GOOD WORDS
FOR 1865
T. MACQUOID

HEREWARD, THE LAST OF THE ENGLISH.

By CHARLES KINGSLEY.

Prelude.

THE heroic deeds of Highlanders, both in these islands and elsewhere, have been told in verse and prose, and not more often, nor more loudly, than they deserve. But we must remember, now and then, that there have been heroes likewise in the lowland and in the fen. Why, however, poets have so seldom sung of them; why no historian, save Mr. Motley in his "Rise of the Dutch Republic," has condescended to tell the tale of their doughty deeds, is a question not difficult to answer.

In the first place, they have been fewer in number. The lowlands of the world, being the richest spots, have been generally the soonest conquered, the soonest civilized, and therefore the soonest taken out of the sphere of romance and wild adventure, into that of order and law, hard work and common sense, as well as—too often—into the sphere of slavery, cowardice, luxury, and ignoble greed. The lowland populations, for the same reasons, have been generally the first to deteriorate, though not on account of the vices of civilization. The vices of incivilization are far worse, and far more destructive of human life; and it is just because they are so, that rude tribes deteriorate physically less than polished nations. In the savage struggle for life, none but the strongest, healthiest, cunningest, have a chance of living, prospering, and propagating their race. In the civilized state, on the contrary, the weakliest and the silliest, protected by law, religion, and humanity, have chance likewise, and transmit to their offspring their own weakliness or silliness. In these islands, for instance, at the time of the Norman Conquest, the average of man was doubtless superior, both in body and mind, to the average of man now, simply because the weaklings could not have lived at all; and the rich and delicate beauty, in which the women of the Eastern Counties still surpass all other races in these isles, was doubtless far more common in proportion to the numbers of the population.

Another reason—and one which every Scot will understand—why lowland heroes "carent vate sacro," is that the lowlands and those who live in them are wanting in the poetic and romantic elements. There is in the lowland none of that background of the unknown, fantastic, magical, terrible, perpetually feeding curiosity and wonder, which still remains in the Scottish highlands; which, when it disappears from thence, will remain embalmed for ever in the pages of Walter Scott. Against that half-magical background his heroes stand out in vivid relief; and justly so. It was not put there by him for stage purposes; it was there as a fact; and the men of whom he wrote were conscious of it, were moulded by it, were not ashamed of its influence. Nature among the mountains is too fierce, too strong for man. He cannot conquer her, and she awes him. He cannot dig down the cliffs, or chain the storm-blasts; and his fear of them takes bodily shape: he begins to people the weird places of the earth with weird beings, and sees nixes in the dark linns as he fishes by night, dwarfs in the caves where he digs, half-trembling, morsels of copper and iron for his weapons, witches and demons on the snow-blast which overwhelms his herd and his hut, and in the dark clouds which brood on the untrodden mountain-peak. He lives in fear: and yet, if he be a valianthearted man, his fears do him little harm. They may break out, at times, in witch-manias, with all their horrible suspicions, and thus breed cruelty, which is the child of fear: but on the whole they rather produce in man thoughtfulness, reverence, a sense, confused yet precious, of the boundless importance of the unseen world. His superstitions develope his imagination; the moving accidents of a wild life call out in him sympathy and pathos; and the mountaineer becomes instinctively a poet.

The lowlander, on the other hand, has his own strength, his own "virtues," or manfulnesses, in the good old sense of the word: but they are not for the most part picturesque or even poetical.

He finds out, soon enough for his weal and his bane, that he is stronger than Nature: and right tyrannously and irreverently he lords it over her, clearing, delving, dyking, building, without fear or shame. He knows of no natural force greater than himself, save an occasional thunder-storm; and against that, as he grows more cunning, he insures his crops. Why should he reverence Nature? Let him use her, and eat. One cannot blame him. Man was sent into the world (so says the Scripture) to fill and subdue the earth. But he was sent into the world for other purposes, which the lowlander is but too apt to forget. With the awe of Nature, the awe of the unseen dies out in him. Meeting with no visible superior, he is apt to become not merely unpoetical and irreverent, but somewhat of a sensualist and an atheist. The sense of the beautiful dies out in him more and more. He has little or nothing around him to refine or lift up his soul; and unless he meet with a religion, and with a civilization, which can deliver him, he may sink into that dull brutality which is too common among the lowest classes of the English lowlands; and remain for generations gifted with the strength and industry of the ox, and with the courage of the lion, and, alas! with the intellect of the former, and the self-restraint of the latter.

But there may be a period in the history of a lowland race when they, too, become historic for a while. There was such a period for the men of the Eastern Counties; for they proved it by their deeds.

When the men of Wessex, the once conquering race of Britain, fell at Hastings once and for all, and struck no second blow, then the men of the Danelagh disdained to yield to the Norman invader. For seven long years they held their own, not knowing, like true Englishmen, when they were beaten; and fought on desperate, till there were none left to fight. Their bones lay white on every island in the fens; their corpses rotted on gallows beneath every Norman keep; their few survivors crawled into monasteries, with eyes picked out, or hands and feet cut off; or took to the wild wood as strong outlaws, like their successors and representatives, Robin Hood, Scarlet, and John, Adam Bell, and Clym of the Cleugh, and William of Cloudeslee. But they never really bent their necks to the Norman yoke: they kept alive in their hearts that proud spirit of personal independence, which they brought with them from the moors of Denmark and the dales of Norway; and they kept alive, too, though in abeyance for awhile, those free institutions which were without a doubt the germs of our British liberty.

They were a changed folk since first they settled in that Danelagh;—since first in the days of King Beorhtric, "in the year 787, three ships of Northmen came from Hæretha land, and the King's reeve rode to the place, and would have driven them up to the King's town, for he knew not what men they were: but they slew him there and then;" and after the Saxons and Angles began to find out to their bitter bale what men they were, those fierce Vikings out of the dark north-east.

But they had long ceased to burn farms, sack convents, torture monks for gold, and slay every human being they met, in mere Berserker lust of blood. No Barnakill could now earn his nickname by entreating his comrades, as they tossed the children on their spear-points, to "Na kill the barns." Gradually they had settled down on the land, intermarried with the Angles and Saxons, and colonised all England north and east of Watling Street (a rough line from London to Chester), and the eastern lowlands of Scotland likewise. Gradually they had deserted Thor and Odin for "the White Christ;" had their own priests and bishops, and built their own minsters. The convents which the fathers had destroyed, the sons, or at least the grandsons, rebuilt; and often, casting away sword and axe, they entered them as monks themselves; and Peterborough, Ely, and above all Crowland, destroyed by them in Alfred's time with a horrible destruction, had become their holy places, where they decked the altars with gold and jewels, with silks from the far East, and furs from the far North; and where, as in sacred fortresses, they, and the liberty of England with them, made their last unavailing stand.

For awhile they had been lords of all England. The Anglo-Saxon race was wearing out. The men of Wessex, priest-ridden, and enslaved by their own aristocracy, quailed before the free Norsemen, among whom was not a single serf. The God-descended line of Cerdic and Alfred was worn out. Vain, incapable, profligate kings, the tools of such prelates as Odo and Dunstan, were no match for such wild heroes as Thorkill the tall, or Olaf Trygvasson, or Swend Forkbeard. The Danes had gradually colonised, not only their own Danelagh and Northumbria, but great part of Wessex. Vast sums of Danegelt were yearly sent out of the country to buy off the fresh invasions which were perpetually threatened. Then Ethelred the Unready, Ethelred Evil-counsel, advised himself to fulfil his name, and the curse which Dunstan had pronounced against him at the baptismal font. By his counsel the men of Wessex rose against the unsuspecting Danes; and on St. Brice's eve, A.D.

1002, murdered them all with tortures, man, woman, and child. It may be that they only did to the children as the fathers had done to them: but the deed was "worse than a crime; it was a mistake." The Danes of the Danelagh and of Northumbria, their brothers of Denmark and Norway, the Orkneys and the east coast of Ireland, remained unharmed. A mighty host of Vikings poured from thence into England the very next year, under Swend Forkbeard and the great Canute; and after thirteen fearful campaigns came the great battle of Assingdown in Essex—where "Canute had the victory; and all the English nation fought against him; and all the nobility of the English race was there destroyed."

That same year saw the mysterious death of Edmund Ironside, the last man of Cerdic's race worthy of the name. For the next twenty-five years, Danish kings ruled from the Forth to the Land's End.

A noble figure he was, that great and wise Canute, the friend of the famous Godiva, and Leofric, Godiva's husband, and Siward Biorn, the conqueror of Macbeth; trying to expiate by justice and mercy the dark deeds of his bloodstained youth; trying (and not in vain) to blend the two races over which he ruled; rebuilding the churches and monasteries which his father had destroyed; bringing back in state to Canterbury the body of Archbishop Elphege—not unjustly called by the Saxons martyr and saint—whom Tall Thorkill's men had murdered with beef bones and ox skulls, because he would not give up to them the money destined for God's poor; rebuking, as every child has heard, his housecarles' flattery by setting his chair on the brink of the rising tide: and then laying his golden crown, in token of humility, on the high altar of Winchester, never to wear it more. In Winchester lie his bones unto this day, or what of them the civil wars have left; and by him lie the bones of his son Hardicanute, in whom, as in his half brother Harold Harefoot before him, the Danish power fell to swift decay, by insolence and drink and civil war; and with the Danish power England fell to pieces likewise.

Canute had divided England into four great Earldoms, each ruled, under him, by a jarl, or earl, a Danish, not a Saxon title.

At his death in 1036, the earldoms of Northumbria and East Anglia—the more strictly Danish parts—were held by a true Danish hero, Siward Biorn, alias Digre the Stout, conqueror of Macbeth, and son of the fairy bear; proving his descent, men said, by his pointed and hairy ears.

Mercia, the great central plateau of England, was held by Earl Leofric, husband of the famous Lady Godiva.

Wessex, which Canute had at first kept in his own hands, had passed into those of the furious Earl Godwin, the then ablest man in England. Possessed of boundless tact and cunning, gifted with an eloquence, which seems from the accounts remaining of it to have been rather that of a Greek than an Englishman; himself of high—perhaps of royal—Sussex blood (for the story of his low birth seems a mere fable of his French enemies), and married first to Canute's sister, and then to his niece, he was fitted, alike by fortunes and by talents, to be the king-maker which he became.

Such a system may have worked well as long as the brain of a hero was there to overlook it all. But when that brain was turned to dust, the history of England became, till the Norman Conquest, little more than the history of the rivalries of the two great houses of Godwin and Leofric.

Leofric had the first success in king-making. He, though bearing a Saxon name, was the champion of the Danish party, and of Canute's son, or reputed son, Harold Harefoot; and he succeeded, by the help of the "Thanes north of Thames," and the "lithsmen of London," which city was more than half Danish in those days, in setting his puppet on the throne. But the blood of Canute had exhausted itself. Within seven years Harold Harefoot and Hardicanute, who succeeded him, had died as foully as they lived; and Godwin's turn had come.

He, though married to a Danish princess, and acknowledging his Danish connection by the Norse names which were borne by his three most famous sons, Harold, Sweyn, and Tostig, constituted himself the champion of the men of Wessex, and the house of Cerdic. He had murdered, or at least caused to be murdered, horribly, Alfred the Etheling, King Ethelred's son and heir-apparent, when it seemed his interest to support the claims of Hardicanute against Harefoot; he now found little difficulty in persuading his victim's younger brother to come to England, and become at once his king, his son-in-law, and his puppet.

Edward the Confessor, if we are to believe the monks whom he pampered, was naught but virtue and piety, meekness and magnanimity; a model ruler of men. Such a model ruler he was, doubtless, as monks would be glad to see on every throne; because while he rules his subjects they rule him. No wonder, therefore, that (according to William of Malmesbury) the happiness of his times (famed as he was both for miracles and the spirit of prophecy) "was revealed in a dream to Brithwin bishop of Wilton, who made it public;" who, meditating in King Canute's time on "the near extinction of the royal race of the English," was "rapt up on high, and saw St. Peter consecrating Edward king. His chaste life also was pointed out, and the exact period of his reign (twenty-four years) determined; and when inquiring about his posterity, it was answered, 'The kingdom of the English belongs to God. After you, He will provide a king according to his pleasure.'" But those who will look at the facts will see in the holy Confessor's character little but what is pitiable; and in his reign little but what is tragical.

Civil wars, invasions, outlawry of Godwin and his sons by the Danish party; then of Alfgar, Leofric's son, by the Saxon party; the outlaws on either side attacking and plundering the English shores by the help of Norsemen, Welshmen, Irish and Danes—any mercenaries who could be got together; and then—"In the same year Bishop Aldred consecrated the minster at Gloucester to the glory of God and of St. Peter, and then went to Jerusalem with such splendour as no man had displayed before him;" and so forth. The sum and substance of what was done in those "happy times" may be well described in the words of the Anglo-Saxon chronicler for the year 1058. "This year Alfgar the earl was banished: but he came in again with violence, through aid of Griffin (the king of North Wales, his brother-in-law). And this year came a fleet from Norway. It is tedious to tell how these matters went." These were the normal phenomena of a reign which seemed, to the eyes of monks, a holy and a happy one; because the king refused, whether from spite or superstition, to have an heir to the house of Cerdic, and spent his time between prayer, hunting, the seeing of fancied visions, the uttering of fancied prophecies, and the performance of fancied miracles.

But there were excuses for him. An Englishman only in name, a Norman, not only of his mother's descent (she was aunt of William the Conqueror) but by his early education on the Continent, he loved the Norman better than the Englishman; Norman knights and clerks filled his court, and often the high dignities of his provinces, and returned as often as expelled; the Norman-French language became fashionable; Norman customs and manners the signs of civilization; and thus all was preparing steadily for the great catastrophe, by which, within a year of Edward's death, the Norman became master of the land.

Perhaps it ought to have been so. Perhaps by no other method could England, and with England, Scotland, and in due time Ireland, have become partakers of that classic civilization and learning, the fount whereof, for good and for evil, was Rome and the Pope of Rome: but the method was at least wicked, the actors in it tyrannous, brutal, treacherous, hypocritical; and the conquest of England by William will remain to the end of time a mighty crime, abetted—one may almost say made possible—as too many such crimes have been before and since, by the intriguing ambition of the Pope of Rome.

Against that tyranny the free men of the Danelagh and of Northumbria rose. If Edward the descendant of Cerdic had been little to them, William the descendant of Rollo was still less. That French-speaking knights should expel them from their homes, French-chanting monks from their convents, because Edward had promised the crown of England to William, his foreign cousin, or because Harold Godwinsson of Wessex had sworn on the relics of all the saints to be William's man, was contrary to their common-sense of right and reason.

So they rose, and fought: too late, it may be, and without unity or purpose; and they were worsted by an enemy who had both unity and purpose; whom superstition, greed, and feudal discipline kept together, at least in England, in one compact body of unscrupulous and terrible confederates.

But theirs was a land worth fighting for—a good land and large: from Humber mouth inland to the Trent and merry Sherwood, across to Chester and the Dee, round by Leicester and the five burghs of the Danes; eastward again to Huntingdon and Cambridge (then a poor village on the site of an old Roman town); and then northward again into the wide fens, the land of the Girvii and the Eormingas, "the children of the peat-bog," where the great central plateau of England slides into the sea, to form, from the rain and river washings of eight shires, lowlands of a fertility inexhaustible, because ever-growing to this day.

They have a beauty of their own, those great fens, even now, when they are dyked and drained, tilled and fenced—a beauty as of the sea, of boundless expanse and freedom. Much more had they that beauty eight hundred years ago, when they were still, for the most part, as God had made them, or rather was making them even then. The low rolling uplands were clothed in primæval forest: oak and ash, beech and elm, with here and there, perhaps, a group of ancient pines, ragged and decayed, and fast dying out in England even then; though lingering still in the forests of the Scotch highlands.

Between the forests were open wolds, dotted with white sheep and golden gorse; rolling plains of rich though ragged turf, whether cleared by the hand of man or by the wild fires which often swept over the hills. And between the wood and the wold stood many a Danish "town," with its clusters of low straggling buildings round the holder's house, stone or mud below, and wood above; its high dykes round tiny fields; its flocks of sheep ranging on the wold; its herds of swine in the forest; and below, a more precious possession still—its herds of mares and colts, which fed with the cattle in the rich grass-fen.

For always, from the foot of the wolds, the green flat stretched away, illimitable, to an horizon where, from the roundness of the earth, the distant trees and islands were hulled down like ships at sea. The firm horse-fen lay, bright green, along the foot of the wold; beyond it, the browner peat, or deep fen; and among it dark velvet alder beds, long lines of reed-rond, emerald in spring, and golden under the autumn sun; shining river-reaches; broad meres dotted with a million fowl, while the cattle waded along their edges after the rich sedge-grass, or wallowed in the mire through the hot summer's day. Here and there, too, upon the far horizon, rose a tall line of ashen trees, marking some island of firm rich soil. Here and there, too, as at Ramsey and Crowland, the huge ashes had disappeared before the axes of the monks, and a minster tower rose over the fen, amid orchards, gardens, cornfields, pastures, with here and there a tree left standing for shade—"Painted with flowers in the spring," with "pleasant shores embosomed in still lakes," as the monk-chronicler of Ramsey has it, those islands seemed to such as the monk terrestrial paradises.

Overhead the arch of heaven spread more ample than elsewhere, as over the open sea; and that vastness gave, and still gives, such "effects" of cloudland, of sunrise, and sunset, as can be seen nowhere else within these isles. They might well have been star-worshippers, those Girvii, had their sky been as clear as that of the East: but they were like to have worshipped the clouds rather than the stars, according to the too universal law, that mankind worship the powers which do them harm, rather than the powers which do them good.

And therefore the Danelagh men, who feared not mortal sword or axe, feared witches, ghosts, Pucks, Wills o' the Wisp, werewolves, spirits of the wells and of the trees, and all dark, capricious, and harmful beings whom their fancy conjured up out of the wild, wet, and unwholesome marshes, or the dark wolf-haunted woods. For that fair land, like all things on earth, had its darker aspect. The foul exhalations of autumn called up fever and ague, crippling and enervating, and tempting, almost compelling, to that wild and desperate drinking which was the Scandinavian's special sin. Dark and sad were those short autumn days, when all the distances were shut off, and the air choked with foul brown fog and drenching rains from off the eastern sea; and pleasant the bursting forth of the keen north-east wind, with all its whirling snow-storms. For though it sent men hurrying out into the storm, to drive the cattle in from the fen, and lift the sheep out of the snow-wreaths, and now and then never to return, lost in mist and mire, in ice and snow;—yet all knew that after the snow would come the keen frost and the bright sun and cloudless blue sky, and the fenman's yearly holiday, when, work being impossible, all gave themselves up to play, and swarmed upon the ice on skates and sledges, and ran races, township against township, or visited old friends full forty miles away; and met everywhere faces as bright and ruddy as their own, cheered by the keen wine of that dry and bracing frost.

Such was the Fenland; hard, yet cheerful; rearing a race of hard and cheerful men; showing their power in old times in valiant fighting, and for many a century since in that valiant industry which has drained and embanked the land of the Girvii, till it has become a very "Garden of the Lord." And the Scotsman who may look from the promontory of Peterborough, the "golden borough" of old time; or from the tower of Crowland, while Hereward and Torfrida sleep in the ruined nave beneath; or from the heights of that Isle of Ely which was so long "the camp of refuge" for English freedom; over the labyrinth of dykes and lodes, the squares of rich corn and verdure,—will confess that the lowland, as well as the highland, can at times breed gallant men.*

CHAPTER I.

HOW HEREWARD WAS OUTLAWED, AND WENT NORTH TO SEEK HIS FORTUNES.

Known to all is Lady Godiva, the most beautiful as well as the most saintly woman of her day; who, "all her life, kept at her own expense thirteen poor folk wherever she went; who, throughout Lent, watched in the church at triple matins, namely, one for the Trinity, one for the Cross, and one for St. Mary; who every day read the Psalter through, and so persevered in good and holy works to her life's end"—the "devoted friend of St. Mary, ever a virgin," who enriched monasteries without number—Leominster, Wenlock, Chester, St. Mary's Stow by Lincoln, Worcester, Evesham; and who, above all, founded the great monastery in that town of Coventry, which has made her name immortal for another and a far nobler deed; and enriched it so much "that no monastery in England possest such abundance of gold, silver, jewels, and precious stones," beside that most precious jewel of all, the arm of St. Augustine, which not Lady Godiva, but her friend, Archbishop Ethelnoth, presented to Coventry, "having bought it at Pavia for a hundred talents of silver and a talent of gold."†

Less known, save to students, is her husband, Leofric the great Earl of Mercia and Chester, whose bones lie by those of Godiva in that same minster of Coventry; how "his counsel was as if one had opened the Divine oracles;" very "wise," says the Anglo-Saxon chronicle, "for God and for the world, which was a blessing to all this nation;" the greatest man, save his still greater rival, Earl Godwin, in Edward the Confessor's court.

Less known, again, are the children of that illustrious pair: Algar, or Alfgar, Earl of Mercia after his father, who died, after a short and stormy life, leaving two sons, Edwin and Morcar, the fair and hapless young earls, always spoken of together, as if they had been twins; a daughter, Aldytha, or Elfgiva, married first (according to some) to Griffin, King of North Wales, and certainly afterwards to Harold, King of England; and another, Lucia (as the Normans at least called her), whose fate was, if possible, more sad than that of her brothers.

---

* The story of Hereward (often sung by minstrels and old wives in succeeding generations) may be found in the "Metrical Chronicle of Geoffrey Gaimar," and in the prose "Life of Hereward" (paraphrased from that written by Leofric, his house-priest), and in the valuable fragment "Of the family of Hereward." These have all three been edited by Mr. T. Wright. The account of Hereward in Ingulf seems taken, and that carelessly, from the same source as the Latin prose, "De Gestis Herewardi." A few curious details may be found in Peter of Blois' continuation of Ingulf; and more, concerning the sack of Peterborough, in the Anglo-Saxon Chronicle. I have followed the contemporary authorities as closely as I could, introducing little but what was necessary to reconile discrepancies, or to illustrate the history, manners, and sentiments of the time.—C. K.

† William of Malmesbury.

Their second son was Hereward, whose history this tale sets forth; their third and youngest, a boy whose name is unknown.

They had, probably, another daughter beside; married, it may be, to some son of Leofric's staunch friend old Siward Biorn, the Viking Earl of Northumberland, and conqueror of Macbeth; and the mother, may be, of the two young Siwards, the "white" and the "red," who figure in chronicle and legend as the nephews of Hereward. But this pedigree is little more than a conjecture.

Be these things as they may, Godiva was the greatest lady in England, save two: Edith, Harold's sister, the nominal wife of Edward the Confessor; and Githa, or Gyda as her own Danes called her, Harold's mother, niece of Canute the Great. Great was Godiva; and might have been proud enough, had she been inclined to that pleasant sin. And even then (for there is a skeleton, they say, in every house) she carried that about her which might well keep her humble; namely, shame at the misconduct of Hereward, her son.

Her favourite residence, among the many manors and "villas," or farms which Leofric possessed, was neither the stately hall at Loughton by Bridgenorth, nor the statelier castle of Warwick, but the house of Bourne in South Lincolnshire, between the great woods of the Bruneswald and the great level of the fens. It may have been her own paternal dowry, and have come down to her in right of her Danish ancestors, and that great and "magnificent" Jarl Oslac, from whom she derived her all-but-royal blood. This is certain, that Leofric, her husband, went in East Anglia by the name of Leofric, Lord of Bourne; that, as Domesday Book testifies, his son Alfgar, and his grandson Morcar, held large lands there and thereabout. Alfgar's name, indeed, still lives in the village of Algar-Kirk; and Lady Godiva, and Algar after her, enriched with great gifts Crowland, the island sanctuary, and Peterborough, where Brand, either her brother or Leofric's, was a monk, and in due time an abbot.

The house of Bourne, as far as it can be reconstructed by imagination, was altogether unlike one of the tall and gloomy Norman castles which twenty years later reared their evil donjons over England. It was much more like a house in a Chinese painting: an irregular group of low buildings, almost all of one storey, stone below and timber above, with high-peaked roofs—at least in the more Danish country—affording a separate room, or rather house, for each different need of the family. Such a one may be seen in the illuminations of the century. In the centre of the building is the hall, with door or doors opening out into the court; and sitting thereat, at the top of a flight of steps, the lord and lady, dealing clothes to the naked and bread to the hungry. On one side of the hall is a chapel; by it a large room or "bower" for the ladies; behind the hall a round tower, seemingly the strong place of the whole house; on the other side a kitchen; and stuck on to bower, kitchen, and every other principal building, lean-to after lean-to, the uses of which it is impossible now to discover. The house had grown with the wants of the family—as many good old English houses have done to this day. Round it would be scattered barns and stables, in which grooms and herdsmen slept side by side with their own horses and cattle; and outside all, the "yard," "garth," or garden-fence, high earth-bank with palisades on top, which formed a strong defence in time of war. Such was most probably the "villa," "ton," or "town" of Earl Leofric, the Lord of Bourne, the favourite residence of Godiva—once most beautiful, and still most holy, according to the holiness of those old times.

Now on a day—about the year 1054—while Earl Siward was helping to bring Birnam wood to Dunsinane, to avenge his murdered brother-in-law, Lady Godiva sat, not at her hall door, dealing food and clothing to her thirteen poor folk, but in her bower, with her youngest son, a two-years' boy, at her knee. She was listening with a face of shame and horror to the complaint of Herluin, Steward of Peterborough, who had fallen in that afternoon with Hereward and his crew of "housecarles."

To keep a following of stout housecarles, or men-at-arms, was the pride as well as the duty of an Anglo-Danish Lord, as it was, till lately, of a Scoto-Danish Highland Laird. And Hereward, in imitation of his father and his elder brother, must needs have his following from the time he was but fifteen years old. All the unruly youths of the neighbourhood, sons of free "holders," who owed some sort of military service to Earl Leofric; Geri his cousin; Winter, whom he called his brother-in-arms; the Wulfrics, the Wulfards, the Azers, and many another wild blade, had banded themselves round a young nobleman more unruly than themselves. Their names were already a terror to all decent folk, at wakes and fairs, alehouses and village sports. They atoned, be it remembered, for their early sins by making those names in after years a terror to the invaders of their native land: but as yet their prowess was limited to drunken brawls and faction-fights; to upsetting old women at their work, levying black-mail from quiet chapmen on the high road, or bringing back in triumph, sword in hand and club on shoulder, their leader Hereward from some duel which his insolence had provoked.

But this time, if the story of the sub-prior was to be believed, Hereward and his housecarles had taken an ugly stride forward toward the pit. They had met him riding along, intent upon his psalter, in a lonely path of the Bruneswald—"whereon your son, most gracious lady, bade me stand, saying that his men were thirsty and he had no money to buy ale withal, and none so likely to help him thereto as a fat priest—for so he scandalously termed me, who, as your ladyship knows, am leaner than the minster bell-ropes, with fasting Wednesdays and Fridays throughout the year, beside the vigils of the saints, and the former and latter Lents.

"But when he saw who I was, as if inspired by a malignant spirit, he shouted out my name, and bade his companions throw me to the ground."

"Throw you to the ground?" shuddered the Lady Godiva.

"In much mire, madam. After which he took my palfrey, saying that heaven's gate was too lowly for men on horseback to get in thereat; and then my marten's fur gloves and cape which your gracious self bestowed on me, alleging that the rules of my order allowed only one garment, and no furs save catskins and suchlike. And lastly—I tremble while I relate, thinking not of the loss of my poor money, but the loss of an immortal soul—took from me a purse with sixteen silver pennies, which I had collected from our tenants for the use of the monastery, and said blasphemously that I and mine had swindled your ladyship, and therefore him your son, out of many a fair manor ere now; and it was but fair that he should tithe the rents thereof, as he should never get the lands out of our claws again; with more of the like, which I blush to repeat—And so left me to trudge hither in the mire."

"Wretched boy!" said the Lady Godiva, and hid her face in her hands; "and more wretched I, to have brought such a son into the world!"

The monk had hardly finished his doleful story, when there was a pattering of heavy feet, a noise of men shouting and laughing outside, and a voice above all calling for the monk by name, which made that good man crouch behind the curtain of Lady Godiva's bed. The next moment the door of the bower was thrown violently open, and in walked, or rather reeled, a noble lad eighteen years old. His face was of extraordinary beauty, save that the lower jaw was too long and heavy, and that his eyes wore a strange and almost sinister expression, from the fact that the one of them was grey and the other blue. He was short, but of immense breadth of chest and strength of limb; while his delicate hands and feet and long locks of golden hair marked him of most noble, and even, as he really was, of ancient royal race. He was dressed in a gaudy costume, resembling on the whole that of a Highland chieftain. His knees, wrists, and throat, were tattooed in bright blue patterns; and he carried sword and dagger, a gold ring round his neck, and gold rings on his wrists. He was a lad to have gladdened the eyes of any mother: but there was no gladness in the Lady Godiva's eyes as she received him, nor had there been for many a year. She looked on him with sternness, with all but horror; and he, his face flushed with wine, which he had tossed off as he passed through the hall to steady his nerves for the coming storm, looked at her with smiling defiance, the result of long estrangement between mother and son.

"Well, my lady," said he, ere she could speak, "I heard that this good fellow was here; and came home as fast as I could, to see that he told you as few lies as possible."

"He has told me," said she, "that you have robbed the church of God."

"Robbed him, it may be, an old hoody crow, against whom I have a grudge of ten years' standing."

"Wretched, wretched boy! What wickedness next? Know you not, that he who robs the Church robs God Himself?"

"And he who harms God's people," put in the monk from behind the chair, "harms his Maker."

"His Maker?" said the lad with concentrated bitterness. "It would be a gay world, if the maker thereof were in any way like unto you, who call yourselves His people. Do you remember who told them to set the peat-stack on fire under me ten years ago? Ah, ha, Sir Monk, you forget that I have been behind the screen—that I have been a monk myself, or should have been one, if my pious lady mother here had had her will of me, as she may if she likes of that doll there at her knee. Do you forget why I left Peterborough Abbey, when Winter and I turned all your priest's books upside down in the choir, and they would have flogged us—me, the Earl's son —me, the Viking's son—me, the champion as I will be yet, and make all lands ring with the fame of my deeds, as they rung with the fame of my forefathers, before they become the slaves of monks; and how, when Winter and I got hold of the kitchen spits, and up to the top of the peat-stack, and held you all at bay there, a whole abbeyful of cowards there against two seven-years' children? It was you bade set the peat-stack alight under us, and so bring us down; and would have done it, too, had it not been for my uncle Brand, the only man that I care for in this wide world. Do you think I have not owed you a grudge ever since that day, monk? And do you think I will not pay it? Do you think I would not have burned Peterborough Minster over your head before now, had it not been for uncle Brand's sake? See that I do not do it yet. See that when there is another Prior in Borough you do not find Hereward the Berserker smoking you out some dark night, as he would smoke a wasps' nest. And I will, by——"

"Hereward, Hereward!" cried his mother, "godless, god-forgotten boy, what words are these? Silence, before you burden your soul with an oath which the devils in hell will accept, and force you to keep," and she sprung up, and seizing his arm, laid her hand upon his mouth.

Hereward looked at her majestic face, once lovely, now careworn, and trembled for a moment. Had there been any tenderness in it, his history might have been a very different one: but alas! there was none. Not that she was in herself untender: but that her great piety (call it not superstition, for it was then the only form known or possible to pure and devout souls) was so outraged by this, or even by the slightest insult to that clergy whose willing slave she had become, that the only method of reclaiming the sinner had been long forgotten, in genuine horror at his sin. "Is it not enough," she went on sternly, "that you should have become the bully and the ruffian of all the fens?—that Hereward the leaper, Hereward the wrestler, Hereward the thrower of the hammer—sports after all only fit for the sons of slaves, should be also Hereward the drunkard, Hereward the common fighter, Hereward the breaker of houses, Hereward the leader of mobs of boon companions which bring back to us, in shame and sorrow, the days when our heathen forefathers ravaged this land with fire and sword? Is it not enough for me that my son should be a common stabber——?"

"Whoever called me stabber to you, lies. If I have killed men, or had them killed, I have done it in fair fight."

But she went on unheeding—"Is it not enough that after having squandered on your fellows all the money that you could wring from my bounty, or win at your brutal sports, you should have robbed your own father, collected his rents behind his back, taken money and goods from his tenants by threats and blows: but that, after outraging them, you must add to all this a worse sin likewise, outraging God, and driving me—me who have borne with you, me who have concealed all for your sake—to tell your father that of which the very telling will turn my hair to grey?"

"So you will tell my father?" said Hereward coolly.

"And if I should not, this monk himself is bound to do so, or his superior, your uncle Brand."

"My uncle Brand will not, and your monk dare not."

"Then I must. I have loved you long and well: but there is one thing which I must love better than you, and that is my conscience and my Maker."

"Those are two things, my lady mother, and not one; so you had better not confound them. As for the latter, do you not think that He who made the world is well able to defend his own property—if the lands, and houses, and cattle, and money, which these men wheedle and threaten and forge out of you and my father, are really his property, and not merely their plunder? As for your conscience, my lady mother, really you have done so many good deeds in your life, that it might be beneficial to you to do a bad one once in a way, so as to keep your soul in a wholesome state of humility."

The monk groaned aloud. Lady Godiva groaned: but it was inwardly. There was silence for a moment. Both were abashed by the lad's utter shamelessness.

"And you will tell my father?" said he again. "He is at the old miracle-worker's court at Westminster. He will tell the miracle-worker; and I shall be outlawed."

"And if you be, wretched boy, whom have you to blame but yourself? Can you expect that the King, sainted even as he is before his death, dare pass over such an atrocity towards Holy Church?"

"Blame? I shall blame no one. Pass over? I hope he will not pass over it. I only want an excuse like that for turning kempery-man—knight-errant, as those Norman puppies call it—like Regnar Lodbrog, or Frithiof, or Harold Hardraade; and try what man can do for himself in the world with nothing to help him in heaven and earth, with neither saint nor angel, friend or counsellor, to see to him, save his wits and his good sword. So send off the messenger, good mother mine; and I will promise you I will not have him ham-strung on the way, as some of my housecarles would do for me if I but held up my hand; and let the miracle-monger fill up the measure of his folly, by making an enemy of one more bold fellow in the world."

And he swaggered out of the room.

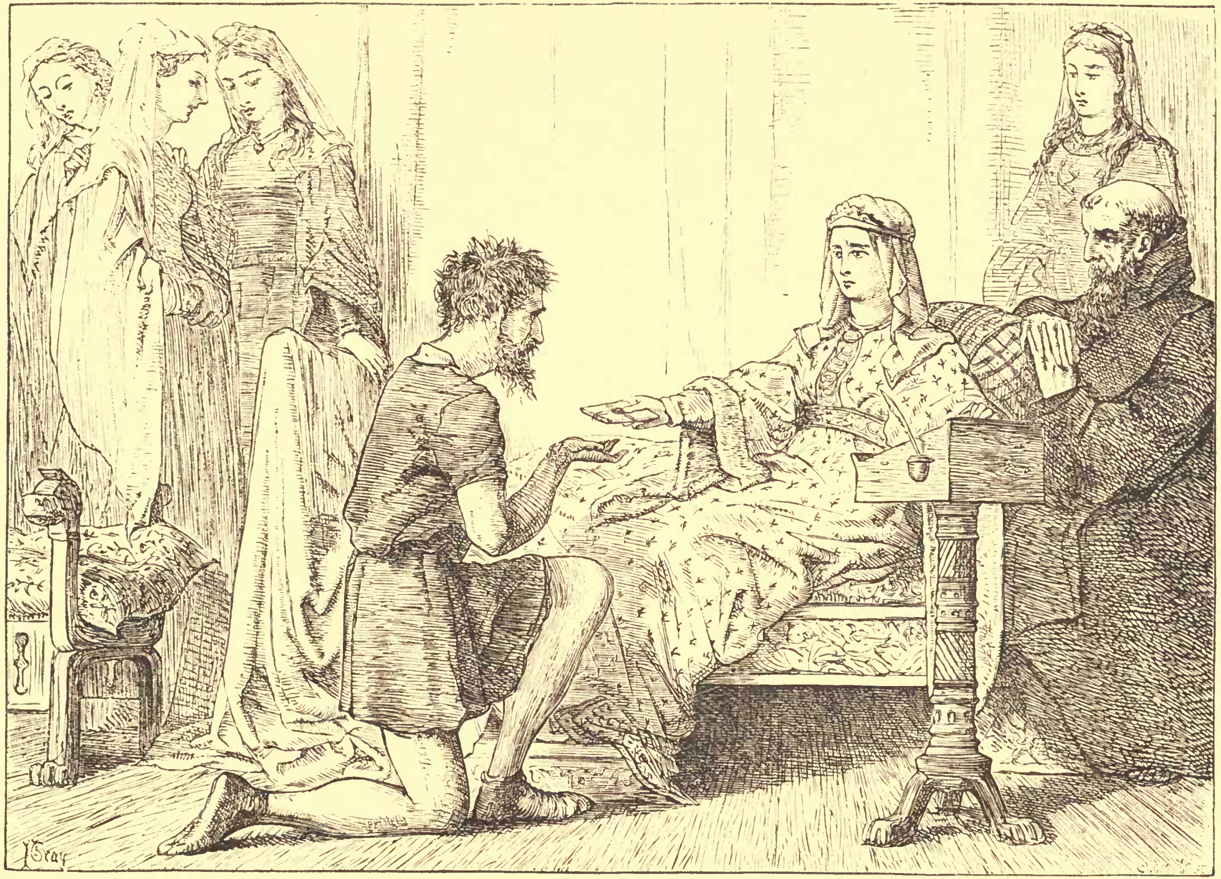
And when he was gone, the Lady Godiva bowed her head into her lap, and wept long and bitterly. Neither her maidens nor the priest dare speak to her for nigh an hour: but at the end of that time she lifted up her head, and settled her face again, till it was like that of a marble saint over a minster door; and called for ink and paper, and wrote her letter; and then asked for a trusty messenger who should carry it up to Westminster.

"None so swift or sure," said the house steward, "as Martin Lightfoot."

Lady Godiva shook her head. "I mistrust that man," she said. "He is too fond of my poor—of the Lord Hereward."

"He is a strange one, my lady, and no one knows whence he came, and I sometimes fancy whither he may go either: but ever since my lord threatened to hang him for talking with my young master, he has never spoken to him, nor scarcely, indeed, to living soul. And one thing there is makes him or any man sure, as long as he is well paid; and that is, that he cares for nothing in heaven or earth save himself and what he can get."

So Martin Lightfoot was sent for. He came in straight into the lady's bedchamber, after the simple fashion of those days. He was a tall, lean, bony man, as was to be expected from his nickname, with a long hooked nose, a scanty brown beard, and a high conical head. His only garment was a shabby grey woollen tunic which served him both as coat and kilt, and laced brogues of untanned hide. He might have been any age from twenty to forty, but his face was disfigured with deep scars and long exposure to the weather. He dropped on one knee, holding his greasy cap in his hand, and looked, not at his lady's face, but at her feet, with a stupid and frightened expression. She knew very little of him, save that her husband had picked him up upon the road as a wanderer some five years since; and that he had been employed as a doer of odd jobs and runner of messages, and that was supposed from



LADY GODIVA ENTRUSTING MARTIN WITH HER LETTER.

Page 9.

his taciturnity and strangeness to have something uncanny about him.

"Martin," said the lady, "they tell me that you are a silent and a prudent man."

"That am I.

'Tongue speaketh bane,
Though she herself hath nane.'"

"I shall try you: do you know your way to London?"

"Yes."

"To your lord's lodgings in Westminster?"

"Yes."

"How long shall you be going there with this letter?"

"A day and a half."

"When shall you be back hither?"

"On the fourth day."

"And you will go to my lord and deliver this letter safely."

"Yes, your Majesty."

"Why do you call me Majesty? The King is Majesty."

"You are my Queen."

"What do you mean, man?"

"You can hang me."

"I hang thee, poor soul? Who did I ever hang, or hurt for a moment if I could help it?"

"But the Earl may."

"He will neither hang nor hurt thee if thou wilt take this letter safely, and bring me back the answer safely."

"They will kill me."

"Who?"

"They," said Martin, pointing to the bower maidens—young ladies of good family who stood round, chosen for their good looks, after the fashion of those times, to attend on great ladies. There was a cry of angry and contemptuous denial, not unmixed with something like laughter, which showed that Martin had but spoken the truth. Hereward, in spite of all his sins, was the darling of his mother's bower; and there was not one of the damsels but would have done anything short of murder to have prevented Martin carrying the letter.

"Silence, man!" said Lady Godiva, so sternly that Martin saw that he had gone too far. "How know'st such as thou what is in this letter?"

"Those others will know," said Martin sullenly, without answering the last question.

"Who?"

"His housecarles outside there."

"He has promised that they shall not touch thee. But how knowest thou what is in this letter?"

"I will take it," said Martin—he held out his hand, took it and looked at it, but upside down and without any attempt to read it.

"His own mother," said he, after awhile.

"What is that to thee?" said Lady Godiva, blushing and kindling.

"Nothing—I had no mother. But God has one!"

"What meanest thou, knave? Wilt thou take the letter or no?"

"I will take it." And he again looked at it without rising off his knee. "His own father, too."

"What is that to thee, I say again?"

"Nothing—I have no father. But God's Son has one!"

"What wilt thou, thou strange man?" asked she, puzzled and half-frightened; "and how camest thou to know what is in this letter?"

"Who does not know? A city that is set on a hill cannot be hid. On the fourth day from this I will be back."

And Martin rose, and putting the letter solemnly into the purse at his girdle, shot out of the door with clenched teeth, as a man upon a fixed purpose which it would lighten his heart to carry out. He ran rapidly through the large outer hall, past the long oak table, at which Hereward and his boon companions were drinking and roystering; and as he passed the young lord he cast on him a look so full of meaning, that though Hereward knew not what the meaning was, it startled him, and for a moment softened him. Did this man who had sullenly avoided him for more than two years, whom he had looked on as a clod or a post in the field beneath his notice, since he could be of no use to him—did this man still care for him? Hereward had reason to know better than most, that there was something strange and uncanny about the man. Did he mean him well? Or had he some grudge against him, which made him undertake this journey willingly and out of spite?—possibly with the will to make bad worse. For an instant Hereward's heart misgave him. He would stop the letter at all risks. "Hold him!" he cried to his comrades.

But Martin turned to him, laid his finger on his lips, smiled kindly, and saying "You promised!" caught up a loaf from the table, slipped from among them like an eel, and darted out of the door, and out of the close. They followed him to the great gate, and there stopped, some cursing, some laughing. To give Martin Lightfoot a yard advantage was never to come up with him again. Some called for bows to bring him down with a parting shot. But Hereward forbade them; and stood leaning against the gate-post, watching him trot on like a lean wolf over the lawn, till he was lost in the great elm woods which fringed the southern fen.

"Now lads," said Hereward, "home with you all, and make your peace with your fathers. In this house you never drink ale again."

They looked at him, surprised.

"You are disbanded, my gallant army. As long as I could cut long thongs out of other men's hides, I could feed you like earl's sons: but now I must feed myself; and a dog over his bone wants no company. Outlawed I shall be, before the week is out; and unless you wish to be outlawed too, you will obey orders, and home."

"We will follow you to the world's end;" cried some.

"To the rope's end, lads: that is all you will get in my company. Go home with you, and those who feel a calling, let them turn monks; and those who have not, let them learn

'For to plough and to sow,
And to reap and to mow,
And to be a farmer's boy.'

Good night."

And he went in, and shut the great gates after him, leaving them astonished.

To take his advice, and go home, was the simplest thing to be done. A few of them on their return were soundly thrashed, and deserved it; a few were hidden by their mothers for a week, in hay-lofts and hen-roosts, till their fathers' anger had passed away. But only one turned monk or clerk, and that was Leofric the Unlucky, godson of the great earl, and poet-in-ordinary to the band.

The next morning at dawn Hereward mounted his best horse, armed himself from head to foot, and rode over to Peterborough.

When he came to the abbey-gate, he smote thereon with his lance-butt, till the porter's teeth rattled in his head for fear.

"Let me in!" he shouted. "I am Hereward Leofricsson. I must see my uncle Brand."

"Oh, my most gracious lord," cried the porter, thrusting his head out of the wicket, "what is this that you have been doing to our Steward?"

"The tithe of what I will do, unless you open the gate!"

"Oh, my lord!" said the porter, as he opened it, "if our Lady and St. Peter would but have mercy on your fair face, and convert your soul to the fear of God and man——"

"She would make me as good an old fool as you. Fetch my uncle the Prior."

The porter obeyed. The son of Earl Leofric was as a young lion among the sheep in those parts; and few dare say him nay, certainly not the monks of Peterborough; moreover, the good porter could not help being strangely fond of Hereward—as was every one whom he did not insult, rob, or kill.

Out came Brand, a noble elder: more fit, from his eye and gait, to be a knight than a monk. He looked sadly at Hereward.

"'Dear is bought the honey that is licked off the thorn,' quoth Hending," said he.

"Hending bought his wisdom by experience, I suppose," said Hereward, "and so must I. So I am just starting out to see the world, uncle."

"Naughty, naughty boy! If we had thee safe here again for a week, we would take this hot blood out of thee, and send thee home in thy right mind."

"Bring a rod and whip me, then. Try, and you shall have your chance. Every one else has had, and this is the end of their labours."

"By the chains of St. Peter," quoth the monk, "that is just what thou needest. Hoist thee on such another fool's back, truss thee up, and lay it on lustily, till thou art ashamed. To treat thee as a man is only to make thee a more heady blown-up ass than thou art already."

"True, most wise uncle. And therefore my still wiser parents are going to treat me like a man indeed, and send me out into the world to seek my fortunes!"

"Eh?"

"They are going to prove how thoroughly they trust me to take care of myself, by outlawing me. Eh? say I in return. Is not that an honour, and a proof that I have not shown myself a fool, though I may have a madman?"

"Outlaw you? Oh, my boy, my darling, my pride! Get off your horse, and don't sit there, hand on hip, like a turbaned Saracen, defying God and man: but come down and talk reason to me, for the sake of St. Peter and all saints."

Hereward threw himself off his horse, and threw his arms round his uncle's neck.

"Pish! Now, uncle, don't cry, do what you will, lest I cry too. Help me to be a man while I live, even if I go to the black place when I die."

"It shall not be!" . . . . and the monk swore by all the relics in Peterborough minster.

"It must be. It shall be. I like to be outlawed. I want to be outlawed. It makes one feel like a man. There is not an earl in England, save my father, who has not been outlawed in his time. My brother Alfgar will be outlawed before he dies, if he has the spirit of a man in him. It is the fashion, my uncle, and I must follow it. So hey for the merry green wood, and the long ships, and the swan's bath, and all the rest of it. Uncle, you will lend me fifty silver pennies?"

"I? I would not lend thee one, if I had it, which I have not. And yet, old fool that I am, I believe I would."

"I would pay thee back honestly. I shall go down to Constantinople to the Varangers, get my Polotaswarf* out of the Kaiser's treasure, and pay thee back five to one."

"What does this son of Belial here?" asked an austere voice.

"Ah! Abbot Leofric, my very good lord. I have come to ask hospitality of you for some three days. By that time I shall be a wolf's head, and out of the law: and then, if you will give me ten minutes' start, you may put your bloodhounds on my track, and see which runs fastest, they or I. You are a gentleman, and a man of honour; so I trust to you to feed my horse fairly the meanwhile, and not to let your monks poison me."

The Abbot's face relaxed. He tried to look as solemn as he could; but he ended in bursting into a very great laughter, and swearing likewise.

"The insolence of this lad passes the miracles of all saints. He robs St. Peter on the highway, breaks into his abbey, insults him to his face, and then asks him for hospitality; and——"

---

* See "The Heimskringla," Harold Hardraade's Saga, for the meaning of this word.

"And gets it," quoth Hereward.

"What is to be done with him. Brand, my friend? If we turn him out——"

"Which we cannot do," said Brand, looking at the well mailed and armed lad, "without calling in half-a-dozen of our men-at-arms."

"In which case there would be blood shed, and scandal made in the holy precincts."

"And nothing gained; for yield he would not till he was killed outright, which God forbid!"

"Amen. And if he stay here, he may be persuaded to repentance."

"And restitution."

"As for that," quoth Hereward (who had remounted his horse from prudential motives, and set him athwart the gateway, so that there was no chance of the doors being slammed behind him), "if either of you will lend me sixteen pence, I will pay it back to you and St. Peter before I die, with interest enough to satisfy any Jew, on the word of a gentleman and an earl's son."

The Abbot burst again into a great laughter. "Come in, thou graceless renegade, and we will see to thee and thy horse; and I will pray to St. Peter; and I doubt not he will have patience with thee, for he is very merciful; and after all, thy parents have been exceeding good to us, and the righteousness of the father, like his sins, is sometimes visited on the children."

Now, why were the two ecclesiastics so uncanonically kind to this wicked youth?

Perhaps because both the old bachelors were wishing from their hearts that they had just such a son of their own. And beside, Earl Leofric was a very great man indeed; and the wind might change; for it is an unstable world.

"Only, mind, one thing," said the naughty boy, as he dismounted, and halloed to a lay-brother to see to his horse—"don't let me see the face of that Herluin."

"And why? You have wronged him, and he will forgive you, doubtless, like a good Christian as he is."

"That is his concern. But if I see him, I cut off his head. And, as uncle Brand knows, I always sleep with my sword under my pillow."

"Oh, that such a mother should have borne such a son!" groaned the Abbot, as they went in.

On the fifth day came Martin Lightfoot, and found Hereward in Prior Brand's private cell.

"Well?" asked Hereward, coolly.

"Is he?——Is he——?" stammered Brand, and could not finish his sentence.

Martin nodded.

Hereward laughed—a loud, swaggering, hysterical laugh.

"See what it is to be born of just and pious parents. Come, Master Trot-alone, speak out and tell us all about it. Thy lean wolf's legs have run to some purpose. Open thy lean wolf's mouth and speak for once, lest I ease thy legs for the rest of thy life by a cut across the hams. Find thy lost tongue, I say!"

"Walls have ears as well as the wild wood," said Martin.

"We are safe here," said the Prior; "so speak, and tell us the whole truth."

"Well, when the Earl read the letter, he turned red, and pale again, and then nought but—'Men, follow me to the King at Westminster.' So we went, all with our weapons, twenty or more, along the Strand, and up into the King's new hall; and a grand hall it is, but not easy to get into, for the crowd of monks and beggars on the stairs, hindering honest folks' business. And there sat the King on a high settle, with his pink face and white hair, looking as royal as a bell-wether new washed; and on either side of him, on the same settle, sat the old fox and the young wolf."

"Godwin and Harold? And where was the Queen?"

"Sitting on a stool at his feet, with her hands together as if she were praying, and her eyes downcast, as demure as any cat. And so is fulfilled the story, how the sheep-dog went out to get married, and left the fox, the wolf, and the cat to guard the flock."

"If thou hast found thy tongue," said Brand, "thou art like enough to lose it again by slice of knife, talking such ribaldry of dignities. Dost not know"—and he sank his voice—"that Abbot Leofric is Earl Harold's man, and that Harold himself made him abbot?"

"I said, walls have ears. It was you who told me that we were safe. However, I will bridle the unruly one." And he went on. "And your father walked up the hall, his left hand on his sword-hilt, looking an earl all over, as he is."

"He is that," said Hereward in a low voice.

"And he bowed; and the most magnificent, powerful, and virtuous Godwin would have beckoned him up to sit on the high settle: but he looked straight at the King, as if there were never a Godwin or a Godwinsson on earth, and cried as he stood:—

"'Justice, my Lord the King!'

"And at that the King turned pale, and said: 'Who? What? Oh miserable world! Oh last days drawing nearer and nearer! Oh earth, full of violence and blood! Who has wronged thee now, most dear and noble Earl?'

"'Justice against my own son.'

"At that the fox looked at the wolf, and the wolf at the fox, and if they did not smile, it was not for want of will, I warrant. But your father went on, and told all his story; and when he came to your robbing master monk—'Oh, apostate!' cries the bell-wether, 'oh, spawn of Beelzebub! excommunicate him, with bell, book, and candle May he be thrust down with Korah, Balaam, and Iscariot, to the most Stygian pot of the sempiternal Tartarus.'

"And at that your father smiled. 'That is bishops' work;' says he, 'and I want king's work from you, Lord King. Outlaw me this young rebel's sinful body, as by law you can; and leave his sinful soul to the priests—or to God's mercy, which is like to be more than theirs.'

"Then the Queen looked up. 'Your own son, noble Earl? Think of what you are doing, and one whom all say is so gallant and so fair. Oh persuade him, father—persuade him, Harold my brother—or, if you cannot persuade him, persuade the King at least, and save this poor youth from exile.'

"Puss Velvet-paw knew well enough," said Hereward in a low voice, "that the way to harden my father's heart was to set Godwin and Harold on softening it. They ask my pardon from the King? I would not take it at their asking, even if my father would."

"There spoke a true Leofricsson," said Brand, in spite of himself.

"'By the ——' (and Martin repeated a certain very solemn oath), said your father, 'justice I will have, my Lord King. Who talks to me of my own son? You put me into my earldom to see justice done, and law obeyed; and how shall I make others keep within bound if I am not to keep in my own flesh and blood? Here is this land running headlong to ruin, because every nobleman —ay, every churl who owns a manor, if he dares —must needs arm and saddle, and levy war on his own behalf, and harry and slay the King's lieges, if he have not garlic to his roast goose every time he chooses'—and there your father did look at Godwin, once and for all,—'and shall I let my son follow the fashion, and do his best to leave the land open and weak for Norseman, or Dane, or Frenchman, or whoever else hopes next to mount the throne of a king who is too holy to leave an heir behind him?'"

"Ahoi! Martin the silent! Where learnt you so suddenly the trade of preaching? I thought you kept your wind for your running this two years past. You would make as good a talker among the Witan as Godwin himself. You give it us, all word for word, and voice and gesture withal, as if you were King Edward's French Chancellor."

Martin smiled. "I am like Falada the horse, my lords, who could only speak to his own true princess. Why I held my tongue of late, was only lest they should cut my head off for talking, as they did poor Falada's."

"Thou art a very crafty knave," said Brand, "and hast had clerk-learning in thy time, I can see, and made bad use of it. I misdoubt very much that thou art some runaway monk."

"That am I not, by St. Peter's chains!" said Martin, in an eager terrified voice. "Lord Hereward, I came hither as your father's messenger and servant. You will see me safe out of this abbey, like an honourable gentleman!"

"I will. All I know of him, uncle, is that he used to tell me stories, when I was a boy, of enchanters, and knights, and dragons, and such like, and got into trouble for filling my head with such fancies. Now let him tell his story in peace."

"He shall: but I misdoubt the fellow very much. He talks as if he knew Latin; and what business has a foot-running slave to do that?"

So Martin went on, somewhat abashed. "'And,' said your father, 'justice I will have, and leave injustice, and the overlooking of it, to those who wish to profit thereby.'

"And at that Godwin smiled, and said to the King, 'The Earl is wise, as usual, and speaks like a very Solomon. Your Majesty must, in spite of your own tenderness of heart, have these letters of outlawry made out.'

"Then all our men murmured—and I as loud as any. But old Surturbrand the housecarle did more; for out he stepped to your father's side, and spoke right up before the King.

"'Bonny times,' he said, 'I have lived to see, when a lad of Earl Oslac's blood is sent out of the land, a beggar and a wolf's head, for playing a boy's trick or two, and upsetting a shaveling priest! We managed such wild young colts better, we Vikings who conquered the Danelagh. If Canute had had a son like Hereward—as would to God he had had —he would have dealt with him as old Swend Forkbeard (God grant I meet him in Valhalla, in spite of all priests!) did by Canute himself when he was young, and kicked and plunged awhile at being first bitted and saddled.'

"'What does the man say?' asked the King, for old Surturbrand was talking broad Danish.

"'He is a housecarle of mine, Lord King, a good man and true; but old age and rough Danish blood has made him forget that he stands before kings and earls.'

"'By ——, Earl!' says Surturbrand, 'I have fought knee to knee beside a braver king than that there, and nobler earls than ever a one here; and was never afraid, like a free Dane, to speak my mind to them, by sea or land. And if the King, with his French ways, does not understand a plain man's talk, the two earls yonder do right well, and I say—Deal by this lad in the good old fashion. Give him half-a-dozen long ships, and what crews he can get together, and send him out, as Canute would have done, to seek his fortune like a Viking; and if he comes home with plenty of wounds, and plenty of plunder, give him an earldom as he deserves. Do you ask your countess, Earl Godwin, —she is of the right Danish blood, God bless her! though she is your wife,—and see if she does not know how to bring a naughty lad to his senses.'

"Then Harold the Earl said: 'The old man is right. King, listen to what he says.' And he told him all, quite eagerly."

"How did you know that? Can you understand French?"

"I am a poor idiot, give me a halfpenny," said Martin, in a doleful voice, as he threw into his face and whole figure a look of helpless stupidity and awkwardness, which set them both laughing.

But Hereward checked himself. "And you think he was in earnest?"

"As sure as there are holy crows in Crowland.

But it was of no use. Your father got a parchment, with an outlandish Norman seal hanging to it, and sent me off with it that same night to give to the lawman. So wolf's head you are, my lord, and there is no use crying over spilt milk."

"And Harold spoke for me? It will be as well to tell Abbot Leofric that, in case he be inclined to turn traitor, and refuse to open the gates. Once outside them, I care not for mortal man."

"My poor boy, there will be many a one whom thou hast wronged only too ready to lie in wait for thee, now thy life is in every man's hand. If the outlawry is published, thou hadst best start to-night, and get past Lincoln before morning."

"I shall stay quietly here, and get a good night's rest; and then ride out to-morrow morning in the face of the whole shire. No, not a word! You would not have me sneak away like a coward?"

Brand smiled and shrugged his shoulders: being very much of the same mind.

"At least, go north."

"And why north?"

"You have no quarrel in Northumberland, and the king's writ runs very slowly there, if at all. Old Siward Digre may stand your friend."

"He? he is a fast friend of my father's."

"What of that? the old Viking will like you none the less for having shown a touch of his own temper. Go to him, I say, and tell him that I sent you."

"But he is fighting the Scots beyond the Forth."

"So much the better. There will be good work for you to do. And Gislebert of Ghent is up there too, I hear, trying to settle himself among the Scots. He is your mother's kinsman; and as for your being an outlaw, he wants hard hitters and hard riders, and all is fish that comes to his net. Find him out too, and tell him I sent you."

"You are a good old uncle," said Hereward. "Why were you not a soldier?"

Brand laughed somewhat sadly.

"If I had been a soldier, lad, where would you have looked for a friend this day? No. God has done what was merciful with me and my sins. May he do the same by thee and thine."

Hereward made an impatient movement. He disliked any word which seemed likely to soften his own hardness of heart. But he kissed his uncle lovingly on both cheeks.

"By-the-by, Martin—any message from my lady mother?"

"None!"

"Quite right and pious. I am an enemy to Holy Church and therefore to her. Good night, uncle."

"Hey?" asked Brand; "where is that footman—Martin you call him? I must have another word with him."

But Martin was gone.

"No matter. I shall question him sharply enough to-morrow, I warrant."

And Hereward went out to his lodging; while the good Prior went to his prayers.

When Hereward entered his room, Martin started out of the darkness, and followed him in. Then he shut-to the door carefully, and pulled out a bag.

"There was no message from my lady: but there was this."

The bag was full of money.

"Why did you not tell me of this before?"

"Never show money before a monk."

"Villain! would you mistrust my uncle?"

"Any man with a shaven crown. St. Peter is his God, and Lord, and conscience; and if he saw but the shine of a penny, for St. Peter he would want it."

"And he shall have it," quoth Hereward; and flung out of the room, and into his uncle's.

"Uncle, I have money. I am come to pay back what I took from the Steward, and as much more into the bargain." And he told out eight-and-thirty pieces.

"Thank God and all his saints!" cried Brand, weeping abundantly for joy; for he had acquired, by long devotion, the *donum lachrymarum*—that lachrymose and somewhat hysterical temperament common among pious monks, and held to be a mark of grace.

"Blessed St. Peter, thou art repaid; and thou wilt be merciful!"

Brand believed, in common with all monks then, that Hereward had robbed, not merely the Abbey of Peterborough, but, what was more, St. Peter himself; thereby converting into an implacable and internecine foe the chief of the Apostles, the rock on which was founded the whole Church.

"Now uncle," said Hereward, "do me one good deed in return. Promise me that, if you can help it, none of my poor housecarles shall suffer for my sins. I led them into trouble. I am punished. I have made restitution—at least to St. Peter. See that my father and mother, if they be the Christians they call themselves, forgive and forget all offences except mine."

"I will; so help me all saints and our Lord. Oh, my boy, my boy, thou shouldst have been a king's thane, and not an outlaw!"

And he hurried off with the news to the Abbot.

When Hereward returned to his room, Martin was gone.

"Farewell, good men of Peterborough," said Hereward, as he leapt into the saddle next morning. "I had made a vow against you, and came to try you; to see whether you would force me to fulfil it or not. But you have been so kind that I have half repented of it; and the evil shall not come in the days of Abbot Leofric, nor of Brand the Prior, though it may come in the days of Herluin the Steward, if he live long enough."

"What do you mean, you incarnate fiend, only fit to worship Thor and Odin?" asked Brand.

"That I would burn Goldenborough, and Herluin the Steward within it, ere I die. I fear I shall do it: I fear I must do it. Ten years ago come Lammas, Herluin bade light the peat-stack under me. Do you recollect?"

"And so he did, the hound!" quoth Brand. "I had forgotten that."

"Little Hereward never forgets foe or friend. Ever since, on Lammas night—hold still, horse!—I dream of fire and flame, and of Goldenburgh in the glare of it. If it is written in the big book, happen it must; if not, so much the better for Goldenborough, for it is a pretty place, and honest Englishmen in it. Only see that there be not too many Frenchmen crept in when I come back, beside our French friend Herluin; and see, too, that there be not a peat-stack handy—a word is enough to wise men like you. Good-by!"

"God help thee, thou sinful boy!" said the Abbot.

"Hereward, Hereward! Come back!" cried Brand.

But the boy had spurred his horse through the gateway, and was far down the road.

"Leofric, my friend," said Brand sadly, "this is my sin, and no man's else. And heavy penance will I do for it, till that lad returns in peace."

"Your sin?"

"Mine, Abbot. I persuaded his mother to send him hither to be a monk. Alas! alas! How long will men try to be wiser than Him who maketh men?"

"I do not understand thee," quoth the Abbot. And no more he did.

It was four o'clock on a May morning when Hereward set out to see the world, with good armour on his back, good weapon by his side, good horse between his knees, and good money in his purse. What could a lad of eighteen want more, who under the harsh family rule of those times had known nothing of a father's, and but too little of a mother's, love? He rode away northward through the Bruneswald, over the higher land of Lincolnshire, through primeval glades of mighty oak and ash, holly and thorn, swarming with game, which was as highly preserved then as now, under Canute's severe forest laws. The yellow roes stood and stared at him knee-deep in the young fern; the pheasant called his hens out to feed in the dewy grass; the blackbird and thrush sung out from every bough; the wood lark trilled above the high oak tops, and sank down on them as his song sank down. And Hereward rode on, rejoicing in it all. It was a fine world in the Bruneswald. What was it then outside? Not to him, as to us, a world circular, sailed round, circumscribed, mapped, botanized, zoologized; a tiny planet about which everybody knows, or thinks they know everything: but a world infinite, magical, supernatural—because unknown; a vast flat plain reaching no one knew whence or where, save that the mountains stood on the four corners thereof to keep it steady, and the four winds of heaven blew out of them; and in the centre, which was to him the Bruneswald, such things as he saw: but beyond, things unspeakable,—dragons, giants, rocs, orcs, witch-whales, griffins, chimæras, satyrs, enchanters, paynims, Saracen Emirs and Sultans, Kaisers of Constantinople, Kaisers of Ind and of Cathay, and beyond them again of lands as yet unknown. At the very least he could go to Brittany, to the forest of Brocheliaunde, where (so all men said) fairies might be seen bathing in the fountains, and possibly be won and wedded by a bold and dexterous knight after the fashion of Sir Gruelan.* What was there not to be seen and conquered? Where would he go? Where would he not go? For the spirit of Odin the Goer, the spirit which has sent his children round the world, was strong within him. He would go to Ireland, to the Ostmen, or Irish Danes men at Dublin, Waterford, or Cork, and marry some beautiful Irish Princess with grey eyes, and raven locks, and saffron smock, and great gold bracelets from her native hills. No; he would go off to the Orkneys, and join Bruce and Ranald, and the Vikings of the northern seas, and all the hot blood which had found even Norway too hot to hold it; and sail through witch-whales and icebergs to Iceland and Greenland, and the sunny lands which they said lay even beyond, across the all but unknown ocean. He would go up the Baltic to the Jomsburg Vikings, and fight against Lett and Esthonian heathen, and pierce inland, perhaps, through Puleyn and the bison forests, to the land from whence came the magic swords and the old Persian coins which he had seen so often in the halls of his forefathers. No; he would go South, to the land of sun and wine; and see the magicians of Cordova and Seville; and beard Mussulman hounds worshipping their Mahomets; and perhaps bring home an Emir's daughter,—

"With more gay gold about her middle,
Than would buy half Northumberlee.'

Or he would go up the Straits, and on to Constantinople and the great Kaiser of the Greeks, and join the Varanger Guard, and perhaps, like Harold Hardraade in his own days, after being cast to the lion for carrying off a fair Greek lady, tear out the monster's tongue with his own hands, and show the Easterns what a Viking's son could do. And as he dreamed of the infinite world and its infinite wonders, the enchanters he might meet, the jewels he might find, the adventures he might essay, he held that he must succeed in all, with hope, and wit, and a strong arm; and forgot altogether that, mixed up with the cosmogony of an infinite flat plain called the Earth, there was joined also the belief in a flat roof above called Heaven, on which (seen at times in visions through clouds and stars) sat saints, angels, and archangels, for ever more harping on their golden harps, and knowing neither vanity nor vexation of spirit, lust nor pride, murder nor war:—and underneath a floor, the name whereof was Hell; the mouths whereof (as all men knew) might be seen on Hecla, and Etna, and Stromboli; and the fiends heard within, tormenting, amid fire, and smoke, and clanking chains, the souls of the eternally lost.

---

* Wace, author of the "Roman de Rou," went to Brittany a generation later, to see those same fairies: but had no sport; and sang—

"Fol i alai, fol m'en revins;
Folie quis, por fol me tins."

As he rode on slowly though cheerfully, as a man who will not tire his horse at the beginning of a long day's journey, and knows not where he shall pass the night, he was aware of a man on foot coming up behind him at a slow, steady, loping, wolf-like trot, which in spite of its slowness gained ground on him so fast, that he saw at once that the man could be no common runner.

The man came up; and behold, he was none other than Martin Lightfoot.

"What! art thou here?" asked Hereward, suspiciously, and half cross at seeing any visitor from the old world which he had just cast off. "How gottest thou out of St. Peter's last night?"

Martin's tongue was hanging out of his mouth like a running hound's; but he seemed, like a hound, to perspire through his mouth, for he answered without the least sign of distress, without even pulling in his tongue.

"Over the wall, the moment the Prior's back was turned. I was not going to wait till I was chained up in some rat's hole with a half-hundred of iron on my leg, and flogged till I confessed that I was what I am not—a runaway monk."

"And why art here?"

"Because I am going with you."

"Going with me?" said Hereward; "what can I do for thee?"

"I can do for you," said Martin.

"What?"

"Groom your horse, wash your shirt, clean your weapons, find your inn, fight your enemies, cheat your friends—anything and everything. You are going to see the world. I am going with you."

"Thou canst be my servant? A right slippery one, I expect," said Hereward, looking down on him with some suspicion.

"Some are not the rogues they seem. I can keep my secrets and yours too."

"Before I can trust thee with my secrets, I shall expect to know some of thine," said Hereward.

Martin Lightfoot looked up with a cunning smile. "A servant can always know his master's secrets if he likes. But that is no reason a master should know his servant's."

"Thou shalt tell me thine, man, or I shall ride off and leave thee."

"Not so easy, my lord. Where that heavy horse can go, Martin Lightfoot can follow. But I will tell you one secret, which I never told to living man. I can read and write like any clerk."

"Thou read and write?"

"Ay, good Latin enough, and Irish too, what is more. And now, because I love you, and because you I will serve, willy nilly, I will tell you all the secrets I have, as long as my breath lasts, for my tongue is rather stiff after that long story about the bell-wether. I was born in Ireland, in Waterford town. My mother was an English slave, one of those that Earl Godwin's wife—not this one that is now, Gyda, but the old one—King Canute's sister—used to sell out of England by the score, tied together with ropes, boys and girls from Bristol town. Her master, my father that was (I shall know him again), got tired of her, and wanted to give her away to one of his kernes. She would not have that; so he hung her up hand and foot, and beat her that she died. There was an abbey hard by, and the Church laid on him a penance—all that they dared get out of him—that he should give me to the monks, being then a seven-years' boy. Well, I grew up in that abbey; they taught me my fa fa mi fa: but I liked better conning of ballads and hearing stories of ghosts and enchanters, such as I used to tell you. I'll tell you plenty more whenever you're tired. Then they made me work; and that I never could abide at all. Then they beat me every day; and that I could abide still less; but always I stuck to my book, for one thing I saw—that learning is power, my lord; and that the reason why the monks are masters of the land is, they are scholars, and you fighting men are none. Then I fell in love (as young blood will) with an Irish lass, when I was full seventeen years old; and when they found out that, they held me down on the floor and beat me till I was well nigh dead. They put me in prison for a month; and between bread-and-water and darkness I went nigh foolish. They let me out, thinking I could do no more harm to man or lass; and when I found out how profitable folly was, foolish I remained, at least as foolish as seemed good to me. But one night I got into the abbey church, stole therefrom that which I have with me now, and which shall serve you and me in good stead yet—out and away aboard a ship among the buscarles, and off into the Norway sea. But after a voyage or two, so it befell, I was wrecked in the Wash by Botulfston Deeps, and begging my way inland, met with your father, and took service with him, as I have taken service now with you."

"Now, what has made thee take service with me?"

"Because you are you."

"Give me none of your parables and dark sayings, but speak out like a man. What canst see in me that thou shouldest share an outlaw's fortune with me?"

"I had run away from a monastery, so had you; I hated the monks, so did you; I liked to tell stories,—since I found good to shut my mouth I tell them to myself all day long, sometimes all night too. When I found out you liked to hear them, I loved you all the more. Then they told me not to speak to you; I held my tongue. I bided my time. I knew you would be outlawed some day. I knew you would turn Viking and kemperyman, and kill giants and enchanters, and win yourself honour and glory; and I knew I should have my share in it. I knew you would need me some day; and you need me now, and here I am; and if you try to cut me down with your sword, I will dodge you, and follow you, and dodge you again, till I force you to let me be your man, for with you I will live and die. And now I can talk no more."

"And with me thou shalt live and die," said Hereward, pulling up his horse, and frankly holding out his hand to his new friend.

Martin Lightfoot took his hand, kissed it, licked it almost as a dog would have done. "I am your man," he said, "Amen; and true man I will prove to you, if you will prove true to me." And he dropped quietly back behind Hereward's horse, as if the business of his life was settled, and his mind utterly at rest.

"There is one more likeness between us," said Hereward, after a few minutes' thought. "If I have robbed a church, thou hast robbed one too. What is this precious spoil which is to serve me and thee in such mighty stead?"

Martin drew from inside his shirt and under his waistband a small battle-axe, and handed it up to Hereward. It was a tool the like of which in shape Hereward had seldom seen, and never its equal in beauty. The handle was some fifteen inches long, made of thick strips of black whalebone, curiously bound with silver, and butted with narwhal ivory. This handle was evidently the work of some cunning Norseman of old. But who was the maker of the blade? It was some eight inches long, with a sharp edge on one side, a sharp crooked pick on the other; of the finest steel, inlaid with strange characters in gold, the work probably of some Circassian, Tartar, or Persian; such a battle-axe as Rustum or Zohrab may have wielded in fight upon the banks of Oxus; one of those magic weapons, brought, men knew not how, out of the magic East, which were hereditary in many a Norse family, and sung of in many a Norse saga.

"Look at it," said Martin Lightfoot. "There is magic on it. It must bring us luck. Whoever holds that must kill his man. It will pick a lock of steel. It will crack a mail corslet as a nut-hatch cracks a nut. It will hew a lance in two at a single blow. Devils and spirits forged it—I know that; Virgilius the Enchanter, perhaps, or Solomon the Great, or whosoever's name is on it, graven there in letters of gold. Handle it, feel its balance; but no—do not handle it too much. There is a devil in it, who would make you kill me. Whenever I play with it I long to kill a man. It would be so easy—so easy. Give it me back, my lord, give it me back, lest the devil come through the handle into your palm, and possess you."

Hereward laughed, and gave him back his battle-axe. But he had hardly less doubt of the magic virtues of such a blade than had Martin himself.

"Magical or not, thou wilt not have to hit a man twice with that, Martin, my lad. So we two outlaws are both well armed; and having neither wife nor child, land nor beeves to lose, ought to be a match for any six honest men who may have a grudge against us, and sound reasons at home for running away."

And so those two went northward through the green Bruneswald, and northward again through merry Sherwood, and were not seen in that land again for many a year.

A MEDITATION OF ST. ELIGIUS.

Jesus *for water Mary sent,*
From where by Joseph's bench he stood.
With pitcher in his hand he went,
And drew the water very good.

Then home upon his head he bore
The pitcher, to the brim upfill'd;
But ere he reach'd the cottage-door,
The pitcher broke, the water spill'd.

His cloak upon the ground he laid,
And in it gather'd up the pool;
Obedient there the water stay'd,
And home he bore it sweet and cool.

Eligius said: "It is not good:
The hands that all the worlds control,
Had there been room for wonders, would
Have made His mother's pitcher whole.

"But even an ancient fable, told
In love of thee, the Truth indeed,
Like broken pitcher, yet may hold
Some water for a loving need.

"Thy living water I have spilt.
I thought to bear the pitcher high;
I stumbled on the stones of guilt—
There the wet fragments scatter'd lie.

"Christ, gather up my life's poor hoard;
It sinks and sobs into the ground;
Bear in thy woven garment, Lord,
What in thy well at first I found.

"For if it pass in bubbled foam,
And I sit down to look and mourn,
What will they do I left at home,
Thirsting and waiting my return?

"What will He say whose love will drink
Of any cup that love hath fill'd,
If I be left on Sychar's brink,
My pitcher broke, my water spill'd?

"Lift, then, and bear my life, thy gift,
Too heavy to be borne by me;
And I the cross will try to lift,
And bear all-humbly after thee."

GEORGE MAC DONALD.

ANGELS' VISITS.

BY W. FLEMING STEVENSON.

CONSIDERING how wide and deep-rooted, as well as Biblical, the belief in angels has been, it is singular how seldom it comes up to the surface. Is it that in these days of illumination we are ashamed of it, that it sounds like a fable which well-bred minds ought to reject, that it is like confessing to witches and ghosts? As our telescopes sweep the skies with a more searching scrutiny, are we staggered that they have not discovered a feather from an angel's wing? Is there a conflict in our minds between the traditional faith we have accepted and the restless, advancing, and polished scepticism of our time, and that we are half inclined to think the sceptics are right? When a faith is so rickety, a little quizzing, a slight assumption of superior culture, will knock it under. And as no one has seen an angel, and as the chubby heads and well-draped and solid winged figures that we are taught are angels, are often ridiculous, and as the world seems to get on without spiritual intervention, it is as well perhaps to repress all enthusiasm about angelic dogmas, and spiritualise and allegorise a little until we get the Bible to say that it never meant to say there were angels. There may be a feeble protest that there are more things in heaven and earth than we have seen or ever can see, and that disclaiming spiritual intervention and agency over and above natural, is the same thing as disclaiming a personal relation between God and His creatures. But no one likes to be pulled up by principles when he only wants a single opinion. It is as irritating as a toll-bar to a man who only drives a mile. Or is it that our notions are too vague and crude to bear expression, like Washington Irving's Irishman who shot an owl, and being told by a friend it was a cherubim, died of fright? Have we thought so little about them, that they mix themselves up crudely with will-o'-the-wisps, meteors, spectres, hobgoblins, and other night fears? If a paper on angels were added to the competitive examinations, one can conceive the blank result; or if any ordinary congregation were examined in the last verses of the hundred and third Psalm, or the third and fourth strophes of the *Te Deum*, how many ordinary men and women could answer? Does Jones think there are angels ministering to him? Has Smith felt that they are more than a vague spot of glory in the Apocalypse? No doubt both of them have said more than once, that "fools rush in where angels fear to tread;" they are keen about the discussion on Campbell's line, "Like angel-visits, few and far between;" and they know of people that they call "good angels." But these phrases, like many more, have acquired a mere conventional force, and are passed from hand to hand as fools' counters, not as wise men's money.

That angels visit us at all, implies a popular recognition of the truth of the Scripture doctrine regarding them; that they are a distinct and most real order of creatures, and that they are in personal relation to us. There is some confusion in it, as in most popular sayings: for it is evident that it refers to what goes on at present; that it is not a dry fact of history dug out for the purpose of illustration; and yet, as for visible angelic appearances, we know of none since the days of the Apostles, and cannot say whether they are as rare as in the days of old. And good angels are among us, moving noiselessly through the world; and most men can recall one in their own circle. It has been some mild and gracious sister moving in gentle ministry about a sick, irritable, peevish, and selfish brother; checking her own wishes by his; quick to anticipate the morbid change of his fancies; smiling under his fretful words and discontent; stung by his thoughtlessness, but only more tolerant; vexed, but not betraying it; sad enough, perhaps, with her own cares, but always cheerful to him; patient, without showing that there is need of patience; on whom he leans all his burden; whom he cannot bear out of his sight; who turns from every pleasant service of life to link her hand in his, and so, hand in hand, to walk down the sad valley of the shadow of death. It has been some stricken one, wasted and imprisoned by disease; and the bright faces of the rest throw no gloom upon her; the children steal to her side to put their hands in hers, and look on her with the awe with which childhood watches pain; she has a kiss and a smile, and a kind word for each; she is their peacemaker in their quarrels, to whom they fly with both their tears and laughter; she holds the secrets of the house, knows every private smart, and gives the tenderest consolation; the stubborn become easy with her, the rough, gentle; she manages the most difficult tempers, makes the largest allowances, soothes down the little petulances that break into the family; as he looks at the pale cheek and the invalid slumbering upon the sofa, the tears may come into her father's eyes, for the rest go busily round in the world, and she must suffer there God's time; but she could least be spared, the link between them all, the angel of the house. It has been some maiden aunt whose quiet love and self-sacrifice make her to be felt rather than noticed where she is a guest; to whom the boys run out with boisterous welcome, whom the girls draw away to their rooms with merry force; who brings into the house the nameless charm that everybody knows; cheerful and happiest when others are happy, with pure honest face in its setting of grey hairs; to whom we turn at the first threat of trial; who has been the first to stand at our side; who makes long journeys to nurse the sick, and parts from one house only to renew her ministry at another; who when she comes brings rest and confidence and peace; who has the secret of doing good and infecting others with her sunshine; thoughtful, unselfish, sympathising, of whom there are many even in the trodden ways of the world. Or it may be some old servant whose place of nurse has given her privilege of speech, who toils for the children as if they were her own, and when misfortune has overtaken the family, follows them through every change, never making a murmur, thinking, helping and planning for them, and when the father is dead, and the mother falls sick, and friends are cold, battles bravely against the tide. Of such angels men must often speak and call them good; of the friend who met us at the critical moment before plunging into wrong; of the helper who cheered us when we were sinking to despair: of one who came when the heart was breaking with sorrow; and another, when the heart was hardening in sin. But if these are good angels, it is by courtesy and figure of speech; speech that proves how genuine and deep this belief in angels has been; that shows with what qualities we invest them. If there are men and women angel-like, there must needs be their counterparts—the angels themselves; for these good angels are not what the children would call "real angels," and the simple primitive question looms up behind—What is an angel?

"A spiritual creature," says Luther, "created by God without a body for the service of Christendom and the Church." "An intellectual and incorporeal substance," says the more scholastic Puritan, "free of will, a servant of God, and by His grace immortal in blessedness." Bishop Bull is even more precise, and pronounces angels to be "certain permanent substances, invisible and imperceptible to our senses." "Incorporeal," say the Fathers, "invisible yet perceptible of sense, rational, intellectual, immortal; the good, bright and impassible; the bad, passible and foul." Hooker's definition blossoms into poetry. "Angels," he says, "are spirits immaterial and intellectual; the glorious inhabitants of those sacred pallaces where nothing but light and blessed immortalitie, no shadowe of matter for teares, discontentments, griefes, and uncomfortable passions to work upon, but all joy and tranquillitie and peace for ever and ever doe dwell." There are five authoritative answers to choose from; of which I confess to like the simpler one of simple-hearted Luther, instinct as it is with his bold faith that man is the great object of God, and therefore of whatever God has made and done. In conceiving thus dogmatically of angels it is plain we must first dispense with anything so gross as a body. They are "incorporeal, invisible." If they have been ever seen it has been because they assumed a visible form, borrowed for the time a body not their own. For spirits

> "in what shape they choose,
> Dilated or condensed, bright or obscure,
> Can execute their aery purposes."

Milton again describes how

> "incorporeal spirits to smallest forms
> Reduced their shapes immense."

And this union between them and the bodies thus assumed we are learnedly told, is "not substantial (as between soul and body), nor hypostatical (as between the divine and human nature of Christ), nor accidental; but assistential." Their numbers are touched with more vagueness. According to the Rabbis there is nothing in the world without an angel, not so much as a blade of grass; and the great Aquinas held that there were more angels than all substances together, celestial and terrestrial, animate and inanimate. Nor is this to be wondered at if, as the Chagigah says, hosts of new angels are created every morning out of the stream of fire which is the breath of God (Dan. vii. 10; Ps. xxxiii. 6). Adams has it that "the Romists allot a particular tutelar angel to every college and corporation; yea to the generation of flies, fleas, and ants;" and quaintly adds: "sure then they will not *pinch themselves;* they appoint to the pope two principal Seraphims, Michael and Gabriel ever attending his person."

There is a closer approximation to the number that have fallen, but the calculation suggests the fanciful arithmetic in Mr. Longfellow's Kavanagh. "So many angels as fell from heaven, so many souls shall ascend to heaven." This was Gregory's thought, that the number of the elect would repair the breach in heaven: and he of the old Puritans with the richest imagination catches the fancy from him, and writes: "They lost a number of spirits; they are glad to have it made up with souls." If it is true that "angels are bright still though the brightest fell," then the redeemed would also be the brightest creatures in heaven supplying the place not of the inferior but the superior.

Herbert boldly claims that pre-eminence for men:

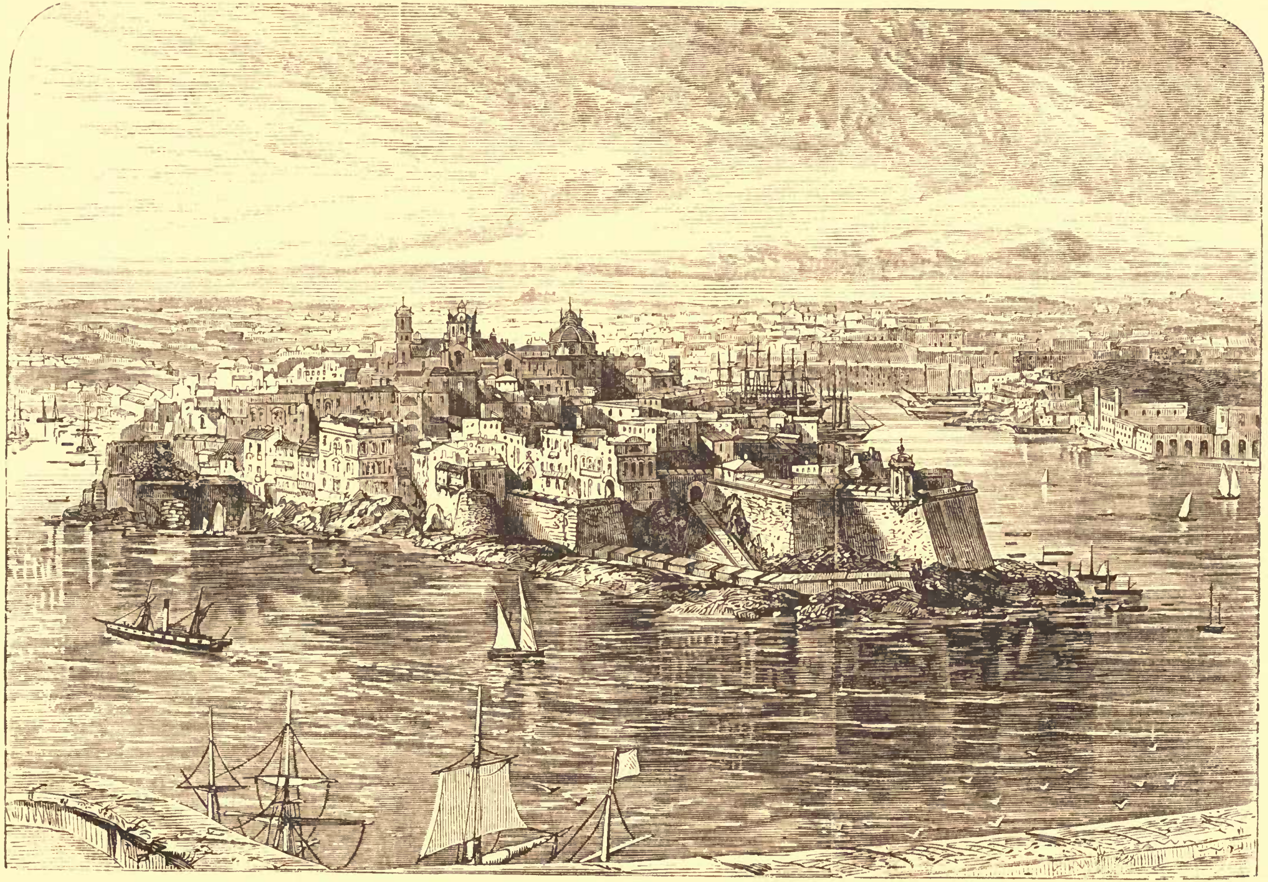
> "To this life things of sense
> Make their pretence:
> In th' other Angels have a right of birth;
> Man ties them both alone,
> And makes them one,
> With th' one hand touching heav'n, and th' other earth."

And to some it might occur that man who, on earth is made a little lower than the angels, will in heaven judge those angels (Ps. viii. 5; 1 Cor. vi. 3).

The rank and authority of these spirits have been strangely though variously defined. According to the Book of Enoch and the Jerusalem Targum, there are six groups of various dignity; according to Philo seven. Dionysius the Areopagite counts nine, and the scholars of the Middle Ages accept his numeration. They fall into three groups with three in each:—

Seraphim, Cherubim, Thrones,
Dominations, Virtues, Powers,
Princedoms, Archangels, Angels.

The Rabbinical Theosophy is more explicit. There are seven archangels—Michael, Raphael, Gabriel,



MALTA.

Uriel, Chamuel, Jophiel, Zadkiel; of whom the four first and greatest sustain the throne of God. These four also preside over the four elements, and are the solemn ministers of God:—Michael is prime minister, presiding over worship; Raphael, minister of health; Gabriel, of war; and Uriel, of justice.* The order and mode of government of an earthly kingdom was thus transferred to heaven: so that we are not surprised to find the four-and-twenty elders of the Revelations are four-and-twenty angels forming a senate or awful inner and secret council, and, like the four-and-twenty orders of the Jewish priests, each having his period of special service. Some preside over kingdoms, some over planets, like

"The Angel of the Earth who, while he guides
His chariot planet round the goal of day,
All trembling, gazes on the eye of God."

Elihu was an angel: and afterwards in Alexandria they said that it was an angel that was the star that led the Magi. The residence of these and of all angels is in the stars, and thus the *Plurality of Worlds* is set at rest.

For their knowledge, it is commonly restricted, though one divine of the sixteenth century affirms there are but three things of which they are ignorant—the day of the Second Advent, men's hearts, and the number of the elect; and another declares them to be "good philosophers, great statists, and knowing the affairs of kingdoms . . . . wise and very knowing, always lusty and lively." Their occupations are very various, though falling under only two great classes—worship and service; the former towards God, the latter towards men: and their worship is always heavenly singing. Latimer preaches of the "angels singing with great pleasant voice;" and Milton speaks of the angels:

"Their happy hours in joy and hymning spent."

Shakespeare uses it for one of his most beautiful similes:

"There's not the smallest orb which thou behold'st,
But in his motion like an angel sings,
Still quiring to the young-eyed cherubims."

Herbert turns it in his own reverent way:

"Lord, let the angels praise Thy name,
Man is a foolish thing, a foolish thing!"

And hearty George Wither, distributing the parts of a universal chorus, gives the angels the tenor:

"Come ye sons of human race,
In this chorus take a place,
And amid the mortal throng
Be ye masters of the song;
Angels and supernal powers,
Be the noblest tenor yours!"

So they appear in the paintings of the great masters: singing, with uplifted heads, sometimes in harmony, before a scroll of music floating loosely over their hands; sometimes in unison, countless faces radiant with blissful worship, till, gazing on the canvas, you wonder that the whole air does not break into audible song. For angelic instruments, the harp is the commonest with the poet, the lute or pipe with the painter. Coleridge speaks of

"the prayer
"Harped by archangels when they sing of mercy;"

and Thomson of the

"visionary hour
When musing midnight reigns or silent noon,
Angelic harps are in full concert heard."

Nor has the silence needful to the hearing of such pure and heavenly strains escaped an earlier poet: as in Henry Vaughan's lines:—

"Calm and unhaunted as is Thy dark tent,
Whose peace but by some angel's wing or voice
Is seldom rent."

But Milton, following no doubt those visions of the Italian painters that his youth has made familiar, celebrates

"the solemn pipe
And dulcimer, all organs of sweet stop,
All sounds as fret by string or golden wire,"

with which, as well as

"with songs
And choral symphonies, day without night,"

the angels circle God's throne.

For their *service*, the Talmudist taught that there was a distinct class of angels who worked while others worshipped. These angels of service not understanding Aramaic, the Jews always prayed in Hebrew. Gabriel indeed, by an old legend, taught Joseph seventy tongues, but this was a solitary exception. Their service rests partly on their strict obedience as agents in carrying out God's thoughts, and partly on their power of sympathy and tenderness, and their love of men. Norfolk declares that Queen Catherine loves Henry VIII.

"with that excellence
That angels love good men with;"

Milton speaks of

"Tears, such as angels weep;"

and Shakespeare of such strange human infatuation as "makes the angels weep." "Sad," Campbell says,

"as angels for the good man's sin
Weep to record and blush to give it in;"

a thought half-Persian in its character, and that is familiar to every one from occurring in that sketch, inimitable for its pathos, where "the recording angel, as he wrote it down, dropped a tear upon the word and blotted it out for ever." Sterne was but a shallow moralist, and did not scruple to sacrifice ethical truth to a pretty thought; and his easy way of wiping out an oath sets at defiance those angels through whom the majesty of the Law was ministered, and who watched round the cradle and cross of Christ. There is relief in turning to the beautiful idea of Sibbes, that "we have a derivative comfort from the attendance of angels upon Christ . . . They attended upon Him as the Head; they attend upon us as the members." It is not mere passive sympathy they bear, but sympathy of service; and by no one touched with deeper feeling than Spenser:

---

* Of these Michael and Gabriel are mentioned in the Bible; Raphael and Uriel in the Apocrypha. That Raphael should be physician in the Book of Job, it need not surprise us: but Aubrey gravely relates how in his time, Dr. Richard Napier, whose "knees were horny with frequent praying," retired into his closet when a patient came, conversed with Raphael, and prescribed accordingly. Nor were the prescriptions always medical, for in 1621 he told Prideaux that he would be a bishop in twenty years, "as it fell out."

"And is there care in Heaven? And is there love
In heavenly spirits to these creatures base,
That may compassion of their evils move?
There is:—else much more wretched were the case
Of men than beasts! But O th' exceeding grace
Of Highest God that loves His creatures so,
And all His works with mercy doth embrace,
That blessed angels He sends to and froe
To serve to wicked man, to serve His wicked foe!

"How oft do they their silver bowres leave
To come to succour us that succour want!
How oft do they with golden pinions cleave
The flitting skies, like flying pursuivant,
Against foul fiends to aid us militant!
They for us fight, they watch, they duly ward,
And their bright squadrons round about us plant,
And all for love, and nothing for reward:
Oh why should Heavenly God to men have such regard!"

And this heavenly service is most various. "The angels," cries Luther in his valiant way, "prepare themselves for the combat and to strike down Turk and Pope into the bottomless pit;" and they are also "our true and trusty servants, performing offices and work that no poor mendicant would be ashamed to do for another;" while again we "would be in despair if we should see for how many angels one devil makes work to do." The devils, he cries in one of his sermons, fly as thick about us as the crows, what need therefore of angels! And by an odd conceit he proportioned their size to the importance of those they watched, giving the larger to great men like princes, and the smaller to children and common folk. "If a man is saved from drowning, or escapes a falling stone, that is not chance, but the will of the dear angels." Enemies spiritual and temporal are to be fought and ourselves tended. In church, "whensoever and wheresoever the Word of God is preached, there are the angels present, which keep in safe custody all those who receive the Word of God and study to live after it" (Latimer). "They observe us," another old divine says, "and our carriages in the congregation." And each has a guardian angel, no doubt like that in, I think, Dürer's engraving, where the little child with bright simple face walks trustingly by the precipice, and the serpent, and the thorn; and the angel walks beside with folded wings and eager watch, and a guiding hand on the child's shoulder. This angel is always on guard, sometimes defending best when offending most; an office that may be assigned by Shakespeare when he says that

"Consideration, like an angel, came
And whipped the offending Adam out of him:"

though probably only a reference to the expulsion from Paradise. It is cognisant of the spiritual relations of the soul:—

"The blessing fell upon her soul;
Her angel by her side
Knew that the hour of peace was come:
Her soul was purified."

The Schoolmen set it a peculiar work at the resurrection, when "every man's good angel shall gather together the bones of him he guarded." And Tennyson suggests that in the further world it might communicate between death-parted friends:

"My guardian angel will speak out
In that high place and tell thee all."

At dying, moreover, the angels have special charge. They bend down so near that they may be heard:

"Hark! they whisper! Angels say:
Sister spirit, come away."

They stoop over them with radiant face like the dawning of heaven:

"And then, like to an angel o'er the dying
Who die in righteousness, she lean'd."

And when the soul flies the body, they accompany it to heaven. "Good night, sweet Prince," says Horatio of the dead Hamlet,

"And flights of angels sing thee to thy rest."

Numerous instances are on record of dying men and women who said they saw troops of angels, and whose vision grew more distinct at the approach of death and the failure of bodily sight. Sometimes it is shouts and songs that are heard; sometimes figures that are seen; and there is nothing visible to the spectators but what they describe as a peculiar brightness on the features of the dying.*

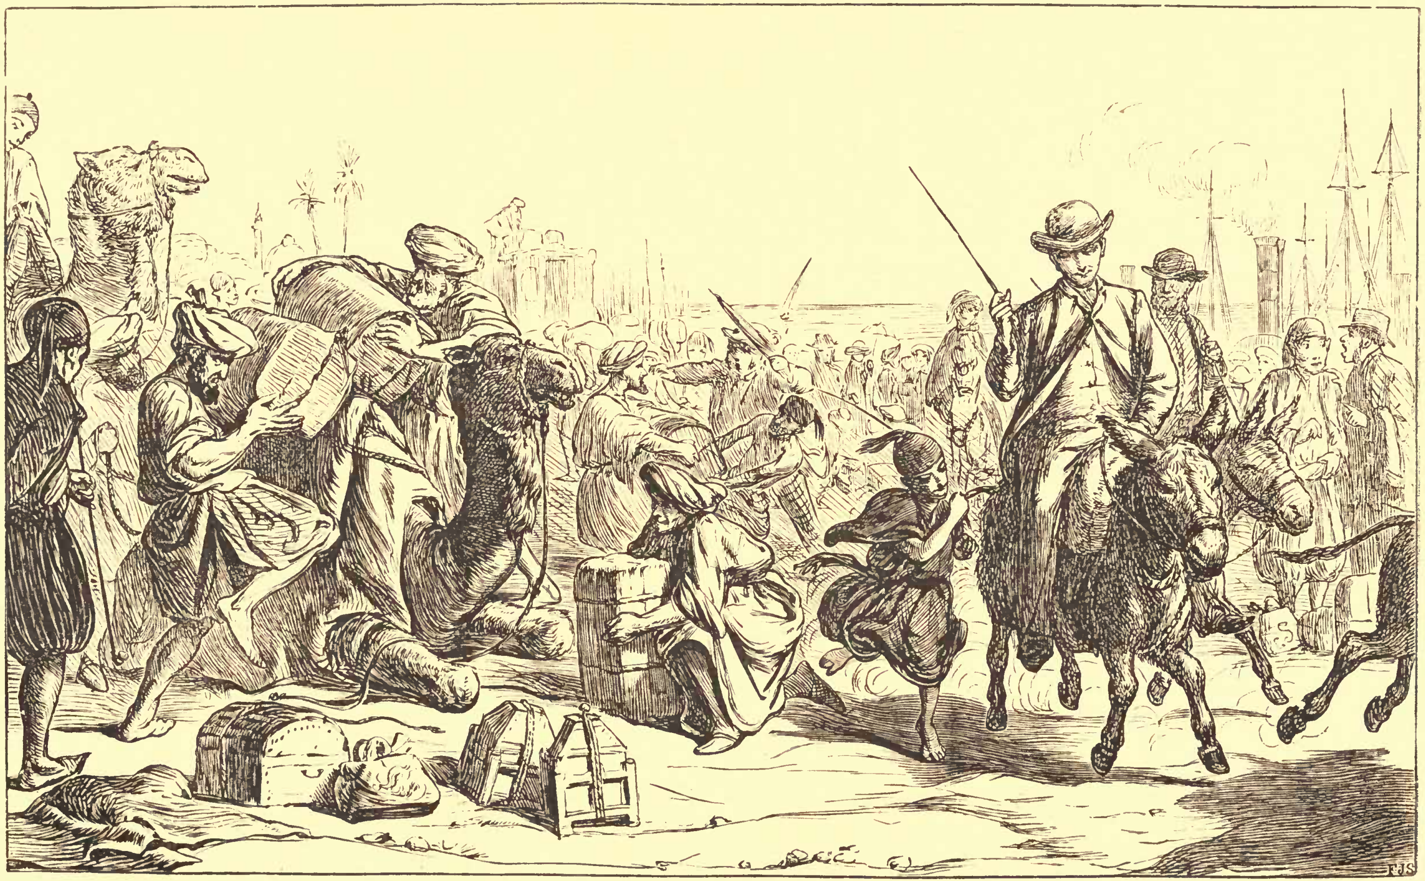
But it is in painting that angels receive their fullest portraiture. We see them as little round-faced chubby children, or as those righteous and most awful spirits that Michael Angelo has painted in the Sistine Chapel. Sometimes the child face is not of the earth but heaven, like the two cherubs that gaze up at the Dresden Madonna; sometimes this winged angel is not distinguishable from a tricksy Cupid. Angel heads and groups form rainbow arches round the glory of the throne. In long fair

---

* Some curious examples will be found in "Notes and Queries," 3rd Ser. vol. iv. pp. 435, 6; vol. v. p. 448. They might be largely increased. When Lazarus dies in the old "Christmas Carol" on the parable of Dives,

"There came two angels out of heaven
His soul therein to guide.
'Rise up, rise up, brother Lazarus,
And go along with me,
For you've a place prepared in heaven,
To sit on an *angel's knee!*'"

The incorporeal definitions had clearly been forgotten.



SCENE ON THE QUAY AT ALEXANDRIA ON THE ARRIVAL OF A STEAMER.

robes and most pure of aspect they glide through the skies; or, much encumbered with their garments, swim across the air; or with red puffed cheeks and straining eyes blow all manner of horns and trumpets. In the creation, angels hold a lump of clay with both hands and mould it into man. They gaze with wistful faces into the manger where Jesus is laid, twinkling like the stars, so that each star seems as if it might burst into an angel. They lead down the ass into Egypt, and bend branches of the tree by the way that Joseph may reach the fruit. In Nazareth they pour out water or dry clothes for Mary;* sweep up the chips and shavings for Joseph; and as children with wings budding on their shoulders become playfellows for the child Jesus. After the temptation, it is they that spread a table in the wilderness. At the crucifixion they receive the blood in golden cups; others hide from the sore sight; and from the background innumerable hosts peer out with an universal awe and shame upon their faces. Yet wild as some of the conceptions are, and puerile and only fantastic as others, it is remarkable with what unity and distinctness angel life and nature as ministering are wrought out, so that this definite type of the great painters moulds our thoughts of angels into the same visible form. The legends of angelic appearances have long ceased. From that ancient one of the voices that were heard in the temple saying: "Let us leav ethese seats;" and of that majestic apparition that restrained the sacrilege of Heliodorus, and gave to Raphael one of his sublimest pictures; and of that other voice before the Romans came, that cried: "Arise, let us go hence;" the legends travelled slowly down for centuries. Elesbaan, king of the Ethiopians, fell into straits in battle and prayed, upon which he heard Gabriel thrice called from heaven, and knowing that the angel was sent to fight for him, he smote his foe with great slaughter. Baronius relates a battle between Clovis and Theodoric, when an angel was seen standing with drawn sword between the armies. The tourists who loiter *en pension* at Engelberg below the mighty Titlis, are told how

> "Celestial bands,
> With intermingling motions soft and still,
> Hung round its top, with wings that changed their hues
> at will:"

and they pointed out the site of the famous abbey of the *Mons Angelorum.* And the mole of Hadrian received its familiar name of San Angelo from the most striking of these appearances; for when, to mitigate the plague in the sixth century, Gregory had organised processions through the streets, as the choir approached they beheld Michael alight at the summit of the mole and sheathe his bloody sword; and "the tomb of Hadrian has been called the Castle of Sant' Angelo to this day." It is more than a thousand years since then, yet two centuries and a half ago there was still exhibited in Normandy the buckler worn by Michael in his combat with the devil, and which, it is said, was of red velvet. Nay, so scrupulous have even modern times been of these angelic traditions, that Michaelmas-day, the 29th of September, being made sacred to all angels, still witnesses the election of borough magistrates and councillors, whom the Middle Ages reverently supposed to be the counterparts on earth of the heavenly beings. It was a simple age which could first see the nearest approach to an angel in an alderman; muscular as well, and breathing more of the spirit of Angelo and Rubens than Guido and Fra Angelico.

So far we may follow the mere human, traditional and legendary lore of angelic phenomena, in which Pagan and Christian thoughts, and earth and heaven, and things congruous and incongruous, are inextricably blended; and which have greatly helped to confuse our minds and spread a Sadducean* scepticism of angels altogether. Turning to the Scriptures themselves, we are in quite another atmosphere. Angels are recognised there from the first, from the cherubims that kept the way of the tree of life with a flaming sword turning every way, to the last, to the angel that was sent to Patmos by Jesus to testify the Apocalypse to John. They are so woven into the texture of the Bible that to reject them is to reject it. They are recognised without apology or surprise, having as real an existence as men. They take their place in the history with simplicity and dignity; supernatural, but without a trace of the marvellous. They cannot be ignored in Bible teaching, and they occur often enough to reveal their peculiar position.

Uniformly they appear as men. They eat, sit, walk, stand, are clothed, speak and are spoken to, lay their hands on men, receive the courtesies paid by host to guest. It is this that gives point to the saying that we may entertain angels unawares. But then they ascend in the flame of a sacrifice, fly through heaven, are made visible to men when their eyes are shut—in visions, dreams, trances; and invisible to men when their eyes are open; pass through prison doors without disturbing the guards, and walk through the streets without attracting the people. From all this, as well as from the fact of their creation, it might be inferred they are not without a body. What is related of the resurrection body of the Lord is as wonderful and to us incomprehensible, as what is related of them. Their countenance is radiant, "terrible," "like lightning." Before his martyrdom, Stephen's face shone as the face of an angel. Their very garments are dazzling: they illuminate the sky at night and the gloom of a prison cell. Sometimes they appear with a staff; sometimes with a sword. An angel touched the rock with his staff, and Gideon saw fire leap out and consume the kid's flesh and unleavened cakes. David saw an angel stand between heaven and earth with his sword stretched over Jerusalem. But when we would approach closer we are repelled. The picture is shadowy and vast. Heaven towers above us. We are on the borders of another and mightier world. It is like the change from one of Miss Procter's little child-angels, "with trailing pinions and weary feet," or Steinle's sweet and pure and feminine frescoes in the choir at Cologne, to Milton's Uriel

---

* In Margaret of Navarre's Miracle Play, the child angel offers to wash Him and warm His bed:—

> "ne veuillez épargner
> Moi très-petit . . . . car, soit pour vous baigner,
> Ou pour chauffer vos draps en votre lit,
> À vous servir je prendrai grand délit."

* "For the Sadducees say that there is neither angel nor spirit."—Acts xxiii. 8.

> "gliding through the even
> On a sunbeam, swift as a shooting star
> In autumn thwarts the night;"

or his picture, that blinds like a flash of lightning when—

> "outflew
> Millions of flaming swords, drawn from the thighs
> Of mighty Cherubim; the sudden blaze
> Far round illumined hell;"

or that awful vision of Him who

> "on His impious foes right onward drove
> Gloomy as night . . . . in His right hand
> Grasping ten thousand thunders."

We stand before such beings as Daniel and John saw, helpless to conceive and not daring to penetrate their vast magnificence. The one *clothed in linen, whose loins were girded with fine gold of Uphaz: His body also was like the beryl, and his face as the appearance of lightning, and his eyes as lamps of fire, and his arms and his feet like in colour to polished brass, and the voice of his words like the voice of a multitude.** The other *clothed with a cloud, and a rainbow upon his head, and his face as it were the sun, and his feet as pillars of fire, his right foot resting upon the sea and his left foot on the earth, and when he had cried, seven thunders uttered their voices.* This is vague; the vagueness of overwhelming splendour, of conditions of life unknown to us; the vagueness of a tropic forest to an Esquimaux: and we can only cry humbly and patiently, "Behind the veil, behind the veil!"

Yet we know much about them, that in power and might they are superior to man, that they are mighty, that they excel in strength. We read also of their wisdom, knowing all things that are in the earth, discerning the good and bad, yet ignorant of the day of the Son of Man, and desiring to penetrate the mystery of the Gospel. It is only by casual allusion that we learn of their appearance and habit, as they are introduced upon some mission to man. Their service to him is related with much detail. They accompany God's servants upon important missions, are messengers between God and His prophets, carry answers to prayer and carry prayer back again to God, warn of impending dangers, cross the purposes of evil men, rescue some and smite others. Angels burned Sodom, destroyed the first-born of Egypt, harassed David's people with pestilence, cut off the army of Sennacherib, and struck down Herod. Angels saved Lot, guarded Daniel from the lions, let the Apostles out of prison, struck the chains off Peter. Angels accompanied Christ from heaven, had charge over Him on earth, ministered to Him in the desert, strengthened Him in Gethsemane, rolled the stone from His sepulchre, and announced His ascension. They encamp about the saints, watch over children, rejoice in the conversion of every sinner, and bear the righteous at death into heaven. They carry out of the Kingdom all that offends, gather together the elect, are the reapers at the end of the world, herald the resurrection, sever the wicked from the just and cast them into the fire, and guard the twelve gates of the New Jerusalem. They preside over the powers of nature and the destinies of kingdoms. There are angels of the wind and the water* and the lightning and the sun; of Greece and Persia.

In these allusions to angelic ministry some allowance must be made for the rich symbolism of the prophetical books; and there are things no doubt hard to be understood. But it remains abundantly clear that angels are used as God's agents both in the rational and irrational world; that whatever they do they do but His commandment. The world is not wound up like a clock, to run down when it is worn out. It is governed by a personal God through His personal and ever-present interposition. It is not regulated by laws only, but by a Law-giver. May not He who established and upholds these laws commit their administration to His servants? Is it more reverent to dislodge God from all natural phenomena, to cast Him up to some distant throne far above the inevitable and inexorable mechanism of natural laws, or, with the Jews, to hear His voice in the thunder and see His angel in the lightning? Since God must needs work through some medium, is it at all more difficult to conceive of angels being that medium? And very human and tender their care is, and wise and benign their ways; soothing, healing, gently leading, with few words but most eloquent acts, pitiful and yearning, flashing their keen swords against lust and pride and the devil, but sheathing them in righteous sorrow when their work is done.

That there are many is beyond doubt. The reckoning in Revelation is vague, and the 200 millions represent no more than vast and countless numbers. —A mysterious reticence characterizes all that

---

* So in John xii. 29, the voice of an angel is compared to thunder. What a contrast between these angels and Mohammed's Gabriel with his six hundred wings! Even Goethe's archangels in the Prologue to "Faust," unsurpassed as they are in poetry for dignity of conception and an almost celestial music in the verse, sink into puppets beside these two.

* If John v. 4, had not so great a weight of MSS. against it, it would be a pertinent illustration of Rev. xvi. 5.

Scripture teaches of these spirits—their form, their rank and order, their habitation, their number. It is enough for us to know that they are many, so many that they can care for all saints. They crowded the ladder in Jacob's vision; he met hosts at Mahanaim; they covered the hill-side about Elisha till it burned like fire; at the raising of His hand Christ could have summoned more than twelve legions to the cross; an innumerable company, writes the Apostle Paul:—

> "Wider far
> Than all the globous Earth in plain outspread—
> Such are the courts of God—the angelic throng,
> Dispersed in bands and files, their camp extend
> By living streams among the trees of life,
> Pavilions numberless."

This then we know from God's word, that there is an angel world, vast, it may be, as the world of men; spirits excelling us in dignity, strength, and knowledge; the bright, puissant, and obedient ministers of Heaven; agents in the administration of nature and the ruling of kingdoms; invested with miraculous power, and charged by God with the ward of all that fear Him; so swift, that in the twinkling of an eye they may come at call of prayer; so subtly made, that they may walk the earth unseen. They have had part in every great epoch of the universe; sang the praise of the creation, descended with the Lord Incarnate, glorified Him in His resurrection, and shall come again with Him in the clouds of heaven. They are moved to joy or weeping over men; they have succoured the oppressed, loosed the prisoners, smitten tyrants, shut the mouths of lions, fed the hungry, strengthened the weary, soothed the heart-broken, cheered the homeless and emigrant, banished despair. They have heralded our brightest and perpetual blessings, and been with the loneliest spirit in the hour of its most cruel agony; in death they do not forsake us, and they welcome with their holy chant and jubilee every sinner that Christ brings to the Father. Is the knowledge of this to be of no use and comfort to us? Why have these breaches been made into heaven, that we may see angels ascending and descending? Do angels cross our vision in glorious flight as we read the Bible, and vanish like dreams when we close the Book? The past is full of them; they cannot have come to a sudden stop. They were never so active as when Christ came; and if Christ the Head is withdrawn, Christ the Body remains in the Church: and they that ministered to the Head, will they not minister to the members? *Are they not ministering spirits sent forth to minister for them that are the heirs of salvation?* There is enough to indicate what that ministry may be; that it will be one of sympathy and help to man; that angels' visits are not "short and far between," but constant; signs of God's love and means of God's care; that

> "Millions of spiritual creatures walk the earth
> Unseen, both when we wake and when we sleep." *

And if much of mystery remains, much that we shall only know hereafter, we know enough to warrant the liveliest faith in angel service; nay, as noble old Howe says, "it is a great incongruity we should have strange, uncouth, shy, frightful, or unfrequent thoughts of them in the meantime." Two centuries ago, Baxter was wondering why so little heed was paid to them by the Church: he might lift his complaint as loud now.† Yet it must add to the solace of a Christian life, characteristically a life of pilgrimage and isolation, that it is watched by pure and gracious Beings who bear their help to us at God's bidding and in their own love, who come straight from the Father of Spirits, who work with unseen ministry like the secret powers of nature, the dew and the frost and the fitful wind, but whom one moment's revelation might make visible. Christ, as He taught, might have hung the air with clouds of listening angels; we, as we journey, might as haply see the path lined with horses and chariots of fire. And there are troubled, lonely, baffled moments when to know that angels are beside us is like a cup of water to a man spent with thirst. They can tell what squadrons parried the assaults of Satan, what dangers they averted, what weary hours they beguiled with celestial harmonies, what messages they brought and prayers they answered, by what sick-beds they stood, around what slumbering households they encamped, for what worn-out and fainting spirits they have fought. We have moreover their example of unfaltering obedience and loyalty, of unselfish and unhindered service. We walk by faith in Him who sends them, and in them His gift. And we shall see them as our fellow-servants on that day when we cross the River, and, as in Bunyan's wonderful dream, we go up through the regions of the air to the City higher than the clouds, while they compass continually sounding with melodious noise, as if heaven itself was come down.

---

* What is written of them in the Bible will repay the most diligent study, as any one may discover who will read such a work as Dr. Stier's "Words of the Angels."

† He says that he counted in Newman's "Concordance" that the angels were mentioned three hundred times in the Bible. This must have included the *Apocrypha*, where they occur almost forty times.

ON THE NATURE AND COMPOSITION OF FOOD.

By LYON PLAYFAIR, C.B., LL.D.

[THE FIRST OF TWO PAPERS.]

THE comparison of the body of an animal with a common steam engine, if not perfect in a scientific point of view, has at least the merit of enabling us to study with ease certain common requirements of both.

Before a steam engine can do its work it must be supplied with coal, which is merely changed vegetable matter, still readily combustible. The coal burns when it receives a proper supply of air, and the heat produced by the union of the two is passed over to water, so that it may be converted into mechanical force. During the burning of the coal, the water receives a steady boiling heat of 212° F., and the furnace evolves gases which consist of carbonic acid, water and vitiated air; these are finally thrown out of the chimney, while nothing of the original fuel remains behind except the uncombustible ashes in the grate.

Up to this point the animal body has a strange resemblance to the steam engine. The three requisites for the animal are,—food, that is recent vegetable or animal matter; air, which is to burn this in the body and keep up a steady animal heat of 98°; and water, necessary for the working of the complex animal machine. The food, like the fuel of the steam engine, is burned in the body, and in the same way, except that the rate of combustion is slow in the latter and quick in the former; identical gases—viz., carbonic acid, watery vapour, and vitiated air—are discharged from the windpipe as they are from the chimney of the furnace; while nothing of the original food remains in the body, after the lapse of a certain time, except unconsumed substances, like the ashes of the furnace, rejected from the system as effete matter. At this point, however, our comparison is not perfect, for part of the food is used to repair the waste which the body continually suffers, while the engine is repaired with a material not found in the fuel.

Let us take up the comparison again, and apply it in another direction. The force of the engine primarily arises in the sun that shone on the world in past ages and stored up its power in the plants which then grew and are now preserved to us as coal. The fuel merely gives out this original power in burning, and the heat being converted into simple motive force by alternate push and pull of the piston, acting through levers, joints, and bands, enables mechanical work of infinite variety to be performed. The force in the animal is derived also primarily from the sun, which, illuminating the world now as it did in olden times, causes vegetation to flourish and stores up force in the food to be applied in the working of the animal machine. The combustion of the food in the body produces a motive force of simple alternate relaxation and contraction of the muscles, which, working through levers, joints and tendons, enables the animal to apply the force in an endless variety of ways. A few words more will complete the comparison for our present purpose. It is easy to express by calculation the amount of mechanical work which a machine can or does produce, and it is equally easy to show what labour an animal with a given quantity of food might perform; but it is beyond human ken to express by figures the intellect of the engineer who is required to guide the engine, and it is only permitted to us to wonder reverently at the vital intelligence which directs the working of the animal body and regulates all its voluntary and involuntary movements. Let us not confound the known with the unknown.

It would be considered a folly for any man to undertake the direction and application of an engine, with the structure and working of which he is entirely ignorant. The body of a man is a far more complex and wonderful machine than any steam engine, and it is the duty of each man to preserve it in the best working order and to apply it to the best purposes. But our systems of education do not include any provision for his acquaintance with this machine, so that it is not surprising that it frequently gets out of order. The science which professes to study the workings of the animal body is termed physiology, and, though still in its infancy, has already large proportions. Our present purpose is merely to take from its book of knowledge a single leaf, on which Liebig and other eminent chemists have written, and to explain what they have told us in regard to food.

Here we must again draw attention to the point in which our comparison of the steam engine with the animal body failed. In the case of the former the material of which the engine is constructed is entirely different from the fuel supplied to it; in the case of the animal the very structure itself is furnished by the food; and as the body is constantly wasting so must it be continually supplied. We must therefore expect to find in food two classes of ingredients:—(1) those required to build up the fabric of the body; (2) those necessary for the support of animal heat. Our attention will be in the first place confined to what may be called the structural part of food.

Beccaria in 1742 asked, "Is it not true that we are composed of the same substances which serve as our nourishment?" and George Herbert expresses the same idea when he writes:—

> "Herbs gladly heal our flesh because that they
> Find their acquaintance there."

In all kinds of vegetable food capable of affording nutrition there are certain substances which are not only like, but essentially the same in composition as, the principles of which the animal body consists. The albumen of the white of egg is equally found in the cabbage; the fibrin which forms an important part of blood and the chief part of flesh, abounds in wheaten flour and in the cauliflower. The casein or cheese which is obtained from milk is present still more abundantly in peas and beans, from which the Chinese in reality extract it and make cheese for sale. So that if we were to take any of these principles from vegetables, or from the flesh or blood of animals, and place them in the hands of the most skilful chemical analyst, he would not only be unable to distinguish those of vegetable from those of animal origin, but he would find it difficult, by composition merely, to separate one principle from another, all having the same ingredients in almost the same proportions. They contain, besides sulphur, four organic elements, viz., Carbon, Hydrogen, Oxygen, and Nitrogen, in such proportion that the following composition in 100 parts would fairly represent them all, except perhaps Fibrin:—

Carbon	53·8
Hydrogen	7·0
Nitrogen	15·7
Sulphur	1·2
Oxygen	22·3
	100·0

Better numbers than these could scarcely be given for the organic portion of flesh or of blood free from fat.

With these facts before us, the nutrition of an animal is easily understood. Animals find the materials for their structure already elaborated by vegetables, and have nothing to do but to give them a place and form in their organism. As the builder finds the bricks supplied to his hand and only requires to fashion them in order, so the animal has nothing whatever to do with the formation of structural materials, but has only to arrange them so as to carry out the design of the great Architect who created his body. No one finds it difficult to understand how a carnivorous beast receives the materials for its frame. It eats the flesh, blood, and bone of its prey, and merely rearranges them in its own system; in a chemical sense it eats itself. A suckling child is also carnivorous; it is a young cannibal, feeding upon its mother and applying part of her body to its own uses. Equally simple is the nutrition of the vegetable-feeder, who finds all the materials of its structure ready prepared in plants, and has nothing to do with their elaboration, but only with their application.

As flesh-feeders live upon vegetable feeders, the primary source of all animal frames resides in plants which form the only laboratory for the preparation of the structural materials of animals. All this has been arranged with infinite foresight by the Creator; for animals, in the execution of their higher functions, such as locomotion, volition, mechanical and mental work, could not expend their vital agencies in elaborating materials for their bodies out of unlike matter. Plants execute this work for them so completely that animals have nothing to do but to build the ready-formed materials into their frame. A convenient name for this class of structural materials is that of *flesh-formers*, and by that term we include them all, whether they be of vegetable or animal origin.

Let us leave the class of structural food for a time, and consider the fuel which gives the necessary heat to the body. The temperature of a man is from 98° to 99° Fahrenheit, or about 40° higher than the air is in this country. The body being therefore continually robbed of heat by a cold atmosphere, must have an internal source of supply. The fuel which burns in the furnace of the body consists mainly of bodies from which the element nitrogen is absent. The order in which they form fuel of the best quality is the following:—(1) Fat, (2) Starch, (3) Cane Sugar, (4) Grape and Milk Sugar. Their value varies considerably, for 40 parts of fat will give out as much heat as 97 parts of starch or 100 parts of sugar, or 310 parts of flesh, when that structural food is used for such a wasteful purpose as the supply of heat to the skin. In the ordinary combustion of a fire, the oxygen of the air unites with the carbon and hydrogen of the fuel, forming carbonic acid gas and water. The air taken in by the lungs furnishes oxygen to the blood. About 7 cwt. of this gas are annually inhaled by the lungs of an adult man, and nearly one-fifth enters into combustion in the body with the food. Clearly it must pass away again in some form, for the body of a healthy adult is the same in weight at the end as at the beginning of the year. It is easy to calculate how much heat a daily supply of oxygen would afford; for the combustion in the body, though slow, gives out just as much heat as if the food were burned in a fire-place. After making full allowance for the heat expended in evaporating the usual quantity of water by perspiration, there is as much left as would raise 143 lbs. of water from 32°, the freezing point, to 212°, the boiling point. As water requires more heat to raise it through this range than the solids of the body, the amount of heat daily generated by the combustion of food is amply sufficient to keep the body of a man of 150lbs. in weight at the proper temperature.

As the quantity of coal consumed in a common fire-place changes with the conditions under which the combustion proceeds, so also does the quantity of food vary with the altering conditions of the body. When a fire is stirred combustion is quickened, because oxygen from the air enters more freely among the particles of the fuel and unites with its ingredients. When the body of a man is stirred into activity by any cause, such as by walking, by labour, by speaking, the lungs act more quickly, additional oxygen enters the body, and its internal heat is augmented. The rhythm of the respiration regulates the quantity of air taken into the lungs and of the oxygen absorbed. About six-sevenths of the oxygen absorbed by the blood are used to burn the charcoal or carbon in the food, the other seventh part burning the free hydrogen of the fats or wasting the tissues. An adult man in this country, while at rest, burns in his body rather more than 7 oz. of carbon daily; gentle exercise increases the amount to 8¾ oz., and hard labour augments it to 11¾ oz.

We may the more readily understand the varying quantities of food demanded to preserve the constant temperature of the body if we suppose, by way of illustration, that the task were assigned to us of keeping up the heat in the cabin of a ship to a uniform temperature of 98°. Our ship may be supposed resting before Calcutta, where we have seen the temperature of a cabin above 90°. In this case, in the discharge of our assigned duty, we would require to burn very little coal to raise the temperature of the cabin an additional number of 8°. The ship sails to England and arrives in winter when a frost prevails; coal must now be heaped up in the stove to prevent the heat of the cabin from sinking below the prescribed temperature. The ship is next ordered on a whaling expedition to the arctic seas, where, on its arrival, the intense cold compels us to keep up an incessant fire burning with great briskness, if our fixed temperature is to be maintained. The body of a man is a chamber always to be kept at the same heat under the most varying circumstances. Its temperature when in health is the same, whether it basks in the sun at Naples, or is exposed to the rigour of a winter at Melville Island in the polar seas. This constancy of heat is preserved by burning fuel in the body in exact proportion to the demand for it. If clothes are heaped on the body, it is more slowly chilled and requires less fuel, so that our garments economise food and are an actual substitute for it. During famines it is not unusual to find families lying in bed covered with clothes, so as to diminish the cravings of hunger, the warmth being an equivalent for one kind of food, and the rest diminishing the activity of the lungs, or, in other words, the supply of oxygen to the system. But although this answers as a temporary expedient, the internal fire soon goes out unless fuel be supplied to it. Sir John Franklin in his travels writes—"During the whole of our march we experienced that no quantity of clothing would keep us warm while we fasted, but on those occasions on which we were able to go to bed with a full stomach we passed the night in a comfortable manner." The altered rhythm of respiration and the consequently changing appetite regulates for us, with more precision than the best adjusted damper in a fire-place, the quantity of fuel required by the body. With that wonderful wisdom which is displayed in all the works of God, we find even the nature of food in different countries suited to the exigencies of climates. The fruits and rice of hot countries form fuel rich enough for the tropical regions, while the fat and blubber of fish give the requisite highly combustible food to the Eskimos and other arctic inhabitants. The quantity of food shovelled daily into the mouth of one of these people would be incredible unless so frequently attested. Thus Sir J. Parry weighed the food of an Eskimo lad, and found him to consume in one day:—

Seahorse flesh, hard frozen .	4 lbs. 4 oz.
" " boiled . .	4 " 0 "
Bread	1 " 12 "
Rich gravy soup . . .	1¼ pint.
Raw spirits	3 glasses.
Strong grog	1 tumbler.
Water	1 gall. and 1 pint.

Sir John Ross assures us that a full-grown Eskimo will eat daily 20 lbs. of flesh and oil. A Yakut washes down this quantity of flesh with a quart or two of train-oil, and will eat in addition, as a sort of dessert, on great occasions, a dozen tallow candles. Captain Cochrane says, in his pedestrian journey through Siberia, that a good calf, weighing 200 lbs., will serve four or five Yakuts for a single meal; and Admiral Saritcheff assures us that in his travels he knew one Yakut who consumed in twenty-four hours, "the hind quarter of a large ox, 20 lbs. of fat, and a proportionate quantity of melted butter for his drink." The admiral sent for this man, to test his powers on a weighed meal, but unluckily he had just breakfasted; in spite of which, however, he sat down and consumed a second repast of 28 lbs. of thick rice porridge, containing 3 lbs. of butter. Now, although in all these authentic accounts, we must remember that savages, whether in hot or cold countries, have great powers of fasting and gormandising alternately; still, the chief explanation of the enormous consumption of highly combustible food, is the requirements of the rigorous climate. It does not, as compared with our own food in this country, represent a greater difference of fuel than would be required to keep the same apartment heated to 60° or 70° in sunny Palermo or in frozen Spitzbergen.

The winter sleep of hybernating animals further illustrates the source of animal heat. In summer they eat more food than is required for the daily waste of the body, and the excess is stowed away as fat. This accumulates around the caul and loins, and pushes up the diaphragm or seperating membrane so as to lessen the space in which the lungs play. The fat gathers further round the edges of the heart and lungs, and still more contracts the room for the action of both organs. Just as a man after a heavy dinner, which pushes temporarily the diaphragm against the lungs, or a fattened pig after a meal, falls asleep because an insufficiency of air enters the system, so the hybernating animal sinks into a more permanent state of repose. The respiration becomes so sluggish that several minutes sometimes elapse between the respiratory acts. As a consequence of diminished combustion, the temperature of the winter sleeper lessens considerably. A similar fall in the heat of the body, though of course to a much less degree, is experienced by the after-dinner sleeper, who, feeling chilled by the lessened oxidation, draws his chair towards the fire before indulging in repose. The bodies of winter sleepers are like lamps slowly burning, the fat being the oil and the lungs the wick. Gradually, as the fat is burned away, the space for the play of the lungs becomes enlarged; more oxygen now enters the system, and the animal resumes its active habits in satisfying the demands for food. Any fat animal might, under favourable circumstances, live upon its own fat for a considerable time. There is a case, recorded in the Linnean Transactions, of a pig which was overwhelmed by a landslip and was excavated alive after 160 days, during which time it had lost 120 lbs. in weight. Its fat had been nearly, but not completely, burned away, otherwise the living lamp would have gone out for want of oil. The fat tails of the Dumba sheep, in the Somali Country, described by Captain Speke, diminish in size during an arid season, and compensate the animal for the uncertainties of its pasture.

Having now considered very generally the nature of the structural and of the heat-giving food, we may turn to the mineral matter which exists in animal bodies and in the food fitted for their support. Unfortunately the knowledge on this subject is far from being precise. Certain mineral bodies, such as phosphate of lime, magnesia, soda, and potash, chloride of sodium or common salt, sulphates of the alkaline bases, and oxide of iron, are absolutely essential to nutrition. The function of some of them is too obvious to escape notice, as in the case of bones, in which phosphate of lime forms the chief part, amounting in weight, in a full-grown adult, to about 15 lbs. 12 oz. But with regard to other mineral bodies, their exact mode of action is not so apparent. Thus, common salt is known to be quite essential to nutrition. It was formerly a punishment in Holland to feed great criminals on food free from salt, and they are stated to have been subject to the most loathsome diseases. Cattle, on the extensive prairies of America, can be kept from straying by establishing salt-licks in particular places. And yet the whole amount of salt in the body does not probably exceed 4 oz. Undoubtedly it is essential to the processes of digestion and assimilation, although we cannot explain more than a few of its actions. We know that it aids the absorption of water into the system by the process of diffusion; it supplies the acid which the stomach requires for digestion; it gives soda for the formation of bile and of pancreatic juice, and it helps the solution of albumen. If all the organic elements of nutrition—the flesh-formers and heat-givers—were presented to an animal in abundance, in the absence of these mineral substances, the animal would not only cease to thrive, but all nutrition would be impossible. They enter into every organ as a necessary part of it. Different organs, however, show a selection for particular mineral substances. Thus, the brain loves phosphorus, while the bones affect phosphate of lime; fluor-spar passes chiefly to the teeth, to give hardness to their enamel; silica or flint lodges in the nails and in the hair; phosphates of magnesia and phosphate of potash dwell in the flesh, while phosphate of soda prefers to take up its abode in the blood and cartilages. Our information, however, on the subject is very meagre, and while we recognise the importance of these mineral ingredients of food, chemists do not at present profess to explain their action. Just as the flesh-formers are continually passing away from the system in a partially burned state, so do these mineral substances. They leave the body generally in the same form as they were introduced, but in some cases, as with sulphur and phosphorus, they are removed in the form of products of combustion, —sulphuric and phosphoric acids.

Having now taken a general survey of the three classes of ingredients of food—1, the structural food, or "flesh-formers;" 2, the non-nitrogenous food, or "heat-givers;" 3, the mineral food—it is desirable, before examining the value of the various kinds of food, to consider the method in which they are mixed by nature so as to form a complete wholesome nutriment. There is one kind of food in which the mixture is so complete that it may be safely taken as a general type of what all food should be: we allude to the food with which the mother feeds her infant child, viz. MILK. The milk of the cow in 100 parts has the following composition:—

Water	87·13
Casein	4·00
Butter	3·50
Sugar of Milk	4·60
Mineral Substances	0·77
	100·00

We see how carefully nature has provided for the growth of the infant. In the casein there is abundance of structural food for the building up of organs; in the highly combustible fat or butter, and in the less carbonaceous sugars, we have a full supply of heat-givers. For the sake of simplicity we have not expressed in the previous analysis the nature of the mineral substances, but it may suffice if we state that in 100 parts of them there are more than 56 parts of bone earth for the building up of the young skeleton, besides common salt, potash salts, iron, silica, and every mineral ingredient that we find in the body. It may be interesting to inquire, with regard to the typical food, what proportion the structural materials have to the respiratory or heat-giving substances. For this purpose, we must convert both the butter and sugar into a common value, and calculate them as if they were starch, which is the most common heat-giving body in different kinds of food. Estimated in this way, the quantity of heat-givers is three times greater than that of flesh-formers. But the nutrition of the young animal is in many respects different from that of the adult. In the case of the latter it is only necessary to supply the daily waste of the tissues; in the former it is also requisite to furnish materials for the growing body, and also abundant fuel to maintain the higher temperature of the infant. With this difference kept in view, all our efforts in diet appear to aim at imitating the typical food, milk, by adjusting a proper balance between the flesh-formers, heat-givers, and mineral bodies. Thus, with a flesh-forming aliment like beef or mutton, we take a rich heat-giving one like potatoes or rice. To fat bacon, abounding already in heat-givers, we add beans, which compensate for its poverty in flesh-formers. With fowls, poor in fat, we consume ham, rich in this combustible. Our appetites and tastes become the regulators of food, and adjust the relative proportions of its several ingredients; and until the appetite becomes depraved by indulgence or disease, it is a safe guide in the selection of aliments.

The reader will now be prepared to appreciate the value of tables showing the relative amount of the three great classes of alimentary substances as they are presented by nature in different kinds of food. The chief varieties of food are described in the table on page 29, which indicates the composition of the nutritive portions of food in 100 parts, which, according to the fancy or convenience of the reader, may be taken as 100 grains, 100 ounces, or 100 lbs. The table indicates all the important ingredients of food. To show how this table is to be read, let us take bread as an example, and find out its nutritive value in 100 oz. In the case of bread the table gives the following information, in ounces and tenths of ounces:—

100 oz. of bread contain—

Water	44·8 oz.
Flesh-formers	8·2 ,,
Starch	44·5 ,,
Fat	1·0 ,,
Starch-equivalent of heat-givers	46·9 ,,
Ratio of flesh-formers to heat-givers	1:5·72 ,,
Mineral matter	1·5 ,,
Carbon in flesh-formers	4·4 ,,
Carbon in heat-givers	20·5 ,,
Total carbon	24·9 ,,

In other words, we are told that in every 100 oz. of bread consumed by us there are about 8 oz. of matter calculated to repair the waste in the body, 47 oz. of fuel to keep up the heat, 1½ oz. of mineral matter for the bones and for carrying on the processes of digestion and assimilation; while we receive the further information that 20½ oz. of charcoal (carbon) are burned completely in the fuel, and about 4½ oz. go in another direction, regarding which we shall have important information to give in the succeeding paper. It may be useful again to explain what is meant by the term "starch-equivalent" of heat-givers. The latter consist of fat, sugar, starch, and gum; but each of these have, as we have already shown, a different value as fuel, just as coal, and wood, and peat have different heating powers in common fire-places. If, therefore, all kinds of fuel were massed together indiscriminately, a very erroneous idea would be given of the heat-giving character of the food; but by converting them all into one value, viz., that of starch, the comparison of one kind of food with another may readily be made.

Water is a large ingredient in all kinds of food. Perfectly lean flesh contains 75 oz. of water in 100 oz. of meat, but the quantity of water varies much in different foods. Thus flour, oatmeal, and the cereals generally contain about 13 oz. of water in the 100 oz., while turnips, carrots, potatoes, and parsnips have from 75 oz. to 85 oz. of water in 100 oz. of the food as sold.

We now proceed to make some general observations on the different kinds of food in the table, remarking, however, that all such tables give only a general and not a perfectly precise information, because as each beast fitted for the market is more or less fat, so each kind of plant grown varies more or less in its composition. The table is therefore constructed on what may be supposed to be average samples of each kind of food.

It may justly raise a question if it be right to consider all the flesh-formers of equal value, whether they are derived from vegetable or animal aliments. Would, for instance, the 22 oz. of casein in 100 oz. of split peas be equal to the same amount of albumen and fibrin found in 100 oz. of beef? In all probability they would not, for when nature presents us with three materials of like composition—fibrin, albumen, casein—she has no doubt specific functions for them to perform in building up the animal frame. But experience certainly shows us that if we present all these three materials to the body, it can exercise labour and be kept up in strength whether they are derived from animals or from vegetables. Let us take the case of a hunt as an illustration. In a hunt an omnivorous animal, a man, is mounted upon a herbivorous animal, a horse; he is attended by carnivorous dogs, which pursue a vegetable-feeding hare or a flesh-eating fox. In the case of all these animals, a maximum amount of labour is bestowed while the hunt lasts, but the tissues, which by their waste produced the labour, were built up in some cases by animal, in other cases by vegetable food. Undoubtedly the nature of the food has much influence upon the character of animals, and of their ability to exercise consecutive and persevering labour; but this is a question far in advance of that which we are at present discussing.

In animal aliments the heat-giving portions are in the form of fat. No doubt fat forms an indispensable part of all dietaries, for we find it also in vegetables as well as animals. In 100 parts of oatmeal there are six parts of fat, and in maize or Indian corn there are seven parts to the 100. And just as we found the flesh-forming principles in vegetables and in animals to be the same, so do we find the same kinds of fat in both kingdoms of nature. Human fat exists in palm oil; the fat of train oil, as got from the whale, is also found in the

TABLE OF COMPOSITION OF FOOD IN 100 PARTS.

Note.—In this Table 10 parts Fat are considered equal to 24 parts of Starch. Under the heading "Starch, &c.," Cellulose and Gum are included. The amount of Carbon is taken as follows:—

Flesh-formers . .	53·8 per cent. Carbon.	Sugar of Milk . .	40·0 per cent. Carbon.
Starch . . .	44·44 ,,	Fat	77·0 ,,
Sugar (Cane) . .	42·1 ,,		

root of valerian; the fat of mutton and beef exists in cocoa beans. But the simplicity of nutrition, which characterises the assimilation of flesh-formers, is not found to prevail in respect to fats. The latter need not pre-exist in food, for animals may make them out of sugar or starch. A cow forms the butter in milk, though none was in the grass on which it fed; a pig will fatten on potatoes, in which no hog's lard is found; a bee can make wax for the comb from flowers in which there is no wax; and a goose fed on wheat forms fat which was not in the food. So fat, although important as a part of a diet, and forming, in fact, one of the most valuable ingredients of heat-givers, is not essential in the same sense that the flesh-formers are. In fat meat the proportion of the latter to the starch-equivalent of heat-givers is nearly the same as in milk, viz., as 1 to 3. In cheese and in eggs the proportion of the two classes is as 1 to 2.

Going down the nutritious table we come to the leguminous plants, such as peas, beans, and lentils. With the exception of cheap cheese, this class of plants presents us with the most flesh-forming food in the whole table. Lentils ought to form the chief part of the meal sold as *revalenta arabica*, (although much sold under that name is chiefly Glasgow pease meal, costing, 2*d.* per lb.), and has been long known to us as the "red pottage" for which Esau sold his birthright. In this class of highly nutritious food we find the flesh-formers and heat-givers standing in the proportion of 1 to 2½. This proportion is, in fact, too small for healthy nutrition, and we find experience teaching us to augment the proportion of heat-givers to flesh-formers, so we mix potatoes with peas in making pea soup, and we take fat bacon with our beans.

The third group of food in the table comprises the cereals or corn crops, and bread made from flour; all of these contain flesh-formers in marked quantity, though less in amount than in the two preceding groups. Rice stands lowest in this group, having 6 parts in the 100 of flesh-formers, while oatmeal stands highest, having 16 parts. All of them abound in starch, and contain fat in quantity varying from 1 to 7 per cent. Omitting rice, in which the proportion of flesh-formers to heat-givers is as 1 to 12, the other members of the group range between 1 to 5 and 1 to 8. Bread, which can support life by itself, though not with vigour and activity, has its flesh-formers and heat-givers in the ratio of 1 of the first to 5¾ of the latter.

We now come to the group which we ordinarily class in culinary language as "vegetables," including potatoes, carrots, parsnips, turnips, and succulent vegetables. They all contain so much water (from 75 to 85 per cent.), that their nutritious value in 100 parts is low as compared with the preceding group. None of them contain as much as 1½ oz. of flesh-formers in 100 oz. of the vegetable. We now find, in addition to starch and fat, a notable quantity of sugar—in the case of carrots amounting to 5 per cent. Their mineral matter is rich in alkaline salts, which possibly explains their value in scurvy. Potatoes form an eminent heat-giving food, for the proportion between the flesh-formers and heat-givers is as 1 to 16, whilst in the other vegetables in this group the proportion is as 1 to 8. They are therefore all justly considered as accessory food, useful as additions to more nitrogenous foods, but not economical as a source of supply of the latter.

As we descend in the table we come to arrowroot, and similar bodies, such as sago and tapioca, and sugar. These now cease to be considered as, in many respects, entitled to be classed as food. They afford, it is true, one very important ingredient of food—fuel for the support of animal heat—but when of the best quality may be entirely free from flesh-formers, or from mineral material fitted for the supply of the system. They can never be used for nutrition proper, having nothing in them to build up the structure of the body, but they may be highly useful as additions to a diet, by increasing the quantity of heat-givers when these are deficient.

The same remarks apply to such substances as butter, suet, and lard. Like all fats, they may form powerful accessories to nutritious food, but they cannot by themselves nourish the body, having no nitrogen in their composition, or, at all events, only that which comes from their accidental mixture with fleshy matter. They are rich in carbon, which in their dry state amounts to from 77 to 79 per cent., and in their commercial state to from 67 to 70 per cent. They also contain free hydrogen, so that 100 parts of them mount in a starch-equivalent to from 206 to 216 parts.

Some surprise may be experienced that the table contains no account of the stimulating and alcoholic beverages, but it is more convenient to consider them separately. There must be some remarkable use in tea, or it would not at the present time be used by 500 millions of men, or by about one half of the human race. In the United Kingdom, not far from 3 lbs. of tea are annually used by each person —man, woman, and child included: while coffee, although not so much taken by us, requires an annual supply of 600 millions of pounds to satisfy the consumption of the world. There are three stimulating substances—tea, coffee, and Paraguay tea—which have no relationship as regards the plants which furnish them, or as to the countries in which they were indigenous, but all of them are taken as stimulating beverages: a fourth substance, the Guarana tea, is of a like character. Now, when chemists examine these four substances, an alkaloid called *Theine* is found in them all. This alkaloid has very peculiar physiological properties. In small quantities, it appears to arrest the too rapid waste of the tissues. When a person has been labouring, the organs of the body necessarily waste, but the transformation begun is apt to continue when the demand for labour has ceased, and theine has the property of stopping this change. But when taken in too large quantities, as frequently happens in the present evil fashion of taking tea at all hours of the day, it acts on the nervous system, producing irritability of temper and acting unfavourably on the assimilation of food. When this nervous irritability exists, by a change from tea to cocoa (in which an alkaloid closely analogous to theine, called theobromine, exists) equanimity of temper is generally restored. Both tea and coffee contain narcotic and intoxicating oils in small quantity, the aroma and quality much depending upon these oils. Tea and coffee in their solid state contain abundance of casein, the important flesh-forming ingredient of milk; but this does not find its way into the infusion, unless indeed when poor people put soda into the water, which, thus rendered alkaline, may dissolve some of it. It is to the theine that the chief action is due; 100 oz. of tea contain about 3 oz. of theine, and 100 oz. of coffee about 1¾ oz. of the same alkaloid. The quantity of carbon added to a dietary by an infusion of either tea or coffee is too insignificant to be considered. Cocoa abounds in fat—in fact one half, or 50 per cent., consists of a peculiar butter, while there is also about 2 per cent. of its own alkaloid, analogous to but milder in its effects than theine. In the present state of chemistry we cannot follow the transformations of these alkaloids in the body, or explain how they produce their effects.

The alcoholic beverages so commonly used by man act, when taken in small quantities, in a manner similar to tea, but in larger quantities they operate injuriously by exciting the circulation and producing evils of the same kind as an excessive quantity of food. Beer is the cheapest form in which alcohol can be taken; one ounce of alcohol in beer costs twopence; in spirits it costs fourpence; and in cheap wines, eighteen pence. In making beer the grain undergoes in part the same changes that it experiences when taken as food by an animal. The malting of barley converts its starch into gum, then into sugar, which in a subequent change is transformed by yeast into alcohol and carbonic acid. The substance in the malting which has this transforming effect upon the starch is called *Diastase*; and a similar body, though under a different name, exists in saliva. Accordingly we find Chica beer made in South America by a process less pleasant than malting. Old women chew maize and spit it into jars, when it passes into alcohol, the starch having been changed into sugar by the saliva of the old crones. In the South Sea Islands, Cava beer was made in a like way from the seeds of the long pepper, which was chewed by young women with good teeth, and after being spat into jars was fermented for the king and nobles.

The transformation of all starchy food into sugar is illustrated by these primitive brewers. The animal grinds the food, and by the saliva converts the insoluble starch into soluble sugar, while the changes of such portions as escape the action of this fluid are completed by the pancreatic juice. The stomach has mainly to do with the flesh-formers, and effects their solution, although it commences also the breaking up of the fats. But it is not our present purpose to follow the food through the body, or to show how it is assimilated. We propose, however, in a subsequent paper to apply our knowledge of the composition of food to an examination of the amount which should be taken by persons under varying circumstances of age, sex, and employment.

DEVOTIONAL MUSINGS.

I.

I will commit my way, O Lord, to Thee,
Nor doubt Thy love, though dark the way may be,
Nor murmur, for the sorrow is from God,
And there is comfort also in Thy rod.

I will not seek to know the future years,
Nor cloud to-day with dark to-morrow's fears;
I will but ask a light from Heaven, to show
How, step by step, my pilgrimage should go.

And if the distant perils seem to make
The path impossible that I must take,
Yet, as the river winds through mountains lone,
The way will open up—as I go on.

Be still, my heart; for faithful is thy Lord,
And pure and true and tried His Holy Word;
Through stormy flood that rageth as the sea,
His promises thy stepping-stones shall be.

II.

In Heaven is many a shining star,
And yet my way is dark as night;
I see them gleam in depths afar,
But not by them I see aright.

They glimmer in the glassy lake,
They twinkle in the blue serene;
But yet my darksome road I take,
As ne'er a light in Heaven had been.

And there are truths so far away
No light upon our path they show;
We see them clear and bright as day
Yet by their light we may not go.

But Jesus, Thou art near and far;
With light Thou dost encompass me;
I see Thee like the midnight star,
And as at noon I walk by Thee.

Thou dost uplift my soul to Heaven,
Calm, beaming down upon our strife;
Yet by Thy grace is also given
Light on the common paths of life.

O blessed Jesus! shining far,
And shining near upon our way,
We praise Thee as the glorious star,
We praise Thee as the Light of day.

III.

Now is the accepted time,
Now the day of our salvation:
Now the Lord of Heaven sublime
Bears the sinner's condemnation;
Meek and lowly,
Pure and Holy,
Come to Him, and take his yoke,
Light the burden of his folk.

He hath brought down God to earth,
Man to raise again to Heaven;
He was born a virgin's birth,
That the new birth might be given
To us hapless,
Lifeless, sapless,
Withered branches dead in sin;
Come to Christ, and glory win.

Come with all your doubts and fears,
Come with all your soul's diseases,
Come with all your sinful years,
Only come at once to Jesus;
He is gracious;
And the precious
Ransom of our souls is He—
Jesus slain at Calvary.

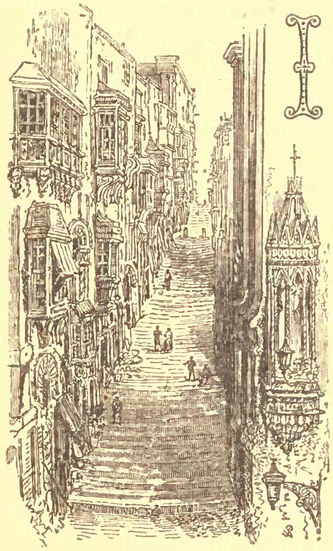
O, this precious Now is ours,
Let us hear His invitation;
He is knocking at our doors
With the proffer of salvation;
But to-morrow,
May be sorrow,
Woe and anguish, and the cry
"Too late, too late!" the hour is by.

ORWELL.

EASTWARD.

By THE EDITOR.

I.—MALTA AND ALEXANDRIA.



Street View in Malta.

I WAS not ordered by "the doctors" to visit the East for the good of my health, which, I am thankful to say, was excellent; nor was I deputed by the Church to which I have the honour to belong to undertake a missionary tour; nor did I propose to myself the vain attempt of writing a book describing the East for the thousandth time, whether in the form of "letters," "tour," "diary," "sketches," "thoughts," or "pictures." I even protested to my excellent publisher and fellow traveller against preparing a single article for the pages of GOOD WORDS. I went to visit Palestine, "the place of my fathers' sepulchres;" and no one will be disposed to ask a reason for my undertaking such a journey.

But there is something so fascinating about the East, that it is hardly possible to resist the *cacoethes scribendi*, that we may in some measure share our enjoyment of it with others. In spite of the conviction, then, that nothing new can be written about the East by a hurried tourist, that all that one can say has doubtless been said far better by some other before, that only the scholar, the antiquary, or the artist can reveal new facts or new beauties, the impression, albeit a delusion, still remains that we may be able to give some pleasure by telling, as by the fireside, what we saw and enjoyed, to the invalid or the weary man, who may be unable to digest "sterner stuff." I would respectfully ask such to accompany me, now and again, for a few months, eastward.

Let me inform those who have not "Bradshaw" by them, that Alexandria is the starting-point to Palestine for all travellers approaching it from the west. This port may be reached by the admirable steamers of Mr. Mc Iver, from Liverpool, or by the Peninsular and Oriental Company's steamers from Southampton, and a glimpse of Gibraltar be got *en route*. To those who enjoy a sea voyage, and to whom a few days extra time is of no consequence, this route is by far the easiest. The shortest sea passage is by Ancona, to which there is now a continuous line of railway from Turin. There is also communication twice a month from Marseilles to Alexandria by the first-rate steamers of the French *Messageries Imperiales* Company, as well as by those of the old and favourite P. and O. Company. The expense by either route is much the same, everything taken into account; perhaps, upon the whole, that by Marseilles is the cheapest. Those, too, who have never been abroad may by this route get a glimpse of the Continent as they pass along. We, for example, left London on Wednesday morning, were all Thursday in Paris, left the same night, and reached Marseilles about one in the afternoon of Friday. This is little, no doubt, yet the day in Paris and the general view of the country, including the picturesque towns of Nismes and Avignon, may be put in the balance against Gibraltar.

We left Marseilles on the morning of the 20th of last February, in the somewhat old—and not in all respects singularly comfortable—but yet sound ship *Valetta*, with as good a captain and officers as voyager could wish. It is a weakness of mine always to prefer a British ship to every other, especially when out of soundings. There is something in the "Aye, aye, sir!" which inspires confidence, which nothing uttered by a foreigner can do. This is of course "provincial," but we don't profess to be anything else.

The weather had nothing of the warm south in it; the air was sharp and chill. We had showers of snow and sleet, the hills were white, the skies dull as lead, and one looked forward to Egypt and Syria as to a comfortable fire, whatever other attraction they might possess. Soon after leaving the splendid docks of Marseilles we sat down to a sumptuous breakfast, and, as it happens in most sea voyages, the passengers met together for the first time, and in very many cases for the last. How important is the prospect of a voyage, even of a week, to those who have to "go down to the sea in ships;" but to none on board of this or any vessel afloat, was it more momentous than to a respected member of our party. Poor fellow! He was a victim; a down-trodden, crushed, silent, and miserable slave to the demon of sea-sickness. That remorseless ocean monster shook him, bound him, laid him prostrate, beat every bone in his body, knotted every muscle, tore every nerve, tortured him, turned him inside out, yet without a word of remonstrance from him, except a feeble groan, or look of agony from glazed eyes which had hardly an atom of expression to respond to the truly kind look of Morris the steward. But at this first breakfast table my friend was all alive and energetic; the power of the land was still upon him, for the ship was steady as a rock, and the beat of her powerful paddles was hardly echoed by the glasses upon the table. "How fortunate we are," "What a calm day," "I hope it will continue so," "No one could be sick with such weather," "We may have it so all the way to Alexandria"—these were the pleasing reflections from the different smiling, laughing, contented passengers, male and female, military and mercantile, Jew and Gentile, French, German, and English, who surrounded the table. Yet these pleasant hopes were most unexpectedly interrupted by an unaccountable lurch of the vessel, succeeded by another, and accompanied by the sharp scream of the wind as it struck the rigging, its obedient harpstrings. I suggested to my friend the prudence of leaning down on his berth for a few minutes, while I went to ascertain the cause of this very strange commotion. He did so, promising to join me in a few minutes. Alas! it was nearly a week ere he cared for anything upon earth, or rather upon sea, for all upon the quiet and solid earth seemed to him then a terrestrial paradise, which he would never revisit, unless for burial, if even for that.

I shall never forget the scene which presented itself when I went on deck. We had been caught by a gale, which very rapidly increased to a hurricane. Now although, as the old song says,

> "I've cross'd the great Atlantic,
> And weathered many a breeze,
> Besides being up the Baltic
> And divers other seas,"

yet I never before encountered a hurricane; and it is well worth seeing, for once at least. The waves at first seemed taken all aback, as if suddenly roused from their beds, without having time to dress themselves and appear with that solemn dignity before the world which becomes an ocean-sea. They rose with awful bulk of green water, and swelled up until, curling their monstrous heads, with a thundering and defiant roar they sank again, only to gather strength to come nearer and nearer, as if to send the vessel down with one thud to the lowest abyss. Again the wind seized them with a hissing yell, as if in a passion, and tore them to pieces when they presumed to rise, scattering them into an atmosphere of the finest snowdrift, and, mingling air and water in one white seething plain, seemed to unite sea and sky in a drizzle of flying mist. One of the most remarkable effects of the wind upon the sea was along an ugly range of precipices to leeward. The waves, according to the calculations of one of the officers, were driven up the precipice for about 120 feet, but, owing to the force of the wind, were unable to fall back with all their volume, so that the foam seemed to incrust the rock like ice, and to blow as smoke over the summit. The watch could not stand on the forecastle, which seemed buried in spray. The officers held on upon the gangway, their faces well "cured" with "the salt sea faeme." We bored our way till the afternoon through all this turmoil with that calm and resolute bravery which our steam-engine personified, as it did its duty steadily with its giant arms, and regularly-supplied drops of oil—kindly supplies, useful to our getting through every sort of hurricane, however strong we may be.

The wind blew as it would blow its last. "Is it possible," I asked our gallant little captain, "that it could blow stronger?" "I have never," he replied, "seen it blow so hard except in the China seas." "What if the engine give way?" was the question suggested by me—who says I was uneasy?—to the old and steady engineer, Mr. Allan, from Glasgow. But he would not entertain the suggestion. "A better tool never was in a ship," was his only reply, "and for seven years she has never made a miss." "Thank you, Allan!"

Notwithstanding the excitement of the hurricane and its intense interest, I was by no means disposed to complain when the *Valetta* ran for shelter—a most unusual occurrence. Fortunately Toulon happened to be the harbour of refuge. It was worth our while encountering the gale, to enjoy the unexpected pleasure of seeing this famous place. My chief associations with it, strange to say, were stories told me by "the old lieutenant," of Sir Samuel Hood and other worthies whose exploits were achieved here. The severe gale we had encountered told even upon this quiet recess. A brig which had broken from her moorings was being towed back to them by a tug; large ships of war, with their topmasts struck, were rolling so that we could see their decks. We were not permitted to land, and could therefore only estimate the strength of the place by what we saw from the ship's deck; but judging from the batteries, which extend from the water's edge to the mountain sides, Toulon appeared to be impregnable. It must be a beautiful place in summer, and highly picturesque, but on this day it looked cold and miserable in the extreme.

The rest of our voyage to Malta was rather rough, but no special event disturbed it. My older readers may not care to hear of the following incident, but doubtless the children will. It is one very common in all voyages during stormy weather and when far from the coast. Several small birds were blown out of sight of land during the gale. They were so wearied as to be easily caught. One little lark was so pleased with the warmth of the hand that he sat down on it, burying his little cold feet in his feathers, and looking about with his bright eye, not in the least afraid, and as if feeling assured that he had been cast amongst good, kind people. These birds are always very thirsty, and drink with delight. In summer they sometimes remain on board for days, feeding upon flies, and in some cases they have been known to clear a cabin of cockroaches, a sort of ugly black beetle, and to get quite fat upon them. One beautiful lark we caught remained until we were passing close to the shore in the Straits of Bonifaccio, when we let him off, and he flew away to sing again in his own green fields; but another died, and was found in the morning in his cotton bed lying on his back, his little claws curled up to the sky.

We reached Malta late on the night of the 23rd, and finding that the steamer was not to leave till three in the morning we resolved to go on shore. Most fortunately for us a friend on board had a friend in Malta, the kind-hearted Free Kirk minister, who came out to receive him and be his guide during the strange hours of midnight. All the world knows Malta, yet I would not exchange my impressions of it, received during those silent watches, for the most accurate knowledge which could be obtained by daylight. Strange to say, I feel almost thankful that my stay was so short in that famous city of old knights and modern soldiers. I have no intention of turning to any gazetteer or history of the knights of Malta to get up a description of its harbours, batteries, or ancient history. Anyone wishing this sort of information may get it without going there. I am quite satisfied with what I learned from my midnight walk, while everyone, the governor included, was in bed, except the sentries and a few policemen and houseless ragamuffins. The moon was shining "with the heavens all bare;" every house revealed itself, not in the clearness of noonday, which would have been a defect,—few towns and fewer men being able to stand that sort of revelation,—but in the soft and subdued golden light of the full moon which blended wonderfully with the limestone of which the island is composed. We walked up streets by long flights of stairs, admired the balconies, and the innumerable bits of picturesque architecture and varied outline that everywhere met the eye, and seemed so tasteful when compared with the pasteboard rows of our prosaic streets, which are built by contract and squeezed into stupid shape by our city authorities, who seem to think that the "orders" of architecture mean all houses being alike, as policemen are. We soon reached the side of the town which overlooks the great harbour; and though I have lost all memory of the names, if I ever heard them (which I no doubt did), of forts, streets, palaces, batteries, yet I never can forget the impression made by what Joseph Hume used to call "the tottle of the whole." Guided by our friend we wandered along battery upon battery, passed innumerable rows of big guns, which had pyramids of shot beside them, and which looked down white precipices, as if watching the deep harbour which laved their base, and sorrowing that they had nothing to do. We saw forts—forts on this side, forts on the other side, forts everywhere, forts above us, and forts below us. We saw beneath us dark forms of line-of-battle ships, like giants asleep, but ready in a moment to wake up with their thunder. Yet we saw no signs of life in the silence of midnight except a few lights skimming across the deep black water below; nor did we hear a sound except the song of the Maltese boatman who steered his gondola with its firefly lamp, and the tread of the sentinel as his bayonet gleamed in the moonlight, and the sudden question issued from his English voice, "Who goes there?" We stood beside noble palaces, formerly inhabited by the famous knights, every ornament, every coat of arms, distinct and clear as by day; and we thought——well, never mind our sentimentalism. We stood beside the statue of the great and good Lord Hastings, and traced his silent features between us and the sky, which revived many thoughts in me of my earliest and best friends. And thus we wandered until nearly three in the morning, in a sort of strange and mysterious dreamland; and for aught that appeared, the Grand Master and all his knights still possessed the island, and might be seen on the morrow's morn,—if we were disposed to wait for them,—watching a fleet of infidel Moslems in the distance, come to disturb their peace and the peace of Europe, if not to destroy Christianity itself. And we thought——no matter, ye sturdy Protestants, what we thought of these fine fellows! How thankful we were that all the shops were closed, where we might have been cheated by daylight; that priests, and friars, and nuns, and sea captains, and admirals, and all the puff and parade, were snoring in their nightcaps. They would have, beyond doubt, destroyed the pleasing illusion. After buying some delicious oranges from ever-wakeful boys, and bidding grateful farewell to our obliging guide, we returned to the *Valetta* full of thankfulness for our midnight visit to Malta. We never wish to see it again. We fear the daylight.

After leaving Malta we seemed to have entered another world. The sky was without a cloud; the sea was unruffled by the slightest breeze, and began to be coloured by that exquisite deep blue-like *lapis lazuli* which may be approached sometimes in our northern skies, but never in our northern seas. Nothing could be more beautiful than the play of the white foam as it flew from the ship's bow, or from her paddles, and fell like white pearls upon the glassy surface. I was reminded of a similar effect at the Falls of Niagara, produced by the sparkling foam as it ran up the smooth surface of the deep water, which like a huge green wheel of ocean rolled over the table-rock. In both cases, the contrast was beautiful in the extreme,—between the pure white and the indigo blue in the one instance, and the emerald sea green in the other.

During our short voyage to Alexandria shoals of dolphins rose alongside of us, while once or twice flying fish were seen skimming the surface with silvery wings,—both features significant of a change in our latitude. Strange to say our engine, which had stood so well throughout the hurricane, broke down in the calm on two occasions. My worthy friend the engineer accounted for this by saying "that it was entirely owing to the number of ministers on board, and nothing else. Nae engine," he added, with emphasis, "could staun five o' ye; the best machines are naething against ministers!" But making all allowance for our parson-power, the "good tool" had no doubt been wounded in the battle with the storm.

One other little fact I must not omit to mention, as evidencing the distance to which fine substances can be wafted by the air. For two days, and when out of sight of land, though our course ran nearly parallel to Africa, the weather rigging of the ship was all brown with fine sand, which adhered to the tar. And this was only visible on the side of the ropes next the desert.

And now for a few days we felt the perfect repose and benefit of a voyage. To one who, like myself, never suffers from nausea even, it is the most perfect rest. The busy world, we know, is getting on very well without us, and so we determine to get on without it. The postman's knock belongs to another sphere of existence, and we hear it no more, except as in a feverish dream. A mighty gulf of deep water separates us from the world of letters, business, calls, meetings, appointments, committees, visits, and all like disturbers of selfish ease. We assume, being ourselves in robust health, that all our friends are in a like condition, and are pleased to think that they lament our absence, hope to hear from us by the next mail, and will be glad to have us home again; while sometimes we cannot but regret, with a feeling which alarms our conscience, that we do not sufficiently respond to their anxieties. On ship-board, pleasure and necessity are one. We cannot help being idle. We may possibly exert ourselves to play draughts or backgammon, but not chess—that requires thought. To read anything is an act of condescension, and no one thinks that his duty. In fact, the word "duty" seems confined to the officers and crew, including the steward. Those portions, too, of our life which on land are made subordinate to more important things, such as our meals and sleep, at sea are made the important events of the day. We retire at any hour to our cabin, sleep, read, meditate, as we please, and as long as we please. No one accuses us of sloth, and asks us to rise and take "a constitutional." No one asks if we are ill—that is charitably taken for granted; the majority are surprised if we are well, and envy us. We are, moreover, not expected to speak to any one, and if words are exchanged, they are understood, upon honour, to be mere contributions to general happiness. The brain and memory empty themselves so completely of all that has troubled or occupied them during previous periods of existence, that we seem to begin life again as children, and to be amused with the most passing trifles. Sensible men who, a few weeks or even days before, were occupied with important affairs of Church or State, become interested in the cow on board, feel her horns, scratch the back of her ears; and beg for some crumbs of bread to feed the chickens. A dog on board becomes an institution. A sea-bird attracts every eye; while a ship looming on the horizon makes all, who can stand, come on deck and watch the approaching wonder, as the ancient mariner watched the mysterious sail. Who, on shore, ever thinks of the longitude or latitude of his house? Not one in fifty believes that it has either one or other; but at sea our position is known every day at 12 o'clock: and the spot upon the earth's surface which we at that moment occupy becomes a matter of serious speculation until dinner time.

We beseech wearied men never to visit Paris, to be baked on the Boulevards, sick of the Rue Rivoli, have their digestion destroyed by mushrooms and cockscombs at the Trois Frères; nor to be pestered by guides, ropes, ladders, mules, or *Alpenstocks*, in walking across slippery glaciers, or down savage ravines in Switzerland; nor to be distracted by *Murray* in wandering from gallery to gallery, or from church to church in Italy;—but to launch upon the deep, get out of sight of land, and have their brains thoroughly invigorated by fresh air and salt-water.

At this time, by the kind and cordial permission of the captain, I had a religious service with the men in the forecastle, as my custom has ever been when on a voyage. It had little formality in it: some were in their hammocks, most were seated around on the "bunkers," and were dimly visible under the low deck, with the feeble lights. There is a reality in this easy and familiar way of addressing Jack, which is much more likely to do him good than the regular assemblage with Sunday dress in the cabin, when probably a sermon is read for the benefit of the educated passengers, which the crew take for granted is not expected to be understood by any one below the purser. In such cases they attend worship for the same reason that they wash the decks or reef topsails,—because they are "ordered." I would therefore earnestly beg of my respected brethren in the ministry to remember "poor Jack" when at sea, and never to imagine that a sailor "cares for none of these things." Few audiences are more attentive, more willing to learn, or more grateful for so small a kindness. We are apt to forget what these men endure for our sakes—what sacrifices are required by the necessities of their occupation,—what their sore temptations, and few advantages. The least we can do, when an opportunity offers itself, is to speak to them as to brethren, and to tell them of the love of a common Father and Saviour; and we know not when the seed thus cast upon the waters may spring up. It may be in the hospital among strangers, or when pacing the deck at midnight, or when clinging to a plank for life, or even when going down "with all hands."

On the forenoon of Saturday, the 27th, we sighted Alexandria.

The first sign of nearing a new country from the sea, is generally the pilot-boat and its crew. With what interest do we look over the side of the ship, and watch the dresses and countenances of the first specimens of the tribe among whom we are to pitch our tents for a time! The boat, with a flag in its bow, which pulled out to meet us from Alexandria, had a crew which were a fit introduction to the East, with their rough comfortable brown boat-coats and hoods, their petticoat trousers, swarthy faces, and shining teeth. And as for "Master George" himself, the Egyptian pilot, as he stepped up the gangway to shake hands with his old friends, and take charge of the ship, he was, from toe to turban, a perfect study for an artist.

There is nothing at all remarkable in the view of Alexandria from the sea. Notwithstanding the white palace, the old summer-house of the Pasha, and other distinguished buildings, which are sure to be pointed out, the town looks like a long horizontal streak of whitewash, mingled with brown, and crossed perpendicularly with the sharp lines of ships' masts.

But a scene well worth noticing was the crowd of boats that pressed around the ship to convey passengers to the shore. Imagine thirty or forty such, with their nondescript crews, crowding to the ship's side, every man on board of them appearing in a towering passion, and yelling as if in the agony of despair, and, with outstretched hands and flashing eyes, pouring forth a stream of guttural Arabic, that seemed to the ear to be a whole dictionary of imprecations without a pause, and as far as one could judge, without a motive, unless it were that they took us for lost spirits claimable by the greatest demon. The noise is great when landing from a Highland steamer, and when Highland boatmen, the scum of the port, are contending for passengers or luggage. But without defending the Gaelic as mellifluous, or the Highlanders as types of meekness, on such an occasion, yet in vehemence of gesticulation, in genuine power of lip and lung to fill the air with a roar of incomprehensible exclamations, nothing on earth, so long as the human body retains its present arrangement of muscles and nervous vitality, can surpass the Egyptians and their language.

If the Pyramids were built, as some allege they were, to preserve the inch as a measure of length for the world, why should not the Sphinx have been raised, with her calm eye, dignified face, and sweet smile, even now breaking through her ruins like sunlight through the crags, to be an everlasting rebuke to Eestern rage, and a lesson in stone exhorting to silence.

My first day in the East stands alone in my memory unapproached by all I have ever seen. It excited feelings of novelty and wonder which I fear can never again be produced. I had expected very little from Alexandria, and thought of it only as a place of merchandise, notorious for donkeys, donkey-boys, and Pompey's Pillar. But as soon as I landed, I realised at once the presence of a totally different world of human beings from any I had seen before. The charm and fascination consisted in the total difference in every respect between East and West.

Passing through the utter chaos, and dilapidation, and confusion of the custom-house, and clambering over, as we best could, the bales of cotton covering an acre, under the protection of the blue cloudless heavens, winding our way among goods of every description, and between barrels and hampers, amid the cries and noise of the mixed multitude who crowded the wharves, filled the boats, and offered themselves as porters, guides, and whatever else could command a *backsheesh*, we reached the outskirts of the custom-house, passed the officers, entered the bazaar, and had time to look around.

The first impression made upon a European is, as I have said, that he has never seen anything at all like it. The shops, with various kinds of goods displayed behind a man who is seated cross-legged, willing to sell them apparently as a favour, hardly attract the eye any more than open cupboards would do. But the persons who crowd along the narrow lane—only look at them! They are manifestly from all parts of the earth—Greeks, Turks, Jews, Armenians, Hindoos, Copts, Arabs, Nubians, Albanians, drunken Jack Tars, English officers on the way to or from India, &c. With the exception of the Europeans, each man appears in his own distinct individuality of face and raiment. In America there is a Yankee type everywhere visible, with lips, nose, cheeks, and hair, by no means romantic, though business-like; in Russia there is a Muscovite type, which admits of little variety; and everywhere, from the Mississippi to the Volga, there is a certain uniformity of face, or at all events of dress; coats and trousers with buttons, long tails or short tails, hats or caps,—a sort of Caucasian respectability. But here, each face seems to stand alone. There are eyes and foreheads, noses and beards, colours of skin, peculiarities of expression—the sly, the dignified, the rascally, the ignorant, the savage, the refined, the contented, the miserable,—giving each face its own distinct place in the globe. And there is, if possible, a greater variety in costume. Every man seems to have studied his own taste, or his own whim, or, possibly, his own religion, in the shape, colour, and number of his garments. The jackets, the pelisses or dressing-gowns, the waistcoats, the petticoats, the inexpressibles, the sashes, the turbans, the headgear, each and all are different in colour and in details of arrangement. The arms, whether dirk or dagger, single pistols or half a dozen, modern or as old as the invention of gunpowder, sword, gun, or spear—each have their own peculiar form and arrangement, so that every Eastern has to a Western a novelty and picturesqueness that is indescribable. And the motley crowd presses along: fat, contented, oily Greek merchants, or majestic Turks, on fine horses splendidly caparisoned, or on aristocratic donkeys, who would despise to acknowledge as of the same race the miserable creatures who bray in our coal-carts; bare-legged donkey boys, driving their more plebeian animals before them; Arabs from the desert, with long guns and gipsy-like coverings, stalking on in silence; beggars, such as one sees in the pictures of the old masters—verily "poor and needy, blind and naked;" insane persons, with idiotic look, and a few rags covering their bronzed bodies, seeking alms; Greek priests, Coptic priests, and Latin priests; doctors of divinity and dervishes; little dumpy women with their peculiar waddling gait, wrapt in white muslin sheets, their eyes only visible; and soaring over all this strange throng are strings of camels, lank and lean, so patient-looking and submissive, pacing on under their loads of cotton, with bent heads and sleepy eyes, their odd-looking drivers mounted high above, rocking with that peculiar motion which the camel's pace produces—all this, and infinitely more, formed a scene that looked like a fancy fair got up for the amusement of strangers.

Before leaving the bazaar, let us look into this coffee-shop open from the street. There is no ornament of any kind in it, nor does it aim at the magnificence and glitter seen in our whisky and gin-shops at home—such palaces being unknown in the East. It is of the humblest description, having no ornament of any kind but a few mats on its floor and upon its raised dais. Capital is not required,—a little charcoal, a coffee-pot, and some coffee forming the whole stock in trade. Odd-looking, turbaned men, smoking their nargiles, are each a picture of quiet contentment. But the chief attraction to me was a blind man, who sat cross-legged on the dais, with a rude sort of fiddle, on which he played a monotonous accompaniment to his chant, resting perpendicularly on his knee. He was apparently an *improvvisatore*, who had to think for a little time before composing his verse, or more probably he was only a reciter of old Arab poems. While chanting, and scraping on the fiddle, there was a smile of great humour on his face, and no sooner were two or three lines repeated, than his audience exhibited the greatest satisfaction, and turned their eyes to a young man who sat on the opposite dais, quietly smoking,—a competitor, apparently, with the blind musician and ballad-singer. He seemed sometimes puzzled for a moment, as he blew a few rapid whiffs from his pipe, while the blind man listened with the greatest attention. But no sooner was his response given than a general movement was visible among the auditors, who turned to the blind minstrel as if saying, "Match that, old fellow, if you can!"

Along the whole bazaar there were little episodes of this sort presenting features of social life totally different from our own. But my excellent friend the missionary of the Church of Scotland at Alexandria, who had come to meet us, would not permit me to remain longer in the bazaar. He laughed heartily at my enthusiasm, assuring me that I would think nothing of all this by the time I reached Damascus, and begged I would come away, as we must have a drive and see a few sights before dinner; although, to tell the truth, I was much more pleased with the sort of sights around me than the prospect of beholding even Pompey's Pillar. Obeying orders, we were soon in the square or long parallelogram which forms the respectable part of the town and where the chief hotels are situated; but it had no more interest for me than Euston Square. Not so the drive. Soon after leaving the hotel we were again in the East, with its dust, poverty, picturesqueness and confusion. We visited an old Greek church, which four years ago had been excavated out of a mass of debris. We gazed with interest upon its walls dimly frescoed with Christian subjects, and looked into its dark burial vaults, and thought of the Alexandrian school, and of those who had worshipped probably more than a thousand years ago in this old edifice. We passed lines of camel-hair tents perched upon a rising ground and occupied by the Bedouin, who had come from the desert perhaps to buy or to sell; we passed the brown clay huts of the Fellaheen, with their yelling dogs and naked children; we passed crowds of donkeys bearing water skins, resembling black pigs that had been drowned and were oozing with water; we saw with delight that feature of the East—groves of palms needing no glass to cover them, drooping their feathered heads in the sunny sky; we stood where many generations had stood before, beneath what is called Pompey's Pillar, and repeated the speculations of past ages as to how it could have been erected there, and as to what a glorious portico that must have been of which it had formed a unit; and what a magnificent temple it must have adorned! We then returned to the square from which we had started, feeling more and more that we were in a new world.

One or two other sights added to our enjoyment of this first day in the East. One was a bare-legged *syce* with silver-headed cane, who flew along, like an ostrich, to clear the way for the carriage of his noble master and mistress, and to announce their august presence, while they reclined in their handsome chariot, driven by a Nubian charioteer, with comfortable satisfaction in their look, such as their Jewish ancestors manifested when, in the same country long ago, they enjoyed leeks and garlic, wishing for little better. Another sight was a funeral in which the body was carried on a bier, preceded, as the custom is, by blind men, and followed by relatives, and women as hired mourners who did their duty well, giving loud lamentations for their money. And another was a marriage procession in which the bridegroom was going for his bride with lanterns and wild Turkish screaming instruments intended to represent music:

and having seen all this we joined European society at the *table d'hôte* at a late hour, and fell again into the old grooves of modern civilisation.

After dinner, the conversation in the smoking room turned upon the state of the country. There was an eager enquirer with note-book in hand who cross-questioned a few witnesses who were lolling about the window and seemed disposed to answer his queries. The most ready replies were given by two persons, the one with a red nose, and the other with a squint.

Enquirer asks:—"What sort of a man is the Pasha?" He had been given to understand in London that he was a wide-awake, spirited gentleman, and thoroughly alive to the benefits of commerce and free trade, &c.

Red Nose blows two or three whiffs and mutters, "A thorough scoundrel!" Having gathered force to enlarge upon his text, he adds, "You know, all 'the powers that be' in this land are scoundrels; you cannot believe what anyone says. If he speaks the truth it is either in mistake, or because he can make more by it than by lying. Bribery and corruption are the rule from the Pasha to the donkey-boy. The great king in the country, upstairs and downstairs and in my lady's chamber, is *backsheesh*."

Silence reigns and all the witnesses seem to agree on this point. Red Nose encouraged, proceeds, being stimulated by the demand from Enquirer for an illustration.

"Last year this admirable Pasha—this eastern merchant—sold the first cotton he should bring into Alexandria, that is his first crop, to the house of —— and Co. at a certain price. Cotton in the meantime rose, and the Pasha sold his crop at an advanced price to another house; and being challenged for his breach of contract, he defended himself upon the ground that his bargain was to sell the first cotton brought *into* Alexandria, whereas this had been delivered at the station *outside* of Alexandria!"

Several declared this to be a fact beyond all dispute.

"The truth is," remarked another party, "nothing can exceed the ill-usage of the English by the Egyptian authorities. Our Consul, good man though he be, is too soft, too easy, and too much of a gentleman for them. It is not so with the French. A complaint made at the French consulate is immediately attended to, and the power of France is brought down upon the Turks at once. With the English Government, through their Consul, the Pasha is approached with 'Please be so good, your highness, as to consider this or that;' but with the French, the word of command goes forth, 'This must be done, sir! or we shall pull down our flag!'"

"It is quite possible," said the stranger, who was swinging in a chair, and whose face was nearly concealed by an immense beard, but who had a rather remarkable expression of intelligence—"it is quite possible that there is a good deal of bullying on the part of both the great powers; but I am also disposed to think that if the consuls would tell their side of the story, they could say something about the bullying of the merchants also. I have been knocked about a good deal in foreign ports, though I neither buy nor sell, and I have everywhere noticed a habit on the part of many resident merchants, of great respectability too, and amongst none more than my countrymen the English, to treat the native powers with proud contempt, to show very little respect for their national laws, their feelings, or even religious customs, when these threatened to stand in the way of their becoming rich. Their idea seemed to be that Providence had sent them abroad for the sole purpose of making money by good means, bad means, any means, but to make it by all means, and as rapidly as possible. If any difference arises between them and the native government, the poor Consul, forsooth, is told to poke up the British Lion and make him roar. And I have also noticed, that our Englishmen have, in many cases, far less respect for their religion, though it be true, than the heathen have for theirs, though it be false."

"How so?" inquired the man with the squint, as if he had been in the habit of looking at a question from all sides.

"Why," replied Long Beard, "last Sunday, for example, I noticed many vessels from England loading and unloading, and I was told that this was done in some cases by command of the captains who liked to do it, and in others by the imperative orders of the commercial houses at home. This is the sort of way British Christians—British Protestants, often witness for their religion among Turks and heathen. No wonder missionaries often labour in vain, when they are practically opposed by so many careless professing Christians."

"I'll bet a dollar that you are a missionary!" cried Red Nose, taking his cigar out of his mouth and looking inquisitively towards the stranger.

"It is quite unnecessary to risk your money, for I gladly admit the fact."

"Whew," remarked Red Nose mysteriously, "that accounts for it!"

"Accounts for what?" inquired the missionary.

"O nothing in particular!" replied Red Nose, breaking off. "I don't like disputes about religion."

After taking a short stroll to look at the stars, and observing that there was as yet no gas in Alexandria with all its progress and wealth, but that every one was obliged by law to carry a lantern, we retired to bed.

We there met a few friends, whose acquaintance we had made in other portions of the civilised world; but fortunately, owing to the cool state of the weather, they did not press their company upon us so as to be numbered amongst the plagues of Egypt. It was many years since we had met the genuine mosquito; but who that has once experienced it, can forget the nervous shock which runs through the body when his sharp "ping" is heard close to the ear, as he blows his trumpet for battle! To open the net curtains in order to drive a single enemy out is probably to let a dozen in; and once they are in, how difficult to discover the aerial imps; and when discovered how difficult to get at them, and when all this labour has been gone through, and the curtains are again tucked in, and every crevice closed, and the fortress made secure, and the hope indulged that the enemy hath fled, and the sweet feeling of unctious repose again mesmerises soul and body—O horror to hear again at *both* ears "ping, ping-ing!"

On this first night we did battle with intense energy and bravery against one intruder, and having slain him we were at peace; but then came the barking of the dogs, those ceaseless serenaders of Eastern cities, of which more anon—and then sleep as deep as that of Cheops.

Note.—The population of Alexandria is understood to be about 200,000: 30,000 are Italians, and 10,000 Jews. The Greeks are also very numerous. The leading mercantile houses amount to about twenty-five; most of them English. The cotton of Egypt passes, of course, through Alexandria: 4,000,000 acres are said to be under cultivation, each acre yielding from 300 to 600 lbs. There is in Alexandria an American mission to the Copts, with a boys' and girls' school well attended. The Church of Scotland has also an excellent mission in the city, superintended by my friend, Mr. Yuille. Miss Ashley's girls' school has about eighty scholars. The boys' school is also tolerably well attended. There is a "Bethel" ship in the harbour, belonging to the mission, which on Sundays has a large congregation, to which I had the pleasure of ministering. The late Pasha granted a free site for a place of worship, which is being erected by the Church of Scotland. Prussia is also erecting a new and commodious church. The German Hospital has proved a great blessing. The present Pasha is, I have been informed, doing a good deal for education, and has founded a large number of schools throughout the country—two of them being in Alexandria. The pupils are admitted free, and kept at the expense of the Government. Such of them as enter the public service are exempted from the conscription. The Pasha also supports 150 priests in connection with his great mosque.

THOUGHTS FOR THE NEW YEAR.

By HENRY ROGERS.

It is a happy characteristic of our nature, that Hope is stronger than Fear; and rarely do we see a more striking or comprehensive proof of it than in that unanimity of pleasant auguries, "the nods and becks and wreathed smiles," the universal shaking of hands and mutual felicitations, with which almost all nations in all ages have agreed to usher the New Year in. Every one seems astrologer enough to cast the horoscope of the young stranger, and to pronounce that the planetary aspects are benign; every one is his own soothsayer, and the omens are always favourable!

And yet nothing is darker than the prospect on which Hope gazes with such rapt eyes. It is as if travellers, having gained the summit of the Righi in a deep mist, which enveloped alike the fairer and the sterner features in that wondrous scene, should clap their hands, and break out into acclamations at the beauty of the landscape.

The aspect of the outward world amidst this universal hilarity makes the contrast more striking. This concert of happy omens takes place when, as one would imagine, it would be least likely. It is the midnight of the year, and all nature mourns in desolation; and this universal chirrup of hope and joy is as if the song-birds began their carol in the depth of winter; as if the cuckoo's note were heard in the leafless woods; as if the gay butterfly fluttered and the cricket chirped amidst the dry ferns of the last autumn.

Everything without, seems to remind us rather of ruin and decay, blasted hopes and dreary prospects, than of coming joy and gladness. More natural would our gratulations at first sight seem if we began the year still, as our forefathers once did, at the vernal equinox, when the bud is bursting and the young grass is springing, and Mother Earth is recovering from her long winter's trance; or if we celebrated the New Year's festival, as the Jews did, in the month Nisan, when the young sun and the green earth were painting all nature in harmonious colouring with the vivid imagery of man's hopes, or, typifying his various combinations of hope and fear, by the alternate lights and shadows, the blending tears and smiles, of a changeful April day. But as it is, the wind sighs mournfully through the leafless trees, telling of man's too speedy decay, or the snow wraps all nature in that shroud which seems the emblem of man's winding-sheet: and yet from out man's habitations goes forth the cry of gladness; from each reeling steeple come the merry chimes of bells; and every face smiles as every lip utters the words, "A Happy New Year." Doubtless it is a strong proof of what we began with, that "hope springs immortal in the human breast;" else as in other cases, nature's face would have waked a responsive and sympathetic echo in the bosom of her chosen child; even as the vernal or the autumnal day surprises him, with silent force, into spontaneous mirth or involuntary sadness.

Again; what is all too actual in the present and too certain in the future, would, one would think, qualify in some degree the exuberant buoyancy of the hour. Not only is it certain that during the very last moments of the Old Year, and the very first of the New, was the great reaper Death gathering his sheaves just as usual; not only is it true that on the morning of this great holiday there lies in almost every street one or more of whom we sadly say that they count by years no longer, and on whose eyes has broken "another morn than ours;" not only does it open upon multitudes to whom the first day of this new year will also be their last; not only must it open upon thousands more to whom Love, as it draws the curtain, and anxiously gazes at the pale wan face on which death has set his seal, can hardly say without faltering, "A Happy New Year,"—as well knowing that before the leaves shall open, perhaps before the snowdrop shall peep from under its winter mantle, the "robin redbreast will be chirping upon their grave;" not only are there thousands more to whom, as the sun of the last year went down in clouds, so the first sun of the new year rises in them, and to whom the mere transition from one epoch to another makes no difference; not only is all this true, but when we consider further how large a fraction—no less than a fortieth part or so—of those who welcome the new year with gratulation will never see the end of it, or who beginning it in prosperity, which naturally justifies their hopes, will end it in adversity, which will too surely prove the vanity of them; one would naturally expect that such facts and reflections as these would repress somewhat of that hilarity which is apt to inspire us all at this season.

It cannot be required indeed (for it would not be natural, and would assuredly be ungrateful) that we should put on sackcloth and sit in ashes, or allow our fears to preponderate over our hopes; nor that we should suspend over the heads of the guests at the convivial meetings which celebrate this annual festival the sword of Damocles,—for that would take away the appetite altogether; but in imagination, methinks, we might do well to provide ourselves with some such device as that of the wise Saladin, and teach ourselves to "Remember that we are mortal!" Standing on this isthmus of time between the two eternities, we should temper our hopes with our fears, and allow a sober wisdom derived from the lessons of the past to shade the brightness of the expectations which we are apt to form of the unknown future.

Yet no sooner is the knell of the old year tolled, at the last stroke of midnight, than the merry chimes ring out the birth of his glad successor. It is as in other cases: "The King is dead—long live the King!" and all mankind (true courtiers here), hasten to "salute the rising sun." The dead monarch, whatever his claims to remembrance or the benefits of his reign, is forgotten as soon as he is gathered to the sepulchre of his fathers; and the loyal flatterers begin, as usual, the work of adulation.

The image which leads us to toll the knell of the Old Year, and greet with merry chimes the New, is, of course, a very obvious one; the old year is no doubt in one sense dead and buried, and the new is just born, and is, and will be for 365 days and a little more, a living reality. Yet as everything may be taken by two handles (or, for that matter, by a thousand), there would be almost as much propriety if these symbols were, not inverted perhaps, but greatly changed.

Herodotus tells a story of the Trausians, a tribe of Thracians, who were so far from rejoicing when a "man child was born into the world," that its kith and kin—including the disconsolate parents, the authors of this new mischief—gathered in a circle round the forlorn object, and howled out their lamentations on the hapless condition of the young pilgrim of life, under the vivid sense of all the ills he was heir to in coming into this bleak world; and that, for similar reasons, they celebrated the obsequies of their friends with rejoicings and triumph, as having escaped them. They tolled man into life, and rang a merry peal at his departure from it! Whether they learned these singular notions and equally singular customs from the miseries of their own barbarous condition, or from profoundly moralising on the condition of human life—in other words, whether they were mere savages or philosophers in this matter—may be doubted. We must, at any rate, confess that in this, as in some other aspects of their character as delineated by the shrewd old annalist, they were very original savages; though it must also be confessed that their sentiments on this occasion were not so true to nature, nor, therefore, to philosophy, as those expressed in the exquisite Hindoo epigram:

"Naked on parent's knees, a new-born child
Thou sat'st and wept, while all around thee smiled;
So live, that sinking to thy last long sleep,
Thou then may'st smile, while all around thee weep:"

When *that* wish is fulfilled, Solomon's paradox becomes true, "That the day of a man's death is better than the day of his birth;" and Paul's, that however good to be here, it is "far better to depart."

But though we could not, like the Trausians, celebrate the obsequies of the old year with a merry peal, yet is it not too significant to toll its funeral knell, as if it were to be buried, cut off from all communication with us, and were nothing more to us? Would it not be as wise to bid it farewell, as a friend departing from our shores,—not dead in truth, nay, *never* to die to us—with a strain of pensive and solemn music? And if we cannot for very shame imitate those savages of Herodotus, and meet the new year with lamentations, yet might we not with propriety welcome it in strains which should intermingle the sense of awe and mystery with the aspirations of hope and joy, as an orchestra attunes the minds of an audience to the unknown scenes of wonder which the rising curtain is to unveil?

The past, in truth, still lives to us, and, connected by the slight ligament of the present moment, is all that really does. The future does not live as yet. The past is the region, properly speaking, of *fact*,—pleasing or painful, of aspect benign or frowning, chiefly as we ourselves have made it; over it, imagination has little power. As to the future, we live only in imagination,—"that forward delusive faculty," as Butler calls it, "ever obtruding beyond its sphere,"—and the counterpart of that future will never live in reality: it is, in truth, as much a land of shadows as any other in the realms of that great enchanter. And even if we prefer to gaze on the unknown future rather than on the familiar past; if its very mask piques our curiosity, and leads us to speculate on what is behind it, it may yet be naturally expected (instead of our being wholly taken up with greeting a new acquaintance of whom we at present know nothing), that we should at least dwell with pensive and grateful retrospect on the many blessings the Old Year has brought us, if we have been happy in it; or if we have had our trials and sorrows, that we have been brought safely through them, and that at least so much of the more toilsome, hazardous parts of life's pilgrimage will have to be traced no more; or if we have fallen into grievous errors, that we should take that happy moment for penitently confessing them, thanking God that they have not been our ruin, and resolving to walk more warily for the time to come; in a word, that we should let the present be the meeting-place of the past and the future, and allow the lessons of severe experience to chastise and instruct the anticipations of what is to come.

Hope, genuine hope, is not symbolized by that mock sun, that parhelion of fancy, which promises all brightness, but by the rainbow; and the true rainbow of hope, like that of the sky, is the offspring alike of sun and shower—of the bright lights and tearful clouds of experience.

Admirable was that emblem of the two-faced Janus, by which the wise old Romans signified the New Year; one looking back upon the past, and the other forward to the future. For it is only as we wisely exercise retrospect, that we can have any power of anticipation: except as that shall enlighten the future, it is all dark, or lighted only by the will-o' the wisps of fancy. So that if Janus had not had his face that looked backward, that which looked forward must have been represented as blind; and, as an old writer observes, he who will not "take the past to guide him in regulating his hopes of the future, so far from having, like Janus, two heads, must rather be counted as having no head at all."

So obviously natural is it, in all who have reached the mature age of reflection, to chequer the gay with the grave on this day, that one cannot be surprised to see how often our "Essayists," when they have given their readers their New Year's greetings, have fallen rather into a vein of pensive musing than of mirth; of musing which has caught its tone and hues more from sober retrospect, than from joyous anticipation. Thus in that exquisite paper on "New Year's Eve," Elia says: "The elders, with whom I was brought up, were of a character not likely to let slip the sacred observance of any old institution; and the ringing out of the Old Year was kept by them with circumstances of peculiar ceremony. In those days the sound of those midnight chimes, though it seemed to raise hilarity in all around me, never failed to bring a train of pensive imagery into my fancy. Yet I then scarce conceived what it meant, or thought of it as a reckoning that concerned me. Not childhood alone, but the young man till thirty, never feels practically that he is mortal. He knows it, indeed, and if need were, he could preach a homily on the fragility of life; but he brings it not home to himself, any more than in a hot June we can appropriate to our imagination the freezing days of December. But now, shall I confess a truth? I feel these audits but too powerfully; I begin to count the probabilities of my duration, and to grudge at the expenditure of moments and shortest periods, like miser's farthings."

And even the "Lounger," anticipating the image of Charles Lamb, says on a similar occasion: "As men advance in life, the great divisions of time may indeed furnish matter for serious reflection; as he who counts the money he has spent, naturally thinks of how much smaller a sum he has left behind."

We often bewail our ignorance of the future on which our experience of the past sheds so feeble a light; yet it is no paradox to affirm, that that ignorance is the only safe condition on which we can encounter it. It is the source of the hopes with which we welcome it, and ought to suggest the wary wisdom with which we should enter upon it. If man could, by consulting some magic mirror of the old adepts, or some transcendental science as yet unborn, exactly foresee the events of all his future life,—the mode and time of his death included, even to the last cast of the sexton's office,—and hear by anticipation the shovelful of dust rattle on his coffin, would the oracle of the all-knowing Sidrophel be thronged with applicants? I fancy not; at least not to ascertain their own destiny, however curious they might be to know the history of their neighbours. If, on the other hand, they flocked to the oracle only to know *that*, the world would soon wish to relapse into ignorance with all convenient speed; and in any case, I imagine, the chief charm of existence would be lost to us. Men would find, like our first parents, that they had bought knowledge at too costly a price, and that ignorance in Paradise was better than science outside of it. Whereas hope is now stronger than fear, then, not only would fear be stronger than hope, but hope would be quenched, and the chief stimulus of life quenched with it. Hope would be extinguished, but so would not fear; and the soul would sink into utter apathy, were it not—hard alternative!—for that dread of foreseen evil which would keep it only too sensitive, while it would poison all the pleasure of the forseeen good. As it is, whether in adverse or prosperous circumstances, this ignorance (if we have learned the lessons of past experience) may minister to us the hope which is our solace in the one condition, and that distrust and caution which should accompany the other.

Do we enter on the year in gloom and sadness, to which the external aspect of nature is only too responsive? Do we walk in the gay procession of this crowded holiday with the air of mutes at a funeral?

Are we unable to reply to the universal salutation of "A happy New Year," except with the sigh of an undertaker? or do we attempt to reciprocate it in mumping tones which stick in our throat, and choke us to utter them? Let us recollect how easy it is for Him, in whose hands we believe our life is, to "turn the shadow of death into the morning." As we cannot tell what "a day may bring forth," how much less a year! As the winter of nature passes away, so may this winter of our sorrow with it: and the summer sun and the golden harvest find us in a prosperity of which they shall be pleasant emblems. And even if this should not be, yet if we have learned those lessons which a wisdom greater than our own would teach us by the discipline of life, then, even if happiness be yet longer delayed than during this little circle of the months, nay, if it be delayed till we shall reckon by months no more, we shall enjoy a sunshine of the soul, however dark the scene without, of which we cannot be robbed, and which will make this year one of genuine prosperity.

And not less instructively does this ignorance of the future speak to those (though less docile to the teaching than the children of sorrow) who enter on the year in great prosperity. That ignorance rebukes, if anything but experience can, the presumption of anticipating the continuance or the constancy of so fickle a thing. To teach man humility, to "hide pride" from him—a lesson which it is always hard to learn, but which is never so hard as in the days of prosperity—is far too precious an object in God's estimate, not to make it well worth while to enforce it, if need be, at so slight a cost as the ruin of our temporal prosperity; at least, such abatements or fluctuations in it as shall convince us of its instability. Man's tendency, indeed, in all states, is to believe in that law of "continuance," as Bishop Butler says, which suggests that things will be as they are, unless we have palpable proofs to the contrary. But the tendency is never so strong as when it is very *agreeable* to a man to believe that the state of things will be permanent; that he has built an eyrie on the rock, to which the spoiler cannot climb; an "abiding city" where he can take up his rest. A uniform prosperity—more than anything else—tends to engender or foster those dispositions which are inconsistent with either the true knowledge of ourselves, or our due subjection to God. If pride, hardness of heart, contempt of others not so happy as ourselves, or scant sympathy with them, be not the effect (and they too often are), inordinate love and misestimate of the present, and gradual oblivion of the future, except to presume that it will be *like* the present, take too ready possession of the soul. There are, accordingly, few who can so enjoy long continued prosperity as not to be sensibly the worse for it. A few may be observed, indeed, of two opposite classes, who enjoy it to the last: the one, those who seem past learning the lessons of adversity, and who are allowed to "spread as a green bay tree;" and the other, those who, being "taught of God," have learned them so well, are so skilled to use the world without abusing it, and so daily mindful by whose donation all blessings are given, and by what tenure of homage to the Supreme Lord they are alone held, that they do not seem in any appreciable degree injured by them. These, God seems to permit to walk through life in almost unclouded sunshine; not, indeed, without some trials, yet with few, and none of them what we should call great and signal reverses,—with little experience of the "ups and downs of life," as people say. But there are few of us who do not need, and who do not get, the lessons which adversity must teach us; and of the generality it may be said, they are never more in danger than when they have been long prosperous. The ancients well understood the connection between signal prosperity and some coming reverses, though they accounted for the fact which experience taught them, by an erring philosophy. One of the best-known and most instructive stories of Herodotus teaches us how deep was the heathens' conviction of the fact, and how insufficiently heathen speculation reasoned upon it. It was, it seems, the divine "envy," *φθόνος*, which made the gods grudge the continued or exuberant prosperity of poor mortals; and Nemesis, therefore, never failed, in due time, to lay the proud structure in the dust, or send the cankerworm to the root of the fair tree. The historian tells us that Amasis, king of Egypt, had a dear friend in Polycrates, prince of Samos; but the latter was *so* happy, that his friend could not help, in accordance with the theory just mentioned, regarding him as the most miserable of mortals, plainly marked out for the speedy bolts of the divine Nemesis. He exhorted him therefore (if so be he might render the gods propitious by making himself miserable, instead of waiting to let them make him still more so), to disarm, by anticipating, their anger; and to essay this by sacrificing the thing he most valued. Polycrates, impressed by the conspicuous wisdom of this advice, and this reasonable view of the divine government, made choice of a costly ring which he highly valued, and cast it into the sea. Strange to say, it was swallowed by a fish; the fish was caught by a fisherman, and was sent as a present to the king, whose cook found in his maw the ring Polycrates had intended as his *piaculum*, and restored it to its owner; whereupon king Amasis renounced his friendship utterly, as one so fatally prosperous that even what he threw away came back to him; who, therefore, must be destined to be made an example of terrible reverses; and who, as he could not fail to involve his friends in his ruin, ought to be carefully shunned, as rats run from a falling house. And the event, according to Herodotus, showed the justice of the fears of Amasis, and his singular discretion!

Far different, happily, are a Christian's views of Him who cannot grudge any of His own gifts, seeing that they are "without repentance," and that from Him all receive "life, and breath, and all things." Nevertheless, long-continued prosperity is in various ways so inconsistent with man's highest good, that it is as nearly certain that it will have (because it will need) the corrections of adversity, as if, in truth, envy of mortal happiness, and not the desire to endow us at last with something better, were the genuine cause of it.

But best of all may we encounter the future, if, in implicit reliance upon a wisdom which sees the future for us and has provided for it, we can learn the lessons our Saviour would teach us; and trusting in Him who "feeds the fowls of the air, and clothes the lilies of the field," will take no excessive self-vexing care—so the word means—for the morrow. "Take no thought," says our version; and as it now stands the text is apt to suggest a meaning which it was not originally designed to convey. "Take no thought" did not enjoin absolute thoughtlessness about the morrow, or indifference to what prudence tells us it will probably "bring forth," or indolence in discharging what prudence tells us is our duty in reference to it, but the absence of all excessive, anxious thought. This is the force of the Greek word μέριμνα, and our English word "thought," when the version was made, suggests a parallel meaning. The meaning of this word is well illustrated by Archbishop Trench, in his little work on the "Authorised Version of the New Testament," in which he cites some striking passages from our older writers in confirmation of his criticism.

The examples by which our Lord illustrates his maxim, ought to have prevented the hypercriticism to which it has been subjected. It is with regard to what we *cannot* do, not what we can, that he cautions us not to expend any superfluous and unprofitable care, as by "taking thought" to add to our stature (or our life, as others translate the word ἡλικία); parallel to which would be the "taking thought," in order to act as if we could certainly foresee the future, and tell by anxious excogitation what "the morrow would bring forth."

Even M. Renan is not insensible to the beauty of these precepts; though, as is his wont through his singular book—full of treacherous praise and laudatory libel, where "the voice is the voice of Jacob, but the hands are the hands of Esau," or rather where the "Hail Master" accompanies the betraying kiss—he finds out that our Saviour may have gone too far, and enunciated maxims which, however proper for his little Galilean flock (living a sort of Arcadian life which M. Renan has invented for them, but to which we find nothing parallel in the Evangelic history,) are quite inapplicable to the rest of the world! And yet, if all excessive care about the future be absurd and unprofitable,—if as is too plain it poisons life, and if as is equally plain, mankind in all ages and nations are but too prone to it,—the maxims have a world-wide application.

And if we act in the spirit of Christ's maxims; if we have a firm faith in the all-embracing and paternal government of our Heavenly Father; then, though we know nothing of the future, except that we are ignorant of it; though we know nothing of the great *public* events with which the coming year is too surely fraught; though we only know that it opens with the spectacle of one hemisphere in the agonies of the most devastating strife which the world has ever seen, and Europe probably drifting into gigantic revolutions in the attempt to untie the most complicated knot that ever tried the fingers of diplomacy, or invited the Gordian shears of war to cut it; though we know nothing of the sudden events which will bring calamity or absolute destruction, at one fell swoop, to a sufficient number to excite public attention and sympathy, and fill, for a few days, the columns of the newspapers; though we know only that it will bring its usual complement of so-called casualties, and which are truly so to us—which, like the Sheffield inundation, or the Erith explosion, or the Calcutta hurricane, will fall we know not where or when; though we know nothing of the possible droughts or inundations, wrecks or pestilence, fires or floods, commercial embarrassments or manufacturing distress, which may strew the course of the year with havoc; though we are still less able to guess at the casualties which will befall individuals; in how many forms sickness, or death, or penury lie in wait for us; from what ambush the shaft may come which is to smite us to the dust, or those whom we love; or from what spark the fire shall be kindled which is to set the crumbling structure of our earthly happiness in a blaze;—yet if we firmly believe that "all things shall work together for good to them who love God," resign ourselves with an unfaltering faith to His government, and comply with His method of discipline, we may each add, as the apostle did, in a more certain foresight of coming evils than we can have, "None of these things move me."

For enough is known of the certain issues—though nothing be known of the events of the year—to inspire us, not with thoughtless mirth, yet with well founded hope and sober joy. The retrospect of the past ought to comfirm the same truth, for it not only teaches gratitude for the many blessings enjoyed, or still possessed; but gives us a guarantee for the future, and may assure us that if we but act our part with faith, courage and fortitude, "goodness and mercy," as they have "followed us all the days of our life," will accompany us "even unto the end." And as to that unknown future, dark as it is to us, we may with utmost confidence commit ourselves to it. In all the circuitous tracks through the unknown desert, the "pillar of cloud by day, and of fire by night," will not fail to make a path for us; there is nothing that can possibly happen to us, which the subtle alchemy of Divine love, able to bring light out of darkness, and joy out of sorrow, cannot turn into profit or instruction—correctives of our follies, or corroboratives of our virtue.

But let the uncertainties of the year be what they may, *one* thing at least is certain;—that though we cannot control, or even foresee, the events which may fill us with joy or rack us with anguish, before the first day of a new year shall come round again, we may, if we please, absolutely determine its character to *us*, in the only sense in which it is important that it should be determined; or in which it, or any similar portion of time, is or can be of any significance to us at all: that is, by accepting the events, whatever they be, that may befall us, in the plenary belief that they are the dispensations of supreme Wisdom and Love, and in the spirit of resignation and submission to the Divine Will; looking sharply all the while to detect the lessons which they are severally designed and adapted to teach us, and endeavouring to apply them; to find out what are the weak points of character which require strengthening, and what the "easily besetting infirmities" which require correcting: and thus by conscious effort (not as too often by involuntary, perhaps sullen, acquiescence) becoming "workers together" with the designs of God. Thus possessing our souls in patience, striving to turn the external events of life into the instruments of self-discipline, and considering this scene of our existence as but a means to an end, then, however joyless the scene without, even though the whole year should be like its first day to us—be born, and live, and die in mid-winter—there will be a true summer within. However fluctuating and unstable may be the element by which the bark which carries our earthly fortunes is tossed, it will roll us onward towards the eternal haven. However crumbling the edifices which our eager hopes and feeble efforts may build, the solid fabric of the "eternal building" shall be joyfully going on;—that *character* on which immortality is to be impressed, and which shall endure, not by precarious outward supports of immunity from trial or temptation, but by the equilibrium of internal forces; secure in any world, and capable of the unsinning enjoyment of the best; that character, which when annealed by discipline and trial will, for that very reason, be taken to a world where they will be no longer needed; where virtue, become proof against temptation, shall be liberated from it for ever; and, confirmed in all goodness, may be safely trusted with its own felicity: for "the scaffolds may be taken down," as John Howe says, "when the eternal building is finished."

And if this be the issue, the time will come when the events of the year, or of any year, will seem, except so far as they have a bearing on *that*, (however momentous they may now seem to us), "less than the dust of the balance." And in this light, apparently, the great Ruler regards all such events *now:* giving us, in our course of moral probation, as the wise physician gives his patient, cordials or anodynes, when they may be needed, but not sparing to cut deep or use the actual cautery, if the life depend on it.

One of the most striking portions of the "Analogy" is the fifth Chapter of the first Part, where Butler so well applies the familiar fact, that each successive stage of life not only prepares the way for the next, but seems mainly designed for that purpose. I have often thought he might have gone further, and thus derived some striking additional confirmation of the conclusion of his first chapter respecting a "Future Life." For not only is each successive stage *preparatory* to the next, but seems in many respects so purely provisional, that a great part of us—not of our material merely, but our immaterial structure—appears to perish, and slough away (so to speak) when the end is attained; as though it had no other purpose than that of a temporary apparatus for developing a future stage of our life. Thus there seems a constant tendency, up to the very end of life, to drop some part of the provisional man; to deposit some of the very elements of our being. Our sensations grow less vivid, long before our bodily powers in general decay. Our *passive* emotions, as Butler remarks, constantly *weaken* by repetition, as if they were designed only as a *nucleus* on which the *practical* habits, which *strengthen* by repetition, might crystallise. Our appetites in like manner, if only indulged (as nature designed) in moderation, grow less eager and exorbitant, and at length seem almost to vanish; while the higher faculties then, and then only, reach their full vigour, when these have passed it,—often leaving the man in the happy condition of the aged Cephalus, who declares exemption from the torments of appetite and passion, a full compensation for the loss of their pleasures. Nor is it any answer to say that these decay only as the body decays, for this is but to acknowledge the fact in question; nor is it always true, for they often give way before loftier and more energetic passions, and are absorbed by them—more especially by the nobler forms of ambition. The pleasures and pursuits—the sports and pastimes of childhood, though necessary to develope the boy into the man, and rapturously enjoyed without at all thinking of their ulterior end, all seem so strange to the man, that he wonders at the intensity of feeling they once awakened. The man of middle life in a similar manner wonders at the shadows which he chased so eagerly in his youth; and though, like the "childish things" he has "long put away," they have done their work upon him, left indelible traces on his mental history, and, if he has been virtuous, have developed *habits* never destined to perish, he, himself, can hardly help blushing at the escapades of folly into which imagination sometimes led him in the heyday of passion, is ashamed to look at the love-letters he wrote, and regards them much as the freaks of Orlando Innamorato, or his imitator, Don Quixote, when they engraved on the trees of the forest the names and perfections of their mistresses! Thus, not only is each stage of life a preparation for the next, but in each some part of the machinery of our nature is dispensed with and thrown aside, or reappears under totally altered conditions. It is seen to be temporary, like the system of circulation provided for the unborn infant, or the envelope that protects the bud, or the case which incloses the chrysalis. Are all these transformations—far more wonderful than that which changes the aurelia into the winged butterfly—for nothing? Rather, may we not conclude, that if man has really fallen in with the successive conditions of his moral growth and discipline, his nature, defecated from the last traces of this in many respects infantile and provisional state, and retaining only what was designed to be imperishable, shall be conjoined with new and higher faculties, and new vehicles for their exercise, and rejoice in the manhood as well as "liberty" of the "children of God." May we not conclude that these successive abscissions from the original elements of our nature are but like the chips of marble which lie at the sculptor's feet when he is giving the last touches to some immortal statue; and though to a novice in the art, his chisel may seem to cut away portions of the very statue itself, it is at last seen that it was but to develope more perfectly the beauty of his ideal.

For those who resolve to pass the coming year in the way certain to determine its complexion as they would really have it, and make it a pleasant retrospect, it might be well to write a diary *beforehand:* a diary not of how they have spent the days that are past, but of how they intend to spend at least a goodly portion of the days that are to come; to mark off some auspicious "red-letter days" in their calendar on which some signal purposes shall be fulfilled, or which some signal acts of charity, or benevolence, or self-sacrifice shall make for ever memorable. The diaries which record the past for the purpose of *self-improvement* are seldom of much use. They consist of doleful entries of opportunities lost, and long lamentations that more was not made of them. The real feelings are seldom put down with unsophisticated honesty. Vices and faults are never faithfully registered. We never find in a diary a frank avowal:—"This day I told a falsehood; this day I got drunk; this day I cheated a customer; this day I took or gave a bribe; this day I slandered a neighbour; this day I took a cowardly revenge." The very confessions are all of failings such as "lean to virtue's side." Diaries, in short, are often nothing better than huge scholia of egotism or paraphrases of hypocrisy. But a diary inscribed beforehand with things to be done, which deliberate judgment and noble feeling approved, and with a firm resolution that they shall be done, would, if resolution failed, prove, though a mournful, yet a very profitable study at the year's end; and if it had been kept, more pleasant than a novel and more instructive than a sermon. And if we all made our first entry something of this kind: "Resolved on waking on New Year's Day to scour out of my heart, and as far as possible from my memory, all unkindness, anger, and malice which the last year left there, and that I will not rise from my knees till I can, without cursing myself by implication, repeat the sixth clause of the Lord's Prayer, 'Forgive me, as I forgive,'" I do not think we should have done amiss.

Should it strike the reader that this paper is for the most part more grave than generally befits the "festivity of the season," he will perhaps excuse it when he recollects that, this year, the New Year's Day falls on Sunday; and that it is proper, while welcoming the birthday of this new "child of time," to give some thoughts to that day which is commemorative of events that shall be significant to us when "time shall be no more."

Men sometimes like, as Fuller says, to have some notable epoch from which to date their reformation. What day can be better than this double celebration? Yet if the work be not begun on this day, consider that writer's arguments for beginning it on *any.* That day, as this quaint old author says, though it be the obscurest in the calendar, shall to us be for ever memorable. "I do discover a fallacy, whereby I have long deceived myself, which is this: I have desired to begin my amendment from my birthday, or from the first day of the year, or from some eminent festival, that so my repentance might bear some remarkable date. But when those days were come, I have adjourned my amendment to some other time. Thus, whilst I could not agree with myself when to start, I have almost lost the running of the race. I am resolved thus to befool myself no longer. I see no day like to 'to-day;' the instant time is always the fittest time. . . . Grant, therefore, that 'to-day I may hear Thy voice.'"

To conclude: one warning, one legacy of wisdom, the Old Year would bequeath to us, if he had a voice to utter it, for it is one of the analogies with which the natural world everywhere whispers to us moral wisdom. And if we might for a moment personify the dying year in his last days, we should picture him a little shrivelled old man—shrivelled as one of his grandsire's winter pippins—piping in the shrill treble of extreme age, and uttering an experience strongly resembling that of human life. "Listen to me, mortals!" he might say, with the same emphasis with which the old, wise by experience, say the like to the young, who will never be wise without it: "Listen to me, ye mortals! for I also am of the race of the ephemerals. I had my sturdy youth, when it seemed that my life would never end; and I dug, and ploughed, and planted, and enjoyed my jocund prime and my golden summer; and I decked myself in the garlands of May, and reaped the yellow harvest, and gathered the purple vintage of autumn; but scarcely had I attained the object of my desires, and secured the plenty for which I laboured, than I found the shadows lengthening, and the days shortening, and my breath growing short with them, and decrepitude coming upon me, and the days at hand of which I said, 'I have no pleasure in them.' I have laid up riches and know not who shall gather them; have planted trees which must shade far distant years, and stored the vintage of which other years must drink."

CHRIST THE LIGHT OF THE WORLD.

By C. J. VAUGHAN, D.D.

I.—WHY HE CAME.

"Christ Jesus came into the world to save sinners."—1 Tim. i. 15.
"Ye know that He was manifested to take away our sins."—1 John iii. 5.

Two Apostles speak here.

The one says, that Christ Jesus came into the world to save sinners. The other says, that He was manifested to take away our sins.

Men perplex and weary themselves with the question, Why must Christ come? Why could not God, by an act of free pardon, and by an act of entire sanctification, do all that is needful for the restoration and salvation of man? Why this complex machinery, of a Saviour and a Sanctifier, a redemption and a mediation, a tardy and oftentimes discouraging process of converting and transforming grace—when the absolute will of an Omnipotent God might either have prevented the fall, or necessitated the rising?

Such questions will sometimes force themselves upon the mind and heart of the thoughtful. It may not be altogether wrong to ponder them, provided there be two things always found along with that pondering; (1) a deep humility, conscious of inability to fathom God's counsels; and (2) an earnest resolution to deal practically rather than theoretically with the subject; to work out our own salvation with fear and trembling, in the use of means which God has provided, and in the pursuit of an end which God has proposed.

What was the object of Christ's coming, of God's manifestation of Himself in the person of his Son Jesus Christ? is an enquiry always instructive, always quickening; while the speculation as to the necessity of a Redeemer, as to the prior probability of God's rescuing man through the sacrifice and mediation of a Divine but incarnate Saviour, may wait, together with the great mystery of the origin of evil, until man, rescued and glorified, shall be permitted to read God's secrets in the bright light of God's countenance.

Now therefore we have before us two answers to that ever profitable enquiry, What was the object, the practical aim and end, of his coming—of the manifestation, (as St. John calls it) of the Son of God?

1. St. Paul, in his 1st Epistle to Timothy, is writing to a very dear friend. He calls him his own son in the faith; for to him that younger friend owed, under God, his conversion and salvation.

On some occasion, after St. Paul's release from his first imprisonment at Rome—in which the history of the Acts leaves him—he had left Timothy at Ephesus in charge of the congregations.

Describing here the purpose of this commission, St. Paul speaks of a tendency in those times to an unprofitable style of teaching; an attention to what he calls "fables and endless genealogies"—some of the manifold off-shoots of a late and corrupted Judaism—against which he desires his friend earnestly to protest. The real end, he says, of the Gospel charge is love; love, not in the form of a vague benevolence or philanthropy, but as the product of a pure heart, a good conscience, and a sincere faith. Others have swerved from this true doctrine, and gone back to the Law. Forgetting the very use of law—which is the coercion of transgressors—the suppression, by threatening and by penalty, of those sins and crimes into which fallen nature is ever thrusting the unregenerate. But the Gospel was sent to bring men out of this state of unregenerate nature, into a higher region of faith and love, which is wholly unsuitable to the operation of mere law; a region in which man, raised out of the bondage of flesh and sense, by the indwelling presence of God's Holy Spirit, is enabled to desire and to endeavour, day by day, to show forth the praises of Him who has thus called him out of darkness into his marvellous light.

The mention of the Gospel suggests to St. Paul's mind a thankful recollection of his own share in it. Christ has appointed him to a ministry: once "a blasphemer, a persecutor, and injurious," he had now obtained mercy, that he might be an example to others, to the very end of time, of the forgiving grace and love of Christ.

Such is the connection in which the former text stands. "This is a faithful saying, and worthy of all acceptation, that Christ Jesus came into the world to save sinners; of whom I am chief."

"To save sinners." Could there be a briefer, or a more explicit, or a more attractive, statement of the aim of Christ's coming?

Who is a sinner? He is one who (as the original word expresses it) has missed the mark; has failed to hit the object and aim of his being: one who was created for a definite purpose, and has not answered it: one who was designed for a certain work and a certain end, and has neither done the one nor reached the other. That is a sinner. Need we particularize the work set to God's creatures, or the destiny proposed to them? "This people have I formed for myself: they shall show forth my praise." It is the object of creation, in all its parts, to show forth what God is. The material creation, in its marvellous structure, its multifarious beauty, its strange combination of variety and order, its exact adaptation to the wants and enjoyments of its inhabitants, its silent but most eloquent testimony to the hand that made and to the hand that sustains, shows forth what God is in His power, in His wisdom, in the vastness of His conception, and in the minuteness of His care. This part of creation has not sinned; has not missed its aim. "The heavens declare the glory of God, and the firmament showeth His handywork. One day telleth another, and one night certifieth another. There is neither speech nor language, but their voices are heard among them. Their sound is gone out into all lands, and their words into the ends of the world."

But the rational, the moral, the spiritual creation —what of it? That part of it with which we are concerned, of which we all are constituent parts, the race of man—what of it? Has it answered its purpose? Has it continued to reflect God's glory? Has it uniformly and with one voice declared His praise? Made originally in God's image, after God's likeness—endowed with reason, with conscience, with the knowledge of duty, with will and action, with the power of communication with its kind and of communion with its God—having the favour of God proposed as its present blessing, and the presence of God as its eternal home—how has this privileged race demeaned itself? In what condition do we behold it? in what condition do we find it in ourselves? Broken loose—gone from its proper centre—disloyal to its rightful owner—pretending to a liberty which is no honour, and an independence which is no happiness—saying, "My powers are my own—who is lord over me?" that is its state, if nothing worse! The creature is trying to live alone: the thing formed, instead of reflecting, and loving to reflect, its Maker's image—instead of delighting to make mention, and to promote the mention, of One whose it is and whom it serves—aims rather to "be as God;" to be admired and obeyed and loved for itself; to have its own home, and its own work, and its own pleasure, and to forget, while it may, "the rock whence it was hewn, and the hole of the pit whence it was digged." Can any word better express its condition, than that which calls it a sinner —a being that has missed the mark, and fallen short of the aim with which it was created?

And if this be its state, what is its destiny? Can this disloyal, this rebellious, this self-exalting thing, enter, when it dies, the home of holiness, of love, of God? Powers used through a lifetime in pampering self and dishonouring God—faculties debased to self-worship, and affections enchained to earth—a mind immersed in paltry cares, and a heart deluged with impurity and idolatry—does all this prognosticate, is all this compatible with, a happy entrance at death into the inheritance of the saints in light? Where is the promise of that miracle of a sudden transformation from one condition into its very opposite, amidst the last agonies and mysteries of dissolution, which alone could introduce a being thus debased into the glory of those unfallen spirits whose natural home is the presence-chamber of God? St. Paul combines, as by an obvious link of coherence, the two brief clauses, "All have sinned—and come short" (as the necessary consequence) "of the glory of God."

This then is a sinner. He is one who has missed the mark of being; has failed to answer his purpose, alike in work and in destiny; has turned aside from setting forth God's praise, and from walking in the way which leads to glory.

Such were they whom the coming of Christ Jesus into the world contemplated. "To save sinners." "I came not to call the righteous, but sinners to repentance." If we do not recognize ourselves in the description, then neither can we see ourselves in the object. If we do not feel ourselves to have first missed the mark, then neither does Christ come to us with the offer of His salvation.

St. Paul could see himself in the description. "Sinners," he says, "of whom I am chief." Yes, each one of us knows more of himself than he can possibly know of any other. When he takes into account, that which he alone knows, the opportunities and the warnings and the mercies and forbearances which have marked his course, and then also the follies and the perversenesses and the backslidings and the obstinacies by which he has gone astray and done wickedly; he feels indeed, that, however it may be with others, he can without affectation take upon his lips St. Paul's confession, and say that, if Christ Jesus came into the world to save sinners, He came to save those of whom he, he himself, is chief.

Surely it is sweet to us to listen to this brief saying—"Christ Jesus came into the world to save sinners!" To save those who had missed the mark, and come short as much of happiness as of holiness. To restore to peace with God those who had broken it by their sins. To knit again in a bond of tender affection children who had left their Father's home, and were wasting His goods, in selfish misery, in a distant and desolate country. To make God known, and near, and present, in all His longsuffering and in all His love, to those whose wretchedness it was to have lost sight of Him, and to have flung away all assurance of His concern for them and of His will to bless. To take away the sting of death, and to bring life and immortality to light by His Gospel.

Yes, and in order to this—for without it we lose the surest basis and the tenderest tie of all—in order to this, to take our sins upon Him, and by dying, to make propitiation for iniquity. Christ the sacrifice —the sacrifice not to wrath but of love—the gift given, out of boundless compassion, by Him who so loved us that He spared not His own Son from dying on our behalf, so making peace—Christ the sacrifice of the Father's love, must go before Christ the Resurrection, Christ the Mediator, and Christ the Life. When He came to save sinners, He came first to die for them: He came first to be "the propitiation for our sins; and not for ours only, but also for the sins of the whole world."

2. The last words are St. John's; and with the sound of them yet in our ears, we can turn without

fear to that other side of the revelation, which is furnished to us by the same loving teacher in the second of the texts above written. "Ye know that He was manifested to take away our sins."

St. John had an evident dread of all self-deception. He lived on into a comparatively late day of the Church; and witnessed the growth of many of those errors which were to be the scourge and the torment of its onward history. No man had a more deep insight into the love which passeth knowledge: no man had a more anxious apprehension of the perversions which might distort that boundless love into a pretext for indifference to sin.

This third chapter of the Epistle (to go no further) exemplifies sufficiently this twofold characteristic.

"Behold what manner of love the Father hath bestowed upon us, that we should be called the sons of God . . . Beloved, now are we the sons of God, and it doth not yet appear what we shall be: but we know that, when He shall appear, we shall be like Him; for we shall see Him as He is." What then? Shall we presume upon that bright hope? Shall we say, I am safe for time, and safe for eternity—I shall never be moved? Hearken. "And every man that hath this hope in Him (Christ) purifieth himself, even as He is pure. Whosoever committeth sin, transgresseth also the law: for sin is the transgression of the law. And ye know that He was manifested to take away our sins; and in Him is no sin. Whosoever abideth in Him sinneth not: whosoever sinneth hath not seen Him, neither known Him. Little children, let no man deceive you: he that doeth righteousness is righteous, even as He is righteous. He that committeth sin is of the devil; for the devil sinneth from the beginning. For this purpose the Son of God was manifested, that He might destroy the works of the devil."

You see the trembling anxiety to keep together the love and the holiness—the hope and the purity—the sin-bearing and the sin-removal. He was manifested to take away our sins . . . manifested, that He might destroy the works of the devil . . . He that doeth righteousness is righteous . . . He that committeth sin is of the devil.

There have been those in all times who have too much sought to put asunder things which God has made one. They have spoken as if it militated against the freedom and the fulness of the Gospel grace, if one word were said about Gospel holiness. And we know well that holiness may be so dwelt upon, as to sever it from its one motive and from its one source and spring. In that same degree the exhortation is powerless, because in that same degree it has ceased to be the Gospel. But I can never understand how any sincere person should shrink from that preaching of holiness which is itself a Gospel. If I say, You must make yourselves holy, either to earn God's love, or in return for God's love to you; then indeed I speak without Christ, and the heart of the hearer is deaf and dead to my call. But if I say, with the blessed Apostle St. John, Christ was manifested to take away our sins; Christ was manifested to destroy in us the works of the devil; His name was called Jesus, because He shall save his people from their sins—then surely the word is as persuasive as it is scriptural: I tell you of One who knows your weakness as He knows your guilt, and as He provided for the one by His death, so provides for the other by His life.

There is no one amongst us—may God grant it—who deliberately expects both to keep his sin and yet to reach heaven. The heart is thus far true within, that it bears decisive witness against a conversion which is no change, against a justification which brings after it no sanctification. Nevertheless there is such a thing in all of us as a lazy, listless, lifeless acquiescence in a perpetual defeat, in small things or great, by the power of evil; a perpetual postponement of the struggle with, of the victory over, sin; a practical resting upon the Atonement, either in the present or in the future, as something which shall make up for all else, and carry the soul, however earthly and sin-bound, safely across the boundary line at last between death and life. Without presuming to expect to keep our sins and yet to be saved, there is a power in habit, and a readiness to rest, and a dislike to steady toil and protracted conflict, which may make us practically take one half of the Gospel and leave the other; believe that Christ Jesus came into the world to save sinners, and yet forget that for this purpose the Son of God was manifested, that He might take away our sins, and destroy, in us individually, the works of the devil.

Let it not be so any more, beloved friends, with us. Take the whole Gospel. Each half of it is to be prized above gold or precious stone. Not least, surely, that half of it which says, It was the object of Jesus Christ, in coming down from heaven for us men and for our salvation, to take away, to remove, to destroy in us, all that is sinful, all that is bad in us and base and sensual and devilish. He knew what He undertook, and He has strength to do it. Commit yourself to Him for this purpose. If this was His object in coming, that He might destroy the works of the devil, then surely He will not disappoint His own aim in any one who seriously looks to Him for strength. In the power to resist and conquer sin you will read the assurance of forgiveness and justification. "Let no man deceive you," St. John writes—the Holy Ghost that was in him providing thus for the warning and admonition of our own distant times—"he that doeth righteousness is righteous;" not he who has passed through certain experiences or certain excitements; not he who has felt certain feelings or suffered certain sufferings or seen certain sights; not he who has the liveliest impression of the sovereignty of grace or of the omnipotence of the Redeemer: but he who is enabled to show his faith in his works; he who is renewed day by day through the indwelling Spirit for the performance of duty and for the contest with sin; he who by pureness, by meekness, by the Holy Ghost, by love unfeigned, fights the good fight of faith and brings the whole body of sin into subjection. He who came into the world to save sinners, was manifested also to take away our sins.

3. Two or three words of application will suggest themselves on a general view of this great subject.

(1) The truth of God, and the work of grace, is one, not many.

We portion and parcel out Gospel doctrine—we divide and subdivide, distinguish and re-distinguish —until we are in danger of losing the original unity in a self-made multiplicity. Just as in reference to our human nature, we talk of mind and soul, of heart and head, of judgment and will, affection and imagination, till we are almost in danger of forgetting that these distinctions are conventional, not essential; so in the great matters of divine revelation, we discriminate nicely between forgiveness and grace, justification and sanctification, adoption and assimilation, as though it were possible for one of these things really to exist without another; as though it might be, in conception at least, that the same man were justified, yet not sanctified; that one should have by itself the grace of forgiveness, and another, by itself, the grace of a spiritual influence. St. John's strong words, in sound almost truisms, have their everlasting significance in reference to such misapplications of doctrine, "He that doeth righteousness is righteous," and "He that committeth sin is of the devil." He whom God justifies, He also sanctifies: he whose life is still stained with sin, hath not upon him as yet the mark of the divine forgiveness. God's work in man has a unity as well as a detail: the work of Christ and the work of the Spirit move ever in harmony: and where one element of grace is really, there are all its elements in root and in germ. He who is forgiven is also following: "but ye are sanctified" is ever found in combination with "but ye are justified." He who came to save sinners was manifested also to take away our sins.

(2) Again, all that is really a part of the divine Gospel is alike encouraging to the sincere enquirer.

It is all in the form of promise. I will give. I come to do this or that. Ask of me, and I will grant. Nothing is thrown upon us, but that which the weakest and the humblest can best perform; to believe, to ask, to wait, and to accept.

Again, it satisfies not one part, but both parts, of our conscious need.

There are times when the sense of guilt is our pressing trouble. This conscience, stained again by some old and (as we had hoped) already vanquished sin, is restless, clamorous, and will not be pacified. What shall appease it? What but a sacrifice infinite in its value, everlasting in its efficacy—the knowledge of a divine Saviour dying for human sin, and bearing once for all upon Himself the iniquities of us all? Sprinkle afresh upon the conscience the blood of Christ, and He, He himself, will say to its accusing voice, Peace, be still!

And certainly there are times when the sense of sinfulness—not the remembrance of past sin, but the consciousness of present sin—is the predominant misery. I see before me this difficult duty, to which I am unequal: who shall give me strength? I see before me this terrible temptation, often before found resistless: who shall tread it down? My own heart misgives me; the traitor inclination is my enemy within: who shall give the better desire a chance of resisting? Who is that stronger than the strong man armed, who shall take from him his armour and divide his spoils? Then the voice of Christ's Gospel sounds acceptably in our ears, For this purpose Christ came, that He might take away our sins: For this purpose the Son of God was manifested, that He might destroy in us the works of the devil. Put thy trust in Him, and He will give thee the victory!

We cannot believe in a sincere man being desirous of forgiveness and not desirous of holiness. A Gospel which proclaimed an unconditional pardon, but said nothing of an indwelling and inworking Spirit, would be no Gospel to him whose desire it is not only to escape God's punishment, but to be made capable of God's presence, and receptive of God's love.

(3) Finally, the Gospel revelation, and the call of God's grace, is one always seasonable, never out of place.

There is not one person upon earth who is not addressed by it. Because there is not one person who is not a sinner. And there is not one moment in the life of any man, when he does not want the Gospel. Week by week, on the blessed Christian Sunday, are gathered together, in the churches of Christendom, a multitude of human beings. No one can look upon such an assembly unmoved. What a history is recorded upon the memory of those who listen! What a burden, of sin and care and sorrow, is carried thither time after time upon the hearts of the worshippers! What a load of past sins—some perhaps still lived in—some perhaps done over and over again, most days or all days—some to be taken with them to their beds at night, and risen with yet again in the morning! Yes, He who is greater than our hearts must look with displeasure, we fear, upon some of us his nominal worshippers. And then the *prospect* of sin! I tremble even more at the thought of the sin which God sees that I shall commit, than at the thought of that which He has already recorded! It seems so terrible that I who am now kneeling in penitence before God, praying for mercy and grace, should be known by Him, who sees the end from the beginning, to be unconsciously on the very verge of a repetition of that sin against which I am praying! It is enough to make a man serious, to think of such things; and to think of them as multiplied by hundreds and tens of hundreds in the persons of those who sit together in God's presence decorous, grave, and (as it should seem) for the moment earnest. Then I say that the Gospel can never be out of place, at any moment, to such a congregation and to the individuals composing it.

We want it every moment. We want it to keep us from despair. Christ Jesus came into the world to save sinners—of whom I am one—yes, may we not well say it? of whom I am chief. We want it to keep us from carelessness. He was manifested to take away our sins: can it be a trifle then, this sin which we commit thus lightly? a trifle to go against Christ—to tread underfoot the Son of God, and do despite to the Spirit of grace? We want it for life: it is the only thing which can make life safe or sacred or happy—this faith in One above who died for us and lives again—died to save sinners—lives to take away sins! We want it, O most of all, for death: for that death which is so busy amongst us; which gives us so little notice, and waits not, when it comes, either for the comfort of the surviving or for the repentance of the departing. Surely we shall want the Gospel then; with its message of forgiveness and of reconciliation, of death vanquished and immortality revealed! And if we would have it then, we must find it now. A death-bed may be a good ending, but it is a bad beginning, of the work of grace: and he who would die happy must first have lived holy. Awake then now, thou that sleepest! arise from the dead, and Christ shall give thee light!

THOR AT THE BRIDGE.

In old Norse legend have I heard
How Odin, with his sons and daughters,
Set out to seek the Fount of Urd,*
And drink its pure, life-giving waters.

The highest of earth's hills, whose crest
Is lost in clouds, they quick ascended;
The Rainbow on its height doth rest,—
That wondrous Bridge, in air suspended.

A stately mansion, fair and bright,
Stands on the summit of the mountain,
Here the god Heimdall dwells, the White,†
To keep the way unto the Fountain.

Heimdall, whose piercing eye can see
A hundred miles, the gods' wise Warder,
The gateway opens instantly;
He bids them pass the Bridge in order.

He bids them enter, one by one,
The youngest first, then all the others,
Until at last remains alone
The first and strongest of the brothers.

Thor now his giant foot would fain
Set on the Bridge—that glittering wonder!
But Heimdall waves him back again;
"Tarry, thou lover of the thunder.

"The Bridge Bifrost was never made
For you; that jewelled pavement faëry
Is for the weak; without its aid
Your strength can ford the abysses aëry."

Black grew his brow at Heimdall's word;
"Am I, of Odin's seed, I only,
Forbid to taste the Fount of Urd?
Shut out from life? left sad and lonely?"

"Nay," then replied wise Heimdall; "nay;
See yonder River-clouds that darken!
Their names are Kormt and Ermt; the way
Lies straight through them, if thou wilt hearken."

Now gazed great Thor, first on the black
Cold River-clouds before him spreading,

---

* "This water is so holy that everything placed in the spring becomes as white as the film within an egg-shell."—*The Prose Edda.*

† "Heimdall, the White God," "is the warder of the gods, and is placed on the borders of heaven, to prevent the giants from forcing their way over the bridge. He requires less sleep than a bird, and sees by night as well as by day, a hundred miles around him. So acute is his ear that he can hear the grass growing on the earth, and the wool on a sheep's back."—*Ibid.*

Then, longing, lingering, turns he back
To the fair Bridge the rest are treading.

"The eldest I"—his musings run—
"Therefore forbid the flowery portal;
Unfair! and Odin's eldest son
Renounces this your life immortal."

Then Odin spake; "Son Thor," quoth he,
"Why linger longer on the mountain?
The Bridge for us, the Clouds for thee,
But both alike lead to the Fountain.

"What matter, when the goal is ours,
Whether 'twas reached through Bridge or River?
Through Bifrost's magic path of flowers,
Or Kormt and Ermt, with fierce endeavour?"

Then turned he from the Bridge, no more
He thought, he wavered now no longer,
Waist-deep into the clouds plunged Thor,
Intent to prove himself the stronger.

Beneath, firm-footing found his feet,
He breasts the tide with ne'er a shiver,
Blue shone the sky on no defeat,—
He won the Fountain thro' the River!

Oh, thou whose life may little know
Of summer sunshine or of flowers,
Unmurm'ring, stem the tide of woe!
Fight bravely through the black storm showers!

Birth-right of Elder son be thine!
The burden heavier, pathway longer;
What! would'st refuse it? dar'st repine?
—For this hast thou been made the stronger.

C. P.

THE REIGN OF LAW.

BY THE DUKE OF ARGYLL.

The Reign of Law—is this the reign under which we live? Yes, in a sense it is. There is no denying it. The whole world around us, and the whole world within us, are ruled by law. Our very spirits are subject to it—those spirits which yet seem so spiritual, so subtle, so free. How often in the darkness do they feel the restraining walls—bounds within which they move—conditions out of which they cannot think! The perception of this is growing in the consciousness of men. It grows with the growth of knowledge; it is the delight, the reward, the goal of science. From science it passes into every domain of thought, and invades, amongst others, the theology of the Church. And so we see the men of theology coming out to parley with the men of science,—a white flag in their hands, and saying "If you will let us alone, we shall do the same by you. Keep to your own province, do not enter ours. The reign of law which you proclaim, we admit—outside these walls, but not within them: —let there be peace between us." Alas! this will never do. There can be no such treaty dividing the domain of Truth. Every one Truth is connected with every other Truth in this great Universe of God. The connection may be one of infinite sublety, and apparent distance—running, as it were, underground for a long way, but always asserting itself at last, somewhere, and at some time. No bargaining, no fencing of the ground—no form of process, will avail to bar this right of way. Blessed right, enforced by blessed power! Every truth, which is truth indeed, however far off it may have been discovered, however long unknown, or forgotten, or put out of sight, is liable always to confront us suddenly,—with its consequences, its analogies, its suggestions—invading ground which we had thought was sacred, asserting everywhere its presence and its power.

And therefore we must cast a sharp eye indeed on every claim to belong to this great family—this Blood Royal of the Universal Kingdom. The pretenders are very many: for the brotherhood of error is larger than the brotherhood of truth, and it has alliances as subtle and as pervading. Therefore, to accept as a truth that which is not a truth, or to fail in distinguishing the sense in which a proposition may be true, from other senses in which it is not true, is an evil having consequences which are indeed incalculable. There are subjects on which one mistake of this kind will poison within us all the wells of truth, and affect with fatal error the whole circle of our thoughts.

It is against this danger that some men would erect a feeble barrier by defending the position, that science and religion may be, and ought to be, kept entirely separate;—that they belong to wholly different spheres of thought, and that the ideas which prevail in the one province have no relation to those which prevail in the other. This is a doctrine offering many temptations to many minds. It is grateful to scientific men who deprecate being thought hostile to religion. It is grateful to religious men who are afraid of being thought to be afraid of science. To these, and to all who are troubled to reconcile what they have been taught to believe with what they have come to know, this doctrine affords a ready and convenient escape. There is but one objection to it—but that is the fatal objection—that it is not true. The spiritual world and the intellectual world are not separated after this fashion; and the notion that they are so separated does but encourage men to accept in each, ideas which will at last be found to be untrue in both. The instinct which impels us to seek for harmony in the truths of science and the truths of religion, is a higher instinct and a truer one than the disposition which leads us to evade the difficulty by pretending that there is no relation between them. For, after all, it is a pretence and nothing more. No man who thoroughly accepts a principle in the philosophy of nature which he feels to be inconsistent with a doctrine of religion, can help having his belief in that doctrine shaken and undermined. We may believe, and we must believe, many things which we cannot understand; but we cannot really believe two propositions which are felt to be contradictory. It helps us nothing in such a difficulty, to say that the one proposition belongs to reason and the other proposition belongs to faith. The endeavour to reconcile them is a necessity of the mind. We are right in thinking that if they are both indeed true they can be reconciled, and if they really are fundamentally opposed they cannot both be true. That is to say, there must be some error in our manner of conception in one or in the other, or in both. At the very best they can represent only some partial and imperfect aspect of the truth. The error may lie in our theology, or it may lie in what we are pleased to call our science. It may be that some dogma, derived by tradition from our fathers, is having its hollowness betrayed by that light which sometimes shines upon the ways of God out of a better knowledge of His works. It may be that some proud and rash generalisation of the schools is having its falsehood proved by the violence it does to the deepest instincts of our spiritual nature,—to

"Truths which wake to perish never!
Which neither man nor boy,
Nor all that is at enmity with joy,
Can utterly abolish or destroy."

Such, for example, is the conclusion to which the language of some scientific men is evidently pointing, that great general laws inexorable in their operation, and causes in endless chain of invariable sequence, are the governing powers in nature, and that they leave no room for any special direction or providential ordering of events. If this be true, it is vain to deny its bearing on religion. What then can be the use of prayer? Can laws hear us? Can they change, or can they suspend themselves? These questions cannot but arise, and they require an answer. It is said of a late eminent Professor and clergyman of the English Church, who was deeply imbued with these opinions on the place occupied by laws in the economy of nature, that he went on, nevertheless, preaching high doctrinal sermons from the pulpit until his death. He did so on the ground that propositions which were contrary to his reason were not necessarily beyond his faith. The inconsistencies of the human mind are indeed unfathomable; and there are men so constituted as honestly to suppose that they can divide themselves into two spiritual beings, one of whom is infidel, and the other is believing. But such men are rare —happily for religion, and not less happily for science. No healthy intellect, no earnest spirit, can rest in such self-betrayal. Accordingly we find men, like the late George Combe, facing the consequences to which they have given their intellectual assent, and avowing their belief that prayer to God has no other value or effect than so far as it may be a good way of preaching to ourselves. It is a useful and helpful exercise for our own spirits, but it is nothing more. Alas, how can they pray who have come to this? Useful and helpful to believe a lie! That which has been threatened as the worst of all spiritual evils, would become the conscious attitude of our "religion," the habitual condition of our worship. This must be as bad science, as it is bad religion. It is in violation of a law the highest known to man—the law which inseparably connects earnest conviction of the truth in what we do or say, with the very fountains of all intellectual and moral strength. No accession of force can come to us from doing anything in which we disbelieve. Such a doctrine will be indeed

"The little rift within the lute
That by-and-by will make the music mute,
And ever widening slowly silence all."

The conception of natural laws—of their place, of their nature, and of their office—which leads to such conclusions, must be wrong.

What, then, is this reign of law? What is law, and in what sense can it be said to reign?

The laws of nature are simply those facts of nature which recur according to a rule, so as to involve the idea of obedience to a force. This idea of force is essential to the true conception of law. The word is no doubt often very loosely used; but it involves a great deal more than merely "an observed order of facts." The order must be so constant and so uniform as to indicate necessity, that is, the action of a compelling force. When the operations of such force can be reduced to a rule, this rule is itself called the law; and when such rules are so definite as to be capable of mathematical expression and of mathematical proof, they are in the nature of pure truth. The discovery of them is the great quest of science, and the finding of them is her great reward. Such laws yield to the human mind a peculiar delight from the satisfaction they afford to those special faculties whose function it is to recognise the beauty of numerical relations. This satisfaction is so great, and in its own measure is so complete, that the mind reposes on an ascertained law as on an ultimate truth. And so it is ultimate as regards the particular faculties which are concerned in this kind of search. When we have observed our facts, and when we have summed up our figures, our eyes, our ears, and our calculating faculties have done their work; but other faculties are called into simultaneous operation, and these have other work to do. The truth is, when we come to think of it, laws explain little or nothing, and least of all do they explain themselves. They suggest a thousand questions much more curious than the questions which they solve. The very beauty and simplicity of some laws is their deepest mystery. What can their source be? How is their uniformity maintained? Every law implies a force, and all that we ever know is some numerical rule or measure according to which some unknown forces operate. But whence come those measures—those exact relations to number, which never vary? Or, if there are variations, how comes it that these are always found to follow some other rules as exact and as invariable as the first?

There can be no better example of law—of what it is, and what it is not—than the law of gravitation. The discovery of it was probably the highest exercise of pure intellect through which the human mind has found its way. It is the most universal physical law which is known to us, for it prevails, apparently, through all space. Yet of the force of gravitation all we know is, that it is a force of attraction operating between all the particles of matter in the exact measure which was ascertained by Newton, —that is—"directly as the mass, and inversely as the square of the distance." This is the law. But it affords no sort of explanation of itself. What is the cause of this force—what is its source—what are the media of its operation—how is the exact uniformity of its proportions maintained?—these are questions which it is impossible not to ask, but which it is quite as impossible to answer. Sir John Herschel, in speaking of this force, has indicated in a passing sentence a few questions out of the many which arise:—"No matter," he says, "from what ultimate causes the power called gravitation originates—be it a virtue lodged in the sun as its receptacle, or be it pressure from without, or the resultant of many pressures, or solicitations of unknown kinds, magnetic or electric, ethers or impulses," &c. &c. How little we have ascertained in this law, after all! Yet there is an immense and an instinctive pleasure in the contemplation of it. To analyse this pleasure is as difficult as to analyse the pleasure which the eye takes in beauty of form, or the pleasure which the ear takes in the harmonies of sound. And this pleasure is inexhaustible, for these laws of number and proportion pervade all nature, and the intellectual organs which have been fitted to the knowledge of them have eyes which are never satisfied with seeing, and ears which are never full of hearing. The agitation which overpowered Sir Isaac Newton as the law of gravitation was rising to his view in the light of rigorous demonstration, was the homage rendered by the great faculties of his nature to a harmony which was as new as it was immense and wonderful. The same pleasure in its own degree is felt by every man of science who, in any branch of physical inquiry, traces and detects any lesser law. And it is perfectly true that such laws are being detected everywhere. Forces which are in their essence and their source utterly mysterious, are always being found to operate under rules which have strict reference to measures of number,—to relations of space and time. The forces which determine chemical combination all work under rules as sharp and definite as the force of gravitation. So do the forces which operate in light, and heat, and sound. So do those which exert their energies in magnetism and electricity. All the operations of nature—the smallest and the greatest—are performed under similar measures and restraints. Not even a drop of water can be formed except under rules which determine its weight, its volume, and its shape, with exact reference to the density of the fluid, to the structure of the surface on which it may be formed, and to the pressure of the surrounding atmosphere. Then that pressure is itself exercised under rigorous rules again. Not one of the countless varieties of form which prevail in clouds, and which give to the face of heaven such infinite expression, not one of them but is ruled by law—woven, or braided, or torn, or scattered, or gathered up again and folded, by forces which are free only "within the bounds of law."

And equally in those subjects of inquiry in which rules of number and of proportion are not applicable, rules are discernible which belong to another class, but which are as certain and as prevailing. All events, however casual or disconnected they may at first appear to be, are found in the course of time to arrange themselves in some certain order, the index and exponent of forces, of which we know nothing except their existence as evidenced in these effects. It is indeed wonderful to find that in such a matter, for example, as the development of our human speech, the unconscious changes which arise from time to time among the rudest utterances of the rudest tribes and races of mankind are all found to follow rules of progress as regular as those which preside over any of the material growths of nature. Yet so it is. And as it is now, so apparently has it been in all past time of which we have any record. Even the work of creation has been and is being carried on under rules of adherence to typical forms, and under limits of variation from them, which can be dimly seen and traced, although they cannot be defined or understood. The universal prevalence of laws of this kind cannot therefore be denied. The discovery of them is one of the first results of all physical inquiry. In this sense it is true that we, and the world around us, are under the Reign of Law.

It is true, but it is only a bit and fragment of the truth. There is another fact quite as prominent as the universal presence and prevalence of laws—and that is, the number of them which are concerned in each single operation of nature. No one law determines anything that we see happening or done around us. It is always the result of different and opposing forces nicely balanced against each other. The least disturbance of the proportion in which any one of them is allowed to tell, produces a total change in the effect. The more we know of nature, the more intricate do such combinations appear to be. The existence of laws, therefore, is not the end of our physical knowledge. What we always reach at last in the course of every physical inquiry, is the recognition, not of individual laws, but of some definite relation to each other, in which different laws are placed, so as to bring about a particular result. But this is, in other words, the principle of adjustment, and adjustment has no meaning except as the instrument and the result of purpose. This is the ultimate fact of all discovery.

We may, again, take the forces which determine the planetary motions as the grandest and the simplest illustrations of this truth of science. Gravitation, as already said, is a force which prevails apparently through all space. But it does not prevail alone. It is a force whose function it is to balance other forces, of which we know nothing, except this,—that these, again, are needed to balance the force of gravitation. Each force, if left to itself, would be destructive of the universe. Were it not for the force of gravitation, the centrifugal forces which impel the planets would fling them off into space. Were it not for these centrifugal forces, the force of gravitation would dash them against the sun. The orbits, therefore, of the planets, with all that depends upon them, are determined by the nice and perfect balance which is maintained between these two forces ; and the ultimate fact of astronomical science is not the law of gravitation, but the adjustment between this law and others which are less known, so as to produce and maintain the existing planetary system. This is one example of the principle of adjustment ; but no one example, however grand the scale may be on which it is exhibited, can give any idea of the extent to which the principle of adjustment is required, and is adopted in the works of nature. The revolution of the seasons, for example—seed time and harvest—depend on the law of gravitation in this sense, that if that law were disturbed, or if it were inconstant, they would be disturbed and inconstant also. But the seasons equally depend on a multitude of other laws,—laws of heat, laws of light, laws relating to fluids, and to solids, and to gases, and to magnetic attractions and repulsions, each one of which laws is invariable in itself, but each of which would produce utter confusion if it were allowed to operate alone, or if not balanced against others in the right proportion. It is very difficult to form any adequate idea of the vast number of laws which are concerned in producing the most ordinary operations of nature. Looking only at the combinations with which astronomy is concerned, the adjustments are almost infinite. Each minutest circumstance in the position, or size, or shape of the earth, the direction of its axis, the velocity of its motion and of its rotation, has its own definite effect, and the slightest change in any one of these relations would wholly alter the world we live in. And then it is to be remembered that the seasons, as they are now fitted to us, and as we are fitted to them, do not depend only on the facts or the laws which astronomy reveals. They depend quite as much on other sets of facts, and other sets of laws, revealed by other sciences,—such, for example, as chemistry, electricity, and geology. The motion of the earth might be exactly what it is, every fact in respect to our planetary position might remain unchanged, yet the seasons would return in vain if our own atmosphere were altered in any one of the elements of its composition, or if any one of the laws regulating its action were other than it is. Under a thinner air even the torrid zone might be wrapped in eternal snow. Under a denser air, and one with different refracting powers, the earth and all that is therein might be burnt up. And so it is through the whole of nature : laws everywhere—laws in themselves invariable, but so worked as to produce effects of inexhaustible variety by being pitched against each other, and made to hold each other in restraint. In chemistry, this system of adjustment among the different properties of matter is especially intricate and observable. Some of the laws which regulate chemical combination were discovered in our own time, and are amongst the most wonderful and the most beautiful which have been revealed by any science. They are laws of great exactness, having invariable relations to number and proportion. Each elementary substance has its own combining proportions with other elements, so that, except in these proportions, no chemical union can take place at all. And when chemical union does take place, the compounds which result have different and even opposite powers, according to the different proportions employed. Then, the relations in which these inorganic compounds stand to the chemistry of life, constitute another vast series in which the principle of adjustment has applications infinite in number, and as infinite in beauty. How delicate these relations are, and how tremendous are the issues depending on their management, may be conceived from a single fact. The same elements combined in one proportion are sometimes a nutritious food or a grateful stimulant, soothing and sustaining the powers of life; whilst, combined in another proportion, they may be a deadly poison, paralysing the heart and carrying agony along every nerve and fibre of the animal frame. This is no mere theoretical possibility. It is actually the relation in which two well-known substances stand to each other—Tea and Strychnia. The active principle of these two substances, "Theine" and "Strychnine," are identical so far as their elements are concerned, and differ from each other only in the proportions in which they are combined. Such is the power of numbers in the laboratory of Nature! What havoc in this world, so full of life, would be made by blind chance gambling with such powers as these! What confusion, unless they were governed by laws whose certainty makes them capable of fine adjustment, and therefore subject to accurate control! How fine these adjustments are, and how absolute is that control, is indicated in another fact—and that is the few elements out of which all things are made. The number of elementary substances has diminished with the advance of science; and the progress of analysis, with glimpses of laws as yet unknown, renders it almost certain that this number will be found to be smaller still. Yet out of that small number of elementary substances, having fixed rules limiting their combination, all the infinite varieties of organic and inorganic matter are built up by means of nice adjustment. As all the faculties of a powerful mind can utter their voice in language whose elements are reducible to twenty-four letters, so all the forms of nature, with all the ideas they express, are worked out from a few simple elements having a few simple properties.

Simple! can we call them so? Yes, simple by comparison with the exceeding complication of the uses they are made to serve: simple also, in this sense, that they follow some simple rule of numbers. But in themselves these laws, these forces, are incomprehensible. That which is most remarkable about them is their unchangeableness. The whole mind and imagination of scientific men is often so impressed with this character of material laws, that no room is left for the perception of other aspects of their nature and of their work. We hear of rigid and universal sequence—necessary—invariable;—of unbroken chains of cause and effect, no link in which can, in the nature of things, be ever broken. And this idea grows upon the mind, until in some confused manner it is held as casting out the idea of purpose in creation, and inconsistent with the element of will. If it be so, the difficulty cannot be evaded by denying the uniformity, any more than the universality, of law. It is perfectly true that every law is, in its own nature, invariable, producing always, under the same conditions, precisely and necessarily the same effects. But then, if the conditions are not the same, the invariableness of effect gives place to capacities of change which are almost infinite. It is by altering the conditions under which any given law is brought to bear, and by bringing other laws to operate upon the same subject, that our own wills exercise a large and increasing power over the material world. And be it observed—to this end the uniformity of laws is no impediment, but, on the contrary, it is an indispensable condition. Laws are in themselves unchangeable, and if they were not unchangeable, they could not be used as the instruments of will. If they were less rigorous they would be less certain, and the least uncertainty would render them incapable of any service. No adjustment, however nice, could secure its purpose if the implements employed were of uncertain temper.

The notion therefore of the uniformity or invariableness of the laws of nature being difficult to reconcile with the subordination of them to the exercise of will, is a notion contrary to our own experience. It is the very certainty and invariableness of the laws of nature which alone enables us to use them, and to yoke them to our service. Now, the laws of nature are employed in the system of nature in a manner precisely analogous to that in which we ourselves employ them. The difficulties and obstructions which are presented by one law in the way of accomplishing a given purpose, are met and overcome exactly on the same principle on which they are met and overcome by man—viz., by knowledge of other laws, and by resource in applying them,—that is, by ingenuity in mechanical contrivance. It cannot be too much insisted on, that this is a conclusion of pure science. The relation which an organic structure bears to its purpose in nature can be recognised as certainly as the same relation between a machine and its purpose in human art. It is absurd to maintain, for example, that the purpose of the cellular arrangement of material in combining lightness with strength, is a purpose legitimately cognisable by science in the Menai bridge, but is not as legitimately cognisable when it is seen in nature, actually serving the same use. Strike off one of the little barnacles which crust the rocks at low tide, and which to live there at all must be able to resist the surf. Look at the building of its shell—you will see that it is all hollowed and chambered on the plan which engineers have so lately discovered as an arrangement of material by which the power of resisting strain or pressure is multiplied in an extraordinary degree.

"Small, but a work divine;
Frail, but of force to withstand,
Year upon year, the shock
Of cataract seas that snap
The three-decker's oaken spine." *

That shell is as pure a bit of mechanics as the bridge, both being structures in which the same arrangement is adapted to the same end. This is but one instance out of a number which no man can count. No law of nature is liable to change. But every law of nature is liable to counteraction;

---

* "Maud."

and the rule is, that laws are habitually made to counteract each other in precisely the manner and degree which some definite result requires.

Nor is it less remarkable that the converse of this is true : no purpose is ever attained in nature, except by the enlistment of laws as the means and instruments of attainment. When an extraordinary result is aimed at, it often happens that some common law is yoked to extraordinary conditions, and its action is intensified by some special machinery. For example, the forces of electricity are in action probably in all living organisms, but certainly in the muscular system of the higher animals. In a very few (so far as yet known, in only a very few animals among the millions which exist, and these all belonging to the order of fishes), the electrical action has been so stored as to render it serviceable as a weapon of offence. Creatures which grovel at the bottom of the sea or in the slime of rivers, have been gifted with the astonishing faculty of wielding the most subtle of all the powers of nature at their will. They have the faculty of "shooting out lightning" against their enemies or their prey. But this gift has not been given without an exact fulfilment of all the laws which govern electricity, and which especially govern its concentration and destructive force. The Electric Ray, or Torpedo, has been provided with a battery closely resembling, but greatly exceeding in the beauty and compactness of its structure, the batteries whereby man has now learnt to make the laws of electricity subservient to his will. There are no less than 940 hexagonal columns in this battery, like those of a bees' comb, and each of these is subdivided by a series of horizontal plates which appear to be analogous to the plates of the voltaic pile. The whole is supplied with an enormous amount of nervous matter—four great branches of which are as large as the animal's spinal chord, and these spread out in a multitude of thread-like filaments round the prismatic columns, and finally pass into all the cells.* This again seems to suggest an analogy with the arrangement by which an electric current, passing through a coil and round a magnet, is used to intensify the magnetic force. A complete knowledge of all the mysteries which have been gradually unfolded from the days of Galvani to those of Faraday, and of many others which are still inscrutable to us, is exhibited in this structure. The laws which are appealed to in the accomplishment of this purpose are many and very complicated; because the conditions to be satisfied refer not merely to the generation of electric force in the animal to which it is given, but to its effect on the nervous system of the animals against which it is to be employed, and to the conducting medium in which both are moving.

When we contemplate such a structure as this, the idea is borne in with force upon the mind, that the need of conforming to definite conditions seems as absolute a necessity in making an electric fish as in making an electric telegraph. But the fact of these conditions existing and requiring to be satisfied,—or, in other words, the fact of so many natural laws demanding a first obedience,—is not the ultimate fact, it is not even the main fact, which science apprehends in such phenomena as these. On the contrary, that which is most observable and most certain, is the manner in which these conditions are met, complied with, and, by being complied with, are overcome. But this is, in other words, the subordination of many laws to a difficult and curious purpose,—a subordination which is effected through the instrumentality of a purely mechanical contrivance.

It is no objection to this universal truth, that the machines thus employed in nature are themselves constructed through the agency of law. They grow, or, in modern phraseology, they are developed. But this makes no difference in the case, —or rather it only carries us farther back to other and yet other illustrations of the same truth. The battery of an electric fish is both a means and an end. As respects the electric laws which it puts in motion, it must be regarded as a means. As respects the organic laws by which it is itself developed, it is an end. What we do know in this case is *why* the apparatus was made. That is to say, what we do know is the purpose. What we do not know, and have no idea of, is *how* it was made. That is to say, what we do not know is the law which has been used as the instrument of that purpose. When man makes a voltaic battery, he selects materials which have properties and relations with each other previously ascertained—metals worked out of natural ores, acids distilled out of other natural substances;—and he puts these together in such fashion as he knows will generate the mysterious force which he desires to evoke and to employ. But how can such a machine be made out of the tissues of a fish? Well may Mr. Darwin say, "it is impossible to conceive by what steps these wondrous organs have been produced."* We see the purpose—that a special apparatus should be prepared, and we see that it is effected by the production of the machine required; but we have not the remotest notion of the means employed. Yet we can see so much as this, that here again other laws, belonging altogether to another department of nature—laws of organic growth—are made subservient to a very definite and very peculiar purpose. The adaptation of the animal tissues to form a battery, and the purpose of the apparatus when made to discharge electric shocks, are the paramount facts disclosed by science in this case.

It is very difficult to divest ourselves of the notion, that whatever happens by way of natural consequence is thereby removed, at least by one degree, from being the expression of Will and the effect of purpose. We forget that all our own works, not less than the works of nature, are works done through the means and instrumentality of law. All that we can effect, is brought about by way of natural consequence. All our machines are simply contrivances for bringing natural forces into operation; and these machines themselves we are able to construct, only out of the materials and by application of the laws of nature. The steam-engine works by way of natural consequence; so does Mr. Babbage's calculating machine; so does the electric telegraph; so does the solar system. It is true indeed, that in all human machinery we know by the evidence of sight the ultimate agency to which the machinery is due, whereas in the machinery of nature the ultimate agency is concealed from sight. But it is the very business and work of science to rise from the visible to the invisible—from what we observe by sense to what we know by reason.

* Owen's "Lectures on Comp. Anat.," vol. ii. (Fishes).

* "Origin of Species," p. 192, first edition.

Every natural force which we call a law is itself invisible—a conception of the mind arising by way of necessary inference out of an observed order of facts. And very often, if not always, in our conception of these forces, we are investing them with the attributes of intelligence and of will at the very moment, perhaps, when we are stumbling over the difficulty of seeing in them the exponents of a Mind which is intelligent and of a Will which is Supreme. The deeper we go in science, the more certain it becomes that all the realities of nature are in the region of the invisible, so that the saying is literally true, that "the things which are seen are temporal, but the things which are not seen are eternal." For example, we never see the phenomena of life dissociated from organisation. Yet the profoundest physiologists have come to the conclusion that organisation is not the cause of life, but, on the contrary, that life is the cause of organisation,—life being something—a force of some kind, by whatever name we may call it—which precedes organisation, and fashions it, and builds it up. This is the conclusion come to by the great anatomist Hunter, and endorsed in our own day by Professor Huxley, whose philosophy seems to be more hostile than that of most other men to belief in anything which cannot be seen, and weighed, and handled. One illustration which this writer gives is derived from the shells—the beautiful shells—of the animals called the "Foramenifera."* No forms in Nature are more exquisite. Yet they are the work and the abode of animals which are mere blobs of jelly—without parts, without organs—absolutely without structure of any kind. In this jelly, nevertheless, there works a "vital force" capable of building up an organism of complicated and perfect symmetry. But what is a vital force? It is something which we cannot see, but of whose existence we are as certain as we are of its visible effects—nay, which our reason tells us precedes and is superior to these. But the very idea of a force is an idea founded in no small degree on our own experience of effort, that is of will. Whatever difficulty, therefore, there may be in conceiving of a will not exercised by a visible person, is a difficulty which is not escaped by trying to arrest our conceptions at the point at which they have arrived in forming the idea of laws or forces. That idea is itself made up out of elements derived from our own consciousness of personality. It has been said, with perfect truth, by a living naturalist who is of all others most opposed to what he calls theological explanations in science, that we may just as well speak of a watch as the abode of a "watch-force," as speak of the organisation of an animal as the abode of a "vital force."* The analogy is precise and accurate. The forces by which a watch moves are natural forces. It is the relation of interdependence in which those forces are placed to each other, or, in other words, the adjustment of them to a particular purpose, which constitutes the "watch-force;" and the seat of this force is clearly in the intelligence which conceived that adjustment, and in the Will which gave it effect. The mechanism of man is in this respect only an image of the more perfect mechanism of Nature, in which the same principle of adjustment is always the highest result which science can ascertain or recognise. There is this difference, indeed,—that in regard to our works we see that our knowledge of natural laws is very imperfect, and our control over them is very feeble; whereas in the machinery of nature there is evidence of complete knowledge and of absolute control. The universal rule is that everything is brought about by way of natural consequence. But another rule is, that all natural consequences meet and fit into each other in endless circles of harmony and of purpose. And this can only be explained by the fact that what we call natural consequence is always the conjoint effect of an infinite number of elementary forces, whose action and reaction are under direction of the Will which we see obeyed, and of the purposes which we see actually attained.

It is, indeed, the completeness of the analogy between our own works on a small scale, and the works of the Creator on an infinitely large scale, which is the greatest mystery of all. Man is under constraint to adopt the principle of adjustment, because the forces of Nature are external to and independent of his will. They may be managed, but they cannot be disobeyed. It is impossible to suppose that they stand in the same relation to the Will of the Supreme; yet it seems as if He took the same method of dealing with them—never violating them, never breaking them, but always ruling them by that which we call adjustment or contrivance. Nothing gives us such an idea of the immutability of laws as this! neither does anything give us such an idea of their pliability to use. How imperious they are, yet how submissive! How they reign, yet how they serve!

ALFRED HAGART'S HOUSEHOLD.

By ALEXANDER SMITH, Author of "A Life Drama," &c.

CHAPTER I.

THIRTY years ago, before it had become enmeshed in a network of railways, Greysley was a second-rate Scotch town of considerable picturesqueness and individuality. In those days Greysley was self-sustained, and had an existence of its own. It sat at its looms and drove its shuttles all day: the inhabitants had their peculiarities of dress and *patois*, and one walking in the streets of the neighbouring city of Hawkshead—of which city Greysley is now a kind of outlying suburb—could be detected at once by a sharp eye. Hawkshead was an energetic place, and was distinguished by the most varied industrial activity. It worked in iron, it built ships, it was continually deepening its river, for on the river its prosperity mainly depended; the glare of furnaces hung nightly over it; and it was skilful besides in more nice and delicate arts; it hummed with cotton mills, it printed cloths, and its muslins were embroidered by the girls of Ulster as they sat before their cottage doors, in sight of their plots of ripening flax, in the summer evenings. As a consequence of these industrial means and appliances, Hawkshead could keep its pot boiling in tolerable comfort, for while one branch of industry suffered, the others were certain to be in request. Printed cloths and embroidered muslins fluctuated terribly at times, but coal and iron and ships were in constant demand. Greysley, on the other hand, had no variety of occupation. It was to all intents and purposes a weaving town. During the entire day, in the old-fashioned crooked side-streets, the monotonous click of the loom and the sharp whirr of the shuttle were continually heard. While trade was brisk, Greysley stuck to its work and lived well; when depressed, it stood in groups about the market-place and the corners of the streets, and in the evenings read and argued over the fiercest of political newspapers. Thirty years ago trade *was* good, and in the spring and summer evenings the weaver, having comfortably dined, bird-nested or botanised, and later still, discussed European and local politics in cozy taverns, went to bed with the idea that he was the most intelligent of human beings, and that Greysley generally was the axis on which the world revolved.

The town was ancient too, and in the olden time had dealings with the more fabulous of Scottish kings and queens. Some two miles distant in the direction of Hawkshead stood an old castle in which, tradition asserted, Queen Mary—who must have been a great gad-about, and of vast experience in the matter of beds—once slept. In the eastern extremity of the town was an old abbey with old graves about it, and at night the moon silvered very prettily the broken arches and the fine traceries of the main window. In a corner of the abbey, divine service was performed every Sunday after the Presbyterian fashion—psalmody and sermon according strangely with the arches, the worm-eaten pews, and the half-twilight of the place. Past the abbey, across the bridge, through the market-place, and away westward, ran the principal street, till it disappeared in a sort of open suburb of houses of one story, across whose window-panes festoons of birds'-eggs were hanging, and on whose window-sills flowers were blowing in summer, and where loom and shuttle were constantly heard. In the market-place was an inn, a picture of a ferocious Saracen, with a crooked scimitar, stuck upon the front of it like a hatchment; and on market days, at the open windows, groups of rosy-faced farmers were continually smoking and drinking ale. Beside the inn was a tall steeple, with a dial with gilded hours; and on a parapet beneath the clock, Roman candles were displayed—the grown-up inhabitants could remember—on great occasions, when a prince was born, or when Lord Wellington gained another victory in Spain. Then Greysley had a river, which came flowing into it very prettily from the moors; and at the entrance to the town, flanked on either side by flour-mills, where meal was continually flying about, said river tumbled with creditable noise and foam over a ridge of rocks. These rocks were regarded by the inhabitants with pride, and great was the uproar when the river came down after a day's rain, or better still, when a six weeks' frost broke up, and the boards of ice were wedged and jammed and crushed and broken there. On quiet nights the dull thunder of the ice could be heard over half the town, and the schoolboy starting from his sleep heard it with awe, and buried himself deeper in his blankets. The river came into Greysley with a bold look enough, but after its fall over the rocks it lost spirit, and sneaked through the town in a broad shallow stream which carters and their horses forded on occasion; at the further end of the town stood a small disconsolate quay, which seemed always waiting for vessels that never came. Past the quay the river flowed broad and shallow, and soon after it got amongst green fields and trees, and ultimately lost itself in the larger river which came down from Hawskhead—prefiguring the fate of the town, which is doomed to lose all separate existence, and to lose itself in Hawkshead also.

The scenery around Greysley was distinctly pretty. To the south rose a range of green hills, and one with a taste for the picturesque could hardly employ his time better than by walking to a summit, and sitting down there for an hour. There could he see Greysley at his feet, blurred with smoke, with church spires and one or two tall chimneys sticking out of it. Beyond, the Hawkshead river on its way to the sea; in the other direction, to the north-east, the great smoky stain of Hawkshead; and if possessed of a glass, he could discern the canal that connected that city with Greysley, and perhaps on its way the long white passage-boat drawn by trotting horses, and the black caps and scarlet jackets of the riders. He would see also woods and an old castle or so, a score of gentlemen's seats, and farm-houses without number, with the yellow stacks of last year yet standing in the comfortable yards. And he would be touched by the silence and movelessness of the mighty landscape, for at the distance of a few miles man is invisible, the noise of his tools is unheard, his biggest cities become smoky ant-hills; and at the distance of a few years——!

On a certain summer day everything went on in Greysley as was its wont, loom and shuttle clicked and birred, shopkeepers chatted at doors or were busy with customers, hawkers with barrows made publication of the cheapness and excellence of their wares: the sunshine which had lain on one side of the market-place all the morning had deserted it, and was now sliding along the walls of the jail, window by window, making cruel visitation of the prisoners; round the gilded dial in the steeple went the clock hands, and lustily in the upper air were thumped out the quarters and the hours; and in the school-room, the Dominie, in rusty black—who twenty years before had given up all hope of a kirk—was busy teaching, setting copies, hearing complaints, punishing culprits, and ruling as best he could his murmuring kingdom. At twelve o'clock into the playground streamed the scholars from their lessons, the girls consorting together after their fashion, the boys knuckling down to marbles, or pursuing one another like swallows in the game of "Tig." All at once amongst the boys engaged at marbles an altercation arose, loud shouts were heard, and through the skurrying of scholars—one little girl, weeping, and with loosened hair, attempted to separate them—two spitfires were visible, with doubled fists, pitching into each other, closing, rolling on the ground, springing up, and making eager play again. Two or three rounds had been fought, the little girl weeping and pleading all the while, when the school door was opened, and the assistant teacher, or monitor as he was called—who during the hour's recess was instructed in Latin by the schoolmaster in lieu of payment—with a piece of bread in his mouth, looked out to see what was the cause of uproar. Making himself aware of the position of affairs, he darted on the combatants, seized them by the collars of their jackets, shook them separate, and marched them, caught red-handed, into the presence of the schoolmaster, in whose countenance on such occasions the cane was sternly visible. How the schoolmaster really looked could only be known by the culprits themselves, for when the assistant entered with his prisoners he shut the door behind him with his foot. The scholars in the playground were thrilled with the event and its probable issues: the boys stood in groups talking, the girls gathered round their crying companion, who had now got her bonnet on, when all at once the angry clangour of the school bell was heard a full quarter of an hour before the usual time, and the assistant—who had masticated and swallowed his piece of bread—re-opened the door, and peremptorily required the presence of the school. It was evident that there was to be an investigation into the flagrant breach of discipline, and the cane might not improbably visit certain backs before all was over.

What really happened does not much matter. A number of witnesses were examined, a number of boys were rated soundly, several punished more or less as being act and part, or participators, and one who was supposed to be the aggressor severely flogged, and his punishment the little fellow endured without a sob or tear, which very naturally exasperated the feelings of the schoolmaster. The bell again rang at three o'clock, and out rushed the scholars—boy and girl—their books in satchels and in bags. They came out in tumult, ran across the playground, descended the stairs into the street, and went homewards—the boys in noisy parties, the girls in groups of twos and threes, with affectionate arms linked round each other's necks. Just as the last group of girls descended the stair, and was about to go down the street, one of them, glancing round, beheld a little face pressed against the railings of the playground, looking down.

"Are ye comin', Katy Hagart?" cried they in their uncouth Greysleyan accent.

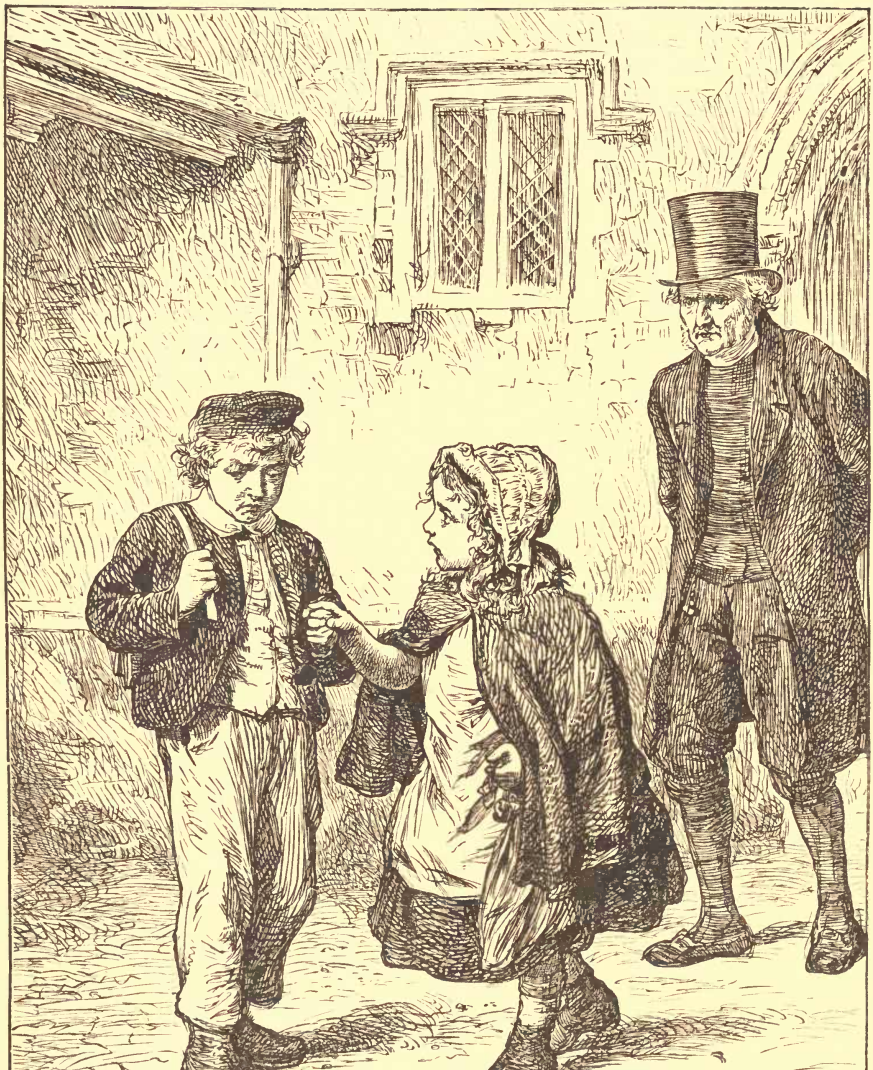
The little face shook a negative, but said never a word.

"Come awa', or we canna wait. Johnny's keepit in, an' i'll no get oot for a while."

Whereat the little face was again shaken, and then came a pure clear voice, pure and clear as the colour of a primrose, and without any rude Greysleyan taint, "I cannot go without Jack," she said. "I'll wait for Jack;" and then the child turned away, and sat down on a playground seat with her books in her lap.

"Weel's ye like," cried her companions; and, like a covey of partridges, one leading, they streamed down the street at a run.

The solitary occupant of the playground—the girl who cried while the battle was proceeding, the sister of one of the combatants, and from the fact that he was "keepit in," apparently the most blameworthy—was a mere wind-flower of a thing, with auburn hair, blue eyes, and a colourless face, or a face that seemed colourless when compared with the red and white of her ruder companions. Amongst them she seemed delicate, but it was not so much the delicacy of weakness as of breeding. Grace and paleness belonged to her, as grace and paleness belong to the lily. As she sat there patiently, her eyes fixed on the school-door, which seemed as if it would never again open, her face had its own beauty, but it was a beauty of an over-



"THE SCHOOLMASTER NOTED THE LITTLE SISTERLY TOUCH."

Page 61.

sensitive kind; especially there was a tremulousness about the slight mobile mouth which was indicative of an unusual capacity for joy or sorrow. To a little thing with such a face and mouth, a harsh word would come like a blow, a kiss of forgiveness meet like a reproach. She was a child that a father who had been knocked about in the world would regard at times with a slight sinking of heart, remembering what sorrow life has in store for even the happiest, how open she was to the arrows of sorrow, and how deeply they would rankle when they struck. And while she sat on the playground seat, and when the better part of an hour had passed, the little tender mouth began to grow piteous in expression, and the blue eyes to fill.

The door opened at last, and Jack—her brother—came out with his books, accompanied by the little wizened schoolmaster, who locked the door with one out of a bundle of keys which he carried. The schoolmaster looked grave, as befitted the occasion, but the boy's face had a latent rebellion in it. As they came across the playground Katy rose from her seat and timidly took her brother's hand. The schoolmaster, who was a kind-hearted man, noted the little sisterly touch, and a shade or two of sternness went off his face. Just when they came to the stair which led from the playground into the street, the schoolmaster laid his hand on the boy's shoulder, and said, in a tone which had a not unkindly ring in it:

"Now, Hagart, I hope your punishment to-day will be a lesson. I have never had to punish you before, and I hope I shall never have to punish you again."

At which words Jack's eyes brightened, and his face flushed a wonderfully proud scarlet, as he turned round, looking up, for he had already descended two or three of the steps.

"If I had told a lie like Thomson, sir, I would not have been punished more than he was, nor have been confined. But I would not change places with him for all that has happened. Come, Katy."

And with a doubtful expression the little schoolmaster looked after the children as they went away. Into his mind the suspicion darted that he had been too severe; he stroked his chin thoughtfully once, locked the door of the playground, put the bunch of keys in his pocket, and walked slowly home.

But at home the highly unimportant matter of Jack Hagart's punishment would not betake itself out of the little schoolmaster's head. Reading, as was his wont of an evening, in his treasure of a black-letter Chaucer, he came to the grand passage in the "Knight's Tale," where Palamon and Arcite, both mad with love for Emily, confront each other in the wood outside the Theban walls, and where Arcite, too noble to take advantage, gives his rival bedding and food, and in the morning brings out from the city weapons and two suits of armour, and allows Palamon to take his choice of each, and assists to arm him, and then for a space two white faces look out of their steel on each other before the great bright swords flash in the May sunlight, and the blood rains down. Reading this passage, the schoolmaster looked suddenly up as if the boyish quarrel had been somehow prefigured therein. "I don't know that I did right to flog that lad Hagart to-day. I suspect he was not so much to blame as I supposed. I like his frank and fearless eye, and must look into the matter to-morrow. What a prince Arcite is; what a sneak Palamon; what a grand fellow is Esau; what an undermining one Jacob; and yet Palamon gets Emily, and Jacob Rachel. It's the way of the world. The arms and kisses of the beautiful woman are for the sneak, and the Dominie's cane falls heaviest on the undeserving back. If things go so strangely in the big world, it is not surprising that they should go strangely in that little noisy one—the school."

CHAPTER II.

The children, Katy still holding her brother's hand, walked home silently. Katy's mind was full of the battle, the flogging, and the confinement, but she did not care to speak about it, and in fact received no encouragement to do so. Jack started from the school in a truculent mood, he was angry with his late opponent, and as he walked he gave him in imagination many a sound thrashing: he was angry with the schoolmaster, and vividly pictured to himself how the schoolmaster would act when he came to know the facts of the case, how he would apologise perhaps, how he would frown on Thomson! As the children walked along, all this passionate play of mind and fancy kept Jack quiet, but the stress gradually wore off, and before they were half-way home he attained to a normal condition, and was able to take cognizance of the world outside. They lived in an eastern suburb of Greysley, and their way led them along the banks of the river, where they stood for a moment to watch a flotilla of ducks, a drake with a dark-green head leading, oaring its way across the shallow stream. The bridge was before them, across which a man on a white horse was riding hastily. They passed through the dusk coolness of the arch without speaking. On a bit of bright sunny ground beyond, a blind beggar was sitting against the wall, his hat placed between his knees for the reception of halfpence, and a large sheet of white paper, bearing a badly spelt appeal to the charitable, pinned to his breast. The children glanced at the poor creature rolling his sightless orbs in the afternoon sunlight, but said nothing. In a short time they came in view of the ridge of rock over which the river fell in a broad and noisy sheet, and here at last Katy found her voice.

"Mamma will be wondering what has kept us," she said.

"Don't tell her that I—I was thrashed and kept in," said Jack.

"She will ask what has detained us, and what can we say?"

Jack's silence indicated that he was posed by this view of the question. He knit his brows over the problem, and at last said with a trifle of hesitation, "Shall we tell her that we have been playing? or that we went to see something?"

"But that would not be true, that would be telling an untruth, Jack," Katy said, half-turning round to him.

"But not a mean lie, not a cowardly lie, not like a lie told to escape a thrashing. It would be what I call a proper lie, and mother would not know anything, and would not be vexed."

But Katy was proof to all this casuistry. She shook her head and said quietly, "No, no, Jack, we must tell the truth—always." And so this matter being settled the children relapsed into silence again.

They had now got beyond the fall, and were walking along the upper reach of the river, where the water was comparatively deep—where a small boat was moored to a weedy stake, where lilies unfolded their broad disks, and where a row of whity-green willows spent the time in gazing on their own shadows. The river was on their left, on their right a range of distilleries, which emitted a peculiar odour, and across and around which a white steam continually curled. Passing, they were clear of houses till they reached the clump in which stood their own. The canal connecting Hawkshead and Greysley, hidden by the distilleries, was visible on their right now, and as they proceeded the long white passage-boat, with its horses and black-capped and scarlet-jacketed riders, flitted past. The sight wiped out every trace of anger and annoyance from Jack's mind. "See," he cried, pointing to the horses, "there's Smiler the leader, the other is Paddy-from-Cork, who was lame a while since. I'm glad to see him out again. Did you ever walk along the canal?" he asked, as the passage-boat, horses and riders, disappeared. "No! Then we'll go on Saturday. Oh, such a place! No houses to be seen, beautiful banks, plenty of hips and haws. And the birds! not the grey sparrows you see here, but shilfas and bullfinches and yellow yelderings. I know their names, for father told me, and found out their nests for me, with the eggs in them. Did you ever see a bird's-nest, Katy? And then we can see an old castle, and the canal carried across the river by a bridge—water above and water below—and an old coal-pit. If you drop a stone into the pit, you wait for five minutes, and then you hear it plunge far far down. I sometimes dream I fall in, and feel the air cold as I cut through it, and waken in a fright. Will you go, Katy? I have sometimes walked half as far as Hawkshead, and then got afraid because I could see no one."

By this time they had reached the half-dozen of irregular villa-like houses in one of which they dwelt. Katy opened an iron gate, and ran in and tapped at the door—she was barely tall enough to reach the bell—which was opened by a maid with face and garments indifferently clean. "What's kep' you? yer dinner's cauld," said the maid, somewhat testily, as the children entered.

In the parlour Mrs. Hagart rose, with her knitting in her hand, when the children entered, and came forward. "What has kept you?" she asked in a soft pure voice, of which her daughter's was the echo. "You are very late," she went on, as she took the books from Katy and began to unloose her bonnet. "Your dinner has been ready for more than an hour, and I have had to keep it warm in the oven. Bring in the children's dinner, Martha. I was getting anxious." But Katy, instead of replying, flushed only. "What has happened?" she asked, turning to Jack, who was struggling to disengage himself from his book belt. "Why don't you speak, one or the other? Something surely is wrong." Whereat Jack, who was drawing his belt across a red face, for somehow the process of extrication was unusually difficult that day, suddenly blurted out, "I was flogged by the master, and was confined besides for an hour," and then having got quit of his books finally, he flung them on the floor with a thump.

"Flogged! confined!" said Mrs. Hagart. "I am sure you had your lessons perfectly in the morning. I heard you repeat them myself."

"Flugged, kep' in!" cried Martha, who had just entered with an ashet of smoking potatoes in one hand, and an ashet of smoking minced meat in the other.

"Yes," said Jack, stoutly; "but I could say my lessons quite well. I was flogged for fighting."

"Fechtin'," cried Martha as she set down the viands and smoothed the white cloth. "What for sud ye be flugged for that? The scoun'rel that was fechtin' wi' *you* sud hae been flugged."

"So he was, but I was flogged also," and then Jack went on to tell how Thomson tried to cheat at marbles; how he (Jack) had remonstrated with Thomson on his attempted crime; how Thomson had become insolent and began to call names, at which the other boys laughed; how he (Jack) again remonstrated with him as to his ungentlemanly conduct; how Thomson had made a grimace, and how his (Jack's) fist, without his very well knowing why, had come in violent contact with Thomson's nose; how the battle became general; how he (Jack) would have licked his opponent, although half a head taller than himself, had not the monitor pounced upon them and brought them before the master;—how, when examined, Thomson told the most horrible lies, asserting that *he* (Jack) had attempted to cheat; that he had struck first—which was true; and how the result was that both were punished, Thomson slightly for being engaged in combat, and he (Jack) severely for being the aggressor; and what he thought hardest of all—for Katy was waiting for him—confined to the school-room for an hour after all were gone. "But," so Jack concluded his narrative, "I got the flogging and Thomson told a lie, and I would rather get a flogging any day than tell a lie."

While the children were at dinner, Mrs. Hagart made private inquiries concerning the combat, and what injuries Jack had sustained therein. Satisfied at length that no harm had been done, she delivered a little homily on the virtues of truthfulness and courage, and of the lustre which they lent to a manly character, which had been simmering in her mind during the foregoing relation. "I don't wish you to be quarrelsome or a bully, John," she said, "but I hope when you are put upon that you will always show a proper spirit. I fear there are many rude boys at school with you; but never forget that you are a gentleman, and make as few companionships with them as you possibly can. Above all things, respect the truth. A gentleman may be poor, he may be in rags, but he never lies. To tell a lie is the most cowardly act of which man or woman, boy or girl, can be guilty. Never tell a lie. Than do so, I would rather you came home to me with your face cut and your clothes torn." And then, startled by her own energy, and by the terrible picture presented to her imagination, the poor lady rose hastily and kissed Jack, while from the tenderest eyes a drop or two fell on that young fellow's curly head.

"Never fear," said the hero, with a spoonful of minced meat in his mouth, "I'll never disgrace you or father. I'm getting big now. Father says I'll be a man soon, and then I'll take care of you and Katy then. Won't I, mother?"

"Yes, yes, John," said Mrs. Hagart, as she resumed her seat with a half sigh. "You'll be a man soon, very soon; but get on with your dinner, dear, and take care not to soil your jacket."

In the depths of Jack's consciousness there was a slight feeling of dissatisfaction with his mother's closing counsel. It clashed somehow with his heroical mood, and he felt angry for a moment almost. But he soon dismissed his trouble, and when dinner was over he went out for an hour's play before he began his attack on to-morrow's lessons. Katy meanwhile had taken her seat on a stool at her mother's knee. She was always tired, poor child, when evening came, and for her the day had been one of unusual excitement.

Jack went out and joined certain of his companions, and around the clump of houses, for an hour or so, in the game of "I spy," they rushed like wild horses. When the young fellow had expended his superfluous energy he came in, and prepared his lessons; that over, he came in to the little parlour—Katy had by this time gone to bed—and by candle-light—for the twilight was closing—he sat down beside his mother, who was knitting, with an odd volume of "Old Mortality" in his hand. After reading a while he closed the book, one finger in the place where he had stopped, and stared earnestly into the fire.

"When will father come home?" he asked at length.

"On Saturday night, John."

"I wonder if he will have sold his sketches?"

"I trust so, John."

"Will he walk home all the way from Spiggleton this time again?"

"I believe so. It's a long way. Twenty miles almost. Father will be very tired."

Joh was silent for a little. He then asked, suddenly, "Are we very poor, mother?"

Mrs. Hagart gave a little start at the question. "Why do you ask?" said she, looking down on him.

"Because if we were not poor, father could come home in the coach, could he not? Don't the rich people ride, and poor people walk?"

"Yes, John. Father is poor; he works hard; and when he walks these twenty miles across the moors, it is for your sake, and for Katy's, and for mine. He thinks of us when he is coming, and that makes the way seem shorter. We are poor, John; but there are many poorer people in the world than we are. When we see you and Katy well and happy and obedient, we think we are rich enough sometimes."

Another pause. "Were you always poor, mother?" Jack was in a terribly inquisitive humour that night.

"No, John, we were rich once—that is, comparatively rich; and I thought you would have been rich also. And perhaps you may be rich yet—after father and I are gone. Stranger things have happened."

"And how did you become poor, mother?"

"Never mind to-night, John. You will hear all about it when you grow older and wiser. You could not understand now."

"When I grow big I shall become rich. I'll work; I'll do something."

"Will you? But don't suppose that money alone will make you happy, although it goes a great way certainly. You must be good also, well mannered, kind to all under you; brave, hating lies, never guilty of any meanness. Grow rich if you honestly can, but whether rich or poor, try always to be good."

"Oh, yes. I'll be rich and good, too. It's easy enough to be good, isn't it? much easier than to be bad. I don't think I could tell a lie if I tried ever so much; and if Thomson makes faces at me again and called me names, I'd strike him again. I wish to be rich, mother. I wish to be a gentleman."

At this last word a slight colour came into Mrs. Hagart's face. "Remember, John," she said, seriously, "that you *are* a gentleman, and have a good right to be one."

"Am I! And that is because you were rich once, is it? You did not live in Greysley then?"

"No, no. In the Highlands you read about in 'Rob Roy,' only much farther away than the places described there. Heigho! how far that time seems removed now. I think I see the rocky islands, the miles of sea-sparkle; I smell again the heather which the shepherds are burning in Rum in the spring evenings, through the whole twenty miles of distance. Although I did not know it, I must have been very happy in those days."

The last few sentences Mrs. Hagart had spoken more to herself than to her son. He, however, caught at the closing words.

"And are you not happy now?"

"Why do you ask, you foolish boy? Of course I am happy. Don't I love you and Katy and father, and so long as I am with you I shall be happy."

"Shall I ever go to the Highlands—where you lived when you were young?"

"Perhaps. And your eye and brow would make you welcome. Every woman would say prayers for you, and every shepherd would be proud to carry you through the moors."

Again Jack stared into the fire, and again his mind reverted to the riches which he was resolved to acquire.

"Do you know what I'll give you, mother, when I become rich?"

"I don't know."

Jack's mind was stumbling amidst all conceivable pleasures and grandeurs till it got fairly bewildered.

"Well, then," said he, "I'll give you a fine house to live in—much finer and bigger than this one; and I'll give Katy a silk dress, and I'll give you a silk dress too, and—and a pair of gold spectacles, like those old Mr. Cargill wears in church."

Mrs. Hagart fairly broke into a smile.

"Much obliged to you, John, very much obliged indeed. But I must wait a little before I need the spectacles. And now, dear, go to bed. You have sat up later than usual. Kiss me, now, and go to bed."

Jack would rather have waited, for his fancy had been roused by the talk; but his mother rose to put away her knitting, and he knew his wishes were of no avail. Then, in search of companionship, he went into the kitchen, where Martha was scrubbing. "Tell me a story, Martha, before I go to bed. I don't feel sleepy." And Martha, nothing loth, told him, in her uncouth *patois*, a wonderful story of how the foul fiend, in the shape of a gallant young shoemaker, carried on a flirtation with a minister's servant-maid; how he nobly, of a Saturday night, treated her to a glass of ale, and paid the reckoning with a crown-piece, and feloniously pocketed the change; for when the landlord, on the Sunday forenoon, before proceeding to church, was counting up his gains, he found a slate in his till instead of the broad silver piece; how the pious maid was reading her Bible one night in her best cap and apron, after her work was done, and how the shoemaker entered and began to abuse the Holy Book; how the maid was shocked at her sweetheart's wickedness, and catching a glimpse of a cloven hoof, adjured him to depart, making mention of a sacred name; how the shoemaker disappeared in a flash of fire; how the maid screamed and then fainted; how the clergyman, busy up-stairs with his sermon, came down to the kitchen, threw water on the maid's face, who then told the story; and how both were conscious of a strong smell of brimstone, which was satisfactory evidence of the character of the visitor:—all this Martha told with awful pause and emphasis, and big, wondering, believing eyes fixed on Jack's, so that the young fellow went to bed all in a tremor, and dreamed that the fiend was chasing him along the river-bank close to the walls of the distilleries, and that he could hear behind him, as he ran, the soft thud of a shoe alternating with the sharp ring of a cloven hoof, and awoke in mortal terror, and was afraid to go to sleep again.

CHAPTER III.

THE Hagart household was composed of Alfred Hagart, his wife Margaret, Jack and Katy, children, and Martha, maid-of-all-work, and Mrs. Hagart's confidante and counsellor in general. The house-accommodation consisted of the kitchen, where the aforesaid Martha worked and slept; the children's bed-rooms; the bed-room occupied by the master and mistress, a large bare room, in which was a large bare desk—apartment sacred to Alfred himself—and the sitting-room, in which the Hagarts received their friends, when any called, and in which they breakfasted, dined, supped, and spent their evenings.

And if, as philosophers aver, everything a man does is indicative of personal character; that an old pair of boots tells tales of the wearer (what a history Mr. Carlyle could have read in Cromwell's!); that a pair of gloves noticeably worn on the thumb of the left-hand, gives a clearer insight into the nature of the owner of the gloves than the perusal of a packet of his early love-letters, for instance; that an old hat, battered and grease-stained, all lustreness of nap, grey and bare with usage, is a piece of authentic autobiography:—if these things be true, it may be expected that the Hagart sitting-room should be indicative of the habits of the Hagart family in general, and of Mr. Alfred Hagart in particular. And there can be no doubt that it was so. I, who knew Hagart well, who sat not unfrequently at his humble board, feel this. And yet the room did not look in any way specially strange or odd. But neither did Alfred Hagart. You required to know Alfred Hagart, and you required to know the sitting-room, and when known they threw light one on the other.

The room was small, and the fireplace fronted you when you entered. At the extremities of the mantelpiece stood two china vases a good deal cracked and chipped, and out of these vases rose gracefully towards each other, as if in acknowledgment of mutual beauty, two gorgeous feathers of a peacock's tail. Alternately between these vases stood an egg of the sea-urchin, and a hollow paper cylinder about the height of an ordinary candlestick, and on these paper cylinders fruits and flowers, and such arabesques and devices as we see on Oriental shawls and Japanese crockery, were glowingly depicted. On the wall above the mantelpiece hung a Highland target, studded with circles of brazen nails, and on the right-hand side there was an indentation as of a pistol-bullet. Across the target were slung two formidable claymores, which, in the grasp of a bold clansman, may have flashed at Sheriffmoor and Culloden, and drunken English blood on both those celebrated fields. You do not know Mr. and Mrs. Hagart yet, so well as I do, and consequently cannot feel the significance of those little matters of household adornment. Alfred was an artist after his sort; he loved all natural objects, and had a genuine delight in colour. The azures and emeralds of the feathers pleased him; so did also the rosy hues and the rough surfaces of the shells. The paper cylinders were patterns prepared for the weaving houses of Greysley and the shawl-printing houses of Spiggleton—for the preparation of such works of art was the occupation of Alfred, and by brain and pencil he kept the wolf from the door as best he could—patterns which had not been fortunate enough to find purchasers. Alfred did not consider his walk of art high; in earlier days he had trod a higher, and been starved out of it; but yet it ministered to his vanity at times,—as indeed what does *not* that a man pursues? Calcraft has his own satisfaction when he turns off his man neatly,—as well as to his profit. An author travelling first-class express is delighted when he beholds, in the compartment opposite, a sweet young creature perusing eagerly the pages of his last charming volume. A similar pleasure, a titillation of vanity quite as noble, our friend experienced when he beheld a lady wrapped in a shawl, the fashionable and elegant pattern of which he had laboriously designed. The mercer had shown that lady dozens of shawls, had expatiated on the beauty and style of each, and out of the glowing assortment the lady had selected *his!* It was a proud moment. On the other hand, if a pattern did not sell, Hagart despised it, as a mamma despises a daughter left a spinster on her hands. The daughter and the pattern had failed in the end for which they were created, and had become mere lumber. These unsuccessful patterns fell to Mrs. Hagart, who, with a woman's deftness and quick wit, whipped them into rolls, stitched up the backs neatly, scolloped the edges with her scissors, and turned them into indubitable ornaments. And thus it came about that they stood on the mantelpiece between the shells, and overhung by the peacock's feathers. It is not every wife who can make household ornaments out of her husband's unsuccesses. My wife, for instance, can make nothing of my rejected poems and magazine articles.

The target and the claymores slung across it had their own significance also. They belonged to Mrs. Hagart, and were portions of her personal property when she married. Mrs. Hagart—her maiden name was Margaret McQuarrie—was of Highland descent, and was related to some of the oldest Highland families. In particular her mother was a daughter of the second cousin of the great McClaymore of McClaymore, and on this intimate and honourable relationship she plumed herself highly. On the nobility and splendour of her ancestors the good lady was accustomed at times to dilate. She talked of the princely state they lived in; of the number of times they had turned the tide of battle; of their crowds of retainers; of the loyal family ghosts that followed them whithersoever they went, flitting down staircases, tapping at windows, scraping at doors, and the like, when one of the great race was about to die. Mrs. Hagart's family was servitored by both worlds. Hagart was wont to listen to these stories with great patience, but the apparitions touched him somehow on his comic side, and much irreverent laughter they kindled in him at intervals. "There is nothing like having a number of family ghosts," he would say good-humouredly, "they add mightily to one's family dignity, and then they are cheap. They cost nothing in the way of rations; they provide their own wardrobe; they exact no board wages. It would be curious to compute how many ghosts could be kept on the wages of a single footman." At these sallies Mrs. Hagart would bridle, and declare she had no patience with vulgar witticisms. But with all his fun Hagart was nearly as proud of his wife's descent as she was herself, and once or twice he has spoken to me of her great connections with awe. Of Mrs. Hagart personally, if pride of family was a fault, it was almost the only one she had: she loved her husband, she was devotedly attached to her children, she was kind and, as far as her means went, liberal to Martha, who would almost have lain down her life for her mistress. The far-descended fingers stitched and darned industriously as if she had come of a race of hedgers and ditchers. She was patient, gentle of speech, economical of habit, as if her great-great-great-grandfather had never ruled broad lands or strung up a follower before his breakfast window of a morning when it pleased him. And if along with the catechism and the stories of Joseph and Ruth, she taught her children genealogy, what harm did it do them, pray? No harm, but a deal of good. Katy's voice had not a touch of the Greysleyan accent, she never shrieked or screamed or romped in the school playground as did her companions. She was always quiet, unassuming, demure,—a little lady; and her mother's stories had a good deal in bringing that about. As for Jack, if under his mother's direction he had not drank so deeply of the well of family history, his clenched fist would not have come in such desperate contact with Thomson's nose, nor would he have gloried so hugely in the fact that he got a severe thrashing for telling the truth, while his opponent got a slight one for telling a lie. Depend upon it, neither man nor boy is the worse of having a grandfather, and of knowing it too.

On one side of the sitting-room hung a small bookcase containing a few religious works, some odd volumes of the Waverley Novels, the Edinburgh Almanack for the year 1826, and certain loose numbers of the London Magazine. In the Waverley Novels, so far as he possessed them, Hagart delighted, and was wont in the evenings to read portions of them, so that Jack and Katy were not unacquainted with Balfour of Barley, Cuddie Headrigg, Miss Wardour, and Jeanie Deans. The Almanack was valued because it contained a list of the regiments of the British army, with a description of their facings, and a catalogue of the actions in which they had been engaged. The loose number of the London Magazine he had picked up during his residence in that city, and many an hour he spent talking to Jack about his metropolitan experiences; of Westminster Abbey and St. Paul's, of the newspapers in mourning for the death of Lord Byron; of Edmund Kean in Richard; of Edward Irvine with his squint and raven hair; of Mr. Thurtell; of Tom Spring, Deaf Burke, and Symon Byrne, departed heroes of the fistic ring; of the Duke, in white trousers and blue surtout, riding past on his cob; of Mr. Turner's wonderful landscapes; and of the First Gentleman in Europe. Hagart had a great love for London, and was wont to aver—when his patterns would not sell—that it was the only place in which a man of parts and genius could expect to receive proper encouragement.

On the opposite wall from the bookcase hung three water-colour sketches. On the right was a gamboge sunrise, on the left a vermilion sunset, and in the middle a sap-green forest. In the corner of each of these works of art might be traced "Alfred Hagart, 1824." These sketches were regarded by the household—Hagart included—with much pride. When Alfred made a hit with his patterns, and when the manufacturers were purchasing freely, it was his custom—sitting over his tumbler of punch with his wife, after the children had gone to bed—to make pathetic allusion to these.

"If I had but continued at that," he would say, pointing with his thumb to the pictures, "we might have been driving our carriage to-day. With the encouragement I had, I was a fool to give up art. A fellow like me, condemned to paint shawl and garment-patterns for the blowsy wives of cobblers and tallow-chandlers—by Jove! it's Flying Childers brought to a hackney-stand, a poet become subeditor."

And this reminds me that it was while living as a water-colour artist in London—to which city he had come up from Scotland—that Alfred Hagart won his wife. Miss McQuarrie, youngest of that distinguished family, had, for the improvement of her mind and manners, been placed at a London boarding-school, which Alfred attended in the capacity of drawing-master. Miss Margaret was young and pretty; Alfred a blooming young man, with bold bright eyes and a heart that would conquer the world. He had a good figure, and he dressed well. He was alert, vivacious, high-spirited; wherever he looked he saw a star glittering. Pupil and master became attached, and as it was not to be hoped that the far-descended and many grandfathered McQuarries would consent to the match until they could not help themselves, the foolish young people, thinking they were performing a stroke of astute generalship, ran away, married, and then, in dutiful epistles, sued for forgiveness. When the letter reached old McQuarrie—for many years the young bride had had no mother, and her mother was her father's second wife, of which union she was the only child—wounded pride and rage nearly threw him into a fit. He cursed and swore horribly, vowed that, having disgraced her family, she might starve, for aught he cared; and threatened to knock the head off man or woman who should dare so much as mention her name in his presence. Old port and bad temper in a year or two assisted the irate gentleman into the other world; and then his money—and report said he cut up well—was divided equally between his children by his first marriage—Kate, a spinster lady living at Hawkshead; and Hector, sheep-farmer, and married man, in the remote Hebrides—leaving not a stiver to his youngest daughter, and, up till the period of her disgraceful marriage, his best beloved. When she heard he was ill, forgetting everything, forgiving everything, she would have run to him, like Cordelia to Lear. It was not her father's anger and curses that kept her back, for these she would have cared little; it was the great distance and the scanty purse. And I think the old gentleman would have felt more comfortable in the other world if that loving daughter's face had been the last sight he had seen in this.

But this had not yet happened. The young bride had a small fortune of one thousand pounds, and this sum she, with much pride and many blushes, handed over to her Alfred. The simple gabies resolved that they would not touch one farthing of it, but would lay it aside for contingencies, one of these being looked forward to in a short time with much interest by both. Alfred unhappily read his newspaper, and attracted by an advertisement of a joint-stock something or other which promised large returns, he was induced to risk the thousand pounds in that bubble speculation. He had hardly done so when the bubble burst, and the money was gone. It was in the horror of this time that the Hagarts received a letter from their half-sister Kate, intimating the resolution come to by her father, and her entire agreement therewith. From her half-brother Hector she never heard.

To the young wife this was dreadful news, and it would have killed her outright had not consolation come in the shape of a little baby face nestling in her bosom. The sharp joy turned the sharp grief out of doors, and she became quite contented and happy. She wished to call her boy after her father —who was yet alive—but Alfred flew into such a dreadful rage at the proposal, that she was obliged to give it up. Many names were tried and thrown aside as unsuitable. At last John was suggested. "Well, what if we *should* call the boy John?" said the husband. "John Hagart does not sound so badly to my ear. Milton's name was John: my father's name was John. Besides, and this makes me like it best of all"—a good deal of acid came into the voice here—"the name has not been borne by any of the McQuarries through their countless generations." And so the boy was called John, and grew apace. How proud of it were father and mother! "It smiles so prettily in its sleep, you would almost fancy it was seeing angels in its dreams," said the poor mother. When he cut his first tooth the two fools were as pleased as if they had come into an estate. Alfred was in ecstasies when it recognised him, fluttered to his arms, and was able to babble "papa." When it began to care for toys, the talent that child displayed would have delighted a stoic! And when on one occasion, the horned autumn moon shining quietly through the London parlour window, he howled lustily because he could not have that luminary for a plaything, the fond parents agreed that the child was a child of unmistakeable genius, and actuated by an ambition that would have results.

In some fifteen months after John's birth a little girl made her appearance, and a difficulty occurred as to what *her* name should be. Alfred was anxious that she should be called Margaret, after her mother. The mother—and the poor lady was only working out a scheme which had come into her head as she sat alone one day nursing it—wished it named Catherine, after her half-sister. Alfred demurred, his wife pleaded; he raised objections of various kinds, his wife pleaded only the more vigorously; at last he consented—he would have cut off his head to please her, the affectionate fellow—and Catherine the girl was called. Having succeeded in this part of her plan, she prepared to carry out the remainder. Alfred being out, John disposed of somehow, Catherine asleep in her crib, the mother whipped open her little writing-desk, scribbled an anxious fluttering letter to her half-sister, full of details of the little girl, "Your namesake," she cunningly added. Telling all about her beauty, her intelligence, her goodness, the pleasant way in which she took medicine, &c., and enclosed a bit of the christening cake. This epistle, into which the poor girl had emptied out her entire heart, and which she fancied capable of touching the hardest, was carefully sealed and directed, and in the evening she slipped out quietly and dropped it in the post-office. This whole thing she kept secret from her husband. It would be pleasant, she thought, to astonish him, and be praised for her cleverness in effecting a reconciliation with one who might be useful to her children.

The little stroke of generalship miscarried, however. Alfred came in one day and found his wife crying. "What is the matter?" shouted he, as he ran up to her. "Oh, Alfred, this cru—cruel letter," and the little woman fairly broke down. Alfred pounced upon the epistle, which had dropped from his wife's lap to the floor, and read it with an angry face. He saw Margaret's tender manœuvre, and with what studied sarcasm her advances had been repelled. And while he tossed it into the fire, and poked at it there with his stick as if it were a living thing on which he was revenging himself, his wife had flown to the cradle, picked up Katy, and was covering her with tears and kisses, intimating in a fond, blind way, that that love and those caresses were now her little girl's only portion. "You'll promise," cried Alfred, speaking in large capitals, "that you will never again open any communication with that hag, that harridan, that old, cold, heartless she-dragon! Never write to her, never answer a letter of hers should she write to you!" and the tender-hearted mother promised that she never would, and from that day the name of Miss Kate McQuarrie of Hawkshead was unmentioned in the Hagart family.

When Alfred Hagart was born, Providence instead of fortune had given him hope. His home was in the rising sun. When drenched by the shower, he always saw the sun shining brilliantly in the next field. And so it was, that finding that he could not make sufficient money by his water-colour sketches to keep the pot boiling, he saw in the clearest manner that a competency could readily be realised if he turned his fine genius to the production of patterns for the manufacturers of shawls and the printers of dresses. Into this new occupation he flung himself with characteristic ardour, and while he encountered greater technical difficulties than he expected, his exertions were rewarded by a moderate amount of success, and finally by a burst of prosperity which was something more than success. This burst of prosperity was nothing other than a proposal by one of the most eminent manufacturing houses in Greysley, that, in consideration of 300*l.* per annum, paid quarterly, he should take up his residence in that town, and devote himself to the production of patterns under the direction of the house, and for its special behoof. On receiving this communication, Alfred Hagart all at once saw his way. He would go to Greysley; he would produce designs of the most astonishing splendour and beauty, the business of the house would increase rapidly, a partnership would be offered him out of sheer gratitude; he would accept it, wealth would flow in; on every birthday of his wife he would present her with a precious jewel; he would have ponies for his boy and girl; he would have a fine house in the country, and lying a-bed in the sunny silence of the April mornings, he would hear from afar the cawing of his own rooks; he would start a carriage, and when Miss Kate McQuarrie ate humble pie and sued for forgiveness,—ay, she would be too glad to make friends *now*,—he would spurn her advances, and freeze her with the scorn with which she had already frozen him. Alfred saw his way very clearly; he broke up his camp in London, and came down to Greysley, where he bent his neck to the yoke for the sake of 300*l.* a-year and his expectations.

It need hardly be said that these expectations were not realised. The splendid and elegant designs were produced, of course; but the business of the house did not extend with the fiery rapidity looked for; a partnership was not offered him nor even in any way suggested. On the contrary, Hagart found to his disgust that the house regarded him strictly as its paid servant, and took the liberty of instructing, directing, and even remonstrating. Several of his elegant designs the house had not the taste even to appreciate. The house, which was affable enough generally on its own premises, would pass him in the street without recognition or with the scantiest nod. The wife of the house had never called on Mrs. Hagart; had never taken the slightest interest in the children. This was hard for a man of genius to endure. Hagart grew restless, ill at ease, cantankerous. One day when the house was sharp-tempered—perhaps it had been kept waiting for breakfast, or had received a letter intimating losses—an explosion took place. There were high words, mutual recriminations, a ripping up of old sores, and the result was that Hagart nobly walked out, shaking the dust off his feet against the house, leaving behind him 300*l.* a-year and his brilliant expectations, which had of late become somewhat shadowy and wan.

I have noticed that wives of men of genius—their husbands being generally of uncertain means—have a sordid respect for fixed salaries, and consider that to secure or to retain said fixed salaries their husbands should allow their noble and delicate spirits to be fretted and wrung. Mrs. Hagart was no exception to the rule. When Alfred came home in a tempest of pride and rage, with the intelligence that he had left the service of the scoundrelly house, and scorned its wretched pittance, I am ashamed to say that his wife did not catch fire from him and blaze in company. On the contrary, the poor lady—I am afraid there must have been something grovelling in her nature, in spite of her great descent—thought only of her weekly bills, her children's wardrobe, and sat down and cried. And Alfred dried her eyes, even as the regal sun of a morning dries the eyes of the drooping flowerets with a golden handkerchief.

"What's the use of lamenting?" he said. "I have never heretofore had a chance. Till now, my light has been burning under the bushel of the house. I am a free man now. The large manufacturing towns of Greysley, Hawkshead, and Spiggleton are eagerly waiting for designs of a superior character, and I am now in a position to supply the demand. The season is about to begin, and I'll take the field with the season. I'll make money for you, Mag, more than you will know what to do with."

Alfred was radiant and confident, and what could a dutiful wife do but dry her eyes, and try and become radiant and confident also?

It was then that Alfred procured the big bare desk which stood in the big bare room which was part study and workshop, as already mentioned. Here he painted his patterns, working all day, and occasionally taking a spell at candlelight. Into this room would his wife steal twice or thrice a-day, to speak a few encouraging words, and to admire the work which happened to be in progress. On these occasions Alfred would say, "Isn't this fellow coming to his features, eh? You see the full effect dawning, don't you, eh?" or if the pattern was completed he would hold it at arm's length, look at it sideways, with one eye shut: "This fellow will make Hogg's and Blogg's mouth water; but they shan't have it under five pounds. I'll put it in the fire first."

Of course Margaret admired the patterns, whether in progress or finished, and her approval gave her husband the most genuine satisfaction. When the representative of a manufacturing house paid him a visit, Alfred received him with much dignity, and tacitly gave him to understand—sometimes told him so in so many words—that he might consider himself a favoured person in being allowed to make a purchase on any terms. This was at first, for as years went past, Alfred grew more humble, and sometimes was frank enough to admit that he needed money, and rather than not effect a sale, would let a whole lot go cheap. When patterns accumulated on his hands, he would walk across the moors to Spiggleton, hawk them through the manufacturers there, sell them for what they would bring, and walk back next day with what cash he could procure in his pocket. These walks to Spiggleton and back were fatiguing, but he declared that he had need to stretch his legs now and again—that on the whole he preferred walking to travelling by the coach, because he liked to smell the gorse, to hear the linnets sing, to watch the plovers sailing over his head, although he could have enjoyed these things almost as much on the top of the coach as on foot. Alfred, you see, had his peculiar tastes.

OUR INDIAN HEROES.

By JOHN WILLIAM KAYE.

[At a time when the great marvel of our Indian Empire is a fact rather admitted than understood, and the growing interest in its affairs is not yet sufficiently strong to satisfy itself by the perusal of elaborate works of history and biography, it has been thought that a series of brief Memoirs of the men who, at different periods, have contributed to the glory and the grandeur of our rule, would be acceptable to the public. The series, which is now commenced, will be continued, without any regard to chronological arrangement. It will embrace records of the lives of men of different professions and different characters. All that is necessary to obtain a place in the gallery is that the portrait should be the portrait of one of our Workmen in the East—of a man who has done something to construct or to consolidate our Indian Empire.]

I.—SIR HENRY LAWRENCE.

"About half-past one o'clock in the afternoon (of the 4th of May, 1799) General Baird, having completed his arrangements, stepped out of the trench, drew his sword, and in the most heroic and animating manner said to his men, 'Come my brave fellows, follow me and prove yourselves worthy the name of British soldiers!' In an instant both columns rushed from the trenches and entered the bed of the river under cover of the fire of the batteries. Being immediately discovered by the enemy, they were assailed by rockets and musketry. The forlorn hope of each attack consisted of a sergeant and twelve Europeans, who were followed by two subalterns' parties; that of the right column was commanded by Lieutenant Hill of the 74th, and the other of the left column by Lieutenant Lawrence of the 77th."—Thus wrote, in the first year of the present century, Colonel Alexander Beatson, historian of the war with Tippoo Sultan and of the famous siege of Seringapatam. Of these two lion-hearted subalterns, who had thus volunteered for the forlorn hope, the first-named went to his death. The second came out of the breach badly wounded, but alive. God had bountifully preserved him to become the father of heroes.

He had gone out to India, some years before, as a volunteer, hoping soon to receive a commission through General Floyd, an officer who had served with distinction in the first war with Tippoo. In this, however, he had been disappointed, for the military authorities in England cancelled the commission which was given to young Lawrence in India; and eventually he was compelled to purchase into the 77th Foot. With this regiment he served in different parts of India, until his gallantry at Seringapatam was rewarded by the gift of a company in the 19th.

Having recovered from his wounds, Alexander William Lawrence took to himself a wife—the daughter of a Protestant clergyman in the north of Ireland, named Knox. Their union was a fruitful one. The first-born of the family was a daughter, who in womanhood became all that an elder sister could be to her brothers, and whose good influence upon them was ever gratefully acknowledged. Then there were two sons, christened Alexander and George St. Patrick, who came in time to do good service to their country; and next, on the 20th of June, 1806, was born, at Maturah, in the Island of Ceylon, where Major Lawrence was garrisoned, another son, who was named Henry Montgomery, of whom I am about to write. His mother used in playful reference to the well-known gems of that place, to call him her "Maturah diamond."*

In 1808, Major Lawrence returned to England, and was appointed, as Lieutenant-Colonel, to a garrison battalion, then posted in the Island of Guernsey. From this place, in 1815, the three elder boys, Alexander, George, and Henry, were sent to the Londonderry diocesan school, the head master of which was their mother's brother, the Rev. James Knox. Two or three years afterwards, Colonel Lawrence bethought himself that the time had come for him to consider the means of providing for his boys; and he wisely determined to find, if he could, standing room for them on the great continent of India, where every man had a fair chance, without reference to birth or fortune, of making his way to the front. Fortunately he had some "interest at the India House." A connection of Mrs. Lawrence's family—Mr. Huddlestone—was one of the Directors of the East India Company. A cadetship was obtained for Alexander, who, in 1818, went over from Ireland and entered the Company's Military Seminary at Addiscombe. A year or two afterwards, George made a similar migration. Neither brother, however, pursued his academical career to the end. The cavalry was held to be a finer service than the artillery, and "India-House interest" availed to procure for each brother in succession a commission in the more favoured branch.

In 1820, another Addiscombe appointment was obtained for Colonel Lawrence's third surviving son; and in the August of that year Henry Lawrence entered the cadet college. Like his brothers, he was soon afterwards offered a cavalry appointment; but he said that he would rather go through his terms at Addiscombe and take his chance, than that it should be said the Lawrences could not pass an examination for the scientific branches of the service, and were therefore sent out in an arm that demanded no examination at all. So he remained at Addiscombe, doing well there, not brilliantly, and taking at the end of his time a good place among the cadets selected for the Artillery. It was a merciful dispensation that he ever lived to go up for examination at all; for it happened that one day, as he was bathing in the canal, the cramp or some other ailment seized him, and he would almost certainly have perished, but for the presence of mind of one of his comrades. A cry was raised that "Pat Lawrence" was drowning, and instantly a brother cadet, Robert Macgregor,* dashed into the water and succeeded in bringing the sinking youth safely to land. This is the one noticeable incident of Henry Lawrence's early life. At Addiscombe he was held in high esteem by his fellow-students, as a brave, honourable, and generous youth, with good intelligence, not very highly cultivated; but I do not know that any of his contemporaries predicted that he would live to out-strip them all.

---

* Henry Lawrence was the fourth son—another brother, not mentioned in the text, died in his infancy. Sir John Lawrence, the present Viceroy of India, was born in Yorkshire on the 4th of March, 1811.

In 1822, Henry Lawrence having been appointed to the Bengal Artillery, arrived at Calcutta and joined the head-quarters of his regiment at Dum-Dum. There he set himself diligently to work to study his profession, and—in this respect differing not at all from his young brother officers—longed ardently for active service. The opportunity was soon presented to him. The war with Burmah commenced, when he was a subaltern of two or three years' standing; and Lieutenant Lawrence formed part of a detachment of artillery that was sent under Colonel Lindsay, to join General Morrison's division, whose business it was to drive the Burmese out of Aracan and to join the main army at Prome. A long and harassing march, across one of the most unhealthy tracts of country in the world, brought the young soldier nearly to his grave. He recovered, however, sufficiently to be conveyed to Penang—then a favourite sanitarium; and from this place he went to China towards the end of 1826, where he found great solace in the Factory Library at Canton. But these partial changes were not sufficient for one smitten by the deadly curse of the Aracan fever; and so eventually he returned to England, for the recovery of his health.

But he was not one to be idle, because "on leave." A friend who met him for the first time at Canton, thinks that in the library there he devoted himself much to the study of works on surveying. It is certain that during his residence in England he joined the Irish Survey, and acquired much knowledge and experience that afterwards were extremely serviceable to him. This visit to Ireland had also another very happy influence on his after life, for he there formed an attachment to one who afterwards became the beloved and honoured companion of his life. When he returned to India, greatly improved and strengthened in every way, he rejoined his regiment, firstly at Kurnaul, where his brother George was stationed, and with whom he lived, and afterwards at Cawnpore, where, in 1832, he passed an examination in the native languages, and thus qualified himself for employment on the Staff. Nor was it long before—mainly, I believe, through the instrumentality of George Lawrence, who represented to Lord William Bentinck that his brother had served with the Irish Survey—Henry was appointed as an assistant to the great Revenue Survey of India, which was instituted in 1833. His head-quarters were at Goruckpoor. There, under happy auspices, he renewed and cemented his friendship with Mr. Reade of the Bengal Civil Service, whom he first met at Canton and afterward at Cawnpore—a friendship which was broken only by death.

"At Goruckpoor," this gentleman tells me, "his house and mine were in adjacent compounds. A plank bridge led from the one to the other, and my kitchen was midway between the two domiciles. Lawrence, who in those days seemed to live upon air, and was apt, in the full tide of his work, to forget every-day minor matters, used frequently to find that he had no dinner provided, though he had asked people to dine with him; and we used to rectify the omission by diverting the procession of dishes from the kitchen to his house instead of to mine. My inestimable major-domo had wonderful resources and an especial regard for Lawrence. The gravity of manner with which he asked in whose house dinner was to be laid was a frequent source of amusement. We had other matters besides a kitchen and buttery in common. He had taken by the hand a young man, who had been in the ranks, by name Pemberton, who afterwards rose in the Survey Department. At the same time I had charge of a young fellow whose discharge from a regiment had been recently purchased by his friends. Interested in this young Scotch student who had found his way to India by enlisting in the Company's Artillery, Lord Auckland had recently emancipated him, and sent him up the country, to be master of the English school at Goruckpoor. To that school, Lawrence, who was greatly interested in it, and who supported it with personal aid and liberal pecuniary contributions, gathered all the boys of poor Christian parents to be found in the cantonment and station, and thence transplanted them, with some of the more intelligent lads of the city, to the Survey Office. Some of the former were little fellows—so little, indeed, that Mr. Bird used to call them 'Lawrence's offsets;' but his care of them was as kind as his teaching was successful. He had a tattoo (pony) for each of them, and relieved the labours of the desk by hurry-skurrying them over the country. I note these particulars," continues my informant, "because in comparing the experiences we elicited of inner barrack life from the young men above mentioned, as we often did, in the teaching and manipulation of the said offsets, and the satisfactory result, I think we may trace the germ in Lawrence's mind of the noble design of the great establishments imperishably associated with his name."

---

* I cannot deny myself the pleasure of naming the young hero who did this good thing, though the modesty of his nature may protest against the publicity. The Robert Macgregor of the text is Major Robert Guthrie Macgregor, formerly of the Bengal Artillery, a man distinguished in many honourable capacities, and not least in that of a scholar and a poet. His admirable volume of translations from the Greek Mythology, recently published, is one of those ever pleasant and acceptable instances of the successful cultivation of literature by men of active business habits and eminently useful lives.

These were the famous Lawrence Asylums of which it is now time to speak. Almost ever since he had entered the service, the "cry of the children" had been continually sounding in his ears. A voice had come to him from the Barrack Square, appealing for help ; and it had become the darling wish of his heart to respond to it in a befitting manner. The state of the children of the European soldiery was, indeed, such as to move the compassion of all who had eyes to see and faculties to comprehend. Even under the happiest circumstances, with all the appliances which wealth could furnish for the mitigation of the exhausting effects of the climate, European children in India were at best sickly exotics. They pined and languished, with pale faces, weakly frames, and fretful tempers. Not easily preserved were the lives of these little ones, though tenderly nurtured and jealously protected against all adverse influences ; amidst the draggings-up of the barracks it was a mercy and a miracle if any were preserved at all. The mortality among the children of the European soldiery was, statistically, "frightful"; but more frightful, perhaps, the life of the few who were rescued from death. The moral atmosphere of the Barrack Square was not less enervating and destroying than the physical ; for the children saw and heard there what should not have been revealed to their young senses ; and the freshness and beauty of innocence were utterly unknown among them. Seeing this, and thinking over it, very wisely and compassionately, Henry Lawrence, whilst yet a young man, conceived the idea of rescuing these poor children, body and soul, from the polluting atmosphere of the barracks, and he ardently longed for the time when, out of the abundance of his own store, he might provide healthy and happy homes for these poor neglected little ones. To transport them from the plains to the hills, to place them under proper guardianship, to give them suitable instruction and ample means of innocent recreation—these were his cherished projects. He saw how easily it could be done—how great a blessing it would be when done; and he determined that, should God ever grant to him worldly wealth, he would consecrate a portion of it to the rescue of the children.

And, doubtless, among the honourable incentives to exertion which were ever urging Henry Lawrence forward in the right road, the thought of the good that he might thus accomplish was not the least powerful. But the attainment of this great object was yet remote, though his foot was firmly planted on the ladder of promotion; for there was one nearer and dearer to him, who needed his help, and his first care was to provide for her. The death of his father had greatly reduced his mother's income; and the Lawrences—not Henry only, but he and all his brethren in India—were contributing from their pay, not at that time in any case very large, more than enough to make her declining years, in all outward circumstances, easy and prosperous. In this good work Henry was very active; and one who, at the time of which I am now writing, helped him in the matter of remittances, and took counsel with him as to the best means of providing additional comforts for the widowed lady, says that he had then, in this holy work, "the fervour of an apostle and the simplicity of a child."

Much might be written about this period of his career—about the days when Lieutenant Lawrence threw all his energies into the survey-work entrusted to him, and was so prompt, it may be said so explosive, in his operations, that Mr. James Thomason, afterwards Lieutenant-Governor of the North-Western Provinces, referring partly to his profession and partly to his bursts of activity, which carried everything before them, nicknamed him "Gun-powder." Those were happy days with him, for they were the early days of his married life. No man could have found a fitter helpmate than Henry Lawrence found in his cousin, Honoria Marshall. The highest and holiest Christian virtues were combined in her with great natural intelligence improved by successful culture. Her energies were scarcely inferior to her husband's; and, perhaps, he mainly owed it to her that literature, in after years, became the recreation, as it was one of the greatest solaces of his life. But there was too much active work for him at this time to leave much time for the study of books. A new field was stretching out before him. Whilst still in the Survey Department, in 1838, the "Army of the Indus" was organised for the invasion of Afghanistan. Eager for active service, Henry Lawrence joined Alexander's troop of Horse Artillery, which formed part of the original force. But it was afterwards ordered to stand fast; and though for a while he was disappointed, the disappointment paved the way to better things. It was at this time that Henry Lawrence attracted the attention of Mr. (now Sir George) Clerk, who for many years ably represented British interests on the North-West frontier of India, and secured to himself, as few have done, the unbounded confidence both of the white and black races. He saw in the artillery subaltern the stuff of which the best political officers* are made, and obtained his appointment as an Assistant to the Frontier Agency.

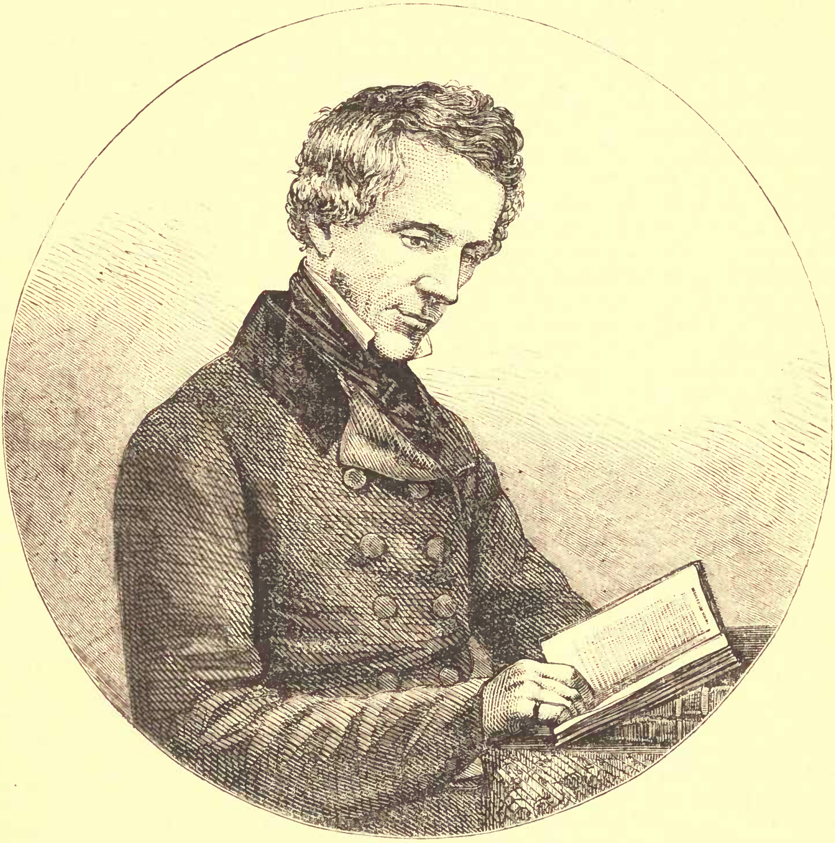
---

* To the majority of English readers this phrase will require some explanation. What in India are called "political officers," or sometimes "politicals," are officers who superintend our diplomatic relations with the native states of India, and are often largely concerned in their administration.

The war in Afghanistan was a grand success. The war in Afghanistan was a gigantic failure. George Lawrence, who was then the Military Secretary of the ill-fated minister, Sir William Macnaghten, was endeavouring, with every prospect of a favourable result, to obtain employment for his brother in the Anglo-Douranee Empire, when the prodigious bubble burst; and the whole country was deluged with blood. An army of retribution was then organised, and with the force under General Pollock went a Contingent of Sikh troops. With this Contingent it was necessary to send a British officer, nominally to be the medium of intercommunication between the British and the Sikh commanders; in reality to hold the latter to his allegiance and virtually to command the force. To this post Captain Henry Lawrence was appointed. It was one, the duties of which required the exercise of as much tact and forbearance as of constancy and courage. The work could not have been better done; and the Sikh Contingent, which under other guidance might have been a serious impediment to our success, really contributed essentially to it.

After the return of the armies to the British provinces, there was a brief interval, during which it appeared that the good services which Lawrence had rendered to his country were not likely to meet with adequate reward. But, after a while, Lord Ellenborough selected him to fill the important, and well-salaried office of Resident at the Court of Nepaul. There was not much active work to be done at Katamandoo. It was the duty of the Resident, at that time, rather to wait and watch, than to interfere over-much in the affairs of the Court of Nepaul. So Henry Lawrence at this period of his career had more time professionally unoccupied than at any other. That he would turn it to good account in one way or another was certain. The way was soon determined by an accident. A quarterly publication, entitled the *Calcutta Review*, was at this time established in the Indian metropolis, and Henry Lawrence, liking the design, supported it with characteristic fervour. He generally contributed two or three papers to each number of the Review. His fertility, indeed, was marvellous. I have a letter before me, in which he undertakes to supply to one number four articles, comprising a hundred and ten pages. His contributions were gravid with matter of the best kind—important facts accompanied by weighty opinions and wise suggestions. But he was always deploring, and not without reason, his want of literary skill. There was, indeed, a charming candour and modesty about him as a writer: an utter absence of vanity, opinionativeness, and sensitive egotism about small things. He was eager in his exhortations to the editor to "cut and prune." He tried hard to improve his style, and wrote that with this object he had been reading Macaulay's Essays and studying Lindley Murray. But, full of solid information as they ever were, the articles more than repaid any amount of editorial trouble, and when they appeared, were generally the most popular contributions to each number of the Review. He continued to the end of his life to contribute at intervals to this publication, and was, when the rebellion of 1857 broke out, employed on a review of the "Life of Sir John Malcolm." But it was at Nepaul that his literary activity was at its height, and it was truly an important incident in his career. It happened that at this time (1844-45) the Punjab was in a state of extraordinary commotion. There had been a succession of sanguinary revolutions. One ruler after another had been swept away by the hand of the assassin, and as the government had grown weaker and weaker, the army had waxed stronger and more insolent, until at last the military power thoroughly overbore the State. That in this state of affairs, the lawless Prætorian bands, who had long been vapouring about marching down to the sack of Delhi and the pillage of Calcutta, would some day cross the Sutlej and attempt to carry their threats into execution, had now become almost a certainty. The British and the Sikh powers were about to come into collision, and it behoved our rulers, therefore, to think well of the work before them, and to learn all that could be learnt regarding the country and the people with whom, whether in peace or war, for good or for evil, we were now about to be nearly connected. The best and the freshest information on the subject was to be found in Lawrence's articles in the *Calcutta Review.* The Governor-General, then Sir Henry Hardinge, read them with great interest and attention, and saw at once that the writer possessed that practical knowledge of men and things that, in the conjuncture then approaching, would render him an invaluable auxiliary, and he longed for an opportunity to call Lawrence to his presence.

The opportunity was not long wanting. From his pleasant retirement, from his library, his review-writing, from the dear companionship of his wife, and from the thought of his darling project of the asylum which was to shelter and to save the children, Henry Lawrence was summoned, as the new year (1846) dawned, to the north-western frontier. The Punjab was in a blaze; the Sikh army, after much vapouring and vaunting, had crossed the Sutlej; and the Commander-in-Chief, with the Governor-General as his second in command, had fought two bloody battles crowned by no more than dubious victories. On those hard-fought fields the two chief political officers of the British Government, Broadfoot and Nicolson, had been killed; and the choice of the Governor-General had fallen upon Henry Lawrence, as the man who seemed to be best fitted to take the direction of the diplomacies of the frontier. This was indeed a spirit-stirring summons, and one which was responded to with an alacrity which overcame all obstacles; and ere the Sikh and British armies again came into hostile collision, Henry Lawrence was in the camp of the Governor-General. He saw the great battle of Sobraon fought—that battle upon which turned the fortune of the Empire of Runjit Singh. It was a battle not only hotly contested, but fairly fought. It was said afterwards that some of the leading Sikh chiefs had betrayed their countrymen and sold the battle to the English. I know how this unworthy imputation grieved the spirit of Lord Hardinge, for he was a man of a noble nature, and incapable of conniving at an act of baseness. That the charge was untrue, History may now, after the lapse of twenty years, solemnly declare. If any man had a right to speak on such a subject, it was Henry Lawrence; for the negotiations must have been carried on through him, as our chief diplomatic agent. His denial of this treachery was ever most emphatic. "Let me," he wrote to the author of this Memoir some years afterwards, "in opposition to Cunninghame, Smyth, and the whole Indian press, distinctly state that Ferozshuhur, Sobraon, and the road to Lahore were not bought; that at least there was no treachery that I ever heard of; that though I was with the army as political agent twenty days before the battle of Sobraon, I had no communication whatever with Tej Singh, until we reached Lahore; and that although Lal Singh had an agent with me, he (Lal Singh) sent me no message and did nothing that could distinguish him from any other leader of the enemy."



Sir Henry Lawrence, from a Photograph.

The battle of Sobraon having been fought and won, there were those in the camp of the Governor-General and Commander-in-Chief who believed that the war was only then commenced, and that it would be necessary to march into the Punjab with a large army and a train of two hundred guns for the siege and capture of Lahore and Umritsur—the one the temporal, the other the spiritual capital of the Sikh Empire. But Henry Lawrence told the Governor-General that the war was over; that there would not be another shot fired. The portfolio was now to be opened, and our policy worked out in peace. And he was right. The policy was a policy of moderation and forbearance, not wanting either in worldly wisdom. The seizure of the Punjab and its incorporation with the British dominions, at that time, though insisted upon by many then and afterwards as a thing that ought to have been done, would not have been just if it had been practicable, and would not have been practicable if it had been just. It was, in fact, neither the one nor the other; so Henry Lawrence counselled, not the annexation of the Punjab, but the reconstruction of the Sikh government, fenced in and fortified by British bayonets. But the materials from which the edifice was to have been built were utterly rotten, and the experiment was a failure. All through the year 1845, it was gradually but certainly going to pieces. During that year, Henry Lawrence held the post of "Resident" at Lahore; but he was not one to sit idly at the capital, when there was active work to be done in which his personal influence might be turned to good account. He spent three months at Lahore, keeping, by the exercise of that rare union of gentleness and vigour which distinguished his character, the turbulent elements of its varied population in control, and on one occasion at least being in danger of losing his life, at the hands of a fanatical and excited population. This was in April, 1846. In the following month he was journeying in advance of a British force towards the almost inaccessible heights of Kote-Kangra. "Kangra," he wrote to me, "is a Gibraltar. It is five miles round, and has one accessible point, which is defended by thirteen gates, one within the other." This fortress stood within the line of a tract of country which the Sikh government had undertaken by treaty to surrender to the British, but the Sikh commandant, moved by the fine old nationality of the Khalsa, declared that he would hold out to the last, unless Runjit Singh himself appeared, to demand from him the keys of the place. But there was no point which the Bengal Artillery could not reach; and before the end of the month of May, aided by the appliances of elephant draught, our heavy guns had toiled up the formidable ascent of that precipitate rock, and the fortress was surrendered without a siege.

Another memorable incident of this period of Lawrence's career was his visit to Cashmere—the country of Gholab Singh—a country which he had before much studied and written about, and had long desired to see with his fleshly eye as he had comprehended it with the eye of his imagination. Of the political circumstances of the journey I have not space to speak. Yet was the fact altogether one of the most remarkable incidents on record of the moral power which such a man as Lawrence may exercise over the Princes of India. He induced the great Jummoo chief to abolish suttee, female infanticide, and slavery, throughout his dominions. And he so interested the Rajah in his great project of the asylum on the hills for the children of the European soldiery, that the Hindoo chief eagerly offered to contribute largely to the scheme, and by his munificence helped to bring it to perfection. In this necessarily brief record of a good man's career, there is some fear lest, as I advance, the history of Henry Lawrence's charities should be overborne by the more stirring incidents of his active life. It may, therefore, be set down here that the long-cherished design of establishing at a healthy hill station an asylum for the children of our European soldiery was fully realised, and that from this time he began to see the good fruits of his beneficence fairly before him. How many healthy and happy children, now grown or growing into useful members of society, have had reason to bless the name of the man who shared his prosperity with them. He had now abundant means of doing good, and he gave unstintingly from his worldly store; exciting others, by his great example, to do likewise. So the Lawrence Asylum flourished—a great fact—and grew in usefulness as its founder grew in years; until, when his work was done, the Government did honour to his memory by adopting it as their own, and providing for it at the public expense.

After this there was what appeared to be a lull; and so Henry Lawrence, whose health had been much shattered by the work of the last few years, was counselled to resort to the only effectual remedy—a visit to his fatherland. His wife had been driven home some time before; and the Governor-General, now Lord Hardinge, was turning his face homewards, and had asked Lawrence to accompany him. There was no man in all India whom that fine old soldier more admired or more trusted; no one beyond his own family circle whom he more dearly loved. The affection was reciprocal. If inducement had been wanting, the invitation thus given to Lawrence to become the travelling companion of his honoured chief would have rendered the measure of his temptations irresistible. As it was, his sense of duty, his strong conjugal affection, and his devotion to the best of leaders, all lured him away for a time from the destroying climate of the East. The great year of revolutions had dawned upon Europe when Hardinge and Lawrence traversed the Continent and confronted the first gatherings of the storm. But without accident or interruption they reached England—to the younger man almost a new, and quite a strange world, for he had not seen it since his youth, and he was then in his forty-second year.

There were those, who then seeing him for the first time, were struck by the remarkable simplicity and unworldliness of his character. No man ever cared less for external appearances. There was no impatience, no defiance of the small conventionalities of life, no studied eccentricity of any kind, but his active mind, ever intent upon great realities, overleapt the social surroundings of the moment. I well remember how, on the day after his arrival in London, as we walked up Regent-street together, and met the usual afternoon tide of well-dressed people, he turned upon me an amused and puzzled look, and saying, with a humorous smile, that all those fine people must look upon him as "a great guy," asked if there was any place near at which he could purchase an overcoat or cloak to hide the imperfections of his attire. It had dawned upon him that in his antiquated frock-coat, and the old grey shepherd's plaid crossed over his chest, he was very much unlike other people; and as a few paces onward brought us in front of Nicol's great shop, he had soon exchanged his plaid for a fashionable paletot, and asked me "if that was something more like the thing?" I do not think that he cared much more for titles than he cared for dress. When, shortly after his return to England, the Queen, on the recommendation of Lord Hardinge, appointed him a Knight Commander of the Bath, though he rejoiced, as a loyal and devoted subject, in his sovereign's recognition of the work he had done, he appeared to be in no hurry to adopt the new prefix to his name, but rather to cling to his old designation of "Colonel Lawrence." For general society he had no taste, and he was glad, therefore, to escape from the bustle and excitement of the capital, and to seek restored health in the country, and happiness in the companionship of the nearest and dearest of his friends.

But it was permitted to him to enjoy only a brief season of repose. Before the trees were bare in that memorable year 1848, news had arrived from India which stirred the very depths of his nature, and prompted him again to be up and doing. The Punjab was again in a blaze. The forbearance of the British Government had been exercised in vain. The experiment of a Council of Regency had failed, and once again there was an appeal to the stern arbitrament of the sword. Then Henry Lawrence felt that his proper place was where the war was raging. He had not yet regained his health. Loving friends and wise physicians alike counselled him that there was danger in a precipitate return to India; but he knew that there would have been greater danger in a protracted sojourn in England, for inactive at such a time, he would have chafed himself to death, beaten his very life out against the bars of his cage. Still it was a hazardous experiment upon the physical capacities of his shattered frame, and when I bade him farewell on the platform of the Southampton Railway, I felt that there was nothing, under Providence, to carry him through the work before him but the invigorating and sustaining power of the work itself, the strong mind repairing the waste of the feeble body. And so it was. Before the end of the year he was at Mooltan, whence he pushed on to the camp of the Commander-in-Chief, and arrived to see the disastrous battle of Chillianwallah fought by the British and Sikh armies. He held no recognised position there, civil or military, but he rendered by his presence an important service to the State; for a few words spoken by him at the right time saved the military commander from committing a stupendous error. After the battle, which both sides claimed to have won, Lord Gough proposed to withdraw his army some five or six miles from the scene of action, for the sake of obtaining better fodder for his cattle. Against this Henry Lawrence warmly protested, saying that if the British fell back at such a time even a single mile, the Sikhs would accept the fact as an evidence of our defeat, and take new heart and courage from our retrograde movements. Nay, more; it might be said from one end of India to the other, that the English had retired beaten from the contest in confusion and dismay. These arguments prevailed; the British army remained on its old encamping ground, and at worst it could only be said that there was a drawn battle.

It need not be told in this place how the errors and disasters of Chillianwallah were retrieved by the crowning action of Goojerat, which placed the Punjab at the feet of the English conqueror. Sir Henry Lawrence had by this time resumed his post as Resident at Lahore, and plainly now there was great work before him. But what was to be the immediate result of conquest? As the decision rested with the Governor-General of India, and Lord Dalhousie was that Governor-General, there could be little doubt of the answer to be given to the question. Indeed, ever since the Sikh Sirdars had drawn the sword against us, and thus proclaimed the failure of our half measures, good and wise as they were, it seemed that there could be but one issue of the war. Few men could see any other possible solution of the difficulty than the annexation of the Punjab; but among those few was Henry Lawrence. "I am sorry," he wrote to me from the Commander-in-Chief's camp, "that you have taken up the annexation cry. It may now, after all that has happened, be in strictness just; but it certainly is not expedient, and it is only lately that I have been able to bring myself to see its justice." But the Punjab was annexed; the empire of Runjit Singh became British territory; and from that time the name of Lawrence was indissolubly associated with the government of our great new province.

The affairs of the Punjab were now to be administered under the superintendence of a Board, of which Sir Henry Lawrence was to be President. Associated with him were his brother, Mr. John Lawrence, then a rising civilian on the Bengal Establishment, and Mr. Mansel, of the same service. Under the controlling authority of these able and experienced men were a number of younger officers of mark and likelihood, many of whom have since risen to distinction. Never was a difficult task more successfully accomplished. All the turbulent elements of Punjabee society were now to be reduced to quietude and serenity; out of chaos was to be evolved order; out of anarchy and ruin, peace and prosperity. Since the death of Runjit Singh, there had been no government in the Punjab with the strong hand by which alone all classes could be kept in due subordination to each other; and the soldiery had therefore been dominant in the State. Their power was now broken; for the most part, indeed, their occupation was gone. But hence the danger of "disbanded soldiers; factions grown desperate;" and the great question was how these prætorian bands, and the Sirdars, or privileged classes, were to be dealt with by the new Government. If there was one man in the country better qualified than all others to solve in practice that great question, it was Henry Lawrence; for with courage and resolution of the highest order, were combined within him the large sympathy and the catholic toleration of a generous heart. He could feel for those who were stricken down by the strong arm of the stranger, even though they had drawn the sword against us—feel as a man may feel when another stronger than he cometh and taketh all that he hath. So he tried to deal tenderly with the Sikh chiefs in their fallen fortunes, and to provide honourable employment for as many as could be brought into the service of the new Christian government. What he did in this way, and how he wrought mightily to make British rule a blessing to the people, may be best told by himself. Whatsoever might have been his opinions on the subject of annexation, he said truly that he "had worked honestly to carry out the policy ordered." In the many-sidedness of the work done we see epitomised a history of British progress in the East—we see the manner in which men reared under that great "monarchy of the middle classes," which so long held India as its own, did, by dint of a benevolence that never failed, an energy that never tired, and a courage which never faltered, let what might be the difficulties to be faced, or the responsibilities to be assumed, achieve those vast successes which are the historical wonders of the world.

"I have been twice all round the Punjab," he wrote to me, after giving a detailed account of the progress of the administration, which it is a mortification to me to be necessitated to omit, "visiting every station, and staying at each a few days. I have not missed one; and though I have not travelled in the usual style of Indian governors, or indeed in the style of most Collectors, I have managed to see everything, from the bottom of the salt mines at Pindadun-khan and Kohat, to Ladakh and Ishardo, on Golab Singh's Northern frontier. Each year I have travelled three or four months, each day riding usually thirty or forty miles, with light tents, and sometimes for days with none at all. Thus I last cold weather rode close round all the frontier, visiting every point of interest, and all our posts, small and great, and riding through most of the passes, from Huzara, by Yuyufzye, Peshawur, Kohat, and the Derajat, down to the Scind Border. Each day we marched fifteen or twenty miles, sending tents on direct to the next ground, and ourselves riding long circuits, or from the new ground visiting points right or left. At stations, or where anything was going on, we halted one, two, or three days, visiting the public offices, jails, bazaars, &c., receiving visitors of all ranks, and inspecting the Punjab regiments and police, and receiving petitions, which latter were a daily occurrence, sometimes a couple of hundred coming in."

Upon such men as Henry Lawrence, work of this kind had ever a bracing and invigorating effect. He could toil early and late, so long as he was conscious of the ability to do good, and could feel that he was in his right place. But even whilst he was thus taking stock of past and estimating future beneficences, a heavy cloud was rising which soon overshadowed the serenity of his mind. Although never perhaps had a little band of English administrators done so much good within so short a space of time, there was something in the machinery of the administration which the Governor-General did not wholly like. He thought that it would be better if at the head of the government of the Punjab there were, not a Board of three Commissioners, but a single Commissioner with undivided authority. Perhaps if all the members of the Board had been like-minded, and the image of their minds had been a reflection of his own, Lord Dalhousie might not have been so eager to change the system. But there were fundamental diversities of opinion on some important questions, and the Board did not therefore work very harmoniously in itself, nor in all respects concordantly with the views of the Governor-General. The fact was, that the chivalrous spirit of Henry Lawrence was grieved by the prostration of the Sikh nobility and the ruin of the privileged classes, and that he was fain to lend them, when he could, a helping hand in the hour of their need. And he did so; too liberally to gain the full concurrence of his brother, or the approval of Lord Dalhousie. The conflict in such a case as this is commonly between the head and the heart. Henry Lawrence felt, Lord Dalhousie thought; the one sympathised, the other reasoned. It is doubtless an evil of no small magnitude, that when by the strong arm of conquest, or by the more delicate manipulations of diplomacy, we gain possession of an Indian principality, we find ourselves with the entire responsibilities of the government on our hands, and yet, owing to the number of importunate claims to be heard and vested interests to be considered, with only, if we are compassionate, a portion of the revenues at our disposal for purposes of administration. To have money in the treasury is to have the means of doing good; and it was argued, with some show of reason, that it was not right to injure the many for the benefit of the few. If so much revenue were alienated in the shape of grants of rent-free land, or pecuniary pensions, the amount must be made good from some source or other—either from the particular revenues of the province, or from the general revenues of the Empire. The tax-paying community, somewhere or other, must suffer in order that a liberal provision may be made for the old aristocracy of the land. Thus Mr. John Lawrence argued; thus Lord Dalhousie argued. Moreover, with the latter it was a great point to prove that the Punjab was a profitable possession. But Henry Lawrence could sympathise with all classes; and he could plainly see that, even on economical grounds, it is sound policy, on the first establishment of our rule in a new country, to conciliate the native aristocracy. "So many overthrown estates," says Bacon, "so many votes for troubles." Internal peace and order are economical in the long run, though the contentment to which they are due be purchased in the first instance at a high price. This was the great point on which the brothers differed. Lord Dalhousie sided with John. When, therefore, the Board of Administration was sentenced to death, it was plain that Lord Dalhousie desired to place the supreme direction of affairs in the hands of the civilian, and to find a place for the soldier in another part of the country.

Henry Lawrence, therefore, offered to resign: John Lawrence did the same. The Governor-General unhesitatingly chose the latter, as the fitter agent of his policy; and the elder brother was appointed to represent British interests in the States of Rajpootana. Lord Dalhousie endeavoured to reconcile Henry Lawrence to this decision, by saying that the time had arrived when the business to be done was rather that of civil administration than of military or political government, and that therefore he had selected the civilian. But I think that this only added new venom to the poisoned dart that was festering in him. He was deeply and most painfully wounded. "I am now," he said, "after twenty years of civil administration, and having held every sort of civil office, held up as wanting civil knowledge . . . As for what Lord Dalhousie calls training, I had the best sort. I trained myself by hard work, by being put into charge of all sorts of offices, without help, and left to work my way. I have been for years a Judge, a Magistrate, a Collector, for two years a Chief Commissioner, for five years President of the Board. I am at a loss to know what details I have yet to learn." But although he never ceased to feel that a great injustice had been done to him, he was sustained by that high sense of duty which was the guiding principle of his life; and he took large and liberal account, with all thankfulness, of the many blessings vouchsafed to him. "If," he said, "from one man I have received less than my deserts, I have from many better men received more than was my due, and in my private relations I have been blessed as few men have been."

So Henry Lawrence turned his back upon the Punjab, and set forth on his way to Rajpootana. Once within the Rajpoot territory, he began his work. "On my way from Lahore," he wrote, "I went about right and left, so as to pay a flying visit to the chief cities of Rajpootana, as Jeypoor, Joudhpoor, Ulwar, Bhurtpore, &c., and have thereby been able to sit down quietly here ever since. On my rapid tour I visited, to the surprise of the Rajahs and political agents, all the jails, or dens called jails, and by describing them since, I have got some hundreds of wretches released, and obtained better quarters and treatment. In the matter of jail discipline the North-West Provinces are behind the Punjab, and even there every step taken by me was in direct opposition to almost every other authority." There was much work of all kinds to be done in Rajpootana—much of it very up-hill work. Traditionally the Rajpoots were a brave, a noble, a chivalrous race of men, but in fact there was but little nobility left in them. How to deal with them was a problem which had perplexed British statesmen before the days of Henry Lawrence, and, although he now addressed himself to its solution with all the earnestness of his nature, he was obliged to confess that he made little progress. "As is usual with me," he wrote after he had been some time in Rajpootana, "it has been a year of labour, for here I have had everything to learn. Heretofore I have had chiefly to do with one, and that a new people; here I have twenty sovereign states as old as the sun and moon, but with none of the freshness of either orb. My Sikh experience gives me very little help, and my residence in Nepaul scarcely any in dealing with the petty intrigues and foolish pride of these effete Rajpoots." There were two matters to which he especially addressed himself at this time,—one, the abolition of widow-burning, still very prevalent in Rajpootana; and the other, a thorough reformation of the prison-discipline of the States, which was then an offence to humanity. He had always a strong feeling of compassion, such as stirred the depths of Howard's heart, for the wretched prisoners, who were huddled together in the jails without any classification of criminals of different degrees or even of different sexes, and he wrote that by simply, during a rapid tour, going once into every jail, and on his arrival at Mount Aboo writing a circular, remarking that in different jails he had seen strange sights that must, if known to beneficent rulers, revolt their feelings, he managed to effect some considerable reforms, and to do great service to humanity.

But although in these ancient Rajpoot States there was much room for the exercise of his chivalrous benevolence, he did not greatly rejoice in the office that he held, for he never ceased to think that he had been "shelved." But his residence in Rajpootana was associated with even a more bitter trial. In that country his beloved wife, whose health had never been good in India, sickened and died. It was a heavy—a crushing blow; and, though he bowed himself resignedly to it, "the difference" was keenly felt by him in every hour of his life. The loss of his helpmate preyed upon his spirits, and sorely affected his health. In his affliction, he sometimes turned for relief to the thought of his children, and meditated a visit to England to embrace them there; at other times he turned to contemplate the great restorative of strenuous action, and longed for some new field on which to exercise his manly energies, and in the proud satisfaction of duty done to find some solace for his private griefs. He hoped that the annexation of Oude would afford him just the exciting work that he coveted. So, when Sir James Outram was driven home by failing health, he offered to take his place at Lucknow. But the offer came too late. A civilian had been appointed to the post; and so Sir Henry Lawrence fell back upon the alternative of a visit to England; and he was about to carry the design into execution when circumstances arrested the homeward movement.

The administration of Mr. Jackson in Oude was not successful. A man of undoubted ability and unquestioned integrity, he wanted temper and discretion; moreover, he wanted sympathy; so he quarrelled with his subordinates, and failed to conciliate the privileged classes, whom it was the inevitable tendency of the introduction of British rule to impoverish and humiliate, and who ought to have been dealt with gently and generously in their misfortunes. So after a while Lord Canning, seeing that affairs were rapidly drifting from bad to worse, removed Mr. Jackson from the Oude Commissionership, and appointed Sir Henry Lawrence to his place. No better selection could have been made, but the wisdom of the act was marred by one fatal defect: it was "too late." When the new Commissioner reached Lucknow, he found that almost everything that ought not to have been done had been done, and that what ought to have been first done had not been done at all, and that the seeds of rebellion had been sown broadcast over the land. He saw plainly what was coming. On his journey to Oude he spent some little time with an old and honoured friend—the friend to whom I am indebted for the account of Lawrence's Goruckpore days—and he told the civilian that the time was not far distant when he (Mr. Reade), with the Lieutenant-Governor and other big Brahmins, would be shut up in the fort of Agra by a rebellion of the Native Army.

But the appointment pleased him. No higher proof of the confidence of the Governor-General could have been afforded to him; no more important duties could have devolved upon him. How he wished that he had gone there a year sooner! But he did all that could be done to repair the errors of the past. He found the aristocracy—the princes and the nobles of the land—bowed down to the dust, keeping body and soul together—men and women alike, of high birth, with the best blood in their veins—by selling their shawls and jewels after dark in the bazaars. At once he took up a duty so mercilessly neglected by his predecessor, and began, without wasting time on preliminary enquiries—for investigation and starvation in such cases are synonymous—to pay the stipends of the old nobility. But it was not in mortal power to arrest the growth of the rebellion, which was then striking deep root in the soil. In other parts of the country the disaffection which was exhibiting itself in the spring of 1857, might be nothing more than military mutiny—a mere professional agitation, accidental, superficial; but in Oude there was small likelihood of its stopping short of a national insurrection. Firstly, it was plain that the introduction of British rule had turned against us all the great territorial chiefs—feudal barons with large bodies of armed followers—and all the once powerful classes which had been maintained in wealth and luxury by the Court of Lucknow. It was plain also that the disbanding of the old native army of Oude had scattered over the country large numbers of lawless and desperate men, owing their ruin to the English usurpation. But, plainest of all was the fact, that a large proportion of the Sepoy army of Bengal was drawn from the small yeomanry of Oude; that the province was indeed the great home of our native soldiery, and that in every village there were numerous families sure to sympathise with the discontents, and to aid the efforts of their sons and brothers in the Company's army.

When therefore the storm burst, and it was certain that a crisis had arrived which would call forth all the energies of the English in India for the maintenance of our dominion, there was no single point of danger to which men's minds turned with deeper anxiety than to Lucknow; but over this anxiety there came an inspiring feeling of confidence when they remembered that Henry Lawrence was there. To the Governor-General this was an especial source of consolation. One of the earliest incidents of the military mutiny was an outbreak in an irregular native regiment posted near Lucknow. With this Lawrence had grappled promptly and vigorously, in a manner which had won general admiration. Lord Canning saw clearly then that the right man was at the point of danger; and when Lawrence telegraphed to him, saying, "Give me full military authority: I will not use it unnecessarily," the Governor-General did not hesitate to place the chief direction of military as well as of civil affairs in the hands of the Commissioner. With this full responsibility upon him, he moved freely and without embarrassment. He could look with the soldier's and with the statesman's eye at the appearances before him; and he was as competent to deal with details of military defence, as to accommodate in other matters the action of his government to the political temper of the times. Preparing to meet the worst emergencies that could arise, he provided for the security of the European garrison; but he endeavoured at the same time to conciliate all classes, and especially to wean the minds of the soldiery from the apprehensions which had taken possession of them with respect to the safety of their caste. It was soon, however, apparent that nothing could be done by exhortations or persuasions—by promises of rewards to the faithful or threats of punishment to the unfaithful. Neither words nor money nor dresses of honour could avail. Nothing but the stout heart and the strong arm could, under Providence, help the English in the extremity of their need.

It would be vain to endeavour in such a memoir as this to narrate the incidents of the defence of

Lucknow, even in so far as Sir Henry Lawrence was connected with them. That story belongs to history. How wisely and assiduously he laboured, with what untiring energy and devotion, in spite of the failure of the frail flesh, has been told by more than one of his comrades. He was in feeble health when first he went to Lucknow. It had been his intention to proceed to England for awhile, partly to recruit his strength and partly to direct the final studies of his son, then about to enter the Indian Civil Service, when the offer of the Oude Commissionership arrested his homeward movements and braced him up awhile for the continuance of his work. But the hot weather coming in with such a crowd of anxieties, tried him severely; and it was plain to those who were about his person that mind and body had been tasked overmuch. "The ordinary labours of his office," wrote one who was continually in official association with him, "had fully tried his strength; but the intense anxiety attending his position at the present crisis would have worn the strongest frame. At first he was able to ride about a good deal, but now he drove about in his carriage. He lost appetite and sleep, and his changed and careworn appearance was painfully visible to all." But he worked on; and when, in the second week of June, such an alarming state of exhaustion supervened that his medical staff cautioned him that further application to business would endanger his life, he could with difficulty be persuaded to lay aside his work for a little time, and on the first symptom of a slight accession of strength, returned eagerly to his duties. Active among the active, as a soldier he was ever in the front and in the midst of danger.

"Sir Henry Lawrence is doing admirably at Lucknow. All safe there."—Such were the words in which letter after letter from the Governor-General to the authorities in England communicated the confidence felt by Lord Canning in the Oude Commissioner. And so fully was that confidence shared by the Home Government, that when the Court of Directors and the Queen's Government, warned by the critical state of our relations in India, found it necessary to nominate a new Governor-General provisionally, in the event of the death or the retirement of Lord Canning, they had no hesitation in selecting Sir Henry Lawrence as the man to whom above all others they could most confidently entrust in that emergency the supreme direction of affairs.

But it was the saddest thing of all—nothing so sad in the history of the calamities of the Indian Mutiny—that he never lived to place this crown upon his brows. Such a recognition at the last would have healed all his old wounds: would have been ample compensation to him for all the crosses he had endured. No soldier of the Company's army had ever been so honoured. Of all the Englishmen in India, he was held to be the one best able, in a crisis of unexampled magnitude, to hold the helm and weather the storm, if by any mischance or caprice Canning had been removed from the scene. All that his honourable ambition ever sought would have been thus attained, and in the completeness of his career he would have found perfect satisfaction. But it was otherwise ordained by God. On the 2nd of July, as he was lying on his couch in an upper room of the Lucknow Residency, a shell burst beside him, and grievously shattered his thigh. His nephew, Mr. George Lawrence, immediately summoned Dr. Fayrer to his assistance, and when Sir Henry saw him he asked at once how long he had to live. When the doctor answered, "about three days," he expressed astonishment that so long a term had been granted to him, and seemed to think that he should pass away before the end of it. As shot and shell were continually striking against the Residency, Dr. Fayrer caused the wounded man to be removed to his own house, which was more sheltered from the enemy's artillery, and there a consultation of medical officers was held, and it was determined that to attempt amputation would be only to increase suffering and to shorten life.

Then Henry Lawrence prepared himself for death. First of all, he asked Mr. Harris, the chaplain, to administer the Holy Communion to him. In the open verandah, exposed to a heavy fire of musketry, the solemn service was performed, many officers of the garrison tearfully communicating with their beloved chief. This done, he addressed himself to those about him. "He bade an affectionate farewell to all," wrote one who was present at this sad and solemn meeting, "and of several he asked forgiveness for having at times spoken harshly, and begged them to kiss him. One or two were quite young boys, with whom he had occasion to find fault, in the course of duty, a few days previously. He expressed the deepest humility and repentance for his sins, and his firm trust in our blessed Saviour's atonement, and spoke most touchingly of his dear wife, whom he hoped to rejoin. At the utterance of her name his feelings quite overcame him, and he burst into an uncontrollable fit of weeping which lasted some minutes. He again completely broke down in speaking of his daughter, to whom he sent his love and blessing. . . . Then he blessed his nephew George, who was kneeling by his bedside, and told him he had always loved him as his own son. . . . He spoke to several present about the state of their souls, urging them to pray and read their Bibles, and endeavour to prepare for death, which might come suddenly, as in his own case. To nearly each person present he addressed a few parting words of affectionate advice—words which must have sunk deeply into all hearts. There was not a dry eye there, and many seemingly hard rough men were sobbing like children."

And ever mingling, in these last hours, with the kindly and affectionate feelings of the man were the sterner thoughts of the leader. Passing away, as he was, from the scene, he had to make new arrangements for the future defence of the beleagured garrison. He knew what was his duty, and though it pained him to set aside one who believed that he had the best right to succeed him in his civil duties, he chose his successor wisely. Then he urged upon the officer whom he had chosen, and all present, the imperative necessity of holding out to the very last, and of never making terms with the enemy. "Let every man," he said, "die at his post; but never make terms. God help the poor women and children." He often repeated these last words. His heart was very heavy with the thought of these helpless little ones, not knowing what dreadful lot might be in store for them.

He gave many sorrowing thoughts, also, to his foster-children in the Lawrence Asylum; and when he was not capable of uttering many words, from time to time he said, alternately with his prayers for the women and children, "Remember the Asylum; do not let them forget the Asylum." He told the chaplain that he wished to be buried very privately, "without any fuss," in the same grave with any men of the garrison who might die about the same time. Then he said, speaking rather to himself than to those about him, of his epitaph—"*Here lies Henry Lawrence, who tried to do his duty.*" "I should like, too, a text," he added, "'To the Lord our God belong mercies and forgivenesses, though we have rebelled against Him. It was on my dear wife's tomb."

He lingered till the beginning of the second day, after he was stricken down, suffering occasionally acute paroxysms of pain, but having many blessed intervals of rest; and at last passed away very tranquilly, "like a little child falling asleep," about eight o'clock a.m. on the 4th of July. "He looked so peaceful and happy," said one who entered the room just after his spirit had departed, "with the most beautiful expression of calm joy on his face. We could not but thank God that his sufferings were over, feeling sure that he was at rest."

After a little while it became necessary to move the body, and some European soldiers were sent for to lift the couch on which it lay. Before they did so, one of the party raised the sheet which covered the face of his beloved chief, and kissed him reverently on the forehead; then the others stooped down and did likewise; and, having so done, bore the body to the verandah. That evening it was buried, in a soldier's grave, with the corpses of four others who had fallen on that day; and so furious was the raging of the enemy at the time, that, I believe, not a single officer of the garrison saw the remains of his beloved general lowered into the grave. But there was not one amongst them who did not feel that he best did honour to the dead by following his great example, and being found ever at his post.

Rough and imperfect as is this brief sketch of Sir Henry Lawrence's career, I hope that it has in some measure set forth the true character of the man, and that, therefore, little need be said about the qualities that constituted his greatness. It will not, I trust, be long before a life so eminently that of a "Christian Warrior"—a life so fitted to encourage and sustain in well-doing by the beauty of its example—will be fully written by one far more capable than I am of doing justice to the theme.* What Wordsworth wrote, Lawrence acted. The ideal portrait of the "Christian Warrior" which the one had drawn, was ever before the other as an exemplar. He read it often; he thought of it continually; he quoted it in his writings. He tried to conform his own life and to assimilate his own character to it: and he succeeded, as all men succeed who are truly in earnest. But, if I were asked what especially it was that more than all perfected the picture of his character, I should say that it was the glow of romance that flushed it all as a glory from above. There was in all that he did a richness and tenderness of sentiment that made it not only good but beautiful. He used to say—and nothing was ever said more truly—"It is the due admixture of romance and reality that best carries a man through life." No words can express better than his own what I wish to say in conclusion, for no words can more clearly set forth what it was that made the peculiar greatness of the man. "The quality," he wrote in 1844,† "variously designated romance or enthusiasm, poetry or ideality, is not to be despised as the mere delusion of a heated brain; but is to be valued as an energy imparted to the human mind to prompt and sustain its noblest efforts. We would urge on the young especially, not that they should repress enthusiasm, but that they should cultivate and direct the feeling. Undisciplined romance deals in vague aspirations after something better and more beautiful than it has yet seen; but it is apt to turn in disgust from the thousand homely details and irksome efforts essential to the accomplishment of anything really good, to content itself with dreams of glorious impossibilities. Reality, priding itself on a steady plodding after a moderate tangible desideratum, laughs at the aimless and unprofitable visions of romance; 'but the hand cannot say to the eye, I have no need of thee!' Where the two faculties are duly blended, reality pursues a straight rough path to a desirable and practicable result; while romance beguiles the road by pointing out its beauties, by bestowing a deep and practical conviction that even in this dark and material existence there may be found a joy with which a stranger intermeddleth not—a light that shineth more and more unto the perfect day." And truly upon Henry Lawrence this light beamed more and more until the perfect day dawned upon him and his work was accomplished upon earth.

HEREWARD, THE LAST OF THE ENGLISH.

By CHARLES KINGSLEY.

CHAPTER II.

HOW HEREWARD SLEW THE BEAR.

Of Hereward's doings for the next few months nought is known. He may very likely have joined Siward in the Scotch war. He may have looked, wondering, for the first time in his life, upon the bones of the old world, where they rise at Dunkeld out of the lowlands of the Tay; and have trembled lest the black crags of Birnam should topple on his head with all their pines. He may have marched down from that famous leaguer with the Gospatrics and Dolfins, and the rest of the kindred of Crinan (abthane or abbot—let antiquaries decide)—of Dunkeld, and of Duncan, and of Siward, and of the outraged Sibilla. He may have helped himself to bring Birnam Wood to Dunsinane, "on the day of the Seven Sleepers," and heard Siward, when his son Asbiorn's corpse was carried into camp,* ask only, "Has he all his wounds in front?" He may have seen old Siward, after Macbeth's defeat (not death, as Shakespeare relates the story), go back to Northumbria "with such booty as no man had obtained before,"—a proof—if the fact be fact, that the Scotch lowlands were not, in the eleventh century, the poor and barbarous country which some have reported them to have been.

All this is not only possible, but probable enough, the dates considered: the chroniclers, however, are silent. They only say that Hereward was in those days beyond Northumberland with Gisebert of Ghent.

Gisebert, Gislebert, Gilbert, Guibert, Goisbricht, of Ghent, who afterwards owned, by chance of war, many a fair manor about Lincoln city, was one of those valiant Flemings who settled along the east and north-east coast of Scotland in the eleventh century. They fought with the Celtic princes, and then married with their daughters; got to themselves lands "by the title-deed of the sword;" and so became—the famous "Freskin the Fleming" especially—the ancestors of the finest aristocracy, both physically and intellectually, in the world. They had their connexions, moreover, with the Norman court of Rouen, through the Duchess Matilda, daughter of their old Seigneur, Baldwin Marquis of Flanders; their connexions, too, with the English Court, through Countess Judith, wife of Earl Tosti Godwinsson, another daughter of Baldwin's. Their friendship was sought, their enmity feared, far and wide throughout the north. They seem to have been civilisers, and cultivators, and traders—with the instinct of true Flemings—as well as conquerors; they were in those very days bringing to order and tillage the rich lands of the north-east, from the Frith of Moray to that of Forth; and forming a rampart for Scotland against the invasions of Sweyn, Hardraade, and all the wild vikings of the northern seas.

Amongst them, in those days, Gilbert of Ghent seems to have been a notable personage, to judge from the great house which he kept, and the "milites tyrones," or squires in training for the honour of knighthood, who fed at his table. Where he lived, the chroniclers report not. To them the country "ultra Northumbriam," beyond the Forth, was as Russia or Cathay, where

> "Geographers on pathless downs
> Put elephants for want of towns."

As indeed it was to that French map-maker who, as late as the middle of the eighteenth century (not having been to Aberdeen or Elgin), leaves all the country north of the Tay a blank, with the inscription:—"*Terre inculte et sauvage, habitée par les Higlanders.*"

Wherever Gilbert lived, however, he heard that Hereward was outlawed, and sent for him, says the story. And there he lived, doubtless happily enough, fighting Highlanders and hunting deer, so that as yet the pains and penalties of exile did not press very hardly upon him. The handsome, petulant, good-humoured lad had become in a few weeks the darling of Gilbert's ladies, and the envy of all his knights and gentlemen. Hereward the singer, harp-player, dancer,—Hereward the rider and hunter, was in all mouths: but he himself was discontented at having as yet fallen in with no adventure worthy of a man, and looked curiously and longingly at the menagerie of wild beasts enclosed in strong wooden cages, which Gilbert kept in one corner of the great court-yard, not for any scientific purposes, but to try with them, at Christmas, Easter, and Whitsuntide, the mettle of the young gentlemen who were candidates for the honour of knighthood. But after looking over the bulls and stags, wolves and bears, Hereward settled it in his mind that there was none worthy of his steel, save one huge white bear, whom no man had yet dared to face, and whom Hereward, indeed, had never seen, hidden as he was all day within the old oven-shaped Pict's house of stone, which had been turned into his den. There was a mystery about the uncanny brute which charmed Hereward. He was said to be half-human, perhaps wholly human; to be the son of the Fairy Bear, near kinsman, if not uncle or cousin, of Siward Digre. He had, like his fairy father, iron claws; he had human intellect, and understood human speech, and the arts of war,—at least so all in the place believed, and not as absurdly as at first sight seems.

---

* Shakespeare makes young Siward his son. He, too, was slain in the battle: but he was Siward's nephew.

For the brown bear, and much more the white, was, among the Northern nations, in himself a creature magical and superhuman. "He is God's dog," whispered the Lapp, and called him "the old man in the fur cloak," afraid to use his right name, even inside the tent, for fear of his overhearing and avenging the insult. "He has twelve men's strength, and eleven men's wit," sang the Norseman, and prided himself accordingly, like a true Norseman, on outwitting and slaying the enchanted monster.

Terrible was the brown bear: but more terrible "the white sea-deer," as the Saxons called him; the hound of Hrymir, the whale's bane, the seal's dread, the rider of the ice-berg, the sailer of the floe, who ranged for his prey under the six months' night, lighted by Surtur's fires, even to the gates of Muspelheim. To slay him was a feat worthy of Beowulf's self; and the greatest wonder, perhaps, among all the wealth of Crowland, was the twelve white bear-skins which lay before the altars, the gift of the great Canute. How Gilbert had obtained his white bear, and why he kept him there in durance vile, was a mystery over which men shook their heads. Again and again Hereward asked his host to let him try his strength against the monster of the North. Again and again the shrieks of the ladies, and Gilbert's own pity for the stripling youth, brought a refusal. But Hereward settled it in his heart, nevertheless, that somehow or other, when Christmas time came round, he would extract from Gilbert, drunk or sober, leave to fight that bear; and then either make himself a name, or die like a man.

Meanwhile Hereward made a friend. Among all the ladies of Gilbert's household, however kind they were inclined to be to him, he took a fancy but to one—and that was to a little girl of eight years old. Alftruda was her name. He liked to amuse himself with this child, without, as he fancied, any danger of falling in love; for already his dreams of love were of the highest and most fantastic; and an Emir's daughter, or a Princess of Constantinople, were the very lowest game at which he meant to fly. Alftruda was beautiful, too, exceedingly, and precocious, and, it may be, vain enough to repay his attentions in good earnest. Moreover she was English as he was, and royal likewise; a relation of Elfgiva, daughter of Ethelred, once King of England, who, as all know, married Uchtred, prince of Northumberland and grandfather of Gospatrick, Earl of Northumberland, and ancestor of all the Dunbars. Between the English lad then and the English maiden grew up in a few weeks an innocent friendship, which had almost become more than friendship, through the intervention of the Fairy Bear.

For as Hereward was coming in one afternoon from hunting, hawk on fist, with Martin Lightfoot trotting behind, crane and heron, duck and hare, slung over his shoulder, on reaching the court-yard gates he was aware of screams and shouts within, tumult and terror among man and beast. Hereward tried to force his horse in at the gate. The beast stopped and turned, snorting with fear; and no wonder; for in the midst of the court-yard stood the Fairy Bear; his white mane bristled up till he seemed twice as big as any of the sober brown bears which Hereward yet had seen: his long snake neck and cruel visage wreathed about in search of prey. A dead horse, its back broken by a single blow of the paw, and two or three writhing dogs, showed that the beast had turned (like too many of his human kindred) "Berserker." The court-yard was utterly empty: but from the ladies' bower came shrieks and shouts, not only of women but of men; and knocking at the bower door, adding her screams to those inside, was a little white figure, which Hereward recognised as Alftruda's. They had barricaded themselves inside, leaving the child out; and now dared not open the door, as the bear swung and rolled towards it, looking savagely right and left for a fresh victim.

Hereward leaped from his horse, and, drawing his sword, rushed forward with a shout which made the bear turn round.

He looked once back at the child; then round again at Hereward: and, making up his mind to take the largest morsel first, made straight at him with a growl which there was no mistaking.

He was within two paces; then he rose on his hind legs, a head and shoulders taller than Hereward, and lifted the iron talons high in air. Hereward knew that there was but one spot at which to strike; and he struck true and strong, before the iron paw could fall, right on the muzzle of the monster.

He heard the dull crash of the steel; he felt the sword jammed tight. He shut his eyes for an instant, fearing lest, as in dreams, his blow had come to nought; lest his sword had turned aside, or melted like water in his hand, and the next moment would find him crushed to earth, blinded and stunned. Something tugged at his sword. He opened his eyes, and saw the huge carcase bend, reel, roll slowly over to one side dead, tearing out of his hand the sword which was firmly fixed into the skull.

Hereward stood awhile staring at the beast like a man astonied at what he himself had done. He had had his first adventure, and he had conquered. He was now a champion in his own right—a hero of the heroes—one who might take rank, if he went on, beside Beowulf, Frotho, Ragnar Lodbrog, or Harald Hadraade. He had done this deed. What was there after this which he might not do? And he stood there in the fulness of his pride, defiant of earth and heaven, while in his heart arose the thought of that old viking who cried, in the pride of his godlessness, "I never on earth met him whom I feared, and why should I fear Him in heaven? If I met Odin I would fight with Odin. If Odin were the stronger he would slay me: if I were the stronger I would slay him." And there he stood, staring, and dreaming over renown to come, a true pattern of the half-savage hero of those rough times, capable of all vices except cowardice, and capable, too, of all virtues save humility.

"Do you not see," said Martin Lightfoot's voice, close by, "that there is a fair lady trying to thank you, while you are so rude or so proud that you will not vouchsafe her one look?"

It was true. Little Alftruda had been clinging to him for five minutes past. He took the child up in his arms and kissed her with pure kisses, which for a moment softened his hard heart; then, setting her down, he turned to Martin.

"I have done it, Martin."

"Yes, you have done it; I spied you. What will the old folks at home say to this?"

"What care I?"

Martin Lightfoot shook his head, and drew out his knife.

"What is that for?" said Hereward.

"When the master kills the game, the knave can but skin it. We may sleep warm under this fur in many a cold night by sea and moor."

"Nay," said Hereward, laughing; "when the master kills the game he must first carry it home. Let us take him and set him up against the bower door there, to astonish the brave knights inside." And stooping down, he attempted to lift the huge carcase: but in vain. At last, with Martin's help he got it fairly on his shoulders, and the two dragged their burden to the bower and dashed it against the door, shouting with all their might to those within to open it.

Windows, it must be remembered, were in those days so few and far between that the folks inside had remained quite unaware of what was going on without.

The door was opened cautiously enough; and out looked, to the shame of knighthood be it said, two or three knights who had taken shelter in the bower with the ladies. Whatever they were going to say the ladies forestalled, for, rushing out across the prostrate bear, they overwhelmed Hereward with praises, thanks, and, after the straightforward custom of those days, with substantial kisses.

"You must be knighted at once," cried they. "You have knighted yourself by that single blow."

"A pity then," said one of the knights to the others, "that he had not given that accolade to himself, instead of to the bear."

"Unless some means are found," said another, "of taking down this boy's conceit, life will soon be not worth having here."

"Either he must take ship," said a third, "and look for adventures elsewhere, or I must."

Martin Lightfoot heard those words; and knowing that envy and hatred, like all other vices in those rough-hewn times, were apt to take very startling and unmistakeable shapes, kept his eye accordingly on those three knights.

"He must be knighted—he shall be knighted, as soon as Sir Gilbert comes home," said all the ladies in chorus.

"I should be sorry to think," said Hereward, with the blundering mock humility of a self-conceited boy, "that I had done anything worthy of such an honour. I hope to win my spurs by greater feats than these."

A burst of laughter from the knights and gentlemen followed.

"How loud the young bantam crows after his first little scuffle!"

"Hark to him! What will he do next? Eat a dragon? Fly to the moon? Marry the Sophy of Egypt's daughter?"

This last touched Hereward to the quick, for it was just what he thought of doing; and his blood, heated enough already, beat quicker, as some one cried, with the evident intent of picking a quarrel:

"That was meant for us. If the man who killed the bear has not earned knighthood, what must we be, who have not killed him? You understand his meaning, gentlemen—don't forget it!"

Hereward looked down, and setting his foot on the bear's head, wrenched out of it the sword which he had left till now, with pardonable pride, fast set in the skull.

Martin Lightfoot, for his part, drew stealthily from his bosom the little magic axe, keeping his eye on the brain-pan of the last speaker.

The lady of the house cried "Shame!" and ordered the knights away with haughty words and gestures, which, because they were so well deserved, only made the quarrel more deadly.

Then she commanded Hereward to sheathe his sword.

He did so; and turning to the knights, said with all courtesy, "You mistake me, sirs. You were where brave knights should be, within the beleaguered fortress, defending the ladies. Had you remained outside, and been eaten by the bear, what must have befallen them, had he burst open the door? As for this little lass, whom you left outside, she is too young to requite knight's prowess by lady's love; and therefore beneath your attention, and only fit for the care of a boy like me." And taking up Alftruda in his arms, he carried her in and disappeared.

Who now but Hereward was in all men's mouths? The minstrels made ballads on him; the lasses sang his praises (says the chronicler) as they danced upon the green. Gilbert's lady would need give him the seat, and all the honours, of a belted knight, though knight he was none. And daily and weekly the valiant lad grew and hardened into a valiant man, and a courteous one withal, giving no offence himself, and not over ready to take offence at other men.

The knights were civil enough to him, the ladies more than civil; he hunted, he wrestled, he tilted; he was promised a chance of fighting for glory, as soon as a Highland chief should declare war against Gilbert, or drive off his cattle—an event which (and small blame to the Highland chiefs) happened every six months.

No one was so well content with himself as Hereward; and therefore he fancied that the world must be equally content with him, and he was much disconcerted when Martin drew him aside one day, and whispered:

"If I were my lord, I should wear a mail shirt under my coat to-morrow out hunting."

"What?"

"The arrow that can go through a deer's bladebone, can go through a man's."

"Who should harm me?"

"Any man of the dozen who eat at the same table."

"What have I done to them? If I had my laugh at them, they had their laugh at me; and we are quits."

"There is another score, my lord, which you have forgotten, and that is all on your side."

"Eh?"

"You killed the bear. Do you expect them to forgive you that, till they have repaid you with interest?"

"Pish!"

"You do not want for wit, my lord. Use it, and think. What right has a little boy like you to come here, killing bears which grown men cannot kill? What can you expect but just punishment for your insolence—say, a lance between your shoulders while you stoop to drink, as Sigfried had for daring to tame Brunhild? And more, what right have you to come here, and so win the hearts of the ladies, that the lady of all the ladies should say, 'If aught happen to my poor boy—and he cannot live long—I would adopt Hereward for my own son, and show his mother what a fool some folks think her.' So, my lord, put on your mail shirt to-morrow, and take care of narrow ways, and sharp corners. For to-morrow it will be tried, that I know, before my Lord Gilbert comes back from the Highlands: but by whom, I know not, and care little, seeing that there are half-a-dozen in the house who would be glad enough of the chance."

Hereward took his advice, and rode out with three or four knights the next morning into the fir-forest; not afraid, but angry and sad. He was not yet old enough to estimate the virulence of envy; to take ingratitude and treachery for granted. He was to learn the lesson then, as a wholesome chastener to the pride of success. He was to learn it again in later years, as an additional bitterness in the humiliation of defeat; and find out, as does many a man, that if he once fall, or seem to fall, a hundred curs spring up to bark at him, who dared not open their mouths while he was on his legs.

So they rode into the forest, and parted, each with his footman and his dogs, in search of boar and deer; and each had his sport without meeting again for some two hours or more.

Hereward and Martin came at last to a narrow gully, a murderous place enough. Huge fir-trees roofed it in, and made a night of noon. High banks of earth and great boulders walled it in right and left for twenty feet above. The track, what with pack-horses' feet, and what with the wear and tear of five hundred years' rain-fall, was a rut three feet deep and two feet broad, in which no horse could turn. Any other day Hereward would have cantered down it with merely a tightened rein. To-day he turned to Martin, and said—

"A very fit and proper place for this same treason, unless you have been drinking beer and thinking beer."

But Martin was nowhere to be seen.

A pebble thrown from the right bank struck him, and he looked up. Martin's face was peering through the heather overhead, his finger on his lips. Then he pointed cautiously, first up the pass, then down.

Hereward felt that his sword was loose in the sheath, and then griped his lance, with a heart beating, but not with fear.

The next moment he heard the rattle of a horse's hoofs behind him; looked back; and saw a knight charging desperately down the gully, his bow in hand, and arrow drawn to the head.

To turn was impossible. To stop, even to walk on, was to be ridden over and hurled to the ground helplessly. To gain the mouth of the gully, and then turn on his pursuer, was his only chance. For the first and almost the last time in his life, he struck spurs into his horse, and ran away. As he went, an arrow struck him sharply in the back, piercing the corslet, but hardly entering the flesh. As he neared the mouth, two other knights crashed their horses through the brushwood from right and left, and stood awaiting him, their spears ready to strike. He was caught in a trap. A shield might have saved him; but he had none.

He did not flinch. Dropping his reins, and driving in the spurs once more, he met them in full shock. With his left hand he hurled aside the left-hand lance, with his right he hurled his own with all his force at the right-hand foe, and saw it pass clean through the felon's chest, while his lance-point dropped, and passed harmlessly behind his knee.

So much for lances in front. But the knight behind? Would not his sword the next moment be through his brain?

There was a clatter, a crash, and looking back Hereward saw horse and man rolling in the rut, and rolling with them Martin Lightfoot. He had already pinned the felon knight's head against the steep bank, and, with uplifted axe, was meditating a pick at his face which would have stopped alike his love-making and his fighting.

"Hold thy hand," shouted Hereward. "Let us see who he is; and remember that he is at least a knight."

"But one that will ride no more to-day. I finished his horse's going as I rolled down the bank."

It was true. He had broken the poor beast's leg with a blow of the axe, and they had to kill the horse out of pity ere they left.

Martin dragged his prisoner forward.

"You?" cried Hereward. "And I saved your life three days ago!"

The knight answered nothing.

"You will have to walk home. Let that be punishment enough for you," and he turned.

"He will have to ride in a woodman's cart, if he have the luck to find one."

The third knight had fled, and after him the dead man's horse. Hereward and his man rode home in peace, and the third knight, after trying vainly to walk a mile or two, fell and lay, and was fain to fulfil Martin's prophecy, and be brought home in a cart, to carry for years after, like Sir Lancelot, the nickname of the Chevalier de la Charette.

And so was Hereward avenged of his enemies. Judicial, even private, inquiry into the matter there was none. That gentlemen should meet in the forest and commit, or try to commit, murder on each other's bodies, was far too common a mishap in the ages of faith to stir up more than an extra gossiping and cackling among the women, and an extra cursing and threatening among the men; and as the former were all but unanimously on Hereward's side, his plain and honest story was taken as it stood.

"And now, fair lady," said Hereward to his hostess, "I must thank you for all your hospitality, and bid you farewell for ever and a day."

She wept, and entreated him only to stay till her lord came back; but Hereward was firm.

"You, lady, and your good lord will I ever love; and at your service my sword shall ever be: but not here. Ill blood I will not make. Among traitors I will not dwell. I have killed two of them, and shall have to kill two of their kinsmen next, and then two more, till you have no knights left; and pity that would be. No; the world is wide, and there are plenty of good fellows in it who will welcome me without forcing me to wear mail under my coat out hunting."

And he armed himself *cap-à-pié*, and rode away. Great was the weeping in the bower, and great the chuckling in the hall: but never saw they Hereward again upon the Scottish shore.

CHAPTER III.

HOW HEREWARD SUCCOURED A PRINCESS OF CORNWALL.

The next place in which Hereward appeared was far away on the South-West, upon the Cornish shore. How he came there, or after how long, the chronicles do not say. All that shall be told is that he went into port on board a merchant ship carrying wine, and intending to bring back tin. The merchants had told him of one Alef, a valiant "regulus" or kinglet of those parts, who was indeed a distant connection of Hereward himself, having married, as did so many of the Celtic princes, the daughter of a Danish sea rover, of Siward's blood. They told him also that the kinglet increased his wealth not only by the sale of tin and of red cattle, but by a certain amount of autumnal piracy in company with his Danish brothers-in-law from Dublin and Waterford; and Hereward, who believed with most Englishmen of the East Country that Cornwall still produced a fair crop of giants, some of them with two and even three heads, had hopes that Alef might show him some adventure worthy of his sword. He sailed in therefore over a rolling bar, between jagged points of black rock, and up a tide river which wandered away inland, like a land-locked lake, between high green walls of oak and ash, till they saw at the head of the tide Alef's town, nestling in a glen which sloped towards the southern sun. They discovered, besides, two ships drawn up upon the beach, whose long lines and snake-heads, beside the stoat carved on the beak-head of one, and the adder on that of the other, bore witness to the piratical habits of their owner. The merchants, it seemed, were well known to the Cornishmen on shore, and Hereward went up with them unopposed; past the ugly dykes and muddy leats, where Alef's slaves were streaming the gravel for tin ore; through rich alluvial pastures spotted with red cattle, and up to Alef's town. Earthworks and stockades surrounded a little church of ancient stone, and a cluster of granite cabins thatched with turf, in which the slaves abode, and in the centre of all a vast stone barn, with low walls and high sloping roof, which contained Alef's family, treasures, fighting tail, horses, cattle, and pigs. They entered at one end between the pigstyes, passed on through the cow stalls, then through the stables, and saw before them, dim through the reek of thick peat-smoke, a long oaken table, at which sat huge dark-haired Cornishmen, with here and there among them the yellow head of a Norseman, who were Alef's following of fighting men. Boiled meat was there in plenty, barley cakes, and ale. At the head of the table, on a high-backed settle, was Alef himself, a jolly giant, who was just setting to work to drink himself stupid with mead made from narcotic heather honey. By his side sat a lovely dark-haired girl, with great gold torcs upon her throat and wrists, and a great gold brooch fastening a shawl which had plainly come from the looms of Spain or of the East; and next to her again, feeding her with tit-bits cut off with his own dagger, and laid on barley cake instead of a plate, sat a more gigantic personage even than Alef, the biggest man that Hereward had ever seen, with high cheek bones, and small ferret eyes, looking out from a greasy mass of bright red hair and beard.

No questions were asked of the new comers. They set themselves down in silence in empty places, and according to the laws of the good old Cornish hospitality, were allowed to eat and drink their fill before they spoke a word.

"Welcome here again, friend," said Alef at last, in good enough Danish, calling the eldest merchant by name. "Do you bring wine?"

The merchant nodded.

"And you want tin?"

The merchant nodded again, and lifting his cup drank Alef's health, following it up by a coarse joke in Cornish, which raised a laugh all round.

The Norse trader of those days, it must be remembered, was none of the cringing and effeminate chapmen who figure in the stories of the middle ages. A free Norse or Dane, himself often of noble blood, he fought as willingly as he bought; and held his own as an equal, whether at the court of a Cornish kinglet or at that of the Great Kaiser of the Greeks.

"And you, fair sir," said Alef, looking keenly at Hereward, "by what name shall I call you, and what service can I do for you? You look more like an earl's son than a merchant, and are come here surely for other things besides tin."

"Health to King Alef," said Hereward, raising the cup. "Who I am, I will tell to none but Alef's self: but an earl's son I am, though an outlaw and a rover. My lands are the breadth of my boot sole. My plough is my sword. My treasure is my good right hand. Nothing I have, and nothing I need, save to serve noble kings and earls, and win me a champion's fame. If you have battles to fight, tell me; that I may fight them for you. If you have none, thank God for his peace; and let me eat and drink, and go in peace."

"King Alef needs neither man nor boy to fight his battle as long as Ironhook sits in his hall."

It was the red-bearded giant who spoke in a broken tongue, part Scotch, part Cornish, part Danish, which Hereward could hardly understand: but that the ogre intended to insult him he understood well enough.

Hereward had hoped to find giants in Cornwall: and behold he had found one at once; though rather, to judge from his looks, a Pictish than a Cornish giant; and true to his reckless determination to defy and fight every man and beast who was willing to defy and fight him, he turned on his elbow and stared at Ironhook in scorn, meditating some speech which might provoke the hoped-for quarrel.

As he did so his eye happily caught that of the fair Princess. She was watching him with a strange look, admiring, warning, imploring; and when she saw that he noticed her, she laid her finger on her lip in token of silence, crossed herself devoutly, and then laid her finger on her lips again, as if beseeching him to be patient and silent in the name of Him who answered not again.

Hereward, as is well seen, wanted not for quick wit, or for chivalrous feeling. He had observed the rough devotion of the giant to the Lady. He had observed too, that she shrank from it; that she turned away with loathing when he offered her his own cup, while he answered by a dark and deadly scowl.

Was there an adventure here? Was she in duresse either from this Ironhook or from her father, or from both? Did she need Hereward's help? If so, she was so lovely that he could not refuse it. And on the chance, he swallowed down his high stomach, and answered blandly enough.

"One could see without eyes, noble sir, that you were worth any ten common men: but as every one has not like you the luck of so lovely a lady by your side, I thought that perchance you might hand over some of your lesser quarrels to one like me, who has not yet seen so much good fighting as yourself, and enjoy yourself in pleasant company at home, as I should surely do in your place."

The Princess shuddered and turned pale; then looked at Hereward and smiled her thanks. Ironhook laughed a savage laugh.

Hereward's jest being translated into Cornish for the benefit of the company, was highly approved by all; and good-humour being restored, every man got drunk save Hereward, who found the mead too sweet and sickening.

After which those who could go to bed, went to bed, not as in England* among the rushes on the floor, but in the bunks or berths of wattle which stood two or three tiers high along the wall.

The next morning as Hereward went out to wash his face and hands in the brook below (he being the only man in the house who did so), Martin Lightfoot followed him.

"What is it, Martin? Hast thou had too much of that sweet mead last night that thou must come out to cool thy head too?"

"I came out for two reasons—first to see fair play, in case that Ironhook should come to wash his ugly visage, and find you on all fours over the brook—you understand? And next to tell you what I heard last night among the maids."

"And what did you hear?"

"Fine adventures, if we can but compass them. You saw that lady with the carrot-headed fellow. I saw that you saw. Well, if you will believe me, that man has no more gentle blood than I have—has no more right to sit on the settle than I. He is a No-man's son, a Pict from Galloway, who came down with a pirate crew and has made himself the master of this drunken old Prince, and the darling of all his housecarles, and now will needs be his son-in-law whether he will or not."

"I thought as much," said Hereward; "but how didst thou find out this?"

"I went out and sat with the knaves and the maids, and listened to their harp-playing, and harp they can, these Cornish, like very elves; and then I too sang songs and told them stories, for I can talk their tongue somewhat, till they all blest me for a right good fellow. And then I fell to praising up old Ironhook to the women."

"Praising him up, man?"

"Ay, just because I suspected him; for the women are so contrary that if you speak evil of a man they will surely speak good of him; but if you will only speak good of him, then you will hear all the evil of him he ever has done, and more beside. And this I heard; that the King's daughter cannot abide him, and would as lief marry a seal."

---

* Cornwall was not then considered part of England.

"One did not need to be told that," said Hereward, "as long as one has eyes in one's head. I will kill the fellow, and carry her off, ere four-and twenty hours be past."

"Softly, softly, my young master. You need to be told something that your eyes would not tell you, and that is that the poor lass is betrothed already to a son of old King Ranald the Ostman, of Waterford, son of old King Sigtryg, who ruled there when I was a boy."

"He is a kinsman of mine then," said Hereward. "All the more reason that I should kill this ruffian."

"If you can," said Martin Lightfoot.

"If I can?" retorted Hereward fiercely.

"Well, well, wilful heart must have its way, only take my counsel; speak to the poor young lady first and see what she will tell you, lest you only make bad worse, and bring down her father and his men on her as well as you."

Hereward agreed, and resolved to watch his opportunity of speaking to the princess.

As they went in to the morning meal they met Alef. He was in high good humour with Hereward; and all the more so when Hereward told him his name, and how he was the son of Leofric.

"I will warrant you are," he said, "by the grey head you carry on green shoulders. No discreeter man, they say, in these isles than the old earl."

"You speak truth, sir," said Hereward, "though he be no father of mine now, for of Leofric it is said in King Edward's court, that if a man ask counsel of him, it is as though he had asked it of the oracles of God."

"Then you are his true son, young man. I saw how you kept the peace with Ironhook, and I owe you thanks for it; for though he is my good friend, and will be my son-in-law ere long, yet a quarrel with him is more than I can abide just now, and I should not like to have seen my guest and my kinsman slain in my house."

Hereward would have said that he thought there was no fear of that:—but he prudently held his tongue, and having an end to gain, listened instead of talking,

"Twenty years ago, of course, I could have thrashed him as easily as——but now I am getting old and shaky, and the man has been a great help in need; six kings of these parts has he killed for me, who drove off my cattle, and stopped my tin works, and plundered my monks' cells too, which is worse, while I was away sailing the seas; and he is a right good fellow at heart, though he be a little rough. So be friends with him as long as you stay here, and if I can do you a service I will."

They went in to their morning meal, at which Hereward resolved to keep the peace which he longed to break, and, therefore, as was to be expected, broke.

For during the meal the fair lady, with no worse intention perhaps than that of teasing her tyrant, fell to open praises of Hereward's fair face and golden hair, and being insulted therefore by the Ironhook, retaliated by observations about his personal appearance, which were more common in the eleventh century than they happily are now. He, to comfort himself, drank deep of the French wine which had just been bought and broached, and then went out into the courtyard, where in the midst of his admiring fellow ruffians he enacted a scene as ludicrous as it was pitiable. All the childish vanity of the savage boiled over. He strutted, he shouted, he tossed about his huge limbs, he called for a harper, and challenged all around to dance, sing, leap, fight, do anything against him; meeting with nothing but admiring silence, he danced himself out of breath, and then began boasting once more, of his fights, his cruelties, his butcheries, his impossible escapes and victories; till at last, as luck would have it, he espied Hereward, and poured out a stream of abuse against Englishmen and English courage.

"Englishmen," he said, "were nought. Had he not slain three of them himself with one blow?"

"Of your mouth, I suppose," quoth Hereward, who saw that the quarrel must come, and was glad to have it done and over.

"Of my mouth?" roared Ironhook, "of my sword, man!"

"Of your mouth," said Hereward, "Of your brain were they begotten, of the breath of your mouth they were born, and by the breath of your mouth you can slay them again as often as you choose."

The joke, as it has been handed down to us by the old chroniclers, seems clumsy enough: but it sent the princess, say they, into shrieks of laughter.

"Were it not that my lord Alef was here," shouted Ironhook, "I would kill you out of hand."

"Promise to fight fair, and do your worst. The more fairly you fight, the more honour you will win," said Hereward.

Whereupon the two were parted for the while.

Two hours afterwards Hereward, completely armed with helmet and mail shirt, sword and javelin, hurried across the great courtyard with Martin Lightfoot at his heels, towards the little church upon the knoll above. The two wild men entered into the cool darkness, and saw before them by the light of a tiny lamp the crucifix over the altar, and beneath it that which was then believed to be the body of Him who made heaven and earth. They stopped trembling for a moment; bowed themselves before that to them perpetual miracle; and then hurried on to a low doorway to the right, inside which dwelt Alef's chaplain, one of those good Celtic priests who were supposed to represent a Christianity more ancient than, and all but independent of, the then all-absorbing Church of Rome.

The cell was such a one as a convict would now disdain to inhabit. A low lean-to roof; the slates and rafters unceiled; the stone walls and floor unplastered; ill-lighted by a hand-broad window, unglazed, and closed with a shutter at night. A truss of straw and a rug, the priest's bed, lay in a corner. The only other furniture was a large oak chest, containing the holy vessels and vestments and a few old books. It stood directly under the window for the sake of light, for it served the good priest for both table and chair; and on it he was sitting reading in his book at that minute, the sunshine and the wind streaming in behind his head, doing no good to his rheumatism of thirty years' standing.

"Is there a priest here?" asked Hereward hurriedly.

The old man looked up, shook his head, and answered in Cornish.

"Speak to him in Latin, Martin: may be he will understand that."

Martin spoke. "My lord here wants a priest to shrive him, and that quickly. He is going to fight the great tyrant Ironhook, as you call him."

"Ironhook?" answered the priest in good Latin enough, "And he so young! God help him, he is a dead man! What is this. A fresh soul sent to its account by the hands of that man of Belial? Cannot he entreat him; can he not make peace, and save his young life? He is but a stripling, and that man, like Goliath of old, a man of war from his youth up."

"And my master," said Martin Lightfoot proudly, "is like young David—one that can face a giant and kill him; for he has slain, like David, his lion and his bear ere now. At least he is one that will neither make peace, nor entreat the face of living man. So shrive him quickly, master Priest, and let him be gone to his work."

Poor Martin Lightfoot spoke thus bravely only to keep up his spirits and his young lord's—for in spite of his confidence in Hereward's prowess, he had given him up for a lost man; and the tears ran down his rugged cheeks, as the old priest rising up and seizing Hereward's two hands in his, besought him with the passionate and graceful eloquence of his race, to have mercy upon his own youth.

Hereward understood his meaning, though not his words.

"Tell him," he said to Martin, "that fight I must, and tell him that shrive me he must and that quickly. Tell him how the fellow met me in the wood below just now, and would have slain me there unarmed as I was; and how when I told him it was a shame to strike a naked man, he told me he would give me but one hour's grace to go back, on the faith of a gentleman, for my armour and weapons, and meet him there again to die by his hand.—So shrive me quick, Sir Priest."

Hereward knelt down. Martin Lightfoot knelt down by him, and with a trembling voice began to interpret for him.

"What does he say?" asked Hereward, as the priest murmured something to himself.

"He said," quoth Martin, now fairly blubbering, "that fair and young as you are, your shrift should be as short and as clean as David's."

Hereward was touched. "Anything but that," said he, smiting on his breast, "Mea culpa—mea culpa—mea maxima culpa."

"Tell him how I robbed my father."

The priest groaned as Martin did so.

"And how I mocked at my mother, and left her in a rage, without ever a kind word between us. And how I have slain I know not how many men in battle, though that, I trust, need not lay heavily on my soul, seeing that I killed them all in fair fight."

Again the priest groaned.

"And how I robbed a certain priest of his money and gave it away to my housecarles."

Here the priest groaned more bitterly still.

"Oh! my son, my son, where hast thou found time to lay all these burdens on thy young soul?"

"It will take less time," said Martin bluntly, "for you to take the burdens off again."

"But I dare not absolve him for robbing a priest. Heaven help him! He must go to the bishop for that. He is more fit to go on pilgrimage to Jerusalem than to battle."

"He has no time," quoth Martin, "for bishops or Jerusalem."

"Tell him," says Hereward, "that in this purse is all I have, that in it he will find sixty silver pennies, beside two strange coins of gold."

"Sir Priest," said Martin Lightfoot, taking the purse from Hereward, and keeping it in his own hand, "there are in this bag monies."

Martin had no mind to let the priest into the secret of the state of their finances.

"And tell him," continued Hereward, "that if I fall in this battle I give him all that money, that he may part it among the poor for the good of my soul."

"Pish!" said Martin to his lord; "that is paying him for having you killed. You should pay him for keeping you alive." And without waiting for the answer, he spoke in Latin.

"And if he comes back safe from this battle, he will give you ten pennies for yourself and your church, Priest, and therefore expects you to pray your very loudest while he is gone."

"I will pray, I will pray," said the holy man; "I will wrestle in prayer. Ah! that he could slay the wicked, and reward the proud according to his deservings. Ah! that he could rid me and my master, and my young lady, of this son of Belial—this devourer of widows and orphans—this slayer of the poor and needy, who fills this place with innocent blood—him of whom it is written, 'They stretch forth their mouth unto the heaven, and their tongue goeth through the world. Therefore fall the people unto them, and thereout suck they no small advantage.' I will shrive him, shrive him of all save robbing the priest, and for that he must go to the bishop, if he live: and, if not, the Lord have mercy on his soul."

And so, weeping and trembling, the good old man pronounced the words of absolution.

Hereward rose, thanked him, and then hurried out in silence.

"You will pray your very loudest, Priest," said Martin, as he followed his young lord.

"I will, I will," quoth he, and kneeling down began to chaunt that noble 73rd Psalm, "Quam bonus Israel," which he had just so fitly quoted.

"Thou gavest him the bag, Martin?" said Hereward, as they hurried on.

"You are not dead yet. 'No pay no play' is as good a rule for priest as for layman."

"Now then, Martin Lightfoot, good-bye. Come not with me. It must never be said, even slanderously, that I brought two into the field against one; and if I die, Martin——"

"You won't die!" said Lightfoot, shutting his teeth.

"If I die, go back to my people somehow, and tell them that I died like a true earl's son."

Hereward held out his hand; Martin fell on his knees and kissed it; watched him with set teeth till he disappeared in the wood; and then started forward and entered the bushes at a different spot.

"I must be nigh at hand to see fair play," he muttered to himself, "in case any of his ruffians be hanging about. Fair play I'll see, and fair play I'll give, too, for the sake of my lord's honour, though I be bitterly loth to do it. So many times as I have been a villain when it was of no use, why mayn't I be one now, when it would serve the purpose indeed? Why did we ever come into this accursed place? But one thing I will do," said he, as he ensconced himself under a thick holly, whence he could see the meeting of the combatants upon an open lawn some twenty yards away; "if that big bull-calf kills my master, and I do not jump on his back and pick his brains out with this trusty steel of mine, may my right arm——"

And Martin Lightfoot swore a fearful oath, which need not here be written.

The priest had just finished his chaunt of the 73rd Psalm, and had betaken himself in his spiritual warfare, as it was then called, to the equally apposite 52nd, "Quid gloriaris?"

"Why boastest thou thyself, thou tyrant, that thou canst do mischief, whereas the goodness of God endureth yet daily?"

"Father! father!" cried a soft voice in the doorway, "where are you?"

And in hurried the princess.

"Hide this," she said, breathless, drawing from beneath her mantle a huge sword; "hide it, where no one dare touch it, under the altar behind the holy rood: no place too secret."

"What is it?" asked the priest, springing up from his knees.

"His sword—the Ogre's—his magic sword, which kills whomsoever it strikes. I coaxed the wretch to let me have it last night when he was tipsy, for fear he should quarrel with the young stranger; and I have kept it from him ever since by one excuse or another; and now he has sent one of his ruffians in for it, saying, that if I do not give it up at once he will come back and kill me."

"He dare not do that," said the priest.

"What is there that he dare not?" said she. "Hide it at once; I know that he wants it to fight with this Hereward."

"If he wants it for that," said the priest, "it is too late; for half an hour is past since Hereward went to meet him."

"And you let him go? You did not persuade him, stop him? You let him go hence to his death?"

In vain the good man expostulated and explained that it was no fault of his.

"You must come with me this instant to my father—to them; they must be parted. They shall be parted. If you dare not, I dare. I will throw myself between them, and he that strikes the other shall strike me."

And she hurried the priest out of the house, down the knoll, and across the yard. There they found others on the same errand. The news that a battle was toward had soon spread, and the men-at-arms were hurrying down to the fight; kept back, however, by Alef, who strode along at their head.

Alef was sorely perplexed in mind. He had taken, as all honest men did, a great liking to Hereward. Moreover, he was his kinsman and his guest. Save him he would if he could; but how to save him without mortally offending his tyrant Ironhook he could not see. At least he would exert what little power he had, and prevent, if possible, his men-at-arms from helping their darling leader against the hapless lad.

Alef's perplexity was much increased when his daughter bounded towards him, seizing him by the arm, and hurried him on, showing by look and word which of the combatants she favoured, so plainly that the ruffians behind broke into scornful murmurs. They burst through the bushes. Martin Lightfoot, happily, heard them coming, and had just time to slip away noiselessly, like a rabbit, to the other part of the cover.

The combat seemed at the first glance to be one between a grown man and a child, so unequal was the size of the combatants. But the second look showed that the advantage was by no means with Ironhook. Stumbling to and fro with the broken shaft of a javelin sticking in his thigh, he vainly tried to seize and crush Hereward in his enormous arms. Hereward bleeding, but still active and upright, broke away, and sprang round him, watching for an opportunity to strike a deadly blow. The housecarles rushed forward with yells. Alef shouted to the combatants to desist: but ere the party could reach them, Hereward's opportunity had come. Ironhook after a fruitless lunge stumbled forward. Hereward leapt aside, and spying an unguarded spot below the corslet, drove his sword deep into the giant's body, and rolled him over upon the sward. Then arose shouts of fury.

"Foul play!" cried one.

And others taking up the cry, called out, "Sorcery!" and "Treason!"

Hereward stood over Ironhook as he lay writhing and foaming on the ground.

"Killed by a boy at last!" groaned he. "If I had but had my own sword—my Brain-biter which that witch stole from me but last night!"—and amid foul curses and bitter tears of shame his mortal spirit fled to its doom.

The housecarles rushed in on Hereward, who had enough to do to keep them at arm's length by long sweeps of his sword.

Alef entreated, threatened, promised a fair trial if the men would give fair play: when, to complete the confusion, the princess threw herself upon the corpse, shrieking and tearing her hair; and to Hereward's surprise and disgust, bewailed the prowess and the virtues of the dead, calling upon all present to avenge his murder.

Hereward vowed inwardly that he would never again trust woman's fancy, or fight in woman's quarrel. He was now nigh at his wits' end; the housecarles had closed round him in a ring with the intention of seizing him; and however well he might defend his front, he might be crippled at any moment from behind: but in the very nick of time Martin Lightfoot burst through the crowd, set himself heel to heel with his master, and broke out, not with threats, but with a good-humoured laugh.

"Here is a pretty coil about a red-headed brute of a Pict! Danes, Ostmen," he cried, "are you not ashamed to call such a fellow your lord, when you have such a true earl's son as this to lead you if you will?"

The Ostmen in the company looked at each other. Martin Lightfoot saw that his appeal to the antipathies of race had told, and followed it up by a string of witticisms upon the Pictish nation in general, of which the only two fit for modern ears to be set down were the two old stories, that the Picts had feet so large that they used to lie upon their backs and hold up their legs to shelter them from the sun; and that when killed, they could not fall down, but died as they were, all standing.

"So that the only foul play I can see is, that my master shoved the fellow over after he had stabbed him, instead of leaving him to stand upright there, like one of your Cornish Dolmens, till his flesh should fall off his bones."

Hereward saw the effect of Martin's words, and burst out in Danish likewise.

"Look at me!" he said, "I am Hereward the outlaw, I am the champion, I am the Berserker, I am the Viking, I am the land thief, the sea thief, the ravager of the world, the bear slayer, the Ogre killer, the raven fattener, the darling of the wolf, the curse of the widow. Touch me, and I will give you to the raven and to the wolf, as I have this Ogre. Be my men, and follow me over the swan's road, over the whale's bath, over the long-snake's leap, to the land where the sea meets the sun, and golden apples hang on every tree; and we will freight our ships with Moorish maidens, and the gold of Cadiz and Algiers."

"Hark to the Viking! Hark to the right earl's son!" shouted some of the Danes, whose blood had been stirred many a time before by such wild words, and on whom Hereward's youth and beauty had their due effect. And now the counsels of the ruffians being divided, the old priest gained courage to step in. Let them deliver Hereward and his serving man into his custody. He would bring them forth on the morrow, and there should be full investigation and fair trial. And so Hereward and Martin, who both refused stoutly to give up their arms, were marched back into the town, locked in the little church, and left to their meditations.

Hereward sat down on the pavement and cursed the princess. Martin Lightfoot took off his master's corslet, and, as well as the darkness would allow, bound up his wounds, which happily were not severe.

"Were I you," said he at last, "I should keep my curses till I saw the end of this adventure."

"Has not the girl betrayed me shamefully?"

"Not she. I saw her warn you, as far as looks could do, not to quarrel with the man."

"That was because she did not know me. Little she thought that I could——"

"Don't holla till you are out of the wood. This is a night for praying rather than boasting."

"She cannot really love that wretch," said Hereward, after a pause. "You saw how she mocked him."

"Women are strange things, and often tease most where they love most."

"But such a misbegotten savage."

"Women are strange things, say I, and with some a big fellow is a pretty fellow, be he uglier than seven Ironhooks. Still, just because women are strange things, have patience, say I."

The lock creaked, and the old priest came in. Martin leapt to the open door; but it was slammed in his face by men outside with scornful laughter.

The priest took Hereward's head in his hands, wept over him, blest him for having slain Goliath like young David, and then set food and drink before the two; but he answered Martin's questions only with sighs and shakings of the head.

"Let us eat and drink then," said Martin, "and after that you, my lord, sleep off your wounds while I watch the door. I have no fancy for these fellows taking us unawares at night."

Martin lay quietly across the door till the small hours, listening to every sound, till the key creaked once more in the lock. He started at the sound, and seizing the person who entered round the neck, whispered, "One word, and you are dead."

"Do not hurt me," half shrieked a stifled voice; and Martin Lightfoot, to his surprise, found that he had grasped no armed man, but the slight frame of a young girl.

"I am the Princess," she whispered, "let me in."

"A very pretty hostage for us," thought Martin, and letting her go seized the key, locking the door in the inside.

"Take me to your master," she cried, and Martin led her up the church wondering, but half suspecting some further trap.

"You have a dagger in your hand," said he, holding her wrist.

"I have. If I had meant to use it, it would have been used first on you. Take it, if you like."

She hurried up to Hereward, who lay sleeping quietly on the altar-steps; knelt by him, wrung his hands, called him her champion, her deliverer.

"I am not well awake yet," said he coldly, "and don't know whether this may not be a dream, as more that I have seen and heard seems to be."

"It is no dream. I am true. I was always true to you. Have I not put myself in your power? Am I not come here to deliver you, my deliverer?"

"The tears which you shed over your ogre's corpse seem to have dried quickly enough."

"Cruel! What else could I do? You heard him accuse me to those ruffians of having stolen his sword. My life, my father's life, were not safe a moment, had I not dissembled, and done the thing I loathed. Ah!" she went on bitterly. "You men, who rule the world and us by cruel steel, you forget that we poor women have but one weapon left wherewith to hold our own, and that is cunning; and are driven by you day after day to tell the lie which we detest."

"Then you really stole his sword?"

"And hid it here, for your sake!" and she drew the weapon from behind the altar.

"Take it. It is yours now. It is magical. Whoever smites with it, need never smite again. Now, quick, you must be gone. But promise one thing before you go."

"If I leave this land safe, I will do it, be it what it may. Why not come with me, lady, and see it done?"

She laughed. "Vain boy, do you think that I love you well enough for that?"

"I have won you, and why should I not keep you?" said Hereward sullenly.

"Do you not know that I am betrothed to your kinsman? And—though that you cannot know—that I love your kinsman?"

"So I have all the blows, and none of the spoil."

"Tush, you have the glory—and the sword—and the chance, if you will do my bidding, of being called by all ladies a true and gentle knight, who cared not for his own pleasure, but for deeds of chivalry. Go to my betrothed—to Waterford over the sea. Take him this ring, and tell him by that token to come and claim me soon, lest he run the danger of losing me a second time, and lose me then for ever; for I am in hard case here, and were it not for my father's sake, perhaps I might be weak enough, in spite of what men might say, to flee with you to your kinsman across the sea."

"Trust me and come," said Hereward, whose young blood kindled with a sudden nobleness—"Trust me and I will treat you like my sister, like my queen. By the holy rood above I will swear to be true to you."

"I do trust you, but it cannot be. Here is money for you in plenty to hire a passage if you need: it is no shame to take it from me. And now one thing more. Here is a cord—you must bind the hands and feet of the old priest inside, and then you must bind mine likewise."

"Never," quoth Hereward.

"It must be. How else can I explain your having got the key? I made them give me the key on the pretence that with one who had most cause to hate you, it would be safe; and when they come and find us in the morning I shall tell them how I came here to stab you with my own hands—you must lay the dagger by me—and how you and your man fell upon us and bound us, and you escaped. Ah! Mary Mother," continued the maiden with a sigh, "when shall we poor weak women have no more need of lying?"

She lay down, and Hereward, in spite of himself, gently bound her hands and feet, kissing them as he bound them.

"I shall do well here upon the altar steps," said she. "How can I spend my time better till the morning light than to lie here and pray?"

The old priest, who was plainly in the plot, submitted meekly to the same fate; and Hereward and Martin Lightfoot stole out, locking the door, but leaving the key in it outside. To scramble over the old earthwork was an easy matter; and in a few minutes they were hurrying down the valley to the sea, with a fresh breeze blowing behind them from the north.

"Did I not tell you, my lord," said Martin Lightfoot, "to keep your curses till you had seen the end of this adventure?"

Hereward was silent. His brain was still whirling from the adventures of the day, and his heart was very deeply touched. His shrift of the morning, hurried and formal as it had been, had softened him. His danger—for he felt how he had been face to face with death—had softened him likewise; and he repented somewhat of his vainglorious and bloodthirsty boasting over a fallen foe, as he began to see that there was a purpose more noble in life than ranging land and sea, a ruffian among ruffians, seeking for glory amid blood and flame. The idea of chivalry, of succouring the weak and the opprest, of keeping faith and honour not merely towards men who could avenge themselves, but towards women who could not; the dim dawn of purity, gentleness, and the conquest of his own fierce passions—all these had taken root in his heart during his adventure with the fair Cornish girl.

The seed was sown. Would it be cut down again by the bitter blasts of the rough fighting world, or would it grow and bear the noble fruit of "gentle very perfect knighthood?"

They reached the ship, clambered on board without ceremony, at the risk of being taken and killed as robbers, and told their case. The merchants had not completed their cargo of tin. Hereward offered to make up their loss to them if they would set sail at once; and they, feeling that the place would be for some time to come too hot to hold them, and being also in high delight, like honest Ostmen, with Hereward's prowess, agreed to sail straight for Waterford, and complete their cargo there. But the tide was out. It was three full hours before the ship could float; and for three full hours they waited in fear and trembling, expecting the Cornishmen to be down upon them in a body every moment; under which wholesome fear some on board prayed fervently who had never been known to pray before.

CHAPTER IV.

HOW HEREWARD TOOK SERVICE WITH RANALD, KING OF WATERFORD.

THE coasts of Ireland were in a state of comparative peace in the middle of the eleventh century. The ships of Loghlin, seen far out at sea, no longer drove the population shrieking inland. Heathen Danes, whether fair-haird Fiongall from Norway, or brown-haird Dubgall from Denmark proper, no longer burned convents, tortured monks for their gold, or (as at Clonmacnoise) set a heathen princess, Oda, wife of Thorgill, son of Harold Harfager, aloft on the high altar to receive the homage of the conquered. The Scandinavian invaders had become Christianised, and civilised also—owing to their continual intercourse with foreign nations—more highly than the Irish whom they had overcome. That was easy; for early Irish civilisation seems to have existed only in the convents and for the religious; and when they were crushed, mere barbarism was left behind. And now the same process went on in the east of Ireland, which went on a generation or two later in the east of Scotland. The Danes began to settle down into peaceful colonists and traders. Ireland was poor; and the convents plundered once could not be plundered again. The Irish were desperately brave. Ill-armed and almost naked, they were as perfect in the arts of forest warfare as those modern Maories whom they so much resemble; and though their black skenes and light darts were no match for the Danish swords and battleaxes which they adopted during the middle age, or their plaid trousers and felt capes for the Danish helmet and chain corslet, still an Irishman was so ugly a foe, that it was not worth while to fight with him unless he could be robbed afterwards. The Danes, who, like their descendants of Northumbria, the Lowlands, and Ulster, were canny common-sense folk, with a shrewd eye to interest, found, somewhat to their regret, that there were trades even more profitable than robbery and murder. They therefore concentrated themselves round harbours and river mouths, and sent forth their ships to all the western seas, from Dublin, Waterford, Wexford, Cork, or Limerick. Every important seaport in Ireland owes its existence to those sturdy Vikings' sons. In each of these towns they had founded a petty kingdom, which endured until, and even in some cases after, the conquest of Ireland by Henry II. and Strongbow. They intermarried in the meanwhile with the native Irish. Brian Boru, for instance, was so connected with Danish royalty, that it is still a question whether he himself had not Danish blood in his veins. King Sigtryg Silkbeard, who fought against him at Clontarf, was actually his step-son—and so too, according to another Irish chronicler, was King Olaff Kvaran, who even at the time of the battle of Clontarf was married to Brian Boru's daughter—a marriage which (if a fact) was startlingly within the prohibited degrees of consanguinity. But the ancient Irish were sadly careless on such points; and as Giraldus Cambrensis says, "followed the example of men of old in their vices more willingly than in their virtues."

More than forty years had elapsed since that famous battle of Clontarf, and since Ragnvald, Reginald, or Ranald, son of Sigtryg the Norseman, had been slain therein by Brian Boru. On that one day, so the Irish sang, the Northern invaders were exterminated, once and for all, by the Milesian hero, who had craftily used the strangers to fight his battles, and then the moment they became formidable to himself, crushed them till "from Howth to Brandon in Kerry, there was not a threshing floor without a Danish slave threshing thereon, or a quern without a Danish woman grinding thereat."

Nevertheless, in spite of the total annihilation of the Danish power in the Emerald isle, Ranald seemed to the eyes of men to be still a hale old warrior, ruling constitutionally—that is, with a wholesome fear of being outlawed or murdered if he misbehaved—over the Danes in Waterford; with five hundred fair-haired warriors at his back, two-edged axe on shoulder, and two-edged sword on thigh. His ships drove a thriving trade with France and Spain in Irish fish, butter, honey and furs. His workmen coined money in the old round tower of Dundory, built by his predecessor and namesake about the year 1003, which stands as Reginald's tower to this day. He had fought many a bloody battle since his death at Clontarf, by the side of his old leader Sigtryg Silkbeard. He had been many a time to Dublin to visit his even more prosperous and formidable friend; and was so delighted with the new church of the Holy Trinity, which Sigtryg and his bishop Donatus had just built, not in the Danish or Ostman town, but in the heart of ancient Celtic Dublin, (plain proof of the utter overthrow of the Danish power,) that he had determined to build a like church in honour of the Holy Trinity, in Waterford itself. A thriving valiant old king he seemed, as he sat in his great house of pine logs under Reginald's Tower upon the quay, drinking French and Spanish wines out of horns of ivory and cups of gold; and over his head hanging, upon the wall, the huge double-edged axe with which, so his flatterers had whispered, Brian Boru had not slain him, but he Brian Boru.

Nevertheless, then as since, alas! the pleasant theory was preferred by the Milesian historians to the plain truth. And far away inland, monks wrote and harpers sung of the death of Ranald the fair-haired Fiongall, and all his "mailed swarms."

One Teague MacMurrough, indeed, a famous bard of those parts, composed unto his harp a song of Clontarf, the fame whereof reached Ranald's ears, and so amused him that he rested not day or night till he had caught the hapless bard and brought him in triumph into Waterford. There he compelled him at sword's point to sing to him and his housecarles the Milesian version of the great historical event; and when the harper in fear and trembling came to the story of Ranald's own death at Brian Boru's hands, then the jolly old Viking laughed till the tears ran down his face; and instead of cutting off Teague's head, gave him a cup of goodly wine, made him his own harper thenceforth, and bade him send for his wife and children, and sing to him every day, especially the song of Clontarf and his own death; treating him very much, in fact, as English royalty during the last generation treated another Irish bard whose song was even more sweet, and his notions of Irish history even more grotesque, than those of Teague MacMurrough.

It was to this old king, or rather to his son Sigtryg, godson of Sigtryg Silkbeard, and distant cousin of his own, that Hereward now took his way, and told his story, as the king sat in his hall, drinking "across the fire" after the old Norse fashion. The fire of pine logs was in the midst of the hall, and the smoke went out through a louver in the roof. On one side was a long bench, and in the middle of it the king's high arm-chair; right and left of him sat his kinsmen and the ladies, and his sea-captains and men of wealth. Opposite, on the other side of the fire, was another bench. In the middle of that sat his marshal, and right and left all his housecarles. There were other benches behind, on which sat more freemen, but of lesser rank.

And they were all drinking ale, which a servant poured out of a bucket into a great bull's horn, and the men handed round to each other.

Then Hereward came in, and sat down on the end of the hindermost bench, and Martin stood behind him; till one of the ladies said:

"Who is that young stranger, who sits behind there so humbly, though he looks like an earl's son, more fit to sit here with us on the high bench?"

"So he does," quoth King Ranald. "Come forward hither, young sir, and drink."

And when Hereward came forward, all the ladies agreed that he must be an earl's son; for he had a great gold torc round his neck, and gold rings on his wrists; and a new scarlet coat, bound with gold braid; and scarlet stockings, cross-laced with gold braid up to the knee; and shoes trimmed with martin's fur; and a short blue silk cloak over all, trimmed with martin's fur likewise; and by his side, in a broad belt with gold studs, was the Ogre's sword Brain-biter, with its ivory hilt and velvet sheath; and all agreed that if he had but been a head taller, they had never seen a properer man.

"Aha! such a gay young sea-cock does not come hither for nought. Drink first, man, and tell us thy business after," and he reached the horn to Hereward.

Hereward took it, and sang—

"In this Braga-beaker,
Brave Ranald I pledge;
In good liquor, which lightens
Long labour on oar-bench;
Good liquor, which sweetens
The song of the scald."

"Thy voice is as fine as thy feathers, man. Nay, drink it all. We ourselves drink here by the peg at midday: but a stranger is welcome to fill his inside all hours of the day."

Whereon Hereward finished the horn duly; and at Ranald's bidding, sat him down on the high settle. He did not remark, that as he sat down, two handsome youths rose and stood behind him.

"Now then, Sir Priest," quoth the king, "go on with your story."

A priest, Irish by his face and dress, who sat on the high bench, rose, and renewed an oration which Hereward's entrance had interrupted.

"So, O great king, as says Homerus, this wise king called his earls, knights, sea-captains, and housecarles, and said unto them—'Which of these two kings is in the right, who can tell? But mind you, that this king of the Enchanters lives far away in India, and we never heard of him more than his name: but this king Ulixes and his Greeks live hard by; and which of the two is it wiser to quarrel with, him that lives hard by or him that lives far off?' Therefore, King Ranald, says, by the the mouth of my humility, the great O'Brodar, Lord of Ivark,—'take example by Alcinous, the wise king of Fairy, and listen not to the ambassadors of those lying villains, O'Dea Lord of Slievardagh, Maccarthy King of Cashel, and O'Sullivan Lord of Knockraffin, who all three between them could not raise kernes enough to drive off one old widow's cow. Make friends with me, who live upon your borders; and you shall go peaceably through my lands, to conquer and destroy them, who live afar off; as they deserve, the sons of Baylial and Judas.'"

And the priest crost himself, and sat down. At which speech Hereward was seen to laugh.

"Why do you laugh, young sir? The priest seems to talk like a wise man, and is my guest and an ambassador."

Then rose up Hereward, and bowed to the king. "King Ranald Sigtrygsson, it was not for rudeness that I laughed, for I learnt good manners long ere I came here: but because I find clerks alike all over the world."

"How?"

"Quick at hiding false counsel under learned speech. I know nothing of Ulixes, king, nor of this O'Brodar either: and I am but a lad, as you see: but I heard a bird once in my own country who gave a very different counsel from the priest's."

"Speak on, then. This lad is no fool, my merry men all."

"There were three copses, King, in our country, and each copse stood on a hill. In the first there built an eagle, in the second there built a sparhawk, in the third there built a crow.

"Now the sparhawk came to the eagle, and said, 'Go shares with me, and we will kill the crow, and have her wood to ourselves.'

"'Humph!' says the eagle, 'I could kill the crow without your help; however, I will think of it.'

"When the crow heard that, she came to the eagle herself, 'King Eagle,' says she, 'why do you want to kill me, who live ten miles from you, and never flew across your path in my life? Better kill that little rogue of a sparhawk who lives between us, and is always ready to poach on your marches whenever your back is turned. So you will have her wood as well as your own.'

"'You are a wise crow,' said the eagle; and he went out and killed the sparhawk, and took his wood."

Loud laughed King Ranald and his Vikings all. "Well spoken, young man! We will take the sparhawk, and let the crow bide."

"Nay but," quoth Hereward, "hear the end of the story. After a while the eagle finds the crow beating about the edge of the sparhawk's wood.

"'Oho!' says he, 'so you can poach as well as that little hooknosed rogue?' and he killed her too.

"'Ah!' says the crow, when she lay a-dying, 'my blood is on my own head. If I had but left the sparhawk between me and this great tyrant!'

"And so the eagle got all three woods to himself."

At which the Vikings laughed more loudly than ever; and King Ranald, chuckling at the notion of eating up the hapless Irish princes one by one, sent back the priest (not without a present for his church, for Ranald was a pious man) to tell the great O'Brodar, that unless he sent into Waterford by that day week, two hundred head of cattle, a hundred pigs, a hundred weight of clear honey, and as much of wax, Ranald would not leave so much as a sucking pig alive in Ivark.

The cause of quarrel, of course, was too unimportant to be mentioned. Each had robbed and cheated the other half-a-dozen times in the last twenty years. As for the morality of the transaction, Ranald had this salve for his conscience, that as he intended to do to O'Brodar, so would O'Brodar have gladly done to him, had he been living peaceably in Norway, and O'Brodar been strong enough to invade and rob him. Indeed, so had O'Brodar done already, ever since he wore beard, to every chieftain of his own race whom he was strong enough to ill-treat. Many a fair herd had he driven off, many a fair farm burnt, many a fair woman carried off a slave, after that inveterate fashion of lawless feuds which makes the history of Celtic Ireland from the earliest times one dull and aimless catalogue of murder and devastation, followed by famine and disease; and now, as he had done to others, so was it to be done to him.

"And now, young sir, who seem as witty as you are good-looking, you may, if you will, tell us your name and your business. As for the name, however, if you wish to keep it to yourself, Ranald Sigtrygsson is not the man to demand it of an honest guest."

Hereward looked round, and saw Teague MacMurrough standing close to him, harp in hand. He took it from him courteously enough, put a silver penny into the minstrel's hand, and running his fingers over the strings, rose and began.

"Outlaw and free thief
Landless and lawless
Through the world fare I,
Thoughtless of life.
Soft is my beard, but
Hard my Brain-biter.
Wake, men me call, whom
Warrior or watchman
Never caught sleeping,
Far in Northumberland
Slew I the witch-bear,
Cleaving his brain-pan,
At one stroke I fell'd him."

* * * *

And so forth, chaunting all his doughty deeds, with such a voice and spirit joined to that musical talent for which he was afterwards so famous, till the hearts of the wild Norsemen rejoiced, and "Skall to the stranger! Skall to the young Viking!" rang through the hall.

Then showing proudly the fresh wounds on his bare arms, he sang of his fight with the Cornish ogre, and his adventure with the Princess. But always, though he went into the most minute details, he concealed the name both of her and of her father, while he kept his eyes steadily fixed on Ranald's eldest son, Sigtryg, who sat at his father's right hand.

The young man grew uneasy, red, almost angry; till at last Hereward sung:—

"A gold ring she gave me
Right royally dwarf-worked,
To none will I pass it
For prayer or for sword stroke,
Save to him who can claim it
By love and by troth plight,
Let that hero speak
If that hero be here."

Young Sigtryg half started from his feet: but when Hereward smiled at him, and laid his finger on his lips, he sat down again. Hereward felt his shoulder touched from behind. One of the youths who had risen when he sat down bent over him, and whispered in his ear.

"Ah, Hereward, we know you. Do you not know us? We are the twins, the sons of your sister, Siward the White and Siward the Red, the orphans of Asbiorn Siwardsson, who fell at Dunsinane."

Hereward sprang up, struck the harp again, and sang—

"Outlaw and free-thief,
My kinsfolk have left me,
And no kinsfolk need I
Till kinsfolk shall need me.
My sword is my father,
My shield is my mother,
My ship is my sister,
My horse is my brother."

"Uncle, uncle," whispered one of them sadly, "listen now or never, for we have bad news for you and us. Your father is dead, and Earl Algar your brother, here in Ireland, outlawed a second time."

A flood of sorrow passed through Hereward's heart. He kept it down, and rising once more, harp in hand—

"Hereward, king, hight I.
Holy Leofric my father,
In Westminster wiser
None walked with king Edward.
High minsters he builded
Pale monks he maintained.
Dead is he, a bed-death,
A leech-death, a priest-death,
A straw-death, a cow's death.
Such doom I desire not.
To high heaven, all so softly,
The angels uphand him,
In meads of May flowers
Mild Mary will meet him.
Me, happier, the Valkyrs
Shall waft from the war-deck,
Shall hail from the holmgang
Or helmet-strewn moorland.
And sword strokes my shrift be,
Sharp spears be my leeches,
With heroes' hot corpses
High heaped for my pillow."

"Skall to the Viking!" shouted the Danes once more, at this outburst of heathendom, common enough among their half-converted race, in times when monasticism made so utter a divorce between the life of the devotee and that of the worldling that it seemed reasonable enough for either party to have their own heaven and their own hell. After all, Hereward was not original in his wish. He had but copied the death-song which his father's friend and compeer, Siward Digre, the victor of Dunsinane, had sung for himself some three years before.

All praised his poetry, and especially the quickness of his alliterations (then a note of the highest art); and the old king filling not this time the horn, but a golden goblet, bid him drain it and keep the goblet for his song.

Young Sigtryg leapt up, and took the cup to Hereward. "Such a skald," he said, "ought to have no meaner cup-bearer than a king's son."

Hereward drank it dry; and then fixing his eyes meaningly on the prince, dropt the Princess's ring into the cup, and putting it back into Sigtryg's hand, sang—

"The beaker I reach back
More rich than I took it.
No gold will I grasp
Of the king's, the ring-giver,
Till, by wit or by weapon,
I worthily win it.
When brained by my biter
O'Brodar lies gory,
While over the wolf's meal
Fair widows are wailing."

"Does he refuse my gift?" grumbled Ranald.

"He has given a fair reason," said the Prince, as he hid the ring in his bosom; "leave him to me; for my brother in arms he is henceforth."

After which, as was the custom of those parts, most of them drank too much liquor. But neither Sigtryg nor Hereward drank; and the two Siwards stood behind their young uncle's seat, watching him with that intense admiration which lads can feel for a young man.

That night, when the warriors were asleep, Sigtryg and Hereward talked out their plans. They would equip two ships; they would fight all the kinglets of Cornwall at once, if need was; they would carry off the Princess, and burn Alef's town over his head, if he said nay. Nothing could be more simple than the tactics required in an age when might was right.

Then Hereward turned to his two nephews who lingered near him, plainly big with news.

"And what brings you here, lads?" He had hardened his heart, and made up his mind to show no kindness to his own kin. The day might come when they might need him; then it would be his turn.

"Your father, as we told you, is dead."

"So much the better for him, and the worse for England. And Harold and the Godwinssons, of course, are lords and masters far and wide?"

"Tosti has our grandfather Siward's earldom."

"I know that. I know, too, that he will not keep it long, unless he learns that Northumbrians are free men, and not Wessex slaves."

"And Algar our uncle is outlawed again, after King Edward had given him peaceably your father's earldom.

"And why?"

"Why was he outlawed two years ago?"

"Because the Godwinssons hate him, I suppose."

"And Algar is gone to Griffin the Welshman, and from him on to Dublin to get ships, just as he did two years ago; and has sent us here to get ships likewise."

"And what will he do with them when he has got them? He burnt Hereford last time he was outlawed, by way of a wise deed, minster and all, with St. Ethelbert's relics on board; and slew seven clergymen: but they were only honest canons with wives at home, and not shaveling monks, so I suppose that sin was easily shrived. Well, I robbed a priest of a few pence, and was outlawed; he plunders and burns a whole minster, and is made a great earl for it. One law for the weak and one for the strong, young lads, as you will know when you are as old as I. And now I suppose he will plunder and burn more minsters, and then patch up a peace with Harold again; which I advise him strongly to do; for I warn you, young lads, and you may carry that message from me to Dublin to my good brother your uncle, that Harold's little finger is thicker than his whole body; and that, false Godwinsson as he is, he is the only man with a head upon his shoulders left in England, now that his father, and my father, and dear old Siward, whom I loved better than my father, are dead and gone."

The lads stood silent, not a little awed, and indeed imposed on, by the cynical and worldly-wise tone which their renowned uncle had assumed.

At last one of them asked falteringly, "Then you will do nothing for us?"

"For you, nothing. Against you, nothing. Why should I mix myself up in my brother's quarrels? Will he make that white-headed driveller at Westminster reverse my outlawry? And if he does, what shall I get thereby? A younger brother's portion; a dirty ox-gang of land in Kesteven. Let him leave me alone as I leave him, and see if I do not come back to him some day, for or against him as he chooses, with such a host of Vikings' sons as Harold Hadraade himself would be proud of. By Thor's hammer, boys, I have been an outlaw but five years now, and I find it so cheery a life, that I do not care if I am an outlaw for fifty more. The world is a fine place and a wide place; and it is a very little corner of it that I have seen yet; and if you were of my mettle, you would come along with me and see it throughout to the four corners of heaven, instead of mixing yourselves up in these paltry little quarrels with which our two families are tearing England in pieces, and being murdered perchance like dogs at last by treachery, as Sweyn Godwinsson murdered Biorn."

The boys listened, wide-eyed and wide-eared. Hereward knew to whom he was speaking; and he had not spoken in vain.

"What do you hope to get here?" he went on. "Ranald will give you no ships: he will have enough to do to fight O'Brodar; and he is too cunning to thrust his head into Algar's quarrels."

"We hoped to find Vikings here, who would go to any war on the hope of plunder."

"If there be any, I want them more than you; and what is more, I will have them. They know that they will do finer deeds with me for their captain, than burning a few English homesteads. And so may you. Come with me, lads. Once and for all, come. Help me to fight O'Brodar. Then help me to another little adventure which I have on hand—as pretty a one as ever you heard a minstrel sing—and then we will fit out a long ship or two, and go where fate leads—to Constantinople, if you like. What can you do better? You never will get that earldom from Tosti. Lucky for young Waltheof, your uncle, if he gets it;—if he, and you too, are not murdered within seven years; for I know Tosti's humour, when he has rivals in his way——"

"Algar will protect us," said one.

"I tell you, Algar is no match for the Godwinssons. If the monk-king died to-morrow, neither his earldom nor his life would be safe. When I saw your father Asbiorn lie dead at Dunsinane, I said, 'There ends the glory of the house of the bear;' and if you wish to make my words come false, then leave England to founder, and rot, and fall to pieces—as all men say she is doing—without your helping to hasten her ruin; and seek glory and wealth too with me around the world! The white bear's blood is in your veins, lads. Take to the sea like your ancestor, and come over the swan's bath with me!"

"That we will!" said the two lads. And well they kept their word.

CHAPTER V.

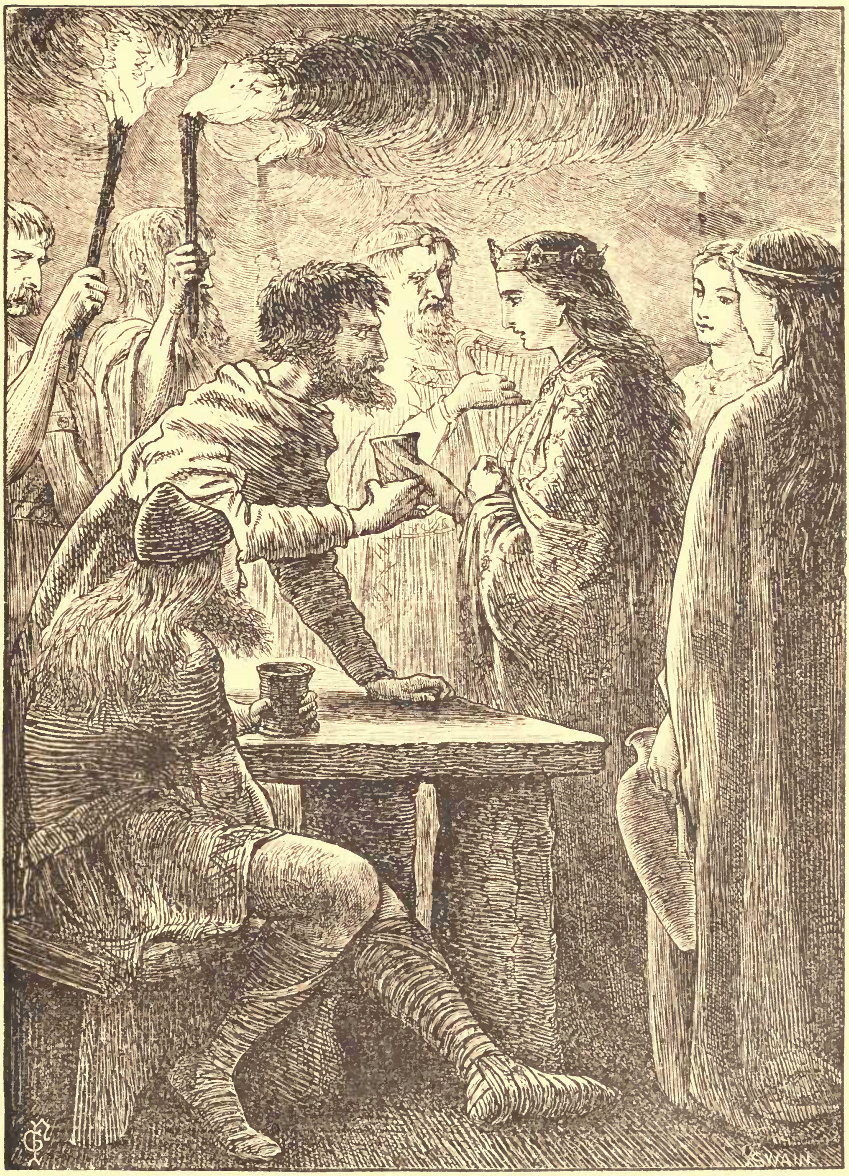
HOW HEREWARD SUCCOURED THE PRINCESS OF CORNWALL A SECOND TIME.

FAT was the feasting, and loud was the harping in the halls of Alef the Cornishman, King of Gweek. Savoury was the smell of fried pilchard and hake; more savoury still that of roast porpoise; most savoury of all that of fifty huge squab pies, built up of layers of apples, bacon, onions, and mutton, and at the bottom of each a squab, or young cormorant, which diffused both through the pie and through the ambient air, a delicate odour of mingled guano and polecat. And the occasion was worthy alike of the smell and of the noise; for King Alef, finding that after the Ogre's death the neighbouring kings were but too ready to make reprisals on him for his champion's murders and robberies, had made a treaty of alliance, offensive and defensive, with Hannibal the son of Gryll, King of Marazion, and had confirmed the same by bestowing on him the hand of his fair daughter. Whether she approved of the match or not, was asked neither by King Alef nor by King Hannibal.

To-night was the bridal-feast. To-morrow morning the church was to hallow the union, and after that Hannibal Grylls was to lead home his bride, among a gallant company.

And as they ate and drank, and harped and piped, there came into that hall four shabbily drest men—one of them a short, broad fellow, with black elf-locks and a red beard—and sat them down sneakingly at the very lowest end of all the benches.

In hospitable Cornwall, especially on such a day, every guest was welcome; and the strangers sat peaceably, but ate nothing, though there was both hake and pilchard within reach.



THE PRINCESS GIVING THE CUP TO HEREWARD.

Page 97.

Next to them, by chance, sat a great lourdan of a Dane, as honest, brave, and stupid a fellow as ever tugged at oar; and after a while they fell talking, till the strangers had heard the reason of this great feast, and all the news of the country side.

"But whence did they come, not to know it already; for all Cornwall was talking thereof?"

"Oh—they came out of Devonshire, seeking service down west, with some merchant or rover, being seafaring men."

The stranger with the black hair had been, meanwhile, earnestly watching the Princess, who sat at the board's head. He saw her watching him in return; and with a face sad enough.

At last she burst into tears.

"What should the bride weep for, at such a merry wedding?" asked he of his companion.

"Oh—cause enough;" and he told bluntly enough the Princess's story. "And what is more," said he, "the King of Waterford sent a ship over last week, with forty proper lads on board, and two gallant holders with them, to demand her: but for all answer, they were put into the strong house, and there they lie, chained to a log, at this minute. Pity it is, and shame, I hold, for I am a Dane myself; and pity, too, that such a bonny lass should go to an unkempt Welshman like this, instead of a tight smart Viking's son, like the Waterford lad."

The stranger answered nothing: but kept his eyes upon the Princess, till she looked at him stedfastly in return.

She turned pale and red again: but after a while she spoke.

"There is a stranger there; and what his rank may be, I know not: but he has been thrust down to the lowest seat, in a house that used to honour strangers, instead of treating them like slaves. Let him take this dish from my hand, and eat joyfully, lest when he goes home he may speak scorn of bridegroom and bride, and our Cornish weddings."

The servant brought the dish down: he gave a look at the stranger's shabby dress, turned up his nose, and pretending to mistake, put the dish into the hand of the Dane.

"Hold, lads," quoth the stranger. "If I have ears, that was meant for me."

He seized the platter with both hands; and therewith the hands both of the Cornishman and of the Dane. There was a struggle: but so bitter was the stranger's gripe, that (says the chronicler) the blood burst from the nails of both his opponents.

He was called a "savage," a "devil in man's shape," and other dainty names: but he was left to eat his squab pie in peace.

"Patience, lads," quoth he, as he filled his mouth. "Before I take my pleasure at this wedding, I will hand my own dish round as well as any of you."

Whereat men wondered, but held their tongues.

And when the eating was over and the drinking began, the Princess rose, and came round to drink the farewell health.

With her maids behind her, and her harper before her (so was the Cornish custom), she pledged one by one each of the guests, slave as well as free, while the harper played a tune.

She came down at last to the strangers. Her face was pale, and her eyes red with weeping.

She filled a cup of wine, and one of her maids offered it to the stranger.

He put it back, courteously but firmly. "Not from your hand," said he.

A growl against his bad manners rose straightway; and the minstrel, who (as often happened in those days) was jester likewise, made merry at his expense, and advised the company to turn the wild beast out of the hall.

"Silence, fool!" said the Princess. "Why should he know our west-country ways? He may take it from my hand, if not from hers."

And she held out to him the cup herself.

He took it, looking her steadily in the face; and it seemed to the minstrel as if their hands lingered together round the cup-handle, and that he saw the glitter of a ring.

Like many another of his craft before and since, he was a vain, meddlesome vagabond, and must needs pry into a secret which certainly did not concern him.

So he could not leave the stranger in peace; and knowing that his privileged calling protected him from that formidable fist, he never passed him by without a sneer or a jest, as he wandered round the table, offering his harp, in the Cornish fashion, to any one who wished to play and sing.

"But not to you, Sir Elf-locks: he that is rude to a pretty girl when she offers him wine, is too great a boor to understand my trade."

"It is a fool's trick," answered the stranger at last, "to put off what you must do at last. If I had but the time, I would pay you for your tune with a better one than you ever heard."

"Take the harp, then, boor!" said the minstrel, with a laugh and a jest.

The stranger took it, and drew from it such music as made all heads turn toward him at once. Then he began to sing, sometimes by himself, and sometimes his comrades, "*more Girviorum tripliciter canentes*," joined their voices in a three-man-glee.

In vain the minstrel, jealous for his own credit, tried to snatch the harp away. The stranger sang on, till all hearts were softened; and the Princess, taking the rich shawl from her shoulders, threw it over those of the stranger, saying that it was a gift too poor for such a scald.

"Scald!" roared the bridegroom (now well in his cups) from the head of the table; "ask what thou wilt, short of my bride and my kingdom, and it is thine."

"Give me, then, Hannibal Grylls, King of Marazion, the Danes who came from Ranald, of Waterford."

"You shall have them! Pity that you have asked for nothing better than such tarry ruffians!"

A few minutes after, the minstrel, bursting with jealousy and rage, was whispering in Hannibal's ear.

The hot old Punic* blood flashed up in his cheeks, and his thin Punic lips curved into a snaky smile. Perhaps the old Punic treachery in his heart; for all that he was heard to reply was, "We must not disturb the good-fellowship of a Cornish wedding."

The stranger, nevertheless, and the Princess likewise, had seen that bitter smile.

Men drank hard and long that night: and when daylight came, the strangers were gone.

In the morning the marriage ceremony was performed; and then began the pageant of leading home the bride. The minstrels went first, harping and piping: then King Hannibal, carrying his bride behind him on a pillion; and after them a string of servants and men-at-arms, leading country ponies laden with the bride's dower. Along with them, unarmed, sulky, and suspicious, walked the forty Danes, who were informed that they should go to Marazion, and there be shipped off for Ireland.

Now, as all men know, those parts of Cornwall, flat and open furze-downs aloft, are cut, for many miles inland, by long branches of tide river, walled in by woods and rocks, which rivers join at last in the great basin of Falmouth harbour; and by crossing one or more of these, the bridal party would save many a mile on their road towards the west.

So they had timed their journey by the tides; lest, finding low water in the rivers, they should have to wade to the ferry-boats waist deep in mud; and going down the steep hill-side, through oak, and ash, and hazel copse, they entered, as many as could, a great flat-bottomed barge, and were rowed across some quarter of a mile, to land under a jutting crag, and go up again by a similar path into the woods.

So the first boat-load went up, the minstrels in front, harping and piping till the greenwood rang, King Hannibal next, with his bride, and behind him spear-men and axe-men, with a Dane between every two.

When they had risen some two hundred feet, and were in the heart of the forest, Hannibal turned, and made a sign to the men behind him.

Then each pair of them seized the Dane between them, and began to bind his hands behind his back.

"What will you do with us?"

"Send you back to Ireland,—a king never breaks his word,—but pick out your right eyes first, to show your master how much I care for him. Lucky for you that I leave you an eye apiece, to find your friend the harper, whom if I catch, I flay alive."

"You promised!" cried the Princess.

"And so did you, traitress!" and he griped her arm, which was round his waist, till she screamed. "So did you promise: but not to me. And you shall pass your bridal night in my dog-kennel, after my dog-whip has taught you not to give rings again to wandering harpers."

The wretched Princess shuddered; for she knew too well that such an atrocity was easy and common enough. She knew it well. Why should she not? The story of the Cid's Daughters and the Knights of Carrion; the far more authentic one of Robert of Belesme; and many another ugly tale of the early middle age, will prove but too certainly that, before the days of chivalry began, neither youth, beauty, nor the sacred ties of matrimony, could protect women from the most horrible outrages, at the hands of those who should have been their protectors. It was reserved for monks and inquisitors, in the name of religion and the gospel, to continue, through after centuries, those brutalities toward women of which gentlemen and knights had grown ashamed, save when (as in the case of the Albigense crusaders) monks and inquisitors bade them torture, mutilate, and burn, in the name of Him who died on the cross.

But the words had hardly passed the lips of Hannibal, ere he reeled in the saddle, and fell to the ground, a javelin through his heart.

A strong arm caught the Princess. A voice which she knew bade her have no fear.

"Bind your horse to a tree, for we shall want him; and wait!"

Three well-armed men rushed on the nearest Cornishmen, and hewed them down. A fourth unbound the Dane, and bade him catch up a weapon, and fight for his life.

A second pair were dispatched, a second Dane freed, ere a minute was over; the Cornishmen, struggling up the narrow path toward the shouts above, were overpowered in detail by continually increasing numbers; and ere half an hour was over, the whole party were freed, mounted on the ponies, and making their way over the downs toward the west.

"Noble, noble Hereward!" said the Princess, as she sat behind him on Hannibal's horse. "I knew you from the first moment; and my nurse knew you too. Is she here? Is she safe?"

"I have taken care of that. She has done us too good service to be left here, and be hanged."

"I knew you, in spite of your hair, by your eyes."

"Yes," said Hereward. "It is not every man who carries one grey eye and one blue. The more difficult for me to go mumming when I need."

"But how came you hither, of all places in the world?"

"When you sent your nurse to me last night, to warn me that treason was abroad, it was easy for me to ask your road to Marazion; and easier too, when I found that you would go home the very way we came, to know that I must make my stand here or nowhere."

"The way you came? Then where are we going now?"

---

* Hannibal, still a common name in Cornwall, is held—and not unlikely—to have been introduced there by the ancient Phœnician colonists.

"Beyond Marazion, to a little cove—I cannot tell its name. There lies Sigtryg your betrothed, and three good ships of war."

"There? Why did he not come for me himself?"

"Why? Because we knew nothing of what was toward. We meant to have sailed straight up your river to your father's town, and taken you out with a high hand. We had sworn an oath—which, as you saw, I kept—neither to eat nor drink in your house, save out of your own hands. But the easterly wind would not let us round the Lizard; so we put into that cove, and there I and these two lads, my nephews, offered to go forward as spies, while Sigtryg threw up an earthwork, and made a stand against the Cornish. We meant merely to go back to him, and give him news. But when I found you as good as wedded, I had to do what I could, while I could; and I have done it."

"You have, my noble and true champion," said she, kissing him.

"Humph!" quoth Hereward laughing. "Do not tempt me by being too grateful. It is hard enough to gather honey, like the bees, for other folks to eat. What if I kept you myself, now I have got you?"

"Hereward!"

"Oh, there is no fear, pretty lady. I have other things to think of than making love to you—and one is, how we are to get to our ships, and moreover, past Marazion town."

And hard work they had to get thither. The county was soon roused and up in arms; and it was only by wandering a three days' circuit, through bogs and moors, till the ponies were utterly tired out, and left behind (the bulkier part of the dowry being left behind with them), that they made their appearance on the shore of Mount's Bay, Hereward leading the Princess in triumph upon Hannibal's horse.

After which they all sailed away for Ireland, and there, like young Beichan—

> "Prepared another wedding,
> With all their hearts so full of glee."

And this is the episode of the Cornish Princess, as told by Leofric of Bourne, the cunning minstrel and warlike priest.

TO MY GRANDCHILDREN.

My blessing on you, little babes,
By whom I think it good,
To find in these my fading days,
My dearest days renew'd.

Oh! bless you, bless you, little babes,
Two little fairy gleams,
Who mix this twilight of my life
With happy morning dreams.

Oh! bless your little helpless ways,
Your curious crows and screeches,
From which my deaf old ears can shape
The sagest pretty speeches.

Oh! bless, and bless, and dearly bless
The little round blue eyes,
In which these old eyes love to watch
The half-thoughts gleam and rise.

Oh! bless, and bless, and dearly bless
Each fraction of a face,
In which my daughter daily grows
To some new form of grace.

O gracious little lives, in which
Two dearer lives are blent;
We bless your coming, and we bless
The precious love that sent;

The love that leads us in its hand,
That loves us even in sighs,
And bids, to light our downward road,
These little twinklers rise.

We bless you, bless you, little babes,
We bless your coming hither ;
Not happier your young lives to grow,
Than our old age to wither !

We bless you, little Gus and Flo !
We bless your coming hither ;
Oh ! grow, and grow, and happy grow,
Whilst we as happy wither ! P. A.

CHRIST THE LIGHT OF THE WORLD.

By C. J. VAUGHAN, D.D.

II.—THE LAMP AND THE LIGHT.

"We have also a more sure word of prophecy ; whereunto ye do well that ye take heed, as unto a light that shineth in a dark place, until the day dawn, and the day star arise in your hearts."—2 Peter i. 19.

St. Peter, expecting the approach of that end of life which his risen Lord had predicted to him, is anxious, before his decease, to secure to the Churches one last testimony to the truth which had made him free. He would assure them, with the earnestness of a dying man, that the Gospel which he had taught, and in which they were walking, was no cunningly devised fable. When the Apostles made known to their converts "the power and coming of the Lord Jesus Christ," they did so, not by conjecture, not even on the strength of a probability however great or an inference however conclusive, but as "eye-witnesses of that majesty" which they asserted. They had seen with their eyes, and heard with their ears, that which attested the Advent.

In such impressive terms does he speak—and no wonder—of one particular scene in the earthly life of Christ, which he, with two other men, had been privileged to witness. He takes as it were for his text the great miracle of the Transfiguration. He, with the two sons of Zebedee, James and John, had been taken aside from the rest, shortly after a remarkable prophecy that some of those standing there should not taste of death, till they had seen a "coming in power" of the kingdom of God; and, being led up into a mountain apart, had seen their Master gloriously transfigured, changed in fashion and aspect, before them, his face shining as the sun, and his raiment glistering with a preternatural light. In the presence of this astounding transformation, there appeared in glory two persons long since passed away from the earth, Moses the Lawgiver of the Old Dispensation, and Elijah the chief and representative of the Prophets. They were seen and heard, talking with Jesus. Their topic of discourse was that mysterious close and consummation of the work of Redemption, (St. Luke says,) "the decease which Christ should accomplish at Jerusalem." In the midst of such discourse, the minds of the three spectators overwhelmed all the time with fear and wonder, a bright luminous cloud passed over the scene; and out of it came an audible voice, saying, "This is my beloved Son, in whom I am well pleased." "This is my beloved Son: hear Him."

One who had witnessed such an event could never forget it : and well might St. Peter, in the close of life, speak of it as he speaks in words preceding the text, "He received from God the Father honour and glory, when there came such a voice to Him from the excellent glory," from the exceeding bright light which betokened God's presence, "This is my beloved Son, in whom I am well pleased. And this voice which came from heaven we heard, when we were with Him in the holy mount."

His words are before us ; surely to your ear, sincere, earnest, heart-felt words, if words were ever such : it is for us to ponder them, and God grant us grace to receive in its simplicity the truth which they disclose !

The text draws the inference. "We have also a more sure word of prophecy :" or more exactly, "And we have more sure the prophetic word ;" we have the word of the prophets confirmed, made more certain and stedfast, by the testimony borne to Christ at the Transfiguration.

"The prophetic word." A Prophet is one who speaks by God's commission in God's behalf. Prediction strictly so called is no essential part of his name or of his office. Some of the prophets of the Old Testament uttered scarcely one, if one, prediction. But they were all utterers, tellers forth, of some message of God. And whether that message took the form of remonstrance or encouragement, of promise or warning, of explanation of the past, reproof of the present, or revelation of the future, in all cases alike it was a constituent part of "the prophetic word :" it formed one portion, more or less prominent, of the whole of that inspired utterance, by which "God in time past spake unto the fathers by the prophets."

Now it is of this utterance as a whole—in other words, of the Volume of the Old Testament Scriptures—that St. Peter here says that it received confirmation, added certainty, from the words heard by him and his brother Apostles on the holy mount of Transfiguration. These words—that emphatic testimony to the Divine mission and to the Divine person of the Son manifest in the flesh—set the seal of God once again, as before at the Baptism, to the fulfilment in Jesus Christ of every utterance, whether of type, prediction, or promise, contained in the prophetic word, in the oral and now written testimony of the messengers of God, "the goodly fellowship of the Prophets."

"Whereunto"—to which prophetic word, as recorded in Holy Scripture—"ye do well in giving heed;" it is right that ye should, as ye do, pay to it the most earnest and devout attention; "as unto a light," or rather "a lamp, shining in a dark (murky or squalid) place, until day dawn and the day-star arise in your hearts."

Observe, the prophetic word is characterized by a different term from that which is applied in Scripture to Christ himself. It is a lamp; not the light of day, not the light of the sun, but the lamp which is its substitute during the hours of evening and of night. The same word is applied to John the Baptist in the fifth chapter of St. John's Gospel. "He was a burning and a shining light:"—"he was the lamp which burns and shines" until the day dawn and the great light of Creation takes the place of the temporary and inferior substitute. So it is with the Prophets generally. What is true of the last and greatest of the prophets, the immediate forerunner and herald of Christ himself, is true of all. Ye do well in giving heed to their word, as to a lamp shining in a murky place till the day dawn.

But was then the Volume of the Old Testament closed and laid aside when Christ came in the flesh? when that true light arose, which lighteth every man coming into the world? Not so. It must still, St. Peter says, be honoured, and still studied. "Ye do well," he says, addressing men of faith and love, "in giving heed to it." The first coming of Christ did not close the work of the Old Testament Scriptures. Writing many years after that first coming, St. Peter commends those who attend to the prophetic word. He fixes a limit, but not a past limit, to the use of Holy Scripture.

(1) First of all, the day must dawn, and the day-star arise, in your hearts. Till Christ is found there, till his bright light is seen and felt within, till the heart rests and is satisfied in the revelation of Christ Himself in it and to it, so long, at all events, ye must give heed to the word which prophets and righteous men spake of old in preparation for his Advent. In this sense, the Advent spoken of is that of which the Lord himself said, "If any man love me, he will keep my word; and my Father will love him, and we will come unto him and make our abode with him." Until that spiritual Advent is realized in us, there can be no intermission of the rule to "search the Scriptures."

How many of us, Christian friends, are ready, on this ground, to cease from the use of Scripture? In how many of our hearts has the day dawned and the day-star risen?

(2) But St. Peter hoped thus much of all whom he addresses. He hoped and he believed concerning all of them, that they had faith, and that their faith wrought by love. And yet he says to them, "Ye do well to give heed to the prophetic word, until," &c. In short, it is plain that he looks forward to a dawn not yet vouchsafed, to a rising not yet given. His thoughts run on to the great Advent of Christ in glory. His language is that of St. Paul in the 13th chapter of his Epistle to the Romans, "The night is far spent, the day is at hand." The "night" is the time that is; the duration (as we speak) of this present world; the period, longer or shorter, as it may please God in his inscrutable wisdom to determine, during which the interests and the ambitions, the cares and the pleasures, the illusions and the sins, of this state of being, shall be suffered to run their course—as distinguished from that period, the arrival of which knoweth no man, when there shall be new heavens, and a new earth; when pain and sorrow, sin and death, shall be for ever done away; when the glory of God shall lighten his city, and the Lamb shall be the light thereof. That is the "day," for which Christians look: at present they are in the night; though it be a night blessed with many lesser lights of divine revelation, which shine until the day dawn and the day-star rise finally upon their waiting hearts. In the meantime they do well to give heed to the prophetic word. And this for a reason which follows, but into which the time suffers us not now to enter; because "no prophecy of Scripture is of any private interpretation;" because "prophecy came not by man's will," but "holy men of God spake as they were moved by the Holy Ghost."

I would pause for a moment upon the expression "private interpretation."

I understand the "interpretation" or "solution" spoken of, to denote an explanation, not of, but by the prophecy.

Something is hidden in the darkness of the future, or in the obscurity of the invisible world. Hidden in God's deep counsels. Man cannot by guessing and cannot by searching find it out. It is an enigma, it is a riddle, of the divine. It is one of those dark impervious caverns which yawn on all sides around the little central light of revelation. God's servants would fain explore, but they cannot. They "enquire and search diligently," but it is in vain. At length God would solve this enigma, would tell this secret, would interpret this mystery. How? He interprets Himself, so far as He sees fit, to one of his prophets. "Surely the Lord God will do nothing, but He revealeth his secret unto his servants the prophets." That is the "interpretation" spoken of by St. Peter. It is the interpretation, by prophecy, of some hitherto secret thing. And what he says of it is, that it is no "private," that is, individual, that is, merely human thing:

it is not of the man himself to interpret God's mysteries: "Do not interpretations belong to God?" The interpretation, which *is* the prophecy, is the expression of another's mind, of another's purpose: it came not by man's will, but came as it was prompted by the Holy Ghost.

So strong and so general a testimony to the inspiration of Holy Scripture must ever be a comfort and help (not least in these times) to the doubting hearts of men.

We may easily lose ourselves in the by-paths which diverge on this side and that from the plain highway of truth. When, for example, we begin to define Inspiration, we are lost at once. The Bible lies unread while men quarrel over it: and when it is next opened, it is not as an oracle of truth, but as a thing soiled, spoiled, and desecrated by a treatment most opposite to its origin and to its end.

Let us suspend all these questions until we really know and really love the Bible; until by its help the day has dawned within, and the day-star arisen in our hearts. Let us resolve, every one of us, not to sit in judgment upon that word which is to judge us, but rather to let it speak for itself within, until we can gather from it, in the way of inference at least, some clear instruction, as upon other topics, so also upon this—the nature and the extent of its own claim to our reverence as the Book of God.

And, for the present, without entering into all the questions which are now sounding in our ears, as to the combination of the divine element and the human in Revelation, or as to the *mode* in which God communicated with those whom He certainly has constituted (whether we will have it so or not) the chief instructors and the chief benefactors of the race of man—instead of this, let us listen to that great Apostle who here speaks to us, and says, Ye do well to give heed to Holy Scripture, for this reason; that it is not a private, individual, merely human, utterance, but its writers came from God to you, and spake as they were moved to speak by the Holy Ghost.

What St. Peter says of the Old Testament cannot be less true of the completed Volume; of that Book in which Evangelists recorded the life and death of Jesus, and Apostles conveyed to Christian congregations the rule of faith and the rule of duty. I shall not spend one word in showing that what is said of the Prophetic, is true, at least equally, of the Evangelical and of the Apostolical Word.

1. First then, we have in the simplest form the duty of giving heed to Holy Scripture.

Doubtless we all imagine that we do so. In days of education it was our text book: in our public services we hear it read weekly: on God's holy day most families have it open:—what lack we yet?

We will reflect upon some possibilities which would certainly prove us disobedient to St. Peter's summons.

In one of the Church Collects for Good Friday, we pray for certain classes and races of men, that God will "take from them all ignorance, hardness of heart, and contempt of his word." And we can all understand how open unbelievers, professed impugners, of the Christian Revelation are guilty of such contempt. But in our Litany, speaking in behalf of ourselves and of Christian people, we pray, in like manner, for deliverance from "hardness of heart, and contempt of God's word." Thus there is such a thing even among Christians as contemning or despising the Word of God. This certainly must be the very opposite to giving heed thereto.

And what else is it but contempt, if we never take the pains to read, and to mark, and to learn, and to digest inwardly, God's Holy Word? if we count it, alone of all books, to need no patient study? if we think that we know beforehand all of it that we need to know, and never bend our knees, in meditation over it, to that God who caused it to be written for our learning? It is the diligent students of the Bible, who are known amongst us as the humble and the devout and the wise and understanding Christians. Them that honour it not, God doth not honour.

We cannot deny that there are peculiar difficulties in the way of this study. There is that impatience of familiar truth, which is in all of us by nature. There is an indisposition to the repeated reading of that which has been known from infancy, and which seems to offer nothing new as the reward of our research. There is a want of obviousness in the connection between reading and profit, even beyond that which hangs upon the use either of prayer, meditation, or communion. We all feel ourselves the worse for living one day without *prayer:* everything is jar, irritation and confusion; temptations have added strength, and duties a tenfold repulsiveness. But the evil consequences of neglecting the Bible are less tangible and more remote. It is not all at once that we become conscious of the dryness and barrenness and hunger of the soul in consequence of being denied its proper aliment, and left to subsist for weeks and years upon the putrid manna of a long-past and long-forgotten yesterday. We may go on thus for long without any sensible decay or any visible judgment. Thus for one person who lives without prayer, a hundred (it may be) or a thousand live practically without a Bible. They do *not* well in this matter of taking heed to the prophetic word.

Add to all this, the impediment felt and mourned over by many, of going back to the Bible from all manner of controversies as to its worth and its authority. Little do they know of the tenderness and precariousness of the life of faith within, who fling abroad here an argument and there a suspicion, here a jest and there a sarcasm, against that Holy Book which Christians in all time have agreed to look upon as the chief storehouse of truth, and the chief repository of comfort. Great indeed ought to be the force of that conviction, and great the urgency of that compulsion, which shall constrain a man not only to surrender for himself, but also to destroy for another, that trust in the sure word of revelation, which has been to so many the one anchor of the soul amongst the winds, waves, and storms of this restless and troublesome world! A man whose faith in the Bible has been thus rudely, thus cruelly shaken, cannot, without some new resettlement and reinstatement, which comes not to many, obey St. Peter's charge, to take heed, in all quiet diligence, to the prophetic word.

And yet, "to whom else shall he go?" Who, save Christ only, even professes to have for us "words of eternal life?"

2. We notice, further, the peculiar character here assigned to the inspired word. It is a lamp, shining in a dark place, until the day dawn.

As many other things—the Church, the Sacraments, conversion, faith itself—so also the written Word has erenow been put in the place of Christ and of the Holy Spirit. The "lamp" has been made the "light." The candle has been idolized as the sun. Language has been held about the Book, which ought to have been used only concerning Him to whom it points and guides.

A man may be well read, and well versed, and well skilled, in his Bible, and yet be no nearer the Way and the Truth and the Life, than he who has trusted in the punctuality of his church-going or in the frequency of his communions. The thing is possible, for it has been seen.

The proper description of the written Word is a lamp shining in a dark place, *until*——until something happens; and then to be withdrawn, being replaced by the full blaze of a cloudless day.

"A dark place." Yes, such is this world of ours: so full of phantoms and shadows, of unrealities and illusions, of nightly dreams and waking visions; so empty of solid joys, of heart-deep comforts, and of permanent satisfactions. And such too is this heart of ours; the reflection, in these respects, of the great world without: itself, like that, busy in the pursuit of happiness; yet evermore, when it brings that happiness in, and counts it over, finding it poor, and small, and partial, and evanescent.

Then the Word is like a lamp shining in this dark place—shining in the world, shining in the heart—until something comes. How true, how striking, a picture! Yes, it is a lamp. It is not the sun, not the bright noon, not even (of itself) the real and sober dawn. It is a lamp. By its aid we pore over the map of life, and try to prepare ourselves for its long stages and comfortless haltings. By its aid we study ourselves: see, in example, what we are; see, in precept, what we ought to be; see, in warning, what we must shun; see, in promise, what we must desire. By its aid, more than all, we read, in description, the character of God, the work of Christ, and the office of the Holy Spirit.

But here the Book stops; and the greatest of all steps, from death unto life, may not yet have been taken. The lamp shines through its hours, and we are thankful: but to live by candlelight were but half a being. The lamp shines in our dark places, *until*——

Until the day dawn. Until the day-star rise in our hearts.

(1) Yes, until One who caused the page to be written, makes the page speak, and speak of Him. Until He who left us this guide through the hours of darkness, says Himself once again, "Let there be light," and reveals Himself in our hearts by his Holy Spirit as "the Sun of righteousness risen with healing in his wings." It is the office of the Bible to tell of Christ, to point us to Christ, to show the way to Christ: not to supersede, not to be instead of Christ.

When the soul, informed by the Word, and at last quickened by the Spirit, has turned to the Lord; when, taught the way, it has also taken it, and come, penitent and earnest, to Him, to whom to come is at once eternal life; then the first office of the Bible is fulfilled: then in the individual soul the day has dawned and the day-star risen.

(2) But even then—then more than ever—the soul has recourse daily to that which has quickened once. Then again for daily growth, as before for one renewal, it gives heed to the prophetic, the evangelic, and the apostolic word. Still, though blind and dead no longer, its home is in a dark place; and it wants the lamp still, even though the inward dawn has begun. Still there is a watching and a waiting: for still it is night, on the whole, and not day; still the day-star shows not on the Church's horizon, nor is the dawn yet visible on the everlasting hills which encircle her dwelling.

Thus then the lamp must shine on, and the faithful will give heed to it still. Shine on, till the second Advent; even through that spiritual, that individual Advent, spoken of at the outset, which links the second Advent with the first. When that great hope of the Church shall be finally realized; when He that shall come is come, and no longer tarries; then shall the lamp fade away of itself before the brightness of his presence, and He who has been read of by its light shall reveal Himself face to face in glory.

But these things are as yet far above and beyond us, and humbler meditations are those which befit us in the present.

"Receive with meekness the engrafted word, which is able to save your souls." Receive it with meekness, study it with prayer, and it shall (under God) do this for you.

"All Scripture is given by inspiration of God; and is profitable for doctrine, for reproof, for correction, for instruction in righteousness." Use it thus; and at last, by its help, "the man of God shall be perfect."

In these things, soberly and thankfully received, let us find for the present satisfaction and repose.

In these things: and not less in those other modes of practical communication with a world unseen, by which Christ our Saviour has been pleased to lighten the darkness of time, and to cast, from the world of reality, a bright ray of hope upon the world of semblance and illusion.

But all this, in all its parts, through the operation of that Divine and Holy and Blessed Spirit, to whom, with the Father, and with his Son our Lord Jesus Christ, be ascribed all honour and glory, all might, majesty, and dominion, now, henceforth, and even for evermore. Amen.

ESSAYS, THEOLOGICAL AND PHILOSOPHICAL.

By HENRY ROGERS, Author of "The Eclipse of Faith."

II.—ON PUBLIC EXECUTIONS.

THE hour is surely at hand when England must abolish either public executions, or capital punishments. If the latter be abolished, of course the former will vanish with them; but if capital punishments are to be retained, public executions must, in my judgment, cease. No inconsiderable party, as we all know, vehemently denounce all capital penalties; and certainly one of their most plausible arguments is derived from the enormous scandals and pernicious results of public executions. That they are attended by no counterbalancing advantages may be, I think, clearly shown; nor by any advantage at all which may not be better attained in another way.

The nation has been slowly feeling its way to a conclusion on this subject,—*very* slowly; but, if I do not greatly mistake, it is now rapidly making up its mind. This is principally due to the discussions of the public press; and more especially to the painfully vivid photographs which its "Correspondents" have given us of the characteristics and incidents of execution scenes, for the last few years. These gentlemen have, for a few short hours, consented to visit hell, in order to reveal its horrors to the folks above ground,—who else would form no conception of them. Without their aid the mass of the people, (who never frequent such spectacles,) would never have had their minds sufficiently possessed of the facts, to form a judgment. But they must be stone blind and deaf too, if they cannot see the frightful vision and hear the appalling sounds which the press flashed and thundered on their eyes and ears at the execution of the late Francis Müller. It may be that the thing itself was not *much* worse than in the days of our forefathers. Certainly we may gather from the pages of our older novelists, as Fielding and Smollett, and from the delineations of Hogarth, that the gallows was then, as now, a very questionable ally of the school or the pulpit,—in spite of the encomiums in that behalf sometimes bestowed upon it. But Fielding and Smollett belonged to a past and less fastidious age; and many took it for granted that the more hideous features of such scenes had been at least softened, if they had not vanished with the procession to Tyburn. The frequent pictures which the press has, of late years, given of a public *hanging*, have dissipated any such illusions, so far as they existed; and have convinced the millions who never visit such a spectacle that the evil is all unchanged, or rather looks worse,—more ghastly and horrible,—in the light and by the contrast of a higher general civilization; nay, probably *is* worse.

This last, indeed, might be reasonably inferred, both from *fact* and *reasoning*. It may be inferred from fact,—inasmuch as probably there never was such a picture of a veritable Pandemonium,—of such utter and brutal insensibility to the tragedy of sin and death there enacting, and which those who looked on madly mistook for a comedy,—of such cool, deliberate election of evil in the very presence of the Nemesis which avenged it, (as though that very circumstance gave vice and crime a distinct flavour and relish,) as was exhibited in the reports of the daily papers, and especially in that most powerful letter in the "Times," on the occasion of Müller's execution.

Never perhaps was there a case in which the bolt of the Divine Nemesis,—*zigzag* as it might for a moment, like the lightning which is its emblem,—more fully smote and shivered its victim; never was there a case which better exemplified the impotence of the criminal to anticipate and secure all the unsuspected avenues by which his guilt might be detected, or so to efface the scent of it, as to baffle the strong hounds of justice and prevent their getting on his track; never was there a case in which heaven and earth,—the laws of Providence, and the resources of human science which it impressed into its service,—more visibly conspired for the detection and punishment of guilt. Though the doomed man "took the wings of the morning and fled to the uttermost parts of the sea," yet the stronger wing of justice had outflown him, and he found the avenger already lying in wait for him in the very place of his refuge! And yet—and yet—that very hour of his execution, did the "synagogue of Satan" that assembled round the walls of Newgate, on November 14th, choose to show their contempt for all these "signs in the heavens above, and signs on the earth beneath."*

---

* I justify such words by two or three sentences from the eye and ear witness of the "Times":—"It was," says he, "such a concourse as I hope may never again be assembled either for such a spectacle, or for the gratification of such lawless ruffianism as yesterday found

It was as if the men were no longer—as men generally are—befooled by a miscalculation of the future and blinded by present temptation; but as if they had deliberately said "Evil! be thou my good!"—eager to snatch a moment's gross sin, even with the flames of hell itself flaring and glowing in their faces. It may be surmised, perhaps, that the bulk of them so behaved because they did not believe there is any hell at all. Not believe there is a hell! They were *in* it; they made part of it, at that moment; for what hell can even a Dante or a Milton imagine worse than to be condemned to dwell in the midst of that seething Maelstrom of obscenity, blasphemy, malignity, of all unutterable lawlessness and wickedness? Utterly impotent seems the conclusion that there *can* be no such place as hell, while there are such scenes on earth; or that the devil *must* be a nonentity, while we see so many demons incarnate; differing apparently from the more ethereal spirit of evil only by adding the grossest sensuality to every other form of lawlessness, as if to make good the oft-discredited miracle of the swine with the devils in them! That most painfully vivid description by the "Times" correspondent is, if true, (and it bore all marks of fidelity to facts,) worse than any preceding page we ever read in the annals of the gallows.

But that these scenes, (if their horrors be not diminished by an advance of morals and religion more than abreast of civilisation,) will become more and more odious, may be inferred from the *reason* of the thing: they will not only *look* more hideous by contrast with civilisation, but *be* so; for whereas (as shall be proved) these spectacles, especially in such an age as ours, must by inevitable necessity,—by force of an obvious law of moral affinities,—attract to them only the very worst elements of society, so those worst elements must needs be worse than can be found in a ruder and more primitive community. No men are so lost as those whose intellect has been developed only to become the bondslave of the passions; who have borrowed from civilisation little but the art of masking evil, and of converting knowledge into cunning; who superadd to the dangerous, but still blind and honest, ferocity of the brute, somewhat of the subtlety and malignity of a fiend. Civilisation and knowledge are indeed themselves, like logic and rhetoric, simply *instrumental*; and are indifferent to the moral and immoral uses to which they may be put. But they are, at least, the more *natural* allies of goodness and virtue; and when divorced from them, and wedded to vice and crime, form a solecism in nature. When they are so conjoined, they breed forms of evil such as the poor savage can, happily, never aspire to emulate. It is as though one gave the wings of the eagle to the form of the serpent, or fixed in the jaw of the lion the fang of the rattlesnake.

Both from fact and from the reason of the thing, therefore, we infer that these spectacles have grown, and must still grow, worse instead of better. And can England, for very shame, endure their continuance? Will she periodically permit in her capital and in her great cities a spectacle which, (by necessity of nature, as will be shown,) calls forth from congenial darkness, from every obscure den and hiding-place where they lie scattered and ordinarily latent, every loathsome reptile form of vice and crime, to crawl and swelter in the blaze of day? Will she persist in every now and then raking all the social ordure into one rotting heap, the pestilential reek of which shames the light and poisons the air, and reminds us of the apocalyptic vision of the smoke that issued from the bottomless pit? Will she continue thus to collect all that is lost to shame, as if on purpose to enable it to defy authority, to mock at everything that but wears the semblance of decency and modesty, to laugh and jeer at everything venerable or awful, and to seize that very moment in which the law is vindicating its claims, for showing contempt of all law by breaking it at the gallows' foot? We have heard a great deal lately about the *utilisation* of our sewage; we know not how *this* sewage is to be utilised; but assuredly to let all the filth of London drain into the Thames is a far less disgrace to our civilisation than to persist in making the Old Bailey a periodical cesspool for all the moral abominations of London.

We are told that nothing in "the shape of decency or modesty or respectability" appeared in the crowd, that was not immediately victimised, insulted, "bonneted," robbed, and in case of resistance—which, however, was utterly hopeless (as though the whole thing was designed to be the triumph of lawlessness, and not the vindication of law)—knocked down and brutally maltreated. It is not very easy, perhaps, to imagine "modesty, decency, or respectability" taking their pleasure then and there; and one almost feels inclined to say, that if they did, they richly deserved their fate. The best that can be said for them is, that they went to gratify a peculiar *goût*, an eccentric appetite for "game," not only "high," but putrid. Now if men will have such venison, even though they cook it by hell fire, they may be thankful if they only burn their fingers.

For the inestimable service conferred by the press on this occasion, I think the public deeply indebted; and I cannot but hope that the scene of November 14th, and the comments upon it, will

---

scope around the gallows. . . . . There can be only one thing more difficult than describing this crowd, and that is to *forget* it. . . . . None but those who looked down upon the crowd of yesterday, will ever believe in the leisurely, open, broad-cast manner in which garotting and highway robbery were carried on. . . . . Such were the open pastimes of the mob from daylight till near the hour of execution." "The impression, however," speaking of the silence at the moment of execution itself, "if any it was, beyond that of mere curiosity, did not last for long; and before the slow, slight vibration of the body had well ended, violence, laughing, oaths, obscene conduct, and still more filthy language, reigned around the gallows far and near."

soon bring public sentiment on this subject to flood tide.

I was anxious to see what comment the "Times" would make on this letter of its correspondent. In one half of the article I entirely concur, namely, that the scene, painful as it was, did not prove that capital punishments ought to be abolished: for which opinion, nevertheless, as it truly said, it would be made an argument. But I must confess, that the other half, in which it seemed to argue that it was a just corollary from the necessity of retaining capital punishment, that public executions must be retained also, (all such scenes notwithstanding,) by no means convinced me. It does not seem to me that the alternative offered is the only one; and if we may judge by the recent "presentments" of the Grand Jury for Lancashire, a large portion of the public is coming to the same conclusion.

But before proceeding to canvass this point I should like to say a few words on the *certainty*, in the nature of things, that public executions must be productive of evil, and of evil only.

The arguments of those who plead for the entire abolition of capital punishment are certainly not without weight and plausibility; though I cannot but think they derive their force from extrinsic considerations, (as for example, among others, the scandal of public executions,) rather than from any intrinsic validity. Assuredly it is not possible to attach much importance to that of Voltaire,—that "when a man is once hanged, he is good for nothing;" for unhappily he is often worth nothing before. But though the arguments for the abolition may not be very cogent, the condition of public opinion may make them irresistible. As I said in the "Edinburgh Review," seventeen years ago—"It is very possible that an impression of the inexpediency of inflicting the punishment in question may diffuse itself so widely, as to render it necessary for the legislature to abolish it. That time is possibly yet distant; but should it come, the experiment must be tried. Anything is better than an uncertainty of obtaining convictions. A milder punishment *certainly* inflicted, is better than one which would be more effectual, if it cannot be inflicted at all; to say nothing of the demoralizing effect of the spectacle of juries deliberately violating one or other of two imagined obligations. In this point of view, any system of legislation must accommodate itself to the actual state of the people, nor presume to be in advance of those who administer it."*

It is therefore of importance, if capital punishments are to be retained at all, that all plausible objections against them should be removed. One of these I hold to be the scandal of public executions; such, indeed, that if these could not be abolished without abolishing capital punishments too, I should be instantly converted into an advocate of the last measure. The evil, if any evil followed, could at best be but temporary; for if it were found, by the resistless logic of statistics, that murders increased upon us, there is not a philanthropist, however sentimental or fanatical, who would not call aloud for the re-enactment of the capital penalty. As long as it is supposed that no more murders would be committed than at present, those who have no eyes to see anything but guilt and its wretchedness, and overlook the *innocent* wretchedness which guilt has caused, flatter themselves that life would not be less secure than it is now. But if they found themselves mistaken, even they must yield to facts. There is not a man, surely, of so perverse a sympathy with crime, so misanthropically philanthropic, as deliberately to desire that the innocent should have their throats cut rather than that the murderer should be hanged.

But I apprehend that the time is not come, when we are called upon to consider any such alternative as that of the suppression of capital punishment altogether. While people are pretty well agreed that it should be restricted to cases of clear murder, or of such crimes as involve *constructive* murder of the coolest kind,—as, for example, firing a house with all its inmates sleeping in it,—yet they are also pretty well agreed that in such cases this punishment should be retained, as the only absolute security to society against those who have once broken into the treasure of life. They maintain that it is clearly sanctioned by the law of God; they know it is defended by almost every jurist of eminence; they believe it to be fully justified, and indeed necessitated, by the interests of humanity. And if it be necessary that society should have an absolute guarantee that a murderer shall do no more mischief, I do not see that there is any difference worth speaking of, between those who would continue and those who would abolish capital punishment. For if these last would in fact take *absolute* security on behalf of society against the repetition of the crime, then the only other conceivible mode of taking it is that of inflicting solitary imprisonment for life; and this, in fact, comes, in the generality of cases, but in a less merciful way, to capital punishment. It is in truth capital punishment of the most hideous kind. All *a priori* reasoning, physiological science, experiment, alike show that such a life soon becomes a living death; and is attended by the gradual and not very tardy extinction of the functions and faculties by which alone man can be truly said to live at all. You cannot reverse all the conditions of human existence, cut off man from all the vitalising influences of the society of his fellows, doom him to the absolute monotony and silence of a prison cell, without, in the majority of cases, superinducing insanity or idiotism. You can no more do it, without touching the vital functions, than you can keep the eye in perpetual darkness without destroying the power of vision. Under such a punishment, those very faculties of man's moral and intellectual nature, for the sake of which alone this equivocal mercy is contended for, become useless. The difference is one simply as to the mode of death; whether it is better to die by an acute or chronic disease. It is a choice between killing by inches, and killing at once; between laying the axe at the root of the tree, or lopping off its branches, barking and "girdling" it, and leaving it to perish by gradual decay. To condemn man to absolute and perpetual solitude, is to doom him to that last calamity which Dean Swift so dreaded for himself when he stood gazing at a tree whose upper parts were dead: "I shall be like that tree," said he, "I shall die a-top." To kill man thus is indeed worse than simply killing him; for it is to bury him before he is dead.

---

* "Edinburgh Review," July, 1847.

For these reasons, an advocate of capital punishment in the extreme case of murder, may justly contend for it, not because it is the most just, or the most severe, or the most dreaded,—though it *is* so, (τὸ τῶν φοβερῶν φοβερώτατον, as an ancient said,)—but because it is a more *merciful* penalty than those would inflict who, without meaning death, do really decree it,—only by a slow fire, instead of the rope or the guillotine. While I sincerely appreciate that comprehensive philanthropy which compassionates suffering of all kinds, I cannot for a moment admit that this mode of treating murderers would be the wisest expression of it, or at all more merciful than hanging. This philanthropy does not look far enough. It can see the gallows, and it sees nothing else. That life should be taken by the hangman in a moment is in its eyes a dreadful thing; but the horror of taking life by small doses of a subtle poison, of letting it slowly ebb away,—this it does not picture to itself. But to him who has the imagination adequately to conceive it, there will be no comparison between the gallows and the solitary cell for life; between instantaneous extinction and a perennial death. I for one say, therefore, Give the murderer, while his faculties are still vigorous, what time you will for repentance, and all needful instruction and exhortation to bring him to it; but in *mercy* spare him that long decay to which, if you will not hang him, and yet must exact for society effectual guarantees against further mischief, you must doom him. Let him not, like Swift's tree, "begin to die a-top."

It is not difficult to show that the analogies which were formerly resorted to, (and not altogether abandoned yet,) to prove the benefits that may result from public executions, are altogether fallacious. It is sometimes said, "Does not the schoolmaster, now and then at all events, summon the entire school to witness the punishment of some notorious and signal offender?" Very true; but not to mention that *exceptio probat regulam*, and that a humane and wise schoolmaster generally punishes privately, as conceiving that it will be likely to have a better effect both on the delinquent and his companions, what is the analogy that is sought to be established?

If the *whole public could be compelled* to witness public executions, then the analogy would be complete. But, to make out the parallel as matters stand now, what ought to be the conduct of a schoolmaster when he flogs a boy? Why, he ought to tell the urchins, "that it was not *compulsory* on any of them to attend; but that if any of them would *like* to attend, they were welcome to do so!" And what would be the consequence? Why, if any of them felt a morbid curiosity for dreadful sights, or a dangerous love of strong sensations, or an odious love of seeing suffering, or a more odious delight in cruelty, or lack of kindliness, or a hope of seeing authority bravely defied, or a wish to encourage an incorrigible offender by sympathy,—such, but such alone, would be there. You would be sure to have the young Domitian, who was fond of stripping flies of their legs or wings, and thrusting pins through cockchafers, and who was diligently qualifying himself by such essays for a graduation in deeper cruelty. You would have the boy who was himself always getting into scrapes, who had often been under the dread "Flagellifer" himself, and who would feel a sort of malicious consolation in seeing another under the same punishment. You would have the young despot who was always playing tyrannical tricks upon the younger boys, and who delighted in seeing their terrors at his approach; it would be an enjoyment of a similar and stronger kind. You would have him who was a ringleader in every act of rebellion, and who denounced all just authority as tyranny; he would go for the purpose of seeing whether his companion would "die game;" and, if he had an opportunity, would encourage him beforehand (and perhaps by secret signals at the time) to a dogged resistance, or at all events a sullen fortitude, and a noble resolution not to play the part of a sneaking penitent. You would have him who was himself in danger of the same punishment, or perhaps had been an accomplice in that very fault which provoked it, but who had not been detected; drawn to the sight by a kind of horrible fascination, and drawn one step nearer to the crime, too, both by familiarity with the punishment and the fact that he *knew* it was possible to escape it; but especially if he saw the chastisement, and the authority that ordained it, made the subject—as it would be in such a choice circle of spectators—of ribald jest or bullying defiance. And to make the parallel complete, you would have him who has a disposition to pilfer, probably taking that very opportunity, of abstracted attention on the part of his companions, to exercise his youthful adroitness. In a word, you would find that whatever in the school was base, selfish, hardhearted, malignant, cruel, disposed to plot or to encourage rebellion against authority, would be there; and nothing besides. None who had a tinct of good-nature, fine intellect, amiable temper, kindly sympathy, would ever dream of accepting so curious an invitation. Their attendance must be *compulsory*, otherwise they would never be present.

It is possible, indeed, to conceive exceptional cases, (if all were *compelled* to be present,) in which the public punishment of some signal crime might do no harm, even if it did no good. But, not to insist that in general those who would be likely to be benefited by the spectacle—that is, who came with dispositions capable of instruction—would know their lesson very well without conning it at the gallows or the triangle, nothing can be more absurd than to make attendance *optional*, and so insure that only those shall be there who will *not* be benefited! And if any persons whatever be likely to benefited, it is a necessary condition that they should be *made* to attend; for nothing but a sense of duty or necessity can make well-disposed people go at all. Such people do not go to a hanging of free choice. Now it need not be said that compulsory attendance at a public execution is utterly out of the question.

But the plan on which the public hangman gathers his spectators is just on such a principle as we have supposed our wise schoolmaster to act upon.

To all who *like* such sights, the legislature in effect says, "Come and see; all you who dislike them, stay away." And the result is just what we might expect, and what we find.

Similar remarks apply to the case of military flogging, and of all public punishments, as we have applied to schools. If all attend, the result is still perhaps problematical; for the natural horror of seeing extreme suffering—no matter what the crime committed—generally awakens, for the time at all events, such invincible and involuntary sympathy of pity and horror, that it drowns the sense of guilt in compassion. But if none came but those who chose to come, we know just what sort of people alone *would* come; and the result would be the same as in the imagined school. Only those who were already hard-hearted, brutal, lawless, and cruel; at best, the victims of a morbid curiosity, and love of strong sensations,—which in themselves are moral failings, and require to be checked, not indulged, else they infallibly lead to something worse,—would be there. The highest motive—and that would be low enough—would be the wish to see with how much fortitude extreme agony could be borne, or with how much bravado just authority might be defied.

And this reasoning, duly considered, reveals the gross practical fallacy in which the very conception of the possible benefits of public executions, (if attendance be optional,) originates. It involves a fundamental mistake in the philosophy of human nature. *Voluntarily* to gaze on suffering—when there is nothing to be done, no active effort to be made to relieve it; or where there is no overbearing law which compels us, though it be painful, to encounter the sight as a necessity,—as for example, when a physician or surgeon looks with a dry eye on the agonies of his patient, or a school or a regiment is impartially compelled (like it or not) to witness what makes the heart shudder,—is always and simply a symptom of a hard heart, and helps further to harden it. All voluntary sight of suffering, involving none of these conditions, implies previous cruelty and callousness of nature; or, if there be nothing more at first than a morbid curiosity, it is sure, if the thing be repeated, to pass into something worse. We here see fearfully exemplified that law which Butler has done so much to make clear, though he was not the first who announced it; for the germ of his observations on this principle of our nature may be found in Aristotle. But the principle itself is of the last importance in relation to all education, and not least in relation to the subject now under consideration. All our passive emotions are weakened by repetition; but, notwithstanding this fact, they of course follow the law of all our habits, and crave, if indulged, increasing frequency of gratification. Now, if they have led on to the strengthening of a correspondent *practical habit*, (which such emotions seem designed principally to develop within us,) this weakening is of little consequence. Thus the sight of suffering naturally excites the emotion of pity; and if that pity can and will do anything for the relief of the suffering, it has answered its purpose; for indeed "the heart is made better" by it. Nor does it matter that the mere emotion decays in vividness at each repetition, —even till a surgeon, for example, can perform an operation as coolly as he eats his breakfast,—if the practical habit of benevolence has strengthened in proportion; for it will then prompt, with far greater power than any passive emotion could, to do the offices of pity. A Howard may look upon scenes with a stoical composure, nay, with a seeming hard-heartedness, which at first dissolved him in tears, and set about the work of relieving them as if he were made of marble, while his benevolence all the while is growing stronger and deeper. And thus, too, a physician may look on a patient's death-bed, nay, on a thousand in a year, and be none the worse for it. But if he who neither *could* nor *would* do anything for the relief of suffering, were continually thrusting himself into every dying man's chamber to which he could get access, for the mere purpose of prying into its horrors,—even though his motive at first might possibly be nothing worse than a morbid curiosity,—how would it fare with him? If he persisted in such an abominable propensity, if he pampered this canine appetite for the garbage of fancy, it is impossible that he should not exemplify the above law of our "passive emotions:" the habit would speedily generate something much worse than mere curiosity, would at last obliterate, by repetition, the capacity of pity, and, in a word, transform the man into a veritable *ghoul*. The mere fact that no good man would willingly look on sufferings except an imperious law or an instinct of benevolence made it a duty, however painful, at once condemns our present practice of summoning those, and those only, to the spectacle of public executions, who come of their own accord. It leaves us in no degree surprised that the gracious invitation should be responded to as it now is; it gives us just such an assemblage as might be expected. All the scum and offscouring of society (barring an eccentric creature here and there who has a diseased fancy for "supping full of horrors," and who, like a late notorious person, would sooner go to an execution than a banquet) flock to the scene as naturally as vulture to carrion. As things now stand, is there anybody who can for a moment be imagined to have any justifiable motive for going to such a spectacle, or any motive at all which does not make him odious? If so, it is he who can say, "I am going to see this sight, honestly and sincerely, from no idle feeling of curiosity, still less from any cruel desire to gloat on suffering; but that I may have my own heart more impressed with the dreadful effects of crime, and may be better guarded against the possible temptations to commit it." But is there one in a million of the spectators who could honestly say this? And if he said it, is there one in ten millions who would believe him? Would not everyone say, "This worthy man, if he can truly say that he went to learn such lesson, had *already* learned it, and might have stayed away. His heart is already sufficiently guarded against temptation, in *wishing* to be guarded."

But if there be any force in the argument that *public* executions are calculated to impress the spectator with the terrible consequences of crime, and so deter him from its commission, then the same reasoning will apply to *all* penal inflictions. Why restrict it to capital punishment alone? Nay, *à fortiori*, one would think that some other punishments, especially those in which much and prolonged corporeal suffering is involved, might make a deeper and more powerful impression than the transient convulsion, endured in silence and with covered face, of the poor wretch whose limbs quiver for a moment, and are then still for ever. It might be thought that the contortions and shrieks of a man under the lash would produce far more horror, as indeed they ever will; even *such* horror that none but one who is compelled to take part in such scenes—unless he be already utterly hard-hearted, or on the high road to it—can bear it; horror, which in every one not so fortified, either by duty or by brutality, becomes uncontrollable agony. However, as far as this argument goes, it will certainly apply, if it apply at all, to all punishment. It follows that we should throw our prison doors open—like our churches—for moral impression; and in fact do just what we do at public executions; that is, compel nobody, but invite all who have any *taste* for that sort of thing to inspect the prisoners during punishment; to come and gaze with a curious, or philosophic, or edified mind on the revolutions of the treadmill, (as at squirrels in their cage,) or at the application of the lash! Yet, strange to say, if the reasoning which represents public executions as an instructive spectacle be correct, we are so far from believing it applicable in other cases, that we have legislated in utter defiance of it. We have been, and are still, retrograding. We have abolished a number of those edifying spectacles which were once highly popular, as well as the punishments which supplied them; as the pillory, the stocks, and flogging at the cart's tail. It will be said, perhaps, that they were abolished principally because they were presumed to have had a pernicious effect on the criminal himself, and only made him worse than before. But this was not the only or the chief reason for the abolition of some of these punishments, more especially the pillory; nor is it easy to comprehend (what some sentimental prison-reformers have now and then affirmed) that the *indignity* of receiving personal chastisement can do much towards dishonouring one who has already reconciled himself to the practice of putting his hands into his neighbour's till or snatching his watch out of his fob! But, as just said, this was not the principal reason for the abolition of such public punishments. It was chiefly the effect they produced on the spectators; partly because they excited undue sympathy with the criminal, and thus counteracted the design of exemplary punishment;—as in that case of flogging the thief at Olney, so humorously described by Cowper, where the "pitiful lass" of Silver End boxed the ears of the "pitiless constable," and the constable chastised the too pitiful beadle, and the beadle *pretended* to chastise the thief, and where the only person who suffered nothing was the thief himself; partly because they tended to do that which has been shown to be so deplorable a result of public executions,—that is, to collect, by the very nature of the lure, that class of spectators who form the very dregs of the population, and to make them more brutal, more contemptuous of law, and more familiar with crime, than they were before. And therefore, though we still have some corporeal punishments, and have recently and not unwisely re-enacted them, in relation to some signally atrocious crimes, (as garotting and the wanton injury of public property,)—punishment which there is little hazard in saying will be found more effectually deterrent than any other,—we wisely dispense with publicity in the infliction. Why we should not do so in the case of hanging, after so long experience of the brutalising effects of the spectacle, it is hard to say.

It is curious to see how very little is said on the subject treated in the present essay, by the great writers on jurisprudence. In vain do we search their copious discussions for any adequate treatment of the expediency or otherwise of public executions. In vain shall we search Beccaria; in vain Montesquieu or Blackstone; or the copious dissertation on punishments by Michaelis in the fourth volume of his "Laws of Moses." As little is said in the great work of Bentham, or of his translator, Dumont. If these writers consider the effect of public punishment relatively to the spectators, it is still simply with a view to the reformation of the criminal code itself, not to the effect of punishment in general as connected with *publicity*. It is with the view of pointing out, for example, the inexpediency of punishments which, by their excessive or disproportionate severity, or revolting character, destroy any *salutary* effects of the spectacle, by exciting a sympathy with the criminal, bringing the law into odium, or quenching all sense of justice in the sentiment of horror. But barring this, all these writers seem to take it for granted that the spectacle itself, if the punishment be but just, *may be* an edifying one. None of them seems to have computed the entire moral effects upon the public, which a purely *voluntary* resort to see a hanging implies; or to see that, as by a necessary law, all the evil elements of the social body must gravitate thither.

It is true that these writers had something else, and more immediately pressing, to think of; and that was the revision and amelioration of the criminal code itself: the removal of those hideous anomalies, those cruel and disproportionate penalties, which disgraced every statute-book in Europe. And one and all of them in different degrees nobly contributed to this result; in one and all, principles and maxims are laid down which in due time bore fruit, and led on at length to the enlightened legislation which did so much for both humanity and justice. Slowly, however, did the light spread; and it is almost comic to see Blackstone sorrowfully acknowledging that no less than 160 "actions," according to the letter of the English law, came under the head of "felony," and exposed their perpetrators to capital punishment, and yet on the same page congratulating the reader that our penal code contrasts favourably with that of some other countries!

Dr. Johnson, according to Boswell, even went so far as to deplore the abolition of the edifying procession to Tyburn, and to express grave fears lest the omission of that time-honoured custom should leave the people with one instructive admonition the less! "He said to Sir William Scott: 'The age is running mad after innovation; and all the business of the world is to be done in a new way; men are to be hanged in a new way; Tyburn itself is not safe from the fury of innovation.' It having been argued that this was an improvement—'No sir,' said he eagerly, 'it is *not* an improvement; they object that the old method drew together a number of spectators. Sir, executions are intended to draw spectators. If they do not draw spectators, they don't answer their purpose. The old method was most satisfactory to all parties; the public was gratified by a procession, the criminal was supported by it. Why is all this to be swept away?' 'I perfectly agree with Dr. Johnson,' very needlessly adds the Boswellian echo, 'on this head; and am persuaded that executions now, the solemn procession being discontinued, have not nearly the effect which they formerly had. Magistrates, both in London and elsewhere, have, I am afraid, in this had too much regard to their own ease.'"*

So slowly do even great minds yield a prejudice founded on custom! For if ever there was a spectacle which one would suppose might be dropped without causing a sigh to anybody, it was surely *that*. Whether we take the descriptions of novelists, dramatists, or historians, nothing could be more brutalising to the populace than that "dance of death" to Tyburn. Habit can reconcile us to anything, and thus Johnson could view the very *abuses* of the ancient custom as among its uses! "The populace is *gratified* by it—the criminal *supported!*" as if either the one or the other entered into the original end of it. He speaks, with as little consciousness of the absurdity of his words, as the gaoler of a county prison felt, when, being asked how many he could hang on his new *drop*, he replied, "Why, sir, we *can* six; but four will hang *comfortably!*"

Yet it would be most unfair, while mentioning this odd freak of Johnson, not to mention that he was one of the very foremost in advocating the reform of the criminal law, by pointing out, with all his wonderful force of thought, the self-defeating effects of the severity of the existing code, both as exciting sympathy with the criminal and preventing the injured from prosecuting. There are few things in any of the professed writers on penal legislation more convincing or more powerful than No. 114 of the "Rambler." He there says, "The frequency of capital punishments rarely hinders the commission of crime, but naturally and commonly prevents its detection; and is, if we proceed only on prudential principles, chiefly for that reason to be avoided." And speaking of the inequality of punishments, he powerfully says, "They who would rejoice at the correction of a thief, are yet shocked at the thought of destroying him. His crime shrinks to nothing compared with his misery; and severity defeats itself by exciting pity."

Similar reasonings were put forth by his great contemporary Burke, in his plea for limiting the number of executions, in the case of the Lord George Gordon Riots.† Such great writers as these, and the illustrious jurists already mentioned, sowed the seed which slowly, but surely, bore fruit, and at length led to an effectual revision of our penal code by the glorious labours of such men as Romilly, Macintosh, and their contemporaries. If they had lived to our day,—however they might still have wished to see capital punishment retained in the case of murder,—they would assuredly have pleaded for the abolition of public executions.

The conviction that the effects of these odious exhibitions are in the immense majority of cases simply pernicious, has long been gaining ground; and probably few would now defend them on the plea that they are calculated to excite a wholesome moral impression; that they may be what some of our older writers fondly deemed them,—a sort of sermon, only preached from the gallows instead of the pulpit! So long as forty-six years ago the minute inquiries made by the Committee who drew up the important "Report on the Criminal Laws" (1819) tended to show that the effect of public executions was very problematical; and an able writer, canvassing the merits of the Report, and particularly questioning the propriety of entering into *this* question, yet virtually comes to the same conclusion to which the Commission had tacitly come. He says—"With regard to public executions, we believe that in all ages and countries, the good effects produced upon those whom curiosity has collected to witness them, have been extremely limited."

† "Reflections on the Approaching Executions." Works, vol. ix.

The great and palmary argument *now* insisted upon, but which really seems very inconclusive, is that public executions give us the only effectual guarantee for the sentence of the law being actually carried out! It is not easy to imagine any real difficulty in the matter in a free country like our own. If, indeed, our Government were a mere despotism; if the officials charged with administering it, could enact the horrors of the Neapolitan prisons or of the old Spanish Inquisition, there would be reason good for this excessive scrupulosity. But is there the shadow of any such danger here? Do we not, under a system of complete responsibility to Parliament and People, confidingly invest the Government with the most enormous powers, involving the most comprehensive social interests in a thousand forms, without even dreaming that in the vast majority of cases there will be the slightest ground to question the probity, however we may often question the wisdom, of those who administer it? Do we not give to our statesmen, judges, and public officials of all kinds, power which nothing prevents being abused, in countless ways, but their public character and the consciousness that they are amenable on the faintest suspicion to public investigation and the severest penalties?—And is it conceivable that while we do all this, and without a scruple, the depositions and signatures of the sheriff, the gaol authorities, and (if you like to make assurance doubly sure) those of a commission of six or eight gentlemen, would not be deemed a sufficient security that the sentence of the law on a few miserable criminals has been duly carried out? If so, why do we *now* intrust to the hands of the proper authorities the administration of the far greater part of our penal machinery? Why do we not demand that the treatment and punishment of criminals in general should be freely open to public inspection?—Nor does the present system, as its advocates admit, absolutely secure the end. Even now, if the authorities duly empowered to carry out the law were really inclined to enter into a daring conspiracy to defeat it, success would not be impossible: and indeed report says that, in one or two instances, such a nefarious attempt to defraud justice has been actually made. Nor would it perhaps be impracticable, if *all* those on whom it devolves to manage the execution were such miscreants as such a conspiracy would imply. At the distance at which the rabble of spectators see the victim, very few can be sure that he is the man; fewer could swear to his identity; and perhaps among those who are in a position distinctly to see his features, there may not be one to whom he is known. Again, the term "publicity" is relative. Very few,—indeed a mere scantling of the population,—do in fact see an execution; and as to their *character*, certainly, if it came to a contest of testimony, one is inclined to say that the depositions and signatures of a respectable Commission, certifying that the deed was done, would weigh more, not only than the impressions, but the oaths of a million of such wretches as gathered themselves together in the front of Newgate on the morning of November 14th; not to mention that there is not the smallest reason to believe that those who go to such spectacles go for the purpose of ascertaining that justice is done, or the *proper* person hanged, or even think of the question of identity at all. They trust all that (as the nation would do, if the thing were devolved on duly qualified officials) to the common sense, honesty, and known responsibility of the officials themselves. I cannot say, therefore, that I am much moved with the argument that it would be difficult to convince the people, under the system of a Commission solemnly appointed for the purpose, that the condemned criminal had been hanged; or that some supposititious corpse, or illusory phantasm, or stuffed *effigies* of a man had not been juggled into his place. It may be safely said that there is not one man in a million who would pretend that he had a grain of doubt that the law had been duly vindicated. To take guarantees that a Commission so constituted had not all perjured themselves, would seem to most people as absurd as to "place guards on the outposts of possibility itself."

If we can take guarantees, as assuredly we may, that the sentence of the law shall be rigidly and impartially carried out within the prison walls, but in the presence of the proper officials alone, there can hardly be a doubt that such a mode of execution would make a far deeper impression, not only on the criminal himself, but on the criminal class generally. As to the former; the false supports which have so often buoyed him up, at all events prevented his fully realising his position, would be struck from under him. He would no longer be distracted by the thought of either a sympathetic or an infuriated crowd. It would put an end to the illusion of that shameful "glory" which has made so many criminals die with bravado in the presence of a vast multitude, and, above all, under the eye of the criminal class itself. That "notoriety" which makes him for a moment the "observed of all observers," though it be but on the gallows, and which so many a criminal mistakes for fame, will no longer "support" him,—to use Johnson's expression. If he be really penitent, or sincerely disposed to concentrate his mind on his terrible position, he will not be distracted (as many have been) in his last moments, by hearing the yells and bellowings of a riotous crowd just outside his prison.

It is, perhaps, impossible in the nature of things that he can feel his true condition, if he be made the object of attention to a vast multitude. Even if they all hate and loathe him, they will still *divide* his thoughts; if there be any sympathy, though it be only that of his own criminal class, it will be an argument for maintaining an air of callous hardihood; and if there be absolutely none—a rare case!—false shame will as often provoke sullen defiance of his fate as any better feeling.

But if compelled to take the dark journey alone, or with only the inflexible and solemn looks of the appointed witnesses of his death upon him, he would be far more likely to be properly affected. It would be with him, as it often is with the *débauché*, who talks with hardy insolence of death and futurity amidst his boon companions and over his cups, but who usually grows tame enough when God has him face to face, in the loneliness of a sick chamber, and in his dying hour.

As to the people generally; I firmly believe that the very imagination of death inflicted upon the criminal in the privacy of a prison, in absolute isolation from all his fellows,—the awe and mystery which would be associated with that terrible and silent scene, would more powerfully affect them than the heterogenous reminiscences of a public execution. It is one of those cases in which the imagination, acting with single concentrated energy, outdoes the effect of a many-coloured and distracting reality. Such a doom would carry with it much of the terror with which the secret "*Vehmgerichte*" were invested, only dissociated from all suspicion of injustice and irresponsibility.

Even under the most favourable circumstances—that is, in a more primitive state of society than our own—it would perhaps be impossible to render public executions really salutary. If they ever are so, it can only be when the people in general are less refined; when the spectacle does not attract, as it must do with us, the bad alone; and perhaps we may add, when the criminal classes are not (as they are sure to be if they have become such in the midst of civilisation) so callous to moral impression, or, as many would say, so superior to all superstition! Of the difficulty of making them simply edifying, even to the most moral population, we have a curious and scarcely credible instance (even if we allow for the well-known effects of epidemic enthusiasm,) in a work published about sixty years ago. In Denmark, it seems, according to M. Catteau, the prisoner was conducted from the prison with such attractive solemnities, and was treated to so charming a sermon just before he was hanged, that the spectacle, and all the pious care bestowed upon the culprit, turned the heads of the common people, some of whom committed murder on purpose to secure so efficacious a *viaticum;* and the Government was compelled to make hanging less seductive in order to correct this eccentric ambition!

Few will apprehend there is danger of any similar phenomena among ourselves. I imagine the most eloquent sermon which the most eloquent Ordinary of Newgate ever preached, or the most winning and persuasive tones in which he ever exhorted penitence to make an edifying end, could not lure any of our *non*-criminal classes to commit murder, in order to be the flattered object of such eloquence, or enjoy the benefit of such surpassing spiritual consolations. But, for the criminal class itself, it would perhaps not be irrational to fear lest the apparently edifying departure which so many great malefactors make, the sudden transfiguration which they undergo under the manipulation of ghostly hands, the readiness with which they are transformed from reprobates to saints, together with the sort of canonisation which the rabble incontinently gives them, should operate upon the minds of some among them; forming one bribe the more to the commission of crimes which, if detected and punished, will yet issue in a repentance so easy and an exit so edifying. Murder will but insure to the culprit spiritual aid and skill of the most approved and seemingly efficacious sort; make locks of his hair and fragments of his clothes precious in the eyes of the rabble as the relics of a martyr, and qualify him to die in the "odour of sanctity." Truly some of the representations we have read of the last moments of criminals may well make some who are on the same road imagine, that the gallows is not only about the easiest path to death, but the shortest road to heaven also!

Heartily do I agree with the editor of the "Times"—though I cannot see with him the necessity of retaining public executions at all—that the subject is well worthy of "the attention of the Commission which is now considering the whole subject of Capital Punishment;" for the spectacles in question are not only a foul blot on our civilisation, but present scenes of which the grossest barbarism would be ashamed. They are the mere Saturnalia of Sin, Death, and Hell.*

---

* The "Times" thinks that London may perhaps demand *exceptional* legislation in this matter. But the evil is much the same everywhere. The scenes at Stafford on the 27th of December last, were nearly as odious as those in London on November 14th.

EASTWARD.

By THE EDITOR.

II.—CAIRO.

In writing about Alexandria, I hardly alluded to the state of Christian missions or of the Christian Church in that city. And should any reader look for information on these matters respecting any of the places we visited, he will, I am bound to say, be disappointed. But let not my silence be misinterpreted. It does not arise, verily, from forming a low estimate, but rather a high one, of the importance of such inquiries. For a long and somewhat varied experience has taught me the extreme difficulty of ascertaining facts on a subject involving so many nice and delicate questions as the actual state of any mission, whether to Jew or Gentile. And having had, in the limited period to which I was compelled to confine my journey, neither the time nor opportunity necessary for inquiry, I feel that it would probably do more harm than good were I to give an opinion on such matters. It is possible that, with this explanation, I may record impressions made upon me by missionary operations, but I will not attempt to do more. I refuse to be cited by any party as a competent witness.*

* No better proof can be afforded of the wisdom of this resolution—partially broken through in my first paper—than the following note (received after this paper

Although Alexandria is, as I stated in my former paper, the starting-point for Palestine (our ultimate destination), yet who could be in it without seeing Cairo? who could be in Cairo without seeing the Pyramids, and doing the usual round of travellers, since the Deluge, or thereabouts? and who, being in Cairo, could omit a visit to the Red Sea? and who could be at the Red Sea, and not, if possible, visit Sinai? Alas! our itinerary ends, like that of Pharaoh, at the Red Sea, for we could not follow Moses further. Of course then we went to Cairo, and in a few pages of easy talk I will tell what we saw there.

"It is a moighty queer thing entirely, you may depend," said an Irishman, "to get a railway ticket in Turkish or Arabic, I don't know which. All I know is, that though I can read Irish I can't read them characters like what a hen would write!" So we felt with Pat at the railway station of Alexandria, *en route* to Cairo. One's ideas about Egypt are made somewhat prosaic by a railway. The familiar whistle, with its impatient screech, which for years now has been a sort of European music, does not seem to harmonize with the Pharaohs. All the plastic power of fancy cannot cram Rameses the Great, or a member of any of the ten thousand dynasties, into a first class; nor realize the possibility of Sennacherib booking himself with his Assyrian staff for Memphis. It is not so, however, with the Jew, older than either. We saw many of them in the third class, and it seemed a quite natural position for this wandering and immortal tribe, who have had experience of every kind of locomotion, from the time they journeyed from Egypt to Canaan until the present day.

The Delta, as a shoreless ocean of flat, rich land, presented no feature to us of greater interest than a similar expanse of cultivated loam in England, Belgium, or anywhere else. But there ever and anon appeared those unmistakable signs of the old East which linked us to the past and belong not to modern Europe, which we turned our backs upon and tried to forget. There were, of course, the graceful palms and other trees of Eastern foliage fringing the horizon and reposing in the calm delicious air. There were camels ploughing—a combination, by the way, which seemed to me as unnatural as a pig in harness; for though the creature submitted with patient dignity to the drudgery, it had nevertheless the look of an upper servant out of place—an old huntsman or whipper-in of a gallant pack driving a coal-cart. It was never intended that this great thirstless teetotal abstainer (for days even from water), who can pace with his noiseless feet, as if in thick stockings, through the desert, and encounter sandstorms and every sort of horror, wander among the rocks of Sinai, go a long pilgrimage to Mecca, or enjoy Arabia Felix,—it was never intended that he should be reduced to do horse, donkey, or ox work, with the plough following his little brush of a tail across the Delta. The ox, if for no other reason than the base idolatries occasioned by his ancestors, should alone be doomed to drudgery like this. But we were told that 800,000 (yes, these are the figures) of horned cattle and horses had been cut off by murrain in Egypt; and that may account, though I don't believe it fully does, for the transformation of the noble "ship of the desert" into a wretched plough tug of the Delta.

As we passed along at a slow rate, yet by no means a smooth one, for a rougher railway we never travelled by, we saw other symptoms of a very different life from what we had been accustomed to;—such as the brown, dusty, crumbling, poverty-stricken, mud villages, built upon mounds of rubbish to keep them out of the inundation, with their squalid hovels, whitewashed mosques, and odd-looking inhabitants—male and female; and the pigeon villages, where those birds are reared in flocks for the market, their nests being clay pots built into a peculiarly-shaped second story with square walls inclining inwards, like the old Egyptian buildings. We also passed half-naked men swinging between them, with regular motion, a sort of basket by which they raised water from a ditch on a lower level to one on a higher, which distributed it over the whole field. We also passed water-mills for the same purpose, turned by oxen, camels, or horses; and frequently we passed Mussulmans at their devotions—ay, that is worth our pausing to notice once for all!

---

was in type), which, in justice to the writer and the American mission, I have much pleasure in publishing:—

"Bathford, near Bath, 2nd January, 1865.

"Dear Sir,—In the January No. of your excellent Magazine, in a note to the article 'Eastward,' you state that there is in Alexandria an American mission to the Copts, with a boys' and girls' school well attended. You will, I doubt not, be ready to correct an error which might be prejudicial. The mission is to the Mahometans as well as the Copts, and its boys' school was well attended by the former until the recent establishment of the Viceroy's schools, which, offering the advantages of board, lodging, and pay, naturally drew away the Mahometan boys from other schools. But the mission does not only consist of schools; the American missionaries have an Arabic service on Sundays, and recently the Arabic audience was too large for the room, and a number were forced to sit outside, among whom were two Muslims, one of whom has applied for baptism, and the other is a refugee from the persecution at Constantinople.

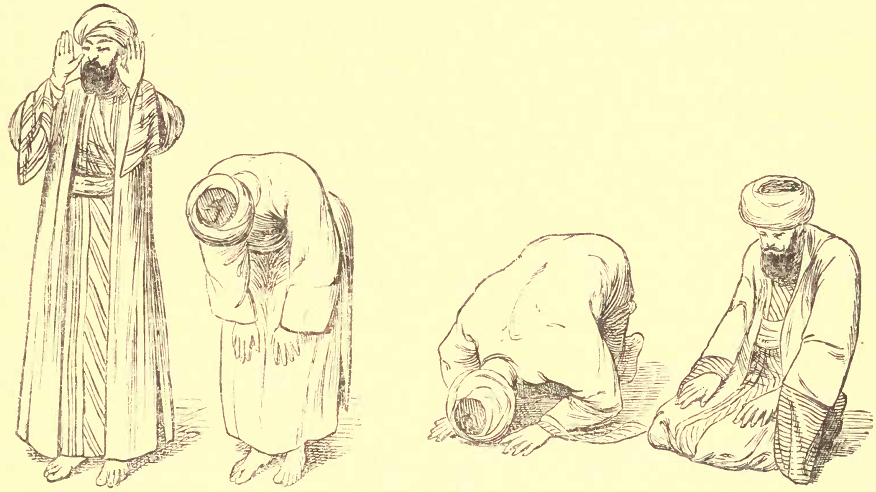
"I could give interesting details of the general mission in Egypt, but refrain from doing so without your leave. I will only state that the native converts are 50, and the average daily attendance at its schools 230.

"The American missionaries, I regret to say, are suffering from the depreciation in their currency owing to the disastrous war: one-third of the subscriptions by their churches at home only reach their hands, and they are appealing for help. The native members of the American mission churches in Egypt have responded nobly by subscribing 270*l.* 11*s.*

"I remain, dear Sir,
"Yours faithfully,
"H. Ranking,
"Formerly Chairman of the American schools at Alexandria.

"The Rev. Norman Macleod, D.D."

How far Mahometans observe the orthodox number of times for devotion (five a day,) I do not know; nor yet what proportion the devotional class bears to the indifferent. The fact, however, is patent to every one who travels in the East that prayer is offered up in every place, not in the mosque only, but in the field, on the ship's deck, in the shop, and amidst the confusion and bustle of the railway station. When one sees for the first time a man in a public place or in the middle of a field suddenly drop down to the ground, one is apt to think that he has been seized by a fit, until the fact dawns, from the regularity of his motions, that he is performing some duty. The worshipper goes about it in the most methodical manner. He spreads his carpet on the ground, if he has one, and then, as sailors would say, takes the bearings of Mecca, towards which he prays. This adjustment of his body, not to speak of his soul, is sometines not easy, especially on ship-board, when the vessel's course is constantly changing. In such cases he consults his fellow-believers, who will often gather round him, and suggest what in their opinion is the right point of the compass to which to direct his eyes. This being determined, he first of all, whether on land or on shore, stands upright with eyes open; then, after meditating for a moment, puts a thumb close to each ear, erects his fingers fan-like, and prays in silence. It is unnecessary to record all his subsequent acts—the bending down and touching the ground with his nose and forehead, the rising up and crossing his hands over his girdle, the kneeling, the sitting upon his heels, the rising up again, et cetera. Scrupulous care is taken as to the relationship of one foot to another, of the right hand to the left, as to the exact spot for the forehead and nose to touch the earth, with their distance from the soles of the feet; and many other "bodily exercises." The prayers, we were given to understand, are all of a stereotyped form, and consist of confessions, and short sentences acknowledging the greatness and attributes of Deity, with episodes regarding the authority of Mahomet. What strikes one is the serious, abstracted countenance of the worshipper, which seems to be unaffected by anything taking place around him any more than if he were alone in the desert. It is reckoned a great sin to disturb a man at his devotions.



Attitudes of the Mahometan during his Devotions.

One of the most reverential worshippers we saw, whose very beard seemed to be an Eastern religion embodied in hair, was an old man on the deck of an Austrian steamer some weeks later in our tour, but we may do honour to the respected devotee now. One of our companions, always full of the "charity which believeth all things," directed my attention to the reverence of the man. Then began, as often happens in such cases, a discussion regarding the different outward circumstances in which a real life of piety may exist and manifest itself, like light in the midst of darkness or like a plant growing under a stone, which ended with sundry speculations as to the mysterious connection between devoteeism and devilry—mere forms of religion without religion itself; but all agreed that this person seemed to be of the true sort, sincere and honest, though ignorant. So when he rose from his knees we were disposed to be very civil to him, and lent him a binocular glass to study the landscape, with which he was greatly delighted. But the good old man stole the glass, and it was only recovered after a search by the steward in his travelling bundle, where it was wrapt up in an old sheepskin. He seemed quite aware of the theft, and skulked off, not without fear of subsequent punishment, which however was not inflicted. He was a thorough type of formalism.

But to return to our railway journey. By far the most notable objects we saw before reaching Cairo were two grey triangles rising over some palms to the south, and piercing, wedge-like, the blue sky: they were the Pyramids. We reached Cairo in the evening, in time to enjoy a golden sunset with burnished clouds rising from the horizon of the Delta to the zenith. Except in peculiar circumstances, such as the presence of snowy peaks or masses of ice to reflect the light, sunsets increase in splendour with an advance to the north. Those of St. Petersburg are unsurpassed. The finest I ever saw at Venice even, were far inferior to them in brilliancy and variety of colour.

We went of course to Shepherd's hotel. To get clear of the railway terminus, however, was by no means easy. The crush of donkey-boys, omnibuses, carriages, and camels, with the crowd of nondescript characters, raised such a storm of sound and such clouds of dust and of doubt, as made the "situation" for a moment bewildering. But once in the hotel, we are again in Europe.

"Shepherd's" is a huge barrack in an open space, with trees and gardens in front. No position could be more agreeable. It has before the door an elevated verandah, approached by a few steps on each side, and forming quite a drawing-room tent in the open air. Within the hotel is a handsome dining-hall, and in the stories above there are broad stone-flagged passages or corridors, which seem to be infinite, and to go round the world; and opening from these corridors are bedrooms numerous enough to accommodate all travellers, with room to spare for mosquitoes and other more permanent lodgers, though these were by no means troublesome.

The verandah at Shepherd's had its own story to tell, and any man could read it. It is the Isthmus of Suez on a small scale, a traveller's link between India and Europe, with the addition of a few square yards which serve as a platform to connect the invalid homes of the cold north with the heating breath of the genial south. Here one meets young lads who have passed their examination at Addiscombe, dressed up *à la mode*, from canvas shoes to cambric-covered hats. They are upon the whole nice, clean-looking fellows, with a gentlemanly bearing about them, and an innocent puppyism, pipe included, which ceases in the eye of charity to be offensive on the verge of the real difficulties in life, which one knows they are about to encounter. Who would refuse a pipe or a snuff to a man before his going into battle? But what care these boys for leaving home! "Aint it jolly!" No! my boys; I know better, "it aint jolly," but, as you would say, "seedy." In spite of all your pluck, I know you have just written to your fathers or mothers with a tear which you would be ashamed to confess, hating to be thought "muffs." You have forced yourselves to declare for their sakes "how very happy you are;" yet you would give worlds to be back again for an hour even at home; and would hug the old dog, and almost kiss the old butler. I'll wager that merry lad with blue eyes and fair hair, has written to his sister Charlotte, who is watching for the mail, telling her to keep up her heart, for he will very soon be able to return on leave. And he has sent a single line to Jack, telling him that he may have the use of all his bats and guns, and fishing-rods, and whatever he has left behind him; for though he had his little tiffs with Jack at home, Jack, in spite of his this or that, seems now perfection in his brother's memory. And the lad also begs to be remembered, in a quiet, confidential way, to a certain young lady whom he is ashamed to name, but whom he verily believes will never marry another, but wait his return from India! God bless the boys! and bring them out of fever and gun-shot wounds to the old folks at home.

Meeting these fresh boys from the West are worn-out, sallow-complexioned veterans returning from the East. Among them are men whose fame is associated only with the dangers of sport with tigers and wild boars, or with the gaieties of the station. But just as likely among those quiet-looking gentlemen may be more than one who has governed a province as large as England, and been a king in the East, and been almost worshipped by wild tribes whom he has judged in righteousness and ruled with clemency. And they are returning to a country where old friends, who parted from them full of life and hope, are long ago buried; and they will visit "the old home" no more, for it is in the hands of strangers; while such of them as are bachelors will henceforth be frequenters of Oriental clubs, and be known as "old Indians," who are supposed to be peculiar and crotchety. There are few nobler gentlemen on earth, after all, than these same "old Indians!" Look at those two fine specimens with pith hats, brown faces, and long grey moustaches! They are very silent, and look sometimes as if very sulky; but their hearts are sound, though their livers are the reverse; and I respect even their growls, that seem to me like harmless thunder, without lightning, after a long sultry day.

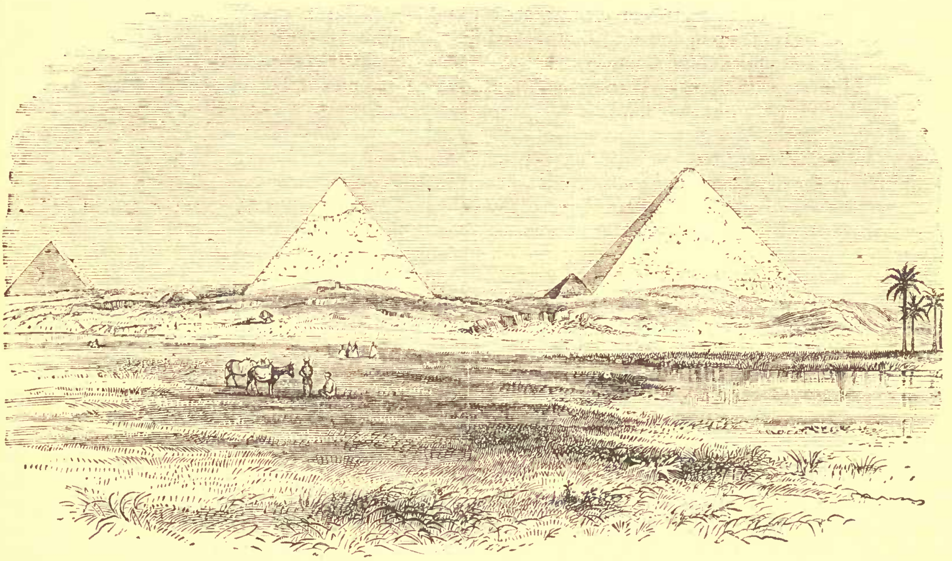
Slowly swinging in that easy-chair is a young man with a pale face and hard cough, while a meek, sweet-looking young woman—his sister, evidently—is reading to him. Near to them is an elderly man, equally feeble, with daughters, as angels, ministering to him. How one sees home friends perusing the letters from such groups, telling their anxious friends that they are "much better," and begging the mother, or sister, or children, to "hope for the best," for "Egypt is such a good climate, and James, or papa, or sister Mary, are *so* good and patient." Health to them!

Along with those are other sheep in this "Shepherd's" fold—men of cotton and men of iron, who possibly may be sheep only in their clothing, with a little patch of wolf-skin under it, at least when having to deal with the Pasha; men of travel too, who have been poking through every part of creation, and whose tents are all pitched under the trees opposite the hotel, as they intend to start on a journey to Sinai, or whose boat is ready to proceed to Luxor and the Cataracts; Americans of course too, from the North and South, and clergy from the same western land with silk waistcoats and immense clerical respectability; and clergy besides from all lands, some dressed as if descending from the pulpit, and some as if they had never entered it.

We have some things to see in Cairo, but we must in the first place "do" the Pyramids, and pay our respects to these old mysterious piles of stone in the desert which people were wondering at before Abraham was born.

The donkey boys who gather around Shepherd's hotel, and seem to be there day and night, make a rush at every stranger who gives any sign of going out to see the sights. The moment one descends the steps, he has a confused impression of a crowd of round, black faces, mixed with asses' heads; while from all sides proceed shouts and screams of "Very fine donkey," "This donkey be Yankee Doodle," "Dan Tucker," "Jem Crow," "Snooks," "Billy Taylor," "Jack and Gill," or some other name suitable to the supposed nationality or taste of the person besieged.

Mounted on very good donkeys, selected by a nice lad named Hassan, a well-known hanger-on at the hotel, and one of John Bull's "rascals, sir!" we set off for the Pyramids. My donkey was small and strong, but in the saddle I saw nothing of him except his ears. The ride at first is through the scattered suburbs of Cairo. Passing through these we came to a mound of rubbish which, as I was informed, marked the Babylon of Egypt. We shortly after reached the bank of the old river, which swept swiftly on with its brown muddy-looking water.



View of the Pyramids, on approaching them from the Plain.

The first view of the Nile here was to me singularly enjoyable. Indeed the first view of a great historical river is always most interesting. It is one of those features of a country which is as unchangeable as the mountains, and is always associated with its history as the permanent highway of all generations, requiring no repair and incapable of decay. And here was the Nile! It is one of the locks of snowy hair on the old head of the world. Reminiscences began to crowd upon the mind, from Moses to Captain Speke; and one ever and anon wished to convince himself of the fact that this was really the ancient river of history. Yet all the objects which met the eye and filled in the view were appropriate. There were picturesque boats and palm-trees on the further shore, and over them were the grey Pyramids rearing their heads a few miles off. What more could we ask to make up a real Egyptian landscape in harmony with one's ideal?

After crossing the ferry and traversing a flat plain on the western shore, with villages and groves of palm-trees, we reached at last an open space with nothing between us and the Pyramids. The first thing which strikes one is, not their size, for that cannot be measured by the eye, but the high platform on which they stand. It is about 130 feet above the level of the green flat of the Delta, and in the midst of a pure sandy desert. "I never thought they were among the sand or so high up: did you?" "I thought they would have looked far larger! Did not you?" "Where in the world is the Sphinx?" "There she is!" "What! that little round ball rising above the sand!" These are the sort of questions or replies which one hears, if anything be spoken at all, as he moves towards those venerable mounds.

We found the strip of land which separates the Pyramids from the green valley to be much broader than it at first seemed. It was thus well on in the day when we reached our destination, and the heat was consequently greater than we had made up our minds for. We made for the Sphinx first, and went round and round her. She appeared like a huge boulder rising out of the sand. I did all in my power to realise the calm majesty, the dignity, serenity, et cetera, of that strange creature's expression; but I gave it up in despair. She seemed to me to be an Egyptian Mrs. Courady, whom no power could invest with beauty. I envy those who can enjoy her smiles. She may have been a theological Venus in the days of the patriarchs; but a most gigantic small-pox from the battering rams of Cambyses, or the fierce anger of some invader, has destroyed the smoothness of her skin. I regret my insensibility to her charms, but I can't help it. She is still a riddle to me.

We also visited here a tomb or temple, I forget which, called "Campbell's," in honour of my excellent cousin, Colonel Peter Campbell of Duntroon (how we Highlanders cling to cousinship when it is respectable!), once consul in Egypt. It is buried in sand, except where the descent into its interior has been cleared. The huge stones of beautifully polished granite with which it is formed throughout, and which are so exquisitely fitted into each other, are very striking. There are two rows of granite pillars about twenty feet high. Some of the smooth blocks of granite in the wall are thirteen feet long, by five broad, and four thick. Travellers who have visited the great temples of the Nile would overlook such a small affair as this; but compared with our European buildings or modern Egyptian ones, it is Cyclopean, and made us feel that

> "They dreamt not of a perishable home
> Who thus could build."

The nearer we approached the Great Pyramid, the more it rose upon us as a revelation of majesty and power. When it was proposed to me to ascend it, I agreed as a matter of course; and when one of our party kindly hinted at the difficulty, I looked up to the artificial molehill, and swaggering about my exploits on Highland and Swiss mountains, I expanded my chest, drew myself upright, and pitied the scepticism of my fellow-traveller. The offer of the Arabs to help me up, I rejected with a smile of quiet assurance and contempt. Walking along the base of the structure, which seemed interminable, we got upon the first ledge, and began the ascent. Half-a-dozen bare-armed, lightly-clad, dark-complexioned, white-teethed children of the desert surrounded me—measuring me with their eyes, and jabbering irreverently in Arabic, about my size, I believe: but they ended by volunteering their assistance. Their speech was interlarded with the one word, which constantly occurs, and forms an important portion of the language of Modern Egypt and Canaan—*backsheesh.* I begged them courteously to leave me: and with an elasticity remarkable to no one but myself I mounted the first step. Having done so, I felt entitled to pause and breathe; for this first step seemed to be a five-feet wall of limestone. To my amazement I found another before me, and another and another, each of which I climbed, with the assistance, I confess, of the Arabs—two before and three behind—but with a constantly diminishing sense of strength, and an increasing anxiety to know when I should reach those short, easy steps which I had been gazing at from below. I was told that the steps to the summit were all like those I had passed, but I was also told not to be discouraged thereby, as, by hard work, I should be a good way up in half-an-hour; and once up I could rest, so as to be fit for the descent, which, after all, was the real difficulty! I gazed up to a series of about 200 stone walls which, after reaching to an elevation of 120 feet higher than the ball of St. Paul's, were lost at last in the blue sky, and I looked down half-dizzy to the base beneath me. The next wall above me was somewhere about my chest or chin! So meditating upon the vanity of human wishes, upon the loss to my parish (so argued the flesh) by a vacancy, upon the inherent excellence of humility, the folly of pride and of sinful ambition, I then, in a subdued but firm tone, declared that no arguments with which I was then acquainted would induce me to go a yard higher. I pleaded principle, but strengthened my convictions by pointing to the burning sun and the absence of a ladder. Bidding therefore farewell to my companions, who went up those giant stairs, I begged my clamorous guides, who clung around, to leave me until they returned. The obvious terror of the Arabs was that they would lose their pay; but I mustered breath enough to say in the blandest manner, "Beloved friends and fellow-labourers! sons of the desert! followers of the false prophet! leave me! go round the corner; I wish to meditate upon the past: depart!" And then I emphatically added, "*Backsheesh, backsheesh, backsheesh!* Yes!" They seemed to understand the latter part of my address, held up their fingers and responded, "*Backsheesh?* yes!" I bowed, "Good!" They replied, "We are satisfied!" and vanished. And so they left me some twenty steps up the Pyramid, and looking towards Ethiopia and the sources of the Nile. I was thankful for the repose. One had time to take in the scene in quiet, and to get a whiff from the inexhaustible past in that wondrous spot. The Arabs away, everything was calm as the grave, except for the howls of a wandering jackal that, like a speck, was trotting away over the tawny sand beneath me.

As to what one's thoughts are in such a place, I believe they are very different from those which one would have anticipated, or which are suggested by memory in seclusion afterwards. Instead of receiving present impressions, we possibly try to pump up emotions deemed suitable to the occasion. We gaze upon the mountain of stone around us, on the Sphinx at our feet, and on the green valley of the Nile; we recall early readings about the wonders of the world, of travels in Egypt, and stories of the big Pyramid; and we ask, "Are we really here? Are these the things which stirred our hearts long ago?" And then trying possibly to gauge the depths of time since these pyramids were erected, we place historical milestones a few centuries apart, putting the first down at the period of the Reformation, then jogging up to the Crusades, the decline and fall of the Roman Empire, the Old Testament times, those of Joseph and his brethren, until we reach Abraham. We then look at the big stones about us and say, "These were placed here long before Abraham!" Then we begin to ask, "Who built them? what were they built for? and who on earth was Cheops?" And then possibly some shells in the limestone attract the eye, and we ask, "When were the occupants of these alive?" And we thus get past Adam and Eve, into the infinite cycles of geologists, until at last the chances are one gets so bewildered and dreamy that he slides into a speculation as to whether "Shepherd" has packed any soda water or pale ale for lunch, for it is very hot; or mutters with Byron,

> "Let not a monument give you or me hopes,
> Since not a pinch of dust remains of Cheops!"

It is, after all, very humiliating to think how a slight pain in foot or head, a disagreeable argument, a hot sun, a stubborn donkey, a scratch on the nose, or some trifle, will affect the whole landscape, however grand. I will back a "corn," or a bad tooth, to destroy the glory of the past or present, and reduce all other thoughts to one burning sensation of intolerable pain!

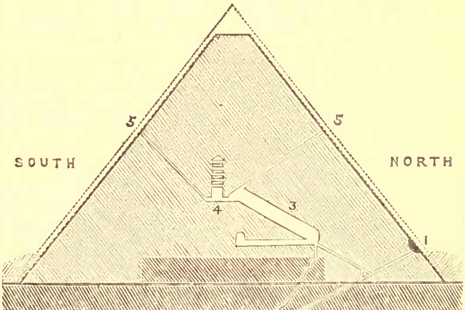
Yet, confessedly, few can escape in such circumstances an awed feeling of vast and unknown antiquity, nor fail to hear faint echoes from the tide of human life that chafed against these immortal walls before history began. I doubt not a great part of the charm which fascinates us in such scenes arises from the consciousness of human brotherhood which all historical countries suggest—of the existence long since of beings like ourselves—men who planned and laboured, lived and died, thousands of years ago, but are yet alive somewhere, and with whom, could they only start into life now, we would be able to sympathise. After all, *persons* are the life of this world, and a personal God the life of the universe.

Before descending from my elevated seat let me point out more fully the relationship of the Pyramids to the valley of the Nile, and to Cairo. Imagine the Delta to be, what it often is, a sea, and the valley of the Nile a narrow strait bounded on the east side by low desert limestone hills, and on the west by an elevated ridge of tawny sand. At the entrance of the strait is Cairo on one side, with its clustering monuments in the sun-light, and on the opposite side are the Pyramids, elevated on a beach of genuine desert sea-shore—sharply separated from the high-tide mark of the inundation.

While leaving the Pyramid, the famous passage from dear old Sir Thomas Browne's "Chapter on Mummies" came to my memory:—"Time sadly overcometh all things, and is now dominant, and sitteth on a Sphinx, and looketh unto Memphis and old Thebes; while his sister Oblivion reclineth semi-somnous on a Pyramid, gloriously triumphing, making puzzles of Titanian erections, and turning old glories into dreams. History sinketh beneath her cloud. The traveller as he paceth amazedly through those deserts asketh of her, Who built them? And she mumbleth something, but what it is he knoweth not!"

Here I ought perhaps to insert a chapter about the Great Pyramid, with information derived at second hand from the circulating or more recondite library; for at first hand I know nothing about it, except what I have revealed. But let me inform a certain excellent lady, in reply to a question which she put to me, and others probably, like her, whose readings on Egyptian antiquities are not more extensive than my own, that the steps I have spoken of are not inside, but outside the Pyramid; and that when built these ledges were all covered so as to present a smooth surface of polished marble which has been stripped off by sundry Caliphs, and made use of in other buildings.

Let me also remind those who have forgotten their geography, that this big Pyramid is about 480 feet high, and that its base covers thirteen acres. It is not, however, hollow, but a solid mass of stone, with the exception of one or two small chambers in the interior, reached by passages, opening from one side, and widening to a more roomy corridor before reaching the centre, where the celebrated stone coffer lies. As to the use



1. Entrance. 2. Well. 3. Corridor.
4. Chamber with Porphyry Coffer. 5. Air Passages.

of the Great Pyramid—for there are dozens of smaller ones in the land—that is a question not yet settled. But it was not built for a tomb, nor for astronomical purposes, nor for idolatrous worship. A theory started by the late Mr. John Taylor, and expounded at length by the Astronomer Royal for Scotland, Professor C. Piazzi Smyth—to whose interesting book we refer the reader * — seems highly probable, if the data on which it is founded are correct. The theory is that it was a great national or world standard of weights and measures of every kind, founded on an exact knowledge of the axis of rotation of the globe; that in this big cairn are measures of length marked off, the unit of which is one inch, or $\frac{1}{500000000}$ of the earth's axis of rotation; that the porphyry coffer in the centre is a standard grain measure or chaldron, holding to a fraction four of our English quarters, or 70,982 English cubic inches; and that there are also subdivisions of the year into months, weeks, and days, "checked off," in the grand gallery leading to the coffer, with sundry other details which we cannot enter on. As the Astronomer Royal is now at the Pyramid we hope to be able on his return to give in our pages the results of his measurements and investigations. In the meantime we are inclined to believe that Mr. Taylor and the Professor are on the right track of discovery.

No event occurred worth recording on our return journey, except the fall of my donkey—if that has any interest to the intelligent public. The event seemed to be of great personal interest to the worthy animal, exciting in me a certain sense of undignified bewilderment, and producing sensations which reminded me of early days, and also of increasing infirmities. The transition was sudden and odd, from dreaming about the Pharaohs and the Exodus, to finding one's-self lying beside an ass in the mud of the Delta. The animal seemed to take his fall as a matter of course. I presume it was a sort of duty which he often imposed upon himself on this route, as a last resource to obtain relief from an extra load. After his rest he jogged on, like Peter Bell's donkey, with perfect ease and unfaltering step.

Next day we visited Heliopolis. The ride to it through the country is most pleasant, with the green fields, palms, acacia, and sycamore trees, and springs of water and water-mills. On reaching it, one sees little with the outer eye, except a granite obelisk with sharply-cut hieroglyphics, standing in an open space of tilled fields, which are surrounded by mounds and walls of brick, in which the chopped straw that was mixed with the clay is yet visible. But Joseph—that noblest of men—married a daughter of the parish minister of Heliopolis; and Plato—that great orb of thought—studied at this primeval Oxford. Can any man paint with words the thoughts suggested by such facts? That obelisk was raised one hundred years before Joseph was born. Herodotus saw it when he came to this old university to get information about Egypt. The Pyramids, older still, rise like mountains in the horizon beyond! Near this is shown the tree under which the Virgin reposed on her flight to Egypt with her Son. It was probably planted centuries afterwards. What of it? One rejoiced to be, for the first time in his life, on the traditional track even, of those wonders which fill the earth, and of facts which transcend fiction.

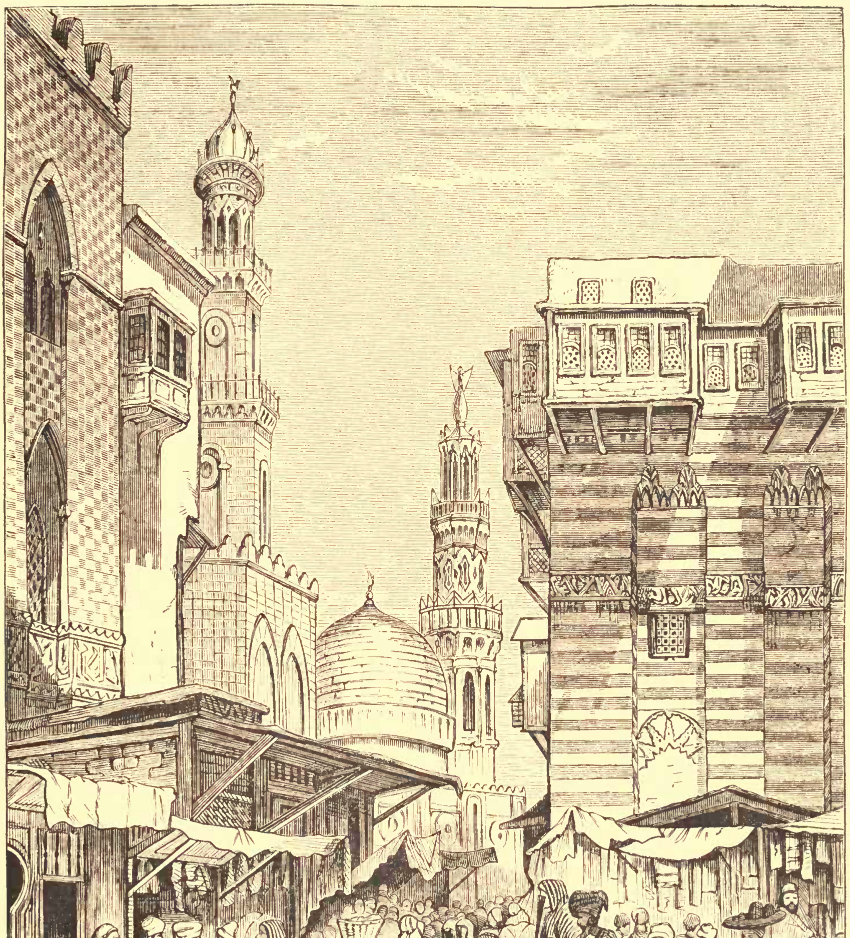
During those short expeditions around Cairo we were, of course, accompanied by our donkey boys, to take charge of their steeds, and belabour or lead them, as required,—all being under the command of Hassan. These boys were with us during three days, under a hot sun from morning till evening, running and jabbering along the dusty highway like *flibberty-jibbets;* yet though pressed to eat a portion of our lunch—offered by us from sheer pity for their wants—they steadily refused, simply saying, "Ramadan! Ramadan!" It was the annual Mahometan Fast, and no better proof could be afforded of the strictness with which it is kept by the mass of the people. Their principles are not true, but they are true to their principles. They cannot be blamed for eating with an appetite the moment the sun goes to bed, but must be praised for their self-denial during the day. We may safely conjecture regarding them, as an oddity of a Scotch preacher once did of the Pharisee who boasted that he fasted twice a week, "I'll wager he made up for it during the other days!" But I don't think these supple, all-skin-and-whipcord boys, ever enjoyed what a voracious Westerner of the same class would call "a blow out."

Let us to the Bazaars. A walk of a quarter of an hour across the open space before the hotel and through nameless streets with little interest save to the Franks, brings us into those crowded arcades of merchandise. They are broader, higher, more aristocratic, and richer than those of Alexandria, and are the most picturesque we have seen. Not so out-and-out Oriental, critics say, as those of Damascus, but, to a stranger who cannot detect the true signs of genuine Orientalism, they are fully more interesting. They are partially covered at the top with matting or palm-leaves, to keep out the glare of the sun and to produce coolness. Every trade has its own "location," and birds of a feather here flock together, whether gunsmiths, butchers, coppersmiths or shoemakers, dealers in soft goods or hardware, pipes or tobacco, horse-gear, groceries, carpets, or confections.

The people who crowded these bazaars, in their various costumes of many colours, are always a source of intense interest. The most striking points in the buildings are the balconies, which in some cases almost meet from opposite sides of the street; but there is an endless variety of quaint tumble-down bits of architecture, with fountains, and gateways shutting in the different quarters,

---

* "Our Inheritance in the Great Pyramid." London: Strahan. 1864.



STREET SCENE IN CAIRO.

while the mosques, with their high walls and airy minarets, overlook all. Ever and anon we saw vistas along narrow crowded lanes, and views into back courts and caravanserais, with such groupings of men and camels, merchants and slaves, horses and donkeys, Bedouins and Nubians, mingled with such brilliant colours from Persian carpets and shawls, such bright lights and sharply-defined shadows as made every yard in our progress exciting, and tempted us to sit down as often as possible on some bench or shop-front to enjoy the inimitable picturesqueness of the scene. A great artist once told me that for three days he tried to settle himself in order to paint in the bazaars of Cairo, but his mind always got so distracted with the richness of his subject that he could never compose himself to his work. No sooner did he resolve to paint one bit than he saw another which seemed better, until for a time he gave it up in despair.

When seated on a bench contemplating the stream of Oriental life which rushed past us, we had what I must call the good fortune to see a very characteristic specimen of an Oriental quarrel. It was between a woman and a shopkeeper. The woman was, like most of her sex whom one meets with in Cairo, obese and dumpy, with the usual veil over her face, which allowed however her flashing dark eyes to be seen, glaring like those of a tigress. Her nails, which she seemed disposed to bring into immediate use as weapons of offence, were dyed. She had large ear-rings and other ornaments. The cause of her wrath seemed to be the loss of a bracelet, which the shopkeeper appeared to have seized as security for some debt. But what a picture were those two! They looked into each other's faces, and shouted at the top of their voices without a pause, question and reply being impossible amidst the roar of their vehement indignation. Their rage was not a series of squalls with thunder and lightning, but rather the continued scream of the tornado. They hurried off to the police, and thither, with a small crowd of excited partisans, we followed them. The police, who were smoking their pipes in a divan under a verandah near one of the gates, rose up, and calmly heard the disputants for a time. The woman demonstrated like a maniac, flung her arms around her, pointed to her bracelet, and yelled; the accused, with forefinger close to the woman's face, tried to yell louder; several men and women took each their part, and all spoke and yelled at the same time, while the leading officer in the centre, joining in the chorus, with hands extended to all parties, yelled at the top of his voice. The discord was made up of screeches without a pause, in harsh and guttural, but apparently most emphatic, Arabic. We never saw such a perfect quarrel before, such a thorough exhibition of human passion; yet it was too ludicrous to be horrible, for all this vehemence meant little: it was like that of the sea captain who excused himself for always speaking in a rage by saying that, if he spoke quietly, none of his crew would believe he was in earnest. How the dispute in question ended, I know not; but I am persuaded that both Billingsgate and St. Giles's would have meekly retired from a contest of words with either the hero or heroine of the Cairo bazaars.

But let us go back to our quiet seat on the bench, and, like "Jock the laird's brother" on the louping-on stone, "glower frae us." There is a strange combination of noise and quiet in the bazaars. Both belong to the East. There are no "cars rattling o'er the stony street," for there are no stones to rattle over. The roadway is hard clay. We are therefore delivered from the loud, grating, harsh European noises of coal-waggons and other vehicles. Here they glide along like sleighs over snow. But the very absence of the noise of wheels necessitates the use of powerful lungs, to warn the moving mass of danger. Accordingly there is an endless shouting of something like this: "Yemīna!" (to the right;) "Shemālek!" (to the left;) "Ducharuc" (thy back;) "Regalek!" (thy leg;) "Jāmlăck!" (thy side;)—very much like the cries from one vessel to another of "Starboard!" or "Larboard!" to avoid a collision; while the constant "Hoah!" (look out!) is ever heard as a note of general alarm.

We were astonished at the freshness of the atmosphere, and the absence of all disagreeable smells in these crowded streets. Never once were we offended by any one of the seventy "distinct and separate" perfumes which Coleridge has immortalized as characteristic of Cologne. Any abnormal odour which we caught was aromatic and agreeable. I don't pretend to account for this, or to say how far police regulations, the dry atmosphere, or the dogs, have the credit of it; but I was informed that, for this town of upwards of 300,000 souls, drainage, in its "social science" sense, has no existence.

As to the dogs, which throng the streets, they are a great Eastern institution, constantly present in all its magnitude to the eye and ear of the traveller. The Cairo dogs, as far as I could judge, belong to the same pariah race, in form and feature, as those of other Eastern cities. They are ugly brutes, without any domestic virtues, and without culture or breeding; coarse-skinned, blear-eyed, and scrubby-tailed. They lead an independent public life, owe no allegiance to any master or mistress, not even to any affectionate boy or girl. They have no idea of human companionship, and could not conceive the possibility of enjoying a walk with man or woman; nor of playing with children, mourning a master's absence, or barking wildly on his return home. They are utterly heathen, and never, like our decent sheep dogs, enter church or mosque. No tradition has ever reached them of any of their tribe having entered a house, even as a tolerated beggar, far less as a welcome guest or honoured friend. To have built the Pyramids or reigned at Memphis would not appear to them more absurd than their possession of such aristocratic privileges. They are kindly treated by the public, in so far as food goes, yet not as friends, but only as despised wretches, the depth of whose degradation is made to measure the charity of those who deign to show mercy to them. We saw six of them patiently watching a poor man at breakfast. How low must their self-respect have sunk! Alms, when bestowed even generously, are received without any genial wag of the tail. That caudal appendage has no expression in it; its sympathetic affection is gone. Their political organisation is loose, though a kind of republic exists among them, made up of confederate states, each state being a quarter of the town and independent of every other. They cannot rise to the idea of *united* states. Thus, if any dog wanders beyond the limit of his own district, he is pursued by the tribe upon whom he has presumed to intrude, and is worried until he returns home, to gnaw his own state bones, consume his own state offal, and be supported by his own niggers. These four-footed beasts have no home, no kennel, no barrel even, which they can call their own. A rug, a carpet, or even a bed of straw, are unheard-of luxuries. They live day and night in the streets. Miserable creatures! I don't believe the smallest Skye terrier would acknowledge them as belonging to his race, but, proud as a piper, would snarl past them with curled-up tail, and a low growl of dogmatic unbelief in the identity of the species, and of insulted dignity at the notion of a return bark being expected from him.

Some people are able, by the power of their fancy, to reproduce in ordinary daylight the Arabian Nights of old El Kahira, or Cairo, as it is called. We think it quite possible, after some months of total separation from Europeans, devoted to the study and reading of Arabic, and to the smoking of timback in a narghelli, that one might reproduce before his mind's eye the ideal glories of the days of Haroun al Raschid. But for a man going from one railway to another, it is impossible to enjoy the old faith in Aladdin's lamp, to invest any Barber with interest, or to expect to get directions from the Genii, as we do now from Bradshaw. Yet one evening, when passing through a bazaar, we took a cup, or rather a china thimbleful, of delicious coffee, with its dark grounds as more solid nourishment; and then we had, for a moment, such a glimpse of Eastern life as might, with time and culture, have grown into a genuine Arabian-night feeling. It was a repetition of the scene in the bazaar of Alexandria described in my first paper, with the difference of a larger café, a more interested audience, and, above all, the fact that they were listening, as former generations had done, to a person reading aloud, with great gusto, stories of a similar kind to those of "The Thousand and One Nights." It was a pleasant sight, and suggested not only romantic thoughts of the past of El Kahira and Bagdad, but, what was of infinitely more importance to me, practical thoughts as to the immense power, which we Westerns have never developed, of good story-telling for the people, illustrative of minor morals, and of "the thousand and one" every-day details of common life, which should be considered and attended to by them for their physical and social well-being. The deep foundations of life require to be firmly laid, and big stones placed upon them, by heavier and more complicated machinery than this, but many an interstice might be filled up in the building, and many a valuable hint given for its internal economy and comfort, by the lighter machinery of good, racy, vernacular, pointed story-telling, which would form most effective week-day sermons for our people over their tea and coffee.

In the meantime, I must bid adieu to Cairo and its bazaars. In my next I may take a glimpse into the mosques, and then for the Red Sea!

Note.—A few hints regarding Palestine travel may be useful at this season of the year when so many start for the East.

The possibility of visiting Sinai *en route* to Palestine can be ascertained only at Cairo, owing to the unsettled state of the tribes of the desert; but at Cairo perfectly accurate information upon this point can be obtained.

A steamer, weekly, at least, leaves Alexandria for the Levant, and lands passengers at Jaffa; or—if the weather is bad, and that difficult seaport cannot be entered—at Caipha in the Bay of Acre, and under the shadow of Carmel. The time occupied in the voyage from Alexandria to Jaffa is at most thirty hours. Jerusalem can be easily reached from Jaffa in eight hours by Ramleh, and in twelve hours by the more interesting route of the two Bethhorons and Nebi Samuel. A party may hire a dragoman at Cairo; but a good one may very possibly be obtained from the hotel-keeper at Jaffa, or even at Jerusalem. A single traveller ought not to engage one until he reaches Jerusalem. The pay for a dragoman at present is about thirty shillings a day for each person of a party of about five, if the engagement be for at least thirty days. The dragoman provides tents, horses, mules, and all the provision required, including the payment of the bills in the one or two hotels in which the traveller can reside. He pays also *backsheesh*, guards, everything, in short, except perhaps his fare to Jaffa (if hired at Cairo) or back fare from Beyrout. Travelling by Sinai, the traveller should be more liberal with his *backsheesh* than the dragoman. Not so in Syria. The dragoman should never be permitted to divert a traveller from any route agreed upon, or which he may wish to take. In spite of some infirmities of conduct, for which others were fully as much to blame as himself, we found our dragoman, Hadji Ali, a very honest and trustworthy fellow: but with all of them a strict bargain should be made before starting, and they need to be carefully watched as well as kindly treated during the journey.

We would recommend the traveller before beginning his tour in Palestine, to make a very careful survey of the girths of his saddles, and the backs of his horses, which are often in a horrid state. Those who wish to ride with comfort ought to provide an English saddle, with good girths and crupper. Two pairs of trousers partially lined with chamois leather should be provided for riding. A bag and portmanteau are not too much luggage; a pith hat and white canvass shoes are comfortable; a Scotch plaid indispensable. The traveller should carry a revolver: it looks heroic, fierce, and dangerous; but it is much safer for himself and others, much more economical, as well as more agreeable for all parties, that he should leave the powder and ball in England till his return. A medicine chest is also very useful and respectable, provided it is never used except when the cook or muleteer wish to avail themselves of some of its "unemployed operatives."

If any man has the courage not only to brave the dangers of that "great and terrible wilderness," but also the anathemas of the "Anti-Tobacco Society," I would advise him to buy his cigars in England, should he be so foolish as to buy cigars anywhere. If further he can defy the teetotal League and the great prophet of Mecca, he will find a little good cognac at the end of a long day's journey helpful to his "oft infirmities." Better far if he can with equal comfort dispense with both of these appliances. A pound or two of good tea from England should be added to his store. We also recommend him to take with him not only Dean Stanley's "Palestine," which is essential, but also his lectures on the Jewish Church. "The Land and the Book," the last edition of Robinson, and the articles on Palestine and the Holy Sepulchre in Smith's Dictionary, will be also useful. For the sake of the nervous I may state that there is really no danger whatever, nor any discomfort, to any sensible and healthy man in journeying throughout all Palestine: it can be done with perfect ease. And for the sake of the married, I may add that any healthy lady up to fifty, even though she has never been on horseback since she was at school, may accompany her spouse, provided he be sedate and willing to take things quietly. From Beyrout a most comfortable diligence will convey passengers in a single day, and along a splendid road, to Damascus. "Touching the coined money," as Dominie Sampson would say, sovereigns are the best coin all the world over: the circular notes of Coutts can be easily cashed at Jerusalem or Beyrout. Finally, a large Macintosh sponge bath, with sides only inflated—and these about ten inches deep—can be packed into a small space, and will be found at sea and on land a great luxury.

The Poorer Class.

TINY NEEDLEWORKERS.

THE wide-spread sympathy felt for the sufferings of needleworkers is generally confined to two classes—the sempstresses of the East end, and the dressmakers of the West end of London. The fact that such labourers live and work in town, is considered to augment the evils of their condition. Fresh air, health, and freedom from sedentary employments are always associated with a country life; and foul air, sickness, and in-door slavery are equally associated with a town-life. Investigations, however, made from time to time, into the state of our rural population at the various seats of manufactures, disclose facts which show that the country has as little to be proud of as the town. A government report recently made by Mr. J. E. White on the workpeople employed in the Hosiery manufacture of Nottinghamshire, Derbyshire, and Leicestershire, proves that country parents may be as hard taskmasters as town milliners and slop-sellers.

The Hosiery trade of these three counties—which is the hosiery trade, in fact, of the United Kingdom—is roundly stated to have a money-value of six millions and a half sterling a year, and to employ about one hundred and twenty thousand people. Twenty years ago this branch of manufacture was almost entirely domestic—carried on at the homes of the work-people,—but the introduction of steam-power has largely changed this state of things. The trade, as a whole, is developed; its returns are increased, as well as the earnings of those who are employed in connection with the new power, but the very large balance of the work which remains, and must remain for a long time, owing to certain mechanical difficulties, in the hands of the home-workers, is much depressed by this machine competition. The present scarcity of cotton further helps to depress this branch of industry, and the condition of the mechanics and their families is very miserable.

After the fabric has been produced upon the machine or frame, whether worked by steam-power or not, a large amount of labour, chiefly needlework, is required for mending, and also in most cases for forming each article by joining the edges or the separate parts in which many of the articles are made, generally spoken of as "seaming," or in the case of gloves as "stitching," &c. Much of the material made in factories and "cut up" into smaller pieces is stated to be sewn there by stitching machines worked by steam-power or treadle, but a great amount is also sent out from the factories into the country to be seamed. This country seaming is done almost entirely by mothers and their children, or by females at their own homes, and the ages of most of the children employed would surely astonish even an East-end slop-seller. Children, according to reliable authority, have been employed at this needlework at two years of age; and it is common to employ them at ages varying from three years and a half, to seven, eight, and nine years. Though boys have been put to work in frames so young that their weak fingers have easily become distorted by the constant grasp of the iron, the labour of those who seam, and who are chiefly girls, is far more excessive. As a rule the small shops as well as the houses are unfit as places of work for the young. Such a shop is generally just long enough and broad enough to hold the number of frames placed in it in a single or double row, with bare passing room. It is often not more than six or seven feet high, and is without proper means of ventilation. Often from one to four frames are in the only living room, poverty not allowing the cost of double fire and light, where, as in some cases, there is a second room. Many of these rooms are as squalid as the worst town dwellings, and crowded as they are, with frames, furniture, and inmates, and noisy with the rattle of frames, meals, such as can be had are cooked and eaten, infants are nursed and put to sleep, and other home work is done, of which, however, cleaning seems to form but a rare part. Seaming is done by the family in the same room; and it is common for girls and women to sit up at work all Friday night, and even for children to be kept up long after midnight. A young woman dares say she was six years old before she began to work till twelve at night, though she worked in a frame all through the night before she was twelve years old. Evidence has been given by parents that their own child—a girl—worked all through the night at about six years of age, with a statement that work of this kind is general. The parents, particularly the mothers, look oppressed and haggard with want, and worn with hard work and care, and the children are heavy, stunted, and without animation. The ignorance, even amongst adults, is extreme. The parents commonly complain that the means of education, where provided, are out of their reach. Where provided they are not always efficient, and a boy complains of being taught by lads no bigger than himself, who only "ax you once and then hit you." The scanty light by which poverty often obliges the seamers to work adds much to the strain upon the eyes in the often long-continued night work. Weak sight is common amongst seamers, and very young girls are often compelled to wear spectacles.

As soon as the children can "see to thread a needle," they are packed off to what are called the "nussing and seaming schools." At these schools the largest amount of seaming is taught, with the smallest amount of reading. The children give their work for their teaching. They go at eight o'clock in the morning, or from that to nine, and when there is much work, or on Friday—the day before "sending in" day at the warehouses—they stop till nine o'clock, or later, at night. These children get an hour for dinner, and, when they are "very good," and work hard, they sometimes get a "knob o' suck" (a piece of sweetstuff) on Saturday.

They soon learn to seam, and are at once taken home to work for the benefit of the family. Let a mother describe the system:—

"I have eight children, six girls and two boys, the eldest fourteen, the youngest an infant. The age at which girls begin seaming is just according as people are circumstanced. The common age is five. Those parents who can afford it keep their children from it longer. A girl of five after two or three months could earn one penny or twopence. My little girl, Mary, aged seven, could get sixpence or ninepence a week, seaming all day. We have kept her at it till ten at night. Sometimes she has a bit of sleep, and I have to wake her. I've heard tell of people pinning their children to their knee to keep them up and to keep them from going away from their work, but I never pinned mine. When we were stitching gloves I have put the glove on a young child's finger to work, because the child could not do it itself. I have stood another young child upon a stool, so that it might be able to see up to the candle on the table. It makes the children cleverer when they begin very young. Children are not of much use at stitching till they are about seven, but they are cleverer if they begin to learn at six. I began at five years old; stayed up often till twelve before I was nine, and worked all night before I was twelve. Parents can't be very particular about the age if they have work: they *must* do it.

"When there is plenty of work it is quite common to stitch till past midnight. Boys stitch fingers sometimes. I have seen a boy twelve years old come home from winding at eight or nine o'clock, and then set to stitch the fingers of three dozen pairs of coarse gloves. When I was a girl, I have sat up myself stitching all through the night, after being at work in a factory all day, and others will stitch after their day's work in the same way. Girls do not always go out to do stitching only. Little girls of eight or so often go out to nurse a baby, and have to stitch while the baby is asleep in the day, and they are kept to stitch after the baby is put to bed. This is called a 'nussing and seaming school.' I went to one. My mistress promised me a penny at the end of nine months if I was a 'good girl': I was a 'good girl,' and my mistress got a deal out of me, but I never got the penny. I never got more than a 'knob o' suck' on Saturdays. The work is very bad for the eyes: my eyes are very weak now, though I'm a young woman. The black work tries us most.

"Thursdays and Fridays are our worst days. On these nights children are kept at the 'schools' till nine or ten if good wage is given—that is towards two shillings a week. It is seldom as much as half-a-crown. Parents will not generally let them stay later than nine or ten, because they think they have done enough for their money, and they often want them to stitch for themselves at home when they get back. My sister went out to nurse a baby when she was going seven. She was always kept to stitch on Thursday and Friday nights till nine or ten. Once she was kept till eleven, and my father fetched her away: but then he was so very particular. She generally went at seven in the morning.

"What makes the work come so heavy at the end of the week, is, that the men are 'shacking' at the beginning. On 'Saint Monday' they go 'pigeoning,' 'skittling,' or after some other amusement, and do but little on Tuesday beyond setting the winders to work, and most don't begin regularly till Wednesday. There are some, however, who work regularly through the week, if they can get work. It would be much better for all to make Monday like any other day. As it is, the work is always behind, and comes in to the stitchers at all times on Friday night, up to twelve, or one and two. They must sit up to do the work then, as the gloves have to be finished and taken into Nottingham in the morning. This late work throws out the meal-times, and we have to get our food how we can."

This is not an account of the condition of full-grown workpeople, given under pressure, by a Bond Street milliner, or an Aldgate slop-seller; it is an account of the condition of thousands of country infants and children, given by a country mother. The state of education under such circumstances may be easily imagined. Take one stunted man's description of his own intellectual acquirements:—"I went to an infant school a bit, but not a deal to a Sunday school. I don't know my letters. Don't know 2 or 1 in large print. Am sorry to say, but I can't. Am very bad at it, and many are like me. Have heard a few people read out of newspapers, but have not heard of the Queen's name. Have heard 'Victoria,' but can't say whether it is her name. Have heard people reading of France, but don't know what it is, or whether it is the name of a place."

Any description of the condition of those employed in the domestic branch of this large manufacture is necessarily somewhat general, and admits of several exceptions; but the unavoidable impression left on the mind by a visit to the stockeners' homes is one of severe labour and much suffering in persons of all ages, and of much oppression of body and neglect of mind in the young. Most parents seem to look upon the fact of their children working in the manner described, as nothing remarkable, or out of reason. Some regret it, but as an evil for which there is small blame anywhere, and no possible help. As one poor withered child, plaintively said, after sitting up all night, "It's very hard work, sir, but there's a many has to do it."

JOHN HOLLINGSHEAD.

THE REIGN OF LAW.

BY THE DUKE OF ARGYLL.

(*Continued from page 58.*)

THE necessity of contrivance for the accomplishment of purpose arises out of the immutability of laws. They must be conformed to, and obeyed. Therefore, where they do not serve our purpose directly, they can only be made to serve it by ingenuity and contrivance. This necessity, then, may be said to be the index and the measure of the power of Law. And so, on the other hand, the certainty with which purpose can be accomplished by contrivance, is the index and the measure of mental knowledge and resource. It is by wisdom and knowledge that the forces of nature—even those which may seem most adverse—are yoked to service. This idea of the relation in which law stands to will, and in which will stands to law, is familiar to us in the works of man: but it is less familiar to us as equally holding good in the works of nature. We feel, sometimes, as if it were an unworthy notion of the Will which works in nature, to suppose that it should never act except through the use of means. But our notions of unworthiness are themselves often the unworthiest of all. They must be ruled and disciplined by observation of that which is,—not founded on *à priori* conceptions of what ought to be. Nothing is more certain than that the whole order of nature is one vast system of contrivance. And what is contrivance but that kind of arrangement by which the unchangeable demands of law are met and satisfied? It may be that all natural forces are resolvable into some One Force, and indeed in the modern doctrine of the Correlation of Forces, an idea which is a near approach to this, has already entered the domain of science. It may also be that this One Force, into which all others return again, is itself but a mode of action of the Divine Will. But we have no instruments whereby to reach this last analysis. Whatever the ultimate relation may be between mental and material force, we can at least see clearly this,—that in nature there is the most elaborate machinery to accomplish purpose through the instrumentality of means. It seems as if all that is done in nature as well as all that is done in art, were done *by knowing how to do it*. It is curious how the language of the great Seers of the Old Testament corresponds with this idea. They uniformly ascribe all the operations of nature—the greatest and the smallest—to the working of Divine Power. But they never revolt—as so many do in these weaker days—from the idea of this Power working by wisdom and knowledge in the use of means: nor, in this point of view, do they ever separate between the work of first Creation, and the work which is going on daily in the existing world. The saying that "The Lord by wisdom hath founded the earth: by understanding hath He established the heavens,"—is coupled in the same breath with this other saying, "By his knowledge the depths are broken up, and the clouds drop down their dew."* Every instance of contrivance which we can thoroughly follow and understand, has an intense interest—as casting light upon the method of the Divine government, and upon the analogy between the operations of our own minds and the operations of the Creator. Some instances will strike us more than others—and those will be very apt to strike us most which stand in some near comparison with our own human efforts of ingenuity and contrivance. There is one such instance which I propose to consider in this paper—the machinery by which a great purpose has been accomplished in nature,—a purpose which man has never been able to accomplish in art, and that is the navigation of the air. No more beautiful example can be found, even in the wide and rich domain of animal mechanics—none in which we can trace more clearly, too, the mode and method in which Laws the most rigorous and exact, are used as the supple instruments of purpose.

"The way of an eagle in the air" was one of the things of which Solomon said, that "he knew it not." No wonder that the Wise King reckoned it among the great mysteries of nature! The force of gravitation, though its exact measure was not ascertained till the days of Newton, has been the most familiar of all forces in all ages of mankind. How, then, in violation of its known effects, could heavy bodies be supported upon the thin air—and be gifted with the power of sustaining and directing movements more easy, more rapid, and more certain than the movements of other animals upon the firm and solid earth? No animal motion in nature is so striking or so beautiful as the—

"Scythe-like sweep of wings, that dare
The headlong plunge through eddying gulfs of air." †

Nor will the wonder cease when, so far as the mechanical problem is concerned, the mystery of flight is solved. If we wish to see how material laws can be bent to purpose, we shall study this problem.

In the first place it is remarkable that the force which seems so adverse—the force of gravitation drawing down all bodies to the earth, is the very force which is the principal one concerned in flight, and without which flight would be impossible. It is curious how completely this has been forgotten in almost all human attempts to navigate the air. Birds are not lighter than the air, but immensely heavier. If they were lighter than the air they might float, but they could not fly. This is the difference between a bird and a balloon. A balloon rises because it is lighter than the air, and floats upon it. Consequently, it is incapable of being directed, because it possesses in itself no active force enabling it to resist the currents of the air in which it is immersed. It becomes, as it were, part of the atmosphere, and must go with it where it goes. No bird is ever for an instant of time lighter than the air in which it flies; but being, on the contrary, always greatly heavier, it keeps possession of a force capable of supplying momentum, and therefore capable of overcoming any lesser force, such as the ordinary resistance of the atmosphere, and even of heavy gales of wind. The law of gravitation, therefore, is used in the flight of birds as one of the most essential of the forces which are available for the accomplishment of the end in view.

---

* Proverbs iii. 19, 20.

† Longfellow's "Wayside Inn." Ser Federigo.

The next law appealed to, and pressed into the service, is again a law which would seem an impediment in the way. This is the resisting force of the atmosphere in opposing any body moving through it. In this force an agent is sought and found for supplying the requisite balance to the force of gravity. But in order that the resisting force of air should be effectual for this purpose, it must be used under very peculiar conditions. The resisting force of fluids, and of airs or gases, is a force acting equally in all directions, unless special means are taken to give it predominant action in some special direction. If it is a force strong enough to prevent a body from falling, it is also a force strong enough to prevent it from advancing. In order, therefore, to solve the problem of flight, the resisting power of the air must be called into action as strongly as possible in the direction opposite to the force of gravity, and as little as possible in any other. Consequently a body capable of flight must present its maximum of surface to the resistance of the air in the perpendicular direction, and its minimum of surface in the horizontal direction. Now, both these conditions are satisfied (1) by the great breadth of surface presented to the air perpendicularly in a bird's expanded wings, and by (2) the narrow lines presented in its shape horizontally, when in the act of forward motion through the air. But something more yet is required for flight. Great as the resisting force of air is, it is not strong enough to balance the force of gravity by its mere pressure on an expanded wing—unless that pressure is increased by an appeal to yet other laws—and other properties of its nature. Every sportsman must have seen cases in which a flying bird has been so wounded as to produce a rigid expansion of the wings. This does not prevent the bird from falling, although it breaks the fall, and makes it come more or less gently to the ground.

Yet farther, therefore, to accomplish flight, another law must be appealed to, and that is the immense elasticity of the air, and the reacting force it exerts against compression. To enable an animal heavier than the air to support itself against the force of gravity, it must be enabled to strike the air downwards with such force as to occasion a rebound upwards of corresponding power. The wing of a flying animal must therefore do something more than barely balance gravity. It must be able to strike the air with such violence as to call forth a reaction equally violent, and in the opposite direction. This is the function assigned to the powerful muscles by which the wings of birds are flapped with such velocity and strength. We need not follow this part of the problem farther, because it does not differ in kind from the muscular action of other animals. The connection, indeed, between the wills of animals and the mechanism of their frame is the last and highest problem of all in the mechanics of nature, but it is merged and hid for ever in the one great mystery of Life. But so far as this difficulty is concerned, the action of an eagle's wing is not more mysterious than the action of a man's arm. There is a greater concentration of muscular power in the organism of birds than in most other animal frames, because it is an essential part of the problem to be solved in flight, that the engine which works the wings should be very strong, very compact, of a special form, and that, though heavier than the air, it should not have an excessive weight. These conditions are all met in the power, in the outline, and in the bulk of the pectoral muscles which move the wings of birds. Few persons have any idea of the force expended in the action of ordinary flight. The pulsations of the wing in most birds are so rapid that they cannot be counted. Even the Heron seldom flaps its wings slower than at the rate of from 120 to 150 working or downward strokes in a minute. Yet the Heron is remarkable for its slow and heavy flight, and it is difficult to believe, until one has timed them with a watch, that the pulsations have a rapidity approaching to two in a second. But this difficulty is an index to the enormous comparative rapidity of the faster-flying birds. Let any man try to count the pulsations of the wing in ordinary flight of a Pigeon, or of a Blackcock, or of a Partridge, or still more of any of the diving sea-fowl. He will find that though the quickness of sight enables him to see in most of these birds each single stroke separate from the next, it is utterly impossible to count them; whilst in some birds, especially in the Divers, and very often in the common Partridge, the velocity is so great that the eye cannot follow it at all, and the vibration of the wings leaves only a blurred impression on the eye.

Our subject here, however, is not so much the amount of vital force bestowed on birds, as the mechanical laws which are appealed to in order to make that force effective in the accomplishment of flight. The elasticity of the air is the law which offers itself for the counteraction of gravity. But in order to make it available for this purpose, there must be some great force of downward blow in order to evoke a corresponding rebound in the opposite, or upward direction. Now, what is the nature of the implement required for striking this downward blow? There are many conditions it must fulfil. First, it must be large enough in area to compress an adequate volume of air; next, it must be light enough in substance not to add an excess of weight to the already heavy body of the bird; next, it must be strong enough in frame to withstand the pressure which its own action on the air creates. The first of these conditions is met by an exact adjustment of the size or area of the wing to the size and weight of the bird which it is to lift. The second and the third conditions are both met by the provision of a peculiar substance, feathers, which are very light, and very strong; whilst the only heavy parts of the frame-work, namely, the bones in which the feathers are inserted, are limited to a very small part of the area required.

But there is another difficulty to be overcome—a difficulty opposed by natural laws, and which can only be met by another adjustment, if possible more ingenious and beautiful than the rest. It is obvious that if a bird is to support itself by the downward blow of its wings upon the air, it must at the end of each downward stroke lift the wing upwards again, so as to be ready for the next. But each upward stroke is in danger of neutralising the effect of the downward stroke. It must be made with equal velocity, and if it required equal force, it must produce equal resistance,—an equal rebound from the elasticity of the air. If this difficulty were not evaded somehow, flight would be impossible. But it is evaded by two mechanical contrivances, which, as it were, triumph over the laws of aërial resistance by conforming to them. One of these contrivances is that the upper surface of the wing is made convex, whilst the under surface is concave. The enormous difference which this makes in atmospheric resistance is familiarly known to us by the difference between the effect of the wind on an umbrella which is exposed to it on the under or the upper side. The air which is struck by a concave or hollow surface, is gathered up, and prevented from escaping, whereas the air struck by a convex or bulging surface escapes readily on all sides, and comparatively little pressure or resistance is produced. And so, from the convexity of the upper surface of a bird's wing, the upward stroke may be made with comparatively trifling injury to the force gained in the downward blow.

But this is only half of the provision made against a consequence which would be so fatal to the end in view. The other half consists in this—that the feathers of a bird's wing are made to *underlap each other*, so that in the downward stroke the pressure of the air closes them upwards against each other, and converts the whole series of them into one connected membrane, through which there is no escape; whilst in the upward stroke the same pressure has precisely the reverse effect—it opens the feathers, separates them from each other, and converts each individual feather into a self-acting valve, through which the air rushes at every pore. Thus the same implement is changed in the fraction of a second from a close and continuous membrane which is impervious to the air, into a series of disconnected joints through which the air passes without the least resistance—the machine being so adjusted that when pressure is required the maximum of pressure is produced, and when pressure is to be avoided, it is avoided in spite of rapid and violent action.

This, however, exhausts but a small part of the means by which law is made to do the work of will in the machinery of flight. It might easily be that violent and rapid blows struck downwards against the elastic air, might enable animals possessed of such power to lift themselves from the ground and nothing more. There is a common toy which lifts itself in this manner from the force exerted by the air in resisting, and reacting upon little vanes which are set spinning by the hand. But the toy mounts straight up, and is incapable of horizontal motion. So, there are many structures of wing which might enable animals to mount into the air, but which would not enable them to advance or to direct their flight. How, then, is this essential purpose gained? Again we find an appeal made to natural laws, and advantage taken of their certainty and unchangeableness.

The power of forward motion is given to birds, first by the direction in which the whole wing feathers are set, and next by the structure given to each feather in itself. The wing feathers are all set backwards, that is, in the direction opposite to that in which the bird moves, whilst each feather is at the same time so constructed as to be strong and rigid towards its base, and extremely flexible and elastic towards its end. On the other hand the front of the wing, along the greater part of its length, is a stiff hard edge, wholly unelastic and unyielding to the air. The anterior and posterior webs of each feather are adjusted on the same principle. The consequence of this disposition of the parts as a whole, and of this construction of each of the parts, is, that the air which is struck and compressed in the hollow of the wing, being unable to escape *through* the wing, owing to the closing upwards of the feathers against each other, and being also unable to escape *forwards* owing to the rigidity of the bones and of the quills in that direction, finds its easiest escape *backwards*. In passing backwards it lifts by its force the elastic ends of the feathers; and thus whilst effecting this escape, in obedience to the law of action and reaction, it communicates, in its passage along the whole line of both wings, a corresponding push forwards to the body of the bird. By this elaborate mechanical contrivance the same volume of air is made to perform the double duty of yielding pressure enough to sustain the bird's weight against the force of gravity, and also of communicating to it a forward impulse. The bird, therefore, has nothing to do but to repeat with the requisite velocity and strength its perpendicular blows upon the air, and by virtue of the structure of its wings the same blow both sustains and propels it.

The truth of this explanation of the mechanical theory of flight may be tested in various ways. Perhaps the simplest is an experiment which may be very easily made. If we take in the hand the stretched wing of a Heron, which has been dried in that position, and strike it quickly downwards in the air, we shall find that it is very difficult indeed to maintain the perpendicular direction of the stroke, requiring, in fact, much force to do so; and that if we do not apply this force, the hand is carried irresistibly *forward*, from the impetus in that direction which the air communicates to the wing in its escape backwards from the blow.

Another test is one of reasoning and observation. If the explanation now given be correct, it must follow that since no bird can flap its wings in any other direction than the vertical—*i.e.*, perpendicular to its own axis (which is ordinarily horizontal), and, as this motion has been shown to produce necessarily a forward motion, *no bird can ever fly backwards.* Accordingly no bird ever does so—no man ever saw a bird, even for an instant, fly tail foremost. A bird can, of course, allow itself to fall backwards by merely *slowing* the action of its wings so as to allow its weight to overcome their sustaining power; and this motion may sometimes give the appearance of flying backwards,—as when a Swift drops backwards from the eaves of a house, or when a Humming Bird allows itself to drop in like manner from out of the large tubular petals of a flower. But this backward motion is due to the action of gravity, and not to the action of the bird's wing. In short, it is falling, not flying backwards. Nay, more, if the theory of flight here given be correct, it must equally follow that even standing still, which is the easiest of all things to other animals, must be very difficult, if not altogether impossible, to a bird when flying. This also is true in fact. To stand still in the air is not indeed impossible to a flying bird, for reasons to be presently explained, but it is one of the most difficult feats of *wingmanship*, a feat which many birds, not otherwise clumsy, can never perform at all, and which is performed only by special exertion, and generally for a very short time, by those birds whose structure enables them to be adepts in their glorious art.

And here indeed we open up a new branch of the same inquiry, showing, in new aspects, how the universality and unchangeableness of all natural laws are essential to the use of them as the instruments of will; and how by being played off against each other they are made to express every shade of thought, and the nicest change of purpose. The movement of all flying animals in the air is governed and determined by forces of muscular power, and of aërial resistance and elasticity being brought to bear upon the force of gravity, whereby, according to the universal laws of motion, a direction is given to the animal which is the resultant, or compromise between all the forces so employed. Weight is one of these forces—absolutely essential to that result, and no flying animal can ever for a moment of time be buoyant, or lighter than the air in which it is designed to move. But it is obvious that, within certain limits, the proportion in which these different forces are balanced against each other, admits of immense variety. The limits of variation can easily be specified. Every flying animal must have muscular power great enough to work its own size of wing: that size of wing must be large enough to act upon a volume of air sufficient to lift the animal's whole weight: lastly, and consequently, the weight must not be too great, or dispersed over too large a bulk. But within these limits there is room for great varieties of adjustment, having reference to corresponding varieties of purpose. To some birds the air is almost their perpetual home—the only region in which they find their food—a region which they never leave whether in storm or sunshine, except during the hours of darkness and the yearly days which are devoted to their nests. Other birds are mainly terrestrial, and never betake themselves to flight except to escape an enemy, or to follow the seasons and the sun. Between these extremes there is every possible variety of habit. And all these have corresponding varieties of structure. The birds which seek their food in the air have long and powerful wings, and so nice an adjustment of their weight to that power and to that length, that the faculty of self-command in them is perfect, and their power of direction so accurate that they can pick up a flying gnat whilst passing through the air at the rate of 70, or 80 miles an hour. Such especially are the powers of some species of the Swallow tribe, one of which, the common Swift, is a creature whose wonderful and unceasing evolutions seem part of the happiness of summer, and of serene and lofty skies.

There are other birds in which the wing has to be adapted to the double purpose of swimming, or rather of diving, and of flight. In this case, a large area of wing must be dispensed with, because it would be incapable of being worked under water. Consequently in all diving birds the wings are reduced to the smallest possible size which is consistent with retaining the power of flight at all; and in a few extreme forms, the power of flight is sacrificed altogether, and the wing is reduced to the size, and adapted to the function, of a powerful fin. This is the condition of the Penguins. But in most genera of swimming birds, both purposes are combined, and the wing is just so far reduced in size and stiffened in texture as to make it workable as a fin under water, whilst it is still just large enough to sustain the weight of the bird in flight. And here again we have a wonderful example of the skill with which inexorable mechanical laws are subordinated to special purpose. It is a necessary consequence of the area of the wing being so reduced, in proportion to the size of the bird, that great muscular power must be used in working it, otherwise the force of gravity could not be overcome at all. It is a farther consequence of this proportion of weight to working power, that there must be great momentum and therefore great velocity of flight. Accordingly this is the fact with all the oceanic diving birds. They have vast distances to go, following shoals of fish, and moving from their summer to their winter haunts. They all fly with immense velocity, and the wing-strokes are extremely rapid. But there is one quality which their flight does not possess—because it is incompatible with their structure, and because it is not required by their habits—they have no facility in evolutions, no delicate power of steering; they cannot stop with ease, nor can they resume their onward motion in a moment. They do not want it: the trackless fields of ocean over which they roam are very broad fields, and there are no obstructions in the way. They fly in straight lines, changing their direction only in long curves, and lighting in the sea almost with a tumble and a splash. Their rising again is a work of great effort, and generally they have to eke out the resisting power of their small wings, not only by the most violent exertion, but by rising against the wind, so as to collect its force as a help and addition to their own.

And now again, we may see all these conditions changed where there is a change in the purpose to be served. There is another large class of oceanic birds whose feeding ground is not under water, but on the surface of the sea. In this class all those powers of flight which would be useless to the Divers, are absolutely required, and are given in the highest perfection, by the enlistment of the same mechanical laws under different conditions. In the Gulls, the Terns, the Petrels, and in the Fulmars, with the Albatross as their typical form, the mechanism of flight is carried through an ascending scale, to the highest degrees of power, both as respects endurance, and facility of evolution.

The mechanical laws which are appealed to in all these modifications of structure require adjustments of the finest kind, and some of them are so curious and so beautiful that it is well worth following them a little farther in detail.

There are two facts observable in all birds of great and long-sustained powers of flight:—the first is, that they are always provided with wings which are rather long than broad, sometimes extremely narrow in proportion to their length; the second is, that the wings are always sharply pointed at the ends. Let us look at the mechanical laws which absolutely require this structure for the purpose of powerful flight, and to meet which it has accordingly been devised and provided.

The law appealed to in making wings rather long than broad is simply the law of leverage. But this law has to be applied under conditions of difficulty and complexity, which are not apparent at first sight. The body to be lifted is the very body that must exert the lifting power. The force of gravity which has to be resisted may be said to be sitting side by side, occupying the same particles of matter, with the vital force which is to give it battle. Nay, more, the one is connected with the other in some mysterious manner which we cannot trace or understand. A dead bird weighs as much as a living one. Nothing which our scales can measure is lost when the "vital force" is gone. It is The Great "Imponderable." Nevertheless, vital forces of unusual power are always coupled with unusual mass and volume in the matter through which they work. And so it is that a powerful bird must always also be in some degree a heavy bird. And then it is to be remembered that the action of gravity is constant and untiring. The vital force, on the contrary, however intense it may be, is intermitting and capable of exhaustion. If, then, this force is to be set against the force of gravity, it has much need of some implement through which it may exert itself with mechanical advantage as regards the particular purpose to be attained. Such an implement is the lever—and a long wing is nothing but a long lever. A very small amount of motion, or motion through a very small space, at the short end of a lever produces a great amount of motion, or motion through a long space, at the opposite or longer end. This action requires indeed a very intense force to be applied at the shorter end, but it applies that force with immense advantage to the end in view: because the motion which is transmitted to the end of a long wing, is a motion acting at that point through a long space, and is therefore equivalent to a very heavy weight lifted through a short space at the end which is attached to the body of the bird. Now this is precisely what is required for the purpose of flight. The body of a bird does not require to be much lifted by each stroke of the wing. It only requires to be sustained; and when more than this is needed—as when a bird first rises from the ground, or when it ascends rapidly in the air—greatly increased exertion is required. And then it is to be remembered that long wings economise the vital force in another way. When a strong current of air strikes against the wings of a bird, the same sustaining effect is produced as when the wing strikes against the air. Consequently birds with very long wings have this great advantage, that with pre-acquired momentum, they can often for a long time fly without flapping their wings at all. Under these circumstances a bird is sustained very much as a boy's kite is sustained in the air. The string which the boy holds, and by which he pulls the kite downwards with a certain force, performs for the kite the same offices which its own weight and balance and momentum perform for the bird. The great long-winged oceanic birds often appear to float rather than to fly. The stronger is the gale, their flight, though less rapid, is all the more easy—so easy indeed as to appear buoyant; because the blasts which strike against their wings are enough to sustain the bird with comparatively little exertion of its own, except that of holding the wing vanes stretched and exposed at a proper angle to the wind. And whenever the onward force previously acquired by flapping, becomes at length exhausted, and the ceaseless inexorable force of gravity is beginning to overcome it, the bird again rises by a few easy and gentle half-strokes of the wing. Those who have seen the Albatross have described themselves as never tired of watching its glorious and triumphant motion:—

> "Tranquil its spirit seemed, and floated slow;
> Even in its very motion there was rest." *

Rest—where there is nothing else at rest in the tremendous turmoil of its own stormy seas! Now, the Albatross has the extreme form of this kind of wing. Its wings are immensely long—about 14 feet from tip to tip—and almost as narrow in proportion as a riband. Our common Gannet is an excellent, though a more modified, example of the same kind of structure. On the other hand, birds of short wings, though their flight is sometimes very fast, are never able to sustain it very long. The muscular exertion they require is greater, because it does not work to the same advantage. Most of the gallinaceous birds (such as the common Fowl, Pheasants, Partridges, &c.) have wings of this kind; and some of them never fly except to escape an enemy, or to change their feeding ground.

The second fact observable in reference to birds of easy and powerful flight—namely, that their wings are all sharply pointed at the end—will lead us still farther into the niceties of adjustment which are so signally displayed in the machinery of flight.

The feathers of a bird's wing have a natural threefold division, according to the different wing-bones to which they are attached. The quills which form the end of the wing are called the "primaries:" those which form the middle of the vane are called the "secondaries;" and those which are next the body of the bird are called the "tertiaries." The motion of a bird's wing increases from its minimum at the shoulder-joint to its maximum at the tip. The primary quills which form the termination of the wing are those on which the chief burden of flight is cast. Each feather has less and less weight to bear, and less and less force to exert in proportion as it lies nearer the body of the bird; and there is nothing more beautiful in the structure of a wing than the perfect gradation in strength and stiffness, as well as in modification of form, which marks the series from the first of the primary quills to the last and feeblest of the tertiaries. Now, the sharpness or roundness of a wing at the tip depends on the position which is given to the *longest* primary quill. If the first or even the second primary is the longest, and all that follow are considerably shorter, the wing is necessarily a pointed wing, because the tip of a single quill forms the end; but if the third or fourth primary quills are the longest, and the next again are very little shorter, the wing becomes a round-ended wing. The common Rook and all the Crows are examples of this. The Peregrine Falcon, the common Swallow, and all birds of very powerful flight have been provided with the sharp-pointed structure.

The object of this structure, and the mechanical laws to which it appeals, will be apparent when we recollect what it is on which the propelling power, as distinct from the sustaining power, of a bird's wing depends. It depends on the reaction of the air escaping *backwards*—that is, in the direction exactly opposite to that of the intended motion of the bird. Any air which escapes from under the wing, in any other direction, will of course react with less advantage upon that motion. But from under a round wing a good deal of air must necessarily escape *along the rounded end*—that is, in a direction at right angles to the line of intended flight. All the reaction produced by this escape is a reaction which is useless for propulsion. Accordingly in all birds to whom great velocity of flight is essential, this structure, which is common in other birds, is carefully avoided. The Hawks have been classified as "noble" or "ignoble," according to the length and sharpness of their wings: those which catch their prey by velocity of flight having been uniformly provided with the long-pointed structure. The Sparrow-Hawk and the Merlin are excellent examples of the difference. The Sparrow-Hawk, with its comparatively short and blunt wings, steals along the hedgerows and pounces on its prey by surprise; never chasing it, except for a short distance, and when the victim is at a disadvantage. And well do the smaller birds know this habit and the limit of his powers. Many of them chase and "chaff" the Sparrow-Hawk, when he is seen flying in the open, perfectly aware that he cannot catch them by fast flying. But they never play these tricks with the Merlin. This beautiful little Falcon hunts the open ground, giving fair chase to its quarry by power and speed of flight. The Merlin delights in flying at some of the fastest birds, such as the Snipe. The longest and most beautiful trial of wingmanship I have ever seen was the chase of a Merlin after a Snipe in one of the Hebrides. It lasted as far as the eye could reach, and seemed to continue far out to sea. In the Merlin, as in all the fastest Falcons, the second quill feather is the longest in the wing; the others rapidly diminish; and the point of the wing looks as sharp as a needle in the air.

There is yet one other power which it is absolutely necessary to some birds that their wings should enable them to exert; and that is the power of standing still, or remaining suspended in the air without any forward motion. One familiar example of this is the common Kestrel, which, from the frequent exercise of this power, is called in some counties the "windhover." The mechanical principles on which the machinery of flight is adapted to this purpose, are very simple. No bird can exercise this power which is not provided with wings large enough, long enough, and powerful enough to sustain its weight with ease and without violent exertion. Large wings can always be diminished at the pleasure of the bird, by being partially folded inwards; and this contraction of the area is constantly resorted to. But a bird which has wings so small and scanty as to compel it to strike them always at full stretch, and with great velocity in order to fly at all, is incapable of standing still in the air. No man ever saw a Diver or a Duck performing the evolution which the Kestrel may be seen performing every hour over so many English fields. The cause of this is obvious if we refer to the principles which have already been explained. We have seen that the perpendicular stroke of a bird's wing, has the double effect of both propelling and sustaining. The reaction from such a stroke brings two different forces to bear upon the bird—one whose direction is upwards, and another whose direction is forwards. How can these two effects be separated from each other? How can the wing be so moved as to keep up just enough of the sustaining force, without allowing the propelling force to come into play? The answer to this, although it involves some very complicated laws connected with what mechanicians call the "parallelogram of forces," is practically a simple one. It can only be done by shortening the stroke, and altering the perpendicularity of its direction. Of course if a bird by altering the axis of its own body, can direct its wing-stroke in some degree *forwards*, it will have the effect of stopping instead of promoting progression. But in order to do this, it must have a superabundance of sustaining force, because some of this force is sacrificed when the stroke is off the perpendicular. Hence it follows that birds so heavy as to require the whole action of their wings to sustain them at all, can never afford this sacrifice of the sustaining force, and except for the purpose of arresting their flight, can never strike, except directly downwards, that is, directly against the opposing force of gravity. But birds with superabundant sustaining power, and long sharp wings, have nothing to do but to diminish the length of stroke, and direct it off the perpendicular at such an angle as will bring all the forces bearing upon their body to an exact balance, and they will then remain stationary at a fixed point in the air. They are greatly assisted in this beautiful evolution by an adverse current of air; and it will always be observed that the Kestrel, when hovering, turns *his head to wind*, and hangs his whole body at a greater or less angle to the plane of the horizon. When there is no wind or very little, the sustaining force is kept up by a short rapid action of the pinions, and the long tail is spread out like a fan to assist in stopping any tendency to onward motion. And here it may be observed that the tails of birds have not, as is often supposed, any function analogous to the rudder of a ship. If this function had been assigned to them, the vane of the tail must have been set, not, as it is, horizontally, but perpendicularly to the line of flight. A bird's tail has in flight no lateral motion whatever. It does indeed materially assist the bird in turning, because it serves to *stop the way* of a bird when it rises or turns in the air to take a new direction. It contributes also largely to the general balance of the body, which in itself is an important element in the facility of flight. Accordingly, almost all birds which depend on great ease of evolution in flight—or on the power of stopping suddenly, have largely developed tails. This is the case with all the birds of prey. But there are some exceptions which show that great powers of flight are not always dependent on the possession of a large tail—as, for example, the Swift.

---

* Professor Wilson's Sonnet, "A Cloud," &c.

The Humming Birds are perhaps the most remarkable examples in the world of the machinery of flight. The power of poising themselves in the air,—remaining absolutely stationary whilst they search the blossoms for insects,—is a power essential to their life. It is a power accordingly which is enjoyed by them in the highest perfection. When they intend progressive flight, it is effected with such velocity as to elude the eye. The action of the wing in all these cases is far too rapid to enable the observer to detect the exact difference between that kind of motion which keeps the bird at absolute rest in the air, and that which carries it along with such immense velocity. But there can be no doubt that the change is one from a short quick stroke delivered obliquely forward, to a full stroke, more slow, but delivered perpendicularly. This corresponds with the account given by so accurate an observer as Mr. Gould. He says: "When poised before any object, this action of the wing is so rapidly performed that it is impossible for the eye to follow each stroke, and a hazy semicircle of indistinctness on each side of the bird is all that is perceptible." There is another fact mentioned by those who have watched their movements most closely which corresponds with the explanation already given—viz., that the axis of the Humming Bird's body when hovering is always *highly inclined*, so much so as to appear almost perpendicular in the air. In other words the wing-stroke, instead of being delivered perpendicularly downwards, which would infallibly carry the body onwards, is delivered at such an angle forwards as to bring to an exact balance the upward, the downward, and the forward forces which bear upon the body of the bird. Mr. Darwin says, "when hovering by a flower, the tail is constantly shut and expanded like a fan, *the body being kept in a nearly vertical position.*" Mr. Wallace, another accurate observer, describes the Humming Birds as "balancing themselves vertically in the air."

These are a few, and a few only, of the adjustments required in order to the giving of the power of flight;—adjustments of organic growth to intensity of vital force—of external structure to external work—of shape in each separate feather to definite shape in the series as a whole—of material to resistance—of mass and form to required velocities; adjustments, in short, of law to law, of force to force, and of all to Purpose. So many are these contrivances, so various, so fine, so intricate, that a volume might be written without exhausting the beauty of the method in which this one mechanical problem has been solved. It is by knowledge of unchanging laws that these victories over them seem to be achieved: yet not by knowledge only, except as the guide of Power. For here, as everywhere else in nature, we see the same mysterious need of conforming to imperative conditions, side by side with absolute control over the forces through which this conformity is secured. When any given purpose cannot be attained without the violation of some law, unless by some new power, and some new machinery—the requisite power and mechanism are evolved—generally out of old materials, and by modifications of pre-existing forms. There can be no better example of this than a wing-feather. It is a production wholly unlike any other animal growth—an implement specially formed to combine strength with lightness, elasticity and imperviousness to air. Again, the bones of a bird's wing are the bones of the mammalian arm and hand, specially modified to support the feathers. The same purpose is effected by other means in connection with precisely the same bones in the flying mammalia—the Bats. In these animals the finger-bones instead of being compressed or soldered together to support feathers, are separated, attenuated, and greatly lengthened to afford attachment to a web or flying membrane which is stretched between them. In other ages of the world there were also flying Lizards. But in all these cases the mechanical principle is the same, and there has been the same ingenious adaptation of material and of force to the universal laws of motion.

On the earth and on the sea man has attained to powers of locomotion with which, in strength, endurance, and in velocity, no animal movement can compare. But the air is an element on which he cannot travel—an ocean which he cannot navigate. The birds of heaven are still his envy, and on the paths they tread he cannot follow. As yet! for it is not certain that this exclusion is to be perpetual. His failure has resulted quite as much from his ignorance of natural laws, as from his inability to meet the conditions which they demand. All attempts to guide bodies buoyant in the air must be fruitless. Balloons are mere toys. No flying animal has ever been formed on the principle of buoyancy. Birds, and Bats, and Dragons, have been all immensely heavier than the air, and their weight is one of the forces most essential to their flight. Yet there is a real impediment in the way of man navigating the air—and that is the excessive weight of the only great mechanical moving powers hitherto at his disposal. When science shall have discovered some moving power greatly lighter than any we yet know, in all probability the problem will be solved. But of one thing we may be sure—that if man is ever destined to navigate the air, it will be by a strict obedience to the laws and by a close imitation of the means which have been employed by the Creator for the same purpose in flying animals.

(To be continued.)

ON THE ZAMBESI.

A SHORT SKETCH OF A LONG JOURNEY.

By JAMES STEWART.

I.—IN THE DELTA, FROM THE SEA TO SHUPANGA.

At sunrise on the first of February, 1862, two ships lay at anchor off the Luabo mouth of the Zambesi, some seven miles distant from the land. One was Her Majesty's steamer Gorgon, and the other a small merchant brig. Over the quarter of the latter vessel Mrs. Livingstone and myself were leaning, and watching the progress of a small steamer coming out from the low tree-covered shore. This we believed to be the Pioneer with Dr. Livingstone on board, and for whom we had been looking, during the previous three weeks.

When this ship was yet some little distance off, I took my glass and could distinctly make out the features of a sturdy looking man in the dress of a naval officer, but without the distinctive badge and stripes, who was standing on one of the paddle boxes. I had no difficulty in recognising him, and I said to Mrs. Livingstone—"There he is."

The start of emotion this announcement produced, even though it was not unexpected, had hardly subsided before the Pioneer let go her anchor, and a small boat brought Dr. Livingstone alongside. He clambered on deck, and met his wife who had not seen very much of him for the previous ten years. Mrs. Livingstone had chosen to accompany me from England, and now after seven months' sailing, waiting at the Cape, and tossing up and down the Mozambique, I was glad to see her safe in her husband's arms.

Next day, with two of the ships we crossed the formidable bar and anchored in Kongone Harbour. There we remained a week. In the meantime I had explained to Dr. Livingstone the object of my journey—of which he had known something a year previously by correspondence. It was to see the country, with the view, in the event of a favourable report, of establishing a mission which should embrace along with the ordinary teaching and preaching, certain direct industrial efforts. And having presented my credentials and printed papers, he was good enough to make an arrangement by which I should accompany him so far into the interior. This, however, was not subsequently carried out.

Home-dwelling readers draw terrible pictures of the African river delta. The very sound of the words is suggestive of prevalent malaria; of tidal mud and lagoon-like reaches of sluggish river meandering through hot and dreary plains of gigantic grass; of mosquitoes in numberless millions and mangrove swamps filled with the sensible effluvia of a profuse vegetation, and sheltering every low form of amphibious life that delights in ooze and revels in slime, with deadly fever lurking everywhere.

The picture is partly true and partly false, but at first your mind is certainly not filled with the contemplation of such horrors. And during the eight days we remained at Kongone the flat and featureless delta of the Zambesi did not seem so unsalubrious a place. One does not think of the unhealthiness, till the fever has poisoned the blood and given a sombre hue to all one's thoughts.

We sailed into the main stream by a canal some six or seven miles long, but so narrow that the paddle boxes of the steamer brushed aside the waving and luxuriant underwood of the virgin African forest; and the sound of the paddle-floats, as they struck the water in the quiet morning air, seemed a strange disturbance to the primeval stillness of these woods.

After leaving the belt of mangroves which varies in depth with the reach of the tide, we sailed very slowly day by day through a vast grassy plain. The flatness of its expanse was broken here and there by clumps of Palmyra and cocoa-nut palms; of lignum-vitæ trees, mimosas and sycamores; and various mallows and sterculiads, of which latter the enormous and grotesque and long-lived baobab was the most gigantic. Scattered over the plain there were also the brown roofs of small native villages, the abodes of the dwellers in the hot and damp delta.

The river itself is more than a mile wide; and in flood a great volume of water sweeps down between its flat banks. It is full of low grassy islands, and not unlike the Danube between Silistria and the Black Sea. If to the scenery of the latter river any of our readers who have passed that route will add a flora and fauna tropical and African, and African heat, they will have no inapt resemblance to the appearance of the lower Zambesi. In the dry season the channel contains numerous bars and sandspits which make the upward voyage very tedious.

No mountains are seen till we arrive at Shupanga less than a hundred miles from the sea, and then the blue tops of Morumbala appear in the distance, and afford a pleasing change of landscape. Our progress up the river, was from many causes extremely slow: and it was not till the evening of Sabbath 23rd February that we reached Shupanga, and cast anchor close to a beautiful grove of mangoes. These handsome trees look at a little distance like fine English elms or beeches, but with a denser foliage, and produce the most delicious of all tropical fruits. We expected to remain here a few days: as the event proved, it came to be a stay of many months.

II.—TO THE SMALL LAKES.

To see the country; to get rid of some disquieting thoughts; and to witness the operation of canoe-building on a large scale, I went a short journey of three days back from the river. I had no white companion, but, instead, a man who though half an African half a Chinaman, was by courtesy called the Senhor, and who was going into the interior to look after canoes for his employer at Quillimane.

The tall six feet grass that covers the country was still bending under the very plentiful dew with which the African summer night wets the thirsty earth, when we started with a considerable following of natives. An hour's travel brought us to a neat and small village among little fields of maize, millet, manioc, sweet potatoes and ground-nuts. These, with bananas, and four or five different sorts of beans, form the staff of life in that part of Africa.

The day's journey led us through alternate belts of forest and open grassy country, very flat and rich in soil, judging from the height of the grass and the size of the timber. Through the forest the path is labyrinthine enough, but the shade is cool and refreshing, and there is a damp, leafy, earthy scent as of warm palm-houses in botanic gardens at home. Small antelopes were abundant below, and birds, baboons and monkeys in the branches above. The flora is not so diversified as on hills, but there is a considerable variety of species, and also of grotesqueness as well as elegance of form in stem and leaf in these dense forests.

I was noticing this in the presence of a beautifully shaped leaf which might form a new pattern for designers, for I have not seen anything exactly like it on the manufactured fabrics of this country, when we suddenly emerged from the cool shade and pleasant gloom of the woods on an open grassy belt, on the edge of which lay a small lake. This was about four o'clock, and thus:

> "In the afternoon we came unto a land
> In which it seemed always afternoon."

No glimpse of African landscape my eyes have rested on, either before or since, impressed me as that did with its truly African character. In the hot, languid afternoon air, the small lake lay in lagoon-like stillness. Its margin for many miles was covered with a deep fringe of blossoms of large white water-lilies. Snow-white ardettas, beautiful airy-looking creatures, steel-grey cranes, and black-winged red-beaked plotuses rose in flocks at our approach, and floated away through the warm atmosphere with their easy, sailing, dreamy flight. Black and white hornbills, more wary and shy, more keen of sight and stronger of wing, sat on the tops of distant trees uttering their hard, horny note. Water-buck and antelopes of various species were grazing peacefully on the gentle grassy slopes, and standing in the shade of small clumps of young trees that grew on the soil of old ant-hills. Large hippopotami lifted their square box-looking heads out of the tepid waters, to examine the string of bipeds that wound round the margin of the lake. They looked towards the shore, blew through their huge nostrils little jets of spray, and with stolid, heavy snorts, that seemed to come from cavernous depths of lungs, sank half satisfied, half-doubtful, into the depths below, only to reappear in a minute or two, shaking the water from their small ears, to stare and snort and dive again to the bottom.

I stood still to look at this scene of tropical grandeur and beauty, that it might be for ever among the pictures of memory. I wondered what effect it had on my companions. Africans, as a rule, are not thrown into ecstacies by striking views and grand glimpses; and if poetic feelings arise in those dark breasts, few poetic words burst from those full lips. But it would be unjust to say that Africans are insensible to the beauty of external nature.

We had still some distance to go, and we passed on rapidly, leaving deer and hippopotami undisturbed by a single shot. About sundown the maize and millet-fields we again entered told us we were close to the village of Tambara. Some women who were drawing water at a well recognised the Senhor, ran home, mustered the available female force of the village, and came out again to escort us to the place where the men were standing. There was much clapping of hands and calling out of "Moio, moio! —Sir, sir!" and a good deal of a vocal process by the women, which can only be described by the word lullilooing!

Sesa, the head-man, was not at home, but the next in order received us under a large tree. We were conducted to an open space in the centre of the village, mats were spread for us to sit down, and fires kindled immediately. The antelope and monkey which had been shot on the journey were skinned and on the way for supper, and in an hour a savoury steam of monkey stew was issuing from one of the large black pots. It is one of the customs of the country that he who kills the animals shall first eat thereof, and so they brought me a large dish of this stew, and asked me to eat. But I had no lusting after monkey meat, and bid them use it themselves.

Nothing so half human as monkey flesh has ever defiled my lips; and after alligator I have never wiped my mouth and said I have enough! Elephant flesh, however, though strong, is very good; and fresh hippopotamus steaks, to my taste, very much better. I have often been glad to get either. Neither could I detect in hippopotamus, either roast or boiled, that strong porky flavour of which some complain. Elephant soup is likewise good, better the second day than the first, as it is improved by long boiling, and when well made is thick, gelatinous, and nutritious.

Instead of monkey, I got some antelope, and the Senhor and I supped together. He plied a bottle containing a strong and coarsely-distilled spirit, the product of the cashew-nut and other fruits. He invited me to drink, but I had no wish to invite a fever by drinking such fiery stuff, and therefore declined. I made some tea, and this also was not disagreeable to the Senhor's taste.

As the moon rose broad and full above the tall trees that encircled the village and cleared land, I took a walk through the place, to see its evening life, and then retired to the hut in which I was to sleep. I was still lying in the darkness thinking over a few verses I had read, when I was startled by a tremendous peal of large drums, and that measured clapping of the hands which calls the African villagers to the katieka, or dance.

It was impossible now to sleep, and as the festivities promised to be on a large scale, I got up to see. The women and children sung and clapped their hands: the drums were beaten by the men. Both men and women danced, and performed movements not always very graceful or refined. Some of these remarkable *poses plastiques* will not bear description to ears polite.

There was a suffocating amount of dust and heat, and smoke, and sweat and noise disturbing and polluting the cool pure moonlight air of that beautiful night. It was the enjoyment of the villagers however. Two things only could make such amusements bearable: bounding animal spirits, and ignorance of anything better. A good deal of the rollicking savageism of Africa rests on these two causes. But as people get older, the animal spirits lose their spring. And some of the older women I noticed seemed to enjoy this fun no more than if they had been at their heavy daily task of pounding corn in the banda, or native mortar. They clapped their hands mechanically and wearily, as in duty bound, but the expression of their worn and withered faces seemed to say that such life was very poor enjoyment, indeed. Poor people, they have need of better teaching! I got tired, and after a time slipped away quietly out of the crowd to my hut. The noise of revelry by night still rang from end to end of the village, but I fell into a sound slumber on my reed bed.

We started early next morning, and about noon reached the place in the forest where the canoes were building. There we found a large number of fallen trees of immense size; the wood being of the same hardness as mahogany. The trees had been felled partly by small axes, and partly by fires kindled at the base of the stem. About twenty nearly naked men were at work on these trunks with small hatchets and adzes of native manufacture. With these light axes and by kindling small fires in the middle line of the tree, after many days, or rather many weeks of labour, the first rude form is given to the primitive vessel. It has then to be transported to the river, which may be twenty miles distant. Ropes of strong fibrous creepers, with which the African forest abounds, are then attached to the half-finished ship. Rude rollers are prepared: and the men, women and children of the nearest village, and subsequently of all the villages on the route, are then summoned. They lay hold of the rough cables, and with an immense deal of pulling, and still more noise and shouting, the hollow trunk begins to move and, for the next fortnight or three weeks, makes slow daily journeys to the bank of the river. There it receives the finishing touches, and without either plane or chisel, a wonderful degree of smoothness is given to it, both inside and out. An iron ring is fitted into the bow: a large and clumsy helm astern; and the launch is then completed. The largest of these canoes will carry about 40 men, or about 3 tons of goods; and on the lower Zambesi they are worth about 14*l.* to 16*l.*

I saw more of the country and of the life of the people before I left; but as the Senhor had to remain to look after the building of this primitive fleet, I returned to Shupanga, with five native companions, by a somewhat different route from that which I had come. On the return march I first witnessed the use of the fire-stick, by which the African in his native wilds supplies himself with fire by means of friction, without the aid of flint or steel, or any of the modern applications of phosphorus.

III.—LAST DAYS.

THE Expedition still remained at Shupanga. And now the days of April were drawing to a close; and so also, though we knew it not, were those of one of our number.

On the afternoon of the second last Sabbath of April I was sitting in the verandah of the house at Shupanga, when Dr. and Mrs. Livingstone came up from the ship. I joined them, and we went for a short walk up the river-side. The following Sunday Mrs. Livingstone was dead.

During the week she became seriously ill of fever, and on Saturday she was moved up to Shupanga House. Danger was then apprehended. Dr. Livingstone himself had remained closely watching by her, day and night together. Dr. Kirk attended her medically. Everything that could be thought of was done to induce a favourable change of symptoms, but without effect. The fatal sign came in unconsciousness to pain and inability to swallow. About six on Sunday evening I had gone down to the ship, when a message came that Dr. Livingstone wished me to come to the house. When I entered the room, and had gently closed the door, he said, "The end is evidently near, and I thought I would send for you."

The end was evidently near; for a certain fixedness of feature, and heavy stertor made this too plain. By the side of a rude bed formed of boxes, but with a soft mattress, and not therefore uncomfortable, on which lay his dying wife, sat Livingstone who had met so many dangers and passed through so many deaths. It will be rudely lifting no veil that should remain unlifted if I say he was weeping like a child. No one's eyes could keep from filling.

He asked me to commit her soul to God in prayer. And he, Kirk, and myself knelt down, and we prayed to Him who has promised to hear us in the day of our trouble, commending her spirit to her Saviour's merits and all-embracing mercy and love. In less than an hour, as the last rays of the sun were departing, there came over the face of the sufferer that final change that sorrow and anxiety shall nevermore alter; and the spirit returned to God who gave it. In this way died Livingstone's wife and Moffat's daughter, at the close of a long clear sunny day, on the last Sabbath of April, 1862.

Next morning a heavy, cold mist lay on the flat lands to the north-east, and over all the country hung a pall of natural gloom. The forenoon was consumed in making various preparations; the grave had to be dug deep to prevent the intrusion of wild beasts and wilder men. The blue-jackets and men of the Pioneer were marched up by Mr. Young, and at midday Mrs. Livingstone was buried under a large baobab tree. At her husband's request, I read the Church of England burial-service over the grave. The sad ceremony was soon over, and we turned and walked from the place in silence.

Mrs. Livingstone's death was occasioned by the true fever of the country, the disease terminating, as it frequently does, in coma. There are some, no doubt, who will harshly blame her for venturing to the Zambesi at that time. Let me say this to qualify such blame. During eight of the previous ten years in which so much of the African continent was for the first time laid open, she had seen very little of her husband. She had a certain share in the work — woman's share not unfrequently—to wait and suffer in patience; for during some of those years she hardly knew whether he was alive or dead. And now, naturally enough, if not too wisely, having found her way to the Zambesi and joined her husband, she had only spent three months in his society, when alone, and without the companionship of a single white woman, she had to lie down and die. And how much hope, and fear, and sorrow, and restless aching of heart, as well as of later happiness, had now been suddenly ended.

A tumulus of sun-dried brick, and a large white cross, in addition to the gigantic tree, mark the place where now rests the wife of Dr. Livingstone.

Resurget.

IV.—ASCENT OF THE SHIRE—THREE WEEKS' VOYAGE IN A CANOE.

MAY and June, as well as March and April, had passed away, and it was now plain that the ships could not ascend the river till next rainy season; and that I must wait a year at Shupanga, or proceed alone into the interior, as far as the disturbed state of the country and the presence of famine would allow me. I resolved, therefore, to go as far as the Murchison Cataracts on the Shire, and as far as the Kebrabasa rapids on the Zambesi. These two journeys occupied me several months.

The contour of the country through which I passed during the three weeks, can be easily described. A few days after leaving Shupanga, I entered the river Shire. It presents a great contrast to the Zambesi, which is broad, shallow in the dry season, and the mother of many islands, as a native would say. The Shire is narrow—about 100 to 150 yards wide—well defined in its channel, with few islands, and deep for the first 100 miles. Ten miles above its junction with the Zambesi, there rises a series of pleasing low rounded hills, 500 to 600 feet high, covered to the top with grass and small timber. Thirty miles further up the river sweeps round the base of Morumbala mountain, which rises to the height of between 3,000 and 4,000 feet, and forms the conspicuous commencement to that chain of hills which runs parallel to the river for a distance of about 200 miles. A less regular chain runs along the western side of the river. The valley itself, through which the Shire winds with many a link and bend, as may be seen by ascending some of the hills on the eastern shore, is thus a great alluvial plain of rich black fat earth, not heavily wooded near the banks, but bearing everywhere grass never less than six feet high, through which clumps of trees are sparingly scattered, giving to the country a park-like appearance; and here and there are long belts of Palmyra palms—the cocoa palm has by this time disappeared. It does not travel far from the coast.

A little above Morumbala the traveller enters the first of two great marshes that form marked features of the Shire valley. At no very distant date these have been small lakes through which the river held its course. The lower is called the Morumbala marsh, and the upper, 100 miles further up, by the winding of the river, is called the Elephant marsh, from the great number of elephants that find a congenial home and safe retreat in its solitude. They are generally seen, but I did not see any in passing. These marshes are not great pools, but tracts of land, each about thirty miles long, intersected by innumerable reedy canals and lagoons. The northern end of the Elephant marsh is marked by a semi-circular belt of palmyras, about twelve or fourteen miles long. In these marshes the land is so flat that if you wish to see half a mile off you must mount, acrobat fashion, on the shoulders of one of your men, and balancing yourself with a punting pole, you may then take a leisurely survey of the surrounding sea of waving green, grass and reeds alone being seen all round, and the tops of distant mountains far off. It is not very enlivening work passing through these marshes. Canoe travelling would be thought by most of my readers frightfully monotonous. But it is quite endurable for the sake of the moral ends to be accomplished.

In this journey, thus so cursorily described, of course I have passed a large number of villages. None of them are very large, but they are pretty frequent. Their names do not as yet live in story or in song: and as they would not interest my readers, I shall not mention them. There are tens of thousands of such places on Africa's broad continent, whose unwritten history the past has wholly swallowed up. Yet in them live multitudes who are moved to laughter and to tears by the very same things that move us. We who dwell in abiding cities of solid stone, with our busy life, rich and full with the ripened thought of all the past, and the giant works of present art to minister to all our wants, can hardly realise the life that millions of our species pass in these villages that exist for a few years, and if once forsaken leave no ruins behind. The people generally are civil: ready to sell, if they have what you require, anything or everything, from a few eggs, a pot of beer, a few dried fish, a bundle of elephant or hippopotamus flesh, to a cotton loom or a small canoe. If they could only grow in quantity sufficient to form a large trade of such natural products as abound in the country, what profits, what colossal fortunes, might be theirs!

During the middle part of this journey, I fell in with Mr. Scudamore of the Universities' Mission, and we sought out Bishop Mackenzie's grave together; and visited some of the chiefs on the way. On Saturday, 2nd August, I arrived at the temporary station of this Mission. From all the gentlemen there I received a most hearty and friendly welcome: and especially from my friend Mr. Horace Waller, whose acquaintance I had made at Shupanga in April. The station was built on a small height, about eighty feet above the river. When I got up I looked about on the plateau. And when I saw the little huts that, out there, represented a capital sum of 20,000*l.* at home, and the support and patronage of the great and the learned and the wealthy of two Universities and many great cities, I wished that men in England could see from what small beginnings and rudest elements of things the great results of missionary enterprise have to spring, and then with more patience would they wait for what needs time and prolonged efforts to produce.

V.—AMONG THE HILLS.

From the station I made several short journeys on foot among the hills. On the first of these, with Mr. Waller, we came on what seemed to be a curious superstition of the country, or some very diabolical piece of midnight work in connection with the slavery business. After our arrival at the village of a chief named Mankokwe, we were refused permission to enter, he being busy, it was said, with a deputation from a part of a country where lives the spirit of a certain deceased chief, and who communicates with his people by a sort of pythoness, who is called his wife. For this purpose an unfortunate woman is immured in a hut, and fed and cared for at the expense of the community, and when she dies another is put in her place. Each large village supplies a wife in turn, and now the evil day had come to Mankokwe's door. My first impression was, that the whole thing was a farce; but about midnight I was awoke by a loud cry ringing through the woods, by hearing the people rushing out of their huts, and the women talking in tones of great commiseration. The cry "Mkasi angu! Mkasi angu!" ("My wife! My wife!") was the lament of some poor fellow who had been bereft of his wife in the night, that she might become the spouse of the cold shade of the mountains. Such, at least, as Herodotus says, is the popular belief, as it was told to me.

My second journey was to the north-east, with Mr. Rowley, and if there were drawbacks from the disturbed state of the country, and from the scarcity of food, they were made up for by pleasant companionship. We went as far as Magomero, and in the blackened remains of several burnt villages, ascertained that the wave of war which was rolling from the north had passed south of the old mission station before it spent its full force. It was on this plateau of the Shire that it was thought the experiment of planting the Gospel in that part of Central Africa could be successfully made.

The ascent of the hills is commenced by passing through the pleasant little valley of the Kubula, which gradually narrows into a mountain gorge. Thereafter for a day the path is a series of steep ascents and descents. Now it passes up the face of a hot and scorching hill at an angle that severely tries the knees and lungs of the climber; and at other times it descends into narrow shady ravines by the side of the most limpid and beautiful streams that any land can boast of, winding about among clumps of graceful feathery bamboos, sycamores of perpetually green foliage and deep shade, among moist rocks covered with mosses and ferns, and other plants that shun the sun and love damp places. This is pleasant enough; but presently the path again leads for an hour among sharp rocks or protruding boulders of grey glistening granite or blackish basalt. Of these rocks, with a mixture of other metamorphic sorts, the hills are chiefly composed.

The height is not more than 4,000 feet, but a long day's journey is necessary, for the descents are many, as well as the ascents. The sight from the edge of the plateau is very grand. Towards the west there appears a vast stretch of the crests of rolling hills overhanging narrow valleys. Towards the east there appears a great comparatively level plain, with a gentle slope eastwards. The plain is about eighty or ninety miles long, or perhaps more, and about fifty broad, and is shut in on the south by magnificent mountains called the Melanje, on the east by Lake Shirwa, and on the north by Mount Zomba. Out of this level table-land rise, like islands out of a calm sea, a great number of conical hills, some only a few hundred feet high, others, like Chiradzuro, rising to the height of 4,000 feet. This gives the plateau anything but a tame appearance; nevertheless, conical detached hills are not those which painters love to copy.

The population is not dense, but it is considerable. The plain everywhere is well-watered, and the villages generally by the banks of streams. The cultivation consists of maize, millet, bananas, Congo beans called nandola, and several other common African products. The flora of the hills and plateau is of course much more varied than that of the level valley below, where the rampant grass or heavy timber chokes all small and delicate flowers. The people in the hills smelt and work iron in a very primitive but ingenious way: bartering hoes and axes with the people of the valley, and receiving in return balls of tobacco and bags of raw cotton.

In the beginning of September, I went northwards to the Murchison Cataracts. On this journey I spent ten days, and had during that time the society of Mr. Proctor, also of the mission party. This was in some respects the most interesting, and certainly by far the most picturesque, part of the Shire journey.

These cataracts are in all seven in number, and stretch over a distance of thirty-five miles. At none of them does the water descend over the rock at an angle greater than that of forty-five degrees; at most of them very much less, from twelve to fifteen or twenty degrees. They are formed by the river passing over the north-west termination of that range of hills that runs, almost without break, parallel to the Shire, from a point forty miles above its junction with the Zambesi. But for these falls there would be uninterrupted water communication, for boats of light draught, from the sea to the northern end of Lake Nyassa, a distance of nearly 500 miles of latitude.

The rocks over which these cataracts pass are mostly igneous. Grey granite is the predominant rock at Matiti, the lowest of the falls. Two miles further up, at Upikira, the second fall, in addition to granite, basalt and a rough hornblende make their appearance. These, with other metamorphic varieties, are continued up to the Great Fall at the top of the cataracts, where a quarter of an hour's walk over the shoulder of a rounded hill brings the traveller suddenly down into an alluvial valley, as flat as if it had been artificially levelled. This is the valley of the Upper Shire.

We continued our journey northwards as far as Guluwe, sixty miles from Lake Nyassa, where the entire failure of food caused us to turn. There we found the people beginning to die of the famine that afterwards swept off its thousands. We arrived at Guluwe on a Saturday night. Twelve of us supped off the fore-quarter of a very small and lean goat, our last provisions; and immediately thereafter, when the moon rose, we went to hunt. We soon found game, but neither Proctor's shot nor my own was successful. The results of the chase were to me only a fall out of a tree whither I had run for safety after missing my buffalo, and a fever next day. On Sunday the hunt was continued without success; and on Monday, weak from want of food and the effects of fever, yet sorely against my will, we commenced our homeward march.

To support a party by hunting requires long experience, and the surrender of one's days and nights to such work; and though I shot a little, I cannot boast of my prowess as a hunter. To educate men—or pave the way for that—not to hunt wild beasts, was my vocation and object on the Zambesi.

The inexplicable difficulty of food will be explained if I say we always commenced our journeys without any, as provisions were as scarce at the station as elsewhere.

VI.—ASCENT OF THE ZAMBESI TO KEBRABASA RAPIDS.

In September I bade farewell with regret to my friends at the mission station, and descended the Shire with Waller. To Dr. Dickenson and Mr. Scudamore it was, alas! a final farewell.

From Shupanga early in November I started for Kebrabasa, and for a few days travelled with my friend, Mr. Richard Thornton, geologist to the Livingstone expedition. He was the first, along with Baron van der Decken, to penetrate to the snowy mountains of Kilimanjaro, under the equator. He was now making a geographical survey of the country adjacent to the Zambesi. His activity and energy led him, on days favourable for theodolite observations, to work through the hottest hours of the most blazing noons. From these excessive exertions and the effects of the climate, a few months afterwards he lost his life, and died at the age of twenty-five, all too soon for science, and too early for his friends.

After parting with him, I continued my journey alone; travelling rather slowly, and it was not till the 15th of December that I reached Kebrabasa; literally the work of ascending the river is cut in two—the navigation is here at an end. Such is the meaning of the native name; and it is a true description of the effects of these extraordinary rapids.

After leaving the canoe at the lower end of the rapids, I went a day on foot. It would require a more lengthy description than the limits of this paper allow, to give the reader any adequate conception of that vast wilderness of stone, and those Titanic masses of rock which form the great groove, seventy miles long, that has been cut through these mountains by the river Zambesi in forcing its way down to the sea. Rocks in river beds at home give one no idea of these tremendous fragments. Boulders as big as cottages cumber the channel, which is exposed in the dry season.

No one, I believe, has yet traced these rapids from end to end. The appearance of the lower part in the dry season is this. The natural channel of the river is about a quarter or a third of a mile wide. In the middle is a deep canal with perpendicular rocky sides, which winds about sometimes at a very sharp angle, with many rocky recesses and projecting points, and full of wild swirling eddies, in addition to the naturally turbulent current. In this canal, varying from thirty to seventy yards in breadth, for perhaps one third of the year, flows all the water of the Zambesi, which is spread out into a channel of a mile broad below.

In flood the whole channel is filled up, and then those hillocks of piled-up rock, deep hollows of sand, the canal, and the gigantic boulders have all disappeared under the surface of a broad sheet of water that sweeps down between shores of rounded tree-covered hills, 700 to 1,000 feet high. The difference produced by this change, between the flood and dry season, is so great, that it is said to be difficult to recognise the surrounding country. Within a few days, while I was there, the river rose ten feet.

Of the rocks, which seem to be all or chiefly igneous, a porphyry, and a curiously coloured syenite—quite unlike the Egyptian syenite—are the most conspicuous; and some of these masses are polished and blackened in an odd way on their upper exposed surfaces. Below, and when fractured, they are of a whitish red; above, they are black and glistening, like a very dark African face or a well-polished boot.

It is a safe generalisation now to make, that all African rivers, unknown as well as known, have such unfortunate interruptions. This arises from the form of the African continent. It has a flat margin of low rich unhealthy coast land varying from 40 or 50 to 200 or 300 miles broad. To that succeeds the interior plateau, the shape of the country being, to use Speke's comparison, like that of an inverted dinner-plate.

Beyond nearly losing my canoe among the rocks, by breaking the "chiwindo" or tow-rope of palm fronds—beyond being awakened on a Sunday night by a shower of rain falling on my face, to discover that my blanket was shared by a very unwelcome bed-fellow, a large yellow-and-black mottled snake—and beyond falling into the river, and being carried down by the current some distance,—nothing very worthy of note occurred on the upper part of this journey. The latter accident was the most serious. So far had I got separated from the canoe, that for a few minutes I thought my journey through Africa and through life were alike at an end; and a pang of keen regret shot through my heart that it should have so terminated. But the time was not yet come. By hard swimming I saved my life, and was pulled on board rather exhausted.

This mishap occurred during what is called a "chirumvurumvuru"; a native word signifying a sudden violent tornado, with lightning, thunder, and rain; and one of the most remarkable instances of exact onomatopœia that probably exists. The sharp whistling sound that comes before the full roar of the blast, is as faithfully expressed by the first syllable, when correctly and slowly pronounced, as the full strength of the storm is by the remainder of the word being rapidly uttered. When I first heard this strange vocable, I pulled out a small vocabulary and wrote it down. Njara, my lad, who had acted as valet, cook, native tutor, general confidant on native affairs, and *fidus Achates*, all rolled into one, and who served me for seven months with sterling honesty, and great patience and fidelity, was rather amused at the number of times he had slowly to repeat this word.

From Tete I went to the coal-fields of the neighbourhood. Those seams I saw were in a natural section of yellowish sandstone, about fifty feet high, which had been laid bare by a small stream cutting out a channel for itself, and thus exposing the rock. The coal was in beds of various thickness; that from which I took a small quantity was seven feet thick; there were others much thicker. These seams were lying at an angle of forty-five degrees. They had been previously examined by Mr. Thornton. On the important point, the value of the coal, it is believed, from the specimens that have been examined, to be of fair quality and of old formation.

Close by, on low rounded hills, near the coal seams, there were lying about considerable quantities of magnetic iron ore. Copper is also said to be found in the neighbourhood, but this last I did not see.

Christmas Day I spent in Tete, and was hospitably entertained by the Governor. He is a shrewd man, but too deeply implicated in the support of that infernal slave traffic which desolates some of the richest parts of this earth.

In the Narrows of Lupata I spent a quiet Sunday on my downward voyage. This is a part of the Zambesi, twelve to sixteen miles long, where the river passes through a gorge in the range of hills that lies nearest to the coast, though at a distance perhaps of 200 miles from the sea. The scenery is very striking, and picturesque enough to rival some of the finest parts of the Rhine between Boppart and Bingen; though the hills are more rounded and somewhat different in form; and of course there are other differences. There is no Stolzenfels below, no Johannisberg above!

On New Year's Day, 1863, I arrived at Shupanga, and found Dr. Livingstone where I had parted from him six months before. In the interval he had explored the river Ruvuma. In ten days the Expedition sailed up the river, and when all its members had departed I was again alone at Shupanga.

While there I took my last and worst attack of fever. Of this inevitable contingency of African travel, though I have said nothing, I had my fair share. Altogether, I must have had eighteen or twenty well-defined attacks, involving in every case the necessity for the use of calomel and quinine, once or twice of croton oil. The fevers have three stages—a cold, with rigors more or less severe, the teeth chattering with the thermometer at 105° in the shade; a hot, with a profuse drenching perspiration; and a convalescent stage, in which you feel perfectly well but perfectly weak. If I was frequently ill I generally got quickly better, and did not usually suffer from those disagreeable accompaniments of slight coma, occasional vomiting, and what patients generally believe to be true hæmaturia, but which is not that.

At Shupanga only did I suffer for a considerable time. A curious psychological fact, as it seems to me, occurred while I was recovering. I had fallen on the floor during the night, I suppose in a faint. On recovering, I felt in the most ludicrous perplexity as to where I was. It was dark and still, without sight or sound. The howl of a hyæna, common enough on most nights, would have told me I was in Africa. But the mind, weak from the body's feebleness, could not muster from the stores of memory, or from present observation, any answer to the question, "What place is this, is it Scotland or Shupanga?" A sort of reflective consciousness made me aware of my being somewhere; but, as neither sensation nor memory would give any information, I could not tell exactly where. As I lay on the earthen floor I moved my left hand. It rested in a hole which had been an eyesore for several days. My hand recognised it from its peculiar broken edge; and the wandering mind, through this sensation, re-established its connection with surrounding matter, and immediately answered the question, that I was in Africa, alone, and in a fit of fever. Upon which I crept back to bed.

These fevers are the chief obstacle to the occupation of the country. They do not appear very speedily to produce any great organic mischief, but they weaken the system. The valleys will always be feverish; but on the higher lands, and by less exposure, moderate activity, and better food, the fever may be nearly, but not entirely, avoided. The strain on the system from exposure, want of good food, and frequent fevers, shows itself in many ways, and amongst others on the teeth. Hard living and travel tries them severely. Though I knew nothing of toothache, I have to confess to the loss while on the Zambesi of a pair of very useful molars in the lower jaw, which simply came out without pain or trouble of any sort.

My greatest privation was the want of wheaten bread. I could have used in three weeks the whole supply in the shape of biscuits that with care had to last six months.

VII.—HOMEWARD FOOTSTEPS.—CONCLUSION.

I HAD now seen as much of the country as could be examined at that time, from the existence of a surrounding belt of war and famine, and as much as served my objects. Further exploration would have involved my staying another year, and I therefore resolved to bend my steps homeward.

This is not the place, nor is there now space in this paper, to express any general summary of opinions, but of the people themselves I formed a higher impression on most points, both intellectually and morally, their present circumstances being considered, than our common traditional beliefs about the African race had led me to entertain. This, I think, will be generally held by all who have no selfish ends or pecuniary interests to serve, by pushing down those unfortunate people in the mire in which they are already sunk. Their religion is man's natural religion everywhere—a confused belief in the existence of one Great and Good Spirit—the Molungo; and a mixed feeling of fear and deference to the multitudes of malignant spirits—fitis—who are supposed to inhabit the hills and valleys, forests and fountains of the land, and who are the chief causes of all the misfortunes that befall men.

The country itself contains many valuable natural products, but all as yet in an undeveloped state. Coal, and iron, and cotton are three of the most important. By the people themselves the cotton is woven in a rude way, and in a district untouched by famine I noticed a considerable number of acres of the growing plant, and counted as many as twenty-four native looms at work. There is not yet, however, enough to make an extensive trade: that is, to freight ships with. The people grow it only for themselves, not for export.

They are all cultivators of the soil, and not nomadic: and the women I regret to say are the chief agriculturists. The sole implement of cultivation is the native hoe. Horses are unknown in the valleys of the Zambesi and the Shire, and cattle only found at some distance inland, and where that minute but formidable opponent of civilisation, the tsetse fly, does not exist. Goats of rather handsome shape, and sheep of the fat-tailed sort, constitute the pastoral wealth of these districts.

The diseases of the people are generally few and simple. They suffer from fever as do white men, but only on rare occasions. Chronic or old man's bronchitis, as it is sometimes called, afflicts the older people and frequently cuts them off. This is the mtombwe or cough of the natives. I have also seen a few cases of leprosy, and one albino. His eyes were pink, like those of a white rabbit, but not so decidedly coloured as I had expected. His sight was weak, and he disliked being exposed to the sun, as it irritated his skin and raised small pustules: or, in the expressive but disagreeable language of my informant, "it made his skin rotten!" Both the parents of this man were said to be black.

Sloughing or phagedenic ulcers are also at times of scarcity of food exceedingly common: and elephantiasis is seen on the coast.

But there is another perpetual ulcer of a different kind, which, more than anything else, tends to keep the African continent in a state of social chaos, intellectual torpor, and spiritual death, and that is the accursed slave-trade. This is still carried on by Spanish, and probably also Portuguese ships; and by rascally Arabs in their sneaking little dhows. The import into the small island of Zanzibar by the activity of those Arab traders sometimes amounts to 20,000 slaves annually.

In February I descended the Quaqua river to Quillimane, where I was received by Colonel Nunes, and, curiously enough, was lodged in the same room that Dr. Livingstone occupied when he reached the east coast on his famous journey across the continent from St. Paul de Loando. I waited six weeks for a ship to Mozambique; six weeks longer at Mozambique, staying in a large, airy, and nearly empty house, given me by the Governor. Thence I sailed to the Cape in Her Majesty's ship *Gorgon*, commanded by Captain John Wilson, with whom, when again I get stranded on some distant shore, may it be my good fortune to meet. I owe him some thanks.

In the house of Dr. James Abercrombie, for more than forty years one of the best known men at Cape Town, and one of my best friends there, I took up my abode when I arrived in that place. For the hospitality of the Cape I ought to speak. Dinners were not few, and the society of one's friends was rendered all the more pleasant by the recollection of dangers past. I sailed to Southampton in the mail steamer *Saxon*, and arrived in this country after an absence of nearly two years and a-half, grateful to Him who had preserved my life in a region where so many of my friends had lost theirs.

To a private meeting in Edinburgh I presented my Report. The present unhappy state of the country to which it referred, the recall of the Livingstone expedition, and the probability of the Church of England Mission being withdrawn, rendered it unadvisable for the Committee to proceed immediately.

Let us hope the delay is but for a time. The Gospel, aided by industrial missions, with a practical and directly civilising agency, varied in its modes of operation, is the only remedy for the many miseries of the dusky and benighted millions who inhabit that continent. On the Zambesi region there is, in the eyes of all men of any charity and sense, ample room and verge enough, not for one, but for half-a-dozen missions, with a free border-land of two or three hundred miles between each. To this work, in another part of the country, I purpose in a few months to return. To the Christian sympathy of my patient and courteous reader I commend the interests of a race that has few friends, but for which better days are surely yet to dawn.

* * *

ALFRED HAGART'S HOUSEHOLD.

By ALEXANDER SMITH, Author of "A Life Drama," &c.

CHAPTER IV.

At the very time that Jack was fighting with Thomson in the school playground, Alfred Hagart was making a successful raid amongst the Spiggleton manufacturers. Trade was brisk, patterns were in request, and good prices were freely given. By Friday afternoon—the combat came off on Thursday—he had sold the last of his stock, and had a more satisfactory roll of bank notes in his pocket than it had known for months. On Saturday morning he started on his homeward way out of Spiggleton, with a parcel neatly done up in brown paper dangling from his left hand, and in the highest possible spirits. He thought he had never seen such a beautiful morning. The air exhilarated him like wine, and as he walked along he could not help admiring the soft braided autumnal clouds. He hummed incontinently snatches of the old songs he was wont to sing when a young blooming courageous man in London, certain to conquer the world, and to make a name in art—and it did not strike him how strange these had been for some years to his lips. Success had come, and these songs returned to him as swallows return in spring to the old eaves. He gave cheerful salutation to the stone-breakers by the wayside. He stopped a little girl whose face he fancied bore some resemblance to Katy's at home, asked her name, patted her on the head, told her to be very good and obedient and to mind her lessons, and nearly drove her mad by a present of sixpence. He thought the waggoners who trudged past a very prepossessing set of men. He could not remember to have seen the gorse so yellow, the bunches of heather so purple, and chaffinches and bullfinches with such pretty coats, or hopping in such numbers across the roads, or feeding so lustily on the hips and haws in the hedges. "That ill-looking rascal Poverty," he said aloud, "has been hanging about my door for a year past; but I have given him a kick now which will make him keep his distance for awhile." He was in high spirits, and walked on rapidly, dangling the brown paper parcel as he went.

An hour brought him to the moor, and another hour to the clachan of King's-barns—a sort of oasis in the moory desert. At King's-barns the coach running from Spiggleton to Greysley changed horses. The inn was a white one-storied building, with a large sign, containing two gilded keys crossed on a blue field. Over the inn hung a large willow tree. Beyond the inn was a smithy, from which proceeded a noisy clanking of hammers, and through the door Alfred could discern a permanent fiery glow, and at intervals a brilliant shower of sparks. Before the smithy a horse stood meekly, with its bridle tied to a nail—waiting the smith's attentions. Opposite the inn were barns, and against the walls of one of these leaned a new cart-wheel, the centre and spokes of which were painted scarlet. Before the inn door a large Newfoundland dog lay dozing in the sunshine. While Alfred was yet some score of paces distant, a troop of white pigeons came over the willow with a whirr of wings, and alit in the roadway—another whirr of wings as he advanced, and they streamed over the barns opposite, two of them throwing the most curious summersaults on the way, as if making fun of being shot. As Alfred came up he looked at the inn wistfully for a moment, and then his face brightened. "Hang it," said he, "what's the harm? I'll have a glass of ale and wait for the coach, which will be here in an hour. Why should a man walk when he can afford to ride? This has been a lucky campaign, and after a victory a man may sing *Te Deum.* Margaret, poor dear, won't think me extravagant:" and so saying he turned into a sanded passage, pushed open a door, entered a low old-fashioned room with a huge green bull's-eye in the window, around which the ivies and later honeysuckles clustered prettily, and thumped with his knuckles on the little deal table.

When the ale was placed before him in a pewter tankard, Alfred took a mighty pull at it, then laying it down he pronounced the monosyllable "Ha!" aloud, and wiped his mouth with the back of his hand. He then took out the roll of notes from his pocket, counted them over leisurely, and while doing so his face became perfectly luminous, as if struck by an idea of extraordinary brilliancy. What was the idea, it is not for me to say; but, his face quite beautiful to behold the while, he divided the parcel into four equal divisions, placing one in each of his trousers' pockets, and one in each of the pockets of his waistcoat. He then undid the brown paper parcel, which consisted of some dark dress stuff, and a smaller parcel wrapped in tissue paper. The dress stuff he hung over the back of a chair, and retired a step or two to admire the effect. "Poor Mag," he said, "it's not much, but you'll value it at forty times its worth. I'd slipper thee in gold if I could!" The dress stuff he folded carefully, and put aside. He then opened the smaller parcel, displaying a slip of crimson silk sleeping in its folds, and with a dexterous movement of the hand he twisted it like a scarf. "She'll look a little sunbeam in this, with her white frock," he muttered, smiling at it with his head on one side. He then wrapt up the silk in its paper, put it inside the dress stuff, tied the whole up again in the brown paper, and laid it on the table. He then applied himself to the pewter, and when he had emptied it the sound of wheels was heard outside, and by the time he had paid the reckoning the Greysley coach was as the door, and the smoking horses were being led round to the stables.

He had no sooner climbed to the top of the coach than he was accosted by a little gentleman with prominent whiskers, who sat there. The little gentleman was dressed in grey, and wore a white hat with a band of crape round it. "Ah, Hagart, how do?" extending three fingers to be shaken. "Glad to see you! How's Margaret? What has brought you to this part of the world?"

At this salutation Alfred became painfully conscious of his brown paper parcel. He felt that to carry such a parcel was far from distinguished, and so he slipped it out of sight between his legs, while he became scarlet with vexation. "I have been at Spiggleton on business," he said, "and am on my way home. I hope your family are well, Mr. Stavert. What are *you* doing here?"

"Business also," said Mr. Stavert. He then, while he kept his head in its old position, twisted his eyes into their left-hand corners so that he could take a view of his companion, while he smiled knowingly. "Business also, Hagart. Money can't rest, you know. Heard of an opening for a little capital in this quarter. Come down to look at it. Have half a mind to go in. Faint heart, you know, never won fair lady. Mines!" And he closed his mouth hard, and made a rattling cataract of the loose silver in his breeches pocket—which people richer than you, are in the disgusting habit of doing.

While the fresh horses are being yoked, which put a stop to conversation, I may as well tell who Mr. Stavert was, and how he became acquainted with our friend.

Mr. Stavert was a man of some little means, and had for wife a remote and out-lying descendant of the great McQuarrie family. Hagart and he were connections therefore, and they had met perhaps some half dozen times previously. Stavert had called on Hagart in London—the only one of his wife's relations who had done so—and our friend had rather a liking for him on that account. Mr. Stavert had neither business, trade, nor profession, but having money at his disposal he dabbled in house property here, in shares in this thing or the other there; and being a shrewd man enough he generally contrived to make such speculations pay. He lived quietly—Cuchullin Lodge, near Hawkhead, was his address—and he flitted into the business world as a rook flits into the street of the country town before the inhabitants are stirring—to see what he could pick up. He had a keen eye for bargains; he was present at auctions and sales of sequestrated furniture, securing for an old song this thing or the other. He was under the impression that luck was in store for him in these quarters; that if he bought a dozen snuff-coloured oil paintings at a sale one of them would be certain to turn out a Raphael; that if at a country house, the family of which had gone to wreck, he bought a cabinet at the price of old fire-wood, he would be sure to discover in the cabinet a secret drawer, and in the secret drawer—well, he did not know what, but something worth his while. No such stroke of good fortune had yet come his way, but he was daily expecting it. At all events he had his profit and his pleasure, and Cuchullin Lodge was plentifully furnished with old tables and chairs of curious workmanship, old China cups and saucers, cracked specimens of Bohemian glass, old Highland brooches and broadswords—the last being Andrea Ferraras of course! Having no recognisable grandfather of his own, of his wife's noble descent, and especially of her connection with the great McQuarrie family, he was extremely proud. He drew nobility from his wife, and wore it proudly. His house, as I have said, was called Cuchullin Lodge. His seal was a stalwart hand grasping a huge battle-axe; and this noble device he was careful to imprint on all his letters. His own family names, so far as they could be discovered, were John, James, Robert, and the like; but these he scorned utterly: his only daughter was called Flora, and his sons, all of them at least who were alive, were severally named Hector, Norman, and Torquil. He was a member of the Hawkhead Highland Society, and once a year, clad in the garb of old Gaul and with glittering claymore in hand, in company with a number of individuals similarly attired, to fierce bagpipe music he marched through admiring streets to the field where pipers strove in dissonance, and lean, long-winded fellows from Lochaber ran races and leaped hurdles, and brawny men from Athole tossed the mighty caber. When Conachar died—the pride of his house—he wore crape on his left arm for six months, and spoke of the deceased in a respectful tone. Resident in the neighbourhood of Hawkhead, the Stavert family were in constant communication with Miss Kate McQuarrie, who was regarded by them as a very august personage indeed. To her they were continually bringing presents of fruits and flowers from the Cuchullin gardens, and, in spite of occasional tiffs, they were regarded by the entire circle of their acquaintance and by themselves as the old lady's heirs-apparent.

Miss McQuarrie was seldom out of the thoughts of the Stavert household, and the coach had no sooner started from King's-barns, than Stavert asked "Have your heard anything of Miss Kate of late?"

This was always a sore subject with Alfred, and his face grew red. "No," he said, "I am not likely to hear anything from that quarter, and I don't much wish, to either."

Again Stavert's eyes went into their left hand corners, while his head remained immoveable and the knowing smile came to his lips. "What will you take for your chance of her cash?"

Alfred did not like this talk at all. He knew the Staverts were to have the money when the time came, and he thought the question somewhat uncalled for.

"Money down!" said Stavert, the eyes and the smile still fixtures.

"I'll take nothing for my chance, as you call it. I don't wish her money. I have never looked for it, and I don't think besides there is any likelihood of my getting it."

"You heard that she has been ill?"

"Mrs. Hagart—her sister—" (Hagart could not help laying a little emphasis on the words) "heard some report of that kind, but as it did not come directly, and as we have both been badly used by her, we took no notice of it. But I trust she's better all the same."

"Miss Kate has made a new will. Did you hear that?"

"I did not hear a word about it. How should I? But what does it matter? *you* of course come in for everything at the end, everybody knows that."

"Do you know, I think your chance is looking up," and Stavert now turned round and looked Hagart full in the face.

"What do you mean?"

"Well, I'll tell you. When Eliza—Mrs. Stavert, you know—heard that Miss Kate was ill—and they heard it in no more direct way than you did—she and Flora—my daughter, whom you have never seen I think—set off to Hawkhead at once to nurse her, leaving me to follow in a day or so. I had a letter from my wife every day, giving me information of the invalid's condition—so attentive she was and anxious. Three days after I packed up my portmanteau, put in my black clothes,—for one, you know, could not tell what might happen, especially at her age, and its always best to be prepared for everything; and besides, if the worst was to come to the worst, I mightn't be able to get home, there would be so much to arrange. When I presented myself with my portmanteau, what do you think I found? My daughter crying, my wife hysterical, and Miss Kate, worn to a shadow, sitting up in bed in a most terrible rage. I asked what was the matter. 'Take me away,' cried my daughter. 'I'll never enter this house again, never,' sobbed my wife. 'Don't till you're asked,' shrieked Miss Kate, sitting up with the bed-clothes around her, out of which her head stuck like an angry hawk's. 'I'm not dead yet! Do you hear? Sorry to disappoint you.' Well this was unpleasant. I got my women-kind into a coach—for they would not stay in the house another moment, although it was just time for luncheon, and I was somewhat hungry—and there they told me the whole story. It seems that Miss Kate has a brooch, as big as a Highland target, set with precious stones, and that this brooch was lying on the looking-glass on the invalid's dressing table. As Miss Kate seemed asleep Eliza asked Flora to try it on, to see how it would become her. In a trice Flora pinned it on her dress, and they both were admiring it in the looking-glass when the sick woman opened her eyes. 'Put that down, you gipsy; it's not yours yet!' You may fancy the brooch was dropped at once, as if it had been red-hot. But Eliza, who has a spirit of her own, I can tell you, said something about its being promised to Flora years ago. '*She* won't have it: *you* won't have it!' cried Miss Kate. 'It won't go past my own sister.' 'Your sister, Margaret Hagart!' cries my wife, beginning to sob, 'what has she ever done for you? Has she ever attended you in sickness, made your gruel, mixed your medicines, slept on the floor beside your bed, as I have done?' 'She has let me alone,' said the other, 'and that's more than ever you have done.' 'What ingratitude!' says my wife, her feelings getting the better of her. 'Margaret Hagart was an undutiful daughter; she broke her poor father's heart, she disgraced her family, she made a low marriage, she's as poor as a church mouse, and'——but I beg your pardon, Hagart, I quite forgot, I really didn't mean to——"

"Never mind," said Hagart quietly, "worse has been said of me than that by my wife's relations. I know you didn't mean to offend. You were only speaking in inverted commas. But you said that Miss Kate had made a new will."

"Oh yes. After this disagreeable passage of arms I was a good deal nettled, as you may suppose; but my wife and daughter, after the first natural anger was over, behaved like angels. From their hearts they forgave her entirely, and would have been at her bedside next morning, I believe, to give her her medicine if I had allowed them. The fact is, I fully expected that when Miss Kate had thought over the matter she would have sent for them. But as no message came I didn't know what to think, so last week being in Hawkhead, I stepped into Hook and Crook's office—Miss Kate's men of business—and learned casually that she had sent for them, and that a new will was in progress. That's the sixth she has made to my knowledge during the last six years," added Stavert, somewhat testily.

Alfred remained silent. "I don't care a straw for the matter myself," continued Stavert. "It's weary waiting for dead men's shoes, and when you get them, as often as not, they pinch your feet. If Kate's money should come your way, I'll be content, Hagart. Your wife is nearer her than mine; and between ourselves she likes me as little as she likes you."

After that the talk broke into indifferent channels, and at the next stage Stavert got down to look at the something he had heard about in the neighbourhood, leaving Hagart to journey alone homewards, much meditating on what he had heard.

CHAPTER V.

The day after the fight Jack found himself in high popularity. He had shown pluck in the encounter with Thomson—who was the bigger and elder boy; he had been severely punished, and his punishment he had taken bravely, and as a consequence his mates admired him more than they did his foe, who by dint of fibbing, it had become generally known, had got off comparatively easily. Much meditating the matter during the evening, the schoolmaster had come to the conclusion that the lad had been unfairly treated, and that some slight reparation should be made in the presence of the whole school if circumstances provided a decent opportunity. As he entered the schoolroom he smiled on Jack and addressed him in a few words of studied civility, which made the boy's heart jump; and when during the class examination—for on the Friday the entire work of the week was gone over—he fairly tripped up the heels of all opponents and placed himself in the position of dux, he received from the master a public compliment. This was a triumph! It was like being knighted by a king in the presence of a whole army. Jack felt it, the whole school felt it, and Jack's popularity reached its acme. When the classes were dismissed to the playground, Thomson was standing in a corner looking vicious, and Jack went up at once and offered to resume the game of fisticuffs with him that afternoon in some place where they would be beyond the jurisdiction of the schoolmaster and where no assistant could have a chance of interrupting them. "Perhaps you think you can lick me," said Jack, "and if you think so, I'll give you another chance." Thomson lowered, and looked as if he could have eaten his opponent with much pleasure: he then muttered some words of declinature, and walked away. Jack's companions were witnesses of the obliging offer, and of course Jack was a hero in their estimation, and Thomson a sulky fellow, a coward and a sneak. The resumption of hostilities in the manner suggested would have been an event; and the boys were naturally disgusted that the sulky Thomson had declined to contribute to their amusement. Figuratively speaking they carried Jack shoulder-high, and trampled Thomson under contemptuous feet.

In the evening, after Katy had gone to bed—for the child was delicate, and was often looked on by Mrs. Hagart till tears from a foreboding heart came into the maternal eyes—Jack went into the kitchen where Martha was ironing linen, her sleeves rolled up over her red arms, and the implement which was not in use placed on the toaster before the fire. The young fellow liked the kitchen for its warmth and light, and because he could there listen to Martha's stories, which were chiefly of a ghostly character, and repeat what portions of the Waverley Novels he had heard his father read, or relate the feats which certain of the British Regiments had performed in the Peninsula and at Waterloo—on which subject his father was garrulous when they walked together. On the present occasion Jack brought one of his school-books with him, and sat down on a low stool in the centre of the light and heat.

"I am going to read you a story," said he.

"Read awa'," said the maiden laconically as she took up the fresh iron from the toaster, wiped the smooth surface of it rapidly with her apron, and resumed operations on the front of one of her master's shirts.

He then began reading aloud from the school-book an abridged account of Mungo Park's African experiences. Read how he travelled for days and days through the hot wilderness, how he was thirsty and hungry, how he lodged at night in trees while jackals and hyenas prowled underneath, and the vast roar of the lion was heard in the distance; how, in his sore distress, he saw the delicate moss in the desert, and drew courage from the thought that the Power which planted and supported *it* there would also care for and support him; how the African women took pity on him, took him into their huts, gave him food and a couch of skins, and sang, as they spun, melancholy songs—that he had no sister to bring him milk, no wife to grind him corn. Jack affected himself by his reading, and when he came to the end he looked up in Martha's face—who had by this time struck work, and was standing with her back to the dresser quietly devouring every word—expecting to gather therein some response to his own moved feelings. But Martha was a damsel of an imperturbable and unsentimental cast, and although interested in the narrative her interest was of a different kind from that of the reader.

"Save 's! tae hae gaen through a' that—what a horse o' a man!"

"But," said Jack, colouring a little from the unexpected shock, "think of the moss, Martha."

"Bonny eneuch, but he wad hae been better pleased if he could hae made his dinner o't," said Martha, as she took an iron from the toaster and drew her finger swiftly across it to see if it was sufficiently heated.

Jack could laugh a little by this time, and he put the book aside. "Martha," said he, after a little pause, "Katy and I are going to make a journey to-morrow."

"Ay, an' whaur are ye an' Katy gaun?"

"Along the canal bank. I promised to let Katy see the canal, and the old castle, and the old coal-pit."

"Tae fa' in an' be drooned!"

"O there's a paling round the pit; it's quite safe. And I wish to show her the canal going across the river, and everything along the banks. She's never seen them."

"But will yer mother let ye?"

"She said she would if I took great care of Katy and did not go too far. I said nothing about the old pit, though."

"Ye manna gang far. Miss Katy is no strong, and canna be fatigued. When will ye turn back?"

"If Katy gets tired, at the place where the passage-boat stops. We can see all we wish by that."

"Ye should turn at the second brig. It's a lang way for ye to gang yer lanes. But noo aff to bed! I hae that basketfu' o' claes to sort before I sleep, an' the maister 'ill be here the morn. Aff wi' ye!"

And so Jack had to carry his brain, seething with Mungo Park, and his excursion of to-morrow, off to bed with him, where it shaped during the night the most extraordinary dreams.

Next morning Jack and Katy rose quite eager about their walk. The boy had something to show, and was delighted to act the part of *cicerone.* The canal had always affected his imagination powerfully; he knew it led to Hawkhead and other towns, and it suggested to him in some obscure way a whole big world lying outside his experience. He had walked often for some distance along the bank alone, but a sense of solitariness more than weariness had driven him back. For Jack, like most imaginative young people, who have not yet become familiar with themselves, was sadly disturbed in lonely places, where there were no houses and no palpable signs of human life. The external unfamiliarity was not greater than the internal unfamiliarity. Queer thoughts came into his head, he was conscious of strange feelings which he could not yet comprehend or give a name to, and he was scared by these quite as much as by the silence and the emptiness. There is no terror like loneliness, no curse so heavy as isolation. Childhood, if at all impressible or imaginative, has always been troubled after this fashion; and it is from this trouble that, a few years after, youth draws its passionate delight in poetry; for in reading the poets, the youth finds that these thoughts and feelings are not personally peculiar, that by them he connects himself with the race; that although new and inexplicable, they are as old as the heart of man. Through poetry the world becomes a mighty room of mirrors, where from every corner recognition is flashed back. And so the young man comes to look upon the poet as his best friend, and to find his dearest society in that solitude which was aforetime irksome. Katy, who had never travelled farther than from the fireside to the schoolroom, was quite tremulous with a pleased expectancy; she was that day to behold wonders; her brother was to be a magician; and her excitement brought an unwonted colour to her cheek, and lustre to her eyes. It was her first excursion, and it was an event in the child's life, as the first ball is an event in the girl's. Mrs. Hagart smiled at her children's enthusiasm, and insisted on clothing them warmly, mixing her motherly precautions with counsels and advices; telling Jack to take care of Katy, imploring Katy to have an eye after Jack, and on no account to allow him to climb trees, break through hedges, or to walk near the canal edge, concluding finally with instructions not to go too far, as their father was expected home that afternoon, and it would never do for them to be absent on such an occasion. The children were standing on the doorstep with their mother and Martha while these injunctions were being delivered, and just as they were passing out of the little gate Martha suddenly exclaimed, "Diel tak' the laddie, his collar's gaen wrang again," and ran out after them. "Here, bairns," she said, producing a small bag, after she had pushed them out of Mrs. Hagart's sight, "here's a piece for ye, but dinna be late, and dinna let Miss Katy walk owre far. Be aff wi' ye. Yer collar's a' richt I see."

It was a warm bright day towards the middle of October, when the world was at rest after the travail of growth and ripening; and over the children as they walked hung the warm azure spaces, and the soft bars and wisps of autumnal cloud which Hagart, on his way from Spiggleton, was at that very moment admiring. Jack and Katy walked on smartly, and in a short time they left the road, and descended on the canal bank. The land was high on either side, and Katy looked at the hips and haws in the hedges, and the dark green firs with their bronze trunks, and the red beeches, and the slender ashes with their clusters of scarlet berries, with that admixture of wonder which gives such a zest to all the delights of childhood. The world loses much when it ceases to become strange. An old king regards his crown very much as an ordinary mortal regards his old hat. And when a rook came sliding slowly along through the summer air, and folded his wings on a tree top, and croaked audibly, she fairly stooped.

"It's only a crow," said Jack, with some contempt, as he divined her feelings, "and a crow is little better than a sparrow. As we get on we shall see birds worth looking at."

In due time they reached the bridge which carried the canal across the river. This was one of the promised sights of the day, and Jack was resolved to make the most of it.

"Look here, Katy!" he cried, as he pressed his face against the railing, and looked down on the stream beneath. "You see the bridge carries the canal across the river and not a drop falls through. Don't be afraid. Look down; isn't it deep? I don't know how it was done," he continued, in a puzzled tone, "for when the bridge was building the canal water must have poured out at both sides. I will ask father about it. See, see the water-hen, yonder, flying across the river! Ah, she's got among the rushes. Do you know, Katy," here he spoke in a strictly confidential tone,—"Do you know I can swim across the river down there; but don't tell mother, else she won't let me out on the Saturdays next summer—of course she'll be afraid I'll be drowned."

"Oh, Jack, don't swim ever there again! Michael Hamilton was drowned, you know, last year."

"Yes, but not down there. It's quite safe down there. Besides, it was in winter, and Michael was on the ice when it broke up. Father has promised me a pair of skates next winter."

Katy somewhat timorously looked down through the railings, and shuddered at the depth; she saw the water-hen skim across the surface of the stream; she was also puzzled with the engineering difficulty which beset Jack, and agreed with him that father should be applied to on the matter. They then resumed their walk.

"Isn't all this strange, Katy?" went on the young gentleman, with the air of a man who had seen the world. "*I* have been half way to Hawkhead! When I grow big I shouldn't like to remain at home. When father walks with me he tells me about foreign countries. Egypt—where Joseph and Pharaoh lived, you know—and the Pyramids; the desert and the Bedouin robbers, with their horses and dromedaries, and black tents; America, with its big lakes and prairies, and wild red Indians, and galloping hordes of buffaloes, ten miles long, and trappers telling stories by their watch-fires at the foot of the Rocky Mountains. When I grow big I shall go and see those places. Father says I shall be a great man. I wonder what I shall be, Katy? I should like to be Edmund Kean, or Edward Irving, or Buonaparte when he ran across the bridge with the flag in his hand, and the cannon-balls whistling about him; or Sir Walter Scott, who wrote the stories about Balfour of Burley and Jeanie Deans. Father is always speaking about great men, and tells me I shall be one. But I think I should like best to go abroad."

"I don't want ever to leave home," said Katy.

"That's because you are a girl, and girls never like to leave home. Mother never likes to leave home. But look, look yonder, over the woods, where the crows are flying, that's the castle!"

And in a short time, on the opposite bank of the canal, on a rising ground cinctured with woods, the red bulk of the castle was distinctly visible, with broken arches and windows that let through the sky, and with dark green patches of ivy here and there on its walls. Around the turrets jackdaws and starlings were flying like gnats. The sun shone full upon it, and on the billows of coloured foliage that surrounded it. This was felt to be the supreme sight of the day, and the children sat down to contemplate it at leisure.

"I would like to live in a castle," said Katy, at length.

"All the people that lived there are dead long since," said Jack. "That castle is nearly as old as the abbey in Greysley. Queen Mary lived there, and she has, may be, looked out at yon window. How queer that seems, Katy! She slept there the night before the battle of Langside. Father says that Queen Mary was the most beautiful woman that ever lived, and that every man who looked on her face fell in love with her, and that every man who fell in love with her was brought to the scaffold, and was proud to die for her. I wish I had lived in her time. But see! Katy, Katy! there's a shilfa—chaffinch, father calls it."

Katy looked, and saw a pretty bird hopping at a little distance on the canal bank, but in a moment it was gone, with a flash of coloured wings.

"O Jack, what a pity; what a pity!" said Katy almost crying; "the shilfa is better than the bridge or the castle."

A brilliant idea struck Jack when he saw his sister's distress. "Katy," he said, "let us take the bread which Martha gave us and crumble it on the bank, and hide ourselves behind a bush, and we'll see shilfas and a lot of other birds coming to peck them. Never mind the old pit to day! We can see it some other time. I'll keep a bit for you in the bag, in case you should get hungry. Shall we? Well then, hide yourself behind the bush here, where you won't frighten them, and I'll scatter the crumbs."

When Katy was properly ambushed, Jack took one of the slices of bread, and broke it into small pieces, which he sprinkled on the ground. He then took his place beside his sister, who had watched his proceedings with much interest. Katy grew excited, and Jack had some difficulty in preventing her from peeping over the bush at intervals. "You mustn't do that, you'll frighten them. I can see beautifully, and I'll give you my place when they come."

Then something made a jerking flight across the canal, and the chaffinch alit near the crumbs, looked round him warily, and then began to peck. "There's the shilfa again! Do you see it well? Isn't it bonny. Here are other two, bullfinches by jing, cock and hen! Ain't they making a capital dinner? And, my eye!" whispered he, getting quite excited, "see the new one just lighted, that's a yellow yelderin." And next moment Jack was knocked almost speechless at the success of his *ruse*, for there amongst the crumbs, pecking away with diligence, was a redbreast, just as if it had hopped out of the most pathetic story book in the world, where indeed—to town children at least—it is best known.

"That's a robin," he said; "I never saw one before, except in winter."

"The pets," whispered Katy, looking with all her eyes; "couldn't we catch one and put it in a cage? It would be so nice to feed it, and give it bits of sugar."

"They'll be off if we move or speak loud. But I'll get you plenty of young ones when summer comes, and then you can feed them as much as you like. Ain't they tucking in! The crumbs will be finished in a jiffey. Look! look! the robin's going to fight!" and Jack leaning forward in his eagerness to witness the combat, slipped his foot and went rolling down the bank.

When he picked himself up the birds were gone, of course, and there was Katy standing up behind the bush and looking down on him with a face of alarm. "I'm not hurt," he cried out, laughing as he knocked the dust from his elbows and knees. "I'm not hurt in the least. Come down, and take care and not slip. I rather think I astonished them!" and he laughed heartily, as if he had performed some very clever action.

"You have never seen a bird's nest?" said Jack, as they resumed their walk. "I knew dozens this spring. Father found them for me: he's a splendid bird-nester, but he would not let me take away so much as a single egg. He knows the name of every bird that flies, I think. The shilfa builds in trees. I don't know where the bullfinch builds. I never saw its nest, and I never heard father speak about it. The yellow yelderin builds in dry banks and ditches, and under long tussocks of withered grass, and its eggs look as if they had been splashed with ink. But the prettiest eggs of all are the hedge sparrow's—a sort of blue-green, just like the stones in mother's ring. I'll show you lots of nests when summer comes."

When they drew near the station-house which was the bourne of their journey, Jack in huge delight spied at some distance beyond, coming towards it, the long white passage boat, and the black caps and scarlet jackets of the outriders. At the station-house the boat stopped to allow passengers to get out, and to take in others. He hurried Katy forward that they might reach that point in time to see all that could be seen. He wondered what horses would be out that day, hoped they might be his favourites, Smiler, the grey, and Paddy-from-Cork, the roan; and promised himself much enjoyment in pointing out their several merits to Katy. The boat and the horses were to his mind better than even the birds. The excursion had been successful, but the passage-boat was a pleasure on which he had not calculated, and on that account the pleasure was all the greater.

CHAPTER VI.

The station-house, situated on the bank of the canal, about three miles' distance from Greysley, was a small white inn, which, if one might judge from its somewhat dilapidated appearance, did not drive a roaring trade. Behind were one or two outhouses, and on the same line with itself was a large shed, in which luggage for the passage-boat was stowed. The whole place was sleepy enough usually, and only when the boat appeared did it wake up to some semblance of life. As the children approached, half-a-dozen intending passengers came out of the inn with their parcels and stood upon the little wharf. A country road, with beechen hedges on each side, came right down on the canal bank by the side of the station-house, and at the end of the road a plain carriage waited, the coachman on the box, while a little further forward a serving man in dark livery stood at ease, one white-gloved hand clasped on the other. Jack glanced at the somewhat unusual sight as he passed, and thought he had never seen horses with such sleek coats, or that arched their necks and tossed their heads so proudly. The children had hardly got in front of the station-house when up trotted Smiler and Paddy-from-Cork with their riders, who seemed to Jack to look down haughtily, as befitted their dignity. The drag-rope was immediately unloosened, and the long boat, with its white awning, under which the people sat, came alongside the wooden wharf with a bump. Parcels were tossed in, parcels were tossed out; passengers stepped in carefully and disappeared under the awning; passengers emerged from the awning and stepped out carefully on the wharf. Amongst the passengers who came out Katy noticed an old lady with her maid,—the old lady mightily interested in the matter of luggage; and to her the serving man in dark livery came forward and touched his hat. A sentence or so was interchanged, and the man took the luggage under his own special charge, and with the assistance of one of the station-house hangers-on, had it conveyed to the carriage, which was waiting. This Katy noticed with her quick eyes; Jack was busy watching Smiler and Paddy-from-Cork, the latter having at the moment its hot nostrils thrust into a pail of water which an ostler was holding up to it on knee crooked for the purpose. Released from the care of luggage, the old lady took her maid's arm and came along the wharf, assisting herself with a stick. She stooped a little, her face was thin and pale, but her eye was keen and sharp, and, in its glances, seemed to pierce everybody and everything. She was strangely dressed, the child observed, and in some particulars not specially well. She wore a dress of black silk—silk which had evidently been turned—and the upper part of her body was covered with a white tippet. The hand that rested on the stick was thin and withered, with big blue veins wandering through it, and the fingers, Katy saw, were covered with massive rings. She was speaking to her maid, and her voice was sharp and imperious—a voice that could administer rebuke as a strong and willing arm a lash, and which seemed to be unaware that there was such a thing as contradiction or dissent in the world. Passing towards the carriage in front of the children she bent on them her keen eyes, then stopped short and gazed on them for a moment or so, much to Katy's trepidation—Jack was at that moment watching how the ostler was dashing the remainder of the pailful of water on Paddy-from-Cork's fetlocks—and went slowly on. After going half-a-dozen paces she whirled her maid impatiently round, and came towards them. Jack was now conscious that he was the object of scrutiny, and although he coloured he returned the gaze with steadiness. The old lady stopped right in front of them, at about the distance of a yard.

"Come here!" she said; and she beckoned with a finger that was like a wild bird's claw.

The children advanced: they could not very well tell why.

"What is your name?"

Jack did not like to be catechised after this fashion, but there was an imperiousness in the lady's manner which he could not resist.

"Hagart," he said.

"And you live in Greysley? Your mother's name is Margaret, your father's—Alfred?"

"Yes," said Jack, a good deal astonished.

"Your father is an artist, or a painter, or something of that kind?"

There was something in the intonation of the question—some little spice of contempt or hostility, as it seemed to the boy, which nettled him; and, lifting up his head proudly, he blurted out, "My father is a gentleman," and then he blushed scarlet at his own temerity.

The old lady's eyes lingered on his face for a little, after a somewhat inscrutable fashion. "Your name is John," she went on, "and this is Katy! Let me see you, Katy."

Katy, who had shrunk back a little, was drawn forward by the strange questioner. She was trembling; and when the old lady placed both her hands on her cheeks, lifted up her face, and gazed into it as if she wished to read something in it, she fairly broke down and cried.

The quick colour flooded Jack's face in an instant—but this time it was anger, not shame—and his eyes grew bright. "Let Katy alone!" he said impetuously. "Who are you? I never saw you before. You have no right to question us. Come away, Katy!" and he took his sister's hand.

And thereat the curious sweetness of a smile came into the severe mouth, which puzzled the boy. She looked at him till the smile died away, and when it died the face did not seem nearly so stern. "Who am I? You may well ask! It's my turn to be questioner now. Did you never hear your mother speak of her sister?—of her whom you were called after, Katy?"

"No," said Jack, "I never did," while he mentally contrasted his mother's youthful figure and soft outlines with the bowed figure before him.

This response of Jack was true in the letter if not in the spirit. He certainly had never heard his mother speak directly of Miss Kate McQuarrie—but then his mother had spoken of her frequently to Martha, and through Martha some dim shadowy notion of Miss Kate, her habits and whereabouts, had oozed and percolated to the children—sufficient to make them recognise her now.

"So, so; but I have no reason to complain. She took her way, I mine. Tell your mother that I have seen you to-day, and that I recognised you by your faces. Tell her that I would not act to-day as I acted long ago. Tell her I don't ask to meet her. Tell her that I have been ill, and that I am going to stay with some friends near this. Will you remember?"

"Yes," said Jack and Katy, both at once.

"Then go home, dears," said Miss Kate McQuarrie—for, as a matter of course, it was she—as she turned away. But the next moment she had left her maid's arm and came hobbling back. "Stay," she said, and then she thrust a coin into Katy's hand, and closed the little fingers upon it. "It's a sixpence; but don't open your hand till you come to the first tree. Mind! Here's a sixpence to you, John, and don't open *your* hand till your sister opens hers. If you disobey me, I'll come to you in your sleep and frighten you in your dreams. Kiss me, Katy!" and the old lips came down and lingered on the young cheek and mouth. "Now go home, go home, and the first tree—remember!"

Miss Kate looked after the children. "Oh me," she said, as she put her hand to her forehead, and pressed it wearily, "their faces vex me sorely;" then turning round, she took her maid's arm, and walked towards the carriage.

Jack and Katy began to walk home in a perfect state of bewilderment. During the colloquy the passage boat had started, and the black caps and red jackets were seen ahead disappearing round a curve of the canal. But they had on a sudden lost all interest. "That was our aunt," said Jack, finding his voice at last.

"She said I was called after her," said Katy.

"Isn't it strange we never heard of her—from mother? Mother told me that her people were rich: I wonder if aunt is rich! I wonder what she has given us," continued he, suddenly remembering and working the coin in his hand. "It seems bigger than a sixpence; it's a shilling perhaps! Shall we look?"

"No, no; wait till we come to the tree."

"Then run, and we'll be able to find out all the sooner;" so off they started.

"Now!" said Jack when they reached the tree. They both opened their hands, and were appalled by the gleam of gold. Miss Kate's sixpences were sovereigns.

"Hallo!" cried Jack, staring at the gold piece glittering in his palm.

"Let us go home," cried Katy, all in a tremor; "let us go home to mamma, Jack."

Jack thought this was the best thing to be done under the circumstances, and they started off at once. A crowd of birds were pecking at the crumbs which had been scattered half an hour before, and flew off at their approach unheeded. The old castle had lost its charm, although the sun shone lovingly on the red walls, and the birds were yet sailing around the turrets. They crossed the canal bridge, and saw the stream beneath, but they did not pause a moment to look through the railings. The strange meeting, and the sixpences which had transformed themselves into sovereigns, had got into their bewildered brains, and abode there to the exclusion of everything else. They walked rapidly, and when they came to the path that led down from the canal by the side of the distilleries to the road along the river bank, they were further astonished by beholding their father trudging briskly along with a brown paper parcel dangling from his left arm. Expected in the evening, there he was walking home in the early afternoon!

"See!" cried out the children, both at once, as they ran up to him, and displaying the sovereigns that had grown warm in their perspiring palms—so closely had they been held.

"Where did you get these?" said Hagart, "did you find them? or have you become a highwayman, Jack?"

"We got them from our aunt," they said, both at once.

"From Miss Kate McQuarrie!" said Hagart, coming to a full stop and staring at them. "And where did you see Aunt Kate?"

"At the station-house on the canal. We walked there this morning. She came out of the passage-boat while we were standing there. She said she knew us by our faces. She slipped this into our hands, and told us that we were not to look at what it was till we came to the first tree."

"She frightened me very much, and then she kissed me, and told me that I was her namesake. Am I, papa?"

"I never heard you speak of Aunt Kate, father! She said she was sorry for something she had done to mother, and that we were to tell mother that she had been ill, and was going to stay with friends near the station-house."

"Why, this beats Stavert!" said Hagart. "I never was so astonished by anything in the whole course of my life. What a bundle of news I have for Margaret, to be sure! She won't care much for my present now." And then as some happy idea struck him his face became luminous as we saw it in the little Inn at King's-barns. "It will be as good as a play," he muttered half to himself. "But come along," said he, thrusting his parcel into his left armpit, and taking his children one in each hand. "Don't speak to your mother about this till once I give you leave. Remember. But it's very odd."

They walked for a little space in silence, and then Hagart said suddenly, "Do you remember the stone griffin I once showed you on Sir Andrew Freemantle's gates, Jack?"

"Yes!"

"Do you ever remember to have eaten a half-cooked rhubarb dumpling without sugar—a dumpling that set your teeth on edge?"

"Yes; and very sour and bitter it was."

"Exactly! I should fancy your aunt resembles the griffin and the sugarless dumpling. What is she like? I never saw her in my life."

"Very old," said Jack. "She has a hooked nose, and stoops, and walks with a stick, and leans on the arm of a maid—but she has the sharpest eyes; they go through you."

"She had the funniest old-fashioned bonnet, and wore a black silk skirt, and a large white tippet," said Katy.

"Humph! Well now, say nothing about this till I give you leave. Do you know, Jack, I have been in luck! Spiggleton's a very Peru. This campaign has been like one of Napoleon's Italian ones—victory on victory! I have sold all my sketches, my boy!"

"All your sketches!"

"All! every one, Jack. And I'll take the field with a new army in a fortnight. Napoleon did not let his enemy rest—no more will I. I'll invade Spiggleton, and dictate my own terms to the rascals. Trade is brisk, and I'll have my own prices."

When Alfred reached his own door he gave the bell such a triumphant peal that his wife started and ran to the window, where she stood gazing on him with some surprise. He had hardly time to kiss his hand gallantly to her when Martha opened the door. "Now, Martha, take these children off, and make them wash their hands and faces. They are to dine with me to day. And, Martha, don't let them into the parlour till I call for them. Off with you!"

By this time Mrs. Hagart was in the lobby. "You are earlier than we expected, Alfred, and dinner is not quite ready. Where did you meet the children?"

"On the way home," said Hagart, as he entered the parlour with his wife and closed the door; "and I promised the rogues that if they tidied themselves they should dine with us. And now—" by this time he had dropped into a chair, and was regarding his wife with a beaming countenance—"I suppose you are dying to know what fortune I have had!"

"Yes, indeed, Alfred," said his wife, extracting considerable comfort from his pleased face.

"Mercenary minx! What do you think of that?" and out of his right breeches pocket he took out a small roll of notes.

His wife counted over the roll, and when she was done she smiled. "This is pretty well, Alfred."

"And that!" and out of his left breeches pocket came another small roll. When his wife had counted *it* she said, "Bless me! you have been quite in luck."

"Should you like any more?" cried he.

"Well——"

"For I have got more yet," and out of one vest pocket came another roll, and out of the other vest pocket yet another roll. "There they are—fifty pounds in all." And then he got up and kissed his wife, who was at that moment the happiest little woman in the world.

"Fifty pounds is a large sum, Alfred. We will be able to pay——"

"Don't talk of paying! You'll pay everything and everybody. I'll be back in Spiggleton in a fortnight and bring more."

"But why didn't you give it me all at once?" his wife asked as she rolled up the money.

"To bring surprise to a climax! I separated them two hours ago. Every roll of notes brought an additional sunbeam to your face, Mag, very pleasant to see. You would not deny me that pleasure, would you? I've been thinking about it all day. You have been pale and anxious enough at times—God knows. I would do anything to make you happy."

"And you make me always very happy, Alfred. We have had our trials, but——"

"Now don't speak," said Alfred, putting up his hand. "I have something more for you yet." And he brought over the paper parcel and opened it. "Now then, isn't that pretty?"

His wife admired her dress hugely and went to the window to examine its texture, but her eyes had no sooner fallen on the scarf which Alfred had uncovered than—divining its purpose, and for whom it was intended—she put her hand to the bell; "We must have Katy in to see this."

"Wait a bit. They will come in good time. Sit down, Margaret! Do you remember Stavert—who called on us once or twice in London when we married first?"

"Yes."

"Well, he came in on the coach with me from King's-barns—for with fifty pounds in my pocket I nobly scorned to be a pedestrian—and he spoke to me about your sister."

Mrs. Hagart's face was covered in a moment by a pained flush. This was the first time that her husband had alluded to Miss Kate McQuarrie in her hearing since the day he thrust that lady's letter in the fire.

"He spoke to me about your sister," and he then related the conversation, interpolating his own remarks by the way. "That's what Stavert said. He and his wife are in disgrace, but whether our chances are looking up I shall leave the younkers to tell." He then went to the parlour-door, and called out, "Come here, ye freebooters, and explain to mamma how you come to be in possession of golden coin!"

In a moment Katy and Jack were in the room, the sovereigns in their hands.

"From whom did you get that money?" cried Hagart, glancing at his wife, and managing his household drama with considerable dexterity.

"From an old lady who told us she was our aunt. We met her at the station-house by the canal. We were to tell you she had been ill. She said she knew us by our faces."

"She kissed me, and told me I had been called after her," said Katy.

"She put sovereigns in our hands and told us they were sixpences, and we were not to open our hands and look at them till we came to the first tree; and so we ran to the tree, that we might see what we had got. I thought my sixpence was a large one."

Hagart was in great spirits; but what was his dismay when he saw a complex trouble come into his wife's face. She suddenly took hold of Kate, pressed her to her heart, and broke into a great fit of crying.

"Margaret," said he, "what's the matter?"

"Oh, Alfred!" she sobbed, still straining the child close, "I am so glad—and so sorry. You can't understand me. You don't know what I have been keeping in my heart for so long. I wish the children had not met my sister."

"Why, Margaret? There's no harm done, so far as I can see, and perhaps some good may come of it. I don't care, of course, for her money; but I shouldn't be surprised if she came to see you one of these days."

"No, no, Alfred; she won't come; she won't write. I don't know why I should feel so vexed"—the little woman here began to wipe her eyes—"and perhaps after all it is better that she should have seen the children and liked them, poor dears. You must think me very foolish! We'll have holes bored in the sovereigns, Alfred, and the children will wear them. I value them very much, and would not exchange them for anything ten times their value."

And so, aided by many comforting words from her husband, Mrs. Hagart regained composure; and after running into her bed-room to wipe away the traces of tears, the whole family sat down to dinner. When the meal was over, and the children gone, Hagart, over his second tumbler of punch, worked himself into the belief that he was to make a fortune out of Spiggleton, and his wife believed that he was so destined—as she had believed that out of this thing or the other he was so destined a dozen times before.

THE LAST WORDS OF SOCRATES.

"We owe a cock to Æsculapius."

No scorn or doubt was thine, O martyred one,
  Nor feigned compliance with accustomed rite.
  But Faith, in that last hour, serenely bright,
Through smile half-sad, and jest half-earnest, shone.
Rich rays of glory crown the westering sun;
  And thou, thy long day's journey all but o'er,
  Casting one glance from that eternal shore,
Thy crown of light, thy better life hadst won.
No draught Nepenthè, quick and strong to soothe,
  Vied with that hemlock in its power to save,
And dim eyes, opening on th' unveilèd Truth,
  Saw the far land that lies beyond the grave;
Hushed into silence man's perpetual strife,
All healed by death the long disease of life.

E. H. P.

THE GREEKS AND THE GREEK CHURCH IN LONDON.

After writing my papers on the Jews in London,* my eye happened to fall upon a paragraph in the newspapers, to the effect that a deputation was about to be sent from the Eastern or Greek Church to prepare the way for intercommunion with the Protestant Churches of the West. The subject interested me, and I resolved to institute inquiries for my own information as to the actual state of the Greeks and of the Greek Church in London, and how they stand affected towards us. I purpose telling the readers of Good Words the result, premising that I offer no opinion whatever on the desirableness or undesirableness of the proposed union, but simply wish to give information on the subject.

The idea of a union between the Church of England and the Greek Church dates as far back as the time of Peter the Great, who is said to have proposed it through his Ambassador to this country. The proposition, however, if it ever was made, fell to the ground—possibly from a somewhat excusable objection our Government had to entertain a religious question emanating from such a source. From that time till within the last three or four years the subject, with one or two ineffective exceptions, seems to have dropped, at least on the part of the Western Protestant Churches; but now it appears to have been taken up with considerable energy. Several clergymen of the Church of England entertained the possibility of intercommunion, and the deeper they went into the question the greater appeared the possibility of accomplishing it. But it remained for that eminently practical nation, the United States of America, to take the first step towards its accomplishment.

At the general convention of the Protestant Episcopal Church in the United States, held in New York in October, 1862, the Reverend Dr. Thrall, one of the clerical deputies from California, called the attention of the meeting to the fact, that there were at that time in San Francisco between three and four hundred communicants of the Greek Church, many of whom had been under his pastoral charge, although not feeling free to receive the Communion at his hands owing to the unsettled relations between their Church and his own. The congregation was increasing rapidly in numbers; they were about to build a church of their own and become organised into a parish, and before long there might be appointed in that city a Bishop of the Russo-Greek Church, who would claim jurisdiction, and thus bring about a conflict with the Bishop of California. He asked for the appointment of a committee of inquiry and correspondence on the subject, the main object of which would be to present the claims of the American Church, as a true portion of the Church Catholic, as duly qualified to guide and feed those who might come from the Russian dominions to reside temporarily or permanently in America. Such a movement might at last enable the Anglican and Greek Churches to present an undivided front to Rome and the infidel.

After a lengthened discussion, the motion was put and carried unanimously; and a committee, composed of three Bishops and six clerical and lay deputies, was appointed to carry out the resolution.

A short time after the adjournment of the general convention the committee had the gratification of receiving a communication from the Rev. George Williams, B.D., of King's College, Cambridge, congratulating them on the step they had taken, and informing them that many English divines of great eminence, including the late Bishop of London, had already entertained the practicability of their proposal, and that he had personally visited Russia with the view of ascertaining the opinion of the Greek clergy, which he found to be most encouraging. He, moreover, advised the American Protestant Episcopal Church to correspond with the English clergy on the subject, as the united efforts of the two Churches would have a greater effect in bringing about the object in view than each acting independently.

The American committee appear to have unanimously adopted the suggestion. A communication from them was forwarded to England. The result was the formation of the American and English committees—two in name, though in fact one joint committee of the Reformed Catholic Church—for considering and reporting upon this delicate and momentous matter.

It must not be imagined that the movement in England and America was viewed with indifference by the Greek clergy. The subject, on the contrary, was most cordially entertained by them; and two letters were sent to the chaplain of the Russian embassy in Paris, the learned Arch-Priest Wassilieff, signed by thirteen patriarchs of the Greek Church, and by him inserted in the "Union Chrétienne," a journal published in Paris. These letters profess the warmest satisfaction at the idea of again uniting the Greek Church with her Western sisters, and express a strong hope that the movement will be encouraged in every possible manner. The Arch-Priest Wassilieff has himself written several admirable articles in the "Union Chrétienne" on the subject, which want of space will not allow me to quote in the manner they deserve. One short extract alone must suffice as showing the feeling of the rev. gentleman towards the English Church:—

"We do not hesitate to say that the Anglican

---

Reformation has left untouched a great Catholic principle which allows that Church to renew at pleasure the bonds of fraternity with the ancient Universal Church. Let it be understood that we do not here speak of the Roman Church. Romanism and Catholicism are incompatible ideas: they differ from each other as do the particular and the universal. Therefore a re-union of the Anglican with the Roman Church as it is, is properly considered impossible. The Anglican Church will never submit to the yoke of Papacy. Her religious convictions as well as the national aspirations are irresistibly opposed to any such thing. The Anglican Church will be no one's slave."

In the Arch-Priest's address to the Protestant clergy of England, he says, "The *true* Catholic Church in seeking for *unity* does not confound it with *uniformity*. As to matters of opinion, while she is faithful to apostolic discipline, yet in its application she is tolerant of national peculiarities. It is a principle with her to allow every people their own liturgic tongue and their national independence, her end being the salvation of souls, and her kingdom not of this world.

"Then, brethren of England, you may with entire confidence extend your hand to us, as we with respect and in all sincerity extend ours to you.

(Signed) "THE ARCH-PRIEST WASSILIEFF."

The perusal of the papers from which the above statements are abstracted rather puzzled me, for I had imagined that the Russo-Greek Church had little to recommend it to the Protestant mind over the Roman Catholic. I considered, and had in fact been taught, that the doctrine of Mariolatry was carried by it even to a greater extent than by the Latin Church; that the confessional was as powerful in the one as in the other, and the hierarchy as despotic; that the adoration of pictures was carried to a greater extent than in Roman Catholic countries; and that in Russia the Czar was the spiritual Head of the Church, and used it frequently for political purposes. But now I am informed that the Russian Greek Church is fully as free from temporal jurisdiction and as liberal as the English Protestant Church itself.

By way of arriving at a just conclusion on the question, I resolved to wait on the Archimandrite of the Greek Church in London, the Rev. Narcissus Morphinos, and obtain if possible from him some information on the doctrine and organisation of his Church. To this resolution I was greatly stimulated by the high reputation for learning, piety, and courtesy of the reverend gentleman. When I called on him it was not without some trepidation, as I was not only utterly unknown to him, but was also without any letter of introduction.

If I was somewhat nervous when I entered his sitting-room, the feeling vanished when I met the reverend gentleman, as nothing could be more amiable than the reception he gave me as soon as he was aware of the object of my visit.

"I will give you all the information in my power, candidly and willingly," he said.

He placed before me a sheet of foolscap paper and pen and ink, and then seating himself on the opposite side of the table, he continued:

"Now ask me any questions you please, and you can, if you like, write down my answers."

I willingly accepted his offer, and the following is a tolerably exact report of the questions and answers which passed between us.

Q. "Will you inform me what position the Virgin Mary holds in the Greek Church? I have been told by a Roman Catholic gentleman that it is higher than in his own creed?"

A. "The statement is utterly without foundation. We highly venerate the Virgin, but nothing more. We neither adore nor worship her. In our Liturgy you may perceive we have not a single prayer to her. In our catechism, also, the student is expressly cautioned against any idea of the kind."

Q. "Do you offer any worship to pictures?"

A. "None whatever; that again is a slander of the enemies of our Church. In our catechism all are warned against any error of the kind."

Q. "What is the reason then that a picture of the Virgin or a Saint is found in every Russian peasant's house?"

A. "You must bear in mind that the great mass of the peasantry and lower orders generally were, till lately, exceedingly ignorant; although now great efforts are being made for their instruction. It would be useless to put a tract or a printed prayer into the hands of a man who could not read. The pictures in the Russian peasants' houses are simply for picture reading. A man who cannot read can easily understand the meaning of a painting. As learning progresses among them, the necessity for this picture-reading will be the less; still, at the same time, a fine painting or a good copy may occasionally teach a good lesson."

Q. "Do you believe in purgatory?"

A. "Certainly not. The Greek Church accepts nothing for which it has not Scripture authority, and neither in the Old nor New Testament is the word purgatory mentioned."

Q. "Do you hold to the practice of the confessional in the Greek Church?"

A. "We do; but you must not confound our confessional with that of the Roman Catholics."

Q. "Why not?"

A. "We differ in many respects. We have no regular series of questions to put to a penitent. Our confession is conducted in the following manner. Before administering the Sacrament, I inform my congregation of my intention to do so, and request those who may wish to receive it to give me their names. I ask each if he has any particular sin weighing on his conscience so heavily as to impede him from communicating, as in that case it will be necessary for him to confess it."

Q. "Is the gravity of the sin left to his own conscience? Is he at liberty to decide whether it is sufficiently serious to necessitate confession?"

A. "It is. If he replies that he has no heavy sin weighing on his mind, I ask him no further questions, but administer to him the Sacrament. If, on the contrary, he tells me he has, I hear his confession."

Q. "Do you question him on other sins he may not have stated?"

A. "Certainly not; it is only on the sins he has voluntarily confessed that I examine him."

Q. "Suppose, for example, he has robbed any one of a sum of money?"

A. "I advise him to repent of his fault, and make restitution of the money stolen if it be in his power; and if he does not obey me, I refuse him the Sacrament."

Q. "Suppose he makes restitution, what steps do you then take?"

A. "I pray with him that his sin may be forgiven, and if I believe him to be penitent, I allow him to communicate."

Q. "Do you insist on any penance?"

A. "We have no penance in the Greek Church."

Q. "Do you grant him absolution?"

A. "In the Greek Church we have no absolution for confessed sins. The power of forgiveness of sins we believe is only in the hands of the Almighty."

Q. "In the Roman Catholic confession there are many regular questions asked, some of which are exceedingly repugnant to the Protestant mind, especially when addressed to women. Do you use them in the Greek Church?"

A. "Never. No Greek priest dare question women on subjects of the kind. We are very cautious to avoid the slightest appearance of scandal, or even the possibility of it in the Greek Church. All our parochial clergy are obliged to be married before they are ordained."

Q. "Has the hierarchy of the Greek Church the power of altering or adding to doctrinal points?"

A. "None whatever. We follow strictly the Holy Scriptures, which we hold to be the only rule of faith. In this we diametrically differ from the Romish Church. For example, the doctrine lately promulgated by the Pope—that of the Immaculate Conception—could not have been propounded by the Greek Church."

Q. "Is your Church liberal in its opinions?"

A. "Yes. Perhaps more so than your own. I will give you an example. If an English Protestant dies in our country he is buried without difficulty in Greek consecrated ground, and the service may be performed, either by an English Protestant minister or one of our own community. A short time since I was called upon to perform the burial service over a poor Greek who had died in London. A piece of ground had been selected in one of your cemeteries. At the last moment permission was refused me, as it was consecrated ground. I argued that the Greek Church was so nearly allied to the Anglican that there should be no difficulty in the matter, but without avail. I was not allowed to bury the poor man in consecrated ground."

Q. "Do you consider the inter-communion of the Russo-Greek Church and the Anglican to be practicable?"

A. "Nothing would delight me more. There appears to me, however, to be great difficulties in the way, but remember I am only expressing my own individual opinions. As I told you before, the Greek Church follows implicity the Holy Scriptures in their teaching, but your Church appears to be more allied to the Roman Catholic on some questions than ours, and on matters of the kind I think great objections will arise to perfect inter-communion. In all subjects of discipline the Greek Church is the most tolerant in the world, but hitherto she has proved inexorable to all innovation in doctrinal matters, and this determinatiom on her part has formed the great solidity of the Greek Church, and has defended her from schismatic changes. Fifty years since, when it was proposed to unite the Greek Georgian Church with the Russian, it was found, on investigation, that the doctrines were in every point exactly the same, although the Churches had been separated since the fourth century."

Q. "Will you kindly quote an instance in which you consider the Greek Church follows more closely the Holy Scriptures than our own?"

A. "I will take perhaps the most material—the procession of the Holy Ghost. The Greek Church believes that the Holy Ghost proceeds solely from the Father."

Q. "From what text do you derive your authority?"

A. "From the 15th chapter of the Gospel of St. John, the 26th verse. 'But when the Comforter is come, whom I will send unto you from the Father, *even* the Spirit of truth, which proceedeth from the Father, he shall testify of me.' I consider there are other objections to intercommunion, but that I hold to be the principal."

I now changed the conversation to the Greek congregation in London and their church. The worthy Archimandrite answered all my questions on this subject with the same frankness as he had hitherto shown.

"The Greek congregation in London," he said, "does not exceed four hundred and fifty or five hundred, comprising women, children, and native servants. The men are mostly merchants, almost, if not all, of good standing and great respectability. Many of them have their offices in the immediate neighbourhood. In Finsbury Circus you will find several of the highest firms. I perhaps may be considered prejudiced, but I believe it would be difficult to find in London a more respectable congregation than my own. Those who reside at a distance also attend service at my church."

"Have not the Russians a church of their own in London?"

"Yes, there is one attached to the embassy, but if there had not been it would have been impossible for them to have attended at mine, as they do not understand our language, although our service is exactly the same. As I said before, in the Eastern as in the Protestant religion, the service must be in the language of the worshippers. Would you like to see our church? We can enter it from the house."

I told him I should consider it as a favour, and he immediately led me into the building. It was small, of a square form, and in beautiful order. The altar was concealed by low ornamented gates (the Iconostasis), which were approached by two broad marble steps on which the communicants knelt when receiving the Sacrament, the priest taking the bread and wine from the altar behind him. There was no organ, the Greek Church having as strong an aversion to the instrument as Presbyterians. On each side of the steps leading up to the altar were two immense candelabra, each holding perhaps ten or a dozen candles. In front of the altar was a considerable space, which during the service is kept clear. To the right of the altar were three seats for the trustees of the church, and on the left were two desks for the readers, and a pulpit behind them. On the right beyond the trustees' seats, were three rows of seats for women, and facing the altar were those for the men. Altogether there were one hundred and fifty-six seats. There were also two very small lateral galleries, scarcely seen from below. What particularly struck me was the shape and carving of the seats. They were something of the shape of our cathedral stalls. The carving on them, though in low relief, was so artistically designed and executed, that I called the attention of the Archimandrite to their beauty.

"They certainly are very handsome," he replied, "the mere carving of each seat cost eight pounds."

"By whom was it paid?"

"By subscription among the congregation. The church has been built about thirteen years, and the whole expense was borne by the Greek merchants in London."

"And from what funds is the church maintained?"

"Entirely from private voluntary subscriptions."

"What rent do you receive for each sitting?"

"We have no sittings appropriated to particular individuals. Any person coming into the church takes the first he finds vacant. From women and children we receive no contributions. All expenses are paid by the men by annual subscriptions, according to their means or liberality."

"If it is not an indiscreet question, what may be the amount of the usual subscription?"

"Some gentlemen pay five pounds a-year each, others ten, some twenty, the average I think is about twenty-five, two subscribe eighty and one two hundred."

"And what may be the gross amount of your receipts?"

"About sixteen hundred pounds a-year, irrespective of our charity fund, which will be about two hundred a-year more?"

I looked round me with astonishment, for the church by no possibility could have held more than four hundred persons. Perhaps the worthy Archimandrite noticed my surprise, for he continued, "I will show you our printed balance sheet if you please."

He did so afterwards, and I found the annual income of the church from sittings to be £1660.

"Have you many Greek poor?" I inquired.

"Very few, or our charity fund would be much larger. The Greek Church strongly insists on the necessity of good works."

"Do you burn lights in the day time before your altar?"

"We do, but neither that nor our ceremonies would be any impediment on our part to intercommunion with the Western Churches. We hold that all nations have their own peculiar ideas as to the most respectful method of worshipping the Creator, and the simple service of the Presbyterians we admit to be as valid as our own. We allow every nation not only their own language but their peculiar rites as well."

I remained some time longer with the Archimandrite, and then took my leave, much gratified with my visit and the courtesy I had received.

I afterwards waited on the Reverend Eugene Papoff, the priest of the Russian embassy, and requested he would give me his opinion on certain points connected with the Russo-Greek Church. The reception he gave me was fully as cordial as that I had received from the Archimandrite. To my inquiry whether the Czar, as temporal head of the Russo-Greek Church, had any jurisdiction in spiritual matters, he informed me that he had none whatever. The Russian Church was governed by a synod over which the Emperor had no control. To my question, whether he believed it would be possible to unite the Eastern with the Western Churches, he pointed out the same difficulty as that instanced by the Archimandrite, the doctrine of the procession of the Holy Ghost. All other points he believed might be smoothed down. He spoke with great animation on the subject of the union of the Churches, pointing out the immense effect it would have could the eighty millions of the Eastern Church be united with the Western Churches, and his great desire that it might be accomplished. He showed me also the chapel of the Russian Embassy, but as it was at the time undergoing repairs, I could not judge of it properly. He told me that as very few Russians reside in London beyond those attached to the Embassy, it was as large as was required, the principal portion of the Russian merchants who reside among us being from the German provinces, and of course mostly of the Lutheran persuasion.

Without wishing to say anything as to the propriety of the intercommunion of the Churches, I may yet observe that if we are allowed to judge of the tree by its fruits, the Greek Church, as well as the Greeks, is worthy of our respect. I submit that the fact of so small a congregation subscribing £1660 a-year by voluntary subscriptions to the maintenance of their church irrespective of their charity fund, does them credit. But this is not all. Among the most liberal contributors to our Protestant charities in London are the Greek merchants, so much so that they offer admirable examples to many of our London merchants.

WILLIAM GILBERT.

ON THE NATURE AND COMPOSITION OF FOOD.

By LYON PLAYFAIR, C.B., LL.D.

[THE SECOND OF TWO PAPERS.]

In a previous article we pointed out that there were three great classes of ingredients in food, (1) the nitrogenous ingredients, popularly called "flesh-formers," (2) the non-nitrogenous substances, such as fat and starch, popularly termed "heat-givers," and (3) mineral ingredients. We accepted, as sufficient for scientific as well as for practical purposes, these great generalisations of Liebig. In doing so, it is fair to tell the reader that certain physiologists will consider we are not up to the present state of knowledge, and that we ought to abandon such divisions, "because flesh-formers may not always form flesh, and may sometimes serve as heat-givers, and that both must co-operate in nutrition." But we have already warned the reader that nature requires an admixture of all the classes of aliments in perfect nutrition. This picking to pieces a grand connected classification is not new in the history of the eminent German chemist to whom science owes so much. When he wrote on agriculture, his broad conceptions were misunderstood, and small interpolations were supposed to disconnect or to destroy them, till at length an eminent farmer, the late Mr. Pusey, told us that the only thing which science had done for agriculture was to show "that nitrogen was the food for wheat and phosphorus for turnips." This picking out of two elements from twelve, every one of which was equally necessary to the growth of the plants, was such a singular misapprehension of scientific teaching, that the author of the present paper then remonstrated in the following terms:—"This is a strange retrograde step in agriculture, when one of its most eminent cultivators, and editor of the Journal of the English Agricultural Society, commends the notion of specifics in the practice of his art. What would be thought of a like dogma in animal physiology? Because the Arab in his desert has little fat and therefore more nitrogenous tissue or flesh; because a Highlander is large-boned and therefore abounds in phosphate of lime; would it be permitted to pick out the two single elements,—nitrogen and phosphorus—from food, and give as a practical dictum, like that announced by Mr. Pusey for agriculture, that nitrogen is the food for an Arab, and phosphorus is the food for a Highlander!" But this illustration, which was taken on account of its absurdity, has now become almost a reality in the writings of some of our distinguished physiologists. Because they find that portions of each of the classes of alimentary ingredients may pass undigested through the system, they tremble to call them of necessity "flesh-formers" or "heat-givers;" because the first class may, and in fact do, under certain circumstances, act in developing heat, and because the heat-givers must co-operate with nitrogenous substances in building up the body, a due proportion of both being essential for the support of life, they abandon the generalisation, and look only to the amount of two elements, carbon and nitrogen, neglecting every other element in food, in the absence of one of which full nutrition would be impossible. To deny that the nitrogenous constituents of food are the flesh-formers for such reasons is like saying that bricks are not made of clay, because water and coal are also necessary for their production. This looking to detail and losing the great whole is neither new to common life nor to science. A man may pass through a city without seeing it on account of the separate houses, or he may miss the forest from the multitude of its trees. To some the fine proportions and adornment of a noble edifice are lost, though the size and material of the individual stones may have been observed. So some physiologists have tried to upset a beautiful generalisation by presenting difficulties which have only existence in a limited understanding of it. It is not asserted by chemists that each of the three divisions of food can act in its own way without mutual co-operation. Flesh could not be made by the nitrogenous ingredients of food, unless the heat-givers and mineral ingredients were at the same time aiding it in the work, nor could the two latter be of use in nutrition unless the former were in active co-operation. If they are not well adjusted and taken in proper quantity, some part of them may pass through the system unused. The beauty and truth of the great classification of the ingredients of food is not weakened but strengthened by such facts. We shall adhere, therefore, to the threefold division of food, asserting that the nitrogenous materials are essentially the builders up of the organs of the body, when aided by mineral ingredients, and in co-operation with the non-nitrogenous substances, which have their separate but connected duties to perform in the support of respiration and consequently of heat.

An adult man takes from 30 to 60 ounces of solid food daily, or in the course of the year about seven times the weight of his body, and yet that remains of the same weight at the end of the year as it was at the beginning. We know that part of this food is burned away in the support of respiration, but we have not yet considered in detail what becomes of the nitrogenous portions of the food. The body of a man consists of certain chemical ingredients the weight of which is known to us. Quetelet found by a large series of observations that the mean weight of an adult man of 30 years of age is a little above 140 lbs., or exactly 2245 ounces; if such a man were put into a mortar and mashed up, so that all his organs were destroyed and his bones mixed up in the mass, the chemical constituents of the pounded-up man would be as follows, in ounces and tenths of an ounce. (And here we may remind the reader, who is not accustomed to work with decimals, that the figure after the point always means tenths of an ounce in this paper; and when a *second* figure occurs after the point, it refers to so many hundredths of an ounce.)

Albuminoids or "flesh-formers" .	342·9	oz.
Derivatives from albuminoids, like gelatin	109·4	,,
Fat	55·2	,,
Colouring and extractive matter .	12·5	,,
Mineral substances	205·9	,,
Water	1519·1	,,
	2245·0	,,

We may run the first two lines together, and say that a man of 30 years of age contains in his body 452 ounces of substances having a like composition to the flesh-formers in his food. There is an old tradition that the body of a man changes completely in seven years. The fact is that it changes, if not completely, at least nearly so, in about 113 days. In other words the body wastes at such a rate, that all its nitrogenous substances would disappear in 113 days if the waste were not supplied by flesh-formers in the food. The bones obviously take a longer time to change, and if we may hazard a guess by the quantity of phosphates excreted, they may not change completely for 15 years. The blood is continually carrying to each organ of the body nutritive substances to repair it, but it is also simultaneously carrying away matters which have served their purpose and which are to be removed from the system. The new materials are built exactly into the place and form of those which are removed, so that the configuration of each organ or tissue remains apparently unaltered, although in fact continually changing. In every organ of an individual, life, in the form of local births, and death, by the destruction of parts, rapidly and incessantly alternate. A portion of matter is endowed with its allotted period of life, and is moulded into a living tissue, while a like portion of matter dies and is absorbed and secreted as its predecessors were before. The probability is that force is never manifested in any organ of the body without a partial destruction of it. A finger cannot be raised without a portion of its muscles being wasted in the effort, absorbed into the blood, and subsequently excreted from the system. The oxygen dissolved in the blood which circulates through the muscle is the immediate cause of the destruction. Blood circulating through a muscle at rest contains about 7½ per cent. of oxygen, but when the muscle is in a state of contraction it is reduced to 1⅓ per cent.; so that it obviously passes over and necessarily destroys the tissue which is exhibiting activity. Violent muscular effort soon shows this result by exhaustion. Rest now becomes necessary to enable the blood to restore the wasted part and build in living tissue in the place of that which has been removed. There is no reason why we should be afraid to admit that every thought and sensation produces a similar waste of nerve and brain tissue, just as mechanical labour does of muscular tissue. It is impossible to conceive mind manifesting itself to the world through inert and unchanging matter, when we know that animation and the power of change are essential to every living act. As our intellectual work is done through the agency of material organs, these must be altered in the performance of the commands of volition.

We now proceed to consider how much material must be supplied to the body to compensate for the waste which it experiences under different circumstances. We first propose to discuss how much food is requisite for mere subsistence; then to ascertain what quantity suffices for full health; and finally to supplement our information by investigating the amount necessary to support hard and continuous labour.

To treat these subjects properly would require a large volume: in our present limits little more can be expected than generalities. We need not search long to find cases in illustration of the quantity of food which is just barely sufficient to prevent starvation. In the well-known mutiny of the "Bounty," Captain Bligh and twenty-five men were set adrift in boats near the Friendly Islands, and from the close of April to the end of May subsisted on a daily allowance of one-twenty-fifth of a pound of biscuit for each man, with a quarter of a pint of water, and occasionally a teaspoonful or two of rum. While each man must have wasted daily, at a minimum, 2 oz. of albuminous or flesh-forming matter, he received only 280 grains of solid food, containing 39 grains of flesh-formers, or only one-twelfth of the daily loss of the body. Such an instance as this is one of prolonged starvation, not of subsistence. Perhaps no example of an existence prolonged by low diet is more remarkable than that of Franklin and Richardson in their memorable march from the shores of the Northern Ocean to Fort Enterprise. Only one hundred and forty miles had to be accomplished; but the march was undertaken in a climate demanding unstinted food, while the travellers could get little else to eat than *tripe de roche*, a sort of moss. The emaciated travellers found that a mile or two became a heavy day's journey. Yet we all remember that one of the party, Michel, a half-bred Iroquois, remained strong and active, while his companions were dying; the cause being afterwards ascertained to be that he lived upon the flesh of the dead, killing his comrades for a supply of food. With a strength thus preserved, Michel could easily have overcome Richardson and Hepburn in open fight, when the former, with a moral courage rarely surpassed, unsupported as he was by jury or court martial, became at once the judge and the executioner of the wretch who nourished himself by the sacrifice of his fellow-men. We have recalled this anecdote, because it presents a desired contrast, and illustrates our meaning, that prolonged starvation is not subsistence in the sense intended by us. We wish to arrive at a condition of food on which a man might subsist without being able to do active labour, for from such a foundation we might build up the requirements of persons under varying conditions. In prisons we have persons confined in warm houses, and doing but little work, while we have also cases recorded where the allotted food has proved insufficient for their sustenance. Let us quote two instances in point. In Bengal, some time since, the rations of the prisoners were entrusted to a contractor, and, as might have been expected, he gave them in such limited quantity, that the health of the prisoners suffered, and their weight sensibly decreased. Under this system each prisoner received weekly 140 oz. of rice, 24 oz. of dahl (a kind of pea), and 3½ oz. of oil. The *daily* value of this diet is as follows:—

Flesh-formers	2·05 oz.
Fat	0·73 ,,
Starch and sugar	17·84 ,,
Mineral matter	1·30 ,,

The total carbon in this diet is 9·05 oz. Here, then, we have an instance of a diet on which men lived, though barely and insufficiently. As, however, these men were Hindoos, let us take another instance from this country. Some years since a medical man, wofully ignorant of the science of dietetics, recommended that the prisons of Dundee, Perth, and Paisley should substitute treacle-water for milk; that is, an aliment containing no flesh-formers at all for one rich in them. The new diet was then as follows in the case of the Dundee prison:—Oatmeal, 10 oz.; bread, 6 oz.; meat, 1 oz.; treacle, 1·9 oz.; barley, 1·7 oz.; peas, 2 oz.; vegetables, 2 oz. Under this dietary the prisoners became discontented, although their health did not suffer materially; but Dr. Christison, who drew attention to the case, states that 50 per cent. of them lost in weight an average of 4·3 pounds each. This gives us, then, an excellent instance of a mere subsistence dietary. Its nutritive value is expressed in the following numbers:—

Flesh-formers	2·87 oz.
Fat	0·87 ,,
Starch	12·94 ,,
Mineral matter	0·48 ,,

The starch equivalent of the heat-givers is 15 oz., the total carbon in the food being 7·58 oz., and the ratio between flesh-formers and heat-givers is 1 : 5·2. One more instance will suffice. In the recent valuable inquiry into the food of the labouring classes, made by Dr. E. Smith at the instance of the Medical Officer of Health to the Privy Council, the diet is given of needlewomen in London. Calculating this diet by our tables, we find its nutritive value to be the following:—

Flesh-formers	1·90 oz.
Fat	1·04 ,,
Starch	8·94 ,,
Mineral matter	0·31 ,,

The total carbon in this diet is 5·8 ounces, while the ratio of the flesh-formers to the starch equivalent, which is 11·36 ounces, is as 1 : 6 nearly. That a diet so low as this should prevail among our poor needlewomen, inferior as it is to the insufficient rations of the Hindoo prisoners when fed on contract, sufficiently accounts for the excessive mortality among them as they pursue their tedious work:—

> "In poverty, hunger, and dirt,
> Sewing at once with a double thread
> A shroud as well as a shirt."

Summing up what we fear may have been wearisome numbers to many of our readers, it may be stated generally, that a man is reduced to the verge of starvation when he has only 2 oz. of flesh-formers daily in his food. The variation in fat and starch is less between a sufficient and insufficient diet than in the case of flesh-formers, but when the fat falls to 1 oz. daily and the starch to under 12 oz., the diet must be considered a mere subsistence one, even as regards the heat-givers. This estimate only allows 7·1 oz. of carbon in food, while 8oz. may be considered a minimum, even in a low ordinary diet. In our poor-law unions it is usual to give a subsistence diet, or one suited to the small amount of labour in the workhouse test, and the Poor-Law Board have for several years discussed the nutritive value of the diets given. This experience is highly valuable, and is mainly due to an intelligent official of the Board, Mr. Harries, who from an early period perceived the importance of regulating the dietaries by chemical instead of by arbitrary considerations. The following numbers express the value of the dietaries of able-bodied paupers, as the mean result for all England and Wales during the year 1863:—

	Men.	Women.
Flesh-formers	3·19 oz.	2·85 oz.
Heat-givers	14·41 ,,	12·76 ,,
Mineral matter	0·60 ,,	0·52 ,,

We are now prepared to go a step further, and discuss what may be considered a full and satisfying diet for able-bodied men who are engaged in occupations that do not involve excessive mechanical labour. We might take as a class of this kind the large body of soldiers found in each country during peace, and whose support in activity and health ought to be and is one of its most important public concerns. As the result of experience, we do find that there is a singular accordance in the nutritive value of soldiers' diets in different countries, as will be seen by the following figures :—

	England.	France.	Prussia.	Austria.
	Oz.	Oz.	Oz.	Oz.
Weight of solid food in ounces . . .	59·67	48·6	55·0	40·75
Flesh-formers . . .	4·25	4·40	4·0	4·21
Fat	3·46	1·43	1·10	1·39
Starch	15·67	16·39	16·85	15·11
Mineral matter . . .	0·79	0·70	0·72	0·64
Carbon	11·90	10·45	10·50	10·38

An inspection of these numbers points out the singular fact that, although the amount of solid food varies considerably in quantity, as it also does in the materials of which it is composed, yet the amount of flesh-formers in each country is remarkably uniform, in all cases reaching or slightly exceeding 4 oz. daily, while the quantity of carbon is usually 10½ oz., although in the case of the English soldiers it is nearly 12 oz. These military diets are only in times of peace, for they are found to be quite insufficient during war. They are in fact hardly sufficient for the recruit during his heavy drills, although the sergeant fattens and thrives under them. We may therefore safely take the nutritive value thus expressed as being sufficient for men who are not exposed to heavy labour. We select one or two instances in which the daily consumption of food has been carefully weighed, from among the middle classes, to show the limit of variations :—

	Flesh Formers.	Starch Equivalent.	Mineral Matter.	Carbon.
	Oz.	Oz.	Oz.	Oz.
1. Dr. Dalton; height 5 ft. 7 in.; muscular, athletic; philosopher	4·59	21·65	0·60	10·45
2. Dr. Hammond; 6 ft. 2 in., 14 stone; physiologist . . .	4·25	17·78	0·58	9·28
3. Physician to Murray's Lunatic Asylum, Perth; age 33, weight 8½ stones; walks daily 3 to 4 miles . . .	3·47	18·93	0·54	8·91

The numbers derived from the study of these middle class diets, lead us to results very nearly the same as those for soldiers, viz., that for able-bodied men, not engaged in active mechanical labour, there should be in their daily food, 4 oz. of flesh-formers, from 2 to 4 oz. of fat, and from 8 to 12 oz. of starch. Besides these ingredients, a man of this kind should receive daily ¾ oz. of mineral ingredients, 23 oz. of oxygen from the air, and about 80 oz. of water, partly contained in the food, and partly imbibed as drink. This is the only way in which a diet can be considered in the present state of science. The system which still prevails among some medical men, and among some Government officers, of looking only to the total number of ounces of solid food, without reference to its composition, is much more silly than would be the act of a builder who looked only to the total weights of building materials shot into his yard, without examining whether these aggregate weights consisted of water, lime, or bricks. Let us recapitulate the results to which we have arrived : the mere subsistence food of a man, without labour, being 2 oz. flesh-formers, 1 oz. fat, and 10 to 12 oz. starch, we must add for comfortable and healthy nutrition to this diet, 2 oz. more of flesh-formers, and 2 oz. more of fat, besides mineral matter, water, and air. We are now able to go another step in advance and inquire, whether such nutrition is fitted for a fully employed labourer.

All experience teaches us, that when much labour is to be accomplished, a large quantity of food must be consumed. A horse, when put to work, receives corn and beans, both being rich in flesh-formers, in addition to hay. Soldiers cannot fight on their peace diet. We learnt this by dire experience in the Crimea, when our overwrought and underfed soldiers died by thousands of disease, and not by the bullets or steel of the Russians. Towards the end of the war, the mistake was rectified, and the troops became healthy. Other countries knew the fact, and issued "war rations" as part of their system in feeding troops. These war rations are shown in the table given in the next page.

If these numbers be compared with the peace rations already given, it will be found that the 4 oz. of flesh-formers in peace increased to from 5 to 6 oz. in war; the heat-givers and carbon being augmented in proportion. Not less than 5½ oz. of structural food ought to be given in war, when toilsome marches, want of sleep, and trench-work task the body heavily in labour. Our sailors in the navy receive 5 oz. of flesh-formers daily, and those of the French navy 5½ oz. In the Crimea our soldiers, with their insufficient diet, were only able to remove 10 cubic yards of earth daily, in the construction of the railway from the port to the camp; while the English "navvies" sent over, removed 20 cubic yards. The latter, however, received 45½ oz. of solid food daily, containing 5¾ oz. of flesh-formers, and above 17 oz. of carbon. Navvies, when labouring on piece-work, frequently eat upwards of 80 oz. of solid food, containing 6¾ oz. of flesh-formers, nearly 4 oz. fat, and 24½ oz. of starch, the carbon being about 15½ oz. In fact, the contractor who engages them knows that their working power is gauged by their appetite, and the men whose appetites fail, are not unfrequently discharged as unfit for employment. "I send round my clerk," says a contractor, "when the men are getting their dinners, and those who can't eat, he marks with a bit of chalk, and we send them about their business." Right in principle though not humane in practice. When unusual work is required, an unusual supply of food must be given. In the late Schleswig war, the meat was doubled on actual fighting days, and the soldiers then fought on a navvy's allowance of nearly 7 oz. of flesh-formers. In Holland there is, or there was lately, a singular economy in this respect. The Dutch soldier in garrison was fed like a pauper, with 3 oz. of flesh-formers daily, but his war ration brought it up to nearly 4½ oz.; "Dutch courage," or fighting with a full stomach, has thus a physiological explanation.

	Solid Food.	Flesh-formers.	Starch Equivalent.	Mineral Matter.	Carbon.
	Oz.	Oz.	Oz.	Oz.	Oz.
English soldier (Crimean ration) . .	41·0	4·5	19·0	0·6	10·3
Ditto ditto (Kafir ration) . . .	47·4	5·7	21·1	0·7	11·6
French soldier (Crimean War) . . .	59·7	6·5	26·8	0·9	14·4
Prussian ,, (Schleswig War, 1864)	48·0	5·9	22·7	0·8	12·4
Austrian ,, (War ration)	38·6	5·1	26·2	0·5	14·2
Russian ,, (Crimean ration) . .	36·6	4·7	16·0	0·6	8·7

From what has been already said, it will have been gathered that we are of opinion that 2 oz. of flesh-formers may keep a man alive when at rest; but that 3½ oz. are required to preserve his health with moderate exercise; while 6 oz. are requisite for a hard day's work. The difference between the two last numbers gives us 2½ oz. as the quantity of flesh-formers necessary for hard productive labour, or for exercise such as walking twenty miles daily, over and above the 3½ oz. used for keeping the body in health. In the functions of bodily activity there are four kinds of work which a man has to perform: (1) Vital work; (2) Heat work; (3) Mechanical work; (4) Mental work. The vital work refers to that proceeding in the body, in the direction of which man is more or less an unconscious agent. The heart beats, the blood circulates, the lungs play, digestion, assimilation, and secretion go on by an inner directive movement independent of the man's will. On these operations a large amount of work is expended. We can calculate it with accuracy in the case of the human heart. This important organ is continually propelling blood with force through the arteries, never ceasing day or night in its labours. If we suppose that the efforts used by it in propelling blood were all concentrated in raising its own weight, then its daily work is represented by the astonishing number that it might raise its own weight about ninety miles high. But the conscious man in which the heart resides can, with a hard day's work, only do as much as is represented by raising the weight of his own body one mile high. It follows from the investigations of Haughton that the heart, weighing only 9⅘ oz., does one-third of the daily force of the whole frame, which weighs 150 lbs. It labours incessantly, and can tire out 200 times its own weight of the stanchest muscles of the body. The mechanism arranged by Divine power, and placed beyond human control, performs its functions with that wonderful perfection which is observed in all the works of the universe carried on independently of man's will, while the less perfect working of the muscles of the body is no doubt owing to man's inability to use to the best advantage the machine entrusted to the guidance of an imperfectly instructed and erring will. After what has been said, it will not be surprising to find that rather more than one half of the flesh-formers in food are required for the work of life, leaving only about one-half for productive labour. With regard to the "Heat work," we have little to do at present, for this is chiefly got out of the heat-givers, or substances not containing nitrogen. It is by the transformation of the organic tissues that the vital, mental, and mechanical works are performed, or that the immaterial powers are manifested through matter to the world. The tissues in changing are oxidised, or partially burned, and are excreted in the form of urea. This oxidation may produce heat, and we know that so much heat as would raise the temperature of a pound of water by one degree Fahrenheit is equivalent to the mechanical effect produced by allowing 772 lbs. to fall through the space of one foot. So that the change of tissues may produce mechanical effects in the body instead of heat. This is the essential physical difference between a plant and an animal. Though plants have certain mechanical effects to produce, these are quite subordinate to their general purposes in life, while the conversion of chemical affinity into mechanical effects is the characteristic of animal existence. The potential energy of the food and of the oxygen of the air produces the muscular energy and heat of the animal.

It is not quite certain, but it is, nevertheless, highly probable, that under ordinary circumstances the force expended in the labour of an animal is derived only from the potential energy in the flesh-formers of food, and in the oxygen which transforms them from organic tissues into urea, which is the chief excretive matter of the system. All experience teaches that work can only be got out of an animal by nitrogenous food, and that the amount of available labour is proportional to the quantity of flesh-formers consumed in the food. Let us compare the labour of a horse and of a man in this respect. Seven men can do the work of one horse, according to the usual calculation, or the labour of a man equals one-seventh of that of a horse. A strong horse may be well sustained when at rest with 15 lbs. of hay, and 5 lbs. of oats; but if real work is to be got out of the horse, 16 lbs. of oats are supplied. Calculating from the known composition of hay and oats, the horse receives 27 oz. of flesh-formers when at rest, and 24 oz. additional when at work. If the horse be at work on a railway, it co-operates with an excavator or "navvy," who we have shown eats 6¾ oz. of flesh-formers, of which 3½ oz. are required for his bodily subsistence in health, and 3¼ oz. are available for work. So that the real working food in the case of the horse and of the man is as 3¼ oz. are to 24 oz., or as 1 : 7⅓. which is very nearly the proportion of their working capacities, as ascertained by experience. In the case of the horse, the working power is got out of plants; in the case of the man, it is derived from a mixed animal diet. Yet such a diet is not essential to a man. The miners in Chili, who work like horses, live nearly like them, for two loaves in the morning, boiled beans in the day, and roasted grain at night constitute, according to Darwin, their ordinary food. Even distinguished physiologists doubt whether there is enough potential energy resident in the wasting tissues of the body, to account for the labour of a man. This hesitation is groundless, and can only arise from the fact that few calculations have been made on the subject. We find that the daily waste of tissues secreted as urea by the kidneys, would, after supporting fully all the vital functions of the body, and the limited mental functions of a labourer, enable him to execute such mechanical labour as would raise about one million pounds to the height of one foot. But it has been found that the hardest labourer can, by continuous work, only raise daily 792,000 lbs. to the height of one foot. Though man uses his powers much more economically than a steam-engine, it cannot be supposed that he husbands every part of it, and, therefore, an excess of available power was to be looked for. It is, however, in this excess that physiologists have found their stumbling-block. They have perceived that heat, as well as mechanical work, is produced by the waste of flesh, and have, therefore, hesitated to admit a separate class of heat-givers in food. A carnivorous animal is often obliged to depend upon its own tissues as a source of heat during its long-sustained fasts. Even in confinement the hyena is seen moving from side to side of its cage, not in impatience of its imprisonment, but by exercise to transform its tissues, and to allow part of the potential energy of the flesh and oxygen to pass into heat, so that the temperature of its body might be sustained. So a man in a cold day rubs his hands and beats together his arms, or dances with his feet. It is known as the result of experiment that the temperature of the muscles rises during contraction. In tetanus the heat of the body is raised from 98° to 111° on account of the muscular convulsions producing heat. If the transforming tissues do not produce mechanical power to the full extent, they pass the unused force in the form of heat. Darwin tells us that, when in the Pampas, he lived tolerably well, though confined to a meat diet, "but felt that it would only agree with him with hard exercise." Yet he found the Guachos living for months on nothing but beef, "although they eat, I observe, a very large proportion of fat." The Guachos were carnivorous, and like the carnivora required heat developed by exercise, unless they had fat to keep up the heat-work of the body independently of the transformation of tissue. And this explanation accounts for a remark of Sir John Richardson, in his Arctic Travels—"When people have fed for a long time solely upon lean animal food, the desire for fat becomes so insatiable, that they can consume a large quantity of unmixed and even oily fat without nausea." So that we are brought back again by these remarks to the necessity of heat-givers as constituents of food, which we were afraid our readers might lose sight of in the length of our remarks on the production of mechanical effects from the transformation of the organised flesh-formers. To insist again upon the absolute necessity of a proper and judicious admixture of the different ingredients of food, we might quote Moleschott's estimate, that the average complete food for an adult man in good health should contain, in 1000 parts,

Water	812·07	parts.
Flesh-formers	37·70	,,
Fat	24·36	,,
Starch, sugar, &c.	117·17	,,
Mineral matter	8·70	,,
	1000·00	

The Chinese are the only nation who *manure* their blood by separate mineral ingredients not found in the food, for they carefully incinerate the husk of rice and mix the ashes with the grain.

We have hitherto confined our remarks to adult able-bodied men, and cannot find space to discuss the dietaries of the young and of the aged. The proper amount of nutriment in the food of children is a matter of such surpassing importance that we feel much inclined to dwell upon it in detail. We must content ourselves however by observing that after having examined and discussed the dietaries of a large number of public schools, containing resident children from 7 to 14 years of age, with an average of about 10 years, we arrived at the conclusion that such school dietaries ought to have the following daily nutritive value:—

Flesh-formers	3·3 oz.
Fat	1·6 ,,
Starch, &c.	11·4 ,,
Starch equivalent of heat-givers . .	13·8 ,,
Mineral matter	0·6 ,,
Carbon in the food	8·2 ,,

The ratio of flesh-formers to heat-givers as expressed by the starch equivalent is in the dietary of school children as 1 : 4·2, while in that of adults it is as 1 : 5. But when we recollect that the bodies of the young have to grow as well as to be sustained, we understand why the proportion of flesh-formers is greater in their case than with the full-grown man. Dr. E. Smith's work, termed "Practical Dietary," affords useful hints on this subject.

The various numerical results presented to the reader may convince his mind without giving him the power of embodying them with practical applications. If this be the case, the reason is to be found in our deficient systems of education. We are not taught as we should be the useful practical lessons of life, or how to apply the teachings of science to our every-day wants. We forget the saying of Milton:—

> "To know
> That which before us lies in daily life
> Is the prime wisdom."

Nor shall we attain the benefits which these discoveries of science are calculated to bestow upon mankind until women are taught domestic economy rationally, not empirically, as a part of their education. Women are the feeders as well as the mothers of men, and if our ladies would but devote a small fraction of the time, which they expend in exercising their fingers by playing scales on the piano, in cultivating a knowledge of the science of life, it would serve them well when they experience their "joy that a man is born into the world;" they would then more seriously fulfil the solemn duties which they have to perform, would largely diminish the amount of infantile mortality, and would give to the world successive generations more fitted to accomplish the purposes of the great God who created them. As part of this rational education an acquaintance both with the science and art of cookery should rank high in importance. Paley says, "As the state of population is governed and limited by the quantity of provisions, perhaps there is no single cause that affects it so powerfully as the *kind* and *quality* of food which chance or usage has introduced into the country." Count Rumford observes, "It seems to me more than probable that the number of inhabitants who may be supported in any country upon its national produce depends as much upon the state of the *art of cookery* as upon that of *agriculture*." There is much more philosophy in the last remark than might be discovered by a superficial consideration of it. If that man be a benefactor to his country, who makes two blades of grass grow where one grew before, so equally is he who, by a judicious selection and cooking of food, enables two men to be fed for the same sum that one was fed before. If the one practically extend the territory of his native land, the other by husbanding its resources enables a larger population to be fed and retained within it, instead of being driven out in a forced emigration by want of the necessaries of life. Let us illustrate this point. In the Irish famine the author of this article was one of the Government Commissioners, and had his attention directed to the necessity of feeding a large population on a very limited supply of money. Such questions as these naturally arose to the mind and were then discussed—Does the market price of flesh-formers vary much in different kinds of food? Does the price of heat-givers and of carbon show large variations; if they do, what is the method of combining them so as to make a shilling feed six people, when it formerly fed only three? Luckily such considerations as these, which, from their novelty, obtained little attention in the Irish famine, have had an intelligent application during the late cotton famine in Lancashire. Suppose, in illustration of our meaning, that we write down the weights of a few kinds of food which would be necessary, if taken alone, to give a weekly supply of 28 oz. (4 oz. daily) of flesh-formers to an able-bodied man. They are as follows, with their retail market price in Edinburgh on January 2nd, 1865:—

			s.	*d.*
147	oz.	Butcher's meat, costing . .	6	1
700	,,	Fresh milk . . ,, . .	14	7
93	,,	Cheese . . ,, . .	3	0
127	,,	Split peas . . ,, . .	1	2
200	,,	Flour . . ,, . .	2	1
341	,,	Bread . . ,, . .	2	8
175	,,	Oatmeal . . ,, . .	1	4
2000	,,	Potatoes . . ,, . .	8	11

Let us, in like manner, find out the weight and the cost of giving 140 oz. of the starch equivalent of heat-givers required for a week's nutrition of an adult. The numbers now are:—

			s.	*d.*
416	oz.	Butcher's meat, costing . .	17	4
1120	,,	Fresh milk . . ,, . .	23	4
224	,,	Cheese . . ,, . .	7	0
221	,,	Split peas . . ,, . .	1	10
190	,,	Flour . . ,, . .	2	0
298	,,	Bread . . ,, . .	2	3
183	,,	Oatmeal . . ,, . .	1	4
616	,,	Potatoes . . ,, . .	2	9

The great difference between the numbers in these two tables shows that it was never intended that man should live on one kind of food, but that he should make proper mixtures of them, in order that he might supply the deficiency in one ingredient by an abundance of it in another kind of food. Thus potatoes, which are a dearer food than meat for the supply of flesh, are far cheaper as a source of heat to the body, so with this view we associate them in our meals. Cheese gives us cheap flesh but dear fuel, so we take with it bread, which supplies the latter economically. Potatoes lay on flesh at an extravagant rate, so with potato soup we mix peas, which add to its nutritive value and to their economy.

The making of palatable mixtures of various kinds of food forms the art of cookery. It is a maxim as old as Hippocrates, that "whatever pleases the palate nourishes," and it is only when taste becomes depraved by indulgence that the pleasure of eating becomes contemptible. Many dishes of the cook are full of scientific significance. As an illustration, let us ask, why are small square pieces of bread, fried in lard, sent up with vegetable soup? Because starch requires to be mixed with saliva before it is converted into sugar in the act of digestion, and as the soup would pass to the stomach without mastication, fried or hard bread protected from the water by fat, so as to prevent its softening, is taken along with the soup, and compels mastication and a flow of saliva. But if cooks exhibit important scientific applications, they often err from ignorance of science. All the sapid or tasting ingredients of flesh reside in its juices, and not in the solid substance. If the flesh of a deer, an ox, a pig, a cat, or a fox be well squeezed, so as to express their juices, what remains has the same vapid taste for all of them. For this reason roast or stewed meat is generally better flavoured than boiled, and the cook protects the juices by pouring melted fat over the joint during its roasting. In boiling meat for soup, cold water should be used at first, so as to extract as much of the nutritive juices as possible, and the heat be raised gradually. But if the meat be wanted in a boiled state for itself, and not for its soup, then it should be plunged at once into boiling water, and kept boiling for a few minutes, so that all the outer albumen may be coagulated, in order to imprison the sapid and nutritive juices; then cold water should be added till the temperature is reduced to 160°, at which it should be kept till the cooking is completed, because that heat is necessary for the coagulation of the colouring matter of the blood. In all cases, no more heat than is sufficient should be employed in cooking. Thus, in making soup, all the fire in the world will not make the water hotter than its boiling temperature, at which point it can be retained by a very moderate expenditure of fuel. Violent ebullition, such as we see cooks often practise, while it does no good, does much harm, not only by wasting coal, but also by carrying off in the steam much of the aromatic and volatile ingredients of the food. Having thus commended the art of cookery as a worthy object of study, we must leave it in order to complete our article with a few general considerations.

The food of different countries has much influence on the character and prosperity of the populations inhabiting them. Cheap and easily procured food is by no means a constant blessing to the nations possessing it. On the contrary, it often produces such a rapid increase of population, that the working classes, in countries tolerably supplied with food, are often in a state of misery and degradation. A lavish abundance of food may produce wealth, but the wealth, in such cases, is very unequally distributed, being enjoyed by a few, while the mass of the population, whose growth it has stimulated, compete with each other for wages, and subsist without enjoying the comforts of civilised life. In such cases we generally find that nations have become lazily satisfied with the bounties which nature has lavishly bestowed upon them, and content themselves with one or two articles of food, instead of exercising productive labour in the supply of a variety. What potatoes were to the Irish before the famine, rice is to the Hindoo, and dates to the Egyptian. But, in all these countries, the same results followed—abject misery among the masses, contrasted with a sprinkling of wealth upon a few. Let us examine the cause of this phenomenon as regards Ireland. An acre planted with potatoes produces about six tons of the tubers, and this quantity is stated to be sufficient for a family of six persons, allowing 6 lbs. daily to each member. An acre of wheat produces 1830 lbs. of the grain, which yields 1700 lbs. of flour. As 25 ounces of flour would barely feed a man daily, a little calculation will show that the acre of wheat could not support more than three men, while the acre of potatoes is alleged to support six. The difference in bulk, as a means of satisfying the appetite, is very considerable, for while the potato feeder got 6 lbs. the wheat-supported man has only 1½ lb. Hence arose the popularity of the potato in Ireland; for, although it is not true that a man could be sustained on 6 lbs. of potatoes daily, he could be with the addition of butter-milk. This economy of subsistence produced a rapid increase of the population, and its natural consequence, depreciation in the rate of wages. But it produced also a reckless and improvident character among the Irish peasantry. The potatoes were grown on the lazy-bed system, which induced no improvement of the land, for it compensated in part for bad drainage. The labour required was only at three periods of the year: during sowing, earthing, and harvesting, while idleness prevailed for the rest of the time, and the habits of the population necessarily became idle and impulsive. We see like results following interrupted labour in Sweden and Norway, where cold interferes with the work; and in Spain and Portugal, where heat frequently arrests it; the result, however, is the same as with the Irish—fickleness and instability of character being the consequence of impulsive interrupted labour. But there is also a physiological, as well as economic reason why the wages of the Irish were so much lowered by their dependence on one staple article of food. Before the famine, the average consumption of an able-bodied labourer, in Ireland, was 9½ lbs. of potatoes for a man, and 7½ lbs. for a woman. But 9½ lbs. of potatoes contain little more than 2 oz.

of flesh-formers, which it will be recollected is the mere subsistence allowance, and on which a man could not do a day's work. For a low day's work, 4 oz. are requisite, and this would imply the consumption of 19 lbs. of potatoes, an amount that even an Irishman's stomach could neither have held nor digested. But as a labourer could not do a fair day's work he could not receive a fair day's wage; so it is not wonderful that he was ground down with poverty. The Irish famine was the greatest blessing to Ireland. Although it occasioned much individual suffering, it produced unmixed national good. The confidence in the potato was rudely broken, new kinds of food were introduced to the peasantry, new wants were created, and labour of a more uniform and equal kind was required to gratify these wants. The excess of population necessarily emigrated, and the remainder, having less competition, and being able, by their more nutritious food, to give better and more productive labour, had their wages rapidly increased. It will, indeed, require more than one generation to root out the evils of the past, but the improvement even now is marked in a high degree. No labourer is a better one than the Irishman when properly fed, and he now ranks equal in nutrition to our Scottish agricultural population.

Whilst Ireland was groaning under poverty, partly owing to misrule in past ages, but chiefly due to inferiority in food, Scotland was a thriving country. There were other causes besides food for this difference, but that was a notable and important cause. In

"The halesome parritch, chief o' Scotia's food,"

oatmeal furnished an aliment which enabled productive labour to be freely given, and high wages to be freely paid. But there is still a lamentable absence of variety in our Scotch cookery for the poorer classes, and this is not likely to be remedied till dietetics are more familiarly studied. Scotland has given us for the years 1856-1857 admirable agricultural statistics which open up curious questions. Could such a country produce suffficent flesh formers to feed its population of 3,062,294 persons, allowing 3 oz. of flesh formers daily to each? The requirement is no less than 93,560 *tons* annually. But the agricultural plants of Scotland, excluding grass and hay, yield every year 130,178 tons of albumen, fibrin and casein. Our oats alone grow 80,000 tons of these flesh formers; but as 180,000 horses come in competition with our population in their appreciation of them, we must allow them 3 lbs. of oats daily, and this reduces, after a further withdrawal of one-tenth for seed, our flesh formers in oatmeal to 60,800 tons available to man. Let us further bestow all the beans on horses, the turnips on cows, and sacrifice the barley to whisky, and we have left 87,000 tons of flesh formers for food. This is not sufficient for our requirements, but then we have not considered the supply of animal food. Our milch cows alone yield us 19,500 tons of flesh-formers in milk to eat with our porridge, and this addition brings us above our wants; so that we are enabled to send some of our oats to our English friends to feed their horses, and abundance of cattle for that meat-loving nation. These calculations show that Scotland could support a much larger population than she possesses, even though our deer forests retard the growth of beef and mutton.

If we cast a general survey over the whole world, the influence of food on national character is most striking. It may be, and no doubt is, an excess in this direction to say with Mülder, that the steadiness and constitutionalism of England is owing to its beefsteaks and porter, and that the revolutionary character of France depends upon their infinite variety of dishes; but there is some truth even in this extravagant view. In Africa, the flesh-eaters conquer and subdue the miserable tribes who subsist on vegetable products. In the Indian mutiny, the rice-eaters of Bengal were not the men who made our empire totter, but the pulse-feeders and the flesh-eaters of the upper provinces. The gallant Ghoorkas, who gave us aid in our distress, were omnivorous like ourselves, and fond as we are of hunting down game and eating it. England would never dare to trust her defence to an army of vegetarians. Prior felt this when he wrote—

"Was ever Tartar fierce or cruel
Upon the strength of water-gruel?
But how restrain his rage or force,
When first he kills, then eats his horse?"

OUR INDIAN HEROES.

By JOHN WILLIAM KAYE.

II.—THE HONORABLE MOUNTSTUART ELPHINSTONE.

A HISTORY of the Civil Service of the East India Company would be a most interesting and instructive record. In that service many great men, sprung from the middle classes, without high family connections or any other adventitious circumstances to give them more than their first start in life, have risen to high position and to still higher reputation. From the days of Warren Hastings to the days of John Lawrence, there have never been wanting members of the Civil Service to evince by their actions the possession of heroic qualities of the highest order. To be a civilian in India is not to be merely a member of a great bureaucracy. The duties which he is called upon to face are not solely the duties of the desk. As the soldier in India is often called upon to lay down the sword and to take up the portfolio of the administrator, so the civilian is often, on the great highroad of his duty, surrounded by circumstances which compel him to lay down the portfolio and to gird on the sword. Of the civilian-soldier there was no better type than Henry Lawrence. Of the soldier-civilian there is none better than Mountstuart Elphinstone. Both by their unaided exertions attained to the highest honours. The one, in the greatest crisis which our Indian Empire has ever witnessed, was appointed provisionally to the Governor-Generalship. The other was twice offered the Governor-Generalship and twice refused it. I have given some account of the first; I now proceed to narrate some of the more noticeable incidents in the history of the second.

Mountstuart Elphinstone was the fourth son of a Scotch peer of that name; but though by courtesy an "honorable" and of a very ancient lineage, the associations of his family were rather those of the middle classes than of the aristocracy, and many of his kindred, moved by that spirit of adventure which is so powerful an element in the national character, had gone forth to seek their fortunes in the East. His father was a soldier, who rose to be a general officer and Governor of Edinburgh Castle; but one of his uncles was a Director of the East India Company, and Indian writerships were held to be no unsatisfactory provision for the younger sons of Scotch peers.

The first fourteen years of Mountstuart's life were spent in Scotland; a goodly part of them in Edinburgh Castle. What he learnt either at home or at the High School, which he attended for two years, was probably not much; for he was not a studious boy, but one delighting in manly exercises, and somewhat addicted to mischief. Seventy years afterwards there were those who still bore in remembrance the lithe figure and the long curly golden locks of the good-looking, lively, sprightly boy, who outraged the loyal sensibilities of his father and other officers of the Castle, by singing snatches of revolutionary songs, learnt from the French prisoners who were confined there. His juvenile principles had a strong republican complexion, and the hair which he wore down his back was intended to be the outward sign of his revolutionary sentiments. And it is related that, years afterwards, the memory of this juvenile republicanism was a standing joke against him, and that after his arrival in India some of his companions gave it practical expression, by presenting Mountstuart with a cap of liberty and a tri-color cockade.

When he was fourteen years of age, he was sent to England, and placed under the educational charge of Dr. Thomson of Kensington; with whom he remained until he was taken away to be sent to India, as a writer on the Company's establishment. He spent his holidays at the house of his uncle Mr. Adam, whose son John was destined for the same service and who lived to become one of its brightest ornaments. As a stripling, young Elphinstone does not seem to have been more grave in his studies than as a boy. He was said to have been "clever enough for anything," but very idle, full of spirit, and somewhat boisterous in his mirth. But he was fond of reading too—in certain directions; and it is remembered that he delighted in quoting Shakespeare and reciting snatches of doggerel rhyme, perhaps of his own making. Those were days when no one thought of literary examinations or proficiency-tests of any kind, and yet they produced public servants unsurpassed by any that have been given to India by Haileybury or the Civil Service Commission.

In July, 1795, Mountstuart Elphinstone, being then sixteeen years of age, embarked for India. Among his fellow-passengers was his cousin John Adam, of whom I have already spoken, and a cadet named Houston, who was going out to join the Bengal Cavalry. The former, in due course, became Secretary to Government, member of Council and, during a brief interregnum, Governor-General of India. The latter, after doing some good service in India, became Lieutenant-Governor of Addiscombe (where he was known to more than one generation of cadets by the sobriquet of "Black Dick"), and died Sir R. Houston, K.C.B.*

---

* These memoranda of the boyish life of Mr. Elphinstone are derived principally from an excellent memoir published in the "Journal of the Asiatic Society"—a memoir for which the readers of that publication are

When, early in 1796, young Elphinstone landed at Calcutta, Sir John Shore was Governor-General of India. He was a man of a quiet mind, and the times were eminently quiet. But the historian of his career has one noticeable incident to dwell upon —one not unexciting story to tell—the story of the Oude succession. Sir John Shore set aside the claims of Vizier Ali to the throne of Oude, and the young man from that time cherished a feeling of bitterest resentment against the English. A dangerous and disaffected person, he was held under some kind of surveillance at Benares, but he had a considerable number of followers, with all his own insolence and vindictiveness, and one day in 1799, they fell upon the British officers at the Residency, and massacred all within their reach. It happened that at this time Mr. Elphinstone was assistant to the magistrate at Benares. His young cavalry friend, Houston, was paying him a visit whilst the slaughter was going on at the Residency; and the disastrous tidings reached them in time only for them to mount their horses and, pursued by Vizier Ali's troopers, to ride for their very lives. There are some men who appear to be born ever to be in the thick of the world's action—ever on the great high-road of History, pressing forward, with their loins girt about; whilst others repose quietly in peaceful nooks, or saunter idly along the by-ways of life. To the first, and the smaller class, belonged Mountstuart Elphinstone. This escape from Vizier Ali's horsemen prefigured his whole career. There was now to be a great growth of History; and for more than twenty years he was to be ever in the thick of it.

A new Governor-General had begun to reign; and a new era had commenced. Lord Wellesley was a man with a "grand policy," and, scorning all constitional restraints, he determined to work it out. This grand policy was incompatible with peace; so in a little time our armies were in motion, firstly in Southern India, where Tippoo was to be subdued; and secondly in Central India, where accounts were to be settled with the Mahratta princes. To the events which were developing themselves in the latter part of the country, I have now to invite the reader's attention—a wide expanse, stretching from Delhi to Poonah, over which Lord Wellesley was extending the network of his diplomacies, in days when diplomacy was ever another name for war. For men of action the times were most propitious. The Company's civil servants might "provide the investment," or administer the regulations; they might be merchants, or magistrates, or revenue collectors, if they desired to live peaceably with good houses over their heads; but for more adventurous spirits there was a grand outlet through what was officially called the "Political Department," but which in Europe is known as the Diplomatic Service. To that service all the most high-spirited young civilians eagerly betook themselves; and Mr. Elphinstone among the first of them. His early inclinations had been all towards the military profession; in his teens he had looked upon the life of a subaltern as the *ne plus ultra* of human enjoyment; and there was that in him, which, had circumstances favoured his wishes, would have made him one of the first captains of the age. But although it was provided that he should live much in the camp, and see, face to face, the stern realities of war, there was no recognised position for him in the battle-field, and therefore only the danger of the fight without its honours and rewards.

But there were honours and rewards of another kind, and young Elphinstone was fully satisfied. In 1801, he was appointed an assistant to the British Resident at Poonah, or in other words an attaché to the British Mission at the court of the Peishwah—the greatest of the Mahratta princes. The Resident was Colonel (afterwards Sir Barry) Close; an officer of high distinction, to whom both soldiers and diplomatists looked up with reverence, and under whom any young aspirant might be proud and happy to serve. In the whole range of the service there was no post better suited to call forth and develop the energy and ability of such a man as Mr. Elphinstone. Once appointed to it, he was on the high road to fame and fortune. The times, as I have said, were most propitious for those who panted for action. The Mahrattas having usurped the power of the Mogul, and established their supremacy in Upper India, were now contending among themselves. This was our opportunity. The great game was now to be played with something like a certainty of winning. The disunion of the Mahrattas was their weakness; their weakness was our strength. *Dum singuli prœliantur universi vincuntur.* It was Lord Wellesley's policy to interfere in these internal disputes, and he did so, by espousing the cause of the Peishwah and entering into a friendly alliance with him. Whether the British Governor might not have been content to look on a little longer, without taking a hand in the game, is a question for historians to discuss. It is enough here to say that having entangled ourselves in diplomacies we were soon in the midst of war.

The year 1803 was a memorable one in the annals of India; memorable in the career of Mountstuart Elphinstone—memorable in the career of a still greater man, who then first made for himself a place in history. Colonel Arthur Wellesley, the brother of the Governor-General, had taken part in the operations which resulted in the conquest of Mysore; but the qualities which he had displayed were not so conspicuously great as to preserve him from the reproach of being favoured as the brother of the Governor-General. The Mahratta war, however, proved him to be a true soldier. It was the

indebted to Sir Edward Colebrooke. It is to be hoped that the general public will be allowed in this respect to participate in the advantages now enjoyed only by the members of the Society. The memoir is too good to be buried in the Proceedings of a learned and too limited community.

privilege of Mountstuart Elphinstone to watch the dawn of the great captain's glory. It has happened to many a man at the outset of his career to profit largely by an accident which has been a heavy blow and a great loss to another. Second only perhaps to Barry Close, in the diplomatic service of India at that time, was Colonel John Malcolm. It had been arranged that to this officer, who knew all the Wellesleys well, and in whom the Governor-General had unbounded confidence, should be entrusted the political conduct of the operations in Berar; but at the commencement of the campaign he fell sick, and, bitterly disappointed, he was compelled for very life's sake to quit the camp. Then Mr. Elphinstone was sent to fill his place, and eagerly he went to the front. In August, 1803, he joined General Wellesley at Ahmednuggur; and though he had not been long in camp before sickness fell upon him also, he did not succumb to it. The great battle of Assye found the young civilian with his foot in the stirrup beside his military chief. The flanks of their horses touched each other as they rode, conversing quietly as on parade, through the thick of that hot fight. All his old military ardour was then revived; and such not only was his coolness under fire, but the quickness of his eye and the soundness of his judgment with respect to military dispositions and combinations, that at the close of the campaign Wellesley said of his young friend that he had mistaken his calling, for he was certainly born a soldier.

This was after the siege of Gawilghur, at which Mr. Elphinstone was present, and had again evinced the fine soldierly qualities which had excited the admiration of Sir Arthur Wellesley at Assye. There was then a season in which the negotiator took the place of the military commander, and there were some sharp diplomatic conflicts which demanded the exercise of no common skill and sagacity: for one of the astutest of native politicians was then arrayed against us—the well-known Wattel Punt. By this time, however, Colonel Malcolm had returned to camp. Just fifty years afterwards, Mr. Elphinstone, who always recalled those old days with delight, described to the writer of this memoir the effect produced by Malcolm's reappearance, as that of a sudden return of fine weather, cheerful and exhilarating; such was the sunshiny, genial nature of the man. As willing to play as to work, "Boy Malcolm" enlivened everyone who came within the influence of his bright face and his hearty laugh, and the gravity of Sir Arthur Wellesley was not proof against it. Among the objects of his mirth at that time was their astute diplomatic antagonist, Wattel Punt, whom Malcolm nicknamed "Old Brag," after a game of cards formerly much played in India—a game which required in the player an imperturbable countenance and an impassive demeanour. "What a face for Brag!" said Malcolm, who had once been addicted to the game; and from that time the sobriquet clung to the Mahratta diplomatist. Many years afterwards the Duke of Wellington told Mr. Elphinstone that Talleyrand reminded him a good deal of "Old Brag;" but that the Frenchman was "not so clever."

Malcolm's absence had made Elphinstone's fortune. Sir Arthur Wellesley wrote officially to his brother, the Governor-General, in eulogistic language, well deserved, of the services rendered to him by the young civilian. "Upon the occasion," he wrote, "of mentioning Mr. Elphinstone, it is but justice to that gentleman to inform your Excellency, that I have received the greatest assistance from him since he has been with me. He is well versed in the languages, has experience and a knowledge of the Mahratta powers and their relations with each other, and with the British Government and its allies. He has been present in all the actions which have been fought in this quarter during the war, and at all the sieges. He is acquainted with every transaction that has taken place, and with my sentiments upon all subjects. I therefore take the liberty of recommending him to your Excellency."

On the conclusion of peace, Mr. Elphinstone was appointed to represent British interests at the court of the Rajah of Berar; and he remained at Nagpore, after the departure of Lord Wellesley from India, during the brief second reign of Lord Cornwallis, and the interregnum of Sir George Barlow. The times were uneventful; but they were not wanting in opportunities to a man of Mr. Elphinstone's character; for rarely has one so fitted for active life evinced at the same time so eager an inclination towards studious pursuits. In quiet times, he could subside contentedly into a book-worm, and find measureless delight in the great works of ancient and modern literature. One of his favourite authors was Thucydides, and many years afterwards he reminded his friend Mr. (afterwards Sir Richard) Jenkins of the days when they read the works of that great historian together at Nagpore. Having left England at the early age of sixteen, and having up to that time shown no great partiality for persevering study, he had carried with him to India only a slender stock of learning. But he had taken with him, all the same, a genuine love of literature, and he coveted the possession of a greater store of this precious intellectual wealth. So, whenever there was not much active work to be done, in the line either of war or of diplomacy, he addressed himself eagerly to his books. There are many who, in after days, knowing him only as a scholar and a recluse, were slow to believe in the energy of his character and the activity of his habits; but at the time of which I am now writing he was all energy and activity, and his literary campaigns were but the complement or filling-up of a life of action. He was a bold and accomplished rider; he delighted in field-sports; he had a quick eye and a ready hand with the boar-spear; and in the face of any kind of danger, was as cool and collected as though he had nothing before him more difficult than a Greek verb.

Those were days when reputations ripened rapidly, and young men went to the front with great responsibilities upon them, such as in later times were seldom entrusted to them in the earlier stages of their career. The British Government in India, now represented by Lord Minto, had need of all its ablest servants; for it seemed that a conjuncture had arisen of a grave and alarming character, and that England might soon be called upon to contend with other great powers for the mastery of the East. It happened that, after the peace of Tilsit in 1807, there was great dread of the results of the close alliance which was then formed between the powers of France and Russia. After the bloody fights of Eylau and Friedland, the two armies had fraternised, and the two emperors had embraced each other on a raft floating on the surface of the river Niemen. Among the vast projects of conquest which they then formed was a conjoint campaign "contre les possessions de la Compagnie des Indes." The territories of the East India Company were to be divided between these two great continental potentates. It was believed that the attack would be made by land rather than by sea; and that Persia would become a basis of operations against the north-western provinces of India. The danger was not an imaginary one. It was the harvest-time of great events, and the invasion of India by a mighty European force did not seem to rise above the ordinary level of the current history of the day. So the British Governments in India and in England prepared themselves for the defence of their Eastern dominions. This, in the first instance, was to be done, not by the equipment of armies or the erection of fortifications, but by diplomatic address. It was possible to undermine French influence at the court of Persia; and it was possible to obtain the good offices of the sovereign princes occupying the territories between the British and the Persian frontiers. The invading armies must have marched through Afghanistan and Sindh, or through Afghanistan and the Punjab. It was of primary importance, therefore, for the British Government to cement friendly alliances with the rulers of those countries. And Lord Minto wisely determined to send embassies to them. Mr. Elphinstone was then selected to conduct the British mission to be despatched to the Court of Caubul. In these days, there is nothing in such a task as that which then devolved upon the young statesman, to lift it out of the regions of common-place. But fifty years ago the great tract of country lying between the Sutlej River and the Hindoo Koosh was almost a *terra incognita* to British travellers. One enterprising Englishman—a civil servant of the East India Company, named Forster—had explored those countries, and had published two interesting quarto volumes descriptive of them. But he had travelled in disguise, and crept along his route; whereas there was now to be an imposing embassy, making a great display of the wealth of the British Government and the greatness of its resources. The reigning monarch at that time was Shah Soojah, he with whom at a later period we formed a closer and more disastrous alliance. Mr. Elphinstone was to endeavour to rouse his fears for his own safety, and by showing him that if Persia entered into a compact with the European powers hostile to England he would inevitably be destroyed, stimulate him to put forth all his strength to oppose their progress from the westward. It was the policy of our government to abstain from entering into even defensive engagements with the Court of Caubul; but Mr. Elphinstone was told that "should the contracting these engagements be absolutely required by the King, the eventual aid to be afforded by us ought to be limited to supplies of arms, ordnance, and military stores, rather than troops."

Proceeding by the route of Bekanier, Bahwulpur, and Mooltan, the mission entered Peshawur on the 25th of February, 1809; and on the 5th of March, Mr. Elphinstone had his first audience of the King. Whatsoever might be Shah Soojah's character as a ruler or a statesman, the English Ambassador saw plainly that he was a courteous, well-mannered gentleman, and that his feelings towards the British government were really, as they were professedly, friendly. But he was distracted by domestic cares. He had a dangerous revolution to cope with in his own kingdom. He did not wish the British mission to proceed any further into the heart of his dominions, which were in a disturbed state; and, indeed, the best advice that he could give to the English gentlemen was, that they should go home as fast as they could. When a man's own house is on fire it is no time to alarm him on the score of remote dangers; so Elphinstone prepared himself to depart, but not before he had negotiated a treaty of general friendship with the Shah, and indeed done all that it was requisite to do; for the dangers which he had been sent to anticipate had disappeared by themselves. There was no longer any fear of Persia becoming the vassal of France and Russia, and helping those powers to invade our British dominions.

But there were other results flowing from this embassy than those of a diplomatic character. Though Mr. Elphinstone had visited only the outskirts of what was then the kingdom of Caubul, and according to subsequent distribution of territory did not enter Afghanistan at all, he contrived to acquire almost as much information relating to the whole country and all classes of its inhabitants, as if he had made the grand tour from Peshawur to Caubul, and from Caubul to Candahar. He returned indeed laden with literary spoils, and it is not to be doubted that the fruit was well worth the cost of the gathering, large as was the expenditure upon it. The government of the day grumbled—as governments and individuals are wont to grumble in such circumstances—when the bill was to be paid; but the highest praise was bestowed upon Elphinstone, and the most liberal consideration shown to him, when he sought an extension of time to make out his accounts and to complete his reports. This work he performed at Calcutta, where he remained throughout the year 1810. But one of the highest diplomatic appointments in the country was waiting for him. He had been selected to fill the office of Resident at Poonah; and at the beginning of 1811 he set out to join it.

He took ship at Calcutta; and among his fellow-voyagers was that young apostolic chaplain, Henry Martyn, who was setting out on his journey to the Persian Gulf, and to that bourne whence no traveller returns. Widely different as were their lives, their characters, and their objects, they were both men of a high order of intelligence, and united by the common sympathies of genius. It is easy to understand how, after a little while, they mutually agreed within themselves to avoid certain debatable topics of discourse, and to take for their themes such matters of common interest as are never wanting, when two highly cultivated minds are brought into contact with each other. If Martyn learnt much from Elphinstone, we may be sure that Elphinstone also learnt much from Martyn. When they landed at Bombay, both were brought up for critical judgment before the learned recorder of Bombay, who was continually sitting in literary assize both on books and on men. General Malcolm, recently returned from Persia, was then at Bombay. He introduced Elphinstone to Mackintosh, and Elphinstone introduced Martyn. When not interrupted by an incursion of what the recorder called "Vandals"—or common-place, small-talk people—there was much animated discourse at the breakfast-table, or in the evening, between those four—the soldier, the civilian, the lawyer, and the priest—which truly must have been worth hearing.

During his residence at Calcutta, Elphinstone had brought together and arranged the valuable information he had collected relating to the countries which he had visited beyond the Indus, and those still further to the northward, which he had never reached. But he had intended, in the first instance, that this information should take the shape only of a report to Government; and it was not until Sir James Mackintosh stimulated him to seek a larger audience and to give the public the benefit of his labours, that he began even to meditate on the possibility of publishing a book of travels. He had by no means made up his mind on the subject, when he quitted Bombay and made his way to the Mahratta capital, taking with him a promise from Malcolm to pay him an early visit. In May, the promise was redeemed. In spite of the hot weather, the two friends, in whom at that time the enthusiasm of the sportsman glowed with equal heat, gave themselves up rather to hard riding and fierce boar-hunting than to literary pursuits. In truth they had both of them pored too long over their papers, and were fain to brush away the cobwebs in the jungle. It was not till some time after Malcolm had left him, that he began seriously to consider the question of publication; and then he said that his appearance as an author would depend much upon the extent of country which Malcolm intended to embrace in the great work upon Persia which he was then preparing for the press. "It is necessary," he wrote, "that I should know with some precision what you intend to do, or I shall spoil your work and waste my trouble (and no small trouble it is writing quires of paper, let alone writing for the public), while I might be hunting, hawking, reading, &c., &c., with much more profit both to myself and the public, even if I did not take in hand the account of India, which you so fully convinced me was required." Malcolm's answer was satisfactory. He purposed to confine his inquiries to Persia; so Elphinstone sate himself down at Poonah to write an account of the "Kingdom of Caubul."

He wrote very carefully and conscientiously, for he was one not easily pleased, and sometimes he was so little satisfied with his work that he felt inclined altogether to abandon his project. He was encouraged, however, by one or two of his friends; especially by Mr. Jenkins, who then represented British interests at Nagpore, and to whom the historian from time to time submitted portions of his manuscripts, courting the critical revisions of his friend. Jenkins, it would seem, had even a severer distaste for anything like diffuseness and redundancy than Elphinstone, and used the pruning knife with an unsparing hand. "I am once more at my eternal book," wrote the latter to Jenkins in 1814, "correcting the duplicate for despatch to England. I see the benefit of your cutting, and am very thankful for the zeal with which you performed that uninviting duty. It is something like a real amputation, where the surgeon has a tedious and disagreeable task, and for the time gets no thanks from the patient." At last the book was finished and sent home; and the great publishing house of Longman and Co. undertook to produce it. And they brought it out in becoming style, as books were brought out in those days—a magnificent quarto, with an elaborate map and coloured engravings, published at a price which would now be sufficient to scare away most purchasers. It was an undoubted success. It made Mr. Elphinstone's literary reputation; and it is still, after a lapse of fifty years, consulted with undiminished interest and advantage by all who seek information relating to the countries which it so faithfully describes.

At that time, the patience of Indian authors was severely tried by the tardiness and uncertainty of communication with England. The interval between the dispatch of the manuscript and the arrival of the printed book was so great, that a writer had almost forgotten his work before it came back to him in type. Mr. Elphinstone's case was no exception to the rule. He had almost begun to think that he should never hear of his book again, when he received from England tidings to the effect that it had been published, that it had been reviewed, and had become the talk of London and

Edinburgh. This revived his spirits, and he wrote with all the enthusiasm of a young author, in the first flush of his fame, to communicate his good fortune to the friend who had taken so much interest in the progress of his work. "My immediate object," he wrote to Mr. Jenkins in May, 1816, "is to tell you of the success of my Travels, in which I am sure you will take as much interest as myself. My letter must in consequence be a mere collection of puffs of my own works, for which this is all the apology you are to expect. First, the *Edinburgh Review*—[It is Sir James Mackintosh, a partial friend, and writing with the professed design of encouraging the Indians, but still it cannot be totally false and delusive]:—'The style of Mr. E. is in our opinion very good. It is clear, precise, significant, manly, often nervous, always perfectly unaffected, severely guarded against every tendency to Oriental inflation [*totum munere hoc tuum est*] quite exempt from that verbosity and expansion which are the sins that most easily beset our ingenious countrymen in the East.' . . . Lady Wood writes from Edinburgh that 'The reputation and success of Caubul astounded her ears on all sides, &c. The Man of Feeling (Henry Mackenzie) had been to see her on the evening before, and talked of the noise he had heard of this book, and his desire to see it (it had then been out above three weeks).'" Other evidences of the interest which the work had excited and the praises it had elicited are given, and then Elphinstone says, "Malcolm corroborates all these stories, and says that he was at Oxford when the review came there, and that the hakims [wise men] were even more struck with the extracts than with the review. . . . Now," continued Elphinstone, "as I am sure that you will be glad to hear all this, I tell it to you at the risk of appearing vain and foolish; but though I tell it to you, I do not tell it to all the world; and I beg you to consider well to what persons you whisper the secret that Midas has ass's ears. My conclusion is that the book has answered much above my expectations, which you remember were sufficiently moderate, and that the great reasons are the novelty of the subject and the plainness of the work."

But the time was now approaching when he was to "have a rougher task in hand," and face more dangerous enemies than the critics of London and Edinburgh. Lord Minto had been succeeded in the government of India by Lord Moira, better known to Indian history by his subsequent title of the Marquis of Hastings. The new Governor-General had taken up the reins in a critical period of our history, and there was plainly much work to be done of the most active and stirring character. Ten years had passed since, under an alarming financial pressure, an unsatisfactory peace had been patched up with the Mahratta powers. It was a conclusion where nothing was concluded, a settlement where nothing was settled. And much of our work had now to be done over again. But before the great game was to be played in Central India, the Nepaulese, according to Lord Moira's programme, were to be fought and conquered. Some of our leading Indian statesmen at that time, including Elphinstone and Metcalfe, thought that it would have been wiser to have settled the Central Indian question first. "We ought," wrote the former to Mr. Jenkins in February, 1815, "to have settled the centre of India before we began with the Goorkhas." "The grand and irreparable mistake," he added, "was Barlow's peace. Scindiah and Holkar had engaged us with regular armies, they were beaten to the ground, and we had only to impose such terms as should keep them quiet for the future, instead of which we left them entire to profit by their experience. Accordingly they have employed ten years in adopting a system of war better suited to their circumstances, and we must have another and perhaps a longer tussle, before we get them down again. I should hope Scindiah would stay quiet at present, and let us station a force in Bhopaul, after which we must lie on our oars, and not complete the confederation of the Nerbuddah until we have more leisure. When we once begin in earnest on the protection of the Peishwah's country in that neighbourhood, I think we must have a war with Scindiah; and even if we avoid that, we must one day have a Pindaree hunt, which is the same thing." And then he added, with one of those rapid transitions from politics to literature which are so charmingly frequent in his letters, "I wish your work were done before that time comes. Pottinger's has gone home in a ship that sailed yesterday.* . . . I wish I had mine back again, but as I cannot, I trust to the divine enemy. Stick to the method of Tacitus."

It would be out of place in such a memoir as this to enter minutely into the complicated history of Mahratta politics at that time. The situation was well described by Metcalfe, in a few sentences, when he said, "There is Runjeet Singh looking eagerly on from the north-west. There is Meer Khan within a few marches of the Agra and Delhi frontiers. There are Scindiah and the Rajah of Berar settling whether they shall attack us or not; and thus virtually menacing our frontier from Agra down to Cuttack. There are the Pindarees ready to pour themselves into every defenceless country." These last were the enemies with whom, in the general interests of peace and order, it was our first business to contend; and as soon as the conclusion of the Nepaul war afforded the means of organising a large force for operations in Central India, the orders were given, the grand army was collected, and the Governor-General, who was also commander-in-chief, placed himself at its head. Although the primary and ostensible object of the assembling of the force was the extirpation of these hordes of freebooters, it seemed from the first to be more than probable that a war with the substantive Mahratta states would follow these first movements. The Mahrattas, indeed, were convinced that this was our design: and, as the princes and chiefs of India are more frequently driven into hostility by their fears than by their resentments, there could be little doubt as to the ultimate result.

---

* The works to which reference is here made are Lieutenant (afterwards Sir Henry) Pottinger's "Account of Beloochistan," and Mr. Jenkins' "Report on Nagpore." The latter, in which Mr. Elphinstone took great interest, and which had the benefit of his revision, never appealed to the public and the critics, but, printed in an official shape, it has had many diligent students, and has ever been highly appreciated as one of the best Indian monographs in existence.

But the exact shape that the conflict might take was long doubtful. It had been the policy of the British Government to support the Peishwah against the lesser chieftains who threatened his authority; and it would still have been our policy, if the man himself had been worthy of our confidence. But he was essentially a weak prince, and, in his weakness, suspicious on the one hand and treacherous on the other. He had more than the ordinary amount of Mahratta guile, and less than the wonted Mahratta courage. From the first the insincerity of his character had been clear. "This Badjee Rao will never do!" had been the dictum of Sir Arthur Wellesley more than ten years before; and it was now the dictum of Mr. Elphinstone. "Willing to wound and yet afraid to strike," the Peishwah had, whilst collecting large bodies of Mahratta troops in the neighbourhood of Poonah, endeavoured to corrupt the fidelity of the Sepoys in the British service. Of the treachery of Badjee Rao, Mr. Elphinstone had been long aware; but it was sound policy, at that time, not to precipitate a rupture by betraying his suspicions, so he limited his course of action to protective measures, and quietly prepared himself for a crisis which he knew could not be very remote. The autumn of 1817 saw that crisis rapidly approaching.

On the 17th of October, Elphinstone wrote to his friend Richard Jenkins, at Nagpore, saying:—"I suppose that you are very busy, being so near the scene of action. Are your Mahratta ministers as intriguing, prevaricating, shuffling, lying, cavilling, grumbling, irritating a set of rascals as mine are here? If I recollect them right, they are not. I think Jeswunt Rao and the rest had some little candour when they were in the right, and some little sense of shame when they were in the wrong, of which there is no trace here. Certainly your sweeping judgment during the last troubles would have been safer in the end than the more moderate course adopted, and not less just." A fortnight later, it was evident that the anticipated rupture had become a question of hours. Appearances were more and more threatening. The enemy were swarming around the English position, waiting for a signal to throw off the mask. The story may best be told in Mr. Elphinstone's own words. On the 30th of October he wrote privately to Captain Agnew, who was an assistant to General Malcolm, and at that time representing his superior with the force under Sir Thomas Hislop:—"You know how the Peishwah has been going on lately, and you also know that I wished to keep everything back as much as possible for fear of interfering with our negotiations at Gwalior by any appearance of a rupture here. This led me to allow the Peishwah to assemble his troops, which he has done with a degree of celerity that I did not think he could have displayed. I also allowed them to occupy their usual stations, none of which were close to our camp, and though of no consequence while the parties were small, became very threatening in the present state of the Peishwah's army. In spite of all my forbearance, however, the Peishwah's preparations threw the whole country into a ferment. Poonah began to be deserted, and there was an universal opinion that we were speedily to be attacked. During all this time I was watching the Peishwah's intrigues with the Sepoys, and about the 27th I found them going on with increased boldness, and repeated offers were also made to several of our dependents to join against us, and a large sum of money, with a quantity of shawls, &c., were sent into camp in the night. The Peishwah's troops began to hold themselves in readiness, and it appeared that they were about to execute the plan attributed to them in their dealings with the Sepoys—to attack or overawe our camp so as to enable their partisans to come over and induce those who hesitated to join them. Independently of all temporary circumstances, you must know, by the reports that have been made, the wretched position occupied by our brigade among trees and enclosures close to the town. This, combined with the security which we were obliged to affect for the purpose of keeping off a crisis, put it in the Peishwah's power, if he had the spirit, to surprise our camp any night he pleased, and, even if there were no disaffection, to throw us into irrecoverable confusion. On considering all these circumstances, I thought it best to put the brigade in a posture of defence, which, besides the direct advantage of being on our guard, gave us that of bringing the Peishwah's plots to a crisis at a time when he was not perhaps prepared, and freed us from the appearance of timidity produced by our dissembling the knowledge of proceedings which were the talk of the whole country. I therefore wrote to the European regiment to come on as fast as possible without regard to anything except the health of the men; and I likewise begged Colonel Burr (who commands here) to keep his men within the lines, and to remove some great defects in the state of our ammunition and provisions. At the same time I sent to the Peishwah to say that mere military principles required our officers to be on their guard when closely contiguous to another army; that I had therefore authorised them to take the requisite steps, but that I had no suspicion of the Peishwah; and as there were no discussions pending between the Governments, he had nothing to do but remain quiet and everything would go on as smoothly as ever. This created no great sensation at the time, except affected indignation at being suspected; but as soon as it was dark, the whole army got under arms, and I really thought that we should have had a breeze. All, however, is now quiet (at 10 A.M.). I expect the European regiment in this afternoon, and shall then encamp the whole brigade at Khirkee—a good position, out of the reach of surprise, and not easily accessible to the agents of corruption. I shall then having nothing to think of but soothing the Peishwah. I shall take the greatest care to keep the matter of the seduction of the Sepoys secret. I do not think it can have gone far."

After the removal of the British cantonments, the demeanour of the Peishwah's troops became more and more insolent and aggressive. The cantonments were plundered without obstruction from the Peishwah's Government, and it was obvious that a crisis was approaching. General Smith, anticipating a rupture, had concentrated his forces at Phooltamba. This the Peishwah declared to be a menace, saying that it was the third time we had assembled troops at Poonah, and he was determined to bring things to an early settlement. He then deputed Wiltojee Naik, one of his confidential servants, to make certain demands upon Mr. Elphinstone for the removal of the cantonments, for the dismissal of the European regiment, and for the reduction of the native brigade. After a long conversation on the subject of his master's demands, Wiltojee remarked that if the Resident did not comply with them, his Highness's friendship would not last, and warned him of the bad consequences of a rupture. But a threat of this kind was not likely to have much effect upon a man of Mr. Elphinstone's temper. "I renewed my assurances," he wrote, "of our wish for peace, and said that if his Highness moved his army, I should withdraw to camp; that if he remained quiet, or receded, we should still consider him as a friend, and should be careful not to cross the river that separates our camp from the town, but that if his troops advanced towards ours, we should be obliged to attack them. Immediately after Wiltojee Naik quitted me, the Peishwah left the town and withdrew to Parbutty; and within less than an hour large bodies of troops began to move in the direction of our camp, and in such a manner as to cut off the Residency. On the receipt of Wiltojee Naik's message, I had withdrawn a company that had been left in the old cantonments, and as soon as it reached the Residency, the detachment there marched off to camp, keeping the river between them and the Peishwah's troops, who were moving in the same direction. The Residency was immediately plundered and burned." "As the Peishwah's troops," wrote Elphinstone, "advanced, Lieutenant-Colonel Burr fell in, and very judiciously moved out to meet them. He was joined by the battalion formerly in the Peishwah's service from Dapoorie. As he advanced, a cannonade was opened from the Peishwah's guns, which did little execution, and soon after the line was surrounded by vast bodies casually coming on at speed. The 7th Native Infantry, which was drawn off from the left of the line by the eagerness of the men to attack a battalion of Ghoorkahs, was charged while separated, but completely beat off the attack, and the derangement was promptly repaired by Colonel Burr, who immediately joined the corps, and by his coolness and promptitude speedily extricated it from its perilous situation. The horse continued to hover round in large masses until the end of the affair, but were deterred by Colonel Burr's skilful arrangements from any more attempts to charge. After firing some rounds from the field-pieces, the line moved forward, the Peishwah's guns were drawn off, and soon after the whole field was cleared of his troops, on which Colonel Burr returned to this camp, it being now dark. The loss of our brigade in this affair amounts to about 90 men; that of the Peishwah's troops is said to be about 500." It was characteristic of Elphinstone, that he said little about himself. But in truth he fought the battle, and was the real hero of the day. He suffered severely too—"All my writing implements," he reported, "with everything I had, except the clothes on my back, have formed part of the blaze at the Residency, which is now smoking in sight."

Having had this taste of the quality of our troops, the Mahrattas were disinclined to give us further battle; and for some days active hostilities were suspended. But the interval was fatal to the Peishwah. Reinforcements, under General Smith, were hastening to Mr. Elphinstone's assistance. On the 13th they arrived at Poonah, and arrangements were immediately made for an attack on the Peishwah's camp. The blow, however, was not struck until the 17th; and then it fell upon a routed army. The advance of our divisions was sufficient to scare the enemy; they saw that all hope of resistance was utterly futile; so they broke and fled. The game was all up with the Peishwah and his advisers, and the great city of Poonah lay prostrate and helpless at our feet.

Then all the humanity of Elphinstone's nature was roused within him, and how to save the city from the fury of the troops became his first care in the emergency that had arisen. There were many circumstances to inflame the passions of the British soldier, and he scarcely hoped to be able to extinguish them. "After the flight of the army," he wrote to Lord Hastings, "General Smith took measures for reducing the city of Poonah, if necessary, and for saving it, if practicable, from the fury of our troops. This had long been an object of great anxiety to General Smith, and the consideration of it had entered into all his plans for the defeat of the army. The plunder and destruction of our Residency and Cantonments, the losses of many of the Sepoys, the disgraceful circumstances of the murder of the officers at Tulligaum, the massacre of the wives of the Sepoys who had fallen into the enemy's hands on the 5th, the mutilation of a Sepoy who had been taken prisoner while straggling from General Smith's line of march, and many other acts of impotent rage on the part of the Peishwah's Court, had raised the indignation of the men to the highest pitch, and they did not conceal their eager desire to revenge themselves by sacking and plundering the enemy's capital. In this state of the feelings of the army, it appeared difficult to save Poonah in any circumstances, and impossible in the event of resistance. To obviate the last danger, General Smith and I sent letters in duplicate flags of truce to the Peishwah and Gokla offering to protect the town, if evacuated; and warning them of the consequence of holding out. One copy was carried on to the Peishwah and Gokla, who promised an answer, but never sent it. The other was given open to the person in charge of the Peishwah's fortified palace, who promised an answer by noon. Before he arrived, Hurree-rao, the banker generally employed by the Company, came to solicit protection for the bankers and merchants, and offered to establish our guards in the city. In this he succeeded, though some contemptible preparations had been made for defence. Guards were posted at the four principal public offices and the Peishwah's palace, which may be considered as the citadel of Poonah. Every arrangement was made by General Smith for the security of the place. Some trifling excesses were committed in the suburbs before there was time to take precautions, but the city suffered no injury, and the loss of property was quite insignificant. Considering all circumstances, the forbearance of the troops deserved high admiration. General Smith's success in protecting Poonah is attended with very important advantages, tending to maintain our general reputation, and to conciliate friends in the present contest, and as preserving a very fertile source of supply both of money and of commodities for the army."

So Badjee Rao became an outcast and a fugitive; and Mountstuart Elphinstone, as was sportively said at the time, became Peishwah in his place. A new career now opened itself out before him. He had, up to this time, been distinguished only as a diplomatist. In that capacity he had evinced, in a remarkable degree, the sagacity to foresee and to overcome all difficulties and the high courage which encounters all dangers with a cool and resolute bearing. But he was now to find another field for the exercise of his great abilities. Henceforth he was to shine as an administrator. The territories ruled by the Peishwah were to become part and parcel of the British dominions. He had forfeited them by acts of treacherous hostility; and the English Government deemed it essential to their security to curb for ever his power to threaten the paramount state and disturb the peace of the country.

The year 1818 found Mr. Elphinstone entering upon his new duties, as "Commissioner" or governor of the Poonah territories. I remember once to have heard a distinguished English writer declare his opinion that our Anglo-Indian statesmen had been much over-rated, for that it was "very easy to govern people of that kind." There could not be a more prodigious mistake. To govern a people aright, it is necessary that we should understand them aright. And it is anything but an easy matter to understand aright a people, or rather a congeries of peoples, differing from us and perhaps from each other in their languages, their religions, their political institutions, and their social usages; least of all is it easy when these communities are to the last degree jealous and exclusive, and both suspicious and resentful of the approaches and inquiries of strangers. That during the years he had spent, as representative of British interests at the Court of the Peishwah, he had gained much serviceable information relating to the character, and the usuages, and the institutions of the Mahrattas, is not to be doubted. But when he began to superintend the internal administration of the country, he acknowledged, with the true humility of wisdom, how much more he had yet to learn. In later days, men forsaking the traditions of the good old school of Munro, Malcolm, and Elphinstone, have ridden their favourite theories rough-shod over both the privileges and the prejudices of people newly subjected to our sway, never questioning their inclination to be measured by the Benthamite foot-rule of the European stranger. But half a century ago our statesmen, in a ceded or conquered country, held it to be their first duty to learn thoroughly the manner in which the natives of India had governed themselves, before prescribing the manner of governing for them. Now this matter of native administration was, and is, a very heterogeneous and complicated affair; much good mixed up with much evil; and, noticeable above all things by those who care to investigate the truth, such a multiplicity of rights and privileges, derived from different sources and maintained by different tenures, that it demands very cautious treading, on the part even of the wisest and the justest, not to crush some of them underfoot. It may be said, indeed, that in proportion as the British Administrator understands and respects these rights and privileges, his administration is successful. These great essential conditions of knowledge and of sympathy, Mr. Elphinstone now, with his strong head and his large heart, most religiously fulfilled. He was not one to regard the overthrow of a native government as an unmixed benefit to the people. Indeed, at this time he was fearful lest, in the conjuncture which had arisen, other native principalities might be overthrown; and he wrote to Mr. Jenkins, April 13, 1818, saying,—"I hope that you are setting up a native government. One example is enough; and two entire conquests on our hands would embarrass us both in the acquisition and retention. I was far from thinking, as you supposed, that you ought to have deposed the Rajah at once. I thought you very right to keep him on his musnud, although his folly baffled all calculation." And that he was in no hurry to recast the administration of the Poonah territories, as he found it, is clearly evidenced by the fact that a year after the government had passed into his hands, he wrote to the same correspondent (January 17th, 1819) saying ;—"You ask what we are about, and how it happens that you do not hear from us. Both questions can easily be answered in one. We are learning the late system of Justice, Police, and Revenue, and considering what it suits us to establish in its room. In the meantime, as events will not wait till we have finished our deliberations, we are carrying on the government on such principles as the studies alluded to suggest. All this occupies much time and labour. There are five of us belonging to the commission, and all our hands are full all day. I omitted one branch of our labour, which is important enough—fixing the lands to be hereafter held by Jagheerdars. We are also carrying on an expedition against Sawunt Warree under Sir W. Kier, and we have military arrangements of distribution and reduction to superintend."

From the performance of these important duties, which in effect were those of a Lieutenant-Governor of a great province, Mr. Elphinstone was called to fill a still higher and more honourable post. In 1819, the chief seat in the Government of Bombay was vacated by the retirement of Sir Evan Nepean; and it became necessary to appoint a successor. There were then three servants of the Company who had founded such high claims to distinction that the appointment of either one of them to the vacant post would have given general satisfaction throughout India, and with respect to whose several chances of succession public opinion was pretty equally divided. It is a remarkable fact that they were all three of them Scotchmen. One, Sir John Malcolm, had come from a small farm in Dumfriesshire; another, Sir Thomas Munro, from an obscure merchant's office in Glasgow; Mr. Elphinstone alone had any aristocratic connexions, but no one doubted for a moment that his prospects of succession would have been equally good if his origin had been as humble as his contemporaries'. He owed nothing to his birth; nothing to his family. It has been stated, indeed, that his uncle, Mr. William Elphinstone, the director, consistently supported the claims of Sir John Malcolm. But when Mr. Canning, who at that time presided at the India Board, named these three distinguished public servants, and intimated that the appointment of any one of them to the vacant government would meet with the approbation and receive the sanction of the Crown, the Court of Directors of the East India Company selected Mr. Elphinstone to fill the office of Governor of Bombay.

He entered upon the duties of his government at no very stirring period of our history. There were no exciting events, no exceptional circumstances of any kind, to give *éclat* to his administration. He went on from year's end to year's end, along the straight, quiet road of unostentatious beneficence. Not in one great measure or in another great measure—not in any individual actions standing prominently forward to claim the especial notice of the biographer—is the history of his success recorded; but in the completeness and consistency of the whole. If it be asked what he did at Bombay to earn so great a reputation as a statesman and a ruler, it is enough to answer that he made for himself an enduring place in the hearts of the people. To write this is in effect to write that he was wise and just and humane. Bishop Heber * related of him that he had heard it said that "all other public men had their enemies and their friends, their admirers and their aspersers, but that of Mr. Elphinstone everybody spoke highly." And there is still, after the lapse of forty years, no name in Western India more reverenced or more beloved than that of Mountstuart Elphinstone.

There was at this time a many-sidedness about Mr. Elphinstone's personal character and habits which excited the surprise and admiration of all who had an opportunity of closely watching his career. His activity took first one shape and then another. You might have conceived, at one time, that he was an ardent sportsman, with all his heart in the chase; at another, that he was a literary recluse with no thoughts beyond his books; and, again, that his whole mind was given up to the administrative duties of his office. The sport and the literature were in reality but the complements of his official life,—contributing, each in its way, to make up the full perfection of the statesman's character. For it may be said that great statesmen are seldom merely statesmen—that a man to be fit to encounter adequately the pressure of public affairs must have interests apart from the bureau, to keep his mind fresh and his nerves braced up for the contest. That Mr. Elphinstone was a patient and laborious man of business, we know from the evidence of one of his chief secretaries. Mr. Warden says that his conscientious consideration of all the details of his official business was such, "that he took as much pains about a matter of five rupees as about the draft of a treaty." Taken in their literal significance, I should say that these words express that which must be regarded as a defect in the character of a public man; but I conceive that the writer meant only to say that small affairs of government received, equally with great, the attention due to them in proportion to their several requirements. But, for all this laborious addiction to business, we are told that when Mr. Elphinstone was on his visitation-tours (and he visited twice every part of the Presidency) there was "always in the camp, a shikaree (or huntsman), whose business it was to inquire for hogs, and whenever he brought in intelligence of game, Mr. Elphinstone would proclaim a holiday, and go hunting for perhaps one or two days, and he was fond of a chase at any time." I have no doubt that the public business was done all the better for these interludes of recreation.

---

* Heber's picture of Elphinstone is so good that I cannot resist quoting a portion of it:—"Mr. Elphinstone is, in every respect, an extraordinary man, possessing great activity of body and mind, remarkable talent for and application to public business, a love of literature, and a degree of universal information such as I have met with in no other person similarly situated, and manners and conversation of the most amiable and interesting character. While he has seen more of India and the adjoining countries than any man now living, and has been engaged in active political and sometimes military duties since the age of eighteen, he has found time not only to cultivate the languages of Hindustan and Persia, but to preserve and extend his acquaintance in the Greek and Latin classics, with the French and Italian, with all the elder and more distinguished English writers, and with the current and popular literature of the day, both in poetry, history, politics, and political economy. With these remarkable accomplishments, and notwithstanding a temperance amounting to rigid abstinence, he is fond of society; and it is a common subject of surprise with his friends, in what hours of the day or night he found time for the acquisition of knowledge."

Mr. Elphinstone presided over the Government of Bombay during a period of eight years; and then embarked for England, carrying with him the blessings of all classes of the community, native and European. He was then (1827) not yet fifty years of age; he was in the full vigour of his intelligence, and no one ever brought with him from India a higher reputation. That there was still before him a career of public usefulness, either in India or in England, even more distinguished than that which he had already accomplished, all men hoped, many believed. But he had not spent thirty unbroken years in India without paying the ordinary penalty. He returned to England with shattered health; and there were certain inward promptings and warnings which told him that he had done enough work, and cautioned him not to over-tax his powers. There have been, and ever will be, men regardless of this small voice of Nature; but Mountstuart Elphinstone was not, in the ordinary sense, an ambitious man:—

"You all did see that on the Lupercal
I twice presented him a kingly crown,
Which he did twice refuse. Was this ambition?"

Twice the Governor-Generalship of India was offered to Mr. Elphinstone, and twice he refused to accept it. After his return to England he never took public office again.

His refusals were based solely upon his conviction that the state of his health would not suffer him to reside in India. "I have just received,"—he wrote to that excellent public servant, Mr. St. George Tucker, on whom it devolved as Chairman of the East India Company at that time (1834) to communicate the wishes of the Court of Directors,—"I have just received your letter of yesterday, and I need not say how much I am honoured by the intention it communicates. As your time is precious, and clearness indispensable in a case where you may not have time for further reference, I proceed at once to answer the question you put. I am still suffering from a complaint first produced and since renewed by a residence in hot climates. Part of a summer in Italy was sufficient to bring it on, and neither cooler climates nor medicine have yet been able to remove it. I am certain, therefore, that I could be of no use in a hot climate, and that the present state of my health is an effectual bar to my going to India. I am, on this account, unable to profit by your offer to name me as one of the candidates (even if I had no other objection); and can only repeat my best thanks for the honour done me, and for the kindness of your letter."

This letter was written from Leamington, where he was seeking renewed health under the care of the famous Dr. Jephson. Pressed to reconsider his determination, he wrote again, three days afterwards (Sept. 1, 1834) to Mr. Tucker:—"My answer to your former letter was dictated entirely by my opinion about my health; and consequently I scarcely expected that it could be attended by a nearer prospect of success; but the circumstance of your writing a second time, as well as the very kind manner in which your letter is expressed, made me anxious to give the fullest consideration to a subject in which you took so flattering an interest. . . . . I have accordingly taken time to consider, and have consulted Dr. Jephson confidentially as to the possibility of my bearing a residence in a hot climate; but, although he is sanguine as to my speedy and permanent recovery, yet I cannot divest myself of the recollection that, on the only two occasions on which I have been exposed to heat since my first illness, I have had relapses, from one of which I am not yet recovered at the end of two years' residence in England; and from this fact I feel convinced, that if I went to India, I should be obliged to return immediately, and should occasion all the bad effects of sudden changes of government, and, what is still worse, should not be able to do my duty satisfactorily while I stayed. I have not, therefore, any hesitation in adhering to my former opinion, and declining your very gratifying offer. I have, however, many and sincere thanks to return you for the favourable view you take of my qualifications, and for your goodness in affording me an opportunity of reconsidering the question."

In another communication to the same correspondent, he wrote:—"I hope you will succeed in getting Metcalfe, whose great talents and extensive experience derive additional value at this moment from his attention to economy, and his being so favourably disposed to most of the measures which he will have to introduce."

From this time Mr. Elphinstone came to be regarded as the Nestor of Indian statesmanship, and very gracefully the character sate upon him. He had retired with a very moderate fortune, for he had been in an extreme degree liberal and munificent in India; but he had neither wife nor children, and therefore more than sufficient for his very moderate wants. For upwards of thirty years he lived the life of a private English gentleman, devoting his time principally to scholarly pursuits. But, unlike the majority of retired Indian public servants, he never subsided into insignificancy; he was never forgotten! Retiring as were his habits, and unobtrusive as was his character, his opinion was frequently sought by the leading statesmen of the country, when a difficult question of Indian policy was to be settled; and it generally happened, that when his advice was not sought, or, if sought, rejected, there was a mistake to be afterwards bitterly deplored. It has often been remarked that, if he had accepted the Governor-Generalship of India when it was offered to him in 1834, the disastrous war in Afghanistan would not have been undertaken. Certain at least it is that he groaned in spirit over the policy of the expedition, and was scarcely surprised at its results. To the latest day of his life he took the warmest interest in all that related to the current affairs of India; but the great solace of his life was in his books. No man ever loved literature more dearly for its own sake. It has been shown that, stimulated by Sir John Malcolm, he had at a comparatively early period of his career contemplated the preparation of a History of India. During all the subsequent period of his residence in that country, he had, whenever opportunity was presented to him, collected materials for this work, and, now that he was master of his own time, he assiduously devoted himself to its composition. But it may be doubted whether his chief delight was not in the study of the great works of classic literature, and the later fruits of Italian and English genius. He was very catholic in his literary sympathies; but his leanings were towards the imaginative. He would converse, with a sympathetic companion, for long hours on ancient and modern poetry. During many of the last years of his life he resided at Limpsfield, on the Surrey Hills, between Godstone in that county, and Westerham in Kent. His residence was a modest country-house known as Hookwood, surrounded by a pleasant little home park: altogether a charming place for a literary recluse. He was very glad to welcome thither men, whether his old Indian friends or younger men, who had attained some sort of distinction since his retirement from public life, if they evinced any anxiety to meet him. And such was the humility of his nature that he ever made it appear to his visitors—even to the youngest and least distinguished among them—that they were conferring honour upon him by seeking him out in his privacy. He was one of the least ostentatious and egotistical of men. He never talked about himself, unless directly asked for information relating to some of the leading circumstances of his career. Indeed he appeared to some people to be rather in the habit of fencing and evading any indirect inquiries of a personal character; but there was nothing studied or intentional in this; it was merely a general inaptitude to perceive that anything relating only to himself could be a matter of much interest to his companion. But when convinced of the wishes of the inquirer, and roused by his references to past events, his reserve would pass away, his memories would be kindled, and he would talk delightfully about the old times long ago, when he rode beside Wellesley at Assaye, or was burnt out of the residency at Poonah.

There are many living who now look back to those days at Hookwood as amongst the pleasantest reminiscences of their lives,—who can follow the venerable statesman from his library to his drawing-room, from his drawing-room to his breakfast-room, and remember how from morn to noon, from noon almost to midnight, he would converse with his guest (it was his disposition to adhere rather to the singular number) upon an infinite variety of topics, and send his privileged companion to bed a far wiser man than he was when he had risen in the morning. But he was not what is commonly called a great talker, and he never indulged in monologue. He was emphatically a good listener. For many years before his death his eyesight had failed him greatly, and unless some member of his family were residing with him, he was obliged to obtain the assistance of a hired reader; and perhaps this drawback made him take an increased pleasure in literary conversation. There was always a large flow of enthusiasm in his nature, and I believe that the most enthusiastic of his visitors pleased him best. He was so thoroughly a gentleman, that he could not have exhibited his impatience of any kind of dulness; but I rather think that he chafed considerably when he found himself face to face with it.

He died at Hookwood, in his eightieth year, on the 20th day of November, 1859, and was buried in the parish church of Limpsfield. Although he had retired from public life for a period of more than thirty years, he passed away from amongst us as a man who had been to the last in harness. He had friends and admirers in all parts of the country: and when it was known that he was dead, they held a public meeting in London, and many of our leading English statesmen attended to do honour to his memory. It was truly a remarkable fact that its freshness had never passed away. Men spoke of him at that meeting as of one who had been working for India—guiding its councils to the very last day of his life. And perhaps this is the very highest praise that could be bestowed upon him. I do not know another instance of the great and honourable of the land meeting together to vote a public statue to a man who had ceased for more than a quarter of a century to take a part in public affairs. But at the meeting of which I now speak there was as much enthusiasm as if Elphinstone had just returned from India, and died with the sword of action in his hand.

HEREWARD, THE LAST OF THE ENGLISH.

By CHARLES KINGSLEY.

CHAPTER VI.

HOW HEREWARD WAS WRECKED UPON THE FLANDERS SHORE.

Hereward had drunk his share at Sigtryg's wedding. He had helped to harry the lands of O'Brodar till (as King Ranald had threatened) there was not a sucking pig left in Ivark, and the poor folk died of famine, as they did about every seven years; he had burst (says the chronicler) through the Irish camp with a chosen band of Berserkers, slain O'Brodar in his tent, brought off his war-horn as a trophy, and cut his way back to the Danish army — a feat in which the two Siwards were grievously wounded; and had in all things shown himself a daring and crafty captain, as careless of his own life as of other folks'.

Then a great home-sickness had seized him. He would go back and see the old house, and the cattle-pastures, and the meres and fens of his boyhood. He would see his widowed mother. Perhaps her heart was softened to him by now, as his was toward her: and if not, he could show her that he could do without her; that others thought him a fine fellow if she did not. Hereward knew that he had won honour and glory for himself; that his name was in the mouths of all warriors and sea-rovers round the coasts as the most likely young champion of the time, able to rival, if he had the opportunity, the prowess of Harold Hardraade himself. Yes, he would go and see his mother: he would be kind if she was kind; if she were not, he would boast and swagger, as he was but too apt to do. That he should go back at the risk of his life; that any one who found him on English ground might kill him; and that many would certainly try to kill him, he knew very well. But that only gave special zest to the adventure.

Martin Lightfoot heard this news with joy.

"I have no more to do here," said he. "I have searched and asked far and wide for the man I want, and he is not on the Irish shores. Some say he is gone to the Orkneys, some to Denmark. Never mind; I shall find him before I die."

"And for whom art looking?"

"For one Thord Gunlaugsson, my father."

"And what wantest with him?"

"To put this through his brain." And he showed his axe.

"Thy father's brain?"

"Look you, lord. A man owes his father nought, and his mother all. At least so hold I. 'Man that is of woman born,' say all the world; and they say right. Now, if any man hang up that mother by hands and feet, and flog her to death, is not he that is of that mother born bound to revenge her upon any man, and all the more if that man had first his wicked will of that poor mother? Considering that last, lord, I do not know but what I am bound to avenge my mother's shame upon the man, even if he had never killed her. No, lord, you need not try to talk this out of my head. It has been there nigh twenty years; and I say it over to myself every night before I sleep, lest I should forget the one thing which I must do before I die. Find him I will, and find him I shall, if there be justice in heaven above."

So Hereward asked Ranald for ships, and got at once two good vessels, as payment for his doughty deeds.

One he christened the Garpike, from her narrow build and long beak, and the other the Otter, because, he said, whatever she grappled she would never let go till she heard the bones crack. They were excellent new "snekrs," nearly eighty feet long each; with double banks for twelve oars a-side in the waist, which was open, save a fighting gangway along the sides; with high poop and forecastle decks; and with one large sail apiece, embroidered by Sigtryg's princess and the other ladies with a huge white bear, which Hereward had chosen as his ensign.

As for men, there were fifty fellows as desperate as Hereward himself, to take service with him for that or any other quest. So they ballasted their ships with great pebbles, stowed under the thwarts, to be used as ammunition in case of boarding; and over them the barrels of ale, and pork, and meal, well covered with tarpaulins. They stowed in the cabins fore and aft their weapons—swords, spears, axes, bows, chests of arrow-heads, leather bags of bowstrings, mail-shirts and helmets, and fine clothes for holidays and fighting days. They hung their shields, after the old fashion, out-board along the gunnel, and a right gay show they made; and so rowed out of Waterford harbour amid the tears of the ladies and the cheers of the men.

But, as it befel, the voyage did not prosper. Hereward found his vessels under-manned, and had to sail northward for fresh hands. He got none in Dublin, for they were all gone to the Welsh marches to help Earl Alfgar and King Griffin. So he went on through the Hebrides, intending, of course, to plunder as he went: but there he got but little booty, and lost several men. So he went on again to the Orkneys to try for fresh hands from the Norse Earl Hereof: but there befel a fresh mishap. They were followed by a whale, which they made sure was a witch-whale, and boded more ill luck; and accordingly they were struck by a storm in the Pentland Frith, and the poor Garpike went on shore on Hoy, and was left there for ever and a day, her crew being hardly saved, and very little of her cargo.

However, the Otter was now not only manned, but over-manned; and Hereward had to leave a dozen stout fellows in Kirkwall, and sail southward again, singing cheerily to his men—

"Lightly the long-snake
Leaps after tempests,
Gaily the sun-gleam
Glows after rain.
In labour and daring
Lies luck for all mortals,
Foul winds and foul witch-wives
Fray women alone."

But their mishaps were not over yet. They were hardly out of Stronsay Frith when they saw the witch-whale again, following them up, rolling, and spouting, and breaching, in most uncanny wise. Some said that they saw a grey woman on his back; and they knew, possibly from the look of the sky, but certainly from the whale's behaviour, that there was more heavy weather yet coming from the northward.

From that day forward the whale never left them, nor the wild weather neither. They were beaten out of all reckoning. Once they thought they saw low land to the eastward, but what or where, who could tell? and as for making it, the wind, which had blown hard from north-east, backed against the sun and blew from west; from which, as well as from the witch-whale, they expected another gale from north and round to north-east.

The men grew sulky and fearful. Some were for trying to run the witch down and break her back, as did Frithiof in like case, when hunted by a whale with two hags upon his back—an excellent recipe in such cases, but somewhat difficult in a heavy sea. Others said that there was a doomed man on board, and proposed to cast lots till they found him out, and cast him into the sea, as a sacrifice to Ægir the wave-god. But Hereward scouted that as unmanly and cowardly, and sang—

"With blood of my bold ones,
With bale of my comrades,
Thinks Ægir, brine-thirsty,
His throat he can slake?
Though salt spray, shrill-sounding,
Sweep in swan's-flights above us,
True heroes, troth-plighted,
Together we'll die."

At last, after many days, their strength was all but worn out. They had long since given over rowing, and contented themselves with running under a close-reefed canvas whithersoever the storm should choose. At night a sea broke over them, and would have swamped the Otter, had she not been the best of sea-boats. But she only rolled the lee shields into the water and out again, shook herself, and went on. Nevertheless, there were three men on the poop when the sea came in, who were not there when it went out.

Wet and wild dawned that morning, showing naught but grey sea and grey air. Then sang Hereward—

"Cheerly, my sea-cocks
Crow for the day-dawn.
Weary and wet are we,
Water beladen.
Wetter our comrades,
Whelmed by the witch-whale.
Us Ægir granted
Grudging, to Gondul,
Doomed to die dry-shod,
Daring the foe."

Whereat the hearts of the men were much cheered.

All of a sudden, as is the wont of gales at dawn, the clouds rose, tore up into ribands, and with a fierce black shower or two, blew clean away; disclosing a bright blue sky, a green rolling sea, and a few miles off to leeward a pale yellow line, seen only as they topped a wave, but seen only too well. To keep the ship off shore was impossible; and as they drifted nearer and nearer, the line of sandhills rose, uglier and more formidable, through the grey spray of the surf.

"We shall die on shore, but not dry-shod," said Martin. "Do any of you knights of the tar brush know whether we are going to be drowned in Christian waters? I should like a mass or two for my soul, and shall die the happier within sight of a church tower."

"One Dune is as like another, as one pea; we may be anywhere between the Texel and Cap Gris Nez, but I think nearer the latter than the former."

"So much the worse for us," said another. "If we had gone ashore among those Frieslanders, we should have been only knocked on the head outright; but if we fall among the Frenchmen we shall be clapt in prison strong, and tortured till we find ransom."

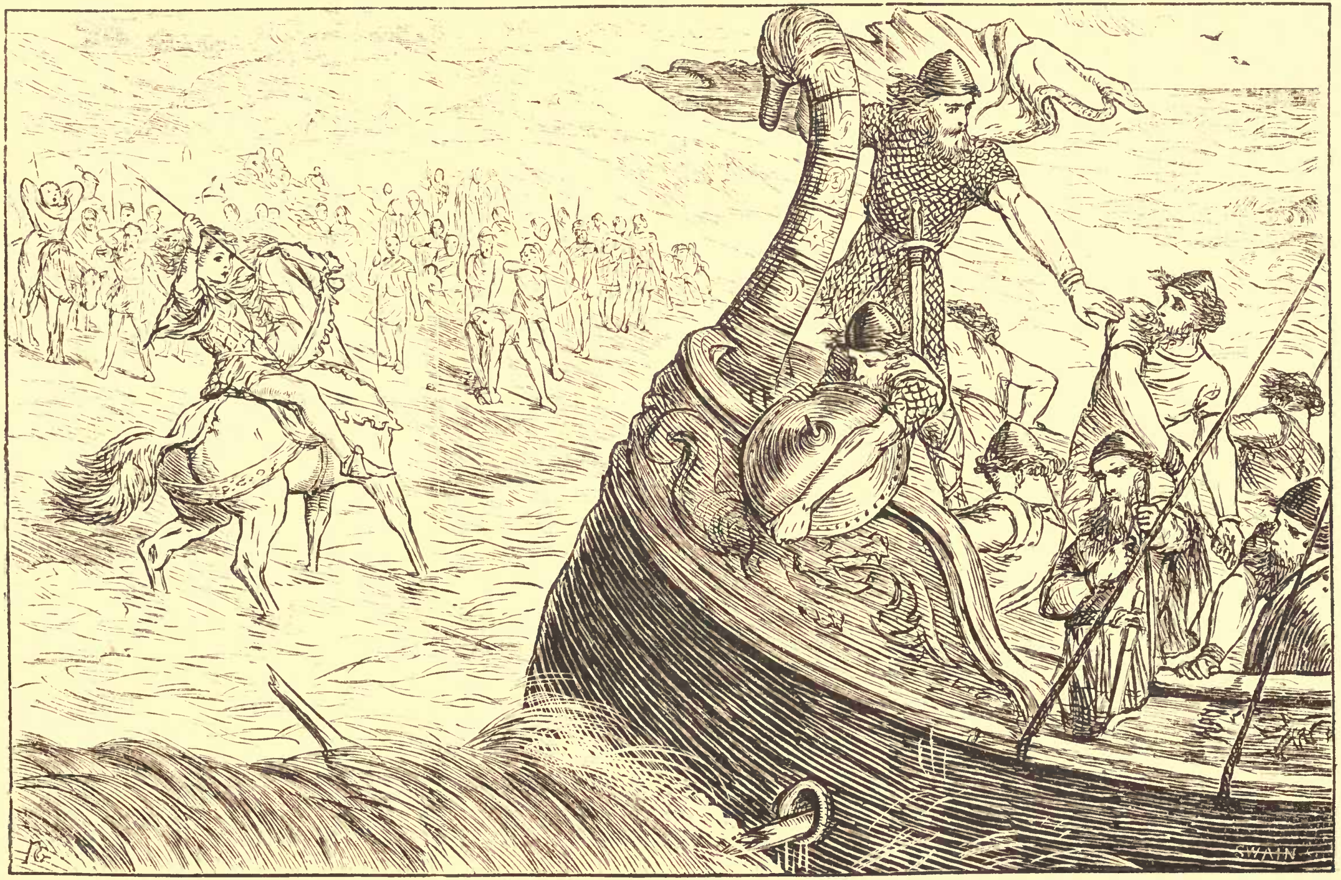
"I don't see that," said Martin. "We can all be drowned if we like, I suppose?"

"Drowned we need not be, if we be men," said the old sailing-master to Hereward. "The tide is full high, and that gives us one chance for our lives. Keep her head straight, and row like fiends when we are once in the surf, and then beach her up high and dry, and take what befals after."

And what was likely to befal was ugly enough. Then, as centuries after, all wrecks and wrecked men were public prey; shipwrecked mariners were liable to be sold as slaves; and the petty Counts of the French and Flemish shores were but too likely to extract ransom by prison and torture, as Guy Earl of Ponthieu would have done (so at least William Duke of Normandy hinted) by Harold Godwinsson, had not William, for his own politic ends, begged the release of the shipwrecked Earl.

Already they had been seen from the beach. The country folk, who were prowling about the shore after the waifs of the storm, deserted "jetsom and lagend," and crowded to meet the richer prize which was coming in "flotsom," to become "jetsom" in its turn.

"Axe-men and bow-men, put on your harness, and be ready; but neither strike nor shoot till I give the word. We must land peaceably if we can; if not, we will die fighting."



"YIELD YOURSELVES, OR DIE!"

Page 179.

So said Hereward, and took the rudder into his own hand. "Now then," as she rushed into the breakers, "pull together, rowers all, and with a will."

The men yelled, and sprang from the thwarts as they tugged at the oars. The sea boiled past them, surged into the waist, blinded them with spray. She grazed the sand once, twice, thrice, leaping forward gallantly each time; and then, pressed by a huge wave, drove high and dry upon the beach, as the oars snapt right and left, and the men tumbled over each other in heaps.

The peasants swarmed down like flies to a carcase: but they recoiled as there rose over the forecastle-bulwarks, not the broad hats of peaceful buscarles, but peaked helmets, round red shields, and glittering axes. They drew back, and one or two arrows flew from the crowd into the ship. But at Hereward's command no arrows were shot in answer.

"Bale her out quietly; and let us show these fellows that we are not afraid of them. That is the best chance of peace."

At this moment a mounted party came down between the sand-hills; it might be, some twenty strong. Before them rode a boy on a jennet, and by him a clerk, as he seemed, upon a mule. They stopped to talk with the peasants, and then to consult among themselves.

Suddenly the boy turned from his party; and galloping down the shore, while the clerk called after him in vain, reined up his horse fetlock deep in water, within ten yards of the ship's bows.

"Yield yourselves!" he shouted, in French, as he brandished a hunting spear. "Yield yourselves, or die!"

Hereward looked at him smiling, as he sat there, keeping the head of his frightened horse toward the ship with hand and heel, his long locks streaming in the wind, his face full of courage and command, and of honesty and sweetness withal; and thought that he had never seen so fair a lad.

"And who art thou, thou pretty bold boy?" asked Hereward, in French.

"I," said he, haughtily enough, as resenting Hereward's familiar "thou," "am Arnulf, grandson and heir of Baldwin, Marquis of Flanders, and lord of this land. And to his grace I call on you to surrender yourselves."

Hereward looked, not only with interest, but respect, upon the grandson of one of the most famous and prosperous of northern potentates, the descendant of the mighty Charlemagne himself. He turned and told the men who the boy was.

"It would be a good trick," quoth one, "to catch that young whelp, and keep him as a hostage."

"Here is what will have him on board before he can turn," said another, as he made a running-noose in a rope.

"Quiet, men! Am I master in this ship or you?"

Hereward saluted the lad courteously. "Verily the blood of Baldwin of the Iron Arm has not degenerated. I am happy to behold so noble a son, of so noble a race."

"And who are you, who speak French so well, and yet by your dress are neither French nor Fleming?"

"I am Harold Naemansson, the Viking; and these my men. I am here, sailing peaceably for England; as for yielding—mine yield to no living man, but die as we are, weapon in hand. I have heard of your grandfather, that he is a just man and a bountiful; therefore take this message to him, young sir. If he have wars toward, I and my men will fight for him with all our might, and earn hospitality and ransom with our only treasure, which is our swords. But if he be at peace, then let him bid us go in peace, for we are Vikings, and must fight, or rot and die."

"You are Vikings?" cried the boy, pressing his horse into the foam so eagerly, that the men, mistaking his intent, had to be represt again by Hereward. "You are Vikings! Then come on shore, and welcome. You shall be my friends. You shall be my brothers. I will answer to my grandfather. I have longed to see Vikings. I long to be a Viking myself."

"By the hammer of Thor," cried the old master, "and thou wouldst make a bonny one, my lad."

Hereward hesitated; delighted with the boy, but by no means sure of his power to protect them.

But the boy rode back to his companions, who had by this time ridden cautiously down to the sea, and talked and gesticulated eagerly.

Then the clerk rode down, and talked with Hereward.

"Are you Christians?" shouted he, before he would adventure himself near the ship.

"Christians we are, Sir Clerk, and dare do no harm to a man of God."

The clerk rode nearer; his handsome palfrey, furred cloak, rich gloves and boots, moreover his air of command, showed that he was no common man.

"I," said he, "am the Abbot of St. Bertin of Sithiu, and tutor of yonder prince. I can bring down, at a word, against you, the chatelain of St. Omer with all his knights, beside knights and men-at-arms of my own. But I am a man of peace, and not of war; and would have no blood shed if I can help it."

"Then make peace," said Hereward. "Your lord may kill us if he will, or have us for his guests if he will. If he does the first, we shall kill, each of us, a few of his men before we die; if the latter, we shall kill a few of his foes. If you be a man of God, you will counsel him accordingly."

"Alas! alas!" said the Abbot with a shudder, "that, ever since Adam's fall, sinful man should talk of nothing but slaying and being slain; not knowing that his soul is slain already by sin, and that a worse death awaits him hereafter than that death of the body, of which he makes so light!"

"A very good sermon, my Lord Abbot, to listen to next Sunday morning: but we are hungry, and wet, and desperate, just now; and if you do not settle this matter for us, our blood will be on your head—and maybe your own likewise."

The Abbot rode out of the water faster than he had ridden in, and a fresh consultation ensued, after which the boy, with a warning gesture to his companions, turned and galloped away through the sand-hills.

"He is gone to his grandfather himself, I verily believe," quoth Hereward.

They waited for some two hours, unmolested; and, true to their policy of seeming recklessness, shifted and dried themselves as well as they could; ate what provisions were unspoilt by the salt water, and, broaching the last barrel of ale, drank healths to each other and to the Flemings on shore.

At last down rode with the boy a noble-looking man, and behind him more knights and men-at-arms. He announced himself as Manasses, Chatelain St. Omer, and repeated the demand to surrender.

"There is no need for it," said Hereward. "We are already that young prince's guests. He has said that we shall be his friends and brothers. He has said that he will answer to his grandfather, the great Marquis, whom I and mine shall be proud to serve. I claim the word of a descendant of Charlemagne."

"And you shall have it!" cried the boy. "Chatelain! Abbot! these men are mine. They shall come with me, and lodge in St. Bertin."

"Heaven forefend!" murmured the Abbot.

"They will be safe, at least, within your ramparts," whispered the chatelain.

"And they shall tell me about the sea. Have I not told you how I longed for Vikings; how I will have Vikings of my own, and sail the seas with them, like my uncle Robert, and go to Spain and fight the Moors, and to Constantinople and marry the kaiser's daughter? Come," he cried to Hereward, "come on shore, and he that touches you or your ship, touches me!"

"Sir Chatelain and my Lord Abbot," said Hereward, "you see that, Viking though I be, I am no barbarous heathen, but a French-speaking gentleman, like yourselves. It had been easy for me, had I not been a man of honour, to have cast a rope, as my sailors would have had me do, over that young boy's fair head, and haled him on board, to answer for my life with his own. But I loved him, and trusted him, as I would an angel out of heaven; and I trust him still. To him, and him only, will I yield myself, on condition that I and my men shall keep all our arms and treasure, and enter his service, to fight his foes and his grandfather's, wheresoever they will, by land or sea."

"Fair sir," said the Abbot, "pirate though you call yourself, you speak so courtly and clerkly, that I, too, am inclined to trust you; and if my young lord will have it so, into St. Bertin I will receive you, till our lord the Marquis shall give orders about you and yours."

So promises were given all round; and Hereward explained the matter to the men, without whose advice (for they were all as free as himself) he could not act.

"Needs must," grunted they, as they packed up each his little valuables.

Then Hereward sheathed his sword, and leaping from the bow, came up to the boy.

"Put your hands between his, fair sir," said the Chatelain.

"That is not the manner of Vikings."

And he took the boy's right hand, and grasped it in the plain English fashion.

"There is the hand of an honest man. Come down, men, and take this young lord's hand, and serve him in the wars as I will do."

One by one the men came down; and each took Arnulf's hand, and shook it till the lad's face grew red. But none of them bowed, or made obeisance. They looked the boy full in the face, and as they stepped back, stared round upon the ring of armed men with a smile and something of a swagger.

"These are they who bow to no man, and call no man master," whispered the Abbot.

And so they were: and so are their descendants of Scotland and Northumbria, unto this very day.

The boy sprang from his horse, and walked among them and round them in delight. He admired and handled their long-handled double axes; their short sea-bows of horn and deer-sinew; their red Danish jerkins; their blue sea-cloaks, fastened on the shoulder with rich brooches; and the gold and silver bracelets on their wrists. He wondered at their long shaggy beards, and still more at the blue patterns with which the English among them, Hereward especially, were tattoed on throat, and arm, and knee.

"Yes, you are Vikings—just such as my uncle Robert tells me of."

Hereward knew well the exploits of Robert le Frison in Spain and Greece. "I trust that your noble uncle," he asked, "is well? He was one of us poor sea-cocks, and sailed the swan's path gallantly, till he became a mighty prince. Here is a man here who was with your noble uncle in Byzant."

And he thrust forward the old master.

The boy's delight knew no bounds. He should tell him all about that in St. Bertin.

Then he rode back to the ship, and round and round her (for the tide by that time had left her high and dry), and wondered at her long snake-like lines, and carven stem and stern.

"Tell me about this ship. Let me go on board of her. I have never seen a ship inland at Mons there; and even here there are only heavy ugly busses, and little fishing-boats. No. You must be all hungry and tired. We will go to St. Bertin at once, and you shall be feasted royally. Hearken, villains!" shouted he to the peasants. "This ship belongs to the fair sir here—my guest and friend; and if any man dares to steal from her a stave or a nail I will have his thief's hand cut off."

"The ship, fair lord," said Hereward, "is yours, not mine. You should build twenty more after her pattern, and man them with such lads as these, and then go down to

'Miklagard and Spanialand,
That lie so far on the lee, O!'

as did your noble uncle before you."

And so they marched inland, after the boy had dismounted one of his men, and put Hereward on the horse.

"You gentlemen of the sea can ride as well as sail," said the Chatelain, as he remarked with some surprise Hereward's perfect seat and hand.

"We should soon learn to fly likewise," laughed Hereward, "if there were any booty to be picked up in the clouds there overhead;" and he rode on by Arnulf's side, as the lad questioned him about the sea, and nothing else.

"Ah, my boy," said Hereward at last, "look there, and let those be Vikings who must."

And he pointed to the rich pastures, broken by strips of cornland and snug farms, which stretched between the sea and the great forest of Flanders.

"What do you mean?"

But Hereward was silent. It was so like his own native fens. For a moment there came over him the longing for a home. To settle down in such a fair fat land, and call good acres his own; and marry and beget stalwart sons, to till the old estate when he could till no more. Might not that be a better life—at least a happier one—than restless, homeless, aimless adventure? And now, just as he had had a hope of peace—a hope of seeing his own land, his own folk, perhaps of making peace with his mother and his king—the very waves would not let him rest, but sped him forth, a storm-tossed waif, to begin life anew, fighting he cared not whom or why, in a strange land.

So he was silent and sad withal.

"What does he mean?" asked the boy of the Abbot.

"He seems a wise man: let him answer for himself."

The boy asked once more.

"Lad! lad!" said Hereward, waking as from a dream. "If you be heir to such a fair land as that, thank God for it, and pray to Him that you may rule it justly, and keep it in peace, as they say your grandfather and your father do; and leave glory, and fame, and the Vikings' bloody trade, to those who have neither father nor mother, wife nor land, but live like the wolf of the wood, from one meal to the next."

"I thank you for those words, Sir Harold," said the good Abbot, while the boy went on abashed, and Hereward himself was startled at his own saying, and rode silent till they crossed the drawbridge of St. Bertin, and entered that ancient fortress, so strong that it was the hiding-place in war time for all the treasures of the country, and so sacred withal that no woman, dead or alive, was allowed to defile it by her presence; so that the wife of Baldwin the Bold, ancestor of Arnulf, wishing to lie by her husband, had to remove his corpse from St. Bertin to the Abbey of Blandigni, where the Counts of Flanders lay in glory for many a generation.

The pirates entered, not without gloomy distrust, the gates of that consecrated fortress; while the monks in their turn were (and with some reason) considerably frightened when they were asked to entertain as guests forty Norse rovers. Loudly did the elder among them bewail (in Latin, lest their guests should understand too much) the present weakness of their monastery, where St. Bertin was left to defend himself and his monks all alone against the wicked world outside. Far different had been their case some hundred and seventy years before. Then St. Valeri and St. Riquier of Ponthieu, transported thither from their own resting-places in France for fear of the invading Northmen, had joined their suffrages and merits to those of St. Bertin, with such success that the abbey had never been defiled by the foot of the heathen. But alas! the saints, that is their bodies, after awhile became home sick; and St. Valeri appearing in a dream to Hugh Capet, bade him bring them back to France in spite of Arnulf, Count of those parts, who wished much to retain so valuable an addition to his household gods.

But in vain. Hugh Capet was a man who took few denials. With knights and men-at-arms he came, and Count Arnulf had to send home the holy corpses with all humility, and leave St. Bertin all alone.

Whereon St. Valeri appeared in a dream to Hugh Capet, and said unto him, "Because thou hast zealously done what I commanded, thou and thy successors shall reign in the kingdom of France to everlasting generations." *

However, there was no refusing the grandson and heir of Count Baldwin; and the hearts of the monks were comforted by hearing that Hereward was a good Christian, and that most of his crew had been at least baptised. The Abbot therefore took courage, and admitted them into the hospice, with solemn warnings as to the doom which they might expect if they took the value of a horse-nail from the patrimony of the blessed saint. Was he less powerful or less careful of his own honour than St. Lieven of Holthem, who, not more than fifty years before, had struck stone-blind four soldiers of the Emperor Henry's, who had dared, after warning, to plunder the altar? † Let them remember, too, the fate of their own forefathers, the heathens of the North, and the check which, one hundred and seventy years before, they had received under those very walls. They had exterminated the people of Walcheren; they had taken prisoners Count Rognier; they had burnt Ghent, Bruges, and St. Omer itself, close by; they had left nought between the

---

* Histoire des Comtes de Flandre, par. E. le Glay. E. gestis SS. Richarii et Walerici. † Ibid.

Scheldt and the Somme, save stark corpses and blackened ruins. What could withstand them till they dared to lift audacious hands against the heavenly lord who sleeps there in Sithiu? Then they poured down in vain over the Heilig-Veld, innumerable as the locusts. Poor monks, strong in the protection of the holy Bertin, sallied out and smote them hip and thigh, singing their psalms the while. The ditches of the fortress were filled with unbaptised corpses; the piles of vine-twigs which they lighted to burn down the gates, turned their flames into the Norsemen's faces at the bidding of St. Bertin; and they fled from that temporal fire to descend into that which is eternal, while the gates of the pit were too narrow for the multitude of their miscreant souls.*

So the Norsemen heard, and feared; and only cast longing eyes at the gold and tapestries of the altars, when they went in to mass.

For the good Abbot, gaining courage still further, had pointed out to Hereward and his men that it had been surely by the merits and suffrages of the blessed St. Bertin that they had escaped a watery grave.

Hereward and his men, for their part, were not inclined to deny the theory. That they had miraculously escaped, from the accident of the tide being high, they knew full well; and that St. Bertin should have done them the service was probable enough. He, of course, was lord and master in his own country, and very probably a few miles out to sea likewise.

So Hereward assured the Abbot that he had no mind to eat St. Bertin's bread, or accept his favours, without paying honestly for them; and after mass he took from his shoulders a handsome silk cloak (the only one he had), with a great Scotch Cairngorm brooch, and bade them buckle it on the shoulders of the great image of St. Bertin.

At which St. Bertin was so pleased (being, like many saints, male and female, somewhat proud after their death of the finery which they despised during life), that he appeared that night to a certain monk, and told him that if Hereward would continue duly to honour him, the blessed St. Bertin, and his monks of that place, he would, in his turn, ensure him victory in all his battles by land and sea.

After which Hereward stayed quietly in the abbey certain days; and young Arnulf, in spite of all remonstrances from the Abbot, would never leave his side till he had heard from him and from his men as much of their adventures as they thought it prudent to relate.

CHAPTER VII.

HOW HEREWARD WENT TO THE WAR AT GUISNES.

THE dominion of Baldwin of Lille—Baldwin the Debonair—Marquis of Flanders, and just then the greatest potentate in Europe after the Kaiser of Germany and the Kaiser of Constantinople, extended from the Somme to the Scheldt, including thus much territory which now belongs to France. His forefathers had ruled there ever since the days of the "Foresters" of Charlemagne, who held the vast forests against the heathens of the fens, and of that famous Baldwin Bras-de-fer—who, when the foul fiend rose out of the Scheldt, and tried to drag him down, tried cold steel upon him (being a practical man), and made his ghostly adversary feel so sorely the weight of the "iron arm," that he retired into his native mud—or even lower still.

He, like a daring knight as he was, ran off with his (so some say) early love, Judith, daughter of Charles the Bald of France, a descendant of Charlemagne himself. Married up to Ethelwulf of England, and thus stepmother of Alfred the Great —after his death behaving, alas for her! not over wisely or well, she had verified the saying,

"Nous revenons toujours
À nos premiers amours,"

and ran away with Baldwin.

Charles, furious that one of his earls, a mere lieutenant and creature, should dare to marry a daughter of Charlemagne's house, would have attacked him with horse and foot, fire and sword, had not Baldwin been the only man who could defend his northern frontier against the heathen Norsemen.

The Pope, as Charles was his good friend, fulminated against Baldwin the excommunication destined for him who stole a widow for his wife, and all his accomplices.

Baldwin and Judith went straight to Rome, and told their story to the Pope.

He, honest man, wrote to Charles the Bald a letter which still remains,—alike merciful, sentimental, and politic, with its usual ingrained element of what we now call (from the old monkish word "cantare") cant. Of Baldwin's horrible wickedness there is no doubt. Of his repentance (in all matters short of amendment of life, by giving up the fair Judith), still less. But the Pope has "another motive for so acting. He fears lest Baldwin, under the weight of Charles's wrath and indignation, should make alliance with the Normans, enemies of God and the holy Church; and thus an occasion arise of peril and scandal for the people of God, whom Charles ought to rule," &c., &c., which if it happened, it would be worse for them and for Charles's own soul.

To which very sensible and humane missive (times and creeds being considered), Charles answered, after pouting and sulking, by making Baldwin bonâ fide king of all between Somme and Scheldt, and leaving him to raise a royal race from Judith, the wicked and the fair.

This all happened about A.D. 863. Two hundred years after, there ruled over that same land Baldwin the Debonair, as "Marquis of the Flamands."

---

* This gallant feat was performed in A.D. 891.

Baldwin had had his troubles. He had fought the Count of Holland. He had fought the Emperor of Germany; during which war he had burnt the cathedral of Nimeguen, and did other unrighteous and unwise things; and had been beaten after all.

Baldwin had had his troubles, and had deserved them. But he had had his glories, and had deserved them likewise. He had cut the Fossé Neuf, or new dyke, which parted Artois from Flanders. He had so beautified the cathedral of Lille, that he was called Baldwin of Lille to his dying day. He had married Adela, the queen countess, daughter of the King of France. He had become tutor of Philip, the young King, and more or less thereby regent of the north of France, and had fulfilled his office wisely and well. He had married his eldest son, Baldwin the Good, to the terrible sorceress Richilda, heiress of Hainault, wherefore the bridegroom was named Baldwin of Mons. He had married one of his daughters, Matilda, to William of Normandy, afterwards the Conqueror; and another, Judith, to Tosti Godwinsson, the son of the great Earl Godwin of England. She afterwards married Welf, Duke of Bavaria; whereby, it may be, the blood of Baldwin of Flanders runs in the veins of Queen Victoria.

And thus there were few potentates of the North more feared and respected than Baldwin, the good-natured Earl of Flanders.

But one sore thorn in the side he had, which other despots after him shared with him, and with even worse success in extracting it,—namely, the valiant men of Scaldmariland, which we now call Holland. Of them hereafter. At the moment of Hereward's arrival, he was troubled with a lesser thorn, the Count of Guisnes, who would not pay him up certain dues, and otherwise acknowledge his sovereignty.

Therefore when the Chatelain of St. Omer sent him word to Bruges that a strange Viking had landed with his crew, calling himself Harold Naemansson, and offering to take service with him, he returned for answer that the said Harold might make proof of his faith and prowess upon the said Count, in which, if he acquitted himself like a good knight, Baldwin would have further dealings with him.

So the Chatelain of St. Omer, with all his knights and men-at-arms, and Hereward with his sea-cocks, marched north-west up to Guisnes, with little Arnulf cantering alongside in high glee; for it was the first war that he had ever seen.

And they came to the Castle of Guisnes, and summoned the Count, by trumpet and herald, to pay or fight.

Whereon, the Count preferring the latter, certain knights of his came forth and challenged the knights of St. Omer to fight them man to man. Whereon there was the usual splintering of lances and slipping up of horses, and hewing at heads and shoulders so well defended in mail that no one was much hurt. The archers and arbalisters, meanwhile, amused themselves with shooting at the castle walls, out of which they chipped several small pieces of stone. And when they were all tired, they drew off on both sides, and went in to dinner.

At which Hereward's men, who were accustomed to a more serious fashion of fighting, stood by, mightily amused, and vowing it was as pretty a play as ever they saw in their lives.

The next day the same comedy was repeated.

"Let me go in against those knights, Sir Chatelain," asked Hereward, who felt the lust of battle tingling in him from head to heel; "and try if I cannot do somewhat towards deciding all this. If we fight no faster than we did yesterday, our beards will be grown down to our knees before we take Guisnes."

"Let my Viking go!" cried Arnulf. "Let me see him fight!" as if he had been a pet gamecock or bulldog.

"You can break a lance, fine sir, if it please you," said the Chatelain.

"I break more than lances," quoth Hereward as he cantered off.

"You," said he to his men, "draw round hither to the left; and when I drive the Frenchmen to the right, make a run for it, and get between them and the castle gate; and we will try the Danish axe against their horses' legs."

Then Hereward spurred his horse, shouting "A bear! a bear!" and dashed into the press; and therein did mightily, like any Turpin or Roland, till he saw lie on the ground, close to the castle gate, one of the Chatelain's knights with four Guisnes knights around him. Then at those knights he rode, and slew them every one; and mounted that wounded knight on his own horse and led him across the field, though the archers shot sore at him from the wall. And when the press of knights rode at him, his Danish men got between them and the castle, and made a stand to cover him. Then the Guisnes knights rode at them scornfully, crying—

"What footpad churls have we here, who fancy they can face horsed knights?"

But they did not know the stuff of the Danish men; who all shouted "A bear! a bear!" and turned the lances' points with their targets, and hewed off the horses' heads, and would have hewed off the riders' likewise, crying that the bear must be fed, had not Hereward bidden them give quarter according to the civilised fashion of France and Flanders. Whereon all the knights who were not taken rode right and left, and let them pass through in peace, with several prisoners, and him whom Hereward had rescued.

At which little Arnulf was as proud as if he had done it himself; and the Chatelain sent word to Baldwin that the new-comer was a prudhomme of no common merit; while the heart of the Count of Guisnes became as water; and his knights, both those who were captives and those who were not, complained indignantly of the unchivalrous trick of the Danes,—how villainous for men on foot, not only to face knights, but to bring them down to their own standing ground by basely cutting off their horses' heads!

To which Hereward answered, that he knew the rules of chivalry as well as any of them: but he was hired, not to joust at a tournament, but to make the Count of Guisnes pay his lord Baldwin, and make him pay he would.

The next day he bade his men sit still and look on, and leave him to himself. And when the usual "monomachy" began, he singled out the burliest and boldest knight whom he saw, rode up to him, lance point in air, and courteously asked him to come and be killed in fair fight. The knight being, says the chronicler, "magnificent in valour of soul and counsel of war, and held to be as a lion in fortitude throughout the army," and seeing that Hereward was by no means a large or heavy man, replied as courteously, that he should have great pleasure in trying to kill Hereward. On which they rode some hundred yards out of the press, calling out that they were to be left alone by both sides, for it was an honourable duel, and, turning their horses, charged.

After which act they found themselves and their horses all four in a row, sitting on their hind-quarters on the ground, amid the fragments of their lances.

"Well ridden!" shouted they both at once, as they leaped up laughing and drew their swords.

After which they hammered away at each other merrily in "the devil's smithy;" the sparks flew, and the iron rang, and all men stood still to see that gallant fight.

So they watched and cheered, till Hereward struck his man such a blow under the ear, that he dropped, and lay like a log.

"I think I can carry you," quoth Hereward, and picking him up, he threw him over his shoulder, and walked toward his men.

"A bear! a bear!" shouted they in delight, laughing at the likeness between Hereward's attitude, and that of a bear waddling off on his hind legs with his prey in his arms.

"He should have killed his bullock outright, before he went to carry him. Look there!"

And the knight, awaking from his swoon, struggled violently (says Leofric) to escape.

But Hereward, though the smaller, was the stronger man; and crushing him in his arms, walked on steadily.

"Knights, to the rescue! Hoibricht is taken!" shouted they of Guisnes, galloping towards him.

"A bear! A bear! To me, Biornssons! To me, Vikings all!" shouted Hereward. And the Danes leapt up, and ran toward him, axe in hand.

The Chatelain's knights rode up likewise; and so it befel, that Hereward carried his prisoner safe into camp.

"And who are you, gallant knight?" asked he of his prisoner.

"Hoibricht, nephew of Eustace, Count of Guisnes."

"So I suppose you will be ransomed. Till, then—— Armourer!"

And the hapless Hoibricht found himself chained and fettered, and sent off to Hereward's tent, under the custody of Martin Lightfoot.

"The next day," says the chronicler, "the Count of Guisnes, stupefied with grief at the loss of his nephew, sent the due honour and service to his prince, besides gifts and hostages."

And so ended the troubles of Baldwin, and Eustace of Guisnes.

CHAPTER VIII.

HOW A FAIR LADY EXERCISED THE MECHANICAL ART TO WIN HEREWARD'S LOVE.

The fair Torfrida sat in an upper room of her mother's house in St. Omer, alternately looking out of the window and at a book of mechanics. In the garden outside, the wryneck (as it his fashion in May) was calling Pi-pi-pi among the gooseberry bushes, till the cob-walls rang again. In the book was a Latin recipe for drying the poor wryneck, and using him as a philtre which should compel the love of any person desired. Mechanics, it must be understood, in those days were considered as identical with mathematics, and those again with astrology and magic; so that the old chronicler, who says that Torfrida was skilled in "the mechanic art," uses the word in the same sense as does the author of the History of Ramsey, who tells us how a certain holy bishop of St. Dunstan's party, riding down to Corfe through the forest, saw the wicked queen-mother Elfrida (her who had St. Edward stabbed at Corfe Gate) exercising her "mechanic art" under a great tree; in plain English, performing heathen incantations; and how, when she saw that she was discovered, she tempted him to deadly sin: but when she found him proof against allurement, she had him into her bower; and there the enchantress and her ladies slew him by thrusting red-hot bodkins under his arms, so that the blessed man was martyred without any sign of wound. Of all which let every man believe as much as he list.

Torfrida had had peculiar opportunities of learning mechanics. The fairest and richest damsel in St. Omer, she had been left early by her father an orphan, to the care of a superstitious mother, and of a learned uncle, the Abbot of St. Bertin. Her mother was a Provençale, one of those Arlesiennes whose dark Greek beauty still shines, like diamonds set in jet, in the doorways of the quaint old city. Gay enough in her youth, she had, like a true Southern woman, taken to superstition in her old age; and spent her days in the churches, leaving Torfrida to do and learn what she would. Her nurse, moreover, was a Lapp woman, carried off in some pirating foray, and skilled in all the sorceries for which the Lapps were famed throughout the

North. Her uncle, partly from goodnature, partly from a pious hope that she might "enter religion," and leave her wealth to the Church, had made her his pupil, and taught her the mysteries of books; and she had proved to be a strangely apt scholar. Grammar, rhetoric, Latin prose and poetry, such as were taught in those days, she mastered ere she was grown up. Then she fell upon romance, and Charlemagne and his Paladins, the heroes of Troy, Alexander and his generals, peopled her imagination. She had heard, too, of the great necromancer Virgilius (for into such the middle age transformed the poet), and, her fancy already excited by her Lapp nurse's occult science, she began eagerly to court forbidden lore.

Forbidden, indeed, magic was by the Church in public: but as a reality, not as an imposture. Those whose consciences were tough and their faith weak, had little scruple in applying to a witch, and asking help from the powers below, when the saints above were slack to hear them. Churchmen, even, were bold enough to learn the mysteries of nature, Algebra, Judicial Astrology, and the occult powers of herbs, stones, and animals, from the Mussulman doctors of Cordova and Seville; and, like Pope Gerbert, mingle science and magic, in a fashion excusable enough in days when true inductive science did not exist.

Nature had her miraculous powers,—how far good, how far evil, who could tell? The belief that God was the sole maker and ruler of the universe, was confused and darkened by the cross-belief that the material world had fallen under the dominion of Satan and his demons; that millions of spirits, good and evil in every degree, exercised continually powers over crops and cattle, mines and wells, storms and lightning, health and disease. Riches, honours, and royalties, too, were under the command of the powers of darkness. For that generation, which was but too apt to take its Bible in hand upside down, had somehow a firm faith in the word of the devil, and believed devoutly his somewhat startling assertion, that the kingdoms of the world were his, and the glory of them; for to him they were delivered, and to whomsoever he would he gave them: while it had a proportionally weak faith in our Lord's answer, that they were to worship and serve the Lord God alone. How far these powers extended, how far they might be counteracted, how far lawfully employed, were questions which exercised the minds of men, and produced a voluminous literature for several centuries, till the search died out, for very weariness of failure, at the end of the seventeenth century.

The Abbot of St. Bertin, therefore, did not hesitate to keep in his private library more than one volume which he would not have willingly lent to the simple monks under his charge; nor to Torfrida either, had she not acquired so complete a command over the good old man, that he could deny her nothing.

So she read of Gerbert, Pope Silvester II., who had died only a generation back: how (to quote William of Malmesbury) "he learned at Seville till he surpassed Ptolemy with the astrolabe, Alcandrus in astronomy, and Julius Firmicus in judicial astrology; how he learned what the singing and flight of birds portended, and acquired the art of calling up spirits from hell; and, in short, whatever—hurtful or healthful—human curiosity had discovered, besides the lawful sciences of arithmetic and astronomy, music and geometry;" how he acquired from the Saracens the abacus (a counting table); how he escaped from the Moslem magician, his tutor, by making a compact with the foul fiend, and putting himself beyond the power of magic, by hanging himself under a wooden bridge so as to touch neither earth nor water; how he taught Robert King of France, and Otto the Kaiser; how he made an hydraulic organ which played tunes by steam, which stood even then in the Cathedral of Rheims; how he discovered in the Campus Martius at Rome wondrous treasures, and a golden king and queen, golden courtiers and guards, all lighted by a single carbuncle, and guarded by a boy with a bent bow; who, when Gerbert's servant stole a golden knife, shot an arrow at that carbuncle, and all was darkness, and yells of demons.

All this Torfrida had read; and read, too, how Gerbert's brazen head had told him that he should be Pope, and not die till he had sung mass at Jerusalem; and how both had come true—the latter in mockery; for he was stricken with deadly sickness in Rome, as he sang mass at the church called Jerusalem, and died horribly, tearing himself in pieces.

Which terrible warning had as little effect on Torfrida as other terrible warnings have on young folk, who are minded to eat of the fruit of the tree of knowledge of good and evil.

So Torfrida beguiled her lonely life in that dull town, looking out over dreary flats and muddy dykes, by a whole dream-world of fantastic imaginations, and was ripe and ready for any wild deed which her wild brain might suggest.

Pure she was all the while, generous and noblehearted, and with a deep and sincere longing—as one soul in ten thousand has—after knowledge for its own sake: but ambitious exceedingly, and that not of monastic sanctity. She laughed to scorn the notion of a nunnery; and laughed to scorn equally the notion of marrying any knight, however much of a prudhomme, whom she had yet seen. Her uncle and Marquis Baldwin could have between them compelled her, as an orphan heiress, to marry whom they liked. But Torfrida had as yet bullied the Abbot and coaxed the Count successfully. Lances had been splintered, helmets split, and more than one life lost in her honour: but she had only, as the best safeguard she could devise, given some hint of encouragement to one Ascelin, a tall knight of St. Valeri, the most renowned bully of those parts, by bestowing on him a scrap of ribbon, and bidding him keep it against all comers. By this means she insured the personal chastisement of all other youths who dared to lift their eyes to her, while she by no means bound herself to her spadassin of St. Valeri. It was all very brutal: but so was the time; and what better could a poor lady do in days when no man's life, or woman's honour, was safe, unless (as too many were forced to do) she retired into a cloister, and got from the Church that peace which this world certainly could not give, and, happily, dared not take away?

The arrival of Hereward and his men had, of course, stirred the great current of her life, and, indeed, that of St. Omer, usually as stagnant as that of the dykes round its wall. Who the unknown champion was (for his name of "Naemansson" showed that he was concealing something at least)—whence he had come, and what had been his previous exploits, busied all the gossips of the town. Would he and his men rise and plunder the abbey? Was not the Chatelain mad in leaving young Arnulf with him all day? Madder still, in taking him out to battle against the Count of Guisnes? He might be a spy, the avant-courier of some great invading force. He was come to spy out the nakedness of the land, and would shortly vanish, to return with Harold Hardraade of Norway, or Sweyn of Denmark, and all their hosts. Nay, was he not Harold Hardraade himself in disguise? And so forth. All which Torfrida heard, and thought within herself that, be he who he might, she should like to look on him again.

Then came the news how, the very first day that he had gone out against the Count of Guisnes, he had gallantly rescued a wounded man. A day or two after came fresh news of some doughty deed: and then another and another. And when Hereward returned, after a week's victorious fighting, all St. Omer was in the street to stare at him.

Then Torfrida heard enough, and, had it been possible, more than enough, of Hereward and his prowess.

And when they came riding in, the great Marquis at the head of them all, with Robert le Frison on one side of him, and on the other Hereward, looking "as fresh as flowers in May," she looked down on him out of her little lattice in the gable, and loved him, once and for all, with all her heart and soul.

And Hereward looked up at her and her dark blue eyes and dark raven locks; and thought her the fairest thing that he had ever seen, and asked who she might be, and heard; and as he heard, he forgot all about the Sultan's daughter, and the Princess of Constantinople, and the Fairy of Brocheliaunde, and all the other pretty birds which were still in the bush about the wide world: and thought for many a day of nought but the pretty bird which he held (so conceited was he of his own powers of winning her) there safe in hand in St. Omer.

So he cast about to see her, and to win her love. And she cast about to see him, and win his love. But neither saw the other for awhile; and it might have been better for one of them had they never seen the other again.

If Torfrida could have foreseen, and foreseen, and foreseen:——why, if she were true woman, she would have done exactly what she did, and taken the bitter with the sweet, the unknown with the known, as we all must do in life, unless we wish to live and die alone.

CHAPTER IX.

HOW HEREWARD WENT TO THE WAR IN SCALDMARILAND.

It has been shown how the Count of Guisnes had been a thorn in the side of Baldwin of Lille, and how that thorn was drawn out by Hereward. But a far sharper thorn in his side, and one which had troubled many a Count before, and was destined to trouble others afterward, was those unruly Hollanders, or Frisians, who dwelt in Scaldmariland, "the land of the meres of the Scheldt." Beyond the vast forests of Flanders, in morasses and alluvial islands whose names it is impossible now to verify, so much has the land changed, both by inundations and by embankments, by the brute forces of nature and the noble triumphs of art, dwelt a folk, poor, savage, living mostly, as in Cæsar's time, in huts raised above the sea on piles or mounds of earth; often without cattle or seedfield, half savage, half heathen, but free. Free, with the divine instinct of freedom, and all the self-help and energy which spring thereout.

They were a mongrel race; and, as most mongrel races are (when sprung from parents not too far apart in blood), a strong race; the remnant of those old Frisians and Batavians, who had defied, and all but successfully resisted, the power of Rome; mingled with fresh crosses of Teutonic blood from Frank, Sueve, Saxon, and the other German tribes, who, after the fall of the Roman Empire, had swept across the land.

Their able modern historian has well likened the struggle between Civilis and the Romans to that between William the Silent and the Spaniard. It was, without doubt, the foreshadow of their whole history. They were distinguished, above most European races, for sturdy independence, and, what generally accompanies it, sturdy common sense. They could not understand why they should obey foreign Frank rulers, whether set over them by Dagobert or by Charlemagne. They could not understand why they were to pay tithes to foreign Frank priests, who had forced on them at the sword's point, a religion which they only half believed, and only half understood. Many a truly holy man preached to them to the best of his powers: but the cross of St. Boniface had too often to follow the sword of Charles Martel; and for every Frisian who was converted another was killed.

"Free Frisians," nevertheless, they remained, at least in name and in their statute book, "as long as the wind blows out of the clouds, and the world stands." The feudal system never took root in their soil.* If a Frank Count was to govern them, he must govern according to their own laws. Again and again they rebelled, even against that seemingly light rule. Again and again they brought down on themselves the wrath of their nominal sovereigns the Counts of Flanders; then of the Kaisers of Germany; and, in the thirteenth century, of the Inquisition itself. Then a crusade was preached against them as "Stadings," heretics who paid no tithes, ill used monks and nuns, and worshipped (or were said to worship) a black cat and the foul fiend among the meres and fens. Conrad of Marpurg, the brutal Director of St. Elizabeth of Hungary, burnt them at his wicked will, extirpating it may be heresy, but not the spirit of the race. That, crushed down and seemingly enslaved, during the middle age, under Count Dirk and his descendants, still lived; destined at last to conquer. They were a people who had determined to see for themselves and act for themselves in the universe in which they found themselves; and, moreover (a necessary corollary of such a resolution), to fight to the death against any one who interfered with them in so doing.

Again and again, therefore, the indomitable spirit rose, founding free towns with charters and guilds; embanking the streams, draining the meres, fighting each other and the neighbouring princes; till, in their last great struggle against the Pope and Spain, they rose once and for all,

"Heated hot with burning fears,
And bathed in baths of hissing tears,
And battered with the strokes of doom
To shape and use,"

as the great Protestant Dutch Republic.

A noble errand it had been for such a man as Hereward to help those men toward freedom, instead of helping Frank Counts to enslave them;—men of his own blood, with laws and customs like those of his own Anglo-Danes, living in a land so exactly like his own that every mere and fen and wood reminded him of the scenes of his boyhood. The very names of the two lands were alike—"Holland," the hollow land—the one of England, the other of Flanders.

But all this was hidden from Hereward. To do as he would be done by was a lesson which he had never been taught. If men had invaded his land, he would have cried, like the Frisians whom he was going to enslave, "I am free as long as the wind blows out of the clouds!" and died where he stood. But that was not the least reason why he should not invade any other man's land, and try whether or not he, too, would die where he stood. To him these Frieslanders were simply savages, probably heathens, who would not obey their lawful lord, who was a gentleman and a Christian; besides, renown, and possibly a little plunder, might be got by beating them into obedience. He knew not what he did; and knew not, likewise, that as he had done to others, so would it be done to him.

Baldwin had at that time made over his troublesome Hollanders to his younger son Robert, the Viking whom little Arnulf longed to imitate.

Florent, Count of Holland, and vassal of the great Marquis, had just died, leaving a pretty young widow, to whom the Hollanders had no mind to pay one stiver more than they were forced. All the isles of Zeeland, and the counties of Eenham and Alost, were doing that which was right in the sight of their own eyes, and finding themselves none the worse therefor; though the Countess Gertrude, doubtless, could buy fewer silks of Greece or gems of Italy. But to such a distressed lady a champion could not long be wanting, and Robert, after having been driven out of Spain by the Moors with fearful loss, and, in a second attempt, wrecked with all his fleet as soon as he got out of port, resolved to tempt the main no more, and leave the swan's-path for that of the fat oxen and black dray-horses of Holland.

So he rushed to avenge the wrongs of the Countess Gertrude; and his father, whose good-natured good sense foresaw that the fiery Robert would raise storms upon his path—happily for his old age he did not foresee the worst—let him go, with his blessing.

So Robert gathered to him valiant ruffians, as many as he could find; and when he heard of the Viking who had brought Eustace of Guisnes to reason, it seemed to him that he was a man who would do his work.

So when the great Marquis came down to St. Omer to receive the homage of Count Eustace of Guisnes, Robert came thither too, and saw Hereward.

"You have done us good service, Harold Naemansson, as it pleases you to be called," said Baldwin, smiling. "But some man's son you are, if ever I saw a gallant knight, earl-born by his looks as well as his deeds."

Hereward bowed.

"And for me," said Robert, "Naemansson or Earl's son, here is my Viking's welcome to all Vikings like myself." And he held out his hand.

Hereward took it.

"You failed in Galicia, beausire, only because your foes were a hundred to one. You will not fail where you are going, if (as I hear) they are but ten to one."

Robert laughed, vain and gratified.

"Then you know where I have been, and where I am going?"

"Why not? As you know well, we Vikings are all brothers; and all know each other's counsel, from ship to ship and port to port."

Then the two young men looked each other in the face, and each saw that the other was a man who would suit him.

"Skall to the Viking!" cried Robert, aping, as was his fancy, the Norse rovers' slang. "Will you come with me to Holland?"

---

* Motley. "Rise of the Dutch Republic."

"You must ask my young lord there," and he pointed to Arnulf. "I am his man now, by all laws of honour."

A flush of jealousy passed over Robert's face. He, haplessly for himself, thought that he had a grievance.

The rights of primogeniture—"droits d'ainesse"—were not respected in the family of the Baldwins as they should have been, had prudence and common sense had their way.

No sacred or divine right is conferred by the fact of a man's being the first-born son. If Scripture be Scripture, the "Lord's anointed" was usually rather a younger son of talent and virtue; one born, not according to the flesh, but according to the spirit, like David and Solomon. And so it was in other realms besides Flanders during the middle age. The father handed on the work—for ruling was hard work in those days—to the son most able to do it. Therefore we can believe Lambert of Aschaffenbourg when he says, that in Count Baldwin's family for many ages he who pleased his father most took his father's name, and was hereditary prince of all Flanders; while the other brothers led an inglorious life of vassalage to him.

But we can conceive, likewise, that such a method would give rise to intrigues, envyings, calumnies, murders, fratricidal civil wars, and all the train of miseries which for some years after this history made infamous the house of Baldwin, as they did many another noble house, till they were stopped by the gradual adoption of the rational rule of primogeniture.

So Robert, who might have been a daring and useful friend to his brother, had he been forced to take for granted from birth that he was nobody, and his brother everybody—as do all younger sons of English noblemen, to their infinite benefit—held himself to be an injured man for life, because his father called his first-born Baldwin, and promised him the succession,—which indeed he had worthily deserved, according to the laws of Mammon and this world, by bringing into the family such an heiress as Richilda, and such a dowry as Mons.

But Robert, who thought himself as good as his brother (though he was not such, save in valour), nursed black envy in his heart. Hard it was to him to hear his elder brother called Baldwin of Mons, when he himself had not a foot of land of his own. Harder still to hear him called Baldwin the Good, when he felt in himself no title whatsoever to that epithet. Hardest of all to see a beautiful boy grow up, as heir both of Flanders and of Hainault.

Had he foreseen whither that envy would have led him; had he foreseen the hideous and fratricidal day of February 22nd, 1071, and that fair boy's golden locks rolling in dust and blood—the wild Viking would have crushed the growing snake within his bosom; for he was a knight and a gentleman. But it was hidden from his eyes. He had to "dree his weird;" to commit great sins, do great deeds, and die in his bed, mighty and honoured, having children to his heart's desire, and leaving the rest of his substance to his babes. Heaven help him, and the like of him!

But he turned to young Arnulf.

"Give me your man, boy!"

Arnulf pouted. He wanted to keep his Viking for himself, and said so.

"He is to teach me to go 'leding,' as the Norsemen call it, like you."

Robert laughed. A hint at his piratical attempts pleased his vanity, all the more because they had been signal failures.

"Lend him me, then, my pretty nephew, for a month or two, till he has conquered these Friesland frogs for me; and then, if thou wilt go leding with him——"

"I hope you may never come back," thought Robert to himself; but he did not say it.

"Let the knight go," quoth Baldwin.

"Let me go with him, then."

"No, by all saints! I cannot have thee poked through with a Friesland pike, or rotted with a Friesland ague."

Arnulf pouted still.

"Abbot, what hast thou been at with the boy? He thinks of nought but blood and wounds, instead of books and prayers."

"He is gone mad after this—this knight."

"The Abbot," said Hereward, "knows by hearing of his ears, that I bid him bide at home, and try to govern lands in peace, like his father and you, Sir Marquis."

"Eh?"

The Abbot told honestly what had passed between Hereward and the lad, as they rode to St. Bertin.

Baldwin was silent, thinking, and smiling jollily, as was the wont of the Debonair.

"You are a man of sense, beausire. Come with me," said he at last.

And he, Hereward, and Robert went into an inner room.

"Sit down on the settle by me."

"It is too great an honour."

"Nonsense, man! If I be who I am, I know enough of men to know that I need not be ashamed of having you as bench-fellow. Sit down."

Hereward obeyed, of course.

"Tell me who you are."

Hereward looked out of the corners of his eyes, smiling and perplexed.

"Tell me and Robert who you are, man; and be done with it. I believe I know already. I have asked far and wide of chapmen, and merchants, and wandering knights, and pirate rascals—like yourself."

"And you found that I was a pirate rascal?"

"I found a pirate rascal who met you in Ireland, three years since, and will swear that if you have one grey eye and one blue——"

"As he has," quoth Robert.

"That I am a wolf's head, and a robber of priests, and an Esau on the face of the earth; every man's hand against me, and mine—for I never take but what I give—against every man."

"That you are the son of my old friend Leofric of Chester; and the hottest-hearted, shrewdest-headed, hardest-handed Berserker in the North Seas. You killed Gilbert of Ghent's bear, Siward Digre's cousin. Don't deny it."

"Don't hang me, or send me to the Westminster miracle-worker to be hanged, and I will confess."

"I? Every man is welcome who comes hither with a bold hand and a strong heart. 'The Refuge for the Destitute,' they call Flanders; I suppose because I am too good-natured to turn rogues out. So do no harm to mine, and mine shall do no harm to you."

Baldwin's words were true. He found house-room for everybody, helped everybody against everybody else (as will be seen), and yet quarrelled with nobody—at least in his old age—by the mere virtue of good-nature—which blessed is the man who possesseth.

So Hereward went off to exterminate the wicked Hollanders, and avenge the wrongs of the Countess Gertrude.

ESSAYS, THEOLOGICAL AND PHILOSOPHICAL.

By HENRY ROGERS, Author of "The Eclipse of Faith."

III.—A "VISION" ABOUT "PREVISION;"

OR, (AS SOCRATES SAYS,) "A DREAM FOR A DREAM."

Let it not be supposed that religion alone makes demands on our faith. Science just now, or at least what often usurps that name, is quite as exacting. Some of its prophecies are as hard to be believed as any in the Old or New Testaments; and its dazzling visions of the "Promised Land" into which it is about to lead its "chosen race" of *savans*,—where they are to revel in omnisicient knowledge and supreme dominion over nature,—are absolutely overpowering. One feels inclined to cry out with Gray's Bard, under the oppression of these Apocalyptic splendours,—

"Visions of glory, spare my aching sight,—
Ye unborn ages, crowd not on my soul."

Of course, I do not for one moment imagine that the many eminent men of our day,—more numerous than at any former period,—who with patient humility, and gentle and modest solicitation of nature, are pursuing the inductive philosophy in the footsteps of Bacon, do otherwise than smile at the ignorant raptures in which many a tyro, who, it may be, has read a short paper on the "Habits of the Field Mouse" before a local Society, or presented a small collection of butterflies and cockle-shells to a local museum, or is made happy by having got admission for some bombastic predictions of the coming scientific discomfiture of all "creeds and theologies," in some local print, indulges on this subject. Nevertheless, this enthusiasm of spurious science,—spurious emphatically, since it idly boasts of what it *will* do, in that spirit of presumption which is exactly antipodal to true science,—is becoming quite a nuisance. "Science," says one, "is the Providence of man." "Science," says another, "is to sweep the world clean of all historical and traditional faiths." "Science," says a third, "is to banish all belief in miracles, and all notions of the supernatural." "Science," says a fourth, "will show the needlessness and absurdity of all such hypotheses, when man has fully outgrown the theological stage of development. It will prove that the universe is nothing but a necessary evolution, in virtue of a law of cosmical order," (though "comical" would be the right word, since it is a law requiring no legislator,) "which makes the idea of a creation as superfluous as it is ridiculous." "Science," says a fifth, bolder still, "will gradually extinguish all idea of a 'God,' for which, when science is perfected, it will substitute the true Être Suprême;" that great *Mumbo Jumbo*, that august many-headed "singular-plural" Deity, the "collective humanity,"—at once God and worshipper! "Science," says a sixth, "will in due time penetrate all mysteries, untwist all intricacies in the so-called web of 'causes and effects,' show the interdependence and relation of all physical, and (as some say,) moral phenomena, and giving man powers in proportion to his knowledge, make him master of his destiny; enable him to read the future almost as readily as the past, and to write history in the shape of prophecy." One almost expects to hear that science is to abolish death, discover the "philosopher's stone" and the "elixir vitæ," and give us copious draughts of the "aurum potabile." Most assuredly many of the promises made in its behalf by some of its more sanguine disciples are just as void of all foundation,—many of its conclusions just as devoid of all premises,—as the dreams of ancient alchemy and astrology. In the eagerness with which many sciolists welcome any extravagant theory, which but promises enough and prophesies enough, though without one particle of experimental evidence to sanction it, the very principles of all inductive science are simply set at defiance.

In no direction is this overweening spirit more manifest than in the hopes of that "prevision" of even the remote future, which "young science" so often promises. Many are anticipating that the privilege of loosing the clasps of the iron-bound book of destiny, and of translating its hieroglyphics, is to be the dower of advancing science. Ingenious meteorologists are giving us—not merely reasonable warnings of immediately impending tempests, which barometrical indications and other probable signs of imminent change doubtless justify; not merely modest, though necessarily vague and general, forecasts of the *probable* weather of the next day or two, founded on the evidence of the phenomena of the passing day, (which may be all very well too;) but, *mirabile dictu!* the diary of the weather for a twelvemonth in advance;—for what particular point of space, is another matter. If such a diary is to be of any use, we ought to have one for every few square miles, certainly for every parallel of latitude; since a moderate railway journey of a couple of hundred miles or so, will often give us all the varieties of sunshine and cloud, moist and dry, rain and drought, wind and calm on the very same morning. However, the thing is done for somewhere or other, and will, like Old Moore's Almanack, be always true for somewhere or other. However professedly founded on a *scientific* basis, there is but little presumption in saying, that, as with the above-named almanack, exact science, and precise data for deduction and calculation, have had little to do with such attempts, and idle conjecture just as much.—Again; it was only the other day that I read in one of the prints, a prediction that science would be enabled by-and-bye, in virtue of "statistics," (to which many seem to attach the same mystical virtue as the Jews to their Cabala,) to predict the year in which another Shakspeare or Milton will be born into the world; the exact period, the completion of a cycle, when such a "rara avis" is *due*—much in the same way as we may predict the return of a comet, all whose elements have been subjected to mathematical calculation. In another journal I saw strong exhortations to study the remotest problems of "pre-historic" archæology, not merely as highly curious in themselves, and therefore, well worthy of the most diligent study, but as an indispensable condition of the knowledge of the remote future! How the raking into Danish "kitchen-middens," or the most accurate application of the craniometer to presumed "pre-historic" skulls, can effectually aid us in casting the horoscope of the future, is not very intelligible; and considering the more than Egyptian darkness which still surrounds all the "pre-historic" ages,—the hubbub of indistinct mutterings which issues from those depths, and to which science gives the most discordant interpretations,—our utter inability to measure "pre-historic" antiquity for want of what Scaliger truly calls the basis of *any* history, the chronological unit, (in this case, a unit of geologic time,)—the above exhortation really sounds like telling us to light our candles at the ashes of old Tubal-cain's forge-fire, or to go into a coal-cellar to see the sun rise! However, the notion was in obvious though unavowed harmony with the theory which had evidently taken possession of the mind of the speculator;—that since man *is to be* gifted with universal knowledge, (the future included,) and as everything in this wonderful "cosmos" is connected with everything else—one stage of development with another—so, a knowledge of the whole interdependence of things, or, as Butler would say, "of all things from everlasting to everlasting," becomes essential; and therefore a perfectly accurate knowledge of the past to an accurate "prevision" of the remote future. And no doubt this is true; but whilst most persons would say, "Then good-bye to the hopes of man's universal knowledge," our more adventurous, though I admit, for the most part, youthful speculators, are by no means daunted. True though it may be, that the really *scientific* knowledge of the future implies a really scientific knowledge of all things past and present, *that*, it seems, is merely a reason why man should be exhorted with all convenient speed to get it! It would be more natural, one would imagine,—more in keeping with the caution of the inductive philosophy,—to abstain at present from such speculations; to abstain till some thousands, or perhaps millions, of years had at least afforded some plausible indications that the applications in question would ever be possible. Even those astronomers who settled it that the stars are nothing but nebulæ condensed into solid globes, did yet at least require the nebulæ to speculate with; and surely it would not be too much to ask that those sages who hope to illuminate the depths of the remote future by lights derived from the depths of primeval time, should at least see some faint nebulous streaks in the region of "Chaos and Old Night," before indulging in these visions of the ultimate achievements of science.

While there is nothing, absolutely nothing, as far as I know, to be alleged for this purely modern presumption of man's ultimately mastering the secrets of futurity, and, as some expressly say, becoming, in fact, his own God, or at all events the *only* God that ever is to be, I have endeavoured in a former paper * to show, not only how purely gratuitous are any such anticipations, but how utterly opposed to all probability, whether we consider the nature of the problems in question, or the limits of the human mind. In this prodigious system of things in which "we live and move and have our being," events of all kinds, great and little, near and remote, are so inextricably interwoven with one another, so reciprocally dependent; such is the infinitely variable manner in which phenomena, themselves of the most various kinds, and the subjects of a dozen different sciences, enter into the very same problem, and constitute or modify the very same result; such is the subtle and ever-shifting action of the infinitely diverse phenomena, mechanical, chemical, meteorological, pschyological, intellectual, social, and moral, which determine the complex conditions of human history, that neither has man faculties to discern and collect all these subtle, latent, ever-varying data from which to make a perfect induction of the elements of the "Science of the Future," nor, if he had, has he the power of analysis and deduction to enable him to calculate the resultant of such a prodigious array of forces, or work out problems into which enter millions of variables. "In this system," as one says who had meditated as deeply as any man ever did on the limits of the human faculties, "any one thing whatever may, for aught we know to the contrary, be a necessary condition to any other;" and hence is that system "so incomprehensible, that a man must really *in the literal sense know nothing at all*, who is not sensible of his ignorance in it." *

---

* "On some Recent Speculations touching the Scientific Apotheosis of Man." GOOD WORDS, Jan. 1861.

One of the most curious, as well as most incomprehensible, of the features about these vaunting speculations as to man's *future* triumphs over the *future*, which are at present so much in fashion with a certain class of persons, is, that he who gave the first stimulus to them in our day—M. Comte—is much more moderate and discreet than his youthful disciples; and continually acknowledges, though of course, despondingly, his sense of the utter unlikelihood, if not absolute impossibility, of man's advancing beyond conjecture in these regions; of obtaining accurate "prevision" in relation to any events, the conditions of which involve that immense multiplicity, variableness, and subtilty of phenomena with which medical, meteorological, social, and political science have to deal. Assuredly all experience, *at present*, confirms this view; and probably this would be allowed by even the most overweening of these speculators. All would admit that to the eyes of the most grey-bearded political sagacity, this world at present is little more than a series of *surprises*. All would admit that no man with a head on his shoulders will venture to do more than modestly guess what will be the condition of any community a hundred or even fifty years hence. To this, the answer sometimes is, (for so says one of our modern seers,) "True, but man *will* one day have this power." But what is this but to confess that all speculations on the subject, whether true or false, have just as little to do with inductive science, as our dreams,—which may also be true or false? Such speculations may be the stuff out of which poetry may be made, but not science. To talk thus, is to play the prophet without his inspiration; nay, it is to double his function on the same conditions! For to say that man will be able to prophesy the future, what is it but to *prophesy* that he *will* prophesy? to say that he *will* have "prevision" of the unknown, what is it but to say that he has now a "prevision" that he *will* have that "prevision"? But for the first "prevision," as well as for the second, we want arguments and demonstration, not idle guesses or wild promises. Meanwhile, all the present experience of the world, and, as I think, the nature of things, and the limits of the human mind, are equally against the hypothesis. It is a mode of argument, however, which many a philosopher is rather too fond of using. When it is urged, for example, that we have no proof from experience, that the transmutation of species,—the metamorphosis of fishes into birds, or apes into men,—has ever taken place, and that we must transcend all the sphere of experience if we admit it; the answer sometimes is—"But how can we tell what an indefinite time (of which we have no records) may have produced?" Certainly, the answer of the science of *experience* should be—"Then of what you know nothing, assert nothing." And the same may be said of the hypothesis,—for hypothesis it is,—that, given time enough, man, maugre all experience, will be the seer of the future. Science—the science of experience—the science of Bacon, knows nothing of it.

The chief source of the fallacy in which these expectations originate seems to be a hasty supposition that the theory of *averages*, founded on a profounder study of statistics, will produce effects which, in truth, it never can. As said in the essay to which I have already referred, we never have *real* science, till we have done with averages: "Science, strictly so called, knows nothing of them; we do not speak of mathematical propositions as being on an average true; nor of gravity as being on an average a uniformly accelerating force. *Averages* always imply as much ignorance as knowledge, and simply show that we have *not* science; for which indeed we substitute them." Nor do we ever condescend to make any reference to them or use of them, except as our *ignorance*, (in the matter of insurances for example,) compels us to make a compromise with them, simply because we have nothing better. Additional probability to our conjectures of the future, the study of averages will certainly give; but conjectures they will still be.

But though it is not easy to conceive that science will ever realise the extravagant hopes of some among its more sanguine disciples, it is certainly possible to *imagine* men endowed with a much higher, more certain, and comprehensive knowledge of the future than the utmost audacity of an unfledged philosopher probably ever dared to speculate upon. And what then? I was trying to follow this thought out the other day, just as a play of imagination, and asked myself, What would be the effects on the world, if some favoured individuals had really attained this prescience? Would it turn the world *topsy-turvy?* Would such a gift be compatible with the laws which now seem even essential to society? Would it prove a curse or a blessing? or would it, in truth, leave the world much as it is? If such men existed, would it be easy for them even to make good their pretensions? If they made them good, would mankind welcome them or hate them most? honour them with statues or lock them up in prisons? Would the scheme of the future, published by them, be only *conditionally* true?—that is, true on the supposition that men would act in a certain manner? and would they be at liberty to act otherwise, in the hope of evading the foreseen evil or anticipating the foreseen good—to plot and counterplot according to the aspects of this conditional destiny? If so, would not the whole programme be turned into confusion; the prophecies, *ipso facto*, refute themselves? and would not those who uttered them be proclaimed enthusiasts or impostors? If, notwithstanding, some few things predicted did take place, would it not be said, as usual, that it was because the prophecy fulfilled itself, suggesting and stimulating to the actions which fulfilled it? If, on the other hand, the future were *not* conditional, (if that theory be conceivable,)—and yet men still *imagined* they had liberty, is it conceivable that they could be induced to acquiesce in it, and perform the actions which destiny had marked out for them? Would they move in the groove which it had ordained? If not, what again would become of the prophecy? If they did, what would become of themselves? Would they not become in imagination, and therefore in reality, the passive slaves of a foreknown, inevitable fate; with all hope extinguished, all fear intensified; awaiting in terror the foreseen evil, and looking with indifference on the promised good, darkened as it would be by the shadow of intervening calamities and stripped of the bright colouring of hope? In short, it seemed to me very doubtful whether these *illuminati* would produce much effect on the world, whether their pretensions were credited or not. If they were not, the world would go on much as usual. If they were, then so long as the world is to be governed by any of its present laws, they must be shut up.—While I was pursuing this thought into its various ramifications, my speculation ended,—as many a speculation of a much better philosopher has ended,—by my falling into a nap. In the dream which followed, I saw distinctly how much better we are able to philosophise when asleep than when awake. The great convenience of this mode is that the *facts*, which your waking moments deny for the testing of your theories, are got in a moment, and without any trouble in the world. No sooner had I fallen asleep, than I found the very state of things I had been speculating about as impossible, had really occurred; and all I had to do was to note the results. Locke says that it is a characteristic of madness, that it reasons rightly from false premises; it is assuredly often a characteristic of that nightly madness which so strangely seizes on us all. I am certain that the logic of my dream was admirable; the only things wanting were the *facts:* but, as a bold philosopher said, "so much the worse for the facts."

---

* "Analogy," part i. ch. vii.

Methought, then, that I had just returned to my native land after a long absence in a distant part of the world, where news even of railroads and the telegraph sounded almost unreal and magical. On meeting with a scientific friend with whom I had often talked of the possible achievements of science and the limits of the human faculties, I asked for news of what was doing in the scientific world. He assured me, with much solemnity, strangly mingled both with exultation and vexation, that a small confraternity of *savans* had far outdone anything that mere science in our early days had ventured to dream of, and had discovered nothing less than the art of exact "Prevision of the Future,"—of calculating future contingencies with absolute accuracy. "And we are trying" said he, "to utilise this magnificent discovery by forming the 'Unlimited Knowledge-of-Futurity Company, Limited!' We may well speak *now* of the *drama* of history; for in truth it will be, like other dramas, composed first and acted afterwards; so that Shakspeare's wonderful assertion that 'all the world's a stage, and all the men and women merely players,' will be true in a new and literal sense."

I told him I was delighted to hear it; but asked whether the discovery was not, like other discoveries, capable of being made generally known, and applied by everybody.

"Everybody!" cried he. "Is any other science capable of being understood and applied by everybody? Is everybody a Comte? or *even* a Newton—or a Dalton? The great *arcanum* can be mastered only by the very few who have the requisite intellectual capacity. Let me tell you, that you have no conception of the "contention of mind," (as Sir John Herschel calls it, in speaking of the strain of the faculties involved in grappling with the higher problems of astronomy,)—you have, I say, no conception of the effort required in applying this *calculus* of the future. Let Sir John Herschel say what he pleases, astronomical problems are a mere bagatelle to the problems our *illuminati* have to solve. This sort of quasi-omniscience, as I may call it, is a heavy burden, I assure you, for a mortal brain."

"I can easily imagine that," said I; "but so much the more will those great men be hailed as the benefactors of their species. Mankind will not only raise statues and monuments in their honour, but, for aught I know, will give them an apotheosis, and perhaps, through the excess of science itself, again lapse into new forms of that very idolatry which science has exploded."

Methought a shade of doubt came over his face.

"It will not be in our time," he replied. "You know but little of human nature, if you think their merits will be very soon acknowledged, or their influence soon duly felt."

"You astonish me," said I. "I know that men are apt to be ungrateful to those who have deserved well at their hands; but surely to such signal benefactors——"

"The difficulty," said he, "is to make men know that they are such. You see, by what I have just said, that there are but very few indeed of these more than Newtons, who are equal to these sublime achievements of science; and the generality look upon them as quacks; in short, regard them much in the same light as the astrologers and sorcerers of former days. The difficulty is to make people believe that they have the wondrous powers which they claim;—that they are aught better than conjurors or fortune-tellers. Some suspect that they are mad enthusiasts; some that they are even impostors, and that their predictions deserve no more credit than Moses' Pentateuch or Murphy's Almanack. They declare that all past experience is against any such pretensions. I could not have credited, if I had not seen it, the stupendous force of mortal prejudice."

"But ought not your friends," said I, "to have *foreseen* this result of their pretensions? Was not that incident of the future among their 'previsions?' and could they not prophesy, that though science could prophesy the future, men would not readily believe it?"

"Perhaps they *ought* to have been prepared for such an event," said he; "for our great master, M. Comte, has told us that while a necessary relation subsists between all *physical* events, the caprices of Will are infinite, and reducible to no law."

I ought, in fact, to have reasoned (and doubtless should if I had been awake), that this was a surrender of the possibility of any such pretended powers; for, as the influence of human will,—and that more and more,—is implicated with and modifies all sorts of physical phenomena, it is impossible to separate them. But we easily get over such trifles in our dreams; and, after all, why should I expect to be more reasonable in my sleeping moments than are many who, it seems, overlook this distinction, though they are awake.

"But then, Mr. Buckle tells you," said I, "that the conditions of Mind and Will are just as necessary as physical antecedents and consequents, and you ought on that hypothesis——"

"I don't know how that may be," said he, peevishly, "but the fact is as I tell you."

"Never mind," said I; "this prejudice against your *savans* must yield in time; they have only just begun to prophesy; but when folks find that what they say always comes true, they will soon get over their senseless prejudice——"

"It may be so," he replied; "but if it is to be tested by events a century hence, our seers will all be in their graves before their pretensions are verified. On the other hand, if they give only prognostics of the morrow, they are told that *that* is but an example of sagacity building upon imminent probabilities; and that these men are doubtless only on a par with other good guessers, or perhaps a little in advance of them."

"But could you not get them to submit their prophetic history of a century or so to a select body of statesmen? Perhaps that——"

"You know little about the matter," said he. "Why, they did so only the other day. They forewarned the Prime Minister that in about a hundred years from this time, England would be in the greatest straits; isolated from every friend and exposed to every enemy; and on the eve of utter destruction by an irresistible combination of hostile powers. And, would you believe it? before they had well finished the prediction, the whole Cabinet unanimously voted that the whole thing was an incredible imposture, and refused to believe a word of it: told them that they—the seers of science, they—the pre-destined authors of a New Apocalypse, were nothing better than the astrologers of former days!"

"I can readily believe that," said I, laughing. "They should have told the story in France."

"We did," said he. "And so much more imbued with scientific light is that great nation, that many of our friends there received the communication with the most implicit docility."

It seems then, thought I, that though Science may be the oracle, so perversely is human nature constituted, that Hope and Fear are its interpreters; and all certain as the future is, mankind colour it just as they please, in spite of demonstration itself.

"But at all events," said I, "there are some classes who would be delighted to avail themselves of these 'previsions.' How readily would the diplomatists listen to your *savans!* What a convenience for one of those gentlemen to have such a prompter at his ear! What a price would he not be willing to pay for such a Pacolet! What an evident and incontestible superiority it would give him over every rival!"

"You forget," he answered, "that his rivals would have *other* prompters with the same resources, who would keep them equally *au courant* with the *arcana* of futurity; so that the result would simply be, that the inevitable event would be accepted without any diplomacy at all."

"That would at all events be a comfort," said I.

"But to tell you the truth," said he, "so far from finding these gentlemen (even if they were convinced of the pretensions of our confraternity) willing to accept such aid, one of them said (truly enough) that diplomacy was like a game at chess or hazard; and that infallibly to know all the results beforehand, would be to rob them of all motive to play; that the chief pleasure of politics, as of every other pursuit, was in the chase; and that I might as well try to persuade a keen sportsman to let his bag be filled at the next game-shop, as to persuade a man to engage at all in pursuits and contests, the end of which was infallibly known beforehand."

"At all events," said I, "what an invaluable 'Own Correspondent' one of these *savans* would be to any newspaper! What would not the editor of a journal give for one who could certainly tell, not only the events of the next day, but of the next year, or, for the matter of that, the next twenty years!"

"The same objection precisely," said he, "would apply; but you also forget that if we had our way, the whole tribe of newspapers would perish. All that our *savans* would have to do, would be to publish, every twenty years or so, the history of the nations, and 'Othello's occupation is gone.' What, at most, could they do, but tear out a leaf or so from our infallible 'Annual Prophetic Ephemeris,' which would of course be as regularly published as the Nautical Almanack? There would be an end of those ingenious daily speculations which keep editors and readers in pleasing suspense; as well as of those busy rumours which profitably fill the columns of to-day, and, by the necessity of contradicting them, as profitably fill the columns of to-morrow. No, my good sir, there are no such enemies of the 'seers of the future' as the editors of the newspapers—unless it be their readers, who, I believe, love the charming suspense of a 'Quidnunc' above all the certainty in the world."

In a similar manner, (in addition to the original doubt which haunted the community with regard to these vast pretensions of science), I found other large classes, much better pleased with the thought of unconsciously *making* history by their daily course of action, than with that of foretelling it; and who determined to hold on by the old jog-trot of probabilities. They were by no means so entranced with the prospect of having a clear "prevision" of the future, as I had at first imagined. The preternaturally gifted men, in short, seemed in danger of being *de trop* in the universe, by reason of their transcendent superiority to all the rest of mankind, and of being reduced by science to all the helplessness of ignorance. It was a singular case of *l'embarras des richesses.*

"But," said I, at length, "if their knowledge of futurity be indeed *scientific*, and not mere probable conjecture on the general course of things, it must embrace the knowledge of *private* events as well as public. I know there are some who say that man may get a scientific knowledge of the future history of communities, but not of individuals; of events in the mass, but not of events in detail. That they may guess at both with probability I concede; but to have accurate *scientific* knowledge of the future in the mass, surely demands the scientific knowledge of the minutest details; for, as all things, the great and the little, are bound up together—as the greatest events often lead to the least, and the least, by a variety of intermediate links, to the greatest, a real prevision of the one is surely impossible without that of the other?"

"Of course," he replied, with some appearance of contempt. "If I know with *absolute certainty* the resultant of a number of component forces, I must know the components themselves; if I am *certainly* to know exactly when and where such and such events—the conjoint product of multitudinous phenomena—are to take place, it can only be by knowing those phenomena perfectly in all their possible relations and interaction; if I am to know *certainly* that a man will die at a given moment, partly from physical disease and partly from mental causes, partly by the effect of climate and partly by his own folly and neglect, partly by one doctor's ignorance and perhaps partly by another doctor's science,—how can I possibly tell the event except by a knowledge of all these conspiring causes? Communities are but collections of units; the *total* effect of their action is the total effect of all the circumstances operating upon each individual: nay, many of these units are often of sufficient importance, sometimes almost singly, sometimes in conjunction with two or three more, to determine the destiny of a nation for a century or more—and unless the history of these were known how could we know the result? Who could certainly have foretold the history of France for the last eighty years, if he had left out the history of the two Napoleons?"

Though I admitted the reasonableness of all this, the coolness with which this pretension, in spite of my being in a dream, was asserted, somewhat staggered me. "My friend," said I, "what you say may be or may not be true; but to those who have sometimes urged me with the possibilities of 'scientific prevision' of future events, in spite of their involution with an infinitude of inter-dependent phenomena, I have sometimes proposed a little experiment, which, it seems to me (perhaps too hastily), may test the power of man to deal with problems, when the phenomena get beyond a certain degree of variety, subtlety, or rapidity of movement. Put a bushel of sand in a fine sieve; mark any grain you will, so as to know it again; then sift it all to the last grain by an equable motion; but before you do so, predict the interstice of the sieve through which that grain will pass; and if you are right, I, for one, can no longer doubt any pretension you may please to make: though I confess that the feat is nothing to the infallible prediction of when and where events are to happen, which are dependent—not like this, on homogeneous conditions, mere mechanical laws—but in virtue of conditions far more subtle, various, and complex, and involving phenomena which belong to some dozen sciences instead of one."

Methought he led me into another room, filled with an array of strange uncouth-looking instruments, and where sat a *savant*, the very impersonation of abstraction and distraction;

"Erudite, profound,
Terribly arch'd and aquiline his nose,"

his brows knit till his eyes were almost hidden, and his forehead ridged and corrugated with intense thought. To him my friend mentioned my little request. It seemed to me that the wonderful man accepted this challenge as coolly as if it had been an invitation to dinner. Methought he slowly rose, proceeded leisurely to fulfil all my conditions, and to my surprise, (though not perhaps to that of some of my readers, if they have sufficient faith in dreams or in science,) after a short calculation, actually resolved the problem. And yet, leisurely as he was, it seemed that in a very few minutes—such virtue is in dreams!—he showed me the particle of sand passing through its predicted and predestined hole!

"This now," said my friend condescendingly, "you perhaps think difficult." I nodded, as I well might. "It is nothing," said he, "a mere nothing, to the intricacies of calculation which we are sometimes obliged to face. You are quite right in supposing that the actual phenomena involved in the production of any remote event, or indeed almost any event, are incomparably more numerous and convoluted than in this case. It was only the other day that I found, that in fifteen years, the trifling circumstance of a horse casting his shoe, and thereby delaying a traveller for a few minutes, will by a series of interconnected events, widening and widening in their influence, like the circles made by throwing a stone into still water, change the condition of a large portion of the world."

"That," said I, "is not in the least degree wonderful; and it reminds me of something I have somewhere read, of a great man whose brilliant career was absolutely determined by some such infinitesimal casualty," (doubtless it was this very reminiscence, which suggested the case in my dreams;) "*that* does not at all puzzle me. What does puzzle me is, that you should have been able to hunt out and predict the *connection* through all these intricacies."

"It is," said he, "by an altogether transcendental Calculus of Variations!"

I had now no remaining doubts of the reality of the discovery. How could I? I therefore told my friend that though his fraternity seemed in danger of being a little *de trop* in the world, on the principle that "too much water drowned the miller," yet that since they could divine the future of *individuals*, as well as communities, it would be easy for them to attain a great reputation, as well as more solid gain, by fortune-telling;—that millions would no doubt come to them to know with certainty,—not their luck—but their destiny.

I must do my *savant* the justice to say that he made a very wry face at such a suggestion; and seemed to feel keenly for the dignity of his sublime science, and the humiliation to which human prejudice subjected it. He shrugged his shoulders and said:—

"You are perhaps a little mistaken; our success even in that direction is not so clear as you imagine. Not less than the sorcerers of old, are we exposed to the jealousy and suspicion of the civil magistrate. The fact is that the same wise politicians who won't listen to our predictions of coming calamities to the community, loudly proclaim that we are the most formidable enemies it has; and constructing a little dilemma of their own, argue thus:—That we shall tell people's fortunes, (thus do they profanely burlesque our sublime art,) either *falsely* or *truly*; if the former, that we must be punished, as Bacon says those who spread false prophecies ought to be; if the latter, that the men to whom we promise future good will be betrayed into indolence and apathy; lose the charm of life and the chief stimulus to activity; or strive to anticipate the promised good in unlawful modes: that, on the other hand, those to whom we prophesy future evil, will sink into dreadful despondency, or essay in a thousand ways to elude or even counteract the decrees of fate; that all sorts of people will flock to our oracles to know, not their own lot, but that of their neighbours; that plots and counterplots against one another will be endless and remediless; and that the whole world will be filled with mutual suspicion, and society poisoned in every vein. They tell us, that it will be much the same as if that great safeguard of the world's peace, and even existence, the invisible secresy of each man's thoughts, were destroyed; and every man carried a window in his breast. They tell us that though they cannot prevent fools from seeking to know their own fortunes, any attempt to reveal the secret of one man's future to his neighbour, will be an offence calling for a severe and summary punishment. It is in vain that we tell them 'that events are neither to be eluded nor frustrated by being foreknown; that the things decreed by fate *must* come to pass:' for they have another dilemma. They ingeniously argue: 'If so, then what is the *good*, or rather, what must not be the *mischief*, of foreknowing them? The foreseen good will be regarded with less vivid desire, and the foreseen evil with greater dread; or rather, the promised good will be poisoned by the sure anticipation of the foreseen evil: so that, at the very best, we shall inflict on men what Leibnitz calls an intolerable evil; for he says, that though men would be willing to accept an indefinite lease of life, provided the incidents were perpetually varied, no mortal would willingly tread the very same beaten track again; which, in effect, every man must do, who *certainly* knows his future beforehand.'

"Besides which, they have the impudence to say, that unless all men be absolute fatalists, they will not acquiesce in the decrees of fate; and they ask a question with which, I confess, in spite of all our science, our *savans* are themselves posed—namely, 'Whether the events predicted are *absolutely necessary*, or only *conditionally necessary*:' that if the people believe the former, then all the aforesaid evils must ensue; if the latter, they would spend life in a perpetual, even though it be a futile, struggle with destiny itself.

"I confess, I say, I cannot decide this question as to whether things are absolutely, or only conditionally necessary; for, as we told them, it was one of those questions which our great masters had pronounced 'metaphysical rubbish,' and impossible of solution; and that therefore it was a mere loss of time and thought to argue about them. 'But,' said they, 'you *must* decide it somehow; for if things are only conditionally necessary; if in order to such and such an event's happening to any individual, that individual is to act so and so; then, since no community will take a course which you say will be ruinous, and no individual will go on board a ship which you tell him will be wrecked, or enter a train in which he will be smashed, your predicted train of events will be liable to be continually broken, your concatenation of "antecedents and consequents" continually disconcerted, — by the mere fact of your *making it known!* It seems that it is essential to your predicted chain of events, that you should *not* make it known; so that *ignorance* of the future, not *science* of it, is the necessary condition of your predictions being fulfilled. By all means therefore, if you wish for the credit of your vaticinations, conceal them till after the event. Prophecies after fulfilment always come true.' Thus do they not only disregard, but taunt us. Though this wisdom cries aloud in the street, like another wisdom, it cries in vain. Men will not heed it."

"But surely," said I, "if the old soothsayers had their thousands eager to consult them, you will have your tens of thousands. What will not people give to get at the *truth*, which those spurious seers only pretended to tell?"

"Very few indeed," said he, "have come as yet; and I begin to doubt whether there are many who *wish* to know it. Those who have come, seem to have little better notion of us than of common conjurers, and treat our prognostications much as theirs were treated. Few will believe aught of the future but what is pleasant, and cannot be got to believe what is otherwise. For them, there is no destiny except what presages good. Every promise of *that*, they believe devoutly, and forget the rest. But they might do that (as all the rest of mankind do) without us; for," he added, echoing my thought, "Hope is the interpreter, though Science is the oracle."

"But do none at least wish to know the hour of their death—that they may duly prepare for it?"

"That least of all," said he. "Not a soul will hear his tale told to the end; they won't let us unveil to them the hour or the mode of their dissolution: beyond it, even if they wished, we cannot go; for the chain of causes and effects, so far as we can discern, is there broken off. But they won't go so far; they prefer having a veil thrown over the closing scene of their life. Like other play-goers, they do not like death to be actually exhibited on the stage, and willingly let the curtain fall ere the catastrophe."

I began to fear lest the lot of our new Magi should resemble that of the ancient alchemists, who, although boasting of their power of making mountains of gold and silver, were always in rags and poverty, for want of credit enough to raise that little loan of money which was the trifling preliminary to the realisation of their golden visions.

"But *you* at least," said I at last, "have not exhibited the childish prejudice of these people, and preferred ignorance to knowledge? You, like a true sage in quest of truth, have doubtless read the mazes of your own life, and have seen yourself dead and buried long ago; *you* have dared to look even to the last point of prophetic vision?"

"For what purpose?" said he. "Is not that knowledge the very misery of prisoners in the condemned cell? are they not accounted miserable precisely because they are to die just that day month? will not hundreds, who pity them for that very circumstance, in fact die *before* them? and yet are they not accounted happy in comparison, because they know it not? Shall I confess it? Even *I* too have so much of a mortal man about me, that I have not been able to overcome the weakness. I have attempted it, but my hand has so shaken as I made the calculation that I have not been able to complete it."

"Well," said I, "that is not wonderful; for if Newton's hand so shook, when he was completing the calculation by which he was to verify his theory of universal gravitation, that he was obliged to ask his pupil to take the pen and perform the operations for him, no wonder a man's hand trembles when he is "working the sum" of his own life, and every digit is bringing out the dread result clearer and clearer. But why not do as Newton did, and send for one of your brother *savans* to perform the friendly office for you? Could you not do this little kindness for one another?"

"I know not how it is," he replied, "but all of us think it may as well be let alone."

"At all events," said I, "you must be happy, as a mighty seer, in the consciousness of possessing this wonderful attribute."

"If to be omniscient and to be powerless; if to have vast gifts lodged with us as useless, can make us so, we are," said he, with a sigh.

I began to suspect that vaulting ambition had overleaped itself; that the knowledge of a God will not comport with the condition of a man; and that we may, while we remain what we are in other respects, know too much for our own happiness as well as too little. But I had no time to pursue my reflections further, for that tremendous wizard who had managed the little calculation about the grain of sand,—and which he thought so little of, though that in the "Arenarius" of Archimedes was a trifle to it,—here broke in by saying; "As you inquired so curiously as to whether we had not read our own horoscope, no doubt you would like to know your own. I will tell you," he added, looking, I thought, first arch, then malicious, then downright wicked. Methought he snatched up at the same time a pencil, and a sort of photographer's box, from behind which he began peeping and mowing at me. In vain I protested I did not wish to know any such secrets. "Sit still," he cried, "I shall have you in a minute,—you shall know exactly when you are to die,—I see it won't be very long—the very instant——" "I *won't* know," I cried, in a paroxysm of terror, which awoke me. I commended all astrologers, sorcerers, and conjurors, scientific and otherwise, to the bottom of the Limbo of Vanity;—whither indeed they sped immediately; for "I awoke and behold it was a dream."

Yet not "all a dream;" for I felt more convinced than ever, that certain knowledge of the future was not only impossible to man, but unless man himself and the world of which he forms a part, and the laws which govern both, were altogether different, it was a gift not to be coveted; that like "pride," it was not made for man; that if men in *general* possessed it, it could only make them supremely miserable by despoiling them of all their joys, and multiplying all their sorrows; that if they had it, they must seek to rid themselves of it by imploring a cup of Lethe before they could act as nature and necessity now prompt them; that if a *few* possessed it, the rest of mankind would either disbelieve them, or if they believed them, must gag them in self-defence; and that in either case, the world would go on much as at present. I felt that it is a prerogative which, as God expressly challenges it as his *peculium*, one of the royal jewels in the diadem of the "Infinite Majesty," so we may be assured He will never part with it to us. And as, unless we were Gods too, we cannot safely possess it, so it is essential to our moral discipline that we be without it. By our ignorance of the future, God governs and educates us; "abases the proud and exalts the lowly," teaches us dependence and humility, stimulates our activity, encourages hope when things look dark, awakens salutary fear when they look dangerously bright; in a word, from the depths of that unknown abyss into which we so vainly peer, evokes the chief instruments and appliances of our moral probation.

It also made me feel more strongly—what I had often felt before—that to utter *true* prophecy must require, for a world like this, infinite wisdom no less than knowledge; and that we need not wonder at any of the obscurities which precede its fulfilment, if it but be made plain when it is fulfilled. For He alone who perfectly knows the conditions under which such intimations can be given, without disturbing that course of events in which foreknown and predetermined issues are to be wrought out by voluntary agents and moral means, can paint the future in that *chiaroscuro* which shall neither allow man to anticipate or frustrate any part of it; which shall leave him the ignorant instrument of working out the designs of a higher will, while he yet follows his own; so to act, that the supreme Ruler has His end, and we have ours.

"A paradox—a paradox!" I fancy I hear many say. It may be so; but I believe it to be a great truth notwithstanding.

NOTES ON THE BALKAN—THE CHURCH IN BULGARIA.

In these days of certificated schoolmasters, there are some places, not far from home, whereof the geographical names scarcely awaken an idea; and this is especially the case with the inland districts of a country, still—to the world's disgrace—called Turkey in Europe. But if in this dim region there be one name less unfamiliar than the rest, it is assuredly that of the Balkan—of the great mountain chain which must be traversed by a northern army before it can lay siege to Constantinople.

The traveller on the high road between Stamboul and Belgrade travels for many a weary day along the sultry and feverish plain, nor until he approaches the town of Philippopolis does he espy in the west the boundary of the Rhodope, on the north the distant range of the Balkan. A day later he has gained the hills, and, supposing him still to keep to the post road, he will cross the Balkan by its most westerly and most famous pass, the Kapu Derbend, or Gate of Trajan.

But we, though on the way to Belgrade, did not at this point keep to the straight line, for we wanted to visit an old Bulgarian monastery, said to lie in a gorge of the Rhodope, at the foot of its highest mountain, Rilo. So we struck into the hills, crossed the pass called Kis Derbend, between the Rhodope and the Balkan, made our first stage at the mineral waters of Banya, and our second at the little town of Samakoff.

The upland plain wherein Samakoff lies is crossed by the bridle roads from Bulgaria, Macedonia, Albania and Thrace. Hence it forms a point of meeting, not, as might be expected, for commercial travellers, but for highwaymen escaping from one pashalik to another; for which purpose the Turkish authorities take care to allow an interval between each crime and the pursuit.

We came to Samakoff provided with a letter to one of its wealthiest Christian inhabitants, who received us hospitably, and conducted us to a chamber surrounded by a broad divan. In arranging the cushions to form our beds we lighted on a pair of loaded pistols. Of course we covered them up again, and said nothing, but their concealment testified, what we had remarked already, that although to pacify a revolt it was conceded that every Bulgarian may have the means of defending his women from Mussulman intruders, yet Mussulmans swagger about in belts full of pistols, while the Christian, if he have arms, must take care that they be not seen.

Samakoff was the first place west of Constantinople where we found Greek not even understood, but this did not constitute the people barbarians. On the contrary they had two nice schools—one for boys, one for girls—large airy edifices, built of wood, and gaily painted, after the fashion of the country. Over the doors was an inscription to the effect that they had been erected by the elders of the community without a farthing of help from any one; the emphasis being a reflection on the late Greek Bishop and existing Turkish Government. We visited these schools, examined the work, the maps and the copy-books, heard the children sing hymns and read, and rewarded the best scholar in each with a copy of the Bulgarian New Testament.

Another object of interest at Samakoff is the convent of Bulgarian nuns, which we visited under the following auspices. We were scarcely settled in our chamber before it was entered by a sweet-looking young woman, dressed in a black mantle and a quaint coif. To our amazement she accosted us in German. She told us that she was an Austrian Slav, and had come from Vienna with her mother, who was servant to a German physician: on her mother's death the old doctor advised her to seek protection as a nun. She said the community at Samakoff was of the order of St. John of Rilo, and acknowledged as spiritual superior the abbot of the monastery of that name. It was formed by a number of elderly women, each of whom took a young woman to wait on her, live with her, and after death become her heir. The nuns support themselves by their own spinning and weaving, and out of their earnings have built a church for themselves: they do not aspire to external benevolence, but on the other hand pride themselves on receiving help from none. To beg a livelihood they hold as degrading as we ourselves do. The works of merit constituting sainthood seem in their estimation to be five—diligence, obedience, abstinence from meat, wearing black garments, and making a pilgrimage to Jerusalem. This journey to Jerusalem is the event of each still life, and lends it its redeeming spice of expectation, retrospect, adventure, poetry. The nuns have not their goods in common: some are comparatively rich, others poor; some are assisted by their relatives to defray the expense of the expedition, others have to pay all from their savings. When the money is obtained, two set out, and walk till they fall in with one of those parties of pilgrims always passing to Jerusalem from Bulgaria. They cross the sea to Joppa, pilgrimise thence to the Holy City, and are received into a monastery. There they may remain a whole year, to join in all the feasts and festivals; and on their return they bring back a holy picture—a marvellous concoction of scarlet and gold, depicting all the holy places, all the holy persons—and the Devil, distinguished by horns and a tail, as is not unnecessary among so many grim forms.

Primed with these particulars, we set out to visit the monastery, and having hopped from one to another of the big stones which act as bridges to the muddy river-street, we entered a gate and found ourselves in a clean and dry enclosure in front of a neat little church. Behind it lay the gardens of the nuns with their little dwellings, containing two rooms—a tiny kitchen, and divan-encircled parlour. Here we paid a succession of visits, first to the principal mother of the community; then to a very old and saintly mother possessed of a famous picture of Jerusalem, and beloved among the younger nuns for her endless stories of adventures by the way; finally, to the special mother of our guide, who caused her dear child to show us various little treasures and to bring out her best Sunday mantle. I wish either of us had anything as dignified and substantial for our best gown. Then came evening service, which we attended, and in the dusk of the church the young nun whispered to us with sparkling eyes how the sisters prayed for the success of the brave Montĕnĕgrīnes, and that God would give all Christians a good courage and an united heart. "The great Christian Powers," said she—"is it true that they are leaving that little band to fight alone? Of the people here I say nothing, they deserve what they suffer, for they have not the hearts of men. But the Montĕnĕgrīnes are the soldiers of the Cross. No nation in all Christendom has battled with the infidels as they."

We wished to have taken the nun with us next day to the monastery as an interpreter, but it was thought more discreet for her to stay at home; so we gave her at parting a Bulgarian Testament, and she gave us each a rosary of plaited silk, marked here and there with large mother-of-pearl beads,—a gift involving the sacrifice of some thirty piastres from the fund she was storing for her journey to the Holy Grave.

The day had been rainy, so the glorious sun of the morrow rose on an earth refreshed and green—men and horses had had a rest, and now set forth with glad spirits and bounding tread. Our shining-armed cavalcade was clattering and gay. Eight well-mounted Mahometan zaptiehs—two of whom were cavasses of the Pasha of Philippopolis, our dragoman, and an Ionian deputed by the British Consul to give us the benefit of one Christian sword in case we should be attacked in the mountains by the first cousins of our Mussulman guards. The Bulgarian driver of the waggon wherein we had come over the hot plain could not leave his horses even for a pilgrimage, but the boy was allowed to go, and on his nimble feet soon had the advantage of us all.

But all our enjoyment would have been marred had we ourselves been left to ride the sorry steeds furnished us by the Mudir at Samakoff. Luckily a "bakshish" induced our guards to change with us, and we could not but laugh at the superstition current respecting horses "accustomed to bear a lady" when we felt these high-mettled animals treading proudly and gently under the unwonted side-saddle, the flowing skirt, and fluttering veil. A well-trained Turkish horse is delightful for a journey, being used to walk both for travels and parade. Hour after hour he bears you evenly, lightly over the rough track—and when you enter the town he rears his head, and marches with a procession-step, representative of your dignity and his own.

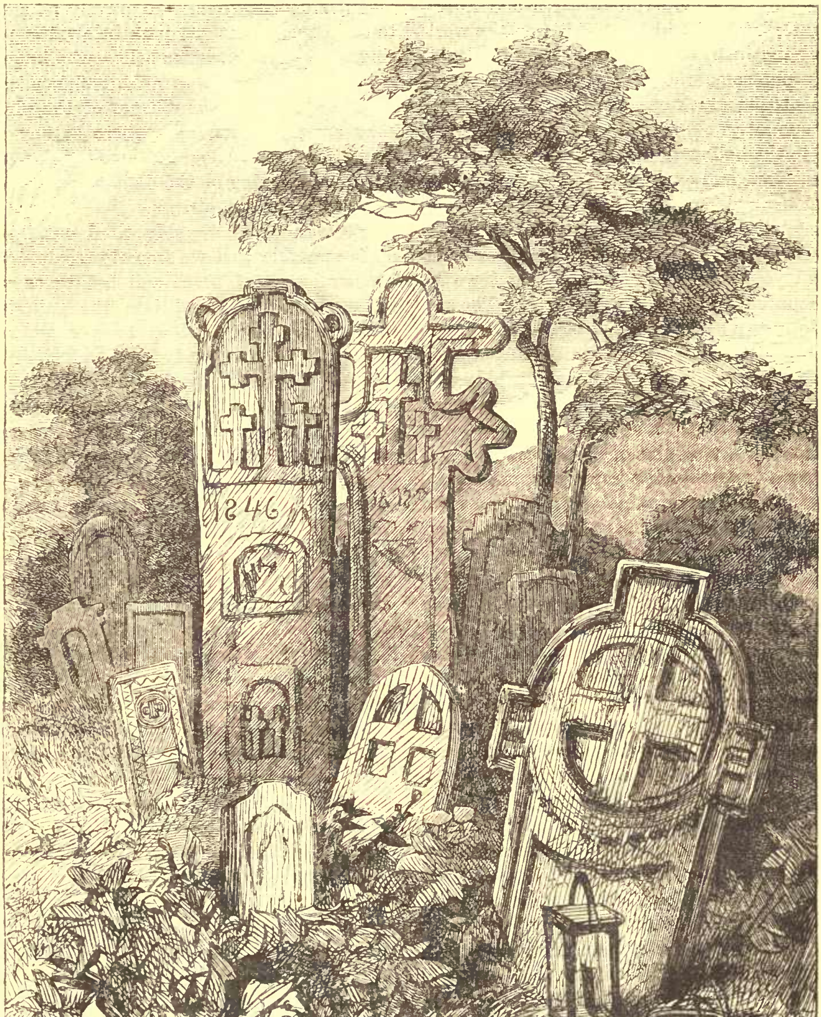
But something more than fine walking became necessary when we left the plain for the pathless glen, and began to dispute with the torrents in their rocky passage down the mountain-side. When at length we reached the head of the pass we came to a bit of rough highland, where a halt was called and the guard showed us the graves of a party of robbers here run to earth and killed. "Until quite lately," said he, "this was the worst glen in all the hills, but the new Pasha of Sophia has lately put some robbers to death and caused their heads to be stuck on poles: that will stop it for this summer." Soon after they called our attention to the hollow sound of the earth beneath the horses' feet, and explained that it was caused by prodigious wild boars which lived underground and undermined all that part of the hill!

And now came a descent almost impracticable for horses, and yet so cutting to the feet that we remained mounted far longer than was safe. The stiff stair led down to a basin, the receptacle of the waters of all the neighbouring mountain streams. One of the zaptiehs pointed out to us a clear pebbly spot where the water escaped by an underground passage. This little tarn of the Balkan, with its grey stones and solemn fir-trees, is one of those scenes which would repay an artist for the journey from England only to carry it home in his portfolio. We sat down on its beach, and could have sat there till now, but the sun was sinking, and the road, ostensibly six hours, was very certain to be ten. Our first sight on remounting was a view over beech forests opening on a grassy vale, at the extremity of which rose an outline of grey walls. "Here," quoth the guards, "is the boundary of the domain conceded by old sultans to the great monastery of Rilo." And scarcely had we passed the frontier when we were met by the convent guard, dressed in white linen tunics and scarlet girdles, and commanded by a man in the garb of an Albanian, who however styled himself a Serb. The array of armed men on horse and foot lent sound and colour to the long dark wood that followed, and once below, the passage through the narrow valley became every moment more beautiful. Exceptionally beautiful indeed, for the mountain scenery between the north of Albania and the Danube is usually rather wild than picturesque. Amphitheatres of hills covered with woods, to which the blending of beech and oak with fir gives in the distance a bluish green; few sudden elevations, few rocky precipices—such is its character, answering exactly to its Slavonic name, "Planina," that is to say, "forest-mountain." Doubtless single scenes show extraordinary loveliness, and the gorge of Rilo is of this number. The hills terminate in horned crags, of the most picturesque abruptness, of the most fantastic form. From these the wood sweeps down in masses, which break into groups and tufts on the park-like meadows which fringe the valley stream. On one side a large building lies to the right, which we took for the monastery, but which proved to be a house set apart for pilgrims, who crowd hither on certain days. To arrive at the convent itself the whole length of the valley must be traversed. The mountains drew nearer and nearer—they seem once more about to close—when, serried in their angle, rise the rugged towers and swelling domes. Outside the gate, in stately row, stand long-gowned, long-veiled, long-bearded caloyers, who gravely salute, and sign to us to enter. As we pass below the portal, out ring the bells. Christian bells—who knows what it is to hear their voices in a Mussulman land! Not in the city, nor in the villages of the plain, where they are forbidden, and where at any rate they would jar with a thousand conflicting sounds—but in the wild hiding of the Balkan—breaking on the stillness of convent air.

We were so thoroughly tired out by our long day's scramble that we scarcely received more than a general sense of peace and beauty as we passed through the court and into the galleries of the monastery. They led us to a chamber painted in bright colours, and furnished with low well-carpeted divans. Here we remained, and had our suppers served,—as much chicken, as much fruit, and as much sweetmeat as heart could wish, besides rice and clouted cream and a huge glass jar of excellent wine. We found also a little cupboard in the wall wherein a bottle of wine and sweetmeats were placed in store for private refection. But that night we wanted nothing but sleep.

Next morning we were invited to an interview with the Abbot in his chamber of audience, and we found him with two or three venerable monks, one of whom, with a long white beard, we had the night before mistaken for the Superior. The real Superior is not more than middle-aged, small and spare, with a refined intellectual countenance unusual among Bulgarians, who are generally large and ponderous men, with a wise expression rather than a clever one. But John Neophytus is no common person. His knowledge of his own language, both ancient and modern, and his zeal to educate and benefit his people, caused him to accept the offer of a Protestant society to translate the Bulgarian New Testament into the vulgar tongue of the people. His name stands on the title-page of the work. He has a store of the sacred books in his convent, and finding we had several with us he exhorted us to turn our journey to account by dispersing them abroad among the people. He told us that the American missionaries in Constantinople who are translating the Scriptures, keep up a correspondence with him, and that two of them had that year been to visit him. Then were shown us the curious old documents which mark the early history of the convent. An inscription on the tower in the court states it to to have existed under the mighty Czar Stephan Dushan, who united Serbia and Bulgaria in his realm. But the earliest chrysobul is of the end of the fourteenth century and from a personage who styles himself John Shishman, Faithful Czar and Autocrat of all the Bulgarians and Greeks, *i.e.*, of the Greeks dwelling in Bulgaria. This Shishman was the last king, and died a Turkish captive, but his title marks that Bulgaria and the Greeks therein resident were independent of the Greek Emperor at the time of the Turkish conquest.

The next documents are Turkish firmans, such as many of the richer monasteries were able to buy from the first Sultan. Since then the revenues of the convent have depended partly on its mountain pasturage, partly on the gifts of pilgrims. Within the last century it has been benefited by the liberality of its northern co-religionists, and the monks have been allowed to gather funds for their new church by begging journeys through Russia, Serbia, Austria, &c.



A Graveyard in Bulgaria.

The monastery of Rilo, in virtue of its privileges, stands (like our Abbey of Westminster) under no Bishop; and hence has been able to maintain its exclusively Bulgarian character. It consists of 150 monks, each of whom has a pupil, who becomes his heir. In all, the personnel of the convent amounts to 400 souls. Women are excluded, and it is even said that none of them may dwell on convent land. This does not, however, extend to visitors, nor to the female relatives of pilgrims.

The acquaintance which the Superior showed with the history of his country and with the present needs of his countrymen, and his services in the matter of the translation, struck us as strangely contradictory of a report we had heard at Constantinople, that the Greek Patriarch did not appoint native Bishops to Bulgarian eparchies, because there were no natives sufficiently educated. We afterwards heard that John Neophytus had been pointed out and demanded as a Bishop by his countrymen, but that the only effect of this recognition of his talents was that the jealous Fanariotes banished him to this secluded Abbey of the Balkan. As it is, he has a lithographic apparatus in the convent, and spoke of setting up a printing press; and, though under the eye of jealous masters—the light must be carefully hid under a bushel—there can be little doubt that the influence of such an Abbot on the young students in the monastery of Rilo will send them forth on their begging journeys able to sow as well as glean.

One remark of the Abbot's struck us especially. We told him that the first Slavonic monastery we had ever seen was that of Cetigne in Montenegro. His brow grew dark, and, after a moment's hesitation, he said, "It is reported that that monastery is now given up to the Mussulmans and burnt." We asked him where he had read it? "In a transcript from the *Journal de Constantinople.*" "Is that all?" cried we; "then do not distress yourself, that journal has burnt Cetigne and killed the whole population of Montenegro already two or three times over." "But," asked the Abbot, "do you believe the great Powers of Europe will sit still and allow that monastery to be burnt?" "We trust and believe not. France will do her best to save it." "France," said he, "perhaps; but England?" Feeling heartily ashamed of ourselves, we answered that the want of interest displayed by England in the Slavonic Christians arose in great part from her ignorance respecting them—that one really never heard their name.

"I have understood so," he replied. "The Americans have told me as much. It is, however, a pity that so great a country, whose children are free to travel where they please, and publish what they please, should remain in such profound ignorance of the *Christians* in a country where she is on such intimate terms with the *Turks*. For the rest," he added, changing his tone, "what have I to do with these matters? I live here as a mouse in a hole, and our Bulgarian people are quiet. Will you please to go over the monastery?"

The monastery is well worth going over; but first let us pause in its open gallery, and feast our eyes on the rich mass of wood that rises precipitately behind the towers in the court. That hill serves the convent at once for wall and screen.

The church standing in the court is new the former one having been burnt to its foundations. It was restored in 1839, with money in great part gathered from alms. It is in the form of a Greek cross, with domes, and cloisters painted both within and without. The interior is supported on columns, and has a beautiful iconastasis of gilded wood, achieved by the Rouman carvers, who do all that sort of work in Turkey. A Christ's head was pointed out to us as painted by a native of Samakoff who had studied at Moscow. It showed the softened Byzantine type of the pictures in the Russian chapel at Wiesbaden.

Strange worshippers were in the temple—shepherds from the Balkan, talking a barbarous dialect of Latin, and calling themselves "Romans," while they live as savages. These people herd flocks, and when the men are absent the women defend the huts, and, like the female Albanians, are noted for their accurate shooting. Their wild mode of life was illustrated by their remarks on ourselves, for, seeing that we were foreigners, and accompanied by a Turkish guard, they took it for granted that we had not come hither of our own free will, and asked, pointing at us, "From what country have they been *robbed?*" But for such monasteries as that of Rilo, these shepherds would be shut out from any form of worship; but here they assemble at certain times to confess and take the sacrament.

We afterwards attended evening service, at one part of which the monks took off their caps, and remained for some time bareheaded, their long locks flowing down their backs. The singing was good, but seemed to us to differ somewhat from what we had heard in Greek churches, and not to have improved so much as the Serbian psalmody.

The most interesting part of the Rilo monastery is the old tower containing the original church. The times when the latter was built reveal themselves by its position three quarters high in the wall, which has no window or lower opening except one overhanging the doorway through which to pour stones or boiling oil on the assailants of the gate. This is not the chapel of St. John of Rilo, who lived and died a hermit, worshipping in caves and hollow trees—it is not even the place of his interment, which lies at some distance on the hill. At the foot of the tower is a cell, wherein insane persons are confined, and whence they are brought into the church during service by way of being exorcised. The monk asked us if such persons were found in our country. We answered, "Yes; but instead of cells we lodge them in large and airy dwellings, and instead of the priest they are brought to the doctor." "And do they recover?" "They do sometimes, but, alas! not always." "Strange," cried he; "that is just the way with ours."

The last place to be visited is the mortuary chapel, wherein we saw numerous skulls on the altar. We were told that to have a skull placed there is a compliment to the departed, for which the relatives are willing to pay. Also that here, as in the Greek parts of Turkey, the dead are disinterred to see whether their bodies be consumed or not. Should they be in a state of preservation it is taken as a bad sign, and masses must be said for the soul. We heard of this custom being observed in the family of immensely rich merchants who enjoy the name and privileges of British subjects! In Serbia this horrible custom has been abolished.

In recompense for our liberal entertainment at the convent, we could get permission to leave nothing next morning, save a donation ostensibly for the church. On the other hand, we carried away some curiously carved wooden spoons, the portrait of old King Shishman taken from a contemporary document, and a bran new history of St. John of Rilo, depicting his eccentricities, miracles, and burial.

As we rode back over the hill there rang in our ears the Abbot's words on the ignorance and indifference of England towards the Slavonic Christians in Turkey—indifference surely culpable in a Power which contributes to hold these Christians in their present miserable condition.

When our dear countrymen take the trouble to inform themselves as to the actual inhabitants of Turkey in Europe, and have learnt that these countries once did govern themselves and fully mean to govern themselves again, they will cease asking one another whether Greece, or Austria, or Russia is to rule between the Bosphorus and the Danube. To this end (for every drop helps the ocean), should we ever make our way safely to Belgrade, and, come once more within the range of non-riding posts, we will tell our friends what we saw and heard in Bulgaria.

It is the last new thing in the Eastern question to have discovered the existence of the Bulgarians—a South Slavonic* population of more than five millions, that hitherto passed muster as Greek. This discovery was due to the appearance in Stamboul of deputations beseeching the European ambassadors to support their claim for a national hierarchy independent of the Fanar.

By Bulgaria we do not mean the small part of it allowed to bear its own name by the Turks, but the whole country peopled by Bulgarians, which stretches from the Serbian lands to the neighbourhood of Adrianople. It has the Danube for its northern frontier; the southern is less easily defined and is indented by colonies—Greek, Arnaut, and Rouman—but may yet be drawn with tolerable continuity from the Albanian mountains to the Gulf of Salonica. How early this region received a Slavonic population appears as yet very uncertain: from Byzantine authors one learns that the Slavonic language was that of its inhabitants in the sixth century; from the testimony of our own ears we know that throughout its length and breadth the Slavonic language is spoken still.

Under the Byzantine Empire the people of Bulgaria appear both as subjects and as rulers. Justinian's birthplace was and is still a Slavonic village, and his Latin name is the translation of his Slavonic one—Upravda. The great Belisarius is said to have been the Slavonic Velisar; the Emperor Basil and his line were Slavs.

This fresh barbarian blood rolled in the veins of the old East Roman Empire till the seventh century, when the first colonists were joined by tribes of a warlike character, with whom they threw off allegiance to Byzance, and overran the greater part of the peninsula. Who these newcomers were is still matter of discussion; but whoever they were, from them dates the name of Bulgaria, and the first dynasty of her sovereigns. Under the more powerful she threatened Constantinople, the weaker acknowledged the Greek Emperor as Suzerein. The monarchy lasted till 1390, when it was overthrown by the Turks.

The most important incident in this epoch of Bulgarian history is the translation of the Scriptures into that tongue by the Thessalonian brothers, Cyril and Methodius.

At the Turkish conquest, 1390, Shishman the king of Bulgaria surrendered himself and his capital to the conqueror's mercy, but the people submitted only by degrees, and always on the condition that if they paid tribute to the Sultan they should be free to govern themselves. Though aiding in Turkish wars their soldiers were commanded by their own voyvodes;* taxes were collected, and towns and villages governed by officers of their choosing; the Bulgarian Church had its native Bishops and its Patriarchs, the latter residing first at Tirnova, then at Ochrida. All this is proved by firmans and berats granted by numerous Sultans.

Of the Bulgarians the more resolute voyvodes were cut off, and the rest left to choose between emigration and apostasy. In 1776 the autonomy of their church was destroyed; in place of native Bishops, of one interest with the people, Greeks were sent from Constantinople, who plundered the peasants, denounced the chief men to Turkish suspicion, set an example of social corruption, and burnt all Slavonic books and MSS. whereon they could lay their hands. The last schools and printing-presses found shelter in the Danubian Principalities.

Few points are more remarkable in the history of Ottoman rule than the mode in which Turk and Greek have played into each other's hands. The Sultan could never have crushed the heart out of his Christian subjects without the aid of a Christian middleman. The Greek has used the brute force of his Mahometan employers to complement his own cleverness and guile. Under the later emperors, Greek dominion was unknown in Slavonic and Rouman lands; under Ottoman Caliphs, Greek Patriarchs and Fanariote Princes have ruled the Roman, the Bulgarian, and the Serb. That nationality must be of tough material which did not give way under this double presence.

---

* South-Slavonic (or Iugo Slavic, from Iug, South), the name assumed by the Slavonic populations *South of the Danube*, to express their sense of kindred among themselves, and distinction from the Russians and other Slavonic peoples.

* Leaders in war—equivalent to the German Herzog, and Latin Dux.

The first breach in the prison wall was made by the revolution at the beginning of this century. Free Greece, autonomous Serbia,—may not Bulgaria have her turn! Gradually the wealthier Bulgarians no longer sent their sons for education to Constantinople, but to Russia, Bohemia, and France; in the country itself were founded native schools. Even in districts already half Græcized the national spirit began to revive. Persons who had only known the Greek character learnt late in life the Bulgarian alphabet; and we have seen parents who spoke their own language imperfectly anxiously providing that their children should know it well. It was the obstacle presented by a foreign hierarchy to these efforts at national development that brought the Bulgarians to the resolution of emancipating their Church from the control of the Fanar.

This temper was taken advantage of by the Roman Propaganda, and emissaries were sent all over the country, promising self-government and services in Slavonic, with no other condition than that a nominal recognition of the Patriarch should be exchanged for that of the Pope. The condition is not hard, and at the first start the Romanist Propaganda was a success. But the principal bait to the adoption of Catholicism was the protection of France, and when it became evident that this protection could not be unlimited, nor exempt its *protégés* from payment of taxes, the new-made Romanists recanted in troops. Their leaders became convinced that the movement could have no other effect than to extend to Bulgaria what had broken the strength of Bosnia and Albania—*i.e.*, a Latin sect, separated from the other Christians, cowering under foreign protection, selling its assistance to the Turks.

But the indifference wherewith the common people had talked of transferring their ecclesiastical allegiance, proved to the thinkers in Bulgaria that the danger of a schism might at any moment recur. For the second time in their Church history it was recognised that the South Slavonians would remain in the Eastern Church only on condition of self-government. If they are to have foreign Bishops and a foreign head, it is all one whether their Pope resides at Constantinople or Rome.

We have said that deputations from Bulgaria made their appearance in Constantinople. They came to demand that their national Patriarchate, formerly recognised by the Porte, should be restored, or, at least, that their Church be declared autonomous, with native Bishops, Archbishop, and synod, and an ecclesiastical seminary at Tirnova. In short, they desire such a system of church government as succeeds admirably in the principality of Serbia.

It is years since the Bulgarians put in their claim, but the Turk is in no hurry to remove a cause of quarrel between his Christian subjects. With great subtlety he has tried to improve the occasion by suggesting to the Bulgarians to leave the Eastern Church. They have been told that by the treaty of Adrianople the Greek Patriarch is declared head of all the orthodox communities in Turkey.

"Be Catholic," said the Mahometan judge, "or Protestant, or set up a sect of your own, and we will recognise you with pleasure: so long as you call yourselves orthodox, we know you only as Greeks."

But the Bulgarians avoided the snare. They replied that their demand affected no religious question; that they had no desire to separate themselves from the orthodox communion. They were perfectly ready to yield the Greek Patriarch recognition as Head of the Eastern Church—to be its *only* Patriarch he had never aspired. His predecessors had tolerated a Patriarch of Bulgaria till within the last ninety years—he himself at the present moment recognises Patriarchs of Jerusalem and Antioch. "Besides," added they, "the practical settlement of the business depends not on the Patriarch, but on the Sultan himself. No prelate throughout the Ottoman Empire can exercise his functions without an Imperial firman, and such a firman is all that is required by our chosen Primate to authorise him to appoint his Bishops, convoke his synod, and regulate our ecclesiastical affairs."

This statement places the Ottoman Government in an attitude other than what has been claimed for it; for it has been usually represented as striving to reconcile its Christian subjects in a religious dispute wherein it may mediate but not interfere.

No doubt, however, the Greek Patriarch might have done much to avoid an appeal to Mahometan authority, and would have best consulted the interests of his own community by at once agreeing to accept the proffered recognition with a fixed tribute. But it must ever be remembered that in a post so important as that of the Constantinopolitan chair, none but a pliant agent is tolerated by the governing Turk. Certain it is that the Patriarch has behaved equally unworthily and unwisely. Three Bishops who had declared themselves ready to resign their sees in Bulgaria unless confirmed therein by the choice of the people, and who might therefore have been used as mediators, he has had seized and conveyed into exile: all such Bulgarians as do not accept his terms he has anathematised and declared heretics.

By these measures the formidable wrath of a slow, stubborn people has been thoroughly roused. The Patriarch who excommunicated them they have renounced—rather than receive his Bishops the communities remain bishopless—should a Greek venture to impose himself upon them, they resist him by every means in their power.

In Sophia, a new Bishop was expected; so men, women, and children filled the palace and blocked it up till, unarmed as they were, they had to be expelled by Turkish soldiers. The Bishop then dwelt in isolation until, on occasion of a burial, he got hold of a Bulgarian priest, and demanded why he did not come to see him. The priest answered that he must stand by his flock; that as it would not acknowledge the Bishop, neither would he. Therefore the priest's beard was shorn, the fez of the dead man stuck on his head, and he was turned out into the streets a warning and a sign. Again the unarmed citizens rose, shops were shut, houses evacuated, thousands of people prepared to leave Sophia. Their elders waited on the Pasha and said—"Either the Greek Bishop must go or *we*." The Pasha advised the prelate to withdraw; and as the authorities in Constantinople would not permit the people to elect his successor, they preferred to do without a Bishop at all. At Nish, a town on the Serbian frontier, the Bishop anticipated an inimical demonstration by accusing the elders of the Bulgarian community of a plot to join the Serbs. Their elders were called before the Pasha, and, without a hearing, without being allowed to say farewell to their families, or to send home for extra clothing, they were hurried into carriages and sent into banishment.

In Constantinople we heard a good deal of the Bulgarian question — the Greek side of it from the Patriarch and his secretary, the Slavonic side from the Bulgarian deputies. Each party supported its arguments in pamphlets swarming with protestations of loyalty to the Sultan, and mutually taunting their antagonists as emissaries of Russia.

We appealed, as to probably impartial judges, to the opinion of foreign residents; and these, especially British and American, gave their verdict for the Bulgarian. British Consuls and American missionaries assured us that they marvelled to find a population in Turkey so industrious, thrifty, moral and clean. They are decried as timid, but the position of their country on the road of Turkish armies to the Danube, has subjected them to unremitting spoliation; like other Slavonic races, oppression makes them sullen, but they learn with eagerness, and so readily adopt western manners, that a Bulgarian who has passed some years in Europe cannot be distinguished from a European.

In our travels throughout the country we had reason to endorse this favourable judgment, and especially we were struck with the zeal wherewith the people are seeking education and starting schools.

Of Bulgaria between the Balkan and the Danube, we cannot indeed speak from personal knowledge, as the Turks declared it unsafe for travellers; but we say from trustworthy authority, that it has schools, of which two of the best are at Shumla and at Tirnova.

In central Bulgaria we visited the schools of Adrianople, Philippopolis, Samakoff, Sophia, Nish, all supported and managed by the Christian communities without pecuniary aid from Government or the Bishops. The school-rooms, mostly of good size and airy, are like everything Bulgarian—clean. The school-books are eked out with the translations published by the American Board. To conciliate the Government, Turkish is frequently taught to a scholar or two, and phrases complimentary to the Sultan have been framed into a sort of school hymn. In some places there is another hymn, to the same tune, in honour of him who shall deliver the Bulgarians from the Turkish yoke. One or the other set of words is sung before the visitor, according as he is judged to be Christian or Turcophil—we had opportunities of hearing both.

At Philippopolis, Samakoff, Sophia, there are girls' schools; the best—that at Sophia—was founded by a patriotic citizen. In his own words: "When my wife died and left me but one son I resolved not to marry again but to give my money and attention to this school." He has even brought a schoolmistress all the way from south of Austria. Slavonic female teachers are most difficult to get—a great impediment to education in Bulgaria. The missionaries in Eski Sagra have a Bohemian teacher, and their girls' school is as full as it will hold.

In southern Bulgaria such schools as we saw were smaller and poorer than those between Constantinople and Belgrade.

At Skopia, which lies on the borders of "Old Serbia," some of the school-books were in Serbian, and pictures of Serb kings and heroes hung round the teacher's room. At Prilip, where one of the great Roumelian fairs is held, there are two Bulgarian schools, holding 400 children. Among the school-books were some altered from the Serb citankas;* the people were eager for histories of Serbia, and the schoolmaster, himself a Serb, told us that most of his pupils could read Serbian as readily as their own tongue.

At Velesa, six hours farther north, all was unmixed Bulgarian. In old time Velesa was a seat of learning, and possessed a treasure of MSS. The Fanariotes made a bonfire of the books, but have failed to root out the taste for reading. Our servant had a store of Bibles and other books to distribute; nowhere had they so many purchasers as at Velesa. The Old Testaments, though costing as much as half-a-crown, were in especial request, and the people wished again and again we had brought more of them.

In the places we have hitherto mentioned, the Greek Bishop contents himself with not supporting the school, and now and then intriguing to expel an energetic teacher. But in Monastir, Salonica, Vodona, and Yenidye, Slavonic education is positively impeded. These frontier towns lie more or less on the Bulgario-Greek frontier, and in the two former the Christian inhabitants are Slavonic. In the latter, though but few Bulgarians reside actually in the city, they form the population of all the country round. Yet in no one of these places is there a Bulgarian school. The Bishop insists that, in the town school, books and teachers must be Greek, and the community, willing or not, must pay for them. If the Bulgarians would be taught in their own language they must build and support an extra school, and in case poverty should not prevent them from doing this every difficulty is thrown in their way.

---

* Reading books.

The result of such anti-national policy is twofold: first, that the people, who elsewhere show themselves so eager to learn, are hereabouts listless and dull; secondly, that throughout these districts the Bulgarians are favourable to the Roman Propaganda. At Monastir the unionists have a school, and at Yenidye they are rearing a church. The whole country is watching this experiment, and should temple, liturgy, and vestments turn out true to the ancient pattern, then the Bulgarians will feel something like sure that the Pope does not mean to Latinize them.

While this matter is pending, efforts are made to get rid of the Greek without taking on the Roman. Certain congregations have bethought them that Protestants are free from both Pope and Patriarch, and Protestants enjoy the protection of England! About Salonica the country populations have applied to know whether, supposing they become Protestants, the British Government will protect them from persecution. Of course they are told emphatically "No. What has the British Government to do with the protection of Bulgarians?" Nevertheless a native bookseller did get the English Consul to stand by him in his attempt to set up a printing press, and to publish school-books for his people. But the Greek Bishop soon bribed the Pasha to withdraw the bookseller's licence; and to silence the British Consul they declared it was used for circulating Russian proclamations. Then the country populations sent to ask for Bibles and Protestant school-books and teachers, offering to pay for all. Their application was made to the Scottish mission; for at Salonica there is a Scotch missionary, who has an agent at Monastir. Both would be glad to help the Christians, but their mission is to the—Jews.

Yet much might be done to assist the Bulgarians by simply sending colporteurs about the country with a store of Bibles and school-books for sale. Thus would a seed be sown in soil so fertile that, ere the growth of another generation, it might be expected to bring forth a hundred-fold.

Salonica—burning, glaring Salonica, with its strife of creeds and starvation of souls—how shall we get back from it, to the scene from whence we started—to the blue-green forest in the shadow of the Balkan?

G. MUIR MACKENZIE AND A. P. IRBY.

THE THREE CORDS.

God made three several cords to bind
His wondrous masterpiece, mankind:
Viewless, but strong and subtly twined.

The first of life, the next of love,
The third to draw the soul above,
That all might thus in order move.

The silver cord of life is short,
Of many delicate fibres wrought,
Knitting soul and body taut.

The cord of love, with lengthen'd threads,
All human hearts together leads,
And holds them like a string of beads.

The third of each unites the strands,
The life and love of many lands,
And places them in God's own hands:

Man with himself; then man with man;
Then man with God: a perfect plan!
Improve it, sceptic, if you can.

Man sinn'd: the cable shook amain,
Then heavy dropp'd, a useless chain:
The cord of life was snapp'd in twain.

And though the cord of love was left
To solace man, of Heaven bereft;
'Twas love no more of heavenly weft;—

Till Love Himself from Heaven descended,
And pour'd His life to God, offended:
Then the third great cord was mended.

E. H.

ALFRED HAGART'S HOUSEHOLD.

By ALEXANDER SMITH, Author of "A Life Drama," &c.

CHAPTER VII.

The meeting with Miss Catherine McQuarrie caused considerable speculation in the Hagart household, but as days passed and nothing came of it, it died away in the minds of the elders, very much as the gleam of the sovereigns died in the minds of the children and became commonplace. Miss McQuarrie was not seen or heard of afterwards. She did not call, she did not write, she sent no message; and the subject died out of the family conversation, and out of the family thought. Perhaps, although she said nothing on the matter, Mrs. Hagart brooded over it in her heart, wondering whither-unto it might tend. If she did, no one was the wiser. Hagart was preparing for what he called his invasion of Spiggleton—that is to say, he was getting ready as rapidly as possible a fresh collection of patterns for the manufacturers there, nothing doubting that, when ready, they would be purchased as greedily, and be paid for as handsomely as the former collection had been. The high spirits of the man during that fortnight! the magnificent castles he built! and Mrs. Hagart, like a dutiful wife, conceived that these airy castles were solid edifices, and that she and the children had nothing to do but enter and take possession.

For that good lady was no philosopher, and had not yet learned to tremble at sudden strokes of good fortune—of these, indeed, she had but scant experience—or to detect the irony that dwells—like east wind in a day superficially sunny—in every song of hope. She was taught the lesson, however, by and by. As for Hagart, he was radiant with happiness! Everything was to go well with him now! Spiggleton would never cease to want patterns and to pay for them, and he would never cease to supply Spiggleton with patterns. If Hagart found a bag of gold on the highway to-day, he was perfectly certain that he would find a bag of gold on the highway to-morrow. Pitiful, pathetic, this faculty of hoping—yet useful, as it keeps men alive. For in truth—and this his wife was just beginning dimly to suspect—Hagart had been an unlucky dog, had been constantly foiled, thwarted, and pushed to the wall; and an unlucky dog he would remain to the end of the chapter. At school when he played at marbles or chuck-farthing he was invariably the loser. He married into a good family—many a man makes his fortune on that—but he had no sooner married than his wife's family turned their backs on him—and her. His wife had a thousand pounds; other men speculate with their wives' money and make a good thing of it—*he* speculated with the thousand pounds and lost every farthing. He obtained a good position in the Greysleyan House, but the position, in which another man would have fattened, he contrived heroically to lose. I verily believe that if Alfred were one of twenty shipwrecked persons on a raft, and, provisions failing on the second day, lots would be drawn on the third, the lot would fall on *him*, his right arm would be opened, and before he was properly cold a rescuing sail would be espied bearing straight down. Hagart had been chasing the rainbow all his life and had tumbled into countless morasses, but no sooner did he get himself extricated than he dashed on again quite certain that this time he would come up with the beautiful apparition and secure the crock of gold that stands at its foot. There is no spectacle so sad as your uniformly unsuccessful man—unless indeed it be the good spirits and brave hopes he contrives to maintain under his uniform unsuccesses.

In a fortnight Hagart was ready to invade Spiggleton. He had produced a brilliant collection of patterns which he flattered himself would astonish his patrons by their style and elegance.

He took farewell of his wife gaily, like a knight who goes out to easy victory, and who is to return laden with glittering spoil. With his expectations—rather with his certainties—he disdained trudging across the moors to Spiggleton, and so he walked down to the Saracen's Head and took his seat in the coach. He sat beside the driver, and as they tooled along he communicated certain of his metropolitan experiences—rarer in those days than now—and talked learnedly of horses. When they arrived at Kings-barns he ordered a glass of brandy for that functionary, and while the horses were changing entered the small room in which we previously saw him and called for a glass of ale. While drinking his ale he began to think how much money he would count there the following day; he fixed the sum mentally, and felt it already in his pocket. When he had finished his ale he resumed his seat beside the driver, who had conceived a great respect for him, and in an hour thereafter he was set down in the Spiggleton market-place. He set to work at once, called on the manufacturers, displayed his patterns with a lordly air, but found them strangely unsympathetic. They looked at his sketches, but declined to buy—like trouts that play about and examine the tempting flies of the angler, but decline to hook themselves thereupon. He stepped from the torrid zone of anticipation to the frigid zone of fact. "Trade had become unsettled," his friends said; "markets were glutted at present, they had a large stock of goods prepared against the winter season, and styles might change by spring. They must hang on their oars. Perhaps in a month or so they might be able to treat with him." Hagart could hardly believe his ears. He felt as if the solid ground had yielded from under him. He reduced his prices and by that means disposed of one or two sketches to the less important houses. High-flying Hope had tumbled like a shot swan. When four o'clock came—for at that hour active business closed in the Spiggleton counting-houses—he retired to his inn defeated, humbled, sore at heart. Next day he went through the manufacturers once again, and offered his sketches at what they would bring—*jobbed* them in fact—and got quit of a few more at low prices. There was nothing for it now but to turn his face homewards. He could not now afford the coach, but must pace wearily the twenty moorland miles. One-half of his patterns he had to bring back with him. The edges of these his wife might scollop with deft scissors, sew up the edges, and place them on the mantelpiece for ornaments. They were fit for nothing else now.

Hagart left Spiggleton in the forenoon, and a mile or so before he reached Kings-barns he heard the rattle of wheels. Glancing round he saw the coach bound for Greysley, and his friend the driver sitting on the box. At the sight he flushed all over with vexation. His mind had been so occupied he had not calculated on this annoyance. He did not wish that the man to whom he had talked so freely, and for whom he had ordered a glass of brandy, should notice that he was a pedestrian. He then remembered that he had encountered Stavert on the coach the last time he had come that way, and the thought that *he* might be there again—looking after one or other of his schemes—did not lessen his confusion. If he had but sold his patterns he could have ridden on the box, and talked about horses as if he had stables of his own, and asked questions about the county gentlemen whose houses or plantations came into view, with the best! Hagart would not tell a direct lie for the world, but he did not scruple to tell an indirect and silent one—as the best of us do not scruple to do at times. So his hasty pace became an idle saunter, he twirled his stick carelessly, he looked about him as if taking in the features of a scene in which he was deeply interested; and when the coach rattled up he returned the salutation of the driver—who, with a sharp remembrance of the favour of the previous day, thought it unfortunate that the rencounter had not taken place a mile or two farther on when he would have had a little leisure—with a mock cheery voice, and remarked that "this neighbourhood was exceedingly pretty." The smile passed out of Hagart's face immediately after the coach passed, but his sauntering air and the careless twirl of his stick he retained until it rounded a turn of the road, and then he struck into the sharp pace that bespeaks a pedestrian with a journey before him.

After the coach passed, Hagart mentally wished that he was beyond Kings-barns. The moor became dreary after that, and he felt its dreariness would be in consonance with his feelings. Besides, he remembered how brilliant his hopes had been while there on the previous day, and he fancied that the place would reproach him somehow. When he drew near, there was the white inn with the willow drooping over it, and the sign of the golden Cross Keys on the blue field. There also were the barns on the other side of the way, but he noticed that against these the new cart-wheel with scarlet boss and spokes was no longer leaning, and that a broken barrow had taken its place. On this occasion the big dog did not bask in the sunshine, for the excellent reason that there was no sunshine to bask in—the day being cloudy and somewhat cold. The landlord stood in the door, and Hagart thought he divined the reason that he did not enter the little sanded room with the ivied window, and call for a glass of ale, as he had done on previous occasions. "A glass of ale would be refreshing," thought Hagart, "but I have not the heart. I could not sit in that room—it would be like remembering Austerlitz at St. Helena. It's not for myself I care, but for thee, Mag, for thee!" And so with a gulp and a quickened step he passed the inn, gained the crest of the rising ground beyond, and set his face valiantly against the stretch of brown moor—trudging along which I shall in the meanwhile leave him.

Before starting, Hagart had instructed the children to wait his return by the coach on the following day after they left school, suggesting in pretty broad terms that if they did so they might not improbably be rewarded for their pains. The hint set Jack's imagination on fire. Splendid visions hovered before him; Katy had recently received a crimson scarf: it was his turn now, and he hardly dared to fancy what good thing might be in store for him—perhaps the long-promised History of Robinson Crusoe and his man Friday, filled with pictures, would be his at last. He suspected that the wonderful volume would arrive on this occasion, and he promised Martha that when he had covered up the brilliant boards with brown paper, and if she would be content to look at, not to touch the pictures, he would bring it into the kitchen and read it to her every word. The coach was due at four o'clock in the afternoon, and Jack and Katy were standing by the Saracen's Head by half-past three. Never surely did clock hand move so slowly as did that clock hand move to Jack. He talked about his present, wondered what it would be, hoped it would be Robinson Crusoe, and was almost angry with his sister because she did not enter into his enthusiasm. "Perhaps you will get something as a present this time also," said he in a reproachful tone, of which the next moment he was ashamed. But to the innuendo Katy made no reply.

When the clock hand pointed to five minutes to four o'clock, Jack cried out, "Only five minutes to four now, Katy! The coach will be here in five minutes! I'll have my present in five minutes. Just think!"

And sure enough almost as he spoke the rumbling of wheels was heard, and in a minute or so the coach from Spiggleton, crowded with passengers outside and inside, came up the street at a gallop, and pulled up at the Saracen's Head.

"Now, Katy, now! Here comes father, and I hope it will be Robinson Crusoe!"

Then the passengers from the inside came out on the pavement and stamped their feet, and the passengers from the top came down on short ladders and stamped *their* feet also, but Hagart was invisible. Meanwhile the guard was chucking all kinds of parcels out of queer receptacles which he opened in the body of the vehicle, and then a couple of ostlers appeared at the horses' heads and led them and the empty coach round to the stable-yard, and at the sight Jack felt desolation creep into his very heart.

"Father has not come," he said, "and there is no other coach. What can be wrong?"

"I don't know," said Katy in a faint voice, and with a slight shiver. "Let us go home—quick."

They then started homewards, Jack full of his disappointment, and yet manfully hoping. "Perhaps father did not get his business done, and will bring the book to-morrow; perhaps he can't get the money for the patterns till to-morrow. Perhaps—but what is the matter, Katy? Are you ill? Your face is as white as paper!"

"O Jack, I can hardly see! Give me your hand! Take my books! Let me rest a little. Oh!"

"Katy! Katy! what is it? Are you ill? What is wrong? Don't frighten me, Katy dear!" He took the books from her hand, and then she leaned against him, with a white face, and with her eyes closed.

"O Katy! look up, look up! Do you hear me, Katy?" and poor Jack getting no response, and holding his sister tightly, else she would have fallen he thought, began to cry.

A washerwoman who happened to be passing laid down her basket of clothes, and with the instinct of her sex came to the rescue. "Puir thing," she said, in a strong Greysleyan accent; and taking the child into her possession, she began, with rough tenderness, to chafe her hands.

"Are ye far frae hame? Whare's her mother? What's the cause o' her fentness?"

"I don't know: she's ill. I never saw her ill before," cried Jack, weeping and wringing his hands.

At this moment a carriage slowly passed by, which Jack stared at in a sort of stupor of recognition, as if he had seen it before in a dream, or in an earlier existence. He no sooner, however, caught a gleam of the face of the occupant, than he left his sister in the hands of the charitable washerwoman and ran after it. "Stop, coachman, stop! I know Aunt McQuarrie. Tell her Katy's ill—is dying! Stop, stop!"

Thus passionately adjured, the coachman pulled up, but not before Miss McQuarrie had let down the window and poked her head out.

"Is that you, John Hagart? What are you crying for?"

"O aunt, Katy has been taken ill, and mother does not know. I saw you as you were passing. I don't know what to do, indeed I don't. Katy, Katy!" and the boy's grief broke out with greater intensity than ever.

"Bring her here," said Miss McQuarrie, "bring her here. Tell that woman to bring her here. Be quick—and come in yourself too."

Jack immediately ran back to the washerwoman and delivered his message. The washerwoman lifted the child and carried her towards the carriage. Jack followed after, picking up his own and his sister's books, which had fallen on the ground, and lay there unheeded.

"It's jist a dwam, my leddy," said the good-hearted Amazon, as she deposited the child on the carriage cushions. "Something has come oure the puir thing's heart. If ye hae some hartshorn, or a smelling-bottle, or a drap o' speerits, it wad bring her roon'."

Miss McQuarrie instantly tore open Katy's dress, dislodging as she did so a sovereign, which was worn round the neck by a thin golden chain—but this at the moment she did not notice. She then whipped a perfume bottle from her reticule, poured out some of the contents in her palm, and bathed the child's face. After a moment or so, with a great sigh of relief, the languid eyes opened. But when Katy became conscious of the stern face which had a fortnight before frightened her on the canal bank, she started up with a cry, and caught hold of her brother's hand. "Where am I? Take me away, take me to mamma!"

"Don't be afraid Katy," said her aunt in a voice unusually low; "I am taking you to mamma. Don't you feel better now?"

Reassured somewhat by the soft voice, Katy could only lean back on the cushion and sigh, while Jack got hold of one of her hands and held it in both of his.

All this time the carriage door had remained open, and the washerwoman, culpably careless of her basket and the property of her employers, had stood looking on, making sympathetic ejaculations at intervals. When Katy had revived and leaned back, she exclaimed, "Ay, she's come to hersel noo. It's a bonny bairn, as like my ain Mary that died five year syne as—"

Here Miss McQuarrie interrupted her. "I am sure I am much obliged to you for your kindness, and I need not detain you longer," and she had her purse in her hand.

"Na, na," quoth the washerwoman, drawing back a step and putting up her hands in rejection. "Na, na, I'll tak' nae siller for onything I hae dune, and for a bairn sae like my ain Mary to," and with that she turned away.

But this seemed to rouse the truculent blood of the old lady. "If you won't take the money, I won't keep it. You'll not let it lie on the ground I dare say." And she flung a coin after the retreating figure, which Jack could hear rattle on the pavement. Without waiting to see whether it had been picked up, she called out to the coachman, "Drive on slowly, and I'll direct you when to stop." Then she closed the door and window.

By this time the colour had come to Katy's cheek, and although somewhat afraid still, she was gradually regaining composure. Her aunt then drew her to her knee, and busied herself smoothing her hair and re-arranging her dress. In so doing she came again in contact with the pendant sovereign.

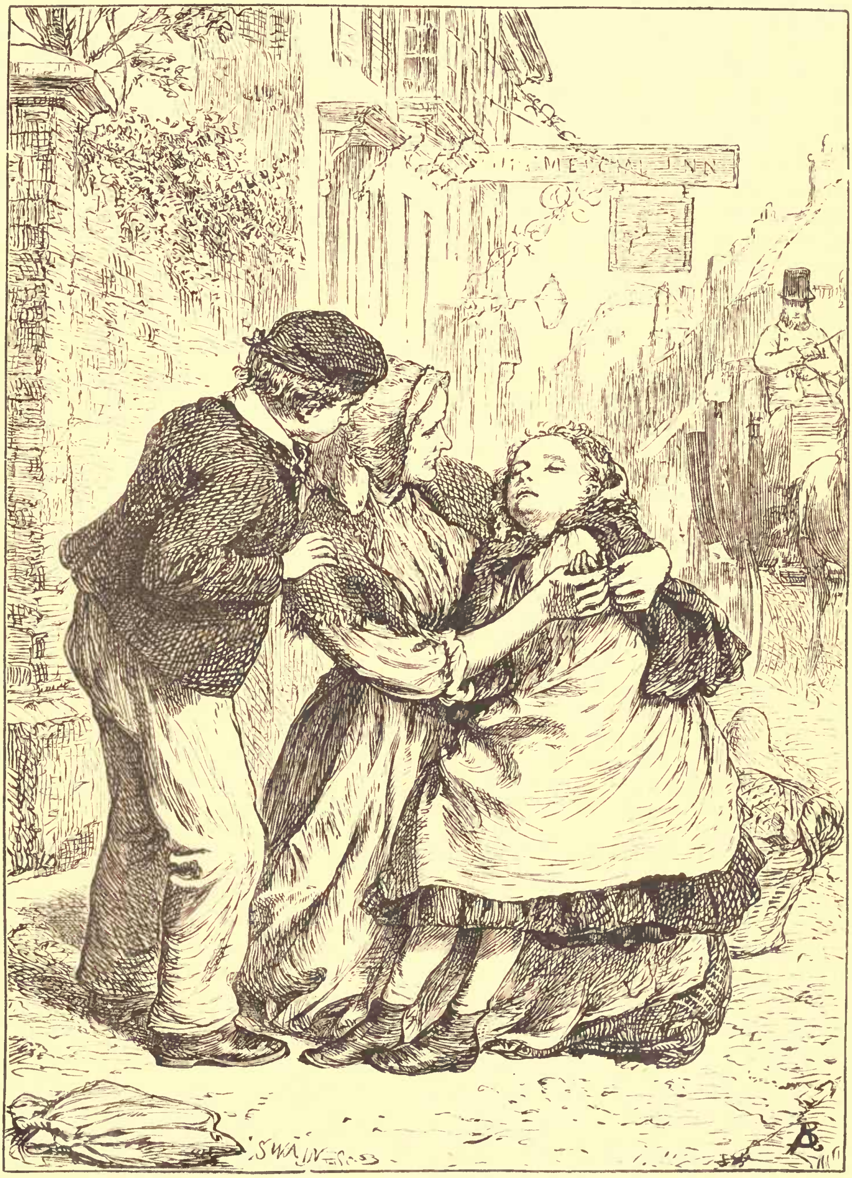
"What is this?" she said, holding the coin in her palm.

"The sovereign you gave me, aunt, on the canal bank—which you said was a sixpence."

"Mother would not allow us to spend them," said Jack, "so she took them to a jeweller's and got them pierced, and put them on two old locket chains of her own, and made us wear them. I've got mine here," he continued, putting his hand on his breast.

"Did you tell your mother you had met me?"

"Yes."



"PUIR THING!" SAID THE WASHERWOMAN.

Page 208.

"What did she say?"

Both Jack and Katy remained silent.

"What did she say? Can't either of you speak?"

"She only kissed Katy and cried very much," Jack said at last.

Miss McQuarrie leaned back and said nothing for a little—only the withered hands were wandering tenderly over Katy's hair and cheek. She then said, "John, you must be near home now! Tell me when you are at home." And relapsed into silence again. Katy was getting used to the caressing hand, and began to think its touch soft and pleasant.

They had now got beyond the distilleries, and looking out of the window, Jack watched the familiar objects gliding past. When they were within twenty yards of the house, he said, "We are at home now, aunt." The old lady pulled the check string; the carriage stopped, and the coachman opened the door. "Lift out the child—carefully. Good-bye, Katy. Good-bye, John."

Katy was lifted out, and when Jack followed he turned round.

"Won't you see mother? She would like to thank you," he said.

"No, no, no! not now," said the old lady, in a voice that sounded strangely in the boy's ear. "Drive on—quick!" And when Mrs. Hagart came to the parlour window, and Martha to the door, there were the children standing outside the gate, and the carriage driving rapidly away.

Mrs. Hagart had known tribulation, but this afternoon after she had heard the children's story she was more troubled than she had ever been before. Katy was unwell, her husband had not arrived by the coach as he had promised—she knew pretty well how to interpret *that*—and here again was a meeting with Miss McQuarrie! As was natural, her mother's heart rushed out towards Katy, and her husband's unsuccesses and these strange appearances of her half-sister were regarded as trifles in comparison. The child did not seem specially ill—she never did—she made no complaint, she felt no pain, she said: all along her temper had been unnaturally quiet and sweet, undisfigured by those spirts of petulance and rage which are common with healthy children, but this afternoon her demeanour was meeker than ever. Her caresses were constant and fond; and when the afternoon began to settle into the early autumn twilight, Mrs. Hagart's heart sank as she felt the heat of the dry little palms and the unwonted brilliancy of the eye. Katy was put to bed, some simple medicine was administered, and then she threw her hot arms round her mother's neck, kissed her, and said she would go to sleep. The little figure was tucked in carefully under the bed-clothes and left. Mrs. Hagart slipped into the room at intervals, and on one of these occasions she found the child's hands moist and a soft perspiration on the forehead.

Meanwhile Martha was busy at work in the kitchen, and in the kitchen Jack sat preparing his lessons for the morrow. He had to get by heart the proper spelling of a column of six-syllabled outlandish words, and although his memory was ready enough usually, he could not this afternoon fix his attention on the page before him. His father's absence, Katy's sudden illness, his second encounter with his aunt were continually spiriting him away from his work, and leading him into a maze of speculation. He at length gave up his task in despair, and thought he would like to sit beside his mother. Laying down his book he went noiselessly—for in that frugal household shoe leather was a matter of importance, and Jack was at present in his stockings—toward the parlour door. It was slightly ajar, and on the walls he could notice the flicker of the firelight. Awe-stricken, frightened, he did not know why he glided into the room which he had at first fancied to be vacant, noting nothing but the dance of red light and umber shade on the furniture. Then a low murmur struck his ear, and led by the sound, he saw his mother kneeling beside a chair and pleading with Heaven for her child. Jack heard only a broken sentence, and he was out of the room and in the kitchen like a shot. "Martha! Martha!" he cried wildly, "I am sure Katy is going to die."

"Wheesht, laddie," said Martha, pausing in her work—"wheesht, laddie, what will Katy dee for? She's fawn on a fine sleep an' will be better i' the mornin'."

"I don't know. She was very ill on the way home, and mother is afraid about her."

"It's nat'rel she should be anxious wi' naebody in the hoose but me."

"Why has father not come? He said he would come by the coach. Katy and I waited for him. He promised he would bring us presents too!"

"Presents! never mind presents, be thankfu' if ye get your denners. It's the fulishest tredd that man's! Sitting in the hoose here like a leddy, an' workin' away wi' pents in a bit brush on a bit o' paper. Why disna he gang oot to his wark like anither man? If he had ony speerit he wadna warm a seat at that tredd again."

"But, Martha, he sold his patterns well last time," said Jack.

"But hoo often does he sell his paw'trens? Is't ance in sax times? If yer mother was na' an uncommon managing woman he micht tak' you an' Katy, ane in each han', an' gang singing through the streets. Presents quotha! But dinna greet," said Martha, dropping into a softer tone, "Katy will be better when she waukens, an ye'll hae her rinning aboot wi' ye in a day or sae."

So comforted Jack wiped his eyes, and really felt that the world was not quite so black as he had painted it a few minutes before. After staring in the fire pondering certain late strange matters he said, "Isn't it strange that we should have seen Aunt Kate again to-day?"

"Strange indeed!"

"She stopped the coach the moment she saw us, and ordered Katy to be taken beside her, and was so kind. But why doesn't she come to see mother? I asked her to come to-day, but she just lay back in a dark corner of the coach and told the coachman to drive on fast."

"Your mother and her quarrelled lang syne, an' thae quarrels canna be made up in a day. But she's comin' roon. She's seen yer faces an' she canna help hersel'. Nature's stronger than pride. Ye'll see her sune again or I'm muckle mista'en—but here's yer mother," and Martha suddenly broke off and began scrubbing the dresser with energy.

Mrs. Hagart entered the kitchen with a quiet settled face. She told Martha that Katy was still sleeping peacefully, and that her skin was moist and her breathing regular. She then busied preparing tea against her husband's arrival, which was instantly expected. The tea was infused, and was left on the kitchen hob, and Martha carried cups, a plateful of buttered toast, and the remainder of a beefsteak pie into the parlour. In about ten minutes after these matters were satisfactorily arranged, the bell rang. "There's father!" cried Jack, as Robinson Crusoe rose faintly on the horizon of his imagination, and he ran and opened the door.

"Is that you, father?—you are late. We were at the coach to-day."

"My poor boy, my disappointment includes yours. I hoped to have brought something for you and Katy, but I come home defeated—like Napoleon after Waterloo." And Robinson Crusoe faded at once and for ever out of Jack's expectations.

Mrs. Hagart in the kitchen could not hear what was said, but she caught the tone of her husband's voice and detected failure in it. It was sober and low-pitched, and she drew her own conclusions. In luck, Hagart was inclined to be somewhat loud and boisterous; in misfortune he was quiet, tender, deprecating, almost obsequious. She divined disaster; but dressing her face in her best smile she came into the lobby where Alfred was taking off his coat.

"O Alfred! you are late, and must be sadly tired. The children were at the coach, but did not find you."

"I walked home, Mag; it's a long way, and it was made all the longer by the patterns I had to bring back with me."

"You have not been successful then, dear."

"Never was so disappointed in all my life. Every one admired my sketches, but they would not buy. I have only sold six, and these at what they would bring."

"Well, well! never mind, so long as you are home again safe. You had better go to the kitchen, John—are you sure you have your lessons correctly?"

Jack went off, and Mrs. Hagart led the way into the sitting-room. When there, she turned round suddenly and caught hold of her husband's hands: "Katy became suddenly unwell to-day on her way from school. I have been so alarmed, Alfred! Will you come and see her?"

In an instant Hagart had his boots off that he might tread noiselessly. His wife lifted the candle, and he followed her into Katy's room. The child lay peacefully asleep with lips apart, a brown curl escaped from her cap astray on her forehead, and one arm thrown over the coverlet. Her cheek was flushed just a little, but her breathing was low and gentle, and her skin still moist. Mrs. Hagart came close to the bedside and held the candle over it, shading it the while with her hand.

"Do you think there is anything serious?" she said.

"I hope not, Margaret, but you must have Dr. Crooks in the morning."

"O Alfred," said she, laying down the candle and throwing herself into his arms, "I cannot bear to part with her—indeed, I cannot! If we should lose her, Alfred, if we should lose her! We don't deserve her, but I cannot part with her." And the tender mother broke into fresh crying, as if she had not been crying half the afternoon already.

While trudging across the moors that day Hagart thought himself wretched enough—thought, in fact, that he could hardly be *more* wretched. If he had not discovered before, he discovered now that misery is a sea that has no bottom. On a stroke of this kind he had not calculated, and his failure at Spiggleton was for the time entirely thrown in the background and forgotten. When he saw his wife's tears he felt that he must do something, and he acted the part of comforter as best he could. He did not think the child was really ill—at least there was nothing to cause alarm. Katy was always delicate, and this was only a slight ailment that would be off in a day or so. At any rate, if anything should be wrong Dr. Crooks would be able to dispose of it; and he would be sent for in the morning. In such matters it was always better to have the doctor at once. And so, with sentences like these, he allayed his wife's anxiety so successfully that when he said it was very cruel in her keeping him from dinner after such a long walk by a false alarm, she—Spiggleton failure notwithstanding—smiled on him as they went into the parlour.

Jack slipped into the room and sat down by the fire while that meal was in progress. He heard his mother tell about the second meeting with Miss McQuarrie, and her kindness in driving the children home. He heard his father's speculations on that event. Then they talked of their prospects for the coming winter, of monetary embarrassments, of anxieties of various kinds; and listening to all this the boy discovered for the first time that he had been born into a difficult world, in which there were other things to do than playing at marbles and discovering birds'-nests, and greater hardships to be endured than even a disappointment in the matter of Robinson Crusoe.

CHAPTER VIII.

THE following morning Dr. Crooks called and saw his patient. He was a little, dapper, clean-shaven man, who entertained a tolerably good opinion of himself: he wore a white neckcloth, a gold repeater, a cluster of large seals at his fob, and when walking he carried his clean-shaven chin erect, and twirled dexterously a black cane with a golden head. He saw his patient, felt her pulse, studying the while his gold repeater, and when satisfied he dropped the little wrist on the bed-clothes and the repeater into his pocket at one and the same moment. He then examined Katy's tongue; that done he rubbed his dapper hands together, stroked his clean-shaven chin, adjusted his white neckcloth, and intimated that, if Mrs. Hagart would attend him, he would write out a prescription.

When they entered the sitting-room Hagart, who was anxiously waiting, rose, and Dr. Crooks made a little bow and smile in reply to his sign of recognition.

"I trust you don't find anything seriously wrong with my daughter," he said.

"Well, nothing serious as yet: nothing at all serious as yet," said the doctor. "She's a delicate child, a very delicate child, Mrs. Hagart, and we must take great care of her. Meantime, she must keep her bed, and be kept perfectly quiet. She's a little feverish, but if you will oblige me with pen, ink, and paper, we'll prescribe something which will reduce that, I hope."

Mrs. Hagart opened her writing-desk and placed it on the table before the doctor, who sat down and scribbled certain hieroglyphics, and signed his name at the foot, drawing two great dashes under it. "This you will give her every two hours, and I'll call the day after to-morrow. Meantime, if she should get worse, send for me at once."

"But you don't think it likely that she will get worse?" Mrs. Hagart asked with a little gulp of alarm.

"I don't anticipate she will," said Dr. Crooks, impressively drawing on his gloves; "I really don't think she will, but it's always best to know how to act if anything should happen. She is very delicate, and great care must be taken—care especially of cold. I am sure," and here the clean-shaven doctor smiled blandly, "she is under the charge of the tenderest of nurses."

Under cover of this fire of compliment the doctor retired. Martha let him out, the Hagarts heard the door close, and next moment they saw him pass the window on his way to Greysley, twirling his gold-headed cane, and carrying his clean-shaven chin erect.

Mrs. Hagart was not quite satisfied with the result of the doctor's visit. She plucked vague alarms out of his professional commonplaces. "He says she is feverish; and then he said if she became worse——"

"But he does not think it likely that she will," said the husband.

"He did not wish to frighten us. Doctors never say exactly what they think. I fear the poor dear is more seriously ill than we suspect. If she is not better to-morrow, I'll go into Greysley and see him myself."

"He said he would call the day after to-morrow. Meantime, we will get the prescription and see its effect. There is no use going to see him: he was only to be sent for in the event of her getting worse. Your fears are mother's foolishness."

"You don't feel as I do, Alfred; indeed you don't. I can't argue with you. I don't know how it is, but I feel that some evil is impending. God grant my feeling may be only mother's foolishness, as you call it."

If Mrs. Hagart was filled with melancholy, her husband was not. The doctor's words had dissipated the only cloud that lingered in his mind. Although tired by his walk from Spiggleton, he had lain awake half the night, and during the night-watches a great idea had flashed upon him. This idea he turned over and over; he grew more enamoured of it every moment; and now the sun of his prospects was shining as at midsummer. The Spiggleton markets were overstocked: Hoggs and Bloggs and the rest of them were inclined to rest on their oars. The Spiggleton markets were overstocked—but then it was with goods for winter wear, and all the patterns he had taken with him were designed for winter fabrics. Was it astonishing that they did not sell? It was astonishing rather that the manufacturers were good-natured enough to look at them. Hoggs and Bloggs must rest on their oars of course—they were waiting to see what styles would be fashionable in spring. It was quite natural they should so wait. But who would set the spring fashions? He would! He would produce a collection of patterns of such unexampled beauty and elegance, adapted for the spring season, that Hoggs and Bloggs would see that the moment for action had arrived; that the iron was hot and must be struck at once; and so by his own energy, spirit, and genius, Hagart saw his way to revive the Spiggleton trade, to cause the whole town to sing aloud for joy, to make Hoggs and Bloggs millionaires, and to put unknown sums of money in his own pocket. This idea had dawned upon Hagart while tossing upon his pillow about two o'clock in the morning; he thought it would do then: and now when he had slept over it and reviewed it with a cool brain, he not only thought it would do—he was sure of it. This grand idea rose-hued his whole world, it made less terrible his butcher's bill, and lent a healthy colour even to poor Katy's cheeks.

Hagart withdrew to the empty room in which the big desk stood, and while endeavouring to realise his brilliant idea, at the very moment indeed when he had sketched a sprig of hawthorn with a butterfly perched upon it—for he determined to tickle Hoggs and Bloggs with distinguished novelty, as the jaded appetite of the epicure is tickled by condiments—

Mrs. Graves, the naval officer's widow who lived two doors off, was preparing to pay a visit of condolence to Mrs. Hagart.

The ladies were not in any intimate way acquainted, but they had once or twice exchanged formal calls. In truth Mrs. Hagart was somewhat stiff and formal towards strangers, and was not in the least disposed to allow man or woman to inscribe his or her name perforce on her list of friends. On meeting strangers she remembered she was a McQuarrie, that she had a great-great-great-grandfather; and from all unwelcome advances she was wont to shelter herself behind a frigid and ceremonious politeness. Such politeness, however, did not in the least disconcert Mrs. Graves. She was a woman of tough moral cuticle, and could not be easily cold-shouldered. She had a charming insensibility to affront. Like the British army, she did not know when she was beaten; and like the British army, through that heroic ignorance she gained many a victory.

When Martha was running into Greysley in the morning to summon Dr. Crooks, she encountered Susan, Mrs. Graves's maid-servant, returning from the dairy with the morning's milk. There was a sentimental friendship between these young women, and if their world was contracted compared to the wide and splendid one in which you and I live—why it was the only world they had, and was interesting to them as ours is to us. Of course when they met there was a quarter of an hour's chatter, and, quite as much a matter of course, the private affairs of the respective households in which they resided constituted a considerable proportion of it. Susan told Martha that her mistress had got home her new dress, and Martha told Susan that Katy had been taken ill. And when Susan went home she brought with the milk this little morsel of news.

Mrs. Graves was a kind-hearted woman enough in her way, and she was experienced in sickness. Her husband, Lieutenant Graves, R.N., had been long ill before he departed this life; she had been weakly herself in youth and early married life. She had had children, but being of rickety constitution they had all died. When she heard the news of Katy's illness she resolved to call on Mrs. Hagart, because she liked to be in the midst of sickness where she could air her experiences, because she liked a little neighbourly gossip, and because the call would give her the opportunity of wearing her new dress, which she flattered herself was of richer material and more fashionable make than any dress possessed by Mrs. Hagart.

That lady was surprised and annoyed when she saw her visitor pace in at the little gate. She was a McQuarrie, and she did not care to receive visitors—especially such visitors as her immediate neighbours; and at the present time she was in no mood to receive visitors of any kind. But Martha opened the door, and Mrs. Graves rustled through the lobby in her silk and was in the parlour in a trice. She caught Mrs. Hagart's coldly extended hand in both her own. "I am so sorry to hear that Miss Katy is ill," she said, "and have not been able to rest all the morning. She is such a pretty child, and I have admired her so often—so quiet, so gentle, so even-tempered. She reminds me so much of my own lost darlings. Susan wished to come round to inquire, but I said I would come myself. So here I am."

What could Mrs. Hagart do? Her icy manner thawed, and she asked her visitor to sit down. If the greatest booby in creation tells me that he is continually reading my books, and that his interesting children have got certain of my poems by heart, I know he is a booby all the same, but I am conscious of a pleasant titillation.

When Mrs. Graves was seated, she was duly informed that Katy had been yesterday taken suddenly ill, and that Jack had been frightened out of his wits; also that the children had been taken home in their aunt's carriage.

Mrs. Graves was eloquent in sympathy. "A darling girl of mine was taken ill in a similar way, and was taken from me. It was just about this season of the year too. The beginning of winter is a bad time for children's ailments—a very bad time. Dr. Macnamara—I and my husband were living in Dublin then—told me it was the winter that killed my girl. If the illness had but come in spring she would have struggled through it, and been a grown woman now—to comfort me."

Thereafter there were tears on both sides, and a good deal of sympathetic ejaculation. Mrs. Graves had come to condole, and had found herself condoled with, which was pleasant. Mrs. Hagart had entirely forgotten by this time that Mrs. Graves had no discoverable grandfather.

"My dear Mrs. Hagart, I have had my trials. I have endured the loss of husband and children, and yet here I am: and in spite of all I can laugh and chatter pleasantly enough with a friend of an evening over a cup of tea. A heart can stand a great deal before it breaks."

Here Mrs. Hagart interjected a pious sentiment, the purport of which may be divined.

"You are a young mother," Mrs. Graves went on, "and cannot be expected yet to bear illness easily. It's wonderful how one gets used to it after a while. I am never so happy as when I am in attendance on a sick bed—having so much experience, you know! If you should ever require me——" Here Mrs. Hagart shook her head. "Well, I'll not insist, but if you ever should, you know, I am at your service. In illnesses, especially with young mothers, the great thing is to have a good doctor."

"We have called in a skilful doctor, Dr. Crooks. He attended Alfred—my husband," interjected the lady hastily, "Alfred" striking the McQuarrie part of her nature as being too familiar for the occasion—"and he brought him round in a week."

"Dr. Crooks!"

"You have no doubt of Dr. Crooks' skill, I hope?" asked Mrs. Hagart, in an alarmed tone.

"I say nothing on the matter. It's not for me to interfere. Dr. Crooks may be a very skilful man, but I know that Mrs. Wardell, when confined of her second baby, died under his charge; and that Mrs. Jones's little boy—the draper's wife in High Street, you know—just about your girl's age, by the way, he was, and of a similar complexion—wasted away under his care, and to this day Mrs. Jones believes that Dr. Crooks never understood the case. But you know I say nothing. Dr. Crooks may be a skilful man, only if I were you I would call Dr. Bowdler."

"Dr. Crooks is known to my husband, and he has every confidence in him," said Mrs. Hagart, somewhat coldly. "He was here this morning, and thinks that the child is not seriously ill, but that the greatest care must be taken of her."

"Doctors, as a class, don't know much about children's ailments—at least not so much as mothers of experience. How should they? They do not watch and tend them day and night as mothers do. I have buried five darlings, Mrs. Hagart, and I ought to know something. Perhaps you would let me see Miss Katy. My experience might suggest—— "

"Oh no, no, no. I really couldn't. She's asleep at present, and the rustle of your dress might waken her."

"Silk," said Mrs. Graves, glancing complacently down at her skirts, "especially heavy silk like this—it cost ten shillings the yard, my dear; and I'm sure you'll think it cheap at the money, just try the texture—is not well suited for a sick room, perhaps. The rustle, as you say, might disturb the darling, but I'll call in a day or so and see my little friend in whom I am so much interested. Don't you think it handsome, and very well made?" And Mrs. Graves got up from her chair, and turned slowly round.

For a moment there was a spark of comic light in Mrs. Hagart's eye. "Very handsome indeed! I suppose you got it made quite recently?"

"It came home only two days ago. The truth is"—here the visitor became much more communicative than she had intended—"this is the first time I have had it on, and I so much wished to know how you would like it."

"I am sure I am very much obliged to you for the compliment. But I must be going to Katy now."

"Oh yes, a patient must have every attention. Don't you think there is something wrong with the fold here? No! I have still some old prescriptions given me by Dr. Macnamara. I keep them in a box with the red sashes and the blue shoes the darlings wore, and I'll send one round if you like. Dr. Macnamara was the most famous physician in Dublin in his time, and poor Lionel always insisted on having the most eminent skill. I am certain it will do good."

"Thank you. But we are in the hands of Dr. Crooks, and must follow his advice."

"Dr. Crooks is to call the day after to-morrow, I think you said. Isn't that a long time to wait?" said Mrs. Graves as she rose, shook hands with Mrs. Hagart, and went into the lobby. "Be sure, my dear, that he understands the case. Everything depends upon that. If you have any reason to suspect that he does not, you can send at once for me—or Dr. Bowdler."

And so Mrs. Graves sailed off, highly pleased with the interview, and leaving Mrs. Hagart the most miserable woman in the world.

WAR-CHARITIES, NATIONAL AND INTERNATIONAL.

By J. M. LUDLOW.

It is not many years since it was the fashion to hope that the era of war had died out in civilised Europe. It is no doubt a remarkable fact, that the several successive generations of human beings, which came into the world, in Europe, within the first few years after Waterloo,—if we reckon their duration, as is usually done, at 33 years,—should have passed away again, without having seen any of those great struggles which leave on history the mark as of a bloody hand. But the Crimean war, with its terrible sufferings, broke up the long, but latterly lurid and treacherous calm. Then came the short, but fearfully bloody Italian war, and Solferino, deadliest battle since Waterloo, with its 40,000 killed and wounded. And lastly has arisen that gigantic American struggle, so momentous in its bearings upon the future of mankind, and the issues of which appeal, as perhaps never war has appealed before, to every good, and to every evil feeling within man's breast; that struggle which will cost, at the lowest computation, the lives of half-a-million of men, before the crime of the man-stealer shall at last be washed out in blood.

Yes, with awe we must acknowledge it, the era of war has not yet died out. He, who is King of kings, and Lord of lords, sees yet fit to use the storms and surges of human passion, the hail of human missiles, the bolts of human thunder, and all other human mimicries of nature's powers of destruction and death, as instruments, like those others in the government of His universe. With whatever trust we may look forward to the day when "nation shall not lift up sword against nation, neither shall they learn war any more," that day has not yet dawned. We have still to reckon with war as an element in the world's history. Let us, therefore, look it in the face.

Now, if we do fairly look in the face the three great wars of our day of which I have spoken, we shall see disengage themselves from the cloud of dust and cannon-smoke which involves them, as it were three forms of beauty, three great works of Christian love. With the story of the Crimean war is inseparably bound up that of Florence Nightingale, and of the noble bands of volunteer nurses, and other volunteer workers of either sex, who accompanied or followed her to the allied camps and hospitals; of the grand-duchess Helena of Russia, and of the 200 or 300 Russian ladies who, in like manner—as we are too apt to forget—went forth to serve in the war-hospitals of their countrymen; and again, amongst ourselves, that of the uplifting of the nation's voice for inquiry into the sufferings of its soldiers,—of the appointment, in deference to that voice, of the Crimean Sanitary Commission, and through its labours the demonstration that, by the use of proper sanitary measures, the sickness of an army in the field can be reduced to less than the death-rate had been before they were adopted; and lastly, that of the quiet and gradual application of the experience thus acquired to the wants of the army in peace-time; the voice of Florence Nightingale being still constantly the first to denounce the evil to be undone, to urge the work to be done, to cheer on the workers. To the American war belongs the application of the latest conclusions of sanitary science to the sudden emergencies of a terrific struggle, waged over two-thirds of a continent at once, through the marvellous organisation of the American Sanitary Commission,—the most gigantic work of practical charity, so far as I know, ever attempted, far less carried out, as it has been, with unflagging zeal, with unexampled success. Lastly, the Italian campaign, through the impressions which it stamped upon the heart and mind of a Swiss traveller, gave birth, many years after, to a scheme of, if I may so call it, international war-charity, which has borne fruit already, and may bear abundant fruit hereafter.

It is surely impossible not to see the historical sequency of these three facts, the progression manifested in them. First came the strong patriotic impulsion arising from a quickened sense of the duties of the non-combatants of a nation towards its suffering fighters, as typified in Miss Nightingale's work. Then came the mighty organisation of that woman's work, for the purposes of one great struggle, by men's hearts and brains among the Federals, with which the name of Frederick Law Olmsted will perhaps remain most especially connected. Then at last the Swiss Henri Dunant puts forth the idea of rendering both the impulse and the organisation permanent, and raising both into the domain of international law, by "neutralising," as the technical term is,—in other words, rendering sacred amid the very horrors of war—both the sanitary services and the sufferers whom they tend.*

Of the first of these three works I will assume that my countrymen have sufficient knowledge already, and that a few dry figures will be a sufficient record of it for my present purpose. Let it, therefore, simply be noted that, to use Miss Nightingale's own words, "we had in the first seven months of the Crimean campaign, a mortality of 60 per cent. per annum among the troops from disease alone . . . in the last six months a mortality not much greater than among our healthy Guards at home"; that the improvement commenced from the moment that under the auspices of the Crimean Sanitary Commission, sanitary measures began to be taken; that under the influence of such measures, the monthly rate of sickness of 34·8 per cent. in January, 1855, fell to 9·3 in January, 1856, to 3·6 in June; and the monthly death-rate from 9·78 in the first period to 0·18 in the second and 0·02 in the third; that by the further application of sanitary principles in time of peace, the mortality of the British army has fallen everywhere in the most extraordinary proportion; by one-third in Malta, by nearly one-half in Nova Scotia, by more than three-fourths in Bermuda, by more than seven-eighths in Barbadoes, by more than eleven-twelfths in British Guiana, by twelve-thirteenths in Jamaica, and in St. Lucia, from 122 per thousand per annum, to 1!—But now let us look across the Atlantic.

I have said that the American Sanitary Commission is the organisation of a woman's work by men. But it is well to recollect that in this instance, as in that of the Crimean war, the work was essentially in its origin woman's work still. Sumter had scarcely fallen when ladies' committees had already sprung up throughout the North to prepare lint, knit and sew for the volunteers. The New York Ladies' Committee was the first to feel the need of regular organisation, to call in the aid of practical men, who in turn applied to Government, and solicited the appointment of a special Sanitary Commission. President Lincoln, with that characteristic slowness of resolve which, when once ripened, grows with him into the most steadfast fixedness of purpose, received the proposal coldly at first. But the army medical staff, organised for a microscopic force of some 15,000 men, had utterly broken down when these had swelled suddenly to 80,000,—soon to rise to 250,000, and almost indefinitely from thence. One regiment lost 20 per cent. of its effectives before seeing the enemy, 35 per cent. before firing a shot. The Surgeon-General of the Forces was anxious for voluntary aid. So at last, after months of delay, the Sanitary Commission was officially constituted, and received a local habitation in one of the public buildings of Washington, with power to use official stationery.

Nothing more. The Commission had declared from the first that it sought "no pecuniary remuneration from the Government," nay, that it asked for

---

* It appears now that the same idea had presented itself at the same time to a French army contractor, M. Henri Arrault, and had actually been published by him in 1861.

"no legal powers, but only the official recognition and moral countenance of the Government." Its general object was, it said,

> "Through suggestions, reported from time to time to the Medical Bureau and the War Department, to bring to bear upon the health, comfort, and *morale* of our troops the fullest and ripest teachings of sanitary science in its application to military life, whether deduced from theory or practical observation, from general hygienic principles, or from the experience of the Crimean, the East Indian, and the Italian wars."

Its proposed work was to be divided between three heads,—1st. "Material of the volunteers," 2nd. "Prevention," 3rd. "Relief." The two latter proved the most important. Under the head of Prevention it was to inquire with scientific thoroughness into the subject of "diet, cooking, cooks, clothing, tents, camping grounds, transports, transitory depots with their exposures, camp police . . . Everything appertaining to outfit, cleanliness, precautions against damp, cold, heat, malaria, infection, crude, unvaried or ill-cooked food, and an irregular or careless regimental commissariat, would fall under this head." Under the head of relief, it was to "inquire into the organisation of military hospitals . . . the precise regulations and routine through which the services of patriotic women might be made available in nursing;" the "nature and sufficiency of hospital supplies;" the "method of obtaining and regulating all other extra and unbought supplies contributing to the comfort of the sick; the question of ambulances and field-service, and of extra medical aid, and whatever else relates to the care, relief, or cure of the sick and wounded," &c.—

A catalogue of "I-want-to-knows," sufficient surely to turn grey the hair of all the clerks in all the Circumlocution Offices throughout the world, but which of itself sufficiently shows the thoroughly *national* character of the movement. Clearly, these men were either the most impudent of charlatans, or they felt that they were speaking in the name of the American people. But the war was a people's war, and they made themselves listened to; and it is observed now with surprise that the forecast, which thus mapped out a work yet unbegun, embraced "nearly all that has since proved essential." Of the spirit with which they grappled with that work, let the following passage of a letter from the General Secretary (Mr. Olmsted) to his associate Secretary at the West, bear witness:—

> "The governing purpose of the organisation is to avoid delay and circumlocution, to the end of accomplishing efficiency and directness of action. All practicable checks and methods consistent with and subsidiary to this are to be observed. None are to be cared for which assuredly interfere with it. . . . What one man cannot do, two must. It is immaterial whether the work is done here or there. The question is one of time, not of trouble. *When the money gives out, we are to scuttle and go down—till then, do our work thoroughly.*"

Thoroughly they have done it hitherto. Indeed the difficulty is to say, not what they have done, and where, but what they have not done, and where not. The work of inspection, which was entered upon both in the East and in the West, the instant the Association was organised, has extended to every army, every camp. A regular staff of inspectors was formed, some of whom forsook far more remunerative positions to enter the service of the Commission, whilst others declined for it the office of Brigade-surgeon in the army. And although the Sanitary Commission has been able to ensure most important reforms in the official organisation of the army medical service (including the appointment of a special corps of sanitary inspectors, an increase in the number of surgeons, assistant surgeons, and medical cadets, the removal of various red-tape obstructions in the way of efficiency, and last not least, the abrogation of the rule of perpetual succession by seniority alone in the medical service), the Commission has not yet deemed it advisable to give up its work of inspection.

Every inspector is required, after inspecting a camp or post, to report elaborately on its condition, the report comprising answers to 180 questions, "covering every important point connected with the sanitary condition of the army." More than 1470 of these reports had been received by the end of 1863, and are tabulated and digested. The Commission has also undertaken to tabulate the whole mortality of the forces, from the records in the Adjutant-General's office. This had ranged, till the end of 1863, from a maximum of 165 per 1000 during the deadly campaign on the Peninsula, to 44½ per 1000 during a period of comparative inaction (June 1861 to March 1862), the average, however, being 65 per 1000. These figures, though high, compared with our Crimean minimum of 25 per 1000 per annum in January, 1856, when our sanitary muddle had been finally got under, are but trifles compared with those terrible ones of 293 per 1000 for July, August, and September, 1854; 511 per 1000 in October—December; and 1174 per 1000 per annum in January, 1855, or even with the reduced one of 250 in April—June, after sanitary operations had commenced. Although full statistics have not yet been published, it is claimed that the American army's death-rate from disease during this war "has been less than was ever before known in the annals of great campaigns," and "less than a third" of that of the United States volunteer forces during the comparative child's play of the Mexican war.

It would seem impossible to over-estimate the share of the Sanitary Commission in such a result, which, when we consider the vast bodies of men that had suddenly to be brought into the field, the enormous area over which the war had to be carried on, the change of climate and of food often for Northern soldiers, the difficulties of the country, the swamps, the malaria, the endemic diseases of many a Southern locality, which Southern whites never venture to inhabit in certain seasons, but which the Federal soldier had to defend in all, is extremely creditable. For it must be remembered that the surgeons to a volunteer army, which can hardly average less than half a million, are almost to a man civil practitioners, to whom the Government had not at first even a book of military medical practice to issue. For their behoof indeed the Commission had eighteen short treatises prepared by medical men of high authority, on the best means of preserving health in camps, on the treatment of the sick and wounded in camp, and on the battle-field, which were distributed gratuitously to surgeons and officers, and have proved invaluable.

But it is in the field of relief that the labours of the Commission have been truly gigantic. This department divides itself into two branches, "general relief," and "special relief." The former embraces the dispensing of "hospital supplies and sanitary stores to general hospitals,—to battle-fields and field-hospitals,—and of sanitary stores" to the regimental hospitals and armies in the field. Special relief is given to needy or sick soldiers in the vicinity of military depots, on accepting furlough or discharge from service,—to prisoners and paroled men, and individual cases of special suffering among soldiers, for which the army regulations fail to provide,—and lastly, for the sick and wounded and their friends, by the Hospital Directory and other means. The greater part of two whole volumes,—each most valuable and interesting,—each singularly full of matter not to be found in the other, the "Succinct Narrative" of the "works and purposes" of the Sanitary Commission (New York, 1864) and the "Sketch" (Boston, 1863), is taken up with the details of the "relief" branch of the Commission's work. As a sample of the first subdivision of this branch, that of "general" relief, let me abridge from the former of the two volumes just referred to, a sketch of "battle-field relief."

> "The Relief Department, as advised by the Sanitary Inspectors in the field, and as directed from the central offices, sends forward with the moving columns of our army, and also, when practicable, to designated convenient points in the vicinity of the army's line of movement, such well-packed trains of selected supplies as for the time are deemed necessary to provide for probable necessities of wounded and exhausted men in the ambulance dépôts and field hospitals. In most of our armies, whether encamped or moving, the Commission maintains a 'flying dépôt,' or special waggon-train of 'sanitary stores,' under the supervision of the inspectors and relief agents. . . . At certain points designated by military advice, and convenient to the protected flank of the moving columns, and sometimes much nearer the points of anticipated combat than the regular medical trains are permitted to approach, the sanitary relief trains rendezvous, and establish dispensing dépôts. In all cases the inspectors and relief agents endeavour, under military advice, to keep the sanitary train sufficiently in advance with the moving columns of the forces to be prepared for the exigencies of battle. The moment a general engagement is announced, the inspector in charge of the Commission's work directs the necessary regulations for the distribution of 'sanitary stores' for the succour of wounded men, and at the same time he and his aids undertake to ascertain, by personal inquiry, what may be the extent and nature of wants to be supplied by such supplementary means. Then by couriers and by telegraph, requisitions are made upon the Commission's nearest dépôts for such supplies, while from the central dépôts still larger invoices of assorted supplies for battle-field relief are hastened forward to the field, or to the temporary dépôts, as occasion may require; and being continually informed respecting the actual and prospective wants of the wounded, the central and the branch offices promptly respond to special requests from the field and to orders from the Commission. By all practicable means, and usually by several routes, the supplies are pushed forward towards the field hospitals, and along the lines where the means of succour are most required."

Now let it not be supposed that this admirable and elaborate system only works on paper, or only serves to administer a few crumbs of relief to a few cases of neglect. The United States Army Medical Department must be, by the very force of things, by this time the most efficiently organised of any in the world. But it was found, in this terrific war, "that in each successive engagement the armies fought with such unequalled pertinacity and valour, that the per-centage of wounded men greatly exceeded the expectations of the Government, and the preparations for the succour and transportation of the wounded." After Burnside's defeat at Fredericksburg (Dec. 1862) the Sanitary Commission surgeons treated upwards of 8000 wounded on the field; at Gettysburg, 13,050 Federals and 7260 Confederates. A special "field relief corps" has been organised, "provided with light waggons containing such remedies and necessaries as surgeons most require in the heat of an engagement"; "and these waggons with their attendants," says Mr. E. C. Fisher, in a paper read at York last year before the Social Science Congress, "are always to be found in the front of the battle where men are falling the fastest"; whilst "at the close of the action,"—often a scarcely less perilous duty,—"the members of the corps hunt up the straggling wounded, assist them to the ambulances and temporary hospitals," and treat them when needful. At the attack on Fort Wagner, "the relief agents of the Commission marched with the assaulting columns to the very moat around the fort," and "under the guns of Wagner, in the hottest of the fire . . . picked and carried off the wounded almost as they fell."

The mind is absolutely bewildered by the quantity and variety of stores which the Commission has distributed. The total value of these, during two years, to December, 1863, for the western department alone, was $2,250,000, the list including such items as 113,329 pairs of drawers, 201,603 shirts, 297,960 towels and handkerchiefs, 229,948 lbs. of lint, 233,000 books and pamphlets, 497,365 lbs. of dried fruit, 103,330 cans of preserved meats. After the battle of Gettysburg alone there were issued $75,000 of supplies, including (to select other items) 4000 pairs of shoes and slippers, 12,900 lbs. of bread, 20,000 lbs. of ice, 100 lbs. of tobacco, 6800 lbs. of white sugar, 1250 bottles of brandy, 2000 jars of jellies. And the cost of distribution for the western branch has been less than 1½ per cent. on the valuation above given; the total expenses of the Commission are less than 3 per cent. on its income. The whole board, twenty-one in number, give their services and time free, their travelling expenses alone being partly refunded to them. 200 paid agents receive on an average 2 dollars a day for labour, "which is, say half of it, highly skilled, sometimes of professional eminence, and worth from five to ten times that amount." Of the way in which the Commission has been supported by the people, it may be sufficient to say, that the state of California sent $500,000 in gold to the treasurer, and that the New York Sanitary Fair realised upwards of $1,000,000. The total receipts of the central treasury had indeed, by March 4th, 1864, not exceeded $1,133,628 28c., of which $985,457 41c. had been expended, but "the aggregate of the sums which have been expended by the numerous branches and aid societies in the purchase of sanitary stores," &c., we are told, "would amount to a much larger sum than the receipts of the central treasury." The contributions of stores are, however, the real expressions of the nation's sympathy. "It is the farmers' wives and daughters," writes a lady, "who make the sacrifices; the materials are purchased by money earned by daily work; the time is taken out of the night's rest, and then, when the bag is ready, they send it away to strangers, not knowing where it is to go, nor who it is that shall receive it." The total value of these gifts of goods was estimated at the close of last year at upwards of $7,000,000, whilst out of 20,906 cases sent to the warehouses, only one was known to have been lost. Many of the express companies carry the Commission's goods either free or at reduced rates; the use of the telegraph is gratuitous for it everywhere. Yet the country's liberality has not done more than cover the needs which called it forth. "In its endeavours to meet the wants of the numerous battle-fields of the summer of 1862," the Commission had "to put its hand to the very bottom of its treasury, and to the last packages in its central depots." After the battle of Antietam in particular, it had exhausted all its stores, and sent its last funds into the markets to purchase more,—when a telegram from California came with the announcement that $100,000 were on their way, only as a first instalment of Eldorado's golden gift. Let it be observed that the Commission has utterly suppressed the practice which at first obtained, of the distribution of relief according to some special appropriation. Whatever is at hand must go to whosoever needs it. The spirit of the troops itself has enforced this true Christian equality. When at first the distributors would inquire: "Any boy here from the State of——?" there would be either no answer at all, or else, "No! only United States soldiers." Add that in tending the wounded the Commission has made no distinction between suffering men, but —as enjoined early in the war by one of the Federal Generals (General Halleck) has treated "friend and foe alike."

I have dwelt chiefly on a feature of the Commission's larger work of "general relief." The branch of "Special Relief," from the variety of purposes which it embraces, is perhaps the more interesting in its details, many of which, as it has been observed, have a sort of motherly character in reference to the soldier. For the Commission has never starchly shut itself up within the limits of a programme. Its labours have by this time widely overlapped its name. Wherever its machinery has been found adequate, or nearly adequate to meet any want of the soldier which seemed to be unprovided for, the pains have not been grudged to apply it to the purpose. The same organisation which could treat 20,000 wounded at Gettysburg helps disabled men to obtain back-pay and pensions, acts as their unpaid attorney or agent for the purpose, secures for them railway tickets at reduced rates, sees that at the station they "are not robbed or imposed upon by sharpers;" looks to the departure of all discharged men, endeavours to rescue them from evil companions if they linger; has an eye on soldiers out of hospital and not in service, and gives information to the authorities of soldiers endeavouring to shirk their duty or to desert. It has twenty-three "homes" or "lodges" scattered over the whole field of war, in which 2,300 soldiers are daily received; temporary hospitals for sick men sent North or discharged, including a "Camp Convalescent" with a constant population of nearly 6000; a "nurses' home" for the temporary relief of army nurses. To the 1st September, 1863, there had been admitted into the six principal "soldiers' homes" of the West alone 167,090 soldiers. Then there is the "Hospital Record," "designed to furnish recent and accurate information concerning every patient in the military hospitals"; whilst to the Commission is owing a system of memorial records of the dead, adopted by the War department, which registers in triplicate "the dying soldier's name, military record, home relations, wounds or sickness, together with his dying requests, and the designation of his place of burial." The Commission has again organised in Philadelphia a special agency for purveying fresh supplies of vegetables, meat, milk, &c., for the General Military Hospitals in Washington, all of which are transported every morning in "refrigerating cars," to the depot in the latter city. Its supplies of fresh vegetables and fruit throughout the war, especially to the Western armies, have formed one of its most essential services. It has established vegetable gardens in Tennessee, and has repeatedly entirely checked scurvy which was already appearing in the ranks, —sometimes wholly sweeping the Western markets of anti-scorbutic vegetables by its purchases.

Of the various publications of the Commission, (which include two semi-monthly periodicals), I have mentioned a few. I cannot however pass over one other—that awful "Narrative of Privations and Sufferings of United States Officers and Soldiers while Prisoners of War in the hands of the Rebel Authorities," a report doubly authenticated by the names appended to it, and by the evidence it adduces, and of which a nobleman of declared pro-Southern sympathies has admitted that no honest man could resist its testimony. Of this it must be said that it discloses and establishes a course of treatment of Federal prisoners by the Confederates, not only in distant localities, but in and around Richmond itself, such as no people, pretending to be Christian and civilised, has ever ventured to practise, and which nothing but the callousness to human misery which is the fruit of slavery can so much as explain. Lastly, though the objects of the Sanitary Commission are specially physical ones, it has acted throughout in hearty co-operation with another noble organisation, the "United States Christian Commission," which addresses itself to the spiritual wants of the soldiers.

And now let us pass from the national to the international charities of war.

A Swiss gentleman, M. J. H. Dunant, finds himself at Solferino on the day of a great battle. He sees the fight itself, the field afterwards, and then again that long and slow and terrible sequel to the heroic game of war, the gathering up of the wounded. At Castiglione, where most of these are brought, he sees the utter break-down of all official preparations for medical relief. The Austrians have impressed away nearly all local means of transportation; those of the French army itself are quite inadequate; many of the wounded have to lie two or three days before they can be so much as removed; when they are so, the whole town has to be transformed into a vast hospital, which itself becomes soon insufficient, through want of means to administer relief, even though the inhabitants are doing their best for their liberators. There is water and there is food, yet the wounded are dying of thirst and hunger; there is abundance of lint, but not hands enough to apply it. Men of all nations are lying side by side on the pavements of churches, helpless and unhelped. "Ah, sir, how much I suffer," says one to the Swiss visitor, "we are left deserted, and yet we fought well!" The faces of these poor wretches are black with flies, maggots are already appearing. As the narrator goes from one to another with only a pail of water and some lint, he is already a benefactor—so utterly rudimentary, so to speak, were the attentions which the wounded of a victorious army, belonging to the most warlike nation of the world, did *not* receive, and that several days already after the battle! Our brave Swiss throws himself heart and soul into the work; recruits volunteer nurse women,—who need no scientific training as yet, for the first thing to be done is to give food, and above all drink to men literally dying of thirst and hunger, then to wash these poor bodies crusted with blood and mud and vermin, and to apply simple dressings to their wounds. Next he tries to organise some system of relief in the most neglected quarter, choosing a church where lie 500 soldiers, with a good hundred more outside on straw under hangings. Women invade this den of misery, fair young girls some of them, whose very tears seem to revive the spirit of the wounded. Small boys are enlisted to fetch and carry between the church and the nearest fountains. The women bring all their old linen; M. Dunant buys what he can in the town, and sends his coachman to Brescia for a whole load of comforts of all kinds. Meanwhile he adds to his staff of volunteers, first an old naval officer, then two English tourists who are detained almost by force, then two more who join of their own accord, then an Italian priest, three or four travellers or idlers, a Parisian journalist, a few officers stationed in the town. But one of these last is the first to give in through emotion, and one volunteer after another has to withdraw from sheer inability to bear the sight of sufferings which he can do so little to relieve. The soldiers who give their help are equally crushed by the sight, and faint repeatedly over their work.

When things are put into something like order at Castiglione, our Swiss goes on to Brescia, where the hospital service is by this time tolerably organised, and only comforts seem wanted,—tobacco above all, the fumes of which are most useful to combat the mephitic exhalations of the crowded wards or churches. With a merchant of Brescia, he undertakes to supply the churches and hospitals with pipes and with "the weed;" but the stores of Brescia soon fall short, and supplies have to be sent for from Milan. In making his rounds he finds his work grow again upon him; in one labyrinthine convent in particular, many rooms full of wounded are left almost deserted. In fact, as he tells us, during the first eight days after the battle, all those of whom the doctor said in low tones as he passed, "There is nothing more to do," were left to die henceforth almost absolutely untended. And be it remembered that for some time the amount of hospital care required was almost as much increased by sickness as it was diminished by the death or convalescence of the wounded; since, over and above the 40,000 killed and wounded of the battle of June 24, there were, two months later, for the three armies, at least an equivalent number of men dead or disabled by sickness.

Our tourist returned to his own Geneva, and three years later was induced to put into print, under the title of "Recollections of Solferino" (*un Souvenir de Solférino*), a record of his battle-field and hospital experiences. This small volume,—the most perfect description I know of a great battle and of its consequences,—was at first only privately printed; but the edition was soon run out, and by 1863 a second and a third had been published, besides translations in several languages. It was indeed no mere piece of artistic word-painting. The book was in itself a true work of Christian love. The writer only spoke (and how modestly!) of what he had himself done, in order to urge others to do likewise. Would it not be possible, he asked, to form, in time of peace, voluntary societies for the relief of the wounded in war, with a view—first, of aiding the medical military staff to provide the necessary attentions and appliances on the battle-field—next, of continuing the same care to the wounded in hospital, till they are fully convalescent? He declares from experience, and the facts of all history support him, that the military relief staff, were it doubled or trebled, must be *always* insufficient on an emergency like that of a great battle, so that recourse must ever be had to the non-military public; and the only question therefore is, whether such recourse shall continue to be had at haphazard as hitherto, or shall be looked forward to and prepared beforehand.

M. Dunant's appeal was heard. The "Genevese Society of Public Usefulness," on the 9th February, 1863, took into consideration the question of creating, in time of peace, societies in aid of the wounded, and that of attaching to armies in war-time a body of volunteers for that purpose; and General Dufour, Commander-in-Chief of the Swiss forces, became chairman of a Committee with this view. On the 1st September, this Committee in turn issued a circular of invitation to an international Conference at Geneva, for examining the means of providing against the insufficiency of the sanitary service amongst armies in the field. The Conference met on the 26th October. Austria, Baden, Bavaria, France, Great Britain, Hanover, Hesse, Holland, Prussia, Saxony, Spain, Sweden, Würtemberg, besides Switzerland itself and the Order of St. John of Jerusalem, were all officially represented by special delegates—(the English ones being Dr. Rutherford, Divisionary Inspector-General of Hospitals, and the British Consul at Geneva, Mr. Mackenzie), Italy by her Consul, Russia by an aide-de-camp to a Grand-Duke and a librarian to a Grand-Duchess; so that few Christian States in Europe of any magnitude kept away.

The resolutions passed by the Conference were less important than its suggestions. The former, ten in number, were to the effect that there should be established in every country a Committee for the sanitary service of armies in war-time; such Committees to act in conjunction with the Governments of their respective countries, but to defray all expenses of their own *employés*, who should moreover wear in all countries one uniform badge (a white armlet with a red cross). But, in addition to these resolutions, the Conference expressed the wish, not only that all Governments should grant protection to the Committees, but that belligerent nations should proclaim the neutralisation of all field and other hospitals, as well as of the whole sanitary staff, whether officials, regular volunteer assistants, inhabitants who should go to the help of the wounded, or the wounded themselves,—and that an identical badge should be adopted for the sanitary corps of all armies, or at least for the whole sanitary service of each, and an identical flag in all countries for field and other hospitals.

The proposals of the Conference were officially accepted at once by several States. The outbreak of the Dano-German War gave reality to the impulse. Committees in aid of the wounded were formed in Denmark, Sweden, Norway, in Holstein, Prussia, Saxony. Volunteer assistants were sent to the camps. At Missunde, the scholars of the Kiel Gymnasium picked up under fire the German and Danish wounded. The Knights of St. John of Jerusalem took charge of a hospital at Altona. The Castle of Augustenburg was formed into another for the Danish wounded, who were cared for by Danish volunteer assistants. No fewer than sixty-eight young civilian medical practitioners of Berlin volunteered for hospital service. Protestant Deaconesses and Brethren of the Rauhe-Haus vied in zeal with Roman Catholic Sisters of Charity and Knights of St. John. The respected Dr. Wichern personally distributed coffee, bread, sausages, and tobacco, in the midst of a bitterly cold and stormy winter's night, to the advanced posts of the Prussian army.

Thirteen Governments having assented to the proposals of the Geneva Conference, the next step resolved upon was to bring together a diplomatic congress, towards concluding an international treaty or pact for carrying them out. The Swiss Federal Council agreed to take the initiative in the matter, and on the 6th June 1864, addressed an invitation to all civilised powers to send delegates to a congress to meet at Geneva on the 8th August, in special reference to the neutralisation of the military sanitary service.

Sixteen powers were again represented on this occasion, but not the same as at the Conference. Austria and Bavaria this time declined to appear, as did also the German Bund, and the Pope. Turkey, Greece, Hanover, Mexico and Brazil were also absent; Russia came too late. Again, four powers, Great Britain, Saxony, Sweden, and the United States, although sending delegates (the English ones being Professor Longman and Dr. Rutherford), did not give them authority to treat on their behalf. The remaining twelve powers, viz., Baden, Belgium, Denmark, France, Hesse Darmstadt, Holland, Italy, Portugal, Russia, Spain, Switzerland, and Würtemberg, entered into a Convention, dated 22nd August, 1864, by which all ambulances and military hospitals, whilst containing any sick or wounded, and unless guarded by a military force, are declared neutral; together with all persons employed in or in connection with them, or with the transportation of the wounded, as well as hospital chaplains, so long as there remain any wounded to be cared for. All such persons are empowered after military occupation by the enemy, either to remain at their post or freely to rejoin their corps, taking with them, however, only articles personally belonging to them. The freedom of all the inhabitants of the country who may attend upon the wounded is guaranteed; the reception of a wounded soldier is to serve as a safeguard to the house which takes him in, so as to exempt it from the billeting of troops, and partially from contributions of war. Sick or wounded soldiers are to be cared for, to whatever nation they may belong; they are to be sent home after war, if unfit for further service, and may otherwise be sent home on parole for the duration of the war. The evacuation of the hospitals, &c., is also neutralised. An identical flag, to be however accompanied in all cases by the national one, is adopted for hospitals, ambulances and operations of evacuation, and an identical badge, to be given out however only by the military authorities,—the flag and badge to bear the red cross on a white ground.

The Convention—to which other powers not parties to it were to be invited to accede—was signed, but it had yet to be ratified.

In the last week of December 1864, as we are informed by the Paris correspondent of the "Times" (for January 6th, 1865), the ratifications were exchanged at Berne between Sweden, Belgium, France, Denmark, Holland, Spain, Italy, and Russia. England has since acceded; Turkey, Greece, Mexico, Brazil, have announced their intention to accede; Hesse and Würtemberg have made their accession contingent on the consent of the German Bund. Austria and Saxony, on the other hand, persist in their refusal to do so. Other powers will no doubt drop in one by one.

A noble diplomatic achievement, surely, well-fitted to rank beside the group of anti-slave-trade treaties. To maximise destruction during the fight is no doubt the primary aim of war; but to minimise suffering afterwards should be its second aim. For the end of war itself is Peace, and for peace every fragment of human life is precious, and should be gathered up from among war's ruins. Even though some of the so-called civilised powers should refuse to enter into the generous fellowship established by the Convention—even though its stipulations should be repeatedly broken when brought to the test of actual warfare—a grand Christian principle stands surely henceforth inscribed in the Law of Nations, and one which must more and more realise itself—that the wounded and the sick, and their necessary attendants, are to be, by friend or foe, held sacred in war-time.

THE PROPHETS OF THE NEW TESTAMENT.

An examination of the closing years of the lives of St. Peter and St. Paul, like that suggested in the last paragraph of "*The Old Age of Isaiah*"* presupposes a fuller knowledge of the history of the Apostolic Church than can be taken for granted in most readers. What is wanted is not merely a survey of the great broad facts of that history as we learn them from the Acts of the Apostles, or as they are stated in manuals and epitomes, but an insight into its inner life, clear pictures before our mind's eye of what men were doing, clear conceptions of what they were thinking and feeling, sympathy with their hopes and fears.

I. As embodying one of the most prominent facts in that inner life, and as being more than most others, forgotten or misconceived, while yet without it we can hardly get below the surface in studying the writings of the two Apostles I have named, I have chosen the subject which stands at the head of this paper, the Prophets of the New Testament. How indistinct our common notions about them are may be shown, I believe, by a very simple test. Of the many thousands who hear and repeat the words that God "has built his Church upon the foundation of *the Apostles and Prophets*, Jesus Christ himself being the chief corner stone" (Eph. ii. 20, and Collect for St. Simon and St. Jude in the Prayer Book of the Church of England), there are probably very few, except among the professed students of Scripture, who do not at once think of the Prophets of the Old Testament as those spoken of. They picture to themselves the unity of the older and the newer dispensations, the "glorious company of the Apostles," Peter and John and Paul, and the others, joined with the "goodly fellowship of the Prophets," with Isaiah, and Jeremiah, and Ezekiel, in a divine and everlasting brotherhood. And yet it is demonstrable to any thoughtful English reader that those men of God of the older days of Israel were not, and could not be, those of whom the Apostle spoke. In this very epistle St. Paul counts up how and through what instruments God builds up his church, and the order in which he places them is this: "Christ," he says, "ascended up on high, . . . and gave gifts unto men, . . . and he gave some Apostles, and some *Prophets*, and some evangelists, and some pastors and teachers; . . . for the edifying (*sc.* the building up) of the body of Christ" (Eph. iv. 11). This is in itself decisive. Both offices originate in gifts bestowed by the risen and ascended Lord. The familiar, oft-quoted words refer to the Prophets of the Christian, not to those of the Jewish Church. But this is not all. In the First Epistle to the Corinthians there is a like enumeration of spiritual gifts, and functions resting upon them, and the names occur there also in the same combination. "God hath set some in the Church, first Apostles, secondarily Prophets, thirdly teachers" (1 Cor. xii. 28). Other instances confirming the inference, if any confirmation be needed, will meet us as we go further.

II. We may assume then, the existence of a body of men in the Apostolic church, known as Prophets and exercising prophetic functions. Leaving, for a moment, the question what those functions were, we shall gain something by getting a clear view of the extent both of the gift and of the order. This was, indeed, in every way the most striking fact connected with it. Under the old covenant, they had been confined within comparatively narrow limits. If we may think of "the sons of the Prophets" as something like a collegiate or monastic body, dwelling together, trained in music and song, prepared to receive divine revelations,* even they were but few, and still fewer became recipients of the higher forms of inspiration. And for four hundred years even this had ceased, and the voice of the last mysterious "messenger of the Lord" (such is the signification of the name of the prophet Malachi) had closed the canon of Old Testament prophecy. The people had even come to reckon the appearance of a Prophet as an epoch of remote chronology, and were looking forward anxiously to the time when one should be raised up to guide and teach them. (1 Macc. iv. 46; ix. 27.)

---

* See Good Words for 1864, p. 857.

At last "the word of God came to John the son of Zacharias in the wilderness" (Luke iii. 2), as it had come to Isaiah or Ezekiel. He appeared reproducing the old life in all its austerity, clad in the "rough garment" of a prophet (2 Kings i. 8; Zech. xiii. 4) like Elijah, abstaining from wine like the Nazarites and Rechabites, living on locusts and wild honey like the wilder Arab tribes to which the Rechabites belonged. So it was that the people "counted John that he was a prophet, indeed" (Matt. xiv. 5; xxi. 26), while others said of him as men had said of the older prophets (Jer. xxix. 26), that he "had a devil and was mad" (Matt. xi. 18; compare John x. 20). So when the greater Teacher came, though the outward form of life was different, though he showed himself as the Master, the Teacher, a Rabbi like other Rabbis (John i. 49; xx. 16), there was this which, even apart from all signs and wonders, made men hold that "a great prophet had risen up among them" (Luke vii. 16; xxiv. 19),—He spake as never man spake: (John vii. 46); as having power and "authority, and not as the scribes" (Matt. vii. 29). But up to the day of Pentecost, these were the only two of whom this was said. No trace of this energy shows itself in the wayward, questioning, doubting disciples. But when that day had fully come there was a great and marvellous change. Over and above the mysterious gift of Tongues, with their thrilling notes, and ecstatic doxologies, and languages of many lands, there was the gift of Prophecy also. It was on this rather than on the other that St. Peter laid stress as fulfilling the old prediction, both in its wonderful power and yet more in its wonderful extent, "I will pour out my Spirit upon all flesh, and your sons and your daughters shall prophesy." Young men and old, yea, even the lowest and most despised were to share the gift. "On my servants (*i.e.* slaves) and on my handmaids (*i.e.* female slaves) will I pour out in those days of my Spirit, and they shall prophesy" (Acts ii. 17, 18). And from that time, it spread with a wonderful rapidity. Sometimes through the laying-on of the Apostles' hands (Acts viii. 17; xix. 6), sometimes with no human intervention (Acts x. 44—46; xi. 15), the Spirit came upon men, and they spake with tongues, and magnified God, and prophesied. Many of these became conspicuous enough to be named as prophets in the higher sense of the word. Barnabas, the son of consolation, or, as we might literally interpret the new name thus given to him, the Son of Prophecy (Acts iv. 36); Stephen speaking with the Holy Ghost and with power, in the highest sense of the word, a prophet of the Lord (Acts vi. 10, 55); and Agabus (Acts xi. 28; xxi. 10); and Silas or Silvanus, and Judas (Acts xv. 32); and Manaen, and Lucius of Cyrene (Acts xiii. 1); and Timothy, bearing the old prophetic title of "man of God" (1 Tim. vi. 11; Deut. xxxiii. 1; 2 Kings iv. 7); the daughters of Philip the Evangelist (Acts xxi. 8); and last and greatest of them all, Saul of Tarsus, the apostle of the Gentiles. But even more striking than this list of names is the abounding proof of the presence of the gift in every church of the Gentiles. At Thessalonica men are warned not to "quench the Spirit" which kindled the power, nor "despise" the utterances which flowed from it (1 Thess. v. 20). At Corinth its excess almost threatened disorder, and called for that full exhaustive discussion of it which, more than any other portion of the New Testament, gives us an insight into its nature (1 Cor. xii. and xiv.). At Rome, even though as yet no apostle had visited that church, it is presupposed, and the disciples are taught to "prophesy according to the proportion, or analogy of the faith" (Rom. xii. 6). At Ephesus, it stands all but highest in the list of the gifts with which Christ had endowed the church (Eph. iv. 11). Strange as it may seem, there were in that age, some hundreds, it may be thousands, of men as truly inspired as Isaiah or Jeremiah had been, as St. Peter and St. Paul were then, speaking words that were, as truly as any that were ever spoken, inspired words of God, and yet of most of them all record has vanished. Their voices smote the air, and did their work, and died away, and we catch but the faintest echoes of them. Their words were written on the sand, and the advancing waves of time have washed away all, or nearly all, traces of what was once as awful as the hand-writing on the wall.

III. And what then was the nature of the gift so widely spread; what purpose did it serve; how did it contribute to building up the Church?

(1.) It is obvious that the gift of Prophecy was very far from being identical with the gift of prediction. It had not been so in the Jewish Church, nor was it so in the Christian. Even as the Heathens used the word it meant something more than that. The Prophet was the spokesman of God, the man to whom the word of God came and who spoke it out with power. What St. Paul dwelt on most when he was speaking of the effects of prophecy was not that it enabled men to foretell things to come, but that by disclosing the secrets of their hearts it made them fall down and worship

---

* Compare especially 1 Sam. x. 5, xix. 20—24; 2 Kings iv. 38, vi. 1.

God (1 Cor. xiv. 24, 25). Outwardly the chief characteristic of the New Testament prophet would seem to have been that he spoke burning words which went straight to men's hearts, that he proclaimed eternal truths which otherwise they would not have known. We must not, however, think of the Prophets as some have thought, as being only earnest, impassioned, enthusiastic preachers, mere interpreters of Scripture, or asserters of moral laws. Even as preachers of righteousness, their power lay not in skill, or even in earnestness of speech, but in the marvellous, supernatural insight which they possessed into the hearts of men. Inspired by the Divine Word, "before whom all things are naked and opened" (Heb. iv. 13), they too knew what was in men, and read their most secret thoughts. They could say to this one, "Thou art the man," "Why hast thou conceived this thing in thine heart?" (Acts v. 4), to that, "Thy sins are forgiven thee" (John xx. 23). They could say to another, as in the case of Timotheus (1 Tim. i. 18), "Thou art called to preach the gospel of thy Lord. Thou shalt have the gift, do the work of an Evangelist," or, as at Antioch, the Spirit through them, could say, "Separate me Barnabas and Saul for the work whereunto I have called them" (Acts xiii. 2). So it was that "the secrets of men's hearts were made manifest," and that "men fell down on their faces, and worshipped God and reported that God was of a truth present" with those who had so marvellous a power (1 Cor. xiv. 24, 25).

(2.) But with this there was also, it must not be forgotten, a distinctly predictive power, not put forth, indeed, for its own sake, as a prodigy and wonder, like the art of a soothsayer and diviner, but contributing, like the other form of the gift, to build up the Church, or to strengthen the life of individual men, helping them to meet dangers which would otherwise have come upon them as a snare. Foresight of the famine that came upon the provinces of the Empire in the days of Claudius roused the Gentile Churches to active beneficence towards the poor Christians of Jerusalem, and so served to knit together the bonds of brotherhood between them. (Acts xi. 27-30.) Foresight of a persecution directed against an individual teacher helped to test his courage and endurance. So it was when at Tyre the disciples "said to Paul through the Spirit that he should not go up to Jerusalem" (Acts xxi. 4); when Agabus warned him, "So shall the Jews at Jerusalem bind the man that owneth this girdle and shall deliver him into the hands of the Gentiles" (Acts xxi. 10-14). Utterances of this kind, we cannot doubt, are referred to when the Apostle tells the elders at Miletus that "the Holy Ghost witnesseth in every city that bonds and afflictions abide him" (Acts xx. 23), when he warns Timotheus that "the Spirit speaketh expressly that in the latter days some shall depart from the faith." (1 Tim. iv. 1.) In this instance it is interesting to note how the prophet reproduces the symbolic forms of those of an earlier age. Agabus took Paul's girdle and bound his own hands and feet, just as Jeremiah "buried his girdle by the hole of a rock in Euphrates" (Jer. xiii. 4-10) and appeared among the people with "bonds and yokes" upon his neck (Jer. xxvii. 2; xxviii. 10).

(3.) But beyond all special predictions that had a historical fulfilment within the horizon of their own age, the teaching of the prophets of the New Testament was essentially apocalyptic. As in that which is pre-eminently the Apocalypse, their eyes were opened to see the things behind the veil, and the ever new, inexhaustible theme of their discourse was "the power and coming," *i.e.* the second coming, "of the Lord Jesus" (2 Pet. i. 16). There was no need for them to fix "times and seasons" as others have done since, for the one thing which they knew concerning them, was "that the day of the Lord so cometh as a thief in the night" (1 Thess. v. 2). All that they could do was to point to a coming period, of undefined length, of apostasy, and lawlessness, and unbelief (2 Thess. ii. 3, 1 Tim. iv. 1, 2 Pet. iii. 3), after which should come the glory of the kingdom. In speaking of that glory, they were as men seeing the reflection of heavenly things in the mirror of their own minds, for they saw "as in a glass darkly" and prophesied "in part only," (1 Cor. xiii. 9-12), sometimes using outward symbols that were figures of the true, the heavenly Jerusalem, the paradise of God, and yet sometimes also revealing to men mysteries that had been "hidden in silence since the beginning of the world" (Rom. xvi. 25). Among these mysteries one, and perhaps the most prominent, was that of the brotherhood of mankind in Christ, that the Gentiles should be fellow-heirs, and of the same body (Eph. iii. 5, 6); or, again, the mystery of "Christ in them, the hope of glory" (Col. i. 27). To them it was given to see glimpses, hardly to be translated into words, of the "glory yet to be revealed," the "manifestation of the sons of God," the *freedom of the glory* of His children (Rom. viii. 13-21). Yes, in words which if they are partly an echo of a prophecy of the Old Testament, are yet also, it may be, taken from a prophetic utterance of the Apostolic Church, "as it is written, Eye hath not seen, nor ear heard, neither have entered into the heart of man, the things which God hath prepared for those that love Him. But God hath revealed them unto us by His Spirit" (1 Cor. ii. 9, 10).* The vision of that glory, lying in the far future, was to sustain the Church through all the long weariness of persecution, conflict, and the sickness of a hope deferred.

---

* The words seem suggested by Isaiah lxiv. 4, "Since the beginning of the world men have not heard, nor perceived by the ear, neither hath the eye seen, O God, beside thee, what he hath prepared for him that waiteth for him." On the other hand they are referred by Chrysostom to a lost apocryphal book ascribed to Elijah. Later critics have seen in them an extract from an Apostolic Liturgy. The hypothesis that they were part of a recorded (but no longer extant) "word of prophecy" that took its starting-point from the words of Isaiah seems, at least, as probable as any other.

Such then were the Prophets, speaking in every church, at almost every meeting. Can we wonder that St. Paul should speak as he does, of such a gift as profitable "for edification, and exhortation and comfort" (1 Cor. xiv. 3)? While Tongues were a sign only to those that believed not, startling and confounding them, Prophecy did the double work of convincing the unbelievers and building up the Church. While a man speaking in the full ecstasy of the Tongues might edify himself, by prophesying he edified the Church (1 Cor. xiv. 2-4). Can we wonder that they should occupy all but the foremost place in the Church of Christ, second only to the Apostles, hardly second even to them, seeing that the Apostles themselves were also Prophets; that the two names should be placed together, as we have seen them, the very order being interchangeable (2 Pet. iii. 2), in the closest juxtaposition? Of one thing we may be quite sure, that wherever the storms of persecution fell, they would have to bear the brunt of it, just as Stephen, the foremost of the "goodly company," was also the proto-martyr of the Church. The ferocity which slew him was not likely to spare them. Many disciples, we know, were scourged and imprisoned (Acts viii. 3; xxii. 4); all were scattered from Jerusalem, except the Apostles (Acts viii. 1), and, although St. Luke does not follow the history of the persecution into detail, all analogy would lead us to think that some at least of those who had been most conspicuous perished in it. Still greater is the probability that others besides James, the son of Zebedee, became martyrs to the faith when Herod the king "stretched forth his hands to vex certain of the churches" (Acts xii. 1). So indeed it had been foretold, in words which bear distinctly on this inquiry. The "Wisdom of God" speaking through the Incarnate Son, had brought the two names together as we find them united in the Epistles, "I will send them *prophets* and apostles, and some of them shall they slay and persecute" (Luke xi. 49). "Behold, I send unto you *prophets*, and wise men, and scribes; and some of them ye shall kill and crucify, and some of them shall ye scourge in your synagogues" (Matt. xxiii. 34). The words, "O Jerusalem, Jerusalem, that killest *the prophets*, and stonest them which are sent unto thee" (Matt. xxiii. 37), present in their form, are predictive rather than historic, look to the future rather than to the past.

Traces of this lost page in the history of the Apostolic church we find, I believe, in passages which are commonly referred to a remoter period, but which receive, when thought of as belonging to the very age in which the writers lived, a clearer and more satisfying meaning. Of some such fiery trial it was that St. Paul wrote when he said of the Jews of Judæa that they "both killed the Lord Jesus, and *their own prophets*" (1 Thess. ii. 15). The stedfast endurance of those martyrs it was that St. James held up to the Twelve Tribes that were scattered abroad, as a pattern. "Take, my brethren, *the prophets*, who have spoken in the name of the Lord, for an example of suffering affliction and of patience" (James v. 10). In the one passage, the order of the names, "the Lord Jesus and *their own prophets*," in the other their speaking in the name of the Lord, the Lord whose coming drew nigh, the same Lord Jesus, forbid our going back to the martyrdoms of the persecutions under Joash, or Ahaz, or Manasseh, and compel us to think of the *prophets* of the Christian Church. These also it was that the Seer of Patmos saw when he looked on the "souls beneath the altar that were slain for *the word of God*, and for the testimony which they held" (Rev. vi. 9, 10). It was of *these* prophets that the Apocalyptic angel declared himself the "fellow-servant" (Rev. xxii. 9). The Lord was "the God of *their* Spirits" (Rev. xxii. 6). Of *their* prophetic word it was true, that "the testimony of Jesus," and "the spirit of Prophecy" were co-extensive terms (Rev. xix. 10).

We have seen, then, abundant proof of this activity in utterance among the prophets of the Apostolic Church. Have we any reason to think of a like activity showing itself either in recording the prophecies that were thus spoken, or in writings that came from a direct prophetic inspiration. Probabilities seem to be nearly equal on either side. On the one hand, the age was one of diffused culture, and in the Greek and Western Churches, at all events, there must have been among the hearers many capable of reporting at the time, or collecting afterwards, utterances which they must have counted precious. On the other, it must be remembered that the majority of the early converts belonged to the less educated class, and that throughout the New Testament there runs the feeling that the world was to be converted, not chiefly by books, but by the living, personal testimony of the Apostles of Christ. The mere absence of such books from the extant literature of the first century is not in itself decisive. In the Old Testament we have traces left of many lost books, both historical and prophetic, written by the seers of Israel.* In the New Testament it is hardly conceivable that a man of St. Paul's wonderful energy should have spent twenty years, doing the work of an Evangelist, without writing a single letter to either a Church or an individual convert. Traces of such letters are found indeed even in the Epistles that have come down to us. The notice that the "salutation" in his own handwriting is "the token in every Epistle" (2 Thess. iii. 17), is surely the language of one who has already written many letters. In 1 Cor. v. 9, there is a reference to something that had been said in a lost Epistle to the Church of Corinth; in Col. iv. 16, to another, also lost, to the Church of Laodicea. St. Peter, in writing to the Christians of Pontus, Galatia, Cappadocia, Asia, and Bithynia, speaks of an Epistle which St. Paul had written to them (2 Pet. iii. 2), in terms which are not met by the extant letters to the Galatians or the Ephesians. A reference to such writings, whether by himself or other prophets, may be found, I believe, in the closing words of the Epistle to the Romans.

---

* It will be interesting and instructive to put together the titles of such as are mentioned.

(1.) The Book of the Wars of the Lord (Num. xxi. 14).
(2.) The Book of Jasher (Joshua x. 13; 2 Sam. i. 18).
(3.) The Book of Nathan the Prophet (1 Chron. xxix. 29).
(4.) The Book of Gad the Seer (*ibid.*).
(5.) The Book of the Acts of Solomon (1 Kings xi. 41).
(6.) The Prophecy of Ahijah the Shilonite (2 Chron. ix. 29).
(7.) The Visions of Iddo the Seer (*ibid.*).
(8.) The Book of the Chronicles of the Kings of Judah (1 Kings xv. 29, and *passim*).
(9.) The Book of the Chronicles of the Kings of Israel (1 Kings xv. 31, and *passim*).
(10.) The Prophecy of Jonah (*probably* written) (2 Kings xiv. 25).
(11.) The Book of Shemaiah the Prophet (2 Chron. xii. 15).
(12.) The Book of Iddo the Seer concerning Genealogies (*ibid.*).
(13.) The Story of the Prophet Iddo (2 Chron. xiii. 22. Same writer, but title of book different).

St. Paul has been speaking (Rom. xvi. 25) of "his Gospel, the preaching of Jesus Christ, according to the revelation of the mystery that had been *kept in silence* since the world began." Of this mystery he adds that it was "now manifested, and by means of *prophetic writings*, according to the commandment of the Everlasting God, made known to all nations." It will be seen that I have given the words "prophetic writings" or Scriptures, where the Authorised Version has "*the* Scriptures of *the* prophets," and the absence of the definite article in the Greek makes this change imperative. The words do not refer then, necessarily, to a known collection like the prophetic Scriptures of the Old Testament, and, inasmuch as the writers of the New Testament when they do speak of the Prophets of the Old use the article, the presumption would be that the words do not refer to them at all. But bear in mind that the Gospel of which St. Paul speaks was that given to him "by revelation" (Gal. i. 12); that the mystery was that which, having been "hid from ages and generations," was then revealed to the Apostles and *Prophets* of the Christian Church (Eph. iii. 5), even that "the Gentiles should be fellow-heirs and of the same body:" bear in mind, further, that St. Paul both professed (Acts xiii. 1) and claimed (1 Cor. xiii. 2) the prophetic gift, and it will not be thought strange that, in speaking of "prophetic writings" as God's instruments for evangelising the world, he should be referring to his own Epistles or to other like statements of the Truth.

An unexpected light is thrown on this interpretation by a remarkable passage in the works of the earliest of the Apostolic Fathers, Clement of Rome, the Clement, in all probability, of whom St. Paul speaks in the Epistle to the Philippians (iv. 3). He was a presbyter, or bishop of the Church of Rome; he wrote to the Church of Corinth. St. Paul, it will be remembered, wrote from the latter city to the Church at Rome. Whatever documents therefore are quoted or referred to by the one may fairly be assumed as probably known to both. If a quotation by one, and an allusion by the other, point in the same direction, the coincidence is at least strong evidence of probable identity. Now it is, to say the least, remarkable that Clement twice quotes, as if from an authoritative and inspired book, what he calls "the prophetic word," or (as the same words are rendered in the English of 2 Peter i. 19), the "word of prophecy." The passage is too interesting to be passed over, and I therefore translate it. "Let us serve God," the passage begins, "and we shall be righteous, but if we do not serve because we do not believe the promise of God, we shall be miserable. For thus also speaks *The Prophetic Word*, 'miserable are the double-minded, and they that doubt in their heart, who say, "all these things we heard even in the times of our fathers, but we, waiting from day to day, have seen none of them." O ye foolish ones, liken yourselves unto a tree; take the vine as an example. First of all it sheds its leaves, and then the tender shoot comes out, and then the sour grape, after that the ripe grape in its season. So likewise my people endured wanderings and afflictions; afterward they shall receive their good things.'" (Clem. Rom. ii. 11, a shorter quotation being given in i. 23). Here then we have the distinct recognition of a written *Prophetic Word*, in the first century, speaking of the coming of the Lord, not fixing times and seasons, exhorting men to patience, entirely in harmony with what we find in the Canonical writings of the New Testament. Is not the probability indefinitely great that this may have been among the "prophetic writings" of which St. Paul speaks, among the "other Scriptures" which St. Peter classes as standing on the same level with St. Paul's Epistles (2 Peter iii. 16)? Does it not suggest the thought that St. Paul's words, "Every Scripture, being God-inspired, is also profitable for doctrine, for reproof, for correction, for instruction in righteousness," may have been meant (their very form being carefully generalised for this express purpose*) to include the inspired writings

---

(14.) The Book of Jehu the son of Hanani (2 Chron. xx. 34).
(15.) The Acts of Uzziah by Isaiah the son of Amoz (2 Chron. xxvi. 22).
(16.) The Lamentations of Jeremiah for Josiah (2 Chron. xxxv. 25. Probably different from the Lamentations now extant, which are subsequent to the capture of Jerusalem by the Chaldeans).

Is it too much to say that we possess but a portion of a wide prophetic literature, and that we cannot think of the greater part of what has been lost as less inspired and authoritative than the Books which have come down to us? Enough, at all events, has been said, that there is no force in any *à priori* objection to the hypothesis of the possible loss of a Gospel or Epistle.

---

* Here again the English version obscures the special distinctions of the Greek. "The Holy Scriptures,"

of the Christian Church as well as those of the Jewish?

Another side, and that a darker one, of the life of the Apostolic Church has yet to be noticed. Side by side with the true prophets, there were in almost every Church, numerous and powerful false prophets, speaking words that came, not from the spirit of holiness and truth, but from a counterfeit, or even, it may be, a dæmonic inspiration. So it had ever been. The bitterest trial of the old Prophets of Israel had been that they were thus thwarted and opposed. "The prophets prophesy falsely, and the priests bear rule by their means; and my people love to have it so" (Jer. v. 31). So it was now. This also had been foretold by the Lord who sent the true Prophets (Matt. vii. 15, xxiv. 11), and the prediction was abundantly fulfilled. Speaking with the same claim to authority, in the same thrilling tones, their sensuous imagination roused, it may be, to an orgiastic frenzy, they spoke words from which all true teachers shrank back in abhorrence. At Corinth those who would not see the true Christ in the crucified Nazarene were heard to utter the awful words, "Jesus is Anathema" (1 Cor. xii. 3). Vainly puffed up in their fleshly minds, they rushed blindly into a region which they had not seen with any true intuition (Col. ii. 18). Giving heed to seducing spirits and teachings that came from demons, they led men to a false, Manichean asceticism, sure to end in a hideous and loathsome licentiousness, instead of to a true holiness (1 Tim. iv. 1). They brought in destructive heresies, even denying the Lord that bought them, denying that Jesus Christ had come in the flesh, and therefore treating the flesh as if it might have its own way, and lead them whither it would, without affecting their salvation (1 John iv. 1—3).

It was to guard against the perilous teaching of such men as these that St. Paul laid down the rule that no seemingly prophetic utterance was truly such, unless the man spoke "according to the proportion," according, we may say, to the analogy "of the faith,"—in harmony, *i.e.*, with the truth of which the Church was "the pillar and the ground," the great central "mystery of godliness, God manifest in the flesh" (1 Tim. iii. 15, 16). With their denials and perversions present to his mind, St. John warned his readers to "try the spirits, whether they be of God," and his test of Truth, like St. Paul's, lay in the acknowledgment that Jesus Christ was Lord, and had come truly in the flesh (1 John iv. 1, 2; 1 Cor. xii. 3). Therefore it was that there was to be no blind acceptance even of inspired, or apparently inspired, utterances; but men were to sit by and judge (1 Cor. xiv. 29). As the result of this testing, we may well believe that the special utterances which approved themselves to the reason and conscience of the Church, as in harmony with its faith, gained a wider currency as in every way trustworthy. Of all the explanations that have been given of the "faithful sayings" which occur so frequently in the Pastoral Epistles, this appears the most probable. Spoken by the prophets of the Church, as condensed expressions of the Truth, they were now endorsed, as it were, with the Apostolic *imprimatur*, as containing "sound," *i.e.*, *healthy* doctrine, in marked contrast to the morbid, doting phantasies of the false prophets.

IV. Such are the broad patent facts on both sides. They suggest some thoughts which it will be well to put distinctly before our minds before we leave the subject.

(1.) What we have seen is surely worth more, even to the Apologist, than much that takes a high place among the Evidences of Christianity. Here, in every page of the New Testament, implied and taken for granted, we have traces of a power mysterious, wonderful, exceptional. It came to men least prepared for it by birth or training. It gave them a power over the hearts of men which no sophist, or poet, or orator had ever exercised. It was at once a "sign" for those who believed not, and it built up those that did believe. This, more than physical signs and wonders, more than even the ties of Christian brotherhood and purity of life, was the secret of the Church's power to overcome the world. That victory stands as a great central fact in the world's history. This is the explanation given by those who were fighting the battle, fighting it against overwhelming odds, and yet assured of victory. Can we suggest any other as adequate? And if we admit this, is it not, at the least, a proof of a new force breaking through the succession of physical, and even of ethical causation, a force which, as we watch its character and its working, we cannot think of as other than divine?

(2.) Does it not give us a fresh sense of the preciousness of the Apostolic writings to think of them as relics of a time so full to overflowing in Divine Gifts? They were inspired because the men who wrote them were prophets. Even the historic work of the Evangelists has its counterpart in the numerous chronicles and histories that were written by the older prophets, and originated, as their labours had done, in the impulse and guidance of the Spirit, making memory more truthful, judgment more enlightened, the imagination which the historian needs more vivid. It is something to have received as our inheritance what has come to us from an age when the fountains of the great deep were broken up, and new floods of Divine Truth rushed in upon the souls of men. If we are tempted sometimes, as we well may be, to wonder and grieve that we have so little, we may also rejoice and give thanks that we have so much. If the Church of Christ was careful to gather up the fragments so that nothing might be lost, those

---

sacred writings or records, of verse 15, describe the known collection of Books which every Jewish scribe studied or interpreted. The "Scripture" of verse 16 is a different word, and the "*all*" is distributive rather than collective.

very fragments have shown themselves to possess a marvellous and creative power. Through all the centuries they have fed, through all the Church's life they will continue to feed the souls that hunger, meeting all wants—conforming themselves, we might almost say, to all true and healthy tastes—milk to the child in age or heart, "strong meat," solid food, to those that are of full age. They retain undiminished the old power of the *prophetic word.* They reveal to men the secrets of their own hearts. They bring before the startled conscience the terrors of the coming Judgment. They comfort the penitent and the mourner with the thoughts of the glory yet to be revealed.

(3.) What we have seen as to the mingling of the evil and the good, the true and the counterfeit prophecy, may well comfort us when our hearts fail and sink at the doubts, errors, denials, which now encompass us. We think that if our lot had been cast in that first golden age, listening to the voice of Apostles and Prophets, we should have believed with the full assurance of faith, and there would have been no room for doubt. Vain and foolish thought! There would have been the risk of more utter denial, more portentous heresy, more abysmal depths of evil. False prophets with all deceivableness of unrighteousness, teachers calling themselves Apostles though they were of the synagogue of Satan (Rev. ii. 2, 9), men speaking in the name of Peter and of James to bring believers back to the "beggarly elements of Judaism," speaking in the name of Paul to plunge them into the foulest lawlessness—this is what we should have had to encounter. Amid these rocks and shoals and quicksands we should have had to make our voyage, and we might easily, "as concerning the faith, have made shipwreck." And it may comfort us in the midst of our perplexities to notice how, in that remoter age, Time, as God's great instrument in the work of judgment, sifted the true from the false, the precious from the counterfeit, and brought about in due order the vindication and the ascendancy of the Truth. The "day" came which "tried every man's work of what sort it was" (1 Cor. iii. 13). The fire burnt up the wood, hay, stubble, of man's devices and imaginations. Much perished utterly, and much even that was true and good has passed away. It did its work and bore its fruit. But the gold and the silver and the precious stones, the words of the Apostles and Prophets as they stand in the New Testament—this has been tried in the furnace and has come out purified and brightened, an everlasting possession for mankind, the inheritance of the Church of Christ even unto the end.

(4.) There remains yet another lesson which we in this age need to learn. We know not fully why, but so it is, the gifts that were then given have not been given since in the same measure, or in like form. "Tongues" and "prophecy" have alike "failed." But not the less does it remain true "that the Spirit divideth to every man severally as He will" (1 Cor. xii. 11). The "word of wisdom" has its counterpart in the wide thoughts of Origen and Augustine, of Hooker and of Butler, the "word of knowledge" in the labours of great interpreters, "governments" in all true pastoral rule, "helps" in all forms of loving sympathy and kindness, and so too Prophecy has its analogue among us. Not in formal decrees of synods, or elaborate teaching of dogmatists, but when the "word of the Lord" comes with power to the heart of a man, and goes forth from it straight to the hearts of others, then the prophet's work is, in its measure, renewed among us. And what was true of the original is true also of the analogue. With that we too are called to overcome the world, and make men confess that God is with us of a truth. We are panic-stricken at the growth of unbelief around us. We snatch at weapons which we have not proved, or which the experience of the past has shown to be cumbrous and useless, or which, if effectual, belong, like fire-tipt and poisoned arrows, to savage and not to Christian warfare. Here is the weapon which we need, the "sword of the Spirit, which is the word of God" (Eph. vi. 17), "piercing even to the dividing asunder of soul and spirit, and of the joints and marrow" (Heb. iv. 12). Not by cries of alarm, or wailings of despondency, or railing accusations, may the doubters around us be won over, and the gainsayers silenced. That power belongs only or chiefly to the Prophetic Word. Let us speak that word of reproof, of comfort, and of hope, as it was spoken, of old, by prophets and Apostles, by the thousands who, since their time, have drunk of the same spirit,—let us prophesy according to the proportion, the analogy, the accordant harmony of the faith, and it will not fail. It has done its work in past ages, in spite of errors, excesses, mutual antagonism, and will do it yet again. Not the doctors of the Schools, but St. Bernard and St. Francis; not the system-builders of Trent or Geneva, but Tindal, and Luther, and Xavier; not the Laudian divines, but Leighton and Taylor, and Baxter and Bunyan; not the Georgian Bishops, but Wesley and Whitefield and Simeon;—these are the names to which we now look back as bright with the glory of the kingdom. So it will be now. Let us strive to look at the questions that are vexing us as we now look on those which vexed our fathers. Amid the warfare of half truths and rash denials, let us recognise *the Prophetic Word,* whenever and by whomsoever it may be spoken, accepting it as limited and tested by the analogy of the faith. So we come back to the old words as the truest and the best, "Covet earnestly the best gifts:" "Seek that ye may excel to the edifying of the church;" "and yet show I unto you a more excellent way" (1 Cor xii. 31; xiv. 12).

E. H. PLUMPTRE.

THE REIGN OF LAW.

BY THE DUKE OF ARGYLL.

(Continued from page 133.)

YET, as we look at nature, the fact will force itself upon us that there are structures in which we cannot recognise any use; that there are contrivances which often fail of their effect; and that there are others which appear to be separated from the conditions which they were intended to meet, and with reference to which alone their usefulness could arise. Such instances occur in many branches of inquiry; and although in the great mass of natural phenomena the supremacy of purpose is evident enough, such cases do frequently come across our path, as cases of exception—cases in which law does not seem to be subservient to will, but to be asserting a power and an endurance of its own. Thus there are monkeys which have no thumbs for use, but only thumb-bones hid beneath the skin: the wingless bird of New Zealand, the "Apteryx," has useless wing-bones similarly placed: snakes destined always to creep "upon their belly" have nevertheless rudiments of legs, and the common "Slowworm" has even the "blade bone" and "collar bone" of rudimentary or aborted limbs: the Narwhal has only one tusk, on the left side, developed for use, like the horn of an heraldic unicorn, but the other tusk, on the right side, is present as a useless germ: the female Narwhal has both tusks reduced to the same unserviceable condition: young whalebone whales have teeth which never cut the gum, and are absorbed as entirely useless to the creature's life: the males of all mammalian animals have teats which never suckle. These, and a thousand other similar cases, have long puzzled the physiologist, and the comparative anatomist.

The degree of importance which may be attached to such cases as a source of real difficulty, will vary with the character of the individual mind, and its capacity of holding by the great lines of evidence which run through the whole order of nature. It is with these cases as with the local currents which sometimes obscure the rising and falling of the tides. When watched from hour to hour, the greater law is clearly discernible by well-marked effects; but when watched from minute to minute, it is not distinct, and there are waves which seem like a rebellion of the sea against the force which is dragging it from the land. The order of nature is very complicated, and very partially understood. It is to be expected therefore that there should be a vast variety of subordinate facts, whose relation to each other and to the whole must be a matter of perplexity to us. It is so with the relation in which different known laws of nature stand to each other, much more must it be so with the far deeper subject of the relation which these laws bear to the Will and intentions of the Supreme. But as cases of intention frustrated, of structure without apparent purpose, of organs dissociated from function and from the opportunities of use, are sometimes sources of difficulty, it may be well to consider this subject a little nearer.

There is one explanation which it cannot be doubted applies to many cases, and this is the simple explanation, that we often mistake the purpose of particular structures in nature, and connect them with intentions which are not and never were the intentions really in view. The best naturalists are liable to such mistakes. A very curious illustration is afforded by an observation of Mr. Darwin, in his "Origin of Species." He says that "if green Woodpeckers alone had existed, and we did not know that there were any black and pied kinds, I dare say we should have thought that the green colour was a beautiful adaptation to hide this tree-frequenting bird from its enemies." Now, this introduces us to a very curious subject, and one as well adapted as any other to illustrate the relation in which law stands to purpose in the economy of nature.

There can be no doubt that the principle of adapted colouring with the effect and for the purpose of concealment, prevails extensively in various branches of the animal kingdom. It arises probably, like all other phenomena, by way of natural consequence out of some combination of forces which are the instruments employed. We have no knowledge what these forces are, but we can imagine them to be worked into a law of assimilation, founded on some such principle as that which photography has revealed. It is true that man has not yet discovered any process by which the tints of nature can be transferred, as the most delicate shades of light can be transferred, to surfaces artificially prepared to receive them. Such a process is, however, very probably within the reach even of human chemistry, and it is one which is certainly known in the laboratory of nature. The Chameleon is the extreme case in which the effect of such a process is proverbially known. Many fish exhibit it in a remarkable degree,—changing colour rapidly in harmony with the colour of the water in which they swim, or of the bottom on which they lie. The law on which such changes depend is very obscure, but it appears to be a natural process, as constant as all other laws are; that is, constant whenever given conditions are brought together. But then, these conditions are not brought together except with a view to purpose. For now let us see how this law, whatever it may be, is regulated and applied.

One thing is certain,—this law is not applied universally; on the contrary it is applied very partially. Is it therefore applied arbitrarily at haphazard, or without reference to conditions in which we can trace a reason and a rule? Far from it.

The rule appears to be this:—adaptive colouring as a means of concealment is never applied (1) to any animal whose habits do not expose it to special danger, or (2) to any animal which is sufficiently endowed with other more effective means of escape.

This is the higher law of purpose which governs the lesser law, whatever it may be, by which assimilative colouring is produced. Now, no man who had observed this higher law could ever fall into the error of supposing that the colour of the green Woodpecker was given to it as a means of concealment. Few birds are so invisible as Woodpeckers, because their structure and habits give them other methods of escaping observation which are most curious and effective. They have few natural enemies but man, and when in danger of being seen by him, they slip and glide round the bole of the tree or bough on which they may be climbing with a swift, silent, and cunning motion, and from behind that shelter, with nothing visible but their head, they keep a close watch upon the movements of the enemy. With such sleight of feet there is no need of lazier methods of concealment.

Accordingly in this family of birds the law of assimilation is withheld from application, and the most violent and strongly contrasted colouring prevails. Jet black, side by side with pure white, and the most brilliant crimsons, are common in the plumage of the Woodpeckers. No birds are more conspicuous in colouring, yet none are more seldom seen. The purpose of concealment being effected by other means, gives way to the purpose of beauty or of adornment in the disposition of colours. And in general the same rule applies to all birds whose life is led among woods and forests. Comparatively inaccessible to birds of prey, they exhibit every variety of tint, and the principle of invisibility from assimilated colouring is almost unknown. It must always be remembered, that animals of prey are as much intended to capture their food, as their victims are intended to have some chances and facilities of escape. The purpose here is a double purpose—a purpose not in all cases to preserve life, but to maintain its balance and due proportion. In order to effect this purpose the means of aggression, and of defence, or of escape, must bear a definite relation to each other in kind and in degree. When arboreal birds leave their sheltering trees they are exposed to the attacks of Hawks, but they have fair opportunities of retreating to their coverts again, and the upward spring of the disappointed Falcon in the air, when his quarry reaches the shelter of trees, tells how effective such a retreat is, and how completely it ends the chase. On the other hand, there is a great variety of birds whose habitat is the open plain—the desert—the unprotected shore—the treeless moor—the stony mountain-top. These are the favourite hunting-grounds of the Eagles, and the Falcons, and the Hawks. There they have free scope for their great powers of wing, and uninterrupted range for their piercing powers of sight. And it must be remembered, that even the slowest of the Hawks can on such ground capture with ease birds which when once on the wing could distance their pursuer by superior speed, because the Hawk, sweeping over the ground, takes the prey at a disadvantage, pouncing on it before it can get fairly into the air. Birds whose habitat is thus exposed could not maintain their existence at all without special means of concealment or escape. Accordingly it is among such birds almost exclusively that the law of assimilative colouring prevails. And among them it is carried to a perfection which is wonderful indeed. Every ornithologist will recognise the truth of the observation, that this law prevails chiefly among the Grouse, the Partridges, the Plovers, the Snipes, Woodcocks, Sandpipers, and other kindred families, all of which inhabit open ground. There can be no better examples than the Grouse and the Ptarmigan of our Scottish mountains. The close imitation in the plumage of these birds of the general tinting and mottling of the ground on which they lie and feed is apparent at a glance, and is best known to those who have tried to see Grouse or Ptarmigan when sitting, and when their position is indicated within a few feet or a few inches by the trembling nostrils and dilated eyeballs of a steady Pointer-Dog. In the case of the common Grouse, as the ground is nearly uniform in colour throughout the year, the colouring of the bird is constant also. But in the case of the Ptarmigan, it changes with the changing seasons, and the pearly greys which in summer match so exactly with the lichens of the mountain peaks, give place in winter to the pure white which matches not less perfectly with the wreaths of snow.

This is indeed a change which requires for its production the agency of other laws than those merely of reflected light, because the substitution of one entire set of feathers for another of a different colour, twice in every year, implies arrangements which lie deep in the organic chemistry of the bird. The various genera of Sand-Grouse and Sand-Partridges which frequent the deserts and naked plains of the Asiatic continent are coloured in exquisite harmony with the ground. Our common Woodcock is another excellent example, and is all the more remarkable as there is one very peculiar colour introduced into the plumage of this bird which exactly corresponds with a particular stage in the decay of fallen leaves—I mean that in which the browns and yellows of the Autumn rot away into the pale ashy skeletons which lie in thousands under every wood in winter. This colour is exactly reproduced in the feathers of the Woodcock, and so mingled with the dark browns and warm yellows of fresher leaves, that the general imitation of effect is perfect. And so curiously is the purpose of concealment worked out in the plumage of the Woodcock, that one conspicuous ornament of the bird is covered by a special provision from the too curious gaze of those for whose admiration it was not intended. The tail-feathers of the Woodcock can be erected and spread out at pleasure like a fan, and, being tipped on their under surface with white of a brilliant and silvery lustre, set off by contrast with an adjacent patch of velvety black, they can produce a brilliant and conspicuous effect. But the same web, which on its under surface bears this beautiful but dangerous ornament, is on its upper surface dulled down to a sombre ashy-grey, and becomes as invisible as the rest of the plumage. These are all provisions of nature, which stand in clear and intelligible relation to the habits of the bird. It rests all day upon the ground, under trees; and were it not for its ingeniously adapted colouring, it would be peculiarly exposed to destruction. Man is an enemy whose cunning inventions overcome all such methods of protection, and the Woodcock when in his most rapid flight is now an easier prey than in older times when sitting on the ground. But before fire-arms had reached the perfection which has enabled us to shoot flying birds, the colouring of the Woodcock served it in good stead, even against the Lords of the Creation. In old times it required special skill and practice to see Woodcocks on the ground, and the large lustrous black eye, which is adapted for night-vision, was the one spot of colour which enabled the fowler of 150 years ago to detect the bird. Thus Hudibras has it :—

> "As men find Woodcocks by their eyes."

There are other animals in which the principle of imitation with a view to concealment is carried very much farther than the mere imitation of colour, and extends also to form and structure. There are some examples of this in the class of insects, so remarkable that it is impossible to look at them without ever fresh astonishment. I refer especially to some species of the genus *Mantis* which are wholly modelled in the form of vegetable growths. The legs are made to imitate leaf-stalks, the body is elongated and notched so as to simulate a twig; the segment of the shoulders is spread out and flattened in the likeness of a seed-vessel; and the large wings are exact imitations of a full-blown leaf, with all its veins and skeleton complete, and all its colour and apparent texture. There is something startling and almost horrible in the completeness of the deception—very horrible it must be to its hapless victims. For in this case the purpose of the imitation is a purpose of destruction, the *Mantis* being a predacious insect, armed with the most terrible weapons, hid under the peaceful forms of the vegetable world. Wonderful as this structure is, it would be none the less, but all the more wonderful, if it should arise by way of natural consequence from some law of development or of growth. It must be a law of which at present we have no knowledge, and can hardly form any conception. But certain it is that here, as in all other cases, the purpose which is actually attained, is attained by a special adaptation of ordinary structure to a special and extraordinary purpose. No new members are given to the *Mantis*; there is no departure from the plan on which all other insects of the same order are designed. The body has the same number of segments, the legs are the same in number, and are composed of the same joints; every part of this strange creature which seems like a bit of foliage animated with insect life, can be referred to its corresponding part in the ordinary anatomy of its class. The whole effect is produced by a little elongation here, a little swelling there, a little dwarfing of one part, a little development of another. The most striking part of the whole imitation—that of the "nervation" of the leaf—is produced by a modification, not very violent, of a structure which belongs to all flying insects. Their wings are constructed of a thin filmy material stretched upon a framework of stronger substance, as the waves of a windmill are stretched upon a trelliswork of spars. This framework is designed in a great variety of patterns—more elaborate and more beautiful than the tracery of gothic windows. In the *Mantis* this tracery, instead of being drawn in a mere pattern, is drawn in imitation of the nervature of a leaf. And imitative colouring is added to imitative structure—so that nothing should be wanting to its completeness and success.

But although the laws which determine both form and colouring are here seen to be subservient to use, we shall never understand the phenomena of nature unless we admit that mere ornament or beauty is in itself a purpose, an object, and an end. Mr. Darwin denies this; but he denies it under the strange impression, that to admit it would be absolutely fatal to his own theory on the origin of species. So much the worse for his theory, if this incompatibility be true. There is indeed a difference, at least in words, between the doctrine now asserted and the doctrine which Mr. Darwin denies. What he denies as a purpose in nature is beauty "in the eyes of man." But this evades the real point at issue. The relation in which natural beauty stands to man's appreciation of it, is quite a separate question. It is certain enough that the gift of ornament in natural things has not been lavished, as it is lavished, for the mere admiration of mankind. Ornament was as universal,—applied upon a scale at once as grand and as minute as now,—during the long ages before man was born. Some of the most beautiful forms in nature are the shells of the ocean, and many of them are the richest, too, in surface ornament. But, prodigal of beauty as the ocean now is in the creatures which it holds, its wealth was even greater and more abounding in times when there was no man to gather them. The shells and corals of the old Silurian Sea were as elaborate and as richly carved as those which we now admire: and the noble Ammonites of the Secondary Ages must have been glorious things indeed. Even now there is abundant evidence that although man was intended to admire beauty, beauty was not intended only for man's admiration. Nowhere is ornament more richly given, nowhere is it seen more separate from the use, than in those organisms of whose countless millions the microscope alone enables a few men for a few moments to see a few examples. There is no better illustration of this than a class of forms belonging to the border-land of animal and vegetable life called the *Diatomaceæ*, which, though invisible to the naked eye, play an important part in the economy of nature. They exist almost everywhere, and of their remains whole strata, and even mountains, are in great part composed. They have shells of pure silex, and these, each after its own kind, are all covered with the most elaborate ornament—striated, or fluted, or punctured, or dotted, in patterns which are mere patterns, but patterns of perfect, and sometimes of most complex, beauty. No graving done with the graver's tool can equal that work in gracefulness of design, or in delicacy and strength of touch. Yet it is impossible to look at these forms—in all the variety which is often crowded under a single lens—without recognising instinctively that the work of the graver is work strictly analogous,—addressed to the same perceptions,—founded on the same idea,—having for its object the same end and aim. And as the work of the graver varies for the mere sake of varying, so does the work on these microscopic shells. In the same drop of moisture there may be some dozen or twenty forms, each with its own distinctive pattern, all as constant as they are distinctive, yet having all apparently the same habits, and without any perceptible difference of function.

It would be to doubt the evidence of our senses and of our reason, or else to assume hypotheses of which there is no proof whatever, if we were to doubt that mere ornament, mere variety, are as much an end and aim in the workshop of nature as they are known to be in the workshop of the goldsmith and the jeweller. Why should they not? The love and the desire of these is universal in the mind of man. It is seen not more distinctly in the highest forms of civilised art than in the habits of the rudest savage, who covers with elaborate carving the handle of his war-club, or decorates with colour the prow of his canoe. Is it likely that this universal aim and purpose of the mind of man should be wholly without relation to the aims and purposes of his Creator? He that formed the eye to see beauty, shall He not see it? He that gave the human hand its cunning to work for beauty, shall His hand never work for it? How, then, shall we account for all the beauty of the world—for the careful provision made for it where it is only the secondary object, not the first? Even in those cases, for example, where concealment is the main object in view, ornament is never forgotten, but lies as it were underneath, carried into effect under the conditions and limitations imposed by the higher law and the more special purpose. Thus the feathers of the Ptarmigan, though confined by the law of assimilative colouring to a mixture of black and white or grey, have those simple colours disposed in crescent-bars and mottlings of beautiful form, even as the lichens which they imitate spread in radiating lines and semi-circular ripples over the weather-beaten stones. It is the same with all other birds whose colour is the colour of their home. For the purpose of concealment that colouring would be equally effective if it were laid on without order or regularity of form. But this is never done. The required tints are always disposed in patterns, each varying with the genus and the species; varying for the mere sake of variation, and for the beauty which belongs to ornament. And where this purpose is not under the restraint of any other purpose controlling it and keeping it down as it were within comparatively narrow limits, how gorgeous are the results attained! What shall we say of flowers—those banners of the vegetable world, which march in such various and splendid triumph before the coming of its fruits? What shall we say of the Humming Birds—whose feathers are made to return the light which falls upon them as if rekindled from intenser fires, and coloured with more than all the colours of all the gems?

No better example indeed can be found than these wonderful creations—the Humming Birds—of the love of mere variety which prevails in nature. More than four hundred species are now known to science, all absolutely distinct, but many of them, in respect to form and structure, and general style of ornament, almost copies of each other, differing in nothing, except that perhaps the colour of the ruby or the topaz is replaced by the radiance of the emerald or the sapphire. Two Humming Birds, called respectively the "Sappho Comet" and the "Phaon Comet," are splendid examples of this sort of substitution. There is a group of these birds to which the scientific name of *Lophornis* has been given, in which the variation for the mere sake of variation is more conspicuous and striking than in most others, on account of the singular manner in which ornament is pursued, not merely in the colouring, but in the form and development of the plumage. These birds are all provided either with tippets or with crests of elongated plumes, which are of some one colour, but end in spots or spangles of another. Take the first two species of this group which we find in the splendid Monograph of the *Trochilidæ* by Mr. Gould. The first of these has the elongated neck feathers of chestnut red, with spangles of luminous green. The next species has the same spangles, but terminating plumes of pure white. A third species has the plumes green, and the spangles white. Changes (so to speak) on the same principle are pursued throughout the group. Some have the elongated plumes as crests, thickly set, small, and round, like the stamens of a flower. In like manner the "Woodstars," the "Flame Bearers," and the "Thorntails," are all groups of species closely resembling each other in general aspect, and in what may be called the idea of the colouring. But this idea is embodied in every conceivable variety of form, the colours changing and replacing each other in combinations ever new and ever beautiful. There is not the smallest ground for believing—on the contrary, there is every reason to disbelieve—that all these changes, or any of them, have any other use than the use of beauty. One fact alone seems conclusive on this point, and that is the fact that all this splendid ornament is almost always confined to one sex. Special adaptation to special purpose is indeed as conspicuous in the Humming Birds as in any other organic form. They feed mainly on the insects which frequent the flowers of the New World, and some of these have nectar-chambers of most curious plan. To get access to them requires a peculiar apparatus, and this apparatus the Humming Birds are provided with, both in the forms of bill and in the powers of wing. So special is the adaptation, that some kinds of Humming Birds seem made to match a few plants which are perhaps confined to a single mountain. Some range over the innumerable blossoms which cover the low hot forests of tropical America, whilst others never leave the limited area of some deserted crater, or the scanty flowers which hold their ground close up to the eternal snows of Chimborazo and Cotopaxi. But all such varieties of form and structure are quite separate from the varieties of colour and of ornament. These vary immensely within the same group where form and structure are closely similar, and where habitat and habits are almost identical. Plumes of blue are of no more value in the "struggle for existence" than plumes of green. Spangles of the emerald are no better in the battle of life than spangles of the ruby. A crest of flame does not enable a Humming Bird to reach the curious recesses of an orchid better than a crest of sapphire. But all these are beautiful, and their beauty is various, and therefore all these are given.

There is one instance in nature (and, so far as I know, only one) in which ornament takes the form of pictorial representation. The secondary feathers in the wing of the Argus Pheasant are developed into long plumes, which the bird can erect and spread out like a fan, as a Peacock spreads his train. These feathers are decorated with a series of conspicuous spots or "eyes," which are so coloured as to imitate the effect of balls. The shadows and the "high light" are placed exactly where an artist would place them in order to represent a sphere. The "eyes" of the Peacock's train are wonderful examples of ornament; but they do not represent anything except their own harmonies of colour. The "eyes" of the Argus Pheasant are like the "ball and socket" ornament, which is common in the decorations of human art. It is no answer to this argument in respect to beauty, that we are constantly discovering the use of beautiful structures, in which the beauty only, and not the usefulness, had been hitherto perceived. The harmonies on which all beauty probably depends are so mutually connected in nature that "use" and ornament may often both arise out of the same conditions. Thus, some of the most beautiful lines on the surface of shells, are simply the lines of their annual growth, which growth has followed definite curves, and it is the "law" of these curves that is beautiful in our eyes. Again, the forms of many fish which are so beautiful, are also forms founded on the lines of least resistance. The same observation applies to the form of the bodies and of the wings of birds. Throughout nature, ornament is perpetually the result of conditions, and arrangements fitted to use, and contrived for the discharge of function. But the same principle applies to human art, and few persons are probably aware how many of the mere ornaments of architecture are the traditional representation of parts which had their origin in essential structure. Yet who would argue from this fact that ornament is not a special aim in the works of man? When the savage carves the handle of his war-club, he does it to give his own hand a firmer hold. But any shapeless scratches would be enough for this. When he carves it in an elaborate pattern, he does so for the love of ornament, and to satisfy the sense of beauty.

The evidence is indeed abundant, that ornament and variety are provided for in nature for themselves and by themselves, separate from all other use whatever. Any theory on the origin of species which is too narrow to hold this fact, must be taken back for enlargement and repair. At the very best it must be incomplete. But here the question arises, is there any ground for any theory at all on the "origin" of species, such, for example, as the various kinds of Humming Bird? Beauty, variety, fitness for a peculiar mode of life,—in these we see a purpose; but is there any indication of a method, according to which this purpose has been pursued? Is there anything to suggest the employment and instrumentality of means? To answer this question we must ask another. What are the indications of method in the works of nature? It is not in variety, but in unity that we recognise the work of law. It is in the facts common to different phenomena that we trace the existence of a common bond—the operation of some common force. And so it is the likeness of different creatures to each other, and the graduated degrees of their unlikeness, which impress the naturalist with the idea of relationship, and tempt him to speculate on its nature and on its cause. These Humming Birds are a case in point. In all the 400 species there is a common structure, to be recognised at a glance. There is, indeed, immense variety, but it is variety within the bounds of law. Some of them are the most brilliant of created things; others are as sombre as the dullest of our European birds. The bills of some are straight, of others gently curved, of others violently bent. Some have particular parts of their plumage greatly developed, which in other species are kept altogether in abeyance. But in all there is one type of structure, not to be mistaken, separating them from all other birds, and running into the most curious details. And here we meet with examples of a kind of fact which more than any other suggests the operation of some physical law. We find community of structure where there is no community of purpose. Nay, we find structure apparently separated from purpose altogether. Thus, the tail feathers of the Humming Birds play an important part, both in respect to utility and in respect to ornament. They are selected in many cases as the most conspicuous and splendid ornaments of the bird. In some, the two central feathers are developed into lengthened plumes, and the remaining feathers are ranged on either side in regular and beautiful gradation. In others, the converse arrangement is adopted—the central feathers being suppressed, whilst those on the exterior are lengthened and adorned. But in all the endless variety of arrangement there is one universal rule—a rule of numbers—a rule which prevails when neither the purpose of use nor the purpose of ornament is concerned in keeping it. The principle of arrangement, so to speak, is founded on the number ten. Two central plumes, flanked on either side by four; or four lateral plumes, connected by three and three; or five and five, pretty equally developed; so as to form a round end, or a forked end, or the radiance of a star. But in some, the full number ten would not, so to speak, *fit the pattern.* The visible arrangement is then changed to some lesser multiple of two—to eight, or six. But in all these cases the supernumerary feathers exist, although their development is arrested. They are suppressed to the eye, but they are not suppressed altogether. In all Humming Birds the rudiments of the full number can be detected.

Now this is only one example of a great class of facts of continual recurrence in nature. The forces which are combined for the moulding of organic forms have been so combined as to mould them after certain types or patterns. It constantly happens that particular parts of any given type which are indispensable to one animal, are of no use whatever to another. Where they are of no use they are small, sometimes mere rudiments. Where they are of use they are enlarged, developed, expanded. For example, the forearm of all the Mammalia, and even of all the Lizards, terminates in five jointed bones or fingers. But in many animals the whole five are not needed, but only some one, or two, or three. In such cases the remainder are dwarfed, but rudimentally the whole number are always to be traced. Even in the Horse, where one only of the five is directly used, and where this one is enlarged and developed into a hoof, parts corresponding to the remaining four fingers can be detected in the anatomy of the limb. In many cases the science of fossil remains enables us to trace the intermediate forms through which existing animals can be connected with animals long since extinct. It must be remembered that the fact of this connection is quite a separate thing from any theory, such as Mr. Darwin's, as to its physical cause. Professor Owen pointed out, in public lectures delivered some years before the publication of Mr. Darwin's book, the existence of fossil animals, which showed an increasing approximation to the forms of the Horse, and of the Ox; and he showed that this approximation was related in time, as it seemed to be in purpose, with the coming need of them for the service and use of Man.

All these facts should convince us that we must enlarge our ideas as to what is meant by "use" in the economy of nature. In the first place it must be so interpreted as to include ornament; and in the second place, it must include also not merely actual use, but potential use, or the capacity of being turned to use in new creations. In this point of view rudimentary or aborted organs need no longer puzzle us, for in respect to purpose they may be read either in the light of history, or in the light of prophecy. They indicate either what has already been, or what may yet come to be. Why new creations should not have been made wholly new;—why they should have been always moulded on some pre-existing form;—why one fundamental ground-plan should have been adhered to for all vertebrate animals, we cannot understand. But as a matter of fact it is so. For it appears that creative purpose has been effected through the instrumentality of forces so combined as to arrange the particles of organic matter in definite forms: which forms include many separate parts capable of arrestment or development according as special organs are required for the discharge of special functions. Each new creation seems to have been a new application of these old materials. Each new house of life has been built on these old foundations. Among the many wonders of nature there is nothing more wonderful than this—the adaptability of the one Vertebrate Type to the infinite variety of life to which it serves as an organ and a home. Its *basement* has been so laid that every possible change or addition of superstructure could be built upon it. Creatures destined to live on the earth, or in the earth, on the sea, or in the sea, under every variety of condition of existence, have all been made out of that one pattern; and each of them with as close an adaptation to special function as if the pattern had been designed for itself alone. There are particular parts of it which are of no use to particular animals. But there is no part of it which is not of indispensable use to some member of the group; and there is one supreme form in which all its elements receive their highest interpretation and fulfilment. It is indeed wonderful to think that the feeble and sprawling paddles of a Newt, the ungainly flippers of a Seal, and the long leathery wings of a Bat, have all the same elements, bone for bone, with that human hand which is the supple instrument of Man's contrivance, and is alive, even to the finger-tips, with the power of expressing his intellect and his will. Here again the Laws of Nature are seen to be nothing but combinations of force with a view to purpose: combinations which indicate complete knowledge not only of what is, but of what is to be, and which foresees the end from the beginning.

EASTWARD.

By THE EDITOR.

III.—CAIRO, AND THE RED SEA.

I AM not yet done with Cairo. But my narrative, in the meantime, must be broken up like my journey, by a visit to the Red Sea.

"Tickets for Suez!" What a shock does such a request as this, which we made at the Cairo station, give to all our associations with the desert, and the journeyings of Abraham and Isaac and Jacob! It is as great as if we proposed to take a passage in an excursion steamer on the Lake of Tiberias, or to visit a cotton mill on the site of the Temple of Jerusalem. But if any one prefer to journey on a camel alongside the railway, he may have one. Dragomen and camel-drivers are always on the *qui vive* to conduct the enterprising traveller to any spot where "the ship of the desert" can sail. Poetry is ever in advance of what is called "progress," though ever present to idealise it when it becomes prosaic. Had time permitted of our choosing between the camel and "first-class," we might probably have chosen the former, and thus obeyed the poetic instinct. As it was, however, we accepted of the conventional and swifter mode of travel, and booked ourselves for Suez. I am not sure but the Patriarchs, in similar circumstances, would have done the same. And why not? A distinguished English prelate, so the story goes, was accosted, when entering his comfortable carriage, by an excellent Mrs. Gamp, who, assuming that comfort and Christianity were necessarily opposed, suggested the delicate inquiry as to what the Apostles would say were they to see one who professes to be their successor travelling in such luxury. "I think it not unlikely," was the meek and wise reply of the worthy bishop, "that they would thankfully acknowledge how much improved the times are since their day!" So we felt, in remembering the past, as we entered the railway for Suez.

We naturally expected to lose all sense of the desert—not once to come under its spell—in our journey through it by rail. But it was really not so. No railway associations obtruded themselves upon our notice, except the long moving shadow upon the sand. We alone seemed to be in the wilderness, drawn along by a power which, from the very scenery through which we passed, had a strange air of novelty and mystery about it. There were no well-built station-houses like Swiss cottages, but only wooden huts at great intervals, which stood alone and solitary in the arid waste, without a name to distinguish them from each other in the boundless expanse of sand. They are simply numbered like milestones. Such buildings fail to give any life to the scene, and excite in us only feelings of pity for the hermits who inhabit them, and whose duties consist, not in conning over breviaries, or in helping forlorn travellers, but in adjusting switches and in supplying water and food to thirsty and hungry steam-engines puffing through the sweltering heat.

The railway changed the scenery of the desert no more than a balloon changes the scenery of the clouds. Once out of Cairo, we were in the ocean of sand and desolation, as much as a ship out of Plymouth is in the ocean of green water. We passed across the characteristic flinty ground of the real desert; we saw rolling hills of tawny, almost golden sand, like yellow snowhills, drifted and smoothed by the winds, and as if never trodden by the foot of man. We saw troops of light gazelles bounding along with elastic step as they fled in terror from the mysterious monster that rushed snorting towards them from the horizon. We saw in great beauty more than one mirage, fully realising all we had ever heard of its deceptive likeness to large pools or lakes of water, with shores indented by tiny bays and jutting promontories, and with a hazy brightness over them singularly picturesque. We saw strings of loaded camels, with Arabs on foot guiding them, and slowly journeying, as their predecessors had done for thousands of years, along that old route, it may be to Palestine or to Arabia Petrea, or to strange and unknown scenes, or to verdant seas of pasture lands and feeding grounds for goats and camels, with tents pitched round springs of water—spots to which no vacation tourist has yet penetrated, and that remain as they were in the days of Job. And thus the desert was very desert, out and out, as it ought to have been, in order to meet the expectations of those more sanguine even than ourselves. On we went, thoroughly enjoying the scene, with no feeling of disappointment whatever. We could certainly picture a more ideal mode of passing through that old romantic waste, but it was impossible to picture a more perfect waste than that which we passed through.

I need not say that as we approached the Red Sea, there were many fidgety movements ever and anon towards the window from which we expected to get the first look of the famous gulf.

The low range of the Mokattam hills, which stretch east and west from Cairo, and to which we had been moving parallel, began at last to swell and break into more massive forms, like a billowy stream rising into the loftier waves of a rapid. Higher and higher they rose, until we could discern the fine broken outline of what seemed to be the summit of a range of precipitous heights looking towards the east, and plunging into invisible depths. These heights were the northerly end of the range of the famous Jebel Attaka—bordering the Red Sea. As we neared the end of the desert plateau along which we had been wheeling, more and more of the precipices, several miles off, began to disclose themselves, until at last, when we reached the edge of the plain by which the railway descends to Suez, we saw the Red Sea, and beyond it a grey outline, which marked to us a new quarter of the world, and was the shore of the Arabian peninsula, in the centre of which we knew Sinai was seated on his throne!

The hotel at Suez is as comfortable as any in Europe; and men of a certain time of life, with their "manifold infirmities," always, I presume, appreciate civilised accommodation. I can quite conceive, remembering my own ignorant and enthusiastic youth, how a member of the ambitious Alpine Club may sincerely believe that he prefers a bivouac above the clouds on the lee side of a row of stones, with a glacier for his bed-pillow, to a decent bed at 2*s.* a night in a hotel; or how some stray sheep from the fold of civilised life, who has wandered to every out-of-the-way spot under heaven, should glory in a savage hut, or rude tent, or some other form of uncomfortable shelter in which to "put up." I am not disposed to cross-question such travellers about their feelings in a cold or hot night, or in a wet or dusty morning. Let me presume that they always awake in their respective abodes with a high sense of their own manliness and pluck, which must be most agreeable to them and a full reward for all their sufferings; but let them pardon, while they pity, easy-going gentlemen who prefer number 16, or any other, in the corridor of a hotel, with "John," or "Mohammed," to clean their boots, and to call them at a certain hour in the morning.

Such was our felicity at Suez.

But "ancient founts of inspiration" were not wanting, as we ascended at night to the house-top, and in the deep silence saw the moon which looked down on Moses and the host of Israel, pouring its effulgence over the Red Sea, and as we also perceived, afar off, the "everlasting hills" which had witnessed one of the most profoundly interesting events in history.

And as for things of the every-day present, there was a comedy announced for the evening, to be acted by the employés of the P. & O., *i.e.*, the Peninsular and Oriental, Company—not a theatrical one!—and very well acted it was. It so happened that among the audience I soon discovered old acquaintances, and others allied by the ties of common friendships. I need not specify who these were, for such matters are personal and without general interest; but I must except one, who reminded me of our meeting in the West Highlands thirty years before. He was then one of the handsomest men I had ever seen (don't blush, Major, if you read this!), and a good man, of an old family withal. Since then he has had many adventures. One of those fixed him in a house built somewhere in the desert between Sinai and the sea, where he employs the Bedawin to gather turquoise from the surrounding district, for sale. He has made friends of all the tribes, conveys supplies for his wants on camels' backs from Suez, shows kindness—like "Staffa" his chief and hospitable uncle before him—to every traveller, and leaves upon all who have the pleasure of knowing him, the impression of what some people call "a real gentleman," others a "thorough good fellow." If *Good Words* ever penetrates to "them parts" on a camel's back, its Editor greets thee, thou Sheik of the Turquoise!

I met here also our excellent consul, Mr. Colquhoun, an old acquaintance, from whom I had received letters of introduction to the Continent thirty years before. His situation I do not envy, but he will ever be the man of heart and honour. Our gallant friend, with big hand and heart, Colonel M. of the Guards, with his better half, we will rejoin in Palestine.

It is a pleasure which a clergyman often enjoys, of meeting in the most unexpected places, persons to whom he has ministered somewhere or other. They kindly introduce themselves to him, as they ought to do, for the gratification thereby afforded to him. Such happiness I had at Suez, and those who caused it may thus learn that their kindness was appreciated.

On the afternoon of our arrival at Suez—to go back a few hours in my story—before the play and all our brotherly meetings began, having a few hours of daylight, we wished to improve them, not by examining the Israelites' passage of the Red Sea, but by bathing in the Sea itself. So we went from the hotel towards the gulf, and were fully convinced that the town of Suez, in spite of its 8000 inhabitants, is a place not worth examining; that the bazaars have nothing but what is commonplace in them; and that this centre point between East and West is, like a true geometrical point, in itself nothing.

We proceeded to the quay built by the French, which extends about a mile into the sea, and along which a railway is being constructed. It is intended to lead to a dock and harbour near an island further down the gulf. Here I can imagine the "intelligent reader" stopping me to inquire about this railway and the Suez Canal:—"Is it likely to succeed? Is it commercial or political? Have the French humbugged John Bull, as they always do? or is the whole scheme a gigantic failure? Are our civil engineers right in their calculations and in their condemnation of it as a mechanical impossibility? Do you think," &c. Now, I must confess, in honest truth, that I cannot give any one reliable information on this subject. All these points which the supposed inquirer moots, and many of a like nature, are questioned and debated in Suez by most intelligent men, just as much as in London. One hears the same difference of opinion in both places.

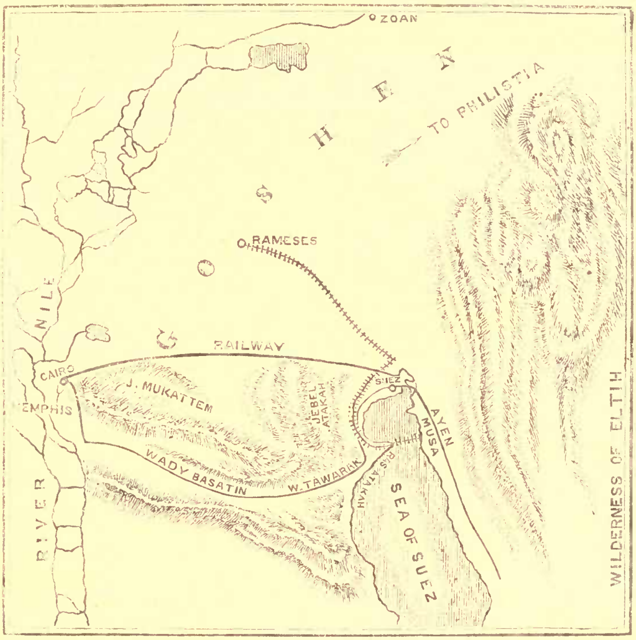
"It will and must pay!" asserts boldly a man with a moustache. "Why, they have already in their town, which I have visited, such a hotel!—such elegance and comfort, such——"

"Bosh! my dear Tom," cries another, "the whole thing is a bubble. No ships will ever take the trouble to beat up the Red Sea in order to go by this canal. And how can any amount of water make the desert productive?"

"Why," retorts a man who knows, as he says, "the whole thing," "my belief is that the sweet water, that is the fresh water, of the Nile—which, remember, they *have* brought, and were the first to bring, to Suez—will convert the ground along its whole course into as fertile soil as the Delta; and my conviction also is that it *will* and *must* pay."

"We shall see, as the blind man said!" murmurs the doubting.

"These French," chimes in a hitherto silent listener, "you may depend upon it, are uncommonly clever fellows, and wonderful engineers; and my own opinion is, that unless they had good grounds for ending successfully they never would have begun at all; and what they have actually done is confessedly more than what was ever anticipated by any but themselves. I have no doubt whatever that a water communication of some sort for vessels larger or smaller will be opened, and that very soon too, between the two seas."



Map of Egypt, showing the March of the Israelites.

"The rascals want Egypt—that's the whole thing. It's a political dodge, and no mistake," argues a contemplative listener, with his legs upon a chair, and his eyes and cigar pointed up to the roof.

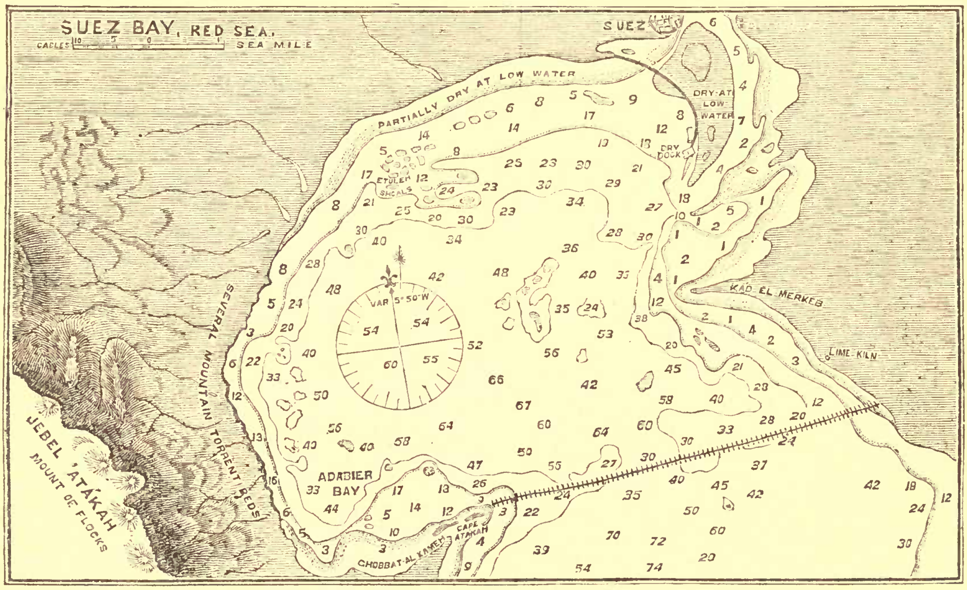
"I don't care a fig," exclaims another member of the self-constituted canal committee, "whether they get Egypt or not! I defy them to be more selfish than this Pasha. We shall have our own route to India, ere long, by Antioch and the Euphrates, and let them have this one if they like."

This is the sort of talk, with more or less information and wisdom, which one hears at Suez.

It was a glorious morning when we started at early dawn for "Ayoun Mousa," or the Wells of Moses, some eight miles or so down the Red Sea from Suez, and situated on its eastern shore. The air was fresh and breezy; the sky cloudless and full of subdued light from the rising sun, whose beams fringed with gold the heights of Jebel Attaka. One of our companions, pointing to the mountain ridge which glowed like a kindling bonfire, remarked, "If the worship of Baal had any connection, like that of his companion Astaroth, with the sun, or if he was always adored in 'high places,' then surely Baal-Zephon, 'over against' which the Israelites camped, was one of those burnished summits."

Our boat was very roomy, clean, and comfortable, and had a seaworthy look about her. She was manned by several very civil, intelligent-looking, and active Arabs. We had some difficulty in getting quit of the shoals and into deep water. The crew, walking from bow to stern, along the gunwale, pushed her onwards with long poles, cheering each other (as most of the human race do when engaged in combined physical labour) by singing, if one can dignify by such a term their melancholy chant. Their words, though genuine Arabic, sounded to our ears exactly like, "I see a whale, oh!"

We got at last into deep water, and the lateen sail having been stretched to the breeze, we cheerily bore away for our destination. It was something worth travelling for, voyaging for, and paying for, to be thus launched on the smooth waters of the Red Sea. The spot is hackneyed to many, but was new and most joyous to us. We were now on the unbroken track of those scenes of Bible story which had been familiar to us from infancy, and had mingled, during life, with so many of our holiest thoughts and associations. Somewhere near us was the place where "the Church," having been delivered by the mercy and power of its great King from heathen bondage, began its marvellous history, as the chief instrument in His hand, in giving freedom to the world. It was impossible for us to avoid recalling the leading events of that drama, the wonders of which Horeb saw the beginning and ending;—the mysterious meeting of Moses with "the angel in the bush";—the "programme," so to speak, then given to him, of all that was to take place in Egypt connected with the Exodus, and which he afterwards rehearsed to the representatives of Israel;—the journey of the two old brothers, Moses and Aaron, the former fourscore years, to the court of the mighty Pharaoh at Zoan, that satanic embodiment of selfwill without love;—the subsequent dread contest between the kingdoms of the world represented by Pharaoh, and the kingdom of God represented by Moses; the fierce dismissal of Moses by Pharaoh, "Get thee from me; take heed to thyself; see my face no more; for in that day thou seest my face thou shalt die!" with the solemn reply of the old man, alone and solitary save for the presence of his God, "Thou hast spoken well; *thou shalt see my face no more!*" Then followed the gathering of the people in Goshen, after months probably of preparation, during the infliction of the successive plagues; the awful destruction of the firstborn of Egypt; the appointment of the Passover, which, in some form or other, by Jew or by Samaritan, has remained until this day;* until at last they began their march, having first received, as was predicted by Moses, tribute from the kingdom of the heathen, when the hitherto despised slaves were not only permitted to go, but entreated to do so on any terms. Their victory was complete: their supremacy was acknowledged: the enemy was spoiled!



N.B.—The figures in this Chart indicate the soundings in feet.

Up to this point the narrative in Exodus is sufficiently clear. But what of the crossing of the Red Sea? It may seem presumption in me to offer any opinion upon what has been so frequently discussed, and on which the most learned critics and most truthful men differ. But like most of those who have preceded me in this journey, I cannot help forming some opinion on the point in dispute; and I take the liberty of expressing it very briefly.

That the children of Israel crossed the Red Sea on their way to Palestine is, I must be permitted to assert, one of the most certain facts in ancient history, and has ever been embodied in the holy songs, traditions, and memorial ceremonies of the Church of God. It is, moreover, now generally admitted that Goshen was on the Delta, and that Rameses, on its eastern side, and about thirty miles from Suez, was the starting point of the vast caravan. But if so, the pilgrims never passed up the narrow valley of the Nile, from Goshen to Memphis, from thence to turn east to pursue their journey by the Basatien route to the Red Sea, south of the Ras Attaka.† This theory is utterly untenable. It is quite clear from the narrative, that their shortest, easiest, and, as it were, natural road to Palestine lay between the head of the Gulf of Suez and the Mediterranean, thence along the coast of Philistia. We are told, however, that "God led them *not* through the way of the land of the Philistines, although that was near; for God said, Lest peradventure the people repent when they see war, and they return to Egypt. But God led the people about, through the way of the wilderness of the Red Sea." So at last they found themselves, some days after leaving Rameses, *with the Red Sea between them and their destination*, encamped "before Pi-hahiroth, between Migdol and the sea, over against Baal-Zephon," wherever those places were. The *facts* which we have to deal with in the narrative are, that somewhere or other they were obliged to cross the Red Sea; that they did so; that the sea stood up in heaps, or like a wall, on their right hand and their left, by the power of God exercised at the word of Moses; and that Israel escaped, while the whole Egyptian army was drowned.

---

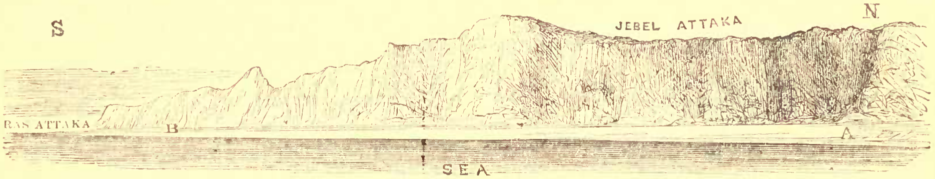
* The paschal lamb was eaten (a small portion, a single mouthful probably, by each person) by *the males only above twenty-one years of age;* and it would not require many lambs for such a sacramental feast, more especially if by "house" is meant, not an habitation, but a family, or clan. These and other points in the narrative are very well discussed by my friend the Rev. George Sandie, in his "Horeb and Jerusalem."

† My brother, minister of Linlithgow, who was one of our party, had, on a former journey to Jerusalem, *viâ* Sinai, travelled from Cairo to Suez by this route, and had no doubt regarding its impracticability for the Israelites.

Can we now-a-days on any good grounds settle where that crossing took place?

Some hold that the narrow portion of the gulf immediately above or below Suez meets the conditions of the narrative. With great respect for those who differ from me, I humbly think not. It is not two miles broad, and is so very shallow that at low water it can be crossed by camels. Nor is there any reason to think that it has been materially changed during the historical era, since the remains of the old canal of Sesostris can still be traced from the Nile to the present head of the gulf. Making full allowance also for what could have been effected by ebb tides, of which there is no mention in Exodus, and for east winds, which could not divide deep water, it is more difficult to account in that case for the destruction of the Egyptian army than for the deliverance of Israel.

As we sailed down the gulf, and gazed at the formation of the western shore, the narrative appeared to us, as it has done to many on the same spot, to receive interpretation. Along that western shore there is, as we have said, a range of wild precipices, forming the "Jebel Attaka," which is the "butt end" of the Mokattam hills. This range rises abruptly from the desert in the north, and is from 2000 to 3000 feet above the level of the shore. It runs for about nine or ten miles along the coast, and has this sort of contour, looking at it from the sea—



Between these wild, rough, broken precipices, impassable by human foot, and the sea, there is a flat plain several miles broad at its northern end (next to Suez), which narrows towards the point, or "Ras Attaka," where, at a spot called by the Arabs, Wady-Edeb, it is of the breadth of from one to two miles. Now, on the supposition that the Israelites encamped on the plain marked B, A, no wonder that Pharaoh—seeing them in such a position, flanked by precipices to the right, the deep sea to the left, with an amphitheatre of steep bluffs shutting them up to the south—should exclaim: "They are entangled in the land, the wilderness hath shut them in!" Forming a *cordon* in their rear, with his 600 war chariots stretching between the Attaka and the sea, he would feel secure of his prize, and might say, as Napoleon did of the English at Waterloo, "At last I have them!" They seemed to all human appearance to have been caught in a trap from which there was no deliverance. "They were shut up," says Josephus, "between the mountains and the sea—mountains that terminated at the sea, which were impassable by reason of their roughness."

In their despair the "children of Israel cried out unto the Lord!" and the Lord delivered them. How did they escape? We read that "the angel of God, which went before the camp of Israel, removed, and went behind them; and the pillar of the cloud went from before their face, and stood behind them: and it came between the camp of the Egyptians and the camp of Israel; and it was a cloud and darkness to them, but it gave light by night to these: so that the one came not near the other all the night." What effect this had on the several details of their deliverance, we cannot fully estimate. Then the children of Israel were commanded to "go forward!"—but not necessarily at once across the sea, opposite the north end of Attaka, but to advance towards the "Ras," or point to the south, where the head of the vast column would begin its march from shore to shore—the cloud, like a rear-guard, hindering in the meantime any attack by Pharaoh. We further read—"the Lord caused the sea to go back by a strong east wind all that night." Now, whatever other purposes this wind was intended to serve, yet, as the gulf runs north and south, an east or a north-east wind could *not* blow the waters southward *out* of the gulf; but, as we noticed by placing our compass on the shore opposite to Jebel Attaka, any wind from the east would drive the water for a considerable distance off the shallows, which stretch from the eastern shore, and thus have the effect of narrowing the channel, and of leaving the deep sea only to be miraculously divided. If the divided portion lay between the Ras Attaka and the opposite plain on which the Wells of Moses are situated, the distance, minus the sands left dry, would be about six or seven miles.

As to the *time* which was occupied by the passage, it does not seem quite clear from the narrative that it was in one night only. The succeeding events are thus recorded, without reference to the usual punctuation and arrangement into verses :—

> "And Moses stretched out his hand over the sea.
>
> "And the Lord caused the sea to go back by a strong east wind all that night, and made the sea dry land.
>
> "And the waters were divided.
>
> "And the children of Israel went into the midst of the sea upon the dry ground.
>
> "And the waters were a wall unto them on the right hand, and on the left.
>
> "And the Egyptians pursued, and went in after them to the midst of the sea, even all Pharaoh's horses, his chariots, and his horsemen.
>
> "And it came to pass, that in the morning watch the Lord looked unto the host of the Egyptians through the pillar of fire and of the cloud, and troubled the host of the Egyptians, and took off their chariot wheels, that they drave them heavily: so that the Egyptians said, Let us flee from the face of Israel; for the Lord fighteth for them against the Egyptians.
>
> "And the Lord said unto Moses, Stretch out thine hand over the sea, that the waters may come again upon the Egyptians, upon their chariots, and upon their horsemen.
>
> "And Moses stretched forth his hand over the sea, and the sea returned to his strength when the morning appeared; and the Egyptians fled against it; and the Lord overthrew the Egyptians in the midst of the sea.
>
> "And the waters returned, and covered the chariots, and the horsemen, and all the host of Pharaoh that came into the sea after them; there remained not so much as one of them."

Now there is nothing, it appears to me, in these words, to contradict the supposition that the sea was divided on the morning immediately after the stormy night; that the advanced guard of the host, which lay encamped along the plain north and south, then began from west to east to cross the gulf near the Ras Attaka; that the march of the whole body continued all that day and the succeeding night; so that not until the watch of the second or following morning, when the rear-guard of the Israelites was emerging out of the depths, and the cloud had passed with them to the opposite shore, did Pharaoh at last move in pursuit. He must then have marched some miles "into the midst of the sea," as his whole army, attempting to return, was overthrown.

If the Israelites thus crossed, from the "Ras Attaka" (or "Point of Deliverance"), they would emerge on the grand plain immediately opposite, in which the "Wells of Moses" are situated. To effect all this we have of course assumed the existence of God's almighty power, moulding the lower kingdom of nature to advance the higher spiritual kingdom.

Such were the impressions made upon us by the land and the book—when seeing the one, and reading the other on the spot. But while we are gazing on the Jebel Attaka in silence, broken only by conjectures and suggestions, our boat, with her ear down, is listening to her own music, as with flowing sheet we stand in for the sandy beach.

The tide had ebbed before we approached the shore near Ayoun Mousa, so the Arabs had to carry us to the dry sand. The trustworthy Ishmaelite to whom I was assigned, strange to say, complained of the ecclesiastical burthen that was laid upon him. It was in vain that I hugged him affectionately round the neck, and with all my might too, while he staggered with me in the sand. He seemed insensible to my kindness, and discharged me into Asia with a half grunt, half groan, as if I were a sack of coals. But these Arabs are an ignorant and degraded race!

The walk along the sandy shore excited in us all the feelings of boyish curiosity and eager love of acquisition. Had we seen the shells, which were new and beautiful, lying on cotton in a cabinet, we might have been indifferent to them; but to gather them *in situ*, to pick up small sponges too, to wander free amidst this museum of conchology, and to pocket whatever we fancied, had peculiar fascination about it. I could have wandered along that beach for days, gathering shells, while the crisp waves of the sea rippled over the shallows. It was on the sea-shore what "nutting" is in the woods.

We had to walk for about an hour across an utterly flat, barren, and sandy plain. This may have been the spot on which the Israelites entered from the sea, and where Miriam beat her loud timbrel, and sang that magnificent ode of victory which, like an echo from the Rock of Ages, is repeated in the song of Moses and the Lamb.

The Wells create a small oasis in the desert. Dr. Stanley calls them the Brighton of Suez, inasmuch as its more aristocratic inhabitants take up their abode there during summer. This gives as melancholy an idea of Suez, as one would have of London if its inhabitants preferred the Isle of Dogs for a summer residence! The Wells nourish a few gardens, with shrubs and cotton plants, and produce a certain amount of cultivation most pleasing to the eye in this arid waste; and, if repose be sought for, must afford it in abundance to those who wish to escape the roar and bustle of Suez.

Before turning away from the Wells of Moses I gazed with a wistful eye along the track which, losing itself in the sandy downs beyond, led on to Sinai. What one would see in a few days, if he pursued that route—the Wady Feiran, Serbal, Sinai, with the silent plains, the coloured rocks, the buoyant air, the awful solitude and mystery of the desert, so full of stirring memories, and Petra too, and Mount Horeb, and onwards to Hebron and Jerusalem! It is a holy pilgrimage from glory to glory, yet one which never, alas! can be pursued by me. Thankful, however, for all I had seen, and hoped yet to see, I bade farewell to Arabia, and retraced my steps to the boat, from which the tide was rapidly ebbing.

When crossing the plain to the sea we met a lanky camel led by his driver, and we resolved, like boys visiting the elephant at a "show," to have a ride. It would be a new experience, gained on a fitting spot, and would enable any novice of our party, ambitious of the honour, henceforth to exclaim, "I, too, have ridden a camel in the deserts of Arabia!"

So the animal was made to kneel, and in performing the operation he seemed to fold up his legs by a series of joints, as one would fold a foot rule. The "Djemel" makes it a point of honour, when any burthen whatever is laid on his back, to utter sounds which may be intended for Arabic groans, sighs, protests, or welcomes, but are certainly unlike any other sounds proceeding from man or beast. Only an angry lion, trying to roar when suffering from sore throat, or with a bag of potatoes stuck in his gullet, could approach to the confused, fierce, and guttural ejaculations of the camel. When kneeling for his burden, as well as on other occasions, even when walking quietly along, he suddenly blows out of his mouth what seems to be his stomach, to air it, just as a boy blows a soap-bubble from a short tobacco-pipe. Amidst the gurgling growls of my kneeling friend, I got mounted, and was told to hold hard, and take care! There was every need for the caution. The brute rose, not as I expected on his forelegs first, but on his hind, or rather on only their half—as if on hind elbows. This motion throws the rider forward, when suddenly the animal elevates himself on his knees, and, as one naturally bends forward to prepare for the last rise in the same direction, he hitches up the other half of his legs behind, and then as suddenly repeats the same experiment with his legs before, until, shaken and bewildered, one is thankful to find himself at rest high above the sands of the desert, rather than prostrate upon them, among the camel's feet. Then began that noiseless tread, with the soft spongy feet, which, however, is more remarkable in its silence on the stony streets than on the shifting sand. The rocking motion, when yielded to, was not unpleasant.

I cannot part from Arabia, and my first and last camel ride on its plains, without expressing my admiration for that old animal which is often abused by travellers, and which fills some people, as I have heard them say, with feelings of disgust. I will not affirm that the creature commands immediate admiration, but I think he inspires immediate respect. The expression of his soft, heavy, dreamy eye, tells its own tale of meek submission and patient endurance ever since travelling began in these deserts. The "Djemel" appears to be wholly passive—without doubt or fear, emotions or opinions of any kind,—to be in all things a willing slave to destiny. He has none of the dash and brilliancy of the horse,—none of that self-conscious pride,—that looking about with erect neck, fiery eye, cocked ears, and inflated nostrils,—that readiness to dash along a racecourse, follow the hounds across country, or charge the enemy,—that decision of will which demands, as a right, to be curried, stroked, patted, pampered, by aristocratic lords and ladies. The poor "Djemel" bends his neck, and, with a halter round his long nose, and several hundredweight on his back, paces along from the Nile to the Euphrates, making up his mind to any amount of suffering, feeling that if his wrongs could not be redressed by Abraham, he has no hope from Lord Shaftesbury. Where on earth, or rather on sea, can we find a ship so adapted for such a voyage as his over those boundless oceans of desert sand? Is the "Djemel" thirsty? He has recourse to his gutta-percha cistern, which holds as much water as will last a week, or, as some say, ten days even, if necessary. Is he hungry? Give him a few handfuls of dried beans, it is enough; chopped straw is a luxury. He will gladly crunch with his sharp grinders the prickly thorns and shrubs in his path, to which hard Scotch thistles are as soft down. And when all fails, the poor fellow will absorb his own fat hump! If the land storm blows with furnace heat, he will close his small nostrils, pack up his ears, and then his long defleshed legs will stride after his swanlike neck through suffocating dust; and, having done his duty, he will mumble his guttural, and leave, perhaps, his bleached skeleton to be a landmark in the waste, for the guidance of future travellers. If this creature be a development from some primeval oyster or mushroom, or the work of atoms which, at an earlier age, once floated in empty space near, it may be, where Saturn or the Pleiades now are, we can only admire the extraordinary sagacity, by which, according to the laws of selection, monads and atoms all contributed, during countless millions of years before the oyster age, and from the oyster age downwards, towards building this fine old ship of the desert, which has needed no repair since the beginning of human history.

But we must return to Cairo! Thanks to that great magician, that Fortunatus cap, the steam boiler, we were able in one day to sail from Suez to the Ayoun Mousa, ride on the "Djemel," return in the afternoon to Suez, and that same night to arrive in Cairo. No doubt we almost missed the train, one minute more would have done it, but fortunately we saved the minute, and were speeding again through the desert. It is very easy for idle gentlemen, who seem to have as much time at their command as the antediluvians, to condemn busy men for taking such rapid journeys, although it be to visit spots which they could never otherwise see. If their own bliss be measured by slowness of travel, why don't they walk on foot or ride on a donkey's back through Europe?

Sincerely grateful for rails and steam, we reached Cairo at night, and so secured another day to see a few sights, and especially the mosques, ere we left the "City of Victory."

As to the mosques, which I promised in my last paper to look into, I need not attempt to describe their external appearance, as the illustrations of them in Ferguson's Architecture, or Murray, will give a better idea of this than any words could do. In its interior, the mosque always struck me as a most impressive place of worship. Perhaps my Presbyterian prejudices dispose me to acquiesce in its perfect simplicity. No statues or pictures are permitted in it; and no seats of any kind are required for people who prefer the floor, which is invariably matted or carpeted, thus giving it, to a European, an air of comfort. Almost the only sign of furniture in it is a pulpit or two from which the people are addressed occasionally by the Moolah. The mosque is always open, I believe, and is seldom without some worshippers, while at stated times during the day it is well attended. There is the utmost decorum and reverence everywhere visible; no hum of voices is heard, nor even footsteps, nor is there anything visible which can distract or arrest the attention of the worshippers. People of every class scatter themselves throughout the vast area, each man selecting a spot for himself where he can kneel towards the "Mirhab," or niche which indicates the direction of Mecca, and seem as much absorbed in his duty as if he were in a desert island. Some are seen sitting cross-legged, and engaged in grave conversation; while others walk soberly up and down. The whole service, judging of it only by what one sees, gives the impression of worship to an unseen God, which must, when first established, have presented a remarkable contrast to that of the Christian Church as it then was; and it certainly is a very different thing from that which at Luxor or Karnac once reigned supreme, with a Bull or Beetle for its God! Mohammedanism owes its origin to Judaism and Christianity; and we who live in the full blaze of the true light, are apt to undervalue the good obtained from its dimly reflected beams, which, nevertheless, irradiate spots that otherwise would be outer darkness.

I must pass over many other sights in Cairo. "If time permitted"—as public speakers say at a late hour—I could gossip about the magnificent tombs of the Caliphs, the *citadel*, and the splendid view of the city from its walls, with the mosques and busy streets at our feet, like Mohammedan ant-hills, and with the hazy Lybian desert, and the Pyramids on the distant shore beyond the dark inlet of the Delta;—and tell about the well-known spot where the one Mameluke Bey escaped from the bloody massacre of all his fellow-chiefs, by the fearful leap of his Arab steed over the wall of the fort; and I could describe—no, that is impossible!—the horrid, death-like place outside the walls where animals are slaughtered in the open air, and where the vultures crowd around,—Faugh! let us press close our nostrils and pass on!

A Turkish bath seems to me to be a most fitting conclusion to sight-seeing like this, in such hot weather too. I know not as yet what that institution may be in London, but having endeavoured to enjoy the luxury in three places—Moscow, Cairo, and Damascus—and all of them being much alike in their essential features, I frankly confess that I have no wish to try the experiment again in "foreign lands." The description of one—though I cannot quite separate in my memory some of the details of the Cairo and Damascus hot-water-and-soap establishments—will serve for all.

We inquired for the best bath in the city; and our intelligent guide, Hassan, the sheik of all the donkey-boys about Shepherd's Hotel—a man who, from his intercourse with the English is assumed to have some knowledge of Western civilisation—assured us, as we were about to enter one of those boiler-houses, that it was the best in Cairo, where "all de lords Inglese go." We bowed and entered. The outside looked very shabby. The first room was a large apartment with an uneven floor, flagged with stone—marble of a sort, I believe. It wore a singularly liquid look, and had about it a general air of hazy, foggy damp. Hanging from the roof were innumerable long sheets drying. One end of the room was elevated, and was reached by a few steps; and on this upper floor were a series of couches, seemingly very clean, on which the half-boiled bathers reclined, smoking nargiles, and radiating forth their heat into space, thereby producing dew. To this dais we were led, and requested to undress. The genius of the place appeared in the form of an old man, evaporated into skin and bone, with a solitary tuft of hair on his head, a wet towel round his loins, and his whole body dripping. I started when I saw him,—I did not know why, until I recognised in him the image of Father Time as pictured in tracts and almanacks, but fortunately wanting the scythe. Delivering our valuables to the care of a patriarchal individual who sat cross-legged in a corner, we were wrapped in a sheet, and led out by Time, accompanied by a scarecrow attendant, who from his long legs might represent leap year. We put on wooden shoes, and passed over heated slippery stones into another apartment, which was so hot that one felt a tendency to become browned like a toast, or to bubble over the skin. This sensation subsided gradually into a pleasing dewy evaporation. We were then conducted to a large open vat full of water, which to us had two objections: one was that it was intolerably hot, the other that it seemed already full of donkey-boys and their friends,—the head of Hassan in their midst, grinning above the surface. But, inspired by the determination to go through with all the horrors of this sudoriferous den, we clenched our teeth, tried to imagine ourselves chimney-sweeps, and jumped in. In due time, when sufficiently saturated, we were (though perhaps this happened at Damascus,) put in a hot chamber and laid on the floor, with cockroaches, or what the Scotch call "clocks," crawling over it in dozens. There we lay, like turbot or cod about to be dressed for dinner. By and by we were soaped from toe to head, lathered with soft palm-tree fibre, then had tepid, and afterwards cold water poured over us, and then a monster began to crack our joints and shampoo us! He succeeded with my companion, who yelled, as the Egyptian, in fits of laughter, seemed to put every limb out of joint, and to dislocate his neck. But when the same Pharaoh tried me, his arms fortunately could not meet around me, so after a violent struggle, in which I fought desperately and tumbled about on the floor like a salmon which a fisher tries in vain to seize round the body, he gave it up in despair, and, for the first time probably in his life, wiped his forehead from fatigue, as he exclaimed "Mushallah!" After sundry other minor appliances, having the same end in view—that of opening the pores of the skin—we returned to the apartment from whence we had originally started, and were there gently dried by a series of warm sheets being laid upon us. Hassan spread his carpet and said his prayers. The sensation after bathing was very pleasant, no doubt, but not more so, nor calculated to do more good, than what most cleanly disposed people experience daily from the application of hot and then cold water, accompanied by the well-known substance, soap, in their quiet bath-room at home.

Doubtless I felt light and elevated when I got out, but as pleasant feelings can surely be produced without being scrubbed like a pig, rubbed down like a horse, boiled like a turkey, exhibited like a new-born infant to the curious, and without having a donkey driver for your C.B.!—and all this with no other consolation than the assurance that the pores of your skin are open forsooth—like the doors of a public institution! For my part, I prefer them closed—or at least ajar.

We had one thing more to do ere we left Cairo for Palestine, and that was to hire a dragoman. There were many applicants. These men are constantly prowling about the hotel: they scent the prey afar off, they meet you in the lobbies, sidle up to you under the verandah, tap at the door of your bed-room, beg pardon in French, Italian, or English, all equally bad; ask if you "vant a dragoman;" produce an old book of certificates signed by the various parties with whom they have travelled, and profess to be ready to proceed with you at a moment's notice to Jerusalem or Timbuctoo. Dragomen are, by the catholic consent of all travellers, considered as scoundrels. But I am inclined to dissent from this as from most sweeping generalizations regarding classes of men. It is alleged of a Scotch traveller that, when told at Cairo by his companion that they must get a dragoman, he asked, "What kind o' a beast's that?" Now I know that some travellers have started on the assumption that the dragoman is but a beast, though a necessary one for the journey; and from want of confidence have suspected, accused, and worried him, threatened him with appeals to the consul, and such like, without any adequate cause, and thus have helped to produce the very selfishness and dishonesty and "want of interest in the party" which they accuse him of.

It is a dragoman's interest to be civil and honest; so I believe it to be quite possible for any intelligent traveller, with some assistance from the better informed, to make, sign, and seal, before starting, such a tight bargain as, with the promise of a reward, if satisfied, at the end of the journey, will make imposition to any appreciable extent impossible. But the indolent traveller, who has abundance of money, often begins by spoiling his dragoman, and then ends by abusing him for being spoiled, and for having taken advantage of the reckless expenditure and careless accounts of his master.

Hadji Ali, who was employed by the Prince of Wales on his tour, offered himself to us, and was accepted. He came, it must be confessed, with a character sadly shaken by his last employer, Lady ——; but after investigating, as far as we could, the whole circumstances of the case, we made our bargain with the Hadji, and had no cause to repent having done so. He agreed to conduct our party of five from Jaffa to Damascus and Beyrout, at the rate of thirty shillings a day for each, during one month. Others, strongly recommended to us, refused to go under forty shillings, owing to the sudden rise in the price of cattle and provisions consequent on the murrain in Egypt. Our contract was written out by my brother, who had experience in the work, on Friday, and Hadji agreed to be on board of our steamer at Alexandria on Monday, with all his camp equipage. And so, having settled that important point, we left Cairo on Saturday for Alexandria, gratefully acknowledging that we had never in one week seen so much to interest us, or to furnish thought for after years. We bade farewell to my old kind-hearted friend, Mr. Dunlop, Vice-Consul,—since transferred to Cadiz,—a man who will make many friends and no enemies wherever he goes. We saw no other "sight" in Egypt which impressed itself on memory, except the crowd of Turks which, like a bed of tulips, filled the third class, each man having a beard and turban which might form a study for an artist. The whistle screeched with its usual impatient violence, and we moved off for the sea, leaving behind us Shepherd's hotel, full of the homeward-bound from India, and the tombs of Egypt, fuller still of the Dynasties of Manetho!

* * *

CHRIST THE LIGHT OF THE WORLD.

By C. J. VAUGHAN, D.D.

III.—NUNC DIMITTIS.

"This Child is set for the fall and rising again of many in Israel."—Luke ii. 34.

Holy Scripture is sparing in its revelations of the infancy and early life of Jesus.

Just the Birth itself—the visit of the Shepherds—the Circumcision on the eighth day—and the Presentation thirty-three days later in the Temple at Jerusalem—and St. Luke tells no more till Jesus is of the age of twelve years; and, after that one incident of boyhood, no more till He is a full-grown man, prepared to enter, through Baptism and Temptation, upon his ministry and sufferings for Israel and for the world.

To these few particulars — supplemented by scarcely one or two more from St. Matthew's Gospel — our thoughts are confined, if we would keep within the limits marked out for us in Inspired Scripture in our meditations upon this deeply interesting portion of the Saviour's life below.

Let us read together the history of an Old Testament saint, who was privileged to see the Holy Child on the occasion of his Presentation in his Father's House below, and to bear to Him that first testimony—the very meeting and junction of the Law and the Gospel—which is repeated perpetually in our churches in the song of the "Nunc Dimittis."

We have three points to notice: The Character of Simeon; his Song; his Prophecy.

1. Of his character three things are said.

(1) He was "just and devout."

A "just" man is one who fulfils all relations. One who lives scrupulously and watchfully in the discharge of all those duties to which God calls him towards other men. In all things he is willing, and he is earnest, to live honestly, to live becomingly, and to live righteously.

A "devout" man is more than this. He is one who has God also in view. We scarcely believe in a just man not being also devout. The righteousness of nature, even towards man, will be found to break down somewhere. There will probably be some duty ill done, half done, or not done, even towards man, if God be not in it. But Simeon was not just only: he was devout. He had a reverent mind. He remembered God. He asked in all things, What will God have me to do? And in order to this, he sought God. He prayed, and meditated, and studied God's Word, and visited his Temple for prayer and praise. And thus his exemplary life towards man was only the expression of an inner life of piety, faith, and love towards God himself.

He was just because he was devout.

(2) Again, he was "waiting for the consolation of Israel."

Israel wanted comfort. The condition of the nation was depressed. Under a foreign yoke—robbed of the visible token of God's distinguishing and protecting grace—it was ill with the people at that time collectively. Israel, as a nation, needed consolation.

And how must the individuals of the nation have felt this need of comfort! What a dry, barren husk had the established religion of the country become! All life gone from it—a system of interpretation put upon God's law itself, trifling in its puerilities, disgusting in its hypocrisies! How must the souls of the faithful few have been crying out for something real—something substantial—something satisfactory — something true! The Scribe and the Pharisee had no consolation for Israel. The heart of the sorrowful, the heart of the self-accusing and sin-condemned, must have yearned and thirsted for something better—something which might really speak of God and from God to the soul within!

But there was something yet more definite than this in the consolation for which Simeon waited. The "consolation" of the 25th verse is called in the 38th verse a "redemption." "Waiting for the consolation of Israel" is there described as "looking for redemption in Jerusalem."

There may have been a want of precision and definiteness in the expectation. We who look back upon the Law and the Prophets from the Gospel and from Christ, can see many things in them which would be mysterious and unintelligible to the Israelite of old time. But I think there was this visible in them even then—that God's promise, Israel's hope, was a Person; that there should come upon earth a Deliverer and a Redeemer, to bring a light not of this world into men's hearts, and a holiness not of this world into men's lives; One who should suffer first, and then reign; One who should bear the iniquities of man, and then lift man himself into a region where sin is not. And this forms the second feature in the condition and character before us. The man "just and devout" was also waiting for a consolation, for a redemption, of Israel.

(3) The secret of his life, outward and inward, is next told us. "The Holy Ghost was upon him." He was under the influence of the Holy Spirit of God. Habitually: for, like the Psalmist of old, he doubtless knew of that Divine Spirit, and prayed for his converting and cleansing and renewing grace. But in another sense too. He received special communications from God, in the manner of the prophets that were before him. The habitual influence was an occasional influence too. The communication of Divine grace was also sometimes the revelation of Divine secrets. "It was

revealed unto him by the Holy Ghost, that he should not see death before he had seen the Lord's Christ." Thus the hope of the consolation of Israel became a personal hope too. Before he should die the common death of all men, he should see the Messiah himself coming to console and to redeem. What an august dignity was thus conferred upon that common human life! What a sanctity must it have possessed for him, when he knew that it was being prolonged for the sake and with the promise of that beatific vision for which prophets and righteous men had for countless generations died looking!

At last, on some common morning—on a day just like other days—there came the inward summons, the call of the Spirit, to go forth towards the Temple. Even then, perhaps, he knew not its meaning: but the call came, and it was obeyed. There, as he stood in the temple-court waiting the Spirit's pleasure, there came in a woman with her infant child and her husband, poor in dress, and bringing towards the altar the offering of the poor; not the "lamb of the first year," but the "pair of turtle-doves or two young pigeons" prescribed in the Law of Moses as the alternative for her whose means were unequal to the regular sacrifice. Little was there to mark any unusual occurrence: such scenes were daily witnessed in the temple-precincts: the eye of sense would certainly have missed the sign: but, when a man has communed all his life long with God—has watched his hand attentively, and is even now looking for its presence—he sees by faith what flesh and blood see not; perceives the Divine presence not in the earthquake, the wind, or the fire, but rather in the still small voice in which He speaks inwardly by his Spirit. Even thus was it with him. In that little child he sees God's salvation; sees the promised seed of the woman; sees the Lord's Christ, the light of Israel and the hope of man. The Holy Ghost had witnessed in him of Christ; had brought him to Christ; and now opened his lips to sing of Christ in his temple.

2. And thus we pass from the character to the song. The old man takes the Babe in his arms, and pours forth his whole soul in thankful praise.

It has been well and beautifully said, upon this scene, "The death that glorifies God has a song on the lips, Christ in the arms, heaven in the eye." May such an end be ours!

The first two chapters of St. Luke's Gospel furnish the Church with three of her daily hymns; the "Magnificat," the "Benedictus," and the "Nunc Dimittis." Notice how different are the three; how characteristic of the authors; how suitable to the circumstances: and draw from this a reflection as to the authenticity of the Gospel; a new evidence of the truth of that narration, of which St. Luke says that he derived it, by accurate and laborious search, from persons who "from the beginning were eyewitnesses and ministers of the Word."

When you say or sing henceforth the "Nunc Dimittis," let your thoughts go back sometimes to what you have here read of its occasion and of its author. Read it as the utterance of one who had spent a long life in waiting for his consolation; who had been cheered by a special promise that he should not die till he had seen Christ; and who now, holding Christ himself in his arms, utters over Him that inspired thanksgiving which made Joseph and the Child's Mother marvel as they listened.

"Lord," he says, addressing himself to the Father in heaven—"Lord, now lettest Thou Thy servant depart in peace"—"now releasest Thou Thy servant"—settest him free from his long earthly service—"according to Thy word;" that word which told me that I should not die till I had seen Christ: now therefore I have seen Him, and I may go.

Notice here Simeon's view of death. It is not the removal of a reluctant, unwilling man from the scene of all his joys and of all his interests: it is the releasing of a weary man at evening from the toil and heat of a long and fatiguing day; it is the desirable and peaceful dismissal of one who has done his work, to a rest which toil has earned and which promise has sweetened. "Lord, now lettest Thou Thy servant depart in peace." It is just the language of one of our own Church Collects, in the Service for the Burial of the Christian Dead, "with whom the souls of the faithful, after they are delivered from the burden of the flesh, are in joy and felicity." It is worth while, Christian brethren, so to live, that the "Nunc Dimittis" may express our own true thought when we die: "Lord, now lettest Thou Thy servant depart in peace, according to Thy word: for mine eyes have seen Thy salvation."

What Simeon saw was Christ himself. It was the little Child in his arms, to which he gives the name of God's salvation. We do well to reflect upon the wonderful faith which here shows itself. Simeon was enabled to look beyond all that was visible—beyond the helpless, unconscious Babe—beyond the long years that must run their course before these voiceless lips can utter one word of wisdom, or these little hands perform one work of power—beyond the yet more distant day when this mortal shall have put on immortality, and this Babe, which has not yet begun the career of human activity, shall have completed the round of toil and suffering, and resumed as the Redeemer that glory which as the Creator He had laid aside for man: "he was strong in faith, giving glory to God; and, being fully persuaded that what He has promised He is able also to perform," he calls the infant Christ the salvation of God, "prepared before the face of all peoples, a light to lighten the Gentiles, and the glory of his people Israel."

(1) First, then, to see Christ is to see salvation. To see Him, as Simeon saw Him, with the eye of faith. If Simeon had not seen Him thus, he would not have seen in Him God's salvation; for everything, to the outward eye, was against his being so. "Every one," our Lord says, "which seeth the Son, and believeth in Him." We who have "not

seen" may yet "believe." Is this, my friends, our idea of salvation—Christ himself? If it be, are we looking for Him? When we can see Christ by faith, then we shall be fit to die: then we can say, "Lord, now lettest Thou me go, and go in peace:" not before.

(2) And then, you will observe the amplitude of the view of Christ here presented. God once more, "prepared" Him; prearranged, fore-ordained, and took steps beforehand for his coming; made ready the way before Him by his Law and by his prophets, by a gradual education of the world to desire Him and to find its need of Him; and at last brought Him into it "before the face," in the sight, "of all the peoples," of all the races and nations of mankind, so as to be as much "a light to lighten the Gentiles"—a light (more literally) unto unveiling of the Gentiles; that is, for the purpose of taking off from the Gentiles that "veil" of which Isaiah speaks as "spread over all nations," the veil of indifference and blindness and hardness of heart—as "the glory of God's own people Israel." Observe, I say, the amplitude of this view of Christ. The eye of the faithful old man was opened to see beyond the confines of his own nation; to embrace in one glance all the kingdoms of the earth in all time and in all place; and to declare that to each and to all, yea, to each individual of all, Christ comes—comes to take off from them the veil of sin, and to fulfil at last the glorious prediction, "All flesh shall see the salvation of God."

3. We have yet to speak of the prophecy.

While Joseph and the Mother were still marvelling at the words spoken by the old man concerning Jesus, he turned to them, and with a solemn blessing first pronounced upon those who were privileged to hold so near a place on earth to the Saviour of mankind, spoke these words to his Mother only:—

"Behold, this [Child]"—or, in the original, "this Person"—"is set (or appointed) for the fall and rising of many in Israel." He is placed, or laid, as a firmly planted rock, with a twofold result and purpose: the fall of some, the rising of others.

Two passages of the Prophet Isaiah, the one from the 8th and the other from the 28th chapter, seem to be here brought together; as also in the 9th chapter of the Epistle to the Romans, and in the 2nd chapter of the First Epistle of St. Peter.

God places this Child in Zion as a precious corner stone, a sure foundation.

Whosoever will may build upon Him the house of his habitation, and rise into a holy temple, safe from the storms of time and the devastations of judgment.

He is set for the rising of many.

But, if men will not thus use Him, as the foundation stone of a safe and sure dwelling; then (according to the other passage) they will find Him a stone of stumbling and a rock of offence: He will be like an obstructing rock in their path—even to them who stumble at the word, being disobedient.

God will not move Christ out of the way because men are perverse enough to stumble over Him.

This Child is set, by a hand not of man, to be either for the rising (if they will have it so), or else for the fall (if they will have it so), of many in Israel.

God gives the Saviour: blessed is he whosoever shall not be offended in Him.

A solemn responsibility! We must either rise by Christ, or fall—which we will!

"And for a sign spoken against."

A sign is a signal. In the Scripture use, it denotes something or some one pointing to God; to God's being, and to God's working.

Thus a miracle is a sign. It points to God. It says, God is at work: this hath God spoken, for this hath God done.

And thus Christ himself is a sign. He came upon earth to point to God. He came, to say by his words, and by his works, and by his character, and by his sufferings, "Behold your God!"

But this sign, like every other, may be, and commonly is, gainsaid, or spoken against. For one who accepts it, for one who, because of Christ, sees and believes in, and lives for God—many cavil; many reject, and many neglect the Gospel.

This in all times. But most of all, when He was himself amongst men. Then indeed gainsaying ran on into open violence; and the Son of Man, despised and rejected of men, was at last given up into the hands of wicked men, to suffer death upon a cross of anguish and infamy.

Such is the warning, uttered, in the ears of his Mother, over the little Infant lying still and helpless in the arms of the aged saint.

"Yea," he adds, "a sword shall pierce through thy own soul also." She who is now rejoicing in the blessedness of being her Lord's Mother, must learn that no one comes so near Christ, without partaking in his sufferings.

She will hear with sorrow the contradiction of sinners against Him: she will see him outcast, destitute, spurned, forsaken: she will at last stand by his cross, and drink to the dregs with Him the cup of sorrow. The "sign spoken against," will bring anguish with Him to his Mother's spirit: her heart will be rent and lacerated as she sees Him pierced and tortured, as she beholds Him slowly pouring out his soul in a bitter and shameful death.

But all this shall be, all this must be, in order "that the thoughts of many hearts may be revealed."

By their treatment of Christ himself, men will show what they are. The veil will be stripped off from them—such is the figure—by their own language and their own conduct towards Christ.

By their estimate of his character, by their appreciation or disparagement of his holy life, and mighty works, and divine doctrine—by their acceptance or rejection of Him whose appeal was ever to the conscience of man, as in the sight of a heart-searching God—men will disclose their true disposition; will show whether they love the world, whether they echo its lying voice, whether they desire darkness lest their deeds should be reproved—or whether, on the other hand, they are brave to see, and bold to confess the truth, whether they have an ear to hear the voice of God, and a will to follow Him whithersoever He goeth.

But, most of all, as the end draws on, and the life of holiness is closing in the death of martyrdom. Then, even more than in earlier days, were the feelings of men tested, the thoughts of hearts revealed, by their dealing with the suffering and the crucified.

The high priests plot and blaspheme, Pilate vacillates and gives way, the soldiers part among them the garments, the people stand beholding, "Judas despairs, Peter repents, Joseph of Arimathea becomes courageous, Nicodemus comes by day, the centurion confesses, one thief blasphemes, the other prays, men faint and flee, women out of weakness are made strong," a sword pierces the heart of the Mother, that the thoughts of many hearts may be revealed.

Even thus has it been in all time. For all time the words were uttered: it is by their treatment of Jesus, in himself and in his people, in his word, in his church, in his sacraments, in his Spirit, that men show decisively, before God, before one another, before themselves (if they will behold it), what manner of spirit they are of.

For us, Christian friends, not least, the prophecy of Simeon is recorded: let us try and judge ourselves by it, that we be not judged of the Lord.

To what purpose, in our case, is this Child set? to which of two purposes? for our fall, or for our rising?

(1) For our fall, if we let the word come to us unheeded, to be snatched away by the tempter, as we turn again, from reading or hearing it, into the world of business and pleasure.

For our fall, if we receive the word for the moment with joy, but take no heed to its watering by the Spirit's grace, to its growth by the sunshine of God's presence, by the dew of God's blessing.

For our fall, if we allow the word to become choked in us by cares and riches and pleasures of this life, so that it brings no fruit to perfection.

For our fall, if we continue in sin that grace may abound—and, because we hear of a free forgiveness and a world-wide atonement, care not how much we draw upon God's forbearance by a wilful waste of opportunity and an obstinate disregard of duty.

This Child is set for the fall of many. And O, my friends, perhaps we have scarcely yet said of how many. It is not only the utterly hardened, not only the avowed unbeliever, not only the scoffer, the dishonest, or the impure, who stumble at the great stumbling-stone: it is quite as often the mere neglecter, the mere procrastinator, the merely undecided, the almost Christian, who shows what he is by his treatment of the Saviour and the great salvation. Not to be with Christ, is—He says it himself—to be (in his judgment) against Him.

(2) Let us listen—God grant it, at least in this our day of opportunity and of blessing—to the alternative here set before us.

This Child is set for the rising of many.

What is this "rising?" and in whom is it verified?

It is a rising out of darkness: out of the low misty valley of sense and worldliness, into the clear light and pure knowledge of Him whom truly to know is eternal life.

It is a rising out of misery: out of a condition of perpetual disquiet, of anxious misgiving, of constant disappointment, of restless fear, of every unsatisfied longing, into a state of rest and peace, of hope and happiness; entered upon the moment we believe in Christ crucified and glorified; confirmed and brightened by every additional day of watchful and holy living; to be perfected hereafter in a world of cloudless bliss, where they who have first been washed and justified and sanctified, shall dwell for ever and ever in the home of God and of the Lamb.

It is a rising out of sin: out of a state of low and degrading acquiescence in every evil lust and passion, or else of weary and hopeless struggling in a net which on every side baffles and encloses, into a state of freedom, life, and power, of grace to love God and liberty to serve Him, in the strength of an indwelling Spirit, given to all who ask Him in the name and for the sake of Jesus.

"Set for the rising of many," the text says: who then are these?

They are those who feel their need of Christ. And which of us has not cause to do so? Which of us can be satisfied with his state without Christ? Which of us has not reason to blush for shame when he thinks of his past conduct towards God his Father, and to tremble in the prospect of standing before God his Judge? Yes, we need a Saviour, every one of us. But which of us all has really found a Saviour? Which of us all, who profess to believe and to worship Christ crucified and Christ risen, has truly sought Him for himself in the depth of his heart, as a lost, helpless sinner, whose one hope and one trust is in Him? We cannot assume, we cannot take for granted, even thus much of any human soul. This desire and this faith is itself the gift of God.

But we can all ask for it. And this is all that we will add to the great subject on which we have dwelt. If we feel that we ought to feel; if we feel that only our own coldness, and indifference, and hardness of heart prevents our coming to Christ; if we feel that it is meet and right that sinners redeemed by the gift of a Divine Saviour should come to Him that they may have life; then let us pray to God himself, each one of us, for the grace and the power so to come to Him—acknowledging before Him our own helplessness either to will or to do, and beseeching Him to work in us that sense of sin and that desire for salvation, which whosoever hath, He will in no wise cast him out.

Reveal in us, Blessed Lord, the thoughts of our hearts; that, deeply feeling our own utter vileness, we may flee for refuge to the one hope set before us in Jesus Christ, who, for us men and for our salvation, came down from heaven, was incarnate by the Holy Ghost of the Virgin Mary, and in human flesh suffered and died, that He might be first the Lord of the living, and then the Life of the dead!

OUR INDIAN HEROES.

By JOHN WILLIAM KAYE.

III.—SIR ALEXANDER BURNES.

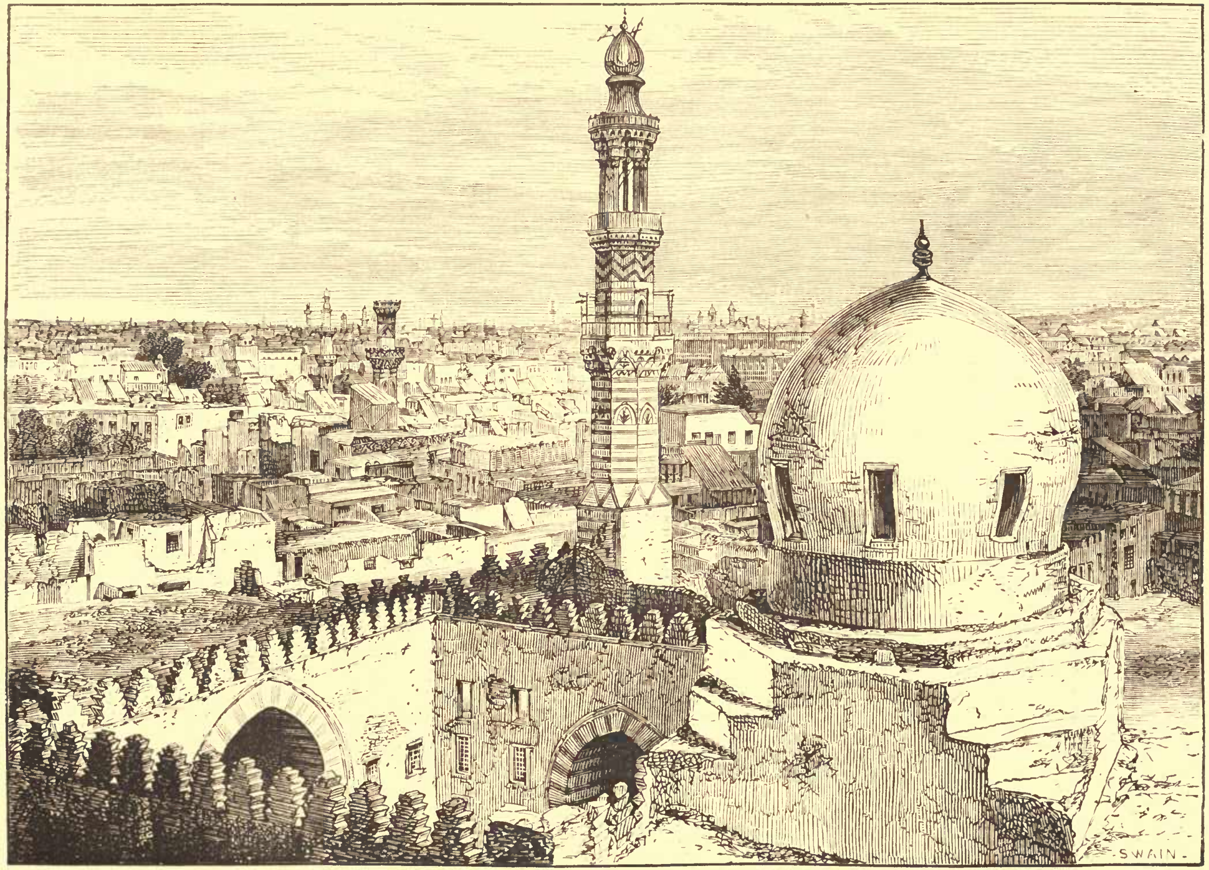
Entering upon the last year of the last century, a youth from the Scotch burgh of Montrose, who had gone up to London to seek his fortune, wrote to his mother, saying, "I have passed many a serious hour, reflecting on, weighing, examining minutely, the advantages and disadvantages, which are likely to follow my conduct in the different plans proposed, and I find the result in favour of going to India on the establishment. Perhaps my wishes to obtain, or my favourable ideas of, that situation have biassed my judgment, and prevented me from seeing every circumstance as it ought to have been seen; so I will say little more on the subject, except to inform you of what distresses me greatly, but will perhaps please you, viz.—the uncertainty of succeeding as I could wish." The letter from which this extract is taken, is signed, "Your loving and affectionate Son, Joseph Hume."

Twenty years afterwards, the writer, who had been thus doubtful of his power to obtain an appointment on the Indian establishment for himself, was able to obtain appointments for others. He had become a man of great influence in his native town. He had gone out to India poor, and he had returned rich, whilst still in the very prime of his life. He had returned to take a distinguished part in public affairs, with thirty or forty years of good life and of good service still remaining in him. It was a natural and a laudable ambition that he should seek to represent his native town in the great imperial Parliament, and to do for it and its people all the good that lay in his power; so he canvassed the group of burghs to which Montrose belonged, in the Liberal interest, and in 1818 was duly returned.

The success of Joseph Hume was great encouragement to the youth of Montrose. He had taken his first start from a very humble beginning, and he had risen solely by the force of his own personal energy. Might not others do the same? The prosperity, too, of their new member was something more than an encouragement to the young men of the burgh. It was an assistance to them. He had become an influential member of the Court of Proprietors of East India Stock, and he had therefore "interest at the India House." It must be admitted that for very many years what was familiarly called "borough-mongering" was the main cause of so many doughty young Scots finding their way into the Indian services. Practically, this was a happy circumstance. At all events it bore good fruit. But for this, the Company's army might have been wanting in that muscular sinewy strength imparted to it by a constant recruiting from the middle classes of the North. The Scotch member, in *esse* or in *posse*, may have thought about nothing but his seat; but it was often his good fortune "to entertain angels unawares," and to count among the happy circumstances of his life that he had "sent to India" a Malcolm, an Ouchterlony, or a Munro.

Some of these happy circumstances were recalled with pleasure and with gratitude at the close of a well-spent life by Mr. Joseph Hume. Of one of them I am now about to write. In the first quarter of the present century there dwelt at Montrose a family bearing the name of Burnes. The family was of the same stock as that from which had sprung the inspired ploughman of Ayrshire, though the two branches of the family were pleased to spell their names after different fashions. The grandfather of Robert Burns, the poet, and the grandfather of James Burnes, writer to the signet, burgess of Montrose, and head of the family of which I am now writing, were brothers. In the first year of the century, James Burnes married a daughter of Adam Glegg, chief magistrate of Montrose, and in due course had fourteen children, nine of whom lived to be adults. Of these nine children the four eldest were sons, and the fourth son was named Alexander, after whom I know not, but there could have been no better name for one who was destined to do great things in the countries watered by the Indus and bounded by the Caucasian range. He often used to say, in later days, that he found his name a help to him. In Afghanistan he was always known as "Sekundur Burnes," and Sekundur (Alexander) has been a great name in that part of the world ever since the old historic days of the Greek occupation.

Mr. James Burnes was, I have said, a burgess of Montrose. He was a man greatly respected by the towns-people, both for his integrity and ability, and he came to be provost or chief magistrate of the borough. For many years he took an active part in the local politics of the place, and it was no small thing for a candidate for the representation of Montrose and its dependencies to have the Burnes interest on his side. He was not a man to forsake his principles for gain; but there was no reason why, with four stout clever boys pressing forward for employment, and eager to make their fortunes, he should not endeavour to turn his influence to good account for the benefit of his children. He was very useful to Mr. Hume, and Mr. Hume, in turn, was well disposed to be useful to the family of Burnes. In truth, the tide of Liberal politics was somewhat high and heady at that time; and even the children of the worthy burgess's household were no indifferent observers of passing events, but had their bursts of political excitement like their elders. The acquittal of Queen Caroline produced as great a fervour of ex-



CAIRO, WITH THE MOSQUE OF SULTAN HASSAN.

ultation in that distant sea-port town, as it did in Westminster or Hammersmith, and one of the Burnes boys, who had at a very early age habituated himself to keep a diary, then recorded in its pages, —"November 14, 1820; news came of the rejection by the House of Lords of the Bill of Pains and Penalties against the Queen. No schooling on account of it. . . . November 15; a most brilliant illumination took place in Montrose and the surrounding neighbourhood, on account of the glorious triumph the Queen had obtained over her base and abominable accusers. Many devices were exhibited, one in the Town Hall with a green bag all tattered and torn; in another window, a figure of the Queen, with the word triumphant, and above it C. R. The display of fireworks was unlimited. Two boats were burned, and some tar-barrels, and upon the whole it did great credit to Montrose." The writer of this was Alexander Burnes, then fifteen years of age, and a student in the Montrose Academy. He was a clever, in some respects perhaps a precocious boy; and had learnt as much in the way, both of classics and of mathematics, as most promising striplings of his age. He had read, too, some books of history, and a few of the masterpieces of English poetry. He belonged to a debating society, and was not altogether unskilled in disputation. Like other high-spirited boys, he had taken part in conflicts of a more dangerous character than mere conflicts of words, and fought some hard battles with the boys of the town. Altogether, though not to be accounted a prodigy, he was a youth of high spirit and good promise, and had in him some of the stuff of which heroes are made.

But I can find nothing in the record of Alexander Burnes' early life to warrant the conclusion that the bent of his mind towards foreign travel was then in any way discernible. What little I can find in his papers rather bears the other way. I have before me a collection, in his own writing, of the speeches he delivered at the "Montrose Juvenile Debating Society," the thesis of one of which (proposed by himself) is, "Whether reading or travelling is most advantageous for the acquisition of knowledge?" To this the "juvenile debater" replied, "My opinion on the present subject is, that reading is the most advantageous for the acquisition of knowledge." And then he proceeded to illustrate this opinion, by reading to the meeting an interesting extract from the recently published volume of the African traveller, Belzoni. Having done this, he said, "Now, to have it in our power to amuse ourselves any night we please with the book which contains all these disasters, without the labour which has been encountered, shows in the clearest light the advantages derived from that most delightful and pleasing amusement, reading." This is charmingly illogical. The young debater forgot, in his enthusiastic admiration of the book that had given him so much pleasure, that there could have been no "reading" in this case, if there had been no "travelling." Certainly it would have been difficult to cite a more unfortunate illustration of the views of the juvenile speaker. It is possible that when, in after life, he came to gather up his ideas a little more compactly, he bethought himself of the mistake he had made, and remembered that it is an essential condition to the "acquisition of knowledge" from books of travel like Belzoni's, that there should be Belzonis to write them.

There is, indeed, nothing to indicate that the desires of young Alexander Burnes at that time turned towards a life of adventure, either as an explorer or as a soldier in the eastern or the western worlds. The success of Mr. Hume was that which decided the choice of the worthy burgess of Montrose, for it afforded at once, a great encouragement and a material aid. The eldest hope of the Burnes family, James, was destined for the medical service—that service in which Mr. Hume had so rapidly made a fortune—and was pursuing his studies in London, with a view to an Indian career. And Alexander, by the assistance of Mr. Hume, was to be provided with a cadetship, as soon as he was old enough to take up the appointment. When, therefore, the young student was within a few weeks of the completion of his sixteenth year, he was sent up to London in a Dundee smack; and having arrived there on the 14th of March, 1821, he was on the following day introduced by Mr. Hume to Mr. Stanley Clerk, a member of the Court of Directors, and was told that his name had been duly entered for a cadetship of infantry on the establishment of Bombay. He spent two months in London, studying under the well-known Oriental professor, Dr. Gilchrist, and watched over by Mr. Joseph Hume, who gave him good advice of all kinds, and acted as his banker; and then, on the 16th of May—his birthday—he attended at the India House, and formally took the oath of allegiance.

It was a matter of pleasant family arrangement that the eldest brother, James Burnes, who had been appointed an assistant-surgeon on the Bombay establishment, should sail in the same vessel with Alexander; so they embarked together, early in June, on board the good ship "Sarah." After an uneventful voyage, they arrived at their destination, and on the 21st of October, 1821, these two young Montrosians found themselves on the beach of Bombay, with very little money in their pockets, and with very slender interest to help them onwards; but with stout hearts, clear heads, and that determination to make for themselves careers in the public service, which, in the days of the East India Company, carried so many members of our middle classes in India straight on to fortune and to fame.

The brothers were soon separated. On the 13th of November, James Burnes was gazetted to do duty as an assistant-surgeon with the Artillery at Matoongah.* Four days before this, Alexander's name had appeared in General Orders, by which he was posted to do duty with the 1st Battalion of the 3rd Regiment of Native Infantry at Bombay. On the 19th, he recorded in his journal, that he had "commenced his military career," and appeared on parade. From that day he made steady progress in his profession. He applied himself sedulously to the cultivation of the native languages. He had continued on board ship the studies which he had commenced under Dr. Gilchrist in London, and now he supplemented his literary pursuits by making and steadily adhering to the rule, to converse with his native servants only in Hindostanee; and on the 8th of December he wrote in his journal, "Having migrated from my own country, and being rather of a curious and searching disposition, I have begun to gain as much information as possible concerning the manners, customs, laws, and religions of this people—a study not only amusing and interesting, but highly instructive; for what is it that makes a man, but a knowledge of men and manners?" There was nothing which a man might not achieve in India, who thus set himself to work in the right way. There was proof of this even then before the young "unposted ensign." He had carried out with him, as most young men carry out, letters of introduction to the Governor and other influential people of the presidency. The Governor at that time was Mr. Mountstuart Elphinstone, whose kindness and affability of manner won the heart of the young soldier at once. "The Governor," he wrote home to his family at Montrose, "received us with great politeness, and invited us to the most splendid fête I had ever beheld, and did not behave in a 'How do?' manner, but was extremely affable and polite, which, among a party of a hundred, and for the most part generals and great men, was a great deal. . . . A few weeks ago a grand public ball was given to Sir John Malcolm, on his leaving India, to which I had the honour of receiving an invitation—but where it came from I know not. It was, if anything, grander than Mr. Elphinstone's fête, and held in a house built for the purpose, about the size of the old Council House at Montrose, illuminated with lamps from top to bottom." There must have been something in all this greatly to inspire and encourage the young Scotch subaltern, for Malcolm himself had risen from the same small beginning, and now his name was in every man's mouth, and all were delighting to do him honour. What might not any young Scot, with the right stuff in him, do in India? In all directions there were encouragements and assurances not likely to be thrown away upon a youth of young Burnes' lively imagination. A Montrose man had sent him out to India: an Edinburgh man was now at the head of the government of Bombay: a Glasgow man was governor of the Madras presidency: and now the son of an Eskdale farmer was receiving the plaudits of all classes of his countrymen, and returning for a while to his native land, a successful soldier and a successful statesman, amidst a whirl of popularity that might have fully satisfied the desires of the most ambitious hero in the world.

---

* If space permitted, it would be a pleasure to me, briefly to trace the career of this worthy and distinguished officer. He had ability of a high order, and passed through life universally respected.

But to young Alexander Burnes the encouragements of the future were not greater than the consolations of the present. "I like the country amazingly," he wrote to Montrose, "and as yet am not at all desirous of a return to my own land." But he added, for thoughts of home were still pulling at his heart, "How dearly should I like to see little Charley or Cecilia trudging into my canvas abode—but, ah! that is far beyond probability. However, I may yet see Charley in India, for he seems a boy made for it."

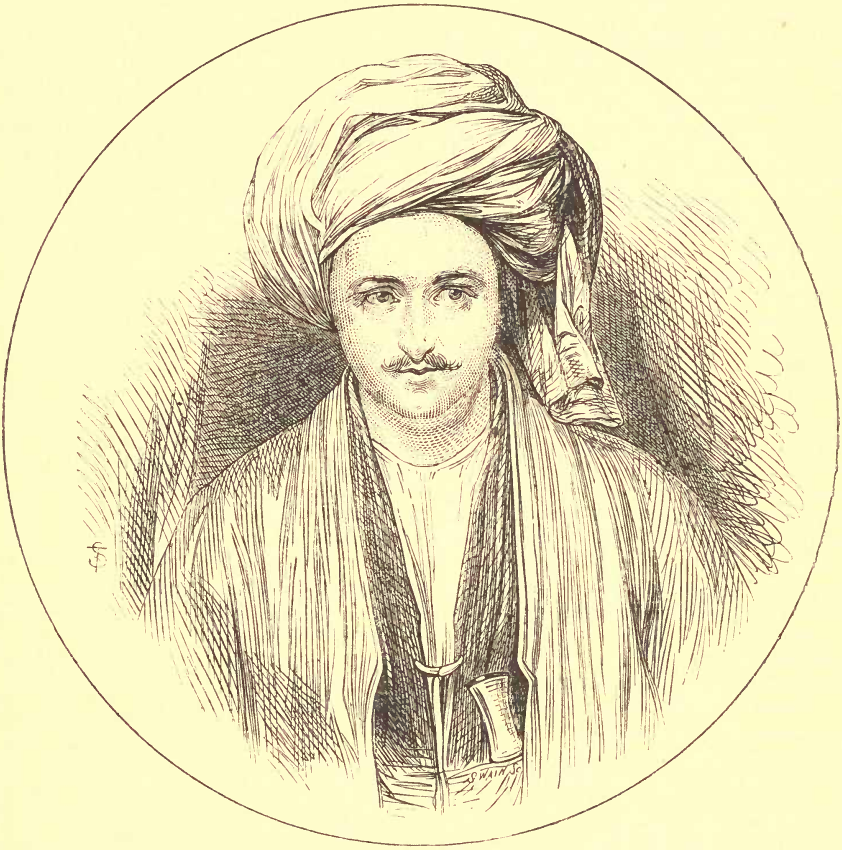
Thoughts of active service soon began to stir his mind. There was a prospect of a war with China, and the young soldier was eager to take part in it. "There has been a most dreadful disturbance," he wrote to his parents, on the 30th of April, 1822, "between the powers of China and the East India Company within these few months; so all trade between these countries is now at a stop, and nothing seems more inevitable than war, for it is in everybody's mouth, and every person is anxious to go. I hope I may be sent. If I am not sent along with my regiment, I shall certainly volunteer; for if a man does not push on, he will never see service, and, of course, will never be an officer worth anything. What will the poor old maids of Montrose do for want of tea?" But the excitement passed away. There was no war. And so young Alexander Burnes fell back peacefully on his Oriental studies, and with such good success, that at the beginning of May, 1822, he went up for an examination in Hindostanee, and found that he had passed for an interpretership. "I was so delighted," he wrote in his journal, "that I could scarcely contain myself."

A fortnight before (April 16, 1822) he had been posted to the 2nd Battalion of the 11th Regiment of Native Infantry, but as the interpretership of that regiment was not vacant, he applied, without success, to be removed to another corps. Any disappointment, however, which he might have felt about this was soon removed by the necessities of action; for a few days afterwards his regiment was ordered to Poonah, which a few years before had been the capital of the Peishwah, and was still in the bloom of its historical associations.

The time passed very pleasantly at Poonah. Governor Elphinstone was at that time there, contributing by his hospitalities to the general happiness, and stimulating the youth of the station by his example, to deeds of heroic sportsmanship. Here young Burnes fleshed his maiden spear during a hog-hunt of three days' duration. Here, too, he began the study of the Persian language. "I have been strenuously advised to begin Persian," he wrote to his friends at Montrose, "as it will improve my Hindostanee, and, perhaps, add greatly to my future prospects in India; so I have commenced it." And he prosecuted the study with such good effect, that after a few months he was able to derive intense gratification from the perusal of the Persian poets. Before the end of the month of September he thus pleasantly reported his progress: "My bed-room is small, and brings often to my recollection my old little closet in the passage, for, as it is my study, I spend a great deal of time in it, and have managed to scribble pieces of poetry on its walls also; but they are now of a different language, for I have got quite enamoured of Persian poetry, which is really, for sound and everything, like a beautiful song. Instead of Lallah Rookh in the English, I have got a Lallah Rookh in the Persian,—at least a much more beautiful poem."

In December the regiment quitted Poonah, *en route* for Surat. At Bombay, where they halted, Alexander Burnes again made a push for an interpretership, and this time with good success; for on the 7th of January, 1823, his name appeared in General Orders, gazetted as interpreter of the 1st Extra Battalion, which happened to be posted at Surat. He was, with one exception, the only ensign in the Bombay Army who held such an appointment. This was great promotion; but in the following year a brighter prospect still expanded before the young soldier. On the general reorganisation of the army, by which each battalion was converted into a separate regiment, with a separate regimental staff, Lieutenant Burnes, then little more than eighteen years old, was offered the regimental adjutancy. The offer excited him greatly, and he wrote:—"Behold your son Alexander the most fortunate man on earth for his years! Behold him Lieutenant and Adjutant Burnes of the 21st Regiment, on an allowance of from 500 to 600 rupees a month." The appointment had been offered to him by his friend Colonel Campbell:—"He did not think," wrote Burnes to Montrose, "that I would accept the situation, for my life in India has been so much devoted to study that he conceived, and correctly too, that I was aiming at some political situation. I soon undeceived him, by telling him that I found my abilities greatly turned to that direction, but that nevertheless I was ready for anything else. . . . No man in his sound senses would refuse a situation of fifty or sixty guineas a month."

From this time his progress was rapid:—"I continued my study of the languages," he wrote



Sir Alexander Burnes in the Costume of Bokhara.

to an old schoolfellow in the West Indies, "and mastered the Persian, which brought me to the notice of Government, and I was selected from the army to be Persian interpreter to a field force of 8000 men, under orders to cross the Indus and attack the territory of Scinde, which is situated at the delta of that great river. . . . The force to which I was attached did not advance; the campaign terminated in 1825; but during its continuance I had, in the absence of other duty, devoted my time to surveying and geography, and produced a map of an unknown track, for which Government rewarded me by an appointment to the department of the Quartermaster-General—the most enviable line in the service. It removed me for good and all, before I had been four years in the service, from every sort of regimental duty. I advanced in this department step by step, and was honoured by the approbation of my superiors. In 1828 they raised me to be Assistant-Quartermaster-General of the Army, and transferred me to head-quarters at Bombay, on a salary of 800 rupees a month. There I met Sir John Malcolm, of whom you may have heard. I knew him not, but I volunteered to explore the Indus from where it is joined by the Punjab down to the ocean, and thus delighted the men in authority. I started at the end of 1829 on this hazardous undertaking,* and after I had got half through it, was recalled by Lord Bentinck, as it would have involved political difficulties at the moment. I did, however, so much that I blush to sound my own praises. The substantial part of them is, that they have removed me entirely to the diplomatic line, as Assistant to the Resident in Cutch, which is a foreign state, in alliance with the British, close on the Indus. It is difficult to draw a parallel between European and Indian situations; but, if one is to be made, I am what is called Secretary of Legation, and on the high road, though I say it myself, to office, emolument, and honour. I have now briefly sketched out my career. My pursuits are purely literary, and confined to investigating the antiquities of Asia and the wonders of this people. I have been tracing the magnanimous Alexander on his Quixotic journey to these lands; and I shall set out at the end of 1830 to traverse further regions, which have been untrodden since the Greeks of Macedon followed their leader. Being an accredited agent of the Government, I have their support in all these wanderings; so you see that I have hung the sword in the hall, and entered the cabinet as a civilian. . . . My great ambition," he said, "is to travel. I am laying by a few spare rupees to feed my innocent wishes, and could I but have a companion like you, how doubly joyous would I roam among the ruins of the capitol, the relics of classic Athens, and the sombre grandeur of Egypt. These, and all the countries near them, are in my mind's eye: I think, I dream of them; and when I journey to my native land, my route will traverse them all. I purpose landing at Berenice on the Red Sea, and, following the Nile in its course across from classic to sacred lands, cross the plains of Syria and about Mount Sinai; thence, by Asia Minor, to the Hellespont and Greece, Italy, and merry France; and last of all to my native Scotia. I have enough of the good things of this life to start on this projected tour, when my ten years of service are out—that is, on October 31, 1831."

But it was ordained by Providence that his journeyings should be quite in a different direction. In the early part of 1830, a despatch arrived at Bombay, from the Board of Control, inclosing a letter of compliment from the President, Lord Ellenborough, to Runjeet Singh, the great ruler of the Punjab, together with a batch of horses that were to be forwarded to His Highness as a present from the King of England. It was necessary that the letter and the horses should be forwarded to Lahore, under the charge of a British officer. Sir John Malcolm was at this time Governor of Bombay. He was full of enterprise and enthusiasm; he had himself been a great traveller; and he was the one of all others to appreciate the achievements and to sympathise with the aspirations of such a man as Alexander Burnes. He accordingly recommended the young Bombay lieutenant for this important duty, and the Supreme-Government readily indorsed the recommendation. But although the man had been chosen, and chosen wisely, there was much discussion respecting the manner of the mission and its accompaniments, and very considerable official delay. "It is part of Sir John Malcolm's plan for the prosecution of my journey," wrote Burnes to the family at Montrose, in September, 1830, "that I quit Bombay before the Government make any arrangements for my voyage up the Indus to Lahore." In these days we know every foot of the ground, and such a journey as Burnes was about to undertake belongs only to the regions of commonplace; but when Burnes, at that time, wrote about "the noble prospects which awaited him in being selected for a delicate and hazardous duty," he by no means exaggerated the fact. He was emphatically the Pioneer, and he had to cut and clear his way through briery difficulties and obstructions which have long since disappeared. He was not merely sent upon a complimentary mission to the ruler of the Punjab; he was directed also to explore the countries on the lower Indus, and to this end he was entrusted with presents to the Ameers of Sinde.* But the Ameers were mistrust-ful of our designs. They believed that Burnes had come to spy the nakedness of the land. With all the clearness of prophecy, they saw that for the English to explore their country, was some day for them to take it. So they threw all sorts of impediments in the way of Burnes' advance. "We quitted Cutch," he wrote to Sir John Malcolm, "on the 20th of January, 1821, and encountered every imaginable difficulty and opposition from the Ameers of Sinde. They first drove us forcibly out of the country. On a second attempt they starved us out. But I was not even then prepared to give up hopes, and I ultimately gained the objects of pursuit by protracted negotiations, and voyaged safely and successfully to Lahore." After he had once entered the Punjab, his journey, indeed, was quite an ovation—"My reception in this country," he wrote to his mother, on the last day of July, "has been such as was to be expected from a prince who has had so high an honour conferred on him as to receive presents from our gracious sovereign. Immediately that I reached his frontier, he sent a guard of horsemen as an honorary escort, and announced my arrival by a salute of eleven guns from the walls of the fortresses I passed. But what is this to the Chief of Bahwulpore, lower down, who came all the way to Cutch to meet me, and with whom I had an interview, announced by eighty guns." The mission, which had reached Lahore on the 18th of July, quitted it on the 14th of August; and Burnes proceeded to Simlah, to give an account of his embassy in person to the Governor-General, who was then, with his secretaries, residing in that pleasant and salubrious retreat.

---

* He was accompanied by Lieut. (now Colonel) James Holland, who afterwards married a sister of Burnes, and who rose, by the force of his distinguished personal merit, to be Quartermaster-General of the Bombay Army.

* If I were writing history, not biography, I should comment upon the error of this. As it is, I cannot resist quoting the following from a minute of Sir Charles Metcalfe, recorded in October, 1830.—"The scheme of surveying the Indus, under the pretence of sending a present to Runjeet Singh, seems to me highly objection-

Lord William Bentinck received the young traveller with characteristic kindness, and listened with the deepest interest to the account of his adventures. He listened to the account, not only of what the young Bombay lieutenant had done, but also of what he desired to do. Before he had started on this journey, Burnes had cherished, in his heart, the project of a still grander exploration—the exploration which was eventually to achieve for him fame and fortune. "I have a vast ambition," he wrote from the banks of the Jhelum to the "old folks at home," "to cross the Indus and Indian Caucasus, and pass by the route of Balkh, Bokhara, and Samarcand, to the Aral and Caspian Seas, to Persia, and thence to return by sea to Bombay. All this depends upon circumstances; but I suspect that the magnates of this empire will wish to have the results of my present journey before I embark upon another." He was right. But, having communicated the results of this journey, he found the Cabinet at Simlah well prepared to encourage another enterprise of the same character, on a grander scale. "The Home Government," he wrote to his sister, on the 23rd of September, 1831, "have got frightened at the designs of Russia, and desired that some intelligent officer should be sent to acquire information in the countries bordering on the Oxus and the Caspian; and I, knowing nothing of all this, come forward and volunteer precisely for what they want. Lord Bentinck jumps at it, invites me to come and talk personally, and gives me comfort in a letter." "I quit Loodhianah," he said a few weeks later, "on the 1st of January, 1832, and proceed by Lahore to Attock, Caubul, Bameean, Balkh, Bokhara, and Khiva, to the Caspian Sea, and from thence to Astracan. If I can but conceal my designs from the officers of the Russian Government, I shall pass through their territory to England, and visit my paternal roof in the Bow Butts."

After a few more weeks of pleasant sojourning with the vice-regal court, Alexander Burnes started on his long and hazardous journey. He received his passports at Delhi two days before Christmas, and on the 3rd of January, 1832, crossed the British frontier, and shook off Western civilisation. He was accompanied by a young assistant-surgeon, named Gerard, who had already earned for himself a name by his explorations of the Himalayahs, and by two native attachés,—the one, Mahomed Ali, in the capacity of a surveyor; the other, a young Cashmeree Mahomedan, educated at Delhi, named Mohun Lal, who accompanied him as moonshee, or secretary. Traversing again the country of the "five rivers," and making divers pleasant and profitable explorations "in the footsteps of Alexander the Great," in the middle of March the travellers forded the Indus, near Attock, took leave of their Sikh friends, and became guests of the Afghans. There were at that time no jealousies, no resentments, between the two nations. The little knowledge that they had of us, derived from the fast-fading recollections of Mr. Elphinstone's mission, was all in our favour; and we in our turn believed them to be a cheerful, simple-minded, kind-hearted, hospitable people. Along the whole line of country, from Peshawur to Caubul, which cannot now be even named amongst us without a shudder, the English travellers were welcomed as friends. From the Afghan capital, Burnes wrote, on the 10th of May, 1832, to his mother—"My journey has been more prosperous than my most sanguine expectations could have anticipated; and instead of jealousy and suspicion, we have hitherto been caressed and feasted by the chiefs of the country. I thought Peshawur

---

able. It is a trick, in my opinion, unworthy of our Government, which cannot fail, when detected, as most probably it will be, to excite the jealousy and indignation of the powers on whom we play it. It is just such a trick as we are often falsely suspected and accused of by the native princes of India, and this confirmation of their suspicions, generally unjust, will do more injury, by furnishing the ground of merited reproach, than any advantage to be gained by the measure can compensate. It is not impossible that it may lead to war. I hope that so unnecessary and ruinous a calamity may not befall us. Yet as our officers, in the prosecution of their clandestine pursuits, may meet with insult or ill-treatment, which we may choose to resent, that result is possible, however much to be deprecated." The sagacity of this is undeniable; but it is to be observed that Burnes was in no degree responsible for the policy here denounced. He had only to execute the orders of his Government.

a delightful place, till I came to Caubul: truly this is a Paradise." His fine animal spirits rose beneath the genial influences of the buoyant bracing climate of Afghanistan. How happy he was at this time—how full of heart and hope—may be gathered from such of his letters as reached his friends. With what a fine gush of youthful enthusiasm, writing to the family at Montrose, to which his heart, untravelled, was ever fondly turning, he describes his travel-life on this new scene of adventure. "... We travel from hence in ten days with a caravan, and shall reach Bokhara by the 1st of July. . . . If the road from Bokhara to the Caspian is interrupted by war, of which there is a chance, I shall be obliged to pass into Persia, and in that event must bid farewell to the hope of seeing you, as I must return to India. The countries north of the Oxus, are at present in a tranquil state, and I do not despair of reaching Istamboul in safety. They may seize me and sell me for a slave, but no one will attack me for my riches. Never was there a more humble being seen. I have no tent, no chair or table, no bed, and my clothes altogether amount to the value of one pound sterling. You would disown your son if you saw him. My dress is purely Asiatic, and since I came into Caubul has been changed to that of the lowest orders of the people. My head is shaved of its brown locks, and my beard, dyed black, grieves,—as the Persian poets have it—for the departed beauty of youth. I now eat my meals with my hands, and greasy digits they are, though I must say in justification, that I wash before and after meals. . . . I frequently sleep under a tree, but if a villager will take compassion upon me I enter his house. I never conceal that I am a European, and I have as yet found the character advantageous to my comfort. I might assume all the habits and religion of the Mahomedans since I can now speak Persian as my own language, but I should have less liberty and less enjoyment in an assumed garb. The people know me by the name of Sekundur, which is the Persian for Alexander, and a magnanimous name it is. With all my assumed poverty, I have a bag of ducats round my waist, and bills for as much money as I choose to draw. I gird my loins, and tie on my sword on all occasions, though I freely admit I would make more use of silver and gold than of cold steel. When I go into a company, I put my hand on my heart, and say with all humility to the master of the house, 'Peace be unto thee,' according to custom, and then I squat myself down on the ground. This familiarity has given me an insight into the character of the people which I never otherwise could have acquired. I tell them about steam-engines, armies, ships, medicine, and all the wonders of Europe, and in return, they enlighten me regarding the customs of their country, its history, state, factions, trade, &c., I all the time appearing indifferent, and conversing thereon 'pour passer le temps.' . . . The people of this country are kind-hearted and hospitable; they have no prejudices against a Christian, and none against our nation. When they ask me if I eat pork, I of course shudder, and say that it is only outcasts who commit such outrages. God forgive me! for I am very fond of bacon, and my mouth waters as I write the word. I wish I had some of it for breakfast, to which I am now about to sit down. At present I am living with a most amiable man, a Nawab, named Jubbur Khan, brother to the chief of Caubul, and he feeds me and my companion daily. They understand gastronomy pretty well. Our breakfast consists of pillaw (rice and meat), vegetables, stews, and preserves, and finishes with fruit, of which there is yet abundance, though it is ten months old. Apples, pears, quinces, and even *melons* are preserved, and as for the grapes, they are delicious. They are kept in small boxes in cotton, and are preserved throughout the year. Our fare, you see, is not so bad as our garb, and like a holy friar, we have sackcloth outside, but better things to line the inside. We have, however, no *sack* or good wine, for I am too much of a politician to drink wine in a Mahomedan country. . . I am well-mounted on a good horse, in case I should find it necessary to take to my heels. My whole baggage on earth goes on one mule, over which my servant sits supercargo; and with all this long enumeration of my condition, and the entire sacrifice of all the comforts of civilised life, I never was in better spirits, and never less under the influence of *ennui*. . . I cannot tell you how my heart leaps, to see all the trees and plants of my native land growing around me in this country."

When Burnes and his companions quitted Caubul, the Nawab Jubbur Khan, who had hospitably entertained, and who had endeavoured to persuade them to protract their sojourn with him, made every possible arrangement for the continuance of their journey in safety and comfort, and bade them "God speed" with a heavy heart. "I do not think," said Burnes, "I ever took leave of an Asiatic with more regret than I left this worthy man. He seemed to live for every one but himself." He was known afterwards among our people by the name of "the Good Nawab;" and the humanity of his nature was conspicuous to the last.

Having quitted Caubul, the English travellers made their way to the foot of the Hindoo-Koosh, or Indian Caucasus, and traversed that stupendous mountain-range, to Koondooz, Kooloom, and Balkh. This was the route explored by those unfortunate travellers Moorcroft and Trebeck, of whom Burnes now found many traces, and whose sad history he was enabled to verify and authenticate. It was a relief to the young Englishman to find himself in the territory of the King of Bokhara, whose evil reputation had not been then established. "As we were now in the territories of a king," he naively recorded in the history of his journey, "we could tell him our opinions, though it had, perhaps, been more prudent to keep them to ourselves."

After a sojourn of three days at Balkh, which had many interesting and some painful associations, for it had been the capital of the ancient Bactrian kingdom, and a little way beyond its walls was the grave of Moorcroft, Burnes and his companions made their way to the city of Bokhara, which they reached on the 27th of June. There they resided for a space of nearly four weeks—receiving from the Vizier all possible kindness and hospitality. "Sekundur," said he to Burnes on his departure, "I have sent for you to ask if anyone has molested you in this city, or taken money from you in my name, and if you leave us contented." "I replied that we had been treated as honoured guests, that our luggage had not even been opened, nor our property taxed, and that I should ever remember with the deepest sense of gratitude the many kindnesses that had been shown to us in the holy Bokhara. . . I quitted this worthy man with a full heart, and with sincere wishes (which I still feel) for the prosperity of this country." The Vizier gave authoritative instructions to the conductors of the caravan with which Burnes was to travel, and to a Toorkoman chief who was to accompany it with an escort, to guard the lives and properties of the Feringhees, declaring that he would root them from the face of the earth, if any accident should befall the travellers; and the King of Bokhara gave them also a firman of protection bearing the royal seal. It is instructive to consider all this with the light of after events to help us to a right understanding of its significance.

From Bokhara the route of the travellers lay across the great Toorkoman desert to Merve and Meshed, thence to Astrabad and the shores of the Caspian; thence to Teheran, the capital of the dominions of the Shah of Persia, from which point he moved down to the Persian Gulf, took ship there to Bombay, and afterwards proceeded to Calcutta. The story has been told by himself, with an abundance of pleasant detail, and is too well known to need to be repeated.

At Calcutta, Alexander Burnes laid before the Governor-General an account of his journey, accompanying it with much grave discourse on the policy which it was expedient for the British Government to pursue towards the different states, which he had visited. The result was exactly what he wished. He was sent home to communicate to the authorities in England the information which he had obtained. All this was truly delightful. Never in the midst of his wanderings in strange places, and among a strange people, had he forgot the old home in Montrose, and the familiar faces of the household there; never had his heart ceased to yearn for the renewal in the flesh of those dear old family associations. He liked India; he loved his work, he gloried in the career before him; but the good home-feeling was ever fresh in his heart, and he was continually thinking of what would be said and thought at Montrose. And in most of our Indian heroes, this good home-feeling was kept alive to the last. It was not weariness of India; it was not a hankering after England. It was simply a good healthy desire to revisit the scenes of one's youth, to see again the faces of one's kindred, and then, strengthened and refreshed, to return with better heart for one's work.

On the 4th of November, 1833, Burnes landed at Dartmouth, and wrote thence to his mother, that he could scarcely contain himself for joy. On the 6th he was in London, with his brothers, David and Charles; dining in the evening with the Court of Directors, who had opportunely one of their great banquets at the London Tavern. Before the week was over, he was in a whirl of social excitement: he was fast becoming a lion—only waiting indeed for the commencement of the London season, to be installed as one of the first magnitude. "I have been inundated by visits," he wrote to his mother, "from authors, publishers, societies, and what not. I am requested to be at the Geographical Society this evening, but I defer it for a fortnight, when I am to have a night to myself. . . . All, all are kind to me. I am a perfect wild beast.—'There's the traveller,' 'There's Mr. Burnes,' 'There's the Indus Burnes,' and what not do I hear. I wish I could hear you and my father, and I would despise all other compliments." "I am killed with honours and kindness," he said, in another letter, "and it is a more painful death than starvation among the Usbeks." In all this, there was no exaggeration. The magnates of the land were contending for the privilege of a little conversation with "Bokhara Burnes." Lord Holland was eager to catch him for Holland House. Lord Lansdowne was bent upon carrying him off to Bowood. Charles Grant, the President of the Board of Control, sent him to the Prime Minister, Lord Grey, who had long confidential conferences with him; and, to crown all, the King,—William the Fourth,—commanded the presence of the Bombay Lieutenant at the Brighton Pavilion, and listened to the story of his travels, and the exposition of his views, for nearly an hour and a half.

He was now hard at work upon his book. He had written many lengthy and valuable official reports; but he had little experience of literary composition for a larger public than that of a bureaucracy, and he was wise enough to discern that the path to popular favour must be very cautiously trodden. Mistrusting his own critical judgment, he submitted portions of his work, before publication, to some more experienced friends, among whom were Mr. James Baillie Fraser, and Mr. Mountstuart Elphinstone. The latter, not oblivious of his own early throes of literary labour, read the manuscript—painfully, in one sense, owing to the failure of his sight, but with the greatest interest and delight. "I never read anything," he wrote, from his chambers in the Albany, to Alexander Burnes, "with more interest and pleasure; and although I cannot expect that every reader will be as much delighted as I have been, yet I shall have a bad opinion of the people's taste, if the narrative is not received with general favour." But although Mr. Elphinstone bestowed these general praises on the work, he was fain to do his young friend good service by honestly criticising the work in detail. "I have made my remarks," he wrote, "with the utmost freedom, and the more so, because I hope you will not pay any attention to them, when unsupported, but will be guided by the opinion of people who know the taste of this town and who are familiar with criticism in general literature. I must premise that many of my objections are founded on general principles, and may, therefore, often be brought against passages which in themselves may be beautiful, but which lack the general effect to which you ought always to look. The first of these principles is, that a narrative of this kind should be in the highest degree plain and simple. . . . To gain the confidence and good will of his reader, a traveller must be perfectly unaffected and unpretending. His whole object must seem to be to state what he has seen in the countries he has visited, without claiming the smallest superiority over his reader in any other description of knowledge or observation. For this reason, every unusual word, every fine sentiment, every general reflection and every sign of an ambitious style should be carefully excluded." A hard lesson this for a young writer; and there was much more of the same kind, sound, and excellent advice, altogether past dispute, and in accordance with the best critical canons. But Mr. Elphinstone lived to see these severe literary doctrines utterly set at naught by a younger race of writers—lived to see a "fastidious public" take to its heart "Eothen," as the most popular book of travels ever published in modern times.

Nor was the only pruning-knife applied to the exuberance of the young writer, that which was wielded by the experienced hand of such chastened writers as Mr. Elphinstone; the official knife was also applied to the manuscript in the Secret Department of the India House. This was, doubtless, in a literary sense, disadvantageous to the book; but, after undergoing these ordeals, it came out under the auspices of Mr. Murray; and Burnes had the honour of presenting a copy to the King at one of His Majesty's levees. "I know all about this," said the good-natured monarch, mindful of Burnes's visit to him at Brighton. The book was an undoubted success. It was well received by the critics and by the public, for not only was there something geographically new in it, but something also politically suggestive. The Russo-phobia was gaining ground in England. There were many who believed that the time was fast approaching, when the Sepoy and the Cossack would meet, face to face, somewhere in Central Asia. It was a great thing, therefore, just in that momentous epoch, that some one should appear amongst us, to whom the countries lying between the Indus and the Caspian were something more than places on the map. As the depository of so much serviceable information, Burnes was sure to be welcome everywhere. There was much, too, in the man himself to increase the interest which his knowledge of these strange countries excited. He was young in years—but younger still in appearance and in manner. When he said that he had been thirteen or fourteen years in India, Lord Munster said to him, "Why that must have been nearly all your life." There was a charming freshness and naïveté about him—the reflection, it may be said, of a warm, true heart, in which the home affections had never for a moment lain dormant.

When Burnes returned to Bombay, he was ordered to rejoin his old appointment as assistant to the Resident in the Persian Gulf; but his services were soon demanded by the Government in a more independent position. Lord Auckland had proceeded to India as Governor-General. He had met Burnes at Bowood, had been pleased with his conversation, and had formed the highest opinion of the energy and ability of the young subaltern. When, therefore, under the evil influence of other men's designs, the "great game" in Central Asia began to take shape in his mind, he recognised at once, the fact, that Burnes must be one of the chief players. So the Cutch assistant was placed under the orders of the Supreme Government, and directed to hold himself in readiness to undertake what was described at the time, and is still known in history, as a "Commercial mission" to Caubul. Commerce, in the vocabulary of the East, is only another name for conquest. By commerce, the East India Company had become the sovereigns of the great Indian Peninsula; and this commercial mission was the cloak of grave political designs. Very soon the cloak was thrown aside as an incumbrance, and instead of directing his energies to the opening of the navigation of the Indus, Alexander Burnes gave up his mind to the great work of checkmating Russia in the East.

Lord Auckland was not an ambitious man,—quiet, sensible, inclined towards peace, he would not have given himself up to the allurements of the great game, if he had not been stimulated, past all hope of resistance, by evil advisers, who were continually pouring into his ears alarming stories of deep-laid plots and subtle intrigues emanating from the cabinet of St. Petersburg, and of the wide-spread corruption that was to be wrought by Russian gold. It was believed that the King of Persia had become the vassal of the great Muscovite monarch, and that he had been instigated by the Government of the Emperor to march an army to Herat for the capture of that famous frontier city, and for the further extension of his dominions towards the boundaries of our Indian empire. The attack upon Herat was a substantial fact; the presence of Russian officers in the Persian territory, as aiders and abetters of the siege of Herat, was also a fact. The dangers which were apprehended were essentially very similar to those which had alarmed us more than a quarter of a century before, and which had caused the despatch of Mr. Elphinstone's mission to Afghanistan. But there were some circumstantial differences. Not only had the Russian power taken the part of the French in the great drama of intrigue and aggression, but there was another actor also with the leading business at Caubul. There had been a revolution, or a succession of revolutions, in Afghanistan. The Suddozye king, Shah Soojah, whom Elphinstone had met at Peshawur, was now a pensioner in the British dominions, and the Barukzye chief, Dost Mahomed, was dominant at Caubul. It was our policy now to secure his good offices, and it was the duty of Alexander Burnes to accomplish this great object. Left to himself, he would have done it. He, who best knew Dost Mahomed, had most faith in him. The Ameer was eager for the British alliance, and nothing was easier than to secure his friendship. But whilst Burnes was striving to accomplish this great object at Caubul, other counsels were prevailing at Simlah—that great hot-bed of intrigue on the Himalayan hills—where the Governor-General and his secretaries were refreshing and invigorating themselves, and rising to heights of audacity which they never would have reached in the languid atmosphere of Calcutta. They conceived the idea of rehabilitating the old deposed dynasty of Shah Soojah, and they picked him out of the dust of Loodhianah to make him a tool and a puppet, and with the nominal aid of Runjeet Singh, who saw plainly that we were making a mistake which might be turned to his advantage, they determined to replace the vain, weak-minded exile, whom his country had cast out as a hissing and a reproach, upon the throne of Afghanistan. It is enough to state the fact. The policy was the policy of the Simlah Cabinet, with which Burnes had nothing to do. It was rank injustice to Dost Mahomed. It was rank injustice to Alexander Burnes. The young English officer, who had been twice the guest of the Barukzye sirdars of Caubul, who had led them to believe that his Government would support them, and who had good and substantial reason to believe that they would be true to the English alliance, now found that he was fearfully compromised by the conduct of his official superiors. He left Caubul, and made his way to Simlah; and it is said that the secretaries received him with eager entreaties not to spoil the "Great Game" by dissuading Lord Auckland from the aggressive policy to which he had reluctantly given his consent.

This was in the summer of 1838. Even if the young Bombay officer could have spoken with "the tongue of angels," his words would have been too late. What could he do against a triumviri of Bengal civilians—the ablest and most accomplished in the country? It is true that he had an intimate acquaintance, practical, personal, with the politics of Afghanistan, whilst all that they knew was derived from the book that he had written, from the writings of Mountstuart Elphinstone and from another book of travels written by a young cavalry officer named Arthur Conolly, of whom I may some day perhaps give further account. But they had had the ear of the Governor-General, whilst Burnes had been working at Caubul, and so their crude theories prevailed against his practical knowledge. It was not then his duty to say that he would take no part in carrying out the policy of the Government which he served. It was a sore trial to him, for he felt that it would be said, as afterwards it was said, that he had partaken of the hospitality of the ruler of Caubul, had left him as a friend, and had returned with an army at his back. It was a sorer trial still to him to see that it was said by his own countrymen that he had approved—indeed, recommended a course of policy which was distasteful to him in the extreme. But as an officer of the Government, he felt that he was bound to do his best to bring the policy, that had been decreed by higher authority, to a successful issue, though it was hard, indeed, to be identified, as he afterwards was authoritatively identified with that policy by those who knew better, and who could enlist him on their side only by fraudulently suppressing or perverting his words.

So it was determined by Lord Auckland's Government that a great army should be assembled for the invasion of Afghanistan and the restoration of Shah Soojah to the throne of Caubul. The army was to march by the way of the Bolan pass, through the country ruled by the Ameers of Scinde; and Burnes was to be sent forward to make all necessary arrangements for the passage of our army through those little-known and difficult regions to Candahar. If he had formed any expectation of being vested with the supreme political control of the expedition, and afterwards of representing British interests at the Court of Shah Soojah, they were not unreasonable expectations. But Mr. Macnaghten was appointed to the post of "Envoy and Minister," and Captain Burnes to the inferior, and under all the circumstances of the case anomalous, office of Resident at Caubul. But the sharpness of his disappointment was somewhat mitigated by the receipt of letters announcing that the Queen had taken his services into gracious consideration, and had made him a knight, with the military rank of Lieutenant-Colonel. This sent him about his work with better heart: and he brought all his energies to bear upon the important duty of smoothing the road for the march of the army of the Indus, and the procession of the restored Suddozye monarch into the heart of the country, which never wanted him, and which he was wholly incompetent to govern.

How the British army entered Afghanistan, how Dost Mahomed was driven out of the country, how the people for a while sullenly acquiesced in the revolution, which was accomplished by the force of British bayonets, and the influence of British gold, are matters which belong to history. When Shah Soojah had been replaced in the Balla Hissar of Caubul, Sir Alexander Burnes settled down into his anomalous position of "Resident" at Caubul. He had no power, and no responsibility. He gave advice, which was seldom taken, and he saw things continually going wrong without any power to set them right. It is impossible to conceive any more unpleasant situation than that which for more than two years—during the latter part of 1839, and all through 1840 and 1841—he occupied at the Court of Caubul. If, at that time, he had not been sometimes irritable, and sometimes desponding, he would have been more or less than a man. He had been taught to believe that Macnaghten had been sent only for a little space into Afghanistan, to be soon removed to a higher office, and then that he himself would be placed in the supreme direction of affairs. But month after month—nay, year after year—passed, and there was no change; and Burnes began to write somewhat bitterly of the good faith of the Governor-General, and to contrast his conduct with the soft words of the man, who had spoken so kindly and encouragingly to him on the "couch at Bowood." At last, in the autumn of 1841, news came that Macnaghten had been appointed Governor of Bombay; but, even then, there were reports that some other officer would be sent up from the Provinces to occupy his seat. It was a period of distressing doubt and anxiety to the expectant minister. The arrival of every post was looked for with feverish anxiety; but his heart sickened with hope deferred.

The anniversary of his arrival in India came round. Twenty years had passed since he had first set his foot on the strand of Bombay. Seldom altogether free from superstitions and presentiments, he entered upon this 31st of October, 1841, with a vivid impression that it would bring forth something upon which his whole future life would turn. "Ay! what will this day bring forth?" he wrote in his journal, "the anniversary of my twenty years' service in India. It will make or mar me, I suppose. Before the sun sets I shall know whether I go to Europe or succeed Macnaghten." But the day passed, and the momentous question was not settled. Then November dawned, and neither Burnes nor Macnaghten received the desired letters from Calcutta—only vague newspaper reports which added new fuel to the doubts and anxieties of the expectant envoy. "I grow very tired of praise," he wrote in his journal, "and I suppose that I shall get tired of censure in time." This was his last entry. There was no more either of praise or of censure to agitate him in this world. Already was the city of Caubul seething with insurrection, and the house of Sir Alexander Burnes was in the city perilously exposed to attack. His Afghan servants told him that he was in danger, and exhorted him to withdraw to the cantonments. He said that he had done the Afghans no injury; why then should they injure him? He could not think that any real danger threatened him, and he retired to rest at night with little fear of the results of the morrow. But with the morrow came the phantoms of new troubles; plainly the storm was rising. First one, then another, with more or less authority, came to warn him that there was "death in the pot." It was no longer possible to look with incredulity upon the signs and symptoms around him. The streets were alive with insurgents. An excited crowd was gathering round his house. Still there might be time to secure safety by flight. But he scorned to quit his post: he believed that he could quell the tumult, and so he rejected the advice that might have saved him.

That the city was in a state of insurrection was certain; but it appeared that a prompt and vigorous demonstration on the part of the British troops in cantonments might quell the tumult; so he wrote to Macnaghten for support, and to some friendly Afghan chiefs for assistance. It was then too late. Before any succour could arrive, the crowd before his house had begun to rage furiously, and it was plain that the insurgents were thirsting for the blood of the English officers. From a gallery which ran along the upper part of the house, Burnes, attended by his brother Charles, and his friend William Broadfoot, addressed himself to the excited mob. They yelled out their execration and defiance in reply, and it was plain that no expostulations or entreaties could turn them aside from their purpose. The enemy had begun to fire upon them, and, hopeless as retaliation and resistance might be, there seemed to be nothing left to the English officers but to sell their lives as dearly as they could. Broadfoot was soon shot dead. Then the insurgents set fire to Burnes's stables, rushed into his garden and summoned him to come down. All hope of succour from cantonments had now gone. Still he might purchase his own and his brother's safety by appealing to the national avarice of the Afghans. He offered them large sums of money if they would suffer him to escape. Still they called upon him to leave off firing and to come down to the garden. At last he consented, and the brothers, conducted by a Cashmeree Mussulman, who had sworn to protect them, went down to the garden; but no sooner were they in the presence of the mob than their guide cried out, "Here is Sekundur Burnes!" and straightway the insurgents fell upon them and slew them.

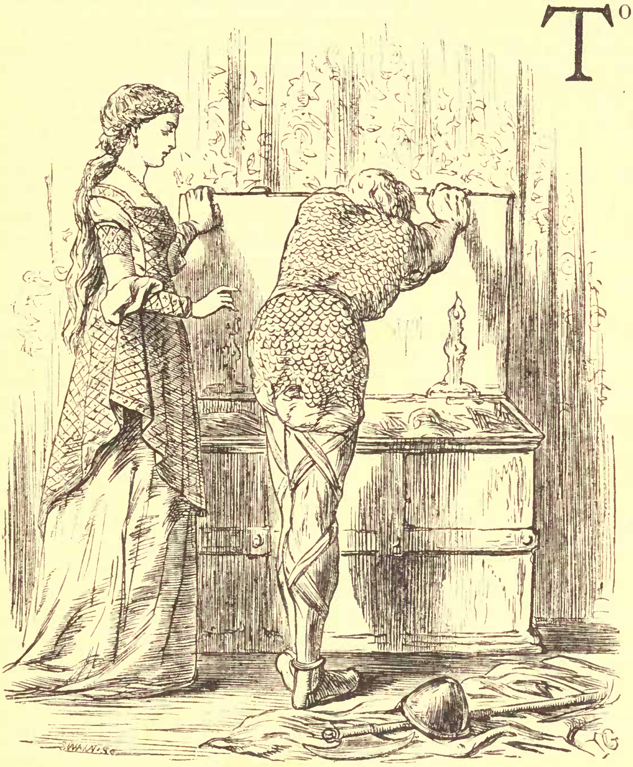
And so, on the 2nd of November, 1841, fell Alexander Burnes, butchered by an Afghan mob. He was only thirty-six years of age. That he was a remarkable man and had done remarkable things is not to be doubted. He was sustained, from first to last, by that grand amalgam of the romantic and the practical, of which Henry Lawrence spoke as the best security for a successful career. He was eager, impulsive, enthusiastic; but he had a sufficiency of good strong practical sense to keep him from running into any excesses. He had courage of a high order; sagacity, penetration, and remarkable quickness of observation. I am inclined to think that, if his life had been spared, he would have attained to much higher distinction, for all that he lacked to qualify him for offices of large responsibility was a greater soberness of judgment, which years would almost certainly have brought. As it was, few men have achieved, at so early an age, so much distinction, by the force of their own personal character, as was achieved by Alexander Burnes.

HEREWARD, THE LAST OF THE ENGLISH.

By CHARLES KINGSLEY.

CHAPTER X.

HOW HEREWARD WON THE MAGIC ARMOUR.



TORFRIDA had special opportunities of hearing about Hereward; for young Arnulf was to her a pet and almost a foster-brother, and gladly escaped from the convent to tell her the news.

He had now had his first taste of the royal game of war. He had seen Hereward fight by day, and heard him tell stories over the camp fire by night. Hereward's beauty, Hereward's prowess, Hereward's songs, Hereward's strange adventures and wanderings, were for ever in the young boy's mouth; and he spent hours in helping Torfrida to guess who the great unknown might be; and then went back to Hereward, and artlessly told him of his beautiful friend, and how they had talked of him, and of nothing else; and in a week or two Hereward knew all about Torfrida; and Torfrida knew—what filled her heart with joy—that Hereward was bound to no lady-love, and owned (so he had told Arnulf) no mistress save the sword on his thigh.

Whereby there had grown up in the hearts of both the man and the maid a curiosity, which easily became the parent of love.

But when Baldwin the great Marquis came to St. Omer, to receive the homage of Eustace of Guisnes, young Arnulf had run into Torfrida's chamber in great anxiety. "Would his grandfather approve of what he had done? Would he allow his new friendship with the unknown?"

"What care I?" said Torfrida. "But if your friend wishes to have the Marquis's favour, he would be wise to trust him, at least so far as to tell his name."

"I have told him so. I have told him that you would tell him so."

"I? Have you been talking to him about me?"

"Why not?"

"That is not well done, Arnulf, to talk of ladies to men whom they do not know."

Arnulf looked up, puzzled and pained; for she spoke haughtily.

"I know naught of your new friend. He may be a low-born man, for anything that I can tell."

"He is not! He is as noble as I am. Everything he says and does—every look—shows it."

"You are young—as you have shown by talking of me to him. But I have given you my advice;" and she moved languidly away. "Let him tell your grandfather who he is, or remain suspected."

The boy went away sadly.

Early the next morning he burst into Torfrida's room as she was dressing her hair.

"How now? Are these manners for the heir of Flanders?"

"He has told all!"

"He has!" and she started and dropt her comb.

"Pick up that comb, girl. You need not go away. I have no secrets with young gentlemen."

"I thought you would be glad to hear."

"I? What can I want in the matter, save that your grandfather should be satisfied that you are entertaining a man worthy to be your guest?"

"And he is worthy: he has told my grandfather who he is."

"But not you?"

"No. They say I must not know yet. But this I know, that they welcomed him, when he told them, as if he had been an Earl's son; and that he is going with my uncle Robert against the Frieslanders."

"And if he be an Earl's son, how comes he here, wandering with rough seamen, and hiding his honest name? He must have done something of which he is ashamed."

"I shall tell you nothing," said Arnulf, pouting.

"What care I? I can find out by art magic if I like."

"I don't believe all that. Can you find out, for instance, what he has on his throat?"

"A beard."

"But what is under that beard?"

"A gôitre."

"You are laughing at me."

"Of course I am, as I shall at any one who challenges me to find out anything so silly, and so unfit."

"I shall go."

"Go then." For she knew very well that he would come back again.

"Nurse," said Torfrida to the old Lapp woman, when they were alone, "find out for me what is the name of this strange champion, and what he has beneath his beard."

"Beneath his beard?"

"Some scar, I suppose, or secret mark. I must know. You will find out for your Torfrida, will you not, nurse?"

"I will make a charm that will bring him to you, were all the icebergs of Quenland between you and him: and then you can see for yourself."

"No, no, no! not yet, nurse!" and Torfrida smiled. "Only find me out that one thing: that I must know."

And yet why she wanted to know, she could not tell herself.

The old woman came back to her, ere she went to bed.

"I have found it out all, and more. I know where to get scarlet toadstools, and I put the juice in his men's ale: they are laughing and roaring now, merry-mad every one of them."

"But not he?"

"No, no. He is with the Marquis. But in madness comes out truth; and that long hook-nosed body-varlet of his has told us all."

And she told Torfrida who Hereward was, and the secret mark.

"There is a Cross upon his throat, beneath his chin, pricked in after their English fashion."

Torfrida started.

"Then—then the spell will not work upon him; the Holy Cross will turn it off."

"It must be a great Cross and a holy one that will turn off my charms," said the old hag, with a sneer, "whatever it may do against yours. But on the back of his hand—that will be a mark to know him by—there is pricked a bear—a white bear that he slew." And she told the story of the fairy bear; which Torfrida duly stored up in her heart.

"So he has the Cross on his throat," thought Torfrida to herself. "Well, if it keep off my charm, it will keep off others—that is one comfort: and one knows not what fairies, or witches, or evil creatures, he may meet with in the forests and the fens."

The discovery of Hereward's rank did not, doubtless, lessen Torfrida's fancy for him. She was ambitious enough, and proud enough of her own lineage, to be full glad that her heart had strayed away—as it must needs stray somewhere—to the son of the third greatest man in England. As for his being an outlaw, that mattered little. He might be inlawed, and rich and powerful, any day in those uncertain topsy-turvy times: and for the present, his being a wolf's head only made him the more interesting to her. Women like to pity their lovers. Sometimes—may all good beings reward them for it—they love merely because they pity. And Torfrida found it pleasant to pity the insolent young coxcomb, who certainly never dreamed of pitying himself.

When Hereward went home that night, he found the Abbey of St. Bertin in horrible confusion. His men were grouped outside the gate, chattering like monkeys; the porter and the monks, from inside, entreating them vainly to come in and go to bed quietly.

But they would not. They vowed and swore that a great gulf had opened all down the road, and that one step more would tumble them in headlong. They manifested the most affectionate solicitude for the monks, warning them, on their lives, not to step across the threshold, or they would be swallowed (as Martin, who was the maddest of the lot, phrased it) with Korah, Dathan, and Abiram. In vain Hereward stormed; assured them that the supposed abyss was nothing but the gutter; proved the fact by kicking Martin over it:—the men determined to believe their own eyes, and after awhile fell asleep in heaps in the roadside, and lay there till morning, when they woke, declaring, as did the monks, that they had been all bewitched. They knew not—and happily the lower orders both in England and on the Continent do not yet know—the potent virtues of that strange fungus, with which Lapps and Samoiedes have, it is said, practised wonders for centuries past.

The worst of the matter was, that Martin Lightfoot, who had drank most of the poison, and had always been dreamy and uncanny, in spite of his shrewdness and humour, had from that day forward something very like a bee in his bonnet.

But before Count Robert and Hereward could collect sufficient troops for the invasion of Holland, another chance of being slain in fight arose, too tempting to be overlooked; namely, the annual tournament at Pont de l'Arche above Rouen, where all the noblest knights of Normandy would assemble, to win their honour and ladies' love by hewing at each other's sinful bodies. Thither, too, the best knights of Flanders must needs go, and with them Hereward. Though no knight, he was allowed in Flanders, as he had been in Scotland, to take his place among that honourable company. For though he still refused the honour of knighthood, on the ground that he had as yet done no deed deserving thereof, he was held to have deserved it again and again, and all the more from his modesty in declining it.

So away they all went to Pont de l'Arche, a right gallant meinie: and Torfrida watched them go from the lattice window.

And when they had passed down the street, tramping, and jingling, and caracoling, young Arnulf ran into the house with eyes full of tears, because he was not allowed to go likewise; and with a message for Torfrida, from no other than Hereward.

"I was to tell you this and no more: that if he meets your favour in the field, he that wears it will have hard work to keep it."

Torfrida turned pale as ashes; first with wild delight, and then with wild fear.

"Ha?—does he know who—Sir Ascelin?"

"He knows well enough. Why not? Every one knows. Are you afraid that he is not a match for that great bullock?"

"Afraid? Who said I was afraid? Sir Ascelin is no bullock either; but a courteous and gallant knight."

"You are as pale as death, and so ——"

"Never mind what I am," said she, putting her hands over his eyes, and kissing him again and again, as a vent for her joy.

The next few days seemed years for length: but she could wait. She was sure of him now. She needed no charms. "Perhaps," thought she, as she looked in the glass, "I was my own charm." And indeed, she had every fair right to say so.

At last news came.

She was sitting over her books; her mother, as usual, was praying in the churches; when the old Lapp nurse came in. A knight was at the door. His name, he said, was Siward the White, and he came from Hereward.

From Hereward! He was at least alive: he might be wounded, though; and she rushed out of the chamber into the hall, looking never more beautiful; her colour heightened by the quick beating of her heart; her dark hair, worn loose and long, after the fashion of those days, streaming around her and behind her.

A handsome young man stood in the door-way, armed from head to foot.

"You are Siward, Hereward's nephew?"

He bowed assent. She took him by the hands, and, after the fashion of those days, kissed him on the small space on either cheek, which was left bare between the nose-piece and the chain-mail.

"You are welcome. Hereward is—is alive?"

"Alive and gay, and all the more gay at being able to send to the Lady Torfrida by me something which was once hers, and now is hers once more."

And he drew from his bosom the ribbon of the knight of St. Valeri.

She almost snatched it from his hand, in her delight at recovering her favour.

"How—where—did he get this?"

"He saw it, in the thick of the tournament, on the helm of a knight who, he knew, had vowed to maim him or take his life; and, wishing to give him a chance of fulfilling his vow, rode him down, horse and man. The knight's Norman friends attacked us in force; and we Flemings, with Hereward at our head, beat them off, and overthrew so many, that we are almost all horsed at the Norman's expense. Three more knights, with their horses, fell before Hereward's lance."

"And what of this favour?"

"He sends it to its owner. Let her say what shall be done with it."

Torfrida was on the point of saying, "He has won it; let him wear it for my sake." But she paused. She longed to see Hereward face to face; to speak to him, if but one word. If she allowed him to wear the favour, she must at least have the pleasure of giving it with her own hands. And she paused.

"And he is killed?"

"Who? Hereward?"

"Sir Ascelin."

"Only bruised: but he shall be killed, if you will."

"God forbid!"

"Then," said Siward, mistaking her meaning, "all I have to tell Hereward is, it seems, that he has wasted his blow. He will return, therefore, to the Knight of St. Valeri his horse, and, if the Lady Torfrida chooses, the favour which he has taken by mistake from its rightful owner." And he set his teeth, and could not prevent stamping on the ground, in evident passion. There was a tone, too, of deep disappointment in his voice, which made Torfrida look keenly at him. Why should Hereward's nephew feel so deeply about that favour? And as she looked—could that man be the youth Siward? Young he was, but surely thirty years old at least. His face could hardly be seen, hidden by helmet and nose-piece above, and mailed up to the mouth below. But his long moustache was that of a grown man; his vast breadth of shoulder, his hard hand, his sturdy limbs,—these surely belonged not to the slim youth whom she had seen from her lattice riding at Hereward's side. And, as she looked, she saw upon his hand the bear of which her nurse had told her.

"You are deceiving me!" and she turned first deadly pale, and then crimson. "You—you are Hereward himself!"

"I? Pardon me, my lady. Ten minutes ago I should have been glad enough to have been Hereward. Now, I am thankful enough that I am only Siward; and not Hereward, who wins for himself contempt by overthrowing a knight more fortunate than he." And he bowed, and turned away to go.

"Hereward! Hereward!" and, in her passion, she seized him by both his hands. "I know you! I know that device upon your hand. At last! at last my hero—my idol! How I have longed for this moment! How I have toiled for it, and not in vain! Good heavens! what am I saying?" And she tried, in her turn, to escape from Hereward's mailed arms.

"Then you do not care for that man?"

"For him? Here! take my favour, wear it before all the world, and guard it as you only can; and let them all know that Torfrida is your love."

And with hands trembling with passion, she bound the ribbon round his helm.

"Yes! I am Hereward," he almost shouted; "the Berserker, the brain-hewer, the land-thief, the sea-thief, the feeder of wolf and raven—Aoi! Ere my beard was grown, I was a match for giants. How much more now, that I am a man whom ladies love? Many a champion has quailed before my very glance. How much more, now that I wear Torfrida's gift? Aoi!"

Torfrida had often heard that wild battle-cry of Aoi! of which the early minstrels were so fond—with which the great poet who wrote the "Song of Roland" ends every paragraph; which has now fallen (displaced by our modern Hurrah), to be merely a sailor's call or hunter's cry. But she shuddered as she heard it close to her ears, and saw, from the flashing eye and dilated nostril, the temper of the man on whom she had thrown herself so utterly. She laid her hand upon his lips.

"Silence! silence for pity's sake. Remember that you are in a maiden's house; and think of her good fame."

Hereward collected himself instantly, and then holding her at arm's length, gazed upon her. "I was mad a moment. But is it not enough to make me mad to look at you?"

"Do not look at me so, I cannot bear it," said she, hanging down her head. "You forget that I am a poor weak girl."

"Ah! we are rough wooers, we sea-rovers. We cannot pay glozing French compliments like your knights here, who fawn on a damsel with soft words in the hall, and will kiss the dust off their queen's feet, and die for a hair of their goddess' eyebrow; and then if they catch her in the forest, show themselves as very ruffians as if they were Paynim Moors. We are rough, lady, we English: but those who trust us, find us true."

"And I can trust you?" she asked, still trembling.

"On God's cross there round your neck," and he took her crucifix and kissed it. "You only I love, you only I will love, and you will I love in all honesty, before the angels of heaven, till we be wedded man and wife. Who but a fool would soil the flower which he means to wear before all the world?"

"I knew Hereward was noble! I knew I had not trusted him in vain!"

"I kept faith and honour with the Princess of Cornwall, when I had her at my will, and shall I not keep faith and honour with you?"

"The Princess of Cornwall?" asked Torfrida.

"Do not be jealous, fair queen. I brought her safe to her betrothed; and wedded she is, long ago. I will tell you that story some day. And now—I must go."

"Not yet! not yet! I have something to—to show you."

She motioned him to go up the narrow stairs, or rather ladder, which led to the upper floor, and then led him into her chamber.

A lady's chamber was then, in days when privacy was little cared for, her usual reception-room; and the bed, which stood in an alcove, was the common seat of her and her guests. But Torfrida did not ask him to sit down. She led the way onward towards a door beyond.

Hereward followed, glancing with awe at the books, parchments, and strange instruments which lay on the table and the floor.

The old Lapp nurse sat in the window, sewing busily. She looked up, and smiled meaningly. But as she saw Torfrida unlock the further door with one of the keys which hung at her girdle, she croaked out:

"Too fast! Too fast! Trust lightly, and repent heavily."

"Trust once and for all, or never trust at all," said Torfrida, as she opened the door.

Hereward saw within rich dresses hung on perches round the wall, and chests barred and padlocked.

"These are treasures," said she, "which many a knight and nobleman has coveted. By cunning, by flattery, by threats of force even, have they tried to win what lies here—and Torfrida herself, too, for the sake of her wealth. But thanks to the Abbot my uncle, Torfrida is still her own mistress, and mistress of the wealth which her forefathers won by sea and land far away in the East. All here is mine—and if you be but true to me, all mine is yours. Lift the lid for me, it is too heavy for my arms."

Hereward did so; and saw within golden cups and bracelets, horns of ivory and silver, bags of coin, and among them a mail shirt and helmet, on which he fixed at once silent and greedy eyes.

She looked at his face askance, and smiled. "Yes, these are more to Hereward's taste than gold and jewels. And he shall have them. He shall have them as a proof that if Torfrida has set her love upon a worthy knight, she is at least worthy of him; and does not demand, without being able to give in return."

And she took out the armour, and held it up to him.

"This is the work of dwarfs or enchanters! This was not forged by mortal man! It must have come out of some old cavern, or dragon's hoard!" said Hereward, in astonishment at the extreme delicacy and slightness of the mail-rings, and the richness of the gold and silver with which both hauberk and helm were inlaid.

"Enchanted it is, they say; but its maker, who can tell? My ancestor won it, and by the side of Charles Martel. Listen, and I will tell you how.

"You have heard of fair Provence, where I spent my youth; the land of the sunny south; the land of the fig and the olive, the mulberry and the rose, the tulip and the anemone, and all rich fruits and fair flowers,—the land where every city is piled with temples, and theatres, and towers as high as heaven, which the old Romans built with their enchantments, and tormented the blessed martyrs therein."

"Heavens, how beautiful you are!" cried Hereward, as her voice shaped itself into a song, and her eyes flashed, at the remembrance of her southern home.

Torfrida was not altogether angry at finding that he was thinking of her, and not of her words.

"Peace, and listen. You know how the Paynim held that land—the Saracens, to whom Mahound taught all the wisdom of Solomon—as they teach us in turn," she added in a lower voice.

"And how Charles and his Paladins" [Charles Martel and Charlemagne were perpetually confounded in the legends of the time] "drove them out, and conquered the country again for God and his mother."

"I have heard——" but he did not take his eyes off her face.

"They were in the theatre at Arles, the Saracens, where the blessed martyr St. Trophimus had died in torments; they had set up there their idol of Mahound, and turned the place into a fortress. Charles burnt it over their heads: you see—I have seen—the blackened walls, the bloodstained marbles, to this day. Then they fled into the plain, and there they turned and fought. Under Mont Majeur, by the hermit's cell, they fought a summer's day, till they were all slain. There was an Emir among them, black as a raven, clad in magic armour. All lances turned from it, all swords shivered on it. He rode through the press without a wound, while every stroke of his scimitar shore off a head of horse or man. Charles himself rode at him, and smote him with his hammer. They heard the blow in Avignon, full thirty miles away. The flame flashed out from the magic armour a fathom's length, blinding all around; and when they recovered their sight, the enchanter was far away in the battle, killing as he went.

"Then Charles cried, 'Who will stop that devil, whom no steel can wound? Help us, oh blessed martyr St. Trophimus, and save the soldiers of the Cross from shame!'

"Then cried Torfrid, my forefather, 'What use in crying to St. Trophimus? He could not help himself, when the Paynim burnt him: and how can he help us? A tough arm is worth a score of martyrs here.'

"And he rode at that Emir, and gript him in his arms. They both fell, and rolled together on the ground: but Torfrid never loosed his hold till he had crushed out his unbaptised soul and sent it to join Mahound in hell.

"Then he took his armour, and brought it home in triumph. But after awhile he fell sick of a fever; and the blessed St. Trophimus appeared to him, and told him that it was a punishment for his blasphemy in the battle. So he repented, and vowed to serve the saint all his life. On which he was healed instantly, and fell to religion, and went back to Mont Majeur; and there he was a hermit in the cave under the rock, and tended the graves hewn in the living stone, where his old comrades, the Paladins who were slain, sleep side by side round the church of the Holy Cross. But the armour he left here; and he laid a curse upon it, that whosoever of his descendants should lose that armour in fight, should die childless, without a son to wield a sword. And therefore it is that none of his ancestors, valiant as they have been, have dared to put this harness on their backs."

And so ended a story, which Torfrida believed utterly, and Hereward likewise.

"And now, Hereward mine, dare you wear that magic armour, and face old Torfrid's curse?"

"What dare I not?"

"Think. If you lose it, in you your race must end."

"Let it end. I accept the curse."

And he put the armour on.

But he trembled as he did it. Atheism and superstition go too often hand-in-hand; and godless as he was, sceptical of Providence itself, and much more of the help of saint or angel, still the curse of the old warrior, like the malice of a witch or a demon, was to him a thing possible, probable, and formidable.

She looked at him in pride and exultation.

"It is yours—the invulnerable harness! Wear it in the forefront of the battle! And if weapon wound you through it, may I, as punishment for my lie, suffer the same upon my tender body—a wound for every wound of yours, my knight!"*

And after that they sat side by side, and talked of love with all honour and honesty, never heeding the old hag, who crooned to herself in her barbarian tongue—

"Quick thaw, long frost,
Quick joy, long pain,
Soon found, soon lost,
You will take your gift again."

CHAPTER XI.

HOW THE HOLLANDERS TOOK HEREWARD FOR A MAGICIAN.

Of this weary Holland war which dragged itself on campaign after campaign for several years, what need to tell? There was, doubtless, the due amount of murder, plunder, burning, and worse; and the final event was certain from the beginning. It was a struggle between civilised and disciplined men, armed to the teeth, well furnished with ships and military engines, against poor simple folk in "felt coats stiffened with tar or turpentine, or in very short jackets of hide," says the chronicler, "who fought by threes, two with a crooked lance and three darts each, and between them a man with a sword or an axe, who held his shield before those two;—a very great multitude, but in composition utterly undisciplined," who came down to the sea coast, with carts and waggons, to carry off the spoils of the Flemings, and bade them all surrender at discretion, and go home again after giving up Count Robert and Hereward, with the "tribunes of the brigades," to be put to death, as valiant South Sea islanders might have done: and then found themselves as sheep to the slaughter before the cunning Hereward, whom they esteemed a magician on account of his craft and his invulnerable armour.

---

* "Volo enim in meo tale quid nunc perpeti corpore semel, quicquid eas ferri vel e metallo excederet."

So at least says Leofric's paraphrast, who tells long confused stories of battles and campaigns, some of them without due regard to chronology; for it is certain that the brave Frisians could not on Robert's first landing have "feared lest they should be conquered by foreigners, as they had heard the English were by the French," because that event had not then happened.

And so much for the war among the Meres of Scheldt.

CHAPTER XII.

HOW HEREWARD TURNED BERSERK.

Torfrida's heart misgave her that first night as to the effects of her exceeding frankness. Her pride in the first place was somewhat wounded; she had dreamed of a knight who would worship her as his queen, hang on her smile, die at her frown; and she had meant to bring Hereward to her feet as such a slave, in boundless gratitude; but had he not rather held his own, and brought her to his feet, by assuming her devotion as his right? And if he assumed that, how far could she trust him not to abuse his claim? Was he quite as perfect seen close, as seen afar off? And now that the intoxication of that meeting had passed off, she began to remember more than one little fault which she would have gladly seen mended. Certain roughnesses of manner which contrasted unfavourably with the polish (merely external though it was), of the Flemish and Norman knights; a boastful self-sufficiency, too, which bordered on the ludicrous at whiles even in her partial eyes; which would be a matter of open laughter to the knights of the Court. Besides, if they laughed at him, they would laugh at her for choosing him. And then wounded vanity came in to help wounded pride; and she sat over the cold embers till almost dawn of day, her head between her hands, musing sadly, and half wishing that the irrevocable yesterday had never come.

But when, after a few months, Hereward returned from his first campaign in Holland, covered with glory and renown, all smiles, and beauty, and health, and good-humour, and gratitude for the magic armour which had preserved him unhurt, then Torfrida forgot all her fears, and thought herself the happiest maid alive for four-and-twenty hours at least.

And then came back, and after that again and again, the old fears. Gradually she found out that the sneers which she had heard at English barbarians were not altogether without ground. Not only had her lover's life been passed among half brutal and wild adventurers; but, like the rest of his nation, he had never felt the influence of that classic civilisation without which good manners seem, even to this day, almost beyond the reach of the white man. Those among whom she had been brought up, whether soldiers or clerks, were probably no nobler or purer at heart—she would gladly have believed them far less so—than Hereward; but the merest varnish of Roman civilisation had given a charm to their manners, a wideness of range to their thoughts, which Hereward had not.

Especially when he had taken too much to drink—which he did, after the Danish fashion, far oftener than the rest of Baldwin's men—he grew rude, boastful, quarrelsome. He would chant his own doughty deeds, and "gab" as the Norman word was, in painful earnest, while they gabbed only in sport, and outvied each other in impossible fanfarronades, simply to laugh down a fashion which was held inconsistent with the modesty of a true knight. Bitter it was to her to hear him announcing to the company, not for the first or second time, how he had slain the Cornish giant, whose height increased by a foot at least every time he was mentioned; and then to hear him answered by some smart, smooth-shaven youth, who, with as much mimicry of his manner as he dared to assume, boasted of having slain in Araby a giant with two heads, and taken out of his two mouths the two halves of the princess whom he was devouring, which being joined together afterwards by the prayers of a holy hermit, were delivered back safe and sound to her father the King of Antioch. And more bitter still, to hear Hereward angrily dispute the story, unaware (at least at first) that he was being laughed at.

Then she grew sometimes cold, sometimes contemptuous, sometimes altogether fierce; and shed bitter tears in secret, when she was complimented on the modesty of her young savage.

But she was a brave maiden; and what was more, she loved him with all her heart. Else why endure bitter words for his sake? And she set herself to teach and train the wild outlaw into her ideal of a very perfect knight.

She talked to him of modesty and humility, the root of all virtues; of chivalry and self-sacrifice; of respect to the weak, and mercy to the fallen; of devotion to God, and awe of His commandments. She set before him the example of ancient heroes and philosophers, of saints and martyrs; and as much awed him by her learning, as by the new world of higher and purer morality, which was opened for the first time to the wandering Viking.

And he drank it all in. Taught by a woman who loved him, he could listen to humiliating truths, which he would have sneered at, had they come from the lips of a hermit or a priest. Often he rebelled; often he broke loose, and made her angry, and himself ashamed: but the spell was on him—a far surer, as well as purer spell than any love-potion of which foolish Torfrida had ever dreamed—the only spell which can really civilise man—that of woman's tact, and woman's purity.

But there were relapses, as was natural. The wine at Robert the Frison's table was often too good; and then Hereward's tongue was loosed, and Torfrida justly indignant. And one evening, there came a very serious relapse, and out of which arose a strange adventure.

For one day the Great Marquis sent for his son to Bruges, ere he set out for another campaign in Holland; and made him a great feast, to which he invited Torfrida and her mother. For Adela of France, the Queen Countess, had heard so much of Torfrida's beauty, that she must needs have her as one of her bower-maidens; and her mother, who was an old friend of Adela's, of course was highly honoured by such a promotion for her daughter.

So they went to Bruges, and Hereward and his men went of course; and they feasted, and harped, and sang; and the saying was fulfilled—

"'Tis merry in the hall
When beards wag all."

But the only beard which wagged in that hall was Hereward's; for the Flemings, like the Normans, prided themselves on their civilised and smooth-shaven chins, and laughed (behind his back) at Hereward, who prided himself on keeping his beautiful English beard, with locks of gold which, like his long golden hair, were combed and curled daily, after the fashion of the Anglo-Danes.

But Hereward's beard began to wag somewhat too fast, as he sat by Torfrida's side, when some knight near began to tell of a wonderful mare, called Swallow, which was to be found in one of the islands of the Scheldt, and was famous through all the country round; insinuating, moreover, that Hereward might as well have brought that mare home with him as a trophy.

Hereward answered, in his boasting vein, that he would bring home that mare, or aught else that he had a liking to.

"You will find it not so easy. Her owner, they say, is a mighty strong churl of a horse-breeder, Dick Hammerhand by name; and as for cutting his throat, that you must not do; for he has been loyal to Countess Gertrude, and sent her horses whenever she needed."

"One may pick a fair quarrel with him nevertheless."

"Then you must bide such a buffet as you never abode before. They say his arm has seven men's strength; and whosoever visits him, he challenges to give and take a blow; but every man that has taken a blow as yet, has never needed another."

"Hereward will have need of his magic head-piece, if he tries that adventure," quoth another.

"Ay," retorted the first speaker; "but the helmet may stand the rap well enough, and yet the brains inside be the worse."

"Not a doubt. I knew a man once, who was so strong, that he would shake a nut till the kernel went to powder, and yet never break the shell."

"That is a lie!" quoth Hereward. And so it was, and told purposely to make him expose himself.

Whereon high words followed, which Torfrida tried in vain to stop. Hereward was flushed with ire and scorn.

"Magic armour, forsooth!" cried he at last. "What care I for armour or for magic? I will wager to you"—"my armour," he was on the point of saying, but he checked himself in time—"any horse in my stable, that I go in my shirt to Scaldmariland, and bring back that mare single-handed."

"Hark to the Englishman. He has turned Berserk at last, like his forefathers. You will surely start in a pair of hose as well, or the ladies will be shamed."

And so forth, till Torfrida was purple with shame, and wished herself fathoms deep; and Adela of France called sternly from the head of the table to ask what the wrangling meant.

"It is only the English Berserker, the Lady Torfrida's champion," said some one in his most courteous tone, "who is not yet as well acquainted with the customs of knighthood as that fair lady hopes to make him hereafter."

"Torfrida's champion?" asked Adela, in a tone of surprise, if not scorn.

"If any knight quarrels with my Hereward, he quarrels with Robert himself!" thundered Count Robert. "Silence!"

And so the matter was hushed up.

The banquet ended; and they walked out into the garden to cool their heads, and play at games, and dance.

Torfrida avoided Hereward: but he, with the foolish pertinacity of a man who knows he has had too much wine, and yet pretends to himself that he has not, would follow her, and speak to her.

She turned away more than once. At last she was forced to speak to him.

"So! You have made me a laughing-stock to these knights. You have scorned at my gifts. You have said—and before these men, too—that you need neither helm nor hauberk. Give me them back, then, Berserker as you are, and go sleep off your wine."

"That will I," laughed Hereward boisterously.

"You are tipsy," said she, "and do not know what you say."

"You are angry, and do not know what you say. Hearken, proud lass. I will take care of one thing, and that is, that you shall speak the truth."

"Did I not say that you were tipsy?"

"Pish! You said that I was a Berserker. And truth you shall speak; for baresark I go to-morrow to the war, and baresark I win that mare or die."

"That will be very fit for you."

And the two turned haughtily from each other.

Ere Torfrida went to bed that night, there was a violent knocking. Angry as she was, she was yet anxious enough to hurry out of her chamber, and open the door herself.

Martin Lightfoot stood there with a large leather case, which he flung at her feet somewhat unceremoniously.

"There is some gear of yours," said he, as it clanged and rattled on the floor.

"What do you mean, man?"

"Only that my master bid me say that he cares as little for his own life as you do." And he turned away.

She caught him by the arm:—

"What is the meaning of this? What is in this mail?"

"You should know best. If young folks cannot be content when they are well off, they will go further and fare worse," says Martin Lightfoot. And he slipt from her grasp and fled into the night.

She took the mail to her room and opened it. It contained the magic armour.

All her anger was melted away. She cried; she blamed herself. He would be killed; his blood would be on her head. She would have carried it back to him with her own hands; she would have entreated him on her knees to take it back. But how face the courtiers? and how find him? Very probably, too, he was by that time hopelessly drunk. And at that thought she drew herself into herself, and trying to harden her heart again, went to bed, but not to sleep; and bitterly she cried as she thought over the old hag's croon:—

"Quick joy, long pain,
You will take your gift again."

It might have been five o'clock the next morning when the clarion rang down the street. She sprang up and drest herself quickly; but never more carefully or gaily. She heard the tramp of horse-hoofs. He was moving a-field early, indeed. Should she go to the window to bid him farewell? Should she hide herself in just anger?

She looked out stealthily through the blind of the little window in the gable. There rode down the street Robert le Frison in full armour, and behind him, knight after knight, a wall of shining steel. But by his side rode one bare-headed, his long yellow curls floating over his shoulders. His boots had golden spurs, a gilt belt held up his sword; but his only dress was a silk shirt and silk hose. He laughed and sang, and made his horse caracol, and tossed his lance in the air, and caught it by the point, like Taillefer at Hastings, as he passed under the window.

She threw open the blind, careless of all appearances. She would have called to him: but the words choked her; and what should she say?

He looked up boldly, and smiled.

"Farewell, fair lady mine. Drunk I was last night: but not so drunk as to forget a promise."

And he rode on, while Torfrida rushed away and broke into wild weeping.

CHAPTER XIII.

HOW HEREWARD WON MARE SWALLOW.

On a bench at the door of his highroofed wooden house sat Dirk Hammerhand, the richest man in Walcheren. From within the house sounded the pleasant noise of slave-women, grinding and chatting at the handquern; from without, the pleasant noise of geese and fowls without number. And as he sat and drank his ale, and watched the herd of horses in the fen, he thought himself a happy man, and thanked his Odin and Thor that owing to his princely supplies of horses to Countess Gertrude, Robert the Frison and his Christian Franks had not harried him to the bare walls, as they would probably do ere all was over.

As he looked at the horses, some half mile off, he saw a strange stir among them. They began whinnying and pawing round a fourfooted thing in the midst, which might be a badger, or a wolf—though both were very uncommon in that pleasant isle of Walcheren; but which plainly had no business there. Whereon he took up a mighty staff, and strode over the fen to see.

He found neither wolf nor badger: but to his exceeding surprise, a long lean man, clothed in ragged horse skins, whinnying and neighing exactly like a horse, and then stooping to eat grass like one. He advanced to do the first thing which came into his head, namely to break the man's back with his staff, and ask him afterwards who he might be. But ere he could strike, the man or horse kicked up with its hind legs in his face, and then springing on to the said hind legs ran away with extraordinary swiftness some fifty yards; and then went down on all-fours and began grazing again.

"Beest thou man or devil?" cried Dirk, somewhat frightened.

The thing looked up. The face at least was human.

"Art thou a Christian man?" asked it in bad Frisian, intermixed with snorts and neighs.

"What's that to thee?" growled Dirk; and began to wish a little that he was one, having heard that the sign of the cross was of great virtue in driving away fiends.

"Thou art not Christian. Thou believest in Thor and Odin? Then there is hope."

"Hope of what?" Dirk was growing more and more frightened.

"Of her, my sister! Ah, my sister, can it be that I shall find thee at last, after ten thousand miles, and thirty years of woeful wandering?"

"I have no man's sister here. At least, my wife's brother was killed——"

"I speak not of a sister in woman's shape. Mine, alas! — oh woeful prince, oh more woeful princess—eats the herb of the field somewhere in the shape of a mare, as ugly as she was once beautiful, but swifter than the swallow on the wing."

"I've none such here," quoth Dirk, thoroughly frightened, and glancing uneasily at mare Swallow.

"You have not? Alas, wretched me! It was prophesied to me by the witch that I should find her in the field of one who worshipped the old gods; for had she come across a holy priest, she had been a woman again, long ago. Whither must I wander afresh!" And the thing began weeping bitterly, and then ate more grass.

"I—that is—thou poor miserable creature," said Dirk, half pitying, half wishing to turn the subject; "leave off making a beast of thyself awhile, and tell me who thou art."

"I have made no beast of myself, most noble earl of the Frisians, for so you doubtless are. I was made a beast of—a horse of, by an enchanter of a certain land, and my sister a mare."

"Thou dost not say so?" quoth Dirk, who considered such an event quite possible.

"I was a prince of the county of Alboronia, which lies between Cathay and the Mountains of the Moon, as fair once as I am foul now, and only less fair than my lost sister; and by the enchantments of a cruel magician we became what we are."

"But thou art not a horse, at all events?"

"Am I not? Thou knowest, then, more of me than I do of myself," and it ate more grass. "But hear the rest of my story. My hapless sister was sold away with me to a merchant: but I, breaking loose from him, fled until I bathed in a magic fountain. At once I recovered my man's shape, and was rejoicing therein, when out of the fountain rose a fairy more beautiful than an elf, and smiled upon me with love.

"She asked me my story, and I told it. And when it was told — 'Wretch!' she cried, 'and coward, who hast deserted thy sister in her need. I would have loved thee, and made thee immortal as myself: but now thou shalt wander ugly and eating grass, clothed in the horse-hide which has just dropped from thy limbs, till thou shalt find thy sister, and bring her to bathe, like thee, in this magic well.'"

"All good spirits help us! And you are really a prince?"

"As surely," cried the thing with a voice of sudden rapture, "as that mare is my sister;" and he rushed at mare Swallow. "I see, I see, my mother's eyes, my father's nose——"

"He must have been a chuckle-headed king that, then," grinned Dick to himself. "The mare's nose is as big as a buck-basket. But how can she be a princess, man—prince I mean? she has a foal running by her here."

"A foal?" said the thing solemnly. "Let me behold it. Alas, alas, my sister! Thy tyrant's threat has come true, that thou shouldst be his bride whether thou wouldst or not. I see, I see in the features of thy son his hated lineaments."

"Why he must be as like a horse, then, as your father. But this will not do, Master Horse-man; I know that foal's pedigree better than I do my own."

"Man, man, simple, though honest!—Hast thou never heard of the skill of the enchanter of the East? How they transform their victims at night back again into human shape, and by day into the shape of beasts again?"

"Yes—well—I know that——"

"And do you not see how you are deluded? Every night, doubt not, that mare and foal take their human shape again; and every night, perhaps, that foul enchanter visits in your fen, perhaps in your very stable, his wretched and perhaps unwilling bride."

"An enchanter in my stable? That is an ugly guest. But no. I've been into the stables fifty times, to see if that mare was safe. Mare was mare, and colt was colt, Mr. Prince, if I have eyes to see."

"And what are eyes against enchantments? The moment you opened the door, the spell was cast over them again. You ought to thank your stars that no worse has happened yet; that the enchanter, in fleeing, has not wrung your neck as he went out, or cast a spell on you, which will fire your barns, lame your geese, give your fowls the pip, your horses the glanders, your cattle the murrain, your children the St. Vitus' dance, your wife the creeping palsy, and yourself the chalk-stones in all your fingers."

"The Lord have mercy on me! If the half of this be true, I will turn Christian. I will send for a priest, and be baptized to-morrow!"

"Oh, my sister, my sister! Dost thou not know me? Dost thou answer my caresses with kicks? Or is thy heart, as well as thy body, so enchained by that cruel necromancer, that thou preferrest to be his, and scornest thine own salvation, leaving me to eat grass till I die?"

"I say, Prince—I say—What would you have a man to do? I bought the mare honestly, and I have kept her well. She can't say aught against me on that score. And whether she be princess or not, I'm loth to part with her."

"Keep her then, and keep with her the curse of all the saints and angels. Look down, ye holy saints" (and the thing poured out a long string of saints' names), "and avenge this catholic princess, kept in bestial durance by an unbaptized heathen! May his——"

"Don't! don't!" roared Dirk. "And don't look at me like that" (for he feared the evil eye), "or I'll brain you with my staff!"

"Fool, if I have lost a horse's figure, I have not lost his swiftness. Ere thou couldst strike, I should have run a mile and back, to curse thee afresh." And the thing ran round him, and fell on all-fours again, and ate grass.

"Mercy, mercy! And that is more than I ever asked yet of man. But it is hard," growled he, "that a man should lose his money, because a rogue sells him a princess in disguise."

"Then sell her again; sell her, as thou valuest thy life, to the first Christian man thou meetest. And yet no. What matters? Ere a month be over, the seven years' enchantment will have passed, and she will return to her own shape, with her son, and vanish from thy farm, leaving thee to vain repentance, and so thou wilt both lose thy money, and get her curse. Farewell, and my malison abide with thee."

And the thing, without another word, ran right away, neighing as it went, leaving Dirk in a state of abject terror.

He went home. He cursed the mare, he cursed the man who sold her, he cursed the day he saw her, he cursed the day he was born. He told his story with exaggerations and confusions in plenty to all in the house; and terror fell on them likewise. No one, that evening, dare go down into the fen to drive the horses up; and Dirk got very drunk, went to bed, and trembled there all night (as did the rest of the household), expecting the enchanter to enter on a flaming fire-drake, at every howl of the wind.

The next morning, as Dirk was going about his business with a doleful face, casting stealthy glances at the fen, to see if the mysterious mare was still there, and a chance of his money still left, a man rode up to the door.

He was poorly clothed, with a long rusty sword by his side. A broad felt hat, long boots, and a haversack behind his saddle, showed him to be a traveller, seemingly a horse dealer; for there followed him, tied head and tail, a brace of sorry nags.

"Heaven save all here," quoth he, making the sign of the cross. "Can any good Christian give me a drink of milk?"

"Ale, if thou wilt," said Dirk. "But what art thou, and whence?"

On any other day, he would have tried to coax his guest into trying a buffet with him for his horse and clothes: but this morning his heart was heavy with the thought of the enchanted mare, and he welcomed the chance of selling her to the stranger.

"We are not very fond of strangers about here, since these Flemings have been harrying our borders. If thou art a spy, it will be worse for thee."

"I am neither spy nor Fleming: but a poor servant of the Lord Bishop of Utrecht's, buying a garron or two for his lordship's priests. As for these Flemings, may St. John Baptist save from them both me and you. Do you know of any man who has horses to sell hereabouts?"

"There are horses in the fen yonder," quoth Dirk, who knew that churchmen were likely to give a liberal price, and pay in good silver.

"I saw them as I rode up. And a fine lot they are: but of too good a stamp for my short purse, or for my holy masters' riding,—a fat priest likes a quiet nag, my master."

"Humph. Well, if quietness is what you need, there is a mare down there, a child might ride her with a thread of wool. But as for price—— And she has a colt, too, running by her."

"Ah?" quoth the horseman. "Well, your Walcheren folk make good milk, that's certain. A colt by her? That's awkward. My lord does not like young horses; and it would be troublesome, too, to take the thing along with me."

The less anxious the dealer seemed to buy, the more anxious grew Dirk to sell; but he concealed his anxiety, and let the stranger turn away, thanking him for his drink.

"I say!" he called after him. "You might look at her, as you ride past the herd."

The stranger assented, and they went down into the fen, and looked over the precious mare, whose feats were afterwards sung by many an English fire-side, or in the forest, beneath the hollins green, by such as Robin Hood and his merry men. The ugliest, as well as the swiftest, of mares, she was, say the old chroniclers; and it was not till the stranger had looked twice at her, that he forgot her great chuckle-head, greyhound-flanks, and drooping hind-quarters, and began to see the great length of those same quarters,—the thighs let down into the hocks, the arched loin, the extraordinary girth through the saddle, the sloping shoulder, the long arms, the flat knees, the large well-set hoofs, and all the other points which showed her strength and speed, and justified her fame.

"She might carry a big man like you through the mud," said he carelessly: "but as for pace, one cannot expect that with such a chuckle head. And if one rode her through a town, the boys would call after one, 'All head and no tail'—Why I can't see her tail for her quarters, it is so ill set on."

"Ill set on, or none," said Dirk, testily, "don't go to speak against her pace, till you have seen it. Here, lass!"

Dirk was in his heart rather afraid of the princess: but he was comforted when she came up to him like a dog.

"She's as sensible as a woman," said he; and then grumbled to himself, "may be, she knows I mean to part with her."

"Lend me your saddle," said he to the stranger.

The stranger did so; and Dirk mounting, galloped her in a ring. There was no doubt of her powers, as soon as she began to move.

"I hope you won't remember this against me, madam," said Dirk, as soon as he got out of the stranger's hearing. "I can't do less than sell you to a Christian. And certainly I have been as good a master to you as if I'd known who you were; but if you wish to stay with me you've only to kick me off, and say so, and I'm yours to command."

"Well, she can gallop a bit," said the stranger, as Dirk pulled her up and dismounted: "but an ugly brute she is nevertheless, and such a one as I should not care to ride, for I am a gay man among the ladies. However, what is your price?"

Dirk named twice as much as he would have taken.

"Half that, you mean." And the usual haggle began.

"Tell thee what," said Dirk at last. "I am a man who has his fancies; and this shall be her price; half thy bid, and a box on the ear."

The demon of covetousness had entered Dirk's heart. What if he got the money, brained or at least disabled the stranger, and so had a chance of selling the mare a second time to some fresh comer?

"Thou art a strange fellow," quoth the horsedealer. "But so be it."

Dirk chuckled. "He does not know," thought he, "that he has to do with Dirk Hammerhand," and he clenched his fist in anticipation of his rough joke.

"There," quoth the stranger, counting out the money carefully, "is thy coin. And there—is thy box on the ear."

And with a blow which rattled over the fen, he felled Dirk Hammerhand to the ground.

He lay senseless for a moment, and then looked wildly round. His jaw was broken.

"Villain!" groaned he. "It was I who was to give the buffet, not thou!"

"Art mad?" asked the stranger, as he coolly picked up the coins, which Dirk had scattered in his fall. "It is the seller's business to take, and the buyer's to give."

And while Dirk roared for help in vain he leapt on mare Swallow and rode off shouting,

"Aha! Dirk Hammerhand! So you thought to knock a hole in my skull, as you have done to many a better man than yourself. He is a lucky man who never meets his match, Dirk. I shall give your love to the Enchanted Prince, my faithful servingman, whom they call Martin Lightfoot."

Dirk cursed the day he was born. Instead of the mare and colt, he had got the two wretched garrons which the stranger had left, and a face which made him so tender of his own teeth, that he never again offered to try a buffet with a stranger.

CHAPTER XIV.

HOW HEREWARD RODE INTO BRUGES LIKE A BEGGARMAN.

THE spring and summer had passed, and the autumn was almost over, when great news came to the Court of Bruges, where Torfrida was now a bowermaiden.

The Hollanders had been beaten till they submitted; at least for the present. There was peace, at least for the present, through all the isles of Scheldt; and more than all, the lovely Countess Gertrude had resolved to reward her Champion by giving him her hand, and the guardianship of her lands and the infant son.

And Hereward?

From him, or of him, there was no word. That he was alive and fighting, was all the messenger could say.

Then Robert came back to Bruges, with a gallant retinue, leading home his bride. And there met him his father and mother, and his brother of Mons, and Richilda the beautiful and terrible sorceress—who had not yet stained her soul with those fearful crimes which she had expiated by fearful penances in after years, when young Arnoul, the son for whom she had sold her soul, lay dead through the very crimes by which she had meant to make him a mighty prince. And Torfrida went out with them to meet Count Robert, and looked for Hereward, till her eyes were ready to fall out of her head. But Hereward was not with them.

"He must be left behind, commanding the army," thought she. "But he might have sent one word!"

There was a great feast that day, of course; and Torfrida sat thereat: but she could not eat. Nevertheless she was too proud to let the knights know what was in her heart; so she chatted and laughed as gaily as the rest, watching always for any word of Hereward. But none mentioned his name.

The feast was long; the ladies did not rise till nigh bedtime; and then the men drank on.

They went up to the Queen-Countess's chamber; where a solemn undressing of that royal lady usually took place.

The etiquette was this. The Queen-Countess sat in her chair of state in the midst, till her shoes were taken off, and her hair dressed for the night. Right and left of her, according to their degrees, sat the other great ladies; and behind each of them, where they could find places, the maidens.

It was Torfrida's turn to take off the royal shoes; and she advanced into the middle of the semicircle, slippers in hand.

"Stop there!" said the Countess-Queen.

Whereat Torfrida stopped, very much frightened.

"Countesses and ladies," said the mistress. "There are, in Provence and the South, what I wish there were here in Flanders—Courts of Love, at which all offenders against the sacred laws of Venus and Cupid are tried by an assembly of their peers, and punished according to their deserts."

Torfrida turned scarlet.

"I know not why we, countesses and ladies, should have less knowledge of the laws of love than those gayer dames of the South, whose blood runs—to judge by her dark hair—in the veins of yon fair maid."

There was a silence. Torfrida was the most beautiful woman in the room; more beautiful than even Richilda the terrible: and therefore there were few but were glad to see her—as it seemed—in trouble.

Torfrida's mother began whimpering, and praying to six or seven saints at once. But nobody marked her—possibly not even the saints; being preoccupied with Torfrida.

"I hear, fair maid—for that you are that I will do you the justice to confess—that you are old enough to be married this four years since."

Torfrida stood like a stone, frightened out of her wits, plentiful as they were.

"Why are you not married?"

There was, of course, no answer.

"I hear that knights have fought for you; lost their lives for you."

"I did not bid them," gasped Torfrida, longing that the floor would open, and swallow up the Queen-Countess and all her kin and followers, as it did for the enemies of the blessed Saint Dunstan, while he was arguing with them in an upper room at Calne.

"And that the knight of St. Valery, to whom you gave your favour, now lies languishing of wounds got in your cause."

"I—I did not bid him fight," gasped Torfrida, now wishing that the floor would open and swallow up herself.

"And that he who overthrew the knight of St. Valery—to whom you gave that favour, and more—"

"I gave him nothing a maiden might not give," cried Torfrida, so fiercely that the Queen-Countess recoiled somewhat.

"I never said that you did, girl. Your love you gave him. Can you deny that?"

Torfrida laughed bitterly: her Southern blood was rising.

"I put my love out to nurse, instead of weaning it, as many a maiden has done before me. When my love cried for hunger and cold, I took it back again to my own bosom: and whether it has lived or died there, is no one's matter but my own."

"Hunger and cold? I hear that him to whom you gave your love, you drove out to the cold, bidding him go fight in his bare shirt, if he wished to win your love."

"I did not. He angered me—He"—and Torfrida. found herself in the act of accusing Hereward.

She stopped instantly.

"What more, Majesty? If this be true, what more may not be true of such a one as I? I submit myself to your royal grace."

"She has confessed. What punishment, ladies, does she deserve? Or, rather, what punishment would her cousins of Provence inflict, did we send her southward, to be judged by their Courts of Love?"

One lady said one thing, one another. Some spoke cruelly; some worse than cruelly; for they were coarse ages, the ages of faith; and ladies said things then in open company which gentlemen would be ashamed to say in private now.

"Marry her to a fool," said Richilda, at last, bitterly.

"That is too common a misfortune," answered the lady of France. "If we did no more to her, she might grow as proud as her betters."

Adela knew that her daughter-in-law considered her husband a fool; and was somewhat of the same opinion, though she hated Richilda.

"No," said she; "we will do more. We will marry her to the first man who enters the castle."

Torfrida looked at her mistress to see if she were mad. But the Countess-Queen was serene and sane. Then Torfrida's southern heat and northern courage burst forth.

"You? marry? me? to? ——" said she, slowly, with eyes so fierce, and lips so livid, that Richilda herself quailed.

There was a noise of shouting and laughing in the court below, which made all turn and listen.

The next moment a serving man came in, puzzled and inclined to laugh.

"May it please your Majesty, here is the strangest adventure. There is ridden into the castle-yard a beggarman, with scarce a shirt to his back, on a great ugly mare, with a foal running by her, and a fool behind him, carrying lance and shield. And he says that he is come to fight any knight of the Court, ragged as he stands, for the fairest lady in the Court, be she who she may, if she have not a wedded husband already."

"And what says my Lord Marquis?"

"That it is a fair challenge, and a good adventure; and that fight he shall, if any man will answer his defiance."

"And I say, tell my Lord the Marquis, that fight he shall not: for he shall have the fairest maiden in this Court for the trouble of carrying her away; and that I, Adela of France, will give her to him. So let that beggar dismount, and be brought up hither to me."

There was silence again. Torfrida looked round her once more, to see whether or not she was dreaming, and whether there was one human being to whom she could appeal. Her mother sat praying and weeping in a corner. Torfrida looked at her with one glance of scorn, which she confessed and repented, with bitter tears, many a year after, in a foreign land; and then turned to bay with the spirit of her old Paladin ancestor, who choked the Emir at Mont Majeur.

Married to a beggar! It was a strange accident; and an ugly one; and a great cruelty and wrong. But it was not impossible, hardly improbable, in days when the caprice of the strong created accidents, and when cruelty and wrong went for nothing, even with very kindly honest folk. So Torfrida faced the danger, as she would have faced that of

"HEREWARD IT WAS, AND SHE LAY UPON HIS NECK."

Page 269.

a kicking horse, or a flooded ford; and like the nut-brown bride,

> "She pulled out a little penknife,
> That was both keen and sharp,"

and considered that the beggarman could wear no armour, and that she wore none either. For if she succeeded in slaying that beggarman, she might need to slay herself after, to avoid being—according to the fashion of those days—burnt alive.

So when the arras was drawn back, and that beggarman came into the room, instead of shrieking, fainting, hiding, or turning, she made three steps straight toward him, looking him in the face like a wild cat at bay. Then she threw up her arms; and fell upon his neck.

It was Hereward himself. Filthy, ragged: but Hereward.

His shirt was brown with gore, and torn with wounds; and through its rents showed more than one hardly healed scar. His hair and beard was all in elf-locks; and one heavy cut across the head had shorn not only hair, but brain-pan, very close. Moreover, any nose, save that of Love, might have required perfume.

But Hereward it was; and regardless of all beholders, she lay upon his neck, and never stirred nor spoke.

"I call you to witness, ladies," cried the Queen-Countess, "that I am guiltless. She has given herself to this beggarman of her own free will. What say you?" And she turned to Torfrida's mother.

Torfrida's mother only prayed and whimpered.

"Countesses and Ladies," said the Queen-Countess, "There will be two weddings to-morrow. The first will be that of my son Robert and my pretty Lady Gertrude here. The second will be that of my pretty Torfrida and Hereward."

"And the second bride," said the Countess Gertrude, rising and taking Torfrida in her arms, "will be ten times prettier than the first. There, sir, I have done all you asked of me. Now go and wash yourself."

* * * * *

"Hereward," said Torfrida, a week after, "and did you really never change your shirt all that time?"

"Never. I kept my promise."

"But it must have been very nasty."

"Well, I bathed now and then."

"But it must have been very cold."

"I am warm enough now."

"But did you never comb your hair, neither?"

"Well, I won't say that. Travellers find strange bed-fellows. But I had half a mind never to do it at all, just to spite you."

"And what matter would it have been to me?"

"Oh! none. It is only a Danish fashion we have of keeping clean."

"Clean? You were dirty enough when you came home. How silly you were! If you had sent me but one word!"

"You would have fancied me beaten, and scolded me all over again. I know your ways now, Torfrida."

THE REIGN OF LAW.

By THE DUKE OF ARGYLL.

(Concluded from page 232.)

We see, then, how the existence of organs separated from function and of structures without immediate use, find their natural place among all the other phenomena of the world. They do not show that "Law" is ever superior to Will, or can ever assert, even for a moment, an independence of its own. On the contrary they show, as nothing else can show, the patient movements, and the incalculable years, through which material laws have been made to follow the steps of purpose.

But then let us remember this:—these discoveries in physiology, though they are helpless to prove that Law has ever been present as a master, are eminently suggestive of the idea that Law has never been absent as a servant:—that as in governing the world, so in forming it, material forces have been always used as the instruments of Will.

It is no mere theory, but a fact as certain as any other fact of science, that Creation has had a history. It has not been a single act, done and finished once for all; but a long series of acts—a work continuously pursued through an inconceivable lapse of time. It is another fact equally certain that this work, as it has been pursued in time, so also it is a work which has been pursued by method. For each class of animal some definite type or pattern has been adhered to; and the modifications of that type have been gradual and successive. These are the facts on which the idea of "Creation by Law" is founded. Let us look a little nearer what this idea is, and what it involves. It is an idea much vaunted by some men, much feared by others. Perhaps it may be found, on closer investigation, that they are fearing or worshipping, as the case may be, an idol of the imagination.

Words which should be the servants of thought are too often its masters, and I know no word which is more ambiguously, and therefore more injuriously used than the word "Law." I do not mean that it may not be legitimately used in several different senses. It is in all cases, as applied in science, a metaphor, and one which has relation to many different kinds or degrees of likeness in the ideas which are compared. It matters little in which of these senses it is used, provided the distinctions between them are kept clearly in view, and provided we watch against the fallacies which must arise when we pass insensibly from one meaning to another. There are at least four different senses which must be carefully distinguished.

First. We have "Law" as applied simply to "an observed order of facts." In this sense there need be no dispute at all in respect to "Creation by Law." There can be no doubt that there is an "observed order" among the forms of organic Life, in the strictest scientific sense. There are phenomena in uniform connection. There are relations which can be made and are made the basis of systematic classification. These classifications are imperfect not because they are founded on ideal connections which do not really exist, but only because they fail in representing adequately the subtle and pervading order which binds together all living things. The order which prevails in the existing world is, as we have seen, not the only order which has been recognised and ascertained by science. A like order has prevailed through all the past history of Creation. In almost all the leading types of Life which have existed in different geological ages, there is an orderly gradation connecting the forms which were becoming extinct with the forms which were for the first time appearing in the world. The facts of Creation therefore do range themselves in an observed order, and in this sense at least there is no doubt that Creation has been "by Law."

But now, secondly, we have "Law" applied not merely to an observed order of facts, but to that order as involving the action of some force or forces, of which nothing more may be known, than their visible effects. Every observed order in physical phenomena suggests irresistibly to the mind the operation of some physical cause. We say of an observed order of facts that it must be due to some "Law"—meaning simply that all order involves the idea of some arranging cause—the working of some force or forces, whether they be such as we can trace and define or not. In this second sense also, then, there can be no doubt that Creation has been "by Law."

Thirdly. We have "Law" as applied to individual forces, the measure of whose operation has been more or less defined and ascertained. Force is the root idea of Law in its scientific sense, and to ascertain the measures of force is the great object of pure science. The Law of gravitation, which is the purest example of Law in this sense, is not merely the "observed order" in which the heavenly bodies move: neither is it only the abstract idea of some force which compels those movements; but it is the exact numerical rule which Newton discovered as the rule, or measure, according to which the force of gravitation acts, and by which it is described and defined. The general idea that some force is at the bottom of all phenomena which are invariably consecutive is a very different thing from knowing what that force is in respect to the rule or measure of its operation. The knowledge that all particles of matter exert an attractive force upon each other, is, so far as it goes, a definite idea: but it is less complete and definite than the idea that the measure of that attraction is "directly as the mass and inversely as the square of the distance."

Now, it is certain that nothing is known or has ever been guessed at, in respect to the history and origin of Life, which corresponds with Law in this its strictest and most definite sense. We have no knowledge of any one or more forces—such as the force of gravitation, or of magnetic attraction and repulsion—to which any one of the phenomena of Life can be referred. Far less have we any knowledge of any such laws which can be connected with the successive creation or development of new organisms. Professor Huxley, in a recent work, has indeed spoken of "that combination of natural forces which we call Life." But this language is purely rhetorical. I do not mean to say that Life may not be defined to be a kind of force, or a combination of forces. All I mean is that we know nothing of any of these forces in the same sense in which we do know something of the force of gravity, or of magnetism, or of electricity, or of chemical affinity. No such knowledge exists in respect to any of the forces which have been concerned in the development of Life. No man has ever pretended to get such a view of any of these as to enable him to apply to them the instruments of his analysis, or to trace in their working any of those definite relations to space, or time, or number which are always the ultimate quest of science, and the discovery of which is her great reward.

But, fourthly, there is still another sense in which "Law" is habitually used in science, and this is perhaps the commonest and most important of all. It is used to designate not merely an observed order of facts—not merely the bare abstract idea of force—not merely individual forces according to ascertained measures of operation—but a number of forces in the condition of mutual adjustment, that is to say, as combined with each other, and fitted to each other for the attainment of special ends. The whole science of mechanics, for example, deals with Law in this sense—with natural forces as related to purpose and subservient to intention. And here we come upon "Law" in a sense which is more perfectly intelligible to us than in any other; because although we know nothing of the real nature of force, even of that force which is resident in ourselves, we do know for what ends we exert it, and what is the "Law" governing our devices for its use. That law is—combination for the accomplishment of purpose. The universal prevalence of this idea in Nature is indicated by the irresistible tendency which we observe in the language of science to personify the forces, and the combinations of force by which all natural phenomena are produced. It is a great injustice to scientific men—too often committed—to suspect them of unwillingness to accept the idea of a personal

Creator merely because they try to keep separate the language of science from the language of theology. But it is curious to observe how this endeavour constantly breaks down—how impossible it is in describing physical phenomena to avoid the phraseology which identifies them with the phenomena of mind, and is moulded on our own conscious personality and will. It is impossible to avoid this language simply because no other language conveys the impression which innumerable structures leave upon the mind. Take, for example, the word "contrivance." How could science do without it? How could the great subject of animal mechanics be dealt with scientifically without continual reference to "Law" as that by which, and through which, special organs are formed for the doing of special work? What is the very definition of a machine? Machines do not increase force, they only adjust it. The very idea and essence of a machine is that it is a contrivance for the distribution of force with a view to its bearing on special purposes. A man's arm is a machine in which the law of leverage is supplied to the vital force for the purposes of prehension. We have seen that a bird's wing is a machine in which the same law is applied, under the most complicated conditions, for the purposes of flight. Anatomy supplies an infinite number of similar examples. It is impossible to describe or explain the facts we meet with in this or in any other branch of science without investing the "laws" of Nature with something of that personality which they do actually reflect, or without conceiving of them as partaking of those attributes of mind which we everywhere recognise in their working and results.

It will be seen, then, that of these four senses in which the word "Law" is used, there are three which can be applied with correctness to the work of Creation so far as it is known to us. First, in respect of the fact that Creation has followed a certain order: secondly, in respect of the fact that this order implies a method, and the instrumentality of means: and thirdly, that throughout Creation the forces which are employed (whatever they may be) have been combined under the supreme "Law" of adaptation to specific purposes.

And here it must be pointed out that the idea of "Law" in this last and highest sense can never be supplanted or displaced by any amount of discovery in respect to the individual forces out of which these combinations are contrived. If we could trace all the forces concerned in the development of a young animal as clearly and as definitely as we can trace the forces employed in the construction of a steam-engine, it would not alter or affect in the least degree the "Law" which is perceived in the intricate adjustments of its frame to purpose and to function. And this which is true of the birth of every individual animal is equally true of the first creation of a new form of Life. Let us remember that when we speak of Forces, we speak of something of whose seat and of whose nature we know really nothing. What is force? What is our conception of it? What idea, for example, can we form of the real nature of that force, the measure of whose operation has been so exactly ascertained—the force of gravitation? It is invisible,—imponderable. All our words for it are but circumlocutions to express its phenomena or its effects. There are many kinds of force in nature, which we distinguish from each other according to their effects, or according to the forms of matter in which they become cognisable to us. But if we trace up our conceptions on the nature of force to their fountain-head, we shall find that they are connected more or less directly with our own consciousness of living effort—of that force which has its seat in our own vitality, and especially with that kind of it which can be called forth at the bidding of the will. If we can ever know anything of the nature of any force, it ought to be of this one. And yet the fact is that we know nothing. The vital forces which work in our organisation work for the most part entirely independent of our will, and even of our consciousness. Those of them which are at the bidding of the will are subject to it only through an elaborate machinery; and if that machinery be damaged, we know too often by sad experience that their connection with the will is broken. If, then, we know nothing of that kind of force which is so near us, and with which our own intelligence is in such close alliance, much less can we know the nature of force in its other forms. It is important to remember this, because both the aversion with which some men regard the idea of Creation by Law, and the eagerness with which some others hail it, are founded on a notion that, when we have traced any given phenomena to what are called natural forces, we have traced them farther than we really have. We know nothing of the ultimate seat of force. Science, in the modern doctrine of the Conservation of Energy, and Convertibility of Forces, is already getting something like a firm hold of the idea that all kinds of force are but forms and manifestations of some one central Force, issuing from some one fountain-head of power. Sir John Herschel has not hesitated to say that "it is but reasonable to regard the force of gravitation as the direct or indirect result of a consciousness and a will existing somewhere." And even if we cannot assume that force, in all its forms, is due to the direct working of the Creator, at least let us not think or speak of the forces of nature as if they were independent of, or even separate from, His Power. All the speculations now so common in respect to "Creation by Law" are simply speculations as to the method employed in the work of Creation. I do not know on what authority it is that we so often speak as if Creation were not Creation, unless it works from nothing as its material, and by nothing as its means. We know that out of the dust of the ground, that is out of the ordinary elements of nature, are our own bodies formed and the bodies of all living things. Nor is there anything that should shock us in the idea that the creation of new forms, any more than their propagation, has been brought about by the use and instrumentality of means. In a theological point of view it matters nothing what those means have been. Mons. Guizot has said with truth in a recent work that "those only would be serious adversaries of the doctrine of Creation who could affirm that the universe—the earth and man upon it—have been from all eternity, and in all respects, just what they are now." But this cannot be affirmed except in the teeth of facts which science has clearly ascertained. There has been a continual coming-to-be of new forms of Life. This is Creation, no matter what have been the forces or "Laws" employed by Creative Power.

This will be more clearly seen if we look for a moment at the particular theory upon the origin of species which has most influence in the present time. The theory of Mr. Darwin has this in common with all other theories of development—that he considers a new species has always been at first simply an unusual birth. But he does not pretend to have discovered any rule or "Law" according to which new forms have been born from old forms. He does not hold that outward conditions, however changed, are sufficient to account for them. Still less does he connect them with the effort or aspirations of any organism after new faculties and powers. He frankly confesses that "our ignorance of the laws of variation is profound." He says we know nothing "of the cause of each particular variation." He "believes in no law of necessary development." In short, his theory sets forth, in part at least, the natural causes which tend to secure the success and spread of new forms *when they have been born;* but it does not even pretend to suggest the law under which such new births are brought about. The very terms which he employs demonstrate this. The idea which is the very essence of his theory, and which has almost established itself in the language of science, is the idea of "natural selection." But natural selection can do nothing except with the materials presented to its hands. It cannot "select" except among the things open to selection. Natural selection can originate or "create" nothing: it can only pick and choose among the things which are originated under some other law—that is, under some other combinations of force. Strictly speaking, therefore, Mr. Darwin's theory is not a theory on the origin of species at all, but only a theory on the causes which lead to the relative success or failure of such new forms as may be born into the world. It is in this point of view only that his theory has found very wide acceptance, because it groups under a convenient name, and according to a true analogy, the causes which determine the comparative success or failure of existing organisms in the "struggle for existence." But it is forgotten that these causes can only come into operation among forms which do exist, and has no connection whatever with those other causes which may be concerned in bringing them into existence. There are two fundamental assumptions to be made before Mr. Darwin's theory can be brought to bear at all upon the history of creation—first, that new forms of life have never been produced otherwise than by birth from pre-existing forms; secondly, that the varieties which are born always vary from their parents in a direction which gives them some comparative advantage in the battle of Life. It is obvious that any new structure which does not supply some direct advantage—any change of mere beauty and variety—is not provided for in the theory, even as regards its preservation and establishment. Of Mr. Darwin's theory, therefore, this may be said with certainty, first, that it does not account for the *origin* of any structure whatever, and secondly, it accounts even for the *preservation* of only a certain number.

As regards the "origin of species,"—the first creation of new forms of Life,—we are left as ignorant as we were before in respect to the instrumentality which has been employed. Even if it were assumed that no other instrumentality than ordinary generation has ever been employed, it must have been employed under extraordinary conditions, and directed to extraordinary results. But there is no scientific basis for this assumption. Mr. Darwin says, truly enough, that "inheritance is that cause which alone, as far as we positively know, produces organisms quite like or nearly like each other." But this is no reason why we should conclude that inheritance is the only cause which can produce organisms quite unlike, or only very partially like each other. We are surely not entitled to assume that all degrees or kinds of likeness can only arise from this single cause. Yet until this extreme proposition be proved, or rendered probable, we have a sound scientific basis for doubting the assumption precisely in proportion to the unlikeness of the animals to which it is applied. And this is the ground of reasoning, besides the ground of instinctive feeling, on which we revolt from the doctrine as applied to Man. We do so because we are conscious of an amount and of a kind of difference between ourselves and the lower animals which is in sober truth immeasurable in spite of the close affinities of bodily structure. The closeness of those affinities, in contrast with the gulf of separation in all other characters, is one of the profoundest mysteries of nature. Professor Huxley has published a work on "Man's Place in Nature," the object of which is to prove that so far as mere structure is concerned, "the differences which separate him from the Gorilla and the Chimpanzee are not so great as those which separate the Gorilla from the lower Apes." On the frontispiece of this work he exhibits in a series the skeletons of the Anthropoid Apes and of Man. It is a grim and a grotesque procession. The Form which leads it, however like the others in mere structural plan, is immensely different in those infinite modifications of the shapes of matter which have such mysterious power of expressing the characters of mind. And significant as these differences are in the skeleton, they are as nothing to the differences which emerge in the living creatures. Huxley himself admits that these differences amount to "an enormous gulf"—to a "divergence immeasurable,—practically infinite." What more striking proof could we have than this, that organic forms are but as clay in the hands of the potter, and that the "Law" of structure is entirely subordinate to the "Law" of purpose and intention under which its various parts are combined for use?

But Science will ask, even if she never gets an answer, what is the physical agency employed in producing this common structure? Very probably this is a question incapable of solution. It certainly is not solved as yet. There is no proof that inheritance is the only cause from which such community can arise. In the inorganic world, which passes by insensible gradations into the world of living organisms, we know that not mere similarity, but absolute identity of form, as in crystals, is the result of forces which have nothing to do with inheritance, but whose function it is to aggregate the particles of matter in identic shapes. It is impossible to say how far a similar unity of effect may have been impressed on the forces through which vital organisms are first started on their way. There are some essential resemblances between all forms of Life which it is impossible to connect, even in imagination, with community of blood. For example, the two-sided arrangement is common to all animals. Again, the general mechanism of the digestive organs is also common through an equal range. These are fundamental similarities of plan, depending probably on the very nature of forces of which we know nothing, but which we have not the slightest reason to suppose are connected with inheritance. Other similarities of plan may depend on the same adjustments of force to force, equally unconnected with inheritance by descent. For whatever may be these forces in themselves, it is certain that they are all combined with a view to purpose: and no theory or discovery in respect to them, or to the means and method employed in the work of creation, can have the slightest effect in removing that work from the relation in which it stands to the attributes of intelligence and of Will.

It is therefore a great mistake to suppose that the progress of modern investigation is in a direction tending to materialism. This may be and always has been the tendency of individual minds. There are men who would stare into the very Burning Bush without a thought that the ground on which they stand must be Holy ground. Nothing is more common than to find men who may be trusted thoroughly on the facts of their own science, who cannot be trusted for a moment on the place which those facts assume in the general system of truth. Philosophy must include science; but science does not necessarily include philosophy. There are, and there always have been, some special misconceptions connected with the prosecution of physical research. It is, however, on the surface of things, rather than below it, that the suggestions of materialism lie thickest to the eye. They abound among the commonest facts which force themselves on our attention in nature and in human life. When the bursting of some small duct of blood upon the brain is seen to destroy in a moment the mind of man, and to break down all the powers of his intellect and his will, we are in presence of a fact whose significance cannot be increased by a million of other facts analogous in kind. Yet on every fresh discovery of a few more such facts, there is generally some fresh outbreak of old delusions respecting the forms and the "laws" of matter as the supreme realities of the world. But when the new facts have been looked at a little longer, it is always seen that they take their place with others which have been long familiar, and the eternal problems which lie behind all natural phenomena are seen to be unaffected and unchanged. Thus it is that the notions of materialism are perpetually reviving, and are again being perpetually swept away—swept away partly before the intuitions of the mind, partly before the conclusions of the reason. For there are two great enemies to materialism,—one rooted in the affections, the other in the intellect. One is the power of THINGS HOPED FOR—a power which never dies: the other is the evidence arising out of THINGS NOT SEEN—and these are at the root of all we see. In reinforcing this evidence and adding to it, Science is doing good work in the present day. It is not the extent of our knowledge, but rather the limits of it, that physical research teaches us to see and to feel the most. Of course, in so far as its discoveries are really true, its influence must be for good. To doubt this were to doubt that all truth is true, and that all truth is God's. There are eddies in every stream—eddies where rubbish will collect, and circle for a time. But the ultimate bearing of scientific truth cannot be mistaken. Nothing is more remarkable in the present state of physical research than what may be called the transcendental character of its results. And what is transcendentalism but the tendency to trace up all things to the relation in which they stand to abstract ideas? And what is this but to bring all physical phenomena nearer and nearer into relation with the phenomena of mind? The old speculations of philosophy which cut the ground from materialism by showing how little we know of matter, are now being daily reinforced by the subtle analysis of the physiologist, the chemist, and the electrician. Under that analysis matter dissolves and disappears, surviving only as the phenomena of Force; which again is seen converging along all its lines to some common centre—"sloping through darkness up to God." Even the writers who have incurred most reasonable suspicion as to the drift of their teaching, give nevertheless constant witness to what may be called the purely mental quality of the ultimate results of physical inquiry. Mr. Lewes, for example, in his work on Aristotle, says: "The fundamental ideas of modern science are as transcendental as any of the axioms in ancient Philosophy." I have already referred to the idea which the progress of Physiology has led us to apprehend so clearly, that the vital forces whose play is seen in the phenomena of animal life are not the result but the cause of organisation, inasmuch as material organs are merely the special forms built up and fashioned by those forces for the discharge of special functions. This doctrine, and all similar conclusions in other departments of inquiry, seem to me rather to bring inside the strict domain of science ideas which in the earlier stages of human knowledge lay wholly within the region of faith or of belief. For example, the writer of the Epistle to the Hebrews specially declares that it is by faith that we understand "that the things which are seen were not made of the things which do appear." Yet this is now one of the most assured doctrines of science, that invisible forces are behind and above all visible phenomena, moulding them in forms of infinite variety, of all which forms the only real knowledge we possess lies in our perception of the ideas they express—of their beauty, or of their fitness—in short, of their being all the work of "Toil co-operant to an End." Creation by Law—Evolution by Law—Development by Law, or as including all these kindred ideas, the Reign of Law, is nothing but the Reign of Creative Force, directed by Creative Knowledge, worked under the control of Creative Power, and in fulfilment of Creative Purpose.

CHRIST THE LIGHT OF THE WORLD.

By C. J. VAUGHAN, D.D.

IV.—USES OF LIGHT.

"I am the light of the world: he that followeth me shall not walk in darkness, but shall have the light of life."—John viii. 12.

The grandeur of the words must strike every one. The Son of God, standing in human form on the earth, standing in the courts of his Father's house among the worshippers at the Feast of Tabernacles, uses this sublime, this magnificent figure, to express that which He came to do for, and to be to, the universe of his moral creation. "I am the Light of the World." Once God said, when He created all things by Jesus Christ, "Let there be Light." It was the first act of that mighty drama, of which the curtain rose on Chaos, and fell on Paradise. "In the beginning the earth was without form, and void . . . darkness was upon the face of the deep. . . . And God said, Let there be Light: and there was Light. And God saw the light, that it was good: and God divided the light from the darkness. And God called the light Day, and the darkness He called Night. And the evening and the morning were the first day."

Now God speaks again—thousands of years lying between—and says once more, "Let there be light:" and, this time, the Light is a Man: One like ourselves in all that makes the infirmities and the sorrows and the sufferings of mortal being; nay, "his visage is marred more than any man, and his form more than the sons of men:" and yet within that despised, that rejected Person, there "dwelleth all the fulness of the Godhead bodily:" and when He speaks at last, in answer to ten thousand taunts and cavillings and blasphemies, to tell men what He is and who; He, the meekest and gentlest of men—He, the patient sufferer, the unresisting, uncomplaining, unanswering, oppressed One—is heard to describe Himself in terms most presumptuous, most blasphemous, if not true, even in that character and that language which the text records, "Then spake Jesus unto them, saying, I am the Light of the World."

It is not altogether inconceivable that a proud, arrogant person—one whose manner was all pretension, and his words all presumption—might have run on at last, in utter self-ignorance and self-delusion, into the notion that he was some great one; might have been gratified, like one of whom we read in Holy Scripture, when he heard men saying of him, "This man is the great power of God;" or, like another, "It is the voice of a God, and not of a man." In all ages men have vaunted themselves, and imposed upon others, to a degree not far short of even this fearful impiety. But we do feel that the combination of the admitted character of Jesus Christ with his equally recorded and admitted language concerning Himself—on the one hand, his silence under rebuke, insult, and outrage, his constant readiness not to be ministered unto but to minister, to undergo all manner of slight and disparagement, and to spend and be spent for others—on the other hand, his repeated claims to be in a distinctive sense the Son of God, one with the Father, the Sovereign Lord and King and Judge of men—is a combination at first sight so incongruous that no fiction would have risked it, and so marvellous that it can scarcely be accounted for but on the hypothesis of its truth.

I. "Jesus said, I am the light of the world." What light is in its nature, has been in all times disputed. The question is still debated; and, even if it could be decided, this would not be the place for its discussion. It is enough for us to describe it in language altogether unphilosophical and popular, and say that light is that thing, be it what it may, which renders objects perceptible to our sense of sight.

A great man of this century (Dr. Chalmers) thus opens his well-known course of lectures on the Epistle to the Romans:—

"It is possible to conceive the face of our world overspread with a thick and midnight darkness, and without so much as a particle of light to alleviate it from any one quarter of the firmament around us. In this case it were of no avail to the people who live in it, that all of them were in possession of sound and perfect eyes. The organ of sight may be entire, and yet nothing be seen, from the total absence of external light among the objects on every side of us. Or, in other words, to bring about the perception of that which is without, it is not enough that we have the power of vision among men; but, in addition to this, there must be a visibility in the trees, and the houses, and the mountains, and the living creatures, which are now in the ordinary discernment of men."

And then he goes on to "reverse the supposition." "We may conceive," he says, "an entire luminousness to be extended over the face of nature, while the faculty of sight was wanting among all the individuals of our species. In this case, the external light would be of as little avail towards our perception of any object at a distance from us, as the mere possession of the sense of seeing was in the former instance. Both must conspire to the effect of our being rendered conversant with the external world through the medium of the eye. The power of vision is not enough, without a visibility on the part of the things which are around us, by God saying, Let there be light: and as little is their visibility enough, without the power of vision, stamped as an endowment by the hand of God on the creatures whom He has formed."

So beautifully do the two worlds of matter and spirit correspond to and fit into each other, that, in this point as in others, we have cause to say, "All things are double, one against another; and God hath made nothing imperfect."

It is Christ who, like the light, renders the things of God visible: and it is the Holy Spirit who communicates to the eye of the soul that power of sight without which the other process would be unavailing. Jesus Christ says, "I am the light of the world:" and for the Ephesians St. Paul prays "that the God of our Lord Jesus Christ, the Father of glory, may give to them the Spirit of wisdom and revelation in the knowledge of Him; the eyes of their understanding being enlightened, that they may know what is the hope of his calling." That which Christ renders visible, the Holy Spirit opens the eye to see.

"I am the Light of the World." We have heard what light is, in its great essential work of rendering objects visible. And in this leading feature we all see how Christ, Christ himself, can be compared to it.

It is presupposed that man is placed in the midst of a multitude of surrounding objects. The light does not create the landscape which it illuminates. The trees and the hills, the river and the meadows, were all existent before a particle of light streaked the sky above them. So is it in spiritual things. It would have been equally true that there is such a thing as spirit, such a Being as God, even though no one had come to make these realities known to us. Revelation is only an unveiling. It is the taking off of a covering from something which was there, and which was just as true and as real, before. There was the object, and there was the eye—there was the eternal verity of the Divine existence and the human relationship; and there was the reason and the conscience, the heart and the soul, qualified (so far as capacity went) to take cognizance of this verity—before the command, "Let there be light," rendered possible the necessary communication between the one and the other, between the already existing truth and the already existing faculty. Christ came to make the real visible: came, in other words, to be the Light.

(1) He had much to tell, even in the way of repetition and of enforcement. The religion of Nature, as we somewhat ungratefully call it, needed an authoritative republication, which it found only in Christ. Contemplate, either in Scripture or in heathen writings, the condition of the world of man as it was in the fullest refinement of Grecian or Roman civilization; and you will see that each particular of duty was completely blurred and obscured by the ever-deepening shadow of a godless life. Jesus Christ came to make morality itself visible to hearts and to lives which had lost its very outline.

(2) But how much more, when the matters of which He came to tell were matters lying outside the sphere of intellect or conscience; things which no one could know without having first lived in heaven; disclosures of God's requirements, of God's secret acts, of God's counsels, and of God's purposes, which only He who had been from eternity in the bosom of the Father could either speak or know! When the objects to be made visible were no longer man's duty to his brother, or even (in broad general lines) to his God; but those new obligations, springing out of new conditions, which rest entirely upon the basis of Propitiation and Redemption, upon a Saviour's sacrifice and a Spirit's grace! These things too might have been, and man not know them. Christ the Light of the World was absolutely needed to make them visible.

We do not always appreciate as we ought this part of our Saviour's office. He is the Light, as well as the one chief Object which the Light has to make visible. He is not the Redeemer only, He is the Revealer too.

II. And now therefore let us use his own glorious similitude, as it lies here before us, and go on to ask what Light does for various classes and conditions of men.

(1) What is light to the traveller?

It may have happened to some of you to lose your way in the dark. You had often before traversed a particular field or trodden a certain pathway. In the daytime you needed not to investigate, you needed not to look around you: you could have passed from point to point, with eyes fixed on the ground, and a mind wholly preoccupied. But on a certain evening, as you took your journey, the light failed you: you had gone in the dusk, you must return in the dark: and now you find the difference between the two things: how great the distinction between a little light and none! You go round and round the hedge or the palisade: you look for the gate or the stile: you look, and you feel, and it is all darkness: night is upon you, and you begin to fear that you must spend its long hours shelterless. At last a feeble glimmering becomes perceptible in a distant quarter: a rushlight in a cottage window, a lantern in a farmyard shed, it is enough for hope in that perplexity: you make for it, and you are safe.

Such is light, when a man compares it by experience with darkness. So small a thing so much to him! And how much more, if the light were in such a case the light of day! kindling the whole region into brightness, and dissipating in a moment all the fear and all the distress of that wandering!

And we, my friends, are all, in this sense, travellers and wayfarers. It is not Christ who makes us so. We have all to make our way through the wilderness of this world to some destination—and what? We cannot answer the question. Sometimes life seems as if it led nowhither; as if it were rather (what Scripture sometimes calls it) a "walk" than a journey; a little circuit, bringing us back at night to the home from which we started, rather than an extended progress, to terminate in an end most unlike its beginning. One day so like another; one experience of ourselves and others so little varied from a former; the events of life so small, its interests so trivial, its occupations so secular and so unheavenly; we go round and round the hedged and fenced paddock of our being, and see no way out of it on this side or on that. Christ comes to us then as the Light; shows us the path which we were missing, the outlet which we were ignoring; says to us, "This is the way, walk ye in it," when we should certainly have turned from it to the right hand or the left.

And most of all in those marked moments of life, which occur sometimes in the most monotonous and least eventful; days of bitter grief, when we feel ourselves bereaved and desolate in a world all cold and bare and dark; days of anxious suspense, when we feel that there is but a step for us between life and death, and we are powerless to take it; days of dreadful humiliation, when we find out our own weakness, our own vileness, our own nothingness, and can do nothing to repair or to supply; then, above all, is the coming of Christ as the Light welcome and reassuring; when He can say, Lean upon me, and I will uphold thee: I have been before thee by this way: I will guide, I will support, I will bring thee home.

Such is light to the traveller.

(2) And what is light to the working man?

What work can be done without light? Handwork and head-work are alike in this. Each requires light. Some kinds of work can be done only by daylight. An hour after sunset, out-door labour is impossible. Candle-light is a poor substitute at the best for daylight. But not this only. Candle-light alters colours, confuses details, obscures fine joinings and minute openings, and, for many eyes at least, is all but useless even for the work of the mechanic and the artisan. Perhaps you are on a journey: you wile away the time by reading: you are deep in some interesting story; you are within sight of the catastrophe: but daylight wanes and fades, and you are helpless and powerless at its mercy. Light of some kind, natural or artificial, is necessary for all labour; as much for that of the scholar and the writer, as for that of the tradesman, the mechanic, or the husbandman.

Now every life has its work. If Christ had never come, still every life would have had its work. There is no such thing, since the Fall—nay, even before the Fall; for man in his original uprightness had his work set him, only the work was neither excessive in amount nor disappointing in result—there is no such thing as a life without duties; passive duties and active, receptive duties and reciprocal. Now is it not the simple truth, that life's work, in this higher sense, needs light for its performance? How difficult, how intricate, how perplexing, how unintelligible, would be the portion of each one of us in this world, with regard to man and with regard to God, without a Revelation! What a poor, inferior, inconclusive thing would toil be, if it had no motive of love and no recompense of reward! How absolutely impossible would it have been for a man to rise out of a low, grovelling, selfish spirit, in playing his part upon earth in the ambitions, competitions, and enterprises of the world, unless he could see his way through all into a purer region and into a better home beyond! We see how it is, even now, even with a Revelation, in the case of men who live practically without God in the world. They are like men ploughing in the dark; like men designing, or painting, or matching colours, without even a lamp; like men reading or writing in a room fireless and candleless! Even such is the daily round of labour, for him who knows not whose he is and whom he serves; remembers not the hand that made him, and despises the Word which is to be his judge. Christ may come into the world, and come as the Light of the world; and yet not be received, and not be used, and not be worked by, as such. And then we see what it would have been for *all* if He had never come: yes, even more gloomy and disconsolate still; because even these men who will not use his light are indebted to it; indebted to it more than they think, for explanations unconsciously accepted, and for hopes unwittingly entertained.

Christ is then, secondly, what light is to the working man. He comes to give a motive for work, and a power for work, and a principle of work; to give an explanation of work in its doing, and to give a hope for work in its end. Strike Christ out again from his world, and dreary indeed and comfortless would be the working life of each one of us.

(3) Once again, think what light is to the watcher. We have spoken of the walker, and of the worker: now think of the watcher.

The Psalmist speaks of those who "watch for the morning." What an experience of human sorrow does he there touch upon!

Few persons can have lived to middle age, without having known what night may be, in the way of gloom and of suspense.

Some of you have spent its long hours in a sick-room. Never can you forget that protracted watching, over the suffering form of some dying friend. It seemed as though the night-watches were interminable. Each hour told its coming and its going upon the church clock in your street; and the moments sounded in your ear, from the watch or the timepiece, with a distinctness and an emphasis which became almost insufferable. "Would God it were morning!" was the cry of your heart, even though the morning might more than probably rise not upon a bed of sickness, but upon the bed of death. "Give light, and let us die," was the voice of nature within: anything rather than this thick darkness, in which every shadow is a form, and every fancy a substance.

And the same thing has been the experience of some, under strong conviction of sin. A particular act of the past day, some deed of unkindness or of uncleanness, done against conscience, against resolution, in spite of prayer, in defiance of God, hangs about your pillow and forbids repose. Or else thoughts, not so distinctly born of a remorseful conscience, but more generally suggestive of the reality of a God too long disregarded, and of the coming of a judgment too evidently unprepared for, have been present with you through the interval of calm and silence, and have agitated you with fears which you trust daylight may scatter, or impressed you with resolutions which you want daylight to realize. You too have known what darkness is to the watcher.

Sometimes the experience takes a stranger form, and presents itself in scenes painfully exciting.

A thrilling story is told, in a late record of Indian life,* which seems to carry with it an authentication not to be gainsaid.

A native hunter passed a whole night within a few paces of a wounded tiger. The man's bare knees were pressed upon the hard gravel, but he dared not shift, even by a hair's breadth, his uneasy posture. A bush was between him and the wild beast: ever and anon the tiger, as he lay with glaring eyes fixed upon it, uttered his hoarse growl of anger; his hot breath absolutely blew upon the cheek of the wretched man, and still he moved not. The pain of that cramped position increased every moment—suspense became almost intolerable; but the motion of a limb, the rustling of a leaf, would have been death. He heard the gong of the village strike each hour of that fearful night, that seemed to him an "eternity, and yet he lived." The tormenting mosquitoes swarmed around his face, but he dared not brush them off. That fiendlike eye met his whenever he ventured a glance towards the horrid spell that bound him; and a hoarse growl grated on the stillness of the night, as a passing breeze stirred the leaves that sheltered him. Hours rolled on, and his powers of endurance were well-nigh exhausted; when, at length, the welcome streaks of light shot up from the eastern horizon. On the approach of day the tiger rose, and stalked away with a sulky pace to a thicket at some distance—and the stiff and wearied watcher felt that he was safe.

How true to the Psalmist's saying, "Thou makest darkness, that it may be night; wherein all the beasts of the forest do move: The sun ariseth, and they get them away together, and lay them down in their dens!"

Such is darkness, and such is light, to the watcher.

And need I say how in *this* case Christ proves himself the Light of the World? In anxiety, in sorrow, in danger, in distress for sin—is it not in these things, above others, that He shows himself strong to save? Christian biographies, Christian experiences, are full of the proofs. How often has He made the wife or the mother willing to part with the joy of her heart, with the desire of her eyes, because He, her Lord and Saviour, demanded the sacrifice, and in demanding transformed it! How often has He cheered the self-tormenting misery of the conscious transgressor, by bringing to his mind the all-sufficiency of His own sacrifice, and saying to the inward ear, "The blood of Jesus Christ his Son cleanseth us from all sin!" How often has He interposed, in the hour of need, for the deliverance of a beleaguered and sorely tempted soul; blunting the weapons of the "strong man armed," giving that shield of faith which quenches the fiery darts of the wicked one, and making the Christian more than conqueror through Him that loved him!

III. "I am the Light of the World: he that followeth me shall not walk in darkness, but shall have the light of life."

1. "He that followeth me." He that walks after me. He that treads in my steps; at once my disciple, my servant, my imitator, and my friend.

Do the words discourage any man? Is any one saying in his heart, "Yes, his follower: but I am not such: I am all weakness, all inconsistency, all unbelief?" It is well to feel this: much as we know against ourselves, there is more yet which we know not: "God is greater than our heart, and knoweth all things." Yet let us not pervert this self-misgiving, just and right as it is, into a reason for despondency: to "follow" is not to overtake, is not to keep up with Him: he who lags ever so much behind, he who faints ever so often in the long toilsome ascent, shall yet be called Christ's follower, if only he still keep in the way, still endeavour, and still draw not quite back!

---

* "My Indian Journal," by Colonel Campbell, pages 142, 143; from which the following paragraph is copied almost *verbatim*.

2. "He that followeth me shall not walk in darkness."

(1) Shall not walk in the darkness of ignorance. Shall not be left entirely untaught, altogether undisciplined, in that education which is for eternity and for heaven. Shall not be left to walk in the sparks of his own kindling; to find the way for himself, or to be his own teacher in the things of the soul and of God. I will be his Teacher: I will be his Light, in knowledge.

(2) And he shall not walk in the darkness of misery. "If one look unto the land, behold, darkness and sorrow, and the light is darkened in the heavens thereof." In Scripture "darkness" is sorrow, and "light" is joy. "Light is sown for the righteous, and gladness for the upright in heart." He shall not walk in misery. He may have his dark days; his days of returning despondency, and of overshadowed hope: but, on the whole, he shall be a gainer, in point of happiness, by having sought and endeavoured to follow Christ: he shall be a happier man, even now, than he was while he cared not how he walked nor whither he went.

(3) And he shall not walk in the darkness of sin. Yes, this is the especial sense in Scripture of light and darkness. "Works of darkness" are sins: "children of light" are holy persons. Christ will enable a man who follows Him to walk no longer in sin. He does not promise him all at once a freedom from sin: still less does He promise him in this life an exemption from temptation. But He does promise that, if a man will follow Him—follow Him as he can—it may be lagging, loitering, even fainting and falling, after Him—yet still following; following Him as his Master, following Him as his Teacher, following Him as his Saviour—he shall not walk in the darkness of sin: he shall find in himself, by virtue of that following, a little strength and a little holiness: he shall find that the Holy Spirit, earnestly sought and anxiously cherished, does work in his heart a work of good, if it be not all, nor of the kind, that he expected: he does find, when he looks back upon the past year, or the past five years, of his earthly pilgrimage, that he has made a little way: Christ is "putting out his enemies before him by little and little:" the path of the Christian, like that of the just, is, on the whole, "as the shining light, which shineth more and more unto the perfect day."

3. "But shall have the light of life." Yes, it is written, "In Him was life; and the life was the light of men."

What is "life," when we speak of the soul? The life of the body was the breath of God. "The Lord God formed man of the dust of the ground, and breathed into his nostrils the breath of life: and man became a living soul." That was the life of this world; the life which goes out of a man when he dies. But the life of which our Lord here speaks is a life which never goes out. It is that life which consists in communication with God; in the effluence of God into man's soul; in union with God through Christ by the Holy Ghost. "This is life eternal, that they might know Thee, the only true God, and Jesus Christ whom Thou hast sent." How "know Thee?" As a man reads in a book? or as a man learns a language, or studies a science? Nay, but as a man knows a friend; knows him by discourse, knows him by intercourse, knows him (above all) by love. "If any man love God, the same (knoweth, or rather) is known of Him." "The light of life" is that kind of insight into the things of God which consists in acquaintance, personal, vital acquaintance, with God himself, as alone He can be known, in Jesus Christ—as alone He can be known, by the Holy Spirit.

This then is the condition, and this the promise; the promise in its two parts, the negative first, and then the positive.

The condition. Follow Christ. Take Him for your Teacher. Determine to have none other: determine, God helping you, not to cease from your effort until you have come up with Him, heard Him speak, and speak to you. Struggle after Him in humility; struggle after Him in faith; struggle after Him by prayer and by watchful living: and you too shall be his disciple.

And what then? Then, He says this to you: You shall not walk in darkness. You shall not be left in the gloom of ignorance, or in the gloom of unhappiness, or in the gloom of sin.

Nay, He says, you shall even "have light." What is light? It is "life." It is Christ himself: He is the Light: you shall have Him: and having Him, you shall find that your soul lives because of Him; that in secret, and by a course which you trace not, something is given to your soul which makes it live; live as it never lived before; live a new, a higher, a Divine life; live a life inside and above this life; a life independent of chance and change, independent of kindness or unkindness, of love or coldness, from those around you, independent of time and sense, of circumstances and possessions; because hidden in God, where Christ himself is, at the right hand of God. "And when Christ, who is our Life, shall appear, then shall ye also appear with Him in glory!"

"I am the Light of the World: and he that followeth me shall have the light of life."

How great an encouragement! How strong a motive for seeking! The beginnings of this "following" are a few weak prayers, a few feeble efforts, a few resolute communings with Him who is the Life: the end of this following is a full blaze of glory, a perfection of knowledge, a satisfaction of love, "pleasures for evermore." Who shall not essay the one, that he may at last know the other?

EASTER EVE.

A NIGHT of silence and of gloom:
My Master lieth in the tomb—
Mine was the sin and His the doom!

* * *

So on this awful eventide,
My self-trust gone, my wealth of pride
All spent and lost, I fain would hide.

And where?—Lo, on this Eve alone
I come with contrite prayer and moan
And lay me down before the Stone.

All is so still, so deadly still—
E'en that dread scene upon the Hill
Scarce shook me with so strong a thrill.

For Calvary had its jeering crowd,
My tears were check'd, my love was cow'd,
My pride took courage 'mid the proud.

The soldiers sleeping heed me not,
Their vigil is perforce forgot:
The world is banish'd from the spot.

So here I weep—for none are near
To fill my craven heart with fear
Of some sharp gibe for every tear.

And the deep stillness hath a cry
Reaching my soul, and none are by
To drown it with their blasphemy.

It saith, "O ingrate heart, for thee
The passion in Gethsemane,
For thee the scourge, the mockery,'

"The scarlet robe, the thorny wreath,
For thee the load He sank beneath,
For thee the nails, the spear, the death!

"Yea, all for thee! and having learn'd
How great that love was, hast thou spurn'd
The due of gratitude it earn'd?

"Thankless and cold! thy broken vow
Of love and service asks thee now,
Here at His tomb, what doest thou?"

'Tis true—yet am I fain to come:
In grief I have no other home
But near Him, though 'tis near His tomb!

And as in self-convicted mood
On mine ingratitude I brood,
A Presence breaks the solitude:

And, like a benediction near,
Blessing, not cursing, in mine ear
Whispers of hope, and not of fear:

"Yea, all for thee! that love He gave,
Forgiving still as it forgave,
Dieth not with Him in the grave!"

* * *

So on this holy eventide
I lay me down as at His side,
And pray to die as He has died:

That I may rise to meet the strife
With this dead heart renew'd, and rife
With impulses of love and life.

But can it be with one so vain,
So weak, so fearful of disdain?
"It can be! by the right of pain,

"And curse, and cross, and this dark night!
Thou shalt 'wax valiant' in the fight,
Thy weakness perfected in might.

"So shalt thou bear His flag unfurl'd,
'Mid ghostly foemen overhurl'd,
In fearless love before the world!"

Then, blessed Master! only Friend!
Be near, inspire, sustain, defend;
In prayer I battle till the end!

Till that new "perfect day" begin
The life of light, the death of sin,
Which by that grace and power I win:

When on this Lenten night forlorn
There breaks the final Easter morn,
And the unsetting sun is born.

* * *

So on this blessed eventide,
Here at Thy tomb, here at Thy side,
I lift my prayer, Abide, abide!

The old sweet prayer so earnestly
Pray'd one sad eve, and heard of Thee,
Abide with me, abide with me!

S. J. STONE.

LESSONS FROM A SHOEMAKER'S STOOL.

IN the course of my wanderings I had the good luck not long ago to fall in with a very remarkable and interesting old man, James Beattie, of Gordonstone, a village of about a dozen of houses in the parish of Auchterless, in the north-east corner of Aberdeenshire. He is a shoemaker, but has conjoined with his trade the teaching of all the children in his neighbourhood. It is remarkable how largely the shoemaking profession bulks in the public eye in this respect. John Pounds, the Portsmouth cobbler, was the founder of Ragged Schools in England; and George Murray, of Peter-head, also a shoemaker, formed the nucleus from which the Union Industrial Schools of that town have sprung. Many others might be mentioned. Probably scientific investigation may hereafter explain this affinity between leather and philanthropy.

Mr. Beattie is now eighty-two years of age. For sixty of these he has been carrying on his labour of love, and he means to do so as long as he can point an awl or a moral, adorn a tale or a piece of calf-skin. He has sought no reward but that of a good conscience. None are better worthy of a recognition in Good Words than the systematic unobtrusive doer of good deeds, and probably few will grudge James Beattie the honour.

While in his neighbourhood a friend of mine gave me such an account of him as made me resolve to see him if possible. By making a start an hour earlier than was necessary for my regular duty, I had no difficulty in making out my visit to him. His workshop being pointed out to me—a humble one-storied house with a thatch roof, and situated in quite a rural district—I went up to the door and knocked.

I hope the three hundred and odd school-managers, with whom I am acquainted in the north of Scotland, will excuse me for saying here, that this ceremony—the knocking—ought always to be gone through on entering a school. It is not perhaps too much to say that, so far as I have observed, it is almost invariably neglected. The door is opened, and an unceremonious entrance is made, by which not only is the teacher made to feel—I know he feels it—that he is not the most important person there, which is not good; *but the pupils are made to see it*, which is very bad. I am aware that this is sometimes due to the fact that the teacher and managers are on the most familiar terms. It is not always so; and even when it is, I venture to think that the courtesy of a knock should be observed. I have never once, when I was alone, or when it depended on me, entered a school without knocking. This, however, by the way.

I had got the length of knocking at James Beattie's door, which was almost immediately opened by a stout-built man under the middle size, with a thoroughly Scotch face, square, well-marked features, eyes small and deeply sunk, but full of intelligence and kindliness. The eyes, without having anything about them peculiarly striking, had a great deal of that quiet power for which I cannot find a better epithet than sympathetic. They are eyes that beget trust and confidence, that tempt you somehow to talk, that assure you that their owner will say nothing silly or for show; in short, good, sensible, kindly eyes. His age and leathern apron left me in no doubt as to who he was. I said, however, "You are Mr. Beattie, I suppose?"

"Yes," he replied; "my name's James Beattie. Wull ye no come in oot o' the snaw? It's a stormy day."

"Perhaps," I said, "when you know who I am, you won't let me in."

"Weel, at present, I dinna ken ony reason for keepin' ye oot."

I then told him who I was; that I was on my way to Auchterless Female School (about two miles off), that his friend Mr. C—— had been speaking to me about him, and that, as I was almost passing his door, I could not resist calling upon him, and having a friendly chat with one who had been so long connected with education. I added that I did not wish to see his school unless he liked, and that if he had any objections he was to say so.

"Objections!" he replied. "I never hae ony objections to see onybody that has to do wi' education. It has aye been a hobby o' mine, and I daursay a body may hae a waur hobby. You that's seein' sae mony schules will be able to tell me something I dinna ken. Come in, sir."

In his manner there was no fussiness, but a most pleasing solidity, heartiness, and self-possession. He did not feel that he was being made a lion of, and he evidently did not care whether he was or no. I went in, and, as a preliminary to good fellowship, asked him for a pinch of snuff, in which I saw he indulged. The house, which does double duty as a shoemaker's stall and school-room, is not of a very promising aspect. The furniture consists of a number of rude forms and a desk along the wall. So much for the school-room. In the other end are four shoemakers' stools occupied by their owners, lasts, straps, lap-stones, hammers, old shoes, and the other accompaniments of a shoemaker's shop. Two or three farm servants, whose work had been stopped by the snow-storm, had come in, either to pass an idle hour in talk or in the way of business.

There were only ten pupils present, a number being prevented by the snow and long roads. When I went in some of them were conning over their lessons in a voice midway between speech and silence, and one or two were talking, having taken advantage of the "maister's" going to the door to speak to me, and the noise called forth from Mr. Beattie the order, "Tak' your bookies, and sit peaceable and dacent, though there's few o' ye this snawy day. Think it a', dinna speak oot; your neebours hear ye, and dinna mind their ain lessons."

This is, I think, very good: "Although there's few o' ye this snawy day," your responsibility is individual, not collective. Many or few, the object for which you are here is the same—viz., to learn your lessons and behave properly. The snow-storm has kept many away, but it furnishes no excuse for noise or idleness. The old man's "though there's few o' ye" thus involved a great principle that lies at the root of all true teaching.

The order was obeyed to the letter. James pointed out a seat for me on one of the forms, took up his position on his stool, and he and I began to talk. I am tempted to give it, to the best of my recollection, in his simple Doric, which would lose much by translation.

"You will not be very well pleased," I remarked, by way of drawing him out, "about this fine new school which has just been opened at Badenscoth. It will take away a great many of your scholars."

"Oh man!" he replied, "ye dinna ken me or ye wudna say that. I hae just said a hunder times, when I heard o' the new schule, that I was thankfu' to Providence. Afore there was ony talk o' the new schule, I hae stood mony a time wi' my back to the fire lookin' at the bairnies when they were learnin' their lessons, and whiles takin' a bit glint up at my face—for I think some o' them like me—and I've said, 'Oh, wha'll mind thae puir creaturs when I'm awa'?' Ye ken," he continued, "I canna expect muckle langer time here noo. Ay, even if I werena an auld dune man, as I am, I wud hae been thankfu' for the new schule. I hae maybe dune as weel's I could, but a' my teachin', though it's better than naething, is no to be compared wi' what they'll get at a richt schule."

"It is quite true," I said, "that you labour under great disadvantages, having both to teach and attend to your work at the same time."

"Weel, it's no sae muckle that, as my ain want o' education."

"You have had a long education," I replied.

"That's just what a freen o' mine said to me ance, and I mind I said to him, 'That's the truest word ever ye spak. I've been learnin' a' my days, and I'm as fond to learn as ever.'"

"But how do you manage to teach and work at the same time?"

"Ye see," he replied, "when I'm teachin' the A B C, I canna work, for I maun point to the letters; but when they get the length o' readin', I ken fine by the sense, withoot the book, if they're readin' richt, and they canna mak' a mistak but I ken't."

Well said by James Beattie! He has discovered by common sense and experience the only true test of good reading, "by the sense, without the book."

"In spite of your own want of education, however," I said, "I understand that you have old pupils in almost every quarter of the globe who are doing well, and have made their way in the world through what you were able to give them. I have heard, too, that some of them are clergymen."

"Ay, that's true enough," he replied; "and some o' them hae come back after being years awa', and sat doon among the auld shoon there whar they used to sit. And I've got letters frae some o' them after ganging a far way that were just sae fu' o' kindness and gude feelin', and brocht back the auld times sae keenly, that I micht maybe glance ower them, but I could na read them oot. Ah sir! a teacher and an auld scholar, if they're baith richt at the heart, are buckled close thegither though the sea's atween them. At ony rate that's my experience.

"See, sir," he continued, holding out a point of deer's horn, "there's a' I hae o' a remembrance o' ane that's in Canada, a prosperous man noo, wi' a great farm o' his ain. When he was at the schule here, he saw me makin' holes wider wi' a bit pointed stick, and he thocht this bit horn wud do't better—and he wasna far wrang—and he gied it to me. Weel, he cam back years and years after, and I didna ken him at first. He had grown up frae being a bairn no muckle bigger than my knee to be a buirdly chield. I sune made oot who he was, and as I was workin' and talkin' to him, I had occasion to use this bit horn. 'Gude hae me,' says he, 'hae ye that yet?' 'Ay,' said I, 'and I'll keep it as lang as I hae a hole to bore.'"

Returning to the subject of teaching, I said, "How do you manage after they have got the alphabet, and what books do you use?"

"Weel, I begin them wi' wee penny bookies, but it's no lang till they can mak' something o' the Testament, and when they can do that, I choose easy bits oot o' baith the Auld and New Testaments that teach us our duty to God and man. I dinna say that it's maybe the best lesson-book, but it's a book they a' hae, and ane they should a' read, whether they hae ither books or no. They hae 'collections' too, and I get them pamphlets and story-books, and when I see them gettin' tired o' their lessons, and beginning to tak' a look aboot the house, I bid them put by their 'collections,' and tak' their pamphlets and story-books. Ye ken, bairns maun like their books."

Well said again! "Bairns maun like their books,"—a necessity far from universally recognised either by teachers or the makers of school-books. Many a healthy plant has been killed by being transplanted into an ungenial soil and kept there, and many a promising school career has been marred or cut short by books that 'bairns couldna like.'"

"You teach writing, arithmetic, and geography, too, I suppose, Mr. Beattie?"

"I try to teach writin' and geography, but ye'll believe that my writin's naething to brag o', when I tell ye that I learnt it a' mysel'; ay, and when I began to mak' figures, I had to tak' doon the Testament, and look at the tenth verse, to see whether the 0 or the 1 cam first in 10. I can learn them to write a letter that can be read, and, ye ken, country folk's no very particular aboot its being like copperplate. Spellin's the main thing. It doesna mak' (matter) if a bairn can write like a clerk if he canna spell. I can learn them geography far enough to understan' what they read in the newspapers, and if they need mair o't than I can gie them, and hae a mind for't, they can learn it for themsels. I dinna teach countin'. Ony man in my humble way can do a' that on his tongue. At ony rate I've aye been able. Besides, I couldna teach them countin'. Ye see, I maun leeve by my wark, and I'm thankfu' to say I've aye been able to do that, but I couldna do't if I was to teach them countin'. It wud mak' sic an awfu' break in my time. When my ain grandchildren hae got a' I can gie them, I just send them to ither schules."

"What catechism do you teach?" I asked.

"Ony ane they like to bring," he replied. "I'm an Episcopalian mysel', but I hae leeved lang enough to ken, and indeed I wasna very auld afore I thocht I saw that a body's religious profession was likely to be the same as his faither's afore him; and so I just gie everybody the same liberty I tak' to mysel. I hae Established Kirk, and Free Kirk, and Episcopal bairns, and they're a' alike to me. D'ye no think I'm richt?"

"Quite right, I have no doubt. The three bodies you mention have far more points of agreement than of difference, and there is enough of common ground to enable you to do your duty by them, without offending the mind of the most sensitive parent. I wish your opinions were more common than they are."

During the conversation the old man worked while he talked. He had evidently acquired the habit of doing two things at once.

"I should like very much," I said, "to see some of your teaching. Will you let me hear how your pupils get on?"

"I'll do that wi' pleasure, sir," he replied; "but ye maun excuse oor auld-fashioned tongue."

He took off his spectacles and laid aside his work, I presume out of deference to a stranger, and was about to call up some of his scholars, when I requested him not to mind me, and said that I should prefer to see him go on in his ordinary way.

"Weel, weel, sir, ony way ye like, but I thocht it was barely dacent to gang on cobblin' awa' when ye were examinin' the bairns."

He accordingly resumed his spectacles and his work, adjusted his woollen nightcap or cowl, striped with red, white, and black—an article of common wear by day among people of his age and occupation—and looking round, said, "Come here, Bell, and read to this gentleman."

This remark was addressed to a little girl about eight years of age. Bell came up when called.

"She has a dreadfu' memory, sir! I weel believe it wud tak' her an hour and a half to say a' she has by heart."

Bell read fluently and intelligently, spelt correctly, and afterwards repeated a whole chapter of Job with scarcely a stumble, and so as to convince me that she really had a "dreadfu' memory." Her answers to several questions proposed by myself were wonderfully mature. I have seldom seen a child whose solidity of intellect and thoughtfulness struck me more than that of Bell M'Kenzie.

"Come here noo, Jamie," he said, addressing a very little boy, "and if ye read weel, or at ony rate *as weel's ye can do*, to this gentleman, ye'll get a sweetie; but if ye dinna, ye'll get naething."

What a world of kindliness and consideration there is in these five little words, "as weel's ye can do," even as they appear on paper! It was a *strict* but not a *hard* bargain. I dare say the modification, "as weel's ye can do," was suggested by Jamie's very tender age: he was just three. Less than "weel" would earn the sweetie, but it must be *as weel's he can do.* The test was, as it should always be in such cases, a relative one. In order, however, to apprehend the full effect of the modifying words, it is necessary to hear the tone of the old man's voice, to see the gentle pat on Jamie's back with which they were accompanied, and the childlike confidence with which the little urchin of three years came up to the old man of nearly eighty-three, and, resting his arm on the apron-covered knee, began to spell out his lesson, having first assured himself by an enquiring look into the "maister's" face, that the stranger meant him no harm. The awl was used as a pointer, and Jamie did at first pretty well—for his age, I thought, wonderfully well, but to the old shoemaker's mind, "no sae weel's he could do," and he had to give place to another boy. He did so, but the tears came into his little eyes, and remained there till he was taken on a second trial and reinstated in favour. He earned and got his sweetie; that was a good thing. He had pleased the "maister" and was no longer in disgrace; that was evidently a far better thing.

The Bible class was then called up.

"That creatur there, Jean," he said, putting his hand on a little girl's head, and looking kindly in her face, "is a gude scholar, though she's but sma'."

Jean, reassured by the remark and prepared for the ordeal, gave a smile and commenced reading the 26th chapter of Numbers. It was difficult, and even Jean halted now and then as a proper name of more than ordinary difficulty came in her way.

"I doot it's a hard bit that, Jean," he said; "is't a' names?"

"Na, nae't *a'*," she replied, with an emphasis on the *a'*, which left it to be inferred that a good part of it was names.

"Weel, do the best ye can. Spell them oot when ye canna read them. Come here, Jessie," he said, addressing the biggest girl present, probably eleven years of age, "and see if they spell them richt." Turning to me, he said, "I'm no sae fond o' chapters fu' o' names, as o' them that teach us our duty to God and ane anither, but it does them nae harm to be brocht face to face wi' a difficulty noo and then. It wad tak' the speerit oot o' the best horse that ever was foaled to mak' it draw aye up-hill. But a chapter like that maks them try themsels in puttin' letters thegither, and naming big words. I daursay ye'll agree wi' me, that to battle wi' a difficulty and beat it is a gude thing for us a', if it doesna come ower often."

"I quite agree with you," I replied.

"Weel, when it's a namey chapter like that, I get my assistant" (with a humorous twinkle of his eye)—"that bit lassie's my assistant—to look ower't, and see if they spell't richt. I couldna be sure o' the spellin' o' the names withoot the book."

After the Bible lesson, and as a supplement to it, Jessie, the assistant, was ordered to ask the Shorter Catechism. She ranged pretty nearly over it all, and received on the whole surprisingly correct answers. Meantime the old man went steadily on with his shoe, all eye for his work, all ear for blunders. Once he heard one girl whispering assistance to another, which he promptly and almost severely checked by "Dinna tell her; there's nae waur plan than that. If she needs help, I'll tell her mysel, or bid you tell her."

A boy who stumbled indifferently through an answer was punished with "Ay, ye're no very clear upon that, lad. Try't again. I doot ye haena stressed your e'en wi' that ane last nicht." He tried it again, but with not much better success. "Oh, tak' care! ye're no thinkin'. If ye dinna think o' the meanin', hoo can ye be richt? Ye micht as weel learn Gaelic."

After several other correct answers, I had a very good example of the quickness of perception which long experience gives. A little girl having broken down, opened the catechism which she held in her hand, and craftily began reading instead of repeating the answer. The shoemaker's ear at once caught it up. He detected from the accuracy of the answer, and at the same time from the hesitating tone in which it was given, the effort of reading, and said, in a voice of considerable severity, "What! are ye keekin'? Hae ye your catechiss in your han'? Hoo often hae I telt ye o' the dishonesty o' that? Ye're cheatin', or at ony rate ye're tryin' to cheat me. Do I deserve that frae ye? Did I ever cheat you? But ye're doing far waur than cheatin' me. Oh, whatever ye do, be honest. Come to the schule wi' your lessons weel by heart if ye can, but if you've been lazy, dinna mak' your faut waur by being dishonest."

It will be seen from this sketch of his teaching that Mr. Beattie is a man of no ordinary type. I have succeeded very imperfectly in conveying an adequate notion of his kindliness and sympathy with everything good. I was surprised to find in a man moving in a very narrow circle such advanced and well-matured theories of education. His idea of the extent to which difficulties should be presented in the work of instruction,—his plan of selecting passages instead of taking whatever comes to hand,—his objection to whispering assistance, "Dinna tell her; if she needs help, I'll tell her mysel', or bid you tell her,"—his severe but dignified reproof of dishonesty, "Ye're cheatin' me, but ye're doing far waur than that. Oh, whatever ye do, be honest," &c.,—his encouragement to thoughtfulness and intelligence, "If ye dinna think o' the meanin', hoo can ye be richt?" seemed to me most admirable, well worthy the attention of all who are engaged in similar pursuits, and certainly very remarkable as being the views of a man who has mixed little with the world, and gained almost nothing from the theories of others.

It was evident from the behaviour of the children that they all fear, respect, and love him.

I sat and talked with him on various subjects for a short time longer, and then rose to bid him good-bye.

"But, sir," he remarked, "this is a cauld day, and, if ye're no a teetotaller, ye'll maybe no object to gang up to my house wi' me and 'taste something.'"

I replied that I was not a teetotaller, and should be very glad to go with him. We went accordingly, "tasted something," and had a long talk.

He has, for a country shoemaker, a remarkably good library. The books generally are solid, some of them rare, and he seems to have made a good use of them. His opinion of novels is perhaps worth quoting:—

"I never read a novel a' my days. I've heard bits o' Scott read that I likit very weel, but I never read ony o' them mysel'. The bits I heard telt me some things that were worth kennin', and were amusin' into the bargain, but I understan' that's no the case wi' the maist o' novels. When a body begins to read them, he canna stop, and when he has dune, he kens nae mair than when he began. Noo it taks me a' my time to read what's really worth kennin'."

I asked him what had first made him think of teaching.

"Mony a time," he replied, "hae I asked that at mysel'; and it's nae wonner, for I never was at the schule but eleven weeks in my life, and that was when I was a loon (laddie) about eleven years auld. I had far mair need to learn than to teach, though I'm no sure but to teach a thing is the best way to learn't. Amaist a' that I ken, and it's no muckle to be sure, but I got it by learnin' ithers. But ye've asked what made me begin teachin'. Weel, sir, it was this: when I was a young lad, there were seven grown-up folk roun' aboot here that couldna read a word. Some o' them were married and had families, and there was nae schule nearer than twa mile, and in the winter especially the young things couldna gang sae far. Ane o' the faithers said to me ae day: 'Ye ken, Jamie, I canna read mysel', but, oh man, I ken the want o't, and I canna thole that Willie shouldna learn. Jamie, ye maun tak' and teach him.' 'Oh man,' I said, 'hoo can I teach him? I ken naething mysel'.' 'Ye maun try,' he said. Weel, I took him, and after him anither and anither cam, and it wasna lang till I had aboot twenty. In a year or twa I had between sixty and seventy, and sae I hae keepit on for near sixty years. I soon grew used wi't, and custom, ye ken, is a kind o' second nature."

"But how did you find room," I asked, "for sixty in that little place?"

"Weel, sir, there was room for mair than ye wud think. Wherever there was a place that a creatur could sit, I got a stoolie made, and every corner was filled. Some were at my back, some were in the corner o' the window, and some were sittin' among the auld shoon at my feet. But for a' that there wasna room for sixty, and so a woman that lived across the road had a spare corner in her house, and when the bairns got their lessons, they gaed ower and sat wi' her, and made room for the ithers. Ye see, the faithers and mithers were aye in gude neebourhood wi' me. They were pleased and I was pleased, and when folk work into ane anither's han's, they put up wi' things that they wudna thole at ither times."

"You must have had great difficulty," I remarked, "in keeping so many of them in order. What kind of punishment did you use?"

"Oh, sir, just the strap. That's it," he said, pointing to one lying among the old shoes.

"And did you need to use it often?"

"Ou ay, mony a time, when they were obstinate. But I maun say, it was when the schule was sae close packit that I had to use't maist. When they were sittin' just as close as I could pack them, some tricky nackits o' things wud put their feet below the seats, and kick them that were sittin' afore them. Order, ye ken, maun be keepit up, and I couldna pass by sic behaviour. I've seldom needit to chasteese them for their lessons," he continued; "the maist o' them are keen to learn, and gie me little trouble."

"Have you any idea," I asked, "of the number of pupils you have passed through your hands during these sixty years?"

"Weel, I keepit nae catalogue o' names, but some o' them that tak' an interest in the bairns made oot that they canna be less than fourteen or fifteen hunder. I weel believe they're richt."

"And you have never charged any fees, I understand."

"Fees! Hoo could I charge fees? I never sought, and I never wanted a sixpence. But I maun say this, that the neebours hae been very kind, for they offered to work my bit croft for me, and it wudna hae been dacent to refuse their kindness. And they gied me a beautiful silver snuff-box in 1835. That's it," he said, taking it out of his pocket; "wull ye no tak' anither pinch?"

I did, and then said that I was glad to learn from his friend Mr. C. that, a year or so ago, he had been presented with his portrait and a handsome purse of money.

"Deed it's quite true, and I was fairly affronted when they gied me my portrait and 86*l.*, and laudit me in a' the papers. Some o't cam frae Canada and ither foreign pairts, but I ken't naething aboot the siller till they gied it to me, for they cam ower me, and got me to tell them, without thinking o't, where some o' my auld scholars were leevin'. I said to mysel' when I got it, that I was thankfu' for't, for I wud be able noo to buy the puir things books wi't."

"You supply them with books then?" I enquired.

"Weel, them that's no able to buy them," he said with a peculiar smile.

I have not succeeded in analysing this smile to my own satisfaction, but, among other things, it expressed commiseration for the poverty of those who were not able to buy books, and a deprecating reproof of himself for having been unwittingly betrayed into an apparent vaunting of his own good deeds.

"You must have great pleasure," I said, "in looking back to the last sixty years, and counting up how many of your old scholars have done you credit."

"Oh! I hae that," he replied. "I've dune what I could, and there's nae better work than learnin' young things to read and ken their duty to God and man. If it was to begin again, I dinna think I could do mair, or at ony rate mair earnestly, for education than I hae dune, but I could maybe do't better noo. But it's a dreadfu' heartbreak when ony o' them turns oot ill, after a' my puir wark to instil gude into them."

I led him by degrees to take a retrospect of the last half century. He told me, in his simple unaffected Doric, the history of some of his pupils, keeping himself in the background, except where his coming forward was necessary either to complete the story, or put in a stronger light the good qualities of some of his old scholars. He paused now and then, sometimes with his hands on his knees and his head slightly lowered, sometimes with his head a little to one side, and his eye looking back into the far-off years, and I saw by his quiet reflective look that he was scanning the fruits of his labours, his expression varying from gaiety to gloom, as the career of a successful or "neer-do-weel" pupil passed in review before him.

I complimented him on his haleness for his years.

"Yes," he replied, "I should be thankfu', and I try to be't, but, I'm feared, no sae thankfu' as I should be. Except hearing and memory, I hae my faculties as weel's when I was ten year auld. Eh! what a mercy! hoo many are laid helpless on their back long afore they're my age, and hoo few are aboon the ground that are sae auld!"

Here the old man's voice faltered, and tears of genuine gratitude filled his eyes.

"Of a' them that began life wi' me, I just ken ane that's no ta'en awa'. There were twelve brithers and sisters o' us, and I'm the only ane that's left. My faither dee'd when I was sixteen. My aulder brithers were a' oot at service, and as I was the only ane that was brocht up to my faither's trade, my mither and the younger anes had to depend maistly on me, and I thocht I was a broken reed to depend on, for I hadna mair than half learned my trade when my faither dee'd. I mind the first pair o' shoon I made; when I hung them up on the pin, I said to mysel', 'Weel, the leather was worth mair afore I put a steek (stitch) in't.' Ye ken they werena sae particular then as they are noo. If the shoe didna hurt the foot, and could be worn at a', they werena very nice aboot the set o't. Mony a time I thocht I wud hae lost heart, but regard for my mither keepit me frae despairin'. Whiles I was for ownin' beat, and askin' the rest to help us, but my mither said, 'Na, Jamie, my man, we'll just work awa' as weel's we can, and no let the rest ken.' Weel, I wrought hard at my trade, and when I should hae been sleepin' I wrought at my books, and I made progress in baith. Ah, sir," said the old man with a pathos I cannot reproduce, "naebody that hasna had to fecht for the best o' mithers can understan' my feelings when I saw at last that I was able to keep her and mysel' in meat and claes respectably. I've had mony a pleasure in my lang life, but this was worth them a' put thegither. Ay," he said, and his voice became deeper and richer, "it's grand to win a battle when ye've been fechtin' for the through-bearin' and comfort o' an auld widow-mither that ye like wi' a' your heart. For oh, I likit my mither, and she deserved a' my likin'."

Here he broke down, his eyes filled, and, as if surprised at his own emotion, he brushed away the tears almost indignantly with his sleeve, saying, "I'm an auld man, and maybe I should think shame o' this, but I canna help being proud o' my mither."

"I think I can understand both your perseverance and your pride," I replied; "you must have had a hard struggle."

"Ay, I cam through the hards, but if I was to be laid aside noo, it wud be nae loss to my family, for they're comfortable, and could keep me weel enough, and I'm sure they wud do't."

"You were well armed for the battle," I replied, "and it was half won before you began it, for you evidently commenced life with thoroughly good principles and strong filial affection."

"Yes, I've reason to be thankfu' for a gude upbringin'. Mony a callant is ruined by bad example at home. I canna say that for mysel'. Whatever ill I hae done in my life canna be laid at my faither or mither's door. No, no! they were a dacent, honest, God-fearin' couple, and everybody respected them."

"Their example seems not to have been lost upon you, for you too have the respect of every one who knows you."

"Weel, I dinna ken," he replied; "everybody has enemies, and I may hae mine, but I dinna ken them: I really dinna ken them."

"Have you always lived in this village?" I asked.

"Yes; and, what's curious, I've leeved under four kings, four bishops, four ministers, and four proprietors. And for mair than sixty years I've gane to the chapel at least ance a week, and that's a walk o' eight mile there and back. That's some travelling for ye. I never was an hour ill since I was fourteen year auld."

He still looks wonderfully hale, but he says that, for some time past, he has felt the weight of years coming upon him.

"Sometimes," he said, "I grow dizzy. I dinna ken what it is to be the waur o' drink, but I think it maun be something like what I've felt—just sae dizzy that if I was to cross the floor and tramp on a bool (marble) I wud fa'."

Judging, however, from his haleness, one would think him not much above seventy, and even strong for that, and with probably years of good work in him yet. He expresses himself clearly, methodically, and without an atom of pedantry, though in the broadest Scotch. He is, as I have said, an Episcopalian, and says, "When it is a saint's day, and the bairns are telt no to come to the schule, for I maun gang to the chapel, if I have occasion to gang doon to the shop a wee in the morning afore chapel-time to finish some bit job, I catch mysel' lookin' roun' for the bairns, though there are nane o' them there. Na," he continued, "I couldna do without my bairns noo at a'; I canna maybe do them muckle gude, but I can do them nae harm, and as lang as I can try to do them gude I'll no gie't up."

Thus ended my first morning with James Beattie in February, 1864, and I felt as if I had been breathing an atmosphere as fresh, bracing, and free from taint, as that which plays on mid-ocean, or on the top of Ben Nevis.

I saw him a second time in January last, and, though it was again a snowy day, I found twenty pupils present. The shoemaking and schoolwork go on as before. The awl and the hammer are as busy as ever, and his care of his bairns unabated. I had scarcely sat down before I asked for "Bell," whose "dreadfu' memory" had surprised me the previous year. I saw, from the grieved expression that passed over his countenance, that something was wrong.

"Eh, man, Bell's deed. She dee'd o' scarlatina on the last day o' September, after eighteen hours' illness. There never was a frem'd body's* death that gie'd me sae muckle trouble as puir Bell's."

Evidently much affected by the loss of his favourite pupil, he went on to say, "She was insensible within an hour after she was taen ill, and continued that way till a short time afore she was taen awa', when she began to say a prayer—it was the langest ane I had learned her—and she said it frae beginning to end withoot a mistak'. Her mither, puir body, thocht she had gotten the turn and was growing better, but whenever the prayer was dune, she grew insensible again, and dee'd aboot an hour after. Wasna that most extraordinar? It behoved to be the Speerit o' God workin' in that bairn afore He took her to Himsel'. Ay, it'll be lang afore I forget Bell. I think I likit her amaist as if she had been my ain. Mony a time I said she was ower clever to leeve lang, but her death was a sair grief to me nane the less o' that. I'll never hae the like o' her again. I've a sister o' hers here. Annie M'Kenzie," he said, addressing a little girl, "stan' up and let this gentleman see ye." Turning again to me, he said, "She has a wonnerfu' memory too, but no sae gude as Bell's. She's just aboot six year auld. She has a prayer where she prays for her faither and mither, and brithers and sister. Puir Bell was the only sister she had, and I said to her ae day that she shouldna say 'sister' ony mair in her prayer; and, wud ye believ't, sir? the tears cam rinnin' doon the creatur's cheeks in a moment. I couldna help keepin' her company. Ye wudna expect that frae ane o' her age. She has a brither too, aboot three year auld, that will come to something. He has a forehead stickin' oot just as if your han' was laid on't."

---

* A person not a relation.

Jamie had made good progress during the year, and earned another sweetie easily. He has been promoted to the dignity of pointing for himself, and no longer requires the awl.

Mr. Beattie seems as vigorous as when I saw him a year ago. The only indication of greater feebleness is, that he has taken regularly to the use of a staff. He walks, however, nimbly and well; but he says the dizziness comes over him now and then, and he feels more at ease when he has a staff in his hand.

He asked me if I could not come and see him next day. I said I was sorry I could not. "I am awfu' vexed at that," he said; "this is the last day o' my eighty-first year. The morn's my eighty-second birthday, and I thocht I micht maybe never see anither, and I made up my mind to gie the bairns a treat. They're a' comin', and they get a holiday. I'm awfu' vexed ye canna come."

"I wish very much I could," I replied.

"A' the neebours," he said, "are takin' an interest in't, and the Colonel's lady has sent me a cake to divide among the bairns—that's a sma' thing compared wi' a' her gude deeds, for she's a by-ordnar fine woman. Ye maun come up to my house and get a bit o' the cake."

I objected that it was scarcely fair to break it before to-morrow.

"Oo ay, ye maun taste it. She'll no object to you gettin' a bit o't afore the bairns."

I yielded of course, and spent another pleasant hour with him, during which I had my first impression confirmed as to his single-hearted benevolence and altogether fine character. I shook hands with him, and as I was leaving said that I had some intention of sending a short sketch of his labours to GOOD WORDS. I asked if he had any objection to his name being mentioned.

"Weel, sir," he said, "I'm real gratefu' for your kindness in coming twice to see me, and takin' notice o' me the way ye've done. It's far mair than I deserve. I dinna think the readers o' GOOD WORDS will care muckle aboot the like o' me, and I've never been fond o' makin' a show, but if ye think an article wi' my name in't wud encourage ithers in my humble way to do a' they can for the upbringin' o' puir creaturs that hae nae ither way o' gettin' education, I'll no forbid ye to do just as ye like."

"Well, then, I'll do it. Good bye!"

"Wull ye gie me anither shake o' your han' afore ye go? I may never see ye again."

"Most willingly," I replied.

He took my hand in one of his, and laying his other on my shoulder, said, "I'm no a man o' mony words, but I wud like ye to believe that I'm gratefu', real gratefu' for your kindness, as gratefu' as an auld man that kens weel what kindness is can be, and I wud like ye to promise if ye're hereaboots next year, and me spared till that time, that ye'll no gang by my door. Wull ye promise this?"

I gave the promise, and was rewarded by two or three kindly claps on the back, a hearty squeeze of the hand, and "God bless ye and keep ye."

The moral of James Beattie's life requires no pointing. A life that has been a discipline of goodness, and to which benevolence has become a necessity,—"I canna do without my bairns noo at a', and as lang's I can try to do them gude I'll no gie't up,"—has a simple eloquence that needs no aid and admits of no embellishment from well-balanced phrases.

May the life which has already far exceeded the allotted span be continued for years to come to a man who has been diligent in business, fervent in spirit, serving the Lord.

JOHN KERR.

EASTWARD.

BY THE EDITOR.

IV.—JAFFA.

WE embarked at Alexandria on Sunday evening* in a Russian steamer which was to start at early dawn for Jaffa. When I say *we*, I do not at present use the editorial, or the modest "we," instead of the too personal and obtrusive "I." It is intended to express the party which embarked at Alexandria to visit Palestine together.

Now one of the most difficult practical problems which a traveller has to solve, is the choice of the companions who make up the "we." His comfort, the whole atmosphere of the journey, the enjoyment from it at the time and from its memory afterwards, depend in a great degree on those who accompany him. Let him beware of his espousals! A divorce may be impossible for months, and his sufferings in the meantime great. Accept therefore of no man who for any reason whatever can get sulky, or who is thin-skinned; who cannot understand a joke or appreciate a bad pun; who wears the photograph of his wife round his neck, or, what is worse, of one whom he wishes to be his wife; who has a squeaking voice, which he is for ever pestering the echoes to admire and repeat; who refuses to share the pain of his party by paying when cheated; who murmurs doubts about the lawfulness of a glass of beer; who cannot "rough it" and suffer in silence; who has long legs, with knees that reach across a carriage; or who snores loudly. Avoid such a man. Drown him, if necessary, unless he reform. What is needed above all else is geniality, frank and free cordial companionship, with the power of sympathising not only with his "party," but with the spirit of the scenes and people among whom he moves. The feeling with which a man gazes for the first time on some famous spot, like Jerusalem or Tiberias, colours the whole afterthought of it. Let one of the party at such a time strike and keep up a false note, the whole music is changed into discord, and so echoes for ever in the ear of memory.

---

* We had thus the happiness of spending another Sunday at Alexandria with our good friend the Scotch minister, Mr. Yuille, and of again assisting him in his services in the harbour on board his "Bethel" ship (presented to the Church of Scotland Mission by the late Pasha) and of preaching to his congregation on shore.

Travellers, I fear, are too apt to form an estimate of the value of missionaries in foreign cities only from the number of "conversions" of the heathen or the unbelievers among whom they are settled. But without at all underrating this great branch of their work, let us not overlook, as we are apt to do, how great a privilege it is to Europeans themselves,—to the wandering traveller, the resident merchant, the young clerk far from home, the sailor visiting the port, the invalid seeking a more genial clime,—to have a simple-hearted, intelligent, God-fearing missionary to visit them in sickness, to advise and comfort them in difficulty and in sorrow, and on each Lord's day to minister to them by prayer and preaching. In our opinion such a missionary is the Christian Consul of the place in which he lives. His value is great, and he deserves the support and encouragement of every right-thinking man.

Now I state all these qualifications with greater confidence, inasmuch as "our party" was unexceptionable. There was myself, for example;—but I dare not here pause as Mathews used to do in his story of the actor who began to enumerate the great performers he had known, suddenly stopping after his own name, and adding, "And I forget the rest!" For to forget would be impossible, that there was also my friend Mr. Strahan, the publisher, and my brother, the minister of Linlithgow, both selected for the important and highly responsible duty of protecting me; the one being accordingly told off to hold the bridle, and the other the stirrup of the weighty writer on those solemn occasions of great physical exertion when he mounted, or dismounted from, his horse or ass; and there were our excellent friends the Rev. Mr. Lundie, of Birkenhead, and Mr. George Barbour, Jun., of Bolesworth, who both joined us on finding that their route was to be the same as ours.

Each of us had his own peculiar greatness. The publisher was great in endurance, even at sea in bad weather,—that is to say, so long as consciousness remained; the minister of Linlithgow was great as a courier, and great also in Arabic, for he could count ten in that language, having been in the country before; the minister of Birkenhead was great in plants; the young Cheshire laird was great on horseback, and could force a trot, and on some occasions a gallop, when all others failed to do so; the writer was great all over, even majestic—in sleep.

Having introduced my friends, I shall, without perhaps mentioning them again, resume the "I" or the "we" as fancy or convenience may dictate, freeing them from all responsibility for what is written by either. As we never had the slightest difference, in our happy journey, I shall indulge the confident hope that the "*we*" will generally concur in the account, such as it is, or may be, which the "I" may give of it.

The steamer was very comfortable, but very slow. There was no forcing her even in smooth water up to eight knots. The captain was a short man, round as a barrel, and with a bullet head, like a seal's, covered by shiny black hair. He was very civil, in his own official way. The vessel was one of a line which unites the coasts of the Mediterranean with those of the Black Sea.

It was crowded with "pilgrims" coming from Mecca, I believe, though I cannot be positive as to their *terminus à quo* or *ad quem*. What interested me most on here meeting, for the first time, with a freight of pilgrims, was their great numbers and their strange habits on shipboard. They were spread everywhere over the decks in family groups, leaving only narrow paths barely sufficient for sailors or curious passengers to move along without treading on them. They lay huddled up in carpets and coverings with the sort of quiet submission to their position which good Europeans manifest in yielding themselves up to death and the grave. Whether they slept, meditated, or were in utter unconsciousness, it is difficult to say; for during most of the day few seemed to attempt to move or shake themselves loose from their place of rest. When the sun shone bright in the morning or evening, and the ship was not uneasy, there was a general rising up of turbans like flowers from the variegated beds of a garden. Narghilés were then produced, lights were passed, bags, handkerchiefs, or other repositories opened, and bread, with figs, garlic, or some other condiment, divided by the old bearded Turkey cock and his hen among their young in the nest around them. It was marvellous to see, as we noticed afterwards on longer voyages than this, how little suffices to satisfy the wants of Orientals.

The one half of the quarter-deck was tented with canvas, and set apart for the more aristocratic portion of the pilgrims; but, except for the darting out and in of some young black-eyed girl or slave who supplied them with water, their long tent was as still as the grave. So still, indeed, did some of those Easterns keep, so submissive and patient were they under all pressure of circumstances, that on one occasion when I went to enjoy the quiet and the fresh breeze at the vessel's bow, and sat on the fore jib, which had been hauled down and stowed, I sprang up in alarm on finding it to move under me. I discovered to my horror that I had been sitting for some time on a Moslem! He survived the pressure; nay, smiled at my expression of alarm. I hope he has not suffered since.

We had one passenger on board who was of some importance—the ex-Duke of Modena. He was on a pilgrimage, as we were told, to Jerusalem, where we afterwards met him. He was a quiet, courteous gentleman, unaffected in manner, and wearing a saddened look, which, knowing the change in his social position, could not but excite our sympathy. It is easy to blame a ruler for what was done or left undone by him while in power; but few of us can know or understand the whole world of circumstances and surroundings, ecclesiastical, political, and social, in which such a ruler has been placed from infancy, nor the gifts or capacities given him by God, so as to form any righteous judgment regarding his personal guilt or innocence. We pitied the Duke for his loss of Modena, although not Modena for the loss of the Duke, who was of great service to us, in securing an excellent table for the passengers while on board. The captain wore his Russian orders, and the cooks and stewards obeyed them; so, what with the Duke and the orders, there was great dignity and good dinners. If Dr. Johnson, that authority on morals, deemed it right for a man on land to pay attention to what must be done thrice every day, who can blame a man at sea for paying attention to his meals when he has little else to concern himself with all the day long? It is surely inconsistent to pity the sick man who dispenses, in more ways than one, with his food, and at the same time to blame the strong man who enjoys it? We again acknowledge our gratitude to the Duke of Modena.

We had other passengers who contributed to make this short voyage a very agreeable one. There were Messrs. Thompson, Ford, and Bliss, with other excellent American missionaries; and our friend Colonel M—— with his lady and party.*

We were rather doubtful as to where we would be put ashore, for the landing at Jaffa is not always to be depended upon. There is no port for the steamer to enter; and if the weather be at all rough, boats cannot leave the harbour: and should they be able to do so, there is often much danger in entering it again, as the passage through the reef of rocks is very narrow, and boats are apt to ship a sea from the breakers, and thus be swamped. The next landing-point is Caipha, or Haifa, under Mount Carmel, and this, we believe, can be entered in any weather. But it is an inconvenient point of access to Palestine, as it necessitates the tourist who wishes to see the north and south of Palestine, to retrace his steps northward after visiting Jerusalem—unless he varies his journey by travelling southward along the plain by Cæsarea to Jaffa. We ourselves would much prefer, if Jaffa failed, to go on to Beyrout, see Damascus, &c., and travel south, embarking at Jaffa. Fortunately the weather was propitious, and the Duke of Modena was anxious to reach Jerusalem by the shortest route. This settled the case in favour of Jaffa, or old Joppa.

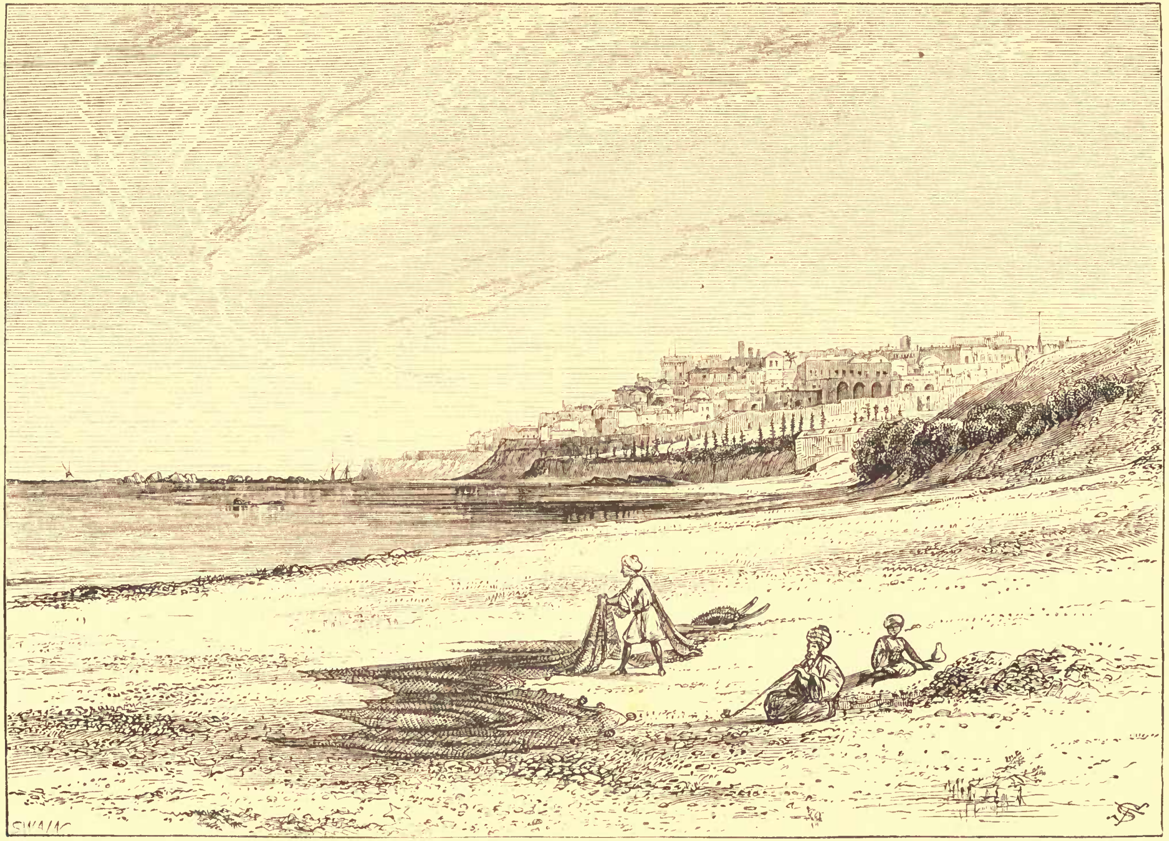
On the afternoon of Tuesday we were approaching the Holy Land, and straining our eyes to get a first glimpse of its everlasting hills.

The sun was setting as we descried the long low line of the Palestine coast. It had set when we blew off our steam, a mile or so from the shore. The twinkling lights of boats were then seen like stars coming towards us, and soon the port officials stood on deck demanding a clean bill of health; and this being produced, boat after boat came clustering to the ship's side. Then arose an indescribable Babel from the screeching of their crews, who seemed engaged in some fierce and deadly strife of words which was itself an interesting study, until, after a while, amidst the roaring of steam and of voices, we were by degrees carried along over the side and down to a boat, in a current of sailors, Turks, Arabs, passengers, portmanteaus, dragomen, and travellers, while officers and captain were at the gangway acting a pantomime in despair, vociferating Russian louder than the steam, stamping their feet, grasping their hair, and appearing half apoplectic with their efforts to be heard, yet able at intervals to command a smile for the comfort of the Duke of Modena. It was a great relief to be off from the ship's side (though more than once I thought unpleasantly of Jonah) and to pull for the old shore.

I do not know whether there is a more convenient landing-place at Jaffa than that by which we passed from sea to land. I have a faint memory that some one told me there was a stair. I hope there is; for if not, that one difficulty might form a more formidable barrier to some travellers than a high mountain pass. Our landing-place was a shelf of wood projecting overhead, under which our boat was brought, and from which a dozen hands of unknown and, in the darkness, dimly visible Arabs, were stretched down to help me up. I was quite alive to the "slip between the cup and the lip," but somehow, though not without difficulty, I was dragged to land, and found myself in Palestine. I cannot say that I was wanting in emotion, yet it was emotion in no way kindled by the spot I trod upon, but by the villanous crowd who surrounded me forcing every thought into one uncontrollable desire to be delivered from these Philistines. With thanksgiving I heard my name shouted by my old friend Dr. Philip, to whom I had written from Scotland, and who was waiting for me to guide me to his hospitable home, about a mile from the town. He had a horse ready for me; so leaving our dragoman—of whom more anon—and all my

---

* There are few pains connected with authorship, even in a small way, more acute than the punctures received from errors of the press, especially when the author has himself only to blame. I suffer monthly from this source. In my last article, for example, I discover that a glacier is described as a "bed-*pillow*" instead of a "bed-*fellow*," and that my friend the Colonel is noted for his large "*hand*" instead of his large "*head!*"



JAFFA, FROM THE SOUTH.

[From a Photograph by J. Graham.

The only disappointing thing about an orange grove, or any garden which I saw in the East, was the roughness of the ground. It is cut up into trenches for the purpose of irrigation. Velvety grass exists not: this would make the retreat perfect.

Outside of the gate of Jaffa was a place I would have liked well to have lingered at. It is a large open space, vanishing into the country, and filled with all the picturesque Oriental nondescripts to whom I have alluded in former pages, and who, from crown to heel, had to me an undying interest. To the usual crowd which was ever moving in that open space, with camels, donkeys, horses, and oxen, were added troops of horses which for weeks and months had been constantly passing from every part of the country along the plain, by the old road to Egypt *via* Gaza, to supply the immense losses sustained there from the murrain. Most of those we saw were very inferior cattle, and represented but the dregs of the land, yet were selling at large, and, for the East, exorbitant prices. The strange-looking characters that accompanied them represented the lowest conceivable grade of horse-dealers: their faces being a study for the physiognomist as well as the artist. We preferred studying them by sunlight rather than moonlight.

The first place in Jaffa which the traveller naturally desires to visit is the traditional house of Simon the tanner, in which the Apostle Peter lived. A portion of it at least is evidently a modern building, but if it is not the old house, it is nevertheless well worth visiting from the characteristic view which is obtained from its flat roof. Standing there, I felt myself for the first time brought into local contact, as it were, with those persons and facts in Gospel history with which every Christian is familiar —which occupy the everyday thoughts and most solemn moments of a minister's life and teaching, and which, as he travels through Palestine, seem to become incarnate, to pass from written pages and to clothe themselves in the visible garb of material scenes; to be brought down from the world of spirit and of abstract truth into the real world in which they once lived and moved, only from thence to be raised again and made more real and living to the thoughts than before. It is associations like these, constantly suggested by the objects which every hour meet the eye and stir the memory of the traveller, that make the land "holy," sobering the mind, and investing every day with the hallowed sunlight and atmosphere of the Lord's day.

But to return to the house-top at Jaffa. The quarter of the town in which it exists, with the general idea of the town itself and the harbour, will be understood better from the engraving of Jaffa which illustrates this chapter, than from any verbal description. The house is close to the sea-wall, and looks to the south, from which the view is taken. The whole landscape as seen from the roof is instructive. Along that winding shore, and not far from the town, tanners still ply their trade; and they may have done so since the days of the Apostle. Tanworks, if they existed at all, would probably be always where they now are, from the fact that a current steadily sets along the coast from north to south, which sweeps the refuse of the works clear of the town and small harbour, while it would have had the opposite effect had the works been on the north shore. Simon's house wherever it stood may have passed away, but one fact at least, suggested by it, remains for our strength and comfort, that our angel brothers who minister to the heirs of salvation, are not strangers to our earth and its inhabitants, nor to the situation of our lowly homes, or the nature of our "honest trades;" for the angel who commanded Cornelius to send for Peter, knew this old town of Jaffa, and knew also the name, the house, and the trade of Simon.

The great sea, whose blue waves danced before us in the sunlight and spread themselves to the horizon to wash the shores of Europe beyond, seemed also to partake of the light shed from the vision revealed to the inner eye of the Apostle when praying beneath this blue sky. He had gazed on this sea, unchanged since then in its features and unwrinkled by time; but as he did so, he little knew what endless blessings of Christian consolation and of spiritual life were given to our Western world in promise, and let down from Heaven with that white sheet! The lesson thus symbolically taught, filled him with pain as it destroyed his past, but fills us with gratitude as it secured our future.

Nor could we forget while standing there, that the first link which unconsciously bound the Apostle to Europe was the person of an Italian: that, at their first meeting, the Roman knelt to Peter, and was rebuked in the memorable words, "Stand up, for I also am a man!" And, remembering all this, the question naturally suggested itself, what that same Peter would have thought if another vision, ascending, we must suppose, from the earth, rather than descending from heaven, had pictured to him what future Italians would do and say in his name? and had that vision also represented the magnificent Cathedral of "St. Peter," with a statue of himself as its chief attraction to successive thousands of "Italian bands" who would kneel devoutly before it, it may be further asked, whether he would have recognised in such a spectacle a true expression of his own Christianity, and a necessary "development" of either the principles or practices of the primitive and apostolic Church which he represented? Would he not be disposed rather to say, with the prophet of old, when contemplating a similar vision: "So I lifted up mine eyes the way towards the north, and beheld northward at the gate of the altar this image of jealousy in the entry!"

One has also an excellent view of the harbour of Jaffa from this same spot. The coast of Syria has really no harbours—such as we mean by the name. It is a line of sand, against which the inland ocean of the Mediterranean thunders with the full force and volume of its waves. The existence of a few rocky ledges like a coral reef running parallel to the shore, forming a breakwater to the small lagoon inside, has alone made harbours possible—and, with harbours, commerce and direct communication with the outer world. Yet, had these been more commodious and common than they are, the separateness of the land from the rest of the world (for which it was selected in order to educate Israel) would have been sacrificed. As it is, the balance is nicely adjusted between exclusiveness from the outer world and union with it. To this small reef of rocks Jaffa, the only seaport of the land of Israel, owes its existence, as well as its continuance from the earliest period of history until the present day. Within that pond, sheltered from the foaming breakers outside, many a vessel lay in peace before even the days of Joshua (ch. xix. 46). Belonging as it did to the tribe of Dan, there "Dan remained in ships" (Judges v. 17). Through that opening, but ten feet wide, to the west, vessels have sailed, and plunged into the deep sea,—Jonahs among them,—for thousands of years. Through the other opening, of much the same size, to the north, have come the floats of cedar trees from Lebanon for rebuilding the house of the Lord. The old town has seen many adventures, and the cry of battle from the wars of the Maccabees, the Romans, the Saracens, the Crusaders, has risen around its walls, and within its houses. The Alexander of modern days, Napoleon, has trodden its streets, and walked in his pride through its Plague Hospital, whether to kill or cure it is difficult to say. The fusillade of that terrible massacre of 4000 prisoners (as it is alleged) on the sands, echoed for hours among its streets. Yet its history is not so eventful as that of most of the old Eastern towns which survive the wrecks of time.

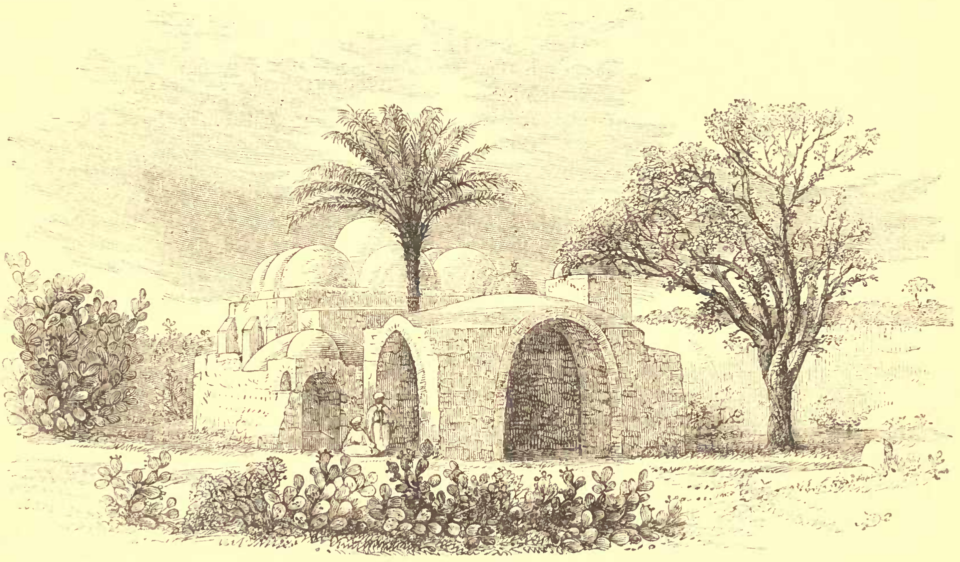
But we must leave the house-top, and keep our appointment at the hotel to prepare for our journey, which is to begin in real earnest on the morrow.

I have already informed the reader of the important fact, that we had hired at Cairo a certain Hadji Ali as our dragoman. True to his engagement, he had met us on the Russian steamer and accompanied us to Jaffa. "Hadji" was an honourable addition made to the name of Ali Abu Haläwy (recommended by "Murray," *alias* my learned and excellent friend Professor Porter, of Belfast), and it represented the fact that its possessor had made the pilgrimage to Mecca. What his motives were in doing so, I do not pretend to know. It may have been in response to his sense of duty, his ideas of piety, or of what might be helpful to him as a dragoman wandering among the tribes of the desert. Be that as it may, we had hired him as the consecrated, saintly Hadji Ali. Now it must be confessed that the Hadji did not look like a saint such as our Western minds conceive one to be. If he was one, he had the gift of concealing the saint and revealing the sinner. But, to do him justice, this revelation was more in an unpleasant sinister twist of his under jaw, in the bandit look of his gaiters, and in the wide-awake, yet reserved and cunning, expression of his eyes, than in any word he ever uttered, or in any act he ever committed during our journey.

Hadji had made arrangements for the road, and wished us to see our horses and be satisfied with his selection—a most difficult and important piece of business! We met at the door of the hotel—one of those peculiar Eastern hostelries of which I shall speak in another paper—to make our acquaintance with our future friends, the horses. They seemed a vulgar pack, without breeding or anything to commend them. But after sundry experiments, protests, rejections, and trials of the girths and saddles, we at last selected our cattle, and arranged to start next morning from the Model Farm. I need not say that Hadji wished to impress us with the greatness of the sum which, owing to the dearth of horses, he had paid for the hire of our stud. I had brought an English saddle with me, and it was ordered to be put on a quiet, patient, respectable-looking, ministerial cob—afterwards called, in spite, "the cow."

We retired that evening to "the Model Farm"—so called, by the way, from its being an experiment, supported by Christians in London, to provide labour for converted Jews. It is superintended by Dr. Philip, who acts as farmer and medical missionary. I availed myself of the opportunity afforded to me of here visiting, without the suspicion of being intrusive or impertinent, a real native dwelling—the house of Mamoud, Dr. Philip's servant. It was what in Scotland would be called a humble "clay biggin." The fire was on the floor. The furniture consisted of two large—what shall I call them?—jars, three or four feet high, for holding grain, with an orifice at the bottom for extracting it. There was also a quern, exactly the same as those used in the Highlands, and with which, when a youth, I have often ground corn for my amusement. A bottle full of oil hung up in the smoke, in order, I presume, to keep it always in a fit state for the lamp—reminding one of the saying of David in his sorrow, "I am become like a bottle in the smoke." The beds, consisting only of carpets and rugs, were rolled up in a corner.

Next morning our cavalcade mustered, and we saw, for the first time, the *matériel* of a tour in Palestine. As to the men who accompanied us, there was our chief, Hadji Ali, with brown braided jacket, loose Turkish trousers, and long black gaiters or leggings as loose and easy as those of a bishop, but wanting the episcopal gloss and rows of buttons. A bright *kaffia* was wrapped round his head and protected his neck and shoulders. Hadji had a horse, of course, assigned to him, but was always willing to exchange it for the animal which became unpopular with any of the party. Next to him in dignity and responsibility was "Nubi," or the Nubian. He was our waiter, personal servant, steward, or whatever will best describe Hadji's mate. He was a tall young man, with skin dark as ebony, shining teeth, intelligent countenance, and most obliging disposition, and from whom we never heard a murmur. The third class was represented by Mohammed, the cook, excellent as an artist, and most civil as a man, whose sole defect was occasional pains, we shall not say where, but intimately connected with his digestion, and to alleviate which I ministered from my medicine-chest, thereby securing to myself from that time the honourable title of Hakeem Pasha, or chief physician. Then came Meeki, the master of the horse, and also of the mules. Meeki always rode a small ass—a creature which, unless he had known himself to be tough and enduring, would have been an ass indeed to have permitted Meeki to mount him. He was a square, thickset man, with short legs, broad back, and ponderous turbaned head. He rode astride or cross-legged, as it suited him. The human side of his character came out wholly as a smoker of his constant friend the narghilé, and as a singer or rather an earnest student of songs, which consisted of little short squeaks full of shakes, and in a minor key. His inhuman side came out in the dogged, fierce, imperious way in which he loaded and drove the pack-horses and mules. I verily believe Meeki had no more heart in him than Balaam, and as little conscience. He was a constant study to us, whether when packing or unpacking at morn or even, or when trudging along at the head of the party on his wonderful little animal, which he so completely covered, that one could see only two small black hind legs pattering along with indefatigable energy over sand and rock from morning till night. Meeki had three muleteers under him, fine active Arab lads, who trembled at his voice. We had thus seven attendants, including Hadji, with about ten pack-horses and mules. All were needed: for, as I have already said, in a note to my first chapter, there are no roads in Palestine, and therefore no wheeled vehicles, not even a wheelbarrow, from Dan to Beersheba. There are no hotels, except at Jaffa and Jerusalem; everything, therefore, required for the journey must be carried.

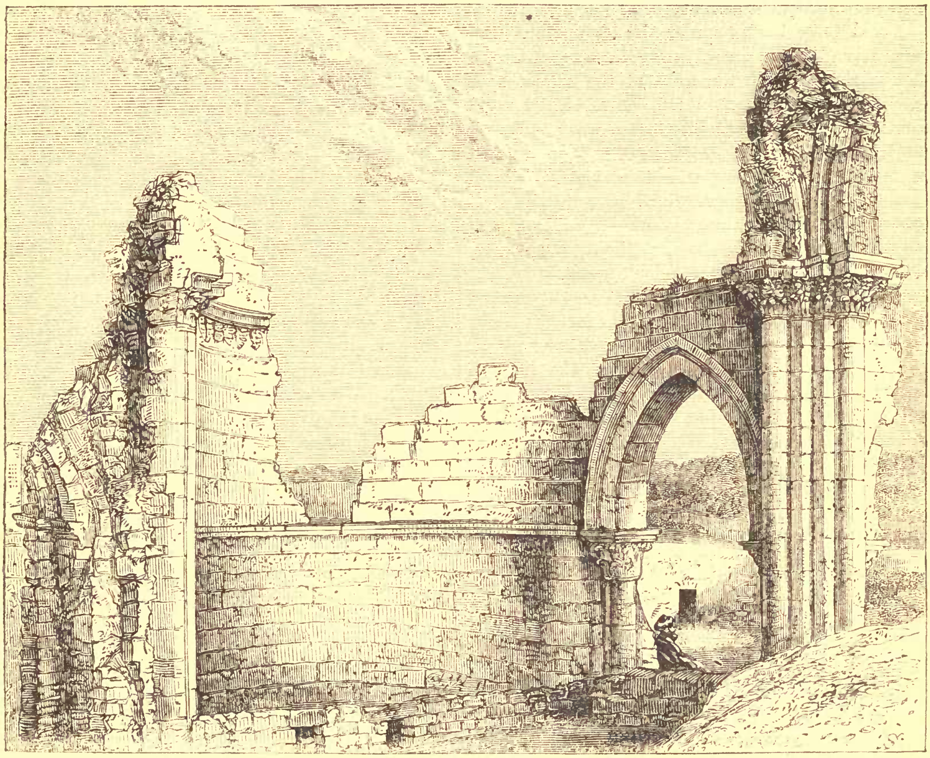


Fountain of Abraham.

We left the Model Farm after breakfast, receiving the adieus of the children, who waved their handkerchiefs to us from the house-top. We were accompanied by their father, who kindly agreed to go with us as far as Jerusalem. The day was beautiful, and the atmosphere exhilarating: so we moved off, across the Plain of Sharon, full of hope for the future and in great enjoyment of the present. We drew up at a grove that formed the outskirts of the gardens, and were made welcome to take as many oranges as we could pocket from the yellow heaps, or what a Highlander would call *cairns*, which were rapidly increasing every minute by the gatherers emptying their basket-loads of the ripe and delicious fruit. To appreciate an orange it must be eaten when taken from the tree and while retaining the full aroma treasured from sun and air. It may have been fancy, but it seemed to me that I had never, except here or at Malta, eaten a perfect orange. We found, however, that these very ripe Jaffa oranges lost their character in a few days.

We soon debouched on the undulating plain, over which we passed along a beaten track. I don't profess to remember its "heighs and hows," the successive aspects of the country, or the bearings by the compass of "tells" or towns: for here I must confess the fact, that I kept no journal nor took any notes, except in letters to my fireside—a spot unknown in all the East. This omission arose from, I verily believe, the mere weariness of the flesh—and the trouble of writing on horseback while a whole party passed on or waited until my observations were recorded—or the bore of writing in one's tent when the demand for repose, conversation, or reading became imperious. I trusted to the permanence of general impressions, and I am not yet convinced of my having committed any great error in having done so. I therefore bow with humble respect and reverence before careful and accurate observers and all scientific travellers, professing myself to be only a gossip about the surface of palpable things, and a recorder only of what I saw and actually experienced, and now clearly remember.

We passed in our ride this forenoon the house where some American missionaries were murdered a few years ago. They were very earnest, but, if the story we heard about them was correct, not very wise or discreet men. We passed also a small hill, or rather mound, called Beth Dagon, where no doubt that fish god had once his foolish worshippers. We passed a handsome fountain called, I know not why, after Abraham; and we saw what was older than Abraham, and what retained all the glory and beauty of their youth—the flowers of the plain. These were always a charm to the eye—a glory of the earth far surpassing that of Solomon. The plains and hills of Palestine are gemmed in spring with flowers. The red poppy, asphodel, pheasant's-eye, pink cranebill, mignonette, tulip, thyme, marsh marigold, white iris, camomile, cowslip, yellow broom, &c., are common to the Plain of Sharon, giving a life and light to the landscape which photography cannot yet copy. We saw also, when near Ludd, the well-known high tower of the mosque at Ramleh, three miles off to our right. It is situated on the highest ridge of the plain, and from its position and height (120 feet) it is said to command a noble view of the Plain of Sharon to the north, and of the Plain of Philistia to the south. We lunched at Ludd, the ancient Lydda, where the Apostle Peter cured Eneas of the palsy. As we approached its beautiful trees and orchards, we came on the cavalcade of our friends, Colonel M—— and his party; and such meetings were always cheering. But instead of resting under the trees with them, we pushed on for the ruins of the church named after England's patron saint, St. George, who was, according to tradition, born and buried here. The church, it is said, was rebuilt by Richard Cœur de Lion. We spread our first table in Palestine under the remains of one of its noble marble arches. An old, bearded Greek Christian



Church of St. George.

visited us, and when some one of our party told him I was a clergyman, he seized my hand and kissed it. It required great faith in the old man to accept the fact of my profession, as I certainly did not wear my canonicals, and from felt hat downwards had no visible traces of the ecclesiastic. He told us many stories about St. George, with keen, believing eyes, bated breath, and uplifted finger. I wish I could recollect them, and had not too hastily assumed that I never would forget such delightful sensation legends regarding the saint; how he was slain, burnt, and beheaded by the King of Damascus, and always came alive again; with the subsequent adventures of his head, which was said to be buried under the high altar. But these legends have passed away from my memory, though they live in the faith of the saint's aged admirer. It has been hinted, however, by some sceptical historian, that St. George was not a very respectable character. I think his Dragon must be meant: charity supports this view. Was it because of some victory gained here by the Crusaders over the Saracens that St. George was adopted as our kind patron, without, I presume, asking his consent? I really don't know.

After lunch we pushed on for our camping-ground at Jimsû, which we saw rising like a fortress above the lower hills, as if to defend the passes beyond. The village is situated on a spur of the hills of Judea. We reached it in five hours from Jaffa, including, I think, our pause at lunch; so that we had an easy day's march.

The first encampment is always a source of interest and excitement to the traveller. We formed no exception to this general experience. Those who associate discomfort with a tent have never lived in one, or it must have been bad, or overcrowded, or, worse than all, in a wet or cold climate. We had two tents; the one accommodating three persons, the other two. On entering the head-quarters and mess-tent, we found the floor spread with rugs; a table round the pole in the centre, arranged for dinner, covered with a beautiful white cloth, and on it two wax candles burning, with ample space round for our camp-stools. Three iron bedsteads were ranged along the side, and our bags and portmanteaus placed beside them, and everything wearing an air of thorough comfort, even luxury. The other tents, belonging to our suite, were pitched near us; one for the kitchen, and the cook's utensils and personal luggage—and the other for the general dormitory of the servants, in which Hadji nightly led off the snores. To pitch those tents so as to have them all in order in the evening to receive "the party," it is necessary that the muleteers should start early with them and all the bagagge, and push on direct to the ground fixed upon, leaving the travellers and dragoman to follow at their leisure.

An excellent dinner was in due time served up by Hadji, and assiduously attended by Nubi. We had not much variety during our tour, but every day there was more than enough to satisfy the cravings of any healthy, even fastidious appetite. Soup, roast mutton, fowls, curry, excellent vegetables, a pudding, a good dessert, and *café noir*, of first-rate quality, after, cannot be called "roughing it in the desert." This sort of dinner we had every day. And for breakfast good tea and coffee, eggs by the dozen, always fresh and good, too, with sundry dishes cunningly made up of the *débris* of the previous dinner. We had also an abundant lunch, which the Hadji carried with him on a pack-horse, and was ready at any time, or in any place, to serve up with the greatest nicety. Tea or coffee could be had as a finale before going to bed, if wanted. All this I state to allay the fears of those who may possibly imagine that, should they visit Palestine, they would have to depend upon their gun or the wandering Bedouin for food. They might as well fear being obliged to rely for entertainment upon the wandering gipsy when travelling between London and Brighton.

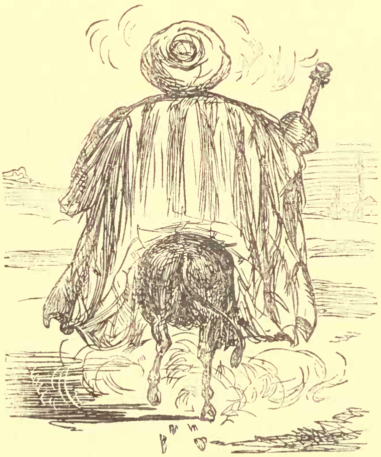
When we reached our tents we found a large number of the Felaheen, or peasant Arabs, from the neighbouring village, assembled. They were very quiet and civil, and did not trouble us *much* about "backsheesh," although our experience regarding this Eastern impost was daily, almost hourly, enlarging. Every petty Sheik, whether of tribe or village, thinks himself entitled to it; the children clamour for it; their parents support the claim; and in some wady, men with clubs or guns may urge it upon the wayfarer to a degree beyond politeness. But, admitting once for all this notorious Oriental weakness, I must also protest against the injustice done to the oppressed descendants of Ishmael, by looking upon them as the only race guilty of levying such an income-tax or "black mail." I fear that it is an almost universal custom, and one not quite unknown among the tribes of the civilised and Christianised portions of the globe, though it may not be so openly practised by them as by the semi-barbarous Orientals. "Backsheesh" reigns supreme in Russia over the peasant and the prince, and is the grand, almost only, passport to the Muscovite nation. It is known in America, North and South, under the guise of "the almighty dollar." It is the *douceur* or *pourboire* of France; the *trinkgeld* or *shmeirgeld* of Germany; and the *buon mano* of Italy—all being constant sources of irritation to the traveller. The tourist in the west of Ireland must more than suspect its existence among "the finest pisantry in the world," though it takes the form there of a "thrifle, yer honor!" Traces of it are not wanting in England and Scotland. Does the British Arab show ordinary civility?—does he direct one on his road, answer a few questions, devote a minute of his idle time to help you, open a cab-door in the city, or a gate in the country? "Backsheesh" is demanded as "sum'ut to drink," or hope of it is expressed by the eye as the hand touches the cap. Does a verger of a church—a sort of Hadji—show you its inside, or point out an illustrious grave within or without it?

neither his piety nor his humanity ever make him forget "backsheesh." Does any servant, male or female, belonging to peer or parson in the land—whether represented by the aristocratic "Jeames" or the maid-of-all-work "Susan"—does the groom, butler, coachman, footman, or keeper, who are fed sumptuously, clothed handsomely, and paid liberally, perform any one act of civility towards you without expecting "backsheesh?" What is the British "tip," "fee," "Christmas box," "trifle," &c., but "backsheesh?" Even while I write a correspondence is going on in the London *Times*, accusing and defending the head servants (Cawasses) of the West-end nobility (Pashas) for demanding a per-centage for themselves from tradesmen on the accounts paid by their masters, and this because of the servants' patronage; not the patronage of the master who pays for the goods, but of the servant who orders them! What is this but "backsheesh" in its worst form, as a mean and dishonest bribe? Please let us cover with a mantle, or with even a napkin of charity, the demand for "backsheesh" made by the wretched peasantry of the East, until we banish it from our own well-to-do people, and from our own wealthy and aristocratic homes.

The Arabs at Jimsû asked backsheesh, and we distributed about sixpence among the tribe. They were satisfied.

But I had provided a talisman wherewith to "soothe the savage breast." I selected it on *a priori* reasons, founded on human nature, before leaving London. Instead of taking powder and shot, I took—could the reader ever guess what?—a *musical snuff-box*, to conquer the Arabs; and the experiment succeeded far beyond my most sanguine expectations. Whenever we pitched our tent near a village, as on this occasion, and produced the box as a social reformer, we had soon a considerable number of people, old and young (the females keeping at a respectful distance), crowding round us, inquisitively but not disagreeably. When the box was wound up, and the tinkling sounds were heard, they gazed on it with an expression more of awe and fear than of wonder. It was difficult to get any one to venture near it, far less to allow it to touch his head. But once this was accomplished, it was truly delightful to see the revolution which those beautiful notes, as they sounded clear and loud through the Arab skull, produced upon the features of the listener. The anxious brow was smoothed, the black eye lighted up, the lips were parted in a broad smile which revealed the ivory teeth, and the whole man seemed to become humanised as he murmured with delight, "tayeeb, tayeeb" (good, good). When once the fears of one were dispelled, the others took courage, until there was a general scramble and competition, from the village patriarch down to his grandchildren, to hear the wonderful little box which could ring such marvellous music through the brain. We respectfully recommend the small "musical snuff-box" to travellers. Even at sea, when the storm on deck blows loudly, and the waves are rude and boisterous, and the passengers sleepy or unamiable, and reading difficult, and the thoughts not bright, they will find that the box—never sea-sick—wound up and allowed to twitter and tinkle old familiar airs, will prove a very cheerful companion. But let me warn any traveller following us in our route that should he hear an Arab attempting to sing "Home, sweet home," or "*Ah, che la morte*," not to attribute too hastily a purely Eastern origin to these airs.

I did not find my first night in a tent either ideal or agreeable. The ear was as yet quite unaccustomed to the heterogeneous noise which found an easy entrance through the canvas. All night the horses and mules seemed to be settling old quarrels, or to be in violent dispute about some matters of personal or local interest: a scream, a kick, a stumble over the tent ropes—shaking our frail habitation and making us start—appeared to mark a climax in the argument. The Arabs kept up an incessant jabber all night—as it seemed to me. The voices, too, of Meeki and Hadji were constantly heard amidst the Babel. Every village, moreover, has its dogs without number: and these barked, howled, and flew about as if smitten with hydrophobia, or in full cry of a midnight chase. One imagined, too—or, worse than all, believed—that some of those wolfish and unclean animals were snuffing under the canvas close to the bed, or thumping against it, as if trying to get an entrance. And if this living creature rubbing against your thin wall was not a dog, might it not be an Arab?—and if an Arab, might he not have a gun or dagger?—and then! But all these experiences belonged to our novitiate. Very soon, between increased fatigue by day, and increased sleep by night, till it could increase no more without becoming apoplectic, all such thoughts and fears vanished, until dogs might bark, horses kick, Arabs talk, and camels groan, without disturbing us more than the waves disturb Ailsa Craig or Gibraltar.



Meeki, Master of the Horse. [*An original sketch.*]

ESSAYS, THEOLOGICAL AND PHILOSOPHICAL.

By HENRY ROGERS, Author of "The Eclipse of Faith."

IV.—REASONS FOR *SCEPTICISM* AS TO CERTAIN SPECULATIONS OF MODERN SCIENCE: ADDRESSED TO A *BELIEVER.*

To M. D.—You ascribe my scepticism, (as you call it,—and, of course, we are all sceptics as to what we do *not* believe,) in relation to some of your new-fangled speculations, to a "blind adherence" to the traditional beliefs of a "stereotyped theology;" and you tell me that it is in oblivion or contempt of what Bacon says in the First Book of his "Novum Organum."

You were never more mistaken in your life. I demur to your scientific crotchets, not because I believe the Bible, (though I *do* believe it,) but because I believe in Bacon. If I know myself, I fancy that even though I had not read a syllable of the Bible, and had no "traditional beliefs" to renounce, I should have objected to the new scientific dogmas which you urge on my acceptance, just as much as I do now; and that precisely because (as I think) you, not I, have forgotten Bacon, and been misled by those "idola" of the human intellect, before which not theologians alone, but scientific speculators too, (as indeed his First Book is more expressly designed to show,) may too readily fall.

The hint, however, to look into Bacon, has not been lost upon me, though I fancy I did not particularly need it; for if I ever made a book my *vade-mecum*, it is the First Book of the Novum Organum.

And surely if ever a book deserved a periodic or constant perusal, it is this. Gibbon, it is said, read every year, the Provincial Letters; Voltaire always had the Carême of Massillon on his table; Robert Hall, the Essays of Addison; one friend of mine used annually to peruse the principal writings of Burke; and another, Don Quixote. I should be afraid to do precisely the same by Bacon, lest he himself should rebuke me for exhibiting somewhat of that same slavish spirit which he condemns in the admirers of Aristotle. But I confess that I read him with a perpetual renewal both of wonder and delight; not only for the profundity and comprehensiveness with which he explores the darkest recesses of human error, but for the perpetual coruscations with which the most exquisite imagination that ever ministered to philosophy, lights up all his dark way, and gleams on the fossil remains and glittering petrifactions of ancient Prejudice, like a thousand wax-lights on the sides of a spar cavern.

It is precisely *because* I take him as my guide, that I reject the dogmas for which you challenge my belief; nor am I unwilling to give you my reasons for so saying.

While he condemns, and justly condemns, (Aphorism lxv.) those who, not content with affirming that there must be a harmony between the "Word" and the "Works" of God, (though it may be long before we can fully show it,) persist in deducing whole "systems of natural philosophy, from the first chapter of Genesis or the book of Job," he is gloriously impartial in his censures, and shows not only that the theologian, but the scientific man also, —as in ages past, so in the ages to come,—may, in spite even of his own clear exposition of error, fall into similar delusions.

He did not suppose, that having once so luminously sketched those "idola,"—some of them congenital to the human mind, others necessarily superinduced in the course of its development,—which obstruct our admission of truth, or betray us into the reception of error, he could thereby secure the mind, (scientific or otherwise,) against the danger of relapsing into them. On the contrary, while he shows that the past history of science, throughout its whole course, has illustrated their potency, and ascribes its long failure or slow and uncertain progress, to their dominion, he distinctly declares that even the inauguration of his own better method would itself bring with it a new temptation to fall into the old errors; that those "idola" he had guarded against, would be apt to reappear in more subtle forms:—that the tendency to hasty generalisation, the impatience of arriving at results, the inability of the mind to "stay its judgment," or exercise a wise abstinence; the temptation to yield to the seductions of a forward and obtrusive fancy, to round an imperfect theory, or give symmetry to a halting hypothesis, would still be apt as ever to haunt the human intellect, however men might acknowledge the principles of the Inductive Philosophy. And therefore he expressly declares, (Aphorism lxiv.)—"There is a certain caution not to be pretermitted; for I foresee and augur, that if ever men, roused by my counsels, betake themselves seriously to experiment, and bid farewell to sophistical doctrines, then, indeed, through the premature and precipitate hurry of the understanding, the leaping or flying to universals or principles of things, great danger may be apprehended from philosophies of this" (the empirical) "kind; against which evil we ought, even now, to be on our guard." Nor is it superfluous to insist, as he did, that men still need to be warned against a class of delusions, which, he says, had been so common in previous ages of philosophy:—"those foolish little models of imagined worlds, (as it were little *apes* of the true, *simiolas*,) which the fancies of men have created in their philosophical systems," and which "must be given to the winds. Let men know how vast a difference there is, (as I have already said,) between the Idols of the *human* mind, and the Ideas of the *Divine*." (Aphorism cxxiv.)

If we may judge from the extent and audacity of modern hypothesis-making in relation to this very class of speculations, or the confidence with which such hypotheses are too often spoken of, as if they were demonstrated truths, this aphorism may be profitably studied in the present day; for the "Hypotheses non fingo," which Newton considered his glory, seems little to the taste of many recent philosophers.

Certainly, my friend, I believe that never since Bacon's time has there been greater licence of hypothesis than in our own day; and that, especially, in relation to subjects demanding (if they are ever destined to be effectually and definitely settled by man at all, and are not rather among those things which it is the "glory of God to conceal," or which He leaves to our modest conjecture only,) the utmost exercise of philosophic caution and self-restraint. Of many of them indeed one may well doubt, with M. Comte, whether they are, or *can* be, the legitimate province of science at all. To investigate the *present* laws of nature, to trace the succession of antecedents and consequents of all *present* phenomena, to analyse and classify the *facts* of the world as it is actually constituted, and lies open to our *experience*, would seem to be the proper province of *experimental science.* But, not content with this, many of you have set up as "world-makers,"—and are as busy as the old Greek philosophers about Cosmogonies; about the origin and evolution of all things; about the possible period of the gestation of the universe from its first embryo condition; the primary elements out of which all things have been evolved; whether there need have been any such thing as "creation"-proper, or any "beginning" at all; whether the "primordial forms" of all animated nature need have been more than three or four, or even more than one; and whether all species of creatures may not have been developed out of, or transmuted into, one another.

Now as the absolute decision of such questions —(some of them seem, in fact, rather the proper *pabulum* of those metaphysical speculations, which modern science generally despises, than of legitimate scientific investigation)—necessarily carries us beyond the sphere of experience into regions transcendental to it, I cannot help feeling some sympathy with M. Comte's too trenchant and summary proscription of all such subjects, as not even belonging to genuine science at all; subjects in which man merely as *man*, with his merely natural *organa* of science, cannot hope to know, and, at best, can but conjecture.

It is accordingly not a little droll to see how M. Comte, indisposed though he was to admit any *other* Supreme Being than "Collective Humanity," yet censures the *dogmatical* Atheist, who seeks to give a plausible account of "the causes and origin of things" as more unreasonable than the Theists themselves: "The true spirit of the Positive Philosophy consists in always substituting the study of laws, for the study of causes. It is, consequently, irreconcileable with the ambitious dreams of a misty Atheism, relative to the *formation of the universe, the origin of animals, and so forth.* Positivism does not hesitate to declare such doctrinal chimeras to be very inferior, even in rationality, to the spontaneous beliefs of mankind."* He on like grounds excludes geology (as ordinarily understood) from the circle of the sciences altogether!

I should certainly be sorry to go so far; or say that men must remain perpetually or absolutely ignorant on all the problems in question; (indeed there are not a few of us who are old-fashioned enough to believe that we may get glimpses of the truth about some of them, even though the oracles of science were dumb;) or deny that science may lawfully, if it will but modestly, form at least its hypotheses respecting them, though it may acknowledge that to obtain absolute certitude is beyond its power. But most assuredly the subjects are such as are inveterately haunted by some of the worst "Idola," and perhaps have their chief charm for men whose ardent imagination particularly exposes them to their seductive power.

But while none ask science to refrain from such speculations, if it will but refrain from dogmatism; if it will not take conjecture for certainty; if it will but acknowledge that a thing is still but a guess, if it be really so, one cannot but wish, in the interests of science itself, that it should deal not only very modestly, but very sparingly with them. If not, they will absorb more and more of the time and toil which should be given to more hopeful and legitimate fields of scientific enterprise; the tendency will constantly be, as in the case of the alchemists, to substitute visionary projects for practical objects; to devote too much attention to things which pique curiosity indeed, but also least repay merely human labour upon them.

The simple fact is, that this class of questions, being bound up with the most intense longings of the human heart for knowledge, are, in the absence of either the supposed *higher* light of revelation, or the all but impossible apathy which Comte enjoins on his dogmatic Atheist, so piquant, so enticing and fascinating, that man, left to himself, will run out into endless speculations as to the origin and the evolution of things; as to whence he came and whither he is going. If he cannot rest content with the Genesis and Apocalypse of the Bible, he will make a Genesis and Apocalypse for himself. Hence the extent to which all such speculations grafted themselves upon the physics of the ancient world; nor was it perhaps (as I have ventured elsewhere to suggest) the least of the *temporal* benefits of Christianity,—"that so many myriads found repose in it from the ceaseless questions which must often have agitated the greatest sages of antiquity; that so large a portion of the highest intellect of our race, in fact, accepted its decisions on those questions, and thus was set free to pursue the path of science within the limits and in the directions in which alone human science can be successfully prosecuted."*

---

* See also "Catechism of Pos. Rel.," pp. 172, 178. Eng. Tr.

Nor have I any hesitation in predicting that if the present era of science should be unhappily signalised by (what some think its boast) a general tendency to religious scepticism, that there will be just as voluminous speculation on these subjects as ever; that there will be a "plentiful crop of sects and schisms," from which the world has for ages been happily free; that they will draw more and more, for the support of their own fungous growth, on the thought, time and toil, which should serve for the nourishment of genuine science; that men will be disputing whether their forefathers were once apes, instead of considering questions vitally interesting to them as *men*; or how the world came into being, rather than how it may be "subdued" and improved. The human mind cannot endure to be without a theory on these subjects, whether it be inclined to scepticism or the contrary; and hence the difficulty of the lesson which M. Comte would so calmly enjoin on his dogmatic Atheist. Hence, too, in numberless writings of the present day, we see a scepticism asserting itself with all the passion and vehemence which it is fond of representing as the peculiar infirmity of theologians!

However, only let science abstain from dogmatically asserting that *that* is demonstrated truth, which is but crude conjecture, and there will be nothing to complain of.

But I cannot say that this is the case with you, or with some of those whose disciple you avow yourself. The theories you urge upon my attention, and which (as I think) illustrate Bacon's "idola" far better than his "inductive method," are affirmed by you and by others with a dogmatism which seems to me diametrically opposed to all true science. I read, for example, in one of the critiques you have commended, (I quote the very words,)—"The best chapter in the book, as might have been expected, is that which treats of 'Design in Nature.' The poor old final causes will always afford to an assailant as easy a victory as that of Falstaff over Hotspur. . . . Yet since there certainly *was* a time when the argument was considered of value, a forcible *exposition of its emptiness* does not seem to us altogether superfluous."

In another place I read, "Language was not innate, but adventitious—a mere acquirement, having its origin in the superiority of the human understanding. . . . Each *separate* tribe formed its own language, and there could *be no doubt* that in each case the framers were *arrant savages*, which was proved by the fact, that the rudest tribes ever discovered had already completed the task of forming a perfect language."

Listen again to the oracles of modern wisdom:—"There arise no new *species*, by any creative interference; none disappear by a divine mandate of destruction, since the natural course of things, the process of development of all organisms and of the earth is amply sufficient for the production of all these phenomena. Even man is neither a distinct creature, formed in a special manner, and differently from all other animals, nor provided with a special soul, and endowed with a divine breath of life; he is only the highest product of a progressive natural selection, and descends from the simious group standing next to man." . . . Again—"By science and *by reason*, we neither have, nor can possibly have, any evidence of a Deity working miracles."

But are these things worthy of the caution of the inductive philosophy? Amidst all this confident and dogmatical assertion, you know, as well as I do, that the points here so curtly assumed are not only, every one of them, denied or disputed by the great mass of intelligent men, but everywhere doubted, at most keenly controverted, in the scientific world itself.

I now proceed to show why, on Bacon's grounds, not on those of "traditional beliefs," I cannot accept as proven, any of the six "articles" of your scientific creed, which you so confidently urge upon my faith: "faith," I may well say; for assuredly, they are not commended to my reason.

I shall only premise one thing; and that is, that the gibes and sarcasms which, after the fashion of the day, you launch against the advocates of "traditional beliefs" and "stereotyped dogmas," will equally apply to you, and science; there is not a foible of the intellect, not an "idolum tribûs," "specûs," or "theatri," with which the one are charged, that may not be retorted on some of the more advanced of the modern champions of science: and precisely because there is, in all of us, so much more of *man* than of either science or theology. Thus, you tell the theologian that he believes what he *wishes* to be true,—in spite of evidence. What else can be said of many of the advocates of those wild theories which scientific fancy has given us in our day,—having all the illusion, and none of the beauty, of poetry? You tell me that the theologian believes a dogma because it is old—and do not our modern speculators often believe their shining novelties, for a similar though an opposite reason, *i.e.* just because they are new? You tell me that many cling to certain opinions, because they wish the Bible to be true; and is it not too evident from the tone of many, that they think an opinion chiefly charming because they wish the Bible to be false? You tell us that of course this or that work, in defence of an "effete orthodoxy," is received with praise by all the orthodox journals, and that we can tell beforehand the organs that will applaud. And cannot we do the same in reference to any novel bit of heterodoxy? Can we not lay our finger beforehand on the very journals that will pet and patronise that, even though it be directly in the teeth of some *other* heterodoxy, which it has already petted and patronised? You tell me that you are shocked at the "odium theologicum" which so universally prevails among theologians, and is indeed the constant theme of reproach in journals and newspapers;—just as if, by the way, the "odium politicum" was quite unknown to the world! But is there not also such a thing as even the "odium scientificum"? Cannot our *savans* on occasion snarl and growl over an old jawbone or an old tooth, out of a gravel drift, as fiercely as theologians over any of their doctrines? Have not the amenities of science been sometimes so forgotten as to call for the rebukes of our great, and in general most just, censor of manners,—our *Custos morum*,—"Mr. Punch"? May not a *Savant* be so provoking and so provoked as even to "spit" on the gaberdine of a heterodox doubter of some tale of the sacred "*gorilla*"?—I do not mention these things as against science, any more than the "odium theologicum" should be so uncandidly and perpetually urged against theology. The "odium theologicum," and the "odium politicum" and the "odium scientificum" are all alike odious; but they are the fruit, not of theology, or politics, or science, but just of human nature—of passion and prejudice;—an *idolum* of the heart, if not of the intellect, and just as misleading as any *idolum* of the intellect can be. When darling opinions, and systems, and hypotheses, and claims to discovery, are to be defended, the coolest and most tranquil fields of speculation—even those of mathematics—are apt to be troubled with these hurricanes of passion, as the quarrels between the followers of Leibnitz and Newton full well show.

---

* Article "Plato," "Edinburgh Review," April, 1848.

Nay, as if to show that there is no infirmity of the intellect, no form of self deception, to which you men of science pronounce theologians peculiarly subject, which is at all peculiar to them, or which is not equally exemplified by other classes of men, even that formidable charge of being the easy dupes and victims of "spiritual pretensions" and "pious frauds" may be retorted upon a good many of you. To the various pretensions and juggleries of modern "spiritualism," science has yielded its full quota of credulity; and if irreligious, *not* religious, men, have sometimes made religion the dupe of "pious frauds," quick-eyed science has often been victimised of late in the very same manner; and simply for this reason, that theologians and philosophers happen to be alike—men. I refer, for example, to the plentiful manufacture and eager reception of the *modern-antique* relics of a Pre-Adamite world.

Perhaps it may be asked here, "But do you intend to charge eminent scientific men with having been voluntarily either accomplices or victims of these 'pious frauds' in behalf of scientific truth?" Assuredly not; no more than I suppose Clemens Romanus himself to have forged the "Apostolical Constitutions," or that some great and good man, for his sins unluckily canonised as a saint, really bequeathed to the church all the rubbish, in the shape of relics, which passes under his name. But in science, philosophy, and theology alike, men will exhibit the same strong hankering for evidence, where they *wish* an opinion to be true, and the same credulity in receiving it; and in all cases, there will be opportunely found those who will take advantage of this disposition, and provide any evidence that may be wanted. Let there be credulity enough, and money enough, and a man can get anything he wants, whether it be the toe or tooth of a Pre-Adamite man, or the toe or the tooth of a St. Francis or a St. Dominic. Let him bid high enough, and bring faith enough, and if he pleases, he can get a genuine spoon of Tubal-cain's own manufacture, inscribed with some hieroglyphics vouching to be the old metal-worker's own trade-mark, and purporting to mean, "Tubal-cain, maker,—Mesopotamia!"

I shall now proceed to notice the six doctrines to which you challenge my assent, on the grounds of science, but, as I affirm, in contravention of all true science. It will be observed that I need neither to impugn nor defend the conclusions themselves. I am concerned only to show that the faith often reposed in them is a mockery of genuine science, at war alike with the method of Bacon and the practice of Newton.

I. And the first I will mention is what you call "Uniformitarianism" in geology, for the idolatry of which, (in the language of a very able Edinburgh Reviewer,) it is really not very easy to account by anything but a certain "turn of thought" in the speculator; or in the language of Bacon, by an "*idolum specûs*," a misleading image in the philosopher's own mind.

According to this, we are, it seems, to assume, (for in the very nature of the case it can be nothing more,) that not only have precisely the same forces been always in operation in the production of terrestrial phenomena, but that in no past time have they operated with greater intensity than at present; that is, that the *rate* or law of change has never been other than it is now, or imperceptibly slow; that as we now see the sea gaining upon this shore and receding upon that, at the rate of a few score yards in a century, similarly slow have such changes ever been; that the vast mountain chains have been elevated to their present height by a movement absolutely insensible; and in one word, to use the favourite term of the advocates of this view—that there have been "no catastrophes," in the history of our world. The ground of such an hypothesis is of course that in the *present* condition of the world there is an *approximation* (for that is all) to such a supposed freedom from "catastrophes;" that is, during the comparatively brief experience of man; that is, again, we are to measure the depths of prehistoric time by our present experience; or, in the phraseology of Protagoras, "make man the measure of all things" in this matter.

Now the first thing that is to be said is, what is meant by a "catastrophe?" If it be meant that anything inconsistent with a precise law of absolute "continuity" in all geological phenomena, (indeed some expressly argue for such a law,) operating with the same imperceptibly slow *rate* of change, is to be considered a catastrophe,—then we have no such condition, even *now*, as the hypothesis in question requires. We have "catastrophes" even *now*, quite sufficient in magnitude to suggest the analogy that in some periods of the world's "pre-historic" history there may have been greater "catastrophes," rather than that there were none. Certainly the tremendous earthquakes which have often shaken down whole cities, or the volcanic eruptions which have swallowed them up,—the inundations which have occasionally swept over whole provinces,—all these seem "catastrophes" sufficiently "catastrophic" to those who suffer from them, however little they may disturb the equanimity of the philosopher who quietly speculates about them 5000 miles off, or 2000 years after date. The earthquake of Lisbon, which destroyed at once 60,000 human beings; the late cyclone at Calcutta, which killed as many, flooded 800 square miles of country, and resistlessly broke the barriers along 80 miles of coast, may surely claim to be called "catastrophes," if there be any meaning in the word at all. And even if, *singly*, none were greater in pre-historic times, yet if they only happened more frequently, (though happily without such "catastrophic" effects to human beings,) the law of geological "continuity" would seem to be sufficiently violated.

What is meant, then, by no "catastrophes"? Is it meant that none were *greater* than the *greatest* that have occurred during the historic period? What an arbitrary limitation is here! Not to repeat what has just been insisted upon, that even if there were no greater catastrophes, (but only more frequent,) all idea of a law of "continuity" would be torn to tatters;—who shall assure us that if there were any as great as the greatest that have occurred in historic time, there may not have been still greater before it? Certainly, those we have seen suggest the idea that the tremendous forces which we thus know to exist in the bosom of Nature, may, for aught we can tell, have acted in remote ages with much more intensity and over much larger surfaces than at present. If it be said that the convulsions of this nature which we *now* witness are infinitesimal, *compared* with what would be required to elevate or submerge whole continents, the answer is, that these convulsions, though less extensive, are equally in the teeth of the *principle* assumed; equally a violation of an absolutely continuous and equable variation; not to say that, if we thus make the idea of a "catastrophe" purely relative to the sum of the unchanged, then the entire annihilation of our world would be but an infinitesimal event in relation to the entire system, or that of half-a-score of worlds still but infinitesimal in relation to the visible universe. They would be relatively no more "catastrophal" than the rolling of a pebble from Mont Blanc would be so to the mountain from which it was detached.

Moreover, it may well be suggested that if the changes of this nature that now take place are less frequent and destructive than those which *may* have visited our earth at earlier periods, it is precisely what we should expect, if God be indeed a beneficent Creator, and the system in which *man* was to play a part was to be preserved at all; that is, if there be really any propriety in the language used by the most illustrious geologists, as well as by the rest of the world, and which supposes that the earth was *prepared* for the habitation of man. When man came to inhabit his house, if he was not to receive a "writ of ejectment" as soon as he got into it, it was essential that there should not be the tumultuous movements and astounding shocks which might occasionally shake it during the building. But not to insist on this; the changes which occur now are assuredly quite sufficiently startling, and wrought by a sufficiently terrible power, to show us what may have been.

To pass by these conjectures;—it may be added that it certainly seems more natural, judging from all the *appearances* of the earth, to suspect that those same forces which now occasionally act with a tremendous energy and intensity over a limited space, sometimes acted in like manner over far larger portions of our globe. The gigantic ravines, the cloven mountains, the earth in rents and fissures, the plicatures, contortions, and fractures of strata, displaced at every angle, all seem to point to occasional changes of prodigious magnitude rapidly effected, and by the operation of the most energetic forces. And even if it be admitted, that all such changes *might* be wrought by given forces operating with inconceivable slowness throughout an unlimited time, still, as they might be also produced by a force of given magnitude operating through a shorter time, either formula, apart from other proofs, will be of equal mechanical value; not to say that there are phenomena, which, even in the estimation of the most eminent geologists, cannot be accounted for by the theory. Even a principal advocate for the uniformitarian view admits, "that many great rivers could never, even in millions of years, have excavated the valleys through which they flow."*

But, above all, were it possible thus to account for the phenomena, still the question recurs, "What can we *know* about the matter?" How can we pretend to go back to those primeval ages, and penetrate those mysteries of the twilight of time? The rebuke of God to the patriarch might well be addressed to many a geologist who dogmatises on this subject—"Where wast thou when I laid the foundations of the earth?"

Speaking of *apparent* violations of his law of geologic continuity, one of the most strenuous of its champions says that its advocate may with "just as much probability and confidence assert" that the revolutions in question have been produced by infinitesimally slow changes brought about along a period "enormous and incalculable, as the catastrophist can maintain it to have been brief and spasmodic."* Precisely so,—a severe judge of evidence would reply. Apart from other and more decisive evidence, neither the one nor the other of you has any business to dogmatise on the matter, since both have got into regions which transcend the sphere of experience.

---

* Cited in "Edinburgh Review," July, 1863, p. 299.

And if any scope at all is to be allowed to such *a priori* reasoning, one would feel inclined to argue with the above very able writer in the "Edinburgh," that considering the infinite variety of nature, the theory of varying intensity of the great physical forces "seems intrinsically far more probable than a monotony of physical operation, the evidence of which seems to exist principally in the *turn of thought* of those who advocate it."

Of course, I do not pretend that it is possible to establish anything certain, by merely human light, on either side; though I think to most candid minds the appearances of the world rather favour another hypothesis than yours. Our very limited experience must be regarded as an altogether fallacious measure; yet it certainly seems not unreasonable, from the aspects of Nature, to surmise that both sudden revolutions and slow variations, intervals of intense action alternating with intervals of repose, have been employed, and probably contemporaneously, in the construction and development of the world. But, whether it be so or not, the question is, what just logical right can we have to lay down this "uniformitarianism" as a postulate, and to judge of all things in the immense series of pre-historic ages, by such an arbitrarily imagined law, deduced from the computed *rate* of present terrestrial change;—though, by the way, geologists differ by hundreds of thousands, and even millions of years, as to the time in which certain given changes have been wrought!

The notion is of course welcome to any one who is pre-determined that the world shall be of unlimited antiquity; for it makes even the commencement of the present human epoch recede into the dimmest distance. But to judge of past time by such a chronometer is, as a witty critic † says, "much the same as if a man, finding that an individual nearly six feet in height had grown only half an inch last year, were to conclude that he must be 140 years old." In short, the principle is nothing but the fanciful extension of our limited experience to immense periods of which we know nothing. This principle is opposed by many eminent geologists with the vigour worthy of those who aspire to act upon Newton's great maxim:—"Hypotheses non fingo." "Do not geologists," as one, himself a celebrated geologist, says, "sometimes speak with needless freedom"—most people would say, most presumptuous freedom—"of the ages that have gone? Such expressions as that 'Time costs Nature nothing,' appear to me no better than the phrase which ascribes to Nature, 'the horror of a *vacuum*.'" (I would just add, that if Time costs Nature nothing—it seems to cost these speculators just as little.) "Are we to regard as information of value the assertion that *millions on millions* of ages have passed since the Epoch of Life in some of the earlier strata? Is not this abuse of arithmetic likely to lead to a low estimate of the evidence in support of such random conclusions, and of the uncritical judgment which so readily accepts them?"*

II. Another favourite speculation of yours, as well as of some other votaries of science, I must think most strangely *un*scientific. I mean that by which, in your antipathy to the idea of "creation," you insist that all the forms of existence, organic and inorganic, have proceeded from one another in the course of an "orderly cosmical evolution," which leaves us without any necessity of speculating upon the fact of *origination;* that, in fact, "we have no reason to think that the universe ever had a beginning, any more than that it will ever have an end."

Now if you accepted the old atheistic hypothesis of the eternal existence of the world as it is,—of an eternal succession of men and mice, for example, and left the problem undetermined whether the first of the series of owls was an egg or an owl,—though I should not think your theory very scientific, I should at least cease to argue with you about it; but as you do not, and choose to chase all the fleeting forms of animated being, through all the diversities and modifications of genera and species, to a few (perhaps to one) "primordial forms," I confess I think your repugnance to the idea of "creation" has not relieved you from the necessity of admitting it; and, as I will proceed to show, that you have left the great difficulty, from which the "turn of thought" of certain philosophers recoils, just where it was!

In one point we are both agreed. The absolute origination of anything is a notion incomprehensible by us,—transcendental to all the faculties of our nature. I, who admit, and you, who deny the Bible, are at one there. I admit that the conception of Creation,—the absolute *origination* of all things, or of *any*thing, is a conception derived thence, and thence alone; I believe it as a *fact*, however incomprehensible; but the appeal is to my faith: "By *faith* we know that the worlds were made by the word of God, and that things which are seen were not made of things that do appear." Everybody then, being agreed that this is the condition of all merely human speculation on the subject, one would think that the next thing to be said by *science* would be, "As this is a subject transcendental to us, let us scientific folks leave it alone." But no; you are not satisfied with such a simple, and *truly* scientific course, but proceed to lay down hypotheses by which the evolution of the whole visible creation is to be explained, not only without any *successive* acts of creation, but in such way, as to leave it in dubiety, whether there has been any such act at all!

---

* Baden Powell. "Order of Nature," p. 345.

† Or rather as *three* witty critics have said,—for the same illustration seems to have occurred to, at all events has been used by, them all.

* Phillips' Address to the Geological Society, cited in "Edinburgh Review," 1863.

These theories still relegate me, at last, to phænomena which leave me precisely in the original difficulty, a difficulty which you merely strive to hide from me, and from your own eyes, by removing the epoch of the origination of all things sufficiently far back, and tracing the succession of changes through a sufficiently long pedigree. "All living things," say some philosophers,—"the infinite diversities of animal forms, the exhaustless variety of species that people this world, were originated, not by creation, but out of one another, by a process of very slow development: men (say) from apes, apes from birds, birds from fishes, fishes from earlier and more rudimentary forms of life; and these, in all probability from three or four minute germs of vitality."

It is hard, of course, to say how *next* to nothing these were; but unhappily for the theorist they were still existent "somethings", and had life; and so we have the problem concerning "*origination*" brought back on our hands; for if "Ex nihilo nihil fit," be absolutely true, it is a difficulty that does not admit of degrees; the creation of an atom is as great a puzzle as the creation of a world. In vain, —scandalized at the idea of creation,—in vain you tell me that your three or four "primordial forms" perhaps date from millions of millions of years ago, more or less; and I confess that a million of years, when you have the command of all time, are of little consequence. Indeed some of our geologic Pantheists who think that man is to become a God, seem to have already anticipated one of the divine attributes; for "a thousand years with them are as one day, and one day as a thousand years." But use your freedom; go as far back as you please; and what then?

I do not ask who gave you, on such a subject, this prodigious licence of speculation; or how you came to have the right to talk thus freely of the transactions of millions of years ago; or how you can *know* anything of those successive changes by which you suppose the whole universe to have been thus evolved from a few primordial forms? I might ask all this, and possibly much more, before exercising a transcendental faith in transcendental speculations on questions which both of us admit to be transcendental. But a far more weighty objection is this—Do you flatter yourself that you have got rid of that ungrateful idea of "absolute creation"? and that it is no longer necessary to encumber yourself with it? What do you make out of those three or four primordial forms, or even that *one* "primordial form," to which some think these may possibly be reduced? Were these eternal? Had they eternal vitality within them,—though it was eternally latent?—latent, though at last destined to make up for lost time, or rather a lost eternity, by evolving out of an invisible egg or two all the visible universe? or were they created out of nothing? In leaving us in doubt upon this point you leave the whole difficulty just where you found it. It is in vain for the theorist to tell us that he has, at all events, limited the successive acts of creation, and given the Deity a *minimum* to do: that the appearance of different species at different periods is all admirably provided for, by that theory by which he has so satisfactorily evolved men out of the ape, and the ape and all his ancestors out of other and still inferior beings. The answer, of course, will be,— "But the difficulty is to evade the idea of 'creation' itself. It is as easy for us to believe that that power, whatever it was, has repeated the act of creation, as that he has performed it once; that he has repeated it at different, widely different, stages of the history of the universe, as that he performed it *at all*. Nay, it is much easier than it would be to suppose the whole animated universe developed out of a seed, perhaps not half the size of a grain of millet."

Now to this question, as to the logical exigency of admitting "origination" at some time or other, I do not see that you give any other answer than an evasive one, which in fact amounts to this,— "But if the act of creation took place at all, it took place so long ago and such a great way off, that we had better say nothing about it." Say nothing, then, and give up those "primordial forms" which betray you while you think they conceal you.

"But it would be distressing to me," you may say, "to imagine that if there *be* a God, he has not proceeded in the way of gradual evolution according to a law which I can trace, and in analogy, at all events, with all those laws which I can see in operation about me, and in conformity with my infinitesimal experience." Yes—that is it: it is the "turn of thought" again; it is an *idolum tribûs*, that is troubling you; you must make yourself and your experience the measure of all things; and in obedience to this, you will speak of ten thousand things of which you know nothing, and talk glibly of the events of millions of years ago, as of those of yesterday.

III. Subservient to the preceding speculation, and, like it, transcending the sphere of experience, is that doctrine of the transmutation of species, in which the old and, as it was at one time thought, exploded theory of Lamarck is substantially revived. I will be perfectly frank. I freely acknowledge to you that it is not the more than Ovidian *strangeness* of these metamorphoses that would at all stagger me, if you but gave me evidence for them as plainly as you give me conjecture and fancy. They are to me as *miracles*, (which, I shall presently endeavour to show, in spite of your protest, they precisely resemble), and all I want is the proper *evidence* for them.—When I see the transformations which take place in this system of wonders in which we live; when I see what becomes of a grain of "mustard seed" thrown into the earth; when I see the grub transfigured into a winged butterfly; when I see the varieties of the same species which actually exist, (though the variation is still within moderate limits,) I hardly see why, in the abstract, anything may not become anything. But when I ask for the *facts* which are to sustain the prodigious theory that all the genera and species of living things have proceeded from two or three "primordial" germs, perhaps even from one, then I feel I may indeed accept your theory as poetry, but I must renounce it as science. For surely you have the strangest way of reasoning. When I ask for specimens in the rocky cemeteries which contain the fossil relics of other extinct animals, of the tentative and transitional forms that must have existed, in numbers numberless, on such an hypothesis, you tell me that the geological eras are so vast that they have perished, and that it is unreasonable to ask for them. When I ask for proofs in historic time that such changes are going on now, you tell me that the whole of historic time is too short to give even an appreciable portion of so slow a transformation! So that, as the geologic eras are so vast that all the required proofs have perished, the historic period is too short to allow any of them to appear! How is it possible to refute,—but then, moreover, how is it possible to establish,—an hypothesis which is so conveniently provided with fanciful alternatives? If I complain of the absence of *experimental* proof, proof which seems to my weakness a necessary condition of *experimental* science, you refer me to Baden Powell, who says that, "Supposing it true that we have *no* experience of a particular event occurring, and supposing at the same time it could be shown that *if* that event *did actually occur*, we could never, (from the particular nature of the case,) have any *evidence* of its occurrence, then it is clear that the argument from *want* of experience must fall to the ground." Certainly;—but so must the argument for the actual occurrence of the event. Surely it is much as if a man, being asked for the proof of something that depended on documentary evidence, were to reply that it was unreasonable to expect or ask it; for that the document was burnt, and therefore, in the particular case, the proof *could* not be given! In short, I object to the speculation, not, as you say, because I believe it to be inconsistent with my "traditional beliefs," but because it seems to me an outrage on the principles of inductive science itself;—telling me to speculate in regions acknowledged to be transcendental to experience; telling me that the condition of doing so is to leave all experience behind me, and that I am not to wonder that I do not find its evidence there!

In truth, it seems to me, when I compare your reasoning on this subject with that on other subjects,—that of "Uniformitarianism," for example,—that you palpably play fast and loose with experience. In order to prove *that*, you will have experience paramount;—the present forces of nature, and none other, operating within precisely the present limits: when you want to prove "transmutation" of species, then the *want* of experience is of no consequence! Similarly, when you want to prove that no testimony can prove miracles, because these, you say, are opposed to experience, then experience is everything; when you want to prove your "transmutations" of species, of the same nature, and equally wonderful with miracles, (nay, more so, if many miracles be more wonderful than a few,) then experience so limited as ours is not worth mentioning! This clearly will not do. You appeal, as an inductive philosopher, to experience; and to experience you must go. As matters stand, you are tied to it, and untied, as pleases you. It is a sleight of hand, something like that of the "Davenport Brothers." By science, you are bound fast in the cords of *experience;* but no sooner are you in your Cabinet, than presto! the lights are put out—fiddles and trumpets played by supernatural agency come tumbling about us—mystic sounds of a dialect unknown to science murmur in our ears—and you are found liberated from your bonds. And thus we are to believe the whole story of transmutations, and that "anything may become anything," all experience notwithstanding.

But assuredly Christians ought not to be twitted with excess of faith, when the votaries of Science can indulge in such *abandon* of fancy.

In another paper I shall briefly consider those remaining articles of your philosophic creed particularly urged on my consideration—namely, the alleged unlimited antiquity of *man*,—I mean the *genus Homo*, such as you and I belong to;—the incredibility of miracles;—and man's predicted absolute mastery of all the secrets of nature.

ALFRED HAGART'S HOUSEHOLD.

By ALEXANDER SMITH, Author of "A Life Drama," &c.

CHAPTER IX.

On the second day, according to promise, Dr. Crooks called, and found his patient much in the same condition, neither appreciably better nor worse. She took little food, slept a good deal, was always patient and sweet-tempered, had always a wan smile for her father; and when her mother came in, her arms were always stretched out for an embrace and her mouth raised for a kiss; and at this Mrs. Hagart would pretend to have forgotten something, or to hear Martha calling, and go off to the parlour for a cry, from which in a little while she would return with a hypocritically cheerful face, and with some little delicacy in her hand with which to tempt Katy's appetite. On his second visit the doctor, as was his wont, did not say much: he felt her pulse, examined her tongue, and then went into the parlour to write out a new prescription.

While drawing on his gloves the mother's anxiety broke out at once.

"Oh, doctor—you must pardon me—but I can't help it. Tell me truly what you think! Aren't you disappointed a little that Katy is not better?"

"I confess," said the doctor, "that I expected to see a greater improvement, but I don't think on the whole that your daughter is worse: no, I don't think she is worse."

"Is her illness serious? You don't think I am likely to lose my darling? Oh, doctor, she's so precious to me,—so precious; and I am so unhappy."

"All illness is serious, more or less, especially with delicate children; but I don't think there is any immediate cause for alarm—I really don't. Keep up your spirits, my dear lady; I expect to see your daughter running about shortly."

"If I could but hope so, doctor! But when I look on the little white, patient face, my heart misgives me sadly. If she would but be querulous and fretful, and show some little spark of quick temper, I would feel easier. Her patience and sweetness frighten me."

"Mothers are always anxious," said the doctor, with a thin smile on his clean-shaven face.

"I suppose they are, and I dare say you think me very foolish; but she is all the world to me. I did not know how dear she was, till I became afraid I should lose her."

And thereat the doctor spoke comfortable words, and said he expected great results from the new prescription. She was not to be over-anxious: he would call in a day or so; and that he had no doubt he would pull the child through. When he was gone, Mrs. Hagart sat down and had a good fit of crying, and when it was over the world did seem a good deal brighter. The doctor had said comfortable words, and she was continually going over them and extracting consolation from them. It was wonderful how much they contrived to yield—how much such words always contrive to yield—provided the rememberer is wretched enough.

A couple of hours after the departure of Dr. Crooks—while Hagart was busy with his patterns, creating the new style which was to make rejuvenescent the flagging Spiggleton trade, and Mrs. Hagart was sitting in Katy's room—Martha was summoned by a sharp peal of the door-bell. Hastily drying her hands—for she was engaged peeling potatoes for the early dinner—she ran out to the little gate, and was astounded to find a grey-haired serving-man waiting there. An actual serving-man—such a one as she had seen once or twice in her life standing by a carriage at a shop door in the High Street of Greysley—with white gloves, a hat with loop and band, and with silver buttons on his drab great-coat. There he stood waiting: no dream, but a reality; and Martha went out to him with no little awe.

"Does Mrs. Hagart live here?" asked the man.

Martha answered in the affirmative.

"Miss McQuarrie sends her compliments, and wishes to know how Miss Katy Hagart is?"

"'Tweel then, she's jist much aboot it," said Martha. "She's neither better nor waur. Dr. Crooks has been here the day, an' ordered a change o' medicine. She's verra quate an' patient, puir thing!"

"This letter is for Mrs. Hagart," said the man, handing an epistle to Martha; "and you are to give it into Mrs. Hagart's own hands."

Martha took the letter, promising to fulfil the message; and as her awe had by this time somewhat abated, she said, "I didna ken that Miss McQuarrie keepit a man-servant."

"No more she does. She is living just now with my master."

"Leevin' wi' yer measter! Then it was yer measter's coach that Miss McQuarrie was in the other day, when she picket up Katy an' brocht her hame?"

The man did not know; but Miss McQuarrie had a day or two since driven into Greysley in the forenoon, and returned to Hurlford to dinner.

"Hurlford! that 'ill be yer measter's place?"

The man said it was; and again intimating that the letter was to be delivered into Mrs. Hagart's own hands, went away.

"What's this noo?" said Martha to herself as she re-entered the house. "It's no' intendit to be seen by the measter, an' jist as weel, for he's no' fit for much but pentin'. Miss McQuarrie's comin' nearer an' nearer, an' we'll be seein' hersel' some o' thae days."

As the letter was to be delivered into the hands of her mistress, Martha thought she would do so at once, as a better opportunity would not likely occur of finding her alone. She accordingly opened the door of the room in which Katy lay, and hearing her mistress's admonitory "Hush! the child is asleep, Martha!" she contented herself by saying in a low voice, "Mem, wad ye please to speak for a moment?" and contrived to put such mysteriousness into her intonation, that Mrs. Hagart was in the kitchen with her at once.

"What is it, Martha?"

"Oh mem! Miss McQuarrie sent her servant-man—at least the servant-man o' the gentleman she's staying wi' at Hurlford—to ask for Miss Katy, an' I tell't him she was jist aboot it, neither better nor waur, and that Dr. Crooks had been seein' her."

"Miss McQuarrie! You must be dreaming, girl!"

"Na, na; no' dreamin' a bit. Whan the bell rang, there was the man at the door, an' he said, Miss McQuarrie sent her compliments: an' mair than that," continued Martha, her eyes becoming bigger and rounder, and her voice growing more mysterious than ever, "he gied me this letter, mem, and tell't me to be particular to gie it into naebody's hands but yer ain."

Mrs. Hagart saw at a glance that the letter was addressed to her, and that it was in her half-sister's hand-writing—once familiar enough, but which she had not seen for long. She felt that the hot blood was mounting to her face, and that her hands were shaking somewhat. Anxious that Martha should see nothing of her discomposure, she said, in as careless a tone as she could assume, "I don't know what this will be about, but perhaps it will require an immediate answer," and then, uncomfortably conscious that her voice was unsteady, she betook herself to the parlour, and shut the door after her.

When she sat down she let the letter lie in her lap, half afraid to open it. What could be the purport of it? Would it sting her as the last letter had stung her? Was it a signal that the family breach was about to be repaired? From the strange interviews with the children, she expected that Miss McQuarrie would take action in one form or another; and now, when action had been taken, she was seized by a singular apprehension of evil. All kinds of images hurried through her brain: remembrances of her old home, her father, her early life, and still the letter lay in her lap unopened.

At last with a trembling finger she broke the seal. She saw the letter began "My dear Margaret," and that it occupied more than one page; and then, with a nervous anxiety to see how it closed, and how her sister subscribed herself, she turned the page and encountered—with a start and gulp, and a sudden thought of butcher and baker, and no end of nice things for Katy ill in the next room—a twenty-pound note. Lifting the note, she read at the foot of the third page, "Your affectionate sister, Kate McQuarrie." So far, then, the letter did not look dangerous, and she began to read it through.

"My dear Margaret," it went on, "you will believe me when I tell you that I feel strangely as I write these words. To go back upon what separated us, is no good. Perhaps if the thing were to happen now, I would not act as I did. But at the time I thought I acted rightly, so did your father—and he knows *now*. Rightly or wrongly, I have found so little happiness in my life, that—even although you had acted more wrongly than you did—I could hope you have found more.

"I knew your children when I saw them. I was sorry to find your daughter, *and my namesake*, so poorly the other day. I trust she is better now. I thought when I had her in the carriage with me that her dress was rather slight for this cold weather. Perhaps the little bit of paper enclosed—*and it is not the last bit I have got either*—may be found useful.

"I do not know that I should see you, or that you would in the least care to see me. Perhaps, if you are not *too proud*, we may meet; but not now. I hardly think such a break as ours can be fairly soldered in this world, but I don't know; and perhaps it may be no use trying. There are things we may forgive, but cannot forget; and there is no ghost so difficult to lay as the ghost of an injury. I don't think I have more to say. I may perhaps send again to inquire for your daughter. Should you ever think of writing me, I shall at least read your letter.

"Your affectionate Sister,
"KATE McQUARRIE.

"P.S.—I notice that you have put the *sixpences* I gave the children on chains, and given them to wear as keepsakes. If I had not found out *that*, I should not have written *this*."

Mrs. Hagart did not at all relish this epistle on the first reading: it seemed to her harsh, cold, inexorable, unforgiving. There was no allusion to her husband in it. It was evident that her sister held her old opinion on that matter. And the mention of the slightness of Katy's apparel struck her as unnecessarily cruel. Altogether it was unsatisfactory, and she felt that if the circumstances had been reversed, *she* would have written with much more warmth, cordiality, and graciousness. But on a re-perusal—and the poor lady, if she read it once, read it a dozen times—it seemed to lose much of its sternness. The hard lines began to relax; and she read and read, until she began to feel that crabbed as were some of the sentences, there was real affection in them. Then the crabbed sentences began to become sorrowful sentences only—sorrowful both ways; sorrowful as regarded the writer, sorrowful also as regarded the reader. "She had to make the first advance," thought Mrs. Hagart, as she smoothed out the letter and the twenty-pound note on her knee, "and she did not know how she would be received. *If you are not too proud, we may yet meet.* She is afraid of my pride, then. *That* will be no very fierce lion in the path of reconciliation. *If I had not found out that, I would not have written this.* But for the sovereigns, she might have thought I hated her. How was she to know that I did not hate her? I think it very generous of her to take the initiative, with all its risks. And as for Katy's dress—well, perhaps it was a little too slight for the season, only she need not have put it so plainly down. But then she wasn't to know that I had her winter dresses nearly finished. After all, she is Katy's aunt, and Katy is her namesake, as she says, and of course she can say what she thinks, and of course I need not be ashamed to accept her present. *If you think of writing me, I shall at least read your letter.* That does look a little grumpy; but then she did not read the last letter I sent, and if I write a letter now she is willing to read it,—which is pleasant so far. I think, altogether, the note is very nice." And then Mrs. Hagart began to feel very happy, for now her thoughts could linger pleasantly around her old home, around her sister, and around the grave of her father. "*He knows now;*" and she thought the reconciliation so proffered, was proffered not only by the living, but by the dead. And sitting thinking, with the letter in her lap, the present faded away, and she was again a little girl standing beside a white wall, with a laburnum tree hanging above her, and looking seaward towards dim rocky islands capped with summer clouds; and there was a step on the gravel, and two large hands were clasped over her eyes, and a voice asked who it was that was holding her, and she cried "Papa!" and she heard her father and sister laugh as the large hands were unclasped, and the summer light and heat came again full against her face and eyes.

But this reverie was but for a moment. When she came back to the present and its concerns, the question arose—How about her husband? Should she show him the letter and the money? He would know all about it some day, and she thought it comported best with prudence and wifely duty, as well as with impulse, to lay the matter before him at once. And so thinking, she thrust the letter and the money into her pocket, and opening the door of the room in which Hagart worked, entered.

"Well, Mag?" he said, as his wife came in. "Come to see this beauty, eh? Isn't that sweet? Isn't there a kind of a sort of air, style, about that, eh? 'Pon my word, I never thought I was so clever a fellow. I feel a sort of inspiration, Mag. This lot will astonish the Spiggletonians. Its beauty will draw the money out of the Spiggletonian pockets, as by his flute-playing that Greek fellow, Amphion, used to draw the trees and stones after him."

Mrs. Hagart stooped to look at the pattern on which her husband was engaged.

"It's very pretty, Alfred, very pretty, indeed." And then, their heads being quite close, she slipped her arm round his neck, and drew his cheek against hers. "I am so happy, so happy, Alfred," she murmured, as she did so.

"Yes, yes, poor dear!" said Hagart. "It's pleasant to know that Dr. Crooks does not think that Katy is seriously ill. I knew you would be happy. And when I once get these things finished, and come home from Spiggleton like——"

"But it's not that," hesitated his wife.

"What then, Mag?" said Hagart, looking up inquiringly.

"Miss McQuarrie sent a servant to ask for Katy to-day."

"The deuce, she did! I suppose the old she-dragon will be making her appearance in person one of these days. I hope she won't catch me, that's all. Has Miss Kate's inquiry made you so happy?"

"It shows that she takes so much interest."

"Better late than never. I can remember the time when she had no interest in either you or the children. As for me, I suppose I am hated like poison, being of a family rich neither in ghosts nor grandfathers."

"Let the ghosts and grandfathers alone," said his wife; "they are not troubling you at present."

"Never saw one of them, good luck! Father and half-sister are enough for me."

"Yes, and half-sister's half-sister, you cross man," and here his wife patted him on the shoulder. "But, Alfred, Miss McQuarrie did more than inquire."

"Bother Miss McQuarrie! What more did she do then?"

"She sent me this, and this," and his wife laid down the letter and the twenty-pound note on the desk before him.

Hagart took up the note and read it. When he had finished, he turned sharply round.

"And this is what has made you so happy?"

"Yes, Alfred."

"Then you'll be good enough to send back to Miss McQuarrie her letter and her money—at once, with my compliments. Confound her! what right has she to say that my daughter's dress is too slight for the season? If it should be so, I can provide another for her."

"I don't think you quite understand——"

"I do understand! *Although you had acted even more wrongly.*" And with that, with a very red face, Hagart tore up the letter, and strewed its fragments on the floor. "This makes you happy, indeed! Even *although you had acted more wrongly.* I'm extremely obliged to her, and to you. *Perhaps we may meet, but not* NOW! If you wore a widow's cap, I dare say the meeting would take place to-morrow. I'm sorry I separate so much mutual affection."

"You are very cruel, Alfred, and I think very selfish. You know she is my only living relative almost—my only sister, at least—and that I am pleased she has made this advance. I am sure that you don't understand her letter, and I am also sure that there is no reference to you in it. If she wishes to make friends with me, she knows that the worst plan she could adopt is to speak slightingly of you in any way. You ought to know that. It was wrong of you to destroy her letter—it was the only one of hers I had."

"I don't care what you are sure of. And if you wished to preserve a specimen of her correspondence, you should have kept the letter you received from her while in London. Why didn't that one make you happy? As for the money, I insist that it shall be sent back at once."

Whereat Mrs. Hagart picked the note from the desk, and said, with her best dignity air, "The money shall not go back, Alfred! I am sorry to disobey you in any way, but this money shall not go back. It has come from my own family, and it would be wrong, foolish, insulting, to send it back. We shall find it very serviceable."

"I suppose I am to be taunted with my poverty next?"

"You know I am too much of a gentlewoman to taunt you, even although I had cause—which heaven knows I have not. I don't understand your mood at all, and I think you will be sorry for what you have said."

"So happy!' cried Hagart, with his most scornful emphasis. This seemed to have stuck hardest in our friend's throat. But Mrs. Hagart took no notice of the exclamation, and retired to the parlour.

Hagart was desperately sulky all day thereafter, and when Martha intimated that dinner was on the table, he growled that he was busy, and would come to tea. Meanwhile Jack had returned from school, and had gone in to chat with Katy. Mrs. Hagart hurried tea; and when Hagart came in, and when his wife handed him a cup, he went and kissed her.

"I am very sorry, Mag," he said.

"So am I, Alfred—that you should have been annoyed; but you will see that I have acted for the best."

"As you always do," said he, taking a slice of buttered toast on his plate.

CHAPTER X.

SEATED once in a circus—after a sylph-like creature, who to slow music had jumped through all manner of hoops, had retired amid plaudits, followed by the clown, who took occasion to throw a summersault as he went—I saw a military-looking gentleman enter the sawdust, and announce that Alfred Powell, the star of European equestrians, would appear as the "Red Rider of the Prairies;" and as he spoke, a fiery steed, bare-backed, and black as Mazeppa's desert-born, leaped into the ring and began careering round and round. This was the Red Rider's horse, and the Red Rider would present himself immediately. One had barely time to settle one's self comfortably in one's seat, when the Red Rider, in curious apparel, with war-whoop, tomahawk, and scalping-knife, bounded over the arriers, vaulted on the flying bare-backed, and amid a thunder of applause threw himself into a graceful attitude, pointed to the rising sun, and—fell. The musicians stopped, the fiery bare-backed stopped, the applause stopped, and the Red Rider lay prone. He had sprained a limb in his fall, the daring impetuous chief; and four military-looking gentlemen appeared and carried him out. During the whole two hours' performances there was no such round of approbation as that which greeted the splendid entrance; during the two hours' performances there was no such ignominious failure. The Red Rider was carried out, the sawdust raked anew, and a fresh candidate for popular favour presented himself. The Red Rider felt humiliated; and in the fact that he had resolved to take the audience by storm, and had been enjoying, during the whole day perhaps, the rapturous hand-clappings of pit and galleries before he had earned them, lay, without question, the bitterest sting of that humiliation. I saw the fallen chief carried away, and thought that I had seen in other places than the sawdust something of the same kind happen pretty frequently. Many a Red Rider rushes out as did this poor star of European equestrians, *falls* when he is about to achieve success, and has to be carried off.

We read in our history books that when good stubborn old George was king only in name, and at war with his late children across the Atlantic, the English ship, Shannon, hovered about Boston Bay, stood in at times showing her colours, and did everything in her power to induce the bigger American Chesapeake to come out and try the issue of battle. It is recorded in these books that the Yankee captain resolved at length to accept the English ship's invitation; and so certain was he of victory, that he ordered—and at no very late hour of the day either—a dinner for the benefit of his victorious officers and crew. And so certain were the Bostonians that the Chesapeake would return with the Shannon in tow, that they left their business and lined the shores to behold the sight which could not be to them other than gratifying. Out went the Chesapeake with brilliant colours flying, Yankee Doodle, or other stirring and appropriate air, hilariously playing, and a hundred hearts beating hopefully; but somehow matters did not go prosperously with it. English shot smashed through the Chesapeake's hull and rigging, making the cock-pit a sorry sight; English boarders in the most unheard-of manner swarmed over the Chesapeake's decks, and while the eager cooks were yet perspiring, and before the eyes of the disgusted Bostonians, the stars and stripes sank, the English Union Jack flaunted proudly above, and the confident prize-taker was towed away a prize. I have always pitied the feelings of that brave American captain! To be defeated is always bitter; but to be defeated when you have made yourself certain of victory, and made other people certain of it too—when you have lived on the idea, laid yourself upon it as on a down bed and rested there—is about the very bitterest thing that can befall a man in a mortal lot in which there are at least ten bitters for every sweet.

And was not Hagart as certain of victory as the brave American captain? Did he not proceed to Spiggleton with his patterns as hopefully as did the Chesapeake with shotted guns and sharpened cutlasses to meet the Shannon? And when defeated at Spiggleton, foiled, baffled, fairly laid on his back, did he not feel something of the humiliation which pierced the heart of the American when he saw his flag go down, and had to give his sword to Captain Broke? Upon my word I don't think the one deserves our sympathy more than the other. Defeat was a serious matter to both. Yet one bitterness was spared the American: he was carried off by his victors—he had not to appear before the Bostonians, and to eat with what appetite he could the dinner placed before him—dinner which was meant to be masticated in circumstances so different. Hagart went out from his household in hopeful mood,—had he not created the new style? was he not saying to Fashion what the Emperor said to the Grand Army "Gentlemen, there's the road to Brussels"?—and to his household he had to return, bringing with him the news of his utter defeat. And this bringing home the news of defeat seemed to the poor fellow worse even than the defeat itself.

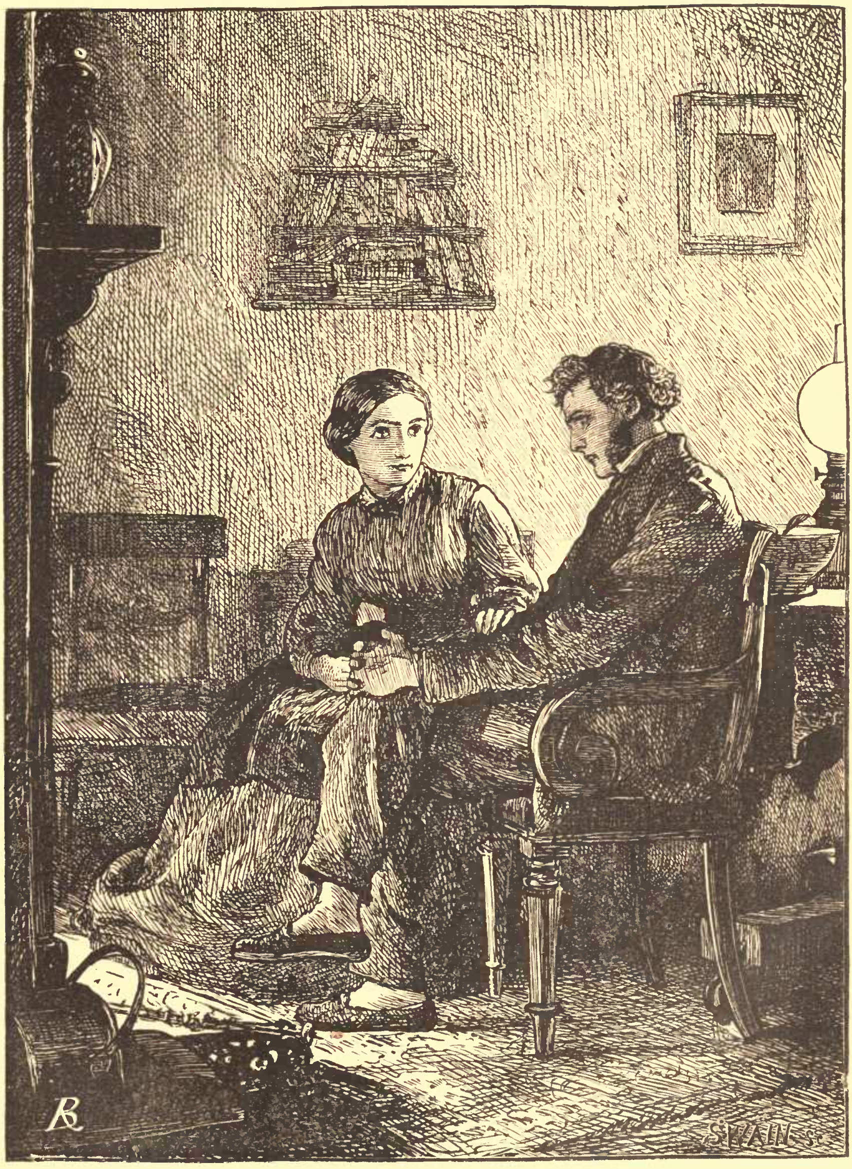
Of course he had to walk across the moors, and of course it rained, for nature has no mercy on the unfortunate. His heavy heart made the journey long, and it was night before he reached Greysley, penniless, footsore, bringing his collection of patterns with him, which had lost all brilliancy now in his eyes. Hoggs and Bloggs had had bad news. The markets were glutted, and into a glutted market it was madness to fling fresh supplies of goods. Hagart intimated that his patterns were intended for the spring season, and expressed his belief that if his novel and tasteful designs were produced they would set the fashion and the producers would reap a fortune. Hoggs and Bloggs lacked faith, they would not run the risk, and declined making purchases. Hagart tried the lesser houses, but with a like result. Among the manufacturers there had crept gloom and apprehension. "Business was in a shaky state. They really could not venture." And when Hagart in his inn looked over the unfortunate sketches, he was astonished at the change he saw in them. Blight and mildew had fallen on them. The country smiled in the morning, but by evening an army of locusts had passed over it. The splendour had all died out. The novelties on which he had so plumed himself had become deformities. To his own apprehension his patterns had grown common, ugly, absurd. His spirits had fallen to zero, and he was inclined to think that Hoggs and Bloggs had rejected his works, not on account of flagging trade and glutted markets, but because they were deficient in every kind of merit whatsoever.

In seasons of good luck, Hagart's singing spirits soared out of sight, like a skylark: in seasons of bad luck, he humbled himself and slunk into the darkest corner he could find. He was wet to-night, and he was glad of it. His boots were covered with mire, and from that fact he derived much satisfaction. Bringing such evil tidings, he thought it proper that he should appear tashed and battered. In some curious way he wished to appeal to his wife's pity, and so he rather liked the rain and mud. If somebody would but waylay him and knock him down, he thought he would accept the knocking down with much pleasure. But when he got home he received as warm a welcome as if he had come home laden with gold. His wife opened the door for him, and had only a cheerful smile when in a single sentence he blurted out all his unsuccess. She helped him to take off his coat, and had waiting for him a change of clothing. He encased himself in the dry garments as if they were too good for him; and when he entered the parlour the fire was burning merrily—for the candles had not been brought in—and making all kinds of lights and shadows dance on the furniture. The tea-things were placed on the table in readiness, and on the footstool before the fire his slippers were laid out. As she poured out the tea Mrs. Hagart put in a pleasant sentence or so, and when he had dined and supped—for on the present occasion the two meals were rolled into one—she brought brewing materials and mixed his punch with her own hands, and sat down beside him, accepting as she did so a tiny glassful of the liquid which he had ladled out for her. Hagart was very silent; he noticed all his wife's little attentions, and thought sincerely at the moment that he was undeserving of them, and that she was heaping coals of fire on his head.

"You must be very tired, dear," said his wife, laying down the tiny glass.

"Heartsore, Mag! I don't care a bit for the fatigue; a night's rest will put that all right. I really don't know what I shall do!"

He looked low and downhearted enough as he sat before the fire, his mind sorely troubled about the future, and his hands clasped on his knee. His wife looked at him with kindly eyes, nimble thoughts in her brain the while. He had had his way up till now, and now he was dead beat. He himself acknowledged he was dead beat. Mrs. Hagart remembered what an unlucky dog he had been, and the idea grew strong upon her—it had visited her before, indeed, but she had driven it away as if it had been a sin—that an unlucky dog he would remain till the end of the chapter. So thinking, she did not love him one whit the less; loved him all the more, perhaps; and she resolved that, he being bowled out, she would take the innings and make what play she could. All unknowing to Hagart as he sat there with his hands clasped on his knee, the reins of household sovereignty slipped from his grasp. He was no longer at the helm: he was no longer commander-in-chief. Mrs. Hagart was a wise woman, and knew in-



"HE LOOKED LOW AND DOWNHEARTED ENOUGH AS HE SAT BEFORE THE FIRE."

Page 308.

stinctively that to possess authority she must not show it; that to be queen of the household it would never do to appear in royal robe and wear crown and sceptre. But she could distinguish substances from shadows, and *having* the sceptre in her possession, she could very easily relinquish the perilous pleasure of wearing it in public. Meantime her duty was to cheer and soothe.

"Everything is as black as thunder. I really don't know to what hand to turn."

"You must not speak in that way, Alfred. You have been fortunate before, and you will be fortunate again. The patterns were very pretty, I am sure; but as trade is dull, you must just rest on your oars, as the Spiggleton people are doing. Trade will revive again."

He knew the twenty-pound note was in his wife's mind; and three days before the bare suspicion of that fact would have put him in a blaze of anger. But he was humble to-night. Disappointment had quenched his pride and self-assertion, as water quenches fire.

"I don't know. I thought the patterns were pretty enough while I was engaged on them; but now they seem the work of a fool. And I think I am a fool and idiot, and have been a fool and idiot all my life."

Alfred would gladly have been knocked down on his way home; he was now doing what he could to perform that little bit of kindness for himself.

"No, Alfred, neither fool nor idiot."

"I thought I had brains once—and so did others. Now I have fallen so low that I cannot tempt fellows like Hoggs and Bloggs to buy my things."

"Hoggs and Bloggs bought your things before, and they will buy them again. Better times will come round."

"I would not care if misfortune fell on myself alone. What will you say if you find out that you have married a fool—a fellow without brains, or knack, or cleverness—who, beaten out of art, can't even paint patterns for manufacturers?"

"But I know that I have not married a fool."

"I absolutely loathe myself," said Hagart, taking himself as it were by the beard and smiting himself. "I think I am the poorest dog in Christendom. I could cut my throat almost. I sometimes wish, Mag, that I had never seen you!"

"Why, Alfred?" asked the wife, who could see no logical connection between the last sentence and what he had been saying previously. "It would have been an unhappy thing for me if I had never seen *you*."

"If you had waited you could have got a better husband—not a dunderhead who cannot even paint patterns that people will buy. What right had I to take you out of your proper sphere and bring down your fortune to mine?"

"So long as I don't complain, I see no cause you have to. But don't let us talk nonsense. You are unstrung to-night, and see things in their blackest colours. I wrote my sister yesterday, dear, and told her that her letter gave me much pleasure, and that I was ready to forget all the past and be friends again as if nothing had happened. Now do you know what I have been thinking?"

Hagart remembered the high ground he had taken two or three days previously when Miss Kate's letter had been under discussion, and contented himself with staring gloomily into the fire.

"I know she means to be friendly," his wife went on; "and there was a great deal of friendship in the letter she sent, although you thought it harsh. The money——"

Here Hagart fidgetted in his seat as if the allusion hurt him.

"Now, Alfred, don't be foolish! The money has been very useful, and I have been able to get some nice things for Katy—poor child, you have not asked for her to-night, although she has been constantly inquiring when papa would be home;—and I was not ashamed to take it, because, although it came from my sister, it belonged to my father, so that I had a sort of right to it. But I have been thinking that it would be a nice thing if Aunt Kate would take Jack to Hawkhead to live with her."

"Take Jack to Hawkhead?"

"Yes, dear. He's getting a big fellow, and is a good scholar, so far as he has gone. I should be sorry to part with him, of course, but it would be an excellent thing for him, and we could see him often. He could go to the Hawkhead University for a year or so; lads as young as he enter there, I believe. And then there are so many openings in a large city for a clever well-educated young man, and with his aunt's influence he would be sure to get on! What do you think?"

"I really don't know," said Hagart, ruefully; "I don't know what hand to turn to. I wouldn't like to lose the boy, but—have you written to your sister on the matter?"

"No. I have only been thinking that it might be brought about in time—that is, if I and my sister get on as well as I expect and hope."

"But if your sister is inclined to build up the breach, there I am again! She hates me, and I was the original cause of quarrel. You and she will never be friends so long as I live."

"Nonsense, Alfred! But what do you think of my plan?"

"I positively can't say. It will be hard to lose the boy."

"Don't you think it would be the best thing we could do? I suppose you don't wish to bring him up to your own business?" said Mrs. Hagart, letting fly an arrow she had kept in reserve.

"Certainly not," said Alfred, hastily; "and it's perhaps best that the rats should forsake the sinking ship. You know it's a sinking ship, and you won't risk your son in it. Perhaps you're right. I also wish I could take out a passage in another craft, but it's too late now."

"What other craft, Alfred?"

"I have wished often that I could get quit of this confounded pattern drawing, and find employment as a clerk, accountant, secretary, or something of that kind. But then I am so unacquainted with the world's ways. I might be able to get a toll-bar," said he, smiling grimly; "but then I never would be able to give a carter correct change, and my blunders would all be against myself.

"If you were the keeper of a toll-bar you would never be able to change half-a-crown correctly, and would be ruined in a month," returned his wife, laughing. "But cheer up, I don't think you are reduced to a toll-bar yet."

"What an organ of hope you have, Mag! With what a smiling face you front misfortune! I can't understand it."

"I have no great organ of hope, as you call it, but I deal prudently with it."

"How?"

"I use just a little every day. When I have a dozen candles in the house I don't light them all at once."

"And I light my dozen at once, and when they burn down I am in the dark! Is that your meaning? If it is, I daresay there is some truth in it. You mean that you are never entirely in the dark?"

"Exactly. But don't let us bother about our organs of hope to-night, Alfred. If Aunt Kate should ask Jack to go and live with her at Hawkhead,—if she *should*, you know, for I am not at all certain that she will,—you will not set your face against it?"

"If I thought it would be for the boy's benefit——"

"I am glad that you have given your consent so frankly. That's a dear! Of course he won't go unless we think it will be for his benefit. Now let us go to bed, for you must be tired. I'll just slip in and see how Katy is?"

"Poor child!" muttered he as his wife left him; "*she* won't leave the sinking ship. Aunt Kate won't take *her*. She will always be mine and mine only."

Hagart was no prophet. She was leaving the sinking ship very fast, and was going farther away than Hawkhead, and with a sterner guide than Aunt Kate.

But although heavily water-logged, the ship was not destined yet to sink. In fact it righted in a surprising manner; and with all sail clapped on, and with a prosperous wind, there was every probability that it might yet make port and remain there for a while. The very next morning, while Hagart and his wife were sitting at breakfast, Martha brought in a note which our friend eyed suspiciously for a moment—perhaps he had some fear of a dun,—he then broke the seal and read the contents aloud.

"Messrs. Wedderburn Brothers present compliments to Mr. Hagart, and will take it kind if he will call at their office, 119, New Street, to-morrow, as early in the day as possible."

"What can this be?" said Hagart, as he tossed the note across the table to his wife. "Wedderburn Brothers is the best house in Greysley for shawls. What can be the meaning of it? The note was written last night, and I suppose I had better go at once."

"I think so, Alfred. I suppose they wish to employ or consult you in one way or another."

And so Hagart swallowed his coffee and sallied into Greysley.

Of Wedderburn Brothers Hagart had no personal knowledge, but he knew the firm was extensive and respectable, and busied itself with the production of the finest and most expensive class of goods. "What can they want with me?" thought he, as he trudged down New Street with a sharp eye for No. 119. "They get all their patterns from Paris, and won't need my services. I really can't guess what they want with me. Hillo, here's No. 119." And he went up-stairs and entered the counting-room with a beating heart.

The Wedderburn Brothers—two grey-haired spectacled men—looked up from their desks when he opened the door. "I had a note from you this morning, and have come——"

"How do ye do, Mr. Hagart?" and the Wedderburn Brothers both rose: "will you step this way, please?" And they led Hagart into a room off the counting-house, and motioned him to a seat.

The elder brother then produced a portfolio filled with sketches, and laid it on the table beside Hagart. "We have just received these from Paris," said he, as he turned them slowly over; "what do you think of them?"

They were a cut above him, and Hagart regarded them with the despairing admiration with which a thousand living bards regard Mr. Tennyson's poems.

"We can do nothing like that in this country, can we?" said the elder brother; "these French fellows beat us all to sticks."

"They do, indeed. I never saw such beautiful patterns in all my life."

"They are just *too* beautiful; that's the fault we find with them," said the elder brother, smiling. "We can't produce them as they stand, and no one would buy them if we could."

"It would be difficult to produce such things properly in Greysley."

"Impossible. Now, why we sent for you was simply this. We wish to see if you will undertake the re-casting of these sketches, and—preserving the aroma of style as far as possible—so shaping and altering them that they will be brought within the range of the skill of our workmen. Do you think you will be able to do so?"

"I shall be delighted to do my best."

"We have heard a good report of you, and have no doubt that you are perfectly competent. The job will extend over several weeks or perhaps months, and we are prepared to allow you four guineas per week during the time, and otherwise to make you as comfortable as we can."

Hagart thought he had never heard such music distil from human lips. "When should you wish me to begin?" asked he.

"At once, this very hour. You have not working materials with you?"

"No."

"Then you can send home for them. One of my lads will be at your service. Just drop a line, and he will bring your things with him. Meantime, here is the room we have set apart for you.

Hagart scribbled hastily on a bit of paper, "Glorious news, Mag. Wedderburn Brothers have got a lot of the most lovely French patterns, and I am engaged to *spoil* them at the rate of four guineas a-week. Of course Jack won't go to Hawkhead now. I'll be home for dinner at five. Be sure and kill the fatted calf, and lay in some beer. Give the bearer all my things, paints, paint-saucers, brushes, tracing-paper, compasses, foot-rule, and all the rest. Good-bye till five. Yours ever,—A. H." And this paper he folded up and gave to the messenger. He then devoted himself to the portfolio, that he might familiarize himself with its brilliant contents.

Hagart came home to dinner elate as morning chanticleer that on tip-toe crows defiance to a dozen sleeping farms. His wife had many questions to ask, and he delighted to be questioned. He stated that Wedderburn Brothers were the most gentlemanly men, and instituted comparison between them and his former employers in Greysley—comparison damaging to the House. He spoke of the nice room he worked in. He was never weary of extolling the beauty of the Parisian designs, frankly admitting that in a certain indefinable air and style they surpassed his own productions, as far as a fine town-bred lady surpasses a country maid. This he acknowledged freely. "But what then?" said he; "if a man can't be a great original poet, it's always something to be an excellent translator. I can't paint like these Frenchmen, but I can bring their admirable designs within the British workman's capacity of production. I can translate them into the vernacular, so to speak. When I have this job finished, it would be an excellent idea to run over to Paris for a week or so, establish a connection with the clever fellows there, arrange to have parcels of patterns delivered to me monthly, and reduce and adapt these patterns for the manufacturers here. The notion is entirely new, and could not fail of success. My field would comprehend Greysley, Spiggleton, Hawkhead, and other manufacturing centres. I'll engage some talented young men to work under my direction, and drive a roaring trade. By Jove, the idea is glorious!" said Hagart, his imagination kindling in its flight like a Roman candle and bursting at last into many-coloured splendours. "And then as I shall be in Paris frequently, at any rate, what is to hinder me from taking you, Mag, and the children over with me and showing you all the palaces, churches, and picture-galleries? I'd like to show you a bit of the world. Wouldn't you like it?"

"Yes," said Mrs. Hagart, looking up from her sewing, for this talk had taken place after supper, and just before going to bed, at which period Hagart's spirits were usually most boisterous—"I should like very much to see Paris and all its sights; but don't you think you have lit all your candles again, dear? You have Wedderburn Brothers and four guineas a-week; let us be content with that, and let Paris alone in the meantime."

MEDITATIONS ON PROVIDENCE.

By the DEAN OF CANTERBURY.

I.

When King David, after his sin in numbering the people, was offered his choice among three different modes of punishment, he replied (2 Sam. xxiv. 14), "Let us fall now into the hand of the Lord, for his mercies are great; and let me not fall into the hand of man." These words point to a tendency in the human mind with reference to our belief in God's Providence, which it may be instructive to discuss and illustrate. I believe that some of our former meditations* will throw light on it: and it in turn may perhaps make them better understood.

The habit is, that of less regarding God as acting on us and around us when human agency is also employed, than when it is absent. We are apt, it is true, to be somewhat inconsistent here as in other portions of our recognition of Providence; but here, perhaps, as we before said in those cases, the inconsistency may be unavoidable, and may indeed be the only right path to pursue. A man comes to his death by the culpable negligence or want of foresight of a fellow-man. We regard that negligence or want of foresight as the assignable cause of his death. We say, if that matter had been better cared for,—if that dangerous path had been fenced, or that rail better laid, or that violent disease taken in time, the man might have been alive now. Yet in the very next breath we say, that it pleased God to take him to Himself: and we deal with the fact of his death in terms which imply that no human power could have saved him. This double way of speaking remarkably illustrates the manner in which we find ourselves compelled to hold and proclaim both truths,—man's freedom of action, and God's sovereign power of disposal. That the two here, as everywhere, seem inconsistent when brought into contact, is not a fault that we can help and correct, but a necessary consequence of the infirmity of our nature, and the narrowness of our comprehension. In reality, God just as much acts where men are concerned in bringing about the result; and men have just as much freedom of action where God overrules the result; but we cannot put the two together; we can only apprehend these truths separately. And separated, we do apprehend them; and we speak of the event on one side as if man caused it, and on the other as if God pre-ordained it.

---

* In Good Words for 1863, p. 627.

Now something of this unavoidable inconsistency is to be observed in the saying of David which I quoted: and perhaps a little more. Three things were offered to him, for his choice of one. "Shall seven years of famine come unto thee in thy land? or wilt thou flee three months before thine enemies while they pursue thee? or that there be three days' pestilence in thy land?"

First of all, the choice was given him by God Himself, in whose power it plainly lay to bring about any one of the three. The dearth from which was to arise the famine: the war which was to bring in the enemies: the seeds and access of the pestilence; all these were, by the very terms of the offer, to be of God's ordaining and bringing about. The hostile forces which were to pursue would be as much under His control, as the disease, or the sun and the clouds. Whichsoever of the three befell the penitent king, he would still fall into the hands of God, and not of man. What then, in his estimation, made the difference? I may say, what would make it in our own? for I doubt not that we all feel the same as he did. Is it not this—that in the one case man *appears* as the agent, whereas in the two others he does not appear, but God only? We may say that the answer, though a beautiful one, is one indicative of weak faith; that if the king had been strong in faith, he would equally have seen himself safe in the great mercies of God, whether man intervened between God and himself, or not. And doubtless this is so; but even though the faith may be weak, it is, I believe, not only one which we are obliged to be contented with, but of that sort which God means us to have. All that happens to us is naturally and necessarily divided off by us into these two classes of events: those which are man's doing, and those which are God's doing. The merchant insures his ship, or undertakes safely to convey the merchandise entrusted to him: and in so doing, he speaks of the act of God, meaning the storm which may imperil, or the calm which may detain, his vessel. Inquiry is made into the cause of a death, and if it has been sudden, or unassignable, it is said to have taken place by the visitation of God.

Let us follow out our habits of this kind a little further. It appears also, that in great and solemn matters we are more ready to acknowledge the interposition of God, than in ordinary and less significant ones; even where the difference of the presence or absence of human agency does not occur. We do not scruple to say in any society, that escape from accident, or recovery from grievous sickness, has been providential. All acquiesce in one sentiment, and even the scorner's brow is for once relaxed into approval. But if the same merciful preservation has extended to the prevention of accident altogether, or to the long maintenance of health uninterrupted, we do not equally characterise these as the act of God, but almost take them as matters of course; and we should pass with the world for enthusiasts or weak-minded persons, if we spoke otherwise about them. This practice, though seemingly different from that other, is in reality the same. As long as the world goes on without any interruption to its ordinary course, we seem to have no reason to attribute that course to anything beyond ordinary agencies, which appear to us as if they always had been, and always would continue to be; but when there comes an interruption in the slightest degree unlooked for, then we begin to speak of Divine Providence, and to see God interfering. This last fact is remarkably illustrated by remembering that sometimes our recognition or non-recognition of God's Hand takes place without any reference to the relative importance of events, but entirely with reference to their usual or unusual character. The rising of the sun each morning by the revolution of the earth on her axis,—the bringing in of summer and winter by the inclination of that axis,—the drawing over us of the cloud from which descends the fertilising shower, these are in reality immeasurably greater events, and more eloquent of divine power, than many things in which we all see and acknowledge the present hand of God. Yet in these we never see it, or even speak of it. Sometimes, indeed, when Nature's operations assume a startling or terrifying character, we seem compelled to see God acting in them. The thunderings and lightnings of the overcharged air, the storm by which the balance of the atmosphere is restored, these seem to us evident proofs of God's interference: whereas that interference is in reality as much proved by the opening of the bud, or by the withering of the herbage after continued drought. We cannot see this matter as it really is, but only as it is relatively to ourselves. For every event our minds strive to supply some agent: if we see man, if we see the ordinary laws of nature at work by our side, we are apt to look no further, and to seek for no higher cause: but if all is blank, and the result only is seen, then we seem to rise upward in thought through the empty heavens, till we come to the Throne and Him that sitteth thereon. This is one form of the feeling induced by our infirmity. And another is, as we have partly seen, that as long as all is quiet, and our minds are not unusually excited, we are content to look no further than natural causes; but the moment our fears are aroused, the moment we are anyhow deeply stirred in spirit, we see and we acknowledge Him in whose hands are all our ways.

Let us go on to speak of the use, and of the abuse, of this practice. Doubtless it has its beneficent use, or God would not have so universally implanted it in our nature—in the best and godliest of men, as well as in those who regard Him not. And I think this use is not difficult to ascertain. "We walk by faith, not by sight." But it is plain that while this is true, it can be true only of the main turnings of our course, not of every step at every time. The evidence of our senses must be our guide in a world which is apprehended by our senses, and faith in things unseen must come in where the world around us threatens to overbear our higher principles and instincts. If a man always, and day by day, guided every portion of his course by consciousness of the things unseen, and not according to the things seen, he would become a dreamer, and would be unfit to move and act in this working-day world. And just so in the case which we are considering. The constant thought and recognition of God is good, is necessary, for us all, who would live for any worthy purpose.

> "Happy the man who sees a God employed
> In all the good and ill that chequers life."

But to refer every ordinary matter, every insignificant result, to Him as its immediate agent, would on the one hand bring in superstition and morbid fancy, and on the other would tend to diminish our reverence for God Himself. It would bring in superstition and morbid fancy: for it would lead us ever to be looking for the Almighty Hand in those minute details of its working, which are concealed from us; and we should be attributing to God our own petty ways of acting, and our own insufficient and unworthy motives. We should be ever regarding ourselves as His chiefly favoured ones, and the misfortunes of others as attributable to His vengeance for that in them which is faulty in our eyes. The last dread famine in Ireland was at one and the same time regarded by Protestants as a judgment on Popery, and by Romanists as a judgment on the land for the success of Protestant missions. Such a circumstance should teach us caution, and show us that it is sometimes good to withhold our decision on the purposes and workings of God's Providence. It does not become sober-minded Christians, who believe that He doeth all things well, to betake themselves to finding fault with His arrangements, if the showers fall more or less frequently than usual, or if a partial blighting of the fruits of the earth diminish the prosperity of one particular portion of our globe. The exceptional weather which spoils a harvest, may be His means of averting a pestilence; and the calamity which causes one branch of industry to stagnate, may be a call from Him to waken thenceforth better and higher energies of a people. We must not judge Him, but trust Him. His Hand is too large for us to see all it does at once; its very opening to shed on us the blessings with which it is loaded, may crush some frail image on which we think our wellbeing depends. Extreme sensitiveness to God's acts, is not true resignation to His will.

Again, I said, that such minute apportionment of all things to His immediate agency tends to diminish reverence for Him. This indeed would follow from its producing superstition; for where there is superstition, there cannot be reverence. But it is also very plain on other grounds. "God is in heaven, and thou on earth," says the Holy Spirit in Scripture: "therefore let thy words be few." That is, not only let thy prayer be short, and sober, and reverent,—avoiding the familiarity induced by many words,—but the meaning doubtless extends further, to this,—let thy surmises and sayings about God and His acts be few, and certain, and reverent also. It has not pleased Him to move visibly among us, nor to hold converse with us face to face. We look before us, and He is not there; and behind us, but we cannot perceive His presence. He withholds Himself from us, that we may adore Him, and magnify Him in our thoughts. When it became necessary, in His great purposes, that He should be seen by man on earth, men did not reverence Him, but they despised Him, and cruelly entreated Him. His ways are not our ways: when we make them our ways, we so far degrade Him. The poor Papist, who has a saint for every turn in life, falls to cursing his saints, when those turns are not to his advantage. He who is not content without seeing God everywhere, would, from the very infirmity of our constitution, reverence Him nowhere. So that it is a good and wise provision of Him who made us, that men in general are not given to morbid and minute tracing of His working in ordinary life. Their thoughts about Him are thus kept within the bounds of sobriety and due reverence, and are attuned to the feelings towards Him which He would have us entertain; so that when we are brought face to face with Him, we meet Him with becoming awe, and abase ourselves in dust and ashes.

But the tendency and the practice bring with them their abuse likewise. And that abuse consists in this—that we are too often given to forget God altogether, where man is concerned. It is not easy to acquit David himself of something like this fault. If enemies were to pursue him while he fled before them, it seemed to him as if he would be exposed to all the fury and all the caprice of man's vindictive agency. And so it is very often with us. We look too much to man, we put too much confidence in human agents. We hope for prosperity, or we fear thwarting, and the access of adversity, simply and entirely from man, forgetting that to every man on earth God says, "Hitherto shalt thou go, but no further." And this evil habit of forgetting God extends far wider than the mere looking to man for good or evil. Thousands among ourselves, not unbelievers by profession, pass through the realities of life without a thought of God and His sovereign disposal of them. Their course, day by day, and year by year, is led without any consciousness that they are in his Almighty Hand. I don't mean that they never pray, or never go to church; but that in the inner chamber of their hearts, where plans are made, and where joys and sorrows have their source, God is not present; their springs of life are godless, and have lost all that can make life worth living.

Another abuse of the habit of which I am treating is, a bold and presumptuous spirit, which not only leaves out God, but openly despises Him, as taking no part in human affairs. This may not seem to be common; but it is in fact far more common than we suppose. Legendary history is full of stories illustrating the punishment of such presumption. We will take but one, and that for the sake of putting clearly before us the spirit which I mean. It is that, repeated in various forms at different places on our island coast, of the merchant adventurer now in sight of land after a prosperous voyage, and reminded that he owes thanks to God for his safety and that of his charge. "Nay," he replies, "thank the good ship and the fair wind." And then in the story, the bank of clouds gathers in the West, and the vengeance of Him who was neglected descends on the ship and her captain, and the pious adviser alone escapes to tell the tale. These stories may or may not be matters of fact: but they point to a great truth in the habits of ordinary men: a confidence in self and in human skill, and a casting off of God as the disposer of the issues of our actions. It is not that we can afford to dispense with any human effort of diligence or skill; these are God's appointed means of working among us and by us; but it is that as He is pleased not to work without these, so these must not be calculated on without taking into account His works, apart from which they are of no avail. The advice of the old Puritan General to his soldiers, to trust in God and keep their powder dry, was, homely as it may seem, sound and good. He would be equally wrong who, professing to trust in God, let his powder get wet, as he who took the proper precaution, but left God out of his calculation. Among men of the world, among those engaged in business and working for this world's wealth, the latter fault is much the more common of the two. We do not remember God as we ought. Things here stand in His place and veil Him from our sight. We take into account everything else first, and Him last: or, far too often, Him not at all.

But let us recur, in drawing our meditation to a close, to the real comfort to be derived from the habit which we have been considering, in cases where nothing stands between us and the Almighty Hand. It may be a weakness to recognise God more in these than in others; but it is a weakness wherein is strength and consolation. When the frame gives way under sickness, and the foundations of life are sapped; when calamity over which we have no control desecrates our homes and hearts; when our flesh and heart fail, not because of man, but because of One greater than man, who is pleading with us face to face; is it not mercifully ordained, that in all such cases the universal tendency is to see God working, to acknowledge ourselves to be in His hand, to feel that His mercies are over all, and are great?

And is it not also a mercy, that we all feel what David did, that it is God, and not man, whom we wish to have for the disposer of our fate? that from the infirmity and caprice of our fellow-creatures we are ever glad to take refuge with Him whose mercies are great, and who we know doeth all things well?

We feel, that man may mistake us, man may deal unjustly and unkindly with us, man may serve his own purposes at our expense, man may be wanting in sympathy, in equity, in lenity: but none of these can be with Him whose tender mercies are over all His works: the Judge of all the earth must be just: the Saviour of mankind must care for those whom He bought with His blood: the blessed Spirit of God will not easily forsake nor reprobate those with whom it is His sacred office to dwell and to plead continually.

"Let us fall into the hand of the Lord, for His mercies are great: and let us not fall into the hand of man."

II.

Our Lord, in the remarkable parable of the rich man and Lazarus, puts into the mouth of Abraham, the Father of the faithful, this saying: that if the rich man's brethren believed not Moses and the Prophets, neither would they be persuaded though one were to rise from the dead: in other words, that if the ordinary means of grace are powerless upon a man's heart and life, the extraordinary judgments of God will be powerless also.

Let us, in this meditation, apply this declaration of our Lord (for it is manifestly delivered under His sanction, and for us) to ourselves. Let us do so in the manner in which we have been, in our other meditations, attempting to deal with sacred truths and their application: by a matter of fact examination into the things which actually happen in our own hearts and lives. Let us in this manner try to make the truth of our Lord's saying apparent, and to force it in upon our thoughts as a reality. The form which our inquiry will take is this: What is the effect on men's minds of the ordinary means of grace and course of God's providence? What again is the effect on men's minds of God's exceptional and extraordinary judgments? And then combining the two together, we shall try to show that if the former effect do not succeed in changing the life, it is not likely that the latter effect will do so.

First then, what is the effect on men's minds of the ordinary means of grace and course of God's providence? What might we expect it to be, from the very nature of those things, and of the minds of men? Let us look at any human character: our own individual character, for instance. What have been the greatest and most lasting effects ever produced on it? How is it, in other words, that we come to be what we now find ourselves? Let us examine, in any case, into some habit which has grown up in us, so that it is a part of our very self. How came it about? We can trace it to constant insensible influence of some kind, and mostly to influence exerted in early life. And when we come to add together a multitude of these influences exerted on us from without and from within, and take into account circumstances which have lain all round us throughout life, we arrive at something like a reason for the greater part of the habits, and likings, and dislikes, and desires, and tendencies of our individual character. These grew up by degrees; we could not trace their growth day by day—hardly year by year: but when we look at the scenes amidst which we lived, and the persons with whom our lot was cast, and, to use a Scripture expression, the times that went over us, we see, taking a large and general view, how each of these habits and propensities must have grown up, even though we could not trace it. Now just such, I believe, is the usual effect of the ordinary means of grace and calls of God's providence, where they affect men at all. The case where they do not, is not at present under consideration; but will be by-and-by. Where a man is affected by them, their working is of this gentle, gradual, deep kind. His life becomes cast into their mould: his daily thoughts run in the channels of their great onward flows and tendencies; his actions take colour from this cast and complexion of his thoughts. It is here as it is with all matters of habit. The man whose days have been spent in the plains cannot be inured to mountain climbing, nor are the forms and phenomena of mountain scenery familiar to his thoughts and imaginations: take him to the hill country, and all would be strange to him. But to the child of the mountains all these things are matter of course, however wonderful they may be in themselves. The masses of vast and shadowing rock, the clouds resting half-way down the mountain side, the torrent ever sounding in its impetuous strength, the cataract with its rainbow,—these, which are wonders to others, are the very materials of daily life to him. The plains-man wearies, and calls for rest, with a few hours' breasting of the hill track, up which his daily work has carried the mountaineer, till his very frame has knit into aptitude for the task. And not otherwise is it with the effect on men's minds of the ordinary means of grace and course of God's providence. Those miracles of Divine goodness, which make up the history of redemption, become a portion of the very life itself. Difficulties which surpass human comprehension, constitute the daily path and walk of faith and holy practice. Where the unaccustomed step would falter and the muscles would immediately weary, the habituated believer goes on his way fearless and contented. The thews and sinews of his mind, so to speak, have gathered the requisite strength—and he can climb the crag without murmuring and without weariness: his eye has been long used to the abyss underlying his vision, and he can gaze down from the cliff-path without giddiness. Effects of this kind are not half enough taken into account among us. They are, for us who have grown up from childhood in the faith, our greatest mercies, and our most precious possessions. Take any of the great doctrines on which the life of the Church is built: the Incarnation, the Atonement, the indwelling of the Spirit, or any other; present such a doctrine to the unaccustomed mind, and what is the effect? Look up at yonder mountain side. Do you see that track zigzagging along the face, as it appears, of the perpendicular rock? It glitters, as you look, in the sun, moist and slippery with the never-failing mists: what human foot could venture thither in safety? Yet day by day along that path passes the woodman, singing as he goes to his work; yet day by day along that dizzy track gaily pass his little children with their father's mid-day meal, sportively plucking the bright blossoms that peep from under the patches of snow. Even so is it with the blessed doctrines on which the soul lives and works in God's Church. To the unbeliever they are full of difficulties—they seem impossible: he gazes on them and wonders that any can receive them and work in their strength: but to him who has grown in their presence and been accustomed to their power, they are things familiar, and their difficulties do not present themselves: their majesty has passed into his spirit, and their living efficiency has long wrought within him. And we may well believe that it is for this reason, among others, that it has pleased the Lord that reception into His Church by Holy Baptism should not wait for the mature understanding, but should be the very first thing in life: in order that the blessed effects of His mighty Love for us should be produced at the greatest possible advantage: in order that "Heaven" may "lie about us in our infancy," and holy and saving truth may be carried into our young minds long before we are aware of its presence. To the Christian child, no playfellow of earliest years is closer to memory and affection, than the child of Bethlehem: no tales of wonder more familiar, than the miracles of the Saviour's mercy: to him, the Cross, and the Tomb, and the Resurrection morning, and the ascending up into heaven, and the sitting at the right hand of God, are no strange things, to be questioned by the doubting reason, and mastered by the understanding: but have formed, from his earliest recollection, the very clothing and inhabitation of his thoughts.

One word, before we pass to our next point, on the outward effect produced now, and continually, on us who believe, by the ordinary means of grace and course of Providence. And here it may be conceived, the result of inquiry will be almost insensible. Between two men, both brought up as Christians, both holding the faith, both living correct and blameless lives, but one a regular attendant at public worship, a constant reader of his Bible, and the other a neglecter of both, what difference can we perceive? The question, it seems to me, is just as if it were asked respecting two buildings, both outwardly complete, in one of which the work of fitting and adorning was diligently carried on, while in the other it was utterly neglected. In outward appearance, both are the same. The mere passer-by knows no difference between the two. But enter within: see the two houses as anyone sees them who knows their inmost recesses, and how vast is the real difference! The one is gradually preparing for the master's use; the other is a mere shell, worthless for human habitation. Or let us take the same truth in the very illustration given by our Lord Himself. Ten virgins went out to meet the bridegroom. Five had provided for delay, and had taken care to be ready whenever he should come: five had made no provision. Here we have before us just the difference in question. All these are Christian souls, come out from the world into the waiting Church of Christ: and our Lord in the parable sets before us the difference between those who by the use of the means of grace make continual preparation for His coming, and those who make no such preparation. The effect of these ordinary means of grace is, to fit and adorn the soul for God's work, and for God's summons to Himself: to supply the waste and wear of daily contact with the world, that there may be oil in the vessel, when the cry is made, that the Bridegroom cometh. He who pays regard to God's ordinances will find the blessing when he needs it most; he who neglects them will find himself, at that hour, all unprepared. And it will be well if he be not shut out, in the day when the Lord gathers his people.

Such then seems to be the effect on men of the ordinary means of grace and the calls and advices of God's providence, when they are listened to and received into the heart.

And now let us ask ourselves, what is the effect on men's minds of God's exceptional and extraordinary judgments? Let us see what we mean by these terms. The parable to which we referred in the beginning gives us a notable example: the rising of one from the dead. But though this exactly suited the case in the parable, it will not suit ours, because we do not now see around us such exercise of divine power as the raising of the dead. And manifestly it will not do to say that there are as great miracles going on around us, if men would consider and perceive them: for by the very nature of the case we want for our present purpose something which men *cannot help* perceiving, and being affected by. Still, the instance in the parable will guide us to the *kind* of incident of which we are in search. Anything which is unusual and breaks in on the ordinary daily course of events assumed as likely to happen, is of the kind which we seek: especially if it bear a character of solemnity, and carry a serious thought down into a man whether he will or no. Of such a kind, for example, is the occurrence of a death in the midst of us; a sudden interposition of One who is able to make things about us to be as He wills, and not as we will. And this is perhaps the commonest instance of God's extraordinary judgments, happening as it does every day somewhere, and many times in the experience of us all among our own kinsfolk and acquaintance. Now what is the usual effect of such an event on men's minds? We may give two answers to the question: first as regards those who are affected by the ordinary means of grace, and course of God's providence,—and then as regards those who are not affected by them. What is the effect on us who believe, of such an event as that which we have mentioned? I mean, the effect on our religious lives and on our own characters? Of course there are various degrees of sorrow and regret, as we approached nearer in intimacy or friendship to anyone who is taken from us: and these must not be altogether left out; for all sorrow is a power over the soul, and brings a lull within, during which the voice of God may be heard. But I mean principally, what is the abiding effect on our religious lives, on our watchfulness for a like summons in our own case, on our estimate of this world and of eternity, on our thoughts of other men and of ourselves? Doubtless, if we be men really in earnest, there is an effect: and O thank God for it. But of what kind? If I mistake not, in our case, just of the same kind, allowing for necessary differences, as that of the ordinary means of grace and occurrences of life. As with them it would be impossible to say what part each service, each Holy Communion, each day's more experience of God's works and ways, bore in the building up and fitting the Christian character; and yet we know that each did bear some part: so is it even likewise with these extraordinary judgments of God. They pass over us: for a short time thought is solemnised, and exuberant spirits are checked, and we feel this life less secure, and another life more real, and nearer to us: and then time goes by, and the past event, like all past events, comparatively loses its power: present and ordinary things flow in, and resume their influences over us; and, to outward seeming, all is again as if the judgment had not been. There is, nevertheless, as I said, a certain abiding effect—but like that other, it is gradual, and insensible, and accumulative; by the recurrence of these warnings we become manifestly and insensibly more prepared against our own time: by the recurrence of sorrow the heart is softened: by the recurrence of kindly and sympathising feelings we have gentler thoughts of others, and less selfish ones about our own likings and interests. But all this result is produced, let it be remembered, on hearts already believing, already predisposed by habit to be turned in the direction of God's preventing and warning grace: and again, all this is produced, not by the sudden and overwhelming force of the event itself, but in spite of that force being notoriously evanescent, and having seemingly been exerted in vain.

And if we now pass on to the matter most directly at issue, and ask, what effect will God's exceptional and extraordinary judgments produce, on one who neglects or refuses to hear the ordinary means of grace and calls of Providence? our answer will surely not be doubtful, nor difficult. On the occurrence of one of those judgments, his thoughts, like those of the other, will be solemnised for a time. There is not a heart so light or a life so worldly, but the sound of the death-bell carries on it some grave reminding, however unwelcome, and however dissimulated. But what is the effect in after time? For good, absolutely nothing. The gentle gradual influence, which in the other case remained after the first shock had passed away, does not in this case exist at all: the man is unaccustomed to the daily warnings and remindings of grace and instruction: his heart is essentially hard, and the repeated and undecided shocks of judgments of this kind, only harden it still more. No sinner is so hardened, as one who lives in the midst of warnings and terror. Incredible as it may seem, we read that no robbers are so brutal, no murderers so pitiless, as those who wander among the wounded after a battle, where every single scene of suffering, one would think, would be enough to melt the sternest heart. Again, it is well known that the habitual sight of anguish and pain is apt in ordinary persons to steel the heart against sympathy with both. And if such be the outward effect, so transitory, so powerless for good, so likely to produce even permanent mischief by repetition, shall we find any inward influence exerted on the heart of the careless and impenitent by these exceptional interferences of God's hand? Even in our own time, even with our Lord's warning words before us, we often hear these events spoken of as if they had power to convert the sinner. It would be presumption to say that God may not make use of any means for this purpose: but it would, on the other side, be idle to shut our eyes to the plain facts of His dealings with men: and one of those plain facts is, that He does not ordinarily make use of events of this kind for that purpose. They who do not listen to the ordinary means of grace, do not, as a matter of fact, listen to these. The sinner who turns a deaf ear to the church-bell, turns a deaf ear to the death-bell also, as far as any permanent good is concerned. Let us strengthen the inference by an example; by *the great* example from history. The Jews heard not Moses and the Prophets. The law spoke of justice, mercy, and the love of God: they were unjust, and unmerciful, and ungodly, rejecting Him whom God had sent, and refusing to receive the testimony of His blameless life and holy words. He raised up one from the dead, in the presence of many of their chief men. And what do we read of the effect on them? "The Pharisees consulted that they might put Lazarus also to death; that because of him many went away, and believed in Jesus." And afterwards the Son of God himself went unto them from the dead, His resurrection being assured to them by the testimony of those who had seen and heard and handled Him, after he was risen. But in all this, they did not believe: they refused the evidence, they persecuted the followers of Jesus, their city and temple miserably perished, and they are scattered over the earth unto this day.

Such was the fulfilment of our Lord's saying in them to whom it was spoken: and of that same kind will it ever be in all men under similar circumstances. If we will not listen to the ordinary means of grace; if the course of God's warning and loving providence have no teaching for us;—then not unusual judgments, not the occurrence of death among us, no nor of sickness and the approach of death to ourselves, will produce the effect which the others could not. These solemn judgments, these startling calls, are full of instruction: but it is to those who are under God's teaching, not to those who refuse it and put it behind them. Conversion and sanctification, life and growth in grace, are to be found in the ordinary services of the Church, and reading of God's word, and seeking to Him day by day; where these are not, none of God's extraordinary calls will waken the sleeping soul.

III.

In resuming our meditations on the Providence of God, one very interesting inquiry presents itself to us. How does the Creator and Redeemer of nature look upon His own creation? What relative value in His eyes have the various ranks and orders of His creatures? Is it possible, that we men may be wrong in believing ourselves to be the flower and crown of His works on earth? As we know that within the limits of our own race He esteems the lowly more than the proud, may it not be even so outside the limits of our own race, that proud *man*, who ever puts himself foremost in creation, may after all be in the sight of God of less account than some tribe of God's creatures far beneath him in power and intelligence?

The answer to this question cannot be unimportant to us. If our own view of our place in creation be confirmed to us by our Lord's own words and arguments, the fact of that confirmation, and the manner in which He is pleased to make the announcement, and the lessons which he draws and which we may draw from it, must be alike edifying and profitable.

Our Lord devotes the second portion of His great Sermon on the Mount to the enforcing on us of a simple and undivided heart in matters pertaining to God. Following in that discourse the process of the Spirit's work on man as afterwards described by Himself, and first dealing with the convictions and measures of sin,—He next comes to His description of the righteousness of those who would be His disciples, and ends by giving them His rules for their judgment of men and things about them. It is in the middle portion that the passage occurs which deals with the question before us. Having told us that our righteousness is not to be done before men, to be seen of them, but is to be such as has real existence before our Father who seeth in secret, He then tells us that no man can serve two masters, God and this present world. The soul of man, whichever way drawn and tending, "moveth altogether, if it move at all." The man who pretends divided service, who thinks that he can afford to have one eye towards God and the next life, and the other towards self and this life, will find in the end that he has been mistaken: that he has not been doing himself good by his attempt which seemed so shrewd and worldly-wise, but evil: that he has been trying to live under impossible conditions, and the result has been the break up and ruin of his eternal prospects, in the demoralisation of his conscience and his inner being.

All this is important to our present consideration, because our Lord passes to the portion in which our question is treated with a "Therefore I say unto you," implying that what follows is grounded on what went before. And so indeed it is. If the heart and the service of the life will not bear dividing, then the thoughts of the heart about a man's daily maintenance and welfare must not, while he professes to believe in and depend on God, be anxiously distracted, partly trusting Him and partly distrusting Him. "Therefore I say unto you, Take not anxious thought for your life, what you shall eat; nor for your raiment, what ye shall put on." I may remark in passing, that the English reader is apt to be misled in this passage by the rendering of our version, "Take no thought," which does not represent what our Lord says, and would, as we now understand the words, be both impossible to carry out, and contradictory to other express commands of Holy Scripture. The original word thus rendered signifies taking anxious, distracted care. It is derived from a verb which means to divide into two or more parts: and is thus admirably suited to describe the sort of care which will not suit him whose heart is to be single and undivided in the service of his Father in heaven. This division of heart, this distracted and distrustful care, we Christians are not to allow in ourselves with regard to our subsistence, or to our necessary shelter and due adornment of the body. And why? for here comes in the treatment of the question which we proposed to ourselves in the outset. And let me remark, that there is a peculiar and delightful interest about this part of our Lord's discourse. Wherever, in the high teaching of inspiration, creation and redemption are brought together, there is a charm in the words which goes to every heart, and impresses them on every mind. Who, for instance, does not feel this in that wonderful eighth chapter to the Romans, where the Apostle assures us, that all creation around is waiting and sighing for the glorious day when our bodies shall be clothed with immortality? And if so, assuredly here also will this be the case, where the Son of God, the Lord of Creation, is pleased to afford us a glimpse of His own estimate of portions of His works which we see about us, and to describe to us those beauties and adornments of His inferior creatures of which He alone knows the secret and the value. "Behold," He says, "the birds of the air: they sow not, neither do they reap, nor gather into barns; yet your heavenly Father feedeth them." The first argument here is of an absolute kind: the second of a relative kind. First, our Lord says, observe, how large a portion of creation is absolutely dependent on the unsolicited and spontaneous goodness of your heavenly Father. These creatures live in wild liberty, giving no care to provide stores for distant time: they are provisionless and defenceless: but He whom you serve, and whose children you are, provides for them. He has endowed them with instinct, guided by which they go in search of their daily food: and year by year and day by day His bounty provides that that food shall lie scattered where they may find it. Will One so careful, and so bountiful, suffer *any* portion of His creatures to go neglected by Him? Cannot you trust the bountiful and loving Father, who feeds the birds of the air? So far for the direct and absolute argument: to which it might perhaps have been answered by one willing to argue for argument's sake, that we are not so sure that we are equally with them the objects of our heavenly Father's care. But our Lord precludes all such distrustful escapes from His inference, by appealing at once to our sense of our place in creation as compared with theirs, and He adds, "Are ye not much better than they?" Our superiority to them is not a matter requiring proof, but a conviction at once to be assumed and appealed to. Now, as I said in the beginning, the fact of our Lord's thus confirming our view of our place in creation, is something. Let our persuasion of an obvious truth be ever so strong, we cannot but feel that our hold on it is firmer, when we hear it asserted by the God of truth.

We are better than they. Now, as far as our outward sight goes, we and they perish by a common fate. Their bodies and ours moulder together in the dust of the earth. But we are better than they. Better, not as regards what we see, this common fate, this common decay. No: if that only be considered, we are much worse than they. We have thoughts and hopes reaching forward into immortality: they have none. If we are to perish with them, bitter is our lot; sad indeed the cutting off of high aspirations, and bright hopes, and eager yearnings. If in this life only we have hope in Christ, we are of all creation most miserable. How, then, are we so much better than they? How can we be so very sure, that the great Father who neglects not them, will not forget nor neglect us? How, but by this—that we have a life which they have not; that the fate which overtakes us and them, is common to us both as far as the outward eye reaches, but that beyond, there is for us a life which there is not for them: that the decay in which our bodies and theirs moulder together is not for us what it is for them—that our dust shall arise, while theirs shall remain? Here is our real superiority—here is the truth by which the Lord's argument is driven home to our convictions: the life to come—the life that now is, a preparation for the life to come. If God so takes care of these fleeting and ephemeral creatures, who endure but for an hour of the great day of the world, how much more will He take care of those whose life is not limited by the duration of the creation itself—who shall survive the wreck of matter and the crash of worlds?

But there is more yet behind. Mere immortality confers a superior rank over that which is mortal: still mere immortality may be a curse and not a blessing. But you know, that that which it cost to make it a blessing, God Himself has paid for us. And in another part of the New Testament we have this very fact used as an argument tending in the same direction as this which we are considering. "He who spared not His own Son, but delivered Him up for us all, shall He not, with Him, also freely give us all things?"

Such is the absolute, and such is the relative argument here used. God who feedeth the birds of the air, will not neglect any portion of His creatures: God who feedeth with tender care an inferior tribe of His creatures, will not neglect nor forget one far better than it. We may safely trust our daily sustenance and welfare in His hands, as long as we do not cast ourselves out of the course of His providential care by an indolent, or a proud, or a reckless repudiation of the work which He has given us to do. "Seek ye first the Kingdom of God and His righteousness:" be found, that is, in the place where He has put you, and fulfilling its duties as accountable to Him, and seeking to know Him, and please Him: and all needful things shall be added to you.

But there is a second portion of our cares and anxieties, to which our Lord applies the same argument. Food is the first necessity of life; the second is clothing. And here enters an element which, not properly belonging to the actual supply of the want, has yet become mixed up with it, and has come to form a considerable part of our cares respecting it. Our clothing is not only for shelter and decorum, but it is also for adornment. A disposition to deck the person is natural to all mankind. And let it be noticed that our Lord, who knows what is in man, takes up and recognises this as a part in dealing with this portion of our wants. He does not repudiate it, nor chide it down. Had He been here employed in giving us cautions as to its moderation and its excess, there can be no doubt that He would have said, even as His Apostle Peter has said, that it becomes not us to place our chief adornment in outward things applied to the body, but in the hidden man of the heart. There within, ought to be the purest tints, there the choicest jewels. But it is not His practice in His divine teaching, to look aside, or go out of the way, to inculcate caution. It is rather His habit, generously to recognise, and with sympathy to speak of, those tendencies which God has implanted in us for good, and thereby to teach us to look on them as good, and to keep them pure and good, and to use them for good. And such a use, there can be no doubt, we are able to make, and by far the greater part of us do make, of this universal tendency to personal adornment. Its excess is foolish and sinful: its moderate use is not only lawful but beneficial, inasmuch as it tends to carry out the designs of God's providence in the social state in which we live. Large classes of the teeming population of the civilised earth are dependent for their living on the demand for fabrics tending to minister to this propensity for adornment. We are not intended to thwart, but to fall in with that arrangement. The line of duty in this matter is already marked for all who will be not unwise, but understanding what the will of the Lord is. The vain and frivolous on the one hand,—the ill-balanced mind and morbid conscience on the other,—will stray out of it: but for most of us there is little danger; public opinion, guided and corrected by Christian intelligence, prescribes the mean, and, generally speaking, it is observed.

So then our Lord takes for granted this our need and the further tendency which accompanies it: and He argues respecting both, much in the same way as before. He forbids us to entertain anxious or distracting thought on the question, wherewithal we are to be clothed. Doubtless in the simple state of society found in that land, and at that time, this anxious care was more visible on the surface, than it can be in our artificial condition. There, the mother of the household is described to us as spending her time at the distaff and the loom: and the choice of pattern and colour, the preparation of the material and the dye, and many other details which we in our homes are now spared, must have vastly enhanced the danger of making this question the course of distracting and mischievous anxiety.

But here, as before, the Lord takes an example from creation around us. "Consider," He says, "the lilies of the field, how they grow: they toil not, neither do they spin: yet I say unto you that even Solomon in all his glory was not arrayed like one of these." Wonderful indeed is such a sentence, from Him who created all things, and whose glory fills the Universe. Wonderful, to hear Him giving us His own estimate of the relative splendour of the richest adornment that man can devise, and the symmetry and colours of the wayside flower. And observe that this second argument, though in the main of the same kind as the former, yet differs somewhat from it in the manner of application. Then, it was, if God feeds the inferior and less worthy tribe of His creatures, shall He not much more feed you who are so far better than they? The difference, on which that argument rested, was one between the two classes brought into comparison: that which God so freely and constantly ministers to the less important class, we may safely assume He will as freely and constantly furnish to ourselves. But here, the difference on which the argument rests is of another kind. It is not between the two classes treated of, the flowers and ourselves,—but between the degrees of perfection attained in the result sought for. In the other case we had simply the fact of the feeding: here, we have the degree of adornment. God clothes the lilies as never man in his pomp, as never woman in her beauty, was yet bedecked. One of these wayside flowers, if we could see all the secrets and all the blendings of its colours, if we could penetrate all the laws which regulate the symmetry and elegance of its form, if we could appreciate all the care bestowed by the Creator on the delicacy and complexion of its texture, would put all human adornment to shame. If we try one of these with the power of the microscope,—the more we magnify it, the more glories of form and colour, the more intricate symmetries of texture, astonish the dazzled eye: subject to the same test the most delicately woven fabric of human skill, the most precise and uniform artificial application of colour, and as it expands before the scrutiny, it degenerates into a coarse and unseemly mass, daubed as if by an unskilful hand. He who has lavished all this exquisite skill on the rank growth of the field, which is flourishing to-day, and cut down and dried up and burnt to-morrow, shall He not much more clothe you, O ye of little faith? Will not He, in His good Providence, bring about for all of us who serve Him and seek to do His will, a sufficient and seemly supply of what is needful and what is becoming for the clothing of the body? We are to trust Him with the sustenance of our lives, we are to trust Him with sheltering and arraying us. We are better employed than that we ought to distract our thoughts day by day about these matters: we have no time to bestow on them as life's business: they must not eat out the spirit of a sound and earnest mind,—they must not unteach us self-denial, they must not be clamouring when we ought to be listening to the whisper of sympathy and God's spirit: they must not ever be rising as drifts of clouds troubling the clear morning of the Christian's day, and blotting the Sun of Righteousness by whose light he walks and works.

This it is, and no impossible, no exaggerated casting away of earthly cares, which the Lord requires of us. It is the knowing what we are, and who cares for us, and acting in that knowledge. It is told of the great Cæsar, that being at sea in a storm, and beholding the shipman unmanned with fear, he cried out, "Fear not: thou hast Cæsar on board." This was perhaps carrying greatness of soul even to infirmity: it might be presumption for a man to put that trust in his fortunes, and to have that confidence in his own work in the world: but it is no undue confidence in us, and it savours of no presumption, to say to our anxious souls, when they distract us with fear for this life's provision and welfare, "Fear not: thou carriest a precious spirit bound for the blessed country afar: the Father of spirits breathed it into thee, the Son of God bled for it, the Holy Ghost guideth and sanctifieth it: thou art freighted with covenant promises, and the fruits of a Christian life stored up against the final harvest: be not thou troubled with daily wants and anxieties: only keep thine hand on the helm, and thine eye on the compass; and let the wild waves rage as they will. Seek first the one great purpose for which thou art, and all things else shall be added unto thee."

ON LIGHT.

BY SIR JOHN F. W. HERSCHEL, BART.

PART I.

REFLEXION.—REFRACTION.—DISPERSION.—COLOUR.—ABSORPTION.

In a conversation held some years ago by the author of the following pages with his lamented friend, Dr. Hawtrey, Head-Master and late Provost of Eton College, on the subject of Etymology, I happened to remark that the syllable *Ur* or *Or* must have had some very remote origin, having found its way into many languages, conveying the sense of something absolute, solemn, definite, fundamental, or of unknown antiquity, as in the German words *Ur-alt* (primeval), *Ur-satz* (a fundamental proposition), *Ur-theil* (a solemn judgment)—in the Latin *Oriri* (to arise), *Origo* (the origin)—in the Greek Ὅρος (a boundary, a mountain, the extreme limit of our vision, whence our *horizon*), Ὁράω (to see), Ὀρθὸς (straight, just, right), Ὅρκος (an oath or solemn sanction), Ὧραι (the seasons, the great natural divisions of time), &c. "You are right," was his reply, "it is the oldest of all words;

the first word ever recorded to have been pronounced. It is the Hebrew for Light (אוֹר Aor)."

Assuredly there is something in the phenomena of Light, in its universality, in the high office it performs in creation, in the very hypotheses which have been advanced as to its nature, which powerfully suggests the idea of the *fundamental*, the *primeval*, the antecedent and superior in point of rank and conception to all other products or results of creative power in the physical world. "It is Light," as we took occasion to observe at the conclusion of a former article (not without reference to this very consideration) "and the free communication of it from the remotest regions of the universe, which alone can give, and does fully give us, the assurance of a uniform and all-pervading energy, a MECHANISM almost beyond conception complex, minute, and powerful, by which that influence, or rather that movement, is propagated. Our evidence of the existence of gravitation fails us beyond the region of the double stars, or leaves us at best only a presumption amounting to moral conviction in its favour. But the argument for a unity of design and action afforded by light stands unweakened by distance and is co-extensive with the universe itself."*

What we propose in the following pages is to place before our readers, in as simple language and form as the nature of the subject will admit, the grounds of this assertion. In some of its features it is too complex and abstruse to be thoroughly followed out by any one not familiar with some of the most intricate departments of mathematical science. In explaining such features (when unavoidable), without prejudice to the strictness of mathematical reasoning adducible and held to be conclusive and satisfactory by those who have mastered it, we must have recourse to analogies more or less close with processes we see going on in nature, and which, whether perfectly understood or not in their *modus operandi*, we, at all events, perceive to consist in a sequence of events, comprehensible in themselves and arising naturally and familiarly one out of another. There are many phenomena of polarized light which admit of being so, as it were, shadowed forth to the mind of a beginner as analogous to things familiar enough. In such cases, though the analogy may be imperfect, or even altogether incompetent to stand for an explanation, the phenomenon is sometimes so neatly conveyed to the intellect that by generalizing to the extreme all the terms used in describing the one, it is very conceivable that the cardinal feature of the other—that which dominates its whole explanation—*may* be included. Even if not so, the object is so far answered, that the student remains possessed of a mental picture which will not allow him to forget its prototype. And it is not a compendium of Optics, or an essay on Vision, or an account of telescopes, microscopes, or other optical instruments, that he has here to expect. Nothing of the kind could by possibility be comprised within such limits as a contributor to a work of this kind must necessarily observe. Suffice it to convey to his apprehension some idea of at least the general nature of the mechanism by which it seems now agreed, with hardly a dissentient voice, that the peculiar communication between distant objects which we call light is effected; and by which, or by *some* mechanism of a nature still more recondite, and at present perhaps beyond our conception of possibility, it must be so.

That we see, is proof of a communication of some sort between the eye and the thing seen. That we cannot see in the dark, is proof that such communication is not the mere act of the eye. And that one object is capable of impressing a photographic picture of itself on another, is proof that the eye, though essential to *seeing*, has nothing whatever to do with the process by which such communication is performed. And furthermore, the immense variety and extent of the chemical agencies of light as displayed in its action both on organic and on inorganic matter, revealed to us by the late discoveries in photography, assign to it a rank among natural agents of the highest and most universal character; and have even rendered it exceedingly probable, if they have not actually demonstrated, that vision itself is nothing but the mental perception of a chemical change wrought by its action on the material tissue of the retina of the eye.

At all events, it is not by any sympathy, or *absolute direct relation* between the eye and the object, that the latter is seen. The intermediate space, and indeed *all space*, is concerned in the process. An object is not seen unless it be in a certain state, which we call "luminous:" a state either natural to it, as in the flame of a candle or the sun, or induced by being placed in presence of another luminous object, as when a sheet of white paper is laid in the sun or before a candle. Nor is it then seen if a screen of metal or any of the class of substances called "opake" be interposed anywhere in the direct straight line of communication; while on the other hand, when so hidden from direct vision, it may be rendered visible "by reflection" from a polished surface held at a fitting angle, *anywhere out of that direct line*, provided only such surface be not similarly screened either from the object or from the eye. Thus we learn two things:—First, that the line of *uninterrupted* luminous communication is a *straight one;* and secondly, that any point whatever in a sphere of indefinite radius surrounding a luminous object (in other words, in infinite space) may become included in the line of indirect or deflected communication between any two places. *The agency*, whatever its nature, *is there and ready*, requiring only a fitting arrangement of material and tangible substances to make it available.

---

* "Celestial Measurings and Weighings." Good Words, for 1864, p. 500.

Light, though the cause of vision, is itself invisible. A sunbeam indeed is said to be seen when it traverses a dark room through a hole in the shutter—or when in a partially clouded sky luminous bands or rays are observed as if darted through openings in the clouds, diverging from the place (unseen) of the sun as the vanishing point of their parallel lines seen in perspective. But the *thing seen* in such cases is not *the light*, but the innumerable particles of floating dust or smoky vapour which catch and reflect a small portion of it, as when in a thick fog the bull's-eye of a lanthorn seems to throw out a broad diverging luminous cone, consisting in reality of the whole illuminated portion of the fog. The moon is seen in virtue of the sun's light thrown upon it. Where the moon *is not* we see nothing, though we are very sure that when in the course of its revolution it shall arrive in the place we are looking at, we shall see it, and that if our eyes could be transferred to the moon's place, wherever it may be in the firmament (if not eclipsed), we should *from it* see the sun. There then, at all times, *is* the light of the sun, but not *visible as a thing*. It exists as an agency. What is true of the sun is no doubt equally so of a star; so that when we look out on a dark night, though we are sure that all space is continually being crossed in every direction by the lines of its communication, *along all which it is active*, and in particular, that all the dark space immediately around us (outside of the earth's shadow) is, so to speak, flooded with the sun's light, we yet perceive only darkness except where our line of vision encounters a star.

What then *is* LIGHT? or, in other words, what is the nature of that communication by which not only information is conveyed to our intellectual and perceptive being, but chemical and various other changes are operated even on inorganic matter by processes originating as it would seem in sources situate in the most distant regions of space (for, be it observed, it has been clearly proved that the light of the stars does produce photographic effects powerful enough to imprint their images permanently on surfaces duly prepared to receive them). Is there any physical mode of conveyance by which, reasoning from what we see in cases which we are able to analyse, we can imagine either a material agent to be bodily transported, or a movement propagated, or an influence wafted, from place to place, so as to render a rational and consistent account of the phenomena of light, or so at least as, generalized, and (so to speak) sublimated in modes not inconsistent with the known properties of matter, to do so?

One feature is common to all ordinary physical modes of communication. The transmission from place to place, be it of what it may—of a letter by post, a gunshot, a sound, a wave, a tremor, or a shock even of an earthquake—*occupies time*. It *has a velocity*: sometimes a very great, but anyhow a measureable one. Is this the case with light? The answer, from all ordinary experience, would be in the negative. But this is only because the velocity in question is so great that the longest distances to which we can send a flash of light and receive it back again by reflection is traversed in an interval of time too short to be perceived *as* an interval, so that the reflection *appears* to be simultaneous with the direct flash. It is otherwise when we bring to bear on the question the ingenious combinations and delicate appliances of modern science. The telescope enables us to become eye-witnesses in the way of astronomical observation of events which take place at distances in space almost inconceivably greater than any we can measure here on earth; at *times* calculable beforehand. And in the way of experiment, the contrivances of clock-work enable us to register the subdivisions of what we call "an instant" into hundreds, nay, thousands, of equal and exactly measureable portions—applying, so to speak, a microscope to time, and estimating, by undeniable calculation, portions of it utterly eluding all our powers of perception. The question has been asked in both these modes, by astronomical observation and by direct physical experiment, and the answer, from each, has been affirmative; and from both agreeing, in a manner which may well be considered wonderful.

The planet Jupiter is attended by four satellites which revolve round it in orbits very nearly circular, and whose dimensions, forms, and situations with respect to that of the planet itself are now perfectly well known. The periodical times of their respective revolutions are also ascertained with extreme precision, and all the particulars of their motions have been investigated with extraordinary care and perseverance. The three interior of them are so near the planet and the planes of their orbits so little inclined to that in which it revolves round the sun, that they pass through its shadow, and therefore undergo eclipse, at every revolution. These eclipses have been assiduously observed ever since the discovery of the satellites, and their times of occurrence registered. As they afford a means of determining the longitudes of places, the *prediction* beforehand of the exact times of their occurrence becomes an object of great importance: and it is evident enough that, all the particulars of their motions being known (as well as of that of the planet itself, and therefore of the size and situation of its shadow), there would be no difficulty in making such prediction (starting from the time of some one observed eclipse of each as an epoch); *provided always* each eclipse were *seen at the identical moment when it actually happened.* Moreover, on that supposition, the times *recorded* of all the subsequent eclipses ought to agree with the times so *predicted.* This, however, proved not to be the case. The observed times were sometimes earlier, sometimes later than the predicted; not, however, capriciously, but according to a regular law of increase and decrease in the amount of discordance, the difference either way increasing to a maximum,

—then diminishing, vanishing, and passing over to a maximum the other way, and the total amount of fluctuation to and fro being about 16m 27s. Soon after this discrepancy between the predicted and observed times of eclipse was noticed, it was suggested that such a disagreement would necessarily arise if the transmission of light were not instantaneous. This suggestion was converted into a certainty by Roemer, a Danish astronomer, who ascertained that they always happened earlier than their calculated time when the earth in the course of its annual revolution approached nearest to Jupiter, and later when receding farthest: so that in effect the extreme difference of the errors or total extent of fluctuation—the 16m 27s in question—is no other than the time taken by light to travel over the diameter of the earth's orbit, that being the extreme difference of the distances of the two planets at different points of their respective revolutions. At present, in our almanacs a due allowance of time for the transmission of light at this rate, assuming a uniform velocity, is made in the calculation of these eclipses; and the discrepancy in question between the observed and predicted times has ceased to exist.

Taking the diameter of the earth's orbit, as concluded from the sun's observed parallax,* at 24,000 diameters of the earth itself, and the latter diameter at 7926½ miles,† this gives a velocity of 192,700 miles per second.

So vast a speed seemed at first incredible, to some indeed even more so than an instantaneous communication. The one *might* be conceived as the result of some sort of spiritual communication: the other seemed, in those days, to transcend all imaginable limits of mere physical agency. But it soon received a very unexpected confirmation from Dr. Bradley's discovery of the ABERRATION of light: to conceive which, let any one imagine a long tube held perpendicularly, at perfect rest, while a falling body (a drop, suppose of a shower of rain), descending also perpendicularly, should pass down its axis. If it entered at the centre of its upper orifice, it would issue at that of the lower; and, judging from this indication alone, and knowing the tube to be exactly vertical, a spectator would truly conclude from it that the descent of the drop was so also. Supposing him and the tube, however, to be carried along uniformly in any direction by a movement unperceived by himself, the hinder part of it would advance to meet the falling drop; which would, if the movement in advance were sufficiently rapid, cause it to strike against it; or if not, to emerge at the lower end so far behind the centre as that movement had carried the tube during the time of its passage from end to end. And this deviation would obviously bear the same proportion to the length of the tube that the velocity of the falling drop bore to that of the tube's advance. Judging, then, from this indication alone, if unaware of his own motion, he would conclude the fall of the drop to be inclined backward from the perpendicular by a certain angle—but if, suspecting it, he should reverse his movement, and travel with equal speed the contrary way, he would find an equal deviation in the contrary direction, and would thus arrive at the *certainty* that it was to the motion of himself and the tube, and not to any real obliquity in the fall of the drop, that this apparent deviation was owing. And by measuring its angular amount (which would be easy by the help of the marks left by two drops in the opposite circumstances on a screen at the lower end of the tube, and comparing it with the length of the latter), this angle, which might be called the *Aberration* (from perpendicularity) of the *apparent* line of fall, would inform him of the proportion his own velocity bore to that of the drop in its passage, and, the former being known, would enable him to estimate the latter.

All this is a paraphrase of the astronomical phenomenon in question. The rain-drop is the light; the tube, a telescope; the screen at its lower end, a micrometer; and the two opposite directions of the observer's motion, the two tangents at opposite sides of the earth's orbit at right angles to the situation of a star as viewed from either. And the angle in question is what astronomers call their "Constant of Aberration"—a very minute one indeed, but perfectly well measurable—amounting to about a third of a minute (20″·45), from which it results that the velocity of light is about ten thousand (more exactly 10,089) times that of the earth in its orbit, which we know to be very nearly 19 miles (18·923) per second, which gives 190,860 miles per second for the velocity of light.

Two different experimental processes for measuring this velocity have been devised and executed—the one by M. Fizeau, of the Parisian Academy of Sciences; the other by M. Léon Foucault, recently and most deservedly elected into the same illustrious body, the inventor of that elegant instrument, the Gyroscope. Both depend on the principle that the impression left on the eye by any luminous object persists for a sensible, though very minute, time (about the tenth of a second); so that an object presented to the sight by successive glimpses only, following each other more frequently than ten times in a second, is seen continuously. If only just so frequent, a fluttering is perceived; but this diminishes as the rapidity of presentation is increased: and when much more frequent, distinct and perfectly uninterrupted vision is produced. In M. Fizeau's experiment (which is the simplest in its conception and explanation), these glimpses are obtained by looking through an opening in a screen corresponding exactly in size and shape to one of the intervals between the teeth of a metallic wheel which is made to revolve before the opening, so that as the teeth pass in succession, they intercept the light so long as they cover it; but allow it to pass when, in place of a tooth, an interval is presented before the eye. Imagine such a wheel, screen, and opening, the wheel being at rest in the last-described situation; and through another such an opening in the same screen, corresponding exactly in size, shape, and situation to another of the intervals between the teeth, let a sunbeam be directed outwards, in a direction parallel to the axis of the wheel, by a highly-polished reflector, so as to strike upon another such reflector so placed, at some considerable *and measured* distance from the wheel, that the light shall be reflected back again by this second mirror. By slightly inclining and properly adjusting this it may be made to return, not to the orifice from which it issued, but to the other behind which the eye of the observer is placed. In this state of things, when all is at rest, he will see the reflected light; but if the wheel be turned slowly round, a tooth will come before the first reflector in place of an opening, and intercept the light—then another opening, another tooth, and so on, producing successive glimpses of light separated by dark intervals.

---

* See GOOD WORDS, for 1863, p. 275.

† This is the equatorial diameter. That stated in GOOD WORDS, for 1864, p. 493, is the polar.

If the motion of the wheel be gradually accelerated, so that more than ten teeth pass before the orifice in a second of time, these glimpses run together into continuous vision; and if considerably more numerous (suppose fifty or sixty per second), the light is perceived steadily as if the wheel were at perfect rest—only, however (if the intervals between the teeth be exactly equal to the breadths of the latter), of half the brilliancy, seeing that only half the quantity of light will have entered the eye in the same time. The motion of the wheel still continuing to be accelerated, however, when it has attained a certain very great rapidity the light is gradually perceived to grow feebler and at length altogether disappears. This happens when the velocity of rotation is such as to bring a tooth of the wheel precisely to cover the whole of the orifice in the screen into which the returning beam should be delivered at the very moment of its arrival, so closing it up altogether; that is to say, when the rotation is just so rapid as to carry each tooth over its own breadth during the time taken by the light to go and return. When this happens, suppose the *acceleration* of the wheel to cease, and its motion to be maintained uniform. Then by counting the turns made per minute by the driving-handle of the train of wheel-work, or otherwise registering its speed, and knowing (from the construction of the train) how many turns of the wheel correspond to one of the driver, as also how many teeth it carries, the exact duration of this interval, no matter how minute, can be exactly computed, so that the time and the space run over by the light in that time both become known.

If the rotation be now still further accelerated, the light begins to reappear, and gradually increases to its former brightness, in which state of things the obstructing *tooth* has been carried, in that same interval of time, quite clear of the opening, and the next *notch* brought exactly opposite to it. With yet increased speed, the light again vanishes, again reappears, and so on alternately, as the second, third, or fourth tooth or notch is successively brought before the opening; and on comparing the velocities of rotation corresponding, they are found to increase in arithmetical progression; which obviously ought to be the case. In M. Fizeau's experiments,* the distance between the reflector and the revolving wheel was about 8600 metres, thus giving for the whole distance travelled over by the light going and returning 17,200 metres, or about 10¾ miles; and for the time occupied in its journey, hardly more than the 18,000th part of a second. A velocity of 196,000 miles per second was assigned by him as their final result, exceeding by about one-sixtieth part that resulting from the astronomical observations.

The experiments of M. Foucault, however, leave no doubt that this last result is too great. In these experiments, instead of measuring these minute intervals of time by the rotation of a toothed wheel, a revolving reflector was employed in pursuance of an idea suggested by Mr. Wheatstone, and applied by him to measure the velocity of electricity. Without figures, and without much more verbal detail than would be compatible with our limits, it would be impossible to give a clear conception of the conduct of this delicate and refined experiment. Suffice it to state, as its ultimate result, a velocity of 185,172 miles per second.† As there are other and independent reasons for believing that the sun's distance has been over-rated by about one-thirtieth in our estimate of 12,000 diameters of the earth, and that, in consequence, the velocity of light deduced from the phenomenon of aberration ought to be diminished in the same proportion, (which would reduce it to 186,300 miles per second,) we are authorized to conclude that in estimating this velocity at 186,000 miles we are within a thousand miles of the truth.

The form of experiment proposed and executed by M. Foucault has this great advantage over the other,—that it can be carried out within much smaller limits of distance. A few yards of travel suffices for the determination of this enormous speed. And this makes it possible to compare the velocity of light in its passage through air and water, and other transparent liquids—*with this remarkable result, that the rate is found to be slower in the denser medium*; a result of the utmost importance, as we shall presently see, as a *crucial fact* in deciding between the claims of the two great rival theories of light to be received as valid.

---

* The actual details of this experiment, as executed by M. Fizeau, were somewhat more complicated. Telescopes were used, &c. For clearness of explanation, we have reduced the whole process to its simplest form of expression.

† 298 millions of metres. See *Comptes Rendus de l'Institut*, Sept. 22, 1860.

Before we can give any intelligible account of these theories, however, it is necessary to enter a little more particularly into the modes by which a *ray* of light may be deflected from its rectilinear *path*, and the laws of such deflection. By this expression we understand nothing more than that the *line of communication* between the illuminating and illuminated object is, in some way or other, *rendered circuitous.* It is so natural to speak of light as *a thing*, and of its line of communication as the *path* along which that thing, be it what it may, *travels*, that we are apt to forget that (except on one hypothesis as to its nature, viz., that it is, actually, a *material substance, bodily transported from place to place*) this form of expression is purely metaphorical, and that by *a ray* nothing more is meant than the mathematical line, be it straight or bent, between two *points*, standing to each other in the relations of illuminat*ing* and illuminat*ed*, along which the communication is kept up—the test being, that an opake body being placed anywhere in that line, the illumination ceases. Such a circuitous line of communication may be established, independent of and in addition to the direct rectilinear one, by placing anywhere in space any material object whatever, provided there be no opake body interposed between it and either of the two points; and this in two different modes. In the one the whole path of the ray, both before and after its deflection, is *outside* of the deflecting body. In this case the light is said to be "*reflected*:" if at a smooth and polished surface, *regularly*, if at a rough one, irregularly; in which case the light is said to be "*scattered.*" In the other mode the path of the ray, subsequent to the point where it first encounters the deflecting body, is wholly or partly *within* it, and the light is said to be "refracted," or "transmitted."

The first law observed in every case, whether of direct or circuitous illumination, is gathered from ordinary and universal experience. The illuminating and illuminated points are mutually interchangeable. By whatever path, however circuitous, light is conveyed from A to B, by the same it can be conveyed from B to A. This condition alone suffices to determine the path, and to fix the situation of the point at which its flexure takes place *by reflexion*, when the light is "incident" on any polished surface, whether plane or curved. That point (P) must be so situated *on the surface*, that the two lines joining it and the illuminating and illuminated points (A, B) shall there make equal angles with the surface, the three points (A,B,P) all lying in one plane with a perpendicular to the surface. For, 1st, except the *angles* were equal, the two directions (PB, PA) would not be *similarly* related to the surface at the point of incidence; so that in reversing the path of the ray, the physical condition which determined the obliquity of the incident ray to the surface in proceeding from A to B, to be greater or less than that of the reflected, would have to be reversed in the passage of light from B to A. And similarly, if the reflected ray lay in a plane to the right or left of that in which the perpendicular and the incident one were contained, the physical condition which determined it to deviate to the one side or to the other of that plane, would in like manner have to be reversed on interchanging the illuminating and illuminated points. On neither supposition could the same *intrinsic* law of communication carry the ray from A through P, to B, and from B, through P, to A. This, then, is the law of regular reflexion, commonly expressed by saying that *the angle of incidence is equal to that of reflexion and lies in the same plane with it.*

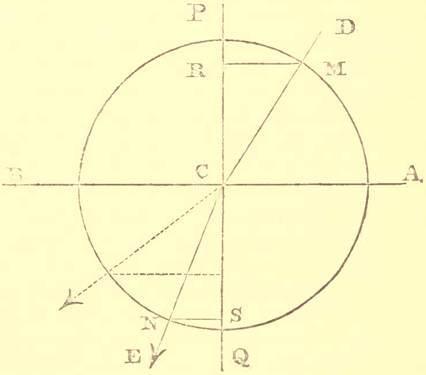
If the reflecting surface be a plane, there will be only one point in it which fulfils these conditions. Thus a perfectly polished flat surface of silver, free from scratches, or that of still water, sends no light to the eye from a candle, and is in fact invisible, except at this one point so determined whence the light is reflected to the eye, and in the direction of which from the eye the reflected candle is seen. With curved surfaces, as well as with those we designate as "rough" or "unpolished," the case is different. In all surfaces of this last-mentioned description the microscope reveals to us such irregularities, such innumerable and abruptly broken facets, protuberances and hollows, as to satisfy us that in every, the most minute, visible portion of such a surface, places must occur in which the condition of equal inclination of the two lines in question to the actual surface, *as it exists in those places*, is satisfied—so that a ray there reflected may reach an eye however situated. By such rays, and by others which have entered into the substance of the object and been there internally reflected or otherwise bent, in a manner presently to be explained, all surfaces not self-luminous become *visible* as *objects*, being seen by rays "scattered" from them in every possible direction.

It is to this power of "scattering" the incident light in all directions, then, that surfaces owe their visibility, and that by its aid we are enabled to trace the course of a ray of light itself *as if* it were a visible thing. Thus a sunbeam passing through a small hole and received on smoke is *seen*, and on a white screen moved rapidly to and fro behind it, appears as a straight luminous line or beam, by the momentary persistence of the sensation caused in the eye at every successive point of its motion; and so, after reflexion or refraction, may its subsequent course be rendered matter of ocular inspection. A pleasing and elegant experiment is to hold a common reading-glass (or even a spectacle-glass) in the sun, and to move rapidly to and fro behind it a white paper, when the course of the refracted light, *converging* from all parts of the glass to the "focus," will be seen in the air as a solid luminous cone, having the glass for its base and the focus for its apex.

The reflexion of light, whether "regular" or "scattered," is, except under very peculiar circumstances to be presently noticed, only partial; so that the reflected image of an object is seen fainter and less luminous than the object itself directly viewed. This is perceptible in an ordinary looking-glass; yet more so when the reflecting surface is still water, or unsilvered glass. The *most reflective* substances are the white metals—such as silver, speculum-metal, steel, or quicksilver: transparent or semi-transparent bodies being much inferior in respect of this quality. If the substance on which the light falls be of the kind called opake, the reflected is the only portion which can be rendered sensible to sight or otherwise traced. But if transparent, a very remarkable phenomenon occurs. The incident ray is, as it were, split or subdivided at the point where it meets the surface of the body, one portion pursuing its subsequent course outside of it, as a reflected ray, in the manner above described; the other within it, undergoing what is called "*refraction*," being bent aside from its former direction at its point of entry, after which it pursues a straight course within the substance or "medium."

If the "refracting medium" be a liquid, a glass, a jelly, or any substance in which no indications of inequality of internal texture can be discovered—no signs of lamination or "grain" shown by a greater tendency to split or "cleave" in one direction more than another, this intromitted portion is *single*. The whole of the refracted light pursues its course from the point of its entry as one ray. The same is also the case when the refracting medium belongs to the class of bodies called "crystallized," or which present a definite "cleavage;" provided the "primitive form" of their crystals be either a cube, a regular octohedron, or a rhomboidal dodecahedron, such as rock-salt, alum, or garnet. In all other transparent crystals the intromitted portion of the light divides itself from the moment of its entry into two distinct rays, pursuing different courses, and presenting the phenomenon known under the name of "double refraction," such substances being called "doubly-refractive media," of which the substance called Iceland Spar, or crystallized carbonate of lime, offers a beautiful example. And here we may pause for a moment to observe that at this point we already find ourselves introduced to an assemblage of relations between light and material objects, which divide the whole universe of such objects, infinite as they are in variety, into *classes*, characterized by their habitudes with respect to light in its reflection from and passage through them. The importance of this remark will grow upon us as we advance further into the subject, and come to perceive that the classification of bodies according to their "optical properties" stands in direct connection with their most intimate peculiarities of mechanical structure and chemical constitution; and brings us, so to speak, into contact with all those more recondite properties and reactions of the ultimate particles of bodies which constitute the domain of molecular physics.

Confining ourselves now to the case where the refraction is single, the rule which determines the course of the refracted ray is as follows. Suppose at the "point of incidence" (*i.e.*, where the ray first enters the medium) a line be drawn perpendicular to the surface. Then, first, the refracted ray will lie in the same plane which contains both the incident ray and this perpendicular; and, secondly, the ray will be so bent at that point that the exterior and interior portions shall make with the perpendicular, not equal angles as would be the case were there no flexure, but angles so related that their *sines* (not the angles) shall bear to each other a certain invariable proportion, whatever be the angles themselves, or whatever be the obliquity of the incident ray to the surface. As it is quite essential to the understanding of what follows that this, "the law of ordinary refraction," should be clearly apprehended, we will illustrate it by a figure. Let A C B be a section of the surface by the plane in which the ray D C, incident at C, and P C Q the line perpendicular to the surface at C, both lie, and C E the refracted ray. Taking C for a centre, with any radius, C M, describe a circle cutting the incident and refracted rays in M and N, from which points draw M R, N S perpendicular to P C Q. Then will these two lines be to each other, in one and the same invariable proportion, whatever be the inclination of the original ray D C to the surface, or to the perpendicular C P. This latter inclination is what is understood by the "*angle of incidence*," and the corresponding inclination (to the perpendicular Q C P) of the refracted ray, by "*the angle of refraction*."



(*To be continued.*)

OUR INDIAN HEROES.

By JOHN WILLIAM KAYE.

IV.—THE REV. HENRY MARTYN.

On the seventh day of February, in the year 1811, in one of the monasteries of Goa, the capital of Portuguese India, a slight, thin-faced man, about thirty years of age, with a hectic flush on his cheek, stood before the tomb of Francis Xavier. Not that the great apostle of the Jesuites had died there, for he had endured his last earthly pangs far away on the Island of Sancian, at the mouth of the Canton river; but that an admiring people had raised there a monument to his memory, richly ornamented, and surrounded with pictures and bronzes the produce of Italian art. The visitor, who stood at that shrine, and listened to the words of the friar who acted as its custodian, was a priest of the English Church, then on his way from Calcutta to Bombay. An enthusiast himself, he could not think without emotion of the grand enthusiasm of the Christian knight who, more than two centuries and a half before, had left the world behind him and abandoned all things for the love of God. With all the outward grandeur of the Romish Church before him, still, rejoicing in his purer faith, he thought humbly and reproachfully of the little that he had done, measured against the great deeds of that Romish giant. And yet was Henry Martyn, for all his feebleness of frame, cast in the same heroic mould as Francis Xavier.

It is altogether a trite remark, that the world has seen many heroes who have never girded on a sword or listened to the roar of the battle. A truth so accepted needs no demonstrations. Little need is there to show how the courage, the devotion, the self-sacrifice, the grand sense of duty which make the heroic character, are found beneath the coif of the Priest as beneath the helm of the Warrior. It is given to some to do; to others only to bear: to some, to strike for the right; to others, to witness to the truth. "Never," it has been said, "did the polytheism of ancient or of modern Rome assign a seat among the demigods to a hero of nobler mould or of more exalted magnanimity than Francis Xavier." And again the same writer: "Amidst all the discords which agitate the Church of England, her sons are unanimous in extolling the name of Henry Martyn. And with reason; for it is, in fact, the one heroic name which adorns her annals, from the days of Elizabeth to our own."* Fitly, then, in itself, is this "one heroic name" in the annals of the Anglican Church placed at the head of this chapter, and more fitly than any other, because it helps at this early stage to illustrate the many-sidedness of the English heroism which has flowered beneath the Indian sun.

Henry Martyn came of an humble stock. In that rich ore country about Truro and Redruth, his father once toiled as a simple miner; but raising himself above the level, by his industry and intelligence, he obtained a seat in a merchant's office, and, appreciating at its true worth the value of that which had done so much for him, he determined to give to his children in early youth that which he had acquired so painfully in adult life; and, by good thrift, provided the means of bestowing upon them the blessings of a good education. But it pleased God, who gave him many children, that there should not be many spared for whom to make this provision. There was a constitutional weakness in the family, and Death laid its hands upon the childhood of the brothers and sisters of Henry Martyn, so that four only of the flock ever lived to see man's estate. And Henry himself was but a weakly, delicate nursling, whose little life needed much care to save it from flickering out in the morning of its existence. But he struggled through infancy and childhood, and went to the Truro Grammar School; and for nine years, under the tutorial care of Dr. Cardew, he gathered up the by no means contemptible stock of learning which was accessible to the students in that provincial institution.

The school-days of Henry Martyn were not happy. He was not, indeed, born for happiness. He lacked the puerile robustness and the effervescent animal spirits which make the season of school-life a season of carelessness and joy. There is more or less of tyranny in every school; and Henry Martyn, being of feeble frame and of somewhat petulant temper, was bullied by his stronger schoolfellows. It would have fared still worse with him, but for the generous protection of one of the bigger boys, who helped him with his lessons, and fought his battles for him, and often rescued him from the grasp of his juvenile oppressors.

It is recorded that he was docile and quick to learn; but he acquired no very remarkable scholastic reputation. His father, however—a shrewd and discerning man—had always great hopes of him. It was the cherished wish of the elder Martyn's heart that his son should have a college education. So, in the autumn of 1795, when scarcely fifteen years old, he sent Henry to Oxford to try for a Corpus scholarship. Bearing a single letter of introduction to one of the tutors of the University, he set out alone on what was then a long and wearisome and, for one of his weakness and susceptibility, a somewhat formidable journey. But there was in young Henry Martyn even then a remarkable sense of self-reliance—a remarkable power of self-support. In his quiet undemonstrative way, he had an immense capacity for going through with anything that he undertook. Thus thrown upon his own resources whilst yet a boy, he acquired confidence in his own strength. Obtaining a set of rooms in Exeter College, without entering as an undergraduate, he prepared himself for the competition; but although he passed an excellent examination, and was much commended, he did not obtain the scholarship. So he went back to Truro, carrying with him his first great disappointment.

---

* Sir James Stephen.

But how many of us in after life have the privilege of feeling that, by God's good Providence, our first great disappointment has been our first great blessing. Thankfully did Henry Martyn acknowledge this from the very depths of his heart. "Had I remained (at Oxford)," he wrote, "and become a member of the University at that time, as I should have done in case of success, the profligate acquaintances I had there would have introduced me to scenes of debauchery in which I must in all probability, from my extreme youth, have sunk for ever." But even if he had not sunk into this deep mire, he would never have formed those associations which made him what he was: he would never, as far as we can in our weakness discern the ways of God to man, have been an apostle and a hero.

Cambridge made him what he was. After another year or two at the Truro Grammar School, Henry Martyn entered at St. John's College, and took up his residence there in October, 1797. He went to this sister university with a considerably larger store of classical learning than he had carried with him to Oxford; but with small knowledge of mathematics. He had never much addicted himself to the exact sciences; and even after this Cambridge career had been marked out for him, he spent, according to his own account, more time in shooting birds and reading amusing books than in studying algebra and geometry. It is worthy of notice, for the very grotesqueness of the contrast it suggests, that the book which young Henry Martyn on the threshold of his university life studied most intently, was "Lord Chesterfield's Letters to his Son."

The commencement of his Cambridge career was not promising. What conceivable hope is there of an undergraduate who gets up his mathematics by endeavouring to commit the problems of Euclid to memory? But such was Henry Martyn's commencement. How at last the power of demonstration entered into his mind, and took such fast hold of it, that he whose notion of the exact sciences was of something to be learnt by rote, at last eventuated as Senior Wrangler of his year, is a chapter of the secret history of the human understanding that will never be revealed to man. All that we know distinctly about it is, that this young Cornish undergraduate took to the study of Newton's "Principia," liking it much better than the study of the Bible; and that in time he came to take delight in what had before been utterly distasteful to him. Then it dawned upon him that he might take honours; and to that end he began to study with all his might.

It was a happy circumstance, and one not to be omitted from the scantiest record of Henry Martyn's life, that at Cambridge he renewed his acquaintance with his old champion of the Truro Grammar School. The big boy who had fought his battles for him was now a steady young man, with plenty of good advice for his little friend, and what was better, a good example. He kept Martyn out of the way of wickedness, and told him that he ought to read hard, "not for the praise of men, but for the glory of God." "This seemed strange," wrote Martyn, some time afterwards, "but reasonable. I resolved, therefore, to maintain this opinion thenceforth; but never designed, that I remember, that it should affect my conduct." But such is the inscrutable perverseness of memoir-writers, that the identity of this excellent friend, who did so much to save Martyn's life at school, and to save his soul at college, is shrouded from the world in the obscurity of the letter K.

Of the undergraduate life of Henry Martyn not much has been recorded or can now be ascertained. One noticeable incident, however, did occur, which wellnigh brought his academical career to a disastrous close. He was constitutionally petulant and irritable; and was sometimes wrought even by little things into such a state of excitement as to be scarcely master of himself. One day, from some cause or other not chronicled, the vehemence of his anger rose to such a height, that he flung a knife with all his force at a friend who had said or done something to cross him. In the blindness of his fury he missed his mark, and the knife entered the opposite wall, where it remained trembling with the violence of the concussion. The friend who so narrowly escaped, was Mr. Cotterill, afterwards minister of St. Paul's, Sheffield.

In this painfully excitable state, it does not seem that even the repose of the vacation, the solace of home, and the kindness of his family, did anything to soothe his troubled spirit. During the long vacation of 1799, according to his own statement, his temper was more unbearable than ever. "The consummate selfishness and exquisite irritability of my mind," he wrote at a later period, "were displayed in rage, malice, and envy; in pride and vainglory, and contempt of all; in the harshest language to my sisters, and even to my father, if he happened to differ from my wish and will. O, what an example of patience and mildness was he!" One of his sisters, too, was a young woman of signal piety; but her admonitions were lost upon him. "The sound of the Gospel, conveyed in the admonition of a sister," was, he said, "grating to his ears." He promised her, however, that he would read the Bible; but when he returned to college, "Newton engaged all his thoughts."

And, academically, he worked to good purpose. At the Christmas examination of 1799, he was first of his year. The news delighted his father; but it was the last earthly solace that he was ever to derive from that source. The new year had scarcely dawned when the good old man was stricken down and laid in his grave. The blow fell heavily on his son—more heavily for the thought that he had sometimes failed in filial duty and respect. The terrible sense of the irremediable sorely troubled him; and in his trouble he sought a present help which Newton could not extend to his pupil—the one mighty hand and stretched-out arm which alone could lift him out of the deep waters in which he was struggling. "As at this time," he recorded at a later period, "I had no taste for my usual studies, I took up my Bible, thinking that the consideration of religion was rather suitable to this solemn time." To this he was exhorted by the good humane friend who had protected him in the Truro Grammar School and guarded the first footsteps of his University career. So the beginning was made—a faltering, stumbling start in the dark—for he did not take up the Scriptures without some distaste, and he "began with the Acts, as being the most amusing." Little by little the light of truth streamed into the obscure tenement of his soul, until he stood in the full broad sunshine of a saving knowledge of the great scheme of redemption. At first he seems to have been disposed to rejoice in the exceeding goodness of God in sending Christ into the world; but this time of rejoicing soon passed away. There came upon him an overwhelming sense of his own unworthiness; and it may be doubted whether from that time he ever had a day of perfect happiness and peace. His good old friend, who rejoiced as a Christian in the exceeding goodness of God, and delighted to see others happy, endeavoured to persuade him that his despondency was not right. It would seem also that his sister did the same. But Henry Martyn was determined not only to enter in at the strait gate, but never to emerge into the broad outer-courts of cheerfulness, and serenity, and fear-expelling love.

Whilst this great change was taking place in his heart, his brain was actively employed mastering the exact sciences, the study of which had now become an engrossing pursuit. It appeared to be peculiarly his lot to illustrate by his own personal experiences, the extraordinary changes and transitions to which by God's providence the human mind, both in its moral and intellectual aspects, may be subjected. That he who had begun the study of God's word by selecting for perusal the most amusing chapters of the Bible, should in so short a time have developed into a ripe Christian, with convictions deeply rooted in the true faith, is not more strange than that one who, under a mortifying sense of his incapacity to understand them, had committed the problems of Euclid to memory, should, at his final examination, have been declared the first mathematician of his year. But so it was. The great annual contest over, Henry Martyn found himself Senior Wrangler. He had gained the highest object of academical ambition. But it afforded him little gratification. It enhanced the bitterness of the regret with which he dwelt upon the great loss that he had sustained; and it made him more than ever suspicious of himself—fearful of stumbling into the pitfalls of human pride. "I obtained my highest wishes," he said, "but was surprised to find that I had grasped a shadow."

It was in the summer of this year, 1801, that Henry Martyn, having returned to Cambridge during the vacation, made the acquaintance, and soon gained the true heart's-friendship, of one who was ordained to exercise a remarkable influence over all the future current of his life. Among the fellows of King's College, was one whose inestimable privilege it was, during a long course of years, not only to set his mark upon the religious mind of the University, but to make his presence felt in the remotest regions of the earth. The warmth and earnestness of Mr. Simeon's preaching had made a great impression on Henry Martyn's mind; and when the time came, he rejoiced with an exceeding great joy to be admitted to his College Rooms, and there to enjoy the unspeakable benefits of his conversation and advice.

Then there grew up between them a warmth of affection never chilled to the last day of their lives. Mr. Simeon delighted in the "wonderful genius" of his young friend, and took the tenderest interest in the growth of his religious convictions. To what grand ministerial purposes might not his fine mind and the earnestness of his nature be turned under good guidance! Henry Martyn had determined to devote himself to the ministry, and Mr. Simeon was eager to have him as a fellow-labourer with him in his own church. Diligently, conscientiously, with a high sense of the responsibility of the holy office, and a profound conviction of his own unworthiness, he prepared himself throughout the year 1802 and the early part of 1803 for holy orders. At this time Martyn was a fellow of St. John's; and he took pupils; but the employment did not much please him, and it may be doubted whether, notwithstanding his eminent abilities, he was well qualified for the work of tuition. What his state of mind was at this time, may be gathered from his letters and journals which have been given to the world:—"Feb. 2, 1803.—In a poor and lukewarm state this morning. Resolved to send away two of my pupils, as I found so much of my time taken up by them of late, instead of being devoted to reading the Scriptures." "Feb. 4.—But talk upon what I will, or with whom I will, conversation leaves me ruffled and discomposed. From what does this arise? From a want of the sense of God's presence, when I am with others." A few days later he records that he is, "through mere habit, disposed to a cynic flippancy. Not quite pleased with the respect and attention shown me by my friends." Then, some ten days afterwards, he says: "Found myself sarcastic—though without any particular sensation of pride and bitterness in my heart;" and a little later: "Much harassed with evil tempers, levity and distraction of mind." Throughout the greater part of March he was "in general dejected." On the 22nd of April, he records: "Was ashamed to confess to —— that I was to be Mr. Simeon's curate—a despicable fear of man, from which I vainly thought myself free;" and again, on the 9th of May: "On Saturday, felt great fear of man, and yet was determined to let slip no proper occasion of speaking out." Then he sets down that he was "Quite fatigued with being so long with ——." A friend wisely suggested that this might arise rather from feelings than from principle; on which Martyn remarks, "and this witness is true, for though I could perceive them to be in the gall of bitterness, I felt little of pity." In July and September there are these entries: "Felt the passion of envy rankle in my bosom on a certain occasion." Sept. 22.—"Two men from Clare Hall breakfasted with me. A fear of man, which prevented me from saying grace before breakfast, brought me into inexpressible confusion of conscience. Recovered a little by saying it after." "In a gloomy temper, from being vainly concerned about the appearance of my body." "Hezekiah's sin was vanity. How many times have I fallen into this sin!"

It may be gathered from these passages, which might be multiplied tenfold, that at that time Henry Martyn was in no sense in a happy state of mind. Irritable, vain, censorious, exacting, intolerant, aggressive, he was so eager to do his duty to God, that he often forgot his duty to his neighbour. If he is to be fairly judged by his journals, he was much wanting in human love—in charity, in kindness, and in courtesy. But it must not be forgotten that Henry Martyn at no time possessed the *mens sana in corpore sano*. Much that appears to be unlovely in his character must be attributed to constitutional infirmity. It was this that jaundiced all the aspects of human life, and at one time stirred up within him such ungovernable fits of passion. But it was his glory to wrestle manfully against these infirmities. The picture of the conflict is before the world—and what a strange picture it is! I do not know another instance of a man at once so self-asserting and so self-denying. There was a sort of sacrificial egotism in his nature, which had more of the sublime than the beautiful about it. He was continually watching himself, as though he were eager to catch himself tripping; he was continually in an attitude of offence against himself even more than against others. Within were conflicts: without were strifes. He trode down with a remorseless heel all the flowers of this world, lest by cherishing them he should unfit himself for the world to come. The reader of his journals, believing that they fairly represent all the varying moods of his mind, may lament that the sunshine so seldom entered that godly shrine. He desired, above all things, to be of the number of the elect. Yet he did not take to his heart those "Good Words":—"Put on therefore, as the elect of God, holy and beloved, bowels of mercies, kindness, humbleness of mind, meekness, long-suffering; forbearing one another, and forgiving one another, if any man have a quarrel against any: even as Christ forgave you, so also do ye. And above all these things put on Charity, which is the bond of perfectness. And let the peace of God rule in your hearts, to the which also ye are called in one body; and be ye thankful."

On the 23rd of October, 1803, Henry Martyn was ordained a deacon of the Church of England. It had been arranged that he should assist Mr. Simeon in the duties both of the church of the Holy Trinity and in the neighbouring parish of Lolworth; and he entered upon these duties with a solemn sense of the responsibilities he had undertaken, and a stedfast determination to do his work in the true spirit of the Apostles, without a fear of the reproach or the ridicule of man. We must go back half-a-century or more in imagination to appreciate the force of these last words. At the present time they have little special significance. But in 1803, the University was but just beginning to tolerate the evangelical earnestness of Mr. Simeon. Only a few years before he had been hooted and howled down, and his ministrations had been interrupted by outrages of the most violent and indecent character. It demanded some courage in a young man to stand forth as Mr. Simeon's associate; and Martyn at one time had been assailed by doubts and anxieties very distressing to his carnal nature. But he fought them down manfully, and he soon began to take a lively pleasure in his ministerial work. He had not, however, devoted himself long to the parochial duties of the ministry, when thoughts of a far different career began to take shape in his mind. He had some time before dimly discerned in the distance a hand beckoning to him to enter upon the glorious fields of missionary adventure. The perusal of the "Life of David Brainerd" had excited within him a desire to go forth and do likewise. This desire was subsequently strengthened by a sermon, in which Mr. Simeon had earnestly discoursed upon the immensity of good that might be done by a single labourer in the vineyard—the illustration being derived from the career which the Baptist apostle, Dr. Carey, had commenced in Bengal. This story fired the enthusiasm of Henry Martyn. Ever intent upon the thought of some heroic abnegation of self, he sprang up open-armed to embrace this grand idea of a missionary sacrifice. But at this time a misfortune befell him which caused him to consider whether it were not his duty to repress these inclinations and to remain in England. The little property amassed by the industry and intelligence of his father was lost to his family, and his sisters therefore became dependent on his exertions. To become a missionary was to become a pauper, and to lose the means of assisting others. So Henry Martyn began to think that it might not be his duty to go forth to preach the Gospel to the heathen.

But from these doubts and anxieties there came deliverance from an unexpected quarter. Among the many good men with whom Mr. Simeon was in affectionate correspondence were William Wilberforce and Charles Grant. Both were members of the House of Commons; and the latter was a member also of the Court of Directors of the East India Company. They were men of influence—but of influence derived only in part from their position; for they were men, also, of large intelligence, unwearying industry, and of an earnest, many-sided humanity that never rested for a moment. There could be no pleasanter history to write than that which should describe all the great schemes by which they sought to benefit the human race, and for the promotion of which, with Messrs. Babington, Stephen, Henry Thornton, and sometimes Lord Teignmouth and Mr. Venn, they held a little parliament of their own, always carrying out its enactments with remarkable promptitude and vigour. To emancipate the enslaved of every kind and degree, whether from the material shackles of the slave-dealer or from the bondage of ignorance and superstition, was the main object of their endeavours. In the conversion of the natives of India to Christianity, Mr. Grant, from the nature of his own personal experiences and associations, had an especial interest. Those were times when there were great impediments in the way of direct missionary action in the Company's territories in India; but the Company required chaplains to minister to their servants; and it was thought that if the English clergymen, who were sent out from time to time in this capacity, were wisely chosen, much good directly and indirectly might be done by them for the promotion of Christ's kingdom upon earth. Upon this subject, Mr. Simeon and Mr. Grant were continually in correspondence; for whilst the latter had the power of providing chaplaincies, the former had the means of supplying from among the more promising young men of the University the right persons to fill them. And among these young men who so fit as Henry Martyn? It was soon settled, therefore, that the first Indian chaplaincy at the disposal of Mr. Grant should be bestowed upon Mr. Simeon's curate. So Henry Martyn went up to town; visited Charles Grant at the India House; was invited to dine with his benefactor at Clapham; and introduced to Mr. Wilberforce. They saw at once that the true spirit of the Apostle was animating the delicate frame of the young minister, and they had great hope of the good to be done by his ministrations.

But the arrangements for his departure were not completed before the summer of 1805. It was necessary that he should be ordained priest; and he could not be ordained until he had completed his twenty-fourth year. Moreover, there was some little uncertainty with respect to the actual issue of the chaplaincy. But, this being removed, Henry Martyn went up to London, and in the chapel of St. James's was admitted a Presbyter of the English Church. He then returned to Cambridge, bade farewell to his congregations, and afterwards took up his abode in London to mature his preparations and to await the sailing of the fleet.

In London he made the acquaintance of those eminent Christians, Mr. Cecil and Mr. Newton, and he had sometimes the privilege of occupying the pulpit of the former in the well-known chapel in John Street, Bedford Row, the ministry of which at a later period was so long held by Mr. Baptist Noel. During this residence in the metropolis, the emotional parts of his nature appear to have been in a state of continual activity. He was one day elevated, another depressed. Any trifling circumstance caused him to burst into sudden tears. He was moved by a divine compassion for the souls of men, to go forth to preach the Gospel in a heathen land; but there was something ever tugging at his heart-strings, and imploring him to remain at home. "Shed tears to-night," he wrote in his journal, "at the thought of my departure. I thought of the roaring seas which would soon be rolling between me and all that is dear to me on earth."

Three weeks after this he started for Portsmouth, there to join the vessel, "The Union," which was to convey him to his new field of labour. It was a two days' journey for him; and it is recorded that at the inn at which he spent the intermediate night, he had a fit of convulsions which greatly alarmed the friends who accompanied him. He continued his journey in a very depressed state, from which he was somewhat roused by finding at Portsmouth Mr. Simeon and other friends, who had come to bid him farewell.* On the 17th, the fleet sailed from Portsmouth—"Though it was what I had actually been looking forward to so long," wrote Henry Martyn to Mr. Simeon, "yet the consideration of being parted for ever from my friends almost overcame me, my feelings were those of a man who should be suddenly told that every friend he had in the world was dead. It was only by prayers for them that I could be comforted; and this was indeed a refreshment to my soul, because by meeting them at the Throne of Grace, I seemed to be again in their society."

It happened that the fleet anchored off Falmouth. The "singularity of the providence of God" thus "led him once more into the bosom of his friends." He thought he had seen the last of all whom he most loved; but now an unforeseen circumstance enabled him again to renew his intercourse with one whom he loved most of all. In the neighbourhood of St. Michael's Mount dwelt a family named Grenfell. To Lydia Grenfell, a daughter of the house, Henry Martyn had given the fondest affections of his heart. The temptation thus presented to him was not to be resisted. So he landed at Falmouth, made his way to Marazion, and passed some days of mingled pleasure and pain in the dear companionship of his beloved. His suit does not seem to have prospered. She had a lingering affection for another man, who appears to have deserted her; and the result of her last meeting with Henry Martyn was that they parted without a betrothal.

---

* Mr. Sargent—his biographer—was one of the party assembled at Portsmouth. He has given an interesting account of the parting.

Off the Irish coast, he wrote to Mr. Grant, saying, "I cannot leave Europe without assuring you that I bid adieu to it with cheerfulness and joy. The prevalence of bile in my constitution, which I feel particularly oppressive in this month, is the only thing that damps my expectations. According to some persons in the ship, the climate in the course of a few years will render me incapable of active exertion. My anxiety does not arise from the fear of an early grave, for many good ends might be answered by such an event, but from a dread lest my present excessive languor should become listlessness and indolence in India. With the apprehension of these things in my mind, I would humbly and earnestly request your prayers for me, and beg that you would occasionally send me such plain admonitions on the subject, that I may be in no danger of being deceived by the bad example of others, or the fancied debility of my own frame. My situation on board is as agreeable as it can be in a ship. I see little reason to prefer my college room to my cabin, except that the former stands still. My sickness, however, has upon the whole been of service to me. . . . The whole fleet is now under weigh. I therefore bid you adieu. May God bless you, my dear sir, and all your family. This is the sincere wish and earnest prayer of one who honours and loves you in the Lord."

The voyage to India tried the courage of Henry Martyn. He was on board a troop-ship; and the troop-ship was what troop-ships commonly were sixty years ago. To preach Christ Crucified to such a congregation was to bring down much hatred and contempt upon himself—to endure hardness of every kind. He found it up-hill work; but he toiled upwards manfully; never turning or looking back. There could scarcely have been a better apprenticeship to the business of that most unpopular evangelical ministry to which he was speeding across the ocean.

In the middle of March, 1806, Henry Martyn arrived at Calcutta. Lord Wellesley had left India; Lord Cornwallis was expected; and Sir George Barlow, a Company's civilian of high character, was invested with the powers of the Governor-General. The mutations of the temporal government were not a matter of much concern to Mr. Martyn, any further than that one ruler might be better disposed than another to give a permissive sanction to missionary efforts, and to afford an example in his own person of piety and godly living and respect for the ordinances of religion. As for himself, he had gone out to India to be a chaplain on the Company's establishment, for the performance of the duties of which office he was to receive a thousand a-year. He had nothing of the missionary about him except the true missionary spirit. He was not his own master; he could not choose the place of his ministrations; he was under the orders of the Commander-in-Chief; and was answerable for all his acts to the temporal authorities, as much as if he had been a lieutenant or an assistant-surgeon. There was much, doubtless, in this irksome to a man of his eager and enthusiastic nature. The chains must have pressed heavily upon one who had set David Brainerd before him as his great exemplar, and who had longed to go forth and do likewise. But the position had its compensations too; and chief among them was this: that there had been no greater obstacle to the diffusion of Christianity among the heathens than the ungodly lives which were commonly led by professing Christians. It was no small thing, then, to be allowed to convert his own countrymen. He had gone out to preach, not to the black man, but to the white; and he saw plainly that if he could but touch the hearts and reform the lives of the English settlers, he would make a grand first step towards the propagation of the Gospel in the East. On board "The Union" he had had some practice in this good work; he knew how painful it was, but he was prepared to endure hardness, and he would not shrink from an encounter with scoffers, let them scoff ever so bitterly at him. It is nothing now to preach evangelical truth from a Calcutta pulpit; but the reader who is acquainted with the state of Anglo-Indian society sixty years ago, knows that at that time it demanded no mean courage to teach as Simeon taught at Cambridge, or Cecil in Bedford Row.

But he had some support from his fellow-labourers of the English Church, though not much. As "The Union" was beating up the Hooghly river to Calcutta, another vessel was beating down the river seawards; and that vessel carried Claudius Buchanan to the southern coast. This was great loss to him; but the venerable David Brown remained to welcome the young priest; to be a father and a friend to him; to provide him with a home, and to sustain him in all his trials. Mr. Brown resided some fifteen miles from Calcutta, at a place on the opposite bank of the river, named Aldeen, not far from the Danish settlement of Serampore, where the Baptist missionaries Carey and Ward lived and laboured. In the grounds attached to this Aldeen house was a deserted idol-temple, upon the margin of the river, the picturesque aspect of which, as it stands out a broad mass of purple shadow against the setting sun, has been noted by thousands of Englishmen passing to and from the great military station of Barrackpore, ignorant of the historical associations which surrounded it. This pagoda had been fitted up as a dwelling-place—one of those convenient guest-houses which, in the old days of Indian hospitality, English residents delighted to have in their gardens for the reception of their friends. This building was now assigned to Henry Martyn, who took up his abode there, with an imagination inflamed by the traditions of the place. He "felt something like superstitious dread at being in a place once inhabited as it were by devils; but yet felt disposed to be triumphantly joyful that the temple where they were worshipped, was become Christ's oratory."

What his ministerial duties were at this time, and what the hostility to which they exposed him, may be gathered from the following extract from an unpublished letter to his friend and benefactor Mr. Grant, which gives a lively picture of the state of society, in its religious or irreligious aspects, at the commencement of the present century. "The ministerial work assigned me here," he wrote in September, 1806, "is to preach every Sabbath evening at the mission church, and every third Sunday at the other. With the former I am delighted; the congregation is numerous and attentive, and, as I have heard, there are encouraging appearances of a work of grace among them. At the New Church I am as a wonder unto many. Whether it is they judge of me relatively with the other clergymen who cannot boast of much *physical* strength, or whether I have really recovered from that insipidity so much complained of at St. John's Chapel, by having exercised my lungs so many months on the quarter-deck, I am called a son of thunder in this place. The Sunday after my first sermon at the New Church, Dr. Ward preached vehemently on the opposite side. I was not present at the time, being laid up with a bilious fever, but heard that it was against evangelical persons and things in general. After describing the rise and progress of the sect of evangelical clergymen in the Church, he proceeded to deny one by one all the leading doctrines of the Gospel. The personal abuse of me which his sermon contained gave such offence that he found it necessary to let it be read, since which many have thought better of it. After the second which I preached, Limerick attacked me. He too was very personal, and gravely and distinctly denied all the doctrines of the Gospel. As I knew how much carnal people would enjoy a controversy between their teachers, and so elude the force of what was intended for their consciences, I declined making the smallest allusion to what had been said. Notwithstanding this, many stay away from church because they say *parties are running so high* among the clergymen. Jefferies unites himself with us, and has preached the pure truth. Stacey will not enter the church till it is purified from our errors. We anxiously await the arrival of Corrie and Parson, whom we expect in the next fleet. When I can see Mr. Brown supplied with coadjutors in Mr. Buchanan's absence, I shall proceed to my proper work with double pleasure. I rejoice in the dispensation of God in sending me to this country more than ever. Through His mercy I enjoy excellent health; and I feel little doubt of seeing some of these poor people turning to God from idols, which hope is the health of my soul."

Such was the outer life of Henry Martyn at this time. His inner life is revealed to us with equal distinctness. There was ever going on within him a conflict in which warm human love was contending on one side and a morbid spiritualism on the other. He could never altogether rid himself of the thought that the love of the creature must be antagonistic to the love of the Creator. Mr. Cecil had told him that it was clearly his duty to marry. Mr. Simeon and other friends had been of the same opinion; and just before he sailed finally for India, he had, it has been seen, encouraged by the sight of the beloved object, given way to the natural inclinations of his heart. But on his voyage he seems to have cast out all hope, and indeed all desire, and to have reconciled himself to the thought of a solitary life. On his arrival in India, he "saw no reasons at first for supposing that marriage was desirable for a missionary;" but after a while his "opinions began to change," and his hopes began to revive, and he sate down to write a letter to Miss Grenfell, inviting her to join him in India. No surprise can be felt by anyone who reads this letter, that it utterly failed to accomplish the desired object. "From the account," he wrote, "which Mr. Simeon received of you from Mr. Thomason, he seemed in his letter to me to regret that he had so strongly dissuaded me from thinking about you at the time of my leaving England. Colonel Sandys spoke in such terms of you, and of the advantages to result from your presence in this country, that Mr. B[rown] became very earnest for me to endeavour to prevail upon you. Your letter to me perfectly delighted him, and induced him to say that you would be the greatest aid to the Mission I could possibly meet with. I knew my own heart too well not to be distrustful of it, especially as my affections were again awakened, and accordingly all my labours and prayers have been directed to check their influence, that I might see clearly the path of duty. Though I dare not say that I am under no bias, yet from every view of the subject I have been able to take, after balancing the advantages and disadvantages that may ensue to the cause in which I am engaged, always in prayer for God's direction, my reason is fully convinced of the expediency, I had almost said the necessity, of having you with me. It is possible that my reason may still be obscured by passion; let it suffice, however, to say that now with a safe conscience and the enjoyment of the Divine presence, I calmly and deliberately make the proposal to you." Perhaps a little less calmness and deliberation, a little less reason and a little more love, a little less talk about the advice of his friends and a little more about his own longing desires, might have been more successful in the pleading of his cause. Even the best of women do not like to be reasoned over and weighed in the scales after this fashion.

The letter to Miss Grenfell which I have quoted above, was written on the 30th of July, 1806. At what date it reached Cornwall is not quite clear; but Miss Grenfell replied to it on the 5th of March following, and it would seem that in April the subject of it was still under discussion at Marazion, where Mr. Simeon visited the Grenfells, and took an opportunity to talk over "Mr. Martyn's affair" with the young lady. He found her not much, and her mother not at all, disposed to favour the proposal for her departure to India. All the young lady's arguments might have been summed up in the one cardinal objection, that she did not love Martyn well enough. Formally, a sort of promise was given, that if the mother withdrew her objections, the daughter would go out to India; but Miss Grenfell made this conditional promise to Mr. Simeon, knowing that the conditions would never be fulfilled. The letter which she wrote to Mr. Martyn was an unqualified refusal.

It cut him to the heart. He had been endeavouring to persuade himself that it would be better for him to remain single—that living in a state of continual self-denial and mortification, he would be better able to fulfil his duty to his God. But the passions of humanity were not to be preached down in this way; and when the day of trial came, he was as little able to withstand the shock as any worldling of six-and-twenty. On the 24th of October the letter arrived—"An unhappy day," he wrote in his journal. "Received at last a letter from Lydia, in which she refuses to come, because her mother will not consent to it. Grief and disappointment threw my soul into confusion at first; but gradually, as my disorder subsided, my eyes were opened, and reason resumed its office. I could not but agree with her that it would not be for the glory of God, nor could we expect His blessing, if she acted in disobedience to her mother. As she has said, 'They that walk in crooked paths shall not find peace;' and if she were to come with an uneasy conscience what happiness could either of us expect?"—On the same day, he sat down and wrote to her a long letter, only a portion of which can be given here:—"Alas, my rebellious heart," he wrote, after saying that he did not still surrender all hope, "what a tempest agitates me! I knew not that I had made so little progress in a spirit of resignation to the Divine will. I am in my chastisement like the bullock unaccustomed to the yoke, like a wild bull in the net, full of the fury of the Lord, the rebuke of my God. The death of my late most beloved sister almost broke my heart; but I hoped it had softened me, and made me willing to suffer. But now my heart is as though destitute of the grace of God, full of misanthropic disgust with the world, sometimes feeling resentment against yourself and Emma, and Mr. Simeon, and, in short, all whom I love and honour most. Sometimes in pride and anger, resolving to write neither to you nor to anyone else again. These are the motions of sin. My love and my better reason draw me to you again."

This letter was written from Dinapore, where Martyn was then stationed. He was very busy with the translation of the Scriptures, and in the season of his disappointment he fell back upon his work as a stimulant and a solace. All things, he knew, were working together for good, and this affliction might yet be a blessing to himself and others. In making the word of God accessible to Heathen and Mahomedan races, surely he was doing grand missionary work, though he might sit all day in his bungalow with his books and papers before him. The entries which he made in his journal, and the letters which he wrote to his friends in the following years (1807 to 1809), show how he was employed. He was continually toiling; continually stumbling; now hoping that he had really done something; now finding to his bitter disappointment, that his translations were inaccurate, and that he must spend more time in correcting them than it would take to commence the work *de novo* again. As he became better acquainted with the languages, he began to make a small commencement of preaching to the natives. In 1810, he records in his journal, "Nothing has occurred this last year, but my removal to Cawnpore, and the commencement of my ministry, as I hope it may be called, among the Gentiles. This, with my endeavours to instruct the servants, has been blessed by the Lord to the improvement of my temper and behaviour towards them." His ministry among the Gentiles was little more than an occasional address, from the verandah of his house, to a crowd of beggars, who were attracted by the alms that he gave, not by the Gospel that he preached. But he thought that some of the seed he scattered might fall upon good ground.

But a change was now about to take place in his way of life. At Cawnpore he had some good Christian friends in whose companionship he delighted. Conspicuous among these were the Sherwoods. They had for some time painfully observed that as he grew in grace, he had waxed more and more feeble in his physical health. The ravages of his old family disorder were visible upon a form which had never indicated strength, and there were those who thought that the approach of death was discernible "in the fine fading of his delicate face." If Martyn did not see this, he felt it; and on the 19th of April, 1810, he wrote to Lydia Grenfell this touching account of himself:—"I begin my correspondence with my beloved Lydia, not without a fear of its being soon to end. Shall I venture to tell you that our family complaint has again made its appearance in me, with more unpleasant symptoms than it has ever yet done? However, God, who two years ago redeemed my life from destruction, may again, for His church's sake, interpose for my deliverance. Though, alas! what am I, that my place should not instantly be supplied with far more efficient instruments? The symptoms I mentioned are chiefly a pain in the chest, occasioned, I suppose, by over-exertion the two last Sundays, and incapacitating me at present from all public duty, and even from conversation. You were mistaken in supposing that my former illness originated from study. Study never makes me ill—scarcely ever fatigues me: but my lungs—death is seated there; it is speaking that kills me. May it give others life. 'Death worketh in us, but life in you.' Nature intended me, as I should judge from the structure of my frame, for chamber counsel, not for a pleader at the bar. But the call of Jesus Christ bids me call aloud. I spare not. As His minister, I am a debtor both to the Greek and to the Barbarian. How can I be silent when I have both ever before me, and my debt not paid?"

From this time a beautiful resignation appears to have descended upon him, and he grew outwardly more cheerful in his manners. Most true is it that "one fire burns out another's burning." A deep-seated affection of the lungs was destroying Henry Martyn, and the biliary disorder which had rendered him so irritable and so desponding, seems to have been burnt out by the tubercular disease. But although sober biography is bound to take account of this, we may believe that this increase of cheerfulness was in part the growth of a sustaining sense of his good work, and the comforting reflection that it would soon be said to him—"Well done, thou good and faithful servant, enter into thy rest." He had not altogether given up the thought of doing real missionary work in the apostolic or sent-forth sense of the word. But he wrote to a friend, saying:—"To the hardships of missionaries we are strangers; yet not averse, I trust, to encounter them when we are called. My work at present is evidently to translate; hereafter I may itinerate."

And indeed the time had come for him to "itinerate"; but not in the sense here recognised. It was plain that to remain at Cawnpore, would be to die at his post. So after much reflection and much prayer, he determined that, with the permission of the temporal authorities, and with the approval of the recognised "Patriarch" of the English Church, David Brown, he would fulfil his long-cherished project of journeying to Persia, there to improve his knowledge of its language, to obtain assistance in the translation of the Scriptures, and to dispute with the Moollahs. So he went down to Calcutta, and "after consulting with the Patriarch," saw the Governor-General, Lord Minto, and the Adjutant-General of the army, and obtained their sanction to his departure on sick leave. "So it strikes me," he said in a letter to Mr. Corrie, "a way is opened and an intimation given of the will of God: may my journey be for the prosperity of Zion. My ship has dropped down (the river)."

I have already narrated, in a previous memoir, how Henry Martyn sailed to Bombay with Mountstuart Elphinstone, and how at that presidency he became acquainted with Sir James Mackintosh and Sir John Malcolm. He appears to have made a different impression on the minds of these two men; which may partly be accounted for by the characteristic variableness of Martyn's own temperament, and partly by a consideration of the different temperaments of the lawyer and the soldier. At all events, Martyn appeared to Malcolm an exceedingly cheerful person. Of the latter, it is most true that "a merrier man, within the limits of becoming mirth," was seldom seen; and it would have been difficult to be otherwise than cheerful under the genial influence of his sunny nature. Be that as it may, he gave the young priest a letter of introduction to the British Minister in Persia (Sir Gore Ouseley), in which he said that Martyn was "altogether a very learned and cheerful man, but a great enthusiast in his holy calling." "I am satisfied," he added, "that if you ever see him, you will be pleased with him. He will give you grace before and after dinner, and admonish such of your party as take the Lord's name in vain; but his good sense and great learning will delight you, whilst his constant cheerfulness will add to the hilarity of your party." Although most men were cheerful in Malcolm's presence, I am inclined to think that causes already stated had done much to increase the habitual cheerfulness of Martyn's temperament.

So, cheerfully, he went about his work, and passed from India to the Persian Gulf. From Muscat he wrote, on the 23rd of April, 1811:—"I left India on Lady-day, looked at Persia on Easter Sunday, and seven days after found myself in Arabia Felix. In a small cove, surrounded by bare rocks, heated through, out of the reach of air as well as wind, lies the good ship 'Benares,' in the great cabin of which, stretched on a couch, lie I. But though weak, I am well—relaxed, but not disordered. Praise to His grace who fulfils to me a promise, which I have scarcely a right to claim—'I am with thee, and will keep thee in all places whither thou goest.'"

On the 30th of May, having obtained the means of attiring himself in full Persian costume, and having suffered his beard and moustache to grow, he started for Shiraz. The heat was intolerable, and the hardships of the journey almost killed him. On the 9th of June he reached his destination, and a few days afterwards, he was in the midst of theological discussions with the Moollahs and other learned people of the place. But he did not make much progress, and he wrote on the 12th of September to his friend Daniel Corrie:—"I do not find myself improving in Persian; indeed, I take no pains to speak it well, not perceiving it to be much consequence. India is the land where we can act at present with most effect. It is true that the Persians are more susceptible, but the terrors of an inquisition are always hanging over them. I can now conceive no greater happiness than to be settled for life in India, superintending national schools, as we did at Patna and Chunar. To preach so as to be readily understood by the poor, is a difficulty that appears to me almost insuperable." To the same old and beloved friend he wrote again in December, saying that he had excited some Mahomedan indignation and that he had been stoned. "They continued," he said, "throwing stones at me every day, till happening one day to tell Jaffier Ali Khan, my host, how one as big as my fist had hit me in the back, he wrote to the Governor, who sent an order to all the gates, that if any one insulted me he should be bastinadoed; and the next day came himself in state to pay me a visit. These measures have had the desired effect; they now call me the Feringhee Nabob, and very civilly offer me the Calean; but indeed the Persian commonalty are very brutes; the Soofies declare themselves unable to account for the fierceness of their countrymen, except it be from the influence of Islam."

All through the first half of the year 1812, he went on in the same way, now translating, now studying, now disputing with the Moollahs, now taking sweet counsel with his distant friends. But all this time his disorder was increasing upon him, and it was plain that the hardships he was enduring would speedily destroy him. So, reluctantly, at last he made up his mind to proceed to England, and in May he left Shiraz. But first of all he was eager to present his translation of the Bible to the King of Persia, and he strove mightily to this end; but official obstructions in the first instance, and afterwards utter prostration from illness, baffled his endeavours, and he was obliged to content himself with presenting it to the Ambassador. On the 9th of July, he wrote from Tabriz:—"My fever never ceased to rage till the 21st, during all which time every effort was made to subdue it, till I had lost all my strength, and almost all my reason. They now administer bark, and it may please God to bless the tonics, but I seem too far gone; I can only say, 'having a desire to depart and be with Christ, which is far better.'" Three days after he wrote to Lydia Grenfell:—"I have applied for leave to come on furlough to England. Perhaps you will be gratified by this intelligence; but oh, my dear Lydia, I must faithfully tell you that the probability of my reaching England alive is but small."

On the 2nd of September, all things being ready, Henry Martyn set out on his journey to England, carrying letters from Sir Gore Ouseley and others, to the chief people on his road. On the morning of the 10th he arrived at Erivan, but he grew weaker and weaker as he went. The fatigues of the journey were more than he could bear. He was dying fast. It had come, indeed, to be only a question of days. On the 5th of October, he wrote in his journal:—"Preserving mercy made me see the light of another morning. The sleep had refreshed me, but I was feeble and shaken, yet the merciless Hassan hurried me off. The munzil, however, not being distant, I reached it without much difficulty. I was pretty well lodged, and felt tolerably well till a little after sunset, when the ague came on with a violence I had never before experienced; I felt as if in a palsy; my teeth chattering, and my whole frame violently shaken. The cold fit, after continuing two or three hours, was followed by a fever, which lasted the whole night, and prevented sleep." On the following day he wrote:—"No horses being to be had, I had an unexpected repose. I sat in the orchard, and thought with sweet comfort and peace of my God; in solitude, my companion, my friend and comforter. Oh! when shall time give place to eternity? when shall appear that new heaven and new earth wherein dwelleth righteousness? There, there shall in no wise enter in anything that defileth: none of that wickedness which has made men worse than wild beasts,—none of those corruptions which add still more to the miseries of mortality, shall be seen or heard of any more."

These were the last words that he ever wrote. Whether he sunk under the disorder against which he had so long been painfully contending, or whether the Plague, which was then raging, seized his shattered frame, and tore out the little life that was left, must ever be uncertain. But ten days afterwards, at Tocat, Henry Martyn entered into his rest.

By those who judge all things in accordance with the measure of success apparent on the surface, it may be said that the life of Henry Martyn was a failure. But there are some defeats grander than any victories. And if such a life were truly a failure, assuredly it was a heroic one. To what extent his good work fructified—whether the souls which he saved, either by his preachings or his translations, were many or few, or none—is known only to the Infinite Wisdom. But he has left behind him an example of Christian courage, patience, and self-sacrifice, the beauty and the freshness of which long years have in nowise dimmed; an example which Protestant Christians of all denominations admire and love; for it is the likeness of one in whom nothing earthly could quench the spirit of the Apostle and the Martyr.

⁎⁎⁎ This slight sketch of Henry Martyn's career has been written partly from unpublished correspondence, but mainly from materials afforded by Sargent's "Life of Martyn"—a new edition of which was published in 1862—and by Wilberforce's collection of the "Journals and Letters," which contains much that is not included in the former work.

HEREWARD, THE LAST OF THE ENGLISH.

By CHARLES KINGSLEY.

CHAPTER XV.

HOW EARL TOSTI GODWINSSON CAME TO ST. OMER.

The winter passed in sweet madness; and for the first time in her life, Torfrida regretted the lengthening of the days, and the flowering of the primroses, and the return of the now needless wryneck; for they warned her that Hereward must forth again, to the wars in Scaldmariland, which had broken out again, as was to be expected, as soon as Count Robert and his bride had turned their backs.

And Hereward, likewise, for the first time in his life, was loth to go to war. He was, doubtless, rich enough in this world's goods. Torfrida herself was rich, and seems to have had the disposal of her own property, for her mother is not mentioned in connection therewith. Hereward seems to have dwelt in her house at St. Omer as long as he remained in Flanders. He had probably amassed some treasure of his own by the simple, but then most aristocratic, method of plunder. He had, too, probably, grants of land in Holland from the Frison, the rents whereof were not paid as regularly as might be. Moreover, as "*Magister Militum*," "Master of the Knights," he had, it is likely, pay as well as honour. And he approved himself worthy of his good fortune. He kept forty gallant housecarles in his hall all the winter, and Torfrida and her lasses made and mended their clothes. He gave large gifts to the Abbey of St. Bertin; and had masses sung for the souls of all whom he had slain, according to a rough list which he furnished,—bidding the monks not to be chary of two or three masses extra at times, as his memory was short, and he might have sent more souls to purgatory than he had recollected. He gave great alms at his door to all the poor. He befriended, especially, all shipwrecked and needy mariners, feeding and clothing them, and begging their freedom as a gift from Baldwin. He feasted the knights of the neighbourhood, who since his Baresark campaign, had all vowed him the most gallant of warriors, and since his accession of wealth, the most courteous of gentlemen; and so all went merrily, as it is written, "As long as thou doest well unto thyself, men will speak well of thee."

So he would have fain stayed at home at St. Omer: but he was Robert's man, and his good friend likewise; and to the wars he must go forth once more; and for eight or nine weary months Torfrida was alone: but very happy, for a certain reason of her own.

At last the short November days came round; and a joyful woman was fair Torfrida, when Martin Lightfoot ran into the hall, and throwing himself down on the rushes like a dog, announced that Hereward and his men would be home before noon, and then fell fast asleep.

There was bustling to and fro of her and her maids; decking of the hall in the best hangings; strewing of fresh rushes, to the dislodgment of Martin; setting out of square tables, and stoops and mugs thereon; cooking of victuals, broaching of casks; and, above all, for Hereward's self, heating of much water, and setting out, in the inner chamber, of the great bath-tub and bath-sheet, which was the special delight of a hero fresh from the war.

And by mid-day the streets of St. Omer rang with clank, and tramp, and trumpet-blare, and in marched Hereward and all his men, and swung round through the gateway into the court, where Torfrida stood to welcome them, as fair as day, a silver stirrup-cup in her hand. And while the men were taking off their harness and dressing their horses, she and Hereward went in together, and either took such joy of the other, that a year's parting was forgot in a minute's meeting.

"Now!" cried she, in a tone half of triumph, half of tenderness; "look there!"

"A cradle? And a baby?"

"Your baby."

"Is it a boy?" asked Hereward, who saw in his mind's eye a thing which would grow and broaden at his knee year by year, and learn from him to ride, to shoot, to fight. "Happy for him if he does not learn worse from me," thought Hereward, with a sudden movement of humility and contrition, which was surely marked in heaven; for Torfrida marked it on earth.

But she mistook its meaning.

"Do not be vexed. It is a girl."

"Never mind!" as if it was a calamity over which he was bound to comfort the mother. "If she is half as beautiful as you look at this moment, what splintering of lances there will be about her! How jolly, to see the lads hewing at each other, while our daughter sits in the pavilion, as Queen of Love!"

Torfrida laughed. "You think of nothing but fighting, bear of the North Seas."

"Every one to his trade. Well, yes, I am glad that it is a girl."

"I thought you seemed vexed. Why did you cross yourself?"

"Because I thought to myself, how unfit I was to bring up a boy to be such a knight as—as you would have him;—how likely I was, ere all was over, to make him as great a ruffian as myself."

"Hereward! Hereward!" and she threw her arms round his neck for the tenth time. "Blessed be you for those words! Those are the fears which never come true, for they bring down from heaven the grace of God, to guard the humble and contrite heart from that which it fears."

"Ah, Torfrida. I wish I were as good as you!"

"Now—my joy and my life, my hero and my scald—I have great news for you, as well as a little baby. News from England."

"You, and a baby over and above, are worth all England to me."

"But listen. Edward the king is dead."

"Then there is one fool less on earth; and one saint more, I suppose, in heaven."

"And Harold Godwinsson is king in his stead. And he has married your niece Aldytha, and sworn friendship with her brothers."

"I expected no less. Well, every dog has his day."

"And his will be a short one. William of Normandy has sworn to drive him out."

"Then he will do it. And so the poor little Swan-neck is packed into a convent, that the houses of Godwin and Leofric may rush into each other's arms, and perish together! Fools, fools, fools! I will hear no more of such a mad world. My queen, tell me about your sweet self. What is all this to me? Am I not a wolf's head, and a landless man?"

"Oh, my king, have not the stars told me that you will be an earl and a ruler of men, when all your foes are wolves' heads as you are now? And the weird is coming true already. Tosti Godwinsson is in the town at this moment, an outlaw and a wolf's head himself."

Hereward laughed a great laugh.

"Aha! Every man to his right place at last. Tell me about that, for it will amuse me. I have heard nought of him since he sent the king his Hereford thralls' arms and legs in the pickle-barrels; to show him, he said, that there was plenty of cold meat on his royal demesnes."

"You have not heard, then, how he murdered in his own chamber at York, Gamel Ormsson and Ulf Dolfinsson?"

"That poor little lad? Well, a gracious youth was Tosti, ever since he went to kill his brother Harold with teeth and claws, like a wolf; and as he grows in years, he grows in grace. But what said Ulf's father and the Gospatrics?"

"Dolfin and young Gospatric were I know not where. But old Gospatric came down to Westminster, to demand law for his grandnephew's blood."

"A silly thing of the old Thane, to walk into the wolf's den."

"And so he found. He was stabbed there, three days after Christmas-tide, and men say that Queen Edith did it, for love of Tosti, her brother. Then Dolfin and young Gospatric took to the sea, and away to Scotland; and so Tosti rid himself of all the good blood in the North, except young Waltheof Siwardsson, whose turn, I fear, will come next."

"How comes he here, then?"

"The Northern men rose at that, killed his servant at York, took all his treasures, and marched down to Northampton, plundering and burning. They would have marched on London town, if Harold had not met them there from the king. There they cried out against Tosti, and all his taxes, and his murders, and his changing Canute's laws, and would have young Morcar for their earl. A tyrant they would not endure. Free they were born and bred, they said, and free they would live and die. Harold must needs do justice, even on his own brother."

"Especially when he knows that that brother is his worst foe."

"Harold is a better man than you take him for, my Hereward. But be that as it may, Morcar is earl, and Tosti outlawed, and here in St. Omer, with wife and child."

"My nephew Earl of Northumbria! As I might have been, if I had been a wiser man."

"If you had, you would never have found me."

"True, my queen! They say heaven tempers the wind to the shorn lamb; but it tempers it too, sometimes, to the hobbled ass; and so it has done by me. And so the rogues have fallen out, and honest men may come by their own. For, as the Northern men have done by one brother, so will the Eastern men do by the other. Let Harold see how many of those fat Lincolnshire manors, which he has seized into his own hands, he holds by this day twelve months. But what is all this to me, my queen, while you and I can kiss, and laugh the world to scorn?"

"This to you, beloved, that, great as you are, Torfrida must have you greater still; and out of all this coil and confusion, you may win something, if you be wise."

"Sweet lips, be still, and let us love instead of plotting."

"And this, too—you shall not stop my mouth—that Harold Godwinsson has sent a letter to you."

"Harold Godwinsson is my very good lord," sneered Hereward.

"And this it said, with such praises and courtesies concerning you, as made thy wife's heart beat high with pride—'If Hereward Leofricsson will come home to England, he shall have his rights in law again, and his manors in Lincolnshire, and a thaneship in East Anglia, and manors for his men-at-arms; and if that be not enough, he shall have an earldom, as soon as there is one to give.'"

"And what says to that, Torfrida, Hereward's queen?"

"You will not be angry if I answered the letter for you?"

"If you answered it one way—no. If another—yes."

Torfrida trembled. Then she looked Hereward full in the face with her keen clear eyes.

"Now shall I see whether I have given myself to Hereward in vain, body and soul, or whether I have trained him to be my true and perfect knight."

"You answered, then," said Hereward, "thus—"

"Say on," said she, turning her face away again.

"Hereward Leofricsson tells Harold Godwinsson that he is his equal, and not his man; and that he will never put his hands between the hands of a son of Godwin. An Etheling born, a king of the house of Cerdic, outlawed him from his right, and none but an Etheling born shall give him his right again."

"I said it, I said it. Those were my very words!" and Torfrida burst into tears, while Hereward kissed her, almost fawned upon her, calling her his queen, his saga-wife, his guardian angel.

"I was sorely tempted," sobbed she. "Sorely. To see you rich and proud upon your own lands, an earl, may be—may be, I thought at whiles, a king. But it could not be. It did not stand with honour, my hero—not with honour."

"Not with honour. Get me gay garments out of the chest, and let us go in royally, and royally feast my jolly riders."

"Stay awhile," said she, kissing his head as she combed and curled his long golden locks, and her own raven ones, hardly more beautiful, fell over them and mingled with them. "Stay awhile, my pride. There is another spell in the wind, stirred up by devil or witch-wife, and it comes from Tosti Godwinsson."

"Tosti, the cold-meat butcher? What has he to say to me?"

"This—'If Hereward will come with me to William of Normandy, and help us against Harold the perjured, then will William do for him all that Harold would have done, and more beside.'"

"And what answered Torfrida?"

"It was not so said to me that I could answer. I had it by a side wind, through the Countess Judith."*

"And she had it from her sister Matilda."

"And she, of course, from Duke William himself."

"And what would you have answered, if you had answered, pretty one?"

"Nay, I know not. I cannot be always queen. You must be king sometimes."

Torfrida did not say that this latter offer had been a much sorer temptation than the former.

"And has not the base-born Frenchman enough knights of his own, that he needs the help of an outlaw like me?"

"He asks for help from all the ends of the earth. He has sent that Lanfranc to the Pope; and there is talk of a sacred banner, and a crusade against England."

"The monks are with him, then?" said Hereward. "That is one more count in their score. But I am no monk. I have shorn many a crown, but I have kept my own hair as yet, you see."

"I do see," said she, playing with his locks. "But—but he wants you. He has sent for Angevins, Poitevins, Bretons, Flemings—promising lands, rank, money, what not. Tosti is recruiting for him here in Flanders now. He will soon be off to the Orkneys, I suspect, or to Sweyn in Denmark, after Vikings."

"Here? Has Baldwin promised him men?"

"What could the good old man do? He could not refuse his own son-in-law. This, at least, I know, that a messenger has gone off to Scotland, to Gilbert of Ghent, to bring or send any bold Flemings who may prefer fat England to lean Scotland."

"Lands, rank, money, eh? So he intends that the war should pay itself—out of English purses. What answer would you have me make to that, wife mine?"

"The Duke is a terrible man. What if he conquers? And conquer he will."

"Is that written in your stars?"

"It is, I fear. And if he have the Pope's blessing, and the Pope's banner—— Dare we resist the Holy Father?"

"Holy stepfather, you mean; for a stepfather he seems to prove to merry England. But do you really believe that an old man down in Italy can make a bit of rag conquer by saying a few prayers at it? If I am to believe in a magic flag, give me Harold Hardraade's Landeyda, at least, with Harold and his Norsemen behind it."

"William's French are as good as those Norsemen, man for man; and horsed withal, Hereward."

"That may be," said he, half testily, with a curse on the tanner's grandson and his French popinjays, "and our Englishmen are as good as any two Norsemen, as the Norse themselves say." He could not divine, and Torfrida hardly liked to explain to him the glamour which the Duke of Normandy had cast over her, as the representative of chivalry, learning, civilisation, a new and nobler life for men than the world had yet seen; one which seemed to connect the young races of Europe with the wisdom of the ancients and the magic glories of old Imperial Rome.

"You are not fair to that man," said she, after awhile. "Hereward, Hereward, have I not told you how, though body be strong, mind is stronger? That is what that man knows; and therefore he has prospered. Therefore his realms are full of wise scholars, and thriving schools, and fair minsters, and his men are sober, and wise, and learned like clerks——"

"And false like clerks, as he is himself. Schoolcraft and honesty never went yet together, Torfrida——"

"Not in me?"

"You are not a clerk, you are a woman, and more, you are an elf, a goddess; there is none like you. But hearken to me. This man is false. All the world knows it."

"He promises, they say, to govern England justly as King Edward's heir, according to the old laws and liberties of the realm."

---

* Tosti's wife, Earl Baldwin's daughter, sister of Matilda, William the Conqueror's wife.

"Of course. If he does not come as the old monk's heir, how does he come at all? If he does not promise our—their, I mean, for I am no Englishman—laws and liberties, who will join him? But his riders and hirelings will not fight for nothing. They must be paid with English land, and English land they will have, for they will be his men, whoever else are not. They will be his darlings, his housecarles, his hawks to sit on his fist and fly at his game; and English bones will be picked clean to feed them. And you would have me help to do that, Torfrida? Is that the honour of which you spoke so boldly to Harold Godwinsson?"

Torfrida was silent. To have brought Hereward under the influence of William was an old dream of hers. And yet she was proud at the dream being broken thus. And so she said—

"You are right. It is better for you—it is better than to be William's darling, and the greatest earl in his court—to feel that you are still an Englishman. Promise me but one thing, that you will make no fierce or desperate answer to the Duke."

"And why not answer the tanner as he deserves?"

"Because my art, and my heart too, tells me that your fortunes and his are linked together. I have studied my tables, but they would not answer. Then I cast lots in Virgilius——"

"And what found you there?" asked he, anxiously.

"I opened at the lines—

> "Pacem me exanimis et Martis sorte peremptis
> Oratis? Equidem et vivis concedere vellem."

"And what means that?"

"That you may have to pray him to pity the slain; and have for answer, that their lands may be yours if you will but make peace with him. At least, do not break hopelessly with that man. Above all, never use that word concerning him which you used just now; the word which he never forgives. Remember what he did to them of Alençon, when they hung raw hides over the wall, and cried, 'Plenty of work for the tanner!'"

"Let him pick out the prisoners' eyes, and chop off their hands, and shoot them into the town from mangonels,—he must go far and thrive well ere I give him a chance of doing that by me."

"Hereward, Hereward, my own! Boast not, but fear God. Who knows, in such a world as this, to what end we may come? Night after night I am haunted with spectres, eyeless, handless——"

"This is cold comfort for a man just out of hard fighting in the ague-fens!"

She threw her arms round him, and held him as if she would never let him go.

"When you die, I die. And you will not die: you will be great and glorious, and your name will be sung by scald and minstrel through many a land, far and wide. Only, be not rash. Be not high-minded. Promise me to answer this man wisely. The more crafty he is, the more crafty must you be likewise."

"Let us tell this mighty hero then," said Hereward, trying to laugh away her fears—and perhaps his own, "that while he has the Holy Father on his side, he can need no help from a poor sinful worm like me."

"Hereward, Hereward!"

"Why, is there aught about hides in that?"

"I want—I want an answer which may not cut off all hope in case of the worst."

"Then let us say boldly, 'On the day that William is King of all England, Hereward will come and put his hands between his, and be his man.'"

That message was sent to William at Rouen. He laughed—

"It is a fair challenge from a valiant man. The day shall come when I will claim it."

Tosti and Hereward passed that winter in St. Omer, living in the same street, passing each other day by day, and never spoke a word one to the other.

Robert the Frison heard of it, and tried to persuade Hereward.

"Let him purge himself of the murder of Ulf the boy, son of my friend Dolfin; and after that of Gamel, son of Orm; and after that again of Gospatric, my father's friend, whom his sister slew for his sake; and then an honest man may talk with him. Were he not my good lord's brother-in-law, as he is, more's the pity, I would challenge him to fight *à l'outrance*, with any weapons he might choose."

"Heaven protect him in that case," quoth Robert the Frison.

"As it is, I will keep the peace. And I will see that my men keep the peace, though there are Scarborough and Bamborough lads among them, who long to cut his throat upon the streets. But more I will not do."

So Tosti sulked through the winter at St. Omer, and then went off to get help from Sweyn of Denmark, and failing that, from Harold Hardraade of Norway. But how he sped there, must be read in the words of a cunninger saga-man than this chronicler, even in those of the "Icelandic Homer," Snorro Sturleson.

CHAPTER XVI.

HOW HEREWARD WAS ASKED TO SLAY AN OLD COMRADE.

In those days Hereward went into Bruges, to Marquis Baldwin, about his business. And as he walked in Bruges street, he met an old friend, Gilbert of Ghent.

He had grown somewhat stouter, and somewhat greyer, in the last ten years: but he was as hearty as ever, and as honest, according to his own notions of honesty.

He shook Hereward by both hands, clapt him on the back, swore with many oaths, that he had heard of his fame in all lands, that he always said that he would turn out a champion, and a gallant knight, and had said it long before he killed the bear. As for killing it, it was no more than he expected, and nothing to what Hereward had done since, and would do yet.

Wherefrom Hereward opined that Gilbert had need of him.

They chatted on: Hereward asking after old friends, and sometimes after old foes, whom he had long since forgiven; for though he always avenged an injury, he never bore malice for one: a distinction less common now than then, when a man's honour, as well as his safety, depended on his striking again, when he was struck.

"And how is little Alftruda?—Big she must be now?" asked he at last.

"The fiend fly away with her—or rather, would that he had flown away with her, before ever I saw the troublesome little jade. Big? She is grown into the most beautiful lass that ever was seen—which is, what a young fellow, like you, cares for; and more trouble to me than all my money, which is what an old fellow, like me, cares for. It is partly about her that I am over here now. Fool that I was, ever to let an Etheliza* into my house;" and Gilbert swore a great deal.

"How was she an Etheliza?" asked Hereward, who cared nothing about the matter. "And how came she into your house? I never could understand that, any more than how the bear came there."

"Ah! As to the bear, I have my secrets, which I tell no one. He is dead and buried, thanks to you."

"And I sleep on his skin every night."

"You do, my little Champion? Well—warm is the bed that is well earned. But as for her;—see here, and I'll tell you. She was Gospatric's ward, and kinswoman—how, I do not rightly know. But this I know, that she comes from Uchtred, the earl whom Canute slew, and that she is heir to great estates in Northumberland.

"Gospatric, that fought at Dunsinane?"

"Yes, not the old Thane, his uncle, whom Tosti has murdered: but Gospatric, King Malcolm's cousin, Dolfin's father. Well, she was his ward. He gave me her to keep, for he wanted her out of harm's way—the lass having a bonny dower, lands and money—till he could marry her up to one of his sons. I took her; of course I was not going to do other men's work for nought; so I would have married her up to my poor boy, if he had but lived. But he would not live, as you know. Then I would have married her to you, and made you my heir, I tell you honestly, if you had not flown off, like a hot-headed young springald, as you were then."

"You were very kind. But how is she an Etheliza?"

"Etheliza? Twice over. Her father was of high blood among those Saxons; and if not, are not all the Gospatrics Ethelings? Their grandmother, Uchtred's wife, was Ethelred Evil-Counsel's daughter, King Edward of London's sister; and I have heard that this girl's grandfather was their son—but died young—or was killed with his father. Who cares?"

"Not I," quoth Hereward.

"Well—he wants to marry her to Dolfin, his eldest son."

"Why, Dolfin had a wife when I was at Dunsinane."

"But she is dead since, and young Ulf, her son, murdered by Tosti last winter."

"I know."

"Whereon Gospatric sends to me for the girl and her dowry. What was I to do? Give her up? Little it is, lad, that I ever gave up, after I had it once in my grip, or I should be a poorer man than I am now. Have and hold, is my rule. What should I do? What I did. I was coming hither on business of my own, so I put her on board ship, and half her dower—where the other half is, I know; and man must draw me with wild horses, before he finds out:—and came here to my kinsman, Baldwin, to see if he had any proper young fellow to whom we might marry the lass, and so go shares in her money and the family connection. Could a man do more wisely?"

"Impossible," quoth Hereward.

"But see how a wise man is lost by fortune. When I come here, whom should I find but Dolfin himself? The dog had scent of my plan, all the way from Dolfinston there, by Peebles. He hunts me out, the hungry Scotch wolf; rides for Leith, takes ship, and is here to meet me, having accused me before Baldwin as a robber and ravisher, and offers to prove his right to the jade on my body in single combat."

"The villain!" quoth Hereward. "There is no modesty left on earth, nor prudence either. To come here, where he might have stumbled on Tosti, who murdered his son, and I would surely do the like by him, himself. Lucky for him that Tosti is off to Norway on his own errand."

"Modesty and prudence? None nowadays, young sire; nor justice either, I think; for when Baldwin hears us both—and I told my story as cannily as I could—he tells me that he is very sorry for an old vassal and kinsman, and so forth,—but I must either disgorge or fight."

"Then fight," quoth Hereward.

"Per se aut per campionem,—that's the old law, you know."

"Not a doubt of it."

"Look you, Hereward. I am no coward, nor a clumsy man of my hands."

"He is either fool or liar who says so."

"But see. I find it hard work to hold my own in Scotland now. Folks don't like me, or trust me; I can't say why."

---

* A princess of the royal blood of Cerdic, and therefore of Edward the Confessor.

"How unreasonable!" quoth Hereward.

"And if I kill this youth, and so have a blood-feud with Gospatric, I have a hornet's nest about my ears. Not only he and his sons—who are masters of Scotch Northumberland*—but all his cousins; King Malcolm, and Donaldbain, and, for aught I know, Harold and the Godwinssons, if he bid them take up the quarrel. And beside, that Dolfin is a big man. If you cross Scot and Saxon, you breed a very big man. If you cross again with a Dane or a Norseman, you breed a giant. His grandfather was a Scots prince, his grandmother an English Etheliza, his mother a Norse Princess, as you know—and how big he is, you should remember. He weighs half as much again as I, and twice as much as you."

"Butchers count by weight, and knights by courage," quoth Hereward.

"Very well for you, who are young and active: but I take him to be a better man than that Ogre of Cornwall, whom they say you killed."

"What care I? Let him be twice as good, I'd try him."

"Ah! I knew you were the old Hereward still. Now hearken to me. Be my champion. You owe me a service, lad. Fight that man, challenge him in open field. Kill him, as you are sure to do. Claim the lass, and win her—and then we will part her dower. And (though it is little that I care for young lasses' fancies), to tell you truth, she never favoured any man but you."

Hereward started at the snare which had been laid for him; and then fell into a very great laughter.

"My most dear and generous host: you are the wiser, the older you grow. A plan worthy of Solomon! You are rid of Sieur Dolfin without any blame to yourself."

"Just so."

"While I win the lass, and, living here in Flanders, am tolerably safe from any blood-feud of the Gospatrics."

"Just so."

"Perfect: but there is only one small hindrance to the plan; and that is——that I am married already."

Gilbert stopped short, and swore a great oath.

"But," he said after a while, "does that matter so much after all?"

"Very little, indeed, as all the world knows, if one has money enough, and power enough."

"And you have both," they say.

"But, still more unhappily, my money is my wife's."

"Peste!"

"And more unhappily still, I am so foolishly fond of her, that I would sooner have her in her smock, than any other woman with half England for a dower."

"Then I suppose I must look out for another champion."

"Or save yourself the trouble, by being—just as a change—an honest man."

"I believe you are right," said Gilbert, laughing; "but it is hard to begin so late in life."

"And after one has had so little practice."

"Aha! Thou art the same merry dog of a Hereward. Come along. But could we not poison this Dolfin, after all?"

To which proposal Hereward gave no encouragement.

"And now, my très beau sire, may I ask you, in return, what business brings you to Flanders?"

"Have I not told you?"

"No, but I have guessed. Gilbert of Ghent is on his way to William of Normandy."

"Well. Why not?"

"Why not?—certainly. And has brought out of Scotland a few gallant gentlemen, and stout house-carles of my acquaintance."

Gilbert laughed.

"You may well say that. To tell you the truth, we have flitted, bag and baggage. I don't believe that we have left a dog behind."

"So you intend to 'colonise' in England, as the learned clerks would call it? To settle; to own land; and enter, like the Jews of old, into goodly houses which you builded not, farms which you tilled not, wells which you digged not, and orchards which you planted not?"

"Why, what a clerk you are! That sounds like Scripture."

"And so it is. I heard it in a French priest's sermon, which he preached here in St. Omer a Sunday or two back, exhorting all good Catholics, in the Pope's name, to enter upon the barbarous land of England, tainted with the sin of Simon Magus, and expel thence the heretical priests, and so forth, promising them that they should have free leave to cut long thongs out of other men's hides."

Gilbert chuckled.

"You laugh. The priest did not; for after sermon I went up to him, and told him how I was an Englishman, and an outlaw, and a desperate man, who feared neither saint nor devil; and if I heard such talk as that again in St. Omer, I would so shave the speaker's crown that he should never need razor to his dying day."

"And what is that to me?" said Gilbert, in an uneasy, half-defiant tone; for Hereward's tone had been more than half-defiant.

"This. That there are certain broad lands in England, which were my father's, and are now my nephews' and my mother's, and some which should by right be mine. And I advise you, as a friend, not to make entry on those lands, lest Hereward in turn make entry on you. And who is he that will deliver you out of my hand?"

"God and his Saints alone, thou fiend out of the pit," quoth Gilbert, laughing. But he was growing warm, and began to tutoyer Hereward.

"I am in earnest, Gilbert of Ghent, my good friend of old time."

---

* Between Tweed and Forth.

"I know thee well enough, man. Why, in the name of all glory and plunder, art thou not coming with us? They say William has offered thee the earldom of Northumberland."

"He has not. And if he has, it is not his to give. And if it were, it is by right neither mine, nor my nephews', but Waltheof Siwardsson's. Now hearken unto me; and settle it in your mind, thou and William both, that your quarrel is against none but Harold and the Godwinssons, and their men of Wessex: but that if you go to cross the Watling street, and meddle with the free Danes, who are none of Harold's men——"

"Stay. Harold has large manors in Lincolnshire, and so has Edith his sister, and what of them, Sir Hereward?"

"That the man who touches them, even though the men on them may fight on Harold's side, had better have put his head into a hornet's nest. Unjustly were they seized from their true owners by Harold and his fathers; and the holders of them will owe no service to him a day longer than they can help: but will, if he fall, demand an Earl of their own race, or fight to the death."

"Best make young Waltheof Earl, then."

"Best keep thy foot out of them, and the foot of any man for whom thou carest. Now good-bye. Friends we are, and friends let us be."

"Ah, that thou wert coming to England!"

"I bide my time. Come I may, when I see fit. But whether I come as friend or foe, depends on that of which I have given thee fair warning."

So they parted for the time.

It will be seen hereafter, how Gilbert took his own advice about young Waltheof: but did not take Hereward's advice about the Lincoln manors.

In Baldwin's hall that day, Hereward met Dolfin; and when the magnificent young Scot sprang to him, embraced him, talked over old passages, complimented him on his fame, lamented that he himself had won no such honours in the field, Hereward felt much more inclined to fight for him than against him.

Presently the ladies entered from the bower inside the hall. A buzz of expectation rose from all the knights, and Alftruda's name was whispered round.

She came in, and Hereward saw at the first glance, that Gilbert had for once in his life spoken truth. So beautiful a girl he had never beheld; and as she swept down toward him, he for one moment forgot Torfrida, and stood spell-bound like the rest.

Her eye caught his. If his face showed recognition, hers showed none. The remembrance of their early friendship, of her deliverance from the monster, had plainly passed away.

"Fickle, ungrateful things, these women," thought Hereward.

She passed him close. And as she did so, she turned her head, and looked him full in the face one moment, haughty and cold.

"So you could not wait for me?" said she, in a quiet whisper, and went on straight to Dolfin, who stood trembling with expectation and delight.

She put her hand into his.

"Here stands my champion," said she.

"Say, here kneels your slave," cried the Scot, dropping to the pavement a true Highland knee. Whereon forth shrieked a bagpipe, and Dolfin's minstrel sang, in most melodious Gaelic—

"Strong as a horse's hock, shaggy as a stag's brisket,
  Is the knee of the young torrent-leaper, the pride of
    the house of Crinan.
  It bent not to Macbeth the accursed, it bends not
    even to Malcolm the Anointed,
  But it bends like a harebell—who shall blame it?—
    before the breath of beauty."

Which magnificent effusion being interpreted by Hereward for the instruction of the ladies, procured for the red-headed bard more than one handsome gift.

A sturdy voice arose out of the crowd.

"The fair lady, my Lord Count, and knights all, will need no champion as far as I am concerned. When one sees so fair a pair together, what can a knight say, in the name of all knighthood, but that the heavens have made them for each other, and that it were sin and shame to sunder them?"

The voice was that of Gilbert of Ghent, who, making a virtue of necessity, walked up to the pair, his weatherbeaten countenance wreathed into what were meant for paternal smiles.

"Why did you not say as much in Scotland, and save me all this trouble?" pertinently asked the plain-spoken Scot.

"My Lord Prince, you owe me a debt for my caution. Without it, the poor lady had never known the whole fervency of your love; or these noble knights and yourself the whole evenness of Count Baldwin's justice."

Alftruda turned her head away half contemptuously; and as she did so, she let her hand drop listlessly from Dolfin's grasp, and drew back to the other ladies.

A suspicion crossed Hereward's mind. Did she really love the Prince? Did those strange words of hers mean that she had not yet forgotten Hereward himself?

However, he said to himself that it was no concern of his, as it certainly was not: went home to Torfrida, told her everything that had happened, laughed over it with her, and then forgot Alftruda, Dolfin, and Gilbert, in the prospect of a great campaign in Holland.

CHAPTER XVII.

HOW HEREWARD TOOK THE NEWS FROM STANFORD-BRIGG AND HASTINGS.

After that, news came thick and fast.

News of all the fowl of heaven flocking to the feast of the great God, that they might eat the flesh of kings, and captains, and mighty men, and horses, and them that sit on them, and the flesh of all men, both bond and free.

News from Rome, how England, when conquered, was to be held as a fief of St. Peter, and spiritually, as well as temporarily, enslaved. News how the Gonfanon of St. Peter, and a ring with a bit of St. Peter himself enclosed therein, had come to Rouen, to go before the Norman host, as the Ark went before that of Israel.

Then news from the North. How Tosti had been to Sweyn, and bid him come back and win the country again, as Canute his uncle had done; and how the cautious Dane had answered that he was a much smaller man than Canute, and had enough to hold his own against the Norsemen, and could not afford to throw for such high stakes as his mighty uncle.

Then how Tosti had been to Norway, to Harold Hardraade, and asked him why he had been fighting fifteen years for Denmark, when England lay open to him. And how Harold of Norway had agreed to come; and how he had levied one-half of the able-bodied men in Norway; and how he was gathering a mighty fleet at Solundir, in the mouth of the Sogne Fiord. Of all this Hereward was well informed; for Tosti came back again to St. Omer, and talked big. But Hereward and he had no dealings with each other. But at last, when Tosti tried to entice some of Hereward's men to sail with him, Hereward sent him word that if he met him, he would kill him in the streets.

Then Tosti, who (though he wanted not for courage) knew that he was no match for Hereward, went off to Bruges, leaving his wife and family behind, gathered sixty ships at Ostend, went off to the Isle of Wight, and forced the landsfolk to give him money and food. And then Harold of England's fleet, which was watching the coast against the Normans, drove him away; and he sailed off north, full of black rage against his brother Harold and all Englishmen, and burned, plundered, and murdered, along the coast of Lincolnshire, out of brute spite to the Danes who had expelled him.

Then came news how he had got into the Humber; how Earl Edwin and his Northumbrians had driven him out; and how he went off to Scotland to meet Harold of Norway; and how he had put his hands between Harold's, and become his man.

And all the while the Norman camp at St. Pierre-sur-Dive grew and grew; and all was ready, if the wind would but change.

And so Hereward looked on, helpless, and saw these two great storm-clouds growing—one from north, and one from south—to burst upon his native land.

Two invasions at the same moment of time; and these no mere Viking raids for plunder, but deliberate attempts at conquest and colonisation, by the two most famous captains of the age. What if both succeeded? What if the two storm-clouds swept across England, each on its own path, and met in the midst, to hurl their lightnings into each other? A fight between William of Normandy and Harold of Norway, on some moorland in Mercia—it would be a battle of giants; a sight at which Odin and the Gods of Valhalla would rise from their seats, and throw away the mead-horn, to stare down on the deeds of heroes scarcely less mighty than themselves. Would that neither might win! Would that they would destroy and devour, till there was none left of Frenchmen or of Norwegians!

So sung Hereward, after his heathen fashion: and his housecarles applauded the song. But Torfrida shuddered.

"And what will become of the poor English in the meantime?"

"They have brought it on themselves," said Hereward, bitterly. "Instead of giving the crown to the man who should have had it—to Sweyn of Denmark—they let Godwin put it on the head of a drivelling monk: and as they sowed, so will they reap."

But Hereward's own soul was black within him. To see these mighty events passing, as it were, within reach of his hand—and he unable to take his share in them—For what share could he take? That of Tosti Godwinsson against his own nephews? That of Harold Godwinsson, the usurper? That of the tanner's grandson against any man? Ah, that he had been in England! Ah, that he had been, where he might have been, where he ought to have been, but for his own folly—high in power in his native land; perhaps a great earl; perhaps commander of all the armies of the Danelagh. And bitterly he cursed his youthful sins, as he rode to and fro almost daily to the port of Calais, asking for news, and getting often only too much.

For now came news that the Norsemen had landed in Humber; that Edwin and Morcar were beaten at York; that Hardraade and Tosti were masters of the North.

And with that, news that by the virtue of the relics of St. Valery, which had been brought out of their shrine to frighten the demons of the storm, and by the intercession of the blessed St. Michael, patron of Normandy, the winds had changed, and William's whole armament had crossed the Channel, landed upon an undefended shore, and fortified themselves at Pevensey and Hastings.

And then followed a fortnight of silence and torturing suspense.

Hereward could hardly eat, drink, sleep, or speak. He answered Torfrida's consolations curtly and angrily, till she betook herself to silent caresses, as to a sick animal. But she loved him all the better for his sullenness; for it showed that his English heart was wakening again, sound and strong.

At last news came. He was down, as usual, at the port. A ship had just come in from the northward. A man just landed stood on the beach, gesticulating, and calling in an unknown tongue to the bystanders, who laughed at him, and seemed inclined to misuse him.

Hereward galloped down the beach.

"Out of the way, villains! Why man, you are a Norseman!"

"Norseman am I, Earl, Thord Gunlaugsson is my name, and news I bring for the Countess Judith (as the French call her) that shall turn her golden hair to snow:—yea, and all fair lasses' hair from Lindesness to Loffoden!"

"Is the Earl dead?"

"And Harold Sigurdsson!"

Hereward sat silent, appalled. For Tosti, he cared not. But Harold Sigurdsson, Harold Hardraade, Harold the Viking, Harold the Varanger, Harold the Lionslayer, Harold of Constantinople, the bravest among champions, the wisest among kings, the cunningest among minstrels, the darling of the Vikings of the north; the one man whom Hereward had taken for his pattern and his ideal, the one man under whose banner he would have been proud to fight—the earth seemed empty, if Harold Hardraade were gone.

"Thord Gunlaugsson," cried he, at last, "or whatever be thy name, if thou hast lied to me, I will draw thee with wild horses."

"Would God that I did lie! I saw him fall with an arrow through his throat. Then Jarl Tosti took the Land-ravager and held it up till he died. Then Eystein Orre took it, coming up hot from the ships. And then he died likewise. Then they all died. We would take no quarter. We threw off our mail, and fought baresark, till all were dead together."*

"How camest thou, then, hither?"

"Styrkar the marshal escaped in the night, and I with him, and a few more. And Styrkar bade me bring the news to Flanders, to the Countess, while he took it to Olaf Haroldsson, who lay off in the ships."

"And thou shalt take it. Martin! get this man a horse. A horse, ye villains, and a good one, on your lives!"

"And Tosti is dead?"

"Dead like a hero. Harold offered him quarter—offered him his earldom, they say: even in the midst of battle: but he would not take it. He said he was the Sigurdsson's man now, and true man he would be!"

"Harold offered him—what art babbling about? Who fought you?"

"Harold Godwinsson, the king."

"Where?"

"At Stanford Brigg, by York Town."

"Harold Godwinsson slew Harold Sigurdsson? After this wolves may eat lions!"

"The Godwinsson is a gallant fighter, and a wise general, or I had not been here now."

"Get on thy horse, man!" said he, scornfully and impatiently, "and gallop, if thou canst."

"I have ridden many a mile in Ireland, Earl, and have not forgotten my seat."

"Thou hast, hast thou?" said Martin; "thou art Thord Gunlaugsson of Waterford."

"That am I. How knowest thou me, man?"

"I am of Waterford. Thou hadst a slave lass once, I think; Mew: they called her Mew, her skin it was so white."

"What's that to thee?" asked Thord, turning on him savagely.

"Why, I meant no harm. I saw her at Waterford when I was a boy, and thought her a fair lass enough, that is all."

And Martin dropped into the rear. By this time they were at the gates of St. Omer.

As they rode side by side, Hereward got more details of the fight.

"I knew it would fall out so. I foretold it!" said Thord. "I had a dream. I saw us come to English land, and fight; and I saw the banners floating. And before the English army was a great witchwife, and rode upon a wolf, and he had a corpse in his bloody jaws. And when he had eaten one up, she threw him another, till he had swallowed all."

"Did she throw him thine?" asked Martin, who ran holding by the stirrup.

"That did she, and eaten I saw myself. Yet here I am alive."

"Then thy dreams were naught."

"I do not know that. The wolf may have me yet."

"I fear thou art fey."*

"What the devil is it to thee if I be?"

"Naught. But be comforted. I am a necromancer; and this I know by my art, that the weapon that will slay thee was never forged in Flanders here."

"There was another man had a dream," said Thord, turning from Martin angrily. "He was standing in the king's ship, and he saw a great witchwife with a fork and a trough stand on the island. And he saw a fowl on every ship's stem, a raven, or else an eagle, and he heard the witchwife sing an evil song."

By this time they were in St. Omer.

Hereward rode straight to the Countess Judith's house. He never had entered it yet, and was likely to be attacked if he entered it now. But when the door was opened, he thrust in with so earnest and sad a face that the servants let him pass, but not without growling and motions as of getting their weapons.

"I come in peace, my men, I come in peace: this is no time for brawls. Where is the steward, or one of the countess's ladies?—Tell her, madam, that Hereward waits her commands, and entreats her, in the name of St. Mary and all Saints, to vouchsafe him one word in private."

The lady hurried into the bower. The next moment Judith hurried out into the hall, her fair face blanched, her fair eyes wide with terror.

---

* For the details of this battle, see Skorro Sturleson, or the admirable description in Bulwer's "Harold."

* Prophesying his own death.

Hereward fell on his knee.

"What is this? It must be bad news if you bring it."

"Madam, the grave covers all feuds. Earl Tosti was a very valiant hero; and would to God that we had been friends!"

She did not hear the end of the sentence: but fell back with a shriek into the women's arms.

Hereward told them all that they needed to know of that fratricidal strife; and then to Thord Gunlaugsson—

"Have you any token that this is true. Mind what I warned you, if you lied!"

"This have I, Earl and ladies," and he drew from his bosom a reliquary. "Ulf the marshal took this off his neck, and bade me give it to none but his lady. Therefore, with your pardon, Sir Earl, I did not tell you that I had it, not knowing whether you were an honest man."

"Thou hast done well, and an honest man thou shalt find me. Come home, and I will feed thee at my own table; for I have been a sea-rover and a Viking myself."

They left the reliquary with the ladies, and went.

"See to this good man, Martin."

"That will I, as the apple of my eye."

And Hereward went into Torfrida's room.

"I have news, news!"

"So have I."

"Harold Hardraade is slain, and Tosti too!"

"Where? how?"

"Harold Godwinsson slew them by York."

"Brother has slain brother? O God that died on cross!" murmured Torfrida, "when will men look to thee, and have mercy on their own souls? But Hereward—I have news—news more terrible by far. It came an hour ago. I have been dreading your coming back."

"Say on. If Harold Hardraade is dead, no worse can happen."

"But Harold Godwinsson is dead!"

"Dead! Who next? William of Normandy? The world seems coming to an end, as the monks say it will soon." *

"A great battle has been fought at a place they call Heathfield."

"Close by Hastings? Close to the landing-place? Harold must have flown thither back from York. What a captain the man is, after all."

"Was. He is dead, and all the Godwinssons, and England lost."

If Torfrida had feared the effect of her news, her heart was lightened at once as Hereward answered haughtily—

"England lost? Sussex is not England, nor Wessex either, any more than Harold was king thereof. England lost? Let the tanner try to cross the Watling street, and he will find out that he has another stamp of Englishman to deal with."

"Hereward, Hereward, do not be unjust to the dead. Men say—the Normans say—that they fought like heroes."

"I never doubted that: but it makes me mad—as it does all Eastern and Northern men—to hear these Wessex churls and Godwinssons calling themselves all England."

Torfrida shook her head. To her, as to most foreigners, Wessex and the south-east counties were England; the most civilised; the most Norman; the seat of royalty; having all the prestige of law, and order, and wealth. And she was shrewd enough to see, that as it was the part of England which had most sympathy with Norman civilisation, it was the very part where the Norman could most easily gain and keep his hold. The event proved that Torfrida was right: but all she said was, "It is dangerously near to France, at least."

"It is that. I would sooner see 100,000 French north of the Humber, than 10,000 in Kent and Sussex, where he can hurry over supplies and men every week. It is the starting-point for him, if he means to conquer England piece-meal."

"And he does."

"And he shall not!" and Hereward started up, and walked to and fro. "If all the Godwinssons be dead, there are Leofricssons left, I trust, and Siward's kin, and the Gospatrics in Northumbria. Ah? Where were my nephews in the battle? Not killed too, I trust?"

"They were not in the battle."

"Not with their new brother-in-law? Much he has gained by throwing away the Swan-neck, like a base hound as he was, and marrying my pretty niece. But where were they?"

"No man knows clearly. They followed him down as far as London, and then lingered about the city, meaning no man can tell what: but we shall hear—and I fear hear too much—before a week is over."

"Heavens! this is madness, indeed. This is the way to be eaten up one by one! Neither to do the thing, nor leave it alone. If I had been there! If I had been there——"

"You would have saved England, my hero!" and Torfrida believed her own words.

"I don't say that. Besides, I say that England is not lost. But there were but two things to do: either to have sent to William at once, and offered him the crown, if he would but guarantee the Danish laws and liberties to all north of the Watling street; and if he would, fall on the Godwinssons themselves, by fair means or foul, and send their heads to William."

"Or what?"

"Or have marched down after him, with every man they could muster, and thrown themselves on the Frenchman's flank in the battle—or between him and the sea, cutting him off from France—or

---

* There was a general rumour abroad that the end of the world was at hand, that the "one thousand years" of prophecy had expired.

Morcar held large lands round Bourne, and throughout the south of Lincolnshire, besides calling himself the Earl of Northumbria. The young men seemed the darlings of the half Danish northmen. Chester, Coventry, Derby, Nottingham, Leicester, Stamford, a chain of fortified towns stretching across England, were at their command; Blethyn, prince of North Wales, was their nephew.

Northumbria, likewise, was not yet in William's hands. Indeed it was in no man's hands, since the free Danes north of the Humber had expelled Tosti, Harold's brother, putting Morcar in his place, and helped that brother to slay him at Stanford Brigg. Morcar, instead of residing in his earldom of Northumbria, had made one Oswulf his deputy: but he had rivals enough. There was Gospatric, claiming through his grandfather Uchtred, and strong in the protection of his cousin Malcolm king of Scotland; there was young Waltheof "the forest thief," who had been born to Siward Biorn in his old age, just after the battle of Dunsinane; a fine and gallant young man, destined to a swift and sad end.

William sent to the Northumbrians one Copsi, a thane of mark and worth, as his procurator, to expel Oswulf. Oswulf and the land folk answered by killing Copsi, and doing every man that which was right in his own eyes.

William determined to propitiate the young earls. Perhaps he intended to govern the centre and north of England through them, as feudal vassals, and hoped meanwhile to pay his Norman conquerors sufficiently out of the forfeited lands of Harold, and those who had fought by his side at Hastings. It was not his policy to make himself, much less to call himself, the conqueror of England. He claimed to be its legitimate sovereign, deriving from his cousin Edward the Confessor; and whosoever would acknowledge him as such, had neither right or cause to fear. Therefore he sent for the young earls. He courted Waltheof, and more, really loved him. He promised Edwin his daughter in marriage. Some say it was Constance, afterwards married to Alan Fergant of Brittany: but it may also have been the beautiful Adelaide, who, none knew why, early gave up the world, and died in a convent. Be that as it may, the two young people saw each, and loved each other at Rouen, whither William took Waltheof, Edwin, and his brother; as honoured guests in name in reality, as hostages likewise.

With the same rational and prudent policy, William respected the fallen royal families, both of Harold and of Edward; at least, he warred not against women; and the wealth and influence of the great English ladies was enormous. Edith, sister of Harold, and widow of the Confessor, lived in wealth and honour at Winchester. Gyda, Harold's mother, retained Exeter and her land. Aldytha,* or Elfgiva, sister of Edwin and Morcar, niece of Hereward, and widow, first of Griffin of Wales, and then of Harold, lived rich and safe in Chester. Godiva the Countess owned, so antiquarians say, manors from Cheshire to Lincolnshire, which would be now yearly worth the income of a great duke. Agatha the Hungarian, widow of Edmund the outlaw, dwelt at Romsey in Hampshire, under William's care. Her son Edward Etheling, the rightful heir of England, was treated by William not only with courtesy, but with affection; and allowed to rebel, when he did rebel, with impunity. For the descendant of Rollo, the heathen Viking, had become a civilised chivalrous Christian knight. His mighty forefather would have split the Etheling's skull with his own axe. A Frank king would have shaved the young man's head, and immersed him in a monastery. An eastern sultan would have thrust out his eyes, or strangled him at once. But William, however cruel, however unscrupulous, had a knightly heart, and somewhat of a Christian conscience; and his conduct to his only lawful rival is a noble trait amid many sins.

So far all went well, till William went back to France; to be likened, not as his ancestors, to the gods of Valhalla, or the barbarous and destroying Viking of mythic ages, but to Cæsar, Pompey, Vespasian, and the civilised and civilising heroes of classic Rome.

But while he sat at the Easter feast at Fécamp, displaying to Franks, Flemings, and Bretons, as well as to his own Normans, the treasures of Edward's palace at Westminster, and more English wealth than could be found in the whole estate of Gaul; while he sat there in his glory, with his young dupes, Edwin, Morcar, and Waltheof, by his side; having sent Harold's banner in triumph to the Pope, as a token that he had conquered the church as well as the nation of England, and having founded abbeys as thank-offerings to Him who had seemed to prosper him in his great crime: at that very hour the handwriting was on the wall, unseen by man: and he, and his policy, and his race, were weighed in the balance, and found wanting.

For now broke out in England that wrong-doing which endured as long as she was a mere appanage and foreign farm of Norman kings, whose hearts and homes were across the seas in France. Fitz-Osbern, and Odo the warrior-prelate, William's half-brother, had been left as his regents in England. Little do they seem to have cared for William's promise to the English people that they were to be ruled still by the laws of Edward the Confessor, and that where a grant of land was made to a Norman he was to hold it as the Englishman had done before him, with no heavier burdens on himself, but with no heavier burdens on the poor folk who tilled the land for him. Oppression began, lawlessness, and violence; men were ill-treated on the highways; and women—what was worse—in their own homes; and the regents abetted the ill-doers.

---

* See her history, told, as none other can tell it, in Bulwer's "Harold."

"It seems," says a most impartial historian,* "as if the Normans, released from all authority, all restraint, all fear of retaliation, determined to reduce the English nation to servitude, and drive them to despair."

In the latter attempt they succeeded but too soon; in the former, they succeeded at last: but they paid dearly for their success.

Hot young Englishmen began to emigrate. Some went to the court of Constantinople, to join the Varanger guard, and have their chance of a Polotaswarf like Harold Hardraade. Some went to Scotland to Malcolm Canmore, and brooded over return and revenge. But Harold's sons went to their father's cousin; to Sweyn—Swend—Sweno Ulfsson, and called on him to come and reconquer England in the name of his uncle Canute the Great; and many an Englishman went with them.

These things Gospatric watched, as earl (so far as he could make any one obey him in the utter subversion of all order) of the lands between Forth and Tyne. And he determined to flee, ere evil befel him, to his cousin Malcolm Canmore, taking with him Marlesweyn of Lincolnshire, who had fought, it is said, by Harold's side at Hastings, and young Waltheof of York. But, moreover, having a head, and being indeed, as his final success showed, a man of ability and courage, he determined on a stroke of policy, which had incalculable after-effects on the history of Scotland. He persuaded Agatha the Hungarian, Margaret and Christina her daughters, and Edgar the Etheling himself, to flee with him to Scotland. How he contrived to send them messages to Romsey, far south in Hampshire; how they contrived to escape to the Humber, and thence up to the Forth; this is a romance in itself, of which the chroniclers have left hardly a hint. But the thing was done; and at St. Margaret's Hope, as tradition tells, the Scottish king met, and claimed as his unwilling bride, that fair and holy maiden who was destined to soften his fierce passions, to civilise and purify his people, and to become—if all had their just dues—the true patron saint of Scotland.

Malcolm Canmore promised a mighty army; Sweyn a mighty fleet. And meanwhile, Eustace of Boulogne, the Confessor's brother-in-law, himself a Norman, rebelled at the head of the down-trodden men of Kent; and the Welshmen were harrying Herefordshire with fire and sword, in revenge for Norman ravages.

But as yet the storm did not burst. William returned, and with him something like order. He conquered Exeter; he destroyed churches and towns to make his New Forest. He brought over his Queen Matilda with pomp and great glory; and with her, the Bayeux tapestry which she had wrought with her own hands; and meanwhile Sweyn Ulfsson was too busy threatening Olaf Haroldsson, the new king of Norway, to sail for England; and the sons of King Harold of England had to seek help from the Irish Danes, and ravaging the country round Bristol, be beaten off by the valiant burghers with heavy loss.

So the storm did not burst; and need not have burst, it may be, at all, had William kept his plighted word. But he would not give his fair daughter to Edwin. His Norman nobles, doubtless, looked upon such an alliance as debasing to a civilised lady. In their eyes, the Englishman was a barbarian; and though the Norman might well marry the Englishwoman, if she had beauty or wealth, it was a dangerous precedent to allow the Englishman to marry the Norman woman, and that woman a princess. Beside, there were those who coveted Edwin's broad lands; Roger de Montgomery, who already (it is probable) held part of them as Earl of Shrewsbury, had no wish to see Edwin the son-in-law of his sovereign. Be the cause what it may, William faltered, and refused; and Edwin and Morcar left the Court of Westminster in wrath. Waltheof followed them, having discovered—what he was weak enough continually to forget again—the treachery of the Norman. The young earls went off, one midlandward, one northward. The people saw their wrongs in those of their earls, and the rebellion burst forth at once, the Welsh under Blethyn, and the Cumbrians under Malcolm and Donaldbain, giving their help in the struggle.

It was the year 1069. A more evil year for England than even the year of Hastings.

The rebellion was crushed in a few months. The great general marched steadily north, taking the boroughs one by one, storming, massacring young and old, burning, sometimes, whole towns, and leaving, as he went on, a new portent, a Norman donjon—till then all but unseen in England—as a place of safety for his garrisons. At Oxford (sacked horribly, and all but destroyed), at Warwick (destroyed utterly), at Nottingham, at Stafford, at Shrewsbury, at Cambridge, on the huge barrow which overhangs the fen; and at York itself, which had opened its gates, trembling, to the great Norman strategist; at each doomed free borough, rose a castle, with its tall square tower within, its bailey around, and all the appliances of that ancient Roman science of fortification, of which the Danes, as well as the Saxons, knew nothing. Their struggle had only helped to tighten their bonds; and what wonder? There was among them neither unity, nor plan, nor governing mind and will. Hereward's words had come true. The only man, save Gospatric, who had a head in England, was Harold Godwinsson: and he lay in Waltham Abbey, while the monks sang masses for his soul.

Edwin, Morcar, and Waltheof trembled before a genius superior to their own—a genius, indeed, which had not its equal then in Christendom. They came in, and begged grace of the king. They got it. But Edwin's earldom was forfeited, and he and his brother became, from thenceforth, desperate men.

Malcolm of Scotland trembled likewise, and asked for peace. The clans, it is said, rejoiced thereat, having no wish for a war which could buy them neither spoil nor land. Malcolm sent ambassadors to William, and took that oath of fealty to the "Basileus of Britain," which more than one Scottish king and kinglet had taken before—with the secret proviso (which, during the middle ages, seems to have been thoroughly understood in such cases by both parties), that he should be William's man just as long as William could compel him to be so, and no longer.

---

* The late Sir F. Palgrave.

Then came cruel and unjust confiscations. Ednoth the standard-bearer had fallen at Bristol, fighting for William against the Haroldssons, yet all his lands were given away to Normans. Edwin and Morcar's lands were parted likewise; and—to specify cases which bear especially on the history of Hereward—Oger the Briton got many of Morcar's manors round Bourne, and Gilbert of Ghent many belonging to Marlesweyn about Lincoln city. And so did that valiant and crafty knight find his legs once more on other men's ground, and reappears in monkish story as "the most devout, and pious earl, Gilbert of Ghent."

What followed, Hereward heard not from flying rumours; but from one who had seen, and known, and judged of all.*

For one day, about this time, Hereward was riding out of the gate of St. Omer, when the porter appealed to him. Begging for admittance were some twenty women, and a clerk or two; and they must needs see the châtelain. The châtelain was away. What should he do?

Hereward looked at the party, and saw, to his surprise, that they were Englishwomen, and two of them women of rank, to judge from the rich materials of their travel-stained and tattered garments. The ladies rode on sorry country garrons, plainly hired from the peasants who drove them. The rest of the women had walked; and weary, and footsore enough they were.

"You are surely Englishwomen?" asked he of the foremost, as he lifted his cap.

The lady bowed assent, beneath a heavy veil.

"Then you are my guests. Let them pass in." And Hereward threw himself off his horse, and took the lady's bridle.

"Stay," she said, with an accent half Wessex, half Danish. "I seek the Countess Judith, if it will please you to tell me where she lives?"

"The Countess Judith, lady, lives no longer in St. Omer. Since her husband's death, she lives with her mother at Bruges."

The lady made a gesture of disappointment.

"It were best for you, therefore, to accept my hospitality, till such time as I can send you and your ladies on to Bruges."

"I must first know who it is who offers me hospitality?"

This was said so proudly, that Hereward answered proudly enough in return—

"I am Hereward Leofricsson, whom his foes call Hereward the outlaw; and his friends, Hereward the master of knights."

She started, and threw her veil back, looking intently at him. He, for his part, gave but one glance: and then cried,

"Mother of Heaven! You are the great Countess!"

"Yes, I was that woman once, if all be not a dream. I am now I know not what, seeking hospitality—if I can believe my eyes and ears—of Godiva's son."

"And from Godiva's son you shall have it, as though you were Godiva's self. God so deal with my mother, madam, as I will deal with you."

"His father's wit, and his mother's beauty!" said the great Countess, looking upon him. "Too, too like my own lost Harold!"

"Not so, my lady. I am a dwarf compared to him." And Hereward led the garron on by the bridle, keeping his cap in hand, while all wondered who the dame could be, before whom Hereward the champion would so abase himself.

"Leofric's son does me too much honour. He has forgotten, in his chivalry, that I am Godwin's widow."

"I have not forgotten that you are Sprakaleg's daughter, and niece of Canute, king of kings. Neither have I forgotten that you are an English lady, in times in which all English folk are one, and all old English feuds are wiped away."

"In English blood. Ah! if these last words of yours were true, as you, perhaps, might make them true, England might be saved even yet."

"Saved?"

"If there were one man in it, who cared for aught but himself."

Hereward was silent and thoughtful.

He had sent Martin back to his house, to tell Torfrida to prepare bath and food; for the Countess Gyda, with all her train, was coming to be her guest. And when they entered the court, Torfrida stood ready.

"Is this your lady?" asked Gyda, as Hereward lifted her from her horse.

"I am his lady, and your servant," said Torfrida, bowing.

"Child! child! Bow not to me. Talk not of servants to a wretched slave, who only longs to crawl into some hole and die, forgetting all she was, and all she had."

And the great Countess reeled with weariness and woe, and fell upon Torfrida's neck.

A tall veiled lady next her helped to support her; and between them they almost carried her through the hall, and into Torfrida's best guest-chamber.

And there they gave her wine, and comforted her, and let her weep awhile in peace.

The second lady had unveiled herself, displaying a beauty which was still brilliant, in spite of sorrow, hunger, the stains of travel, and more than forty years of life.

---

* For Gyda's coming to St. Omer that year, see Ordericus Vitalis.

"She must be Gunhilda," guessed Torfrida to herself, and not amiss.

She offered Gyda a bath, which she accepted eagerly, like a true Dane.

"I have not washed for weeks. Not since we sat starving on the Flat-Holme there, in the Severn sea. I have become as foul as my own fortunes: and why not? It is all of a piece. Why should not beggars beg unwashed?"

But when Torfrida offered Gunhilda the bath, she declined.

"I have done, lady, with such carnal vanities. What use in cleansing that body which is itself unclean, and whitening the outside of this sepulchre? If I can but cleanse my soul fit for my heavenly Bridegroom, the body may become—as it must at last—food for worms."

"She will needs enter religion, poor child," said Gyda; "and what wonder?"

"I have chosen the better part, and it shall not be taken from me."

"Taken! Taken! Hark to her. She means to mock me, the proud nun, with that same 'taken.'"

"God forbid, mother!"

"Then why say taken, to me from whom all is taken?—Husband, sons, wealth, land, renown, power—power which I loved, wretch that I was, as well as husband and as sons. Ah God! the girl is right. Better to rot in the convent, than writhe in the world. Better never to have had, than to have had and lost."

"Amen!" said Gunhilda. "'Blessed are the barren, and they that never gave suck,' saith the Lord."

"No! Not so!" cried Torfrida. "Better, Countess, to have had and lost, than never to have had at all. The glutton was right, swine as he was, when he said that not even heaven could take from him the dinners he had eaten. How much more we, if we say, not even heaven can take from us the love wherewith we have loved. Will not our souls be richer thereby, through all eternity?"

"In Purgatory?" asked Gunhilda.

"In Purgatory, or where else you will. I love my love; and though my love prove false, he has been true; though he trample me under foot, he has held me in his bosom; though he kill me, he has lived for me. What I have had will still be mine, when that which I have shall fail me."

"And you would buy short joy with lasting woe?"

"That would I, like a brave man's child. I say—The present is mine, and I will enjoy it, as greedily as a child. Let the morrow take thought for the things of itself.—Countess, your bath is ready."

Nineteen years after, when the great conqueror lay, tossing with agony and remorse, upon his dying bed, haunted by the ghosts of his victims, the clerks of St. Saviour's in Bruges' city were putting up a leaden tablet (which remains, they say, unto this very day) to the memory of one whose gentle soul had gently passed away. "Charitable to the poor, kind and agreeable to her attendants, courteous to strangers, and only severe to herself," Gunhilda had lingered on in a world of war and crime; and had gone, it may be, to meet Torfrida beyond the grave, and there finish their doubtful argument.

The Countess was served with food in Torfrida's chamber. Hereward and his wife refused to sit, and waited on her standing.

"I wish to show these saucy Flemings," said he, "that an English princess is a princess still in the eyes of one more nobly born than any of them."

But after she had eaten, she made Torfrida sit before her on the bed, and Hereward likewise; and began to talk; eagerly, as one who had not unburdened her mind for many weeks; and eloquently too, as became Sprakaleg's daughter, and Godwin's wife.

She told them how she had fled from the storm of Exeter, with a troop of women, who dreaded the brutalities of the Normans.* How they had wandered up through Devon, found fishers' boats at Watchet in Somersetshire, and gone off to the little desert island of the Flat-Holme, in hopes of there meeting with the Irish fleet, which her sons, Edmund and Godwin, were bringing against the West of England. How the fleet had never come, and they had starved for many days; and how she had bribed a passing merchantman to take her and her wretched train to the land of Baldwin the Débonnaire, who might have pity on her for the sake of his daughter Judith, and Tosti her husband who died in his sins.

And at his name, her tears began to flow afresh: fallen in his overweening pride,—like Sweyn, like Harold, like herself——

"The time was, when I would not weep. If I could, I would not. For a year, lady, after Senlac, I sat like a stone. I hardened my heart like a wall of brass, against God and man. Then, there upon the Flat-Holme, feeding on shell-fish, listening to the wail of the sea-fowl, looking outside the wan water for the sails which never came, my heart broke down a moment. And I heard a voice crying, 'There is no help in man, go thou to God.' And I answered—That were a beggar's trick, to go to God in need, when I went not to Him in plenty. No. Without God I planned, and without Him I must fail. Without Him I went into the battle, and without Him I must bide the brunt. And at best—Can He give me back my sons? And I hardened my heart again like a stone, and shed no tear till I saw your fair face this day."

"And now!" she said, turning sharply on

---

* To do William justice, he would not allow his men to enter the city while they were bloodhot; and so prevented, as far as he could, the excesses which Gyda had feared.

Hereward. "What do you do here? Do you not know that your nephews' lands are parted between grooms from Angers, and scullions from Normandy?"

"So much the worse for both them and the grooms."

"Sir?"

"You forget, lady, that I am an outlaw."

"But do you not know that your mother's lands are seized likewise?"

"She will take refuge with her grandsons, who are, as I hear, again on good terms with their new master, showing thereby a most laudable and Christian spirit of forgiveness."

"On good terms? Do you not know, then, that they are fighting again, outlaws, and desperate at the Frenchman's treachery? Do you not know that they have been driven out of York, after defending the city street by street, house by house? Do you not know that there is not an old man or a child in arms left in York; and that your nephews, and the few fighting men who were left, went down the Humber in boats, and north to Scotland, to Gospatric and Waltheof? Do you not know that your mother is left alone—at Bourne, or God knows where—to endure at the hands of Norman ruffians what thousands more endure?"

Hereward made no answer, but played with his dagger.

"And do you not know that England is ready to burst into a blaze, if there be one man wise enough to put the live coal into the right place? That Sweyn Ulffson, his kinsman, or Osbern, his brother, will surely land there within the year with a mighty host? And that if there be one man in England of wit enough, and knowledge enough of war, to lead the armies of England, the Frenchman may be driven into the sea——Is there any here who understands English?"

"None but ourselves."

"And Canute's nephew sit on Canute's throne?"

Hereward still played with his dagger.

"Not the sons of Harold, then?" asked he, after a while.

"Never! I promise you that—I, Countess Gyda, their grandmother."

"Why promise me, of all men, O great lady?"

"Because—I will tell you after. But this I say, my curse on the grandson of mine who shall try to seize that fatal crown, which cost the life of my fairest, my noblest, my wisest, my bravest!"

Hereward bowed his head, as if consenting to the praise of Harold. But he knew who spoke; and he was thinking within himself: "Her curse may be on him who shall seize, and yet not on him to whom it is given."

"All that they, young and unskilful lads, have a right to ask is, their father's earldoms and their father's lands. Edwin and Morcar would keep their earldoms as of right. It is a pity, that there is no lady of the house of Godwin, whom we could honour by offering her to one of your nephews, in return for their nobleness in giving Aldytha to my Harold. But this foolish girl here, refuses to wed——"

"And is past forty," thought Hereward to himself.

"However, some plan to join the families more closely together might be thought of. One of the young earls might marry Judith here.* Waltheof would have Northumbria, in right of his father, and ought to be well content—for although she is somewhat older than he, she is peerlessly beautiful—to marry your niece Aldytha." †

"And Gospatric?"

"Gospatric," she said, with a half-sneer, "will be as sure, as he is able, to get something worth having for himself out of any medley. Let him have Scotch Northumbria, if he claim it. He is a Dane, and our work will be to make a Danish England once and for ever."

"But what of Sweyn's gallant holders and housecarles, who are to help to do this mighty deed?"

"Senlac left gaps enough among the noblemen of the South, which they can fill up, in the place of the French scum who now riot over Wessex. And if that should not suffice, what higher honour for me, or for my daughter the Queen-Dowager, than to devote our lands to the heroes who have won them back for us?"

Hereward hoped inwardly that Gyda would be as good as her word; for her greedy grasp had gathered to itself, before the Battle of Hastings, no less than six-and-thirty thousand acres of good English soil.

"I have always heard," said he, bowing, "that if the Lady Gyda had been born a man, England would have had another all-seeing and all-daring statesman, and Earl Godwin a rival, instead of a helpmate. Now I believe what I have heard."

But Torfrida looked sadly at the Countess. There was something pitiable in the sight of a woman ruined, bereaved, seemingly hopeless, portioning out the very land from which she was a fugitive; unable to restrain the passion for intrigue, which had been the toil and the bane of her sad and splendid life.

"And now," she went on, "surely some kind saint brought me, even on my first landing, to you of all living men."

"Doubtless the blessed St. Bertin, beneath whose shadow we repose here in peace," said Hereward, somewhat drily.

"I will go barefoot to his altar to-morrow, and offer my last jewel," said Gunhilda.

"You," said Gyda, without noticing her daughter, "are, above all men, the man who is needed." And she began praising Hereward's valour, his fame, his eloquence, his skill as a general and engineer; and when he suggested, smiling, that he was an exile and an outlaw, she insisted that he was all the fitter from that very fact. He had no enemies among the nobles. He had been mixed up in none of the civil wars and blood feuds of the last fifteen years. He was known only as that which he was, the ablest captain of his day—the only man who could cope with William, the only man whom all parties in England would alike obey.

---

* Tosti's widow, daughter of Baldwin of Flanders.
† Harold's widow.

And so, with flattery as well as with truth, she persuaded, if not Hereward, at least Torfrida, that he was the man destined to free England once more; and that an earldom—anything which he chose to ask—would be the sure reward of his assistance.

"Torfrida," said Hereward that night, "kiss me well; for you will not kiss me again for awhile."

"What?"

"I am going to England to-morrow."

"Alone?"

"Alone. I and Martin to spy out the land; and a dozen or so of housecarles to take care of the ship in harbour."

"But you have promised to fight the Viscount of Pinkney."

"I will be back again in time for him. Not a word—I must go to England, or go mad."

"But Countess Gyda? Who will squire her to Bruges?"

"You, and the rest of my men. You must tell her all. She has a woman's heart, and will understand. And tell Baldwin I shall be back within the month, if I am alive on land or water."

"Hereward, Hereward, the French will kill you!"

"Not while I have your armour on. Peace, little fool! Are you actually afraid for Hereward at last?"

"Oh, heavens! when am I not afraid for you!" and she cried herself to sleep upon his bosom. But she knew that it was the right, and knightly, and Christian thing to do.

Two days after, a long ship ran out of Calais, and sailed away north and east.

CHRIST THE LIGHT OF THE WORLD.

By C. J. VAUGHAN, D.D.

V.—A MAN OF SORROWS.

"A man of sorrows."—Isaiah liii. 3.

THIS was one of the marks by which Israel was to know his Christ.

On the whole, no mark was so distinctly foretold. Visions, indeed, of triumph and empire floated here and there before the prophet's soul: visions of a conquering Chief and a sovereign people.

But one thing was plain: that in some marvellous way "He that should come" would combine humility with exaltation, suffering with majesty, shame with glory, and death with life.

The jealous preservation of this chapter by the Jews themselves among the writings of Divine Inspiration, is one of the most extraordinary proofs of the special Providence of God in giving and preserving to our use the sacred deposit of his revealed truth. Every line of it condemns them: and yet they have been made to keep it for us. "Unto them were entrusted," for everlasting preservation, "the oracles of God."

The promised Saviour was to be

A MAN OF SORROWS.

That was to be his characteristic. Though mingling freely in the homes and amidst the enjoyments of others, He was not to give the impression of a joyous person. Humanly speaking—yea, more than humanly speaking—his strength was to lie elsewhere. The power by which He was to draw men to Himself, the charm by which He was to keep men near Himself, was not to be the attraction of cheerfulness, not the pleasantness of his speech or the gladness of his character: it was to be just the opposite of this: it was to be his acquaintance with grief: it was to be his insight into and sympathy with the sufferings of his creatures: those who were to see any beauty in Him that they should desire Him—and the prophet hints that while He was upon earth they would not be many—must see that beauty in this; that He was "a Man of Sorrows."

How this was fulfilled in our Lord Jesus Christ, I need not remind you. But it is good for us to dwell upon it, though we know it.

I. His own personal life was a sorrowful one.

He was away from home; from his Father's presence.

He was a stranger—and made continually to feel it—in a strange land.

From his childhood He was full of thoughts which He could not utter; because, if uttered, they were not understood.

He was a lonely Man. Those who loved Him knew Him not. They were constantly misreading his intentions, thwarting his purposes, and suggesting a line of action which was not his own.

While they were faithful to Him, they could not understand Him. It was a constant struggle for Him to convey spiritual thoughts to the carnal, and heavenly ideas to the earthly-minded.

At last they deserted Him: all forsook Him and fled.

Joyless his life was at all times; unquiet, laborious, homeless: He "had not where to lay his head:"

"there were many coming and going, and He had no leisure so much as to eat." Prayer, his one solace, was often interrupted by new demands: and, when He was at work, his own friends said that He was beside Himself.

His sympathy with others by no means implied their sympathy with Him. In general, the sympathy was all on one side. He had cause indeed to say—well was it for Him that He could say it—"It is more blessed to give than to receive!"

II. But his sorrows, like his labours, were for others. It is in this aspect chiefly that we would now regard Him as the Man of Sorrows.

1. Jesus Christ sorrowed over bodily suffering.

No doubt, his miracles were wrought in attestation of his Messiahship. But how did they attest his Messiahship? Would they have done so if they had been wrought in cold, sullen, scornful indifference? as by One who was performing a necessary task, and that for his own sake; to bear witness to Himself? What made the miracles a sign of the Messiahship, was the whole thing together: the power, doubtless, in part; but not less, the tenderness, and the gentleness, and the sympathy, and the love, which prompted in each case the beneficent act.

It was a great thing that He fed the five thousand in the wilderness with a few loaves and a few small fishes. But was it not almost a greater thing, that He who had the power to do this should have felt that yearning compassion, of which the Evangelists tell, in the sight of that hungry, homeless, needy crowd? "Jesus, when He came out, saw much people, and," because He was the Man of Sorrows, and not a being of some different mould from that of suffering humanity, therefore He "was moved with compassion toward them," and in that warm, kind, generous pity first taught and then fed them.

How beautiful, in that connection, becomes the miracle, recorded by St. Mark only, of the healing of the deaf and stammering man by the sea of Galilee; when He, who had the power, and knew that He had the power, to remove the malady, yet, in the very act of doing so, "looked up to heaven and sighed" as He said the all-powerful "Ephphatha" which bade the deaf ear be opened! That sigh fulfilled the sign given in prophecy of Him that should come. It showed Him, not only as the Almighty One, in whom dwelt all the fulness of the Godhead bodily; but also as that All-pitying One, in whom dwelt all the fulness of humanity too; as the Man of Sorrows, acquainted with grief.

2. He sorrowed too over mental suffering.

When He met that funeral procession coming forth from the gate of Nain, with the widowed and now orphaned mother following behind, it was not that He hailed this as an opportunity of "manifesting forth his glory;" it was not that He coldly or roughly restored the breath to the closed lips, or the warmth to the frozen limbs, or the colour to the pallid cheek and brow of death, as One who would say, Receive the credentials of my Messiahship, and accept me by this sign as your Lord and King: no, a human compassion wrought with the Divine power, and marked the Redeemer not only as the mighty God, but also as the Man of Sorrows, bearing our griefs. "When the Lord saw her, He had compassion on her:" and when He had bidden the young man to arise, it was "to his mother" that He "delivered him."

Even so was it in the more detailed narrative of the raising of Lazarus. Although He thought it needful for God's glory that the death should not be prevented but suffered, and allowed therefore the sisters to think for two days that He was wanting in his care for them, yet how tender was the feeling shown at each step of that wonderful history; from the first mention of the "sleep" of his friend to his disciples at a distance, to the grief shown in the meeting and the tears shed at the grave! That briefest of all sentences, "Jesus wept," how does it carry with it, to all mourners, the assurance of his tender concern for them, who is Himself the Man of Sorrows, acquainted with grief!

3. He sorrowed too over spiritual suffering.

Wherever He saw anxiety and distress for sin, there, more than elsewhere, was his sympathy shown.

The publican standing afar off, in shame and penitence, in the Temple courts; able only to smite upon his breast, and say, "God be merciful to me a sinner;" whether his case was one actually seen, or only given by the All-wise Teacher as the sample and specimen of many; with what strong respect and deep sympathy does He speak of him! "I tell you, this man went down to his house justified rather than the other." As though He would say, I know the thousand times ten thousand hearts in which that Parable will in all ages be fulfilled: I know, and I feel for, and I love them; and here I place on record for all time the assurance of my tenderness and of my sympathy towards the self-accusing and the sin-laden.

And then the "woman which was a sinner;" who came to Him, unbidden and unwelcome and despised of others, as He sat at meat in the Pharisee's house; stood at his feet behind Him weeping, washing his feet with her tears, and anointing them with precious ointment; till at last He uttered those life-giving words, "Her sins, which are many, are forgiven; for she loved much:" and again, "Thy faith hath saved thee; go in peace."

It was but one example, out of many, of the sympathy of Christ with spiritual suffering. How was it with the fallen disciple, with St. Peter, in his sin and in his repentance? Wonderful is the record of that "look" which his Master, then on his trial—wearied, insulted, and outraged Himself, and not least by his own—found time and heart to bestow upon him, as though at once to bring him to himself, and also to assure him that he was not forgotten! Marvellous, too, the tenderness of that thrice-repeated question, after His resurrection, "Simon, son of Jonas, lovest thou me?" as if He would give him the desired opportunity of a threefold recantation of his threefold denial; and then of that solemn and touching re-investiture with the apostolical office, in the charge thrice repeated, "Feed my lambs"—"feed my sheep"—"feed my sheep." Surely there is no one who may not bring to Christ, with all humility, yet with all confidence too, the confession of his sins and shortcomings, his unfaithfulnesses and backslidings!

III. And yet we have scarcely touched upon the keenest of Christ's sorrows.

That sorrow which consists in sympathy with sorrow, carries its balm with it. Two hearts feeling together—and that is sympathy—half console each other. Sympathy is sweet, however bitter the grief which it shares. That person does not know the worst of all sorrow, who knows only a fellow-sorrow; a grief which he is helping to bear, or a grief which another bears with him. If Christ had had no sorrows but those of sympathy with a malady which He could heal, with a bereavement which He could repair, or with a penitence which He could bless with his forgiveness, the words of the text had not been verified in Him to the full.

He was a Man of Sorrows also, and chiefly, in relation to sin.

1. He had to *see* sin.

All around Him there was sin.

(1) Many vices were doubtless practised there, in the Holy Land; making homes wretched, and doing dishonour to God. The common sins of a fallen nature were daily committed, no doubt, if not in his sight, yet at least in the full view of his Omniscient intuition. These things caused Him sorrow.

(2) It was perhaps worse still to see religion itself with its very heart eaten out of it in those who professed to be its disciples and even its teachers. It is quite plain that the formalism, the false sanctimoniousness, the utter and absolute hypocrisy, of the Scribes and Pharisees, was the thing which caused our Saviour on earth the greatest concern as well as the greatest displeasure. It met Him everywhere. He could not go into the Temple, without seeing some sign of it. Perhaps there was a Pharisee saying his prayers; for a pretence making long prayers, full of boasting and self-parade; and then going away to devour a widow's substance. Perhaps there was a Scribe teaching the people; laying down the law, professing (unhappily) to lay down *God's* law, to the ignorant but respectful knot of men, women, and children around him: and in all that he taught them there was not one word of truth, not one word of reality, not one idea communicated by which the soul could be nourished. Perhaps, when Christ was teaching, or when He was in the very act of healing, He saw before Him—it happened constantly—some suspicious countenance, some "evil eye," watching his work and lying in wait to accuse. Often the same spirit broke out in open blasphemy. "This Man is in concert with the devil. The devil lets Him cast him out, that he may be the gainer." The finished work of such men was his betrayal and murder: but the work, in its beginning and in its progress, was harder still for Him to bear; thwarting his gracious designs, and giving at each turn that most painful impression, of being in a hostile presence and watched by a hostile eye.

(3) Sin came nearer to Him even than this. The very lists of the Apostles bear witness to it. "And Judas Iscariot, which also was the traitor." Most wonderful indeed is the record of that Divine forbearance, which treated the traitor Apostle, through three long years, on terms of friendship, confidence, and sympathy. All the miracles were wrought, all the discourses of Christ were uttered, with Judas Iscariot standing in the inner circle. And "Jesus knew from the beginning who should betray Him." Can we think of a trial, of a sorrow, heavier than this? to have in your own household, at your own table, admitted to your confidence, possessed of your secrets, one who is hardening more and more into hostility, and whom you know to be marked out as your eventual betrayer? This sorrow was Christ's all along. He had a traitor in his camp, an enemy in his bosom.

2. But all this stops short of making Christ the Man of Sorrows.

He had also to *bear* sin.

To see sin was sorrow to the Holy One. To see sin ruining men's lives, teaching in God's name, present daily with Him in disguise, was enough to sadden Him. But He was to come closer even than this to it. "He bare," this chapter says, "the sin of many."

We do not desire to speak, where God has not spoken, on a subject the most difficult and the most mysterious of all. But when the Word of God says—and it is only one passage out of many—"God made Him, who knew no sin, sin for us," we see that there must be something intended, of a taking upon Him of human sin, which goes far beyond the mere seeing and hearing, the mere feeling and grieving for, that which is evil; something best expressed, to our imperfect comprehension, by the words offering and sacrifice, atonement and propitiation; insomuch that the sins of each one of us were laid upon Christ to be borne and done away; the justice of God made consistent with his mercy in forgiving and blotting out transgression; and all for the sake of the merits and death of his Son Jesus Christ, who is the one immaculate Lamb given to take away the sin of the world.

It is probably in reference to this, above all else, that Christ is here called a Man of Sorrows. If we wish to see Him in his sorrow, we must go with Him to Gethsemane and Calvary. It was in Gethsemane that the confession fell from Him, "My soul is exceeding sorrowful even unto death." It was on Calvary that the cry was wrung from his lips, "My God, my God, why hast Thou forsaken me?" Surely it was neither the fear of death nor the presence of death which constituted the point and sting of that grief. It was no mere remembrance of what He had seen of sin upon earth, no mere anticipation of what sin might yet be in its misery and in its consequences, which expressed itself in those bitter words of anguish. Sin was nearer to Him even than the memory or the foreknowledge. It was then lying upon Him: He was bearing it—bearing it for us—tasting death, not for Himself, but (by the grace of God) for every man. The crowning point of the sorrows was the conscious incorporation with the sin. He had grieved over it in the spectacle of hardened hearts and seared consciences: He had wept over it in the contemplation of a doomed city, and in the prospect of a ruined and desolated country: now He bore it upon his soul, and, in pouring out that soul unto death, knew and felt that He was not only numbered with the transgressors, but making his soul (as it is written) an offering for sin. The Man of Sorrows is perfected, in that character, as the sin-bearer and the sin-offering.

IV. The subject is full of interest, and full of instruction.

1. If it is as a Man of Sorrows that Jesus Christ comes to us, it must be, first of all, as a memento of the fitness of sorrow to our condition as sinful men.

The great desire and yearning of our nature is for happiness. It is so, and it must be. A man who does not wish to be happy is a man with a deformed and distorted mind. By nature we all desire it; and God implanted that desire in us for our good.

The fault is not in the desire for happiness; but in our mistakes as to its nature.

Many of us mistake carelessness for happiness. This is, in other words, to mistake security for safety, forgetfulness of danger for freedom from danger.

If there is one word of truth in the Bible, we are all in great danger; danger of utter ruin and of final misery. If this be true, it can be no happiness to forget it. We all pity a person whom we see rushing on unawares to a desperate collision or a frightful fall. His ignorance of the danger is what we most commiserate. We do not say, He has been spared a few moments of fear: we rather say, If he had only foreseen he might have prevented the crash. Is it not so with the soul? If each one of us is in danger, it is wretched that we should be triflers. If not the danger only but also a way of escape is made known to us, then seriousness is the first condition of happiness, and carelessness is not only unbecoming, it is fatal too.

Now I say that the thought of our Saviour as a Man of Sorrows should show us the suitableness of seriousness, and even of sadness, to our condition as fallen and sinful beings.

A Christian ought to be happy: but who that is capable of judging will deny this, that one ingredient in true happiness is sorrow? Sorrow for the sufferings of others—sorrow for the sins of others—sorrow for our own sins, first and most of all—is that a bar to peace? In the happiest persons whom we have known there has been a vein of sadness: they were happier in proportion as they had this: for it made their happiness truer, it made it safer, and it made it more Christ-like. A person who is all smiles and jests is not a happy man: because his whole happiness rests upon a lie: he is trying to represent the world to himself as what it is not, as what a fallen and sinful world cannot be: and he is trying to represent his own state to himself as what it is not; for he who is fighting his way through snares and temptations, through infirmities and sins, into a life in which God is all, has other things to do than to picture scenes of flowers and sunshine, of relaxation and repose.

For all men seriousness, for most men sadness, is the expression of the truth. All are in danger: most men are not even in the way out of it.

With a Man of Sorrows for our Saviour, we are reminded of this first truth.

2. Again, only a Man of Sorrows could be a Saviour for all men, and for the whole of life.

We dare not say in what proportion—but certainly in a very large proportion—sorrow is mixed up in the experience of human life.

For one man entirely at ease, in mind, body, and estate, how many, shall we say, are in a condition of discomfort, of conscious disquietude, in one of these respects or in all? Of the readers of these pages, who is there without some definite drawback to entire satisfaction? The health, or the income—the business, or the family—the affections, or the conscience—the past, or the future—I do not suppose there are ten persons amongst them all who could honestly say that in all these things they are entirely and absolutely happy. Now just in proportion as there is a drawback to happiness, there is what we may call a natural affinity and attraction to Christ. Slow as we are to turn to Him in affliction, we are slower still to turn to Him in prosperity. "They that are whole need not a physician, but they that are sick." Not until the lights of earth are dimmed, do men commonly look out for the great, central, all-quickening light of heaven. "When He slew them, they sought Him." And then the thing which most touches them is the thought that the Saviour was a suffering Man below; that He tasted not of human joy, but drank to the dregs the cup of human grief; that He was despised and rejected of men, bore our griefs and carried our sorrows, was wounded for our transgressions and bruised for our iniquities, was Himself (in every sense) a Man of Sorrows, and profoundly acquainted with grief. It is this which makes Him a Saviour for all men and for the whole of life: for the sad as well as the joyful, for hours of gloom as well as moments of gladness.

3. It seems to follow from these things—and it is always worth dwelling upon—that sorrow, however deep, has its solaces and its compensations.

(1) Whatever it be, it is of the nature of sorrow to bring a man nearer to truth, nearer to reality,

nearer therefore to hope. A man in sorrow is all the nearer to the Man of Sorrows. I know too well that he may be in sorrow and yet miss Him. Sorrow of itself brings no man to Christ. There is a "sorrow of the world," St. Paul says, which "worketh death," as well as a "godly sorrow" which "worketh repentance unto salvation." Still, in itself, sorrow is a favourable condition for the soul's health. A man who turns not to Christ in sorrow, would still less turn to Christ in gladness. He is the nearer to Christ for it, though he may not—if he will not—reach Christ through it. One great and chief obstacle is removed: it is his to arise and go to Him.

(2) And sorrow makes a man more useful. It gives him a new experience and a new sympathy. Like his Master, he can now go with acceptance to the suffering. He finds in himself a new power of entering into their sorrows; and if he be a Christian indeed, he is able to "comfort them which are in any trouble by the comfort wherewith he himself has first been comforted of God." This, in the Christian estimate, is no light matter. He can now do Christ's own work—as he could not before—of ministering to the distressed and sorrow-laden. They will trust him now. They will find in him a response which they seek in vain, or probably seek not, in the prosperous. Let him draw out of the wells of salvation a supply both for himself and them!

4. One thing remains; the most important of all: the question, namely, how we stand, we ourselves, in reference to this Saviour.

If He is a Man of Sorrows, it is in order that He may minister to our sorrows. It is that He may draw us to Him by the assurance of his sympathy, and keep us near Him by the experience of his tenderness.

(1) There are some few persons amongst us, who could not truly describe themselves as being in sorrow. Life has dealt gently with them thus far: the rough hand of pain and loss has not yet been laid upon them: they imagine that it will be so with them, or not far otherwise, even to the end. In the meantime they let well alone, and take that which comes.

And is this all? Is there to be no provision made against change, against misfortune, against sorrow, against death?

To you Christ speaks as the Man of Sorrows, just because you want the contrast between what He is and what you are; want it for sobering, want it for awakening, want it for admonition and instruction in righteousness. He would say to you, There are realities which you scarcely dream of, around, above, and before you: if you think not of them, you are lost: come unto me, and I will teach you: I will open the closed eye, and give understanding to the sealed heart: I will make happiness safe for you, make it true, and make it eternal. There cannot be happiness where there is not truth: I will set your feet on the rock, and then you shall never be moved.

(2) Others are at this time in great sorrow: lonely, desolate, friendless, disconsolate. And yet even they do not quite see how and where they are to find Christ. They have a general trust in his mercy, in his tenderness, in his sympathy: but if they are to say that they find rest in Him, find comfort, find love, they cannot. The world is dark to them, and yet heaven is not bright. My friends, He is nearer to you than you think. You must not expect, still less wait for, visible or audible tokens of his presence. He is everywhere, and therefore here: "He that made the eye, does He not see? He that made the ear, shall He not hear?" Yes, He sees your want, in its hidden source and spring: He sees, and He regards it. The heart's desire is the prayer He looks for: deal with Him as if He heard, as if He cared for you; and be assured that it is so. "We shall know," says the Prophet, "if only we will follow on to know the Lord."

(3) The chief trouble of others is about their sins. They are disheartened, they are discouraged, they are half in despair. This sin which has long beset them, this sin which they have prayed against, which they once thought they had half vanquished, is again upon them: again they are entangled, again overcome. Who shall deliver them from the body of this death?

You have seen, my friends, once again now, what Christ is towards sin: how He came, and lived, and suffered, and died, a Man of Sorrows, chiefly because of it: it caused Him his chief anguish: it cost Him his life; twice over; a dying life by reason of sin, and then at last a cruel and desolate death. Therefore be assured that He knows all its malignity, and is ready to give all his compassion and all his strength for its overthrow and for its extirpation. Think of Him in his sorrows; in that predominant sadness from which He took his name: and depend upon his sympathy and upon his help in yours. Doubt not the steadfastness of his purpose, whether on earth or in heaven, "to deliver man." For this He submitted to be born of a woman; for this He placed Himself under the Law of God; for this He taught and laboured, spake words such as man never spake, and went about doing good; for this He at last bore shame and desertion, insult and anguish, the hiding of his Father's countenance, and a death uncheered by one ray of comfort; for this He rose again, and ascended; for this He ever liveth to make intercession. Trust Him humbly, trust Him wholly; trust Him when you see Him not; and when He seems to be silent to you, trust Him still! Soon shall you find yourself a little cheered, and a little aided: now and then a victory will be vouchsafed, when it is safe for you; now and then even from defeat you shall arise strengthened for warfare: at last, all shall be peace; you shall be found to have withstood in the evil day, and, having done all, to stand. You shall hear from your Lord the glad "Well done;" and to him that hath overcome He will give the crown of life.

ON LIGHT.

BY SIR JOHN F. W. HERSCHEL, BART.

PART I.

REFLEXION.—REFRACTION.—DISPERSION.—COLOUR.—ABSORPTION.

(*Continued from page 326.*)

It is evident from what we said in the concluding paragraph on p. 326, that according to the greater or less disproportion between the lines M R, N S, on the diagram there given, or the sines of the two angles of incidence and refraction, the greater or less will be the amount of bending (or *angle of deviation*, as it is called) of the ray at its point of transmission, for one and the same degree of obliquity—as also that for one and the same medium, the *deviation* increases *with* the angle of incidence (though not *proportionally to* it), being *nil* when the ray enters perpendicularly, and a maximum when just grazing the surface. If in any case M R be greater than N S, or the "ratio of the sines" be one of "greater inequality," the bending will be *towards* the perpendicular; if less, or if that ratio be one "of less inequality," *from* it; as indicated by the course of the dotted ray in the figure. If the former be the case in any instance, as in that where a ray passes out of air into water, the latter will happen in the reverse case, as where it passes out of water into air: that is to say, in optical language, "out of a denser medium into a rarer." This follows, from the general fact that the illuminating and illuminated points are convertible, or that a ray can always return by the path of its arrival, so that the refraction of a ray out of any medium into air is performed according to the same rule of the sines, only reversing the terms of the proportion; or in other words, regarding what was the angle of incidence in the one case as that of refraction in the other and *vice versâ*. Numerically expressed, this reversal of the terms of a proportion, or ratio, is equivalent to inverting the numerator and denominator of the fraction expressing it, so that, for instance in the passage of light out of water into air, the "law of the sines" is expressed in the same general terms, but the "refractive index" (by which is meant the *number* expressing the proportion in question) has to be changed into its numerical reciprocal. In the case supposed, when light passes out of air into water, the proportion of the sines is that of 1336 to 1000, or almost exactly 4 to 3; and the "refractive index" is accordingly expressed by the fraction $\frac{4}{3}$, or the almost exactly equivalent decimal 1·336. In the reversed case, then, when the transmission is out of water into air, it will be $\frac{3}{4}=0·75$, or more precisely 0·749.

As a matter of experiment, it is found that between transparent media, or substances capable of being traversed by light, there exists a very wide diversity in this ratio of the sines of the two angles in question, or in the numerical values of the "refractive indices." Thus when light passes out of air into the less refractive species of plate-glass, the index instead of $\frac{4}{3}$ is $\frac{3}{2}$ or 1·5; into sulphur (which in its crystalline form is transparent), 2·0; and into diamond, or the mineral called octohedride, 2·5. In fact each particular transparent substance, solid, liquid, *or gaseous*, has its own peculiar, and, so to speak, *characteristic* index of refraction, which is found to stand in relation to its physical habitudes in many other respects, especially with its chemical composition, and its state of aggregation and density.

Even common air, in respect of a vacuum, has its refractive index—viz.: 1·0003—the effect of which is perceived in the phenomenon of astronomical refraction, by which the sun or moon is rendered visible when actually sunk below the level of the true horizon.
