of Georgia; lastly, the Federal troops, having nearly cleared Missouri, advanced into Arkansas.

In the midst of these successes, Mr. Lincoln addressed a remarkable Message to Congress (March 6, 1862); recommending "the adoption of a joint resolution, which should pledge the United States to co-operate with any State adopting gradual abolition of slavery, by giving to it pecuniary aid." Every State initiating emancipation, he urged, would be lost for ever to the proposed Southern Confederacy. Gradual and not sudden emancipation was better for all.

It was only on the 10th of April that a joint resolution of Congress on the subject was finally approved by the President. But the feeling of the country against slavery was now rising on all sides, and this was but one out of several measures directed against it. On March 13, an additional article of war expressly prohibited, under pain of dismissal, "all officers or persons in the military or naval service of the United States, . . . from employing any of the forces under their respective commands for the purpose of returning fugitives from service or labour." On the 16th April was passed an act emancipating all slaves within the district of Columbia, the President accompanying his signature with a Message expressive of his satisfaction, and the act being followed by another (May 21) "providing for the education of coloured children in the cities of Washington and Georgetown, district of Columbia," out of the proceeds of the taxes received from the coloured population of these cities, and establishing perfect equality before the civil and criminal law within the district between the coloured man and the white.

Still, the President retained his old anxiety not to travel faster than the public feeling. On the 9th May, General Hunter, in command in South Carolina, issued a proclamation declaring all slaves free within the States of Georgia, Florida, and South Carolina. The President (May 19) disallowed it, making known that, he reserved to himself the question whether it was competent for him as Commander-in-Chief, to declare the slaves of any State free; and that he did not feel justified in leaving it to the decision of commanders in the field.

Whether he judged rightly or wrongly in the matter, in the disavowal of General Hunter, as in that of General Fremont before, we cannot but see here the truly brave man, who will shirk no responsibility by casting it on third parties, will not let any subordinate officer dictate a policy to the country. Mr. Lincoln now avowedly contemplates the possibility of emancipation as a military necessity, through an exercise of the war-power. But such a decision belongs to himself only, the chosen servant of the people, its chief military as well as civil officer. Should the act become necessary, therefore, it can never come as the stepping-stone to a military despotism, since it will be that of the only soldier who is directly responsible to the people and the civil law. But whilst thus decisively vindicating his constitutional authority, he uses the very act which he is disallowing as a warning to the slave States of the "signs of the times." Will they neglect their opportunity for gradual, assisted emancipation? The pleading, as we all know, was in vain. "Sinners against their own souls," the seceding slave States, which had spurned such emancipation, had to endure it sudden, uncompensated—ay, and too often in the light of their burning stacks and homesteads, at the point of their former slaves' bayonets.

But the check to General Hunter was no check, and was meant to be no check, to the progress of public feeling against slavery. Amongst a whole group of measures in this direction which immediately followed the President's proclamation, I can but notice two or three.

On June 18, a most important act, embodying the cardinal resolution of the Chicago platform, abolished and forbade slavery throughout all the territories of the United States, present or future. A treaty between the United States and Great Britain for the suppression of the slave-trade conceded a mutual right of search, such as America had always withheld (July 11). An act of July 17 enacted the perpetual freedom of "all slaves of persons who shall hereafter be engaged in rebellion, escaping and taking refuge within the lines of the army,"—"all slaves captured from such persons or deserted by them, and coming under the control of the Government of the United States,—and all slaves of such persons found in any place occupied by rebel forces, and afterwards occupied by the forces of the United States." The restoration or molestation of fugitive slaves, except upon oath of the loyalty of their owners, was expressly forbidden. "No person engaged in the military or naval service of the United States" was to decide on the validity of any claim to service or labour, under pain of dismissal Lastly, the President was authorised to receive into the service of the United States, persons of African descent; "any slave of a person in rebellion rendering any such service" to be "for ever thereafter free, together with his mother, wife, and children, if they also belong to persons in rebellion;" but with power also to provide for "the transportation, colonisation, and settlement, to some tropical country beyond the limits of the United States, of such persons of African descent, made free by the act, as may be willing to emigrate."

Before Congress separated, Mr. Lincoln called the representatives of the Border States together at the White House, and addressed them (July 12), in an earnest speech, on the expediency of adopting his gradual emancipation plan. On the same day he sent a Message to Congress, transmitting the draft of a bill to compensate any State which might abolish slavery within its limits. But none of the Border States responded to his invitation; and though the President's bill was referred to a committee, no action was taken upon it in Congress.

Meanwhile, the Federal arms had been again progressing everywhere, except in Virginia. Whilst the President's Message of March 6 was being delivered, the great western battle of Pea Ridge, was beginning, which ended on March 8 with the rout of the Confederates. Successes were obtained in distant New Mexico and Arizona, both of which were recovered. The great advance down the Mississippi and its valley had been steadily carried on, the Confederates successively evacuating or surrendering their works, and the city of Memphis (June 6), and the Union forces advancing as far as Vicksburg, whilst Arkansas was crossed from its north-west corner to Helena on the Mississippi. The forts of the Lower Mississippi, after six days' bombardment, were run past by Admiral Farragut, and the surrender of New Orleans and the forts was obtained (April 28). The fleet pressing upwards received the surrender of Natchez, and a portion of it actually ran past Vicksburg, which was the only stronghold yet remaining to the Confederates on the great river of the west. The land operations in this quarter had been equally vigorous. The fiercely contested battle of Shiloh or Pittsburgh Landing, Tennessee (April 6-7), ended on the second day by the retreat of the Confederates, leaving 3000 dead upon the field; but the loss of the Federals was no less than 13,298, besides many pieces of cannon. They pushed on into Mississippi, occupying Corinth (May 30), whilst a lodgment was also effected in Northern Alabama, through the capture of Huntsville (April 11). Some successes were however obtained by the Confederates in Tennessee, and their dashing general, John Morgan, invaded Kentucky. On the southern coast the town of Pensacola was occupied from Fort Pickens, which had been retained by the Federals (May 12). The occupation of the western coast was extended, the Federals taking possession of various points in Florida, Georgia, North Carolina, and South-eastern Virginia; but a severe repulse was suffered on James Island, South Carolina, about five miles from Charleston (June 14).

In Virginia the resistance of the Confederates was persevering and successful. General McClellan moved on Richmond, but (March 10) found the Confederate works round Manassas junction evacuated. He now changed his base, commencing a series of most bloody battles, and had finally to fall back to the James River (July 1). General Pope was placed in command of "the army of Virginia," but was defeated in a second battle of Bull Run (August 31), and threw up his command. Various reverses were also suffered in Tennessee and Kentucky.

But, meanwhile, the great principles on which the war turned were coming out more and more. For some time the President adhered to his scheme, towards which Congress had placed $600,000 at his disposal, for colonising the coloured people abroad. Some of them entered into the scheme, and formed a committee, which was received by the President at the White House, and addressed by him (August 14) in a speech, of which notes were taken by one of those present, and which has been much canvassed.

> "You and we," he said, "are different races. We have between us a broader difference than exists between almost any other two races. . . This physical difference is a great disadvantage to us both, as I think. . . If this is admitted, it affords a reason, at least, why we should be separated. . . Your race are suffering, in my judgment, the greatest wrong inflicted on any people. But even when you cease to be slaves, you are cut off from many of the advantages which the other race enjoys. . . I need not recount to you the effects upon white men, growing out of the institution of slavery. See our present condition —the country engaged in war; our white men cutting one another's throats, none knowing how far it will extend . . . It is better for us both, therefore, to be separated. . . If intelligent coloured men, such as are before me, would move in this matter, much might be accomplished."

I have never been able to find the fault with this speech that many have,—absolutely mistaken as I believe it to have been, in point of opinion. The President's first duty was to the Union, which he had to preserve so far as it existed, to restore so far as it was broken up. The effort to restore it, he clearly felt, led him day by day towards the destruction of slavery. That, he thought, could be more easily effected by the simultaneous removal of the coloured race. Yet he was determined—this appears from his whole conduct—to impose no coercion upon them. So he urges them to remove themselves. They are not the equals of the white men here; why not go where they "should be the equals of the best?" Evidently, he is doing by these coloured men precisely as he would be done by. There is, in fact, the broadest assertion of human equality beneath this effort to dissociate two races, of which the one will not treat the other as its equal.

But the President's leading point of view, that of saving the Union, must never be overlooked. He set it forth himself with unmistakeable clearness in a letter of nearly the same date (August 22) to Mr. Horace Greeley, who had somewhat bitterly attacked him in the *New York Tribune*:—

> "Dear Sir,—I have just read yours of the 19th instant, addressed to myself through the *New York Tribune*. If there be in it any statements or assumptions of fact which I may know to be erroneous, I do not now and here controvert them. If there be any inferences which I may believe to be falsely drawn, I do not now and here argue against them. If there be perceptible in it an impatient and dictatorial tone, I waive it in deference to an old friend whose heart I have always supposed to be right. As to the policy I 'seem to be pursuing,' as you say, I have not meant to leave any one in doubt. I would save the Union. I would save it in the shortest way under the Constitution. The sooner the national authority can be restored, the nearer the Union will be—the Union as it was.
>
> "If there be those who would not save the Union unless they could at the same time save slavery, I do not agree with them. If there be those who would not save the Union unless they could at the same time destroy slavery, I do not agree with them. My paramount object is to save the Union, and not either to save or destroy slavery. If I could save the Union without freeing any slave, I would do it;—if I could save it by freeing all the slaves, I would do it;—and if I could do it by freeing some and leaving others alone, I would also do that. What I do about slavery, and the coloured race, I do because I believe it helps to save this Union; and what I forbear, I forbear because I do not believe it would help to save the Union. I shall do less whenever I shall believe what I am doing hurts the cause, and I shall do more whenever I believe doing more will help the cause. I shall try to correct errors when shown to be errors, and I shall adopt new views so fast as they shall appear to be true views. I have here stated my purpose according to my views of official duty, and I intend no modification of my oft expressed personal wish that all men everywhere could be free."

A noble letter, surely. Did ever man more resolutely "come to the light, that his deeds might be made manifest," than this man?

Did the President really believe that his duty could extend so far as to rivet the shackles of the slave? He knew that it could not, and did not. He knew that wherever the Union arms extended, slaves were being received as fugitives, confiscated, freed. He, and his Secretary of War had been issuing orders and proclamations to this effect, in accordance with recent legislation. Negro troops were being embodied on various points, from South Carolina to Kansas and New Orleans. In the free North, the cry for immediate emancipation was rising higher and higher. On the 13th of September —Maryland being already invaded—the President received a deputation from all the religious denominations in Chicago upon the subject. As a study in mental philosophy, no speech of Mr. Lincoln's is more interesting to me than his reply to this deputation. The speech is really that of a man who, to make sure of the correctness of his own conclusions, wishes to argue out every possible objection to them. He has thought much on the subject for weeks, for months. Good men, religious men, men "equally certain that they represent the Divine will," beset him with the most opposite opinions and advice. The one class or the other must be mistaken, "perhaps in some respects both." What good would a proclamation of emancipation from him do? He does "not want to issue a document, that the whole world will see necessarily must be inoperative, like the Pope's bull against the comet." After urging various objections, he concludes by a caution, which reveals the whole man:—

> "Do not misunderstand me because I have mentioned these objections. They indicate the difficulties that have

thus far prevented my action in some such way as you desire. I have not decided against a proclamation of liberty to the slaves, but hold the matter under advisement: and I can assure you that the subject is on my mind by day and night, more than any other. Whatever shall appear to be God's will, I will do."

Nine days more elapsed; South Mountain was fought, then Antietam (Sept. 17), and on the 22nd, the President issued his first emancipation proclamation, announcing that, "On the 1st day of January, 1863, all persons held as slaves within any State, the people whereof shall then be in rebellion against the United States, shall be then, thenceforward, and for ever, free."

The governors of fourteen loyal States, and the proxies from three others, in a meeting at Altoona, expressed their hearty assent to the proclamation (Sept. 24). The President was on the same day serenaded at Washington, and acknowledged the compliment in a short speech, stating, that what he had done, he had done "after a very full deliberation, and under a heavy and solemn sense of responsibility," trusting in God he had "made no mistake," and according to his wont, turning away all praise from himself to "all good and brave officers and men" who had fought the late successful battles.

I now pass to Mr. Lincoln's second annual Message (Dec. 1). In proceeding to the subject of "compensated emancipation," the President said:—

"A nation may be said to consist of its territory, its people, and its laws. The territory is the only part which is of certain durability. 'One generation passeth away, and another generation cometh, but the earth abideth for ever.' . . That portion of the earth's surface which is owned and inhabited by the people of the United States, is well adapted for the home of one national family; and it is not well adapted for two or more. Its vast extent, and its variety of climate and productions, are of advantage in this age for one people, whatever they might have been in former ages. Steam, telegraphs, and intelligence have brought these to be an advantageous combination for one united people. . . There is no line, straight or crooked, suitable for a national boundary upon which to divide. Trace through, from east to west, upon the line between the free and slave country, and we shall find a little more than one-third of its length are rivers, easy to be crossed, and populated, or soon to be populated, thickly on both sides; while nearly all its remaining length are merely surveyors' lines, over which people may walk back and forth without any consciousness of their presence. . . But there is another difficulty. The great interior region, bounded east by the Alleghanies, north by the British dominions, west by the Rocky Mountains, and south by the line along which the culture of corn and cotton meets, and which includes part of Virginia, part of Tennessee, all of Kentucky, Ohio, Indiana, Michigan, Wisconsin, Illinois, Missouri, Kansas, Iowa, Minnesota, and the territories of Dakota, Nebraska, and part of Colorado, already has above ten millions of people, and will have fifty millions within fifty years, if not prevented by any political folly or mistake. It contains more than one-third of the country owned by the United States,—certainly more than one million of square miles. . . A glance at the map shows that, territorially speaking, it is the great body of the Republic. The other parts are but marginal borders to it. . . In the production of provisions, grains, grasses, and all which proceed from them, this great interior region is naturally one of the most important of the world. . . And yet this region has no seacoast, touches no ocean anywhere. As part of one nation, its people now find, and may for ever find, their way to Europe by New York, to South America and Africa by New Orleans, and to Asia by San Francisco. But separate our common country into two nations, as designed by the present rebellion, and every man of this great interior region is thereby cut off from some one or more of these outlets, not perhaps by a physical barrier, but by embarrassing and onerous trade regulations. . . These outlets, east, west, and south, are indispensable to the well-being of the people inhabiting and to inhabit this vast interior region. . . . They will not ask where a line of separation shall be, but will vow rather that there shall be no such line. Nor are the marginal regions less interested in these communications to and through them to the great outside world. They too, and each of them, must have access to this Egypt of the West, without paying toll at the crossing of any national boundary. Our national strife springs not from our permanent part, not from the land we inhabit; not from our national homestead. . . In all its adaptations and aptitudes it demands union, and abhors separation. In fact it would ere long force re-union, however much of blood and treasure the separation might have cost. Our strife pertains to ourselves,—to the passing generations of men,—and it can, without convulsion, be hushed for ever with the passing of one generation."

I must say it seems to me that it would be difficult to find more thoughtful and broader statesmanship than is shown by this portion of the message. I see before me a man who not only looks straight at things,—a very rare gift already,—but tries to look them through and through, and to form his own conclusions upon them. He is not in this respect unlike our own Prince Albert, only with rougher powers, which have to be exerted, under terrible emergencies, upon mightier subjects.

Mr. Lincoln then proceeded to develop his plan for compensated emancipation, by payments from the Federal Government to every State which should abolish slavery before the 1st January 1900. On this plan I need not here dwell. Mr. Lincoln concluded with the following weighty words:—

"Fellow-citizens, we cannot escape history. We of this congress and this administration will be remembered in spite of ourselves. . . The fiery trial through which we pass will light us down, in honour or dishonour, to the latest generation. We say that we are for the Union. The world will not forget that we say this. We know how to save the Union. The world knows we do know how to save it. We—even we here—hold the power and bear the responsibility. In giving freedom to the slave we assure freedom to the free—honourable alike in what we give and what we preserve. We shall nobly save or meanly lose the last best hope of earth. Other means may succeed; this could not, cannot fail. The way is plain, peaceful, generous, just,—a way which, if followed, the world will for ever applaud, and God must for ever bless."

"Plain" and "peaceful" the plan might be called; "generous" to the slaveholders, it certainly was. Was it altogether "just" to the slave? Was it right that the loyalty of certain slave States should be paid for, in the first instance, at their slaves' expense? compensated by the bondage of a whole generation of the coloured race in those States? I am persuaded that such an extension of the duration of slavery in the loyal States formed part neither of Mr. Lincoln's purpose nor of his expectations. Yet in proposing his plan, I believe he did to some extent sacrifice principle to expediency. At any rate the attempt failed. The border States still would not emancipate. The free States would not bribe them to do so. And so the war rolled on towards the fated 1st January, 1863.

Not by any means with credit to the Federal arms. Few single months of the struggle saw more disasters than December, 1862. The terrible failure of Burnside before Fredericksburg; the scarcely less terrible repulse of Sherman before Vicksburg; the surrender of Holly Springs, with 2,000,000 dollars' worth of stores, to the Confederates; the capture of three whole regiments and a party of cavalry by Morgan's guerillas at Hartsville, and other smaller mishaps, were not set off by successes in Arkansas, an advance of General Foster in North Carolina, and the hardly contested battle of Murfreesborough. It was under these circumstances that the President had to fulfil his pledge given in September, 1862, and to issue, on the 1st of January, 1863, his famous proclamation, whereby, "as a fit and necessary war-measure for suppressing the rebellion," he designated as being in rebellion the States of Arkansas, Texas, Louisiana (thirteen counties excepted), Mississippi, Alabama, Florida, Georgia, South Carolina, North Carolina, and Virginia (the forty-eight counties of Western Virginia, and seven others, excepted), and ordered and declared that all slaves within the said States should henceforward be free, and that the Government would recognise and maintain their freedom. The persons so freed were enjoined to abstain from all violence, and to labour for reasonable wages. The proclamation concludes:—

> "And upon this act, sincerely believed to be an act of justice, warranted by the Constitution upon military necessity, I invoke the considerate judgment of mankind, and the gracious favour of Almighty God."

The exact bearing of this step should not be exaggerated. Mr. Lincoln proclaimed the slaves within the rebellious States free: he did not abolish slavery therein. To do this would have altogether transcended even his war powers as Commander-in-Chief, which might however authorise the enfranchisement of all slaves existing at a given period within certain limits, such enfranchisement being practically only a peculiar form of confiscation of a peculiar kind of property. Yet this would no more hinder the inhabitants of the States in question from purchasing other slaves, and exercising over them, the war once ended, all powers given by the local or general law over slaves generally, than a confiscation of all horses and mules within the same limits would have hindered them from buying other animals of the same description, and saddling or harnessing them at pleasure. The proclamation could thus be no more than a beginning of the good work, to be completed in every case by State action.

Still, the great word had been spoken. Upwards of 3,000,000 of slaves were declared entitled to immediate freedom. The chief magistrate of the United States proclaimed to his countrymen, to the world, that the freedom of these 3,000,000 was not merely involved in the maintenance of the American Union, but was essential to it. Henceforth, none but the helplessly or wilfully blind could fail to see that the cause of freedom, in the great conflict which was raging on the American Continent, was the cause of the North.

PART III.

FROM THE EMANCIPATION PROCLAMATION, JAN. 1, 1863, TO HIS DEATH, APRIL 14, 1865.

The Emancipation Proclamation was warmly received by all in Europe whose sympathy with human freedom was genuine, and who had not suffered themselves to be misled by sophisms and mis-statements. The working men of Manchester, amongst others,—in the very midst of the cotton famine,—had met on the 31st December, and forwarded to the President a congratulatory address. His reply (January 19, 1863) might well deserve to be quoted, but want of space prevents.

The session of Congress closed on the 4th of March, after having passed various measures for strengthening the hands of the President, and for the vigorous prosecution of the war, including a bill authorising a draft of the militia of the whole country. It was well for Mr. Lincoln that he possessed this support in Congress, for with the exception of Grant's movements in the valley of the Mississippi, the first six months of 1863 were among the gloomiest of the war. Burnside having been relieved (24th of January) in the command of the army of the Potomac by Hooker, on the 27th of April he too began his advance to Richmond, but only to fall back again after the bloody battles of Chancellorsville. In the West, Vicksburg for several months bade defiance to the Federals. On the 30th of April, Grant commenced a new movement, by landing his forces sixty-five miles lower down the river, which ended by the close investment of Vicksburg itself, 18th of May; but an attempt to carry the place by storm failed again, and a regular siege had to be opened.

Internal dissensions in the North added to the gloom of ill-success. The Democratic party throughout the country was seriously thwarting the action of the Government. Its most prominent spokesman at this time was Mr. Vallandigham, of Ohio, an old pro-slavery man. He accused the Government of having deliberately rejected propositions which would have brought the South back into the Union, proclaimed his intention to disobey a certain order of General Burnside, in command of the department, and called on the people to resist it. General Burnside had him arrested (4th of May), and ordered for trial by Court-Martial. He applied for a *habeas corpus*. The court refused it, on the ground of public safety. He was tried, found guilty, and sentenced to be placed in close confinement in a fortress. The President directed him instead to be sent within the Confederate lines, not to return during the war. He was at once turned loose accordingly into 'Secessia.' But he had been already puffed into a martyr by the Democrats. A meeting was held at Albany (May 16), to which Governor Seymour of New York sent a letter, declaring that if the arrest was approved by the Government, it was "revolution," and "military despotism." Resolutions denouncing arbitrary arrests and the suspension of the writ of *habeas corpus*, were sent to the President.

Mr. Lincoln at once accepted the challenge. In a letter far too long to quote (13th of June), though it affords a most remarkable example of his powers of argument, he defended the whole course of his Government on the points on which its conduct had been impugned.

The Federal territory was at this very moment invaded. On the 9th of June it was discovered that Lee was marching north-west through the Shenandoah Valley. On the 13th, Ewell, drove Milroy from Winchester. On the next day, the Confederate advance began crossing the Potomac, and the operation continued for a whole fortnight practically unimpeded, till the main body passed over on the 27th. Meanwhile the Federal army, to which Lee had thus given the slip, was marching up from Fredericksburg, so as to cover Baltimore and Washington, Hooker being relieved in favour of General Meade, who at once advanced into Pennsylvania, into which the Confederates had already penetrated. The two armies met before Gettysburg; and the result of three days' fighting (July 1–3) was that the Confederates once more retreated, leaving 14,000 prisoners in the hands of the Federals,—the loss of the latter however exceeding 23,000 in all. To crown the glory of the 4th of July, 1863, Vicksburg surrendered on that day unconditionally to General Grant. Four days later, Port Hudson, some time before unsuccessfully assaulted by General Banks (the coloured troops fighting heroically in the action), surrendered also. The Federals now controlled the whole course of the Mississippi; the Confederacy was cut in two. Rosecranz likewise had advanced from Murfreesborough, had turned the flank of Bragg's army at Tullahoma, and was driving him to the south-east, so as to force him back into Georgia. Against Charleston alone the Federal operations were but very partially successful.

This succession of triumphs caused general rejoicing in the North. I pass over with regret, amongst other matters, a letter written to General Grant (July 13) as a "grateful acknowledgment" for "almost inestimable service," in which Mr. Lincoln mentions having disagreed with the General on the prudence of one of his military movements, and winds up with the words: "I wish now to make the personal acknowledgement that you were right and I was wrong."

Yet it was in the very flush of victory, both east and west, that the most serious internal disturbances broke out. On the 13th July, the carrying out of the conscription law was resisted in New York, and for four days mob-law ruled supreme in the great city. The State authorities (Democrats) stood by, almost passive. Governor Seymour asked the postponement of the draft. The President refused, and on the 19th August it was resumed, and carried out without opposition. The New York riots bore exactly the opposite result to what the plotters of them intended. They raised the indignation of the country, heightened the anti-slavery feeling, and crushed the Democrats. In Ohio, Mr. Vallandigham was defeated for the governorship by a majority of nearly 100,000; New York was won by the Republicans; in short, every state except New Jersey recorded by its votes its approval of the Government policy. To this electoral campaign belongs a memorable letter of Mr. Lincoln's in reply to an invitation from the Republican State Committee of Illinois to attend a State convention at Springfield. "Unconditional Union men," they were yet dissatisfied with the President "about the negro," and disliked his emancipation proclamation." After various arguments in its defence, the President said:—

> "You say that you will not fight to free negroes. Some of them seem willing to fight for you; but no matter. Fight you, then, exclusively to save the Union . . . Whenever you shall have conquered all resistance to the Union, if I shall urge you to continue fighting, it will be an apt time then for you to declare you will not fight to free negroes. I thought that in your struggle for the Union, to whatever extent the negroes should cease helping the enemy, to that extent it weakened the enemy in his resistance to you. Do you think differently? I thought that whatever negroes can be got to do as soldiers, leaves just so much less for white soldiers to do in saving the Union. Does it appear otherwise to you? But negroes, like other people, act upon motives. Why should they do anything for us, if we will do nothing for them? If they stake their lives for us, they must be prompted by the strongest motive, even the promise of freedom. *And the promise, being made, must be kept* . . . Peace does not appear so distant as it did. I hope it will come soon, and come to stay: and so come as to be worth the keeping in all future time. It will then have been proved that among free men there can be no successful appeal from the ballot to the bullet, and that they who take such appeal are sure to lose their case and pay the cost. And there will be some black men who can remember that, with silent tongue, and clenched teeth, and steady eye, and well-poised bayonet, they have helped mankind on to this great consummation; while I fear there will be some white ones unable to forget that with malignant heart and deceitful speech they have striven to hinder it. Still, let us not be over sanguine of a speedy, final triumph. Let us be quite sober. Let us diligently apply the means, never doubting that a just God, in His own good time, will give us the rightful result."

The autumn of 1863 saw one serious Federal reverse. General Rosecranz had crowned his already great military reputation by his pursuit of General Bragg through South-Eastern Tennessee, till he had at last compelled him (9th September) to evacuate the Confederate stronghold of Chattanooga. But ten days later, at Chickamauga (19th September), Rosecranz received a terrible defeat from Bragg, reinforced by Longstreet, Lee's best lieutenant, losing upwards of 16,000 men in killed, wounded, and missing.

Under these somewhat gloomy circumstances President Lincoln had to speak (19th November, 1863) on the dedication of a national burying-ground on the field of Gettysburg. His speech on this occasion appears to me simply one of the noblest extant specimens of human eloquence :

> "Fourscore and seven years ago our fathers brought forth upon this continent a new nation, conceived in liberty, and dedicated to the proposition that all men are created equal. Now we are engaged in a great civil war, testing whether that nation, or any nation so conceived and so dedicated, can long endure. We are met on a great battle-field of that war. We have come to dedicate a portion of that field as a final resting-place for those who here gave their lives that that nation might live. It is altogether fitting and proper that we should do this. But in a larger sense we cannot dedicate, we cannot consecrate, we cannot hallow, this ground. The brave men, living and dead, who struggled here, have consecrated it far above our power to add or detract. The world will little note, nor long remember, what we say here, but it can never forget what they did here. It is for us, the living, rather to be dedicated here to the unfinished work which they who fought here have thus far so nobly advanced. It is rather for us to be here dedicated to the great task remaining before us, that from these honoured dead we take increased devotion to that cause for which they gave the last full measure of devotion ; that we here highly resolve that these dead shall not have died in vain ; that this nation, under God, shall have a new birth of freedom, and that government of the people, by the people, and for the people, shall not perish from the earth."

The reverse of Chickamauga might have added solemnity to the President's words. The words themselves were heralds of triumph. Grant had taken in hand the beaten army, adding to it his own veterans. On the 23rd, he moved out to attack Bragg, and on the 25th, in great measure through Sherman's desperate valour, the Confederates were driven from their strong positions, and pursued by Thomas and Hooker into Georgia, whilst Granger and Sherman were sent to relieve Burnside at Knoxsville. But already Longstreet had been beaten off in an assault ; he now raised the siege, but effected a masterly retreat into Virginia.

I need not dwell upon Mr. Lincoln's third annual message (9th of December, 1863). Appended to it is, however, a remarkable proclamation (8th December), containing his scheme for reconstruction of the Union. With certain exceptions, a full amnesty was tendered to all who should take an oath of loyalty to the United States. Mr. Lincoln then provided that any number of persons, not less than one-tenth in number of the votes cast in the ten States of the original secession in 1860, having taken and kept the oath of loyalty, and being qualified voters under their respective State laws before secession, might re-establish a State government in conformity with the oath ; adding that any provision to be adopted by such State government in relation to the freed people of such State, which should "recognise and declare their permanent freedom, provide for their education," and might "yet be consistent, as a temporary arrangement, with their present condition as a labouring, landless, and homeless class," would "not be objected to by the National Executive."

Among the measures of Congress passed this session, I will only mention the establishment of a "Bureau of Freedmen's Affairs," to determine all questions relating to the coloured people, and regulate their employment and proper treatment. A proposed amendment of the constitution abolishing slavery absolutely was adopted by the Senate, and by a majority of the House of Representatives, but did not obtain in the latter the two-thirds vote required by the constitution.

The military operations of the early part of 1864 were unsuccessful or unimportant.

I must not overlook a letter (4th April) written for the purpose of putting on record his previous verbal reply to a deputation from Kentucky on the subject of the draft. After saying, "I am naturally anti-slavery. If slavery is not wrong, nothing is wrong. I cannot remember when I did not so think and feel," he explained the causes which had prevented him as President from acting on this feeling until such time as, through the failure of his appeals for compensated emancipation, he felt himself "driven to the alternative of either surrendering the Union, and with it the Constitution, or of laying strong hold upon the coloured element." He chose the latter, not "entirely confident" in so doing of greater gain than loss. But "more than a year of trial now shows no loss by it in our foreign relations, none in our home popular sentiment, none in our white military force, no loss by it anyhow or anywhere."

On the 5th May commenced the final campaigns of the war, consisting, the one of a renewed march of the army of the Potomac upon Richmond, under Grant and Meade, the other of Sherman's successive advances from Chattanooga toward the Atlantic coast, and from thence again northwards—campaigns on the details of which I cannot dwell, although each is of surpassing interest. In Virginia a veteran and consummate general, Robert Lee, operating, as he indeed always has done throughout the war, not only within his own territory, but upon carefully studied, carefully fortified ground, every inch of which almost is personally familiar to him, and leading an army, small comparatively in numbers, but used to victory, finds himself confronted by a much younger chief, Ulysses Grant ; new indeed to the country, but who has fought his way through a thousand miles of hostile soil, and has won almost each successive victory on fresh ground ; new to the oft-defeated army he commands, but whose most recent achievement has been to lead beaten troops to victory. Between these foemen, each full worthy of the other's steel, the scales to many seem long to tremble equal. Flinging himself across the Rapidan before his enemy can oppose him, Grant enters that terrible "wilderness,"—a broken, wooded country, where artillery cannot manœuvre, where every knoll and clump and patch of scrub may hide a murderous ambuscade. He is met here by the enemy, confident of winning new triumphs. The slaughter is immense ; but on the third day (May 5—7), Lee falls back on his second line of defence. By a series of flank marches, Grant forces Lee, step by step, back upon Richmond, yet without being able to reach the oft-approached goal, until at last (June 18th), by a movement less expected than any, he swings round to the south, and takes up that position before Petersburg, which he is to hold during so many months.

Sherman, on his part, was performing the first, and only really contested one, of his three great marches—that from Chattanooga to Atlanta. His army was numerous, but the country was most difficult, and he had in front of him, at the head of forces perhaps not more than half his own, but superior in cavalry, a skilful and wary adversary, Joseph Johnstone, who on one occasion (Sherman's unsuccessful attack at Kenesaw, June 27), inflicted on him a loss of 2500 men. But, Sherman compelled Johnstone to evacuate one strong position after the other, till at last, when nearly within reach of Atlanta, his success was hastened through Johnstone's supersession (17th July) by the gallant but shallow-headed Hood, who took the offensive, got several times beaten, and soon saw Sherman in Atlanta, and himself out of it (2nd September).

Meanwhile another momentous campaign was proceeding. The four years' term of office of Mr. Lincoln, as President, would expire in March, 1865. The new Presidential election would take place in November. Who was to be the next President? The Democrats put forward General M'Clellan; the ultra-abolitionists, General Fremont (who, however, resigned his candidateship before the election). But the "National Union" Convention at Baltimore (June 8th) unanimously adopted Abraham Lincoln and Andrew Johnson as candidates for the Presidency and Vice-Presidency, on a "platform" embodying a hearty approval of his emancipation proclamation, of the military employment of former slaves, and recognising the duty of affording protection to all persons of whatever colour employed in the national armies. This nomination, accepted by Mr. Lincoln on the 27th, gave great strength to the Republican, or as it may now be called, the National party, and weakened to a corresponding extent whatever hopes the Confederates might have built on Northern dissensions. It was accordingly followed, not long after, by an attempt at negotiation. Three semi-official Confederate Commissioners applied for a safe conduct to Washington, there to treat of peace. There was a trap concealed in the offer, which deceived even old Republican Abolitionists. If the President consented to treat, without any stipulation as to the restoration of the Union, he forfeited all title to support as a Union candidate. If he did so without any stipulation as to the abolition of slavery, he forfeited all title to support from the Abolitionists and the coloured people. And if the self-proposed Commissioners were not accredited by an authority controlling the war-power, the only result of admitting them might be to introduce into the capital, at a time of political crisis, a set of dangerous intriguers. Mr. Lincoln saw through the plot, and baffled it by a safe-conduct (July 18th) combining in a marvellous manner the harmlessness of the dove with the wisdom of the serpent:—

> "To whom it may concern:—Any proposition which embraces the restoration of peace, the integrity of the whole Union, and the abandonment of slavery, and which comes by and with an authority that can control the armies now at war against the United States, will be received and considered by the Executive Government of the United States, and will be met by liberal terms on substantial and collateral points, and the bearer or bearers thereof shall have safe conduct both ways."

Utterly discomfited, the plotters went their way, writing indignant letters to the newspapers. The Democratic party did not, however, abandon the attempt to carry M'Clellan's election.

The month of September, besides witnessing severe fighting in the neighbourhood of Petersburg, where Grant was establishing his own position, and gradually obtaining control of, or destroying, various railway lines by which Richmond communicates with the South, saw the rise into prominence of a young commander hitherto known only as a cavalry leader by various dashing raids through Virginia. Placed in command of the general Federal forces in North-Western Virginia, Sheridan in a couple of brilliant battles (September 19, 23) defeated and drove before him the Confederate General, Early. Undaunted by defeat, Early took advantage of a temporary absence of Sheridan, and of a dense fog, to attack his army before daylight (October 19). The news reached Sheridan, fortunately not very far distant, hastening to his army. Without bringing with him so much as a company to reinforce it, he yet brought victory with his presence; attacked Early that afternoon with his routed troops, and routed him, retaking all captured guns, and as many besides, with some 1600 prisoners.

To divert Grant from Richmond, and Sherman from Atlanta, were now the chief aims of the Confederates. Missouri was for the third time invaded by General Price in October; and, though Rosecranz did little to check it, the Confederates were routed, chiefly by Kansas militia, seconded by 5000 Federal cavalry under Pleasanton, and withdrew, to return no more. Forrest, who had long succeeded in maintaining himself in Western Tennessee, was scouring with his cavalry to eastward, in order to destroy Sherman's communications. Acting in concert with him, Hood, with about 45,000 men, was operating in Sherman's rear, destroying the railway line from Atlanta to Chattanooga, and attacking detached garrisons.

To the same month of October belongs an important event in the civil history of the time,—the adoption of an anti-slavery constitution by Maryland.

And now came the fated 8th November with its Presidential election, which emphatically stamped the seal of national approval on Mr. Lincoln's policy, his term of office being renewed, not only by the votes of all the loyal States but three (Delaware, New Jersey, Kentucky), forming a majority sufficient to have carried his re-election had all the States in secession taken part in the election and voted against him, but by a larger popular majority (upwards of 365,000) than had ever been given in a contested Presidential election. Mr. Lincoln was serenaded, and replied as follows (10th November):—

> "It has long been a grave question whether any Government, not too strong for the liberties of its people, can be strong enough to maintain its own existence in great emergencies. On this point the present rebellion has brought our Republic to a severe test, and the Presidential elections occurring in regular course during the rebellion, added not a little to the strain. If the loyal people united were put to the utmost of their strength by the rebellion, must they not fall when divided and partially paralysed by a political war among themselves? But the election was a necessity. We cannot have a free government without elections; and if a rebellion could force us to forego or postpone a national election, it might fairly claim to have already conquered us. . . . But the rebellion continues, and now that the election is over, may not all having a common interest reunite in a common effort to save our common country? For my own part, I have striven and shall strive to avoid placing any obstruction in the way. So long as I have been here I have not willingly planted a thorn for any man's bosom. While I am duly sensible to the high compliment of a re-election, and duly grateful to Almighty God for having directed our countrymen to right conclusions, as I think, for their good, it adds nothing to my satisfaction that any other man may be disappointed by the result. May I ask those who have differed with me to join with me in this same spirit to those who have not?"

Those who may turn back to Mr. Lincoln's early speeches before and upon entering on the Presidential office, will feel the beautiful consistency with himself which the comparison exhibits throughout. Office has indeed now given him confidence in his own powers, yet without imparting the slightest tinge of vanity, self-seeking, bitterness. His aim is still, as at the first, to lift men above the separating influence of party politics, into that sphere where they may unite their efforts for a common purpose. Moving in that higher sphere himself, his own pure spirit literally knows no political adversaries, but only fellow-countrymen, with whom he longs to work in fellowship.

I left Hood busily engaged in destroying Sherman's communications with Chattanooga. After a period of seeming inaction, Sherman began following his enemy, not very closely pursuing him, but rather pushing him before him, and off the railway line to the westward. Then sending on General Thomas with all superfluous baggage and part of his artillery to Nashville, which he foresaw would serve as a bait to the Confederates, he rapidly doubled back, destroyed effectually that railway line which Hood had only destroyed imperfectly, destroyed Atlanta itself so as to prevent its serving any more as a stronghold or a rallying-point, and with about half his forces began (November 16) the second of his great marches, this time from Atlanta towards the ocean, plunging into the heart of Georgia with ten days' rations, the troops marching in two bodies on a line sometimes fifty miles wide, foraging and destroying the railways as they went.

For a month no certain news reached the North of his whereabouts, nor was the final development of any of these various movements known when Mr. Lincoln addressed to Congress (6th Dec.) his fourth—his last "annual message;" not of undue length, but too long to abstract. I may notice a kindly reference to England and France, in speaking of the efforts of "disloyal emissaries" to "embroil our country in foreign wars." He said, "The desire and determination of the maritime States to defeat that design are believed to be as sincere as, and cannot be more, earnest than our own." He briefly noticed the war, the general advance of the army, the reorganisation of Arkansas and Louisiana under free constitutions, movements to the same effect in Missouri, Kentucky, Tennessee; the free constitution adopted in Maryland, "to secure liberty and union for all the future;" the proposed amendment to the Constitution abolishing slavery, which he recommended to be reconsidered and passed. He dwelt on the late election, on "the extraordinary calmness and good order" which marked it; on the fact that no candidate for office, high or low, had "ventured to seek votes on the avowal that he was for giving up the Union;" on the growth in population shown by the result of the polls; on the abundance of material resources possessed by the nation. He then passed to the means of re-establishing and maintaining the national authority. It did not seem to him that any attempt at negotiation with the insurgent leader could result in good, since he would accept nothing short of the severance of the Union. But his followers could at any time "have peace simply by laying down their arms and submitting to the national authority." And he concluded thus:—

> "I retract nothing heretofore said as to slavery. I repeat the declaration made a year ago, that while I remain in my present position I shall not attempt to retract or modify the emancipation proclamation; nor shall I return to slavery any person who is free by the terms of that proclamation, or by any of the acts of Congress. *If the people should, by whatever means or process, make it an executive duty to re-enslave such persons, another, and not I, must be their instrument to perform it.*"

Now came glorious news from Georgia and Tennessee. Sherman had at last debouched on the coast. Followed by droves of cattle and by thousands of fugitive slaves, his unthinned troops, "fat and well-liking" with the good cheer of Georgia, had completed that marvellous "retreat" which was to result in the reduction of well-nigh all the Eastern sea-board of the Confederacy. After deceiving the enemy by a cavalry feint against Augusta, Sherman had presented himself before Fort Macalister, the only obstacle between him and Admiral Dahlgren's fleet, which was waiting for him off the coast, stormed it (Dec. 13), and after a few days' siege entered Savannah, which Hardee had evacuated (Dec. 21). Meanwhile, Thomas had justified Sherman's confidence, and his title to a chief command; had lured on Hood to destruction—staggered him by a first blow on the road to Nashville—then withdrawn still further under the very walls of the city, then turned on his enemy and crushed him (Dec. 15). Sherman meanwhile had commenced the third of his marches to the northward. Charleston, which had so long baffled the utmost efforts of the Federals, fell at last without a blow, the destruction of a few railway lines causing its evacuation; and Sherman, after penetrating to the very heart of South Carolina, and occupying its capital, Columbia (17th Feb. 1865), turned eastward, to effect a junction with Terry and Schofield, advancing from Wilmington.

A fresh negotiation was now opened by the Confederates, through Mr. A. H. Stephens, their Vice-President, Senator Hunter of Virginia, and Judge Campbell. Mr. Lincoln and Mr. Seward met them personally on a steamer, in Hampton Roads (Feb. 4). The bait was held out, if only the question of separation were postponed, and an armistice granted, of an alliance, offensive and defensive, a war of conquest on Canada or Mexico. The Federal statesmen insisted on re-union, with an acceptance of all measures hitherto taken against slavery. The conference broke up, a failure—no doubt intended to be such by Mr. Davis—and the failure was immediately made use of by himself and his Secretary of State, Mr. Benjamin, to provoke a revival of the war-fury in the South, and to carry what both now saw to be their last resource—the arming of the negroes.

But the time was long past when the South could have outbid the North for the support of the slaves. The amendment to the Constitution, abolishing slavery, had been carried by the requisite majority in Congress, and awaited only the necessary ratification by three-fourths of the States—almost all the most important of which, New York, Massachusetts, Pennsylvania, Illinois, &c., ratified it almost at once.* Mr. Lincoln, serenaded on the evening of the passing of the measure, spoke of the occasion as "one of congratulation to the country and to the whole world," and of the amendment itself as "a fitting, if not an indispensable, adjunct to the winding up of the great difficulty."

A final defeat by Sheridan of his old antagonist Early, nearly the whole of whose force were taken prisoners, heralded brilliantly Mr. Lincoln's resumption of the presidential office (March 4, 1865). From the text of his brief "Second Inaugural" I give an extract:—

> "On the occasion corresponding to this four years ago, all thoughts were anxiously directed to an impending civil war. All dreaded it. All sought to avoid it. . . . Both parties deprecated war, but one of them would make war rather than let the nation survive, and the other would accept war rather than let it perish, and war came.
>
> "One-eighth of the whole population were coloured slaves, not distributed generally over the Union, but located in the Southern part. These slaves contributed a peculiar and powerful interest. All knew the interest would somehow cause war. To strengthen, perpetuate, and extend this interest was the object for which the insurgents would rend the Union by war, while the Government claimed no right to do more than restrict the territorial enlargement of it. Neither party expected the magnitude or duration which it has already attained; neither anticipated that the cause of the conflict might cease even before the conflict itself should cease. Each looked for an easier triumph, and a result less fundamental and astonishing. Both read the same Bible and pray to the same God. Each invokes His aid against the other. It may seem strange that any man should dare to ask a just God's assistance in wringing bread from the sweat of other men's faces; but let us judge not, that we be not judged. The prayer of both could not be answered; that of neither has been answered fully; for the Almighty has His own purposes. 'Woe unto the world because of offences, for it must needs be that offences come; but woe to that man by whom the offence cometh!' If we shall suppose American slavery one of those offences which in the Providence of God must needs come, but which having continued through His appointed time He now wills to remove, and that He gives to both North and South this terrible war, as was due to those by whom the offence came, shall we discern that there is any departure from those divine attributes which believers in the living God always ascribe to Him? Fondly do we hope, fervently do we pray, that this mighty scourge of war may speedily pass away; yet if it is God's will that it continue until the wealth piled by bondmen by 250 years' unrequited toil shall be sunk, and until every drop of blood drawn with the lash shall be paid by another drawn with the sword, as was said 3000 years ago, so still it must be said, that the judgments of the Lord are true and righteous altogether.
>
> "With malice towards none, with charity for all, with firmness in the right, as God gives us to see the right, let us strive on to finish the work we are in, to bind up the nation's wounds, to care for who shall have borne the battle, and for his widow and orphans, to do all which may achieve and cherish a just and a lasting peace among ourselves and with all nations."

Side by side with this message I would fain place, by way of contrast, a speech of March 17, on the occasion of the presentation of a captured flag, in reference to the attempt then being made by the Confederates to enlist the coloured men, from which Mr. Lincoln truly concluded that his countrymen now saw "the bottom" of their enemy's resources. "I am glad," were his last words, "to see the end so near at hand." It is indeed. Sherman has reached Fayetteville (11th March), within 200 miles from Grant, Hardee evacuating it on his approach, and is marching upon Goldsborough. His old antagonist, Johnstone, has been restored to command, and fronts him once more; strikes one somewhat vigorous blow on Sherman's left wing at Dentonville (18th March), but it is the last. Goldsborough is occupied (21st March). Sherman is within 140 miles of Grant. All now turns upon Lee. A night attack on Grant's right is momentarily successful (25th March), but the Confederates have to withdraw at daybreak, leaving 1200 men behind. Meanwhile, the Confederate forces in the Shenandoah Valley being annihilated, Sheridan has come round to City Point on the James with his troops, victors in so many fights (28th March). Sent to the extreme right of Lee's line, to cut off the last line of communication between Richmond and the South, he wins his wonderful victory of Five Forks, chiefly with dismounted cavalry (1st April), thus severing Lee from Johnstone. The main body of Grant's army now attacks the Confederate lines, and forces them; Petersburg is evacuated, then Richmond (3rd

---

* One or two votes are still wanting to make up the requisite number.

April). Lee tries to escape by the south-west, but is pursued by Sheridan, who on the 6th April strikes one of his retreating columns, and takes 6000 prisoners, including six generals. Grant immediately opens negotiations for surrender with his worthy but unsuccessful antagonist, and after a correspondence equally honourable to both parties, the Confederate army of Northern Virginia is surrendered by its veteran commander (9th April). Two days later, Abraham Lincoln made his last speech (April 11th, 1865) :—

> "We meet this evening, not in sorrow, but in gladness of heart. The evacuation of Petersburg and Richmond, and surrender of the principal insurgent army, give hope of a righteous peace, whose joyous expression cannot be restrained. In the midst of this, however, He from whom all blessings flow must not be forgotten. A call for a national thanksgiving is being prepared, and will be duly promulgated. Nor must those whose harder part gives us the cause of rejoicing be overlooked; their honours must not be parcelled out with others. I myself was near the front, and had the high pleasure of transmitting much of the good news to you; but no part of the honour for the plan or execution is mine. To General Grant, his skilful officers, and brave men, it all belongs. The gallant navy stood ready, but was not in reach to take active part. By these recent successes the reinauguration of the national authority, the reconstruction of which has had a large share of thought from the first, is pressed most strongly upon our attention. It is fraught with great difficulty. Unlike a case of war between independent nations, there is no authorised organ for us to treat with, no one man has authority to give up the rebellion for any other man. We simply must begin with and mould from disorganised and discordant elements. Nor is it a small additional embarrassment that we, the loyal people, differ among ourselves as to the mode, manner, and measure of reconstruction."

And now, to the astonishment of many, no doubt, and probably to the disgust of some of his hearers, he goes into the question of the Louisiana State Government, and never gets out of it during the rest of the speech. He concedes that it would have been more satisfactory if the constituency had been larger, and if the franchise had been granted to the coloured race. Still the fact remained that some 12,000 votes in this heretofore slave State had adopted a free state constitution empowering the Legislature to give the coloured race the franchise; and this Legislature had already voted to ratify the constitutional amendment abolishing slavery.

When we consider that only three days later (April 14th) the speaker met his tragic death-stroke, we may be tempted to wish that some grander, larger words had fallen from his lips on such an occasion. And yet the speech has a quiet majesty of its own. Surely no man ever more perfectly realized those words of St. Paul, "Forgetting those things which are behind, and reaching forth unto those things which are before." Behind is a four years' struggle for the very life of the nation, gigantic, world-famous; behind are Sherman's strides of triumph, and Grant's patient strategy, and Sheridan's meteor-like successes, and the fall of the rival capital, and the surrender of a great general and of a long-victorious army; yet all is forgotten in a moment by him who more than any other has the right to rest upon present blessings, since he has borne the whole burthen of past anxieties and sorrows, whilst he reaches forth to the things before, —to the reconstitution of the South on its new basis of freedom, and in particular to this Louisiana State Constitution. There lies his present duty, and how to fulfil that duty is now all his care. That he judged rightly as to the importance of the question of negro suffrage it is impossible to deny. Surely no one could have uttered such a speech at such a moment, but one in whose soul duty was a fixed, dominant, nay, all-absorbing principle; one who, simply and without effort, was fulfilling the wise man's precept: "Whatsoever thine hand findeth to do, do it with thy might."

I know of no further public utterances of President Lincoln before his murder, beyond the brief and touching record of his last Cabinet Council :— "He spoke very kindly of Lee and others of the Confederacy." But no notice of his state-papers and speeches can be sufficient which does not include that voice from his grave, President Johnson's reply (20th April) to Sir F. Bruce on his first presentation as British Minister, known to have been drawn up by his predecessor—the last solemn token of Abraham Lincoln's friendly feeling towards our country and our sovereign :—

> "Sir Frederick Bruce,—Sir: the cordial and friendly sentiments which you have expressed on the part of Her Britannic Majesty gave me great pleasure. Great Britain and the United States, by the extended and varied forms of commerce between them, the contiguity of positions of their possessions, and the similarity of their language and laws, are drawn into contrast and intimate intercourse at the same time. They are from the same causes exposed to frequent occasions of misunderstanding only to be averted by mutual forbearance. So eagerly are the people of the two countries engaged throughout almost the whole world in the pursuit of similar commercial enterprises, accompanied by natural rivalries and jealousies, that at first sight it would almost seem that the two governments must be enemies, or at best cold and calculating friends. So devoted are the two nations throughout all their domain, and even in their most remote territorial and colonial possessions, to the principles of civil rights and constitutional liberty, that on the other hand the superficial observer might erroneously count upon a continued consent of action and sympathy, amounting to an alliance between them. Each is charged with the development of the progress and liberty of a considerable portion of the human race. Each in its sphere is subject to difficulties and trials not participated in by the other. *The interests of civilization and humanity require that the two should be friends.* I have always known, and accepted it as a fact, honourable to both countries, that the Queen of England is a sincere and honest well-wisher of the United States, and have been equally frank and explicit in the opinion that the friendship of the United States towards Great Britain is enjoined by all the considerations of interest and of sentiment affecting the character of both. You will therefore be accepted as a Minister friendly and well-disposed to the maintenance of peace and the honour of both countries. You will find myself and all my associates acting in accordance with the same enlightened policy and consistent sentiments; and so I am sure that it will not occur in your case, that either yourself or this Government will ever have cause to regret that such an important relationship existed at such a crisis."

J. M. LUDLOW.

EASTWARD.

BY THE EDITOR.

XI.—OUT OF PALESTINE.

On our march to Safed on Saturday morning, we again passed the town of Tiberias, and crossed the slope of the steep hill that descends to the portion of the lake beyond it. This promontory is the southern boundary of the famous plain of Gennesareth, which is three or four miles long and about one broad, and skirts the north-west corner of the lake. In all Palestine there are no three miles more interesting. The richness of the plain itself cannot be surpassed, though it is only partially and poorly cultivated by a few oppressed and miserable-looking armed peasants. Yet the glory of its vegetation, and the splendour of its flowering shrubs, suggest a vast "hothouse," whose walls have disappeared, but whose precious exotics remain to beautify the earth. Its tropical heat, the excellence of its alluvial soil swept down from neighbouring hills throughout long ages, the streams of living water that flow through it, sufficiently account for its luxuriant fruitfulness. It is bordered by hills of picturesque form, imposing height, and varied outline. A noble gorge (Wady el Hymâm), with precipitous rocks, descends in one place, while others less wild open their green sides and pour in their fresh streams; and the mountain mass topped by Safed rises 3000 feet above all. On this plain, too, and along a line of about seven miles north from Midjel, were those populous and thriving cities with whose names we are so familiar, and where such busy and momentous hours of our Lord's life on earth were spent. The sites of none of them have been certainly fixed,* with the exception of that of Magdala —whose name of Midjel is preserved in the present miserable cluster of huts at the very entrance to the plain, and which is for ever associated with her who was delivered from a mysterious possession of seven devils, and became full of love and devotedness to Jesus. But I have no doubt that with more time and better means of investigation, every site on the plain could be accurately determined. As it is, however, we know that within the space of a very few miles those lively and bustling cities described in the Gospel narrative once flourished; and we can to some extent restore, by the power of fancy, guided by history, the scenes which make this plain and its shore the most famous in the world.

Passing a stream above Khan Minyeh (the Capernaum of Robinson and others), we began the long and steep ascent to Safed, along a path disclosing views really beautiful, and in some places actually grand, as in the Wady Leimun, where the precipices attain a height of 700 or 800 feet.

An hour or so before reaching Safed, we were overtaken with such a deluge of rain as would have surprised even Glasgow and the west of Scotland. It combined the "pouring down in buckets" of England, with the "even-down pour" of Scotland. Where had our muleteers encamped? Were our tents floated off, or were they only soaked with water, and our beds and bags and portmanteaus reduced to a state of pulp? Hadji Ali, anticipating the worst, wisely suggested that we should proceed at once to the only house in the city where we were likely to get shelter and tolerable accommodation on fair terms. It was the Austrian Consul's. We consented to enter any ark, if we could only get out of the deluge. So for the Consul's we made, with dripping horses, dripping hats, dripping clothes, and dripping noses. We entered the city by the channel of what seemed to be the common sewer rushing like a mountain rivulet, and halted at the rough steps which led to the door of a house, whose outward appearance was characterised by a humble disregard of all pretence to architecture, beyond what was actually needed to place one rough stone upon another, leaving spaces for a door and a few small windows. The chamber into which we were ushered was sufficiently cool. It had stone floors and stone-vaulted roof, but no furniture, save a Consular coat-of-arms, suspended on the wall, and bearing an eagle with two heads, which, by the way, seemed much more puzzled, distracted, and stupid than any eagle with only one head I had ever seen. We found that, although our tents were soaked, our luggage and beds were safe. So in a short time we managed to give our vault some signs of life and comfort. Another room into which ours opened was a kitchen — that is, it had a large chimney, and was full of smoke. Here Hadji and Nubi spread their mats and cooked our victuals, making themselves and us equally comfortable. Most thankful were we for our stone retreat, and not the less so when Consul Mierolowski presented himself, and proved to be a simple-hearted, frank, thoroughly kind man. He was delighted to let his lodgings to us, and thankful for the storm which had driven us his way. He is the only Christian in the place, and very seldom sees any civilised Europeans. Travellers, in ordinary circumstances, live in their tents, and pitch them outside the town, passing him by. Speaking of the rain, he comforted us by remarking, in an off-hand, consular, and statistical way, that an earthquake was due about this time, as they generally come periodically, and the state of the atmosphere was an unmistakable warning. There had been a shock, moreover, three days before, which had made all the inhabitants rush out of their houses; and it was apt to repeat itself, he said, on the third day. We looked at the vaulted roof and stone walls, but said nothing. Earthquakes, the reader must understand, have been a familiar subject of conversation in Safed since 1837, when from two to three thousand persons perished in a few minutes. The houses circling the hill—like the terraces of the Tower of Babel in the old Bible pictures—then fell pell-mell on each other, crushing Jew and Mahommedan into one mass of dead and dying. But as the Consul in announcing the probable return on this day, not necessarily of such an earthquake as would destroy the "Schlupwinkel," as he called Safed, but of such a tremor or shock as might throw us out of our beds—asked a light for his cigar, exclaiming when a few damp lucifers refused their light, "Tausend donnerwetter, noch einmal!" his coolness made us pluck up courage and think of dinner.

---

* I do not attempt to enter on the question of sites, discussed so fully by Robinson, Stanley, Thomson, Wilson, Porter, Buchanan, and others; I must refer my readers to their works for full and ample information on the point.

The consul dined with us, and was both intelligent and communicative, his German being very good. He entertained us with stories about the Jews, and the conduct of the Turkish officials towards them, and towards all whom they can swindle or oppress. "For," as he remarked, "these fellows who govern here, such as Abdul Kerim Effendi or Moodir Bey, know not how long they may be in circumstances to make money. An intrigue by anyone who has a larger purse to bribe the bigger purses, may take the prey out of their hands; so they must pluck and eat it as rapidly as possible. If they only gather and remit the amount of taxes which they bargained for, good; all above that sum which they can cheat the miserable people out of, or force from them, is so much gain to their own pockets."

"For example?" I said.

"For example? Well. A Jew not long ago bought a piece of ground here, and began to erect a house upon it. The Turkish official sent for him and told him, that one of the workmen had brought to him a bone, dug up accidentally from the ground. It was evident therefore that some true believer had been buried there, and that the house of a Jew could not possibly be erected on so holy a spot. The Jew must stop the building. 'And lose all my money!' pleaded poor Moses in vain. But Moses knew his man, and expressing his deep regret for the mistake which he had so unintentionally committed, begged to know if a fine, say of 1000 piastres (that is, a bribe of course to the official) for his sin, would be a sufficient atonement? The official replied that he would consider. Having made up his mind to pocket the money and his orthodoxy, he forthwith got a stone cut with a cross upon it, and this he ordered to be buried in the supposed Mahommedan graveyard. The 1000 piastres being paid in the meantime by the Jew, the Turk assembled some of the orthodox Gentiles along with the orthodox Jews, and expressing his doubts regarding the Mahommedan origin of the bone, and his sincere wish to do justice to the Jew, suggested that they should dig and examine the earth with care. Soon the stone with the cross was exhumed. 'Ah!' said the Turk, 'I rejoice! It has been a Christian burial place: and what care you or I for the dogs? Proceed with your building!'"

The Consul described the Jews as being sunk to the lowest point of morality. Here let me remind the reader that there are in Palestine four cities called "holy" by the Jews;—Hebron, Jerusalem, Tiberias, and Safed. In each there has been a school of Jewish learning, which produced some great scholars—men whose names are famous in every synagogue, and some of whom, such as Maimonides, whose tomb is outside Tiberias, are known to all students. Now the longer one lives in the world the more is he disposed to make exceptions to any generalisation affecting the character of any whole party, class, or sect. But, not forgetting this, I must admit that it is more than likely, from the circumstances in which the Jews of Palestine are placed, that they are, as a whole, very degraded. They live chiefly on the charity of their brethren in Europe, to whom appeals are annually made by men appointed for the purpose—and who receive a "consideration" in the way of per-centage on their collections. This of itself is a strong temptation on the part of the recipients to be idle, lazy, and suspicious; and on the part of the Rabbis, who collect and distribute the alms, to be tyrannical and dishonest. Besides this, according to a principle of the Turkish government, each religious persuasion, other than Mahommedans, are allowed to manage their own affairs—their officials enjoying the power of life and death over those subject to them in ecclesiastical matters. This system saves trouble to the Government, which would derive no profit from saving men's lives, far less from executing justice. Thus it happens that the Jews in Palestine are, as far as we could learn, very fanatical and degraded—the Rabbis ruling with a rod of iron, or of pickle.

The Consul gave us some facts touching the morality of the Rabbis, the truth of which he solemnly vouched for as having come under his own eye; but they are far too terrible and disgusting to be told in these pages.* Of their oppressions and robberies, I may, however, give one or two instances. It is the law, we were given to understand, of the

---

* One terrible story was to the effect that the punishment of death had been inflicted on a Spanish Jewess the day before we reached Safed, for a crime in which *one of the Rabbis who tried and condemned her was himself notoriously implicated.* We begged the Consul to make further inquiries on this subject. This he did, assuring us that all he heard was confirmed by an intelligent Jew, who, though he hated the proceeding, feared to speak. Such is the reign of terror.

Jewish community, that any money which enters a holy city belongs to the Rabbis on the death of its possessor. Now an Austrian Jew, with his son, had lately come, in bad health, to try the virtue of the baths at Tiberias. Feeling worse, he removed to the town of Tiberias itself, where he died. He left a considerable sum of money in a belt round his waist, of which his son and heir took possession. "It is ours!" said the Rabbis, "for he died in a holy city, and his personal property is thereby consecrated to holy purposes." "It is mine!" answered the son, "for I am his lawful heir by the laws of my country." The Rabbis urged, expostulated, threatened, bullied, cuffed,—but all in vain. "Refuse," they said, "and we won't bury your father, but shall cast his body into a cellar." The son remained obdurate. "You must, then," said the Rabbis, "lodge with your father,"—and they locked him up in the cellar, in hot suffocating weather, with his father's dead body! Next day he was taken out, but still refusing obedience, he was seized and robbed of all he had. He then fled, and, as an Austrian subject, cast himself for protection on the Consul, who got him safely and speedily conveyed out of the country, where he ran the risk of being assassinated for daring to rebel against the Rabbis. The Consul was at this time engaged in seeking to get redress.

Mr. Rogers, our well-known and excellent Consul at Damascus, who was formerly in Safed and Jerusalem, informed me afterwards that, upon claiming the property of a British Jew who died at Jerusalem, for the behoof of his family in England, burial of the body was refused by the Rabbis until the property was acknowledged to be theirs. This Mr. Rogers resisted, and determined to get the body buried himself. But when about to lower the Jew into his grave, in the valley of Jehoshaphat, so hot a fire was opened on the burial party from concealed foes on both sides of the valley, that they had to fly for their lives, and secure a strong Turkish guard before they could accomplish their purpose!

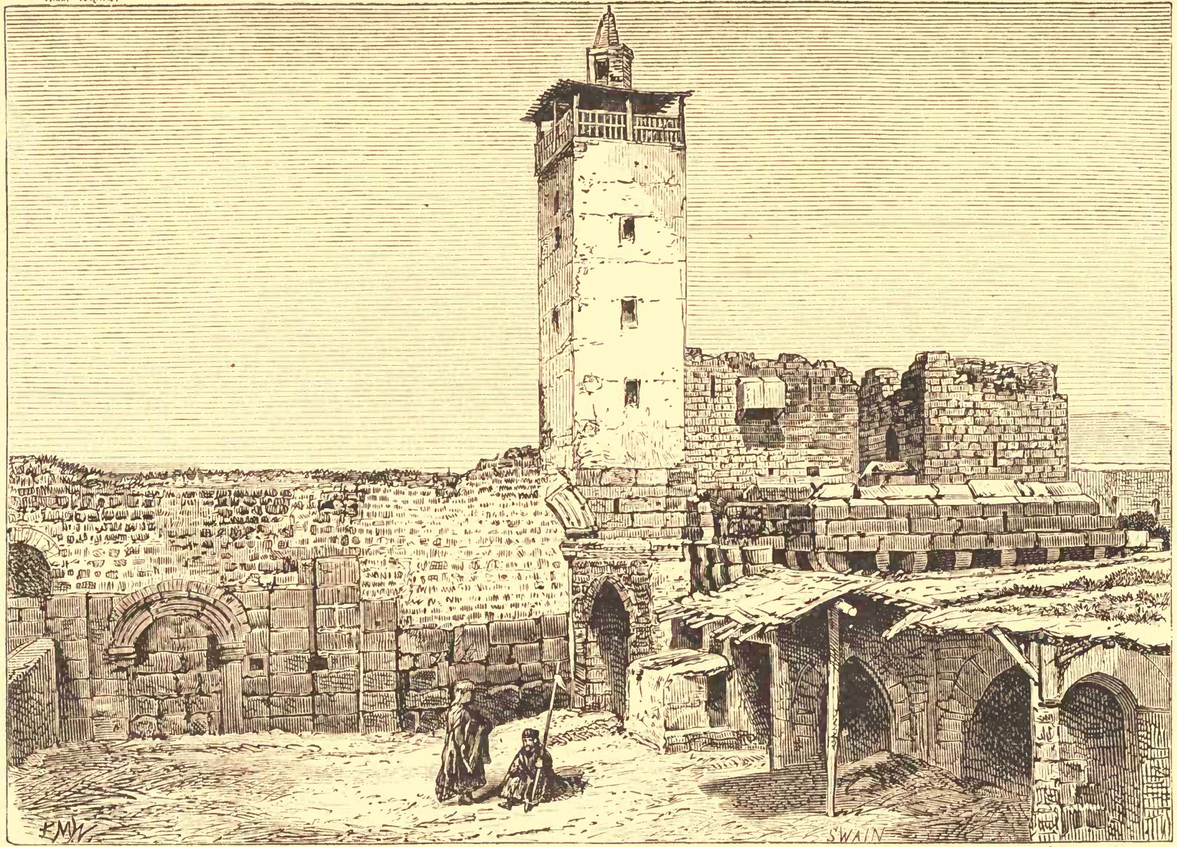
Another story, and I am done. One of the Rabbis in Safed got a false key for the treasury from which the small weekly allowance to the "saints" is distributed, and daily helped himself from it. He was detected in the act by the daughter of the treasurer, but she allowed him to escape on the promise of his resigning to her the blessed privilege of the seat in heaven which he as a Rabbi was entitled to. The girl was grateful for such a prospect of promotion after death. But soon after, he was detected at his old practices by her mother, who was ignorant of his previous delinquency. He then offered her also his seat in heaven, but for some reason it was declined, and she denounced him to her husband. The affair was finally settled by the honoured Rabbi being compelled to satisfy the people whom he had robbed, by publicly giving up to them as a free gift—to be divided as Providence might direct—his seat in heaven! It must have been a large one.

Such is the state of the Jews in Palestine. Cannot the respected and intelligent Jews of Europe and America try to remedy this? It is in their hands to refuse supplies, unless for the encouragement of industry. If they must give alms, these should be administered by some faithful agent, whom they could trust, and not by the Rabbis. This is not a question between Jew and Christian, but between right and wrong, honesty and injustice; and if a tithe of what was told me in good faith and by those well-informed be correct, surely there are Jews in this country who will deal with the matter justly and sensibly. The commercial cities of New York, London, Paris, or Frankfort, could very soon revolutionise for good the "holy" cities of Hebron, Jerusalem, Tiberias, and Safed.

But to return to our Consular conversation. The Consul read to us in German an official report made by him to the Government regarding the country, and enumerated in detail the several villages and towns within his circuit, mentioning the name of "Kaffirnahum." "What!" I exclaimed, "is there any place hereabout so called now? That would go far to set at rest a *questio vexata*—the site of Capernaum." "Sometimes," he said, "it is called Tel Hum, but just as often Kaffirnahum, by the Arabs. There is no doubt about it." To determine this fact, I resolved to ask him to call in a few natives whom I might examine; but, as it was suggested by one of our party that he might misunderstand this procedure as if we doubted his word, I did not prosecute inquiry in this way. Had I reported on my return home, however, that a Consul who has for years lived within a ride of three hours of Capernaum, had assured me that Kaffirnahum was always applied to an old site by the peasants who resided on the spot, such evidence would seem conclusive. Yet from subsequent conversations at Beyrout with Dr. Thomson, author of "The Land and the Book," and with Mr. Rogers, our Consul at Damascus, formerly, as I have said, Consul in Safed, I am persuaded that the worthy Austrian was mistaken, and that neither Tell Hum nor any other place on the shore of the Lake of Tiberias is now called Kaffirnahum by the native population.

The Consul mentioned what, if true—and on inquiry I did not hear it contradicted—would be interesting, namely that Safed and the district immediately around it is called *Canaan* by the natives, who often speak of their "going to" or "coming from *Canaan*," when met journeying to or from the district of Safed. If this on further inquiry be found correct, may it not possibly account for the name of "Simon the Canaanite"?

The day on which we rested at Safed was Easter Sunday, and we had divine service, attended both by English and American friends, who had more or less travelled with us from Jerusalem. In the afternoon we walked up to the ruins of the Crusader Castle of Safed, which immediately overhangs the town. The great earthquake shook



J. Graham, Photo.

THE EAST GATE OF DAMASCUS.

and overturned even its rock-like walls, and completed the destruction which the Turks and Time had long since begun. The evening was glorious. A holy Easter calm rested on mountain, plain, and sea. The view, too, was magnificent; and the thought that this was almost our last look at Palestine, deepened the feeling of sadness with which we gazed on the scene which was so holy to us all. To the south we saw Tabor, and Gilboa, and Hermon ; and beyond them, the hills of Samaria. To the west, the long ridge of Bashan lined the sky, dotted with the characteristic moundlike remains of extinct volcanoes. Beneath us, 3000 feet down, lay the sea of Tiberias, calm as a mirror, shining from its northern end onwards to its southern, where we saw the long depression of the Ghor leading to the Dead Sea. The plain of Gennesareth, and the shore on which Capernaum, Chorazim, and Bethsaida must have stood, were mapped out below. The longer I gazed on this scene and endeavoured in silence to receive the spirit which it breathed, the present became like a dream, and the dreamlike past became present. We came away praising God for His mercy in giving us such an Easter day ; and praising Him still more for giving an Easter day to the whole world by which we are "born again to a living hope by the resurrection of Christ from the dead." Next morning we began the day's journey that was to take us out of Palestine.

The night after leaving Safed we encamped at Maas. The first portion of our journey was through scenery, not only far surpassing anything we had seen in Palestine, but such as would attract attention and excite admiration if seen amidst the glories of Switzerland itself. The road which we followed during part of the day passed through extensive forests, luxuriant in spreading foliage and carpeted with brilliant flowers, revealing nooks of beauty that reminded me of the natural woods clothing some of our Highland hills and glens. There were many devious and perplexing paths, one of which was followed by our ardent flower-gatherer, and which, perhaps for the first time in his life, led him astray. It was some time before he was recovered by the habitual wanderer, Meeki. We rode along the summit of a ridge running north and south. Suddenly, when emerging from the forest into one of its open glades, a scene of great beauty burst upon us. The ridge on which we stood descended for at least 2000 feet in a series of plains, green with crops, and clothed with underwood; until the hill-side rested on the dead flat valley which extends for twenty miles from the Lake of Tiberias to the roots of Hermon. This plain is occupied by a marsh, through which the Jordan flows into lake Huleh, or Merom, which lay beneath us far down,—a bright eye, fringed with a broad circle of reeds, like eyelashes.

The situation of the ancient Kadesh Napthali on the same ridge is very beautiful. I do not remember having seen such noble olives elsewhere. One which I measured was about 18 feet in circumference. The remains of columns, sarcophagi, and buildings—whether Jewish or Roman, I know not—are numerous and impressive. Kadesh was one of the cities of refuge, and it was comforting to think of even the temporary rest and peace that many a "ne'er-do-weel" got by flying to it. It was also the birth-place of Barak; and nobly did its 10,000 Highlanders second their chief in his brave attack on Sisera, when the more comfortable Lowlanders kept to their fertile fields or profitable shipping. Joshua also penetrated these inland solitudes when he fought the battle of Merom—just as the brave Montrose, who, fighting for a worse cause, entered our West Highland fastnesses, and by his very daring secured the victory. Here, too, Sisera was slain in the tent of Jael—a vile, treacherous act, done by a bold, enthusiastic, ignorant, well-meaning woman, and an act which we cannot but condemn, even when feeling no pity whatever for the brave but tyrannical Canaanitish *Cateran* whose death restored to liberty thousands better than himself.

On our journey this day we passed a settlement of Zouaves from Algeria. It is on the side of a most romantic glen, near a hill which Dr. Robinson supposes to have been the site of the capital of Hazor. It was curious to see this village, inhabited by men who have come all this distance from their homes rather than submit to the French. It is probable that they had "compromised themselves" by a too great devotion to their country. But I was glad to see that they appear to have a most comfortable "location," and to be very prosperous in sheep, goats, and cattle.

I must also mention an incident of this day which greatly touched us. After passing through a prettily situated village—I forget its name—we came upon a rather excited crowd, composed chiefly of women, who were weeping and wringing their hands, as they accompanied our cavalcade of muleteers. We discovered, on inquiry, that one of Meeki's servants—unfortunate wretch!—was a native of the village; and that the chief mourners on the present occasion were his mother and sisters, who had received him with joy, and, as the phrase is, "pressed him to their bosoms," as he suddenly and unexpectedly appeared in the old home. The excitement in the village, the honest tears of the women as they gazed after our lad, the eagerness with which relations and old companions accompanied him some way on the journey, I confess "did my heart good." I was thankful for such evidences of the love which exists everywhere (in some hearts) and makes us all akin. The object of all this tender solicitude, was a remarkably nice youth, whose character might be summed up thus, "good-looking, active, and obliging"—a wonderful contrast to Meeki! I heartily expressed my sympathy with him by giving him the handsome *backsheesh* of a paper of good needles, some excellent thread, some artistic buttons, and a pair of glittering steel scissors, all of which I begged him to present, with my love of course, to his amiable and affectionate mother and sisters. The muleteer gratefully received, and as they say of the reply to all toasts, eloquently acknowledged, the gift, and the manner in which it was conveyed.

But my subject changes, and with it my thoughts. When opposite Hermon I could not forget that this magnificent mountain, which towers over Palestine, and whose pure and eternal snows join its landscape to the sky, was the scene of the transfiguration of our Lord.

A true poet has beautifully expressed what until lately was the general belief :—

"What hill is like to Tabor's hill in beauty and in fame?
There in the sad days of his flesh o'er Christ a glory came;
And light o'erflowed him like a sea; and raised his shining brow;
And the voice went forth that bade all worlds to God's Beloved bow." *

But the whole narrative, as is now generally admitted, suggests that it was Hermon, and not Tabor, that was for ever consecrated by this sublime event. I was thankful, when passing out of Palestine, to be able to associate with this the last and most sublime view from its sacred soil, one of the most impressive events which occurred in the history of Him whose life is the light of the whole land. That transfiguration, like Hermon, almost seems alone in its grandeur. It first of all united the old dispensation with the new. For Moses the representative of the law, and Elijah the representative of the prophets, appeared with Jesus in glory, and thus witnessed to Him who had fulfilled both the law and the prophets. Their work was finished. The stars which had illumined the old night were lost in the blaze of this risen sun. A voice from the Shekinah now said, to Jew and Gentile:—"This is my beloved *Son*—hear *Him*." Moses and Elias therefore depart, and leave the disciples with Jesus alone. Henceforth he was to be all and all. Hermon as connecting Palestine geographically with the Gentile world beyond, was a fitting place for such a Revelation of Jesus, in whom alone Jew and Gentile were to become one. The transfiguration also united this world with the next. Moses and Elias had been in glory for many centuries, yet they remained the same identical persons, retained the same names, and spoke the same language, as when on earth. A most comforting thought to us! For while Christ will "change our vile bodies, and fashion them like his own glorious body," yet to our human hearts it allays many fears, and answers many questionings to know that we shall for ever be the same persons; preserving our individual characteristics—all that is imperfect excepted; retaining possibly our old names and old language, as Moses and Elias did; anyhow that we shall know prophets and apostles, and our own dear ones, even as we are known of them. This thought makes parting from friends endurable, "which else would break the heart." How soothing to be assured that as certain as Jesus on the sides of Hermon conversed with Moses and Elias from heaven, and with Peter, James, and John from earth, so all who are united to the One Lord are united to each other; and that, though we cannot make enduring tabernacles here, or abide in any place here below with our friends, however dear, we shall yet in spirit, in heaven and earth, live together with Christ and His whole Church. The Death which Christ accomplished at Jerusalem, the only subject, as far as we know, of converse between Him and those heavenly visitants on this day of triumph, is the pledge of this very blessing. And when in leaving Palestine a feeling of despondency deepened the fear as to our ever joining that grand army, the traces of whose conflicts and triumphs we had been following with such eager interest—Hermon once more supplied us with comfort, refreshing as its own dews, not only from faith in that Death which He *has* "accomplished at Jerusalem," but from the story of that distressed parent, who, disappointed in all other men, had brought his child to Jesus as He descended from the mount, and cried, with mingled hope and doubt, "If thou canst do anything for us, help us!" Oh, blessed reply! "If thou canst believe!" As if He had said, there is no barrier in me—only in thyself. Believe and live! Oh, blessed confession and prayer, which were accepted and answered:—"Lord, I believe; help thou mine unbelief." With this prayer in my heart I turned away from Hermon though not from its memories.

Our journey out of Palestine ended as we crossed the Litâny. This river is as impetuous as a glacier stream, without a calm pool, or rippling ford. But we had a good old bridge to cross by, which saved us from all danger and trouble. High above to the left, on the top of a grand precipice washed by the raging stream, are the magnificent ruins of the Crusaders' stronghold, Kelat-el-Shukeef (Belfort). There is no ruin on Rhine or Danube so imposing.

We passed the Bridge and were *out of Palestine!*

Some of our party ascended to the castle, and came back in raptures with the majestic pile itself, and the majestic view from its walls. I jogged on with Hadji, and occupied my time in giving him what as a mere dragoman he ought, as I told him, to know, but which, to my astonishment, he was profoundly ignorant of. That was the leading facts of the Bible which make the land so interesting to those travellers on whom he depends. He listened with great patience, and seemed grateful for the information, wondering at the Bible stories connected with the places which we had visited together. Let other travellers give similar lessons, and dragomen will thereby become more intelligent and useful; nay, they may be able in their turn to instruct travellers who are very ignorant of their Bibles, and who do not even take the trouble of honestly reading the portions of Scripture referred to in Murray's accurate pages.

---

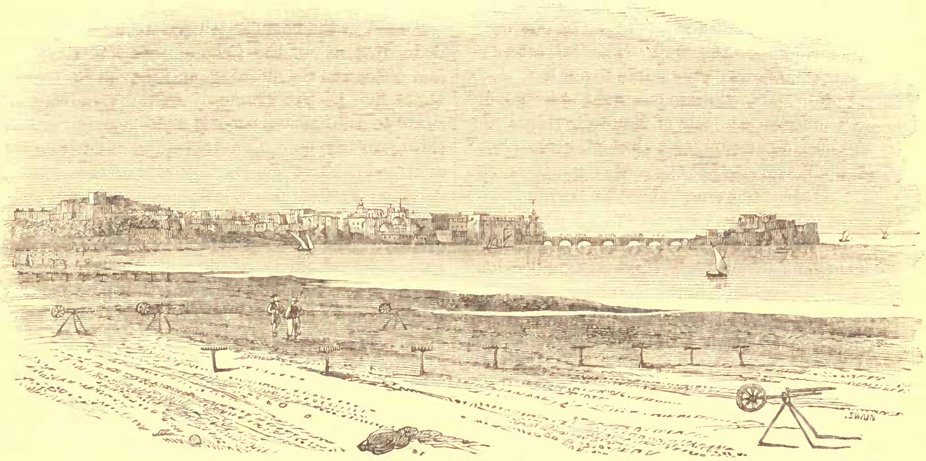
* "The Devil's Dream," by Thomas Aird.

We encamped at Nabathieyeh the Lower—our next stage after Maas. The whole aspect of the country is now changed. Groves of mulberries begin to cover the valleys. The houses of the villages are built more substantially, and with some attempts at art. This can be easily accounted for by the fact that the country is beyond the region preyed upon by the Arabs of the desert. There being here some security for property, there is consequent industry, with comparative comfort.

At no place did our presence attract greater attention than here. Most persons go to Damascus by Banias, or pass on to Sidon. The tent of the traveller is not so hackneyed then at Nabathieyeh as elsewhere. Crowds accordingly gathered round it, sitting in a circle three deep, the young in front and the old behind, as if gazing on wild beasts from another clime; but all were most civil and orderly. As usual, the musical box produced the greatest excitement and interest, as did also the performance which I generally added, on the jews' (or jaws' ?) harp.*

I never saw so many perfectly beautiful boys and girls as here. And this is especially true of the boys of about ten or twelve years of age. The symmetry and elegance of their features, the exquisitely chiselled nose, lips, and chin, and the calm lustrous eyes, quite riveted me. One boy particularly struck us as possessing a face quite as ideal as that of him who, in Hunt's noble picture, represents the boy Jesus in the Temple.

The Turkish governor, in an old shabby surtout, and a shirt that seemed to have been washed in pea soup, paid us an official visit; and was wonderfully high bred in his whole manner, in spite of his garments. He was delighted with some photographs of my children, which I showed him with paterfamilias fondness, and he introduced some of his own "toddling" young ones to us. I was praising their appearance when Hadji told me that he dared not translate my words, as they would give offence. Such praises are feared as signs of an evil eye. I therefore simply echoed his pious wish expressed in regard to myself, that he might have many; although for aught I knew he may have had, like myself, almost as many as his nursery can well accommodate. We both salaamed, however, to the mutual compliment.



J. Graham, Photo.

Sidon, from the North-east.

The next day's journey was not very interesting. We wound down to Sidon, among stupid low hills with nothing worth looking at which I can remember. We were glad to hail the old seaport at last. As we approached it, the air for a considerable distance was loaded with delicious perfume, which in this case we found came from orange-trees in full and glorious blossom. I had no idea that the odour of any flowers, even those of "Araby the Blest," could be carried so far on the breeze.

We spread our carpets among the orange-trees for lunch and repose, enjoying the smell and the exquisite fragrance from the white masses of blossom overhead. The whole neighbourhood is one great garden filled with every kind of fruit-bearing-trees—oranges, figs, almonds, lemons, apricots, peaches, pomegranates—to nourish which abundant streams of water are supplied from Lebanon. Our stay unfortunately was short. We had barely time to visit the old port, within the long line of the wall and castle which protect it from the north. As at Jaffa, the selection of the place as a harbour was evidently determined by a reef of rocks forming a deep lagoon within, and defending it from the waves of the outer sea. But beyond the usual attractiveness to the eye of everything oriental, and the old associations of the place, we saw nothing worth noticing, though there must be much in the town and neighbourhood. There is an efficient branch of the American Syrian Mission here, labouring among the 5000 inhabitants of the town, and also in the upland valleys of the overhanging spurs of the Lebanon. It seems a thriving place, and survives in spite of its old wickedness. The sinners, not Sidon, have been destroyed—yet how has its former glory passed away!

---

* The Arabs are easily amused, and seem to have a keen sense of the ludicrous. A clever toy, an absurd mask, or whatever excites wonder or laughter in children, would stir a whole village, and in most cases be a far better passport for a traveller than the Sultan's firman or ugly revolvers. Laughter and merriment form a better and much more agreeable bond of union between the traveller and the "children of the desert," old and young, than pomposity and powder.

Our camping ground for the night was on the river Damur, which occupied us five hours from Sidon. The road from Sidon to Beyrout is described in "Murray" as being "one of the most wearying rides in Syria." We did not find it so. The two voices, "one of the mountains and the other of the sea," never were silent all the way. The "Great Sea" was dashing its billows on the sands to our left, along which we often rode, while to our right the "goodly Lebanon" contributed some of its lower ridges broken with rock and stream, and clothed with trees. I must admit, however, that the route for many hours is, on the whole, tame; and that the traveller who has time at his command should branch off to such places as El-Jun, not far from Sidon, near which is the old convent which Lady Hester Stanhope long occupied as her private lunatic asylum; and Deir-el-Kamar, one of the most picturesque villages in the Lebanon. We reached our tents about sunset, rather fatigued after our ride from Nabathieyeh; but we enjoyed the luxury of a swim in the "salt sea faem," which made us all fresh again.

The scenery of a considerable portion of the road next day on our way to Beyrout was extremely fine. The lower ranges of the Lebanon running parallel to the sea, with their slopes and glens clothed with mulberry and fig-trees, and covered by white houses and villages high up on their steeps, and with old convents crowning all, reminded me of the road along the Riviera, between Genoa and Spezzia, and in some places was quite as beautiful. After passing through sandy dunes, through large olive groves, and an extensive forest of dwarf pines, we entered Beyrout, and found ourselves in Basoul's most comfortable hotel, and once more in the region of Boots and Waiter, table d'hôte, and civilisation.

Our party broke up at Beyrout. Our friends Mr. Lundie and Mr. Barbour, who had travelled with us from Marseilles, and contributed much to our happiness, resolved to visit Baalbek. My brother, who had been in the country before, remained at Beyrout; while Mr. Strahan and I, whose time was limited, found that we could get a glimpse of Damascus—but no more! Hadji Ali and the tents therefore passed into the service of our friends, and it was not without some feelings of pain that, after settling accounts and *backsheesh* to the satisfaction of all parties, we bade our dragoman and suite farewell. The slight clankings of the chain which had heretofore bound us, were forgotten in the mutual salaams with which we parted.

To our surprise, we learned that a French company had engineered an excellent road to Damascus, a distance of about ninety miles, and ran on it a well-horsed, well-appointed, comfortable diligence! No doubt this was very different from the poetry of a tent, and of a long cavalcade of mules and horses winding among the mountains of Lebanon, and along its old historic paths. But I must confess that the prosaic and much more rapid and comfortable mode of travelling was heartily welcomed and appreciated by us. Had we been obliged to depend on Meeki and his cavalry, we never could have seen Damascus, and consequently would have lost one of the most fascinating scenes in our journey.

Seated in the coupé, with six strong horses before it to drag us up the Lebanon, we left Beyrout at four o'clock in the morning, and arrived at Damascus about five in the evening. What a railway is in speed to a diligence, such is a diligence to ordinary riding in Syria. The travelling was admirably managed: short stages; good horses; excellent driving; resting places at proper intervals, where "meat and drink" were nicely served, with French civility. We had a tolerable view of the country as we jogged along, at first slowly, up the steep ascent of the Lebanon for a few thousand feet, then in full swing down its eastern slopes, then briskly across the flat of the Cœle-Syrian plains, then another long drag over the shoulder of the Anti-Lebanon, until finally, after passing along streams and canals, through cultivated fields and rich gardens and orchards, we entered Damascus, with the horses trotting, and the whips cracking in a way which reminded one of the olden time of the *dillies* and *pavés* of Belgium or France. There was nothing eastern in it. I presume that no carriage wheels had until recently marked those hills or valleys since the days of the Romans.

The scenery of the Lebanon is among the finest in the world, and has been described in the most enthusiastic terms by all who have had time to penetrate its innumerable valleys or gaze on the glorious views from its many commanding heights. The picturesque villages and hoary strongholds, the bright verdure, farms, corn-fields and pasture lands; the fine wooding, from noblest cedars to every fruitful tree, are all worthy of the "goodly Lebanon." But those who get glimpses only of scenery from the prison cell of a coupé, can hardly presume to describe it. What we saw was, however, sufficiently interesting and varied to make the journey agreeable. The finest view we got was that of the silvery Hermon closing up the Cœle-Syrian plain to the South. We again crossed the Litâny as it rolled on to foam past Kelat-el-Shukeef, and empty itself in the Mediterranean near old Tyre.

Our Damascus hotel — the best "Laconda"— combined the comfort of the West with the picturesqueness of the East. The inner court and the fountains open to the heavens; the balmy air, brilliant bright blue sky, fresh water, flowering plants, —all gave it an aspect of comfort and luxury which made it a most welcome and unexpected retreat.

Our first expedition in the morning was to a well-known spot, the Wely Nasr, half an hour's ride from the city. My old acquaintance, Mr. Ferrette, was our guide. Mr. Rogers, the able and learned consul, and the patient, kind friend of every traveller, put his horses at our disposal. The Wely Nasr is a spot which has been visited by every traveller as affording *the* view, which, once seen, will ever be remembered as the finest of the kind on earth. It is a quiet Mohammedan chapel, reared on the shoulder of the ridge of hills which rises immediately above the town, and close to the path by which travellers have for ages entered Damascus. By coming in the diligence we lost the impression which is made when the whole scene is beheld through an open arch which frames the marvellous picture. But although the landscape did not burst thus suddenly upon us, it was, nevertheless, far more glorious than we anticipated, in spite of all we had read and heard about it.

The one feature which arrests the eye is that wondrous oasis, that exuberant foliage of every hue of green, contributed by various tints of olive, walnut, apricot, poplar, and pomegranate. This is interspersed with fields of emerald corn, topped here and there by the feathery palm, that always witnesses for the clime in which it grows; and with silvery flashes from the streams which circulate amidst the "bowery hollows" and through every portion of this vast garden, covering a space whose circumference is thirty miles, though in the pellucid atmosphere it seems to embrace but a great park. In the midst of this green sea there rise domes and minarets above the half-revealed and far-spreading houses and streets, like line-of-battle ships moored in some inland harbour; while beyond it all is brown rock or plain, hot and sultry-looking, as if beating back in despair the sun's rays that attack it with furnace heat. The gardens begin at the very foot of the bare white limestone ridge on which we stand, as the green waves of the deep sea roll along a rocky shore. Far in the distance and beyond the limit of the verdure, the flat plain sweeps to the horizon—here towards Palmyra and Bagdad, there to the Hauran, unless where it is broken by barren hills that rise above the shimmer, like islands amidst a shoreless ocean. It was apparent what gave life to this fruitful spot. Close beside us, and at the bottom of a deep gorge to our right, through which we had passed in the diligence, the river Barada rushed clear and strong; and parallel to it were several narrow deep canals, cut out of the rock, which convey the water at different levels to the city, gardens, corn-fields, and houses, until, having blessed the earth and the homes of men, it disappears into the lakes and marshes seen in the far distance.

But it is not alone what the eye sees which gives the charm to Damascus, but what we know, or what the imagination creates from the elements supplied by authentic history. Beautiful as the spectacle is, yet how would its glory almost pass away if it had no "charm unborrowed from the eye!" We can conceive of some city equally beautiful outwardly, erected in a desert, whether of Australia or California, and made the capital of diggers and men successful in their "prospecting." But could it ever, in the nature of things, look as Damascus does? It is impossible to separate the glory of any earthly scene from the magic charm with which human history invests it; and Damascus is the oldest city on the face of the earth. It remains a solitary specimen of worlds passed away: it is like a living type of an extinct race of animals. It was historical before Abram left Mesopotamia. For a period as long as that which intervened between the birth of Christ and the Reformation, it was the capital of an independent kingdom. For a period as long as from the dawn of the Reformation till the present time, the kings of Babylon and Persia possessed it. For two centuries and a-half later the Greeks governed it; the Romans for seven centuries more; and since their departure, 1200 years ago, Saracens and Turks have reigned here. The mind gets wearied in attempting to measure the long period during which Damascus has survived, as if it were destined to mark the beginning and end of history, to be at once the first and last city in the world!

It is remarkable, also, how many distant parts of the earth are linked to this sequestered and solitary town. It is linked to Palestine by many a cruel war. The soldiers of King David garrisoned it. Nor can we forget how, in connection with Jewish history, there once passed out of these gardens on his way to Samaria a Commander-in-Chief, yet a wretched leper, guided to a poor prophet of the Lord in Samaria by a young, unselfish, God-fearing Jewish captive, stronger than Naaman in her simple faith and truth; or how the same man, who went forth with talents of gold and silver and goodly raiments as his precious treasures, returned with them, but valuing most of all some earth from the land whose God had restored him to health; and thinking more of the wild and fierce Jordan than of his own Abana and Pharpar. To this Damascus also Elisha, the great prophet who had healed Naaman afterwards came,* when that remarkable scene occurred in which the prophet, seeing the false heart of Hazael that was too false to see itself, "settled his countenance steadfastly, until he was ashamed; and the man of God wept!"

Damascus is connected, moreover, with the whole Christian world, for somewhere in this plain the

---

* 2 Kings viii. 7.

Apostle Paul, at that time an honest Jewish-Church fanatic, under the strong delusion which "believes a lie," and thinking he did God a service, was journeying to extirpate by the sword a dangerous heresy which had arisen. There, beneath a bright noon-day sun, he spoke with Christ, and became "Paul the Apostle," a name for ever hallowed in the heart of the Christian Church. From Damascus in later years there went forth another power than his, an army which penetrated beyond the Himmalayah, and established a dynasty at Delhi which, but as yesterday, after revealing the true and unchanged spirit of Islam, was swept away by British bayonets, so that at this moment the last rays of the sun which, rising in Damascus, so long shone in India, is setting in the person of the last Mogul, who is a transported convict in the Andaman Islands! From Damascus other conquering bands poured forth a stream of flashing scimitars and turbaned heads along the Mediterranean; crossed to Europe; and but for the "hammer" of Charles Martel, verily a judge in Israel whose arm was made strong by a merciful God, the crescent might have gleamed on the summit of great mosques in every European capital. The whole history of the city is marvellous, from the days of the soldiers of Babylon to the Zouaves of Paris—from early and oft-repeated atrocities committed on its inhabitants by successive conquerors down to the late massacre of Christians by its own citizens. But, strange to say, we cannot associate one great action which has blessed the world with any one born in Damascus: the associations are all of idolatry, cruelty, and bloodshed. Yet Damascus lives on, while the site of Capernaum is unknown! Let the traveller review all this strange history as he sits at the Wely gazing on the ancient city, and then, ere he goes to rest, himself a small link in this chain stretching into the darkness of the past, let him thank God that he has seen Damascus!

We spent a happy day in wandering through the city. I need not attempt to describe its famous bazaars. I cannot say that I admired them more than those of Cairo, but I thoroughly enjoyed them as a theatre exhibiting out-of-the-way life, and as at every yard revealing such strange oriental groups of human beings gathered out of every tribe, such pictures of form and colour, of man and beast, of old fantastic buildings and Arabian-Night-looking Courts and Khans, of shops for every sort of ware and for every sort of trade; such drinks, with ice from Lebanon to cool them; such sweetmeats, the very look of which would empty the pockets of all the schoolboys in Europe; such antique arms, beautiful cloths, dresses, shawls, carpets of every kind and colour, as would tempt the fathers and mothers of the boys to follow their example;—all this, and more than I can describe, kept me in a state of childlike wonder and excitement as I moved through the bazaars.

My old friends the dogs seemed to me to make Damascus their capital. I was amused at the *table-d'hôte* of the hotel in hearing a dispute regarding the number of the canine race in Damascus. The question, discussed between two gentlemen who had for years resided in the city, was whether the number of dogs amounted to 200,000, or only 100,000 or 150,000. Some suggested larger numbers, but all agreed that 100,000 did not fully represent the grand army, the possibility of being a soldier in which so shocked the high-minded Hazael. An illustration, moreover, was given of Mahommedan custom as applied to dogs. The law is, that any one accidentally killing another person must pay a fine as blood-money to his relations. But can this law apply to the killing of a dog?—not a Christian dog, who is worthless, but a bazaar dog, who is a useful scavenger? It must apply to dogs—so say the dogmatic Damascus police—but how? In this way:—a dog's blood-money is valued at sixteen piastres. Well, the murderer of a dog must forthwith report his crime to the police. The district in which the dog usually resided is then discovered, and the murderer must forthwith purchase bread with the blood-money; and as the dog's relatives are very many and not easily ascertained, he must divide the bread among all the hungry mouths that, backed by wagging tails, may wait to receive it. We give this illustration of canon, or canine, law as we heard it.

One object seen in passing along the streets I cannot forget, and that was a famous old plane-tree forty feet in circumference. There were others less noticeable, but adding beauty and shade to the thoroughfares and open paths.

We went along the dreary and stupid "Bazaar street" once called "Straight;" for it is more than probable that it represents the old street made famous by the history of St. Paul. Yet this must have been a stately thoroughfare in the time of the Romans. The remains of pillars indicate that a colonnade once ran along each side. The old Roman gate in the south wall, by which the Apostle probably entered, now opens to one side only of the old street. The central archway, and the other side-gate are both built up.

Among the "sights" which engaged our attention was the great mosque. It is needless, judging from the light—or darkness—which I have myself gathered from minute descriptions of buildings, to enter into any details regarding its fine court and cistern, its surrounding cloisters, noble pillars, and all the evidences which it affords of having been once a grand Christian church. This fact is unquestioned. There can, moreover, yet be seen on a portion of the old building an inscription in Greek, which fills the traveller with many strange thoughts of the past and future, as he reads it. Being translated it is this: "Thy kingdom, O Christ, is an everlasting kingdom, and Thy dominion endureth throughout all generations!"

A much-valued lady friend who had accompanied us during portions of the journey in Palestine, visited the mosque along with us, guided by the

Consul. That we were permitted to penetrate into the Holy Place without fear—in spite of some ugly-looking faqueers from India, who seemed to growl hate out of their rags and vermin—indicated a very remarkable change in Islam. It arose out of political events which those most affected by them could no more understand, than a child can connect the ebb of the tide in an inland arm of the sea, with the great ocean beyond or with the moon above. A distinguished American missionary, Dr. Thompson, of Beyrout, told me that he had accompanied the first British Consul into Damascus on horseback. They were protected by a strong guard. Before then every "Infidel" had been obliged to enter the Holy City bare-headed, and on foot! Every Christian merchant, though possessing a fortune, was also compelled to rise in the presence of his Mahommedan servant! Long after this, and as late as the Crimean War, no one, except a Moslem, could enter the great mosque on pain of death. Yet so great is the revolution caused either by the power of opinion, or by the fear of foreign bayonets, that, as I have said, we walked undisturbed through the mosque, simply paying backsheesh—a guinea, I think—to oil the tender consciences of its orthodox guardians. What a change is here!

We visited what was once the Christian quarter of the town. A more impressive sight I never witnessed. Oh, how different is reading or hearing about any horror from actually witnessing it. I often, for example, had heard of slavery, and theoretically loathed it. But when a mother was once offered me for sale in America, and when, with honest tears, she begged me that if I bought herself I would buy her child, round which her arms were entwined, and not separate them, what was the burning shame and horror I felt for a crime to destroy which millions of money and hundreds and thousands of lives have been sacrificed? And so, I had heard with sorrow of this massacre, and of the undying hate of orthodox and fanatical Islam. Yet how much more intense was my sense of this hate when I saw a large quarter of a great city reduced to powdered fragments of stone and lime, and walked through or stumbled over street upon street in a chaos of ruin—hearing in fancy the loud or stifled cries for mercy, and the unavailing shout of desperate defence, from nearly 3000 Christians, who for a fortnight were being butchered in cold blood by these Mahommedan demons! That fearful massacre was the true expression of Islam, the logical application of its principles. From Delhi to Jeddah, wherever it dare reveal itself, its spirit is the same. Nor can I agree with those who think that this is the last of the massacres. The last sacrifice by Islam will be coincident with its last breath; though there are, no doubt, Mahommedans whose hearts practically correct their creeds, and who are better than their beliefs.

But let me pass to more pleasing topics. We visited one or two private houses in Damascus, the Consul's among others, to form some idea of the oriental style of domestic architecture. One has no suspicion when passing a common plain wall in the street, that on the other side of it may be a splendid palace. Every sign of what is within seems to be carefully excluded, lest it should attract the attention of the mob. A small door and narrow passage which might conduct to the obscure home of an artisan, lead to a dwelling in which any prince might reside. Few things struck me so much as the beauty, stateliness, and luxury of these houses. In the centre is a large court, floored with marble. A fine fountain bubbles up its crystal water, and trees fill the air with perfume, and cool the ground with their shade. Above is the blue sky, with here and there a distant fleecy cloud. Into this court the public rooms open—not by doors, but by noble archways. If we pass through one of these archways we find ourselves in an apartment with its own marble entrance and fine fountain, and three high arches, opening into recesses on the right and left and in front. The floors are covered with rugs elevated above the level of the court. There are grand divans along their sides, with windows of coloured glass, while exquisite arabesque ornaments in purple, blue, and gold cover the walls and high roofs with intricate traceries and richest colour. Behind one couch we saw a fall of purest water, cooling the air, and passing under the floor to reappear in a fountain below. I have never seen any mansions which so fully realise the idea of a summer residence of perfect beauty. How much more might be made of this style amidst English scenery, and with an English family to give life and comfort to the rooms!

Anxious to overtake the Austrian steamer from Beyrout to Smyrna, and finding that we might miss her if we waited for the diligence, we resolved to post back during the night. The only kind of conveyance which is placed at the disposal of the traveller is a four-wheeled waggonette, with roof and curtains, and a seat along each side capable of accommodating three persons. We had two and sometimes three horses, and were driven by a tall jet black Nubian. The Consul and a few friends saw us off, and with kind consideration furnished us with an additional wrapper, as night on the Lebanon might be very cold or even very wet. But all looked bright and promising for an hour or so after we started. Then however the wind began to rise, until as we faced it on the ridge of the Anti-Lebanon it blew a hurricane, and the rain fell in torrents. I never was exposed to such a storm. Very soon the curtains, which partially sheltered us, were torn into ribands, and the roof did not protect us from the rain, which soon became sleet, and blew with a fierce and bitter blast through the carriage. We had a strong double umbrella, under which we sought shelter for our heads as we spread it behind the back of the driver; but soon the umbrella was also shattered and torn. My companion, who was not so well rigged as me for the gale, began to suffer greatly from the cold; but as

I had fortunately some spare clothes in a waterproof bag, I drew a pair of stout trousers over his, (and he did not find them too tight!); a woollen shirt was tied over his head; worsted stockings were supplied for gloves, and with one of the long cushions thrown over him he was enabled in this picturesque garb to weather the tempest. The Nubian showed marvellous endurance, as he drove his two-in-hand or three-in-hand for thirteen hours. They were generally fine strong cattle, but once or twice they stopped, with a disposition to turn tail to the wind, and were with difficulty forced to meet it. The Nubian would not "*taste*," as we say in Scotland, but was thankful to have some brandy poured over his hands when benumbed by the snow on the mountain-top at midnight. We also, once or twice, when things looked very bad, gave the poor fellow some good backsheesh to keep up his heart and spirits. Wet, cold, and miserable though we were, yet the wonderful appearance of the landscape at sunrise roused us up. We were then winding our way over the Lebanon, and looking across the Cœle-Syrian plain to the ridge of Anti-Lebanon. The sun, with a red glare, was breaking through the wild rack of storm-clouds which were rolling over the mountains. Above, to the zenith, they were black as night, but gradually passed into a dull grey, and then into purple, that with ragged edges and long detached locks of streaming hair, swept along the ground, on which ever and anon bright sunbeams lighted up green fields or some bit of mountain scenery. Had the forests of all Lebanon been on fire, and had their smoke, illumined by their flames, been driven by a hurricane across the fields and hills, the effect could not have been stranger or wilder.

As we came in sight of the Bay of Beyrout, about nine o'clock on Sunday morning, we saw evidences of the gale, in a French line-of-battle-ship with struck masts, rolling her guns under; while the other vessels, with less majesty but with equal discomfort to their crews, seemed in danger of rolling their masts over.

It being thought prudent to delay the sailing of the steamer in consequence of the storm, we had a refreshing sleep at the hotel, and then spent the evening at the American mission house, where I had the happiness of conducting worship, and of meeting brethren with whose names I had been familiar, and whose labours for many years have been earnest and full of blessing. Next day we visited Dr. Vandyke in his literary den, where we found him engaged in bringing to a conclusion his great and learned work, the translation into Arabic of the Holy Scriptures. We also visited several schools, male and female, and were deeply interested in seeing such proofs of eager desire for superior education on the part of boys and girls of every class, and of every faith; and with the thorough and efficient manner in which this desire has been met. The American mission prepared the way, quickened a taste for education among the people, and furnished good books and good teachers, yet for years found it up-hill work.

It is the rapid development of commerce, which has been falling into the hands of the Christian population, that now compels every young man, whether Jew or Greek, Druse, Turk or Maronite, to be educated, and to acquire some knowledge of English, French, and Italian. The American war, by stimulating the cultivation of cotton wherever its fibre will grow or labour can be found, has helped on education, which in its turn will produce results that may lead to the fall of Mahommedanism in Europe at least, and to the political supremacy of the Christian races, so long its slaves. The education of young women has followed the education of young men. Rich Christian husbands, who can marry but one wife, must have one who can be an intelligent companion; "and so on it goes," with wonderful and increasing rapidity.

The projected Syrian College will, when erected, as I hope it shall soon be, complete the work of education. Let me also presume to express the hope that the learned and admirable native of the Lebanon, who is now at the head of the largest and best-taught school and boarding-house in Beyrout, may find a place in the College worthy of his Christian character, talents, and past labours.

But the storm had now moderated, and we had to leave the Syrian shore. The view from the landing-place in the harbour of Beyrout has probably been painted by some artist capable of doing justice to it; but if not, it is worth his journey to do so. The foreground of the harbour, with such studies of form and colour as cannot be found in Europe; the quaint-looking boats, ships, and houses; and the glorious Lebanon rising over the ruined castle or battery that shuts in the port from the North, form a rare subject for a picture of Eastern life and scenery. I could, like some romantic lady, have kissed the old land ere I parted from it; but satisfied with pocketing a pebble from its shore, I stepped into the boat, and with many thanksgivings for the past, exchanged Eastward and the Holy Land for Northward and Home!

Here I must part with my readers, who have been kind enough to accompany me "Eastward." I told them frankly at the beginning of our intercourse that I had kept no journal, having had no intention of ever writing on the hackneyed subject; and I warned them besides to expect no "information" from me, such as is afforded in so many admirable and learned volumes of Eastern travel. But I promised to describe what I saw in the land, and the real impressions made on my mind; and I have endeavoured to fulfil my promise. I shall feel thankful if the intense enjoyment and lasting good which I myself derived from this short tour have been shared in any degree by others.

OUR INDIAN HEROES.

By JOHN WILLIAM KAYE.

XII.—MAJOR D'ARCY TODD.

Elliott D'Arcy Todd was born on the 28th of January, 1808, in Bury Street, St. James's. He was the third and youngest son of Mr. Fryer Todd, a Yorkshire gentleman, of good family and fortune, who, seeking to increase his store by speculation, had the ill fortune to reduce it. The undertakings in which he embarked were wholly unsuccessful, and when little D'Arcy was three years old, his home was broken up and swept away by the tide of misfortune, and it devolved on others to provide for the education of Mr. Todd's children. It happened, fortunately, that there were those who were both willing and able to undertake the charge. Mr. Todd had married Mary Evans—known in our literary history as the "Mary" of Samuel Taylor Coleridge;* and her brother, Mr. William Evans, held an important office in the home service of the East India Company.† He was very much attached to little D'Arcy; and when he took upon himself the charge of the boy's education, he did so with the assured belief that the seed would fall upon good soil, and that there were in him the making of both a good and a great man. Almost from his cradle, D'Arcy had evinced, in his childish actions, the kindling of that martial enthusiasm, which afterwards so unmistakeably developed itself. It is remembered that, when only two or three years old, he would march about the house drumming, and would convert all the chairs in the nursery into soldiers, or cannons, or other insignia of war. In due time, however, he was sent by his uncle to school—first to a preparatory seminary, kept by Miss Dawes, at Turnham Green, and afterwards to an academy at Ware, in Hertfordshire, where, although he developed no great amount of precocious genius, he made good progress, and took a respectable place in the school. He was always, indeed, fond of reading, and the books in which he most delighted were books of adventure, illustrative of self-help and self-reliance, or those which were largely tinged with the glowing imagery of the East. "I have been reading *Robinson Crusoe* and the *Tales of the Genii*," he wrote to his brother Frederick, when he was ten years old. "They have amused me very much. I hope that you love reading as I do, and also that you remember what you read."

From the year 1818 to 1822, D'Arcy Todd resided with his uncle in London, and attended a school in Poland Street. In the latter year, Mr. Evans, who had good interest with the Court of Directors, obtained for his nephew an Addiscombe Cadetship. He joined the Company's Military Seminary when he had just completed his fourteenth year. He was, at that time, a very little fellow, and he was commonly called, "little Todd." But, young as he was, he passed through Addiscombe with credit to himself, and obtained a commission in the Artillery. He was much esteemed by the professors and masters of the college, and beloved by his fellow-students. The progress which he made had greatly delighted his uncle. "D'Arcy continues to get on at Addiscombe," wrote Mr. Evans, in March, 1823, "beyond anything I could have expected. He is now high in the second class—a very unusual progress at his age. He is an excellent draughtsman, and well skilled in mathematics. I expect great things of him when he arrives in India."

He passed his final examination in December, 1823. A few weeks afterwards he sailed for India, on board the *Duchess of Athol*. In the fiery month of May, young D'Arcy Todd, then little more than sixteen years old, landed at Calcutta. It has been a happy circumstance in the lives of many young officers in the Bengal Artillery that their first glimpses of military life were caught at the great head-quarters station of Dum-Dum. There were then, and many years afterwards, stationed there, an unbroken succession of Christian men, whose care it was to preserve from evil the inexperienced youngsters who joined the regiment.* Young D'Arcy Todd fell into their good and kindly hands; and we soon find him writing thus seriously to his brother:—"I hope you think sometimes about death, for it must come, and will seize you when you least expect it, if you are not prepared to meet that Saviour who died for you; for it will be too late on our death-bed to begin to repent. Do not call me a Methodist, my dear brother, for speaking thus to an elder brother, but I love you so much I cannot help speaking to you, as I have been spoken to whilst I have been here; for, when I arrived at Dum-Dum, I met an old friend of the name of Cookson, whom I formerly knew at Addiscombe. He asked me to his home, where I met a clergyman of the name of Crawford, who taught me that the paths of sin are unhappiness and misery, and that the paths of righteousness are happiness. . . . May God bless and sanctify with his presence our meeting, and, short as the time will necessarily be, let it remind us that short is the space between the present and that when we shall stand before the judgment seat of Christ." And again:—"You well know, my beloved brother, I would willingly and with delight, pursue many a long and weary journey, in the hope of enlivening you. My heart fails me when I think of our approaching meeting, my brother, the being nearest and dearest to me on earth, whose love I prize more than my lips or my pen could express. 'And it came to pass that the soul of Jonathan was knit with the soul of David, and Jonathan loved David as his own soul.' This, dearest, expresses, I think, what we feel towards one another. Oh, that the Lord may bless that love which exists between us, and perfect it in that blessed abode where partings shall be no more."

---

* Coleridge was acquainted with, and attached to, her from a very early period of his life—even from the days when he was a blue-coat boy at Christ's Hospital. Years afterwards, Mrs. Todd sometimes visited him with her children, at Highgate, where I often myself saw him when a child, and sometimes sate upon his knee.

† Mr. Evans was "Baggage Warehouse Keeper," an office of some importance in the old commercial days of the Company.

* Foremost amongst these was the late General Powney of the Bengal Artillery—better known to his brother officers, both at Dum-Dum and in Fort William, as "Major Powney"—a man of much Christian piety and great kindliness of heart, hospitable and courteous, who, both by precept and example, led many young officers into the saving paths of truth.

At Dum-Dum D'Arcy Todd remained until the rainy season of 1825, when, all his beloved friends having preceded him to the Upper Country, he was glad indeed to see his own name in orders for a march northward. He was posted to a company of Foot Artillery at Cawnpore; but he had served with it only a little while, when it was ordered to Bhurtpore to take part in the operations of that great siege which has made its name famous in history. There, for the first time, he stood face to face with the stern realities of actual warfare. On the 18th of January the great Jat fortress was carried by the British troops. "I went round the ramparts directly after the storm," wrote the young artilleryman to his brother, "and to me, who had scarcely ever seen a dead body before, the sight was most horrible." The work done, the battery to which he was attached was ordered back to Cawnpore; and there, for a time, young D'Arcy Todd found a home in the house of Major* and Mrs. Whish, whose society was as pleasant as it was profitable to him.

In the course of this year (1826), Second-Lieutenant Todd was posted to the Horse Artillery; but on his promotion in November, 1827, to the rank of First-Lieutenant, he was attached to a battalion of Foot. These changes are always ruinous to the finances of a young officer, and D'Arcy Todd, who had been anxious to remit money to England for the use of his sisters, was sorely disquieted by the heavy expenditure which it was necessary to incur for the purchase of uniforms and equipments. He determined, therefore, to make an appeal to the Commander-in-Chief, in the hope of being re-posted to the mounted branch of the regiment. "Thus far will I go, and no farther," he wrote to his brother. "If this attempt fails, I shall renew (I hope, contentedly) my duties in the Foot, and leave the direction of my affairs to the hand of unerring wisdom, feeling assured that all things work together for good to those who fear the Lord." And not very long afterwards, he obtained what he sought, for he was appointed to a troop of Horse Artillery stationed at Muttra. "From what I have observed of the different services," he wrote, "I now say that I would rather be in the Horse Artillery than any service in the world." He was very happy at this time, for he was domiciled with friends who were both pious and intellectual, and in their society time passed pleasantly away. "I have abundance to occupy both mind and body," he wrote to a member of his family in 1828, "from six in the morning to eleven at night. I divide the day regularly, and endeavour each hour to have a fixed employment. Adam, my favourite Christian author, says, 'Have a work to do daily, with a will to do it, and a prayer on it, and let that work be God's.' I meet the Lewins every morning at half-past eight, when we read and pray together. We then breakfast; after which we separate to our several studies until two P.M., when we read *Russell's Modern Europe* till four P.M. Then we dine; after which we separate till half-past six, when we read *Milner's History of the Church of Christ*—an admirable work. We separate at nine—having read and prayed together. In the hospital and school of the troop we have also a wide field for exertion, to the glory of God."

In November, 1828, Lieutenant Todd went down to Calcutta to be present at the marriage of one of his sisters; but though he moved with all possible despatch, he was too late for the ceremony. He was cheered, however, by the thought of meeting a beloved brother from whom he had for some time been separated. The claims of his profession, at that busy period of the year, rendered the intercourse between the brothers only too brief. In January, 1829, D'Arcy Todd rejoined the Horse Artillery at Kurnaul; but, shortly after his arrival, ill-health compelled him to proceed to the Hills. In this illness, he received unspeakable comfort from the ministrations of his friend, James Abbott, of the Artillery—one whose life has since been a career of romantic adventure brightened by heroism of the true stamp. "My dearest friend, James Abbott," wrote D'Arcy Todd to his brother, "was unceasing in his brotherly attention. He never left my bedside. Oh! the goodness of God in giving me such a friend to smooth my pillow and to cheer me by his presence. He is the dearest friend of your brother. From the time we left the foot of the Hills, he attended me on foot until we arrived here; and when he departed, my heart was agonised." No man ever made more or faster friends than D'Arcy Todd—a blessing for which he was profoundly thankful. In another letter, he wrote:—"Indeed, as to friends, I have been wonderfully blessed; for, when I look back upon the time spent in this country, it appears to me that every one I have met has become a kind friend, and when I look within to see such unworthiness, it is really wonderful."

---

* Afterwards Sir Samson Whish, K.C.B., the captor of Mooltan.

From this illness, by God's blessing, he recovered perfectly; and he returned with renewed zeal to his regimental duties. In his leisure hours he cultivated poetry and painting; but, after awhile, he began to think that he might more profitably devote himself to the study of the native languages. "Having been nearly eight years in the country," he wrote in 1831, "without being on speaking terms with the natives, I have at last determined to conquer the languages." He had no very definite object in view; but he addressed himself very earnestly and assiduously to the work, and made considerable progress, especially in his study of Persian. And it was not long before his industry was amply rewarded. The weakness of Persia, and the manifest designs of more powerful (European) states, had suggested to the British Government the expediency of doing something to arrest what seemed to be the approaching downfall of her independence. So, in 1832-33, large supplies of arms and accoutrements were forwarded to the Shah, for the use of his army; and, in the latter year, it was determined to send out a party of officers and non-commissioned officers to drill and discipline the Persian army. Among the officers selected for this duty was Lieutenant D'Arcy Todd, whose especial duty it was to instruct the Persian gunners in the use and management of artillery after the European fashion.

The appointment was gratifying to him in the extreme. "I look upon it," he wrote in April, 1833, "as a grand opening for the development of whatever may be within. Is it not strange that I should have been studying Persian for the last twelve months, without any definite object in view? If I receive 500 or 600 rupees a month, I shall think the situation well worth the trouble of travelling so far for it; but it is not the cash I think most about; it is a grand opening from the apathetic and dull routine of Indian life. There will probably be a good deal of fighting, and abundance of opportunity of displaying the stuff a man is made of; oh that Fred were to be my companion. Wonderful are the ways of Providence. In the morning we rise, and before evening our prospects, our hopes, our fears, receive new impulses and new features. What a scene is opening before me."

A little while afterwards, he wrote from Calcutta, saying:—"The excitement caused by the first communication regarding my appointment to Persia, is fast wearing away, and I am now able to view all matters connected therewith in a quiet sober light; the glare of romance, the lightning flash of novelty, the bright gleams of warm anticipation have all passed away, or rather have been softened down and mellowed by the pencillings of truth; the picture still remains in all its breadth and colouring. Lord William Bentinck is indifferent to the concerns of Persia, and takes but little interest in anything connected with that country. Time will show whether this be wise policy or not. Lieutenant Burnes, the traveller, a very intelligent and pleasant man, is living with Trevelyan,* at whose house I am now staying. He has lately travelled through Persia, and kindly gives me every information in his power."

During five years, D'Arcy Todd dwelt in Persia, instructing the Persian artillerymen in the details of his profession, and instructing himself in the politics of the country and the adjacent territories. The letters which he wrote to his brother during this period, give an animated picture of his life in Persia. "The first news that greeted us on our arrival at Bushire," he wrote in December, 1833, "was the intelligence of Abbas Mirza's death. No official report has as yet been received here announcing this event, but it is everywhere believed, and is, I have no doubt, *true*,—too true for us. There are three courses before us—we shall either retrace our steps to India (which people seem to think the most probable), or march to Tabreez viâ Shiraz and Ispahan, or re-embark for Bussora, and thence proceed by the way of Baghdad. . . . The country is in a dreadful state of disorder and insecurity, and we have, I think, but little prospect of prosecuting our journey through Persia without loss of property, if not of life." In February, 1834, still writing from Bushire, he said, "At last we are on the eve of departure, and we hope to make our first march, of about a mile, this afternoon. . . . It is impossible to describe the annoyances of making a first march in Persia; it is bad enough in India, but here, where the servants are few and bad, and the people independent, obstacles are thrown in the way at every step. . . . The expenses of travelling are enormous—we have only been able to procure mules at *double* the usual rate of hire. Every servant *must* be mounted, and the expense of feeding animals on the road is more than they are worth. I have five horses, only two of which are for my own riding; the others are for servants who would not move an inch without being provided with a horse! No man, woman or child *walks* in Persia. . . . Unless I receive compensation, I shall be ruined, and there are but faint hopes of our receiving anything beyond our 500 rupees, which will cover about half of our expenses in this country."

At the end of March, he arrived at Teheran, and on the 24th of April, he said, "We left Bushire on the 14th of February and arrived here on the 28th of last month—this is my first opportunity of sending a letter, or you should have heard from me before. Our journey was anything but a pleasant one; the mountains between Bushire and Shiraz were covered with snow, and the passes were difficult and dangerous: however, a few mules and horses were our only casualties. We were often fifteen hours on horseback, with no rest and little food, but the health and spirits of the detachment seemed to improve as we overcame our difficulties. . . . Since our arrival at Teheran we have had the honour of an audience with His Majesty the Shah-in-Shah, the centre of the Universe, &c., &c.—he appeared to be greatly pleased with the show we made, and from his royal lips fell all manner of kind and gracious words." A month afterwards he wrote, "The old king has lately had several severe attacks of illness, and it is more than probable that he will die suddenly. Great commotion in every city and town of Persia will be the immediate consequence. Last Sunday it was reported here that he was no more—the price of everything rose in half-an-hour—some shops were plundered, and many were closed. . . . I have found *one* in Persia with whom I can hold sweet converse on the things that belong to our everlasting peace. Dr. Riach has lately arrived from England with despatches, and he is to be attached to the Envoy in Persia. I find in him a delightful companion—his heart is deeply embued with religion, and I trust that whilst we are together, we may be the means of strengthening and comforting each other. I felt *very* lonely before his arrival—there is scarcely *one* in the country with whom I have a thought or feeling in common. Suddenly and unexpectedly one has appeared." In August, he again wrote, "I consider the Persian appointment as *sheer humbug*—the climate is the only desirable thing in the country. I would never have left Cawnpore had I known what I now know of the prospects of an officer in Persia."

---

* Now Sir Charles Trevelyan, K.C.B.

But there was soon some stirring work to interest him. The King of Persia, Shah Futteh Ali, died, and then ensued, according to custom in those countries, all the troubles of a doubtful succession. "When," wrote D'Arcy Todd, "the intelligence of Futteh Ali Shah's death reached Tabreez, the British detachment were encamped at the town of Khoi, eighty-eight miles north-west of Tabreez, employed in drilling four regiments of infantry and some artillery. We had been engaged in this duty for about a month, and had, in the first instance, formed a camp on the frontier of Turkey, near the Turkish frontier town of Byazeed. Mahomed Mirza, Abbas Mirza's eldest son, was immediately proclaimed at Tabreez King of Persia, by the name of *Mahomed Shah*, and our small force marched without loss of time to that place. Amongst a progeny of several hundred princes, there were of course many competitors for the throne; and it was said that three, the Governor of Fars, the Governor of Mazanderan, and the Governor of Teheran, had each proclaimed himself king. We prepared for an immediate advance upon the capital, notwithstanding the near approach of winter. Our Envoy had been authorised by Government to assist Mahomed Shah by every possible and available means. The new King's treasury was empty, but Sir John Campbell came forward with the requisite sum; warlike preparations went on with amazing rapidity; troops were assembled from all quarters; and in the course of a very short time after the intelligence of Futteh Ali's death reached Tabreez, a respectable force (for this country) of six regiments and twenty-four guns was put in motion towards the capital. We approached within five or six marches of Teheran without meeting with the slightest opposition: on the contrary, our numbers were augmented at every step. Mahomed Shah was everywhere acknowledged as King, and the chances of opposition seemed to diminish as we approached the capital. We did not, however, enter the palace for some days: the astrologers could not fix upon an auspicious hour for the royal entry, and we therefore pitched our camp near the garden palace of Negaristan, in which the King took up his temporary abode. Thus ended our first bloodless campaign!"

Shortly after the accession of Mahomed Shah to the throne of Persia, the Prime Minister was seized by order of the King and put to death. The outbreak of cholera at the capital followed closely on this event, and the court with the army were removed to a village on the slope of the mountains which separate Iran from Mazanderan. Here the Persian Commandant of Artillery died of the pestilence which was raging. "When the King heard of his death," writes Todd in a letter to his brother, dated Teheran, 31st July, 1835—"he sent me a *firman*, placing the control of all matters connected with the Artillery in my hands, until a Persian 'fit for the situation' should be appointed. He will have to wait some time before he finds such a person. If a man like the late Commandant is appointed, I shall give up all hopes of making myself useful in my profession so long as I remain in the country."

But better prospects were now opening out before him. Mr. Henry Ellis was appointed, about this time, British Ambassador at the Court at Teheran. He soon perceived that D'Arcy Todd had capacities which required a wider sphere for their full development than the military routine work on which he was engaged; and he determined, therefore, to employ him in the diplomatic service, as soon as a fitting opportunity should arrive. On the 5th January, 1836, Todd wrote to his brother saying, "Since the day of Mr. Ellis's arrival he has kept our pens and brains *constantly* at work. I have written some quires of foolscap during the last three months in the shape of memoranda, memoirs, plans, and public letters on the subject of the employment of the British detachment, and the improvement of the Persian army. My pen has done me good service, as you will learn by the sequel. My tongue also has not been wanting. I shall now throw off all affectation of modesty, for I am writing to old Fred, and give you an idea of my standing in the opinion of Mr. Ellis. I had from time to time received *hints* of the satisfaction which the Ambassador invariably expressed with my communications on the subject of Persia, both written and verbal.

You will understand this when I tell you that the Acting Secretary of Legation, Dr. Riach, is my very particular friend. A few days ago, His Excellency summoned me into the Palace Garden, and informed me that he had at length come to the conclusion, that our connection with Persia was worse than useless, that Afghanistan was the field for our exertions, that we should connect ourselves closely with that country, that he had written a letter to Lord Auckland, his intimate friend, strongly pressing the necessity of sending a Political Agent to be stationed at Cabool, and recommending no greater or no less a personage than your little brother Elliott D'Arcy, as an officer, whose, &c., &c., eminently fitted him for that important situation!' The announcement, as you may imagine, astounded me. I will pass over the flattering sensations which fluttered through the crimson piece of flesh under my left ribs. I looked the Ambassador full in the face, and when I found that he was not joking, I stammered out a few lame expressions of the gratification which I felt at finding that I had attained so high a place in his good opinion. What think you, Master Fred, of my being *Political Agent* in Cabool? I do not, of course, expect that the prospect which has been thus opened upon me will be realised. Better interest and higher talents will be in the field against me, but I feel certain that Mr. Ellis's recommendation will be of service to me, and that I shall not have to return to regimental duty on my leaving Persia. . . . One of the papers which gave so much satisfaction to Mr. Ellis was a lengthy article of fifty pages on Burnes' Military Memoir on the countries between the Caspian and the Indus, in which I took the liberty to handle somewhat roughly the opinions and reasoning of the intelligent and enterprising 'traveller.'"

In the autumn of this year, 1836, Todd was residing at Tabreez, in the capacity of Military Secretary to General Bethune, who then commanded the legions disciplined by the English officers. "My last was dated Teheran, October 4th," he wrote on the 24th of November, "since which time I have transferred my body to the delightful capital of Azerbijan. . . We have a large society here for Persia. . . We have, besides others, Major-General Bethune, who has appointed me, as I think I have mentioned, his Military Secretary." On Christmas-day he wrote again, saying, "I have just been ordered by the Ambassador to undertake a difficult and somewhat dangerous journey into one of the wildest parts of Persia, on my way to Teheran. I hope to leave Tabreez the day after to-morrow, and shall not arrive at the capital in less than fifty days. My journey is an honourable one, and, if carried through, will bring me to the notice of Government. Mr. M'Neill's choice of me for this journey is not a little flattering." In the third week of February he reached the capital, and reported that he "had ever since been fully employed in writing reports, mapping, &c."

The year 1837 saw him still resident at Teheran, in his military capacity; but he was steadily preparing himself all the time for employment in the political branch of the service, and at last the opportunity came. The following extracts from the correspondence of this year carry on the story of his life:—"*Teheran, September 3rd*, 1837.—By the bye you will have seen ere this that His Majesty has conferred the local brevet of major on the officers serving in Persia. We receive no increase of *pay*, but as formerly all the officers who were made local field-officers in Persia, were *paid* as such, we are about to address a memorial upon the subject to the authorities in India. This local rank is not of much use, but there is something in a name, notwithstanding what the Bard of Avon has said regarding it. There is a possibility, although remote, that 'I may be sent to England on duty.' I shall do my best, you may be sure, to effect this, for although I could not remain at home more than a few months, I feel that it would be of great service to me in every respect, and the prospect of embracing you under such happy circumstances is indeed delightful. . . You will be glad to hear that I have received a complimentary letter from Lord Palmerston, in consequence of my reports regarding the frontier. I have sent home lately some other maps and papers which may be of use to me. . . . *Teheran, December 26th.*—The Secretary of Legation, Colonel Sheil, has gone home with despatches, and will be absent probably nearly a year. You will be glad to hear that Mr. M'Neill has appointed me to act for him, and has done so in a very flattering manner, as you will perceive in perusing the copy of his letter to me on the occasion, which I have sent to our beloved mother. The appointment will not give me anything in a pecuniary point of view; indeed it is possible that I may lose my Persian allowances whilst employed with the Mission; but you must be aware that the honour of the thing is great, and that my being selected for such a situation *may* be of great use to me in my future prospects. My great ambition is to have *political* employment, either in India or in these countries, and I have now made the first step towards my aim and object."

The next year found the Persian Government and the Persian army busied with the siege of Herat, and on the 8th of March Todd wrote with reference to that event, and to the views held by the British Government, that the possession of Herat by Persia would make a dangerous opening for Russian intrigue in the direction of India. "The British Government," he added, "have at last bestirred themselves, and Mr. M'Neill is about to proceed to the scene of operations to mediate between the contending powers, and to put a stop, if possible, to further hostilities. The whole of the orchestra will not accompany the leader of the band, but the acting second fiddle must, of course, be in attendance, and I am preparing to start from this in about four days, with Mr. M'Neill and Major Farrant, who is acting as his private Secretary. . . Should Mr. M'Neill wish to communicate with Lord Auckland, who is now in the north of India, it is possible that I may be sent across with despatches, and then—*then*—oh Fred the magnanimous, what countries shall I not see! Look at the map again, and tell me whether you would not like to be with me; but first read, if you have not read them, Burnes' Travels, Arthur Conolly's journey overland to India—a dear friend of mine is that said Arthur Conolly, now a sincere Christian, and one with whom I have had much sweet fellowship—Elphinstone's Caubul, and Forster's Travels, 1798. I should also for many reasons, which must be apparent to you, much like to see Lord Auckland, and I could not do so under better auspices than as the bearer of despatches, and I may say, though I say it myself, as the possessor of some information that would be useful to him."

In the Memoir of Eldred Pottinger I have spoken so fully of all the circumstances of the siege of Herat, that I need not now again recite them. During a part of the time occupied by the investment of the place, Todd was in the Persian camp; and he was employed by the English Minister, Mr. M'Neill, to negociate with the Heratees. He was the first English officer who had ever been seen by them in full regimentals, and it is recorded of him that when he entered the city, "a vast crowd went out to gaze at him. The tight-fitting coat, the glittering epaulettes, and the cocked hat, all excited unbounded admiration. The narrow streets were crowded, and the house-tops were swarming with curious spectators. The bearer as he was of a message from Mahomed Shah, announcing that the Persian sovereign was willing to accept the mediation of the British Government, he was received with becoming courtesy by Shah Kamran, who, after the interview, took the cloak from his own shoulders, and sent it by the Wuzeer to Major Todd, as a mark of the highest distinction he could confer upon him." The attempt at negociation, however, failed; and the siege was continued. But when, in the month of September, it was finally raised, in the manner already recorded in the last of these sketches, Todd was sent by Mr. M'Neill, the British Minister in Persia, to convey his despatches to the Governor-General of India. At Simlah, he met Lord Auckland, who saw at once that in the approaching struggle in Afghanistan, Todd was a man whose services might be turned to good account. When, therefore, the famous Simlah Manifesto of November 1st, 1838, published to the world a declaration of war against the *de facto* rulers of Afghanistan, and the official arrangements for the conduct of the Caubul Mission were completed, Eldred Pottinger was appointed Political Agent at Herat, and D'Arcy Todd was gazetted as Political Assistant and Military Secretary to the Envoy and Minister, at the Court of Shah Soojah, the restored king of Caubul. But Pottinger remained only for a short time at Herat; and then Todd was dispatched thither, originally on a special mission, under the supposition of Pottinger's return, but afterwards was definitely appointed to the post of British Agent at Herat. The office was one which demanded not only high courage and resolution in the representative of the British Government at that semi-barbarous Court, but also consummate tact, and a temper cool, patient, and forbearing. It was, indeed, a post in which success was so difficult of attainment, that Sir Alexander Burnes, ambitious as he was, and little fearful of responsibility, declined it. The nominal ruler of the place, Shah Kamran, was a puppet in the hands of an unscrupulous Minister. Perhaps there was not in all Asia a worse man than Yar Mahomed, or one with whom it was more difficult for an honourable high-minded Christian officer to contend. It must be admitted that, after his own fashion, the Vizier conducted his negociations on behalf both of Herat and of himself with remarkable ability. His one object was to turn to profitable financial account the presence of the British Mission at Herat. He was treacherous and avaricious to an excess even beyond the extensive limits of Afghan treachery and avarice. All this was soon apparent to Major Todd. "The treaty with Shah Kamran," he wrote to Sir W. Macnaghten, "had been signed but a few weeks —a treaty which secured to the authorities of Herat solid advantages, but prohibited them from negociating with foreign states without the knowledge of the British Agent, when it was discovered that Yar Mahomed Khan, the *de facto* ruler of the country, had secretly made overtures to the Persian authorities at Meshed, expressing his hatred towards the English, and offering to place himself under the protection of the Persian Government." From bad to worse; from worse to worst; so passed the conduct of the unscrupulous minister; until, in November, 1840, the patience of the British Minister was well-nigh exhausted. "During the past month," he wrote to Sir W. Macnaghten in November, "the most aggravated and absurd reports of the advantages gained by Dost Mahomed Khan, the Kohistanees, and Beloochees, over our troops, and of the weakness of our position in Afghanistan, had acquired ready credence in Herat. Urgent and repeated demands for extra assistance in money have been made by the Vizier and others, but without effect. The opportunity has been thought favourable for attempting to work on our fears; and a foray on Candahar was seriously discussed and I believe ultimately decided upon by the Minister and his advisers, letters having been received by him from the city dwelling on the weakness of its garrison, and inviting him to make the attempt. The extravagance of the Vizier about this time involved him in debt to a considerable amount; and finding that I was not disposed to advance more money than had been sanctioned by Government, he endeavoured to obtain my consent to his chappowing the Persian territory. Failing in this he proposed to foray some of the districts nominally subject to his own authority; and at length, discovering the futility of attempting to obtain money from me on these pretences, he thought that by giving publicity to his intention of attacking Candahar, he might intimidate me into purchasing his forbearance. The enterprise was, I believe, resolved on; and though the timely surrender of Dost Mahomed Khan caused this project to be laid aside for the time, it was not fully abandoned." In truth Yar Mahomed was only waiting for another opportunity to renew his efforts at extortion, and an opportunity soon came. There were symptoms of a state of feverish unrest in Western Afghanistan. The Douranee tribes were breaking into rebellion. It then became Yar Mahomed's game to foment the popular discontent. He sent emissaries among the disaffected tribes, urging them to open resistance of the foreign yoke; and at the same time he continued his intrigues with the Persian authorities at Meshed, inviting them to combine with him in an attack on Candahar whilst the communications with Caubul where cut off by the snow.

All this was soon known to Todd. He saw plainly the objects at which the astute Vizier was aiming, and he was determined to thwart the machinations of his unscrupulous opponent. Often have our political officers, at the remote courts of semi-barbarous potentates, found themselves surrounded by a surging sea of difficulty and danger, without any succour at hand but that to be derived from their own cool heads and their own brave hearts. But never, perhaps, was an English officer surrounded by so many difficulties as now surrounded the British Agent at the Court of Shah Kamran at Herat. Yar Mahomed hated D'Arcy Todd, because he was a humane, high-minded English gentleman, who set his face stedfastly against that abominable system of man-stealing and trading in human flesh which was so rife in all parts of Central Asia, and from which Yar Mahomed himself derived a large profit.

And here I must pause for a little space, to speak of the great work which Todd accomplished, on his own responsibility, in rescuing the Russian prisoners from the hands of the Khan of Khiva. It was one of the compensations of the earlier part of his residence at Herat, that his beloved friend James Abbott was stationed there also; and that they took sweet counsel together. Abbott was an enthusiast for good, running over with ardent humanity, and there was no possible service on which he could have been employed so grateful to his feelings, as one which promised to enable him to liberate from cruel bondage the "prisoner and the captive" of a Christian nation. How it fared with him he has himself told, in a book which it is difficult to read without delight and admiration. "When the Russians were advancing upon Khiva," wrote Todd, some time afterwards, "I dispatched on my own responsibility, first, Captain James Abbott, and afterwards Sir Richmond (then Lieutenant) Shakespear, to gain information regarding a most interesting country never before visited by an Englishman, and to endeavour, by persuading the Khan Huzrut to release the Russian captives in his dominions, to take away the only just ground of offence against Khiva on the part of Russia. I am not aware," he added, and in the truthfulness of the words there was bitter significance, "of any other object of unmixed good which has resulted from the ill-fated expedition (into Afghanistan), and I claim the credit of this as having originated it on my own responsibility, and without reference to higher authority."

But, returning now to the contemplation of Todd's difficulties, we find that early in 1841 a crisis was rapidly approaching. Shah Kamran was seriously alarmed for the lives of the English gentlemen, and he told the officers of the Mission that but for his intervention they would all have been murdered and their property pillaged. That this might any day happen was still only too probable. What then was it best in such circumstances? If the officers of the British Mission were murdered at Herat, it would be necessary to dispatch a British force thither to chastise the murderers, and most embarrassing political complications would have arisen. It appeared, therefore, to D'Arcy Todd that, in the interests of his Government, his best and wisest course was to withdraw the Mission. So, on the 9th of February he departed; and twelve days afterwards he had reached the confines of the Heratee territory.

"We left Herat (he wrote to a friend) on the 9th instant (February, 1841), made our first regular march on the 13th, and arrived safely at Ghiresk* on the 21st, with the greatest part of our property. We have had a dangerous and most fatiguing journey . . . . Lieutenant North of the Bombay Engineers, and Dr. Login, are with me, all well." A few days afterwards he wrote to his brother:—"We have, indeed, had a most providential escape from the hands of Yar Mahomed, who was urged by his confidential advisers to seize and plunder us; and our journey to this place with nearly the whole of our property was almost miraculous. There were certainly not five persons in Herat who believed that we should reach our destination in safety." So little at this time did Major Todd think that he could be blamed for what he had done, that bethinking himself as to whether the treatment of the British Mission might not necessitate some armed intervention at Herat, he came to the conclusion that it would devolve upon him to superintend the operations of the army so employed. "Should an expedition against Herat," (he wrote) "be determined on, it is possible that I may be sent as Political Agent with the force. Indeed, unless Sir William goes in person, I should hardly think that any one else would be sent."

But after the lapse of a few weeks, the truth became apparent to him. Lord Auckland was exasperated by Todd's withdrawal from Herat. He wrote that he was "writhing" under his vexation; and though ordinarily a calm, unexcitable man, it was plain that he had lost his temper, and cast aside his habitual moderation. "Lord Auckland," wrote D'Arcy Todd in April, 1841, "on receiving intelligence of my quitting Herat, without waiting for my account of the circumstances which led to that event—without one word from me in explanation or defence of the measure—directed a letter to be written to Sir W. Macnaghten, condemning in the most unqualified and unmeasured terms the whole of my proceedings connected with the rupture—removing me from the political department, and ordering me to proceed to India immediately and join my own branch of the service."

---

* The frontier part of Shah Soojah's dominions.

The decision of the Governor-General wounded him deeply. As he passed through Afghanistan, on his way to Caubul, his mind was rent by distracting thoughts of the degradation to which he had been subjected by Lord Auckland and his Council. But there was at least one drop of sweetness in the bitter cup of his affliction; for his official chief, Sir William Macnaghten, wrote to him, that his "conduct had been as admirable as that of Yar Mahomed had been flagitious. And so," he added, "I told the Governor-General." In the second week of June, Todd was at Caubul; and he wrote thence to his brother, saying, "This affliction—for it is an affliction to be held up to the scorn of men as a demented coward—was doubtless intended for wise and merciful purposes, and I will endeavour to look upon it as a message of love. I have set up many idols and have worshipped them with mad devotion, but they have been thrown down before my face by an invisible hand; and I have been taught that God will not brook a rival in the heart of man . . . The final decision of Lord Auckland arrived about ten days ago. His Lordship is not to be moved, and I see clearly it would not be of the slightest use attempting any further explanation or deprecation. Both have been already offered in a manner to an extent that would have moved a heart of stone."

At this time, it was his intention to proceed to England by the Bombay route, but he afterwards changed his mind, and went down to Calcutta, which he reached early in November. There he had the unspeakable pleasure of meeting his dear friend, James Abbott. He had prepared a memorial to the Court of Directors, to be transmitted to them through the Governor-General, and he hoped by a personal interview to move the heart of Lord Auckland—but he did not succeed. "I have been admitted to an audience with the Governor-General," he wrote on the 13th of November, "and have seen most of the people in authority. His Lordship received me with kindness, and expressed regret at what had occurred, but did not give me an opportunity of explaining fully the motives under which I had acted at the period of my leaving. I have been assured, and I believe the assurance, that every possible facility will be afforded me of speedily adjusting my accounts. The officials, high and low, have been exceedingly civil to me."

The New Year dawned, and ever affectionately mindful of absent friends, D'Arcy Todd wrote to his brother and sister:—"Although this is the 2nd of the month (January), my New Year's greeting is not less sincere or heartfelt, than if it had been penned on the 1st day of the New Year. May every blessing attend you and yours, my dearest J——, throughout this and every succeeding year of your earthly pilgrimage. A poet has said:—

"'As half in shade, and half in sun,
  This world along its path advances;
May that side the sun's upon
  Be all that e'er shall meet the glances.'

I will not, however, express so extravagant a wish, though I love you well enough to desire that your cup of joy may be ever full to overflowing, and that your lot may be always cast in pleasant places. But I know that such is not, and cannot, be the experience of one looking to a 'better land,' and I pray that your joy may be the joy of one who feels that brighter and more enduring things are in store for her, and that your sorrows (light as they may be) may be the sorrows of one who knows that it is but for a moment. I shall ever look back to the few days we were together, as the happiest and brightest of my life."

A month afterwards, he wrote to the same beloved correspondent that he had received no answer to his memorial. But a great trouble had fallen upon the nation; and in the contemplation of the national calamities he soon forgot his own. "No answer," he wrote on the 2nd of February, "has as yet been sent to my memorial, but the receipt, by the authorities at home, has been acknowledged. I expect the whole matter has been referred to the new Governor-General (Lord Ellenborough); but how petty, how insignificant does the subject of my individual wrongs appear, when we think of the terrible scenes that have lately taken place in Afghanistan, or attempt to peer into the future. I cannot write calmly on this subject; I find it impossible, as yet, to think calmly of it; it is difficult to believe that this awful calamity has really fallen upon us, or to realise what we know, with but too painful a certainty, has happened. Of course I have given up all thought of going home; every soldier must now be at his post. I should wish to be as near the North-West Frontier as possible."

On the 28th of February the new Governor-General arrived; and D'Arcy Todd began to hope that he might meet with justice from one who brought a fresh eye and an unprejudiced understanding to the consideration of his case. But the times were unpropitious for the investigation of individual wrongs; and Lord Ellenborough, with his strong military sympathies, had small love for the political service. So, little light gleamed from this quarter; and, in the middle of March, D'Arcy Todd was compelled to acknowledge that all hope was at an end. "I have seen Lord Ellenborough," he wrote. "At the first public levee his lordship addressed me, and said that he was acquainted with my case, but that he had not leisure at present to enter into it. At a formal audience on Thursday last, although he received me kindly and cordially, he told me he could give me no hope of immediate re-employment in the political department, and advised me, as a friend, to rejoin my regiment. I am, therefore, going out to Dum-Dum in a day or two. All will doubtless be ordered for the best, and I would cheerfully and thankfully acknowledge the hand of God in all that befalls me. To show how much Lord Ellenborough knew of my affairs, I may mention that he asked me, amongst other things, whether I had been much amongst Mahomedans, and whether I had ever been to Persia; how I had got to Herat, and whether I *remained* there after the retreat of the Persians in 1838!!* On my answering these strange questions, I was told to give a statement of my services to the private secretary. I represented that every particular would be found stated in my memorial, and asked whether his lordship had received that document; the answer was, *No!* So much for his lordship's being well acquainted with my case. I have taken his lordship's advice, and have joined my company at Dum-Dum. Now that I *know* the worst, it may prove the *best*. Now that all hope of being re-employed in the political department, or any other department, save my own, has vanished, I feel happy and contented. Doubtless, all has been ordered for my good, and I would recognise the hand of a merciful God, of an all-wise friend, in all that has befallen or may befall me."

So he joined the battalion, to which he stood posted, at the head-quarters of the Artillery at Dum-Dum, and subsided into the quietude of regimental life. No man ever descended more gracefully than he did. He took command of a company of artillerymen, and entered into all its professional details with a minute conscientiousness, which showed that he thought nothing beneath him that lay in the path of military duty. He was perfectly resigned, and, except to one or two chosen friends, he never spoke of the injustice that had been done to him—never repined or murmured at his lot. He was very modest and unassuming in his demeanour; and it would have been hard indeed, for any one, who had been admitted to the privilege of familiar intercourse with him, not to regard him with affectionate admiration. He was right when he said that all was for the best; for abundant solace soon came to him from an unexpected quarter; and he was happier than he ever was before. Some years before, a blight had fallen on his life, as it fell upon the lives of Henry Martyn and Arthur Conolly; and he now, therefore, wrote to his sister, in answer to a suggestion that he might be happier, if married:—"No, dearest J——, there never will be any one whom I may call mine, beyond those who are already so. I am, to all intents and purposes, a childless widower. Let this be our last allusion to the subject. I thought F—— might have told you the story, with the heads of which he is acquainted. The wound is an old one, but is still tender to the touch."

But, by the beginning of August, he had discovered that all this was a mere delusion. His heart now belied the words that he had written; and he was eager to recant:—"Dearest sister, what will be your surprise after what I have said to you on the subject of love and marriage, to hear that I, your brother D'Arcy, *am* about to be married? Many considerations have kept me silent on the subject for some time past; these shall be explained to you when we meet, and they may form a chapter in the romance of life. Marian Sandham, the eldest daughter of the surgeon of H.M.'s 16th Lancers, and grand-daughter of dear old Mr. Fisher, our Senior Presidency Chaplain, is the dear girl who yesterday promised to be mine. I have long known her, and yesterday she confessed—but I will not now tell you how or what she confessed. We are to be married in about a fortnight! She—how shall I describe her, or with what shall I commence? You will find in her a worthy sister. She is a child of God, and one of the sweetest of God's children. Her age is little more than twenty—a few months. She came to this country about six months ago; but I cannot go on." And again, on the 15th of August, he wrote:—"I told you in my last that I had long known Marian. During the last six months I have had constant opportunity of seeing her; the matter, therefore, has not been lightly, or hastily, undertaken, and I believe that the blessing of God will be with us . . . Although it was only ten days ago that she consented to be mine, we have agreed that it would be unwise to delay the ceremony longer than is absolutely necessary. Her father is about to leave Calcutta, and we are of course anxious that he should be present. Monday, the 22nd of this month, has therefore been fixed upon as the happy day. I cannot hope that you will be present, but I know, however, that you will be present in the best sense of the word; we shall have your prayers and your sweet congratulations."

On the 22nd, he wrote again, saying:—"Dearest J——, this is my wedding-day! At six o'clock this afternoon, the ceremony will be performed which makes Marian mine, and gives you a noble sister. I am sure you will look upon one another, and love each other as sisters; you are worthy the one of the other, and I cannot pay you a higher compliment; but this is not a time for paying compliments; the word sounds horribly." And then a week after the marriage, he wrote to the same sister:—"I did expect, by God's blessing, to be happy; but I am a thousand times happier than I expected to be."

---

* I well remember the amused look on Todd's face, when coming straight to me from Government House, he told me that the Governor-General said he knew all about his case, and asked him if he had much intercourse with Mahomedans.—"As if he thought that the Persians and Afghans were Christians." Of course Lord Ellenborough had no such thought; but Governors-General are obliged sometimes to say that they know all about that of which they know nothing.

There is not the least doubt that this was the very happiest time of his life. I have seen it recorded of him that his remaining years were embittered by a sense of the injustice that had been done to him; but as I was, at this time, in almost daily communication with D'Arcy Todd, I may say, with the force of more than conjecture or hearsay authority, that not a feeling of bitterness was left in his mind. It is but little to say that he was resigned. He was the most serene, the most contented, the most cheerful of men, in a society which numbered at that time several married families, which had in them the best elements of happiness, and which were in constant intercourse with each other of the most friendly and pleasurable kind. There are, besides myself, some still living, who look back with the most affectionate recollections to those years at Dum-Dum, when D'Arcy Todd and his Marian were winning all hearts by their gentle and endearing ways. In the enjoyment of such home pleasures as were then beneficently vouchsafed to him, he felt that he could live down official injustice and neglect. Assuredly it did not much matter, for he enjoyed, in full and overflowing abundance, the respect, the admiration, and the affection of his brother officers, and the verdict of the public had been pronounced in his favour.

It would have been well indeed for him if this happiness could but have endured. Regimentally, officially, there were better things in store for him than the command of a company of Foot Artillery at Dum-Dum. But he was harboured securely there, and when he left that happy Head-quarters station the storm began presently to gather over his life.

In December, 1843, he was appointed to the command of a Company in the Upper Provinces, and was compelled, with sore regret, to turn his back upon Dum-Dum. "I was quietly sowing my last peas and beans," he wrote, "when the intelligence reached me. In leaving Dum-Dum, we almost felt as if we were leaving home. I had never been before so much attached to a place. Indeed, in former years I had looked upon my dwelling-place merely as the ground on which my tent was pitched. The charge is easily accounted for, and I need not enlarge upon the subject." In the course of the following March, he was appointed to a Horse Field Battery at Delhi, and he proceeded with his beloved wife to the imperial city. But he was now disquieted by thoughts of Marian's failing health; and as the hot weather came on, he was compelled to make arrangements for her residence in the hills. He obtained a month's leave and accompanied her thither, observing that he might have obtained "sick certificate" for himself, but that he wished to be able to rejoin his post at a day's notice; for stirring times were at hand. Again the peace of India was to be broken; and England had need of all her best soldiers. The Sikh legions, no longer restrained by the strong hand of Runjit Singh, had been for some time past dominating the State, and now at last they had risen to such a height of lawlessness, that they threatened to invade the British frontier, and to stream down in a heavy flood of conquest and rapine, to the sack of Delhi, and the pillage of Calcutta. Averse to war and bloodshed, and resolute not to kindle into activity by any signs of intended aggression from the British side of the frontier, the ill-suppressed hostility of our dangerous neighbours, Sir Henry Hardinge, who had succeeded Lord Ellenborough as Governor-General of India, was quietly massing his troops in the neighbourhood of the Sutlej, but outwardly only for peaceful exercise. At this time the high military character of D'Arcy Todd was recognised by the bestowal upon him of that great object of regimental ambition, a troop of Horse Artillery. It was the troop too with which he had served as a subaltern; so the appointment would have gratified him greatly, if any earthly solace at such a time could have touched his heart. But he was grieving then for his beloved wife, whose mortal ailments made his life one of painful anxiety; and he was not to be cheered by any professional success.

On the morning of the 9th of December, all hope had passed away; and at noon Marian Todd was with the angels. "The hand of God is heavy upon me," he wrote on that day to his brother; "but I believe that such an affliction cannot spring from the dust. Pray, pray fervently for your deeply afflicted brother. She fell asleep a few minutes after noon." But it was not permitted to him to fall into a stupor of grief. The Sikhs crossed the Sutlej. His troop was called into action; and he went, as he touchingly said, "from the open grave," not wishing ever to return to it, into the midst of that bloody warfare. He survived the conflict of Moodkhee, but at Ferozshuhar, on the 22nd of December, D'Arcy Todd, broken-hearted, believing that his end was approaching, and declaring that he "only wished to live that the grace of God and the love of Christ might prepare him to leave a world in which there could be no more joy for him," led his troop into action, and perished in the unequal conflict. A round shot, from the Sikh batteries is said to have struck him down, as he was charging at the head of his men, and to have carried instant death with it. And, as I have said elsewhere, "Among the many who fell on that mournful day, there was not a braver soldier or a better man."
